Structural Analysis  
National Dam Safety Program  
Ballinger Lake Dam, N.J.

**ABSTRACT:**

This report cites results of a technical investigation as to the dam's adequacy. The inspection and evaluation of the dam is as prescribed by the National Dam Inspection Act, Public Law 92-367. The technical investigation includes visual inspection, review of available design and construction records, and preliminary structural and hydraulic and hydrologic calculations, as applicable. An assessment of the dam's general condition is included in the report.
28 Aug 1981

Mr. John O'Dowd, Acting Chief
Bureau of Flood Plain Regulation
Division of Water Resources
N.J. Department of Environmental Protection
P.O. Box CN029
Trenton, NJ 08625

Dear Mr. O'Dowd:

We are forwarding, for your information, under separate cover the available copies of the Final Report for Ballinger Lake Dam, NJ00583. Since the dam does not meet the size criteria for inclusion in the National Inventory of Dams, a Corps of Engineers Assessment has not been prepared. The report does, however, provide a valid indication of the condition of the dam.

Sincerely,

D. J. Sheridan
Chief, Planning/Engineering Division
DELAWARE RIVER BASIN

Name of Dam: Ballinger Lake Dam
County & State: Burlington County, New Jersey

AUG<<><<81
PREFACE

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigations and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there be any chance that unsafe conditions be detected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the Spillway Test flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. The test flood provides a measure of relative spillway capacity and serves as an aid in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and the downstream damage potential.
PHASE I REPORT
NATIONAL DAM INSPECTION PROGRAM

Name of Dam: Ballinger Lake Dam NJ 00583
State Located: New Jersey
County Located: Burlington
Stream: Tributary to Rancocas Creek
Coordinates: N39°51.8', W74°48.5'
Date of Inspection: April 30, 1981

ASSESSMENT

Based on visual observations made during the inspection, information provided by the New Jersey Department of Environmental Protection (NJDEP) and conversations with the Owner's representatives, Ballinger Lake Dam is considered to be in fair overall condition.

The dam is a U-shaped earth embankment approximately 950 feet long with a maximum height of about 11 feet. County route 541, a two lane asphalt paved road, is located immediately downstream of the northeast portion of the dam. Immediately downstream of the highway is the asphalt paved parking lot of a restaurant. The top width of the dam varies between 8 feet and 20 feet and the upstream and downstream slopes are about 1H:1V and 4H:1V, respectively. The spillway is a concrete drop inlet with a weir length of 17 feet. The freeboard between the spillway crest and the low point of the top of the dam is about 0.8 feet.

A large number of trees and brush are growing on the embankment on the southwest portion of the dam and near the spillway. A lack of vegetative cover was noted along the entire northeast portion of the dam. Some embankment displacement apparently due to foot traffic, was observed adjacent to the right side of the spillway. No seepage from the embankment was observed.

The concrete drop inlet structure appeared to be in good condition, however, considerable trash accumulation was observed at the invert of the structure. The spillway discharge channel was overgrown with trees and brush and a 42-inch diameter road culvert about 100 feet downstream of the dam was found to be obstructed with debris.

The selected Spillway Design Flood (SDF) for this "Small" size, "High" hazard dam is one-half of the Probable Maximum Flood (PMF). Examination of the results of the hydrologic and hydraulic analyses indicates that the spillway is capable of discharging approximately 13 percent of the SDF prior to overtopping of the embankment. Failure of the dam would not cause a significant increase in the downstream hazard potential. Therefore, the spillway is classified as "Inadequate".

The Owner should retain the services of a licensed professional engineer experienced in the design and construction of dams to assist in complying with the following recommendations and remedial measures.
The recommendations and remedial measures should be initiated very soon.

a. Facilities.

1. More detailed hydrologic and hydraulic analyses should be performed to determine the need for and type of mitigating measures required to ensure the adequacy of the spillway.

2. Trees and bushes should be removed from the embankment. Any remaining voids should be filled with a suitable, thoroughly compacted material.

3. Fill in low regions of the crest of the dam to Elevation 60.0 with suitable thoroughly compacted material.

4. A suitable vegetative cover should be established and maintained on the embankment.

5. The outlet channel should be cleared of trees and brush. In addition, consideration should be given to enlarging the road culvert 150 feet downstream of the dam to improve the capacity of the outlet channel.

6. The vertical earth face on the left side of the outlet retaining wall should be sloped back to prevent slope failure and blocking of the outlet pipe.

b. Operation and Maintenance Procedures

1. The Owner should institute measures to prevent debris and trash buildup in the spillway drop inlet and on the trashrack.

2. The channel immediately downstream of the dam should be kept clear of obstructions.

3. The Owner should develop written operating procedures and a periodic maintenance plan to ensure the safety of the dam.

O'BRIEN & GERE ENGINEERS

John J. Williams, P.E.

1.1 General

a. Authority. This report is authorized by the Dam Inspection Act, Public Law 92-367, and has been prepared in accordance with contract # DACW 61-80-D0013 between O'Brien & Gere Engineers, Inc. and the United States Army Corps of Engineers, Philadelphia District.

b. Purpose of Inspection. The purpose of this inspection is to evaluate the structural and hydraulic condition of Ballinger Lake Dam and appurtenant structures and to determine if the dam constitutes a hazard to human life or property.

1.2 Project Description (Based on information provided by New Jersey Department of Environmental Protection (NJDEP), field observations, and discussions with the Owner's representatives).

a. Description of Dam and Appurtenances. Ballinger Lake Dam is an earth embankment approximately 950 feet in length with a maximum height of about 11 feet. The dam crest width varies from about 8 feet to 20 feet and the side slopes are approximately 1H:1V upstream and 4H:1V downstream. According to information provided by the NJDEP, the U-shaped embankment was constructed of sand and covered with sod. A 90-foot long timber retaining wall of light construction is located on the upstream face of the embankment on the northeast side of the impoundment.

The spillway is a concrete drop inlet, 5 feet wide by 6 feet long, covered by a steel grating. A weir notch, 2.5 feet wide, is located on the upstream (5 feet wide) side of the inlet. Flow through the weir is controlled by stoplogs that extend to the full depth of the structure, about 7.9 feet. A 3-foot square concrete box culvert connects with the base of the downstream wall of the drop inlet. A concrete retaining wall is located at the outlet end of the culvert which is at the downstream side of the embankment. Flow from the box culvert discharges directly into the natural channel downstream of the dam.

b. Location. Ballinger Lake Dam is located on a tributary of the South branch of Rancocas Creek in Medford Township, Burlington County, New Jersey. The site is shown on the USGS Quadrangle entitled "Medford Lakes, N.J." at coordinates N39°51.8', W74°48.5'. A regional location map of Ballinger Lake Dam is included as Figure 1 in Appendix E.
c. **Size Classification.** Ballinger Lake Dam has a maximum height of 11 feet which places it in the "Small" size dam category (less than 40 feet high). The maximum storage capacity of 26 acre-feet at the low point of the top of the dam also falls within the "Small" size classification (less than 1,000 acre-feet). Ballinger Lake Dam is, therefore, classified as a "Small" size structure.

d. **Hazard Classification.** A home and auto-repair shop are located within 100 feet of the downstream toe of the dam. A failure of the dam could result in excessive property damage and loss of life at these locations. A restaurant is located northeast of the impoundment at an elevation lower than normal pool. In the event that the dam is overtopped, the restaurant would be inundated. Therefore, Ballinger Lake Dam is classified in the "High" hazard potential category.

e. **Ownership.** Ballinger Lake Dam is owned by the Medford Lakes Colony Club, Tecumseh Trail, Medford Lakes, New Jersey 08055.

f. **Purpose of Dam.** Ballinger Lake Dam provides a lake which is used for recreational activities.

g. **Design and Construction History.** According to the information received from the NJDEP, the dam was constructed in the mid 1920's by the Medford Lakes Corporation as part of a real estate development. No other information is available relative to the design and construction of the dam.

h. **Normal Operating Procedures.** Operating procedures would consist of removing the stoplogs from the spillway weir notch. No records of operating procedures are available for this site.

### 1.3 Pertinent Data

g. **Dam Data.**

- **Type:** Earth
- **Length:** 950 Feet
- **Height:** 11 Feet
- **Variation in Height:** Varies 8 Feet to 20 Feet
  - Upstream: 1H:1V
  - Downstream: 4H:1V
- **Top Width:** Unknown
- **Side Slopes:**
  - Upstream: 1H:V
  - Downstream: Unknown
- **Zoning:** Unknown
- **Impervious Core:** Unknown
- **Cutoff:** Unknown
- **Grout Curtain:** Unknown

h. **Spillway Data.**

- **Type:** Concrete Drop Inlet
- **Crest Length:** 17 Feet
- **Crest Elevation:** 57.0
- **Approach Channel:** Natural Stream
- **Downstream Channel:** Timber Stoplogs.
- **Regulating Outlet:** 2.5 Feet Long
SECTION 2
ENGINEERING DATA

2.1 Design

a. Data Available. No design data or drawings are available for this structure.

b. Design Features. The principal design features for this structure are discussed in Section 1.2a.

2.2 Construction

The dam was originally constructed in the mid-1920's. However, no further information is available.

2.3 Operation

No operational data is available for this dam.

2.4 Evaluation

a. Availability. All information made available was provided by the NJDEP. No original design or construction information is available.

b. Adequacy. The information made available by the NJDEP, discussions with the Owner's representative and observations made during the field investigation provided adequate data for a Phase I evaluation.

c. Validity. There appears to be no reason to question the validity of the information provided by the NJDEP.
SECTION 3
VISUAL INSPECTION

3.1 Findings

a. General. The field inspection of Ballinger Lake Dam took place on April 30, and June 24, 1981. At the time of the inspections, the reservoir water surface was a few hundredths of a foot above the spillway crest. No underwater areas were inspected. The observations and comments of the field inspection team are in the checklist which is Appendix B of this report. The appearance of the facility indicates that it is fairly well maintained.

b. Dam. A large number of small trees and brush were observed growing from the embankment on the southwest side of the Lake. The portion of the embankment on the northeast side of the Lake lacks vegetative cover. The only upstream slope protection observed was the 90 feet timber retaining wall along the northeast portion of the embankment. Evidence of embankment settlement was observed along the retaining wall. The freeboard at the time of the inspection averaged about 2 feet; however, the minimum freeboard within the reach of the timber retaining wall is about 0.8 feet. Some erosion, apparently due to foot traffic, was observed adjacent to the right side of the spillway. No seepage was observed coming from the embankment.

c. Appurtenant Structures. The concrete drop inlet structure appeared to be in good condition. On April 30, the stoplogs in the weir notch, were nearly level with the spillway crest and a small amount of discharge was observed. Considerable trash accumulation was observed at the invert of the spillway structure. The trashrack located on the top of the spillway consists of a grating with bars spaced about one inch apart. This spacing will prevent the passage of small debris which could collect on the grating and reduce the spillway capacity significantly.

d. Reservoir Area. No evidence of excessive sedimentation in the reservoir was observed. The banks of the reservoir are on very gentle slopes. A residential area surrounds the reservoir.

e. Downstream Channel. The downstream channel is about 10 feet wide with 1H:1V side slopes and is heavily overgrown with trees and brush. On the left side of the outlet retaining wall, the earth embankment is vertical. A small road culvert which is located about 150 feet downstream of the dam, is obstructed with vegetation.
SECTION 4
OPERATIONAL PROCEDURES

4.1 Procedures

The operating procedures for Ballinger Lake Dam consist of placing and removing the stoplogs from the spillway weir notch. According to the Owner's representative, the reservoir is drawn down each spring.

4.2 Maintenance of Dam

According to the Owner's representative, the dam is inspected each spring and repairs are made as needed. The spring inspection usually includes drawing down the reservoir and replacing ground cover where needed on the embankment. A lack of ground cover is evident on Ballinger Dam.

4.3 Maintenance of Operating Facilities

During the spring inspection, the spillway is cleared of trash and debris. However, the spillway inlet structure had an appreciable amount of debris on its floor at the time of the inspection.

4.4 Description of Any Warning Systems in Effect

According to the Owner's representative, written warning procedures would be implemented in the event of an impending dam failure. The local police department would be contacted and the Medford lake's maintenance crew would contact downstream residents.

4.5 Evaluation of Operational Adequacy

The drop inlet spillway should be kept free of obstructions at all times.

The dam maintenance program should include the removal of trees and brush from the embankment and the maintenance of a suitable vegetative cover.
SECTION 5
HYDRAULICS AND HYDROLOGY

5.1 Evaluation of Features

a. Design Data. No hydrologic or hydraulic design data was included with the information provided by the NJDEP. Ballinger Lake has a total drainage area of 0.90 square miles of which 0.75 square miles is controlled by the Lake Mishe-Mokwa Dam. The drainage basin has a maximum length of about 1.5 miles and an estimated maximum width of one mile. The ground surface in the basin varies from a maximum of approximately El. 150 to El. 57 at normal pool. Roughly 70 percent of the basin is residentially developed with the balance primarily pine woods.

The spillway at Ballinger Lake Dam has an estimated discharge capacity of 41 cfs.

For further information, refer to the calculations and computer printout included in Appendix C of this report.

b. Experience Data. No rainfall or reservoir level records are maintained at this site. According to local residents, the dam was overtopped within the last ten years. At that time, the reservoir rose to within about one foot of the top of the concrete spillway headwall. The northeast portion of the reservoir was overtopped and both the restaurant on that side of the dam and the house downstream of the dam were flooded.

With the impoundment level at normal pool, Elevation 57.0, it would take approximately 2.5 hours to draw the reservoir down about 8 feet to Elevation 49.0 which is the invert of the stop logged drop inlet.

c. Visual Observations. On the date of the inspection, the invert of the drop inlet was partially obstructed with trash and debris. A 42-inch diameter road culvert is located about 150 feet downstream of the dam. A heavy accumulation of debris was observed in the culvert that would greatly reduce its discharge capacity and cause flood water to backup into the hazard area between the road and the dam during high discharges.

d. Overtopping Potential. The recommended Spillway Design Flood (SDF) range for a "Small" size, "High" hazard dam is one-half of the Probable Maximum Flood (PMF) to the full PMF. Due to the small storage capacity of the reservoir, the selected SDF is one-half of the PMF. The SDF was developed from the SCS unit hydrograph using one-half of the computed PMF. The inflow hydrograph to Lake Mishe-Mokwa was routed through the dam and combined with the inflow hydrograph to Ballinger Lake. The resulting SDF hydrograph was routed through Ballinger Lake Dam with the initial water surface elevation at the spillway crest. The peak inflow and outflow rates for the SDF were computed to be about 1540 cfs. The spillway is capable of discharging approximately 13 percent of the SDF prior to overtopping of the embankment (refer to Appendix C for computations and the computer printout).
e. **Spillway Adequacy.** A dam break analysis was performed to evaluate the "hazard to loss of life downstream from the dam from that which would exist just before overtopping failure" (ETL 1110-2-234, 10 May, 1978). The breach was assumed to occur at approximately 100 percent of the SDF (50 percent of the PMF) with the reservoir surface 1.6 feet above the low point of the top of the dam (2.4 feet above the spillway crest). The flow at the hazard area prior to failure of the dam was computed to be about 1540 cfs with a corresponding flow depth of 6.3 feet (3.3 feet above the channel banks). The breach flow at the hazard area was computed to be about 2540 cfs with a corresponding flow depth of 7.3 feet (4.3 feet above the channel banks). The sill elevation of the lowest house in the hazard area is approximately the same as the elevation of the channel banks. A failure of the dam is not considered to significantly increase the hazard to loss of life downstream. Therefore, the spillway is classified as "Inadequate".
SECTION 6
STRUCTURAL STABILITY

6.1 Evaluation of Structural Stability

a. Visual Observation. The trees growing from the embankment present potential hazards to the structural integrity of the dam. The root systems create seepage paths through the embankment and, if uprooted during severe wind conditions, could remove portions of the embankment. In addition, the dam could be subjected to erosion in the event of overtopping due to the lack of vegetation on the surface of the northeast portion of the embankment.

b. Design and Construction Data. No design or construction data is available for this dam.

c. Operating Records. No operating records are kept for this dam. According to the Owner's representative, the reservoir is usually drawn down each spring for repairs by removing the spillway weir stoplogs.

d. Post Construction Changes. No records of post construction changes have been maintained for this dam.

e. Seismic Stability. Ballinger Lake Dam is located in Seismic Zone 1 on the "Seismic Zone Map of Contiguous States." A dam located in Seismic Zone 1 is generally considered to be safe under expected earthquake loadings in this Zone if it is stable for static loading conditions. Based on the field inspections, Ballinger Lake Dam appears to be stable for static conditions.
SECTION 7

ASSESSMENT, RECOMMENDATIONS, AND PROPOSED REMEDIAL MEASURES

7.1 Dam Assessment

a. Safety. The visual observations and review of available information indicate that Ballinger Lake Dam is in fair condition. The deficiencies and problem areas noted include inadequate spillway capacity and inadequate maintenance.

The selected SDF for this structure is one-half of the PMF. The spillway is capable of discharging approximately 13 percent of the SDF prior to overtopping of the embankment. Failure of the dam by overtopping would not result in a significant increase in the water surface elevation at the hazard area over that which would occur just prior to failure. Therefore, the spillway is classified as "Inadequate".

b. Adequacy of Information. The information obtained from the New Jersey Department of Environmental Protection (NJDEP), conversations with the Owner's representatives and observations made during the field investigations provided adequate data for a Phase I investigation.

c. Urgency. The recommendations and remedial measures described in Section 7.2 should be initiated very soon.

d. Necessity for Further Evaluation. Further investigation should be performed in accordance with Section 7.2a, Item 1.

7.2 Recommendations and Remedial Measures

The Owner should retain the services of a licensed professional engineer experienced in the design and construction of dams to assist in complying with the following recommendations and remedial measures.

a. Facilities.

1. More detailed hydrologic and hydraulic analyses should be performed to determine the need for and type of mitigating measures required to ensure the adequacy of the spillway.

2. Trees and bushes should be removed from the embankment. Any remaining voids should be filled with a suitable, thoroughly compacted material.

3. Fill in low regions of the crest of the dam to Elevation 60.0 with suitable thoroughly compacted material.

4. A suitable vegetative cover should be established and maintained on the embankment.
5. The outlet channel should be cleared of trees and brush. In addition, consideration should be given to enlarging the road culvert 150 feet downstream of the dam to improve the capacity of the outlet channel.

6. The vertical earth face on the left side of the outlet retaining wall should be sloped back to prevent slope failure and blocking of the outlet pipe.

b. Operation and Maintenance Procedures

1. The Owner should institute measures to prevent debris and trash buildup in the spillway drop inlet and on the trashrack.

2. The channel immediately downstream of the dam should be kept clear of obstructions.

3. The Owner should develop written operating procedures and a periodic maintenance plan to ensure the safety of the dam.

24 hr, 200 S.M. Rainfall = 22.8″

SCS Lag Time - Uncontrolled D.A.

Upland Method

Greatest Hydraulic Distance = 1500'

Avg. Slope = (80 - 57) / 1500 = 1.53%

Velocity = 1.85 fps (SCS Handbook, Hydrology)

\[ \text{Velocity} = \frac{1500}{1.85} = 811 \text{ sec} \]

\[ L = 1.6 (811) = 4877 \text{ sec} = 0.14 \text{ hr} \]
SCS CURVE, NO. METHOD:

\[ L = \frac{0.8 (S+1)^{0.7}}{1900 Y^{0.5}} \]

\[ S = \frac{1000 - 10}{80} = 12.5 \]

\[ L = \frac{(1500)^{0.8}(3.5)^{0.7}}{1900 (1.5)^{0.5}} = 0.36 \text{ HRS.} \]

CALIFORNIA HWYS. METHOD:

\[ T_e = \left( \frac{11.9 L^3}{H} \right)^{0.285} \]

\[ = \left( \frac{11.9 (0.28)^3}{80 - 57} \right)^{0.285} = 0.18 \text{ HRS.} \]

\[ L = 0.6 \times 0.18 = 0.11 \text{ HRS.} \]

KERBY METHOD:

\[ T_e = \left( \frac{2}{3} \left( \frac{L H}{\sqrt{5}} \right) \right)^{0.467} \]

\[ = \left( \frac{2}{3} \left( \frac{1500(0.03)}{\sqrt{1.015}} \right) \right)^{0.467} = 8.3 \text{ MIN} \]

\[ L = 0.6 \times \frac{8.3}{100} = 0.08 \text{ HRS.} \]

USE \[ L = 0.14 \text{ HRS. FOR UNCONTROLLED D.A.} \]

For dam overtopping, \( C_w = 2.6 \), \( l_{\text{max}} = 94/7' \).

\[ Q_w = C \cdot L \cdot H^{3/2} \]
where \( C = 3.0 \) (Brod crest weir/trash rack)
\( L = 17' \)
\( H = \text{W.S.E. above weir crest} \text{ el. 57} \)

** See Nomograph on page 4

** HW = W.S.E. above culvert invert el. 49.1

D = 3'

---

**LAKE MISHE - MOKWA**

All data relative to the drainage area controlled by Lake Mishe-Makwa Dam was obtained from the Phase I report on that dam provided by Phila. COE.
CHART 1

EXAMPLE
5' x 2' Box 0 + 75 cfs
Q0 = 15 cfs/ft

\[
\begin{array}{c|c|c}
\text{Inlet} & \text{MW/D} & \text{MW} \\
\hline
(1) & 1.75 & 3.5 \\
(2) & 3.90 & 3.8 \\
(3) & 2.05 & 4.1 \\
\end{array}
\]

HEIGHT OF BOX (D) IN FEET
RATIO OF DISCHARGE TO WIDTH (Q/B) IN CFS PER FOOT
HEADWATER DEPTH IN TERMS OF HEIGHT (MW/D)

(W/ D) SCALE WINGWALL FLARE

\[
\begin{array}{c|c|c}
\text{(1)} & 30^\circ \text{ to } 75^\circ \\
\text{(2)} & 90^\circ \text{ and } 15^\circ \\
\text{(3)} & 0^\circ \text{ (extensions of sides) } \\
\end{array}
\]

To use scale (2) or (3) project horizontally to scale (1), then use straight inclined line through D and 0 scales, or reverse as illustrated.

HEADWATER DEPTH FOR BOX CULVERTS WITH INLET CONTROL

BUREAU OF PUBLIC ROADS JAN 1963
BREACH CONFIGURATION

Top of Dam Elev. 57.8 (Low Pt.)

Bottom of Breach Elev. 47.0

75'

Water surface elev. at which breach begins ≈ 59.4
Time for breach to reach maximum size = 1 hour

CHANNEL CROSS-SECTION AT HAZARD AREA

n = 0.08

n = 0.05

n = 0.08

Sill elevation of lowest house
in damage area ≈ 41.49.0

Reach length = 100'

Slope = $\frac{47 - 46}{100} = 0.01$ ft ft
Reservoir Drawdown Calculations

Normal Pool Storage = 21 A.F. (Sec. 11, App. A)

Normal Pool Surface = El. 57.0

Invert of stop logs = El. 49.0

\[ V = i \cdot D \cdot A = 1.5 \times 31 \times 0.9 \approx 47 \text{ cfs} \]

Drawdown between El. 57 & El. 49

\[ Q = C \cdot A \cdot \sqrt{2g} \]

\[ C = 0.8, \quad \theta = 45°, \quad \text{Rectangular, square, centered, rectangular, culvert} \]

\[ A = 3.14 \text{ ft}^2 \]

\[ \text{Drawdown} = 4' \]

\[ Q = 0.5 \times 31 \times 6.02 \times 2 \]

\[ Q \approx 115 \text{ cfs} \]

Time to drawdown from El. 57 to El. 49:

\[ t = \frac{Q \times 43560}{A} \]

\[ t = \frac{113 \times 43560}{3.14 \times 6.02} \approx 25.5 \text{ hrs} \]

Assuming all step logs remained

</tbody>
</table>

**Note:**
- Area calculations are based on the given height and water surface area.
- Water velocity is measured in feet per second (fps).
- Flow rate is calculated in cubic feet per second (cfs).

Site Geology
SITE GEOLOGY

BALLINGER DAM

Ballinger Dam is situated in Burlington County within the Atlantic Coastal Plain physiographic province. The dam and lake rest on marine and transitional sediments of the Kirkwood formation Tertiary age. The Kirkwood formation consists of sandy silts, some carbonaceous matter and micaceous fine sands. The unit strikes about N\(\text{65}^\circ\)E. and dips about 20 feet to the mile in a southeast direction. The project site lies within the outcrop area of the beveled NW edge of the Kirkwood formation. This exposed portion of the formation is considered a part of the recharge zone for the deep "700-foot sand" which acts as a principal aquifer for water supply in the New Jersey coastal zones.

Paleozoic bedrock is estimated to occur at a depth in excess of 1000 feet at the project site.
