THIS REPORT HAS BEEN DELIMITED AND CLEARED FOR PUBLIC RELEASE UNDER DOD DIRECTIVE 5200.20 AND NO RESTRICTIONS ARE IMPOSED UPON ITS USE AND DISCLOSURE.

DISTRIBUTION STATEMENT A

APPROVED FOR PUBLIC RELEASE;
DISTRIBUTION UNLIMITED.
SECURITY MARKING

The classified or limited status of this report applies to each page, unless otherwise marked. Separate page printouts MUST be marked accordingly.

THIS DOCUMENT CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES WITHIN THE MEANING OF THE ESPIONAGE LAWS, TITLE 18, U.S.C., SECTIONS 793 AND 794. THE TRANSMISSION OR THE REVELATION OF ITS CONTENTS IN ANY MANNER TO AN UNAUTHORIZED PERSON IS PROHIBITED BY LAW.

NOTICE: When government or other drawings, specifications or other data are used for any purpose other than in connection with a definitely related government procurement operation, the U.S. Government thereby incurs no responsibility, nor any obligation whatsoever; and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data is not to be regarded by implication or otherwise as in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use or sell any patented invention that may in any way be related thereto.
A recurring problem of tank design is the increasing of firepower, armor protection, and mobility without a comparable increase in weight and size. During the last decade, as the potentialities of steel armor have come closer and closer to realization and metallurgy has so far been unable to provide a satisfactory substitute for steel as the basic armor material, this problem has become increasingly difficult to solve. The development of the T49 90 mm gun tank, which combines the armament of a medium gun tank with the armor protection and mobility of a light gun tank, represents one attack upon it at the medium gun tank level.

Studies conducted for several years before mid-1951 indicated the possibility of mounting a 90-mm tank gun in a 76-mm gun tank if the gun selected were a low-pressure weapon designed for firing fin-stabilized HEAT rounds; adoption of a low-pressure gun would make possible the saving of weight needed to offset the results of increasing the weapon's caliber by 14 mm. As a result, development of a smoothbore gun of this type, designated the T132 90-mm gun, was put under way, with the requirement that its tube be quickly replaceable in the field. At first it was believed that the T132 gun could be mounted in a T41E1 tank without making major changes in the vehicle or increasing its over-all weight. However, it soon was found that both a new gun mount and a new turret were desirable, and the problem then became one of designing these so that they would not increase vehicle weight. During 1950 and early 1951 work was concentrated on the development of a mount and turret which would meet all the conditions set.

In June 1951 the different phases of the work were brought together under a project for development of the T49 90-mm gun tank. The objective of this project was a lightly-armored high-speed tank of the light gun class but with the firepower of a medium gun tank, to be used principally for antitank missions.

In compliance with the quick-removal-of-tube requirement, the T132 smoothbore gun had been designed so that its tube could quickly...
be changed in the field. The gun was originally to be installed in the T138E1 combination gun mount of the T41E1 76-mm gun tank; however, because the T138E1 mount had been designed for a gun with a nonremovable tube and could not satisfactorily be adapted to the T132 weapon, a new combination gun mount was designed. This was the T145 mount with T87 recoil mechanism. Development of the T145 mount, in its turn, compelled altering of the T132 gun's contour so that it would fit the T145, rather than the T138E1.

The next major change in design was necessitated by the results of tests of the ammunition developed for use in the T132 gun, which tests had revealed the improbability of the gun-ammunition combination attaining the ballistic results desired. Accordingly, the design of the T132 gun was modified to call for very shallow rifling of the tube and a slight increase in chamber pressure; the revised design, designated T132E1, was nevertheless that of a low-pressure gun to fire fin-stabilized HEAT projectiles. Since this change in plans, the development of the gun has proceeded from the T132E1 to the T132E3 model. The T132E2 differs from the T132E1 only in certain modifications of the chamber, which has been further modified in the T132E3. All models from T132E1 through T132E3 have light rifling of
one twist in twenty-five calibers. Each is a thin-walled gun for firing 16-pound fin-stabilized HEAT projectiles at a muzzle velocity of approximately 2,800 fps. From these models, the T132E3 has been selected as the main armament of the T49 tank.

No new HEAT ammunition is being developed for use in the T132E3 gun, which will fire the T108E40 90-mm HEAT shell. The original requirement that the T49's gun should fire only HEAT rounds has been modified, and the following rounds now under development are now specified for use in the T132E3:

- 90-mm HEP shell, T142E8
- 90-mm HE shell, T91
- 90-mm WP smoke shell, T92

As developed to date, the T49 90-mm gun tank is a lightly- armored full-track-laying vehicle of 25.5 ton combat weight; it is 27. inches long, 124 inches wide, and 108 inches high.

Except for turret and main armament and very minor differences in hull, the T49 tank is identical with the M41 and M41A1 76-mm gun tanks. The turret developed for the T49 is made up of arc-welded castings and plate, and is rotatable through 360° on a ball-bearing ring. An amplidyne system controls the electric motors used to traverse it; this represents a recent development, intended to replace the commonly-employed constant-pressure hydraulic traversing system. Protected by armor varying in thickness from 0.5 to 1.25 inches and mounted at obliquities ranging from 0° to 72°, the turret has space for the 90-mm tank gun, a T41E3 range finder, and a caliber .50 machine gun on the T145 combination gun mount. The weight of the 90-mm gun is counterbalanced by radio equipment, ventilator blower, and other equipment located or stowed in the turret's rear. A pintle mount for an M2 HB machine gun is located on the turret's top.

The fire control equipment for the T49 tank includes a T41E3 range finder, a T23E2 ballistic drive, an M31 azimuth indicator, commander's, gunner's, loader's, and driver's periscopes, and other instruments needed to make fire as accurate as possible.

The manufacture of two pilot models of the T49 tank was initiated in the spring of 1952. They are now being subjected to engineering tests, which are scheduled for completion in the near future. However, in the summer of 1953 Army Field Forces indicated that they were no longer interested in this tank, their reason being that the low-pressure guns developed for its main armament could not guarantee an 88% probability of first-round hit. Because of this withdrawal of user interest, it is possible that work on the T49 will not be continued beyond engineering testing and that the tank itself will not be put into production.
90-mm Tank Gun, T132E3

Caliber 90 mm
Length, over-all 192.26 in
Length of bore 50 cal
Travel of projectile in bore 152.65 in
Rifling
   Length 152.775 in
   Number of grooves 32
   Twist, uniform right-hand, one turn in 25 cal
   Weight of tube 970 lb
   Weight of breech mechanism 390 lb
   Weight of complete gun 1,440 lb
Chamber capacity 267 cu in
Density of loading 0.57
Rated maximum chamber pressure 30,000 psi
Breechblock, type vertical sliding
Breech mechanism semiautomatic
Firing mechanism percussion-inertia
Ammunition, type fixed
Muzzle velocity 2,800 fps
Maximum effective range 2,000 yd
Perforation of homogeneous armor
   HEAT shell 12 in
   Rate of fire 8 rd/min

Combination Gun Mount, T145

Weight no information
Recoil mechanism, type concentric hydrospring
Number of recoil cylinders 1
Recoil length
   Normal no information
   Maximum no information
Equilibrator, type no information
Elevating mechanism, type electrical and manual
   Maximum elevation 20°
   Maximum depression -10°
Traversing mechanism, type electrical and manual
   Maximum traverse, right or left 360°

Fire Control Equipment

Quadrant, gunner's M1
Periscope M13
Setter, fuze M14 or M27
Periscopes (4) M17
Lights, instrument (3) M36
Drive, ballistic T23E2
Indicator, azimuth M31
Periscopes (2) M20A2
Finder, range T41E3
Mount, periscope M93
Mount, periscope M94
