Acute Liver Failure in a Deployed Soldier

1. REPORT DATE: 10/13/2017
2. REPORT TYPE: Abstract
3. DATES COVERED: From 10/13/2017 To 10/18/2017

4. TITLE AND SUBTITLE

5. AUTHOR(S)
Lt Col John Gancayco

6. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES)
59th Clinical Research Division
1100 Wilford Hall Loop, Bldg 4430
JBSA-Lackland, TX 78236-9908
210-292-7141

7. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES)
59th Clinical Research Division
1100 Wilford Hall Loop, Bldg 4430
JBSA-Lackland, TX 78236-9908
210-292-7141

12. DISTRIBUTION/AVAILABILITY STATEMENT
Approved for public release. Distribution is unlimited.

Acute liver injury in deployed soldier.

Michael Brazeau, D.O. Michael.brazeau.2@us.af.mil

John Gancayco, M.D. john.g.gancayco.mil@mail.mil (Presenter)

Andrew Hall, M.D. halla3@slu.edu

Craig Joint Theater Hospital, Bagram Afghanistan

Introduction: Supplements can be a dangerous source of casualties in the deployed setting. This case describes an incidence of acute hepatic injury induced by Hydroxycut. Supplements, like Hydroxycut, are non-regulated and often proprietary blends leading those taking them unaware of potential risk. Following this case, the Afghanistan Captured Material Exploitation (ACME) lab at Bagram conducted chemical analysis of several supplements used by soldiers to investigate the potential threat.

Case:
The patient is a 22-year-old, deployed male. He was exercising on a regular basis in an attempt to lose weight and began taking Hydroxycut 6 days prior to his presentation to the hospital. On presentation he had complaints of muscle aches and malaise. His initial labs where remarkable for a CK of 6720, AST of 111U/L, ALT 62 U/L, INR 1.9; his other labs to include a toxicology screen, hepatitis panel, and acetaminophen level were normal. His AST and ALT peaked at values of 611 and 938 respectively before down trending. He was monitored in the hospital for 3 days prior to down trending and then followed up 1 week later with noted normalization of his labs except his AST and ALT which were 346 and 718 respectively, his INR was less than 0.8.

Discussion: This case is an example of supplement-induced acute liver injury. Supplements are notorious for their minimal regulation by the Food and Drug Administration (FDA). While the FDA does regulate to ensure that products are not adulterated or misbranded, safety is left to the manufacturers which results in potential dangers to patients. Unfortunately, this supplement has been linked to the same condition before and a health advisory was issued in 2009 in connection to hepatitis; the supplement was briefly removed from the market and a new formulation was released, but toxicity continues to be reported. Since manufacturers call their product ingredients proprietary, individuals are left not knowing the makeup of the supplements they take. In the attached charts are the ingredients that the ACME lab in Bagram found to be in common supplements used by deployed soldiers.
