FOREWORD

The work reported herein was done at the request of the Air Force Flight Dynamics Laboratory (AFFDL), Air Force Systems Command (AFSC), under Program Element 62405364, Project 1362, Task 136203.

The results of tests presented were obtained by ARO, Inc. (a subsidiary of Sverdrup & Parcel and Associates, Inc.), contract operator of the Arnold Engineering Development Center (AEDC), AFSC, Arnold Air Force Station, Tennessee, under Contract AF 40(600)-1200. The tests were conducted from May 2 to May 10, 1966, under ARO Project No. VA0508. The manuscript was submitted for publication on June 29, 1966.

This technical report has been reviewed and is approved.

ABSTRACT

Static force tests were conducted in the 40-in. supersonic tunnel of the von Kármán Gas Dynamics Facility on a separable-nose crew escape capsule in the presence of the forward section of the airplane fuselage. The separation rocket jet plume was simulated with cold air. Data were obtained at Mach numbers from 1.5 through 4.5 at capsule angles of attack from -14 to 20 deg. The fuselage section, relative to the capsule, was positioned at several locations aft of the capsule at zero angle of attack. Reynolds number, based on a model length of 18.1 in., ranged from $1.81 \times 10^6$ to $9.41 \times 10^6$. Selected results are presented showing the effects of the fuselage section on the static longitudinal stability and drag characteristics of the capsule.

SECTION I
INTRODUCTION

These tests constitute a part of Phase II of a wind tunnel test program requested by the Flight Recovery Group (FDFR), AFFDL, to provide data for investigating crew escape systems for high-speed flight vehicles. In Phase I (Ref. 1) the static stability and drag characteristics of the F-104 aircraft separable-nose escape capsule were obtained for angles of attack from -30 to 30 deg with cold flow simulation of the exhaust plume from the escape rocket at various altitudes. In these Phase II tests, static longitudinal stability and drag data were obtained on the capsule in proximity to the forward section of the airplane fuselage. The fuselage section position relative to the capsule varied from 3.09 to 13.38 in. aft of the capsule and from 3.34 to 11.78 in. below the capsule.

During later Phase II tests of this program, a remotely controlled support system will be used to position the fuselage with respect to the capsule and provide independent pitch and yaw of both capsule and fuselage. Other crew escape capsule configurations will also be tested.

Static force data were obtained at Mach numbers from 1.5 through 4.5 at capsule angles of attack from -14 to 20 deg. The fuselage angle of attack was zero. Reynolds number, based on a model length of 18.1 in., ranged from $1.81 \times 10^6$ to $9.41 \times 10^6$.

SECTION II
APPARATUS

2.1 WIND TUNNEL

The 40-in. supersonic tunnel (Gas Dynamic Wind Tunnel, Supersonic (A)) is a continuous, closed-circuit, variable density wind tunnel with an automatically driven, flexible-plate-type nozzle and a 40- by 40-in. test section. The tunnel operates at Mach numbers from 1.5 to 6 at maximum stagnation pressures from 29 to 200 psia, respectively, and stagnation temperatures up to 760°R ($M_a = 6$). Minimum operating pressures are about one-tenth of the maximum at each Mach number. Further tunnel information may be obtained in Ref. 2.
2.2 MODELS

The separable-nose escape capsule model and the fuselage section model (Figs. 1 through 3) were 1/10-scale models of the F-104 aircraft and were provided by AFFDL. The capsule had three wedge-shaped stabilizing booms extending to the rear. These booms (Fig. 1c) were positioned 120 deg apart, and the upper boom was fitted with a trim tab (Figs. 1a and b). The cold air jet nozzle was positioned in a cutout on the lower aft portion of the model (Fig. 1e) and was attached to the sting such that the model was isolated from the jet reaction force.

Details of the nozzle are given in Fig. 1d, and the procedures used to calculate the nozzle dimensions and chamber pressures for simulation of the full-scale jet plume shape at various altitudes over the Mach number range are given in Ref. 1.

The fuselage section model (Fig. 1f) was strut mounted from the tunnel sidewall. Three strut lengths were used to obtain the fuselage positions shown in Fig. 2. As shown in this figure, configurations 2 and 2a were identical except that a section at the top of the fuselage was removed for configuration 2a, Fig. 1f. The purpose of this was to allow clearance for the capsule sting support at angles of attack (α > 4 deg). The three longitudinal slots in the fuselage simulate the storage locations of the capsule stabilizer booms while the aircraft is in normal flight. The cutout on the bottom of the fuselage is a relief for the escape rocket exhaust during initial firing.

2.3 INSTRUMENTATION

Capsule force measurements were made with a six-component, moment-type, strain-gage balance supplied and calibrated by the von Kármán Gas Dynamics Facility. Prior to the test, loadings in a single plane and combined static loadings were applied to the balance which simulated the range of model loadings anticipated for the test. The range of uncertainties listed below corresponds to the differences between the applied loads and the values calculated with the balance equations used in the final data reduction. The minimum uncertainties given are for loads up to about 10 percent of the maximum applied and are for loadings on the particular component only (no combined loading interaction effects). The maximum uncertainties are for combined loadings.
Balance Component | Design Load | Range of Static Loadings | Range of Uncertainties
--- | --- | --- | ---
Normal Force, lb | 250 | ±20 to ±250 | ±0.40 to ±0.75
Pitching Moment, in.-lb | 1234 | 0 to ±350 | ±4.70
Axial Force, lb | 300 | 50 to 300 | ±0.25 to ±1.25

Two jet chamber pressure measurements were made using transducers calibrated for a full-scale range of 1000 psia and considered accurate to within 1 percent of full scale.

Base pressures were measured with transducers calibrated for full-scale ranges of 15-, 5-, and 1-psid, referenced to a near vacuum, and considered accurate to within 0.25 percent of full scale. A base drag correction was made for the balance cavity area only.

A summary of the test conditions is given in Table I.

SECTION III
RESULTS AND DISCUSSION

The effects of the presence of the fuselage section on the static longitudinal stability and drag characteristics of the escape capsule, jet off and jet on, are presented in Figs. 4 through 9 for Mach numbers 1.5, 2.5, 3.5, and 4.5. Configuration 1 in these figures is the capsule alone, and the results are from the phase I tests (Ref. 1). Configuration 7 was not tested at Mach 1.5 since the capsule bow shock would reflect from the tunnel wall between the capsule and fuselage, and the configuration 7 data at Mach 4.5 are not presented since the tunnel boundary layer separated upstream of the fuselage and influenced the flow about the capsule.

It can be seen that the effects of removing the section of fuselage to allow sting clearance for configuration 2a (Fig. 1f) generally resulted in a shift in the magnitude of the coefficients between configurations 2 and 2a, the trends of the data remaining the same (see Fig. 4a for an example). The data for configurations 2 and 2a also show some very large discontinuities with jet on, particularly at negative angles of attack (Figs. 5b, c, and d). These discontinuities are a result of changing local flow conditions on the trailing boom, and in the high-pressure region at the capsule base, as the angle of attack changes. At the negative angles of attack, the jet impinges on the front portion of the fuselage section and causes large regions of flow separation over the capsule. Schlieren photographs of configuration 2 at $M_{\infty} = 3.5$ for angles of attack of 0, -6, and -8 deg and
$p_c/p_\infty = 4204$ are given in Fig. 6. As can be seen, the flow is separated up to the nose of the capsule at $\alpha = -8$ deg.

Some of the data presented in Figs. 4 and 5 for Mach numbers 1.5, 2.5, 3.5, and 4.5 are summarized in Figs. 7, 8, and 9 for the jet off and jet on to show the effect of the fuselage position on the capsule trim angle of attack, capsule lift coefficient at trim, and capsuledrag at zero lift. In general, whether the jet was off or on, the effect of positioning the capsule close to the fuselage (configuration 2) was a decrease in the capsule trim angle of attack, lift at trim, and drag at zero lift. At a given angle of attack, the results in Figs. 4 and 5 show that positioning the capsule near the fuselage increased the lift and produced a negative increment of pitching moment. The magnitude of these effects caused by the proximity of the fuselage to the capsule was found to decrease with both Mach number and separation distance until at the largest separation distance (configuration 7) little or no influence of either Mach number or distance is present in the results.

**INSTRUCTIONS**

1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.

2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b. & 8c. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

1. "Restricted Data is included. Marking is to be in accordance with appropriate security regulations."

2. "Foreign announcement and dissemination of this report by DDC is not authorized."

3. "Qualified requesters may obtain copies of this report directly from DDC. Other qualified DDC users shall request through U.S. military agencies."

4. "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified users shall request through DDC.""T"

5. "All distribution of this report is controlled. Qualified DDC users shall request through DDC."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall include an indication of the security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
