Beaver, Pennsylvania 15009

AUGUST 1981

81 12 28 174
This report is prepared under guidance contained in the "Recommended Guidelines for Safety Inspection of Dams," for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I Investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through frequent inspections can unsafe conditions be detected and only through continued care and maintenance can these conditions be prevented or corrected.

Phase I Inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established guidelines, the spillway design flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. The spillway design flood provides a measure of relative spillway capacity and serves as an aid in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and the downstream damage potential.
PHASE I REPORT
NATIONAL DAM INSPECTION PROGRAM

Maggio Estate Dam No. 2, Lycoming County, Pennsylvania
NDI No. PA 01120, PennDER No. 41-103
Red Run
Inspected 31 March 1981

ASSESSMENT OF
GENERAL CONDITIONS

Maggio Estate Dam No. 2 is owned by the Estate of Michael Maggio and is classified as a "Significant" hazard - "Small" size dam. The dam was found to be in fair overall condition at the time of inspection.

Hydraulic/hydrologic evaluations, performed in accordance with procedures established by the Baltimore District Corps of Engineers, for Phase I Inspection Reports, revealed that the spillway capacity is less than the inflow to the impoundment during the 100-year flood. A spillway design flood (SDF) in the range of the 100-year flood to the 1/2 Probable Maximum Flood (1/2 PMF) is required for Maggio Estate Dam No. 2. Because the dam is on the low end of the "Small" size category in terms of height and storage capacity, the 100-year flood was chosen as the SDF. The spillway is therefore considered "Inadequate." It is recommended that the owner develop remedial measures to ensure that the dam will not be overtopped by the 100-year flood.

The inspection revealed certain items of remedial work which should be performed by the owner without delay. These include:

1) Develop remedial measures to ensure that the dam will not be overtopped by the 100-year flood.
2) Fill and seed the tire ruts on the crest of the dam.
3) Excavate, fill, compact and seed the animal burrow on the upstream face of the dam.
4) Monitor the seeps beneath the spillway and at the toe of the embankment left of the spillway at regular intervals and during periods of high reservoir levels for turbidity or increase in flow, which may indicate potential for the piping of embankment material. If turbidity or increased flows are noted, a qualified geotechnical engineer should be retained to recommend remedial measures.
5) Provide erosion protection for the earth sides of the spillway.

6) Fill the downstream edge of the spillway and provide with erosion protection.

7) Clear the debris from around the 12-inch concrete outlet pipe and provide a trash rack for the pipe inlet.

8) Cut all trees at the toe of the embankment at ground level. All trees with a trunk diameter greater than 3 inches should have their root systems removed. All resultant areas of erosion and cavities should be filled, graded, compacted and seeded.

9) Provide for emergency drawdown of the reservoir.

In addition, the following operational measures are recommended to be undertaken by the owner:

1) Develop a detailed emergency operation and warning system.

2) During periods of unusually heavy rainfall, provide around-the-clock surveillance of the dam.

3) When warning of a storm of major proportions is given by the National Weather Service, activate the emergency operation and warning system.

It is further recommended that formal inspection, maintenance, and operational procedures and records be developed and implemented. These should be included in a formal maintenance and operations manual for the dam.

PHASE I INSPECTION REPORT
NATIONAL DAM INSPECTION PROGRAM
MAGGIO ESTATES DAM NO. 2
NDI NO. PA 01120, PennDER No. 41-103

SECTION 1 - PROJECT INFORMATION

1.1 GENERAL

a. Authority - The Dam Inspection Act, Public Law 92-367, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a program of inspection of dams throughout the United States.

b. Purpose of Inspection - The purpose of the inspection is to determine if the dam constitutes a hazard to human life or property.

1.2 DESCRIPTION OF PROJECT

a. Description of Dam and Appurtenances - Maggio Estate Dam No. 2 is an earthfill embankment 872 feet long and 28.9 feet high. The embankment has a crest width that varies from 15 to 81 feet and side slopes of from 1.6H:1V to 2.2H:1V (Horizontal to Vertical) upstream and 2.1H:1V downstream. The upstream face of the embankment is protected with riprap. The left half of the dam separates this pond from another smaller pond downstream.

The spillway, located at the right abutment, consists of a concrete broad-crested weir which is 38 feet long perpendicular to the direction of flow. The unprotected earth sides of the spillway extend 1.5 feet above the crest of the weir.

The outlet pipe, located near the left abutment, is a 12-inch concrete pipe which equalizes the water surface between this lake and the one immediately downstream at low flows.

The dam is located in an area that has been extensively strip mined and appears to have been built from material from these mining operations.

b. Location - Maggio Estate Dam No. 2 is located on Red Run, a tributary to Lycoming Creek in McIntyre Township, Lycoming County, Pennsylvania. The dam is approximately 1.89 miles northwest of Ralston in McIntyre Township. The coordinates of the dam are N 41° 31.7' and W 76° 58.5'. The dam can be found on the USGS 7.5 minute topographic quadrangle, Ralston, Pennsylvania.
c. **Size Classification** - The height of the dam is 28.9 feet. Storage at the top of the dam (Elevation 1641.5 feet Mean Sea Level (ft. M.S.L.)) is 329 acre-feet. Therefore, the dam is in the "Small" size category.

d. **Hazard Classification** - If the dam should fail, economic damage is likely to result to Route 14 and to a trailer in Ralston, which is 4 to 6 feet above the streambed and 10,800 feet downstream. Loss of life may occur; therefore, the dam is considered to be in the "Significant" hazard category.

e. **Ownership** - The dam is owned by the Estate of Michael Maggio, c/o Robert J. Wollett, Attorney at Law, 416 Pine Street, Williamsport, Pennsylvania 17701.

f. **Purpose of Dam** - The impoundment created by the dam is used for recreation and fishing.

g. **Design and Construction History** - Maggio Estate Dam No. 2 was built by Michael Maggio about 1953.

h. **Normal Operational Procedures** - The reservoir is typically maintained at the spillway crest, elevation 1640.0 ft. M.S.L.

### 1.3 Pertinent Data

- **a. Drainage Area (square miles)** - 1.08
- **b. Discharge at Dam Site (c.f.s.)** -

  | Maximum Flood | Unknown |
  | Spillway Capacity at Maximum Pool | (El. 1641.5 ft. M.S.L.) | 220 |

- **c. Elevation* (feet above Mean Sea Level (ft. M.S.L.))** -

  | Design Top of Dam | Unknown |
  | Minimum Top of Dam | 1641.5 |
  | Maximum Design Pool | Unknown |
  | Spillway Crest | 1640.0 |
  | Streambed at Toe of Dam | 1612.6 |
  | Maximum Tailwater of Record | Unknown |

*All elevations are referenced to the spillway crest, El. 1640.0 ft. M.S.L., as estimated from the USGS 7.5 minute topographic quadrangle, Ralston, Pennsylvania.
d. **Reservoir (feet)** -

Length of Maximum Pool (El. 1641.5 ft. M.S.L.) = 1050.0
Length of Normal Pool (El. 1640.0 ft. M.S.L.) = 1150.0

e. **Storage (acre-feet)** -

Top of Dam (El. 1641.5 ft. M.S.L.) = 329.0
Normal Pool (El. 1640.0 ft. M.S.L.) = 290.0

f. **Reservoir Surface (acres)** -

Top of Dam (El. 1641.5 ft. M.S.L.) = 27.0
Normal Pool (El. 1640.0 ft. M.S.L.) = 25.0

g. **Dam** -

Type = Earthfill
Total Length (feet) = 872.0
Height (feet) - Design Field = Unknown
Top Width (feet) = Varies from 15-81
Side Slopes - Upstream = 1.6H:1V to 2.2H:1V
Downstream = 2.1H:1V
Zoning = Unknown
Impervious Core = Unknown
Cut-off = Unknown
Drains = Unknown

h. **Diversion and Regulating Tunnels** - None

i. **Spillway** -

Type = Broad-crested weir
Location = Right abutment
Length of Crest Perpendicular to Flow (feet) = 38.0
Crest Elevation (ft. M.S.L.) = 1640.0
Gates = None
Downstream Channel = Steep and narrow

j. **Outlet Works** - 12-inch concrete pipe used to equalize the water surface between this impoundment and the one immediately downstream.
SECTION 2 - ENGINEERING DATA

2.1 DESIGN

Information reviewed for preparation of this report consisted of the Pennsylvania Department of Environmental Resources' (PennDER) File No. 41-103. This included:

1) The report submitted by General Analytics, Inc., on Ralston Sizing and Preparation Area which includes Maggio Estate Dam No. 2. The report relates general information about the ponds in the Maggio Estate and their general condition.

2) Notice of Violation to Maggio Estate c/o Robert J. Wollet from Division of Dams and Encroachments stating the deficiencies and corrective measures needed to the dam dated 17 July 1975.

3) Various correspondence between Robert J. Wollet and Dams Safety Section, Division of Dams and Encroachments, deciding to retain an engineer to design a 40-foot concrete spillway for Maggio Estate Dam No. 2 and to breach the upstream dam.

5) Permit issued by the Water and Power Resources Board, allowing the reconstruction of the dam (dated 27 July 1976).

6) Letters from Lewis Meuse and Congressman Allen E. Ertel expressing concern over the condition of the Maggio Estate Dam No. 2 (dated 6 and 23 January 1978).

7) Letter, dated 10 May 1978, to Robert J. Wollet, from the Dams Safety Section, requesting the water surface be lowered several feet.

8) Inspection report by a representative of the Division of Dam Safety, stating no effort had been made to permanently lower the pool elevation by 2 feet, and that considerable seepage was noticed below the dam to the left of the spillway (dated 18 September 1979).
2.2 CONSTRUCTION

The dam was constructed by Michael Maggio in about 1953. The spillway was rebuilt in 1976.

2.3 OPERATION

No formal records are available for operation of the dam and reservoir. The spillway is uncontrolled and the reservoir is typically at the spillway crest level.

2.4 EVALUATION

a. Availability - The information reviewed is readily available from PennDER File No. 41-103.

b. Adequacy - The information available, combined with the visual inspection measurements and observations, is adequate for a Phase I Inspection of this dam.

c. Validity - There is no reason at the present time to doubt the validity of the available engineering data.
2.2 **CONSTRUCTION**

The dam was constructed by Michael Maggio in about 1953. The spillway was rebuilt in 1976.

2.3 **OPERATION**

No formal records are available for operation of the dam and reservoir. The spillway is uncontrolled and the reservoir is typically at the spillway crest level.

2.4 **EVALUATION**

a. **Availability** - The information reviewed is readily available from PennDER File No. 41-103.

b. **Adequacy** - The information available, combined with the visual inspection measurements and observations, is adequate for a Phase I Inspection of this dam.

c. **Validity** - There is no reason at the present time to doubt the validity of the available engineering data.
SECTION 3 - VISUAL INSPECTION

3.1 FINDINGS

a. General - The dam was found to be in fair overall condition at the time of inspection on 31 March 1981. No unusual weather conditions were experienced during the inspection. Noteworthy deficiencies observed during the visual inspection are described briefly in the following paragraphs. The complete visual inspection checklist, field sketch, top of dam profile, and typical cross-section are presented in Appendix A.

b. Embankment - Tire ruts are located on the crest of the left section of the embankment. A rodent hole is located on the upstream face near the left abutment. Low brush and a row small trees are growing on the embankment. About 200 feet left of the spillway at the downstream toe of the embankment, a clear seep of approximately 0.25 g.p.m. was observed.

c. Appurtenant Structures - The sides of the spillway are earth with no erosion protection. The downstream edge and sides of the concrete spillway are eroded and undermined. A clear seep of approximately 5 g.p.m. was observed at the downstream end of the concrete spillway. The earth discharge channel has very little erosion protection. Debris is collecting near the entrance of the 12-inch concrete outlet pipe.

d. Reservoir Area - The reservoir slopes are gentle and no sign of instability was observed. There appeared to be a small amount of sedimentation near the upper end of the reservoir.

Upstream 600 feet from Maggio Estate Dam No. 2 is a 300-foot long, 10-foot high embankment that has been breached. Upstream 5000 feet from Maggio Estate Dam No. 2 is a small impoundment with an embankment 400 feet long and 8 feet high. The spillway is a 15-inch corrugated metal pipe.

e. Downstream Channel - The channel passes through a steep and narrow valley before reaching Ralston. Route 14 crosses the downstream channel at Ralston. There is also a mobile home located next to the downstream channel in Ralston, 4 to 6 feet above the streambed. Below the dam at the outlet pipe is another small impoundment with an embankment height of 25 feet.
4.1 PROCEDURES

There are no formal procedures for operating the reservoir or evacuating the downstream area in case of an emergency. It is recommended that formal emergency procedures be adopted, prominently displayed and furnished to all operating personnel.

4.2 MAINTENANCE OF DAM

There are no formal records of maintenance or formal procedures for evaluating the necessity of maintenance for the structure. It is recommended that formal inspection procedures be developed.

4.3 MAINTENANCE OF OPERATING FACILITIES

Maintenance is unscheduled. It is recommended that a formal operation and preventive maintenance schedule be developed and implemented.

4.4 DESCRIPTION OF ANY WARNING SYSTEM

There is no warning system in the event of dam failure. It is recommended that an emergency warning system be developed.

4.5 EVALUATION OF OPERATIONAL ADEQUACY

The current operational procedures are inadequate. It is recommended that a formal maintenance and operations manual be prepared for the dam.
5.1 EVALUATION OF FEATURES

a. Design Data - No hydrologic or hydraulic design calculations are available for Maggio Estate Dam No. 2.

b. Experience Data - No information concerning the effects of significant floods on the dam is available.

c. Visual Observation - The sides of the spillway are made of unprotected earthfill which will erode during periods of high flow, causing the embankment to fail adjacent to the spillway. These training walls should be provided with some type of erosion protection.

Located upstream from Maggio Estate Dam No. 2 are two impoundments; both dams have been breached but the dam furthest upstream has a breached section that was rebuilt. Both impoundments are not considered to have a significant effect on Maggio Estate Dam No. 2.

d. Overtopping Potential - Maggio Estate Dam No. 2 is a "Small" size - "Significant" hazard dam requiring evaluation for a spillway design flood (SDF) in the range of the 100-year flood to the 1/2 Probable Maximum flood (1/2 PMF). Because the dam is on the lower end of the "Small" size category in terms of storage capacity, the 100-year flood was chosen as the SDF.

Using material from "The Hydrologic Study - Tropical Storm Agnes" prepared by the Corps of Engineers in New York City, the peak inflow to the impoundment for the 100-year flood was calculated to be 1420 c.f.s. The peak inflow to the impoundment for the 100-year flood was also calculated to be 600 c.f.s., using material from "Water Resources Bulletin, Bulletin No. 13, Floods in Pennsylvania", prepared by the Department of Environmental Resources, Commonwealth of Pennsylvania. Averaging these two methods produced a peak inflow of 1010 c.f.s., which was used in this analysis.

The spillway capacity at the minimum top of dam is 220 c.f.s., which is approximately 22 percent of the peak inflow to the impoundment from the 100-year flood.
e. Spillway Adequacy - As outlined in the above analysis, the spillway capacity is less than the peak inflow to the impoundment during the 100-year flood; therefore, the spillway is considered "Inadequate".
SECTION 6 - STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

a. Visual Observations - A seep at the toe of the embankment and one from under the concrete weir were flowing clear at 0.25 g.p.m. and 5 g.p.m., respectively. These seeps should be monitored at regular intervals and during periods of high reservoir levels for turbidity or increase in flow, which may indicate potential for the piping of embankment material. If turbidity or increased flows are noted, a qualified geotechnical engineer should be retained to recommend remedial measures.

b. Design and Construction Data - Calculations of slope and structural stability were not available for review. The slopes have had a history of satisfactory performance. In view of the modest height of the dam, a history of satisfactory performance of its slopes, and no signs of distress observed during the visual inspection, no further stability analysis is deemed necessary.

c. Operating Records - Nothing in the operational information indicates concern relative to the structural stability of the dam.

d. Post-Construction Changes - No changes adversely affecting the structural stability of the dam have been performed.

e. Seismic Stability - The dam is located in Seismic Zone 1 of the "Seismic Zone Map of the Contiguous United States", Figure 1, page D-30, "Recommended Guidelines for Safety Inspection of Dams." This is a zone of minor seismic activity. Therefore, further consideration of the seismic stability is not warranted since the dam is considered to be structurally stable.
SECTION 7 - ASSESSMENT, RECOMMENDATIONS/REMEDIAL MEASURES

7.1 DAM ASSESSMENT

a. Safety - Maggio Estate Dam No. 2 was found to be in fair overall condition at the time of inspection. The dam is a "Significant" hazard - "Small" size dam requiring a spillway capacity in the range of the 100-year flood to the 1/2 PMF. The 100-year flood was chosen as the SDF because the dam is on the low end of the "Small" size category, based on the height and storage capacity. As presented in Section 5, the spillway capacity is less than the peak inflow to the impoundment during the 100-year flood. Therefore, the spillway is considered "Inadequate."

b. Adequacy of Information - The information available and the observations and measurements made during the field inspection are considered sufficient for this Phase I Inspection Report.

c. Urgency - The owner should initiate the remedial measures discussed in paragraph 7.2 as soon as practicable.

d. Necessity for Additional Data/Evaluation - The hydraulic/hydrologic analysis performed in connection with this Phase I Inspection Report has indicated the need for additional spillway capacity. It is recommended that the owner develop remedial measures to ensure that the dam will not be overtopped by the 100-year flood.

7.2 RECOMMENDATIONS/REMEDIAL MEASURES

The inspection revealed certain items of remedial work which should be performed by the owner without delay. These include:

1) Develop remedial measures to ensure that the dam will not be overtopped by the 100-year flood.

2) Fill and seed the tire ruts on the crest of the dam.

3) Excavate, fill, compact and seed the animal burrow on the upstream face of the dam.
4) Monitor the seeps beneath the spillway and at the toe of the embankment left of the spillway at regular intervals and during periods of high reservoir levels for turbidity and/or increase in flow, which may indicate potential for the piping of embankment material. If turbidity and/or increased flows are noted, a qualified geotechnical engineer should be retained to recommend remedial measures.

5) Provide erosion protection for the earth sides of the spillway.

6) Fill downstream edge of the spillway and provide with erosion protection.

7) Clear the debris from around the 12-inch concrete outlet pipe and provide trash rack for pipe inlet.

8) Cut all trees at the toe of the embankment at ground level. All trees with a trunk diameter greater than 3 inches should have their root systems removed. All resultant areas of erosion and cavities should be filled, graded, compacted and seeded.

9) Provide for emergency drawdown of the reservoir.

In addition, the following operational measures are recommended to be undertaken by the owner:

1) Develop a detailed emergency operation and warning system.

2) During periods of unusually heavy rainfall, provide around-the-clock surveillance of the dam.

3) When warning of a storm of major proportions is given by the National Weather Service, activate the emergency operation and warning system.

It is further recommended that formal inspection, maintenance, and operational procedures and records be developed and implemented. These should be included in a formal maintenance and operations manual for the dam.
APPENDIX A

VISUAL INSPECTION CHECK LIST, FIELD SKETCH, TOP OF DAM PROFILE, AND TYPICAL CROSS-SECTION
Check List
Visual Inspection
Phase 1

Name of Dam: Maggio Estate Dam No. 2  County: Lycoming  State: Pennsylvania  Coordinates Lat.: N 41°31.7'  Long.: W 76°58.5'

</table>

Spillway capacity at the minimum top of dam (EL. 1641.5 ft) is 221 c.f.s.
The inflow to the impoundment for the 100-year flood was calculated using material from "Water Resources Bulletin, Bulletin No. 13, Floods in Pennsylvania", prepared by the Department of Environmental Resources, Commonwealth of Pennsylvania.

Drainage Basin from Plate 1 - Model 2

Regression equation from Table 2

\[ Q = C A^x \]

- \( T = 100 \) Years
- \( C = 564 \)
- \( A = \text{Drainage area, 1.085 sq. mi.} \)
- \( x = 0.744 \)

\[ Q_{100} = 564 \times (1.085)^{0.744} \]

\[ Q_{100} = 597 \text{ c.f.s.} \]
The inflow to the impoundment for the 100-year flood was calculated using material from "The Hydrologic Study - Tropical Storm Agnes" prepared by the Special Studies Branch, Planning Division, North Atlantic Division, Corps of Engineers, in New York City.

DRAINAGE AREA - 1.08

1. Compute the mean logarithm

\[ \log (Q_m) = C_m + 0.75 \log R \]

\[ \log (Q_m) = \text{Mean logarithm of annual flood peaks} \]
\[ R = \text{Drainage area, sq. mi.} = 1.08 \]
\[ C_m = \text{Map coefficients for mean log of annual peaks from Fig. 21 - 2.14} \]
\[ \log (Q_m) = 2.14 + 0.75 (\log 1.08) \]
\[ = 2.1651 \]

2. Compute standard deviation

\[ S = C_2 - 0.05 (\log R) \]

\[ S = \text{Standard deviation of the logarithms of the annual peaks.} \]
\[ C_2 = \text{Map coefficient for standard deviation from Fig. 22} = 0.38 \]
\[ R = \text{Drainage area, sq. mi.} = 1.08 \]
\[ S = 0.38 - 0.05 (\log 1.08) \]
\[ = 0.3783 \]

3. Select skew coefficient from Fig. 23 = 0.38

4. \[ \log (Q_{100}) = \log (Q_m) + k (P_s) S \]

\[ k (P_s) = \text{Standard deviate for a given exceedence frequency percentage (P) and skew coefficient (g) from Exhibit 39 of Beard's "Statistical Methods in Hydrology" 2.61} \]

\[ \log (Q_{100}) = 2.1651 + 2.61 (0.3783) \]
\[ Q_{100} = 1,421 \text{ c.f.s.} \]

Averaging the flow from this method and the previous method produced a peak inflow to the impoundment of 1010 c.f.s.

REGIONAL GEOLOGY
Maggio Estate Dam No. 2
NDI No. PA 01120, PennDER No. 41-103

REGIONAL GEOLOGY

Maggio Estate Dam No. 2 is located in the glaciated section of the Appalachian Plateaus physiographic province. The impounded lake occupies the middle of the north fork of the Red Run stream valley. The lake is fed by drainage from a perennial stream flowing south from a lake located higher in the valley. Drainage from the Maggio Estate Dam No. 2 flows south to Lycoming Creek where it forms a confluence just north of the town of Ralston. The average topographic relief in the stream valley from the dam to Lycoming Creek is approximately 800 feet.

The study area has been glaciated at least three times and originally (prior to strip mining) was overlain by glacial ground moraine of the Nebraskan, Kansan, and Wisconsin glaciations. No test boring information was available for review; thus, the extent and thickness of the strip mine spoil is difficult to ascertain. According to the Soil Conservation Service Survey for Lycoming County, soils originally present prior to strip mining were of the Lordstown, Volusia, and Wurtsboro series. These soils are typically very stony silt loam and very stony sandy loam.

Geologic data taken from the Geologic Map of Pennsylvania indicate that bedrock in the vicinity of the lake is composed of rocks which belong to the Pennsylvania Pottsville Group and the Mississippian Pocono Group. The Mississippian Pocono Group is predominantly a gray, hard massive cross-bedded conglomerate and sandstone with some shale. The Pottsville Group is light gray to white, coarse grained sandstones and conglomerates with some mineable coal seams.
