DO NOT RETURN TO ORGINATOR.

The findings in this report are not to be construed as an official Department of the Army position, unless so designated by other authorized documents.
ABSTRACT

A simplified procedure for preparing PTB sockets is described. Preimpregnation of the stockinet and evaporation of solvent prior to lay-up results in a stronger, more porous socket.
INTRODUCTION

A prior report of this laboratory described a technique for preparing a porous patella-tendon-bearing below-knee socket with a soft distal end. Since this report was written a new method of making porous laminates has been developed.

By this method it is possible to make laminates two and a half times stronger and twice as porous as the older method, utilizing a simpler and more reproducible procedure.

The adaptation of this method to the preparation of porous patella-tendon-bearing below-knee sockets with a soft distal end is described.

LAMINATING PROCEDURES

(1) Examine the patient's stump for bony prominences and tender areas, and outline these areas with an indelible pencil.

(2) Sew one end of a 12-inch length of 3-inch orthopedic stockinet and fit it over the patient's stump well above the knee cap.

(3) With the stump held in 15° flexion, wrap the stump with 3 rolls of plaster of Paris bandage, starting from the middle of the stump and spiralling down and up the stump from the distal end to above the patella.

(4) Smooth the wrap by massaging with the hands and working the plaster around the bony prominences.

(5) As the plaster begins to harden, place the thumbs on each side of the patella-tendon and the finger pads in the popliteal areas, with the upper fingers at the level of the posterior curve of the knee.

(6) Use firm finger and thumb pressure until the plaster has hardened completely.

(7) When the plaster has hardened, release the finger pressure but allow the wrap to remain on the stump an additional minute or two.

(8) Carefully remove the wrap and fill the cast with plaster of Paris.

(9) Drill a 1/4" hole in a pipe near one end; insert the pipe inside a paper cup through the bottom of the cup, slide the cup up until the 1/4" hole is inside the cup. This is for later use with the vacuum system.

(10) Insert the pipe into the plaster of Paris until the top of the paper cup is flush with the plaster.

(11) After the plaster has set, remove wrapped cast.

(12) Apply plaster to build-up in the required areas which have been outlined with indelible pencil.

(13) Trim and smooth mold as required.

(14) Apply 3 coats of Hi-Glo parting lacquer, drying after each coat.

(15) Moisten a PVA sheet in a damp towel; pull down over the model and make certain that sheet is wrinkle free.

(16) Tie PVA sheet off at the pipe.

(17) Apply a vacuum of 12 in. Hg. to the system to pull the PVA against the mold.

(18) Cut one piece of nylon Banlon and 5 pieces of nylon orthopedic stockinet about 6 inches longer than model. Turn the Banlon stockinet inside out. Sew one end of each piece to correspond with the distal end of the stump model. Trim sewn end. Next, WEIGH ALL STOCKINET TO NEAREST GRAM.

(19) Pull one layer of Banlon stockinet and one layer of orthopedic stockinet down over the layup and tie off at pipe.
(20) Outline on the stockinet the area to be impregnated with silicone rubber using masking tape around the circumference to keep the excess rubber out of the remaining cloth (Fig. 1). This area is defined as that portion of the distal stump where the slope of the stump borders start to change sharply to the distal end.

(21) Mix Silastic RTV 502 Silicone Rubber (25 g) and 2 drops of catalyst and thoroughly impregnate the outlined area to 1/4" distal to the mark.
(22) Stretch a moistened PVA sheet over the impregnated area and tie it off. (Fig. 2)

(23) With the fingers, spread and burnish the silicone rubber into the stockinet to the mark and permit the silicone rubber to cure. Remove the PVA bag.
Position a piece of Mylar sheeting around the distal end of layup at the proximal edge of the silicone rubber and extending about 3-4 in. beyond the tip of stump model (Fig. 3).

Tape the contact area of the Mylar to the socket wall with masking tape.
(26) Mix the following formula: Silastic 5370-19 g., Silicone Rubber 502-31 g., Catalyst 5370-3 g., and pour into the open end of the Mylar cylinder (Fig. 4).

(27) Introduce sufficient foaming material to allow its expansion 1 inch distal to the end of model.

(28) After 5 minutes remove the Mylar supporting wall.
(29) Contour foam so there is about 1 inch of foam covering silicone area (Fig. 5). Make an alignment mark on foam so it can be later realigned. Remove foam tipped stockinet from model.

(30) Pull a disposable glove over the foam tip just to the edge of the silicone. This will protect the foam from getting impregnated with resin in a subsequent step. Pull the orthopedic stockinet back over the covered foam tip.
(31) Take these foam tipped pieces and roll loosely. Roll the 4 remaining pieces of orthopedic stockinet. Place all stockinets into a 12" x 16" polyethylene bag.

(32) **Mixing Resin:** Referring to Table I, go down the first column until you come to the weight of the stockinet. The amount of resin components will be found directly to the right in the next 3 columns. For example: Stockinet weight = 100 g; then directly to the right under the column headed EPON 815, you will find a weight of 129 g. Under column headed VERSAMID 140, you find 84 g, and under METHYLENE CHLORIDE column, you find 172 g. These are the amounts of each ingredient that should be mixed together for the 100 g. of stockinet. Add pigment.

(33) Pour all the resin mixture into the bag onto the stockinet. Impregnate the stockinet by kneading. Spread stockinet in bag to see if all pieces are uniformly impregnated. If some areas are void of resin, squeeze resin into these areas from other parts of the stockinet.

(34) Place pieces of stockinet side by side on paper towels and put into a circulating air oven set at 95°C (203°F) for exactly 5 minutes.

(35) Remove from oven. Wipe silicone coated stockinet with a piece of gauze to remove any resin. Remove disposable glove from foam tip.
(36) Pull foam tipped stockinet over layup, align, and tie to pipe. Next, pull two pieces of the remaining orthopedic stockinet over the layup and tie. (Fig. 6.)

(37) Wrap a piece of masking tape around the layup about 1 inch proximal of the edge of the foam-silicone edge. Tape some paper towels around the layup to protect the stockinet proximal to this foam-silicone edge.
(38) Brush coat the distal tip with Shell EPON 815 - 4 parts and Shell Curing Agent T - 1 part. After tip is thoroughly impregnated, wrap a 1-inch wide strip of PVA around just at the distal edge of the masking tape. This will insure a firm bond at the laminate-silicone boundary. Use a heat gun to cure tip (3-5 minutes).

(39) After tip has set up, turn remaining two pieces of stockinet inside out and pull over layup and tie at pipe.

(40) Apply a PVA sleeve to the layup. Pierce the inner bag with an awl and tie the outer sleeve at both ends.

(41) Place under a vacuum of 12 in. Hg. Apply a heat gun to set up the under-cut areas. When these areas have set, place layup in an oven for 1-1/2 hour at 95 C. (This step can be carried out in one operation if a hose is run into the oven for connection of the vacuum pump to the laminate).

(42) Remove the outer PVA bag and trim the laminate at the proximal end and remove the plaster model from the socket. Glue a 3/4" thick piece of wood 4-1/2" in diameter to bottom of socket for attaching to the adjustable leg.

(43) Attach the socket and foot to the adjustable leg to obtain correct alignment.

(44) Place the plaster model back into the socket, and place the entire assembly into the duplicating jig and duplicate in accordance with standard practice.

(45) Remove the complete setup from duplicating jig, making temporary spot glue joints; attach the two pieces together, keeping the correct alignment.

(46) Shape ankle section and fair into the wood base at the base of the socket.

(47) Make identifying marks on the ankle section and the wood base section.

(48) Hollow out the ankle section for lightness.

(49) Place socket on the ankle section, keeping all marks aligned.
(50) With the plaster mold in the socket pull a PVA sleeve down over the below-knee socket and secure on the distal end.

(51) Fashion a Mylar cylinder and attach to the wood base at the distal end of the socket; extend up to the patella-tendon impression on the socket.

(52) Melt A.C. Polyethylene grade 629 at 125 C and pour into the top of Mylar cylinder and allow to harden.

(53) Remove the Mylar and glue the ankle and socket sections together temporarily. Shape the polyethylene according to the desired contours and shape and smooth the complete assembly.

(54) After shaping, separate the two sections and pull the PVA sleeve down over the socket and cover the polyethylene, making sure the PVA sleeve also covers the base of socket and the wooden glue plate.

(55) Punch through the PVA bag with an awl at one of the two holes in the plaster model and attach to the ankle section. Tie PVA off at pipe.

(56) Cut three layers of nylon orthopedic stockinet and one layer of nylon Banlon stockinet; weigh all stockinet; then, roll and place them into a polyethylene bag.

(57) Referring to Table I (see Step 32), determine the correct amounts of resin components and solvent (methylene chloride). Weigh out these components, add pigment, mix, and pour into the polyethylene bag onto the stockinet. Knead the resin into the stockinet.

(58) Spread the stockinet in the bag to see if all pieces are uniformly impregnated.

(59) Spread impregnated pieces of stockinet on paper towels and place into the oven for exactly 5 minutes at 95 C.

(60) Remove stockinet from the oven and pull over layup with the Banlon on the outside.

(61) Start vacuum pump and pull a PVA sleeve over entire layup. Tie off both ends and adjust the vacuum to 12 in. Hg.
(62) Use a heat gun to set up the laminate at the patella.

(63) When the undercut at the patella has set, shut off the vacuum and place laminate into an oven set at 95 C. for two hours.

(64) Remove laminate from the oven, strip away the PVA, trim the proximal end and remove the plaster mold and inner socket. Break away the polyethylene and remove the PVA from the inner socket.

(65) Apply glue to the wooden block at the distal end of the socket and insert the socket into the laminated shank.

(66) Trim and finish socket in usual manner, bonding the two laminated edges together at brim using EPON 815 - 4 parts and Curing Agent T 1-1 part.

#### INSTRUCTIONS

1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.

2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with applicable security regulations.

2b. GROUP: Automatic downgrading is specified in DoD Directive 8520.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b. 8c. 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

   (1) "Qualified requestors may obtain copies of this report from DDC."

   (2) "Foreign announcement and dissemination of this report by DDC is not authorized."

   (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified users shall request through DDC."

   (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through DDC."

   (5) "All distribution of this report is controlled. Qualified DDC users shall request through DDC."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTAL NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (sponsoring the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TB), (B), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
