7 June 1976
The views expressed in this paper are those of the author and do not necessarily reflect the views of the Department of Defense or any of its agencies. This document may not be released for open publication until it has been cleared by the appropriate military or government agency.
This study examines the factors which impact on the top level management processes within the Department of Defense. The information presented is based on readings, studies, interviews, questionnaires, and lectures. A review of relevant management theory, an outline of the formal Defense management process, and a presentation and analysis of data regarding the actual process make up the body of the paper. Due to the broad scope of the subject, the conclusions take the form of working hypotheses. The study then
I recommend specific areas for further study. Among the primary hypotheses are a lack of effective long-range and contingency planning, an absence of an articulated and perceived code of value standards, and an adversary relationship between key participants which short-circuits rational decision-making. Recommendations for further study include creating a specific staff function for planning, eliminating the Service Secretariats, revising the Joint Strategic Planning System, an immediate direct role by the top executives to streamline and sanitize the organization, and establishment of a firm set of value standards.

CHAPTER I

INTRODUCTION

PURPOSE

The purpose of this study is to analyze the Department of Defense's strategic management process with primary attention toward those factors which set the tone for the organization. Specifically, I intend to investigate the credibility of the value base, the factors which influence managerial behavior, and the organizational structure which furnishes the information used in the planning and decisionmaking process. Mr. Schlesinger, in his farewell address, challenged the Armed Forces at the heart of the institutional integrity which is derived from a viable management process:

"Today, along with some serious thought, there is a widespread picking at our national institutions: government, industry, unions—the Armed Forces. A national mood of skepticism has gone too far. While a judicious skepticism indeed is always necessary, a mood of undiluted skepticism forces concentration on the inconsequential and ignores the permanent and the valuable. Institutions are indispensable; they organize men for common purposes. Without them we would have unproductive conflict and no pooling of effort.

This larger social vision bears on the health of the nation's Armed Forces. No institution, no more than any nation or man, can live by bread alone. Unless we articulately redefine our values, identifying those we are prepared to fight for, the health of the nation's military force will ultimately suffer."
JUSTIFICATION

Although the Armed Forces is not currently receiving the notoriety in the same sense as Gulf Oil, Lockheed Corporation, the CIA, the FBI, or even the Executive Branch of our government, we should not get a feeling of false security. The period is probably a reflection of the cyclic nature of national priorities. Since the Department of Defense accounts for over one-quarter of the Federal budget it is always subject to scrutiny, not only as a source of funds for more attractive programs, but for the philosophy and efficiency which determine how it uses the funds which have been allocated.

The questions that come to my mind in regard to this study are: (1) Does the Department of Defense have a value and goal structure which is clearly identifiable, understood throughout the organization, and monitored so as to guide actions and preclude corruption? (2) Does the management process surface the proper information to the decisionmaker so that he can take the best action; both for the immediate situation and for establishing flexible, longer range policy planning goals? (3) Just what part do people play in the process? Are outside environmental pressures, personal styles, and informal relationships accounted for in the management equation?

Examples of deficiencies in the Armed Forces which suggest the justification for the study are defense personnel being hosted by industrialists; a lack of civilian/military loyalty to their organization after a decision has been made; indecisiveness in the
selection of weapons systems such as MICV, ROLAND, SAM-D, B-1A Bombers and nuclear ships; Congressional influence on base closures; fiscal irresponsibility due to time constrained decisions; improper outyear forecasting, and reluctance to change decisions made previous to production; and resource scarcity in trained personnel, funds and raw material.

DEFINITIONS

It is necessary to establish at the outset a few definitions in order to assure common understanding of some basic terms. At Appendix A is a summary listing of the abbreviations which will be used throughout the study.

**Strategic Management.** The process used by top level management in the Department of Defense for determining (and maintaining) the relationships of the organization to its environment expressed through the use of selected objectives, and of attempting to achieve the desired status of relationship through resource allocations with efficient and effective action programs by the organization and its subparts.

**National Security Strategy.** The Department of Defense portion of a comprehensive program designed to provide for the security of the United States through the establishment of integrated policies and procedures for the departments, agencies, and functions of the Government concerned with national strategy.

**Strategic Planning.** The process of deciding on objectives of the organization, on changes in these objectives, on the resources
used to attain these objectives, and on the policies that are to
govern the acquisition, use, and disposition of these resources.
Connotes big plans, important plans, plans with major consequences.

**Management Control.** The process by which managers assure that
resources are obtained and used effectively and efficiently in the
accomplishment of the organization's objectives.

**Subsystem.** The subsystem is a subordinate component of the
system. It contributes to system objectives by interacting with
other subsystems.

**Environment.** The environment contains the external forces and
agencies with which the system attempts to cope.

**METHODODOLOGY**

The methodology used to gather the information required in order
to make the study included reading extensively from books, periodi-
cals, and previous studies; findings from a questionnaire and fol-
lowup interviews administered to a selected group of middle managers
from a cross section of the Department of Defense senior level staffs;
notes taken during lectures, and question and answer periods con-
ducted by the top executives in the Department of Defense; and
knowledge gained by participation in the Army War College's manage-
ment course which featured many prominent people from the field of
management. A full listing of these documents and people is in the
Bibliography.

Since the scope of this study is large, the literature and per-
sonnel used for the data base had to be highly selective in order to
provide the coverage necessary. Due to the selective nature of the data source, there is a potential for bias which would be eliminated were the topic narrowed and the same effort made. I am particularly pleased with the quality of the selected grouping since not only are the applicable staff agencies of the Department of Defense establishment represented, but they have been represented by views from both the top executives and from the middle managers. On the other hand, for the same reason, the conclusions drawn will be in the framework of working hypotheses and recommendations for further, more detailed study.

The specific format of the study will be:

--in Chapter II to present a scholarly portrayal of management thought in order to provide a backdrop upon which to focus the Department of Defense process.

--in Chapter III to outline the Department of Defense management atmosphere which has been set forth in formal communications.

--in Chapter IV to interpret, analyze, and present the information collected regarding the actual working process.

--in Chapter V to arrive at working hypotheses which will provide the starting point for recommended further study.

In order to narrow the study, certain assumptions and limitations have been established. It is assumed that Department of Defense managers want to do the best job possible. In a broader sense, that a goal of the federal government is to have all departments and agencies on a coordinated policy formulation and budgeting schedule. That in reality there are factors not a part of the formal process
which have influenced decisionmaking negatively by either not being considered in staff proposals or by being so out of phase with the process that their value is disregarded. Finally, it is assumed that the process is flexible enough to permit change.

Since the subject of strategic management includes both strategic planning and management control, this study will address only the strategic planning aspect of policy formulation. It will further be limited to the current situation except when providing the necessary background information to draw valid conclusions.
CHAPTER II
THEORETICAL CONSIDERATIONS

OVERVIEW AND MODEL

In researching for this study the evident trend in literature was the notion of change. My realization of this originated with the movie of Alvin Toffler's book, *Future Shock*, narrated by Orson Welles. The consequences which were suggested hit home. His warning was that unless we could manage change, and influence the rate at which it occurs, it would overwhelm us. This warning shows the tremendous importance of a viable Department of Defense strategic management process. Even the words Strategic Management Process are significant in that they focus on top-level, corporate duties and responsibilities in the context that they are dynamic and changing in relationship with the environment which surrounds them.

Peter Drucker, in an article for *Harvard Business Review* in 1974, titled "New Templates for Today's Organizations," recognized complexity and change in the structural aspects of the management process in his subtitle which read, "Traditional structures are no longer adequate for today's complex organizations; new designs are required to serve their needs." He went on to outline how "classical" organizations such as General Motors, DuPont, and Sears had wrestled with this phenomenon and arrived at this conclusion.²

A different approach for managing complex and changing organizations was reflected in the July/August 1975 edition of *Public
The article titled, "Public Sector MBO and PPB: Cross Fertilization in Management Systems," began with the following words:

At different times and in different places, different management systems are in vogue. Some of these systems represent real innovation; more often someone 'reinvents the wheel.' One type of system currently being rediscovered within the federal government is Management by Objective, or MBO.3

Dr. George Odiorne, in a recent lecture at the Army War College, reiterated a major point in his book, Management Decisions by Objectives, when he gave a strong endorsement to MBO because of its focus on value increased outputs.4 Furthermore, there are some valid shortcomings with the Planning, Programming, and Budgeting System (PPBS) now used in the Department of Defense as will be shown in Chapter IV. These shortcomings, the fact that in 1971 Federal Agencies were released from the mandatory use of PPBS, and the trend toward reevaluating management systems throughout society, justify a review of PPB in the Department of Defense to see if it remains the best system for its requirements. In order to make this review it is necessary to establish a base of sound management theory by which the Department of Defense can be compared and analyzed.

There are several methods which could be used to present this theoretical base. I have chosen one of the more modern management philosophies—the Systems Approach. The "system" is an organization composed of interdependent subsystems, delineated by identifiable boundaries from its environment. An organization can be further
defined as a subsystem of its broader environment. It is goal-oriented, composed of a technical subsystem, a structure subsystem, a psychological (people-oriented) subsystem, and coordinated by a managerial subsystem.\textsuperscript{5}

The systems approach emerged in the last 15 years, essentially by combining the theories of scientific management of the early 1900's with the behavioral and technical approaches of the 1930-60s. Scientific management espoused by Taylor placed emphasis on planning, standardizing and improving efficiency of human work. Henri Fayol added the administrative views of a pyramidal form, unity of command, exception principle, authority delegation, and span of control. Max Weber came up with a bureaucratic model, again emphasizing hierarchy of authority, division of labor based on functions, a system of rules, impersonal relationships, a system of work relationships, and placement based upon technical competence.\textsuperscript{6}

In the late 1930s many forces were modifying the traditional management theory. The two primary changes were the behavioral sciences which emphasized the human aspects of administration, and the management sciences which recognized the advent of technology—quantification, mathematical models, and computer technology.\textsuperscript{7} A summary of relevant management theory is presented below using the systems model as a format guide.
ENVIRONMENT

All organizations are thought of as being a part of another larger organization. They have boundaries which separate them from one another such as ideology, physical, geographical, functional, and financial. These organizations receive inputs from across their boundaries, transform them, and return outputs. Individual organizations require a process for insuring that an effective link exists between the organization itself and its environment, no matter how rapidly things are changing. Efficiency of operation must also be considered, particularly with the budget constraints imposed on a public organization. However, in the long run current efficiency normally does not impact as greatly on the viability of the organization as the effectiveness of its adaptability to change in the environment.

The Office of the Secretary of Defense in the Department of Defense is the level of organization which sets the tone for the effective interface with the outside environment. Nevertheless, every sub-organization down to the individual soldier interfaces with the exterior environment and does influence the effectiveness of the whole organization. The exchange of information, energy and materials with its environment is done through a phenomenon known as boundary crossing. In fact, most organizations have "partially open" or "partially closed" boundaries depending on where you look at them. Boundaries can be thought of as a filtering process. The relatively closed organization has rigid, impenetrable boundaries,
such as the control element of a crime syndicate; whereas, the open organization has permeable boundaries, similar to membership in the PTA. A certain degree of boundary identifiability may be good in that the filtering process standardizes inputs and outputs, and provides a degree of independence for the organization from intrusion from outside.

Environmental forces have a direct influence on the way an organization structures itself in order to cope. Specific staff departments are established in order to perform the boundary spanning interface. Generally speaking, the more dynamic the environment, the more complex and differentiated the internal structuring of the organization becomes. An organization operating in a dynamic situation must be adaptable to change. There are certain characteristics which affect most organizations—cultural, technological, educational, political, legal, resource availability, demographic, sociological, and economic. These general characteristics have an important affect in determining the resources available for inputs, the specific mission, the most appropriate internal process, and the acceptability of organizational outputs. Other characteristics have a more specific influence on decisionmaking and the internal workings of the organization. They are the requirements of the recipient user, the resource supplier, the competitor, the society and political attitude, and the technological adaptability.

Shirley Terreberry, in a 1968 article for Administrative Science Quality, expressed the environmental concept well: "organizational
change is increasingly externally induced; organizational adaptability is a function of the ability to learn and perform according to changes in the environment."9

STRUCTURE

Peter Drucker summarized structural theory when he wrote:10

The simplest organization structure that will do the job is the best one. What makes an organization structure 'good' are the problems it does not create. The simpler the structure, the less that can go wrong. --To obtain both the greatest possible simplicity and the greatest 'fit', organization design has to start out with a clear focus on key activities needed to produce key results. --Organization is a means to an end rather than an end itself. Sound structure is a prerequisite to organizational health; but it is not health itself. The test of a healthy organization is not the beauty, clarity, or perfection of its organization structure. It is the performance of people.

An organization is the pattern of ways in which large numbers of people, too many to have intimate face-to-face contact with all others, relate themselves to each other in the conscious, systematic establishment and accomplishment of mutually agreed purposes.11

Top level or corporate management tasks, in the organization, differ fundamentally from the tasks of the other management groups. They are multidimensional. They recur but are intermittent, and make different and often conflicting demands on personality and temperament. There is need to structure the top management job so that both the objectives to be accomplished and executives themselves are considered. There is also a need to provide the stimulation and information for them to accomplish the job.12
Essentially organizational structure is the design by which (1) functions are separated, (2) authority and responsibility are divided and delegated, and (3) people are related to each other. Three main structural types may be taken as representing the forms used by most organizations. These basic structures are shown at Appendix B and are: line, line and staff, and functional.

Organizations have both formal and informal structures. The formal structure is the result of explicit decisionmaking and is typified in the above discussion. Informal structure refers to those aspects of the system that are not formally planned, but arise spontaneously out of activities and interactions of people. Particularly at the corporate level of management the informal communications network is present because of the environmental interfacing activities, and must be recognized so that it relates to and compliments the formal structure.

Coordination of activities and integration of effort is absolutely essential. There are several mechanisms for accomplishing this. Joseph Litterer suggests three: (1) the hierarchial system which follows a chain-of-command, (2) the administrative system which deals with the horizontal bureaucratic work flow, and (3) the voluntary system where people see a need to coordinate. Organizations facing a changing environment and accelerating technology have found it necessary to adapt new means of insuring integration such as committees, task forces, coordinating teams, and program managers. It also seems that most modern organizations undergo frequent changes in structure. Instead of providing for permanent, highly structural
relationships, the dynamic organization has less structuring, more frequent change of positions and roles, and a more dynamic interplay between the various functions.\textsuperscript{15}

**GOALS AND VALUES**

It is of some importance at the outset of this discussion to note that major DOD management publications do not address the subject of goals and values in very much detail. This absence may be a military reflection of George Steiner's observation that in the past there was but one aim in business and that was to maximize profits.\textsuperscript{16}

The job of top level management in regard to setting values is:

--to align its corporate purpose with its social and economic responsibility;

--to make sure each person in the corporation not only understands these purposes, but is willing to be committed to them;

--to see that these purposes are acted upon by people of the corporation.\textsuperscript{17}

Specifically, values are the views which individuals hold on what is good and desirable. The lack of a good value base leads to "Watergates." Recognition of the need for a value base is reflected in the Scout Law, "A Scout is trustworthy, loyal, etc.," or West Point's "Duty, Honor, Country" and a cadet does not "lie, cheat or steal nor tolerates those who do." Values provide standards by which people are influenced in their choice of actions. Value issues fall into five levels: individual values, small group values, organizational values, direct environmental values, and
cultural values. Some of these, obviously, are not influenced by management, while others are. All impact on the thought process of decision making and should be considered in planning, and communicated so that each member of the organization knows what is expected of him in his day-to-day work integrity. The Code of Conduct is an example of a well-communicated value base.

Goals are more specific than values, and represent the desired future conditions which the organization strives to achieve. Depending on the level and size of the organization and the nature of the item, the term goal may be changed to objective; however, they focus the attention of participants on actions which are important to the organization. They are designed to provide the standards for measurement of success, the technologies required, and the managerial processes. Top management usually determines broader goals which help relate the organization to its environment. It also translates these goals into broad operational objectives for the next lower level component.18

People within an organization also have individual goals. These personal goals are many times both compatible and at the same time in conflict with the goals of the organization. It is necessary to satisfy a certain level of these individual goals in order for the individual to accept the organizational goals and make the best contributions possible. Some conflict is inevitable.

Mr. Thomas Watson, Jr., Chairman of IBM Corporation, emphasized this point by stating that:
... the basic philosophy, spirit, and drive of an organization have far more to do with its relative achievement than do technological or economic resources, organizational structure, innovation and timing. All these things weigh heavily on success. But they are, I think, transcendent by how strongly the people of the organization believe in the basic precepts and how faithfully they carry them out.19

PSYCHOSOCIAL

People!

J. Watson Wilson wrote, "If you dig very deeply into any problem you will get to 'people'." Clarence Francis put it another way, "I believe the greatest assets of a business are its human assets, and the improvement of their value is a matter of both managerial advantage and moral obligation."20

Human behavior and its effect on productivity have been a chief interest of management for a long time. Some people are better managers, some better technicians, and some better workers. As automation increases, finer distinctions in occupational specialty occur; pay gets higher, the importance of knowledge is recognized, and people management becomes more important. Some very key people-management areas are: (1) communication, (2) decisionmaking, (3) innovation and change, (4) conflict, (5) leadership, (6) authority and responsibility, and (7) learning, perception, and creativity.21

Human behavior refers to a person's conduct. Harold Leavitt concludes that most behavior is caused by something, is further motivated by certain needs in the person, and directed toward a
goal. The process is shown in Table 1 and will take on a cyclic effect, as shown by the feedback loop, unless the goal is achieved.22

Table 1
HUMAN BEHAVIORAL CYCLE

<table>
<thead>
<tr>
<th>Stimulus (cause)</th>
<th>Need (want)</th>

</tr>
</thead>
<tbody>
<tr>
<td>Tension</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Discomfort</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Goal</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

There are individual variations in human behavior which occur primarily in the perception and understanding of what is going on, and in individual motivation. People tend to select information which enhances their satisfaction, and ignore information which is disturbing.23

A summary of the things which motivate performance are in Table 2.24
Abraham Maslow approached motivation from a slightly different view. He looked at it as a climbing process; higher needs becoming activated as lower ones were satisfied. His five basic levels were physiological (hunger, sleep, etc.), safety, love, esteem and self-actualization in that ascending order. He felt that esteem and
self-actualization are rarely satisfied; and that man seeks more satisfaction of them as they become more important to him.25

As another frame of reference for evaluating motivational drives Douglas McGregor looks at people in two ways, which he terms "Theory X and Theory Y." Briefly, Theory X people dislike work and avoid it when they can, work for money to satisfy basic needs, are motivated through threat of punishment, and require tight control. Theory Y people will exercise self-correction in their goal achievement, seek responsibility, have a potential for development, and will be motivated by esteem and self-actualization.26

How a manager evaluates and structures his organization in view of the above discussion will obviously weigh heavily on its effectiveness.

TECHNOLOGY

Technology has two aspects--physical items such as machinery and equipment, and accumulated knowledge concerning the means to accomplish the job. Men's greatest attribute is the ability to use his mind. Men, in the form of management, translate and multiply advancing technology for the welfare of mankind. Computers, as an example, aid in storing and diffusing knowledge, and thereby improve methods for further discovery and scientific advancement.27 The real impact of management can be seen in the Apollo disaster of 1967 where authorities found that the management of the contractor was sloppy, and the controls over safety and inspection of components
were lax. These deficiencies caused the fire as much as poor
design and choice of materials in the capsule.28

It is unmistakable that science and technology have become an
influential part of society. This impact is not in any way limited
to the United States, or to inside or outside an organization; it
is everywhere. The forces of accelerating technology are altering
life in important ways. Worldwide industrialization is causing
cultural systems to more closely align. Education is an example
of an area in which all nations must push forward in order to cope
with industrialization. Even organizational structures of complex
organizations are required to be similar, so that the exchange of
information and resources can be efficiently performed. Inherent
dangers in the growing emphasis on technology are that it will
become an end in itself, and that man will be its slave and not its
master. The interaction between the technical aspect and the human
aspect of an organization will be absolutely critical when effective-
ness of the final product is determined.

Case studies show some of the specific impacts of accelerating
technology to be:29

--the number of people in the chain-of-command increases.
--span of control of the executive increases.
--management by committee grows.
--clerical and administrative personnel increase.
--a change in type of work being done takes place; hence worker
anticipation, and retraining requirements occur to an extent so great
that the job might not get done.
--more highly trained specialists are required.
--cost of management is higher.
--integration of activities is much more important.
--much more information for decisionmaking and feedback for control are available.

In order to better incorporate technology into the organization and to insure that we are in control, forecasting of technological expansion implications has been attempted for several years. Technological forecasting, as distinct from general forecasting, has been described as "the probabilistic assessment, on a relatively high confidence level, of future technology transfer." It is interesting to note that in the area of technological forecasting, the military service has had the greatest application and methodology development to date. Outsiders expect that "the military will intensify their efforts in this area." 

MANAGERIAL

The managerial function of management spans the entire organization directing the technology, organizing the people and resources, and relating the organization to its environment. The heart of the process is the linking together of the other subsystems of the organization. At the top-management level, relating the organization to the environment takes high priority and is done in a comparatively nonstructured manner. Planning is long range in nature. The general activities of planning are nonprogrammable with solutions to complex unusual problems being observed from a satisfying point.
of view. Decisionmaking is largely judgmental and based on a look at all relevant inputs to the problem-solving process.32

M. Henry Mintzberg authored an article in the July-August 1975 edition of Harvard Business Review titled "The Manager's Job: Folklore and Fact." The article is a result of research in the area of what managers actually do. The key points are applicable here to furnish a backdrop for our DOD picture. Mintzberg's intention is to break away from the traditional Fayolian words of, "a manager organizes, coordinates, plans, and controls," and to introduce him to a more useful description of managerial work.

Following are four myths about manager work which he states do not bear up under scrutiny of the facts:

<table>
<thead>
<tr>
<th>Folklore</th>
<th>Fact</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. The manager is a reflective systematic planner.</td>
<td>The manager works at an unrelenting pace, that their activities are characterized by brevity, variety, and discontinuity, and that they are strongly oriented to action and dislike reflective activities.</td>
</tr>
<tr>
<td>2. The effective manager has no regular duties to perform.</td>
<td>In addition to handling exceptions, managerial work involves performing a number of regular duties, including ritual and ceremony, negotiations, and processing of soft information that links the organization with its environment.</td>
</tr>
<tr>
<td>3. The senior manager needs aggregated information, which a formal M.I.S. best provides.</td>
<td>Managers strongly favor the verbal media—namely telephone calls and meetings.</td>
</tr>
</tbody>
</table>
Folklore  

4. Management is, or at least is quickly becoming, a science and a profession.

Fact  

The managers' programs—to schedule time, process information, make decisions, and so on—remain locked deep inside their brains.

The puzzle is put together by Mintzberg in Table 3 which takes a manager who has vested authority over an organizational unit and subscribes to him ten roles. He summarized the message of his article by outlining three areas where management could become more effective:

-- The manager should find systematic ways to share privileged information.

-- The manager should deal consciously with the pressures of superficiality by giving serious attention to the issues that require it, by stepping back from his tangible bits of information in order to see a broad picture, and by making use of analytical inputs.

-- The manager should gain control of his own time by turning obligations to his advantage and by turning those things he wishes to do into obligations.

CHAPTER III

THE DEPARTMENT OF DEFENSE MANAGEMENT DESIGN

PURPOSE AND SCOPE

The Department of Defense was created as a part of a comprehensive program designed to provide for the security of the United States through the establishment of integrated policies and procedures for the departments, agencies, and functions of the government concerned with national security. The system is founded on the Constitutional basis of civilian control over the military. The President is Commander-in-Chief of the armed forces, and Congress is given power "to declare War," "to raise and support armies," and "to provide and maintain a Navy." Although this separation of power between Congress and the President divides, and possibly weakens civilian control of the military establishment, this arrangement nevertheless provides workable restraints on the armed forces.

The management process within the Department of Defense is energized in its national security policy advisory role by the National Security Council (NSC), which was established to assist the President in making national security policies. The other major role of the Department of Defense, that of implementing national security policy, is controlled through the budget process. Budget requests are submitted based on the resources needed to carry out the policies established by the National Security Council. The resulting monies come from frequent and extensive compromise by the
President and the Congress based on analysis of programs and national priorities. The Department of Defense is called upon to explain and defend its positions throughout the process.

In the final analysis money is the common denominator in the operation of the defense establishment since it determines the availability of manpower, resources, and training. In order to properly request funds, to judiciously allocate reduced authorizations, and to get the best return on the operating dollar, an efficient, coordinated, strategic management process is required.

EVALUATION OF DEFENSE MANAGEMENT

The National Security Act passed in 1947 initiated a continuing effort to better manage the armed forces. Between 1947 and 1961 each service developed its own programs without any method available to compare them systematically with competing programs of other services. Military requirements themselves were seldom related to costs, and therefore had little affect on resource allocation and the budget. Furthermore, the budget was only calculated for one year. This process prevented future costs of programs from being considered in the decisionmaking process.

These practices created many problems in formulating a sound national strategy. The national level decisionmakers could not determine if the missions could be accomplished because they could not evaluate service interface, cut-year force and hardware planning, and what the real cost-effective courses of action were. The planning, programming, budgeting system (PPBS) initiated in 1961 by
Mr. McNamara in the Department of Defense was an attempt in overcoming these problems.

Mr. McNamara, following WW II, had been hired by Henry Ford II, along with several other ex-air force officers, to work on Ford's management problems. From this experience, along with knowledge of similar management techniques in DuPont and General Motors, he came to the Department of Defense.

Table 4 shows the generally accepted major features of PPBS along with their operational areas and typically representative documents.

In summary, the primary reason for program budgeting is that it provides a formal, systematic method to improve decisions concerning
the allocation of resources. It does this by answering questions and by requiring identification of all actions in terms of programs related to stated objectives. Another reason for program budgeting is that planning is carried on with attention and recognition of the associated costs. Finally, it provides a basis for choosing between available and feasible alternatives. At that point, the decisionmakers can exercise their judgment and experience in an appropriate and informal context.

Given the decision on what to do and how to do it, management techniques for improving efficiency, such as work measurement, performance budgeting, and management by objective enter into the picture. Program budgeting is aimed at decisionmaking and saving money by making better choices. Deciding on what to do on a day-to-day basis is left to those who are closer to the operation.36

This then is the framework within which defense management at the strategic level is designed to operate—a decisionmaking situation where the environment and personal experience mold the decisionmaker to systematically look at feasible alternatives of program elements in view of their total impact on the goals of the organization.

CURRENT MANAGEMENT DESIGN

The Department of Defense system is "designed" to establish program objectives, plan long-range programs, determine the full cost of programs, analyze program alternatives, assess output in
errs of objectives, and use the budget process as an instrument for implementing program decisions.

As stated earlier, since the Department of Defense receives its policy guidance from the President through the National Security Council, and since it operates on monies allocated by Congress, it must manage itself so as to respond to and operate within the timing of these major actions. In order to do this there are three operating cycles going on at the same time, namely: (1) the current year operating budget, (2) preparation for the following years budget, and (3) long-range planning guidance for the budget two years away (see Appendix C).

The Five Year Defense Program (FYDP) is the official formal written record of decisions that have been made in Department of Defense. The objective of the planning, programming, and budgeting cycle is to update this program. New decisions are being made throughout the year, and since all Department of Defense components must use the FYDP as their standardizing document, it is imperative that it be continually monitored. The FYDP is comprised of ten major Defense programs which represent the mission and support responsibilities of the Department of Defense. Each program consists of many program elements. A program element represents a grouping of forces, manpower, and costs for an organization, function, or activity. The structure provides a systematic means of measuring the actual use of resources against planned and approved programs. Manpower authorizations and cost data recorded for each program element covers a time span for a period of at least five
years beyond the current year of funds and manpower. Forces are
displayed for an additional three years to provide an adequate
basis for identification of long lead-time resources and cost
requirements. In addition, the FYDP provides a workable tool for
a manager who can manipulate the display of common data, so that
it becomes specifically meaningful in the function he is performing.
Table 5 shows the ten Defense programs, and the DOD office of
primary responsibility.

</table>
The formal planning cycle stems from Presidential decisions issued through National Security Decision Memorandums (NSDM) from the National Security Council. The Office of the Joint Chiefs of Staff (JCS) forms the body charged with the responsibility of strategic military planning for the Secretary of Defense, who in turn provides guidance and decisions for the organization. The official procedure is incorporated into the Joint Strategic Planning System (JSPS). The JSPS includes the following: the Joint Intelligence Estimate for Planning (JIEP), the Joint Long-Range Estimative Intelligence Document (JLREID), the Joint Long-Range Strategic Study (JLRSS), the Joint Strategic Objectives Plan (JSOP), the Joint Strategic Capabilities Plan (JSCP), the Joint Research and Development Objectives Document (JRDOD), and the Joint Force Memorandum (JFM). Each year these documents are reviewed, updated, and revised.

The JIEP, JLREID, and JLRSS are all documents which furnish background information for planning. The JIEP contains the approved enemy threat for the short and mid-range periods (10 years). The JLREID provides the principal intelligence base for the long-range (10-20 years) upon which the JLRSS and JRDOD are developed. The JLRSS provides a projection of the role of military power, and
outlines broad strategic implications which should be considered in
the preparation of studies, estimates, appraisals, policies, plans,
and research and development objectives (JRDOD). The JSCP and the
JSOP are the specific plans. The JSCP deals with the short-range
period (2 years) and consists of two volumes published biannually
to provide guidance to defense components for accomplishment of
military tasks, based on projected military capabilities and condi-
tions. The JSOP deals with the mid-range period (2-10 years) and,
likewise, consists of two volumes. Its purpose is to advise the
President and Secretary of Defense on the military strategy and
force structure for attaining the national security objective of
the United States, and to provide mid-range planning guidance for
defense components. The JFM provides JCS views on the capabilities,
inherent risks, and major force issues requiring decisions during
the current year. Appendix D shows the interrelationship and timing
sequence of the Joint Strategic Planning System documents outlined
above.

After JSOP I is published, the Secretary of Defense provides
initial guidance on defense strategy in the Defense Policy and
Planning Guidance (DPPG) document. At the same time the Assistant
Secretary of Defense for Program Analysis and Evaluation issues the
Tentative Planning and Programming Guidance Memorandum (TPPGM) adding
force programming guidance, broad fiscal guidance and constraints,
potential issue areas, and guidelines for preparation of the Service
Program Objective Memorandum (POM).
SEC II and JRDO are then published and followed by the formal Planning and Programming Guidance Memorandum (PPG) which finalizes the previous tentative guidance (TPPG) and permits issuance of the JFM.

So far in the process the services really have not been deeply involved. One week after the JFM is issued the services (Army, Navy, etc.) submit their Program Objective Memorandums (POMs) which outline proposed changes to FYDP baseline force levels and deviations from the JFM. Staff agencies within the Office of the Secretary of Defense prepare POM Issue Papers, and later decisions are made on the proposed changes and are returned to the services in the form of Program Decision Memorandum (PDM).

The budget cycle commences after receipt of the PDMs. Each service submits its budget estimate by program, with backup information, to the Secretary of Defense (Comptroller), who reviews it with representatives of Office of Management and Budget (OMB). Program Budget Decisions (PBD) will begin going back to the services as soon as they are reached. Services prepare rebuttals, if applicable, for resolution in a joint meeting of the Secretary of Defense, the JCS, and the Service secretary affected. The final DOD budget is then forwarded to OMB for approval and inclusion into the President's budget for submission to Congress in January. A "level-of-effect" current services budget for the next fiscal year is submitted to the new Congressional Budget office in November so that Congress can start analysis before receipt of the President's budget. In this way, and with other budget dates established in the Congressional
Budget and Impoundment Act of 1974, the final budget approval should be forthcoming at the beginning of the fiscal year and provide a more efficient, better coordinated Federal Budget.

As a closing note to this portion of the paper, it should be noted from Appendix C that the time for one cycle from threat analysis to submission to OMB and the Congress is two years. It should also be noted from the organizational structure, shown at Appendix E, that the management system is weighed heavily toward dealing with decisions relating to resource planning and provides minimum capability toward the management of people or the establishment of organizational values and goals. An additional point to remember is that the documents are highly classified and receive limited distributions within the organization.

**SIGNIFICANT INTERFACING SYSTEMS**

The Branches and Congress are major environmental systems which influence the manner in which the Department of Defense is managed. The primary executive interfacing agencies are the National Security Council and the Office of Management and Budget. The Congressional interface is done essentially by the various committees. From within DOD the individual services—Army, Air Force, Navy, Marines—are the primary sub-components.

We will look first at the individual services. The National Security Act of 1947, with amendments, provided increased authority to the Secretary of Defense by reducing the authority of the Service Secretaries. It was established that the Secretary of Defense,
through the individual services, was responsible for the administration of the US Armed Forces. Management within each service was to be performed under the direction, authority, and control of the Secretary of Defense. This management is now accomplished through the management of resources as previously outlined.

Each service is responsible for the administration of its manpower and readiness based on the guiding documents and budget outlays given them by DOD. At Appendix F are charts which show the specific PPBS document cycle between DOD and the services. The basic philosophy of how each service interfaces with DOD is stated below.

Army. The Army system is designed to provide timely, pertinent views for consideration by the Secretary of Defense and guidance for Army staffs and managers. The primary objectives are to:

a. Articulate the strategy.
b. Structure the force requirements.
c. Allocate resources.
d. Insure readiness of the total force.

The Army believes that realistic force planning should be based on well-founded, broad national strategy objectives. Forces should then be developed to meet the requirements of the broad strategy. Fiscal, manpower, production, and research and development constraints are applied to the proposed force structure once this is accomplished. The sequence is considered essential for an appreciation of the real risks imposed by the constraints.
Air Force. The Air Force system is developed on the philosophy that modern weapons and delivery systems have created the capability for exceptionally rapid destruction of a nation's war making capacity. To support this philosophy, the attainment of forces-in-being prior to D-Day is mandatory. This means that the USAF must include an adequate stockpile of weapons, the most efficient carriers to deliver these weapons, and the required combat units with adequate supporting elements ready for D-Day. However, they realize that the optimum wartime posture may not be attained; therefore, to accommodate the advantages which would accrue from a warning period, an M-Day (mobilization) concept is also utilized in war planning.

The total force policy envisions the in-being force to react within strategic warning time and a modernization of the ready reserve.  

Navy. The Navy philosophy and documentation fairly well parallels that of the Air Force in that they want a large in-being force; but realizing that it is not completely possible, plan specifically in separate documents for mobilization. This differs from the Army, which integrates mobilization planning into their other documents. The Navy system serves three basic purposes:

a. Provides for development of Navy concepts, requirements, and objectives; and for their presentation to higher authorities.

b. Provides for the transition of strategic and operational concepts, technological and intelligence forecasts, and guidance into places and objectives.

c. Provides guidance and direction for the application of current capabilities.
Marine Corps. The Marine Corps size and roles are more established by law than the other services. They are supported logistically, by the Navy, and the Navy incorporates many of the PPBS procedures into their operations—Marine Corp. POM is an example. The Marine Corps does, however, prepare complimentary supporting documents for the JSPS, which are presented by their Commandant.

Forces outside the Department of Defense are primarily the Executive Branch and the Congress. Policy direction for the Executive Branch comes from the President directly or through the National Security Council (NSC). The use and mix of these have varied depending upon the President. President Eisenhower required the NSC to evaluate almost all top-level proposals and provide him with recommendations. President Kennedy made little use of the NSC, drawing from individuals both in and out of government for ideas and recommendations. President Johnson, likewise, made little use of the formal council, preferring to meet for luncheons or small meetings with selected advisers. President Nixon went back more closely to President Eisenhower's methods, and as the power of the Secretary of State rose he and the Department of State tended to dominate policymaking. With the lessening of Dr. Kissinger's role in the NSC under President Ford, there is more of a balance; however, Dr. Kissinger, more than any formal group, still seems to be the dominate policy advisor to the President.

Statutory members of the NSC are the President, Vice President, Secretary of State, and Secretary of Defense. The Secretary of the
Treasury, Attorney General, Director of Central Intelligence, and the Chairman of the Joint Chiefs of Staff regularly attend meetings. There are seven senior bodies which support and assist the NCS. One of these, the Senior Review Group, is the work-horse and is the agency which issues the National Security Decision Memorandum (NSDM) to the Department of Defense.

The Office of Management and Budget (OMB) was established by Part I of the Reorganization Plan No. 2 of 1970. The Plan designated the Bureau of the Budget as the Office of Management and Budget. The intent of the Plan was to provide the President with an institutional staff capability in the various areas of executive management—particularly in program evaluation and coordination, government organization, information and management systems, and development of executive talent. The Office continues to perform the key function of assisting the President in the preparation and execution of the Federal budget. OMB is further authorized to make detailed administrative studies for the President with a view to "securing greater economy and efficiency in the conduct of the public service."

The Congress exercises its responsibility to raise and support the defense forces primarily through appropriations and authorizations in response to the President's budget. These actions are handled on a day-to-day basis through specific committees who make recommendations to their respective chambers of Congress. These committees review the Defense budget in detail and conduct hearings with key personnel from the DOD.
Congressional review is undertaken from the separate standpoints of authorization of programs (Senate and House Armed Service Committees) and appropriations of funds (Senate and House Appropriations Committees). The bills are initially passed in the House and move to the Senate. If there are differences they are resolved in joint conference. The new budget act added three more committees to the process in order to provide a more detailed analysis of the budget, better insight into out-year impacts of programs, and better supervision of expenditures. At Appendix C is a diagram showing the new budget process. The Congressional Budget Office is to assist both the Senate and House Budget Committees in their investigations, and also to provide a better interface with the Office of Management and Budget. Each of these committees have staff members who work with the Department of Defense on specifics of programs. It appears that there will be more work required from DOD staffers; however, better federal budget formulation should evolve.
CHAPTER IV

INTERPRETATION, ANALYSIS, AND PRESENTATION OF DATA

BACKGROUND

Insight into the structure and function of an organization can best be gained by analyzing the manner in which decisions and behavior of such operative employees are influential within and by the organization.43

The intent of this chapter is to look at the functioning of the corporate level of the Department of Defense. It will focus on the goals and values which influence the behavior of its members, and the environment within which the members operate. This working picture of the DOD strategic management process will be contrasted against the process design previously discussed in Chapter III and the theoretical considerations of strategic management in Chapter II; in order to come up with the working hypotheses and recommendations in Chapter V. Specifically, this chapter will use as a model the flow diagram in Table 6. The model depicts the primary elements which make up the decisionmaking process for strategic planning.
Table 6
DECISIONMAKING PROCESS FLOW

</tr>
</tbody>
</table>

The data is presented with the following subtopics discussed under each of the major headings.

**STRUCTURE**
- Organizational Structure
- PPBS
- Budget
- Decisionmaking
- Coordination
- Technology
- Regulations/Laws

**PEOPLE**
- The Executive
- The Worker
- Staffing

**GOALS AND VALUES**
- Policy Formulation
- Power Influence
- Politics
- Powerful People
- Congress
- Organizations (OMB and Lobbies)
- Public Opinion

Each subtopic will be discussed in three categories—general comments, strengths, and weaknesses. As stated earlier, the points are consensus views from the total research effort, and are not isolated one or two-man opinions. The total listing of the data base is in the Bibliography and the author of this paper has the specific sources which tie the data base to the discussion point. As an example, if the statement were made that the Service Secretariates should be eliminated as a separate organizational level,
it means that the majority view held by the participants in the
data base voiced that position, and that there were no views
expressed to the contrary. Generally speaking there are more
weaknesses shown than strengths; not because there are more
weaknesses, but because the research pointed toward problems.

FACTORS IMPACTING ON THE DOD MANAGEMENT DESIGN

Overview

In order to set the scene and to get a feel for the big picture
for the detailed discussion which follows, Table 7 displays the
responses to a question on the questionnaire designed to prioritize
environmental factors which impact on DOD decisionmaking (the entire
questionnaire along with the target group is at Appendix H).

Question: Listed below are several environmental factors which
influence decisionmaking [author note: all questions were directed
at the strategic (top level) management process of DOD]. Please
circle the number which reflects how you view their importance.
Give examples in the space below each factor. (High degree of
influence is 5; low degree is 1.)
The detailed interpretation, analysis, and presentation of data follows.

Structure

Organizational Structure

General comments:

1. Civilian control over the military at the office of the Secretary of Defense (OSD) level is right, important, and necessary. The advisory Office of the Joint Chiefs of Staff (JCS) should remain essentially military.

2. The Office of the Secretary of Defense does not interface well with the environment. Example: one office only to interface on budget matters with Congress and OMB—not Comptroller, PA&E, etc.

3. The trend is toward centralized planning for major, high cost/exposure issues. This is proper, but should result in more lower priority decisions being delegated, and smaller staffs at OSD and service component level.

4. The informal structure, and all that it includes, has a strong influence over the bureaucracy—steering groups, ad hoc meetings, behind the scenes activity, etc.

5. The Service Secretariate staffs are redundant and unnecessary.

6. There is no staff function specifically for strategic and long-range planning.

7. Do not reorganize for reorganization's sake. The 1973 Army reorganization is perceived as good. The 1975 reorganization of AMC is viewed with skepticism so far.
Strengths:

1. The Project Manager program for high cost/exposure items has proven very effective in cutting across organizational boundaries.

2. The service reorganizations resulting from staff cuts have proven effective. Certain fine tuning remains in such things as civilian/military mix and individual staff sizes.

3. The DA System Coordinator process is good.

4. The Defense Policy Council is a good coordination device, as is the whole PPBS.

Weaknesses:

1. Staffs must be more streamlined. There are too many parallel functions and responsibilities—the Army Secretariat staff and the Army staff are examples. On the other hand, interfacing staff agencies between levels in the organization are necessary.

2. The Defense Systems Acquisition Review Council (DSARC), although proper in concept, is being very abused. It is acting as a corporate body to advise on broad issues and also just another staff meeting where principles coordinate functional responsibilities as a staff for the Secretary of Defense. It is becoming an operator, making "how to" as opposed to making "whether or when to" decisions. It is becoming another question-asking body. It is creating an adversary relationship with Project Managers. The number of issues and depth of detail gone into by the DSARC is too great.
General comments:

1. It is unanimous that the total Planning, Programming, Budgeting System is better than any previous system and that it should be retained with constant fine tuning. The challenge is to prevent surprises as much as possible. Most feel that the programming and budgeting process need to be cleaned up and better coordinated; and that better guidance, based on a better environmental fit, needs to be given. In general terms the budget is seen as running the show, programming is done as well as possible, and there is virtually no meaningful long-range planning.

2. More input needs to come up the chain. Currently too much of the JSFS reasoning originates from OSD.

3. More emphasis needs to be placed on contingency planning. Flexibility in planning is essential so as to better manage within fixed costs and when critical decisions must be made in a short period of time.

4. The system needs to stick to the basics and not get fancy. The right questions should be asked, so that the right answers are given—which lead to the best decisions.

Strengths:

1. The JSFS ties together planning with fiscal responsibility.

2. It is a systematic approach to thinking. It is designed to bring the decisions to the appropriate decisionmaker at a specific time.
3. It forces people to look to the future.

4. There is slow progress being made toward integrating the three cycles of budget preparation and implementation.

5. Field commands (USAREUR, TRADOC, etc.) are beginning to input into the JSPS.

Weaknesses:

1. There is an adversary relationship between services for budget dollars which causes the whole truth about specific programs and threats not to be told. There is also an adversary role between OSD and service staffs on raw data figures upon which to make assumptions, give guidance, and build programs.

2. Planning is the weakest part of the JSPS. Out-years are frequently straightlined or guessed at. Several people listed this as the major weakness in the whole management process.

3. The JSPS could be much better coordinated. The JSPS and the other elements in the PPBS do not interface well; too much motion, too many stovepipes (things done without coordination), outdated documents due to time constraints, excessive detail, and frustration.

4. The three concurrent cycles are confusing. Each cycle is too long (two years) and data deteriorates. Action officers and users become confused as to which cycle is being talked about. Timing between elements of each cycle is poorly allocated, as will be discussed later.

5. Guidance is too weak for good staff action. OSD staffers ask too many questions and give too few answers; hence, the
subordinate staff officers not only are spending their time answering the mail, but doing it without knowing what is really wanted. The dog keeps chasing his tail.

6. Good contingency planning is just not done. To compound the problem the budget system does not allow enough lateral movement of monies between programs to permit optimum management.

7. Certain elements in the JSPS are particularly weak:
   a. The TPFDL is considerably out of date (72/73 time frame).
   b. The JFMs are not good. They represent parochial views, and an "if you scratch my back, I'll scratch yours" approach.
   c. Due to continual updating, the FYDP must be continually checked by actions officers.
   d. Many documents are just not used because of security classification, size, limited distribution, and user knowledge that they were written in a vacuum without proper input of information and staffing. The JSOP I and II are good examples.
   e. The most serious problem seems to be in the ABD process. This problem is compounded because these decisions have to do with distributing the shortage of funds. The comptroller makes many decisions on dollar reductions without sufficient knowledge of the impact. Draft PBDs are often withheld so that agencies are not kept informed of their status or future until too late. It is questioned by some as to whether the Comptroller is more loyal to OMB (since they coordinate continuously) or to the mission. Too many low cost/unimportant PBDs get actioned at OSD level. PBDs often announce new policy; this is neither legal nor realistic. The paperwork
involved in the PBD process is absolutely staggering compared to the short (few weeks) time to get it done. Because of the short time and high volume, bad, cost-ineffective decisions are made with the long-range consequences inadequately considered.

8. Extreme caution must be taken to put adequate and factual data into a program since so much of the process depends on ADP. Many decisions are based on bad data or faulty assumptions and the decisionmaker does not even realize it. The M-16 rifle study is an example.

9. There is no effort to educate newly assigned people on the PPBS. They either sink or swim; hence, many costly errors are made and lost time initially.

Budget

General comments:

1. The overall GNP growth is slowing down with a trend toward budget balancing. This means that new program funding will usually require cutting an existing program.

2. The budget is considered to be the most influential factor in DOD management. Some say that PPBS is, in fact, only a budget.

3. The defense budget is both a political document and a management tool.

4. There is a basic dichotomy; budget analysts look at inputs and planners look at outputs.

5. Generally OMB is considered to be the devil's advocate; however, the current DOD/OMB relationship is better than most Federal Agencies. It is hopeful that the OMB/CBO relationship will
be good. The first cycle under the new OMB/CBO/DOD process reveals that the DOD budget was too detailed in the four out-years. The President wants a little more flexibility in out-years.

6. Decisionmakers must be tough and hold to budget guidance positions. Planners and programmers must do their job well and then be held accountable.

Strengths:

1. The budget process forces better management practices. It cuts down waste and corruption.

Weaknesses:

1. Buying power of the dollar is going down and the size of the budget is remaining constant. In a real value declining budget the large number of fenced programs by law, regulations, and sunk costs create an inability to allocate resources effectively and a tendency to make fewer bold decisions.

2. Basically the tail wags the dog. Good threat analysis and force planning is stifled due to budgetary constraints. Many times since it is known beforehand that the money is not there, realistic threat analysis and planning is not done. This rationalized analysis leads to an improver risk assessment.

3. The budget is becoming a Congressional rather than an Executive operation as a result of the Congressional Budget and Impoundment Act of 1974. The increased work load created by Congressional committees may cause budgetary forecasting to be even less effective due to time constraints.
4. There is an adversary role between PA&E and the Comptroller due to the output/input focus discussed earlier. An example is that PA&E works for ten months to build a $122 billion program and the Comptroller spends two months cutting out $12 billion in increments as small as $50 thousand. This creates snap judgments and costly errors.

**Decisionmaking**

**General comments:**

1. The heart of PPBS is to have good analysis and alternatives presented to the appropriate decisionmaker. Viable alternatives are many times being eliminated too early in the process.

2. Major decisions are made by the Secretary and Under Secretary of Defense. However, all levels in the organization who have initiative can make decisions and their authority be fairly well understood.

3. There are too many decisions pushed upward. The system is not forcing personnel lower in the organization who have the authority to make the decisions within their scope.

4. Many decisions are made by committee, SELCOM, DSARC and other groupings.

**Strengths:**

1. OR/SA is being used much better and more realistically.

2. Good decisionmakers can ask for more alternatives if they do not like what they see.
Weaknesses:

1. Many times there are no decisions to make; they are foreclosed before they reach DOD. Examples are: White House on SALT, MBFR, and FMS; Congress on nuclear boat procurement and the SST. These decisions may not be a result of sound information or even cost-effectiveness, but purely for personal political purposes. This political irresponsibility is further complicated by key position political appointees who have little experience militarily and are unduly ambitious politically.

2. OSD and Congress tend to micro-manage too much. Decisions are being made by people who have the authority, with neither the responsibility for the result nor the experience to make the decision.

3. As a result of unwise decisions from outside and a tendency to micro-manage, there is much wasted motion, and the time for making good decisions is lost to "plugging-the-gap."

4. There are not enough tough decisionmakers at the staff director level. It is hard to scrub approved programs even if they have become marginal. The tendency is to feather each other's nest. Safeguard, MICV, and SAM-D are examples.

5. Although every organization needs two points of view, there are several adversary relationships in the process which hamper good decisionmaking—OSD vs. services; service vs. service; controller vs. planner; OMB vs. OSD; and military vs. civilian.

6. Weak contingency planning and lack of planning for feedback leaves the decisionmaker in a crisis when a change occurs.
7. Viable alternatives many times are eliminated too early, and by the time the issue gets to the decisionmaker only one good alternative remains, along with several unworkable ones. Another way used by poor staff personnel in DOD to get a parochial or unprepared position approved is to hold off the decision package until the last minute and then "blitz" the decisionmaker who has little or no time to evaluate it properly. The recent commissary issue is a good example.

8. The PPBS (JSPS) does not yet have a good way to integrate military judgment with quantifiable data. This will be even more critical with fewer military in OSD (discussed under staffing later).

Coordination

General comments:

1. Coordination is absolutely essential and the apparatus is available within DOD for it. Whether the system is used depends upon the individual staff chiefs, and if they stress it.

2. Coordination on the individual action officer level is pretty good. The higher you get in the organization the less coordinating there is. Specifically, coordination of programs between services and between OSD assistant secretaries is almost nonexistent on issues they have a deep interest in, and in which coordination might mean compromise.

Strengths:

1. Project managers coordinate well.

2. Middle manager action officers do pretty well on a personal effort basis.
Weaknesses:

1. Lack of time is a major detriment to good coordination. Testifying before Congress, answering questions from several staff agencies doing the same thing, committee meetings and short suspenses are all time robbers. Even before the three new congressional committees, the OSD (ISA) staff spent 25% of its time preparing for and testifying before Congress.

2. Laziness and parochialism stifle coordination. Too much unnecessary paperwork is created due to asking questions rather than getting answers by face-to-face or voice coordination. This is compounded by managers who only coordinate with people who agree with them, or even stovepipe the action without coordination at all. The Deputy Secretary of Defense must be very careful of this with his recent directive for Project Managers to submit progress reports directly to him.

3. The coordination is particularly weak between military and civilian personnel of different staffs and organizations.

4. The JSPS (as a part of PBBS) is the least coordinated of any of the important items, and it should be the heart of the organization. JCS is perceived to be the prime offender.

Technology

General comments:

1. The United States is the strongest nation technologically in the world and must remain so. Under Secretary of the Army Norman R. Augustine made the following comment in a recent article for the Government Executive magazine:
As our Army celebrates its 200th birthday this year, it is provocative to realize that a single battalion of today's Army probably has more firepower than did George Washington's entire Army. Materiel advances in the future promise to grow at an even greater rate—to the benefit of those who realize them and to the detriment of those who fail to do so. The leverage superior material gives one side on a battlefield should never be underestimated.

Its influence is noticeable, and has often been decisive, in warfare since the middle ages—for example. Germany losing the battle of Britain to brave men in a superior fighter plane and a new development called radar; gallant Poles dropping from their horses in futile attacks on German armor; Japan reduced from defiance to defeat by bewildering explosions over two of her cities. The machine gun, the long bow, the stirrup, the communications intercept receiver, the tank—all took their toll of unprepared adversaries.

2. Budgetary facts are that we cannot do everything in technology that is desired, so the current philosophy of highest priority of funding to the technological base, next to product improvement, and third to quantitative jumps in new equipment, is good. This is amplified by other philosophy guidance which is: buy from the top of your established priority list, live by your policies, finish testing before production, allow for uncertainty, strive for commonality between services, use competition for a lower cost and better product, and stress simplicity for a lower cost and lesser support.

3. DOD must exhibit to Congress and the Executive Branch a valid and convincing justification for materiel and personnel requirements.
Strengths:

1. Decisionmakers are recognizing that technology is important and are giving dollars for it.

2. DOD continues to study and implement improved technology. Examples are organizational development, life cycle management (LCM), PERT, design to cost, staff reorganizations, TRACE, Project Managers, PPBS, OPMS, OR/Sa, ADP, and satellites.

3. ADP potential is unlimited, and DOD is realistically using it to its maximum under a very mature recognition that it does not solve problems, but supplies information.

Weaknesses:

1. The R&D field is the worst for shadow staffing (to be discussed under "The Executive") and stovepiping. It is also noted for not wanting to scrub previously approved programs and the featherbedding syndrome. Longevity of civilians who have vested interests in programs is detrimental to making the hard decision stick. Examples are the attack helicopter, MICV, and Foreign vs. US buy (ROLAND).

2. There is too much service parochialism and lack of coordination—B-1A vs. aircraft carriers vs. line divisions.

3. Programs do not have adequate control and feedback checks to insure that they are effective once they are approved. The tendency is to forget the program and go to the next one. Much downstream fiscal irresponsibility could be controlled.

4. ADP still is not trusted. We are in the infancy of insuring that good assumptions and data go into a program, so that good solid
data comes out for decisionmakers. The field is wide open for innovative means to portray information and provide follow-up data.

Regulations

General comments:

1. Regulations are not considered to be a significant factor in decisionmaking. They are there; and they are followed. If there is a major problem (like in reducing regular officer strength) the regulation can probably be changed.

2. The Government Accounting Office (GAO) is the primary outside regulatory agent and the Inspector General (IG) the primary inside agent. Both are essentially doing good work and help keep the organization honest.

3. A general philosophy should be to not over-regulate. The War Powers Act may be an example of a regulation being in too much detail. Decisionmakers must have flexibility to act in a reasonable and timely manner.

People

The Executive

General comments:

1. The chief executives—Secretaries of Defense, Army, Navy, etc., and the Assistant Secretaries—are considered to be good men who will make tough and good decisions. The same holds true for the top military; however, the very next levels of the DOD corporate management contains a high percentage of men who do not want to make waves, are unduly concerned about job security, have vested personal interest in specific programs, and are conservative in their thinking.
1. The better civilians as well as military sometimes let parochialism, ambition, and power affect their loyalty and work toward what is best for the organization and nation.

3. The personality and charisma of the key executives has more affect than their expertise.

Weaknesses:

1. Power seeking dishonest executives find ways to bypass or short-circuit the system. Shadow staffs are a good example of civilians with diffuse loyalties, little military experience, and who think their loyalties are higher than the delegated decision-maker. As soon as they see that a decision is made which is prejudicial to their interests, they bypass or short-circuit the system. The fact is that they can just about make or break a program at any level.

2. The adversary relationship between the very top executives is many times detrimental, particularly when money decisions have to be made.

3. There is a tendency to look for quantifiable solutions since they can be justified better than judgmental ones.

4. There are not enough tough decisionmakers at staff level. Decisions by committee and compromise are becoming more prevalent. The committee approach is complicated by the tendency to centralize decisionmaking in a declining budget and the senior decisionmakers are not left the time to do all the things required of them.

5. Information is considered power, but yet most senior men do not trust computers due to the "garbage in" and realize that the
JSPS has been rationalized. This distrust fosters the disregarding of formalized information and opens the door to personalized gathering of information. Due to time constraints, travel constraints, political influence, and people short-circuiting the system, the information gleamed by the decisionmaker often is scanty and prejudiced, and the resulting decisions poor.

6. Too many decisions throughout the system are made on how they look to influential people and pressure groups. Base closures are a good example.

The Worker

General comments:

1. Paying attention to the military member is a major deficiency in OSD management. Members of the Armed Forces are treated only as numbers. Human behavior, job satisfaction, and people programs in general are seldom considered in OSD. The whole management system is built around materiel resource management and the dollar.

2. Since there are no specific staff functions for people programs, and since the planning element of PPBS is virtually non-existent in this area, it would follow that few initiatives would be taken to transmit organizational values, goals and objectives to the worker.

Strengths:

1. At the service level, career management programs are producing a better, more professional worker.

2. Programs for drug, race, and women are progressive and being integrated with success.
Staffing

General comments:

1. The military/civilian mix is critical. As suggested earlier, the Secretariats could be eliminated. If so, civilian positions should be integrated into new positions on the service staffs, and the service staffs aligned in function with the OSD staff and made to fit the overall environment.

2. The trend in OSD is to eliminate key military positions. The substitution of three star assistant secretary positions with schedule "C" political appointees is unacceptable. The loss of experience provided by the military, plus the political motivations and short tenure of that level civilian, could only have a detrimental effect.

3. The size of the DOD and service staff should be kept small so that they do not become operators. They must be planners and allocators.

4. The tour of duty for military on both the DOD and service staffs should be three to four years. Civilians should either stay in touch with the organization or be in positions which do not require it.

Strengths:

1. The civilian/military mix on the service staffs is pretty good.

2. The officer and enlisted career management programs are beginning to get specialists into jobs requiring specialists.
Weaknesses:

1. Because the JSPS is not used for day-to-day work, the background information is not generally understood by the staff when formulating recommendations and making decisions.

2. Staffs are not designed to interface with the environment well, either by mission or by expertise. As an example, only until recently has the Army had an experienced Comptroller.

3. The military/civilian mix in OSD is too heavily civilian, and will become worse if the deputy assistant secretaries are all converted.

4. Many staffs are still too large. OSD in general is too big, specifically the J5 and ISA. DCSOPS in the Army is too big.

5. Political appointees do not stay long enough to learn the system, and more importantly to be held accountable for programs they initiate. The military tour length should be at least three to four years for the same reasons. On the Army staff it is generally shorter than that. A secondary reason for tenure is to cut down on the shadow staffing by civilians.

6. Hiring practices must be watched. The selection process is very constrained. The Air Force is overly aggressive on getting retired Air Force personnel onto the OSD staff, as well as a high representation of active personnel.

Goals and Values

Policy Formulation

General comments:
1. Tied to planning, the value standards and directional goals of the Department of Defense are its weakest link. The values and goals are not communicated and perceived by the organization. Assuming that they could be clearly extracted from the posture statements to Congress, it appears that outside DOD is the only direction that they are really communicated. Within DOD they are set aside as "so much talk," and are replaced by what surfaces as the most important thing at the time.

Strengths:

1. The regulations by major headquarters describe well the responsibilities and coordinating practices to be used. Administrative documentation is solid.

Weaknesses:

1. DOD at the corporate level is too big. No one knows who is "steering the boat."

2. The values and goals are neither known, perceived, nor enforced by the organization. The result is a directionless, reactive venture which is open to poor decisions, fiscal irresponsibility, and devious methods to accomplish the mission.

Power Influence (Politics)

General comments:

1. As stated before, the budget is a political document as well as a management tool. In reality it is driving DOD.

2. Personal motivations and prejudices, plus broader national issues do materially influence DOD management. Examples are SALT,
Volunteer forces, elections, base closures, and procurement of high cost items due to industrial needs and location.

3. The politics of the adversary relationships mentioned previously stifle good management.

Weaknesses:

1. Selective use of presenting alternatives to the decision-maker, and in "blitzing" him at the last minute cause many unintentional bad decisions.

2. Other undesirable political practices are:
   a. The competition for dollars, for key positions in the organization, for a voice in Congress, and for manpower.
   b. The concern for how a program looks, stovepipes, featherbedding, scratching each other's backs, and the appointment of cronies into key positions.
   c. Instances such as Senator Muskie not passing the military appropriations bill in order to make the system work; and Mr. Kissinger using EMS as a political tool without coordinating the impact beforehand.

3. Outside agencies getting bigger while OSD is cutting the size of interfacing staffs. The new congressional budget staffs are an example.

Power Influence (People)

General comments:

1. Powerful people do influence DOD decisionmaking and rightfully so; however, many times they do so on short notice. DOD must understand this and plan for it.
2. Congress is getting relatively stronger and the Executive weaker. There are strong and weak men in each who must be identified.

Strengths:
1. Many times it takes an outside personality to make a decision that the organization itself would not make. Commonality of aircraft between services is an example.

Weaknesses: Same as previously stated.

Power Influence (Congress)

General comments:
1. The Congress is younger, more predictable, better staffed, and more independent in its thinking. They prefer for the services, not OSD, to talk to them since they perceive the services know more honestly what they need, have more detailed information, and can be bargained with more.

2. Congressional interest is growing in the sense of getting into more detail about military programs. DOD must retain the flexibility to move funds around when required.

3. A majority view is that DOD should take a leading role in testifying before Congress on all issues which affect more than one service. Services should testify on the specifics of their programs, if required. OSD as the corporate head should be held accountable for testimony and the joint position.

4. The Congressional Budget and Impoundment Act of 1974 is causing growing pains and adjustments.
Strengths:

1. The DOD has a better relationship with Congress than most Federal Agencies due to better management.

Weaknesses:

1. The increasing size and number of staffs outside DOD asking questions, compared to the decreasing size of the DOD staff, is causing problems.

2. The Congressional Budget and Impoundment Act of 1974 is causing:
   
a. more operational decisions being made by Congress on military programs;

b. more work for OSD and services;

c. loss of credibility due to time delay in getting answers;

d. a need for close coordination between congressional committees and members; and

e. a possible loss of protection to DOD from the HASC and the SASC.

Power Influence (OMB and Lobbies)

General comments:

1. It is a fact of life that DOD will have to adapt to the adversary nature of OMB and pressure group influence. This can work to both our advantage and disadvantage.

2. It is important to be honest and straightforward in regard to the presentation of the needs of the nation, in regard to
security, and to the organization, in regard to administrative requirements. DOD must stand up for what is required.

Strengths:

1. OMB and DOD have a fairly good working relationship.
2. Pressure groups can be used quite well in taking care of the soldier's benefits. They should be used more.
3. Industrial lobbies are more powerful than ever before.

Weaknesses:

1. OMB, due to a lack of knowledge, tends to treat the budget needs of DOD in purely dollar terms and not evaluate the basis for the requirements.
2. Pressure groups have a tendency greater than most of using methods which are illegal for gaining their purposes. All members of DOD must be watchful of this, both the programs they are in favor of, or are against.

Public Opinion

General comments:

1. Public opinion does not play as important a role in DOD decisionmaking as it did, or does, during wartime. The public attention is now focused elsewhere, and it is the job of DOD to do their job efficiently and honestly.
2. As in its interface with Congress, OSD should be the primary spokesman to the public and the media on all issues affecting more than one service. Services can provide information on their own issues so long as it does not have broader overtones. Close coordination is absolutely essential between OSD and the services, and between the services themselves in these matters.
Weaknesses:

1. Public statements have not been well thought out or researched in many cases, nor has there been close coordination between services on how certain similar items are handled. The firing of senior officers is an example.

2. The military on occasion has been perceived as being inept in management due to cost overruns, etc.

3. The Marine Corps is still having trouble with its image in basic training. Practices which lead to system abuses must be more strongly controlled by OSD, and the press handled very factually and honestly. The abuse issue is also reflective of a lack of a meaningful value base.
CHAPTER V

HYPOTHESES AND RECOMMENDATIONS

SUMMARY STATEMENT

The Department of Defense strategic management process has been analyzed against the background of management theory and within the framework of its working environment. Particular attention has been paid to the value structure, to managerial behavior, and to the organizational designs which impact on the planning and decisionmaking process. It has been pointed out that necessity for change and adaptation are facts of life in the federal bureaucratic system. This requirement is nothing new, but the manner and speed with which individual agencies have responded to the need have varied considerably. The Department of Defense, traditionally one of the largest and most complex of the federal agencies, has the reputation of being the best managed. Although there are many weaknesses and areas for improvement, it is important to remember that DOD is a pioneer in the area of management innovation, that internal analysis of organization structure and change is under constant review, that DOD met well the first year demands of the new Congressional Budget and Impoundment Act of 1974, and that the innovations and techniques used in high-dollar materiel resource management have proven very successful.

It should be noted, too, at this point that in any organization as large as the Department of Defense there will be inefficiencies,
frustrations, requirements for change imposed which seem irrational, and communications problems which will never be solved. This realization, however, does not free management from its responsibility for continually striving to improve.

A general statement of the Department of Defense strategic management process is that the budget is so important, all else revolves around it, that programming and budgeting are tied together fairly well and are improving, and that realistic, practiced planning is virtually nonexistent. Additionally, there is no articulated value code, and the goals and major objectives which may or may not be transmitted to Congress in posture statements are not internalized downward within the Defense establishment. In summary, two important functions of top-level management, planning and goal setting, appear to be substantially ineffective. The organization is actually functioning on a short term basis with decisions being made based on what will best serve the immediate requirement. As Mintzberg tells us, this is not uncommon, except that in the absence of a set of value standards, clear goals, and unified out-year planning, the results are a fertile ground for inefficiency, corruption, and low morale. Corporate management becomes an operator, and is caught in an activity trap which further precludes planning—a vicious circle.

**HYPOTHESES**

In this context, the specific working hypotheses derived from the data are outlined below following the same format as in Chapter IV.
Structure

1. The major deficiency in the strategic management process is in the area of out-year planning. There are significant problems in all facets. The top down authorship of JSPS documents and a perception that budget and capability constraints are either consciously or subconsciously applied before the threat is analyzed, cause the required forces to be determined using unrealistic risk assessments. The lack of coordination in the preparation of the documents, and the limited distribution due to security classification result in few members of the internal OSD and service staffs either reading the documents or using them in their day-to-day decisionmaking. Tied into these problems is a lack of contingency planning in the area of force structuring and materiel resource allocation should logic or budget necessitate a change.

2. OSD deals primarily in materiel resource management. There is too little staff activity dealing with goal setting in people programs.

3. There is more than one level in DOD acting in the corporate management role; specifically OSD and the separate services. This is not necessarily improper. However, OSD and even the services are too deeply involved in operational decisions, too little involved in planning and analyzing what the organization is doing, and too duplicatory in functions such as environmental interface. There is also considerable internal parallelism of responsibility and activity.
4. The informal structure has a very significant influence on decisionmaking. This is neither unusual nor bad. There are bad features, however, which are hurting the process. Shadow staffing, pigeonholing of actions, overuse of committees, and stovepiping are a few examples.

5. The budget cycle is too long for the dynamic environment in which we live. Certain sequences are too long, and certain too short. DOD just cannot change fast enough under these conditions.

6. The PPBS philosophy should remain as the Department of Defense management framework.

People

1. Parochialism is very strong in both staff and line. There is need for competition and dissenting views; however, the adversary role between services, between OSD and the services, between the military and the civilian, and between the budget analyst and planner is too great for rational management.

2. There are not enough tough decisionmakers at the Assistant Secretary, Deputy Assistant Secretary, and staff section chief level; and, in general, their guidance is weak. Due to this scarcity of tough decisionmakers, too many minor decisions are pushed upward and viable alternatives eliminated, resulting in the good decisionmaker seeing one viable alternative and several weak ones. The situation is further complicated by too much paperwork which takes time, fogs issues, delays decisions, and keeps important things from being done.
3. Civilian control in OSD is essential; however, the military/civilian mix is swinging too far toward the civilian.

Goals and Values

1. A second major deficiency in DOD management is that there is neither an institutionalized code of ethics or value base, nor a set of long-range goals which are understood and used to "guide the ship" in everyday operations and planning.

2. There are many policy decisions imposed upon DOD from higher authority. Too many of these are political in nature and made without the impact on the organization being fully recognized.

3. The services want to remain autonomous in many more areas than effective management would logically permit. Congress, for one, is accustomed to working with the services and basically wants to continue to do so. DOD for the most part is willing to permit this relationship.

RECOMMENDATIONS

Reflecting back to a previous quote from Peter Drucker will focus the genesis of thought on where the Department of Defense needs to work in its continuing efforts to improve strategic management. Drucker reminds us that, "the test of a healthy organization is not the beauty, clarity, or perfection of its organization structure. It is the performance of people." At the heart of many of the hypotheses arrived at during this study is the performance of people—what values underline their thoughts, how well they share information, how well they set priorities on
issues and time, whether or not self-seeking ambitions override the good of the organization, and whether or not they are willing to be held accountable for their actions.

At the chief executive level of the Office of the Secretary of Defense and in each of the services, time and effort must be set aside for evaluating where it is that the boat is going, and what basic course it is to follow; all the time remembering that it takes people to steer and operate the boat. Who these people are, how well they are trained, and how effectively they work together determines if, when, and in what condition the boat reaches its distant port.

Specific recommendations for further study are:

Structure

1. Create a specific staff element on the OSD and service staffs with the sole purpose of long range planning. Planning must become a viable portion of the PPB system and must be oriented toward establishing goals for all aspects of organizational endeavor, not just materiel resource management and war planning.

2. Eliminate the Service Secretaries and realign the staffs as follows:
   a. OSD—Retain the civilian Secretary, Deputy Secretary, and Assistant Secretaries of Defense. Have a General Officer Deputy to each Assistant Secretary. Maintain the Joint Staff, however, at a low level sufficient for the JSPS function. Provide for better coordination between the Joint Staff and the OSD staff in the JSPS.
b. Services--Retain the Service Chief, Vice Chief, and Deputy Chiefs as military. Add a second Vice Chief (names could be changed) who would be a civilian, and a civilian second in charge to each Deputy Chief. The military Vice Chief would be a Director of the Army Staff. The civilian Vice Chief would be the second in command to the Chief.

3. The OSD staff should concentrate more on the big picture. Their specific forces should include primarily interface with the environment on matters requiring a unified DOD position and which require input into the overall DOD goals and objectives. Decision-making, likewise, should be limited to major directional matters and high dollar programs. Services must be given the guidance, delegated the authority, and held responsible for setting more detailed objectives and providing input into the OSD planning process. Staff agencies should be better aligned so as to provide proper interface with the environment, and to carry out the internal functions of the establishment. Goal setting should include people management as well as materiel management.

4. The Service Staffs should also be essentially "direction setters." They should be kept relatively small so that they will not become operators. Their primary function should be to arrive at, disseminate, and control objectives which carry out the Service portion of the Defense function. The Service staff should parallel the OSD staff so that information will flow freely. They should also provide for environmental interface on functions affecting only one service, and for internal management functions, as required.
5. The whole JSPS should be revised to include shorter cycles, more financial contingency planning, publishing of some documents less frequently so that more time can be spent on close-in rational decisionmaking, more user input into planning which results in a more legitimate document, and a more closely coordinated process.

People

The Secretary and Under Secretary of Defense should take on as personal projects getting involved in people programs, eliminating detrimental adversary relationships, eliminating inept personnel from key positions, and ensuring that the staff is balanced so that the proper mix of institutional memory and current field experience is maintained. They should reflect on Drucker's statement that, "The test of a healthy organization is not the beauty, clarity, c perfection of its organizational structure. It is the performance of its people."

Goals and Values

1. Establish a firm set of value standards. They need not be long and detailed, but they must be communicated throughout the organization and receive sufficient command attention so as to be understood and used by all members—both military and civilian.

2. As outlined under "Structure" above, create a specific staff element with the purpose of planning and assisting the top executives in their direction setting responsibilities.

JOINT STRATEGIC PLANNING SYSTEM
JOINT STRATEGIC PLANNING SYSTEM

The JCS are charged with certain planning responsibilities which are discharged by the promulgation of seven documents:

- JIEP—Joint Intelligence Estimate for Planning
- JLREID—Joint Long Range Estimative Intelligence Document
- JLRSS—Joint Long Range Strategic Study
- JSOP—Joint Strategic Objective Plan
- JFM—Joint Force Memorandum
- JSCP—Joint Strategic Capabilities Plan

These documents represent planning in three areas: strategy (JLRSS, JSOP, JFM, JSCP); intelligence (JIEP, JLREID) and research and development (JR&DOD). The time frames they cover and their interrelationships are shown below:

The attached questions are designed to assist in forming and validating ideas to be used in my combined masters paper for Penn State and individual research project for the AVC. My goal will be to analyze the strategic (top level) management process within the Department of Defense. Primary emphasis will be on planning and decisionmaking, and little on management control. My feeling now is that we must continue to have a formalized process to follow in order to arrive at logical, cost-effective decisions. Specifically, I will examine the present Planning, Programming, Budgeting System (PPBS), as supported by the Joint Strategic Planning System (JSPS), to see if it serves the purpose. I am led to believe that there are environmental and personality considerations which play a major role in making decisions and guiding operating policies that are not a part of PPBS. If your replies, and my other research, substantiate this belief, then my focus will be to see if these considerations can be incorporated into the PPB process, or what portions of the process may be just plain unnecessary or counterproductive.

I have asked you to help me based on your previous assignment within the strategic management process. I am looking for candid opinions, examples, and recommendations. The time you spend will be very much appreciated. I expect, too, that the results could require a follow-up personal discussion, if you are willing.

Again, thank you! Return to me in Room A303 or Box 76 as soon as you are finished.

If you have no knowledge or opinion on a question, please go on to the next one.

GARY P. GRAVES
1. What was the nature of your duties within the Department of Defense management system? Period of time?

2. Is the current method of staffing the Department of Defense adequate; i.e., political appointee, civilian/military mix, size of the staff, length of tour, etc? Elaborate briefly.

3. Can one individual's personality and ideas make a significant difference in management decisions? As an example--the Secretary of Defense or principal staff member? Which ones? List examples.
4. Who actually makes decisions in the Department of Defense? Based on what? Is decentralization spelled out well enough so that each decisionmaker knows his authority?

5. Are top level decisionmakers presented with an adequate number of alternatives, or are alternatives fairly well decisioned out at lower levels? If at a lower level, where are the viable alternatives eliminated?
6. Listed below are several environmental factors which influence decision making. Please circle the number which reflects how you view their importance. Give examples in the space below each factor.

7. OPBS, as an institutional management system, has been discontinued in many of the agencies who adopted it in the 60's due to employee hostility, lack of flexibility, excessive time to administer, and non-use. Does it continue to meet Department of Defense needs? Has it ever met the needs?

What are the strengths of the current system?

What are the weaknesses of the current system?

Could you suggest a better system? Explain.
8. In the area of Legislative Liaison and Public Information, do you feel it is logical or appropriate for Department of Defense to be the primary actor in the external arena in lieu of the individual services? Why?

9. General Johnson stated that there were eight staffs in the Pentagon. Does the system provide for proper coordination? In your opinion what coordinating measures are most effective? Least effective?

10. What do you think the impact of the Congressional Budget and Impoundment Act of 1974 will be on the Department of Defense? Individual services? What problems do you anticipate?
11. What are the weaknesses in our strategic management decision-making in the face of a declining budget?

12. What other ideas or thoughts do you have regarding the adequacy of the strategic management process in the Department of Defense, or to the quality of the decisions which it produces?

13. Could you recommend the name and duty position of a person or persons who currently work in the Department of Defense with whom I could discuss the management process.

Thanks!
