TOPICAL HAZARD EVALUATION PROGRAM
OF CANDIDATE INSECT REPELLENT AI3-36530
US DEPARTMENT OF AGRICULTURE PROPRIETARY CHEMICAL-AMIDE
STUDY NO. 75-51-0903-79
MAY 1976 - MAY 1978

Approved for public release; distribution unlimited.
A preliminary hazard evaluation of A13-36530 was performed by means of laboratory animal studies using rats, rabbits and guinea pigs. The technical grade compound did not produce eye or skin irritation, or cause a photochemical irritation in rabbits, did not sensitize guinea pigs and did not demonstrate an acute ingestion hazard. It is recommended that A13-36530, US Department of Agriculture Proprietary Chemical - Amide, be approved for further testing as a candidate insect repellent.

A summary of the pertinent findings and recommendations of the inclosed report follows:

A preliminary hazard evaluation of AI3-36530 was performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade compound did not produce eye or skin irritation, or cause a photochemical irritation in rabbits, did not sensitize guinea pigs and did not demonstrate an acute ingestion hazard. It is recommended that AI3-36530, US Department of Agriculture Proprietary Chemical-Amide, be approved for further testing as a candidate insect repellent.

FOR THE COMMANDER:

BRENDAN E. JOYCE, Ph.D.
LTC, MSC
Director, Laboratory Services

Approved for public release; distribution unlimited.
1. AUTHORITY.

   b. Memorandum of Understanding between the Department of the Army; Office of The Surgeon General; the US Army Health Services Command; the US Army Environmental Hygiene Agency; the Armed Forces Pest Control Board; and the US Department of Agriculture, effective 1970 with Amendment No. 1 effective August 1974.

3. PURPOSE. The purpose of this program is to provide guidance for further entomological testing of the candidate insect repellent AI3-36530.

4. SUMMARY OF FINDINGS. A hazard evaluation of the candidate insect repellent AI3-36530, US Department of Agriculture Proprietary Chemical-Amide, was conducted by this Agency using New Zealand White rabbits for skin and eye studies, Hartley guinea pigs for a skin sensitization study and Sprague-Dawley rats for determination of oral toxicity. A tabular presentation of animal toxicity data developed in this Agency follows.*†

† The experiments reported herein were performed in animal facilities fully accredited by the American Association for the Accreditation of Laboratory Animal Care.

Approved for public release; distribution unlimited.

APPROXIMATE LETHAL DOSE (ALD)

Oral

Rats (male) - no diluent ALD >3300 mg/kg

Presents little lethal hazard from acute accidental ingestion.
PHOTOCHEMICAL SKIN IRRITATION STUDIES

Rabbits

A single application (0.05 ml) of a 25 percent (w/v) solution of the compound (AI3-36530) and of a 10 percent oil of Bergamot solution (positive control) in 95 percent ethyl alcohol were applied to the intact skin of six rabbits. Five minutes after application, the rabbits were exposed to UV light (365 nm) for 30 minutes at a distance of 10-15 cm.

Control

Following UV exposures of the rabbits, 0.05 ml of test compound, positive control and diluent were applied to additional skin areas to serve as unirradiated control sites. Application areas were checked for skin irritation at 24, 48 and 72 hours.

- A 25 percent solution of AI3-36530 in ethanol did not cause a photochemical irritation reaction under test conditions.
- Positive control application and irradiation caused greater irritant effects than in unirradiated skin areas.
- Ethanol solutions of AI3-36530 caused mild irritation at both UV and non-UV skin sites.
- Compound AI3-36530 did not cause a photochemical irritation reaction under test conditions and is not expected to cause a photochemical irritation reaction in humans.
- Ethanol solutions of this compound may cause skin irritation in some sensitive individuals. Persons experiencing this reaction should wash off the solution as soon as possible.

* A known skin sensitizer
Study No. 75-51-0903-79, May 76-May 78

5. CONCLUSION. Technical grade compound AI3-36530 presents no acute hazard from eye, skin, photochemical or sensitization contact or from acute ingestion. A potential for mild skin irritation exists when AI3-36530 is applied in ethanol solutions.

6. RECOMMENDATION. Under the provisions of the Memorandum of Understanding (paragraph 1b), it is recommended that AI3-36530, USDA Proprietary Chemical-Amide, be approved for further testing as a candidate insect repellent. Ethanol solutions of this compound may cause skin irritation in sensitive individuals and, if experienced, the site should be washed with copious amounts of water.

APPENDIX

TOPICAL HAZARD EVALUATION PROGRAM
DEFINITIONS OF CATEGORIES OF COMPOUNDS BEING CONSIDERED FOR ACUTE SKIN APPLICATION

CATEGORY I - Compounds producing no primary irritation of the intact skin or no greater than mild primary irritation of the skin surrounding an abrasion. (INTERPRETATION: No restriction for acute application to the human skin.)

CATEGORY II - Compounds producing mild primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should be used only on human skin found by examination to have no abrasions or may be used as a clothing impregnant.)

CATEGORY III - Compounds producing moderate primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should not be used directly on the skin without a prophetic patch test having been conducted on humans to determine irritation potential to human skin. May be used without patch testing, with extreme caution, as clothing impregnants. Compound should be resubmitted in the form and at the intended use concentration so that its irritation potential can be reexamined using other test techniques on animals.)

CATEGORY IV - Compounds producing moderate to severe primary irritation of the intact skin and of the skin surrounding an abrasion and, in addition, producing necrosis, vesiculation and/or eschars. (INTERPRETATION: Should be resubmitted for testing in the form and at the intended use concentration. Upon resubmission, its irritation potential will be reexamined using other test techniques on animals, prior to possible prophetic patch testing in humans, at concentrations which have been shown not to produce primary irritation in animals.)

CATEGORY V - Compounds impossible to classify because of staining of the skin or other masking effects owing to physical properties of the compound. (INTERPRETATION: Not suitable for use on humans.)

EYE CATEGORIES:

A. Compounds noninjurious to the eye. INTERPRETATION: Irritation of human eyes is not expected if the compound should accidentally get into the eyes, provided it is washed out as soon as possible.

B. Compounds producing mild injury to the cornea. INTERPRETATION: Should be used with caution around the eyes.

C. Compounds producing mild injury to the cornea, and in addition some injury to the conjunctiva. INTERPRETATION: Should be used with caution around the eyes and mucosa.
Study No. 75-51-0903-79, May 76 - May 78

D. Compounds producing moderate injury to the cornea. INTERPRETATION: Should be used with extreme caution around the eyes.

E. Compounds producing moderate injury to the cornea, and in addition producing some injury to the conjunctiva. INTERPRETATION: Should be used with extreme caution around the eyes and mucosa.

F. Compounds producing severe injury to the cornea and to the conjunctiva. INTERPRETATION: Should be used with extreme caution. It is recommended that use be restricted to areas other than the face.
