TOPICAL HAZARD EVALUATION PROGRAM
OF CANDIDATE INSECT REPELLENTS AI3-33663A AND AI3-35580A
US DEPARTMENT OF AGRICULTURE PROPRIETARY COMPOUNDS
STUDY NOS. 75-51-0004-80, 75-51-0005-80
SEPTEMBER 1976 - MARCH 1980

Approved for public release, distribution unlimited.
Preliminary hazard evaluations of A13-33663a and A13-35580a were performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade compounds did not cause any skin, eye or photoirritation, and did not cause a sensitization reaction. They also were not acute ingestion hazards. It was recommended that both A13-33663a and A13-35580a be approved for further testing as candidate insect repellents.

A summary of the pertinent findings and recommendations of the inclosed report follows:

Preliminary hazard evaluations of A13-33663a and A13-35580a were performed by means of laboratory animal studies using rats, rabbits, and guinea pigs. The technical grade compounds did not cause any skin, eye or photoirritation, and did not cause a sensitization reaction. They also were not acute ingestion hazards. It was recommended that both A13-33663a and A13-35580a be approved for further testing as candidate insect repellents.

1. AUTHORITY.

   b. Memorandum of Understanding between the US Army Environmental Hygiene Agency; the US Army Health Services Command; the Department of the Army Office of The Surgeon General; the Armed Forces Pest Control Board; and the US Department of Agriculture, Agricultural Research, Science and Education Administrations; titled, Coordination of Biological and Toxicological Testing of Pesticides, effective 23 January 1979.

3. PURPOSE. The purpose of this program is to provide guidance for further entomological testing of the candidate insect repellents A13-33663a and A13-35580a.

4. SUMMARY OF FINDINGS. Hazard evaluations of the candidate repellents A13-33663a and A13-35580a, US Department of Agriculture (USDA) Proprietary Compound, were conducted by this Agency using New Zealand White rabbits for skin and eye studies, Hartley guinea pigs for a skin sensitization study and Sprague-Dawley rats for determination of oral toxicity. A tabular presentation of animal toxicity data developed in this Agency follows: *†

* In conducting the studies described in this report, the investigators adhered to the "Guide for the Care and Use of Laboratory Animals," US Department of Health, Education, and Welfare Publication No. (NIH) 74-23, revised 1978.

† The experiments reported herein were performed in animal facilities fully accredited by the American Association for the Accreditation of Laboratory Animal Care.

**PHOTOCHEMICAL SKIN IRRIGATION STUDIES**

**Rabbits**

A single 0.05 mL application of a 25 percent (w/v) solution of the compounds and a 10 percent (w/v) Oil of Bergamot solution (positive control) in 95 percent ethyl alcohol were applied to the intact skin of six rabbits. Five minutes after application, the rabbits were exposed to UV light (365 nm) for 30 minutes at a distance of 10-15 cm.

A 25 percent solution of either compound in ethanol did not cause a photochemical irritation reaction under test conditions. Compounds A13-33663a and A13-35580a did not cause photochemical irritation reaction under test conditions and are not expected to cause a photochemical irritation in humans.

**Control**

Following UV exposures of the rabbits, 0.05 mL of test compound, positive control and diluent were applied to additional skin areas to serve as unirradiated control sites. Application areas were checked for skin irritation at 24, 48 and 72 hours.

Positive control application and irradiation caused greater irritant effects than in unirradiated skin areas.
**SENSITIZATION STUDIES**

**Guinea Pigs (Male)**

Intradermal injections of 0.1 mL of a 0.1 percent solution (w/v) of either AI3-33663a, AI3-35580a, or of dinitrochlorobenzene (DNCB)* in a mixture containing 1 volume of propylene glycol and 29 volumes of saline.

Ten test guinea pigs were given 10 sensitizing doses over a 3-week period. After 2 weeks rest, they were challenged with ID injections of test compound.

<tbody>
<tr>
<td>Challenge dose of either test compound did not produce a sensitization reaction.</td>
<td>Compounds AI3-33663a and AI3-35580a did not produce a sensitization reaction under test conditions and are not expected to produce a sensitization reaction in man.</td>
<td></td>
</tr>
<tr>
<td>Challenge dose of DNCB in positive control guinea pigs produced a marked sensitization reaction in 10 out of 10 guinea pigs.</td>
<td>DNCB produced a marked reaction, indicating guinea pigs respond to sensitizing agents.</td>
<td></td>
</tr>
</tbody>
</table>

* A known skin sensitizer
5. CONCLUSION. Technical grade compounds A13-33663a and A13-35580a are not skin, eye or photoirritants nor sensitizers. Neither compound presents an acute ingestion hazard.

6. RECOMMENDATION. Under the provisions of the Memorandum of Understanding (paragraph 1b), it is recommended that A13-33663a and A13-35580a, USDA Proprietary Compounds, be approved for further testing as candidate insect repellents.

APPENDIX

TOPICAL HAZARD EVALUATION PROGRAM
DEFINITIONS OF CATEGORIES OF COMPOUNDS BEING CONSIDERED FOR ACUTE SKIN APPLICATION

CATEGORY I - Compounds producing no primary irritation of the intact skin or no greater than mild primary irritation of the skin surrounding an abrasion. (INTERPRETATION: No restriction for acute application to the human skin.)

CATEGORY II - Compounds producing mild primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should be used only on human skin found by examination to have no abrasions or may be used as a clothing impregnant.)

CATEGORY III - Compounds producing moderate primary irritation of the intact skin and the skin surrounding an abrasion. (INTERPRETATION: Should not be used directly on the skin without a prophetic patch test having been conducted on humans to determine irritation potential to human skin. May be used without patch testing, with extreme caution, as clothing impregnants. Compound should be resubmitted in the form and at the intended use concentration so that its irritation potential can be reexamined using other test techniques on animals.)

CATEGORY IV - Compounds producing moderate to severe primary irritation of the intact skin and of the skin surrounding an abrasion and, in addition, producing necrosis, vesiculation, and/or eschars. (INTERPRETATION: Should be resubmitted for testing in the form and at the intended use concentration. Upon resubmission, its irritation potential will be reexamined using other test techniques on animals, prior to possible prophetic patch testing in humans, at concentrations which have been shown not to produce primary irritation in animals.)

CATEGORY V - Compounds impossible to classify because of staining of the skin or other masking effects owing to physical properties of the compound. (INTERPRETATION: Not suitable for use on humans.)

EYE CATEGORIES:

A. Compounds noninjurious to the eye. INTERPRETATION: Irritation of human eyes is not expected if the compound should accidentally get into the eyes, provided it is washed out as soon as possible.

B. Compounds producing mild injury to the cornea. INTERPRETATION: Should be used with caution around the eyes.

C. Compounds producing mild injury to the cornea, and in addition some injury to the conjunctiva. INTERPRETATION: Should be used with caution around the eyes and mucosa.

D. Compounds producing moderate injury to the cornea. INTERPRETATION: Should be used with extreme caution around the eyes.

E. Compounds producing moderate injury to the cornea, and in addition producing some injury to the conjunctiva. INTERPRETATION: Should be used with extreme caution around the eyes and mucosa.

F. Compounds producing severe injury to the cornea and to the conjunctiva. INTERPRETATION: Should be used with extreme caution. It is recommended that use be restricted to areas other than the face.
