ENTHALPIES OF COMBUSTION OF exo-THDC, RJ-4, ISOMERIZED RJ-4, AND JP-9

by

N. K. Smith and W. D. Good

Bartlesville Energy Research Center,
Department of Energy,
Bartlesville, Oklahoma

Research sponsored by:
Air Force Office of Scientific Research (NA)
Department of the Air Force
Contract No. AFOSR-ISSA-78-0009

Approved for public release; distribution unlimited.

June 1978
The enthalpies of combustion of four liquid ramjet fuels, exo-THDC, RJ-4, RJ-4-I, and JP-9, were measured by precision oxygen-bomb combustion calorimetry. The following values are reported for the net enthalpy of combustion at 298.15 K (25°C):

- exo-THDC: $-(10081.5 \pm 2.3)$ cal g$^{-1}$
- RJ-4: $-(10153.1 \pm 2.3)$ cal g$^{-1}$
- RJ-4-I: $-(10144.4 \pm 2.2)$ cal g$^{-1}$
- JP-9: $-(10089.3 \pm 2.4)$ cal g$^{-1}$
ENTHALPIES OF COMBUSTION OF exo-THDC, RJ-4, ISOMERIZED RJ-4, AND JP-9

ENTHALPIES OF COMBUSTION OF exo-THDC, RJ-4, ISOMERIZED RJ-4, AND JP-9

by

N. K. Smith and W. D. Good

Bartlesville Energy Research Center
Department of Energy

The enthalpies of combustion of four liquid ramjet fuels, exo-THDC, RJ-4, RJ-4-I, and JP-9, were measured by precision oxygen-bomb combustion calorimetry. The following values are reported for the net enthalpy of combustion at 298.15 K (25°C): exo-THDC, \(-10081.5 \pm 2.3\) cal g\(^{-1}\); RJ-4, \(-10153.1 \pm 2.3\) cal g\(^{-1}\); RJ-4-I, \(-10141.4 \pm 2.2\) cal g\(^{-1}\); and JP-9, \(-10089.3 \pm 2.4\) cal g\(^{-1}\).

1. INTRODUCTION

In cooperation with the Air Force Office of Scientific Research, this laboratory has studied compounds with high enthalpies of combustion per unit mass\(^{(1,3)}\) and per unit volume\(^{(2,4)}\). This report gives the details of experimental measurements of the enthalpies of combustion of four hydrocarbon liquids being evaluated as ramjet fuels.

\(^{a}\) Work conducted under an Interagency Agreement, AFOSR-ISSA-78-0009, between the Air Force Office of Scientific Research (AFSC) and the Department of Energy.
2. EXPERIMENTAL

MATERIALS

All four fuels studied are liquids. Carbon skeletons of three are shown in Figure 1. exo-THDC, exo-tetrahydrodicyclopentadiene, is a pure compound. RJ-4, exo-tetrahydrodi(methylcyclopentadiene), and RJ-4-I, endo-tetrahydro-di(methylcyclopentadiene) are mixtures of isomers in which the location of the methyl groups is unknown. JP-9 is a blend of 10.3 weight percent methylcyclohexane, 68.4 weight percent of exo-THDC, and 21.2 weight percent of the hydrogenated dimers of norbornadiene whose empirical formula is $\text{C}_{14}\text{H}_{18}$. Carbon skeletons of typical isomers are shown in Figure 2. The empirical formula for the blend is $\text{C}_{10.529}\text{H}_{16.202}$.

exo-THDC, RJ-4, and RJ-4-I were provided by G. W. Burdette, Propulsion Development Department, Naval Weapons Center, China Lake, California. The JP-9 sample was obtained from James R. McCoy, Fuels Branch, Fuels and Lubrication Division, Air Force Aero Propulsion Laboratory, Wright-Patterson Air Force Base, Ohio; it is from Sun Oil Co. Batch 24. All materials were used as received.

Carbon dioxide was recovered from the combustion products of typical calorimetric experiments with all four fuels. Quantitative carbon dioxide recovery is a good indication that combustion was complete, that the sample was dry, and that sample composition was understood. A summary of carbon dioxide recovery is given in Table 1. The value for JP-9 is noticeably lower than the recoveries from the other three fuels.

a Mean value.

National Bureau of Standards benzoic acid sample 39t was used for calibration. Its certified energy of combustion, -(26434 ± 3) J g⁻¹, was converted to standard conditions⁸ giving -(6313.02 ± 0.72) cal g⁻¹ for ΔEₒ/M, the specific energy of the idealized combustion reaction.

Previous combustion experiments on the auxiliary oil, laboratory designation TKL 66, gave a value for ΔEₒ/M of -(11004.41 ± 0.42) cal g⁻¹.

For the cotton thread fuse, empirical formula CH₁.77⁴O₀.88⁷, ΔEₒ/M = -4050 cal g⁻¹.

APPARATUS AND PROCEDURE

Experimental procedures used for the combustion calorimetry of hydrocarbons by this laboratory have been described.⁸,⁹ Rotating-bomb calorimeter BMR II⁸ and platinum-lined bomb Pt-3b⁹, internal volume 0.349 ⁴ dm³, were used without bomb rotation. For each experiment, 1 cm³ of water was added to
the bomb, and the bomb was flushed and charged to 30 atm (3040 kPa) with pure oxygen. Because the oxygen was pure, nitric acid formation was negligible. Each experiment was started at 296.15 K, and the final temperatures were very nearly 298.15 K. Fragile flexible ampoules of borosilicate glass confined the liquid samples. In filling ampoules with JP-9, the apparatus was charged with enough methylcyclohexane to provide its saturation vapor pressure before introducing the sample in order to minimize the evaporation of that component from the fuel.

UNITS OF MEASUREMENT AND AUXILIARY QUANTITIES
The results are based on the 1961 atomic weights and the 1963 definition of the thermochemical calorie (cal = 4.184 J). The reference temperature is 298.15 K (25°C). For reducing weights in air to masses, converting the energy of the actual bomb process to that of the isothermal process, and reducing to standard states, the values in Table 2 were used for density \( \rho \), specific heat capacity \( c_p \), and \( \left( \frac{\partial E}{\partial P} \right)_T \). The values of density were obtained from the mass of material contained by ampoules of known volume. Values of \( c_p \) for exo-THDC and RJ-4 were from differential scanning calorimetry. Values of \( c_p \) for RJ-4-I and JP-9 are estimates as are all values of \( \left( \frac{\partial E}{\partial P} \right)_T \).

CALIBRATION
One set of calibration experiments with benzoic acid was run concurrently with the series of experiments with exo-THDC and RJ-4. The calibration result was \( E_{\text{calor}} = 4008.11 \pm 0.20 \) cal\(_{\text{th}}\) K\(^{-1}\) (mean and standard deviation of the mean). A second set of calibration experiments was run concurrently with

the series of experiments with RJ-4-I and JP-9. The calibration result was 
\[ \varepsilon(\text{calor}) = (4007.02 \pm 0.26) \text{ cal}_\text{th} K^{-1} \] (mean and standard deviation of the mean).

3. CALORIMETRIC RESULTS

Results of typical experiments with the four fuels are summarized in Table 3. Values of \( \Delta E_c^\circ/M \), the specific energy of the idealized combustion reaction, for all experiments are given in Table 4; all values refer to the reaction of unit mass of sample. The idealized combustion and formation reactions for exo-THDC are represented by equations 1 and 2, respectively. The idealized combustion and formation reactions for RJ-4 and RJ-4-I are represented by equations 3 and 4, respectively.

\[ C_{10}H_{16}(l) + 14 O_2(g) = 10 CO_2(g) + 8 H_2O(l) \] (1)

\[ 10 C(\text{c, graphite}) + 8 H_2(g) = C_{10}H_{16}(l) \] (2)

The reader should be reminded that RJ-4 and RJ-4-I are mixtures of isomers.

The idealized combustion reaction for JP-9 is represented by equation 5.

\[ C_{10.529}H_{16.202}(l) + 14.579 O_2(g) = 10.529 CO_2(g) + 8.101 H_2O(l) \] (5)

4. DERIVED RESULTS

Derived values of the standard molar energy of the idealized combustion reaction, \( \Delta E^\circ_c \), the standard molar enthalpy of combustion, \( \Delta H^\circ_c \), and the standard molar enthalpy of formation, \( \Delta H_f^\circ \), (exo-THDC, RJ-4, and RJ-4-I only), of the fuels in the liquid state are given in Table 5. Values of \( \Delta E^\circ_c \) and \( \Delta H^\circ_c \) refer to equations 1, 3, and 5; the values of \( \Delta H_f^\circ \) refer to equations 2 and 4. The uncertainties given in Table 5 are the "uncertainty intervals." The enthalpies of formation of \( \text{CO}_2(g) \) and \( \text{H}_2\text{O}(l) \) were taken to be \(-94.051\) and \(-68.315\) kcal mol\(^{-1}\), respectively. Uncertainties assigned to the respective values were 0.011 kcal mol\(^{-1}\) for \( \text{CO}_2 \) and 0.010 kcal mol\(^{-1}\) for \( \text{H}_2\text{O}(l) \).

The values of enthalpy of combustion given in Tables 3, 4, and 5 are the "gross" heats of combustion for which the reaction products are gaseous carbon dioxide and liquid water. For combustion yielding gaseous carbon dioxide and gaseous water, the values of the "net" heat of combustion are: exo-THDC, \(-(10081.5 \pm 2.3)\) cal g\(^{-1}\); RJ-4, \(-(10153.1 \pm 2.3)\) cal g\(^{-1}\); RJ-4-I, \(-(10141.4 \pm 2.2)\) cal g\(^{-1}\); and JP-9, \(-(10089.3 \pm 2.4)\) cal g\(^{-1}\).
