**STAMMER: SYSTEM FOR TACTICAL ASSESSMENT OF MULTISOURCE MESSAGES--ETC(U)**

**UNCLASSIFIED**
STAMMER:

system for tactical assessment of multisource messages, even radar

R. J. Bechtel
P. H. Morris
Systems Development Corporation

May 1979

Prepared for
Naval Electronic Systems Command
ADMINISTRATIVE INFORMATION

This work was performed by the Tactical Command and Control Division, (Code 824) as a part of the Tactical Situation Assessment (TSA) problem under NOSC Project No. CC18. Work was performed by Mr. Robert J. Bechtel and Dr. Paul H. Morris of Systems Development Corporation under Contract N00123-76-C-0172. This TSA task is a part of Command and Control Block Program (62721N-XF21-201.100) sponsored by NAVELEX, Code 330, the Command and Control Division of the Research and Technology Directorate. NAVELEX, Code 03. A part of the funding for this effort was from The Information Processing Technology Office of DARPA under DARPA Order 3454.

Released by
R.C. Kolb, Head
Tactical Command and Control Division

Under Authority of
J.H. Maynard, Head
Command Control-Electronic Warfare
Systems and Technology Department
STAMMER was developed to serve as a demonstration of the applicability of rule-based inference techniques to the Tactical Situation Assessment (TSA) problem. In addition, it serves as a testbed for development of new inference rules and techniques.

I. PURPOSE

STAMMER was developed to serve as a demonstration of the applicability of rule-based inference techniques to the Tactical Situation Assessment (TSA) problem. In addition, it serves as a testbed for development of new inference rules and techniques. To achieve these goals, the following features were included in STAMMER:

1) A graphics interface. STAMMER uses a slightly modified version of DSPLA (Ref. 1) to display platform tracks and to provide a visual presentation of position information.

2) Explanation of inference. Whenever the system uses a rule to reach some conclusion, the user may examine the data base, rules, and derivations to discover why the conclusion is considered valid.

3) Ease of rule addition. A primary reason for adopting a rule-based inference approach is the flexibility and ease of modification that inference rules provide. A convenient mechanism for adding rules makes this flexibility available.

4) A flexible data base structure. While the structure of the demonstration data base is fixed, functions are provided to allow redefinition of the data base structure for different applications.

5) Multiple terminal configurations. The ideal terminal arrangement for STAMMER includes both a controlling text terminal and a slaved graphic display terminal. However, such a configuration is not always available, so STAMMER has been designed to run in standalone text and standalone graphics modes as well as a two-terminal mode.

6) Demonstration scenario. To make demonstration simple, and to allow concentration on a working system, a scenario, consisting of data base structure definition, a technical data base, production rules, and messages has been provided. Additionally, an executable file containing the scenario has been provided.

7) Measures of confidence. Realizing that many useful rules are not absolute, STAMMER works with confidences rather than logical truth values in its inferences. These confidences are roughly related to probabilities and provide a broad range of measures for the strength of any conclusion.
II. SYSTEM OVERVIEW

STAMMER serves as an organizer of information. It collects information by receiving messages and radar reports, and organizes this raw data into graphic displays and textual commentary to aid in tactical situation assessment. The organization that STAMMER performs is more than simple formatting, however. Through the use of specified rules, the system combines information from messages and reports to draw conclusions about the situation in the vicinity of the home ship. These conclusions are reflected in both the display and commentary. The system data base is available for examination, and includes not only the original raw data, but also information about why and how the conclusions were reached.

During execution, the user will see the following cycle repeated as long as messages and reports are received:

(1) A message or report is received -- the user is informed, and the critical information in the message is printed for reference.

(2) A display, showing the area situation with the new information, is drawn. The user may manipulate this image.

(3) The system makes some commentary on the conclusions it can reach, on the basis of the new information.

(4) If any conclusions were reached, the user is given the opportunity to query the system about the contents of its data base.
III. DEMONSTRATION SCENARIO AND SELECTED EXAMPLES

In this demonstration run we have used the following scenario: the home ship Perry is stationary off the coast of Iceland with radar on. A storm covers the northwest portion of the island and the surrounding ocean area. The Perry begins to move towards St. Johns, roughly paralleling a merchant lane, so that ships within the lane will fall inside its radar coverage. Merchant3 is travelling in the lane from St. Johns to Reykjavik. Red and Blue are hostile warships with the intention of intercepting Merchant3. They attempt to simulate merchants by travelling at merchant speed in two other lanes. At a convenient point they will make a sudden dash at maximum speed to reach the lane of interest.

Patrol17 flies from Reykjavik to the southern tip of Greenland, reporting on platforms in the area. The Perry receives information from it, from ground-based stations in the region, and from its own radar. The system demonstrated is supposed to be onboard the Perry, collating this information.

It should be stressed that the system has no knowledge of the identities of platforms or other aspects of the scenario, other than that which it receives in messages or deduces from the information available to it.

Comments added to the typescript are preceded by a semi-colon. Lines consisting of three asterisks indicate sections omitted for brevity.
EXECUTE

Are you running on a Tektronix?... No
Do you have a Tektronix available for display? No

*** WEATHER REPORT RECEIVED.

Time: 0
Storm centered at 65.83, -24.45, approximate diameter 175.7003

No rules were satisfied. ; no deductions triggered at this point.

*** MESSAGE RECEIVED. Message number 1

Time: 360
Concerns a new platform. Assigned working name MERCHANT3
Content:

(CATEGORY: MERCHANT SPEED: 10 LATITUDE: 62.97 LONGITUDE: -26.73 TOS: 180 SOURCE: EXTERNAL) ; the message identifies the platform as a merchant.

1. NON-COMBATANT is the WARLIKE of MERCHANT3 ; deductions from the technical database.
2. CIVILIAN is the TYPE of MERCHANT3 ; since it is known the platform is a merchant.
3. SURFACE is the MEDIUM of MERCHANT3
4. COMBATANT is not the WARLIKE of MERCHANT3
5. AIR is not the MEDIUM of MERCHANT3
6. SIGHTING0341 is INSIDE-A-MERCHANTLANE

Explanation system
Type HELP for help, CR to exit.
QUESTION?
Leaving EXPLAIN.
MESSAGE RECEIVED. Message number 2

Time: 400
Concerns a new platform. Assigned working name BLUE
Content:

(TOS: 150 LATITUDE: 61.8 LONGITUDE: -20.87 SOURCE: EXTERNAL)

1. SIGHTING0380 is INSIDE-A-MERCHANTLANE

;the system has assigned the name sighting0380 to the sighting
;just received and observes that it is in a merchant lane.

Explanation system
Type HELP for help, CR to exit.
QUESTION ? Tell me about MERCHANTLANE

1. LANE1 is a MERCHANTLANE
2. LANE2 is a MERCHANTLANE
3. LANE3 is a MERCHANTLANE

QUESTION ?
Leaving EXPLAIN.
***RADAR REPORT.

Time: 420  
Location: Range: 26.15674  Bearing: 290.5145  
Assumed to be a new contact, assigned working name CONTACT1  
;this is a radar sighting of MERCHANT3, although the system  
does not know it.

1. SIGHTING0400 is INSIDE-A-MERCHANTLANE

2. MERCHANT is somewhat likely to be the CATEGORY of CONTACT1  
because no known combatant could have reached it.

3. NON-COMBATANT is somewhat likely to be the WARLIKE of CONTACT1

4. CIVILIAN is somewhat likely to be the TYPE of CONTACT1

5. SURFACE is somewhat likely to be the MEDIUM of CONTACT1

6. COMBATANT is somewhat unlikely to be the WARLIKE of CONTACT1

7. AIR is somewhat unlikely to be the MEDIUM of CONTACT1  
;since the system has deduced some likelihood of contact1  
;being a merchant, it extends this likelihood to include  
;the properties of merchants, as given in the technical  
data base.

Explanation system
Type HELP for help, CR to exit.
QUESTION ? WHY (ready to be asked about an assertion) 4

1. IDS ;a system rule, used to implement the technical data base.

QUESTION ? WHY (ready to be asked about a rule)

1. CONTACT1 is a  PLATFORM
2. MERCHANT is somewhat likely to be the CATEGORY of CONTACT1
3. CIVILIAN is the TTYPE of MERCHANT  ;item in technical data base.

Do you want to know about any of these? No

QUESTION ?
Leaving EXPLAIN.
### RADAR REPORT.

**Time:** 440  
**Location:** Range: 21.7085  Bearing: 309.0736  
**Assumed to be CONTACT1**

1. **MERCHANT** is very probably the CATEGORY of CONTACT1  
   because its course and speed match those of a known merchant.  
   the "very probably" indicates the CUMULATIVE effect of the  
   evidence thus far.

2. **SIGHTING0434** is INSIDE-A-MERCHANTLANE

Explanations system  
Type HELP for help, CR to exit.  
**QUESTION? WHY** (ready to be asked about an assertion) 1  
   ;i.e. summarize the evidence for the assertion in 1.

   1. A-MATCH-FOR-A-KNOWN-MERCHANT  ;these are the rules  
   2. NOT-REACHABLE-BY-ANY-COMBATANT  ;that were used.

**QUESTION? WHY** (ready to be asked about a rule) 1

   1. CONTACT1 is a CONTACT  
   2. MERCHANT3 is a MERCHANT  
   3. SIGHTING0434 is the LAST-SIGHTING of CONTACT1  
   4. 63.37 is the LATITUDE of SIGHTING0434  
   5. -25.41 is the LONGITUDE of SIGHTING0434  
   6. 55.53572 is the COURSE of SIGHTING0434  
   7. 10.45755 is the SPEED of SIGHTING0434  
   8. 440 is the TIME of SIGHTING0434  
   9. SIGHTING0341 is the LAST-SIGHTING of MERCHANT3  
   10. 180 is the TIME of SIGHTING0341  
   11. 62.97 is the LATITUDE of SIGHTING0341  
   12. -26.73 is the LONGITUDE of SIGHTING0341  
   13. 55.53572 is ROUGHLY-THE-SAME-COURSE-AS 55.53572  
   14. 10.45755 is ROUGHLY-THE-SAME-SPEED-AS 9.935611  
   15. 10.45755 is not LESS-THAN 9  
   16. 10.45755 is not GREATER-THAN 25

   ;these describe in detail the conditions that caused the  
   ;rule to fire (succeed).

Do you want to know about any of these?  
**Answer:** No

**QUESTION? Is CONTACT1 HOSTILE**

not to my knowledge ;merchants may or may not be hostile.

**QUESTION?**  
Leaving EXPLAIN.
***MESSAGE RECEIVED. Message number 4

Time: 510
New message concerning RED
Content:

(TOS: 210 LATITUDE: 65.7 LONGITUDE: -26.61 SOURCE: EXTERNAL)

1. MERCHANT is somewhat unlikely to be the CATEGORY of RED
   because its track crosses a storm.

2. SIGHTING0521 is INSIDE-A-MERCHANTLANE

Explanation system
Type HELP for help, CR to exit.
QUESTION? Tell me about STORM

1. STORM0295 is a STORM ;lists the storms.

QUESTION? WHERE is S0295

The following is a list of lat-lon pairs defining the edge of the storm.
((64.67 -25.66) (64.67 -22.12) (65.46 -20.68) (66.5 -21.57) (67.11 -24.48) (66.88 -27.41) (65.99 -28.45) (65.3 -27.75))
   ;the storm would also be plotted if the display were on.

QUESTION?
Leaving EXPLAIN.
***MESSAGE RECEIVED. Message number 8

Time: 685
New message concerning RED
Content:

(LATITUDE: 63.81 LONGITUDE: -27.95 TOS: 615 SOURCE: PATROL17 CLASS: KYNDA)
;this message identifies RED as a hostile warship, KYNDA class.

***RADAR REPORT.

Time: 695
Location: Range: 32.19589 Bearing: 137.7162
Assumed to be a new contact, assigned working name CONTACT2

;this is actually a radar sighting of BLUE.

1. MERCHANT is somewhat unlikely to be the CATEGORY of CONTACT2 because it popped up outside normal merchant range.

2. MERCHANT is somewhat unlikely to be the CATEGORY of CONTACT2 because it lies outside all known merchant lanes.

Explanation system
Type HELP for help, CR to exit.
QUESTION ? WHY (ready to be asked about an assertion) 1

1. A-DISTANT-POPUP
2. OUTSIDE-ALL-MERCHANTLANES

QUESTION ? WHY (ready to be asked about a rule) 1

1. CONTACT2 is a CONTACT
2. SIGHTING0664 is the FIRST-SIGHTING of CONTACT2
3. 32.19589 is the RANGE of SIGHTING0664
4. 32.19589 is GREATER-THAN 30

Do you want to know about any of these? No

QUESTION ?
Leaving EXPLAIN.
***RADAR REPORT.

Time: 705
Location: Range: 26.82486 Bearing: 133.1563
Assumed to be CONTACT2

1. MERCHANT is probably not the CATEGORY of CONTACT2
   because its speed is greater than maximum merchant cruise speed.

2. MERCHANT is probably not the CATEGORY of CONTACT2
   because it lies outside all known merchant lanes.

   ;the evidence mounts that CONTACT2 is not a merchant.
***RADAR REPORT.

Time: 720
Location: Range: 25.51945 Bearing: 336.6366
Assumed to be a new contact, assigned working name CONTACT3

;contact3 is really a radar sighting of RED.

1. MERCHANT is somewhat unlikely to be the CATEGORY of CONTACT3 because it lies outside all known merchant lanes.

Explanation system
Type HELP for help, CR to exit.
QUESTION? WHAT is THE FIRST-SIGHTING OF CONTACT3

1. SIGHTING0737

QUESTION? Is SIGHTING0737 REACHABLE-BY-A-COMBATANT

yes

QUESTION? WHOSE WITHIN-REACH is SIGHTING0737

1. not SIGHTING0562
2. SIGHTING0613

QUESTION? WHOSE SIGHTING is SIGHTING0562

1. BLUE

QUESTION? WHOSE SIGHTING is SIGHTING0613

1. RED

;although the system is intended only to detect non-merchants, here the operator has effectively made use of it to suggest the identity of CONTACT3.

QUESTION?
Leaving EXPLAIN.
***MESSAGE RECEIVED. Message number 10

Time: 747
Concerns a new platform. Assigned working name PATROL17
Content:

Explanation system
Type HELP for help, CR to exit.
QUESTION ? WHOSE SOURCE is PATROL17

1. SIGHTING0613
2. SIGHTING0594

QUESTION ? WHOSE SIGHTING is SIGHTING0613

1. RED

QUESTION ? WHOSE SIGHTING is SIGHTING0594

1. MERCHANT3

QUESTION ?
Leaving EXPLAIN.
***MESSAGE RECEIVED. Message number 14

Time: 748
New message concerning PATROL17
Content:

(SOURCE: EXTERNAL TOS: 645 LATITUDE: 61.77 LONGITUDE: -37.97)
Beyond area of interest. Ignored.

the patrol has now moved out of range.

*   *   *

;at the end of the run, we summarize the conclusions.

Explanation system
Type HELP for help, CR to exit.
QUESTION ? WHAT is CONTACT3
1. almost certainly not MERCHANT

QUESTION ? WHAT is CONTACT2
1. definitely not MERCHANT

QUESTION ? WHAT is CONTACT1
1. somewhat likely to be MERCHANT

QUESTION ?
Leaving EXPLAIN.

IV. USER'S GUIDE

DEMONSTRATION SYSTEM

To run the demonstration system, type RUN STAMMER[CR]. Answer the questions about terminal configuration and a map with Y for yes and N for no.

When a display appears, you may use any of the DSPLA function key commands listed in appendix A to manipulate the picture.

When the system enters explanation mode, you may ask questions to explore the data base and to trace the derivation of conclusions.

EXPLAIN is provided to allow you to ask questions about the contents of the data base (memory) and how they got there. Question forms are:

1. WHO is
2. WHAT is
3. WHOSE
4. WHERE is
5. WHY
6. Is
7. Tell me about
8. Display command level
9. OK
10. Zap
11. Help
12. New rule definition

Typing a carriage return to a QUESTION ? prompt will cause an exit from EXPLAIN.

Information in the data base is represented in the form

[ITEM] [RELATION] [ITEM]

Most explanation facilities are geared to letting you find out what is in one of these slots, given fillers of the others. For instance, WHO and WHAT return the first ITEM in all assertions whose RELATION and second ITEM are those given. WHOSE returns a second ITEM, given a RELATION and a first ITEM. Is will respond to the presence or absence of a fully specified assertion in the data base.

EXPLAIN has been designed to make user interface relatively easy. At most points, typing ? will give a list of possible next entries, and ESC may be used to complete unambiguous words, or fill in unambiguous characters. To help the system function properly, please give it time to do its job. Unacceptable characters are not echoed (the bell rings), as is the
case with excessive typeahead. If asked to [confirm], type a space. Please end questions with a carriage return.

**WHO is**

Format: WHO is (THE, A, AN) [RELATION] (OF) [ITEM]

(a, an, the, and of are optional)

Examples: WHO is LESS-TAN 7
WHO is INSIDE STORM0005

Some relations do not require that an item be specified. At present, these are INSIDE-A-MERCHANTLANE and REACHABLE-BY-A-COMBATANT. For these relations, the command looks like

WHO is INSIDE-A-MERCHANTLANE

For related queries, see WHOSE and WHAT.

**WHAT is**

Format: WHAT is (THE, AN, A) [RELATION] (OF) [ITEM]

Example: WHAT is THE LATITUDE OF POSITION0312

As with WHO, the, an, a, and of are optional, and an item is not required with the relations REACHABLE-BY-A-COMBATANT and INSIDE-A-MERCHANTLANE.

**WHOSE**

Format: WHOSE [RELATION] is [ITEM]

WHOSE is roughly the inverse of WHAT, e.g., if WHAT is THE POSITION OF SIGHTING0027 is answered with POSITION0026, then WHOSE POSITION is POSITION0026 will answer SIGHTING0027.

**WHERE is**

Format: WHERE is [OBJECT]

Example: WHERE is CONTACT7

Acceptable objects are platforms, merchantlanes, and storms.

**WHY**

Format: WHY [NUMBER]

Example: WHY 3

In reply to WHO, WHAT, WHOSE, and some Tell-me-about questions, you will be presented with a numbered list of answers. To follow the derivation of any of these, ask WHY followed by the number of the answer of interest. You will then be given a list of productions, if the answer was deduced by the system (not taken from a message or the technical data base). If such a list appears, you can do a WHY to it to view the information which enabled
the rule. The chain of WHYs may be extended indefinitely, alternating between data and rules. See the OK and Zap commands for further refinements.

**Is**

**Formats:**
- Is (THE, A, AN) (RELATION) (OF) [ITEM] [ITEM]
- Is (THE) [ITEM] (A, AN, THE) (RELATION) (OF) [ITEM]
- Is (THE) [PLATFORM] (A) [ID INFO]

**Examples:**
- Is THE LATITUDE OF POSITION 0035 -1.22
- Is RADAR THE SOURCE OF SIGHTING 0342
- Is KYNDA2 HOSTILE

Is checks to see if a given assertion is in the data base. A, an, the, and of are optional. Is is fairly flexible in format to allow more natural phrasing. In addition, identification information (name, class, category, flag, medium, type, hostility, etc.) is directly available, without the need to give the intervening relation.

**Tell me about**

**Format:**
- Tell me about [SOMETHING]
- Tell me about [GROUP] [NUMBER]

**Examples:**
- Tell me about MERCHANTS
- Tell me about RULE 5

Tell me about is probably the most flexible command. In the first format, you may ask about a wide range of things, including ITEMS, PRODUCTIONS (RULES), or any subtype (MERCHANTS, COMBATANTS, CONTACTS, PATROLS). Using the second format, you may examine the details of a particular message or rule (production) referred to by number.

**Display command level**

**Format and example:**
- Display command level

If you have a display available, this pseudo-query will give access to the top level of DSPLA to permit drawing rhumb lines and such like. If you are running on a Tektronix in single terminal mode, you will have to give the top level DSPLA command Q to return to EXPLAIN.

**OK**

**Format and example:**
- OK

OK is a useful part of the WHY feature. WHY functions by maintaining a context stack of "active" answers. OK pops this stack to allow you to ask about a different answer in a list you've already asked WHY of.
Zap

Format and example: Zap
Zap is the ultimate OK. It clears the WHY context stack completely.

HELP

Format and example: HELP
HELP calls the help function that prints a brief summary of each command, along with examples.

New rule definition

Format: New rule definition
Example: New rule definition
Rule name? RULE5
Text?
: IF *X IS A STORM
: AND *Y IS A CONTACTS
: AND *Z IS A SIGHTING OF *Y
: AND *Z IS INSIDE *X
: THEN MERCHANT IS THE CATEGORY OF *Y
Confidence? .35

RULE5

The name of a rule may be any LISP atom. Care should be taken to avoid conflicts with existing rule names, which may be listed using the Tell me about RULES query.

The text of a rule is made up of a number of lines, each of which is a condition or an action. No rule may have more than one action, and conditions must precede actions. Conditions are flagged with the words IF, AND, or UNLESS, and actions are flagged with the word THEN. Lines of a rule are generally of the form:

[flag word][item](IS, A, AN, THE)(relation)(OF)[item]

Items may be either variables or basenodes. Variables are flagged by beginning them with an asterisk. There are two other formats which may occur in rule lines. These are:

[flag word][item](IS, A, AN, THE)[special item] and
[flag word][item](IS)[special relation]

Special items are all members of SUBTYPES (CONTACTS, COMBATANTS, etc.) plus STORM and PLATFORM. Special relations are INSIDE-A-MERCHANTLANE and REACHABLE-BY-A-COMBATANT.
The confidence of a rule should be a number between 1.0 and -1.0. Use of recognition is supported during text input, and ? will respond with a list of expected entries, except during variable names.

To leave the system at an intermediate point, type two control-Cs. If you come to the end of the messages, type QUIT[CR] followed by control-C to exit.

**Running From Scratch**

The following files hold the code for the STAMMER system:

NEWSNET.COM
STAMMER.COM
EXPLAIN.COM
SUPP.COM
DSPLA.COM
FORK.COM
WITHINR.COM

These files must all be loaded (in the order given above) for STAMMER to function properly. The easiest way to do this is to load the file FASTSAPS, which will load the other files. This will give you an empty STAMMER, ready for initialization and experimentation.

The memory structure, contents, productions and messages which make up the demonstration system are contained in the files

STRUCT.COM
STMEM.LSP
STPROD.LSP, and
STMSG.LSP

respectively, and may be loaded directly. If you wish to load STAMMER with the demonstration scenario, load QKTEST in place of FASTSAPS.

Once the system is loaded, execute the function STAMMERTOP with no arguments to reach the STAMMER executive. Typing EXECUTE[CR] at this point will begin execution of the demonstration scenario.
V. DESIGN

The critical aspects of STAMMER's design may be divided into four parts. These are memory (the database), rule interpretation, explanation, and graphics. Following is a discussion of the design of each of these parts.

MEMORY

Memory in STAMMER consists of ASSERTIONS which are made up of two BASENODES and a RELATION. Assertions are of the form aRb (read "a is an R of b"), where a and b are the basenodes and R is a relation. The relations that may be used in assertions are restricted to a predefined (and expandable) set. It is possible to add assertions to and delete assertions from memory and to retrieve assertions and basenodes from memory.

The actual implementation of assertion structures is accomplished through a package of network manipulation functions called SNET and is relatively unimportant, with two exceptions. The first is that SNET creates a unique identifier for each assertion. Second, SNET labels each element of an assertion in the following way: for the example aRb, a is said to be ONE of the assertion, b the TWO, and R the RELATION. This terminology will be used hereafter.

The data base is divided into two sections, dynamic and virtual. Whether a particular assertion is dynamic or virtual depends on its relation. To save space, some common relations (such as LESS-TIlAN) are implemented as LISP functions, which take basenodes as arguments. These relations are called ORACLES, and are computed rather than retrieved from memory. The savings in space comes from eliminating the large number of assertions which would be required to represent, for example, all possible LESS-TIlAN relations. Assertions which have an oracle as their relation are said to be virtual, while those whose relations are not oracles are dynamic.

Every assertion has some confidence associated with it. This confidence is based on the source of the assertion. Assertions created by message receipt and oracles have confidences fixed at 1.0, while assertions created by rule firing have confidences based on their derivations. It is important to note a distinction between assertions and confidences. Assertions are statements about objects, while confidences are statements about assertions. For this reason, assertions may be referred to as first-order knowledge, and confidences as second-order knowledge.

There are a number of functions provided for manipulating assertions. These fall into the categories suggested by the operations of creation, deletion, and retrieval. Creation functions include ASSERT, CASSERT, STATE, and DENY. ERASE is the deletion function. Retrieval is performed by RETRIEVE2, RETRIEVE2B, RETRIEVE2S, RETRIEVE2BS, RETRIEVE3, and RETRIEVE3B.

The assertion functions have the property of never creating duplicates. If an assertion already exists, its identifier is returned as the result of a creation attempt.
RULE INTERPRETATION

Conceptually, the inference rules are very simple. Every rule attempts to retrieve information from memory and, if it succeeds, constructs a new assertion in memory. The retrievals are called conditions, and the construction specification is called the action. This view of rules is straightforward, but does not consider the complications introduced by variables and conditions that are not simple conjunctions.

Conditions may bind variables to the results of their retrievals. These bindings may be used by later conditions to constrain their retrievals. If retrievals had only one possible answer, variable binding would present no problem. However, many retrievals will return a number of answers from memory, and it is desirable to carry all of these possibilities forward so that one application of a rule will find all possible conclusions.

The method chosen for handling the problem of multiple bindings is backtracking. At every binding point (occurrence of a new variable), the possible values for the variable are collected (retrieved). One value is selected, and the remaining conditions are evaluated using a binding of the variable to that value. Upon failure of a condition or successful construction of a conclusion, evaluation backs up to the last binding point and selects a new value, then proceeds forward. When the possible bindings for a variable are exhausted, evaluation backs up to the preceding binding point. When the topmost binding point has finished with all possible values, evaluation of the rule is complete. Earlier, it appeared that a backtracking mechanism would be unnecessarily cumbersome, but clever application of recursive function calls and mapping functions have simplified the mechanism considerably.

There are several other aspects of rule evaluation that are important to the functioning of the system. The first is the interaction of confidence measures and the success of conditions. Conditions in STAMMER rules may be either positive or negative. Positive conditions succeed if there is any answer to a retrieval request with confidence greater than 0.0. Negative conditions fail if there is any answer to a retrieval request with confidence greater than 0.0. Failure to retrieve an assertion is assumed to be confidence 0.0. It is possible to remove the positive confidence restriction on positive conditions and still expect the system to work. However, doing so amounts to declaring the converses of all rules to be true, which unfortunately is not the case in general. Rather than accept cheap but occasionally faulty converses, the user is required to explicitly state converse rules.

Another issue relates duplication of conclusions and the construction of derivation trees. When a conclusion is added to the network (memory), a derivation tree containing the rule name and the assertions that satisfied the rule's conditions is added to the network and associated with the assertion. This derivation tree performs three functions. It is used to provide a trace of inferences for explanation; it is used to derive the confidence in the conclusion; and it serves to prevent duplications of conclusions. Before a conclusion is actually constructed, the would-be contents of its derivation tree are compared with the derivations of that assertion which already exist, if any. If any of the existing derivations matches the derivation under consideration, the conclusion is not constructed, and the existing binding set fails. This arrangement permits an assertion to be the conclusion of
several rules, or even of a single rule with different assertions satisfying its conditions, but prevents a rule from firing again and again based on the same evidence.

In the interest of efficiency, two further refinements have been added to the rule evaluation procedure. The first of these concerns rule selection, and the second limits the assertions that are considered by the conditions.

The original rule selection mechanism in STAMMER was a simple list of rule names, which were tested in order until a rule succeeded or all rules failed. When a rule succeeded, the process started again from the beginning of the list. If all failed, evaluation stopped. This meant that every time a rule fired, the rules at the beginning of the list were evaluated again. The first attempt to improve upon this inefficient process reorganized the rules into an effectively circular list, and instead of starting evaluation at the head of the list, upon achieving success merely went on to the next rule in order. Evaluation was halted when all rules had been evaluated without succeeding since the last success. While this change brought some improvement, the increased speed was primarily an artifact of the particular rule set in use, since the two arrangements are essentially identical, being linear searches of a list. A major improvement has been made by adding information about the rules to the evaluation process. Certain rules, once tried, will never again be satisfied until another message or report is received. After evaluating these rules once, they can be (temporarily) removed from the rule list, thus decreasing the length of the list that is tested sequentially, resulting in a noticeable improvement in execution time. However, this improvement is possible only through the inclusion of "meta" information about the structure of rules and particular rule sets. This information is not derived automatically at present, but must be added by hand to appropriate rules.

Another type of meta information is used automatically to reduce the number of assertions that are considered by each condition. The idea underlying this refinement (which has resulted in a better than ten-to-one increase in execution speed) is one of context. At any point in the system's execution, many assertions need not be considered as candidates for conditions because they have been used in the past. However, distinguishing "interesting" from "uninteresting" assertions is no easy task. The following steps illustrate the reasoning behind the context mechanism that STAMMER employs:

1) Consider a state of the network. Try to fire rules. Some may succeed, others fail. Keep trying until all fail. At this point, no rule will fire until new assertions are added to memory.

2) At the start of a STAMMER run, no rules can fire until a message or report is received. (This corresponds roughly to the base step of an induction, with the rest of the points providing the induction step.)

3) Add some new assertions through message receipt. Now the only rule firings that can occur are those that use the new assertions to satisfy at least one of their conditions.
4) For those conditions satisfied by new assertions, old assertions may also provide possible bindings. But if the bindings provided by old assertions were to succeed, they would have done so before the new assertions arrived. They didn’t so you can ignore the bindings provided by old assertions in conditions where new assertions are available.

With some minor adjustments, this argument summarizes the approach used. The message monitor and the conclusion building mechanism add their assertions to the context, which is cleared before each message receipt. In evaluating a condition, its retrieval is performed. If any new assertion is included in the retrieval, only new assertions are considered for that condition. Otherwise, all retrievals are considered.

In practical terms, this means that the system concentrates on what it just learned about, without wasting time trying possibilities that failed in the past and haven’t changed. The improvement in performance is significant.

This method of controlling ineffective inferences works only so long as all rules have a chance to fire at all times (on all new information receipts). If a new rule is defined in the middle of a run, it would not have a chance to be applied to information that was added to memory before its definition. To avoid missing inferences when new rules are defined, part of the rule-definition procedure is an application of the new rules to the existing memory with the context cleared. Since no assertions are marked as new, no “new” assertions can block the use of old assertions in satisfying the rule, so all possible conclusions are derived.

EXPLANATION

The explanation system provides two primary capabilities — retrieval of memory contents and inference tracing. In support of the user interface, there are two features of the system that have been concentrated on in design.

Retrieving memory contents is a relatively easy task, since functions for the retrievals already exist. Similarly, since derivations are also a part of the system memory (created by conclusions), tracing a derivation presents no major computational problems. The problem in explanation lies in providing a “comfortable” format for the user to phrase queries. To make the user interface as natural as possible, the explanation system provides a query language that is “English-like.” This language is an extremely limited version of English, which includes only certain types of questions and methods of phrasing those questions. However, the language was designed so that, while limited, it is sufficient to cover the user’s needs without making its shortcomings apparent.

Using a natural language-like language is helpful in encouraging an intuitively simple user interface, but obviously creates some problems. The problem of parsing can be dealt with by careful language design. Another problem, which is more “human factors” oriented, is the large amount of typing which an English-like language can require. To avoid this problem, the explanation system makes heavy use of the LISP function ASKUSER, which features recognition, prompting, and other features conducive to pleasant interaction. The combination of a carefully designed language and ASKUSER makes it possible to indicate the form of retrievals simply.
The second feature of the user interface which simplifies interaction is the use of a "prettyprinter" for memory contents. Rather than answering retrieval requests with a (probably) incomprehensible network structure, all answers are printed in a format designed to be easily understood. Assertions are printed with noise words like "is" and "of", and confidences are converted into modifier strings. When a list of answers is presented, the list is numbered, with each element presented on a separate line. Basenodes are printed in a form that is conceptually clearer than their internal representation (e.g., SIGHTING0732 rather than N0732).

Perhaps the most important aspect of the explanation system is that, on request, help is available to explain the use of the explanation system itself.

GRAPHICS

Graphical support for STAMMER is provided by DSPLA (Ref. 1), a package developed at NOSC specifically for tactical situation assessment. The DSPLA system is a collection of FORTRAN subroutines that allow storage, retrieval, and display of ship and aircraft tracks. It provides many tools for manipulating and enhancing the usefulness of the displays. STAMMER controls the display routines by means of a LISP-FORTRAN interface, obtained from SRI International and modified for our purpose. This makes use of TOPS-20 monitor calls to establish the display routines as a separate interior process to the dominant INTERLISP process running STAMMER. The interface is facilitated by a set of LISP procedures tailored especially for controlling DSPLA. These include additional monitor calls that allow the use of a separate terminal for graphics output.

Modifications to DSPLA

Integrating DSPLA with STAMMER required some alterations to the code and link-editing procedure. These were necessary (1) to support the LISP-FORTRAN interface, (2) to attach a new front end to STAMMER, and (3) to make minor improvements to the basic system. In general these changes are not visible at the user command level.

To support the interface, the top level control loop was changed to a single call and return to allow control to pass back to STAMMER. Since the interface does not permit calling a main FORTRAN program, all essential control was transferred to subroutines. For convenience some input normally derived from user interaction is now instead passed as arguments to subroutines (here the STAMMER controlling process takes the place of the user). At link-edit time, it is necessary to include a support file F10F.REL and perform an initialization procedure (Details are in the file FORK.DOC. See below.)

Attaching the front end to STAMMER required subroutines to initialize an empty data base and to add new platforms and sightings as they arose. Because of limitations in space available and its disuse in our system, the ground truth structure was shrunk to nothing. Simultaneously the tracking structure was expanded to accommodate the large number of tracks required by our system. To allow saving the DSPLA structure for later restart, the initialization had to be non-destructive, i.e., accomplished by means of data statements.
Other minor changes to DSPLA include new input routines to explicitly set the correct character echoing mode for TOPS-20 and to obviate the need for a carriage return when in finger key mode. The algorithm for computing the window that includes a given set of tracks was modified to preserve the aspect ratio. This was to maintain compatibility with the ISI map routine which otherwise arbitrarily contracts the picture. The routines that search the tracking structure for platforms were modified where necessary to require a match on all ten characters. This change allowed the use of platform names which coincide in the first five characters. To allow graphic output to go to a terminal other than the job controlling one, a new global variable and common storage area, NTTY, was introduced.

Further information on these changes is given in comments in the code.

Modifications to LISP-FORTRAN Interface

Modifications were necessary to allow Fortran-10 (in which DSPLA is written) to be used in place of Fortran-4 (also known as F40). The interface was also changed so that the superior and inferior processes could run in parallel, with synchronizing waits only where necessary. This feature is very useful when running with graphics going to a separate display terminal.

GRAPHICS-RELATED FILES

LISP-FORTRAN interface: FORK.LISP, FIOF.MAC (see also FORK.DOC).
DISPLA routines: DISPLIB.FOR, DISPIO.MAC
STAMMER-DISPLA Interface: DISPLA.LSP
VI. MATHEMATICAL TECHNIQUES

Mathematical methods are used extensively only in the geometry procedures that determine the geographical conditions satisfied by sightings. The functions that combine confidences also merit some discussion.

GEOMETRY FUNCTIONS

Distance and bearing are computed by formulas derived from three-dimensional vector geometry. Thus they are not flat-Earth approximations, but are valid for all points of the Earth's surface. Higher level functions use well-known trigonometric formulas, based on a flat-Earth approximation. However, they are defined in terms of distance and bearing, so that their results are applicable to all regions of the Earth sufficiently small to be treated as flat, including regions near the poles.

A couple of procedures are deserving of special mention. The function that determines interior points of a polygon is based on Cauchy's Integral Formula. Functions that determine whether a platform could have reached a given position without being spotted by a patrol use geometric methods rather than algebraic or analytic ones.

DERIVATIONS OF GEOMETRIC FORMULAS

1. Range, bearing

Assume the Earth is a sphere. With suitable units, the radius may be taken as 1. The spherical polar coordinates of a point on the surface are \((\theta, \phi)\), where \(\theta\) and \(\phi\) are the latitude and longitude, respectively. In Cartesian coordinates this becomes

\[
(r \cos \theta \cos \phi, r \cos \theta \sin \phi, r \sin \theta).
\]

Let \(A\) and \(B\) be points with lat-lon pairs \((\theta_1, \phi_1)\) and \((\theta_2, \phi_2)\) respectively. Let \(u\) and \(v\) be the position vectors of \(A\) and \(B\). Let \(\psi\) be the angle between \(u\) and \(v\), that is, the angle subtended at the Earth's center by \(A\) and \(B\). Then

\[
\cos \psi = u \cdot v = \cos \theta_1 \cos \phi_1 \cos \theta_2 \cos \phi_2 + \cos \theta_1 \sin \phi_1 \cos \theta_2 \sin \phi_2 + \sin \theta_1 \sin \theta_2
\]

The range in nautical miles is given by \(60 \ast \psi\) (when \(\psi\) is measured in degrees).

To compute the bearing from \(A\) to \(B\), we first obtain a unit vector \(p\), orthogonal to both \(u\) and \(v\). This is given by

\[
p = (u \times v)/\sin \psi.
\]

Next we require a unit vector \(q\) orthogonal to \(u\) but in the plane determined by \(u\) and the
Earth's axis. We may write
\[ q = (u \times k)/\cos \theta_1 \times u, \]
where \( k \) is a unit vector in the \( z \) direction (parallel to the Earth's axis, pointing north).

The vector \( q \) may be positioned tangent to the Earth at \( A \), pointing northward. The vector \( p \) can be placed so that it is tangent to the Earth at \( A \) and rotated 90 deg counterclockwise from the direction toward \( B \). Then (modulo 360)
\[ \text{Bearing}(A, B) = 90 \pm \arccos (p \cdot q). \]
The ambiguous sign is positive when the rotation from \( p \) to \( q \) is counterclockwise.

We derive an expression for \( p \cdot q \) as follows:
\[ p \cdot q = (u \times k) \times (u \times v)/\cos \theta_1 \sin \psi \]
But \( (u \times k) \times (u \times v) = -k \times (u \times (u \times v)) \)
\[ = -k \times (u \times (u \times v)), \text{ since } u \text{ is a unit vector} \]
\[ = -(\cos \theta_1 \cos \phi_1 \cos \phi_2 - \cos \theta_1 \sin \phi_1 \cos \theta_2 \cos \phi_2) \]
\[ = \cos \theta_1 \cos \theta_2 \sin (\phi_1 - \phi_2) \]
If we assume \( \theta_1 \neq \pm 90 \), we may cancel \( \cos \theta_1 \) to get
\[ p \cdot q = \cos \theta_2 \sin (\phi_1 - \phi_2)/\sin \psi \]
The bearing is undefined when \( \psi = 180 \). We set
\[ \text{Bearing}(A, B) = \begin{cases} 90 & \text{when } \theta_1 = 90 \\ 0 & \text{when } \theta_1 = -90 \end{cases} \]

2. Interior points of a polygon

If \( \Gamma \) is a simple closed rectifiable curve and \( a \) is any complex constant then
\[ \int_{\Gamma} \frac{dz}{z-a} = \begin{cases} 2\pi i, & \text{if } a \text{ is inside } \Gamma \\ 0 & \text{otherwise} \end{cases} \]
by Cauchy's Integral Formula (Ref. 3).

But \[ \int_{\Gamma} \frac{dz}{z-a} = \int_{\Gamma} d(\log(z-a)) \]
\[ = \int_{\Gamma} d(\log|z-a|) + i \int_{\Gamma} d(\arg(z-a)) \]
When \( \Gamma \) is completely traversed, \( \log|z-a| \) returns to its original value.
Thus \[ \int_{\Gamma} d(\log|z-a|) = 0 \]
It follows that (cancelling the i)
\[ \int |d(\arg(z-a))| = \begin{cases} 2\pi, & \text{if } a \text{ is inside } l' \\ 0, & \text{otherwise} \end{cases} \]

Suppose \( l' \) is a polygon with vertices (in order) \( z_1, \ldots, z_n \). For convenience we write \( z_{n+1} = z_1 \). Then

\[ \int |d(\arg(z-a))| = \sum_{j=1}^{n} \int_{z_j}^{z_{j+1}} |d(\arg(z-a))| = \sum_{j=1}^{n} [\arg(z_{j+1}-a) - \arg(z_j-a)]. \]

where for each summand, a branch of \( \arg \) is chosen that is continuous in the region of integration. If we write

\[ b_j = \text{Bearing}(a,z_{j+1}) - \text{Bearing}(a,z_j), \]

then

\[ \arg(z_{j+1}-a) - \arg(z_j-a) = \begin{cases} 360 + b_j & \text{if } b_j < -180 \\ b_j & \text{if } -180 \leq b_j \leq 180 \\ b_j - 360 & \text{if } b_j > 180 \end{cases} \]

3. Closest approach

Suppose \( S_1 \) and \( S_2 \) are objects moving at constant velocity. Assume \( S_1 \) starts from \( A \) at time \( 0 \) with velocity vector \( v_1 \). Simultaneously \( S_2 \) starts from \( B \) with velocity vector \( v_2 \). We wish to compute \( d \), the distance of closest approach and \( t \), the time of closest approach.

Let \( C \) be the point of closest approach. Relative to \( S_2 \), the motion appears as follows:

\[ \cos \theta = w \cdot (v_1 - v_2) / |v_1 - v_2| \]

Clearly \( d = \text{Range}(A,B) \sin \theta \)

and \( t = \text{Range}(A,B) \cos \theta / |v_1 - v_2| \)

CONFIDENCE COMBINING FUNCTIONS

These are the same as those used in MYCIN (Ref. 2) except that disjunction does not occur in our rules. Briefly, each assertion has a measure of belief and a measure of disbelief associated with it. The antecedent of each rule is a conjunction of conditions. The measure of belief (disbelief) of the antecedent is the minimum (maximum) of the
measures of belief (disbelief) of the individual conditions. Each rule has a weight attached to it. The contribution of belief (disbelief) provided by a successful rule firing is the product of this weight and the measure of belief (disbelief) of the antecedent. When two rules bear upon the same hypothesis, their contributions of belief and disbelief are combined separately according to the formula

\[
\text{Combine}(c_1, c_2) = c_1 + c_2 - c_1 \times c_2.
\]

Then the total contribution of disbelief is subtracted from the total contribution of belief to give the confidence. When more than two rules combine, the process is iterated. That is,

\[
\text{Combine}(c_1, c_2, c_3) = \text{Combine}[c_1, \text{Combine}(c_2, c_3)].
\]

E  EXIT FK MODE

'P' FUNCTION KEY

POSITION THE CURSOR ANYWHERE ON THE TERMINAL SCREEN AND ENTER 'P'. THE LAT-LON POSITION OF THE CURSOR WILL BE PLACED INTO A STACK WHICH CAN HOLD 10 POSITIONS (THE 11TH POSITION WILL OVER-WRITE THE 1ST). THE POSITIONS IN THE STACK CAN THEN BE USED FOR OTHER PURPOSES, SUCH AS POINTS OF ORIGIN FOR BEARING LINES, CENTERS OF FIGURES, ETC.

'M' FUNCTION KEY

POSITION THE CURSOR ANYWHERE ON THE TERMINAL SCREEN AND ENTER 'M'. THE DISPLAY WILL BE MAGNIFIED BY A FACTOR SET BY <SCALE> AND CENTERED AT THE CURSOR POSITION. THE DEFAULT FACTOR IS 2.
'R' FUNCTION KEY

POSITION THE CURSOR ANYWHERE ON THE TERMINAL SCREEN AND ENTER 'R'. THE DISPLAY WILL BE REDUCED BY A FACTOR SET BY <SCALE> AND CENTERED AT THE CURSOR POSITION. THE DEFAULT FACTOR IS 2.

'V' FUNCTION KEY

POSITION THE CURSOR ANYWHERE ON THE TERMINAL SCREEN AND ENTER 'V'. THE DISPLAY WILL BE GIVEN AT THE SAME SCALE BUT CENTERED AT THE CURSOR POSITION.

'L' FUNCTION KEY

ENTER 'L' AND A LISTING OF ALL ACCESSIBLE FILES AND SUBFILES WILL BE GIVEN ALONG WITH THEIR CORRESPONDING FILE CODES. WHEN PROMPTED, ENTER ONE OF THE FILE CODES (SUBFILES MAY BE VIEWED ONLY WITHIN ITS PARENT FILE). THE FILE WILL BE DISPLAYED WITH PAGE SIZE SET BY <PGSIZ> (DEFAULT IS 20 LINES) AND CURRENT TYPE SIZE (MUST BE SIZE 1 FOR SINGLE TYPE SIZE TERMINALS).

'G' FUNCTION KEY

ENTER 'G' TO VIEW THE GTH FILE. PAGE SIZE IS AS SET BY <PGSIZ> AND CURRENT TYPE SIZE IS USED (MUST BE SIZE 1 FOR SINGLE TYPE SIZE TERMINALS). ONCE THE FILE IS DISPLAYED, USE 'F' TO VIEW SUCCEEDING PAGES; 'B' TO VIEW PRECEEDING PAGES; 'R' TO RETURN FROM VIEWING, 'E' TO EDIT A LINE; AND ANY VALID SUBFILE CODE TO VIEW SUBFILES.

'T' FUNCTION KEY

ENTER 'T' TO VIEW THE TRH FILE. PAGE SIZE IS AS SET BY <PGSIZ> AND CURRENT TYPE SIZE IS USED (MUST BE SIZE 1 FOR SINGLE TYPE SIZE TERMINALS). ONCE THE FILE IS DISPLAYED, USE 'F' TO VIEW SUCCEEDING PAGES; 'B' TO VIEW PRECEEDING PAGES; 'R' TO RETURN FROM VIEWING, 'E' TO EDIT A LINE; AND ANY VALID SUBFILE CODE TO VIEW SUBFILES.

'H' FUNCTION KEY

POSITION THE CURSOR AT THE LOWER LEFT CORNER OF THE FIRST LETTER OF THE TRACK NAME AND ENTER 'H'. THE TRACK HISTORY OF THAT TRACK WILL BE DISPLAYED IN FILE FORMAT. CONTINUE WITH FILE COMMANDS.

'D' FUNCTION KEY

IF IN FUNCTION KEY MODE THE DISPLAY IS ERASED FOR VIEWING OTHER DATA, ENTER 'D' TO RE-DISPLAY THE PLOT.
'B' FUNCTION KEY

ENTER 'B' TO SET TYPE SIZE TO LARGEST ON THE TEKTRONIX 4014 TERMINAL. THIS IS THE DEFAULT TYPE SIZE AND SHOULD BE USED ON SINGLE TYPE SIZE TERMINALS.

'9' FUNCTION KEY

ENTER '9' TO SET TYPE SIZE TO NEXT TO LARGEST ON THE TEKTRONIX 4014 TERMINAL. THIS SIZE SHOULD NOT BE USED ON SINGLE TYPE SIZE TERMINALS.

':' FUNCTION KEY

ENTER ':' TO SET TERMINAL TYPE SIZE TO NEXT TO SMALLEST ON THE TEKTRONIX 4014 TERMINAL. THIS SIZE SHOULD NOT BE USED ON SINGLE TYPE SIZE TERMINALS.

';' FUNCTION KEY

ENTER ';' TO SET TYPE SIZE TO SMALLEST ON THE TEKTRONIX 4014 TERMINAL. THIS SIZE SHOULD NOT BE USED ON SINGLE TYPE SIZE TERMINALS.

'?' FUNCTION KEY

ENTER '?' TO OBTAIN INFORMATION ON ENTRY, FORMAT, AND HOW TO OBTAIN ADDITIONAL INFORMATION ON FUNCTION KEYS, AS WELL AS A LISTING OF AVAILABLE FUNCTION KEYS AND THEIR FUNCTIONS.

'K' FUNCTION KEY

POSITION THE CURSOR ANYWHERE ON THE TERMINAL SCREEN AND ENTER 'K'. THE LAT-LON POSITION IS PLACED IN A TRACK STACK WHERE IT MAY BE INTERPRETED AS A TRACK INCIDENT. INCIDENTS ARE SEPARATED BY A TIME INCREMENT, DT (SET BY (T)(SP)(I)). 'Z' WILL CLEAR THE TRACK STACK OF ALL DATA. <WRITE> MAY BE USED TO WRITE THE TRACK STACK ON TO THE DISK AS A FILE; <EXCH> MAY BE USED TO EXCHANGE THE TRACK STACK WITH A TRACK IN THE TRACKING STRUCTURE; OR <READ> MAY BE USED TO READ A FILE CONTAINING TRACK DATA INTO THE TRACK STACK. POINTS THEN PLACED INTO THE STACK BY 'K' WILL FOLLOW THE DATA ALREADY THERE.

'S' FUNCTION KEY

ENTER 'S' TO CAUSE THE GLOBAL AREA COORDINATES TO BE SET TO THE CURRENTLY DISPLAYED AREA WINDOW.
'A' FUNCTION KEY

ENTER 'A' TO APPEND CURRENTLY DISPLAYED TRACKS TO ALL FOLLOWING DISPLAYS. THIS CAN ONLY BE CANCELLED BY <NDAPP>. APPENDED TRACKS ARE UNAFFECTED BY CHANGES IN THE TIME WINDOW.

'Z' FUNCTION KEY

ENTER 'Z' TO CLEAR THE TRACK STACK OF ALL DATA.

'F' FUNCTION KEY

ENTER 'F' TO MOVE THE TIME WINDOW FORWARD BY A TIME INCREMENT, DT (SET BY <T><SP><I>) AND EXECUTE THE PREVIOUS PLOT COMMAND.

'B' FUNCTION KEY

ENTER 'B' TO MOVE THE TIME WINDOW BACKWARD BY A TIME INCREMENT, DT (SET BY <T><SP><I>) AND EXECUTE THE PREVIOUS PLOT COMMAND.

' ' FUNCTION KEY (SPACE)

ENTER ' ' TO EXECUTE THE PREVIOUS PLOT COMMAND.

'N' FUNCTION KEY

ENTER 'N' TO CAUSE THE MOST RECENTLY DEFINED FIGURE (CIRCLE, ELLIPSE, ETC.) TO HAVE ITS POINT OF ORIGIN OR CENTER CHANGED TO THE TOP POSITION IN THE TRACK STACK.

'C' FUNCTION KEY

ENTER 'C' TO RETURN TO COMMAND MODE.

'U' FUNCTION KEY

ENTER 'U' TO VIEW THE FIGURE FILE. PAGE SIZE IS AS SET BY <P GSIZ> AND CURRENT TYPE SIZE IS USED (MUST BE SIZE 1 FOR SINGLE TYPE SIZE TERMINALS). ONCE THE FILE IS DISPLAYED, USE 'F' TO VIEW SUCCEEDING PAGES; 'B' TO VIEW PRECEEDING PAGES; 'R' TO RETURN FROM VIEWING; 'E' TO EDIT A LINE; AND 'Q' TO QUIT VIEWING.

'E' FUNCTION KEY

ENTER 'E' TO EXIT FUNCTION KEY MODE AND RETURN TO KEYBOARD MODE.

FKMODE ENTER FUNCTION KEY MODE

FORM OF DISPLAY FIGURE FILE:  <FIG>

THE FIGURE FILE IS DISPLAYED FOR VIEWING AND/OR EDITING USING COMMANDS OF THE FILE HANDLING SYSTEM. FOR A DESCRIPTION OF THESE COMMANDS, EXECUTE <FILES> AND THEN '?'.

FORM OF ENTER FUNCTION KEY MODE:  <FKMOD>

THE ATTACHED PROGRAM FUNCTION KEYBOARD BECOMES THE PRIMARY COMMAND SOURCE. COMMANDS ARE EXECUTED BY POSITIONING THE CURSOR (WHEN NECESSARY) AND PUSHING THE APPROPRIATE FUNCTION KEY BUTTON. FUNCTION KEY MODE IS EXITED WHEN THE "KBMODE" FUNCTION KEY IS PUSHED.

FORM OF WRITE FILE:  <WFILE><SP><FILE NAME>

FILE NAME IS A 5 CHARACTER (MAX) ALPHAMERIC NAME WHICH WILL IDENTIFY THE FILE TO BE WRITTEN. FILE NAMES BEGINNING WITH 'G' WILL CAUSE DATA TO BE WRITTEN FROM THE GTH/GTK STRUCTURES. ALL OTHER FILE NAMES DENOTE THE TRH/TRK STRUCTURES. THE FILE IS WRITTEN TO DISK IN BINARY MODE.

FORM OF READ FILE:  <RFILE><SP><FILE NAME>

FILE NAME IS A 5 CHARACTER (MAX) ALPHAMERIC NAME WHICH WILL IDENTIFY THE FILE TO BE READ. FILE NAMES BEGINNING WITH 'G' WILL CAUSE DATA TO BE READ INTO THE GTH/GTK STRUCTURES. ALL OTHER FILE NAMES DENOTE THE TRH/TRK STRUCTURES. THE DISK FILE TO BE READ SHOULD HAVE BEEN CREATED BY DSPLA USING THE <WFILE> COMMAND.
FORM OF RE-DISPLAY PREVIOUS PLOT: <DISP>

THE PREVIOUS DISPLAY IS REPRODUCED FOR VIEWING AND/OR ACTION.

FORM OF DISPLAY GTH FILE: <GTH>

THE GTH FILE IS DISPLAYED FOR VIEWING AND/OR EDITING USING COMMANDS OF THE FILE HANDLING SYSTEM. FOR A DESCRIPTION OF THESE COMMANDS, EXECUTE <FILES> AND THEN '?'.

FORM OF DISPLAY TRH FILE: <TRH>

THE TRH FILE IS DISPLAYED FOR VIEWING AND/OR EDITING USING COMMANDS OF THE FILE HANDLING SYSTEM. FOR A DESCRIPTION OF THESE COMMANDS, EXECUTE <FILES> AND THEN '?'.

FORM OF FIND RNG, BNG, TIME: <RBT>

DATA IS DRAWN FROM THE TRACK STACK. WITH A GIVEN SPEED, THE RANGE, BEARING, AND TIME OF TRAVEL FROM POINT 1 TO POINT 2, POINT 2 TO POINT 3, ETC. IS CALCULATED, USING GREAT CIRCLE FORMULA, AND DISPLAYED.

FORM OF SET MAGNIFY SCALE: <SCALE>

ALLOWS CHANGING THE FACTOR BY WHICH DISPLAYS ARE MAGNIFIED OR REDUCED. THE DEFAULT FACTOR IS 2.

FORM OF INCLUDE ARROWHEADS: <ARROW>

CAUSES ARROWHEADS TO BE DRAWN AT THE ENDS OF TRACK LINE SEGMENTS TO DENOTE THE DIRECTION OF TRAVEL OF TRACKS WHEN PLOTTED (DEFAULT CONDITION).

FORM OF NO ARROWHEADS: <NOARR>

CAUSES ARROWHEADS TO NOT BE INCLUDED ON TRACKS WHEN PLOTTED.

FORM OF INCLUDE LABELS: <LABEL>

CAUSES THE TRACK NAME TO BE DISPLAYED BY THE TRACK WHEN PLOTTED (DEFAULT CONDITION).

FORM OF NO LABELS: <NOLBL>

CAUSES THE TRACK NAME TO NOT BE DISPLAYED BY THE TRACK WHEN PLOTTED.

FORM OF INCLUDE SYMBOLS: <SYM>

CAUSES SYMBOLS TO BE DRAWN AT TRACK INCIDENT POINTS WHEN TRACK IS PLOTTED (DEFAULT CONDITION).
FORM OF NO SYMBOLS: <NOSYM>
CAUSES SYMBOLS TO NOT BE DRAWN AT TRACK INCIDENT POINTS WHEN TRACK IS PLOTTED.

FORM OF NO LINES: <NOLIN>
CAUSES TRACK INCIDENT POINTS TO NOT BE CONNECTED WITH LINES WHEN A TRACK IS PLOTTED.

FORM OF CONNECT WITH LINES: <LINES>
CAUSES TRACK INCIDENT POINTS TO BE CONNECTED WITH LINES WHEN TRACK IS PLOTTED (DEFAULT CONDITION).

FORM OF MOVE TIME BACKWARD: <B>
MOVES THE TIME WINDOW BACKWARD BY A TIME INCREMENT DT (SET BY <T><SP><I>), AND THE PREVIOUS PLOT COMMAND IS EXECUTED (<SP>).

FORM OF DEFINE RHUMB LINE: <RHUMB>
ALLOWS DEFINING A LINE OF BEARING ALONG A RHUMB LINE AND SETTING A SYMBOLIC NAME FOR THAT BEARING LINE. PARAMETERS REQUIRED ARE POINT OF ORIGIN AND BEARING. THE SYMBOLIC NAME MAY THEN BE USED AS THE NAME OF A TRACK WHICH PLOTS THE BEARING LINE.

FORM OF FUNCTION KEY INFO: <FKDOC>
ALLOWS ACCESS TO DOCUMENTATION ON AVAILABLE FUNCTION KEYS.

FORM OF DEFINE RADIUS: <RADIU>
ALLOWS DEFINING A RADIUS OF TRAVEL AND SETTING A SYMBOLIC NAME FOR THAT RADIUS. PARAMETERS REQUIRED ARE POSITION OF CENTER AND SPEED. THE TIME INCREMENT, DT (SET BY <T><SP><I>), IS MULTIPLIED BY THE SPEED TO GIVE A RADIUS. THE SYMBOLIC NAME MAY THEN BE USED AS THE NAME OF A TRACK WHICH PLOTS THAT RADIUS.

FORM OF WRITE TRACK STACK: <WRITE><SP><FILE NAME>
FILE NAME IS UP TO 5 ALPHAMERIC CHARACTERS WHICH ARE TO IDENTIFY THE TRACK IN THE FORM OF A DISK FILE. THE EXTENSION OF FILE NAME WILL BE .DAT. DATA ASSOCIATED WITH THE TRACK IN THE TRACK STACK (NAME, TARGET PARAMETER, TYPE, NUMBER OF INCIDENTS, AND TRACK NUMBER) ARE ALSO WRITTEN. IF TRACK NAME IS UNDEFINED, A NAME, INITIAL TRACK TIME, AND TRACK NUMBER MUST BE ENTERED BEFORE THE TRACK IS WRITTEN. THE TRACK STACK IS UNAFFECTED BY THE WRITE OPERATION.
FORM OF READ TRACK FROM DISK: <READ><SP><FILE NAME>

FILE NAME IS THE 5 CHARACTER (MAX) ALPHAMERIC DISK FILE NAME WHICH IDENTIFIES THE TRACK TO BE READ. AFTER READING THE TRACK STACK WILL CONTAIN THE TRACK AND ASSOCIATED DATA (TRACK NAME, TYPE, ETC.). POINTS ENTERED INTO THE TRACK STACK WILL FOLLOW THE DATA HELD THERE.

FORM OF EXCHANGE TRACK STACK: <EXCH><SP><TRACK NAME>

TRACK NAME IDENTIFIES A TRACK ALREADY IN THE TRACKING STRUCTURE AND MAY BE THE NAME, TYPE OR CLASS, OR TARGET PARAMETER. THAT TRACK IS THEN EXCHANGED WITH THE TRACK IN THE TRACK STACK, ALONG WITH ALL ASSOCIATED DATA. PLOTTING MAY THEN BE DONE WITH THE NEW TRACK OR THE OLD TRACK NOW IN THE TRACK STACK MAY BE WRITTEN TO DISK. POINTS ENTERED INTO THE TRACK STACK WILL FOLLOW THE DATA HELD THERE.

FORM OF APPEND FOLLOWING: <APPND>

THE TRACKS DISPLAYED IN THE PREVIOUS DISPLAY WILL BE AUTOMATICALLY INCLUDED IN THE FOLLOWING DISPLAYS UNTIL CANCELLED BY <NOAPP>. ALL APPENDED TRACKS WILL NOT BE AFFECTED BY A CHANGE OF THE TIME WINDOW.

FORM OF CANCEL APPEND: <NOAPP>

ALL TRACKS APPENDED BY <APPND> ARE RELEASED FROM AUTOMATIC INCLUSION TO ALL DISPLAYS.

FORM OF RE-START DISPLAY: <START>

DSPLA IS RE-INITIALIZED, SETTING ALL PARAMETERS TO DEFAULT AND ALLOWING THE RE-ENTERING OF SCREEN WIDTH AND GRID SIZE. ALL STORED SEGMENTS AND DATA DEFINED PREVIOUS TO THE EXECUTION OF THIS COMMAND ARE LOST.

FORM OF DEFINE ELLIPSE: <CELL>

allows defining a confidence ellipse and setting a symbolic name for that ellipse. Parameters required are center position, major axis, minor axis, major axis bearing, and time. The symbolic name may then be used as the name of a track which plots that ellipse.

FORM OF DEFINE BEARING LINE: <LOB>

allows defining a line of bearing along a great circle and setting a symbolic name for that bearing line. Parameters required are point of origin and bearing. The symbolic name may then be used as the name of a track which plots that bearing line.
FORM OF DEFINE CIRCLE: <CIRCLE>

 allows defining a circle and setting a symbolic name for that circle. Parameters required are center position and radius. The symbolic name may then be used as the name of a track which plots that circle.

FORM OF PLOT TRACKING: <PTR><SP><UNIT CODE>,<UNIT CODE>

 A unit code may be (1) the name of the craft, of which only the first five letters need be given; (2) the type or class of craft such as FFG7A; (3) the target parameter of the craft, such as FA for friendly air; (4) a figure name denoting an ellipse, circle, or line of bearing previously defined, such as .LOBO. Up to 15 unit codes may be entered in any combination. The craft tracks are drawn from the tracking structure and plotted under current conditions (map, area, time, etc.)

FORM OF LOCATE TRACKING: <LTR><SP><UNIT CODE>,<UNIT CODE>

 A unit code may be (1) the name of the craft, of which only the first five letters need be given; (2) the type or class of craft such as FFG7A; (3) the target parameter of the craft, such as FA for friendly air; (4) a figure name denoting an ellipse, circle, or line of bearing previously defined, such as .LOBO. Up to 15 unit codes may be entered in any combination. The craft positions at the current time (regardless of what the time window is) are drawn from the tracking structure and plotted under current conditions (map, area, etc.) excluding time.

FORM OF LIST FILES: <FILES>

 A listing of accessible files and subfiles is given along with their corresponding file codes. To view a particular file (subfiles are accessible only from its parent file) enter its corresponding file code when prompted.

FORM OF SET TYPE SIZE 1: <SIZE1>

 For a Tektronix 4014 terminal, the largest type size is selected. This is the default size type and must be used on single type size terminals.

FORM OF SET TYPE SIZE 2: <SIZE2>

 For a Tektronix 4014 terminal, the next to largest type size is selected. Only type size 1 should be used on single type size terminals.
FORM OF SET TYPE SIZE 3: <SIZE3>

FOR A TEKTRONIX 4014 TERMINAL, THE NEXT TO SMALLEST TYPE SIZE IS SELECTED. ONLY TYPE SIZE 1 SHOULD BE USED ON SINGLE TYPE SIZE TERMINALS.

FORM OF SET TYPE SIZE 4: <SIZE4>

FOR A TEKTRONIX 4014 TERMINAL, THE SMALLEST TYPE SIZE IS SELECTED. ONLY TYPE SIZE 1 SHOULD BE USED ON SINGLE TYPE SIZE TERMINALS.

FORM OF SET LINES PER PAGE: <PGSIZ>

ALLOWS CHANGING OF THE NUMBER OF LINES PER PAGE WHEN VIEWING FILES. THE DEFAULT PAGE SIZE IS 20 LINES. NOTE THAT MAXIMUM PAGE SIZE VARIES WITH TYPE SIZE ON MULTIPLE TYPE SIZE TERMINALS.

FORM OF HELP: <?>

GENERAL INSTRUCTIONS FOR COMMAND INPUT, FORMAT, AND OBTAINING ADDITIONAL HELP ARE GIVEN ALONG WITH A LISTING OF ALL COMMANDS AND THEIR FUNCTIONS.

FORM FOR SET GEOGRAPHIC AREA: <C><SP><MAP CODE>

MAP CODE IS THE CODE OF A MAP AREA AS DEFINED BY DSPLA. A LISTING OF AVAILABLE MAP AREAS AND THEIR CODES MAY BE OBTAINED BY EXECUTING <C><SP><LIST>. THE GLOBAL AREA WINDOW IS SET TO THE BOUNDARIES OF THE MAP BUT LAND MASS OUTLINES ARE NOT INCLUDED IN FUTURE DISPLAYS.

FORM FOR REPEAT LAST PLOT: <SP>

THE PREVIOUS PLOT OR LOCATE COMMAND IS RE-EXECUTED UNDER THE CURRENT CONDITIONS (MAP, AREA, TIME, ETC.).

FORM OF REDUCE DISPLAY: <R>

THE PREVIOUS DISPLAY WILL BE REDUCED BY THE FACTOR SET BY <SCALE>. THE DEFAULT FACTOR IS 2.

FORM OF ENQUIRE: <E>

ENQUIRE PROVIDES A DISPLAY OF STATUS, WINDOW, AND DATA RANGE INFORMATION.
FORM OF KILL DISPLAY:  <K><SP><DISPLAY NAME>

DISPLAY NAME IS THE 5 CHARACTER (MAX) NAME UNDER WHICH THE DISPLAY WAS STORED. STORAGE OCCUPIED BY THE DISPLAY IS RELEASED AS IS THE DISPLAY NAME. IN CASE OF DUPLICATE NAMES, THE FIRST NAME IS DELETED.

FORM OF RECALL DISPLAY:  <D><SP><DISPLAY NAME>

DISPLAY NAME IS THE 5 CHARACTER (MAX) NAME UNDER WHICH THE DISPLAY WAS STORED. THE STORED DISPLAY IS DISPLAYED ON RECALL BUT MAY NOT BE OPERATED ON (MAGNIFIED, MOVE TIME FORWARD, ETC.). IN THE CASE OF DUPLICATE NAMES, THE FIRST DISPLAY IS DISPLAYED.

FORM OF STORE DISPLAY:  <S><SP><DISPLAY NAME>

DISPLAY NAME IS UP TO 5 CHARACTERS WHICH WILL IDENTIFY THE DISPLAY BEING STORED FOR LATER RECALL AND DELETION. UP TO 25 DISPLAYS MAY BE STORED. DUPLICATE NAMES SHOULD NOT BE USED.

FORM OF CHANGE TIME WINDOW:  <T><SP><TIME CODE 1><TIME CODE 2>

TIME CODE 1 MAY BE (1) <I> TO ALLOW KEYBOARD ENTRY OF A NEW TIME INCREMENT (DT) - NO CODE 2 IS USED WITH THIS OPTION; (2) <G> TO DENOTE CHANGING THE GLOBAL TIME WINDOW; (3) <L> TO DENOTE CHANGING THE LOCAL TIME WINDOW. TIME CODE 2 MAY BE (1) <SP> TO DENOTE INPUT OF NEW VALUES FROM THE KEYBOARD; (2) <D> TO DENOTE DEFAULT VALUES (WHICH ARE AN INFINITE TIME WINDOW).

FORM OF CHANGE AREA WINDOW:  <A><SP><AREA CODE 1><AREA CODE 2>

AREA CODE 1 MAY BE (1) <G> TO DENOTE CHANGING THE GLOBAL AREA WINDOW; (2) <L> TO DENOTE CHANGING THE LOCAL AREA WINDOW. AREA CODE 2 MAY BE (1) <SP> TO DENOTE INPUT OF NEW VALUES FROM THE KEYBOARD; (2) <C> TO DENOTE USING THE WINDOW VALUES USED OR COMPUTED IN THE PREVIOUS DISPLAY; (3) <D> TO DENOTE DEFAULT VALUES (WHICH ARE ALL ZERO) AND CAUSE AN AREA WINDOW TO BE COMPUTED TO INCLUDE ALL DATA BEING PLOTTED.

FORM OF MOVE TIME FORWARD:  <F>

THE TIME WINDOW IS MOVED AHEAD BY AN INCREMENT, DT (SET BY <T><SP><I>), AND THE PREVIOUS PLOT COMMAND IS EXECUTED (<SP>).

FORM OF MAGNIFY DISPLAY:  <M><SP><GRID CODE>

THE PORTION OF THE PREVIOUS DISPLAY DEFINED BY THE GRID CODE IS MAGNIFIED ACCORDING TO THE FACTOR SET BY <SCALE>. THE DEFAULT FACTOR IS 2. GRID CODES ARE DEFINED AS FOLLOWS:

<table>
<thead>
<tr>
<th>Grid Code</th>
<th>Area Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Upper Right Quad</td>
</tr>
<tr>
<td>2</td>
<td>Upper Left Quad</td>
</tr>
<tr>
<td>3</td>
<td>Lower Left Quad</td>
</tr>
<tr>
<td>4</td>
<td>Lower Right Quad</td>
</tr>
<tr>
<td>5</td>
<td>Center</td>
</tr>
<tr>
<td>6</td>
<td>Top Half</td>
</tr>
<tr>
<td>7</td>
<td>Left Half</td>
</tr>
<tr>
<td>8</td>
<td>Lower Half</td>
</tr>
<tr>
<td>9</td>
<td>Right Half</td>
</tr>
</tbody>
</table>
FORM OF SET GEOGRAPHIC MAP: <G><SP><MAP CODE>

MAP CODE IS THE CODE OF A MAP AREA AS DEFINED BY DSPLA. A LISTING OF
AVAILABLE MAP AREAS AND THEIR CODES MAY BE OBTAINED BY EXECUTING
<G><SP><LIST>. THE GLOBAL AREA WINDOW IS SET TO THE BOUNDARIES OF THE
MAP AND LAND MASS OUTLINES ARE INCLUDED IN FUTURE DISPLAYS IN MERCATOR
PROJECTION FORMAT.

FORM OF LOCATE GROUND TRUTH: <LGT><SP><UNIT CODE>, . . . , <UNIT CODE>

A UNIT CODE MAY BE (1) THE NAME OF THE CRAFT, OF WHICH ONLY THE FIRST
FIVE LETTERS NEED BE GIVEN; (2) THE TYPE OR CLASS OF CRAFT SUCH AS
FFG7A; (3) THE TARGET PARAMETER OF THE CRAFT, SUCH AS FA FOR FRIENDLY
AIR; (4) A FIGURE NAME DENOTING AN ELLIPSE, CIRCLE, OR LINE OF BEARING
PREVIOUSLY DEFINED, SUCH AS .LOBO. UP TO 15 UNIT CODES MAY BE ENTERED
IN ANY COMBINATION. THE CRAFT POSITIONS AT THE CURRENT TIME
(REGARDLESS OF WHAT THE TIME WINDOW IS) ARE DRAWN FROM THE GROUND
TRUTH STRUCTURE AND PLOTTED UNDER CURRENT CONDITIONS (MAP, AREA, ETC.)
EXCLUDING TIME.

FORM OF QUIT: <Q>

QUIT CAUSES A RETURN TO THE CALLING PROGRAM.

FORM OF PLOT GROUND TRUTH: <PGT><SP><UNIT CODE>, . . . , <UNIT CODE>

A UNIT CODE MAY BE (1) THE NAME OF THE CRAFT, OF WHICH ONLY THE FIRST
FIVE LETTERS NEED BE GIVEN; (2) THE TYPE OR CLASS OF CRAFT SUCH AS
FFG7A; (3) THE TARGET PARAMETER OF THE CRAFT, SUCH AS FA FOR FRIENDLY
AIR; (4) A FIGURE NAME DENOTING AN ELLIPSE, CIRCLE, OR LINE OF BEARING
PREVIOUSLY DEFINED, SUCH AS .LOBO. UP TO 15 UNIT CODES MAY BE ENTERED
IN ANY COMBINATION. THE CRAFT TRACKS ARE DRAWN FROM THE GROUND TRUTH
STRUCTURE AND PLOTTED UNDER CURRENT CONDITIONS (MAP, AREA, TIME, ETC.)

INDEX OF POSITION - DSPLAE

ENTER ONE OF THE ABOVE POSITION INDICES WHICH IS TO BE USED AS A
SOURCE FOR THE FIGURE CENTER OR ORIGIN. THE POSITION MOST RECENTLY
ENTERED IN THE CURSOR STACK APPEARS FIRST, THE SECOND MOST RECENT
SECOND, ETC.

LONGITUDE OF CENTER OR ORIGIN - DSPLAE

ENTER A LONGITUDE IN DEGREES AND MINUTES WITH DEGREES SEPARATED FROM
MINUTES BY A MINUS, '−', AND WEST LONGITUDE DENOTED BY A LEADING MINUS
SIGN.

56
LATITUDE OF CENTER OR ORIGIN - DSPLAE

ENTER A LATITUDE IN DEGREES AND MINUTES WITH DEGREES SEPARATED FROM MINUTES BY A MINUS, ‘-‘, AND SOUTH LATITUDE DENOTED BY A LEADING MINUS SIGN.

SOURCE OF INPUT OF CENTER OR ORIGIN - DSPLAE

ENTER ‘C’ TO DENOTE THE CURSOR STACK AS THE SOURCE OF LAT-LON POSITIONS; ‘K’ TO DENOTE INPUT OF LAT-LON FROM THE KEYBOARD. THIS POSITION IS USED AS THE FIGURE CENTER OR ORIGIN.

SPEED FOR RADIUS - DSPLAE

ENTER A SPEED AS AN INTEGRAL NUMBER OF KNOTS. THIS SPEED IS MULTIPLIED BY THE CURRENT VALUE OF THE TIME INCREMENT, DT, TO ARRIVE AT A DISTANCE WHICH IS USED AS THE RADIUS FOR THE CIRCLE.

BEARING FOR RHUMB LINE - DSPLAE

ENTER THE BEARING OF THE RHUMB LINE AS POSITIVE MINUTES AND DEGREES FROM TRUE NORTH. MINUTES ARE SEPARATED FROM DEGREES BY A MINUS, ‘-‘.

RADIUS OF CIRCLE - DSPLAE

ENTER THE RADIUS OF THE CIRCLE AS AN INTEGRAL NUMBER OF MILES.

BEARING OF GREAT CIRCLE LINE - DSPLAE

ENTER THE BEARING OF THE GREAT CIRCLE LINE AS POSITIVE MINUTES AND DEGREES FROM TRUE NORTH. MINUTES ARE SEPARATED FROM DEGREES BY A MINUS, ‘-‘.

TIME OF ELLIPSE - DSPLAE

ENTER AN INTEGRAL TIME VALUE IN MINUTES TO BE ASSOCIATED WITH THE ELLIPSE.

BEARING OF ELLIPSE - DSPLAE

ENTER THE BEARING OF THE MAJOR AXIS OF THE ELLIPSE AS POSITIVE DEGREES AND MINUTES FROM TRUE NORTH. MINUTES ARE SEPARATED FROM DEGREES BY A MINUS, ‘-‘.
LENGTH OF MINOR AXIS OF ELLIPSE - DSPLAE

ENTER THE LENGTH OF THE MINOR AXIS OF THE ELLIPSE AS AN INTEGRAL NUMBER OF MILES.

LENGTH OF MAJOR AXIS OF ELLIPSE - DSPLAE

ENTER THE LENGTH OF THE MAJOR AXIS OF THE ELLIPSE AS AN INTEGRAL NUMBER OF MILES.

GDXLON - DSPLAA

ENTER A POSITIVE LONGITUDE INCREMENT IN DEGREES AND MINUTES WHICH IS TO REPRESENT ONE FOURTH OF THE LONGITUDE SPAN ACROSS THE GLOBAL AREA WINDOW. MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’. MINUTES NEED NOT BE ENTERED IF ZERO. HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. GXLON + 4(GDXLON) THEN GIVES THE ENDING VALUE (RIGHT BOUNDARY) OF THE GLOBAL AREA WINDOW. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE GLOBAL AREA WINDOW WILL NOT BE DISPLAYED. THE GLOBAL AREA WINDOW IS USED AT ALL TIMES EXCEPT FOLLOWING THE SETTING OF THE LOCAL AREA WINDOW.

GDYLAT - DSPLAA

ENTER A POSITIVE LATITUDE INCREMENT IN DEGREES AND MINUTES WHICH IS TO REPRESENT ONE FOURTH OF THE LATITUDE SPAN ACROSS THE GLOBAL AREA WINDOW. MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’. MINUTES NEED NOT BE ENTERED IF ZERO. HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. GYOLAT + 4(GDYLAT) THEN GIVES THE ENDING VALUE (UPPER BOUNDARY) OF THE GLOBAL AREA WINDOW. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE GLOBAL AREA WINDOW WILL NOT BE DISPLAYED. THE GLOBAL AREA WINDOW IS USED AT ALL TIMES EXCEPT FOLLOWING THE SETTING OF THE LOCAL AREA WINDOW.

DYLAT - DSPLAA

ENTER A POSITIVE LATITUDE INCREMENT IN DEGREES AND MINUTES WHICH IS TO REPRESENT ONE FOURTH OF THE LATITUDE SPAN ACROSS THE LOCAL AREA WINDOW. MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’. MINUTES NEED NOT BE ENTERED IF ZERO. HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. YOLAT + 4(DYLAT) THEN GIVES THE ENDING VALUE (UPPER BOUNDARY) OF THE LOCAL AREA WINDOW. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE LOCAL AREA WINDOW WILL NOT BE DISPLAYED. ONCE THE LOCAL AREA WINDOW IS SET, IT AFFECTS ONLY THE FIRST FOLLOWING DISPLAY.
DXLON - DSPLAA

ENTER A POSITIVE LONGITUDE INCREMENT IN DEGREES AND MINUTES WHICH IS TO REPRESENT ONE FOURTH OF THE LONGITUDE SPAN ACROSS THE LOCAL AREA WINDOW. MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’. MINUTES NEED NOT BE ENTERED IF ZERO; HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. XOLON + 4(DXLON) THEN GIVES THE ENDING VALUE (RIGHT BOUNDARY) OF THE LOCAL AREA WINDOW. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE LOCAL AREA WINDOW WILL NOT BE DISPLAYED. ONCE THE LOCAL AREA WINDOW IS SET, IT AFFECTS ONLY THE FIRST FOLLOWING DISPLAY.

GXOLON - DSPLAA

ENTER A LONGITUDE IN DEGREES AND MINUTES AT WHICH THE GLOBAL AREA WINDOW WILL BEGIN (LEFT BOUNDARY). MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’, AND WEST LONGITUDES ARE DENOTED BY A LEADING MINUS SIGN. MINUTES NEED NOT BE ENTERED IF ZERO; HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE GLOBAL AREA WINDOW WILL NOT BE DISPLAYED. THE GLOBAL AREA WINDOW IS USED AT ALL TIMES EXCEPT FOLLOWING THE SETTING OF THE LOCAL AREA WINDOW.

GYOLAT - DSPLAA

ENTER A LATITUDE IN DEGREES AND MINUTES AT WHICH THE GLOBAL AREA WINDOW WILL BEGIN (LOWER BOUNDARY). MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’, AND SOUTH LATITUDES ARE DENOTED BY A LEADING MINUS SIGN. MINUTES NEED NOT BE ENTERED IF ZERO; HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE GLOBAL AREA WINDOW WILL NOT BE DISPLAYED. THE GLOBAL AREA WINDOW IS USED AT ALL TIMES EXCEPT FOLLOWING THE SETTING OF THE LOCAL AREA WINDOW.

YOLAT - DSPLAA

ENTER A LATITUDE IN DEGREES AND MINUTES AT WHICH THE LOCAL AREA WINDOW WILL BEGIN (LOWER BOUNDARY). MINUTES AND DEGREES ARE SEPARATED BY A MINUS, ‘-’, AND SOUTH LATITUDES ARE DENOTED BY A LEADING MINUS SIGN. MINUTES NEED NOT BE ENTERED IF ZERO; HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE LOCAL AREA WINDOW WILL NOT BE DISPLAYED. ONCE THE LOCAL AREA WINDOW IS SET, IT AFFECTS ONLY THE FIRST FOLLOWING DISPLAY.
XOLON - DSPLAA

ENTER A LONGITUDE IN DEGREES AND MINUTES AT WHICH THE LOCAL AREA WINDOW WILL BEGIN (LEFT BOUNDARY). MINUTES AND DEGREES ARE SEPARATED BY A MINUS, '−', AND WEST LONGITUDES ARE DENOTED BY A LEADING MINUS SIGN. MINUTES NEED NOT BE ENTERED IF ZERO. HOWEVER, IF DEGREES ARE ZERO, A ZERO MUST BE ENTERED. THE TRACKS OR PARTS OF TRACKS THAT OCCUR IN AREAS OUTSIDE THE LOCAL AREA WINDOW WILL NOT BE DISPLAYED. ONCE THE LOCAL AREA WINDOW IS SET, IT AFFECTS ONLY THE FIRST FOLLOWING DISPLAY.

GTIMEF - DSPLAT

ENTER AN INTEGRAL TIME IN MINUTES THAT THE GLOBAL TIME WINDOW IS TO END AT. TRACKS OR PARTS OF TRACKS THAT OCCUR AT TIMES AFTER GTIMEF WILL NOT BE DISPLAYED (UNLESS THE LOCATE COMMAND IS USED). THE GLOBAL TIME WINDOW IS USED AT ALL TIMES EXCEPT THE FIRST DISPLAY FOLLOWING THE SETTING OF THE LOCAL TIME WINDOW.

GTIMEI - DSPLAT

ENTER AN INTEGRAL TIME IN MINUTES THAT THE GLOBAL TIME WINDOW IS TO BEGIN AT. TRACKS OR PARTS OF TRACKS THAT OCCUR AT TIMES BEFORE GTIMEI WILL NOT BE DISPLAYED (UNLESS THE LOCATE COMMAND IS USED). THE GLOBAL TIME WINDOW IS USED AT ALL TIMES EXCEPT THE FIRST DISPLAY FOLLOWING THE SETTING OF THE LOCAL TIME WINDOW.

TIMEF - DSPLAT

ENTER AN INTEGRAL TIME IN MINUTES THAT THE LOCAL TIME WINDOW IS TO END AT. TRACKS OR PARTS OF TRACKS THAT OCCUR AT TIMES AFTER TIMEF WILL NOT BE DISPLAYED (UNLESS THE LOCATE COMMAND IS USED) IF THE LOCAL TIME WINDOW IS USED. ONCE THE LOCAL TIME WINDOW IS SET, IT AFFECTS ONLY THE FIRST FOLLOWING DISPLAY.

TIMEI - DSPLAT

ENTER AN INTEGRAL TIME IN MINUTES THAT THE LOCAL TIME WINDOW IS TO BEGIN AT. TRACKS OR PARTS OF TRACKS THAT OCCUR AT TIMES BEFORE TIMEI WILL NOT BE DISPLAYED (UNLESS THE LOCATE COMMAND IS USED) IF THE LOCAL TIME WINDOW IS USED. ONCE THE LOCAL TIME WINDOW IS SET, IT AFFECTS ONLY THE FIRST FOLLOWING DISPLAY.

DT - DSPLAT

ENTER AN INTEGRAL TIME INCREMENT (DT) IN MINUTES. DT IS USED IN A NUMBER OF PLACES. WHEN THE 'F' AND 'B' COMMANDS OR FUNCTION KEYS ARE USED, DT IS THE AMOUNT THAT THE TIME WINDOW IS MOVED FORWARD OR BACKWARD. DT IS USED IN DEFINING A RADIUS; THE SPEED IS MULTIPLIED BY DT TO GIVE A RADIUS OF THE RESULTING CIRCLE. DT IS THE TIME INCREMENT BETWEEN POINTS OF A TRACK GENERATED BY THE 'K' FUNCTION KEY.
SPEED FOR RANGE, BEARING, TIME - DSPLA

ENTER AN INTEGRAL SPEED IN KNOTS TO BE USED AS THE SPEED OF THE CRAFT FOR CALCULATING TIME OF TRAVEL BETWEEN THE POINTS OF THE TRACK IN THE TRACK STACK.

TRACK NUMBER - DSPLA

ENTER A 3 DIGIT INTEGER WHICH WILL BECOME THE TRACK NUMBER OF THE TRACK. THE NUMBER SHOULD BE UNIQUE. TRACK NUMBERS ARE LISTED ALONG WITH OTHER TRACK HEADER INFORMATION WHEN DISPLAYING THE TRACK FILE. AN EDITING FEATURE IS AVAILABLE FOR CHANGING THE HEADER AND TRACK DATA WHEN DISPLAYING THE TRACK FILE.

TRACK ALTITUDE - DSPLA

ENTER THE ALTITUDE OF THE CRAFT GENERATING THE TRACK. THE ALTITUDE SHOULD BE AN INTEGRAL NUMBER OF FEET AND WILL BE KEPT CONSTANT THROUGH TRACK GENERATION.

INITIAL TRACK TIME - DSPLA

ENTER THE TIME OF THE INITIAL POINT OF THE TRACK AS AN INTEGRAL NUMBER OF MINUTES. SUCCEEDING POINTS WILL BE A TIME ‘DT’ AFTER THE PRECEDING POINT. DT (TIME INCREMENT) MUST BE SET PRIOR TO GENERATION OF A TRACK AND IS CHANGED BY COMMAND.

SCALE - DSPLA

ENTER THE FACTOR BY WHICH DISPLAYS ARE MAGNIFIED OR REDUCED AS THE NUMBER OF DEGREES AND MINUTES WHICH ARE TO CORRESPOND TO 1-00 DEGREES IN THE OLD DISPLAY. DEGREES AND MINUTES ARE TO BE SEPARATED BY A MINUS, ‘-’. THE DISPLAY WILL BE MAGNIFIED OR REDUCED BY A FACTOR OF THE NEW SCALE VALUE WHenever A MAGNIFY OR REDUCE COMMAND IS EXECUTED.

NUMBER OF LINES PER PAGE - DSPLA

ENTER THE NUMBER OF LINES PER PAGE FOR FILE DISPLAY AS AN INTEGER NUMBER. DEFAULT PAGE SIZE IS 20 LINES. NOTE THAT AS THE TYPE SIZE IS DECREASED, THE MAXIMUM NUMBER OF LINES PER PAGE INCREASES, AND VICE VERSA.

FILE CODE - DSPLA

TO VIEW ONE OF THE ABOVE LISTED FILES, ENTER THE CORRESPONDING FILE CODE. SUBFILE CODES MAY NOT BE ENTERED EXCEPT WITHIN THE VIEWING OF ITS PARENT FILE. ONCE THE FILE IS DISPLAYED, USE ‘F’ TO VIEW SUCCEEDING PAGES; ‘B’ TO VIEW PRECEDING PAGES; ‘R’ TO RETURN FROM VIEWING THAT PAGE; ‘E’ TO EDIT A LINE; ‘Q’ TO QUIT VIEWING; ‘C’ TO RETURN TO COMMAND MODE IN DSPLA; AND ANY SUBFILE CODES TO VIEW SUBFILES. TYPE SIZE MAY BE CHANGED BY COMMAND OR FUNCTION KEY. TEKTRONIX 4012 TERMINALS MUST USE TYPE SIZE1.
Appendix B
Memory Structure

B-1
The following is a list of the most important relations and basenode types in the demonstration system. The format used is \(<\text{BASENODE TYPE}\> \langle\text{RELATION which descends from that type}\>\).*

Platforms have NAME, CLASS, CATEGORY, TYPE, MEDIUM, MAX-SPEED, CRUISE-SPEED, HOSTILITY, WARLIKE, SIGHTINGS, FIRST-SIGHTING, LAST-SIGHTING.

Sightings have LATITUDE, LONGITUDE, TIME, COURSE, SPEED, RANGE, BEARING, SOURCE, MESSAGE, SUCCESSOR.

Storms have VERTICES.

Merchantlanes have VERTICES, START, DESTINATION, TO-PORT, FROM-PORT.

Vertices have LATITUDE, LONGITUDE.

The technical data base uses relations much like those of platforms, with the following changes: there are no sightings, and all relation names are prefixed with T, e.g. TYPE becomes TTYPE.
These are the oracles that are defined for the demonstration system.

(PRQ (PRMT)
(PRINI

" EXPLAIN is provided to allow you to ask questions about the contents
of the data base (memory) and how they got there. Question forms are:

1. WHO is
2. WHAT is
3. WHOSE
4. WHERE is
5. WHY
6. Is
7. Tell me about
8. Display command level
9. OK
10. Zap
11. Help
12. Miscellaneous (not a command, but further information)

Typing a carriage return to a QUESTION ? prompt will cause an exit
from EXPLAIN.

For further information about a particular query form, type its number.
Type 0 to leave Help.
"
)

  (PRINI

"WHO is
Format: WHO is (THE,A,AN) <RELATION> (OF) <ITEM>
[a, an, the, and of are optional]

Examples: WHO is LESS-THAN 7
WHO is INSIDE STORM0003
Some relations do not require that an item be specified. At present, these are INSIDE-A-MERCHANTLANE and REACHABLE-BY-A-COMBATANT. For these relations, the command looks like

```
WHO is INSIDE-A-MERCHANTLANE
```

For related queries, see WHOSE and WHAT.

```
(GO HE1))
((EGP PRMT 2)
(PRIN1

"WHAT is
Format: WHAT is (THE, AN, A) <RELATION> OF <ITEM>

Example: WHAT is THE LATITUDE OF POSITION0312

As with WHO, the, an, a, and of are optional, and an item is not required with the relations REACHABLE-BY-A-COMBATANT and INSIDE-A-MERCHANTLANE.
```

```
(GO HE1))
((EGP PRMT 3)
(PRIN1

"WHOSE
Format: WHOSE <RELATION> is <ITEM>

WHOSE is roughly the inverse of WHAT, e.g. if WHAT is THE POSITION OF SIGHTING0027 is answered with POSITION0026, then WHOSE POSITION is POSITION0026 will answer SIGHTING0027.
```

```
(GO HE1))
((EGP PRMT 4)
(PRIN1

"WHERE is
Format: WHERE is <OBJECT>

Example: WHERE is CONTACT7

Acceptable objects are platforms, merchantlanes, and storms.
```

```
(GO HE1))
((EGP PRMT 5)
(PRIN1

"WHY
Format: WHY <NUMBER>

Example: WHY 3

In reply to WHO, WHAT, WHOSE, and some Tell me about questions, you will be presented with a numbered list of answers. To follow the derivation of any of these, ask WHY followed by the number of the answer of interest. You will then be given a list of
productions, if the answer was deduced by the system (not taken from a message or the technical data base). If such a list appears, you can do a WHY to it to view the information which enabled the rule. The chain of WHYs may be extended indefinitely, alternating between data and rules. See the OK and Zap commands for further refinements.

")

(GO HE1)
((EGP PRMT 6)
(PRINI

"Is"

Formats:  
Is (THE, A, AN) <RELATION> (OF) <ITEM> <ITEM>
Is (THE) <ITEM> (A, AN, THE) <RELATION> (OF) <ITEM>
Is (THE) <PLATFORM> (A) <ID INFO>

Examples:  Is THE LATITUDE OF POSITION0035 -1.22
Is RADAR THE SOURCE OF SIGHTING00342
Is KYNDA2 HOSTILE

Is checks to see if a given assertion is in the data base. A, an, the, and of are optional. Is is fairly flexible in format, to allow more natural phrasing. In addition, identification information (name, class, category, flag, medium, type, hostility, etc) is directly available, without the need to give the intervening relation.

")

(GO HE1)
((EGP PRMT 7)
(PRINI

"Tell me about"

Format:  
Tell me about <SOMETHING>
Tell me about <GROUP> <NUMBER>

Examples:  Tell me about MERCHANTS
Tell me about RULE 5

Tell me about is probably the most flexible command. In the first format, you may ask about a wide range of things, including ITEMS, PRODUCTIONS (RULES), or any subtype (MERCHANTS, COMBATANTS, CONTACTS, PATROLS). Using the second format, you may examine the details of a particular message or rule (production) referred to by number.

")

(GO HE1)
((EGP PRMT 8)
(PRINI

"Display command level"

Format and example: Display command level

If you have a display available, this pseudo-query will give access to the top level of DSPLA, to permit drawing rhumb lines and such like. If you are running on a Tektronix in single terminal mode, you will have to give the top level DSPLA command G to return to
EXPLAIN.

"OK
Format and example: OK

OK is a useful part of the WHY feature. WHY functions by maintaining a context stack of 'active' answers. OK pops this stack to allow you to ask about a different answer in a list you've already asked WHY of.

"Zap
Format and example: Zap

Zap is the ultimate OK. It clears the WHY context stack completely.

"HELP
Format and example: HELP

HELP calls the help function that you're presently in.

"Information in the data base is represented in the form <ITEM> <RELATION> <ITEM>

Most explanation facilities are geared to letting you find out what is in one of these slots, given fillers of the others. For instance, WHO and WHAT return the first ITEM in all assertions whose RELATION and second ITEM are those given. WHOSE returns a second ITEM, given a RELATION and a first ITEM. IS will respond to the presence of absence of a fully specified assertion in the data base.

EXPLAIN has been designed to make user interface relatively easy. At most points, typing ? will give a list of possible next entries, and ESC may be used to complete unambiguous works, or fill in unambiguous characters. To help the system function properly, please give it time to do its job. Unacceptable characters are not echoed (the bell rings), as is the case with excessive typeahead. If asked to [confirm], type a space. Please end questions with a carriage return.

")

"
"Sorry, I don't understand what you want.
Please try again.
"
