NAVY OCCUPATIONAL TASK ANALYSIS
PROGRAM DEPARTMENT
NAVAL MILITARY PERSONNEL
COMMAND
FOREWORD

This Handbook for Construction of Task Inventories for Navy Enlisted Ratings was produced for the Navy Occupational Development and Analysis Center (NODAC). The objectives for developing such a handbook were two-fold: (1) to provide NODAC with a documented record of current task inventory development procedures, to be used both as an on-the-job training resource and an institutional memory, and (2) to identify potential improvements to existing NODAC procedures from research, analysis, and current practices of other job/task analysis organizations.

Funding for the development of the handbook was provided by the Occupational Systems Department of the Naval Military Personnel Command (NMC-5). The handbook was written by Diane M. Ramsey-Klee, Ph.D. of R-K Research and System Design under Contract N06001-80-C-0455 with the Navy Personnel Research and Development Center. Marjorie H. Royle was the technical monitor.

CDR J. L. Todaro
Officer-In-Charge
Navy Occupational Development and Analysis Center
ACKNOWLEDGMENTS

The procedural guidelines contained in this handbook have been formulated from many information sources as reflected in the size of the Annotated Bibliography. Eight references were particularly valuable for their content and format ideas, and they are cited below.

Job and task analysis handbook (TRADOC PAM 551-4[T]). Fort Monroe, VA: HQ, United States Army Training and Doctrine Command, August 1979.

During the course of this contract, a number of military organizations engaged in occupational analysis were visited to gain firsthand knowledge of current procedures in job/task inventory construction and current military uses of occupational survey data. Two visits were made to the U.S. Air Force Occupational Measurement Center (USAFCMC) to gather resource material about how the USAF conducts its occupational surveys. The second of these trips was to attend an International Occupational Analysts' Workshop hosted by USAFCMC at Randolph AFB, TX. During these two visits, USAFCMC personnel were especially helpful and sharing of their experience and expertise. In particular, I want to acknowledge the assistance of Dr. Walter E. Driskill, Chief of the Occupational Analysis Branch; LT COL (Dr.) Jimmy L. Mitchell, Head of the Airmen Analysis Section; Paul M. DiTullio, Head of the Management Applications Section; Gerald R. Clow, Head of the Inventory Development Section; CAPT Gary Patterson; CAPT Linda Wielhorst; and CMSGT Robert Wing.
Insight into how job and task analysis is performed in the United States Army, particularly in relation to the Instructional Systems Development (ISD) process, was provided by Bernard Silverberg, U.S. Army Training Developments Institute, Fort Monroe, VA. Darrell Worsteln, U.S. Army Soldier Support Center, Alexandria, VA, contributed further useful information.

Valuable information also was provided by CAPT Ralph Anzelmo, Office of Manpower Utilization, United States Marine Corps, Quantico, VA concerning the USMC program in job and task analysis.

Two individuals from the Navy training community provided both their time and extensive resource materials and ideas for this handbook. I wish to thank John Lang, CNET (N-9), Pensacola, FL; and George Matthews, NAVEDTRA-PRODEVCEN, Pensacola, FL.

Many individuals interviewed at NODAC contributed ideas, made suggestions, and later helped work out the confusions and inconsistencies that surfaced during the final writing stage. Early guidance was provided by LCDR Harry Kellner, Director of NODAC's Data Collection Division, and ETCH Michael Bottle of this same division who authored the internal NODAC manual "Task Inventory Development Procedures," February 1981. Subsequent to their departure, LT James Pereira and PNCH Merle Krueger, their replacements, and LT Chris Holm of the Data Collection Division spent many hours in review of the draft and in consultation on changes.

My special appreciation is extended to a number of individuals who provided guidance and support throughout the project. First, to Maurice (Mike) Callahan, NMPC-5, for his early recognition of the need to document NODAC's operational procedures, and to CDR John D. Holland, previous Officer-In-Charge of NODAC, for his support in carrying out the initial intent of the contract. CDR Jeanne K. Todaro, the new Officer-In-Charge of NODAC, encouraged a climate favorable to the introduction of innovations and changes that would benefit the way that NODAC fulfills its mission. Hopefully, this handbook has kept faith with the expectations of all these individuals who had a stake in the outcome.

My final acknowledgment of credit due goes to Marjorie H. Royle, Navy Personnel Research and Development Center (NPRDC) as the technical monitor on this contract for her always timely response to a multitude of requests for references, clarifications, and guidance. Other valuable insights were provided by Dr. John J. Pass, NPRDC and currently Technical Director of NODAC, through his assessment of survey sampling strategies and rating scale design, and his understanding of the potential contribution of the contents of CNET training importance surveys to the design of future NODAC occupational surveys.

CHAPTER 1
INTRODUCTION
INTRODUCTION

The primary objective of the Navy Occupational Development and Analysis Center (NODAC) is to collect, process, and analyze occupational information about the job content of enlisted ratings and officer specialties in the United States Navy. This information is used as the major basis for making decisions related to the occupational classification structure of the Navy, the design of training curriculums, enlisted advancement requirements, manning determinations, and future manpower/hardware interface requirements. The procedures followed by NODAC in conducting occupational analysis for the most part have gone undocumented, with the notable exception of a recent manual describing "Task Inventory Development Procedures" (February 1981). This procedural guide was prepared by NODAC to meet two needs. First, the loss of an experienced task inventory developer can have a serious negative impact on NODAC's program in that the expertise acquired by this individual is no longer available either in written or spoken form. Further, there is a need to train new people, as they are hired or transferred into NODAC, in the basic information and techniques required in task inventory development. In the past, this training has been accomplished primarily by on-the-job experience.

Purpose

The purpose of this handbook is two-fold. First, it presents a general structure for documenting all of the occupational survey and analysis procedures performed by NODAC. Second, it documents in detail the first stage of the NODAC enlisted occupational survey and analysis process. Not only are current procedures documented, additional procedures used by other military services and government agencies are described as well where they could prove to be of benefit to NODAC. The long-term objective is to develop a handbook or set of handbooks that can be maintained and updated on a periodic basis to incorporate new knowledge and techniques, in order to provide the best current information and guidance to NODAC task inventory developers and occupational analysts.

Scope

Figure 1-1 presents a flowchart of the NODAC occupational survey and analysis process for enlisted ratings. The overall process can be broken down into three major stages: (1) construction of a NODAC task inventory for a particular enlisted rating, (2) administration of the inventory to a sample of job incumbents in the rating being surveyed and processing of responses to the inventory using the Comprehensive Occupational Data Analysis Programs (CODAP), and (3) analysis of the response data and preparation of reports containing the findings of the occupational survey.
Figure 1-1. Flowchart of the NODAC Enlisted Occupational Survey and Analysis Process.
To conduct occupational surveys and perform occupational analysis, NODAC is organized into five divisions. Figure 1-2 shows the NODAC table of organization, which includes divisions to conduct both enlisted and officer surveys, automated data processing, analysis, and development and updating of occupational standards. Three divisions are directly involved in the enlisted occupational survey and analysis process. The stages at which each of these three divisions comes into play are also shown in Figure 1-2.

Ideally, handbooks documenting the procedures for each of the three stages in developing surveys of enlisted ratings as well as a handbook for development and analysis of officer surveys should be prepared. The scope of this first handbook is to document Stage 1—Construction of Task Inventories for Navy Enlisted Ratings. A companion handbook for Stage 2—Task Inventory Administration and CODAP Processing—is being prepared by NODAC.

Organization of Handbook

This handbook is organized into seven chapters plus six appendices. In addition, an extensive annotated bibliography is included after Chapter 7.

A background chapter follows this brief introduction. In it, occupational analysis in the military and civilian sectors is reviewed; a working terminology for job task analysis is established; and basic issues in task inventory development are discussed.

Chapter 3 describes past and present uses of data produced by the Navy Occupational Task Analysis Program (NOTAP) of NODAC. Historical consumers as well as recent new consumers are described. Chapters 2 and 3 are concerned with presenting historical background and philosophical issues in occupational analysis. The reader who wants to move right into a discussion of the task inventory construction process itself may skip Chapters 2 and 3. However, newcomers to task inventory development and those who desire a deeper understanding of the occupational analysis field in the military and civilian sectors should read these two chapters.

Chapters 4 through 7 present a detailed "How To" description of the various phases in developing a NOTAP task inventory booklet. An overview of task inventory development is presented first in Chapter 4. Then in Chapter 5, the first phase of task inventory development, research and work-up of information, is described. The second phase, preparation for and conduct of observations and interviews of job incumbents in the rating being surveyed, is explained in Chapter 6. In Chapter 7, the user of this handbook is guided through the third phase, an explicit set of procedural steps for developing and reviewing the task inventory booklet prior to printing and administration to ship and shore commands.

An annotated bibliography of approximately 75 publications in the field of occupational analysis is included after Chapter 7. Each reference includes a complete citation as well as a brief description of the contents of the publication. From these descriptions, the reader may choose those publications of enough interest to read in full.
The six appendices to this handbook provide reference materials of value to Navy task inventory developers. Appendix A contains a glossary of job task analysis terms with accompanying definitions. In Appendix B, definitions for common acronyms used in job task analysis are provided. A list of standard NODAC action verbs with accompanying definitions is presented in Appendix C. In Appendix D, specific guidelines for writing task statements are provided along with practice exercises. Appendix E contains specific instructions and training materials for conducting job analysis interviews. Six alternative techniques for task inventory development that may be appropriate to try out, depending on the nature of the rating being surveyed, are described in Appendix F.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY ENLISTED RATINGS

CHAPTER 2
BACKGROUND
Analysis of the world of human work provides information needed to prepare job descriptions, to devise occupational classification structures, and for decisions on the curriculum content of training programs. The level of detail required to perform each of these functions dictates the specificity needed in the occupational analysis and influences the choice of an analysis method. The primary source of job data usually is the job holder at the work site and sometimes this individual's immediate supervisor. In this chapter, the history of occupational analysis in the military and civilian sectors is reviewed, the terminology of job task analysis is introduced, and basic issues in task inventory development are discussed.

Occupational Analysis in the Military

The occupational analysis approach, or one of its variations—job analysis or task analysis, is now used by all branches of the military in the United States. It has also been used by the armed forces in Canada, Australia, and Great Britain. This wide use has encouraged the evolution of occupational analysis concepts and the sharing of survey methodology and analytic techniques. A common denominator in much of this work is the package of currently some 50 computer programs collectively called CODAP (Comprehensive Occupational Data Analysis Programs).

Air Force research into procedures for conducting job analysis by means of occupational surveys dates back to 1961 (Morsh & Archer, 1967). In 1970 the Air Training Command Occupational Survey program was combined with the USAF Occupational Testing program of the Air Force Human Resources Laboratory (AFHRL). This merger was redesignated the USAF Occupational Measurement Center (USAFOMC) in 1974. AFHRL was responsible for the initial development of CODAP, the primary set of statistical programs now used by all military services in the United States in analyzing task data. Ongoing development and refinement of the Air Force version of CODAP, which runs on UNIVAC computing equipment, has been performed by AFHRL since the initial availability of CODAP in 1963. Occupational surveys of Air Force enlisted and officer specialties continue to be performed by the USAF Occupational Measurement Center. USAFOMC currently uses a job inventory booklet that incorporates scannable columns for marking responses. USAFOMC job inventories are administered to job incumbents at their job sites by occupational survey control officers.

The Navy Occupational Task Analysis Program (NOTAP) is a Naval Military Personnel Command (NMPC) program whose primary objective is the collection, processing, and analysis of occupational information about the job content of Navy ratings (specialties). The collective term for this function is job task analysis (Callahan & Rosenthal, 1977, p. 20). NOTAP's beginnings can be traced back to early 1966 when the Secretary of the Navy's Task Force on Navy/Marine Corps Personnel Retention recommended personnel research be
undertaken through the vehicle of a five-point manpower management project that included billet analysis. In the same year a Management Information System Task Force was also established, one of whose goals was the creation of an occupational database. Exploratory development research began in FY 1967 and advanced development funding was applied in FY 1969. Callahan and Rosenthal (1977) record that "the job analysis programs of the other military services, government agencies, and civilian industry were analyzed, various methods of collecting and processing data were considered, and an introductory approach to the collection and analysis of Navy occupational data was adopted" (p. 20).

Upon the successful completion of the task analysis exploratory development effort, task analysis techniques were applied to assist in improving the utilization and training of Naval enlisted personnel in the aviation ratings. On 1 July 1973, the Navy's occupational task analysis effort was transferred from the Naval Personnel Research and Development Laboratory to the Navy Personnel Program Support Activity and assumed operational status as NOTAP. On 1 March 1976, NOTAP and the Navy Occupational Standards Department were consolidated to become the Navy Occupational Development and Analysis Center (NODAC).

NOTAP continues to be the Navy's system for performing job task analysis. Data collection is accomplished using a job task inventory questionnaire. The process of developing the task inventory instrument is described by Callahan and Rosenthal (1977) as follows.

Initially, data collection team members use secondary sources of job data, such as Occupational Standards, NEC [Navy Enlisted Classification] manuals, and rate [level of proficiency] training manuals to familiarize themselves with the work content of the rating [occupation].... The primary source of job data, however, is the man at the job site. Accordingly, the primary input to the task inventory takes place during the observation and interview of job incumbents [job holders] at the work site. Data collection team members then consolidate their findings and produce a job task inventory to be administered by NOTAP team members to a representative sample of personnel in the rating under study. (p. 21)

At the present time, all Navy ratings have been surveyed. To insure that decisions are made based on current data, ratings are resurveyed on a four-year cycle. The previous survey instrument is used as the basis for the resurvey, after it has been updated by means of on-the-job-site interviews.

After the NOTAP task inventory booklets have been team administered to a representative sample of job incumbents in the rating under study, supplemented by a mail survey of job incumbents who are not accessible to on-site administration (in order to increase the representativeness of the survey sample), respondent data provided on a separate response packet are subjected
to an optical scanning operation that transcribes the data to magnetic tapes.
The tapes then are processed by the Navy's version of CODAP which runs on IBM computing equipment. Development of an enhanced CODAP System 80 currently is being sponsored by the DoD Executive Agent for Joint Task Analysis Support because of limitations in the existing IBM CODAP system that the Navy, Marine Corps, and Coast Guard have been using. The new system will have more analytic power and flexibility, a more user-oriented display capability, and increased transportability to other DoD agencies.

The Marine Corps task analysis program is similar to NOTAP. USMC task analysts develop a job task inventory booklet based on the previous survey instrument, observation and interview at three to four different locations covering all pay grades, and the input of subject matter experts. USMC task inventories are team administered at the job site, and analysis of respondent data is performed on the basis of percentage of time spent on each task by processing the data through the IBM version of CODAP.

The Coast Guard has been conducting occupational surveys with job inventories patterned after those used by the Air Force. The Coast Guard uses a mail survey procedure for collecting occupational data by means of a task inventory questionnaire rather than administering the occupational survey to job incumbents at their job sites. Questionnaires are developed at Coast Guard service schools and reviewed by senior personnel in the ratings before mail-out. Inventory returns historically have been processed by a system of the Coast Guard's own devising in combination with the IBM version of CODAP.

The Army's activities in occupational analysis are provided by two programs. The Occupational Survey Division of the U.S. Army Soldier Support Center conducts occupational surveys for traditional job analysis purposes to support decisions about the Military Occupational Specialty (MOS) classification structure employed by the Army. A mail survey procedure is used to collect occupational data which have been analyzed by the UNIVAC version of CODAP since 1973. Prior to 1973, occupational data were analyzed by a system devised by the Army. The other Army occupational analysis program is the conduct of training task analysis. The Army Training Developments Institute provides assistance to Army service schools and training centers in pursuing a systematic approach to instructional curriculum design. This assistance takes the form of guidelines, procedural handbooks, instructional modules for learning job and task analysis methods, and job performance aids.

Most of the military occupations in the Canadian Forces have been surveyed using occupational questionnaires. The items contained in Canadian questionnaire booklets are presented simultaneously in both English and French, and responses are marked on a separate response packet. As more members of the Hispanic or other ethnic minority populations are recruited into the armed forces, bilingual occupational inventories may become an option to consider in this country as well. Administration of Canadian occupational surveys is supervised by personnel from the Directorate of Military Occupational Structures because their questionnaires are long and complex, requiring three and one half hours to complete. The Canadians have modified the IBM version of CODAP to meet their needs and added other programming features tailored to their application. They currently are testing the new CODAP System 80 as a potential improvement over their existing
computer analysis capability. A Canadian Forces-U.S. Air Force exchange program in occupational analysis has recently been established.

The task analysis program of the British Royal Navy is structured similarly to that of the U.S. Navy. They use the IBM version of CODAP to analyze response data to their task inventories and have expressed interest in the new CODAP System 80 as a vehicle to upgrade their computer analysis capability. Training management systems at three of the Royal Navy's apprenticeship training establishments have been studied using CODAP to analyze data gathered by questionnaires.

The Australian Armed Forces have developed many task inventories. These survey instruments generally are patterned after those used by the U.S. Air Force. One CODAP processing center located in Canberra analyzes task inventory response data for all branches of the Australian Armed Forces—the Army, Navy, and Air Force. In each of the three services, an occupational analysis section develops survey instruments tailored to the unique features of that branch of the Australian military. A standardized method of administering these surveys to job incumbents at the job site is followed. In addition to the routine administration of periodic occupational surveys, special occupational studies are also conducted using CODAP. Officers from the Australian Armed Forces are assigned to tours of duty working with the U.S. Air Force occupational research program.

The CODAP-based military job analysis systems described above have had their greatest impact on personnel and training programs in terms of providing an occupational information database and systematic analysis of that database to assist managers in making decisions concerning how jobs are structured, how they should be organized and defined, and what training is both necessary and relevant.

Occupational Analysis in the Civilian Sector

The civilian sector has not experienced as much urgency or impetus to systematize occupational analysis procedures as has the military sector. McCormick (1976) in his review of the early study of human work concluded that "Of the various deficiencies of conventional job analysis procedures, probably the sharpest criticism is that the typical essay descriptions of job activities are not adequately descriptive of the jobs in question, especially in the case of jobs that deal primarily with decision and communication activities..." (p. 654). Earlier practices of the United States Training and Employment Service typify conventional job analysis procedures in which the job analyst's skill in verbally describing the job as it exists in its actual setting determined the validity and usefulness of the job description. Subsequently, the United States Training and Employment Service shifted to a functional occupational classification approach, the results of which are reflected in the current edition of the Department of Labor's Dictionary of Occupational Titles (1976). Data contained in the job definitions in this dictionary include information on WHAT gets done, HOW it gets done, and WHY it gets done. In addition, individual occupations are incorporated into a classification structure identified by a 6-digit code number. Other
developments in occupational analysis in the civilian sector have involved
the use of structured questionnaires or taxonomies such as the Position
Analysis Questionnaire (PAQ), which provides for the analysis of jobs in
terms of worker-oriented job elements (McCormick, Jeanneret, & Mecham, 1969),
and the Occupation Analysis Inventory (OAI), which provides more descriptive
specificity than the PAQ while retaining applicability to the entire occupa-
tional spectrum (Cunningham, Tuttle, Floyd, & Bates, 1971). One current
research approach in this area is to develop a relatively short inventory
that will be applicable to a range of jobs.

An important recent contribution to a systematic and quantitatively
oriented approach for developing more effective procedures to identify valid
and necessary curriculum content has come from The Center for Vocational
Education at The Ohio State University. An extremely readable five-volume
description of procedures for constructing task inventories, surveying the
task performance of civilian occupations, and analyzing survey data to aid
curriculum planners and developers in determining the appropriate performance
content for job training has resulted from this Center's programmatic re-
search effort (Ammerman & Pratzner, 1977). The procedures are intended to be
of value to both occupational curriculum personnel and those persons con-
cerned with noncurriculum issues of occupational description and updating of
job content information.

The Bureau of Intergovernmental Personnel Programs (BIPP) of the U.S.
Civil Service Commission (now the Office of Personnel Management) has issued
a set of three publications providing guidance to state and local governments
in conducting job analysis for a variety of purposes in the civilian sector.
One of these publications (Job Analysis: Developing and Documenting Data,
1973) is a guide to preparing for and conducting a job analysis. Examples of
how the job analysis can be used are also included in this reference. The
Office of Personnel Management (OPM) has taken a quite different approach to
task analysis than that followed by the military. This civilian agency
typically uses complex, multi-part task statements that would be difficult to
analyse by CODAP, and does not subject its task response data to any computer
analysis. The present level of analysis consists of using task data to write
position descriptions. Recently OPM has experimented with the use of CODAP
in cooperation with NODAC.

The most recent adaptation in the civilian sector of the U.S. Air Force
CODAP approach to occupational analysis has been accomplished by Prince
George's County, Maryland. This county government has developed a computer-
ized method of job analysis for personnel management called "TI (Task Inven-
tory): CODAP" through a process utilizing task inventories descriptive of
the total work domain to determine the specific tasks performed by each
employee (Gambarrella & Alvord, 1979). The motivation for this effort
was the usefulness of a systematic method of job analysis for many different
areas of personnel administration, including job classification and pay, more
efficient work assignment and distribution, recruitment, performance evalua-
tion, job training, and productivity. The "TI: CODAP" manual developed by
this Maryland county agency is intended to provide an understanding of CODAP
methodology and detailed instructions for the system's installation for those
administrators in other jurisdictions who are serious about using CODAP to
construct a systematic approach to their personnel management operations.
The Terminology of Job Task Analysis

The terminology of job task analysis reflects a hierarchical taxonomy of human work. In a hierarchical taxonomy of human work, occupational components are classified into a graded arrangement that reflects levels of specificity starting from the very general and going to the more specific, with the specific always being included in the general. The hierarchical arrangement starts with an occupational field as the most general level and progresses through the job level to several levels of greater specificity. Figure 2-1 shows the progression from the most general level to the most specific level in the Navy enlisted occupational hierarchy. In Navy enlisted job task analysis, the next most general level after the occupational field itself is a rating within an occupational field. Sometimes closely related jobs within a rating are grouped into a job community or job cluster. If this is the case, then the job community/cluster becomes the third most general level in the hierarchy. Moving down through the hierarchy, the job then becomes the next level. Duty categories are the major subdivisions of a job. Within duty categories, tasks constitute the next most specific level of behavior in a job. Duty categories provide a meaningful way to organize task statements so that both the inventory respondent and the occupational survey analyst have a structured and logical way to look at jobs. A task element is a subdivision of a task whose level of complexity is directly subordinate to the task itself; sometimes called a subtask (Air Force usage). The Navy enlisted occupational hierarchy, then, starting from the most general term and going to the most specific term, is OCCUPATIONAL FIELD, RATING, JOB COMMUNITY/CLUSTER, JOB, DUTY, TASK, and TASK ELEMENT.

Appendix A contains a glossary of job task analysis terms in common usage. Because of their central importance to this handbook, certain definitions in the glossary are repeated here that pertain to the Navy enlisted occupational hierarchy.

OCCUPATIONAL FIELD

A group of persons who are engaged in closely related occupations (professions and/or vocations). The allied health care field, for example, consists of physicians, nurses, nurse practitioners, medical technicians, medical therapists, orderlies, etc. Examples of Navy enlisted occupational fields are administration, construction, marine engineering, aviation maintenance/weapons, and ship maintenance.

RATING

An enlisted occupational specialty in the Navy made up of duties calling for closely related skills, knowledge, abilities, and aptitudes. The rating is the basic occupational unit used in carrying out the personnel actions of selection, training, classification, and assignment.
JOB COMMUNITY/CLUSTER

A group of persons who perform identical or closely related jobs within a rating. Job communities are characterized by NECs, primary duties, systems or equipment, skill levels, platforms, and any unique features of the family of tasks involved. In the Navy, service ratings are one example of job communities.

JOB

The duties and tasks performed by a single worker constitute his or her job. If identical duties and tasks are performed by several individuals, they all hold the same job.

DUTY

One of the major subdivisions of work performed by one individual, generally performed according to a prescribed method to meet a set standard. One or more duties constitute a job. A duty normally exists in one functional area and is characterized as follows: (1) it is a recognized segment of a job that occupies a principal portion of a job incumbent's work time, (2) it occurs repeatedly and/or frequently in the work cycle, and (3) it involves work requiring closely related skills and knowledge.

TASK

A unit of work that occupies a significant portion of work time spent in the performance of a duty. It is the most specific level of behavior in a job and describes the performance of a meaningful job function in terms of a specific action applied to a particular object. The behavior must be observable, have a definite beginning and end, and result in a completed work action or a measurable work product.

TASK ELEMENT

A subdivision of a task whose level of complexity is directly subordinate to the task itself. A task element is a distinct and constituent part of a task, constituting a logical and necessary step in the performance of the task. Performing a task element does not result in a completed work action or a measurable work product. It is the smallest unit of work contained in the job that is considered in job task analysis. Sometimes called subtask (Air Force usage).
Figure 2-1. Navy Enlisted Occupational Hierarchy Showing the Progression from the Most General Level to the Most Specific Level.
Proficient job performance is dependent on the skills and knowledge that a job incumbent possesses. Job task analysis terms pertaining to acquired skills and knowledge are defined in the glossary of Appendix A as follows.

**SKILL**

A set of related physical and/or mental competencies capably applied to a specific task or group of related tasks. A skill requires considerable precision and is learned through extensive practice and study. It may be applied to several tasks or jobs with little or no transfer of training required. A skill implies proficiency which is measured by quality or quantity task performance criteria.

**SKILL LEVELS**

The proficiency levels (apprentice, journeyman, supervisor, and manager) of task performance.

**KNOWLEDGE**

A substantial amount of related information that can be recalled with or without the aid of documentation. Knowledge is distinguished from small amounts of unrelated pieces of information that can be rapidly learned. Knowledge in itself is not a skill, but a prerequisite for the application of skills. Skills may require recall of knowledge.

Stating the tasks of a job accurately and comprehensively helps insure that the list of task statements in a job task inventory questionnaire, used to solicit responses from job incumbents, will provide complete occupational data. Construction of good task statements is critical to the success of any job task survey. Statements of tasks should follow a certain grammatical structure, conform to certain rules, and use terminology that is generally current and meaningful to persons working in the job. Brevity and clarity are the foremost considerations. Job task analysis terms pertaining to the construction of task statements are defined in the glossary of Appendix A as follows.

**OCCUPATIONAL STANDARDS**

The minimum standards for tasks required of enlisted personnel within specific occupational entities (ratings and rates).
TASK STATEMENT

The statement of a task is composed of three basic elements: (1) a specific action verb, descriptive of what is done; (2) a brief identification of what is being acted upon—the object of the action verb; and (3) whatever qualifying phrases that may be needed to clearly distinguish the task from related or similar activities, to limit and define the scope of concern, or to communicate unambiguously what task it is.

ACTION VERB

An action verb is one of the basic elements of a task statement and is descriptive of what is being done in the task. The action verb usually is in the present tense (e.g., repair), although it sometimes appears in the gerund form (e.g., repairing). The subject of the action is understood to be "I" so that the task statement unambiguously refers to what the respondent does on the job.

Many other job task analysis terms are defined in the glossary of Appendix A. The reader is referred to this glossary for definitions of additional terms as they occur in this handbook. Definitions for common acronyms used in job task analysis are contained in Appendix B.

Basic Issues in Job Task Inventory Development

A number of basic issues in job task inventory development have not been resolved and continue to complicate decisions about how best to design occupational survey instruments. These basic issues are discussed below.

Specificity. Probably the most basic and thorniest issue in job task inventory development is the question of the level of work specificity at which task statements should be written. The level of specificity or detail that is appropriate for the task statements of a job task inventory questionnaire or occupational survey is dependent on the purpose for which the statements will be used. Greatest specificity is needed for making decisions about the curriculum content of training programs. More general statements are suitable for purposes of occupational description.

Figure 2-2 illustrates this specificity continuum for Navy enlisted job task analysis, going from the least requirement for specificity (occupational description) to the most (training task analysis). At the specificity level of occupational description, Navy enlisted occupational standards define what work job incumbents should be performing in a particular rating. At the level of job task analysis, occupational data are collected on what work job
Least \rightarrow \text{SPECIFICITY} \rightarrow \text{Most}

**Occupational Description**

- Navy Occupational Standards
  - 25-30 task statements for each pay grade of an enlisted rating, organized under 5-10 standard topic titles. Define what work job incumbents should be performing in a particular rating. USES: Development of personnel advancement requirements and advancement in rate exams, rate training manuals, correspondence courses, and "A" and "C" school curriculums; enlisted distribution and detailing; rating review board deliberations.

**Job Task Analysis**

- Navy Occupational Task Analysis
  - 250-600 task statements for any given enlisted rating contained in a NOTAP job task inventory questionnaire. Provides occupational data on what work job incumbents actually are performing in a particular rating. USES: Recruitment, selection, assignment, occupational description, rating structure and classification systems management, revision of occupational standards, "A" and "C" school curriculum design, manpower requirements determinations, personnel research.

**Training Task Analysis**

- Navy Training Task Analysis
  - Thousands of detailed, non-surveyed items for developing or updating a training curriculum. From this list are selected for training those tasks and their elements that meet the learning objectives. A recent program to conduct training importance surveys, as an adjunct to NOTAP survey data, provides valuable input for training curriculum decisions. USES: Establishes or updates the training curriculum for a particular course.

Figure 2-2. Specificity Continuum for Navy Enlisted Job Task Analysis.
incumbents actually are performing in a particular rating. If there is not a good match between what job incumbents should be doing and what they actually are doing, the discrepancy needs to be resolved. One possible explanation might be that there is a manning shortage at certain pay grades that caused job incumbents to be performing tasks either above or below their rates. A second possibility might be technological change in which the introduction of new technology in a rating has not yet been reflected in the instructional curriculums for "A" and "C" schools for that rating.

The product of job task analysis is one of the points of departure for training task analysis—the job analysis activity requiring the greatest level of specificity. Job task analysis computer printouts from NOTAP are used for assistance in the training task analysis process. Thousands of detailed task items may be written as candidates for a training task inventory, particularly for the high technology ratings that involve a wide spectrum of complex equipment and systems. However, conducting a comprehensive training task analysis is both costly and time-consuming. In addition, many of the elements identified during the detailed analysis are not selected for inclusion in the training curriculum. Therefore, an alternative approach to gathering the information needed to design an appropriate instructional curriculum has been developed. Targeted training importance surveys now are being administered to supplement traditional NOTAP surveys in pinpointing tasks, skills, and knowledge requiring training emphasis.

A specific example of the specificity continuum going from enlisted occupational standards through NOTAP task statements to training objectives is illustrated in Figure 2-3. At the least specific level of detail, an enlisted occupational standard might be stated as "Tune a gasoline engine." This occupational standard might be broken down into the three task statements shown in Figure 2-3. The second of these task statements, "Gap spark plugs," might further be broken down into a set of learning objectives for properly gapping spark plugs, three of which might be the ones shown in Figure 2-3.

The level of specificity required in an enlisted occupational survey varies, depending on the nature of the work of the rating. For example, the administration and handling of classified materials may be a duty category for the Yeoman rating and occupy a much larger percentage of time than for other enlisted ratings where compliance with security procedures represents a much smaller commitment of time. In the civilian sector, for example, "Clean up the work area" might be a specific task for a secretary or a mechanic. However, for janitors or clean-up personnel, the activity might represent a much larger work function.

Developing a task inventory in which all statements are equal in specificity may be a theoretically laudable but practically impossible undertaking. As far as possible, however, all task statements in a task inventory should be written at the same level of work specificity. Deviations from this goal should be based on the level of specificity needed in a given work situation to adequately describe the tasks performed.
Figure 2-3. Example of the Specificity Continuum Going from Enlisted Occupational Standards through NOTAP Task Statements to Training Objectives.
The fundamental question in determining an appropriate level of specificity is, Can one task inventory serve all of the purposes or uses enumerated in Figure 2-2? Cost considerations dictate that a number of purposes should be served by a single occupational survey, and certainly the amount of effort and time required by operating forces to provide job data should be kept to a minimum. While it seems highly advantageous to attempt to serve all masters with a single occupational survey instrument, a number of considerations place constraints and limitations on how much detailed task data can be collected during the administration of a job task inventory questionnaire. The specificity at which task statements can be written is largely determined by the overall length of the inventory, the amount of time available for its administration, and the good judgment of the inventory developer.

Inventory Length. Although the Navy training community has a need for a greater level of specificity in how task statements are constructed, two constraints have mitigated against administering lengthy task inventory questionnaires. The first of these constraints is the fatigue factor. Two hours is about the limit that a respondent to a task inventory booklet can be expected to provide accurate, complete, and reliable job data. A longer period of time spent in responding to an inventory tends to induce boredom and fatigue with consequent negative effects on the quality of responses obtained. Furthermore, it is not desirable to keep individuals away from their jobs for more than two hours.

The second constraint involves limitations on the number of task statements and number of respondents that can be processed at one time by the version of CODAP in use. In the new CODAP System 80, the maximum number of inventory items possible overall has been increased from 2000 to 5000, and the number of respondents that can be accommodated in a single analysis is constrained only by the storage limitations of the computing equipment being used. Older versions of CODAP have more severe limitations.

With newer versions of CODAP being able to analyze up to 5000 inventory items, the issue of optimum inventory length in relation to human factors becomes important. One study in the literature suggests a promising approach for including as many inventory items as desired while at the same time minimizing the time demands on inventory respondents. In an evaluation of the Marine Corps task analysis program, an experimental design is given for dividing a lengthy task inventory into a series of shorter, overlapping inventories (Kishi, 1976, pp. 76-80). The purpose of the mini-booklet inventory method is to reduce the total number of task statements to which any one job incumbent has to respond, that number depending upon the number of mini-booklets chosen in the experimental design. Thus, the time required to complete the inventory is greatly reduced and the job incumbent is less likely to become bored, inattentive, or unmotivated to provide accurate responses. The overlap of task statements in each small inventory booklet is designed to provide adequate samples of response to each item.
Inventory Comprehensibility. A significant proportion of Navy recruits have reading skills well below the reading difficulty level of the written materials they will encounter in training and their daily work (Duffy & Nugent, 1978). Some naval enlisted personnel, especially those in the non-designated ratings and those in some of the service ratings, may not be able to read task inventory questionnaires with sufficient comprehension to understand them fully. Therefore, it becomes essential to consider ways that task inventories can be written as clearly as possible to increase their readability. Short words should be used in preference to long words or expressions. Task statements should be as brief as possible and phrased unambiguously. Unusual words, shop talk, and technical jargon should be avoided.

Not only should task inventory items be readable for all respondents, instructions or directions for responding should be equally comprehensible. There is some evidence that this is not generally the case. In a study of the readability of the Position Analysis Questionnaire (Ash & Edgell, 1975), the directions were measured by four readability indexes. Using the Flesch and SMOG indexes, the directions were measured at the college readability level; using the Dale-Chall and FOG indexes, the directions were measured at the college graduate readability level.

In another study of the readability of the task statements and instructions in Marine Corps task inventories (Kishi, 1976), instructions were considerably more readable than the task statements (9-10 grade level for instructions vs. college graduate level for task statements) using the Dale-Chall formula. Since the instructions did not contain a large number of technical words, fewer words were rated as "unfamiliar," thus reducing the difficulty level. However, the FOG and SMOG indexes reflected somewhat greater difficulty levels for instructions. Evidently the increased sentence length in instructions outweighed any reduction in the number of words with many syllables. Because of the many inconsistencies, differences, and built-in limitations of the various readability indexes, it is hazardous to draw precise conclusions about the readability of task inventories. The author of the readability study report of Marine Corps task inventories cautioned against relying too heavily on the measurements obtained from applying readability indexes since each formula is really applicable only to the types of written material on which it was based.

Duffy and Kabance (in press) take an even stronger position with regard to the usefulness of readability formulas in their conclusions from a study testing the readable writing approach to text revision. In a series of five experiments, their results indicated that readable writing revisions can facilitate comprehension under very particular circumstances. However, the resulting changes in the readability score are not, in any way, predictive of the changes in comprehension. Thus, these authors concluded that a readability formula score is neither a good guideline nor a good criterion for producing comprehensible text. In the absence of more specific and substantial guidance on how to construct a comprehensible task inventory, the inventory developer will have to rely on the general guidelines presented here, good judgment, and common sense.
Blocking. The grouping of task statements and other inventory items into blocks can be a useful technique for organizing the contents of a task inventory if the blocking is done appropriately and the labeling of the blocks is accurate and comprehensive. Blocking, when it is used, typically is based on duty categories. Duty categories are functional areas of a job used to group related tasks. Block labels help the inventory respondent skip quickly over blocks of items that do not apply to his or her work in the rating or specialty. The respondent can answer a blocked inventory more quickly and probably provides more carefully considered responses than those to a lengthy unblocked inventory containing many tasks that the respondent does not perform. When blocking is used, a job incumbent should be able to respond to a maximum number of items in the amount of time allotted for administration of the survey. This may mean that the content of the inventory can be prepared at a greater level of detail and specificity. In addition to guiding a respondent through an inventory booklet, duty titles or block labels aid the occupational analyst in identifying job groups or clusters.

However, choosing a title or label for a duty category or block is critical. If the title/label does not accurately and completely reflect the items in the block, the respondent may skip over the block when in fact he or she may perform some of the tasks. For this reason, the U.S. Navy and Marine Corps deliberately do not include duty headings in their task inventories so that a respondent is not tempted to skip a section. However, task statements in NODAC and USMC inventories are grouped into blocks under implicit duty headings, with the rationale for this blocking being known to the NODAC and USMC task analyst.

NODAC has experimented with blocked task inventories in which the blocks were implicit or made explicit by appropriate labeling. NODAC has also experimented with an inventory format in which the items in each section were presented in a random order. Although this experimentation was not conducted in a research mode addressed to comparing which format yields better respondent data or most facilitates the subsequent analysis of respondent data, some tentative conclusions can be drawn. Duty categories provide a meaningful way to organize task statements so that both the inventory respondent and occupational survey analyst have a structured and logical way to look at jobs and the duties inherent in these jobs. Other conclusions can be drawn from U.S. Air Force experience.

The organization of U.S. Air Force job inventories relies heavily on the blocking feature, whether the block can be skipped or not. Common tasks which everyone in a particular Air Force specialty performs are placed at the beginning of the inventory. Now the remaining tasks are grouped into blocks depending on the nature of the specialty and is left up to the judgment of the USAF inventory developer. The USAF Occupational Measurement Center has opted for this inventory format because inventory developers are convinced it expedites responding to a job inventory in an allotted amount of time and because it facilitates analysis of the output form CODAP.
Sequence of Inventory Items in a Block or Section. Several methods for sequencing inventory items in blocks or sections have been used by inventory developers, and each method has certain advantages and disadvantages. Task statements should be arranged in some orderly and rational sequence such as by duty categories, by an alphabetical listing of all tasks, or by randomization. Arranging task statements by duty categories brings together similar work activities in one block. An alphabetical listing of task statements under each duty category heading tends to group together tasks in which the action verbs are similar. A randomized arrangement may force respondents to read and consider each item, rather than skipping over groups of items and failing to consider ones that they actually perform. Randomness may also make the inventory artificially difficult, however, because of the constant change in context or frame of reference required for each item.

Arranging task statements alphabetically within duty areas is the form of organization used by the USAF Occupational Measurement Center in preparing its job inventories. In NODAC task inventories, task statements are grouped in a logical sequence under standard duty category headings, although the duty categories are not identified in the inventories by either a heading or by spatial separation between groups of tasks. The preference of task inventory developers in Prince George's County, Maryland (Gambardella & Alvord, 1979, p. 26) and the U.S. Marine Corps has been to list tasks without regard to alphabetical order but in an order which either presents a logical sequence of activities or just makes good sense to both the respondent and the job analyst.

Respondent considerations in choosing a sequencing method include ease of inventory response, a tendency to skip over items, response bias, and a possible order effect (e.g., initial items may be responded to more frequently or judged to have a greater relative time spent than later ones). Research is needed in this area to determine possible respondent effects. In the absence of more specific evidence concerning how different sequencing methods might affect the quality and comprehensiveness of inventory responses, the inventory developer will have to choose an order that makes good sense and that is logical for the nature of the occupation being surveyed.

Rating Scales Used in Task Inventories. If the job incumbent responding to a task inventory is instructed to indicate only whether or not each task in the list is performed, the inventory takes the form of a simple check list. However, usually additional information is asked about each task, generally referred to as primary and secondary task rating factors. Primary task rating factors allow the respondent to indicate or rate the relevance of each task performed to the job, for example, in terms of importance, frequency of performance, or amount of time spent performing the task. A relative time spent scale usually is used in preference to a scale based on absolute time spent or percentage of time spent because job incumbents have great difficulty breaking up total time spent (100 percent) into individual percentage estimates for all tasks in an inventory. Secondary task rating factors typically elicit more subjective responses from the job incumbent about each task performed. Examples are criticality of task, difficulty of
The U.S. Air Force collects its task data by having job incumbents first check all tasks they perform now. All tasks checked then are rated on a nine-point Relative Time Spent in Present Job scale as follows:

1. Very small amount.
2. Much below average.
4. Slightly below average.
5. About average.
6. Slightly above average.
7. Above average.
8. Much above average.
9. Very large amount.

The U.S. Navy collects its task data by having job incumbents indicate the relevance of each task in the inventory booklet to their particular job by also responding to a Relative Time Spent scale, with points ranging from "Very much" (a score of 7) to "Very little" (a score of 1). The Relative Time Spent scale responses are changed into proportionalized Relative Time Spent responses for each respondent by converting the Relative Time Spent responses to percentages that sum to 100 percent for all tasks performed by an individual. In addition, for each task statement, a Percent Performing score is calculated by scoring each respondent 1 if he or she performs the task at any level (1 to 7) and 0 if he or she does not perform the task at all. Scores across all respondents then are summed, and a total Percent Performing is calculated. The new CODAP System 80 is able to accommodate any rating scale, not just relative time spent.

In a research study of methods to evaluate rating scales for stable task inventory information, Pass and Robertson (1980) concluded that the dichotomous Task Performed scale yields stable, meaningful task information from job incumbent responses. No practical gain in information was achieved from the more complex Relative Time Spent scale. These researchers felt that more informative, more efficiently collected estimates of the time spent per task probably could be based on job incumbents' ranking of a small number of the most time-consuming tasks.

In addition to collecting Relative Time Spent data, NODAC task inventories also collect data pertaining to the capacity in which the job incumbent performs the task. The respondent is instructed to indicate his or her involvement in the task (a secondary factor) by marking one of three choices: (1) I assist (helper relationship), (2) I do, or (3) I supervise.
NODAC currently is considering omitting the secondary factor task involvement rating scale from future inventories because no consumers of NODAC data appear to be using the data collected by this scale. A further argument for not collecting these data is that involvement in the task as traditionally rated does not constitute a psychometric scale. The verb "Assist" is vague and ambiguous. Assisting someone in the performance of some task usually can be expressed as another task (e.g., "Record fuel tank soundings made by supervisor" or "Hand tools up to co-worker overhauling engine of helicopter"). The verb "Supervise" is also ambiguous as it is used in the task involvement rating scale because the task itself is not what is supervised, rather the worker performing the task. For these reasons, the Air Force does not use the secondary factor scale "I assist, I do, I supervise."

Survey Sample Size. When a job task inventory questionnaire is administered for a particular rating, not all job incumbents occupying billets of that rating are sampled, unless the rating is small. In the early days of NOTAP, the job task inventory sample size typically amounted to over 60 percent of all personnel in a rating. In order to reduce the survey burden on the operating forces, sample size has been reduced to 18-23 percent, and recent research has indicated that the sample size can be reduced even further, in some cases, without compromising the validity of survey results. In a research study of methods to evaluate survey sample size for stable task inventory information, Pass and Robertson (1980) concluded that highly stable rating scale data and cluster solutions are obtainable from samples substantially smaller than those previously administered. This study's empirically developed relationship between sample size and stability can be usefully employed to determine cost-effective sampling for task inventory surveys. For example, for the large occupational populations of Navy ratings alone, use of these aids may reduce the time demands on the fleet by approximately 52,000 work-hours per cycle of inventory administration.

If an Army Military Occupational Specialty (MOS) has less than 1000 individuals in it, the complete census of the MOS is surveyed. Otherwise, a representative sample is administered the survey. If there are 3000 or fewer individuals in an enlisted Air Force specialty, the job inventory is administered to everyone in the specialty. Otherwise, a representative sample of the members of the specialty is surveyed. The Air Force is not able to take advantage of the cost benefits of smaller samples because with a small sample they would be unable to develop specialty-oriented training standards needed by the Air Force training community or know about all job variations in the heterogeneous specialties. In addition, Air Force occupational analysts believe that large sample sizes promote user confidence in the data obtained.

Methods for Administering Task Inventories. Team administration of job task inventory questionnaires has always been the preferred NOTAP data collection method because it produces a greater return of useful and accurate data. Consequently, this method is employed whenever possible, supplemented
by a mail survey of job incumbents who are deployed or at locations not covered by survey teams to increase the representativeness of the survey sample. Contact and interference with the fleet are kept to a minimum. However, since the job incumbent is the primary source of information, it is necessary to go directly to the worker at the job site.

When a mail survey procedure has to be used exclusively, fewer returns can be expected and the representativeness of the sample may be compromised. If no one is available to answer the job incumbent's questions regarding the survey booklet, directions for responding may be misinterpreted and may lead to the return of inaccurate data which are difficult to identify. As a result of these potential problems, the Navy and Marine Corps team administer their job and task inventories, although both the Army and Coast Guard have successfully employed a mail survey procedure. Diligent follow-up to maximize the percentage of returns is the key to a comprehensive survey. The Air Force administers its surveys through consolidated base offices by mailing job inventories to the occupational survey control officer at each base who then is responsible for administration.

Methods for Transcribing Task Inventory Responses to Machine-Readable Format. Various technologies are available for transcribing task inventory responses to machine-readable format. Optical scanning, usually of the mark sense variety, has been employed in the past primarily by organizations with a large number of job incumbents to be surveyed on a relatively regular basis. The high cost, compared to standard printing, of printing the special forms required for scanning has almost guaranteed that only those organizations large enough to benefit from economy of scale would employ this methodology. The speed and reliability of scanning equipment has increased significantly over the past several years, so that once the response forms are properly marked and coded, the task inventory data can be converted to machine-readable format at speeds unmatched by conventional keyed data entry. Problems encountered with the use of scanning are incompletely marked or erased responses and responses marked in a medium unreadable by the scanning equipment (e.g., a blue ballpoint pen).

Scanning has been the method of choice by military users of CODAP. When scanning is chosen, response forms must be formatted and printed to strict specifications within the capabilities of the scanning equipment to be used. Caution must be taken to design a form that is readable both by the scanning equipment and by the job incumbent who will be entering responses on the form. The U.S. Air Force uses a job inventory booklet designed and printed by MRC, Iowa City, IA. In this booklet, a set of nine scannable response columns is printed alongside of the items on each page of the inventory to make it easier to respond. The respondent does not have to mark his or her responses on a packet of scannable response sheets separate from the inventory booklet itself. Use of the MRC booklets has decreased the error rate experienced by the USAF Occupational Measurement Center since there is less likelihood that the inventory respondent will mark responses in the wrong place. However, the MRC booklets are more expensive than using a separate packet of scannable response sheets.
NODAC currently is using NCS equipment to scan a separate packet of response sheets. In order to take advantage of the cost savings attainable by printing response sheets in bulk, NODAC currently has a one to two year supply on hand. However, when this supply is exhausted and the present lease agreement for the NCS equipment runs out, NODAC will have the option of changing over to the MRC inventory booklet format in which response columns are integrated. Most military users of CODAP are constrained in their choice of a method for transcribing task inventory responses to machine-readable format by the equipment resources available within their own organization in order to minimize costs.
CHAPTER 3

USES OF NOTAP TASK INVENTORY DATA
USES OF NOTAP TASK INVENTORY DATA

The data produced by the Navy Occupational Task Analysis Program (NOTAP) of NODAC historically have been used in a myriad of ways by a multitude of consumers. Historical uses of NOTAP data are described in Callahan and Rosenthal (1977) and in Navy Occupational Analysis in the 1970's (1977). Table 3-1 summarizes past and present uses of NOTAP task inventory data. Definitions for abbreviations and acronyms used in Table 3-1 to identify NOTAP users are provided below and in Appendix B.

NOTAP data are used by the Naval Military Personnel Command (NMPC) in support of its recruitment, selection, and assignment functions. Job satisfaction data collected by NOTAP surveys are used in making policy decisions to improve retention. NMPC also uses NOTAP data to prepare descriptions of Navy enlisted ratings and officer specialties. In addition, the Rating Review Board (RRB) of NMPC uses NOTAP data and special studies as primary resources in rating structure and classification systems management (1) for NEC (Navy Enlisted Classification) validation, and (2) for making decisions to modify, combine, establish, or disestablish Navy ratings, service ratings, and NECs. A standing requirement exists for NOTAP data concerned with current and projected RRB agenda items to serve as validation for proposed changes to the existing rating structure.

NOTAP data provide the primary source of information for revision of enlisted occupational standards. One of the major users of NOTAP data is the Occupational Standards Division (Code 31) of NODAC. In turn, revised enlisted occupational standards are used by many Navy consumers for a variety of purposes as itemized below.

- The Instructional Program Development (IPD) Centers of the Naval Education and Training Command (CNET) use enlisted occupational standards for developing personnel advancement requirements (PARs) and advancement in rate examinations, rate training manuals, and nonresident correspondence courses.

- The Naval Technical Training Command (CNTT) uses enlisted occupational standards and NOTAP task inventory data to develop "A" and "C7" school curriculums.

- The Naval Military Personnel Command (NMPC) uses enlisted occupational standards for enlisted distribution and detailing.

- The Chief of Naval Operations (CNO) uses enlisted occupational standards for rating/rate management (OP-132).

- The Naval Sea Systems Command (NAVSEASYSCOM) has used enlisted occupational standards for developing the Maintenance Requirement Cards (MRCs) used in the Planned Maintenance System (PMS).

- The Naval Air Systems Command (NAVAIRSYS.COM) has used enlisted occupational standards for developing the Naval Aircraft Maintenance Program (NAMP) of the Planned Maintenance System (PMS).

The Navy training community is another major user of NOTAP data. For every Navy rating in its databank, NOTAP provides the training community with an initial package of standard CODAP computer printouts including a wide range of background data, equipment usage, task performance; and job clustering information. This initial package is often followed by a workshop in the use and interpretation of NOTAP data, and by additional computer printouts specially designed to assist in the training task analysis process. NOTAP staff personnel regularly participate in and conduct workshops for the staffs of the Chief of Naval Education and Training (CNET), the Chief of Naval Education and Training Support (CNETS), the Chief of Naval Technical Training (CNTT), and numerous service schools.

Recently NODAC has begun a new program of conducting training importance surveys to support CNET in instructional curriculum design. The contents of training importance surveys for enlisted ratings in the Navy are determined by CNET. However, the administration of these surveys and the computer analysis of the resulting respondent data are conducted by NODAC.

Navy Manpower and Material Analysis Control, Atlantic and Pacific (NAVMACLANT and NAVMACPAC) use NOTAP data in support of management and manning studies for establishing manning requirements and making manning determinations.

NODAC has supported personnel research in the Navy by providing NOTAP data to the Navy Personnel Research and Development Center (NPRDC), the Office of Naval Research (ONR), the Bureau of Medicine and Surgery (BUMED), and Navy contractors. Researchers at NPRDC have used NOTAP job satisfaction measures as predictors of retention for Navy enlisted personnel (Royle & Robertson, 1980), and NOTAP task data to develop methods for evaluating job task scales and survey sample size for stable task inventory information (Pass & Robertson, 1980). NODAC has provided job analysis information to the Office of Naval Research and has interfaced NOTAP data with Bureau of Medicine and Surgery information for a cooperative occupational analysis of the Hospital Corpsman (HC) rating. Magnetic tapes of NOTAP inventory response data have been provided to a Navy contractor for a study of taxonomic approaches to enlisted occupational classification (Ramsey-Klee, 1979).

Numerous and varied special studies have been conducted by NODAC using NOTAP data. Typically these applications are one-time studies conducted at the request of an internal Navy command. Examples of these applications are the following: (1) a study for the Office of the Secretary of the Navy of NOTAP job satisfaction and re-enlistment intent data as related to compensation and shortage of petty officers; (2) a commonality study for CNO of the Aviation Structural Mechanic (AM) rating to determine if the AMH (Hydraulic) and AMS (Structures) service ratings could be combined; (3) a study for CNO of NOTAP job satisfaction and re-enlistment intent data compared with data from the Navy's separation questionnaire; and (4) an occupational study for CNO of the Mess Management Specialist (MS) rating to compare NOTAP job satisfaction data to the ethnic origin of rating incumbents.
NOTAP data are a resource of the DoD Executive Agent for Joint Task Analysis Support and the Joint Interservice Training Committee for determining the feasibility of establishing common core training.

Aside from the uses already described, NOTAP data and expertise have been utilized in a broad variety of other ways. Analysts from NOTAP assisted the National Security Agency in setting up a similar program in that agency; the Civil Service Commission sought and received assistance in employing NOTAP methods and techniques to assist in validating the Professional and Administrative Career Examination (PACE) as a substitute for the Federal Service Entrance Examination (FSEE); NOTAP has processed civilian occupational task analysis data for the Office of Civilian Manpower Management; and the British Royal Navy patterned its task analysis program after NOTAP.

Technical support and consultation have also been provided to the Immigration and Naturalization Service in using CODAP to develop a training program and to defend their selection procedure against legal challenge; to the U.S. Park Police in using CODAP to construct a job information test employed in their promotion system and a performance rating form; and to Prince George's County, Maryland in developing TI-CODAP, a computerized method of job analysis for personnel management (Gambardella & Alvord, 1979).

New uses and requirements for NOTAP data come into being as a result of the increased use of occupational survey data by Navy manpower and personnel managers and the Navy research community. Requests for new studies are made via the Naval Military Personnel Command (NMPC-5) or by direct contact in writing to the Officer-In-Charge, NODAC.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY ENLISTED RATINGS

CHAPTER 1
OVERVIEW OF TASK INVENTORY DEVELOPMENT
OVERVIEW OF TASK INVENTORY DEVELOPMENT

Scope

Task inventory development is the first stage of the occupational survey and analysis process. At NODAC, construction of a task inventory for a particular enlisted rating consists of three major phases as shown in Figure 4-1. In Phase I, research is conducted to locate and gather all resource materials useful to the task inventory developers. In Phase II, the task inventory development team visits selected Navy commands in order to observe and interview job incumbents in the rating to be surveyed. During these interviews, they identify all the duties and tasks that job incumbents actually perform, and the equipment or systems they operate or maintain. In Phase III, the task inventory developers return to NODAC to construct the task inventory booklet. They finalize the contents of the task inventory and submit it to several levels of review, both within and outside of NODAC. When the review is complete and all necessary revisions have been made to the task inventory, a final review copy of the inventory with all recommended changes attached is routed up the NODAC chain of command for comment and final approval. The approved task inventory booklet then is prepared on printing guides, proofed, corrected, and sent to the printer. These three phases of task inventory development are described in detail in Chapters 5, 6, and 7.

Figure 4-1. The Three Phases of NODAC Task Inventory Construction for a Particular Enlisted Rating.

Phase I
- Research and Work-Up of Information

Phase II
- Prepare for and Conduct Observations and Interviews (O&I)

Phase III
- Inventory Construction and Review
Job task analysis aims at determining the nature of existing jobs in the Navy, the relationships among these jobs, and what individuals performing these jobs actually do at the job task level. When task inventory developers go out on observation and interview (O&I), they are NOT visiting selected commands to inspect the internal efficiency and effectiveness of individual operating units.

- They are NOT inspectors.
- They are NOT efficiency experts.
- They are NOT time and motion study technicians.
- They do NOT evaluate individual operating units.
- They do NOT audit standard operational procedures.
- They do NOT evaluate individual proficiency.

Failure on the part of job incumbents being interviewed during O&I to understand that NODAC task inventory developers are not visiting their command for any of the reasons listed above has been the source of some hostility and lack of cooperation in the past. "Clearing the air" on these points can have a favorable impact on the success of the O&I phase.

**Time Frame for Task Inventory Development**

The standard time frame for NODAC task inventory development is 35 weeks. The sequential development activities that take place during this 35-week period and the amount of time required to accomplish each activity are shown in Table 4-1. In Chapters 5, 6, and 7, these activities are described in detail.

CHAPTER 5
RESEARCH AND WORK-UP
OF INFORMATION
(PHASE 1)
In the first phase of task inventory development, research is conducted to locate and gather all resource materials useful to the task inventory developers. Figure 5-1 shows a flowchart of the various steps performed in Phase I. Each step is described in detail below.

Selection of Ratings To Be Surveyed

Selection of the ratings to be surveyed is made by the Commander, Naval Military Personnel Command (NMPC) and the Chief of Naval Education and Training (CNET), based on projected occupational development and review requirements for the Navy. When NMPC/CNET issues a request for an occupational survey of an enlisted rating, the machinery of task inventory development is set in motion.

Step 1 - Development of Inventory Booklet Assigned to Development Team

Responsibility for the development of the task inventory booklet is assigned to a NODAC development team when the authorization to conduct an occupational survey and analysis of an enlisted rating is received. Members of the development team are assigned from NODAC's Data Collection Division, depending on the size and location of the rating. In addition, one member each from the Analysis and Occupational Standards Divisions is assigned to the development team. The purpose of the early participation by these two analysts is to provide for a continuous flow of information to the analysts during the inventory development process.

Any individuals in the rating being surveyed who are currently on board at NODAC are designated as subject matter experts (SMEs) and serve as advisors to the project. However, they are excluded from participation until after the development team returns from observation and interview (O&I). The reason they are excluded is that they tend to be biased about the work of their rating and may overlook tasks that they consider to be routine. Instead, their expertise is drawn upon during the final construction of the inventory booklet when they are asked to provide guidance on the proper wording of task statements and other technical issues.

A senior enlisted member of the Data Collection Division is appointed as the project manager of the task inventory development team. This individual is responsible for coordinating the activities of team members and reports to the Task Inventory Development (TID) supervisor. The TID supervisor reports to the Director of the Data Collection Division on a weekly basis.
Figure 5-1. Flowchart of Phase I - Research and Work-Up of Information.
Step 2 - Conduct Research/Gather Resource Materials

In Step 2, research is conducted to locate and gather all resource materials useful to the task inventory development team. These materials are gathered from both outside and within NODAC sources.

**Outside Sources.** All rating-related information obtained from outside sources is listed in Table 5-1, along with instructions about how and where to locate the information. The first source, MAPMIS (Manpower And Personnel Management Information System), provides information about where incumbents in the rating are located geographically, broken down by service ratings and pay grades (see Figure 5-2). This information is needed to determine which job incumbents are working out of the rating, and which commands to visit during the observation and interview phase. The MAPMIS listing is obtained by filling out a Data Processing Services Request (NAVPERS 5230/34), a copy of which is shown in Figure 5-3.

The second source provides information from CNET about the "A" school curriculum for the enlisted rating being surveyed. What is requested specifically are the learning objectives for the curriculum. How the needs of the Navy training community are addressed by NODAC occupational surveys is discussed in Chapters 2 and 3 of this handbook.

A third source of information is the input requested from NODAC's primary and technical advisers, the Navy training community, and the Chief of Naval Operations (OP-13). A copy of the previous task inventory booklet for the rating is sent to the appropriate Navy warfare command (Submarine, Surface, or Air), the appropriate systems command (Sea, Air, or Supply), CNET (N-9), CONNAV, CONAVEDTRAPRODEVCEN, and CNO (OP-13), along with a letter requesting any changes or additions desired by these advisers. These commands have a second opportunity later in Phase III to review the final draft of the updated task inventory booklet and to suggest further revisions.

A fourth potential source of useful information are the manuals prepared by manufacturers of equipment or systems being used in the rating, particularly manuals for newly introduced equipment or systems. The introduction of new equipment or systems into the work of a rating is a sign to the task inventory development team that old sources of information may be out of date. In this case, it may be desirable to telephone or write the manufacturer to request a copy of any available documentation for the equipment or system. The types of documentation that are likely to be available include engineering, maintenance, operating, and technical manuals.

**NODAC Sources.** All rating-related information obtained from NODAC sources is listed in Table 5-2, along with instructions about how and where to locate the information. Information about the work of the rating can be found in current occupational standards; the task titles listing; the previous task inventory booklet; the Job Dec for Rate; previous task inventory common coding; the previous NODAC Occupational Brief; and previous trip reports or correspondence relating to the rating. Additional sources are the rate training manuals, applicable course manuals, applicable personnel qualifications standards (PQS) manuals, all of which are available in the Code 21 Technical Library. A new source of information to be utilized is a training importance survey that may have been conducted for the rating.

</table>
Development Plan. At this point it should be possible for the task inventory development team project manager to formulate a plan for developing the task inventory booklet. The development plan is a management tool that contributes to efficient use of resources when constructing a task inventory booklet." During the book building process, the development plan provides a ready reference to "where you are, where you are going, and where you have been." The plan should contain at least the following elements:

- Time Frame for Task Inventory Development (see Table 4-1).
- Work Assignments for Members of the Task Inventory Development Team.
- Planned Ways to Coordinate the Workload.

The task inventory development plan should be documented and filed in a project summary file. It is the first piece of documentation for an audit trail of the task inventory development process for the rating being surveyed. It is the responsibility of the project manager to initiate, add to, and maintain the project summary file throughout the entire development process in order to ensure that complete information is available.

At the end of Phase III of task inventory development, a file is prepared in order to document which commands were selected for observation and interview, task inventory organization, additional survey background information, survey sample and expectations, and any problems encountered.

Step 3 - Meeting with Enlisted Community Manager

A meeting is held with the cognizant Enlisted Community Manager (ECM) for the rating being surveyed. The purpose of this meeting is to inform the ECM of NODAC's planned survey for updating the occupational data of an enlisted rating under that ECM's purview and to determine additional survey requirements. The NODAC task inventory development project manager attends this meeting with the two representatives to the team from the Analysis and Occupational Standards Divisions.
Step 4 - Work-Up of Information

In Step 4, the resource materials located and gathered in Step 2 are assembled and organized. Each category of information is described below.

Geographic Location/NEC Listing (MAPMIS 1221-4000 UR). A partial example of MAPMIS 1221-4000 UR is shown in Figure 5-2. This example also shows where the various categories of information can be found in the listing. Individuals identified in this listing to be working out of the rating are highlighted. These individuals are instructors, recruiters, rating incumbents in correctional facilities, or those working in special out-of-rating assignments, for example, individuals assigned to the Human Resource Management Detachment (HRMD) or the Counseling and Assistance Center (CAAC). These individuals are not performing the usual work of the rating, and they should not be part of the survey sample.

This listing also is used to determine the geographic areas and types of commands suitable to be visited by the NODAC 0&I team. The following factors should be considered in making a final selection.

- The rating population available to be surveyed, by pay grade and by NEC.
- The sea/shore commands located in the geographic area.
- Cost to visit the geographic area.

Selection of commands within each geographic area is determined by the number of job incumbents available, broken down by command type, by NEC, and by system/job type. Command selection is tentative at this point. Final determination depends on later liaison with the commands under consideration.

Equipment and Task Lists from Previous Inventory. Determine the percentage of response to items in the equipment and task lists from the previous inventory. Two sources of information are used—the Job Dec for Rate and the previous task inventory booklet. Highlight items in the task inventory that received less than a 5% response on the previous survey as determined from the Job Dec for Rate.

Rate Training Manuals and Personnel Qualification Standards (PQS) Manuals. Rate training manuals and any available personnel qualification standards (PQS) manuals for the rating to be surveyed are located in the Code 21 Technical Library. Members of the task inventory development team are expected to read these manuals prior to 0&I to familiarize themselves with the work of the rating.

When Step 4 is completed, Phase I - Research and Work-Up of Information is concluded. The task inventory development team then moves on to Phase II - Prepare for and Conduct Observations and Interviews (0&I), which is described in detail in Chapter 6.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES FOR NAVY ENLISTED RATINGS

CHAPTER 6

PREPARE FOR AND CONDUCT OBSERVATIONS AND INTERVIEWS (O&I)

(PHASE II)
PREPARE FOR AND CONDUCT
OBSERVATIONS AND INTERVIEWS (O&I)

In the second phase of task inventory development, the task inventory development team visits selected Navy commands in order to observe and interview job incumbents in the rating to be surveyed. During these interviews, senior job incumbents review the previous task inventory booklet to determine whether its contents accurately reflect the duties and tasks that job incumbents actually perform, and they identify new tasks and equipment or systems that are not represented in the previous inventory. Figure 6-1 shows a flowchart of the various steps performed in Phase II. Each step is described in detail below.

Step 5 - Make Final Selection of Commands To Be Visited

The geographic areas and types of commands tentatively determined in Step 4 to be suitable and cost effective to visit by the NODAC O&I team are subjected to a final selection in Step 5. NODAC's tentative selection is influenced by the number of job incumbents available for observation and interview, broken down by command type, by NEC, and by system/job type. Liaison with the commands under consideration determines which of them actually are good candidates to be visited. Final considerations are any special activities going on in the command when the O&I team is scheduled to visit that would interfere with or rule out a successful O&I, and which ships will be available when the O&I team is scheduled to visit.

Historically, NODAC has conducted 12 observation and interview trips per year, roughly one per month on a staggered schedule of overlapping task inventory development for 12 ratings annually. However, with the ever increasing costs of travel, the command is considering a new policy of conducting O&I quarterly for several ratings at the same time. When the final selection of commands to be visited has been made, the task inventory development team moves on to Step 6 which is a two-part step.

Step 6A - Prepare Paper Work for O&I and Track It Through the System

This step is labeled Step 6A because it is performed at the same time that Step 6B is performed. Procedures for preparing the necessary paper work for the O&I trip are listed below.

- Draft trip origination message using the standard message format shown in Figure 6-2. The process should be started seven weeks prior to the scheduled O&I departure date.
SUBJ: NAVY OCCUPATIONAL TASK ANALYSIS PROGRAM (NOTAP) FOR _____ RATING (NHPC-5)

Figure 6-2. Standard Format for Drafting O&I Trip Origination Message (Cont.).

6-4
Fill out Temporary Additional Duty (TAD) requests using the form shown in Figure 6-3. These requests should be filled out at the same time that the trip origination message is drafted.

- Submit draft trip origination message and TAD requests for Code 21 review. Paper work then is typed by Code 11 and submitted to Code 2 for review. When Code 1 approval is obtained, Code 11 delivers the approved paper work to NMPC-5.

- Monitor progress of paper work for O&I trip to ensure timely completion and return from NMPC-5.

- Deliver signed orders to Anacostia Disbursing (Travel Section), Building 92.

- Pick up orders, Travel Requests, and per diem checks from Anacostia Disbursing. Make certain that everything is correct.

**Step 6E - Prepare and Reproduce Interview Guides and Task Inventory Booklet**

At the same time that the procedures of Step 6A are being carried out, Step 6B is also performed. A list of the procedures followed in preparing and reproducing the various O&I interview guides and copies of the previous task inventory booklet are specified below.

- The Individual O&I Interview Guide is a standard form (see Figure 6-4). Reproduce sufficient copies of this form for use during O&I (usually 100 copies).

- The Physical Standards Interview Guide is a standard form (see Figure 6-5). Reproduce sufficient copies for use during O&I (usually 100 copies).

- Reproduce sufficient copies of the previous task inventory booklet (usually 5 copies).

**Step 7 - O&I Predeployment Meeting**

In Step 7, a meeting of the task inventory development team is held prior to their deployment on O&I in order to review the preliminary contents of the task inventory booklet to be certain that it meets the objectives of the survey and the information requirements of NODAC's consumers. All members of the development team attend this meeting, including the two representatives to the team from the Analysis and Occupational Standards Divisions. A standard meeting agenda is followed, and the team project manager assigns the material to be reviewed by each team member at the meeting. All resource materials used in the familiarization process are made available at this meeting.
TAD REQUEST

Name ______________________________________ Rank/Rate/Grade ______ Officer Designation ______ Date ______

Figure 6-5. Interview Guide for Collecting Physical Standards Judgments During Observation and Interview.
The standard agenda for the 0&1 predeployment meeting is shown in Figure 6-6. The agenda covers six major topics for review and discussion. Specific points to be covered under each topic also are listed in Figure 6-6. A recorder should be appointed to document all changes from standard procedures adopted at this meeting, as well as any other significant items discussed. The documented agenda of the 0&1 predeployment meeting becomes a part of the audit trail of the task inventory development process, and is filed in the project summary file.

Any questions that may arise during the 0&1 predeployment meeting which cannot be resolved during the meeting are referred to a subject matter expert (SME) in the rating. An SME at NODAC or one in the Washington, DC area is telephoned or visited to resolve the questions.

Step 8 - Coordinate 0&I Visit to Commands Selected

In Step 8, the task inventory development team project manager coordinates the 0&I visit to the commands selected for observation and interview by performing the following procedures:

- Conduct final liaison with the commands to be visited.
- Assign specific responsibilities to 0&I team members.
- Publish the trip schedule and itinerary for all members of the 0&I team. The standard form used to prepare the trip schedule and itinerary is shown in Figure 6-7.
- Inform team members of uniform and other requirements.

Points of contact at each command to be visited are telephoned the week prior to departure to make certain that the team is expected and that the trip will go smoothly without any unexpected surprises.

Step 9 - Final Checkoff Prior to Departure on 0&I

When the task inventory development team is ready to depart for 0&I, each team member should have the following items in his or her possession.

- Orders, Travel Request, and per diem checks
- Team trip schedule and itinerary
- Previous task inventory booklet (1 copy)
- Individual Observation and Interview Guide (25 copies)
- Physical Standards Interview Guide (25 copies)
- Current Occupational Standards (1 copy)
- Note-taking paper and pencils, colored pencils or felt-tip pens for marking task inventory booklet (at least 5 colors)
AGENDA FOR 061 PREDEPLOYMENT MEETING

1. BACKGROUND
   A. Why is rating being resurveyed at this time? Are there any special or nonroutine users?
   B. Any special considerations such as possible break-out or merger of NECs, new equipment, or rating incumbents occupying the billets of other ratings?
   C. Review user requirements.

2. 061 LOCATIONS AND SELECTION PROCESS
   A. How were commands selected for 061 determined?
   B. Why were these commands considered a good source of information? Why not other commands or more commands?

3. TASK INVENTORY ORGANIZATION
   A. Background Information. What categories of information are included in the Background Section—for example, Command Status, Job Titles, Work Locations? If other information is being collected in this section, describe it and explain why. The requirement may have come from the Occupational Standards Division (Code 31).
   B. General Quarters, Watches, and Collateral Duties. Explain any exceptions to the standard list for the rating or any changes from the previous task inventory.
   C. Equipment/Tools/Systems. Specify any changes to the equipment/tools/systems list in the previous inventory and why.
   D. Task Statements. Specify any changes to the task list in the previous inventory and why.
   E. Job Satisfaction and Job Importance. Explain any exceptions to the standard list or any changes from the previous task inventory.
   F. Physical Standards. Review the Physical Standards Interview Guide (see Figure 6-5).
   G. Miscellaneous Data. Specify what miscellaneous data are being collected and why.

(Continued)

Figure 6-6. Agenda for 061 Predeployment Meeting.
4. ADDITIONAL SURVEY BACKGROUND INFORMATION
   A. Specify any additional information useful in explaining types of equipment, newness of equipment, possible overlap of jobs, a shortage of job incumbents in the rating, and so on.
   B. Specify any special locations of equipment (for example, System XYZ is only found on Class DD 963 ships--SPRUANCE Class Destroyers).
   C. Specify any changes in the work of the rating that are anticipated (for example, a new service rating is under consideration).
   D. Specify any problems existing in the fleet concerning the rating (for example, E4s reporting on board cannot adequately perform the work of their rate).
   E. Specify date of current occupational standards for the rating. Are there any special questions about the work of the rating that the Occupational Standards Division wants answered?
   F. Is a training importance survey being planned or developed for the rating? If so, when is it expected to be administered? If a training importance survey has already been conducted for the rating, indicate the date of administration.

5. O&I REQUIREMENTS
   A. Specify planned observation and interview procedures.
   B. Are there any security problems associated with conducting O&I for the rating? What changes in O&I procedures can be made to avoid these problems?

6. TIME FRAME FOR TASK INVENTORY DEVELOPMENT
   A. Is the development of the task inventory proceeding on schedule? Explain any deviations from the time schedule and why.
   B. Are there any problems with meeting the remainder of the time schedule? If so, explain what they are.

Figure 6-7. O&I Trip Schedule and Itinerary Form.
Step 10 - Conduct O&I/Compile Individual Lists of Task Inventory Items

Establishing Contacts. The first morning of an O&I trip is spent verifying schedules with activities to be visited and making any necessary changes. Normally two-person teams will visit commands to conduct interviews. This reduces the time required at any one command, and ensures that the information is gathered from more than one point of view. It also permits one person to interview a supervisor while another talks with a subordinate or builds a list of all equipment, tools, or systems that are operated, used, or repaired by people in that rating at that command. Both interviewers should not interview the same person, in a two-on-one situation.

Identifying and Selecting People to Interview. The first points of contact at a command will probably be the job supervisors. Generally they should be interviewed before talking with their workers. This helps establish the team's sincerity and credibility, and provides a better picture of the overall rating. Job supervisors have information about the job that may not be available to job holders, including items such as the order in which tasks are performed, infrequently performed but critical tasks, and clues as to which job holders may be most qualified to describe certain aspects of a job. Most supervisors leave the detailed description of work activities to their workers.

Workers usually provide factual information about their individual jobs but only limited data about a total system. Because interviewing all the workers is seldom desirable or possible, key personnel or workers with job experience in different shops or duties should be identified so that all are covered. In addition, minimum qualifications for interviewees should be specified. No interviewee should be included who has less than one month in his or her present job, and those with more experience should be selected, whenever possible.

Interviewing two or more people together, especially supervisors and subordinates, is usually not advisable, because, in those circumstances, people are more likely to say what they are supposed to do, rather than what they actually do. Group interviews are useful, however, in getting information from a number of people quickly. Group interviews could be used during O&I, near the end of a trip, to identify tasks that are done infrequently.

Selecting a Site. Interviews should be conducted in the work setting whenever possible. This puts the interviewee at ease, provides many cues to the interviewer, and helps the interviewee explain more easily all the tasks that he or she does. Unfortunately, Navy ships and shore stations are often noisy, crowded, hot, and full of interruptions. Because of this, sometimes interviews must be held outside the working area. In this case, a tour of the work spaces is especially important. As much time as possible should be spent at the actual work site.
Conducting Job Analysis Interviews. Techniques for conducting job analysis interviews are similar to those for conducting other types of interviews, although the content of the job analysis interviews may be different. Appendix E contains specific instructions and training materials on how to conduct job analysis interviews.

Although flexibility in tailoring the interview to the specific situation is important, using a standard order for structuring the interview helps ensure complete coverage. One useful order is by major duties. After asking for job title—an easy introductory question, the interviewer should ask about the duties performed. For each duty, all the tasks that are performed should be recorded. All the equipment used should be identified, along with the persons who do preventive maintenance and repairs on them. In addition, the interviewer should probe for additional tasks by asking who does the tasks before and after each task identified. The interviewer should examine reports and documents such as Watch, Quarter, and Station Bills, PMS Schedules/MRCs, PQS Schedules and Booklets, Division/Work Center Organization Charts or Procedures Manuals and obtain copies, if possible, of those that appear useful. In all cases, the interviewer should ask for clarification where necessary and follow up on unfamiliar terms, or new or unusual equipment.

When all the duties in the job have been covered, the interviewer should ask about tasks performed in collateral duties, watches, training activities, or emergency drill procedures.

For some jobs, a different order may be more appropriate, such as by duty station or work location, by system or equipment, or by time of the day or day of the week. Background information about the particular rating will be useful in selecting an appropriate order.

The team member who is compiling equipment lists should ask some interviewees, particularly supervisors, to review preliminary lists of the inventory contents, developed from previous inventories, and indicate tasks that are no longer current, equipment no longer used, or items that are incorrect or misleading. If each interviewee is given a different color pencil or felt-tip pen to use, responses from several people can be combined on one list, producing a summary record as these responses are gathered. While the equipment list is being reviewed, the interviewer can use the list of action verbs to probe for additional tasks for each equipment or system.

At some time near the end of the interview, the interviewer should ask each person to identify the most physically demanding tasks that he or she is required to perform. The majority of these tasks should be rating-related, although physically demanding tasks that are part of general shipboard duties may also be included, especially for ratings with few physical demands. For each task, the interviewer should determine as precisely as possible the specific task performed or object moved, the force required or weight of the object, and the number of people usually teamed together to do the task, as well as any special circumstances that make the task difficult. Examples of physically demanding tasks include the following:
As one of a 3-person team, remove the SSG pump (about 500 lb) from its mounting in the main propulsion space, and move it via catwalks to a vertical escape trunk (for further movement to the shop). (Electrician’s Mate)

As one of a 2-person team, drag 150 feet of aircraft fueling hose out of stowage on flight deck. (Aviation Boatswain’s Mate Fuels)

On completion of firing, hand-carry 5-inch round (74 lb) from gun mount back to magazine. (Gunner’s Mate Guns)

During a fire or flooding (emergency or drill), as one of a 2-person team, rapidly carry P250 pump (147 lb) to the scene. (General Shipboard)

The following guidelines should be used in documenting these tasks:

- Be as specific as possible about the equipment or component used. Model numbers or exact names are useful in determining weight or force required. For example, changing tires will vary greatly in physical demands depending on the particular tire.

- If power equipment or chain hoists are used, do not classify the task as physically demanding unless manual procedures are used for back-up, or physical strength is required to position the moving equipment or the object to be moved.

- Do not include general custodial chores such as moving furniture.

- Do not include working party tasks in which the demand could be reduced by carrying fewer objects at one time, or filling containers less completely. Include such tasks if the smallest reasonable load is physically demanding in itself, such as 5-inch rounds of ammunition, each weighing 74 pounds.

Descriptive information for each task should be recorded on the Physical Standards Interview Guide (Figure 6-7). The Guide has space for 20 tasks, although most interviewees will be able to provide only 5 to 10 tasks. When all the tasks have been described and recorded, the interviewee should be asked to rank them from most to least physically demanding and the ranks should be added to the Interview Guide in the column provided.

At the end of the interview, the O&I Check List (see Figure 6-8) should be used to ensure that all areas of interest are covered. Interviewers should keep it on their clipboards or in their notebooks and review it from time to time during the interview to prompt themselves to ask additional questions. They also should review it as they conclude the interviews to make certain everything has been covered. Any items of special interest for the particular rating should be added to the check list at the start of O&I.

Differences in Procedures Over the Course of O&I. An O&I trip consists of three general phases—an orientation to the rating, intensive data
O&I Check List

Have you covered?

Job Titles
	Watches

Import
	Underway

Collateral Duties

Primary Duties

All categories of Occupational Standards
	Walk-through of spaces and shops
	Walk-through of regular processes or procedures (steps, output, tools used)

Equipment

Who uses it?
	Who does PMS?
	Who repairs (to O level, MAA level, and Depot level)?
	Who does Quality Assurance?

Tools and Supplies

Who orders?
	Who issues?

Safety procedures

Emergency procedures

Training procedures

Applicable PQS

Space maintenance and upkeep

Written procedures or check lists used

Publications

Paper work or forms completed (OIC cards, etc.)

Any new equipment or procedures expected within the next year?

Physically demanding tasks

Figure 6-8. O&I Check List.
gathering, and filling in details. For the first two days, much of the time is spent in getting a general orientation to the rating and building a framework on which to put the specifics that will be gathered later. Particular attention should be paid at this point to the kinds of work that people do, and how the work is divided up by command, shop within command, NEC, and pay grade. This information will help ensure complete coverage of the rating.

The second, intensive data-gathering phase lasts about a week and includes most of the interviews. During this time much information will be collected, and facts filled in on the framework established in the first phase. Extensive notes should be taken for each interview. As soon as possible after the interviews, notes should be reviewed and details added to make the information more complete. As the interviews progress, lists of job titles, collateral duties, watches, equipments, and task statements should be coordinated among team members, and areas identified in which more information is needed.

During the final few days, most of the time will be spent checking and confirming information, adding less common tasks and equipments and elaborating areas in which there are questions. Fewer notes will be needed, and interviews may be briefer and more specific. At this stage, interviewers will need to make an extra effort to appear interested in what the interviewees say. One way to do this is to develop specific questions about how the job of the specific person being interviewed differs from others.

Documenting What Has Been Learned. The various lists of tasks, equipments, and systems that team members develop by the end of the O&I trip, as well as their many pages of notes, document the specific information learned on the trip. In addition to this, during an O&I trip interviewers form a general impression of the rating, including information on how the work is structured, the types of jobs performed, who performs them, and where they are performed. This is important information. It should also be documented, so that it will be available for job task analysts to use in better understanding the data they receive from the surveys.

In order to document this general information, near the end of the O&I trip each interviewer should write a one- to two-page summary of what he or she has learned about the structure of the rating. The summary should be placed in the project summary file. It should include information on the following questions, if possible:

1. What are the basic types of jobs done in this rating, and are there specific locations where each type is performed?

2. Do the existing service ratings correspond to the actual divisions in the work of the rating? Do the NEC's?

3. Are some rating-related tasks sometimes done by people in other ratings, or do people in this rating commonly do the tasks of another rating?
4. Do most people perform most of the tasks at one time or another, or do most people only do a few tasks?

5. Is maintenance of equipment done in a different location from operation?

6. Are particular problems mentioned by many people (for example, lack of training on a certain equipment)?
Step II - Prepare Post 061 Trip Report

When the task inventory development team returns to NODAC after 061, the team project manager prepares a post 061 trip report. A standard outline is followed in preparing this report as shown in Figure 6-9. The report is submitted to the Director of the Data Collection Division (Code 21) who reviews the report to check if the work of the rating has been covered adequately and if the 061 team visited a representative sample of ship and shore activities where job incumbents in the rating are located. Recommendations or suggestions for improving the coverage appear at the end of this report so that they may be taken into consideration the next time that the rating is surveyed. The report is filed in the project summary file as part of the audit trail of the task inventory development process.

When Step II is completed, Phase II - Prepare for and Conduct Observations and Interviews (061) is concluded. The task inventory development team then moves on to Phase III - Inventory Construction and Review, which is described in detail in Chapter 7.
Step 11 - Prepare Post O&I Trip Report

When the task inventory development team returns to NODAC after O&I, the team project manager prepares a post O&I trip report. A standard outline is followed in preparing this report as shown in Figure 6-9. The report is submitted to the Director of the Data Collection Division (Code 21) who reviews the report to check if the work of the rating has been covered adequately and if the O&I team visited a representative sample of ship and shore activities where job incumbents in the rating are located. Recommendations or suggestions for improving the coverage appear at the end of this report so that they may be taken into consideration the next time that the rating is surveyed. The report is filed in the project summary file as part of the audit trail of the task inventory development process.

When Step 11 is completed, Phase II - Prepare for and Conduct Observations and Interviews (O&I) is concluded. The task inventory development team then moves on to Phase III - Inventory Construction and Review, which is described in detail in Chapter 7.
POST O&I TRIP REPORT

RATING(S)__________________________

PROJECT MANAGER__________________

Information Required

1. Geographic areas visited:
2. Inclusive dates at each area visited:
3. NODAC representatives conducting observation and interviews in areas visited:
4. Total number of commands surveyed:
   a. Ashore _______
   b. Afloat _______
5. Names of shore activities visited and name/rank or rate/title and phone number of primary command liaison/point of contact:
6. Name and hull number of each afloat activity visited and name/rank or rate/title of command point of contact:
7. Major intermediate liaison activities and name/rank or rate/title and phone number of individual conducting liaison efforts:
8. Major problems/shortcomings encountered:
9. Positive occurrences worthy of note:
10. Personnel assistance rendered criteria for special consideration (include name/rank or rate/title/command/justification):

   b. Rating _______ No. _______
12. Cost per person - per area:
13. Recommendations/suggestions for future consideration:

Figure 6-9. Outline of Post O&I Trip Report.
CHAPTER 7

INVENTORY CONSTRUCTION AND REVIEW
(Phase III)
INVENTORY CONSTRUCTION AND REVIEW

In the third phase of task inventory development, the task inventory developers return to NODAC to construct the task inventory booklet. Then the contents of the task inventory are submitted to several levels of review, both within and outside of NODAC. When the review is complete and all necessary revisions have been made to the task inventory, a final review copy of the inventory with all recommended changes attached is routed up the NODAC chain of command for comment and final approval. The approved task inventory booklet then is prepared for printing, proofed, corrected, and sent to the printer. Figure 7-1 shows a flowchart of the various steps performed in Phase III. Each step is described in detail below.

Step 12 - Construction of Task Inventory

Construction of the task inventory booklet takes place, for the most part, in a series of task inventory development team meetings held immediately after return from the Q17 trip. The team member from the Analysis Division is present to help assign items to duty categories and to clarify task statements. As the team writes an item, it is typed on the word processing terminal. At the end of each work session, the items written during that session are printed and photocopied, so that each team member may review them before the next work session. During each session after the first one, previously written items are edited and corrections are made using the word processor.

Sections of Task Inventory Booklet. Procedures for constructing a NODAC task inventory booklet result in seven standard sections plus the front material to the booklet and a final NOTE page. The standard sections are listed below and described in detail following the list.

- Front Material
- Section A - Background Information
- Section B - General Quarters, Watches, and Collateral Duties
- Section C - Equipment/Tools/Systems
- Section D - Task Statements
- Section E - Job Satisfaction and Job Importance
- Section F - Physical Standards
- Section G - Miscellaneous Data
- Final NOTE Page
Figure 7-1. Flowchart of Phase III - Inventory Construction and Review.
Front Material. The front material consists of (1) the cover of the task inventory booklet; (2) a page indicating who prepared the inventory, who the technical advisers (subject matter experts) were, and which commands reviewed the inventory prior to its administration; (3) a standard covering letter; and (4) a Privacy Act Statement. Figure 7-2 shows an example of a standard cover for a NODAC task inventory booklet for the Opticalman (OM) rating. The insignia for the rating and the name and abbreviation for the rating are inserted in the center portion of a standard, preprinted NODAC booklet cover. Below the rating name and abbreviation, the month and year that the survey will be administered is also inserted. Figure 7-3 shows an example, also for the OM rating, of the page listing the names of the NODAC team members who prepared the inventory, the SME(s) who provided technical advice, and the commands that reviewed the inventory.

In Figure 7-4, the standard covering letter from the Officer-In-Charge of NODAC to Selected Personnel in the Opticalman (OM) rating is shown. This example letter explains the purpose of the survey, what occupational information the respondent is being asked to furnish, how the survey information will be used, and a reassurance that the survey is not a test. Figure 7-5 reproduces the standard Privacy Act Statement that appears in all NODAC task inventory booklets.

Section A - Background Information. The Background Information section consists of the following three subsections that relate to blocks on the corresponding optical-scannable Response Packet for the survey.

Block 43 - Command Status. The standard instructions for completing Block 43 on page 2 of the Response Packet are shown in Figure 7-6, and the standard list of command status choices is shown in Figure 7-7.

Block 44 - Job Titles. If a job title received less than a 5% response on the previous inventory and it was not mentioned by any job incumbents or supervisors during O&I, it should not be included in the new inventory. However, if it was mentioned by either an incumbent or a supervisor, or if it received at least a 5% response on the previous inventory, it should be included in the new inventory. The list of job titles then is arranged in alphabetical order and numbered sequentially.

The standard instructions for completing Block 44 on page 2 of the Response Packet for the May 1981 Opticalman (OM) task inventory booklet are shown in Figure 7-8. The list of job titles is typed in the format of the example provided in Figure 7-9 which shows the actual list of job titles for the OM rating.

From: Officer-In-Charge, Navy Occupational Development and Analysis Center
To: Selected Personnel in the OPTICALMAN (OM) Rating

Subject: Opticalman (OM) Task Inventory

1. The Commander, Naval Military Personnel Command (CNMPC) has developed an occupational task analysis system for use in analyzing officer and enlisted occupations. The primary purpose is to provide occupational data needed to improve the utilization, training, and assignment of personnel. This system has been comprehensively tested and its operational feasibility, military usefulness, and cost effectiveness have been successfully demonstrated. The system is administered by the Navy Occupational Development and Analysis Center, an activity under the Commander Naval Military Personnel Command (CNMPC), and is called the Navy Occupational Task Analysis Program (NOTAP).

2. You have been selected, as a representative of your rating, to help gather occupational information by furnishing accurate and detailed responses to statements about the duties and responsibilities of your present job. You are the EXPERT. Tell us "what" you do; "how" you do it; and "how much time" you spend doing it, as well as answering other related questions and statements about your training, work experiences, equipment worked on, etc.

3. As new technologies are developed and equipment changes are made, it may become necessary to modify the qualification requirements of personnel in your occupational field. Your responses will contribute toward the updating of related school curricula, occupational standards, rate training manuals, and advancement in rate exams in order to meet the changing demands on Navy personnel.

4. With your help the Navy Occupational Task Analysis Program can go a long way toward starting the ball rolling in the right direction. Please keep in mind—THIS IS NOT A TEST—THERE ARE NO SCORES—NO PASSING OR FAILING GRADES. Just say how it is done now. This information will help in determining what should be and will be of future value to you and to those yet to come aboard.

J. K. Todaro

PRIVACY ACT STATEMENT

Authority to request this information is derived from 5 USC 301, Departmental Regulations. The purpose of this information is to determine what specific tasks are being performed by job incumbents and for analysis and comparison between groupings of individuals within a rating. The data will be used in updating training school curricula and advancement examinations, revising occupational standards and rate training manuals, in developing training requirements and NECs, and in personnel and related health research. Completion of this information is mandatory. Failure to provide the required data may result in administrative action being taken.

SECTION A. BACKGROUND INFORMATION

BLOCK 43. COMMAND STATUS

Page 2 of the Response Packet, Block 43

The following section is a list that contains possible employment of your command. From the list select the one employment category (Command Status) that most accurately describes the present employment of your command. If an appropriate Command Status does not appear in the listing, enter "00" in Block 43 and write your Command Status on the ADD-ON sheet provided.

EXAMPLE:

BLOCK 43. COMMAND STATUS

01. PREPARATION FOR OVERSEAS MOVEMENT (FOM)/PRE-DEPLOYMENT WORKUPS (30 DAYS PRIOR TO SCHEDULED DEPLOYMENT).

02. DEPLOYED.

03. POST-DEPLOYMENT STAND-DOWN (30 DAYS AFTER DEPLOYMENT).

If your present Command Status is DEPLOYED you would mark Block 43 as follows:

---

Figure 7-6. Standard Instructions for Completing Block 43 - Command Status of the NODAC Task Inventory Response Packet.
01. PREPARATION FOR OVERSEAS MOVEMENT (POM)/PRE-DEPLOYMENT WORKUPS (30 DAYS PRIOR TO SCHEDULED DEPLOYMENT)

02. DEPLOYED

03. POST-DEPLOYMENT STAND-DOWN (30 DAYS AFTER DEPLOYMENT)

04. HOMEPORT/HOMEBASE LOCAL OPERATIONS (NOT INCLUDING SHIPYARD, T'NDER, OR RESTRICTED AVAILABILITY)

05. TENDER/RESTRICTED AVAILABILITY, LEAVE AND UPKEEP

06. SHIPYARD OVERHAUL

07. SHIPBOARD INSPECTION (REFRESHER TRAINING, INSURV, ORE/ORI, MJAI/NPI) SCHEDULED TO BE HELD WITHIN THREE WEEKS

08. CONUS ASHORE

09. OVERSEAS SHORE BASE

10. SHORE BASE INSPECTIONS, CONUS OR OVERSEAS (MATERIAL READINESS, ORE/ORI, AIMAT, ETC.) SCHEDULED TO BE HELD WITHIN THREE WEEKS

Figure 7-7. Standard List of Command Status Choices in a NODAC Task Inventory.
The following section is a list of Job Titles held by personnel in your rating. From the list, select ONLY ONE Job Title that most accurately describes your primary job at your present command. If an appropriate Job Title does not appear in the listing, enter "OO" in Block 44 and write your Job Title on the ADD-ON Sheet provided.

**EXAMPLE:**

**BLOCK 44. JOB TITLES**

01. ASSISTANT DIVISION OFFICER
02. DIVISION OFFICER
03. LEADING CHIEF PETTY OFFICER

If in your present job, you are primarily a DIVISION OFFICER you would mark Block 44 as follows:

![Diagram of Job Title selection with marked 02]

**Figure 7-8.** Standard Instructions for Completing Block 44 - Job Titles of the NODAC Task Inventory Response Packet.
BLOCK 44. JOB TITLES

01. ASSISTANT DIVISION OFFICER
02. DIVISION OFFICER
03. LEADING CHIEF PETTY OFFICER
04. LEADING PETTY OFFICER
05. MAINTENANCE DATA COLLECTION SYSTEM (MDCS) COORDINATOR
06. OPTICAL ALIGNMENT TEAM MEMBER
07. PERISCOPE REMOVAL/INSTALLATION TEAM MEMBER
08. PERISCOPE REPAIR SUPERVISOR
09. QUALITY ASSURANCE (QA) SUPERVISOR
10. SHIP SUPERVISOR/SUPERINTENDENT
11. SHOP SUPERVISOR
12. SMALL INSTRUMENT REPAIRMAN
13. SUPPLY PETTY OFFICER
14. WORK CENTER SUPERVISOR

Figure 7-9. Example of a List of Job Titles from a NODAC Task Inventory.
Block 45 - Work Location. If a work location received less than a 5% response on the previous inventory and it was not mentioned by any job incumbents or supervisors during O&I, it should not be included in the new inventory. However, if it was mentioned by either an incumbent or a supervisor, or if it received at least a 5% response on the previous inventory, it should be included in the new inventory. The list of work locations then is arranged in alphabetical order and numbered sequentially.

The standard instructions for completing Block 45 on page 2 of the Response Packet are shown in Figure 7-10. The list of work locations is typed in the format of the example provided in Figure 7-11 which shows the list of work locations for the OM task inventory booklet. At the bottom of the last page of the list of work locations, the following instructions should appear.

END OF SECTION A
CONTINUE TO NEXT SECTION

Section B - General Quarters, Watches, and Collateral Duties. If an item in the general quarters, watches, and collateral duties list of Section B received less than a 5% response on the previous inventory and it was not mentioned by any job incumbents or supervisors during O&I, it should not be included in the new inventory. However, if it was mentioned by either an incumbent or a supervisor, or if it received at least a 5% response on the previous inventory, it should be included in the new inventory. In Section B, general quarters, watches, and collateral duties should be listed under three separate headings. Under each heading, the duties are arranged in alphabetical order, and the entire list is numbered sequentially.

The standard instructions for completing Section B on page 3 of the Response Packet are shown in Figure 7-12. The list of general quarters, watches, and collateral duties is typed in three separate groups in the format of the example provided in Figure 7-13 which shows the Section B duties for the May 1981 Opticalman (OM) task inventory booklet. At the bottom of the last page of Section B, the following instructions should appear.

END OF SECTION B
CONTINUE TO NEXT SECTION
BLOCK 45. WORK LOCATION

Page 2 of the Response Packet, Block 45

Indicate in Block 45 the work location where you spend the majority of your time performing the job you marked previously. If an appropriate Work Location does not appear in the listing, enter "00" in Block 45 and write in your Work Location on the ADD-ON Sheet provided.

EXAMPLE:

BLOCK 45. WORK LOCATION

01. DIVISION OFFICE
02. OPTICAL SHOP
03. PLANNING AND ESTIMATING OFFICE

If you are presently assigned to the OPTICAL SHOP you would mark Block 45 as follows:

The first three work locations in the actual list for the rating are inserted here.

Work location 02 above.

Figure 7-10. Standard Instructions for Completing Block 45 - Work Location of the NODAC Task Inventory Response Packet.
BLOCK 45. WORK LOCATION

SECTION B. GENERAL QUARTERS, WATCHES, AND COLLATERAL DUTIES

Page 3 of the Response Packet, Section B

This section is used to identify the General Quarters, watch, and collateral duty assignments that are performed by personnel in your rating.

From the list, select all the General Quarters stations, watches, and collateral duties that you perform in your present job, and under the corresponding number indicate that you perform that duty. If there are GENERAL QUARTERS, WATCHES, or COLLATERAL DUTIES you perform that are not listed write them on the ADD-ON SHEET provided.

NOTE: If you do not perform a General Quarters station, watch, or collateral duty listed, leave the item number blank.

EXAMPLE:

SECTION B. GENERAL QUARTERS, WATCHES, AND COLLATERAL DUTIES

01. ASSISTANT GUNNERY OFFICER
02. FORWARD/AFT BATTLE DRESSING STATION
03. GUN MOUNT SAFETY OBSERVER

If in your present job, you are assigned to a FORWARD/AFT BATTLE DRESSING STATION under Item #2 you would mark as follows:

B. GENERAL QUARTERS, WATCHES, AND COLLATERAL DUTIES

### SECTION B. GENERAL QUARTERS, WATCHES, AND COLLATERAL DUTIES

- **GENERAL QUARTERS:**
  - 01. Assistant Gunnery Officer
  - 02. Forward/Aft Battle Dressing Station
  - 03. Gun Mount Safety Observer
  - 04. Optical Shop
  - 05. Repair Party Member

- **WATCHES:**
  - 06. After Steering
  - 07. Assistant Duty Master-at-Arms
  - 08. Brig Watch
  - 09. Combat Information Center (CIC)
  - 10. Duty Driver
  - 12. Duty Fire Party
  - 13. Duty Leading Chief Petty Officer (LCPO)
  - 14. Duty Leading Petty Officer (LPO)
  - 15. Duty Master-at-Arms
  - 16. Duty Repair Officer
  - 17. Helmsman
  - 18. Junior Officer of the Deck
  - 19. Lee Helmsman
  - 20. Lookout
  - 21. Messenger of the Watch
  - 22. Officer of the Deck (OOD)
  - 23. Petty Officer of the Watch
  - 24. Phone Talker
  - 25. Pier Sentry
  - 26. Rescue and Assistance Detail
  - 27. Roving Security Patrol
  - 28. Security Alert Team Member

SECTION B. GENERAL QUARTERS, WATCHES, AND COLLABORATIVE DUTIES (CONT.)

29. WEAPONS SECURITY SENTRY

COLLABORATIVE DUTIES:

30. ALCOHOL/DRUG ABUSE PETTY OFFICER

31. CAREER COUNSELOR

32. DAMAGE CONTROL PETTY OFFICER (DCPO)

33. EQUIPMENT CALIBRATION PETTY OFFICER

34. HUMAN RELATIONS COUNCIL

35. MAINTENANCE DATA COLLECTION SYSTEM (MDCS) COORDINATOR

36. MANHOUR ACCOUNTING PETTY OFFICER

37. PERSONNEL QUALIFICATION STANDARDS (PQS) PETTY OFFICER

38. PLANNED MAINTENANCE SYSTEM (PMS) COORDINATOR

39. QUALITY ASSURANCE INSPECTOR

40. QUALITY CONTROL INSPECTOR

41. SAFETY PETTY OFFICER

42. SUPPLY PETTY OFFICER

43. TRAINING PETTY OFFICER

44. WEIGHT TESTING RECALL COORDINATOR

END SECTION B
CONTINUE TO NEXT SECTION

Figure 7-13. Example of Section B Duties from a NODAC Task Inventory (Cont.).
Section C - Equipment/Tools/Systems. If an item in the equipment/tools/systems list of Section C received less than a 5% response on the previous inventory and it was not mentioned by any job incumbents or supervisors during O&I, it should not be included in the new inventory. However, if it was mentioned by either an incumbent or a supervisor, or if it received at least a 5% response on the previous inventory, it should be included in the new inventory. In Section C, the items should be listed under two separate headings, each in alphanumeric order: (1) equipment/tools/systems, and (2) publications/reports/forms/logs/records. The entire two-part list then is numbered sequentially.

The standard instructions for completing Section C on page 4 of the Response Packet are shown in Figure 7-14 where the respondent is instructed to consider how often the equipment/tool/system is used (Section C-1) and how often it is repaired (Section C-2). The equipment/tools/systems list is typed in the format of the example provided in Figure 7-15 which shows a portion of Section C for the January 1981 Operations Specialist (OS) task inventory booklet. At the bottom of the last page of Section C, the following instructions should appear.

END OF SECTION C
CONTINUE TO NEXT SECTION
SECTION C. EQUIPMENT/TOOLS/SYSTEMS

Page 4 of the Response Packet, Section C

The following section is a list of equipment, tools, and systems that are used and/or repaired by personnel in your rating. This section identifies what equipment, tools, or systems you use or repair in your present job.

From the list select all the equipment, tools, or systems that you use and/or repair in your present job, and under the corresponding number indicate the frequency of your action. If you both use and repair an item make a selection in both sections C-1 and C-2 for that item.

NOTE: If you do not use or repair an item listed, leave the item number blank.

NOTE: The term "Repair" in this section DOES NOT include Operator Maintenance, Preventive Maintenance, or Inserting Changes to Publications.

EXAMPLE:

SECTIONS C. EQUIPMENT/TOOLS/SYSTEMS

1. ACETYLENE TORCH
2. ADDING MACHINES/CALCULATORS
3. AIR COMPRESSOR

If in your present job, you use an ACETYLENE TORCH daily, and you do not repair it, under item #1 you should mark as indicated below:

176. WEAPONS PLOT

END OF SECTION C
CONTINUE TO NEXT SECTION

Figure 7-15. Partial Example of Section C Items from a NODAC Task Inventory.
Section D - Task Statements. From information collected during the O&I phase, task inventory development team members write task statements, making certain that all tasks performed by job incumbents in the rating are covered. Also, the quantity of tasks written under each duty category should be generally proportionate to the amount of work performed in that functional area so that accurate time-spent data will be collected by the task inventory.

Specific guidelines for writing acceptable task statements can be found in Appendix D. However, the key rules to keep in mind are the following.

- A task statement should start with an action verb in the present tense, with the subject of the sentence understood to be "I" (for example, FILL OUT, INSTALL, LUBRICATE, PREPARE, SCREEN, UPDATE).

- A task statement should contain only one action verb and one object of the action verb (for example, LUBRICATE ANALOG COMPUTER, MEASURE VOLTAGE, REPAIR ELECTROMECHANICAL VALVES, SPLICE WIRES).

- Validate the verb against the list of standard NODAC action verbs (see Appendix C) to make certain the meaning is correct. New verbs are acceptable. However, they must be defined for addition to the standard list, and they must meet task inventory development requirements. In order to keep the number of verbs to a minimum, a new verb should not be added if it is nearly the same as an existing verb on the list.

- Two action verbs may be used only when they are almost always performed together (for example, ADJUST/ALIGN OPTICAL EQUIPMENT, CLEAN/INSPECT EQUIPMENT COOLING SYSTEM, REMOVE/REPLACE RELAYS). Two objects should never be included in one task statement.

- A task statement should not include a qualifier unless the qualifier is absolutely essential to the meaning of the task (for example, ISOLATE FAULTY CIRCUIT IN BALLISTIC MISSILE, PACKAGE FILES FOR TRANSMITTAL TO FEDERAL RECORDS CENTER, REMOVE/REPLACE PRINTED CIRCUIT BOARDS ON TEST EQUIPMENT).

- The task reflected in the task statement must be time measurable. That is, the job incumbent should be able to judge the time spent on the task relative to time spent on all other tasks in the inventory.

- Each task statement must be mutually exclusive of every other task statement in the inventory. That is, task statements must not overlap each other in any way, such as the first task being one step in the performance of some other task.
All task statements in a task inventory should be written at the same level of work specificity.

The task must be appropriate to the job/rating or general duty.

Write short, concise task statements.

Avoid ambiguity. The task statement should mean the same thing for all incumbents in the rating.

Use abbreviations cautiously. If they are essential to the meaning of the task, spell out the formal term first and follow it with the abbreviation in parentheses.

Avoid fabricated words or terms.

Avoid jargon unless that is the only way to describe the task.

Next, make certain that those tasks covering an occupational standard are included in the list of task statements. Examine the updated task list to determine if each "A" school learning objective is covered by a task statement. If the learning objective is not covered, write a new task statement to cover it. The list of task statements then is compared against the previous inventory booklet. The flowchart shown in Figure 7-16 may be a help in comparing new task statements against old statements in the previous inventory booklet. The list is also compared to the most recent list of standard task statements prior to this one, making certain that the wording of standard statements is consistent. If the task inventory being developed is for one of the aviation ratings, then the most recent list of standard task statements for an aviation rating should be the basis for comparison.

Next, related tasks are grouped into standard duty categories provided by the task inventory development team project manager. For some ratings, the standard duty categories are not appropriate, and a logical grouping with new duty category titles must be developed. The task statements are placed in a logical sequence under each duty category, and the duty categories are placed in a logical sequence in Section D.

For each rating, the task inventory contains a standard set of duty categories covering damage control, general shipboard duties, training, and administration. The list of current items and duty categories should be obtained from the most recent NOTAP inventory and added at the end of Section D. All of the rearranged task statements then are numbered sequentially. The representative to the task inventory development team from the Analysis Division (Code 23) assists during this process. The duty categories used in reorganizing the list of task statements are identified by their standard letter code, and this list of duty categories is typed for in-house review.
Figure 7-16. Flowchart for Comparing New Task Statements Against Old Statements in Previous Inventory Booklet.
Figure 7-16. Flowchart for Comparing New Task Statements Against Old Statements in Previous Inventory Booklet (Cont.).
Figure 7-16. Flowchart for Comparing New Task Statements Against Old Statements in Previous Inventory Booklet (Cont.).
The task inventory development team then reviews the rearranged list of task statements to double check that all occupational standards have been covered, and a list of occupational standards not covered by any task statement is developed.

The standard instructions for completing Section D on page 10 of the Response Packet are shown in Figure 7-17. The list of task statements is printed in the format of the example provided in Figure 7-18 which shows a portion of Section D for the January 1981 Machinery Repairman (MR) task inventory booklet. Although the task statements are grouped by duty categories, the headings for the categories are not included, and there is no separation between the tasks of different duty categories. The reason duty category headings are not included is to prevent respondents from being able to skip over an entire duty category. Respondents may think they do not perform that duty when in fact they actually do perform some of the tasks in the category.

On the first page of Section D, the following instruction appears under the name of the section:

RESPONSES REQUIRED IN D-1 AND D-2

This instruction alerts the inventory respondent that each task performed needs to be considered twice. First, the respondent marks in Section D-1 the capacity in which he or she performs the task (the secondary factors I ASSIST, I DO, I SUPERVISE). Second, the respondent evaluates how much time is spent on that task relative to all other tasks performed and marks the relative time spent on a 7-point scale in Section D-2.

At the bottom of the last page of Section D, the following instructions should appear.

END OF SECTION D
CONTINUE TO NEXT SECTION

Section E - Job Satisfaction and Job Importance. The Job Satisfaction and Job Importance section is a standard section and is included in all NODAC task inventory booklets. The standard instructions for completing Section E on page 25 of the Response Packet are shown in Figure 7-19. Items pertaining to job and career satisfaction are responded to on a 5-point scale in Section E-1. Importance of the satisfaction for the item is marked on a 5-point scale in Section E-2.

The three pages of standard items included in Section E are shown in Figure 7-20. At the bottom of the last page of Section E, the following instructions should appear.

END OF SECTION E
CONTINUE TO NEXT SECTION
SECTION D. TASK STATEMENTS

Page 10 of the Response Packet, Section D

The following section is a list of task statements that are performed by personnel in your rating. They are used to identify what you do in your present job.

From the list, select all the task statements that apply to you when you perform your present job. Under the corresponding number, evaluate how much time is spent on that task (relative to all other tasks performed by you) and in what capacity you perform that task.

NOTE: If a task statement does not apply to you when you perform your present job, leave the item blank.

NOTE: A mark under a task number of Part D-1 requires a corresponding mark to be made in that same column of Part D-2.

EXAMPLE:

SECTION D. TASK STATEMENTS

01. INSPECT AZIMUTH AND BEARING CIRCLES
02. CLEAN/LUBRICATE COMPONENT PARTS OF AZIMUTH AND BEARING CIRCLES
03. REMOVE/REPLACE COMPONENTS OF AZIMUTH AND BEARING CIRCLES

If in your present job, you Clean/Lubricate Component Parts Of Azimuth and Bearing Circles and you spend very much time performing that task, under item #2 you would mark as follows:

Figure 7-18. Partial Example of Section D Items from a NODAC Task Inventory.
SECTION E. JOB SATISFACTION AND JOB IMPORTANCE

The statements which you will read are not intended to invade your privacy as an individual or compromise your position as a member of the U.S. Navy. They are designed to provide you with a way of expressing how you feel about your job and the environment in which you work. Your responses provide information which is studied and considered when making decisions related to your rating.

From the list select all the items that you feel apply to you in your present job. Under these items in section E-1 (Job and Career Satisfaction), make an entry that expresses your satisfaction or dissatisfaction with that specific item. In section E-2 (Importance of Satisfaction Item), make an entry that expresses how important satisfaction in this item is to you in your present job.

NOTE: If an item does not apply to you, then that item should be left blank in the response booklet. If a mark is placed in section E-1 then a mark is required in section E-2.

SECTION E. JOB SATISFACTION AND JOB IMPORTANCE
(RESponses required in E-1 and E-2)

01. OPPORTUNITY FOR ADVANCEMENT
02. OPPORTUNITY FOR PRESTIGE AND STATUS WITHIN YOUR ORGANIZATION
03. OPPORTUNITY TO DO WORTHWHILE WORK
04. RECOGNITION FOR WORK DONE
05. JOB APPEAL
06. JOB CHALLENGE
07. TOOLS/EQUIPMENT AVAILABLE TO DO THE JOB
08. REPAIR PARTS/CONSUMABLE SUPPLIES AVAILABLE TO DO THE JOB
09. FREEDOM TO DO THE ENTIRE JOB
10. VARIETY OF WORK WITHIN YOUR JOB
11. OPPORTUNITY TO SEE WORK RESULTS
12. OPPORTUNITY TO CONTRIBUTE TO JOB COMPLETION/WORK TEAM EFFORT
13. ACCEPTANCE OF YOUR RECOMMENDATIONS/SUGGESTIONS
14. OPPORTUNITY TO HELP OTHERS
15. FREEDOM FROM JOB PRESSURES
16. FREEDOM FROM FREQUENT JOB CHANGES WITHIN THE ACTIVITY
17. GUIDANCE RECEIVED TO DO THE JOB
18. ON-THE-JOB TRAINING
19. FORMAL SCHOOL TRAINING FOR THE JOB
20. OPPORTUNITY TO DEMONSTRATE YOUR CAPABILITIES
21. OPPORTUNITY TO DECIDE HOW WORK IS TO BE DONE (FREEDOM TO MAKE WORK RELATED DECISIONS)
22. OPPORTUNITY TO DO THE JOB FOR WHICH YOU ARE BEST QUALIFIED
23. OVERALL JOB
24. COMPETENCE OF SUPERVISORS
25. WORKING RELATIONSHIPS WITH SUPERVISORS
26. COMPETENCE OF CO-WORKERS/PEERS
27. WORKING RELATIONSHIPS WITH CO-WORKERS/PEERS
28. COMPETENCE OF SUBORDINATES
29. WORKING RELATIONSHIPS WITH SUBORDINATES

Figure 7-20. Standard Items Included in Section E of a NODAC Task Inventory.
30. WORK SURROUNDINGS (SAFETY)
31. WORK SURROUNDINGS (COMFORT)
32. UTILIZATION OF GOVERNMENT MONEY
33. UTILIZATION OF GOVERNMENT MATERIAL
34. UTILIZATION OF PERSONNEL
35. UTILIZATION OF YOUR TIME
36. STABILITY OF COMMAND SCHEDULE
37. TEMPO OF JOB ACTIVITY
38. OVERALL MILITARY CAREER

Utilize your entire Naval experience in formulating your response to the items listed below. Indicate your level of satisfaction in section E-1 with those items with which you have had contact or experience. For each item marked also indicate its importance to you in section E-2.

39. WORK HOURS AT SEA
40. WATCH HOURS AT SEA
41. WORK HOURS IN PORT
42. WATCH HOURS IN PORT
43. DUTY HOURS IN PORT
44. AMOUNT OF LIBERTY IN HOME PORT
45. AMOUNT OF LIBERTY AWAY FROM HOME PORT

66. LENGTH OF SEA TOUR
67. LENGTH OF SHORE TOUR

END OF SECTION E
CONTINUE TO NEXT SECTION

Figure 7-20. Standard Items Included in Section E of a NODAC Task Inventory (Cont.).
Section F - Physical Standards. The task inventory development team compiles a master list of physically demanding tasks from all demanding tasks nominated during O&I. The tasks are ranked in order of frequency of nomination. The team then omits any tasks that do not require much strength or stamina compared to the others on the list, and notes the tasks that are general shipboard duties rather than rating-related. The 20 highest ranking tasks that are rating-related are selected for inclusion in the final inventory booklet. If the rating does not have 20 physically demanding tasks (for example, Personnelman or Yeoman), the list is supplemented with the highest ranking general shipboard duties.

The standard instructions for completing Section F on page 27 of the Response Packet are shown in Figure 7-21. The list of tasks selected for inclusion in Section F is arranged in the format of the example provided in Figure 7-22 in which the first two tasks to be rated on three task characteristics are shown for the Interior Communications Electrician (IC) rating. At the bottom of the last page of Section F, the following instructions should appear.

END OF SECTION F
CONTINUE TO NEXT SECTION

Section G - Miscellaneous Data. The Miscellaneous Data section is a standard section and is included in all NODAC task inventory booklets. The standard instructions for completing Section G on page 28 of the Response Packet are shown in Figure 7-23. Five items pertaining to the useful life of naval uniforms are included in this section. Figure 7-24 shows the standard page containing these five items. At the bottom of the page, the following instructions should appear.

END OF SECTION G
CONTINUE TO NEXT PAGE

Final NOTE Page. The final NOTE page of a NODAC task inventory appears on the inside of the back cover of the booklet. It is a standard page which informs the respondent that additional ADD ON sheets and COMMENT sheets are available from the proctor administering the occupational survey. An example of the final NOTE page is shown in Figure 7-25.

Six alternative techniques for possible use in Step 12—Construction of Task Inventory—are described and illustrated in Appendix F. Depending on the nature of the rating being surveyed, one or more of these techniques may be appropriate to try out.
SECTION F. PHYSICAL STANDARDS

Page 27 of the Response Packet, Section F

This section contains 20 tasks, which are identified by a letter of the alphabet (A-T). Listed under these tasks are three numbered items. These items are numbered to correspond to item numbers in section F of the task inventory booklet.

In those tasks that you perform, estimate under each item the line that pertains to you, and blacken the item number in the response packet in the column for which the corresponding item number appears. If you do not perform the task under A, leave the item number blank and continue to the next task. In making selections, choose only one response under each item.

EXAMPLE: AS A MEMBER OF A 4-12 MAN TEAM,
RIG/UNRIG SHORE POWER CABLES,
WEIGHING APPROXIMATELY 400 POUNDS.

If you, as a member of a 4-12 man team, rig/unrig shore power cables, weighing approximately 400 pounds and the typical frequency of the task is 1-4 TIMES PER MONTH and the demand versus strength is ALTHOUGH DEMANDING, IS STILL WITHIN YOUR CAPABILITIES and the task is difficult to perform ONLY BECAUSE OF THE POUNDS FORCE EXERTED, then you would respond to items 1 through 3 as follows:

In the response packet, blacken 6 under Column 1 - 1-4 TIMES PER MONTH
blacken 3 under Column 2 - ALTHOUGH DEMANDING,
IS STILL WITHIN YOUR CAPABILITIES
blacken 4 under Column 3 - ONLY BECAUSE OF THE POUNDS FORCE EXERTED

Figure 7-21. Standard Instructions for Completing Section F - Physical Standards of the NODAC Task Inventory Response Packet.

7-34
SECTION F. PHYSICAL STANDARDS

A. AS A MEMBER OF A 4-12 MAN TEAM, RIG/UNRIG SHORE POWER CABLES, WEIGHING APPROXIMATELY 400 POUNDS.

1. TYPICAL FREQUENCY OF ONE/EACH ACTIVITY IN WHICH THE ABOVE FORCE IS EXERTED:
   1. MORE THAN 50 TIMES A DAY
   2. 13-50 TIMES PER DAY
   3. 6-12 TIMES PER DAY
   4. 1-5 TIMES PER DAY
   5. 1-4 TIMES PER WEEK
   6. 1-4 TIMES PER MONTH
   7. SELDOM

2. DEMAND VERSUS STRENGTH
   1. SO EASY THAT IT REQUIRES PRACTICALLY NO EFFORT AT ALL
   2. REQUIRES SOME EFFORT, BUT STILL QUITE EASILY WITHIN YOUR STRENGTH/GRASP
   3. ALTHOUGH DEMANDING, IS STILL WITHIN YOUR CAPABILITIES
   4. PUSHES THE VERY LIMITS OF YOUR CAPABILITIES--YOU ARE BARELY ABLE TO MOVE THE OBJECT(S) TO PERFORM THE TASK
   5. SOMETIMES EXCEEDS YOUR STRENGTH CAPABILITIES
   6. USUALLY EXCEEDS YOUR STRENGTH CAPABILITIES

3. THIS TASK IS DIFFICULT TO PERFORM
   1. PARTLY BECAUSE OF THE DIFFICULT GRIP (TO HOLD/MOVE/USE THE TOOL OR OBJECT)
   2. PARTLY BECAUSE OF THE CRAMPED RESTRICTED SPACE WHICH Restricts BODY LEVERAGE
   3. PARTLY BECAUSE OF THE REACH (TO MOVE/USE/INSTALL THE OBJECT)
   4. ONLY BECAUSE OF THE POUNDS FORCE EXERTED
   5. (NOT DIFFICULT AT ALL, AS YOU INDICATED IN THE PRECEDING QUESTION)

Figure 7-22. Partial Example of Section F Items from the NODAC Interior Communications Electrician (IC) Task Inventory.
B. AS A MEMBER OF A 2 MAN TEAM, CARRY A MK 23 GYRO COMPASS, WEIGHING APPROXIMATELY 144 POUNDS, TO/FROM WORK SPACE/SHOP THROUGH PASSAGEWAYS AND UP/DOWN LADDERS.

4. TYPICAL FREQUENCY OF ONE/EACH ACTIVITY IN WHICH THE ABOVE FORCE IS EXERTED:
1. MORE THAN 50 TIMES A DAY
2. 13-50 TIMES PER DAY
3. 6-12 TIMES PER DAY
4. 1-5 TIMES PER DAY
5. 1-4 TIMES PER WEEK
6. 1-4 TIMES PER MONTH
7. SELDOM

5. DEMAND VERSUS STRENGTH
1. SO EASY THAT IT REQUIRES PRACTICALLY NO EFFORT AT ALL
2. REQUIRES SOME EFFORT, BUT STILL QUITE EASILY WITHIN YOUR STRENGTH/GRASP
3. ALTHOUGH DEMANDING, IS STILL WITHIN YOUR CAPABILITIES
4. PUSHES THE VERY LIMITS OF YOUR CAPABILITIES--YOU ARE BARELY ABLE TO MOVE THE OBJECT(S) TO PERFORM THE TASK
5. SOMETIMES EXCEEDS YOUR STRENGTH CAPABILITIES
6. USUALLY EXCEEDS YOUR STRENGTH CAPABILITIES

6. THIS TASK IS DIFFICULT TO PERFORM
1. PARTLY BECAUSE OF THE DIFFICULT GRIP (TO HOLD/MOVE/USE THE TOOL OR OBJECT)
2. PARTLY BECAUSE OF THE CRAMMED RESTRICTED SPACE WHICH Restricts BODY LEVERAGE
3. PARTLY BECAUSE OF THE REACH (TO MOVE/USE/INSTALL THE OBJECT)
4. ONLY BECAUSE OF THE POUNDS FORCE EXERTED
5. (NOT DIFFICULT AT ALL, AS YOU INDICATED IN THE PRECEDING QUESTION)

Figure 7-22. Partial Example of Section F Items from the NODAC Interior Communications Electrician (1C) Task Inventory (Cont.).
The following section is intended to survey your opinion. If your opinion is not adequately expressed in the choices, leave the appropriate question blank.

The following information is solicited and will be considered in making management decisions related to Navy uniform items. For the items listed below, select the time frame which most accurately describes the "useful-life" of that item.

Definition: "Useful-Life" - that period of time elapsed from initial procurement until repair or replacement is necessary due to deterioration of the fabric or structure of the garment through normal wear.

For each uniform item, five time frames have been selected. Make a selection which most accurately reflects your experience with that uniform item.

EXAMPLE:

SECION C. MISCELLANEOUS DATA

01. WORKING UNIFORM

1. LESS THAN 3 MONTHS
2. 3 TO LESS THAN 6 MONTHS
3. 6 TO LESS THAN 8 MONTHS
4. 8 TO LESS THAN 12 MONTHS
5. 12 MONTHS OR MORE

If your experience is that the useful-life of the working uniform is 5 months, you would mark under item #1 as follows:

G. MISCELLANEOUS DATA

Figure 7-23. Standard Instructions for Completing Section C - Miscellaneous Data of the NODAC Task Inventory Response Packet.
SECTION G. MISCELLANEOUS DATA
RESPOND TO ALL ITEMS IF ADEQUATELY EXPRESSED

1. WORKING UNIFORM
   1. LESS THAN 3 MONTHS
   2. 3 TO LESS THAN 6 MONTHS
   3. 6 TO LESS THAN 8 MONTHS
   4. 8 TO LESS THAN 12 MONTHS
   5. 12 MONTHS OR MORE

2. DRESS SHOES
   1. LESS THAN 12 MONTHS
   2. 12 TO LESS THAN 18 MONTHS
   3. 18 TO LESS THAN 26 MONTHS
   4. 26 TO LESS THAN 36 MONTHS
   5. 36 MONTHS OR MORE

3. WHITE SHORT-SLEEVED SHIRT
   1. LESS THAN 12 MONTHS
   2. 12 TO LESS THAN 18 MONTHS
   3. 18 TO LESS THAN 26 MONTHS
   4. 26 TO LESS THAN 36 MONTHS
   5. 36 MONTHS OR MORE

4. SERVICE DRESS BLUE JACKET
   1. LESS THAN 24 MONTHS
   2. 24 TO LESS THAN 36 MONTHS
   3. 36 TO LESS THAN 42 MONTHS
   4. 42 TO LESS THAN 60 MONTHS
   5. 60 MONTHS OR MORE

5. DARK BLUE DRESS TROUSERS (SKIRTS FOR WOMEN)
   1. LESS THAN 12 MONTHS
   2. 12 TO LESS THAN 24 MONTHS
   3. 24 TO LESS THAN 30 MONTHS
   4. 30 TO LESS THAN 48 MONTHS
   5. 48 MONTHS OR MORE

END OF SECTION G

Figure 7-24. Standard Items Included in Section G of a NODAC Task Inventory.
NOTE

YOUR PROCTOR HAS COMMENT SHEETS AVAILABLE FOR YOU TO PROVIDE COMMENTS ON SPECIFIC PROBLEMS AND/OR SUGGESTIONS CONCERNING YOUR RATING THAT YOU BELIEVE WOULD BE HELPFUL FOR ANALYSIS. YOUR COMMENTS SHOULD ADDRESS IMPROVEMENT TO THE RATING, THE TRAINING PROCESS, AND CAREER OPPORTUNITIES WITHIN YOUR RATING.

INSERT THE ADD-ON AND COMMENT SHEETS INTO YOUR RESPONSE PACKET.

THIS CONCLUDES YOUR PART IN THE INVENTORY. TURN IN ALL MATERIALS TO THE PROCTOR. THANK YOU FOR YOUR COOPERATION AND CONTRIBUTION TO THE NAVY OCCUPATIONAL TASK ANALYSIS PROGRAM.

Figure 7-25. Example of the Standard Final NOTE Page in a NODAC Task Inventory Booklet.
Step 13 - Review by Local SME in Rating, and Revision

The sections of the task inventory booklet finalized in Step 12 are given a preliminary review in Step 13 by a NODAC subject matter expert (SME) in the rating if one is on board. Otherwise, an SME in the rating is contacted in the Washington, DC area and asked to review the contents of the inventory booklet. The SME is likely to catch oversights in coverage of the work of the rating, and may suggest better ways of phrasing some of the task statements to make them more clearly understandable to job incumbents. Based on this review, the sections of the inventory affected are revised to incorporate the useful suggestions made by the SME.

Step 14 - NODAC Code 21 "Murder Board" Review, and Revision

The purpose of the "Murder Board" is to review the task inventory booklet for content and completeness prior to in/out of house review. In preparation for the Murder Board review by Code 21 personnel, five copies of all sections of the inventory booklet are reproduced, including the instruction sheets for appropriate sections of the inventory. Also prepared is a list of duty categories that indicates which task statements are included in each duty category.

The five members of the Murder Board consist of one representative each from Code 21 (Director, Data Collection Division), Code 211 (Head, Task Inventory Development and Occupational Survey Branches), and Code 211A (Supervisor, Task Inventory Development Branch), plus one Code 21 task inventory developer not associated with the development of the booklet. Only the project manager of the task inventory development team attends the Murder Board review. The Murder Board is convened at the request of Code 21, usually in conference with the project manager. Members are notified when the board will meet (normally the Wednesday after task inventory construction is completed). Each member is provided with a copy of the inventory booklet and duty category list.

A Murder Board review may take as little as two hours or as long as four hours, depending on how diversified the work of the rating is and how well the task inventory development team has done its job. During the Murder Board, any necessary changes to the task inventory booklet are agreed upon and recorded on the project manager's copy. All changes are made using the word processing equipment, and the revised task inventory booklet is then ready for in/out of house review.
Step 15 - In/Out of House Review

Four divisions of WODAC and a number of out-of-house commands are given the opportunity to provide a technical review of the task inventory booklet. The four WODAC divisions reviewing the inventory are provided a task inventory booklet with duty categories identified. These divisions are the following:

- Code 211 - Head, Task Inventory Development and Occupational Survey Branches
- Code 22 - Director, Applications and ADP Division
- Code 23 - Director, Analysis Division
- Code 31 - Director, Occupational Standards Division

The out-of-house commands reviewing the booklet are as follows:

- Primary Adviser(s) - 1 copy each
- Technical Adviser(s) - 1 copy each
- CNET (N-9) - 2 copies
- CNTT (O16) - 2 copies
- CO NADEVTRAPRODEVGEN - 2 copies
- CNO (OP-13) - 1 copy
- ECM (OP-132) - 1 copy

WODAC's primary advisers are the Navy warfare commands (Submarine, Surface, and Air), Logistics, Medicine, and Intelligence. Technical advisers are the Sea Systems, Air Systems, and the Supply Systems commands. The particular commands asked to review the booklet depend on the nature of the rating being surveyed.

The cover of the task inventory booklet is constructed from a preprinted standard cover located in the TID Master File. Three types of information are inserted on the standard cover page to identify the rating under review (insignia, name, and abbreviation). Photocopies of all sections of the inventory then are assembled into review booklets.
A covering memo is prepared for the booklets being distributed for review within NODAC. The standard format of this covering memo is shown in Figure 7-26, with appropriate insertions to be placed in the blanks. The memo is typed and submitted for review up the chain of command to Code 21 for signature. When signed, four copies of the signed memo are photocopied. The original memo is returned by the project manager and filed in the project summary file. The final draft of the task inventory booklet, along with a copy of the covering memo then is distributed to the four NODAC reviewers.

A covering letter is also prepared for the booklets being distributed for review outside of NODAC. The standard format of this covering letter is shown in Figure 7-27, with appropriate insertions to be placed in the blanks. The draft letter is reviewed up the Code 21 chain of command and then typed. Code 21 reviews it once more and forwards it to Code 2 for review and to Code 1 for signature. Code 11 serializes the master copy of the covering letter. Sufficient copies of the signed, serialized covering letter to be sent to out-of-house reviewers then are photocopied.

Packages consisting of the covering letter, final draft of the task inventory booklet, and a blank Response Packet are assembled for mailing to each of the out-of-house reviewers. Correct addresses are obtained from the Standard Navy Distribution List in Code 11, and large mailing envelopes are addressed and mailed by first class mail.

Step 16 - Revision, Final NODAC Review, and Printing Guides

The responses from the internal NODAC review and the review by out-of-house commands are accumulated as they are received. No changes are made to the final draft of the task inventory booklet until the deadline for responding has been reached or all responses have been received, whichever comes first. The task inventory development team project manager then examines the changes recommended by the reviewers and decides which recommended changes should be made. For any recommended change that is not made, the project manager must provide the reason why that change should not be made. The reason is written adjacent to the recommended change.

The project manager then submits the revised final draft of the task inventory booklet, with all reviewer recommended changes attached, to the Supervisor of the Task Inventory Development Branch (Code 211A). Code 211A reviews the revised booklet and attachments, and writes any recommended further changes or other pertinent comments on the bottom half of the Task Inventory Routing Sheet (see Figure 7-28).

Code 211A then submits the revised final draft booklet, the attachments, and the Task Inventory Routing Sheet to the Head of the Task Inventory Development and Occupational Survey Branches (Code 211) who follows the same review procedure as that followed by the project manager, recording any further changes or comments on the Task Inventory Routing Sheet. The routing is signed off as each reviewer completes the review. Code 211 then submits the package to the Director of the Data Collection Division (Code 21).

Subj: Technical Review of the Rating Task Inventory Booklet
Ref: (a) BUPERSMAN 1450100
Encl: (1) Review Draft of Rating Task Inventory Booklet
(2) Sample response packet

1. Pursuant to reference (a), NODAC is the activity responsible for collecting, analyzing, and maintaining the Occupational Data Bank for the Navy Occupational Task Analysis Program (NOTAP) for all Navy ratings. NODAC is developing a Navy-Wide occupational inventory of the rating. This inventory is not a duplication of current work studies, manpower validations, or other personnel programs. Rather, it is the initial step in a comprehensive analysis of the rating directed toward pinpointing definite work/job requirements as related to equipment, working conditions, and duty location. This data will be used by COMNAVMILPERSCOM, CNET, Rating Sponsors, and in the development of Occupational Standards.

2. To accomplish the above objective, an inventory of occupational data for the rating has been constructed based on the observation and interview of personnel in paygrades E-3 through E-9 in the rating, and the most recent Occupational Standards. The inventory is currently in the review process. To ensure a comprehensive review by knowledgeable personnel in the community the assistance of your staff is requested. The assistance required will be limited to technical advice relative to the contents of enclosure (1).

3. Enclosure (2) is used to record the responses to the Task Inventory Booklet when it is administered, and is provided to you for information purposes only.

4. NODAC point of contact for questions related to this draft inventory is who can be reached via Autovon 288-4631/32 or commercial 202-433-4631/32.

5. CNTECHTRA and CO, NAVEDTRAPRODEVCE are requested to forward comments to CNET (Code N922) for consolidation. Other distribution list addresses are requested to provide comments to NODAC. Concurrence will be assumed if comments are not received by . Negative responses are not required.

Figure 7-28. Task Inventory Routing Sheet for Final NODAC Review.
Code 21 also reviews the revised final draft booklet and all attachments and comment sheets, coordinates any required additional changes with the project manager, and submits the revised final draft booklet to the Technical Director of NODAC (Code 2) for review and comment. Any additional changes resulting from Code 2 review are coordinated with the project manager.

During the NODAC final review process, correction of spelling errors and any other very obvious errors are made in the final draft booklet by the reviewer at the time of discovery. Any other recommendations for change (content, order of items, etc.) are added to the Task Inventory Routing Sheet ONLY. The routing sheet/comments are returned to Code 211A for filing in the project summary file.

Finally, the project manager delivers the revised final draft booklet to Code 11 for transfer onto printing guides (Printer's Long Edits). When the preparation of the booklet is completed, Code 11 returns both the revised final draft booklet and the copy prepared on printing guides to the project manager for proofing. At this time, the month and year that the survey will be administered are added to the cover page.

**Step 17 - Final Proof, Corrections, Printing Request, and Printing**

The project manager and one other member of the task inventory development team proofread the copy of the inventory booklet from the printing guides against the revised final draft booklet. Any typographical errors they find are identified on a piece of paper clipped to the printing guide near where the mistake was made.

The proofread booklet on printing guides, with typographical errors flagged, then is submitted up the chain of command for review. The project manager delivers the package to Code 211A for review and submission (via Code 211) to Code 21. When the Code 21 review is completed, the package is returned to Code 11 for correction of typographical errors. Code 11 performs the necessary corrections and returns the corrected copy of the inventory booklet on printing guides to Code 211A. A check is made that the corrections were properly made, and then the package is routed to Code 1 (via Code 2) for signature of the covering letter in the front material of the booklet. After signing the covering letter, Code 1 sends the booklet to Code 11 to be serialized and dated, after which Code 11 returns the booklet to the project manager.

The project manager makes three photo-reduced (by 20%) copies of the booklet from the printing guides. A copy with duty categories attached is delivered to the Applications and ADP Division (Code 22). The second copy is placed in the project summary file. The third copy is retained by Code 211A until the inventory booklet is printed and available for reference.
The project manager then fills out the DD Form 283 Defense Printing Service Requisition (see Figure 7-29) and the publications running sheets according to the printing request procedures detailed in the printing request folder located in Code 21. The printing request is signed by Code 21, and one copy of the request and publications running sheets are retained by Code 21 for filing.

The final printing guides along with four copies of the printing request and the publications running sheets then are delivered to Publications and Printing at the following location.

Publications and Printing
Pers-109/NTPC-012X
RM 1721, Navy Annex
Washington, DC

Step 18 - Complete Project Summary File

The various components of the audit trail that should be filed in the project summary file are as follows, more or less in the order of their addition:

- MAPHIS 1221-4000 UR
- Development plan
- Previous task inventory booklet
- Agenda and notes of the O&I predeployment meeting
- O&I trip itinerary for all team members (master)
- Post O&I trip report
- New task inventory booklet
- All pertinent letters/messages/memos
- Task inventory routing sheet

When the new booklet is sent to the printer at the completion of Step 17, the task inventory development team project manager takes an inventory of the project summary file to make certain that all of the required information is included. The complete file then is delivered to the Supervisor, Occupational Survey Branch (Code 211B). At this point, responsibility for maintaining the project summary file rests with the Occupational Survey Branch as the task inventory is being administered during Stage 2 of the NODAC occupational survey and analysis process.
Figure 7-29. DD Form 283 Defense Printing Service Requisition.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY ENLISTED RATINGS

ANNOTATED BIBLIOGRAPHY
OF INFORMATION SOURCES

This 5-volume set presents an extremely readable description of procedures for constructing task inventories, surveying the task performance of occupations, and analyzing survey data to aid curriculum planners and developers in determining the appropriate performance content for job training. The procedures are intended to be of value to both occupational curriculum personnel and those persons concerned with noncurriculum issues of occupational description and updating of job content information.

The Position Analysis Questionnaire (PAQ) is a structured job analysis questionnaire composed of worker-oriented job elements. Four readability indexes—the Dale-Chall, the Flesch, the FOG, and the SMOG—were applied to both the directions and questions of the PAQ. The PAQ directions reach a college readability level using the Flesch and SMOG indexes and reach the college graduate level using the Dale-Chall and FOG indexes. The PAQ questions reach the college graduate readability level on all four indexes. Implications regarding the use of the PAQ in light of its difficult level of readability are discussed. The authors conclude that if the PAQ is to gain wider usage as a principal job analysis technique used by personnel practitioners, then serious consideration should be given to appropriate revision of the instrument so that it can be understandably read by a much larger segment of the population.

The bluejackets' manual has historically contained a concise wealth of information about the many diversified tasks required of sailors in the United States Navy. This 20th edition continues the tradition with a "back to basics" manual that covers a wide spectrum of subjects of interest to Navy men and women, from recruit to admiral, throughout their naval service. Of particular interest is the addition of an extensive bibliography (Appendix J) which offers additional references, both official and unofficial, on hundreds of subjects.

This report describes and compares the various Job Performance Aid techniques and identifies and categorizes factors important to selection, design, cost-performance trade-off, conduct of future research, and implementation of performance aiding technology. More than 100 surveyed JPA systems and techniques are classified under five categories: (1) format/content, (2) display media, (3) applied training, (4) peripheral test/diagnostic, and (5) delivery systems. Major factors are identified as critical to the development of a JPA algorithm, including personnel aptitude and experience, type and complexity of task, type and complexity of equipment, and degree of proceduralization required. A conceptual model is presented for use by the JPA community in cost trade-off analyses, in JPA selection algorithms, and in the grouping of theoretical trends. The report also presents a theoretical base for use of memory in JPA; previews a theory for mixing JPA techniques, principles, and methodologies; and outlines goals for future JPA research and technology efforts.

This article presents a brief history of the Navy Occupational Task Analysis Program (NOTAP) since its early conception in the mid-1960's. Also discussed are the data collected by NOTAP and the method of data collection—by a job task inventory questionnaire. Respondents are billet incumbents (job holders). Data collected are processed by the Comprehensive Occupational Data Analysis Programs (CODAP) which were developed under the auspices of the United States Air Force Human Resources Laboratory. Various uses of NOTAP data are described.

This report presents a heuristic model for analysis of the issues involved in the classification of human performance. The "why," "what," and "how" of classification are discussed in turn. An extensive appendix presents provisional classifications of human performance descriptors including human responses, performance capabilities, operations, equipment and materials, personnel, physical environments, social environments, selection, training, human physical moderators/mediators, physiological moderators, and psychological moderators/mediators.
The Comprehensive Occupational Data Analysis Programs (CODAP) package is a highly interactive and efficient system of computer routines for analyzing, organizing, and reporting occupational information. Previously, CODAP contained approximately 35 main programs for analyzing data collected with job inventories to produce task-level descriptions of the work performed by individuals and groups of individuals. It also contained programs for identifying and describing the types of jobs existing in an occupational category, and for describing the characteristics of individuals falling into special or job-type groups. Eight new programs described in this paper represent a major addition to the CODAP system, filling an important gap by equipping the analyst with tools for analyzing and manipulating information describing work tasks rather than jobs or persons. In addition to describing the eight new programs in detail and showing how they interact with existing programs, the paper provides an example demonstrating how the new programs can be used to develop and apply an equation which assigns training priorities to tasks in an occupational area based on consideration of relevant task factor information.

This user's manual documents the new CODAP System 80 being prepared for use on IBM computers. Development of this new CODAP software was sponsored by the DoD Executive Agent for Joint Task Analysis Support because of limitations in the existing IBM CODAP system that the United States Navy, Marine Corps, and Coast Guard have been using. The new system has more analytical power and flexibility, a more user-oriented display capability, and enhanced transportability to other DoD agencies. The new system can accommodate any rating scale, not just relative time spent. In addition, the maximum number of items that can be included in a job task inventory has been increased from 2000 to 5000.

This paper describes the development of an Occupation Analysis Inventory (OAI) to satisfy the need for a comprehensive taxonomy of human work and accompanying measurement devices and procedures suitable for educational purposes. Such a taxonomic system should be organized into a hierarchical

BIBLIO-3
structure ranging from occupational categories (clusters) and descriptors to task categories and descriptors, thus providing analytical capability at different levels of complexity. "Ergometrics" is defined as the application of psychometric principles and procedures to the study of human work. The development of the OAI is conceived as the first phase in an ergometric R&D program directed toward the problem of articulation between the educational and work domains.

This handbook provides a validated set of procedures and guidelines for analyzing tasks into subtasks and into supporting skills and knowledges. The handbook is designed for use in technical training by subject matter experts. It assumes that tasks have already been selected for training, that trainee proficiency levels have been determined, and that the trainee population is known. Three major stages of the task analysis procedure are contained in the handbook: (1) development of preliminary performance requirements, (2) identification of subtasks, and (3) identification of supporting skills and knowledges.

As occupational analysis becomes more sophisticated, the length of occupational survey task inventories has become longer. The added length results from impetus to meet the following objectives: to describe tasks at the lowest level of work activities that describes a complete and inseparable operation, to provide technical training schools with the most useful data to structure their courses, and to best describe career field structure to classification interests by multi- or cross-ladder surveys. Longer surveys make critical four fundamental criteria for describing occupational survey tasks. These criteria are (1) each task must be time-ratable, (2) each task must communicate in the language of the specialty, (3) each task must be mutually exclusive of other tasks in the inventory, and (4) each task must differentiate among workers where actual task performance differs. Compromise between these criteria is often necessary in the practical world. The appropriate level of detail is determined by carefully balancing criteria 3 and 4. Setting the level of detail at the appropriate point maximizes the information to be gained from task inventories and minimizes the length to provide accurate data to users of the occupational survey program.

BIBLIO-4

This report is one in a series examining reading requirements, reading skill levels, and the effects of a mismatch of skill and requirements on school and job performance in the United States Navy. It describes the limitations in the use of readability formulas, and proposes alternative approaches to (1) determining the comprehension requirements of existing Navy text, and (2) ensuring that writers attend to comprehension requirements in producing new text.

Widespread concern has been voiced over an apparent mismatch between the reading ability of naval personnel and the reading requirements they encounter in a naval career. Since reading is a skill prerequisite to all naval careers, a mismatch of skills and requirements could have widespread consequences for fleet effectiveness. This report provides a review of the area, with suggestions for an R&D program as well as management actions which would help reduce the problem of matching skill and requirements. While the focus of the R&D recommendations is on the naval service, many of the recommendations should be applicable to a variety of settings.

This report is one in a series examining reading requirements, reading skill levels, and the effects of a mismatch of skill and requirements on school and job performance in the United States Navy. The purpose of this research was to determine the extent to which increasing readability by carrying out readable writing revisions will improve comprehension. In a series of five experiments, the results indicated that readable writing revisions can facilitate comprehension under very particular circumstances. However, the resulting changes in the readability score are not, in any way, predictive of the changes in comprehension. Thus, the authors conclude that a formula score is neither a good guideline nor a good criterion for producing comprehensible text. Further, they recommend that reference to a readability formula as a means of controlling comprehension should be deleted from all Navy procurement specifications and internal writing control documents.

The purpose of this research was to provide descriptive information on reading skill levels in the United States Navy that can be used when making decisions concerning implementation of any of the various options for minimizing functional illiteracy. A standard reading test (the vocabulary and comprehension subtests of the Gates-MacGinitie Reading Test, Survey D) was administered to all recruits (approximately 31,500) entering the Recruit Training Command, San Diego over a 1-year period (13 May 1974 to 30 May 1975). A significant proportion of the sample was found to have reading skills well below the difficulty of the manuals used in training. Reading skills were examined in relationship to rating assignments, the difficulty of rate training manuals, race, education, and Basic Test Battery (BTB) scores.

Task analysis, a critical front-end activity in the instructional systems development methodology, is the process of partitioning job tasks into their component subtasks and identifying the skills and knowledges required to support task performance. Implementation of a standardized procedure in the United States Air Force for identifying essential subtasks and supporting skills and knowledges was expected to hold considerable potential for increasing training efficiency and reducing training costs. A simplified task analysis procedure and documentation system was specified, and a task analysis handbook (AFHRL-TR-79-45[II]) was prepared.

This executive summary for the new CODAP System 80, being prepared for use on IBM computers, provides an overview of occupational analysis in the military, use of the existing IBM CODAP system, current limitations of the existing system, and capability of the new system to overcome these limitations.

The objective of this study was to refine and coordinate occupational analysis, job performance aids (JPAs), and elements of the instructional systems development (ISD) process for task-specific maintenance training.
A comparative analysis of Task Identification and Analysis (TIMA) and current occupational analysis technologies indicates substantial incompatibilities between them. The Task Identification Matrix (TIM) of the TIMA technology identifies specific tasks for each specific hardware to which it is applied. In contrast, although using similar maintenance functions, the occupational analysis technology identifies sets of heterogeneous maintenance tasks across an Air Force Specialty Code (AFSC) without regard to the specific hardware in the AFSC; this hardware is frequently of varying vintages of design. By neglecting the real differences among tasks within the same set, from hardware to hardware, current occupational analysis results in oversimplified and distorted portrayals of job content of many maintenance AFSCs. Proposals are made for expanding the capability of the technology by gathering information on hardware-specific bases, which makes possible the reporting of results in terms of hardware-specific sets of tasks. Proposals are also made for gathering and displaying data concerning activities which normally are common elements of many maintenance tasks such as the use of test equipment and hand tools.

An approach to developing job task inventory questionnaires by interviewing supervisors or job incumbents is described. An initial interview provides the bulk of the information from which task statements are extracted. A verification interview is conducted with a different interviewee. A follow-up interview is conducted with the previous interviewees to review and modify a draft of the job inventory questionnaire. Applications of job task inventory questionnaires in studies of engineering, sales, and clerical jobs within American Telephone & Telegraph are described, and summaries of study results are presented.

For personnelists and managers of human resources in both the public and private sectors, this manual offers a systematized and data-based approach for constructing an integrated personnel system. The job analysis methods employed in these procedures embody a combination of desirable features developed by the United States Air Force and other traditional methods, although the procedures rely almost entirely on the occupational survey methods and Comprehensive Occupational Data Analysis Programs (CODAP) developed by the U.S. Air Force. Included in the manual are detailed steps for constructing, administering, and analyzing employee responses to a task inventory; and an explanation of principal CODAP programs and their applications toward the integration of CODAP as part of a comprehensive personnel management system.

This glossary will be the official source for interservice educational and training terminology. It will include abbreviations/acronyms, terms, and their definitions.

This paper attempts to lay the ground work for furthering our understanding of the differences among tasks and the ways in which tasks influence behavior. Three general 'problem areas' are reviewed and evaluated: (1) problems in defining the concept 'task'—i.e., what are the components and characteristics of an adequate task definition; (2) problems relevant to the description of tasks—i.e., what are the most useful and appropriate bases for making task descriptions and comparisons; and (3) problems relevant to understanding task effects—i.e., how do task factors make differences in the ways people think and act.

After evaluating several issues relevant to the problems of task definition and description, one working definition of the concept is proposed, and one general approach to task description is suggested as likely to be most useful in understanding the behavioral impact of tasks. Finally, a framework is proposed which outlines the diversity of effects that may be attributable to task factors in a performance situation, and suggests how these effects may be conceptualized and related.

This training manual is designed to aid in the orientation of personnel newly assigned to the Office of Manpower Utilization (OMU), Headquarters, United States Marine Corps. It provides a brief overview of Marine Corps task analysis (TA) as it is conducted by OMU. Basic steps in the TA process are (1) construct a task inventory; (2) administer self-report inventory; (3) analyze, using CODAP; (4) recommend solutions to identified problems; and (5) secure approval of recommendations. The manual gives a brief description of each step. OMU's major goal of improving the utilization of human resources in the Marine Corps is discussed, and the way that the staff is organized to accomplish this goal is presented. Appendices provide brief descriptions of task analysis terms and a synopsis of the Comprehensive Occupational Data Analysis Programs (CODAP) used to define jobs in an occupational field.

This publication is an alphabetical compendium, in dictionary format, of acronyms and abbreviations in common usage in the Washington, DC - Military Industrial Complex, the Washington scene of action, and throughout the world where United States forces and supporting industry are located. Definitions are included. Unfortunately, this valuable reference is out of print.

The purpose of this manual is to set forth workable procedures as experienced by the Career Task Analysis Department of the Naval Education and Training Support Center, Pacific. The procedures set forth have been found to be effective and efficient methods for assembling job data and interpreting, refining, expanding upon, and otherwise processing this information to produce complete and reliable job task listings as the basis for instructional system design. These procedures are intended to supplement and amplify Interservice procedures for instructional systems development - Phase I: Analyze (NAVEDTRA 106A).

This manual serves as the guide for applying the United States Air Force systems approach to the development of education and training programs. It presents a technology of instructional design and a model for developing cost-effective instructional systems. This manual applies to all education and training personnel who plan, develop, approve, administer, or manage Air Force instruction and its supporting materials.

Interservice procedures for instructional systems development - Phase I: Analyze (NAVEDTRA 106A), 1 August 1975.

This manual is the first in a series detailing interservice procedures for instructional systems development (ISD). The first step in the ISD process is to establish exactly what constitutes, or will constitute, adequate on-the-job performance. The "analyze" phase answers the questions of what tasks, performed in what manner, under what conditions, in response to what cues, to what standards of performance, make up the job. The ultimate purpose of ISD is to produce a properly trained person, that is, a person who can do the job for which he or she was trained.

This publication provides guidance in developing job information through job analysis for use by State and local governments. It is written primarily for personnel technicians who have some familiarity with job analysis. Guidelines are given for preparing for and conducting the job analysis, and examples of how the job analysis can be used are included. Some job analysis terms are defined, and techniques for gathering job analysis data are presented in an appendix.

Job and task analysis course (Vols. 1-8). Fort Monroe, VA: United States Army Training Development Institute, August 1979.

This course provides an introduction to job and task analysis which focuses on basic skills necessary to United States Army TRADOC analysts. The job training package is primarily designed for the novice or apprentice analyst. However, it also serves as a useful training tool and refresher for analysts with some degree of experience. In addition, it provides a quick introduction for newly assigned managers in analysis and training design/development activities, and for personnel assigned as evaluators to acquaint them with the Job and Task Analysis process.

The course is designed around five subject areas encompassing 27 training modules: basic analysis skills (e.g., identifying tasks, basic interviewing), basic researching skills required to develop a task inventory, selecting tasks for training, techniques for analyzing tasks and recording task performance, and management of analysis. As the self-paced student completes each training module, he or she moves on to a criterion test followed by feedback regarding performance on the test.

Job and task analysis handbook (TRADOC PAM 351-4[T]). Fort Monroe, VA: HQ, United States Army Training and Doctrine Command, August 1979.

This Job and Task Analysis Handbook provides the procedural guidance for the analysis phase of Instructional Systems Development (ISD) and serves as a ready reference in day-to-day analysis activities. The organization of the handbook aids in understanding the job and task analysis process and describes the steps necessary during the analysis phase. The data collected during front-end analysis (defined here as job and task analysis) is regarded as valuable in its application to the United States Army training development process. This pamphlet is an aid to the novice analyst, but assumes that he or she has completed the corresponding job training package. Understanding of the process and competence in the variety of job and task analysis skills will come with time and effort. This handbook aids that understanding, but still requires time and experience on the job as an analyst.

BIBLIO-10

This document is a job performance aid (JPA) for conducting United States Army job and task analyses. The bulk of the information in the aid is condensed or summarized from the Job and task analysis handbook (TRADOC PAM 351-4), the Job and task analysis course, and TRADOC Regulation No. 351-4. This JPA also contains information and guidance that is not in these three references, but all information is compatible with them. It is designed to lead users through the major steps and decisions required to perform a job and task analysis.

Three readability formulas (Automated Readability Index [ARI], Fog Count, and Flesch Reading Ease Formula) were recalculated to be more suitable for United States Navy use. The three recalculated formulas were derived from test results of 531 Navy enlisted personnel using multiple regression techniques. The formulas are directly interchangeable because they were all calculated using the same database. The ARI can be used when new material is being written, as the new material is usually typed anyway. The Flesch Formula is preferable when the Automated Flesch Count machine is available and existing material is being graded for reading difficulty. The Fog Count can be used when no equipment is available to aid the count.

This report is the fourteenth technical report of 16, published as part of an evaluation of the United States Marine Corps task analysis program. The objectives of the research were to determine an optimum inventory size that would adequately cover the tasks without unduly fatiguing the Marine respondents; to develop procedures for the phrasing of task statements to avoid ambiguities and be understandable to as broad a range of Marines as possible; and to develop recommendations for inventory design and format. An experimental design is given for dividing a lengthy task inventory into a series of shorter inventories; there is sufficient overlap of task statements in each small questionnaire booklet to provide adequate samples of response to each item. Data are presented from the application of six measures of readability to nine task inventories. Guidelines for wording of task inventory items to improve understanding are provided.

This is the first in a series of five training manuals developed for use by the Office of Manpower Utilization (OMU), Headquarters, United States Marine Corps in its Task Analysis (TA) Program. This initial manual is designed for trainers of OMU staff members assigned to the TA Program. The objectives of this training manual are (1) to recommend procedures and training materials for minimizing the time required to orient and train new TA team members; (2) to increase the period of time new staff members will be productive on a TA team by shortening the indoctrination and training period; and (3) to upgrade skills for increasing the effectiveness and productivity of experienced, as well as new members of TA teams. Principles of training are discussed at a general level, and the reader is referred to other reference sources to supplement this introductory manual.

This report is the fourth in a series of five training manuals developed to aid the Office of Manpower Utilization (OMU), Headquarters, United States Marine Corps in the training and orientation of new staff members assigned to the Task Analysis Program. The first section reviews problems of communication within an organization or task analysis team that can hinder effectiveness, and it gives suggestions for improving the quality of intra-organization communication. The second section stresses the importance of active listening, recommendations for achieving active listening, testing for understanding, and problems in active listening. The third section is the most detailed and gives a broad range of guidelines on "How To Write Clearly."

Each project in the United States Marine Corps' Task Analysis Program is assigned to staff members organized to form a work team. Their continuing performance, as an effective team, is crucial for the success of the project. This final training manual, in a series of five, provides guidelines for effective teamwork, and work-team maintenance and development. Topics covered include organizational maintenance, development, and teamwork; management by objectives; and use of the matrix organization structure.

This training guide was developed for use by staff members of the Office of Manpower Utilization (OMU), Headquarters, United States Marine Corps in their preparation for task analysis projects. It is designed to provide basic orientation to task analysis and detailed suggestions for carrying out the entire observation and interview phase of the task analysis process. To ensure the quality of findings, this training guide details specific recommendations for all major steps in the data-gathering process including improving interviews by checking questions, building respondent motivation, developing listening ability, managing the interview, and improving both observation and the recording of information. Suggested techniques were drawn from the literature pertaining to job analysis, reliability and validity, interviewing, listening ability, improving observation, and communications.

This report provides a draft military specification for use by United States Air Force and other DoD agencies in specifying the requirements for maintenance task identification and analysis (MTI&A). This specification defines the requirements for the content and format of MTI&A to be used as a basis for subsequent preparation of organizational and intermediate level Job Performance Aids (JPA) called Job Guide Manuals (JGM) and Logic Tree Troubleshooting Aids (LTTA), as well as other types of technical manuals.

Appendix B of this report presents a list of permissible maintenance function verbs. Each verb is defined in terms of one or more meanings associated with maintenance, and examples are provided. Any synonyms for a verb are listed by order of preference (i.e., ranked), and the preference rank of the verb itself is also indicated. Where necessary, special usage notes are also included.

This development effort was conducted under contract by Human Factors Research, Inc. The objective was to develop information and techniques to assist hardware developers in assessing the people-related implications of their designs and for conducting manpower cost-effectiveness trade-off studies during the design process. The procedures followed for the development of task taxonomies used in this study are reported in pages 100-115.
The effort described in this technical note generated the data necessary to produce a first-generation guidebook of manpower and personnel-related information needed by hardware developers and program managers to assess the impact of candidate system designs on the United States Navy's human resources. The guidebook has been published in a working draft for user evaluation as NFRDC Technical Note 79-8, "An Engineer's Guide to the Use of Human Resources in Electronic System Design," dated June 1979.

Section I of this manual presents 25-50 task statements for each pay grade of an enlisted rating, organized under 5-10 standard topic titles. Twenty-four occupational fields are listed in the table of contents, and an appendix contains a list of approved action verbs for task statements. NOTAP (Navy Occupational Task Analysis Program) surveys are used to create updated task statements.

Section II of this reference is the official manual for NEC (Navy Enlisted Classification) code identification of enlisted personnel and requirements. The NEC structure, of which the NEC coding system is a part, supplements the enlisted rating structure in identifying personnel on active or inactive duty and billets in manpower authorizations. NEC codes reflect special knowledge and skills that identify personnel and requirements when the rating structure is insufficient by itself for manpower management purposes.

This specification sets forth Naval Sea Systems Command (NAVSEA) and Naval Electronic Systems Command (NAVELEX) content requirements for manuals necessary for installation, operation, organizational-, intermediate-, and depot-level maintenance, repair, and parts support (without services of manufacturer's representatives) of equipment and systems. This specification is approved for use by all interested commands of the Department of the Navy and the Marine Corps, and is available for use by all other Departments and Agencies of the Department of Defense.
Manuals, technical: General style and format requirements (MIL-M-38784A).

This specification covers the general style and format requirements for the preparation of manuscripts and reproducible copy for standard technical manuals and changes thereto. It also applies to nonstandard technical manuals to the extent specified. Examples at the end of this specification are typical and may be adapted to fit the specific equipment or situation being covered. The paramount consideration in preparing a technical publication is its technical content. This content should be presented in language free of vague and ambiguous terms, using the simplest words and phrases which will convey the intended meaning.

This specification covers the detailed requirements for preparation of organizational maintenance manuals and checklists for aircraft, missiles, and non-munition accessories which have a requirement for maintenance instruction manuals. Appendix A adds a verb list to this specification. Each verb is defined in terms of one or more meanings associated with equipment maintenance. A simple sentence is provided for each usage. A number entry in the preference column indicates the standing of that verb compared to others with the same or similar meaning (highest ranking is 1). Any synonyms with which the verb was ranked are listed in terms of their own ranking. If a synonym holds first rank, it is underlined. Where necessary, special usage notes are also included. Lower ranking verbs can be used when the first-ranked verb is particularly awkward or misleading in a given statement.

This special report begins with the task inventory booklet and proceeds through the steps required to develop job descriptions and group jobs. Simple illustrations are used to show results of the various computer processing steps. The illustrations provide a systematic yet nontechnical explanation of how job descriptions are developed and grouped by the Comprehensive Occupational Data Analysis Programs (CODAP). The report is concerned with the results of each processing action and not with computer language, use of algorithms, or control devices. Each illustration is preceded by a brief explanation.

BIBLIO-15

This book incorporates much of McCormick's previous work. The text includes a discussion of job analysis methods; work-, behavior-, and attribute-requirement typologies; and applications of job analysis information to job design, job requirement determination, job evaluation, vocational choice, and work adjustment.

McCormick, E. J. *Job and task analysis.* In M. D. Dunnette (Ed.), *Handbook of industrial and organizational psychology.* Chicago, IL: Rand McNally, 1976.

This chapter begins with a brief overview of various aspects of job analysis and job analysis methods. The primary focus, however, is in terms of systematic approaches to the analysis of human work, including a discussion of various major efforts that have been made, namely, functional job analysis, the use of task inventories, and other forms of structured job analysis questionnaires such as the Position Analysis Questionnaire (PAQ). In addition, there is a discussion of the use of structured job analysis questionnaires as the direct basis for establishing aptitude requirements of jobs and, in turn, compensation rates for jobs, thus possibly eliminating conventional test validation procedures and job evaluation procedures.

McCormick, E. J., Jeanneret, P. R., & Mecham, R. C. *A study of job characteristics and job dimensions as based on the Position Analysis Questionnaire* (Report No. 6). Lafayette, IN: Purdue University, Occupational Research Center, 1969.

This report is a summary of the several phases of a research program relating to the analysis of human work as characterized primarily in terms of "worker-oriented" job elements. A major facet of the program was that of identification of such job elements and their organization into job dimensions. In this connection it was hypothesized that there is some underlying "structure" of human work across the spectrum of jobs; this research program was directed in part toward the further clarification of such structure. In addition, however, certain phases of the program were directed toward the experimental application of job data based on job elements and job dimensions to certain practical personnel problems. One of these experimental applications dealt with job evaluation, and the other with the development of personnel requirements from essentially job analysis data.

This report presents a discussion of the general work of the United States Navy that includes a description of the special environment within which Navy occupational tasks are performed; a description of each enlisted occupation or "rating"; and a description of each officer category and specialty.

This manual provides methods, procedures, and forms to be used by job analysts in constructing task inventories and by curriculum designers in acquiring useful information concerning occupational performance. The approach is an application of United States Air Force task inventory concepts. The reader is guided through an explicit set of steps and procedures. Also provided are the means by which the reader can periodically assess his or her understanding of important concepts and terms introduced in the manual.

Because the term "job analysis" is used to refer to the whole class of studies of occupational information as well as to the study of a single job, this paper points up the need to develop and consistently use a better defined set of categories which will more precisely communicate the type of job analysis to be undertaken and its purpose. C. L. Shartle's basic taxonomy of job analysis terms is reviewed, and E. J. McCormick and J. Tiffin's summary table of the uses of job and task analysis data is presented. The author proposes a matrix approach to designating the levels and uses of job information and provides sample cell entries in the resulting matrix display.

This report reviews the history and development of the task inventory within the general context of occupational analysis. Three approaches to occupational analysis were evaluated against a common set of attributes, namely, engineering methods, functional job analysis, and the task inventory.
TI/CODAP (task inventory with computer assistance) comes closest to meeting the criteria of good occupational analysis. It also produces many useful products for job evaluation, manpower planning, and occupational structuring. CODAP, the software package developed by the United States Air Force Human Resources Laboratory for manipulating and analyzing task inventory data, was reviewed in order to indicate the kind and range of analyses possible. The author concludes that the relevance, utility, and comprehensiveness of the TI/CODAP approach seem to offer a significant step forward over other forms of occupational analysis.

This procedural guide sets forth in detail the procedures for collecting, organizing, analyzing, and reporting information describing work performed by United States Air Force officers and enlisted personnel. Specific steps in the application of the Air Force method of job analysis are presented in chronological order. This procedural guide is still one of the major references for how to perform an occupational analysis.

This report was prepared to develop guidance for United States Air Force, other DoD agencies, and industry in the use of specifications contained in AFHRL-TR-79-50 to fulfill the requirements for maintenance task identification and analysis (MTI&A). This report is to be used as a handbook. It includes definitions, procedures, planning data, staffing criteria, checklists, suggested forms, and guidelines for review, evaluation, and quality audit of MTI&A products. The guidance provided by the specification and this handbook are suitable for the procurement of MTI&A for both organizational and intermediate levels of maintenance.

The Equipment Identification Code (EIC) Master Index is the primary source for the codes assigned to identify shipboard system, subsystem, and equipment when documenting maintenance actions in accordance with procedures prescribed in OPNAV 4790.4, 3-M system manual. A revised EIC Master Index is published periodically (annually or semi-annually) based on the volume of significant changes.

This overview briefly describes the United States Navy system for conducting job task analysis. Data collection is accomplished using a task inventory questionnaire administered to job incumbents in the fleet. NOTAP data are used in the naval training community for various purposes, in revising occupational standards, in developing manning and training requirements for new systems and equipment, in rating structure and classification systems management, and in many other ways.

With some 5,000 entries, this expanded and revised fourth edition of the Naval terms dictionary is an easy-to-use compilation of technical terminology, colloquialisms, and slang currently in use in the United States Navy. The entries are arranged alphabetically, and italics are used to indicate cross-referenced words or phrases. Five appendices contain a variety of hard-to-find information: (1) Navy ship types, (2) Navy enlisted rating structure, (3) aircraft-designation system, (4) missile-designation system, and (5) electronics nomenclature (AN system).

This textbook presents the sequential decision structure necessary to design or to plan for a system at sufficient depth to enable engineers and managers to grasp the scope of the interdisciplinary nature of these activities. Part I provides an overview of the design-planning purpose, scope, and content. Part II describes the activities of the feasibility study, resulting in a set of alternatives or candidate systems. In Part III, the necessary steps in structuring the analyses for choosing among the candidate systems is presented. The activities required for implementing the results of the preliminary activities are identified in Part IV. The reason for including this reference in the Annotated Bibliography is that an appendix to Chapter 23 defines and illustrates a typical breakdown of tasks for a large-scale, closed-loop operations/maintenance system.

Methods were developed to determine: (1) the stability and redundancy of responses to two job task scales—the continuous Relative Time-Spent scale and the dichotomous Task-Performed scale, (2) the stability of "job types"
(i.e., clusters of job incumbents) derived from scale responses, and (3) the change in stability when sample size is reduced. Results indicated that the Task-Performed scale yields stable, meaningful task information (i.e., percentages of personnel performing tasks) from responses by job incumbents, but no practical gain in information is achieved from the Relative Time-Spent scale. A better way to collect time-spent data is proposed. Findings also demonstrate that highly stable scale data and cluster solutions are obtainable from samples substantially smaller than those presently administered. The study's empirically developed relationship between sample size and stability can be usefully employed to determine cost-effective sampling for task inventory surveys.

Phalen, W. J. Comprehensive Occupational Data Analysis Programs (CODAP): Ordering of hierarchically grouped case data (KPATH) and print KPATH (PRKPATH) programs (AFHRL-TR-75-32). Brooks Air Force Base, TX: Air Force Human Resources Laboratory, August 1975. (NTIS No. AD-A016 724)

This is one in a series of reports written to acquaint occupational analysts, occupational research personnel, and personnel managers with the functions and utilities of a set of Comprehensive Occupational Data Analysis Programs (CODAP). This technical report describes and gives examples of applications of the Ordering of Hierarchically Grouped Case Data (KPATH) and Print KPATH (PRKPATH) programs. These programs greatly facilitate the identification of background variables having similar values for all or most cases in any hierarchical group. Because of the highly technical nature of this report, it is of interest only to readers who have a need to understand how the CODAP KPATH and PRKPATH programs function.

This manual is a summary of the first four volumes of the 5-volume Inter-service procedures for instructional systems development (NAVEDTRA 106A) and contains specific procedures and formats for application by the United States Navy. This manual is Part I of a 2-part supplement to NAVEDTRA 106A, designed to be used by all NAVEDTRACOM activities. It was prepared for those who will be analyzing, designing, developing, implementing, and controlling instructional programs for naval personnel. This manual is currently being revised.

Procedures for the planning, design, development, and management of Navy technical training courses (CNTT-A30 [Rev. 4-76]). Millington, TN: Chief of Naval Technical Training, April 1976.

This manual contains the procedures to meet unique needs in planning, design, development, and management of Chief of Naval Technical Training courses. Prior to the publication of this manual, Interservice procedures
Questionnaire construction manual (P-77-1). Fort Hood, TX: United States Army Research Institute for the Behavioral and Social Sciences, July 1976. (DTIC No. ADA 037 815)

This manual was prepared primarily for the use and guidance of those who are tasked to develop or administer questionnaires as part of United States Army field tests and evaluations. The general content and concepts, however, should be useful to anyone involved in constructing or administering surveys, interviews, or questionnaires. Chapter 1 is an Introduction to this manual. Chapters 2-10 present guidance on preparing, assembling, and arranging items in questionnaires. Chapter 11 discusses the importance of and procedures for pretesting questionnaires prior to their regular administration. Chapter 12 discusses characteristic of respondents that influence questionnaire results. Chapter 13 deals briefly with analysis and evaluation of responses, and Chapter 14 discusses interview presentation.

Task inventory data for five representative United States Navy enlisted ratings were studied to (1) define the taxonomic structure underlying the design of the Navy Occupational Task Analysis Program's task inventory booklets, and to (2) develop alternative taxonomic methodologies that will extend the usefulness of the task inventory data and shorten the task inventories, thereby reducing time demands on operational units during their administration.

A survey of the literature revealed that no published taxonomic methodology could be applied directly to improve the task inventory booklets. Consequently, a composite content analytic methodology and clustering methodology were developed. Applying the content analytic methodology to the task inventory data demonstrated that this procedure can be used effectively to compare Navy ratings, relate task analysis data to occupational standards, and systematically generate task statements. The recommended method includes a pool of standardized task statements that could be used to create new task inventory booklets and training curriculums.
The Extended Task Analysis Procedure (ETAP) is a 12-step process designed to analyze tasks that are primarily procedural in nature, and tasks that are usually called "soft skill" tasks. Soft skill tasks are those that require so many decisions about the appropriate behavior under various circumstances, that the task cannot be reduced to a specified procedure. These soft skill tasks are called transfer tasks to distinguish them from procedural tasks. Built into the 12 steps of ETAP are three different approaches to analysis depending on the type of task to be analyzed—Procedural Analysis, Factor-Transfer Analysis, and Principle-Transfer Analysis. These training materials include eight lessons. Lessons 1-7 are in a definite sequence and should be studied in order. The last lesson—Lesson 8—teaches a standard notation system for numbering the different levels and types of tasks described in ETAP.

Extended Task Analysis is a procedure for identifying the component skills and knowledge which must be learned if the whole task is to be mastered. The procedure meets the needs of both task description and subsequent instructional design, and is an effective method to use for a wide variety of tasks. This user's manual has been designed to assist the analyst to do an Extended Task Analysis. It is a handy reference for anyone who has already completed training in the use of ETAP.

In a previous study, work dimensions (factors) were derived from ratings of a representative sample of approximately 400 jobs on the Occupation Analysis Inventory (OAI). The OAI contained 622 work elements describing various types of work activities and conditions. A follow-up to this study is reported in this monograph. The replication yielded different factors from those obtained in the earlier study. The implications of this difference are discussed.

Responses made by members of four representative ratings to the job satisfaction items on the Navy Occupational Task Analysis Program (NOTAP) surveys were analyzed to determine the relationship between job satisfaction and intent to reenlist. Response data obtained from enlisted personnel in a survey of career counselor effectiveness were analyzed to determine actual reenlistment behavior, since this information could not be obtained from NOTAP data. Aspects related to the work itself predicted overall job satisfaction, while those related to military life predicted reenlistment intent. Reenlistment intent was highly related to actual reenlistment, while other variables (including job satisfaction) added little to prediction of enlistment.

The utility of job-analysis output for training design was analyzed in terms of three questions: (1) To which training-design decisions can the results of a job analysis be expected to contribute? (2) What characteristics give job-analysis output utility for training design? (3) What requirements need to be considered before criteria are applied? Criteria were developed for judging job-analysis output for training design. Important independent requirements are the organization of the output and the characteristics of the job-task statements.

The objective of this study was to determine quantitative relationships between human resource variables and technician performance on maintenance tasks for nuclear missile systems. Human resource variables relevant to maintenance operations were identified. Instruments for measuring the human resource variables and task performance measures were developed. An 11-category taxonomy (of task action verbs and their definitions) was developed for coding the maintenance tasks. Data on task performance, human resource variables, and technician opinions were collected from United States Air Force records or from technicians working at five Air Force bases. Statistical analyses of the data were performed. The results of this well-designed and executed study are numerous, and these findings have important implications for future Air Force research.

This technical bulletin describes techniques for measuring the complexity and variety of tasks as part of an analysis of tasks and patterns of tasks in terms of the technical dimension of the work situation. A supplement to this technical bulletin (STB 66-4A) contains the major data collection instruments: structure of functions scale, equipment rating form, engineering task lists, task complexity classification list, and task comparison forms.

By classifying the behaviors required in performing a task, and training personnel in the basic abilities implied by those behaviors (rather than the specific technical elements in a task), this research contends that curricula may be made more realistic in terms of task demands. A set of such categories of task behavior has been called a taxonomy. A taxonomy is defined, and the steps in the taxonomic process are delineated. The problems of task classification can be approached more systematically through methods of numerical taxonomy than through traditional classification techniques.

This anthology presents the research that HumRRO has done on literacy in relation to work. It is also a collection of the results of their work for application in education and training activities as well as in development of job materials. The volume is divided into three parts: (1) determining functional literacy demands of jobs, (2) reducing discrepancies between literacy skills of personnel and literacy demands of jobs, and (3) collected papers on functional literacy.

The basic objective of this research project was to determine the effectiveness of the United States Marine Corps Task Analysis (TA) Program as it has been conducted by the Office of Manpower Utilization (OMU). This report summarizes the main findings and conclusions in the eight research areas into which the study was divided: (1) TA observation and interview procedures; (2) task inventory construction; (3) occupational field sample size;
(4) computer procedures and data analysis; (5) DMU organization and personnel; (6) orientation, training, and team performance; (7) peace-time TA and its relation to war-time conditions; and (8) the use of worker characteristics in classification and assignment. The overall conclusion is that the TA program is a highly valuable asset to the Marine Corps in improving and maintaining effective utilization of its human resources. An appendix to this final report contains an annotated list of the 15 technical reports that are end products of this project.

This internal NODAC manual is a compilation of three years of note taking, article reading, and philosophy based upon conversations with many persons involved in the occupational analysis and training fields. Four major phases in the task inventory development process are described in detail in this manual: (1) research and preliminary construction, (2) predeployment, (3) observation and interview, and (4) final construction and review. Ten appendices provide additional procedural guidance.

This paper presents an overview of the Comprehensive Occupational Data Analysis Programs (CODAP) system designed to familiarize a new occupational analyst with various perspectives on the system and to provide a broad-brush view of a typical analysis being translated into the necessary sequence of computer programs. The three perspectives chosen are (1) the research approach, (2) the procedures, and (3) the programs. For each of the three perspectives discussed, a basic definition is provided. Appendix A to this paper presents a CODAP program summary. Listed are descriptions of the 49 major computer programs associated with the United States Air Force CODAP package.

Volume I of this dictionary contains names and definitions of the various occupations in the United States economy, arranged alphabetically according to the job titles. Other names by which the same jobs are known in various sections of the country are called alternate titles and are also included. Data contained in the definitions include information on WHAT gets done, HOW it gets done, and WHY it gets done. Each job definition is assigned one or more industry designations. Individual occupations are incorporated into a classification structure and identified by 6-digit code numbers.
Volume II of this dictionary complements Volume I and serves as a method of grouping jobs having the same basic occupational, industrial, or worker characteristics to help the user discern relationships among occupations. It also provides a standard approach to classifying the abilities, vocational experiences, and potentials of workers.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY ENLISTED RATINGS

APPENDIX A

A GLOSSARY OF
JOB TASK ANALYSIS TERMS
"A" SCHOOL: Schools that provide the basic technical knowledge and skills required to prepare for job entry level performance and further specialized training, including apprenticeship training. An NEC, NOBC, MOS, or AFSC may be awarded to identify the skill achieved.

ACTION VERB: An action verb is one of the basic elements of a task statement and is descriptive of what is being done in the task. The action verb usually is in the present tense (e.g., repair), although it sometimes appears in the gerund form (e.g., repairing). The subject of the action is understood to be "I" so that the task statement unambiguously refers to what the respondent does on the job.

APPRENTICE: A relatively unskilled person who has officially entered an occupational field. Performs certain basic tasks and assists journeymen in tasks requiring higher skill levels. During this time, the individual is being trained for entry into journeyman status. Usually describes the E1-E4 pay grade levels of a rating.

AUDIT TRAIL: A methodical, documented record of rationale, data sources, events, problems, decisions, and products resulting from the processes and procedures used in constructing a task inventory or in conducting a job/task analysis.

BILLET (JOB): The basic personnel unit of a naval organization that requires the full-time services of one individual (incumbent). A billet has the following characteristics: (1) it normally utilizes related skills and knowledge, and (2) it is officially established with a definite purpose and scope and exists even when vacant. A billet typically consists of a cluster of duty assignments covering the routine, general quarters, watch, and other types of military or rating-related duty assignments. See also JOB.

"C" SCHOOL: Instructional courses that provide advanced knowledge, skills, and techniques needed to perform a particular job in a billet and/or a course that awards a skill (NEC or NOBC) or is a prerequisite to a skill-awarding course; skill progression training.

CLUSTER:
1. In NOTAP data analysis, a group of persons performing a number of common tasks, or spending similar amounts of time on like tasks. See also CLUSTER TITLE.
2. In course design, tasks grouped for training by task characteristics such as skill level, rank, or by special facilities required.

CLUSTER TITLE: In NOTAP data analysis, a designation for a group of persons whose responses are very similar in tasks performed and time spent on each task. See also CLUSTER.
CODAP: An acronym for a computer system of Comprehensive Occupational Data Analysis Programs developed by the Human Resources Laboratory of the United States Air Force. Approximately 50 programs comprise this software package which is used by all branches of the military service for processing and analyzing respondent data collected by occupational survey instruments.

COMMON COPING: A term used by the Navy Occupational Development and Analysis Center (NODAC) to mean mapping each standard task statement in the NODAC catalog onto its corresponding occupational standards. In this catalog, a list of rates to which each task statement applies follows each statement.

COMPONENT: A subassembly of an equipment with a specific function or circuit that contributes to the total equipment function. A major subunit of an equipment, a number of parts, subassemblies or modules joined together to perform a specific function. A component is normally encased as a separate unit, and may perform its function within a number of different equipments or systems.

NOTE: For the purpose of describing task levels, a circuit is an assembly of parts that performs a specific low-level function within an electric or electronic system.

CONDITIONS: Conditions describe constraints (physical, legal, or other), safety considerations, tools or materials to be available, and specific aspects of the environment in which a task is to be performed.

EXAMPLES: In the dark, in the rain, underway, on a destroyer, from memory.

COVERT BEHAVIOR: Thinking/mental processes inferred from overt behavior. Covert behavior may have an observable product or result. See also OVERT BEHAVIOR.

CRITICALITY: The degree to which an element is essential to the performance of a task. Critical elements are those which must be performed correctly to preclude injury to personnel, damage to equipment, or improper operation.

CUE: A word, signal, or prompt that causes the individual to perform the task action.

EXAMPLE: Task Action: Troubleshoot the rectifier power supply.
Cues: 1. Equipment fails to meet standards during an operational check.
2. Equipment malfunctions.
DUTY: One of the major subdivisions of work performed by one individual, generally performed according to a prescribed method to meet a set standard. One or more duties constitute a job. A duty normally exists in one functional area and is characterized as follows: (1) it is a recognized segment of a job that occupies a principal portion of a job incumbent's work time, (2) it occurs repeatedly and/or frequently in the work cycle, and (3) it involves work requiring closely related skills and knowledge.

DUTY CATEGORY/HEADING/TITLE: Categorizes groups of tasks under identifiable headings to help in organizing lists of tasks. Duty titles should begin with an action word ending in "ing" (gerund).

EXAMPLE: Performing Corrosion Control and Material Preservation.

EIC: See EQUIPMENT IDENTIFICATION CODE (EIC).

ELEMENT: See TASK ELEMENT.

ENABLING OBJECTIVE: A 3-part objective that helps the student achieve a terminal learning objective. It describes the behavioral actions, the performance conditions, and the attainment standard expected of the student when he or she completes the task.

EQUIPMENT: A major assembly constituting either a system with a specific function or one of several assemblies contributing to a total system.

EQUIPMENT IDENTIFICATION CODE (EIC): A 4-character code identifying equipment in the Navy 3-M (Maintenance and Material Management) system. Codes and equipments are cross-referenced in Navy maintenance and material management information system - Equipment identification code master index (NSO 4790.E2579).

"F" SCHOOL: Schools that provide team training to fleet personnel who are current or prospective members of shipboard teams with specific functions. These schools also provide individual refresher, operator, maintenance, or technical training of less than 13 calendar days as required by fleet or type command needs.

FINGER COURSES: Instructional courses, usually taught in "C" schools, that provide specialized training in specific technical knowledge and skills as opposed to basic technical knowledge and skills.

FRONT-END ANALYSIS: Refers to job analysis, selection of tasks for training, and development of Job Performance Measures (JPMs).
HIERARCHY: A body of entities, objects, or items within a subject field organized, classified, or arranged in a graded series. A hierarchical arrangement reflects levels of specificity, starting from the very general and going to the more specific, with the specific always being included in the general.

INSTRUCTIONAL SYSTEMS DEVELOPMENT (ISD): An orderly process for planning, developing, implementing, and evaluating instructional programs which ensures that personnel are taught the knowledges, skills, and attitudes essential for successful job performance.

JOB: The duties and tasks performed by a single worker constitute his or her job. If identical duties and tasks are performed by several individuals, they all hold the same job. See also BILLET (JOB).

JOB COMMUNITY/CLUSTER: A group of persons who perform identical or closely related jobs within a rating. Job communities are characterized by NECs, primary duties, systems or equipment, skill levels, platforms, and any unique features of the family of tasks involved. In the Navy, service ratings are one example of job communities.

JOB INCUMBENT: An individual holding a particular job or occupying an assigned billet; job holder/billet occupant.

JOB/OCCUPATIONAL ANALYSIS: The basic method used to obtain a detailed listing of duties, tasks, and task elements necessary to perform a clearly defined, specific job. It involves observations of workers and conversations with those who know the job, in order to describe in detail and comprehensively the work involved, including conditions and standards.

JOB PERFORMANCE AID: A chart, check list, document, guide, instruction sheet, or other device that facilitates job performance by reducing the amount of information the job incumbent must recall or retain in order to successfully carry out the task.

JOB PERFORMANCE MEASURE (JPM): A test used to determine whether or not a job incumbent meets job task standards. The JPM measures a job incumbent's proficiency in performing a task in the job environment. JPMs are designed principally for the evaluation of job incumbent performance, not student performance in a training environment; however, the JPM is frequently used for both.

JOB TASK ANALYSIS: The process of determining the duties and tasks that are, or should be, performed by persons occupying a given type of billet, working in the same rating, or fulfilling a given job function. See also TRAINING TASK ANALYSIS.
JOB TASK INVENTORY (QUESTIONNAIRE): The instrument used to collect essential data for the job analysis is the task inventory. The inventory collects background information and occupational data in the form of statements of tasks performed, usually arranged by duty categories. Respondents may also be asked to rate each task performed on a number of factors. Other job-related information that may be collected include job titles, collateral duties, equipment usage, job satisfaction, physical demands, and other dimensions that add depth to the analytical process.

JOURNEYMAN: A person who operates or maintains components and systems within an occupational field; exercises supervisory duties limited or isolated to occupational field subsystems; trains subordinates within the occupational field. Usually describes the E5-E6 pay grade levels of a rating.

JPA: See JOB PERFORMANCE AID (JPA).

JPM: See JOB PERFORMANCE MEASURE (JPM).

JURY OF EXPERTS: A group of subject matter experts selected to record, organize, and pass judgment on data and other matters related to the specific field or area of expertise.

KNOWLEDGE: A substantial amount of related information that can be recalled with or without the aid of documentation. Knowledge is distinguished from small amounts of unrelated pieces of information that can be rapidly learned. Knowledge in itself is not a skill, but a prerequisite for the application of skills. Skills may require recall of knowledge.

LEARNING OBJECTIVE: Describes precisely what is to be learned in terms of the expected student performance under specified conditions to accepted standards. These learning objectives identify the mental skills, information, attitudes, or physical skills that are required to perform the terminal learning objective.

LEVEL OF SPECIFICITY/DETAIL: The level of specificity or detail that is appropriate for the task statements of a job task inventory questionnaire or occupational survey is dependent on the purpose for which the statements will be used. Greatest specificity is needed for making decisions about the curriculum content of training programs. More general statements are suitable for purposes of occupational description.
MANAGER: A person who controls and directs the implementation of command policies within the enlisted community associated with an occupational field, or across occupational fields, as required. Usually describes the E8-E9 pay grade levels of a rating.

MENTAL SKILLS: Information handling intellectual processes including identifying, associating, classifying, discriminating, chaining, using rules/solving problems. Mental skills are the capability of applying learned information to some practical and measurable situation.

EXAMPLES: Evaluating a tactical situation is done by the mental skill of integrating appropriate information; the determination of whether radar controls are properly set is done by differentiating radarscope presentations which indicate properly set controls from those that are set improperly.

MNEMONIC: A device, such as a formula, rhyme, abbreviation, etc., used as an aid in remembering.

MODULE: An assembly or combination of parts, circuits, subassemblies and assemblies mounted together. A subassembly or a component with a specific function or circuit that contributes to the total component function. A module is a subunit of a component or equipment.

EXAMPLES: A printed circuit board, a power supply section, a gear box, a control unit, an electric motor, or a hydraulic pump.

MULTIPLE TASK: A task that has a variety of possible elements. There are two basic types: One is always performed by following the same basic procedures; the other is one in which the inputs vary, with the task performed differently depending on the input. A type of task which may be identified during job analysis.

NAVY ENLISTED CLASSIFICATION (NEC): NEC codes reflect special knowledge and skills that identify personnel and requirements when the rating structure is insufficient by itself for manpower management purposes. A listing of NECs for each rating can be found in Navy enlisted manpower and personnel classifications and occupational standards – Section II: Navy enlisted classifications (NAVPERS 18068D).

NEC: See NAVY ENLISTED CLASSIFICATION (NEC).
NOTAP (NAVY OCCUPATIONAL TASK ANALYSIS PROGRAM): A program designed to gather, assemble, computerize, and analyze occupational data; prepare and publish analysis reports on data collected; and provide appropriate printouts and special studies for use by manpower personnel and training managers.

OBSERVATION AND INTERVIEW (O&I): A job holder is observed in the job environment performing all or a substantial part of the job; the job holder performs the job while the analyst asks questions.

OCCUPATIONAL ANALYSIS: See JOB/OCCUPATIONAL ANALYSIS.

OCCUPATIONAL BRIEF: The report summarizing the results of a Navy occupational survey. This report is produced by the Navy Occupational Development and Analysis Center.

OCCUPATIONAL FIELD: A group of persons who are engaged in closely related occupations (professions and/or vocations). The allied health care field, for example, consists of physicians, nurses, nurse practitioners, medical technicians, medical therapists, orderlies, etc. Examples of Navy enlisted occupational fields are administration, construction, marine engineering, aviation maintenance/weapon, and ship maintenance.

OCCUPATIONAL STANDARDS: The minimum standards for tasks required of enlisted personnel within specific occupational entities (ratings and rates). Navy occupational standards are prepared by a department of NODAC and are contained in NAVPERS 18068D, Manual of Navy enlisted manpower and personnel classifications and occupational standards—Section I: Navy enlisted occupational standards.

OCCUPATIONAL SURVEY REPORT: The report summarizing the results of an Air Force occupational survey. This report is produced by the Air Force Occupational Measurement Center.

OJT: See ON-THE-JOB TRAINING (OJT).

ON-THE-JOB TRAINING (OJT): Training in a task or duty while engaged in its performance during daily operation and maintenance situations. The training can be part of a formal program or simply, and more commonly, knowledge and skills acquired primarily on the initiative of the individual learner.

OVERT BEHAVIOR: Behavior which is observable/measurable. See also COVERT BEHAVIOR.
PAR: See Personnel Advancement Requirement (PAR).

Part: The smallest units in an equipment, component, or module whose unit totality contributes to the operational function of the equipment, component or module. One piece, or two or more pieces joined together and not subject to disassembly without destruction of designed use.

Pay Grade: There are nine pay grades for naval enlisted personnel reflecting a person's level of proficiency within a naval rating as follows: E-1 - Recruit; E-2 - Apprentice; E-3 - Seaman/Fireman/etc.; E-4 - Petty Officer Third Class; E-5 - Petty Officer Second Class; E-6 - Petty Officer First Class; E-7 - Chief Petty Officer; E-8 - Senior Chief Petty Officer; E-9 - Master Chief Petty Officer. See also RATE.

Personnel Advancement Requirement (PAR): A description of the minimum requirements for enlisted advancement, used by individuals to prepare for advancement and by commands to determine individual readiness for advancement. Contains occupational and military requirements based on NAVPERS 18068 series, and administrative and formal school training requirements.

Personnel Qualification Standards (PQS): The PQS system is a method for qualifying officer and enlisted personnel to perform assigned duties. A PQS is a written compilation of knowledge and skills, derived from task analysis, required to qualify for a specific watch-station, maintain a specific equipment or system, or to perform as a team member within the assigned unit. The PQS also contains the standards by which the required performances may be judged.

Physical Skills: Specified muscular activities for accomplishing a goal; manual dexterity or manipulative activity basic to the performance of a task. Physical skills employ mental activities to some measure.

Examples: Operating electronic test equipment, using a welding torch, driving a car, firing a rifle, digging a ditch.

Platform: The unit (e.g., ship or aircraft type, shore facility, etc.) where task actions are performed.

PQS: See Personnel Qualification Standards (PQS).
PRELIMINARY TASK LIST: A comprehensive list of every task performed on the equipment being analyzed. It includes all tasks referenced in available technical manuals, PQS, NOTAP, MRCs, and other documents, as well as tasks known to the SMEs but not otherwise listed. These tasks are listed in the order in which they are performed.

RATE: Level of proficiency within a naval rating equated to the pay grade for enlisted personnel (E-1, E-2,..., E-9). For example, RM3 signifies a Radioman, Third Class corresponding to the E-4 pay grade. See also PAY GRADE.

RATE TRAINING MANUAL: A manual designed for enlisted personnel to study for advancement examinations and published by the Chief of Naval Education and Training. It may be used as a text or reference in a Navy school, as a reference for questions in Personnel Qualifications Standards, as a text for a correspondence course, and as a self-study manual. It covers the qualifications for advancement by actual inclusion of the necessary information or by reference to available sources of this information. For most ratings, each rate training manual covers two rates— the E-4 and E-5 rates in one manual and the E-6 and E-7 rates in another. (Formerly called "Navy Training Course.")

RATING: An enlisted occupational specialty in the Navy made up of duties calling for closely related skills, knowledge, abilities, and aptitudes. The rating is the basic occupational unit used in carrying out the personnel actions of selection, training, classification, and assignment.

SAMPLE: A finite number of observations, individuals, or units selected from those which comprise a particular universe for the express purpose of making an inference about the universe; often assumed to be representative of the total group, or universe, of which it is a part. A general term referring to a group selected by any means to represent a population.

SERVICE RATING: Required specialization (usually at the lower pay grades) in certain phases of a broad occupational field. Using the fire control technician rating as an illustration, at the petty officer third, second, and first class levels, a person in this field specializes in either of two service ratings—FTG (gun fire control technician) or FTM (missile fire control technician). At the chief petty officer level, the job incumbent is required to acquire a broader knowledge covering both guns and missiles in the general rating of fire control technician.

SKILL: A set of related physical and/or mental competencies capably applied to a specific task or group of related tasks. A skill requires considerable precision and is learned through extensive practice and study. It may be applied to several tasks or jobs with little or no transfer of training required. A skill implies proficiency which is measured by quality or quantity task performance criteria.
SKILL LEVELS: The proficiency levels (apprentice, journeyman, supervisor, and manager) of task performance. A designation used to indicate proficiencies at different places along a continuum of skills from the least to the most.

SME: See SUBJECT MATTER EXPERT (SME).

SMS: See SUBJECT MATTER SPECIALIST (SMS).

SOFT SKILL: Skill to perform jobs where job requirements are not specifically defined in terms of actions to be taken and expected outcomes. Typically an area of performance that does not have a definite beginning and end as hard skill areas.

EXAMPLES: Coaching, counseling, managing, supervising, and leadership.

SPECIFICITY: See LEVEL OF SPECIFICITY/DETAIL.

STANDARD: A statement of how well a task must be performed; refers to the acceptable quality of performance of a task in the real-world job environment. Task standards are the basis for job performance measure standards.

SUBJECT MATTER EXPERT (SME): A technical specialist who has high level knowledge and professional skill in the performance of some job and who is consulted by a task analyst or an instructional designer in the process of job task analysis. An SME may be a generalist with broad background and experience in a particular rating, or an expert in specific, specialized areas of a rating. (Navy usage) See also SUBJECT MATTER SPECIALIST (SMS).

SUBJECT MATTER SPECIALIST (SMS): A technical specialist who has professional skill in the performance of some job and who is consulted during training task analysis. An SMS who has extensive field experience makes a better technical advisor than one who is an excellent instructor but is limited in actual operational experience. The ideal SMS is one with both instructor experience and recent "hands on" operational experience. (Air Force usage) See also SUBJECT MATTER EXPERT (SME).

SUBSYSTEM: A major functional subassembly or grouping of items or equipment which is essential to the operational completeness of a system.

SUBTASK: See TASK ELEMENT.
SUPERVISOR: A person who oversees and directs the job performance of subordinates within an occupational field; performs/manages personnel and administrative functions within an occupational field; trains subordinates. Supervisory personnel usually are at the E-7 pay grade level of a rating.

SYSTEM: Any organized assembly of equipments and procedures united and regulated by interaction or interdependence to accomplish a set of specific functions. A combination of equipments or of equipments and components that perform operational functions.

EXAMPLES: Airborne early warning systems, airconditioning systems, fire control systems.

TASK: A unit of work that occupies a significant portion of work time spent in the performance of a duty. It is the most specific level of behavior in a job and describes the performance of a meaningful job function in terms of a specific action applied to a particular object. The behavior must be observable, have a definite beginning and end, and result in a completed work action or a measurable work product.

TASK DELAY TOLERANCE: A measure of how much delay can be tolerated between the time the need for task performance becomes evident and the time actual performance must begin.

TASK ELEMENT: A subdivision of a task whose level of complexity is directly subordinate to the task itself. A task element is a distinct and constituent part of a task, constituting a logical and necessary step in the performance of the task. Performing a task element does not result in a completed work action or a measurable work product. It is the smallest unit of work contained in the job that is considered in job task analysis. Sometimes called subtask (Air Force usage).

TASK INVENTORY: See JOB TASK INVENTORY (QUESTIONNAIRE).

TASK STATEMENT: The statement of a task is composed of three basic elements: (1) a specific action verb, descriptive of what is done; (2) a brief identification of what is being acted upon—the object of the action verb; and (3) whatever qualifying phrases that may be needed to clearly distinguish the task from related or similar activities, to limit and define the scope of concern, or to communicate unambiguously what task it is.
TAXONOMY: A taxonomy involves the systematic differentiation, ordering, relating, and naming of type groups within a subject field. In these terms, the classification of naval ships is a kind of taxonomy in which ships are grouped by class, type, and overall purpose.

EXAMPLE: 2200 class, DD type, combatant purpose.

Taxonomy is a prerequisite for classification, that is, the organization of tasks, or of any subject matter, into groups requires the previous development of a sound logic and rationale for the organization. The grouping of task statements under duty headings in NOTAP task inventories is one example. As a second example, in developing a taxonomy of job analysis terms, job and task analysis data could be categorized by possible uses and levels of analysis. Thus, an analysis of an occupation for job design might be termed "occupational structure analysis." An analysis at the task level for instructional curriculum design might be termed "training task analysis."

TERMINAL LEARNING OBJECTIVE (TLO): Derived from job performance measures, TLOs are to be attained during training. TLOs are broken down into their component parts which are documented as learning objectives and which may be further divided into learning steps. Each TLO contains actions, conditions, and standards.

TLO: See TERMINAL LEARNING OBJECTIVE (TLO).

TRAINING TASK ANALYSIS: A detailed, highly specific task analysis performed by training activities to design and update instructional curriculums. Job task analysis computer printouts are used for assistance in the analysis process, resulting in an organized set of terminal, learning, and enabling objectives. See also JOB TASK ANALYSIS.

TRANSFER TASK: A task that can be characterized as possessing variability in its cues, elements, conditions, and standards. By definition, a transfer task can be accomplished/performed correctly in a variety of ways dependent upon the situation, the performer, and the conditions.

</tbody>
</table>

C-3
BAKE
HARDEN, DRY BY SUBJECTING TO HEAT.

BALANCE
WEIGH IN A BALANCE; COMPARISON IN RELATIVE FORCE, IMPORTANCE, OR VALUE; SETTLE AND ADJUST (AS AN ACCOUNT); COMPUTE THE DIFFERENCE (AS AN EQUATION); E.G., BALANCE EARTHWORK QUANTITIES.

BALLAST
STEADY OR EQUIP WITH OR AS IF WITH BALLAST (A HEAVY SUBSTANCE USED TO IMPROVE STABILITY).

BARRICADE
BLOCK OFF, PREVENT ACCESS TO.

BATHE
IMMERSE IN WATER, SOME OTHER LIQUID, OR STREAM AS FOR CLEANING OR TREATING.

BATTEN DOWN
COVER AND FASTEN DOWN; CLOSE A HATCH OR WATER-TIGHT DOOR.

BEACH
GROUND (A BOAT) ONTO A BEACH, DRIVE (A BOAT) ASHORE.

BELAY
CANCEL AN ORDER; STOP; FIRM; SECURE A LINE.

BELT
PUT AMMUNITION IN A BELT FOR SUBSEQUENT ARMING OF AN AUTOMATIC WEAPON; E.G., BELT AMMUNITION.

BEND
TURN OR INCLINE IN A PARTICULAR DIRECTION.

BEND ON
SECURE ONE THING TO ANOTHER, AS BEND A FLAG ON A HALYARD.

BIAS
APPLY A SLIGHT POSITIVE OR NEGATIVE VOLTAGE TO INSERT A STEADY VOLTAGE IN SERIES WITH AN ELEMENT OF AN ELECTRONIC DEVICE, E.G., VACUUM TUBE OR TRANSISTOR.

BLAST
USE EXPLOSIVE TO DEMOLISH OR CLEAR.

BLEED
DRAIN OR EMPTY LIQUID, GAS, OR OTHER CONTENTS THAT WILL RUN OUT, AS FROM A STEAM CYLINDER, OXYGEN TANK, OR LEADING BODY; E.G., DRAIN OFF LOW PRESSURE STEAM FROM ANY OF THE STAGES OF TURBINE; DRAIN A HYDRAULIC DEPTH CHARGE RELEASE MECHANISM.

BLEND
MIX OR INTERMINGLE SMOOTHLY AND INSEPARABLY; AIRCRAFT MAINTENANCE FIELD: APPLY JEWELER'S ROUGH OR AN EMERY CLOTH, FOR EXAMPLE, TO THE SURFACE OF BLADES INSIDE AIRCRAFT ENGINES TO REMOVE FOREIGN PARTICLES IMPLANTED ON THE BLADES; E.G., BLEND POWER TURBINE BLADES OR BLEND COMPRESSOR ROTOR BLADES.

BLOCK OPEN
OBSTRUCT SO AS TO KEEP FROM CLOSING.
<table>
<thead>
<tr>

<td>CONSUME BY FIRE.</td>
</tr>
</tbody>
</table>

C-5
FILE: VERB LIST

A1 IPDE RELEASE 1 SYSTEM (VM/370 PUTR002) 02-11

BURN OUT
REMOVE MOISTURE AND ELIMINATE WAX OR PLASTIC USED IN DENTURE PATTERN BY APPLICATION OF HEAT; E.G., BURN OUT METAL FRAMWORKS.

CAGE
PUT OR CONFINE IN, OR AS IN, A CAGE OR POSITION, AS A GYRD.

CALCULATE
DETERMINE BY MATHEMATICAL PROCESSES-IMPLIES HIGHLY INTRICATE PROCESSES AS AGAINST COMPUTES WHICH IMPLIES SIMPLE ARITHMETICAL PROCESSES AND EXACT RESULTS; FORECAST CONSEQUENCES OR RESULTS, AS IN TAKING RISKS.

CALIBRATE
ASCERTAIN THE CALIBER OF, DETERMINE, RECTIFY, OR MARK THE GRADATIONS OF; ADJUST IN ACCORDANCE WITH A PREVIOUSLY DEFINED STANDARD; E.G., CALIBRATE PASSIVE AND ACTIVE SONAR EQUIPMENT.

CALK
TIGHTEN (A JOINT FORMED BY OVERLAPPING PLATES) BY DRIVING THE EDGE OF ONE PLATE INTO THE SURFACE OF THE OTHER; HENCE, MAKE TIGHT AGAINST LEAKAGE BY ANY SIMILAR MEANS, SUCH AS PACKING WITH OAKUM.

CALL
AWAKEN AS THE ONCOMING WATCH; ATTEMPT TO ESTABLISH COMMUNICATION WITH.

CANCEL
DESTROY; DEFACE; MARK FOR DELETION.

CANNIBALIZE
TAKE FROM ONE, AS PART FROM A MACHINE, AND ADD IT TO ANOTHER.

CAP
PROVIDE OR COVER WITH OR AS WITH A CAP; COMPL.

SURPASS WITH SOMETHING BETTER.

CAPTION
ENTITLE; PLACE AN IDENTIFICATION ON.

CARE
BE CONCERNED OR SOLICITIOUS; MAKE PROVISIONS OR LOOK OUT FOR.

CARRY OUT
TAKE ACTION ON BASIS OF ORDERS, REGULATIONS, DIRECTIVES, ESTABLISHED POLICIES, APPROVED PLANS, ETC.

CARVE
CUT (A SOLID MATERIAL) SO AS TO FORM SOMETHING; E.G., CUT MEAT FOR SERVING.

CASH
PAY OR OBTAIN CASH FOR.

CAST LOOSE
REMOVE RESTRAINT(S); LET GO, AS LET GO A LINE.

CAST OFF
THROW OFF, LET GO, UNFURL.

CATALOGUE
MAKE A LIST, INSERT IN A LIST; E.G., CATALOGUE.
NEGATIVE AND POSITIVE PRINTS FOR FILING.

CEMENT
BIND TOGETHER USING CENTERING MACHINE (OPTICAL)

CENSOR
EXAMINE CORRESPONDENCE, NEWS DISPATCHES, SPEECHES, ETC., IN ORDER TO SUPPRESS OR DELETE WHATEVER, IF COMMUNICATED, MIGHT AID THE ENEMY OR INJURE MILITARY OR CIVILIAN DISCIPLINE OR MORAL...

CENTER
PLACE IN OR ON A CENTER; COLLECT AROUND A CENTER.

CERTIFY
CONFIRM FORMALLY IN WRITING AS MEETING A STANDARD.
ATTTEST AUTHORITY AS TRUE, ACCURATE, AS REPRESENTED OR AS MEETING A STANDARD; TESTIFY TO IN WRITING; E.G., CERTIFY TIME AND LEAVE RECORDS; CERTIFY PILOTS AS QUALIFIED FOR PARTICULAR AIRCRAFT.

CHANGE
ALTER; REPLACE WITH ANOTHER; TRANSFORM; SUBSTITUTE; E.G., CHANGE AIRCRAFT BATTERIES.

CHARGE
LAY OR PUT A LOAD ON OR IN; PLACE A CHARGE IN OR ON; E.G., CHARGE A TORPEDO AIR FLASK.

CHART
DRAW, OR EXHIBIT ON, A CHART, MAP, OR GRAPH; E.G., CHART DENTAL CONDITIONS; CHART MINE FIELDS AND SWEPT CHANNELS.

CHECK
INSPECT FOR SATISFACTORY CONDITION, ACCURACY, SAFETY, OR PERFORMANCE; COMPARE WITH A SOURCE, ORIGINAL, OR AUTHORITY TO VERIFY EXACTNESS; E.G., CHECK OVERHAUL SCHEDULES FOR CONFORMITY WITH MAINTENANCE PROGRAM. STOP OR ARREST THE MOTION OF SUDDENLY OR FORCIBLY, TO RESTRAIN OR HOLD RESTRAINT OR CONTROL; INVESTIGATE OR VERIFY AS TO CORRECTNESS.

CHOCK
FURNISH WITH OR SECURE BY A CHOCK OR CHOCKS.

CIRCULATE
PASS FROM PERSON-TO-PERSON OR PLACE-TO-PLACE; DISTRIBUTE; FLOW WITHOUT OBSTRUCTION.

CLARIFY
MAKE MORE READILY UNDERSTANDABLE; INTERPRET.

CLASSIFY
PLACE IN CATEGORIES, AS PERSONNEL, DUTY POSITIONS, SUPPLIES, ETC.; E.G., CLASSIFY INTERCEPTED ELECTROMAGNETIC RADIATIONS, SUCH AS RADAR, NAVIGATIONAL, JAMMING, OR MISSILE CONTROL SIGNALS.

CLEAN
RID OF DIRT, IMPURITIES, OR EXTRANEOUS MATTER.

CLEAR
FREE FROM POLLUTION, OR CLARITY; FREE FROM...
DBSTRUCTION; E.G., CLEAR FOGGED AREAS OF NEGATIVES; CLEAR AND RESTORE FAULTY AUTOMATIC TELEPHONE EQUIPMENT TO NORMAL OPERATIONS.

CLIMB
ASCEND.

CLIP
CUT, OR CUT-OFF OR DUT; TRIM BY CUTTING; HOLD OR FASTEN TOGETHER.

CLOSE
STOP OR FILL UP, AS AN OPENING, SHUT; BRING TO AN END, CLOSE OUT; UNITE; CONSOLIDATE.

COAT
COVER OR SPREAD WITH A FINISHING, PROTECTING, OR ENCLOSING LAYER.

CODE
PUT IN OR INTO REPRESENTATIVE FORMS OR SYMBOLS.

COIL
LAY DOWN LINE IN CIRCULAR TURNS, USUALLY ONE TURN ATOP THE OTHER.

COLLATE
EXAMINE AND COMPARE CRITICALLY TO VERIFY ARRANGEMENT, PARTS, ETC.; E.G., COLLATE A SUMMARY REPORT PREPARED IN SEPARATE PORTIONS BY SEVERAL INDIVIDUALS.

COLLECT
GATHER TOGETHER, ASSEMBLE, ACCUMULATE, COMPILE, CALL FOR AND/OR RECEIVE PAYMENT; E.G., COLLECT DATA ON STRUCTURE AND FUNCTIONINGS OF NAVAL ORGANIZATIONS.

COLLET
SET IN, OR FURNISH WITH, A COLLET (I.E., A MET BAND, AS IN AN ANEROID BAROMETER).

COLLIMATE
MAKE PARALLEL (AS RAYS OF LIGHT); ADJUST THE LINE OF SIGHT OF (A LEVEL OR TRANSIT); E.G., COLLIMATE BASIC OPTICAL INSTRUMENTS.

COMMAND
DIRECT AUTHORITATIVELY, ORDER; E.G., COMMAND A SQUAD IN CLOSE-ORDER DRILL; COMMAND A DESTROYER SQUADRON.

COMMUNICATE
GIVE, OR GIVE AND RECEIVE, INFORMATION, SIGNAL OR MESSAGES IN ANY WAY, AS BY SPEECH, GESTURES, WRITING, ETC.

COMPACT
PACK TOGETHER BY VIBRATION OR ROLLING.

COMPARE
EXAMINE FOR LIKENESS AND/OR DIFFERENCES; E.G., COMPARE PERFORMANCE WITH ESTABLISHED STANDARDS; COMPARE OPERATING COSTS OF DIFFERENT SHOPS.

COMPENSATE
COUNTERBALANCE, MAKE UP FOR; GIVEN AN EQUIVALENT TO; ADJUST; MAKE EQUAL RETURN TO; USUALLY WITH THE PREPOSITION "FOR"; E.G., COMPENSATE A

</tbody>
</table>
COMPRESS.

CONSTRUCT

PUT TOGETHER SYSTEMATICALLY; BUILD, DEVISE, AS A BRIDGE, THEORY, TRIANGLE, ETC.: E.G., CONSTRUCT TESTS FOR MEASURING ACHIEVEMENT, CONSTRUCT BENCH AND FLOOR MOLDS.

CONSULT

CONFERENCE WITH ANOTHER TO OBTAIN FACTS, ADVICE, OPINIONS, ETC.: E.G., CONSULT WITH CARDIOVASCULAR DISEASE SPECIALIST.

CONTOUR

SHAPE TO FIT AN OUTLINE OF AN ESPECIALLY CURVING OR IRREGULAR FORM OR FIGURE.

CONTRACT

ENTER OFFICIALLY INTO A FORMAL AGREEMENT TO OBTAIN OR PROVIDE MATERIAL, SUPPLIES, EQUIPMENT, AND/OR SERVICES; E.G., CONTRACT FOR AVIATION EQUIPMENT; GET SMALLER; SHRINKS.

CONTRIBUTE

GIVE OR SUPPLY IN PART, ALONG WITH OTHERS, AS INFORMATION OR ADVICE, A SECTION OF A PLAN, ETC.

CONTROL

CHECK OR REGULATE; KEEP WITHIN LIMITS; EXERCISE DIRECTING, GUIDING, OR RESTRAINING POWER OVER; E.G.; CONTROL SITE DEPLOYMENT OF MATERIALS AND EQUIPMENT.

CONVERT

CHANGE, TRANSFORM, TURN, EXCHANGE FOR SOMETHING EQUAL IN VALUE (A SECURITY, CURRENCY, ETC.); E.G., CONVERT POINTS INTO GRID COORDINATES.

COOPERATE

ACT OR OPERATE JOINTLY WITH ANOTHER OR OTHERS; IMPLIES VOLUNTARY ACTION RATHER THAN UNDER ORDERS OF IMPPLICIT DIRECTION.

COORDINATE

BRING INTO COMMON ACTION WITH OTHERS, GENERALLY WITH EQUAL RANKS, NOT SUBORDINATES, AS IN COORDINATING ATTACKS WITH ADJACENT UNITS OR SUPPORTING UNITS, OR AS IN COORDINATING STAFF FUNCTIONS TO OBTAIN A RESULT THAT REQUIRES ACTION ON THE PART OF SEVERAL STAFF SECTIONS; E.G., COORDINATE REPAIR ACTIVITIES BETWEEN SHIP AND SHIPYARD.

COPY

DUPLICATE; IMITATE; ANNOTATE IN ACCORDANCE WITH STANDARD MUSIC EDITORIAL PRACTICES.

CORRECT

MAKE OR SET RIGHT; ALTER OR ADJUST TO BRING TO A REQUIRED CONDITION; RECTIFY; INDICATE ERRORS, FAULTS, DISCREPANCIES TO BE AMENDED.

CORRELATE

ESTABLISH A MUTUAL OR RECIPROCAL RELATION BETWEEN; E.G., CORRELATE REQUIREMENTS AND RESOURCES.

<tr>
<td>DISPERSE</td>
<td>DRIVE OR SEND OFF IN VARIOUS DIRECTIONS; SCATTER; SPREAD WIDELY; DISSEminate.</td>
</tr>
<tr>
<td>DISPLAY</td>
<td>EXHIBIT; SHOW; SPREAD BEFORE A VIEW; E.G., DISPLAY RETENTION PUBLICITY.</td>
</tr>
</tbody>
</table>
DISPOSE
GET RID OF; DESTROY; E.G., DISPOSE OF OBSOLETE FILES AND PUBLICATIONS.

DISSEMINATE
DIFFUSE, DISTRIBUTE, SPREAD BY DISPERSION, CIRCULATE; E.G., DISSEMINATE INTELLIGENCE DATA.

DISTINGUISH
RECOGNIZE OR DISCRIMINATE ONE THING FROM ANOTHER; PERCEIVE CLEARLY; E.G., DISTINGUISH BETWEEN RADAR BLIPS.

DISTRIBUTE
DIVIDE, DEAL OUT, PORTION; ADMINISTER, DISPENSE; E.G., DISTRIBUTE INCOMING MAIL TO SHIP DIVISION.

DIVE
SUBMERGE UNDERWATER; E.G., DIVE AND PERFORM SALVAGE OPERATIONS.

DOCUMENT
FURNISH WITH EVIDENCE OR THE LIKE.

DOG
SECURE IN PLACE BY MEANS OF VARIOUS MECHANICAL DEVICES, AS FOR HOLDING.

DON
ENVELOPE ONESELF; E.G., DON AVIATION-TYPE LIFE VEST.

DOWNLOAD
REMOVE THE WEIGHT BORNE UP BY A STRUCTURE; E.G., DOWNLOAD A MISSILE FROM AN AIRCRAFT.

DRAFT
MAKE A PRELIMINARY SKETCH OR COMPOSITION OF; E.G., DRAFT A NAVAL MESSAGE.

DRAIN
DRAW OFF LIQUID GRADUALLY OR COMPLETELY.

DRAW
CAUSE TO MOVE IN A PARTICULAR DIRECTION BY OR BY A PULLING FORCE; CAUSE TO MOVE CONTINUOUSLY TOWARD OR AFTER A FORCE APPLIED IN ADVANCE; CREATE A LIKENESS OR PICTURE IN OUTLINES; SKETCH.

DRESS
DISPLAY FROM FLAGSTAFF AND FROM EACH MASTHEAD LARGEST NATIONAL ENSIGN FURNISHED TO SHIP; PREPARE BY SPECIAL PROCESS, AS ROUGH LUMBER; APPLY DRESSING TO WOUND; CLOTHE; E.G., DRESS DIVERS.

DRILL
TRAIN IN MILITARY OR PHYSICAL EXERCISES BY HAVING DO REPEATED PERFORMANCES; E.G., DRILL PERSONNEL IN HANDLING EXPLOSIVES AND DETONATORS; PIERCE OR BORE WITH A DRILL.

DRIVE
FORCE (A PASSAGE INTO OR THROUGH) BY PRESSING, DIGGING ETC.; E.G., DRIVE SURVEY STAKES.

DRY
MAKE DRY; FREE FROM WATER OR LIQUID; E.G., DRY OPTICAL ASSEMBLY.

DUST
WIPE THE DUST FROM; SPRINKLE WITH A POWDER.

C-15
FILE: VERB LIST

A1 1PDE RELEASE 1 SYSTEM (VM/370 PUT8002) C2-11

OR DUST

EASE OFF

EASE A LINE: Slacken when taut

EDGE

BORDER; SHARPEN; ADVANCE; E.g. EDGE LENSES

EDIT

REVISE AND MAKE READY FOR PUBLICATION: ASSEMBLE (AS A MOTION PICTURE) BY CUTTING AND REARRANGING; PREPARE AN EDITION OF

EFFECT

BRING TO PASS; ACCOMPLISH BY PERFORMANCE; MAKE POSSIBLE BY EXECUTION; E.g., EFFECT AUTHORIZED FIELD MODIFICATIONS OF EQUIPMENT

ELEVATE

MOVE OR RAISE TO A HIGHER PLACE OR POSITION

ELIMINATE

REMOVE OR GET RID OF; OMIT; EXCLUDE, EXPEL

EMBALT

TREAT (A DEAD BODY) TO PROTECT FROM DECAY

EMPLOY

PUT TO USE PRINCIPLES AND TECHNIQUES, AS IN FOREMANSHIP

EMPTY

REMOVE THE CONTENTS OF

ENCODE (CODE)

CONVERT FROM ORDINARY LANGUAGE INTO CODE; E.g., ENCODE A NAVAL OR INTERNATIONAL SIGNAL

ENCOURAGE

INSPIRE WITH COURAGE AND SPIRIT; FOSTER ESPIRIT CORPS

ENERGIZE

GIVE ENERGY TO, ACTIVATE; SWITCH ON; E.g., ENERGIZE A SUBMARINE FATHOMETER

ENFORCE

COMPEL OBSERVATION OF OR COMPLIANCE WITH, SUCH A REGULATION, RULE, POLICY, PROCEDURES; E.g., ENFORCE SAFETY REGULATIONS AND PROCEDURES

ENGAGE

BRING TOGETHER OR INTERLOCK; INVOLVE ONESELF; TAKE PART IN; E.g., ENGAGE IN STUDIES ON EFFECT OF LOW PRESSURE ON FLIGHT PERSONNEL

ENGRAVE

CUT FIGURES, LETTERS, DEVICES IN A SURFACE FOR PRINTING; PRINT FROM AN ENGRAVED PLATE; PRINT WITH A GRAVER

ENSURE

MAKE CERTAIN AND INEVITABLE; MAKE SURE OF; E.g., ENSURE MAXIMUM CARE OF PATIENTS

ENTER

GO OR COME INTO A PLACE OR CONDITION; MAKE A BEGINNING; BEGIN AS A PARTICIPANT; INSCRIBE, ENROLL, RECORD; E.g., ENTER CHANGES IN PUBLICATIONS

EQUATE

TREAT, REGARD, OR EXPRESS AS EQUAL OR EQUIVALENT

C-16

FILE: VERB LIST

VERMINS AND RATS.

CAUSE TO CEASE BURNING.

DRAW OUT, PULL OUT, DEDUCE, DERIVE, MANAGE TO OBTAIN; COPY OUT, MAKE A SELECTION OR QUOTATION; E.G., EXTRACT PORTIONS OF RADIO FREQUENCY PLANS.

MAKE, BUILD, PUT TOGETHER, FRAME, MANUFACTURE, AS BY ASSEMBLING PARTS (CONNOTES PROCESSING OVER A PERIOD OF TIME RATHER THAN RELATIVELY INSTANTANEOUS CONSTRUCTION); E.G., FABRICATE RIGID TUBING AND FLEXIBLE BASE ASSEMBLIES.

FAIL SHORT OF SUCCESS OR ACHIEVEMENT IN SOMETHING EXPECTED, ATTEMPTED, DESIRED, OR APPROVED. DEACTIVATE, DE-ENERGIZE OR OPEN; E.G., ISOLATE AN ELECTRICAL CIRCUIT FOR TROUBLESHOOTING OR REPAIR PURPOSES.

COIL A ROPE OR HAWSER IN FAKES (COILS), ESPECIALLY BY WINDING IN LAYERS USUALLY OF A ZIGZAG OR FIGURE EIGHT FORM, TO PREVENT TWISTING OR FOULING WHEN RUNNING OUT (NAUTICAL); E.G., FAKE DOWN A LINE OR WIRE.

ATTACH FIRMLY OR SECURELY IN PLACE; FIX SECURE TO SOMETHING ELSE.

TURN THE BLADE OF AN OAR HORIZONTALLY AT THE ISH OF A STROKE TO REDUCE RESISTANCE OF AIR OR WATER; CHANGE THE PITCH OF A VARIABLE PITCH PPELLER ON AN AIRPLANE TO VARY AMOUNT OF SITE THE AIR; BLEND EDGES TOGETHER BY FILEING, SANDING, ETC., ALSO TO SECURE AN ENGINE IN FLIGHT.

SUPPLY FOR USE OR CONSUMPTION; MOVE INTO A MACHINE OR OPENING IN ORDER TO BE USED OR PROCESSED; E.G., FEED FLATWORK INTO PANGLE.

CARRY OR CONVEY OVER WATER IN A BOAT OR PLANE.

TAKE APART, AS A HAND WEAPON, INsofar AS SUCH DISASSEMBLY CAN BE ACCOMPLISHED PRACTICALLY IN THE FIELD (NOT A COMPLETE STRIPPING OF THE WEAPONS AS COULD BE MADE IN A REPAIR SHOP).

RUB SMOOTH OR CUT AWAY; ARRANGE IN ORDER FOR REFERENCE; LAY AWAY DOCUMENTS, PAPERS, ETC. IN A METHODICAL MANNER.

MAKE COMPLETE BY INSERTING OR SUPPLYING INFORMATION.

C-18
FILTER
SEPARATE BY STRAINING.

FINISH
PROVIDE WITH A FINAL COAT OR SURFACE; E.G., FINISH A CONCRETE SURFACE.

FIRE
IGNITE OR DISCHARGE A FIREARM OR MILITARY WEAPON.

FIRE FIGHT
FIGHT AND EXTINGUISH FIRES.

FIT
MAKE READY OR QUALIFIED; ADJUST TO REQUIRED FORM AND SIZE; EFFECT CONFORMANCE TO; OUTFIT; E.G., FIT INTEGRATED TORSO HARNESS SUITS.

FIX
MAKE PERMANENT THE IMAGE ON A PHOTOGRAPHIC FILM BY REMOVING UNUSED SALTS; REPAIR.

FLASK
ENCLOSE IN A FLASK, E.G., PLACE (A DENTURE) IN A FLASK FOR PROCESSING.

FLEMISH DOWN
COIL A ROPE ON DECK IN A FLAT, CIRCULAR, CONCENTRIC PATTERN (NOT ONE COIL ON TOP OF ANOTHER); E.G., FLEMISH DOWN A LINE OR WIRE.

FLEX
BEND, PARTICULARLY TRACTABLE OR RESILIENT MATERIAL.

FLUSH
POUR LIQUID OVER OR THROUGH; WASH OUT WITH A RUSH OF LIQUID; OPEN.

FOLD
REDUCE THE LENGTH OR BULK OF BY FOLDING OVER; ONE PART OVER ANOTHER PART.

FOLLOW UP
MAKE A RENEwed, REPEATED OR SUPPLEMENTARY ACTION BASED ON ACTION PREVIOUSLY INITIATED, TO PROMPT A DESIRED RESPONSE; CARRY TO COMPLETION; FOLLOW THROUGH.

FORECAST
PREDICT; INDICATE AS LIKELY TO OCCUR.

FORGE
FORM BY HEATING AND HAMMERING; HEAT INTO A SHAPED MOLDED FORM; E.G., FORGE METAL LINKS, PAD-EYES AND CHISELS.

FORM
CONSTRUCT; FRAME.

FORMAT
PRODUCE IN A SPECIFIED FORM OR STYLE.

FORMULATE
EXPRESS OR PUT IN SYSTEMATIZED STATEMENT; E.G., FORMULATE PLANS, POLICIES, PROCEDURES, ETC.

FORWARD
TRANSMIT; SEND ONWARD, AS A REPORT, THROUGH CHANNELS.

FRAME
ENCLOSE IN A BORDER; E.G., FRAME A PICTURE.

C-19
FRAP
BIND TIGHTLY BY PASSING LINES AROUND: DRAW TOGETHER THE PARTS OF TACKLE OR OTHER COMBINATION OFropes TO INCREASE TENSION.

FUEL
PROVIDE WITH FUEL.

FUNCTION
SERVE; E.G., FUNCTION AS WATCH STANDER.

FURNISH
SUPPLY, PROVIDE, EQUIP; E.G., FURNISH SONAR REPORTS TO SONAR STATIONS.

FUSE
REDUCE TO A LIQUID OR PLASTIC STATE BY HEAT; BLEND BY MELTING TOGETHER.
ATTACH A FUZE TO; E.G., FUZE AIRCRAFT BOMBS AND ROCKETS.

GAG
CHOKE OR STOP UP; E.G., GAG A SAFETY VALVE.

GAS
SUBJECT TO OR AFFECT WITH GAS; AS: STUPIFY OR KILL WITH POISONOUS FUMES; FILL OR SUPPLY WITH GAS.

GENERATE
START, BRING INTO EXISTENCE.

GIVE
PASS OVER, DELIVER, OR TRANSMIT IN ANY MANNER; E.G., GIVE ARTIFICIAL RESPIRATION; GIVE MEANINGS OF AIRCRAFT EMERGENCY SIGNALS.

GLAZE
FURNISH OR FILL WITH GLASS; E.G., GLAZE A WINDOW WITH A SMOOTH GLOSSY SURFACE OR COATING.

GRADE
RATE, AS EFFICIENCY REPORTS, ON BASIS OF PERFORMANCE; SLOPE OR INCLINE GRADUALLY; E.G., GRADE ROAD SURFACES.

GRANT
GIVE (WHAT IS REQUESTED); ASSENT TO; E.G., GRANT SUBCONTRACT AND PURCHASE ORDER APPROVAL OR CONSENT.

GREASE
LUBRICATE, PARTICULARLY MOVING PARTS OF MACHINERY.

GRIND
WEAR, SMOOTH, OR SHARPEN BY ABRASION OR Friction.

GRIND IN
LAP IN (AS A VALVE AND VALVE SEAT) SO THAT ONE SURFACE SERVES AS A LAP FOR THE OTHER.

GRIP
INFORM MAINTENANCE PERSONNEL OF A MALFUNCTION.
SECURE BOAT FOR SEA BY MEANS OF GRIPES.

GROUND
RUN ASHORE, STRIKE THE BOTTOM; REMOVE FROM FLIGHT STATUS; CONNECT AN ELECTRICAL LEAD TO GROUND; I.E., TO SHIP, CHASSIS, EARTH.
FILE: VERB LIST

<p>| GUARD       | WATCH OVER SO AS TO PREVENT ESCAPE, DISCLOSURE, OR INDISCRETION. |
| GUIDE       | REGULATE; MANAGE; DIRECT IN A CERTAIN WAY; ORDER; INSTRUCT; SUPERINTEND TRAINING OF. |
| GUM         | SHEAR, STIFFEN, OR CLOG WITH GUM OR A GUMMING SUBSTANCE. |
| MAIL        | ADDRESS A NEARBY BOAT OR SHIP. |
| HALF-MAST   | LOWER TO A POSITION PART WAY (NOT NECESSARILY HALF WAY) DOWN THE MAST OR FLAGSTAFF. |
| HANDLE      | MANAGE, CONTROL, DIRECT, DEAL WITH, PERFORM A FUNCTION WITH REGARD TO; TREAT, MANIPULATE; TOUCH; E.G., HANDLE MANILA LINE OR WIRE POPE OR CARGO. |
| HANG        | FASTEN TO AN ELEVATED POINT WITHOUT SUPPORT FROM BELOW; FASTEN AS TO ALLOW FREE MOTION, SUSPEND; FIX IN POSITION OR AT A PROPER ANGLE. |
| HARD-FACE   | WELD A WEAR-RESISTANT METAL ONTO THE SURFACE OF (A METAL PART). |
| HARDEN      | MAKE HARD; E.G., HARDEN GRAVERS, SPRINGS, AND SCREWDRIVER BITS. |
| HARMONIZE   | BRING INTO ACCORD; E.G., HARMONIZE MELODIES IN FOUR PARTS. |
| HEAVE       | CAST, THROW; E.G., HEAVE A HEAVING LINE. |
| HOIST       | LIFT OR RAISE, PARTICULARLY WITH THE AID OF EQUIPMENT. |
| HOLD        | HAVE OR KEEP IN POSITION; MAINTAIN GRASP; REMAIN FASTENED; STOP ACTION OF TEMPORARILY. |
| HONE        | SHARPEN, GIVE AN EDGE TO, OR ENLARGE HOLES TO PRECISE DIMENSIONS AND CONTROLLED FINISHES. |
| HOUSE       | STOW OR SECURE IN A SAFE PLACE. |
| IDENTIFY    | ESTABLISH THE IDENTITY OF; DISTINGUISH, DISCRIMINATE; IN NAUTICAL PARLANCE, RECOGNIZE OR NAME; E.G., IDENTIFY FLAGS AND ENSIGNS OF MAJOR MARITIME POWERS. |
| ILLUSTRATE  | MAKE CLEAR, EXPLAIN, DEMONSTRATE, AS BY FIGURES, AND EXAMPLES; E.G., ILLUSTRATE CORRECT INSTRUMENTS FLIGHT TECHNIQUES; CREATE ILLUSTRATIONS. |
| IMMERSE     | DIP OR PLUNGE INTO A FLUID. |</p>

FILE: VERB LIST

A1 IPOE RELEASE 1 SYSTEM (VM/370 PUT8002) 02-11

**JACK OVER**

TURN A MAIN ENGINE OR TURBINE BY MEANS OF AN AUXILIARY (JACKING) ENGINE.

**JETTISON**

DISCARD; CAST OFF AS AN ENCUMBRANCE.

**JOIN**

CONNECT; LINK TOGETHER.

**JUMP**

BYPASS; CLOSE A BREAK-IN OR CUT-OUT PART OF A CIRCUIT.

**KEEP**

MAINTAIN; E.G., KEEP RECORDS.

**KEYPUNCH**

PUNCH HOLES OR NOTCHES IN CARDS, IN CERTAIN PATTERNS, A MEANS OF PREPARING DATA FOR ENTERING IT INTO A COMPUTER.

**KNOW**

DEMONSTRATE KNOWLEDGE; E.G., KNOW THE LAWS OF DIVING.

**LABEL**

IDENTIFY BY DESCRIBING OR AFFIXING WRITTEN MATERIAL ON SPECIFIC OBJECTS; DESCRIBE OR DESIGNATE; DISTINGUISH, IDENTIFY.

**LACE**

SECURE TOGETHER A GROUP OR BUNDLE OF ELECTRICAL LEADS/WIRES BY MEANS OF A CONTINUOUS PIECE OF CORD FORMING HITCHES AT REGULAR INTERVALS AROUND THE GROUP OR BUNDLE; DRAW OR PASS THROUGH EYELETS OR GROMMETS.

**LAP**

WORK TWO SURFACES TOGETHER WITH OR WITHOUT ABRASIVES UNTIL A VERY CLOSE FIT IS PRODUCED.

**LASH DOWN**

TIE DOWN AND FASTEN WITH ROPE, CABLE, CHAIN, ETC.; E.G., LASH DOWN AND SECURE AIRCRAFT.

**LATCH**

MAKE FAST WITH OR AS WITH A LATCH.

**LAUNCH**

CAUSE TO SLIDE FROM LAND INTO WATER; SET AFOAR; GIVE A START TO, PUT IN OPERATION; E.G., LAUNCH PONTOON BARGES; CAUSE TO BECOME AIRBORNE; E.G., LAUNCH AIRCRAFT.

**LAUNDER**

WASH CLOTHING, BEDDING, ETC.

**LAY**

SET IN ORDER OR POSITION (AS BRICKS).

**LAY OUT**

PREPARE MATERIAL FOR A SUBSEQUENT WORK OPERATIC; E.G., LAY OUT ELEMENTARY DESIGNS OR METAL STRUCTURES.

**LEAD**

DIRECT IN ACTION OR OPINION; GUIDE OR CONDUCT; PRECEDE AND DIRECT IN MOVEMENTS, AS LEAD PEN.

**LETTER**

PRINT; INSCRIBE.
LEVEL
BRING TO A COMMON LEVEL OR PLANE; AIM A GUN OR OTHER WEAPON HORIZONTALLY; FIND HEIGHTS OR POINTS OF LAND.

LIGHT-OFF
LIGHT UP; SET A FIRE GOING, ESPECIALLY IN A BOILER OR A CORE OVEN, OR IN OIL-FIRED, INDIRECT ARC, OR RESISTOR FURNACES.

LIST
SET DOWN IN A LIST; CAUSE (A VESSEL) TO LEAN TO ONE SIDE.

LIVE
SURVIVE; E.G., LIVE AT DEPTHS IN A SATURATED CONDITION.

LOAD
LAY A LOAD OR BURDEN ON OR IN; PLACE A LOAD OR CHARGE IN (A FIREARM, ROCKET LAUNCHER; ETC.); E.G., LOAD GUNS.

LOCALIZE
LIMIT OR CONFINE TO A PLACE, AREA, OR LOCALITY; DETERMINE THE ORIGIN OR PLACE OF, AS AN ORGANIC OR MECHANICAL MALFUNCTION, ETC.; E.G., LOCALIZE A MALFUNCTION IN EQUIPMENT SUBASSEMBLIES.

LOCATE
DESIGNATE THE SITE OR PLACE OF; DEFINE THE LIMITS OF; STATION SOMEONE IN PLACE; SEARCH FOR AND DISCOVER THE POSITION OF; E.G., LOCATE AN ENEMY SUBMARINE; LOCATE DAMAGE CONTROL FITTINGS; LOCATE IN DARKNESS, NAVIGATION RUNNING LIGHT SWITCHES; LOCATE A MALFUNCTION.

LOCK
MAKE SECURE OR INACCESIBLE BY MEANS OF LOCKS.

LOG
ENTER INTO A NAVAL RECORD; AS A SHIP'S LOG OR CORRESPONDENCE LOG; E.G., LOG ROUTINE CORRESPONDENCE.

LOOSEN
FREE FROM RESTRAINT; UNTIE, DETACH, SLACKEN.

LOWER
LET DESCEND; REDUCE THE HEIGHT OF; BRING DOWN.

LUBRICATE
APPLY A LUBRICANT (OIL, GREASE, GRAPHITE, ETC.); MAKE SLIPPERY.

MACHINE
PLANE, SHAPE, TURN, MILL, ETC. BY MACHINE; E.G., MACHINE A CONCAVE OR CONVEX SURFACE.

MAINTAIN
HOLD OR KEEP IN A STATE OR CONDITION, ESPECIALLY IN A STATE OF EFFICIENCY, NEWNESS, VALIDITY, OR CLEANLINESS; E.G., MAINTAIN A SURFACE PLCT; KEEP PROPERTY (REAL ESTATE, MACHINERY, EQUIPMENT) IN SUCH FASHION AS NOT TO LET FAIL OR DECLINE; SUPPORT, SUSTAIN, UPHOLD, DEFEND.

MAKE
BRING INTO BEING BY FORMING OR SHAPING; PUT
| FILE: VERB LIST | TOGETHER BY COMPONENTS; PRODUCE AS A RESULT OF ACTION, EFFORT, OR BEHAVIOR. |
| MAKE OUT | DRAW UP OR PREPARE IN WRITING; E.G., MAKE OUT REPORTS. |
| MAN | FURNISH WITH PEN FOR WORK OR DEFENSE; TAKE ASSIGNED PLACES FOR WORK OR DEFENSE; STRENGTHEN, BRACE OR FORTIFY; E.G., MAN A SOUND-POWERED PHONE HEADSET. |
| MANAGE | CONTROL, GUIDE, DIRECT, OR ADMINISTER, AS A FACILITY, PROGRAM, PROJECT, OR AN OFFICE. |
| MANEUVER | CAUSE TO EXECUTE TACTICAL MOVEMENTS; MANAGE OR BRING ABOUT WITH SKILL; MANIPULATE; E.G., MANEUVER BOAT ALONGSIDE. |
| MANGLE | PRESS OR SMOOTH AS LINEN. |
| MANIPULATE | OPERATE WITH HANDS OR MECHANICAL MEANS; E.G., MANIPULATE LEVERS. |
| MANUFACTURE | MAKE BY HAND, MACHINERY, OR OTHER AGENCY; WORK INTO SUITABLE FORMS FOR USE; FABRICATE; E.G., MANUFACTURE REINFORCED CONCRETE BLOCK. |
| MARK | PUT A MARK ON, I.E., FIX OR TRACE OUT THE BOUND OR LIMITS OF; E.G., MARK SURVEY STAKES. |
| MARRY | MATCH COMPONENTS FOR COMPATIBLE OPERATION; SYNCHRONIZE; MATCH UP, BRING TOGETHER. |
| MASK OUT | COVER OR CONCEAL, AS BY SURFACING OVER WITH TAPE; E.G., MASK OUT NONPRINTING AREAS. |
| MATCH | CAUSE TO CORRESPOND. |
| MATE | JOIN TOGETHER. |
| MEASURE | ASCERTAIN THE EXTENT, DEGREE, QUANTITY, DIMENSIONS OR CAPACITY OF, BY A STANDARD; ESTIMATE; E.G., MEASURE RADAR RINGTIME. |
| MEET | BECOME ACQUAINTED WITH; CONFORM TO; E.G., MEET DEADLINES. |
| MELT | REDUCE FROM A SOLID TO A LIQUID STATE, USUALLY BY HEATING; E.G., MELT FERROUS AND NONFERROUS ALLOYS. |
| MEND | MAKE (SOMETHING BROKEN, WORN, TORN, OR OTHERWISE DAMAGED) WHOLE, SOUND, OR USABLE BY REPAIRING. |
| MILL | SHAPE OR DRESS BY MEANS OF A ROTARY CUTTER. |
MIX
COMBINE OR BLEND INTO ONE MASS.

MODIFY
MAKE CHANGES IN OR ALTERATIONS TO.

MONITOR
OBSERVE, LISTEN TO, CHECK ON (AS EQUIPMENT, PERSON, OR FUNCTION) FOR COMPLIANCE WITH INSTRUCTIONS, REGULATIONS, OR EFFECTIVENESS; E.G., MONITOR COMMUNICATIONS TRANSMISSIONS.

MOUNT
ATTACH TO A SUPPORT, ARRANGE OR ASSEMBLE FOR USE OR DISPLAY, FRAME.

MOVE
PASS FROM ONE PLACE OR POSITION TO ANOTHER.

NAME
GIVE A NAME TO IDENTIFY, SPECIFY, OR MENTION BY NAME; DESIGNATE.

NAVIGATE
DETERMINE POSITION OF SHIP, PLANE, OR BOAT; STEER, DIRECT, OR PLOT THE COURSE FOR A SHIP OR AIRCRAFT.

NEGOTIATE
CONFERENCE, BARGAIN, OR DISCUSS WITH A VIEW TOWARD REACHING AN AGREEMENT; E.G., NEGOTIATE CONTRACT MODIFICATIONS.

NEUTRALIZE
COUNTERACT THE ACTIVITY OR EFFECT OF; MAKE INEFFECTIVE.

NOMINATE
DESIGNATE OR NAME; PROPOSE FOR SOME HONOR.

NOTATE
MUSIC FIELD: REPRESENT SOUND BY WRITTEN OR PRINTED CHARACTERS.

NOTIFY
INFORM; MAKE KNOWN, GIVE NOTICE OF.

OBSERVE
ADHERE TO, FOLLOW, KEEP OR ABIDE BY (LAW, DUTY, RULE, CUSTOM); CELEBRATE; NOTICE OR PERCEIVE, PAY SPECIAL ATTENTION; EXAMINE SCIENTIFICALLY; E.G., OBSERVE THE SAFETY PRECAUTIONS APPROPRIATE TO ELECTRONIC EQUIPMENT.

OBTAIN
PROCURE, GET POSSESSION OF; E.G., OBTAIN DATA FOR INCLUSION IN A ROUGH DECK LOG.

OFFICIATE
ACT IN AN OFFICIAL CAPACITY; SERVE AS A LEADER OR CELEBRANT OF A CEREMONY, AS A RELIGIOUS SERVICE.

OIL
PROVIDE WITH LUBRICANT.

OPAQUE
MAKE SO AS NOT TO ADMIT LIGHT; PAINT OVER IN ORDER TO BLOT OUT PORTIONS (AS OF A NEGATIVE); E.G., OPAQUE DEFECTS.

OPEN
ENTER UPON; BEGIN; TO MAKE AVAILABLE FOR ENTRY OF
PASSAGE BY BURNING BACK OR CLEARING A WAY.

OPERATE
PUT INTO OR CONTINUE IN OPERATION OR ACTIVITY; MANAGE, CONDUCT, CARRY OUT OR THROUGH; DRIVE, AS TO OPERATE A VEHICLE; MANIPULATE CONTROLS TO PRODUCE AN EFFECT OR FUNCTION; E.G., OPERATE A VOICE RADIO OR SHUTTER SEARCHLIGHT.

ORDER
COMMAND; GIVE AN ORDER TO; PLACE ON ORDER; E.G., ORDER FIRE DEPT. SUPPLIES.

ORGANIZE
ARRANGE; SYSTEMATIZE PERSONS OR THINGS INTO PROPER PLACES, ESPECIALLY IN RELATION TO EACH OTHER; GIVE STRUCTURE TO; PUT IN PROPER ORDER.

ORIENT
PUT (PARTICULARLY ONESELF) INTO CORRECT POSITION OR RELATION; ACQUAINT (ONESELF) WITH AN ENVIRONMENT, CONDITION, OR SITUATION; SET OR ARRANGE IN POSITION; FIX DIRECTION; E.G., ORIENT STUDENT ON COURSE REQUIREMENTS.

ORIGINATE
BEGIN, PRODUCE AS NEW, SUCH AS PROCEDURES, PLANS, TECHNIQUES, ETC.

OUTFIT
FIT OUT OR EQUIP WITH FOR ANY PURPOSE, AS FOR A JOURNEY.

OUTLINE
SUMMARIZE MOST SIGNIFICANT FEATURES OF, OR GIVE PRELIMINARY OR GENERAL SKETCH OF, AS BATTLE PLANS, SYSTEMS, REGULATIONS, ETC.

OVERHAUL
EXAMINE THOROUGHLY AND CHECK FOR NEEDED REPAIRS; MAKE REPAIRS AND ADJUSTMENTS NEEDED TO RESTORE WORKING ORDER; E.G., OVERHAUL generating and control equipment.

PACK
PREPARE GOODS, BOOKS, EQUIPMENT, MATERIALS, ETC. FOR SHIPMENT; FILL COMPLETELY; E.G., PACK A WHEEL BEARING.

PACKAGE
WRAP OR BOX AS FOR SELLING, CARRYING, DISPOSING OR STORAGE; E.G., PACKAGE ITEMS FOR SHIPMENT.

PAINT
APPLY OR TREAT WITH A COATING BY BRUSHING, SWABING, OR SPRAYING; ELECTRONICALLY DISPLAY TARGET ON CATHODE RAY TUBE.

PARALLEL
COMPARE OR INDICATE ANALOGY OF; SHOW SOMETHING EQUAL OR CORRESPONDENT TO; PLACE SO AS TO BE CORRESPONDENT IN DIRECTION OR OUTPUT; E.G., PARALLEL GENERATORS.

PARTICIPATE
TAKE A PART OR SHARE WITH OTHERS IN SOME ACTIVITY, ENTERPRISE, ETC.; E.G., PARTICIPATE AS A LEADER IN RECREATIONAL AFFAIRS.
FILE: VERB LIST

PASS
TRANSFER FROM ONE TO ANOTHER.

PATCH
MEND, REPAIR, STRENGTHEN, ETC., WITH A PATCH OR OVERLAY; E.G., PATCH LACERATIONS, ABRASIONS AND PUNCTURES OF LIFE RAFTS; CONNECT CIRCUITS.

PATROL
CONDUCT ROUTINE SECURITY ROUNDS; PATROL PROPERTY.

PAY
FILL THE SEAMS OF A WOODEN VESSEL WITH PITCH OR OTHER SUBSTANCE; LET OUT (A ROPE) BY SLACKENING; GIVE IN RETURN FOR GOODS OR SERVICES.

PEEN
HAMMER, BEND, ETC., WITH A PEEN (THE HEMISPHERICAL OR WEDGE-SHAPED END OF A HAMMER); E.G., PEEN COLD RIVETS.

PERFORM
CARRY OUT OR EXECUTE SOME ACTION.

PHOTOGRAPH
TAKE A PICTURE OF.

PILOT
CONTROL THE FLIGHT OF AN AIRCRAFT; STEER A SHIP INTO OR OUT OF HARBOR OR PORT, OR THROUGH DIFFICULT WATERS.

PIN
FASTEN OR SECURE WITH A PIN.

PIPE
CALL OR DIRECT BY THE BOATSWAIN'S PIPE; E.G., PIPE ALL SHIPBOARD CALLS.

PLACE
SET OR ARRANGE TO ESTABLISH IN A CERTAIN POSITION; AS RANK, ORDER, CONDITION, ETC.; DISPOSE OF IN A DESIRED OR SELECTED WAY; E.G., PLACE SURVEY STAKES.

PLAN
REPRESENT AS BY A DIAGRAM; DEVISE OR PROJECT AS A METHOD OR COURSE OF ACTION; PREARRANGE THE DETAILS OF, AS TO PLAN A CAMPAIGN; INTEND, PROPOSE TO DO, E.G., PLAN A DAILY WORK ASSIGNMENT.

PLOT
MAKE A PLAN OR MAP OF SOMETHING; MARK THE POSITION OF SOMETHING ON A MAP OR PLAN; DELINEATE; DRAW, OUTLINE AN ACTION IN ADVANCE, LAY OUT, DEVISE; E.G., PLOT BEARINGS, RANGES, AND FIXES ON NAUTICAL CHARTS.

PLUG
STOP, MAKE TIGHT, OR SECURE BY INSERTING A PLUG.

POISE
MAKE BALANCE, EQUALIZE, KEEP STEADY, AS IN THE PHRASE “POISE A CLOCK BALANCE WHEEL.”

POLISH
BRING TO A HIGHLY DEVELOPED, FINISHED, OR REFINED STATE; MAKE SMOOTH AND GLOSSY, USUALLY BY FRICTION; BURNISH.

</table>

C-32
RECONDITION HYDRAULIC VALVES AND CYLINDERS.

RECORD
WRITE, ENTER, REGISTER FOR PURPOSE OF EVIDENCE OR REPRODUCTION; E.G., RECORD DATA IN A CHRONOMETER RECORD BOOK; TRANSFORM SOUND BY ELECTRICAL OR MECHANICAL MEANS, AND REGISTER IT IN SOME PERMANENT FORM.

RECOVER
REGAIN; RECLAIM; SAVE FROM LOSS AND RESTORE TO USEFULNESS; HAUL BACK ABOARD GEAR PREVIOUSLY PASSED OR STREAMED, AS TRANSFER RIG OR MINESWEEPING GEAR.

RECRUIT
ENGAGE FOR MILITARY SERVICE; E.G., RECRUIT INDIVIDUALS INTO THE U.S. NAVY.

REDUCE
DIMINISH (ESPECIALLY IN BULK, AMOUNT, OR EXTENT); BRING INTO A CERTAIN ORDER, ARRANGEMENT OR CLASSIFICATION; BRING FROM ONE FORM TO ANOTHER; E.G., REDUCE FIELD SURVEY NOTES.

REEVE
PASS, AS THE END OF A ROPE, THROUGH ANY HOLE OR OPENING IN A BLOCK, RING, OLT, ETC.; FASTEN BY PASSING THROUGH A HOLE AND/OR AROUND SOMETHING; E.G., REEVE A SINGLE WHIP, RUNNER, LUFF TACKLE OR TWOFOLD PURCHASE.

REFACE
RENEW A FACED SURFACE WITH A DIFFERENT MATERIAL, OR (AS ON THE END OF A CYLINDRICAL PIECE) BY RE-CUTTING OR REGRINDING.

REFER
SEND OR DIRECT TO SOME PERSON, PLACE OR THING, AS FOR TREATMENT; E.G., REFER TO LOGIC OR SCHEMATIC SYMBOLS.

REFURBISH
MAKE CLEAN, BRIGHT, OR FRESH AGAIN; RENOVATE.

REGISTER
ENTER IN A RECORD OR LIST, ENROLL, RECORD OFFICIALY; INDICATE ON A SCALE; SAFEGUARD BY HAVING A RECORD MADE, AS REGISTERED MAIL; E.G., REGISTER PAY ALLOTMENTS.

REGULATE
CONTROL OR GOVERN ACCORDING TO A RULE, PRINCIPLE, OR SYSTEM; ADJUST FOR ACCURATE OPERATION, AS GAUGES OR SCALES; E.G., REGULATE WATER LEVEL IN A STEAMING BOILER.

REHEARSE
TRAIN OR MAKE PROFICIENT BY PRACTICE PRIOR TO A PUBLIC PERFORMANCE.

REINFORCE
STRENGTHEN BY ADDITIONAL ASSISTANCE, MATERIAL, OR SUPPORT.

REINSTALL
REPLACE WITH ORIGINAL; E.G., REINSTALL SYSTEMS.

PROCEDE IN A SERIES OF OPERATIONS; E.G., ROUTE CLASSIFIED MATTER.
SAFEGUARD PROTECT, DEFEND; TAKE PRECAUTIONARY MEASURES.
SALVAGE SAVE ANY PROPERTY FROM DESTRUCTION.
SAMPLE TAKE A SAMPLE OF; TEST.
SANITIZE MAKE SANITARY (AS BY CLEANING OR STERILIZING).
SALVAGE SAVE ANY PROPERTY FROM DESTRUCTION.
SCALE ARRANGE IN A GRADUATED SERIES, SCALE A TEST; MAKE OR PATTERN IN REGULARLY GRADED PROPORTIONS; REGULATE.
SCAN LOOK AT CLOSELY, SCRUTINIZE; IN ELECTRONICS (TELEVISION AND RADAR), TRAVERSE (A SURFACE) WITH A BEAM OF LIGHT OR ELECTRONS; E.G., SCAN AREAS WITH RADAR TO LOCATE TARGETS.
SCHEDULE DESIGNATE FIXED TIMES FOR ACCOMPLISHMENT OF, AS TRAINING PROGRAMS, MAIL DELIVERIES, COURIER SERVICE, ETC.
SCORE DETERMINE THE MERIT OF; GRADE; MAKE SCRATCHES METAL, ETC., BEFORE BENDING OR CUTTING.
SCRAPEREMOVED FROM A SURFACE USUALLY BY REPEATED STROKES OF AN EDGED INSTRUMENT; MAKE SMOOTH OR CLEAN WITH STROKES OF AN EDGED INSTRUMENT OR ABRASIVE.
SCREEN EXAMINE, USUALLY METHODICALLY, IN ORDER TO SEPARATE INTO DIFFERENT GROUPS; SELECT OR ELIMINATE BY A SCREENING PROCESS; E.G., SCREEN CANDIDATES FOR PROMOTION; SCREEN DEFECTIVE COMPONENTS FOR FEASIBILITY OF REPAIR.
SCRUB CLEAN A SURFACE WITH HARD RUBBING; SCOUR.
SEAL MAKE GAS TIGHT BY PROCESS OF SEALING TO PREVENT LEAKAGE; E.G., SEAL OPTICAL ASSEMBLIES.
SEARCH LOOK FOR, HUNT THROUGH, EXAMINE, GO OVER, EXPLORE, INQUIRE, SCRUTINIZE.
SEASON TREAT SO AS TO PREPARE FOR USE; E.G., SEASON A MAGNETIC.
SECURE MAKE SAFE; MAKE FIRM, FAST, OR TIGHT.
SEGREGATE SET APART FROM THE MAIN MASS OR GROUP; E.G., SEGREGATE USEABLE MATERIAL (FROM SCRAP).

</tbody>
</table>
TRANSMIT
SEND, FORWARD, TRANSFER FROM ONE PLACE TO ANOTHER; IMPLIES PASSING ON TO OTHERS THROUGH ESTABLISHED CHANNELS.

TRANSPORT
CARRY FROM ONE PLACE TO ANOTHER, ESPECIALLY OVER RELATIVELY LONG DISTANCES; E.G., TRANSPORT AN INJURED PERSON BY FIREMAN'S LIFT.

TRANSPOSE
CHANGE THE USUAL, NORMAL, OR RELATIVE POSITION OF; WRITE OR PLAY A MUSICAL COMPOSITION IN A DIFFERENT KEY; E.G., TRANSPOSE INSTRUMENTAL MUSIC BY WHOLE TONES.

TREAT
SUBJECT TO SOME ACTION OR PROCESS TO IMPROVE APPEARANCE, TASTE, USEFULNESS, ETC.; PROCESS, BRING OR PUT A PERSON OR THING INTO A SPECIFIED OR IMPLIED CONDITION BY TREATING; E.G., TREAT CHEMICALLY A CLOSED COOLING SYSTEM OF AN INTERNAL COMBUSTION ENGINE.

TRIM
MAKE TRIM AND NEAT, ESPECIALLY BY TRIMMING AND CLIPPING; ARRANGE THE WEIGHTS (FUEL, WATER) IN A SHIP TO OBTAIN THE DESIRED IMMERSION FORWARD OR AFT; ADJUST CONTROL SURFACES TO OBTAIN THE DESIRED ATTITUDE OF A PLANE OR SUBMARINE.

TROUBLESHOOT
EVALUATE A SYSTEM OR EQUIPMENT TO DETERMINE AND ISOLATE THE CAUSE OF A MALFUNCTION; E.G., TROUBLESHOOT ELECTRICAL AND MECHANICAL CONTROL SYSTEMS.

TRUE
MAKE TRUE; ESPECIALLY FIT, PLACE, MAKE, SHAPE, ADJUST ACCURATELY; E.G., TRUE PRESSURE GAGE HAIRSPRINGS.

TUNE
ADJUST OR ADAPT TO A CONDITION, STATE, ETC.; BRING INTO HARMONY OR AGREEMENT; E.G., TUNE AN ELECTRONIC MECHANISM SUCH AS SURVEILLANCE RADAR.

TURN
CAUSE TO MOVE AROUND AN AXIS OR CENTER; ROTATE; TWIST; TURN ON A LATHE.

TURN IN
DELIVER UP OR HAND OVER, AS TURN IN A REPAIRABLE ITEM.

TURN-UP
START AN AIRCRAFT.

TYPE
PRODUCE WRITTEN INFORMATION BY MEANS OF A TYPEWRITER; CLASSIFY, AS IN BLOOD TYPES.

UNCRATE
REMOVE FROM CRATE.

UNDERCUT
CUT AWAY MATERIAL FROM THE UNDER SIDE OF; E.G., UNDERCUT ARMATURE COMMUTATORS.
UNDERPIN
FORM PART OF, STRENGTHEN, OR REPLACE THE FOUNDATION OF.

UNDERSTAND
PERCEIVE AND COMPREHEND THE NATURE AND SIGNIFICANCE OF; KNOW.

UNFASTEN
LOosen, UNPIN, UNBuckle, UNDO, DETACH.

UNLOAD
TAKE OFF, DELIVER, DISCHARGE FROM, DRAW CHARGE FROM, AS UNLOAD A GUN.

UNLOCK
OPEN OR RELEASE BY, OR AS BY, UNDOING A LOCK OR LOCKING DEVICE.

UNMATE
SEPARATE; UNMATCH; E.G., UNMATE MISSILES.

UNPACK
REMOVE COVERING FROM.

UNPLUG
UNCLOG, CLEAR AN OBSTRUCTION.

UNSCRAMBLE
SEPARATE INTO ORIGINAL COMPONENTS; RESTORE (SCRAMBLED COMMUNICATIONS) TO INTELLIGIBLE FORM.

UPDATE
BRING UP TO DATE; REVISE; MAKE CURRENT; E.G., UPDATE AIR CONTROLMAN DATA CARDS.

UPGRADE
RAISE OR IMPROVE THE GRADE OF; RAISE THE CLASSIFICATION OF.

UPHOLSTER
FURNISH WITH (USUALLY, SOFT) COVERING.

UPSET
SHORTEN AND THICKEN (A RED-HOT IRON) BY BEATING ON THE END; E.G., UPSET A RIVET.

USE
EMPLOY; CARRY OUT PURPOSE OR ACTION BY MEANS OF; EXPEND OR CONSUME BY PUTTING TO USE; E.G., USE ELECTRICAL AND ELECTRONIC SCHEMATICS.

UTILIZE
PUT TO USE FOR A SPECIFIC PURPOSE; E.G., UTILIZE DATA.

VACUUM
OPERATE A VACUUM DEVICE TO CLEAN.

VALIDATE
VERIFY; SUBSTANTIATE; E.G., VALIDATE PROGRAMMED INSTRUCTION MATERIAL.

VARNISH
COVER WITH VARNISH.

VEER
LET ANCHOR CABLE, LINE, OR CHAIN RUN OUT BY ITS OWN WEIGHTS.

VENT
PROVIDE WITH AN OPENING FOR THE ESCAPE OF A GAS OR LIQUID OR FOR THE RELIEF OF PRESSURE.

VENTILATE
VENT; CAUSE AIR TO CIRCULATE; E.G., VENTILATE AND
CLEAN TANKS.

VERIFY
PROVE, CONFIRM; SUBSTANTIATE; AUTHENTICATE; CHECK OR TEST THE ACCURACY OR EXACTNESS OF.

WALK DOWN
WALK DOWN OR ALONG A RUNWAY, TAXIWAY, OR PARKING AREA TO PICK FOREIGN OBJECTS THAT MIGHT BE INGESTED INTO JET ENGINES; E.G., FOD WALKDOWN.

WARM
MAKE READY FOR OPERATION OR PERFORMANCE BY PRELIMINARY OPERATION; E.G., WARM UP MAIN STEAM LINES.

WARN
GIVE NOTICE TO BEFOREHAND, ESPECIALLY OF DANGER; URGE OR ADVISE TO BE CAREFUL.

WASH
CLEANSE BY OR AS IF BY THE ACTION OF LIQUID, ESPECIALLY WATER; PASS THROUGH A BATH TO CARRY OFF IMPURITIES OR SOLUBLE COMPONENTS; E.G., WASH LINE AND HALF-TONE NEGATIVES.

WAX
APPLY PROTECTIVE WAX COATING; SHAPE A WAX PATTERN OF THE BASE OF A DENTURE & A SOUND COMPLETED TOOTH ARRANGEMENT TO FORM A TRIAL DENTURE.

WEIGH
LIFT THE ANCHOR OFF THE BOTTOM; MEASURE THE WEIGHT OF.

WELD
UNITE OR CONSOLIDATE METALLIC PARTS BY HEATING OR HAMMERING.

WHIP
BIND THE ENDS OF LINE TO PREVENT FRAYING.

WIND
TIGHTEN THE SPRING OF; E.G., WIND CHRONOMETERS; TURN A SHIP AT A PIER.

 WIPE
RUB WITH SOMETHING SOFT FOR CLEANING; E.G., WIPE DOWN AN AIRCRAFT.

WIRE
USE WIRE ON; E.G., WIRE SHUT A VALVE; INSTALL ELECTRIC WIRES IN OR ON.

WRAP
COVER, ESPECIALLY BY WINDING OR FOLDING; ENCLOSE WITH PROTECTIVE COVERING.

WRITE
PRODUCE A COMPOSITION; COMPOSE; DRAW UP OR COMPOSE IN LEGAL FORM; E.G., WRITE CAPTIONS FOR PICTURES.

ZERO
DETERMINE OR ADJUST THE ZERO OF; E.G., ZERO SYNCHROS.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY EnLISTED RATINGS

APPENDIX D
HOW TO WRITE TASK STATEMENTS
How to Write Task Statements

This appendix was prepared to help first-time task statement writers develop the skills and experience needed for writing acceptable task statements to cover the work of a Navy enlisted rating. A comprehensive list of tasks should include all tasks that are now performed in the rating and no tasks that are irrelevant to the work of the rating. This will ensure that later analyses and decisions related to the occupational classification structure of the Navy, the design of training curriculums, enlisted advancement requirements, manning determinations, and future manpower/hardware interface requirements will neither neglect important aspects of the work performed, nor waste time on irrelevant aspects. Individuals who have had some experience in task statement writing will also find this appendix helpful for review and for learning more about the rules to follow in writing acceptable task statements.

Practice exercises are spaced throughout this appendix to help you apply what you are learning. If you are a new task statement writer, you will want to have your own copy of this appendix so you can work the practice exercises. Most of the exercises have feedback following them, so you can work through them by yourself. For others, you will need the help of a co-worker or your supervisor. Time spent learning the material in this appendix will help you avoid the pitfalls in task statement writing and increase your ability to produce good task statements easily.

Definition of a Task

A task is a unit of work that occupies a significant portion of work time spent in the performance of a duty. It is the most specific level of behavior in a job and describes the performance of a meaningful job function in terms of a specific action applied to a particular object. The behavior must be observable, have a definite beginning and end, and result in a completed work action or a measurable work product (either the performance can be observed or the results of the performance can be seen and measured).

A task is a unit of physical or mental activity and represents a composite of methods, procedures, and techniques which commonly serve to accomplish one meaningful unit of work. Tasks involve worker interactions with such objects and concepts as equipment, material, other people, information, ideas, data, and events. In most instances, the performance of a task by a worker has a reasonably definite beginning and end, the whole activity requiring a mixture of decisions, perceptions, procedures, and/or physical actions serving a useful job purpose or a particular work assignment.

Supervisory and managerial tasks often are more mental than physical in nature reflecting an emphasis on information processing and communication functions. These functions are common features of many jobs dealing with the supervision or management of personnel. Supervisory and managerial tasks
need not be limited to observable work performance, but often may identify
job activities not readily discernible by a person other than the worker.
Although these activities are not readily observable, there should always be
an observable outcome, end product, or service.

**EXAMPLES OF TASKS**

<table>

<tr>
<td>Counsel recruits on pay and allowances</td>
<td>Recruits knowledgeable about pay and allowances</td>
</tr>
<tr>
<td>Forecast future budget requirements</td>
<td>Future budget requirements forecast (estimated)</td>
</tr>
</tbody>
</table>

Below are listed some things that are NOT tasks.

- Worker qualifications (such as intelligence, aptitude, knowledge, education, skill, training, and experience) are not tasks and are not included in the task section of an inventory. However, information regarding certain qualifications, such as training, education, and work experience may be obtained by including appropriate items in the background information section of the inventory.

- Receiving of instruction is not a task unless actual useful work is performed during the training. Thus, classroom instruction, self-instruction, laboratory or shop instruction, and the coaching a person receives are not tasks. On-the-job training, however, may include the performance of work tasks under a supervisor. The giving of instruction, when it is a part of a job assignment,
is considered to be a task activity. Similarly, continuation training that is a routine part of the job to maintain a particular skill (such as practice in the use of emergency equipment), is considered to be a task of the job.

- Job responsibilities, position assignments, and work goals are not tasks. Although a part of a total description of the work, they serve here as useful sources and justifications for tasks, but are not themselves stated as tasks.

- Responsibilities and functions of an agency, shop, work center, team, or office are not tasks. Tasks are activities of people, not of organizations.

**PRACTICE EXERCISE**

Indicate which of the following items are tasks that are observable and measurable.

1. Manufacture dummy wooden torpedoes.  
2. Calculate firing data for the MK-16 torpedo.  
3. Troubleshoot suspension system.  
4. Apply first aid measures to a chemical casualty.  
5. Understand battle tactics.  
6. Perform inventory control duties.  
7. Process special request/authorization (NAVPERS 1336/6).

Check your responses with the feedback on the next page.
<table>
<thead>
<tr>
<th>TASK</th>
<th>Description</th>
<th>Observability</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Manufacture dummy wooden torpedoes. This activity is observable and measurable.</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>Calculate firing data for the MK-16 torpedo. The product (firing data) for this task is observable.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>Troubleshoot suspension system. This task can be observed during its performance. The results can be measured.</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>Apply first aid measures to a chemical casualty. This task can be both observed and measured during the performance.</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Understand battle tactics. It is impossible to observe or measure someone in the act of &quot;understanding.&quot;</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td>Perform inventory control duties. This is probably a duty area (the word &quot;duties&quot; is a big hint). It is difficult to observe and measure the performance of an entire duty, although we can observe and measure the tasks which make up a duty.</td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td>Process special request/authorization (NAVPERS 1336/6). This is a task. Its performance is both observable and measurable.</td>
<td></td>
</tr>
</tbody>
</table>

**Structure of a Task Statement**

The statement of a task is composed of three basic elements: (1) a specific action verb, descriptive of what is done; (2) a brief identification of what is being acted upon—the object of the action verb; and (3) whatever qualifying phrases that may be needed to clearly distinguish the task from related or similar activities, to limit and define the scope of concern, or to communicate unambiguously what task it is.

```
1. ACTION VERB
2. OBJECT OF ACTION VERB (NOUN)
3. QUALIFIER (if essential to the meaning)
```
Thus, task statements are simple declarative statements. They typically start with an action verb in the present tense, with the subject of the sentence understood to be "I" (so that the statement makes personal sense to a job incumbent who may be asked about what he or she does on the job). The following are examples of task statements, with several showing the use of meaningful qualifiers.

<table>
<thead>
<tr>
<th>ACTION + OBJECT OR ELEMENT BEING ACTED UPON + NECESSARY QUALIFIER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Counsel work center personnel on career advancement</td>
</tr>
<tr>
<td>Hook tow bars to aircraft</td>
</tr>
<tr>
<td>Isolate faulty circuit in ballistic missile</td>
</tr>
<tr>
<td>Lubricate analog computer</td>
</tr>
<tr>
<td>Paint flight deck markings</td>
</tr>
<tr>
<td>Type letters of reprimand/admonition</td>
</tr>
</tbody>
</table>

**PRACTICE EXERCISE**

Identify the tasks in the following list.

1. Compute latitude and longitude from fix information. 
2. Know foreign policy. 
3. Turn off buzzer. 
4. Calculate loads. 
5. Measure point-to-point distances on a map. 
6. Adjust gauges. 
7. Correlate lookout/radar information with CIC plots.

Check your responses with the feedback on the next page.
FEEDBACK

1. **TASK** Compute latitude and longitude from fix information. This is a task. It is specific and written in the verb/object format. The qualifier "from fix information" makes the statement more specific than simply saying "compute latitude and longitude."

2. Know foreign policy. This is not a task. The verb "know" can mean many things to different people. It is not specific enough to be used in a task statement.

3. Turn off buzzer. This is not a task. It may be a step in performing some task.

4. Calculate loads. This is not a task. This statement is not specific enough to qualify as a task. The statement could be improved by qualifying what type of loads are calculated, for example, calculate loads for cargo nets.

5. **TASK** Measure point-to-point distances on a map. This is a task. Note how "point-to-point distances" is better than just "distances" and how "on a map" makes the task statement more specific.

6. Adjust gauges. This is not a task. The statement does not specify the type of gauge to be adjusted.

7. **TASK** Correlate lookout/radar information with CIC plots. We would call this a task. It is specific, observable, and measurable.
General Guidelines for Writing Task Statements

In constructing, reviewing, and editing the task statements of a NOTAP task inventory, three considerations should be kept in mind: First, the purposes to be served by the information obtained; second, the individual whose job is being surveyed and who will complete the inventory; and finally, the format to be used so that the data collected can be analyzed by the Comprehensive Occupational Data Analysis Programs (CODAP).

Purposes To Be Served by Task Information. Each task statement should be written in the context of the uses to be made of the information derived from it. In general, the statement should serve one or both of the following purposes.

- The task statement should elicit responses that differentiate between workers in different job types within the enlisted rating.
- The task statement should elicit responses that differentiate between managers and supervisors, supervisors and journeymen, and journeymen and apprentices.

The Job Incumbent Responding to the Task Statements. In considering the job incumbent who responds to the task inventory, each task statement should conform with the following ground rules.

- The task statement must be clear so that it is easily understood by the job incumbent.
- The task statement must be stated using terminology that is consistent with current usage in the enlisted rating. Avoid overly technical jargon and obsolete terms.
- The task statement should be brief to save reading time of the respondent.
- The task statement must be unambiguous so that it has the same meaning for all job incumbents in the rating.
- Abbreviations must be used cautiously since they may not be understood throughout the rating. It is good practice to spell out the term and follow it by the abbreviation in parentheses where it first appears in the inventory. In later usage, the abbreviation may stand alone. However, it is best to avoid abbreviations whenever possible.
- The task statement must be worded so that the task rating scales make good sense when applied to it.

- The task statement must be ratable in terms of time spent and other rating factors. This eliminates skill, knowledge, and responsibility items that begin with such words as "Have responsibility for..." "Know how to..." "Understand..." "Have knowledge of..." Such statements found in source materials should be written as two or more activity task statements (e.g., "Set up filing system" or "Maintain files" NOT "Have responsibility for maintaining files").

- Vague or ambiguous verbs should be avoided if possible. The following verbs and verb phrases may be considered vague or ambiguous, depending on how they are used. Typically they indicate a lack of precision in stating what work activity is intended by the statement.

```
Account for  Coordinate  Produce
Answer      Establish   Provide
Arrange for  Forward    Receive
Assist      Handle      Recommend
Assume      Implement   Resolve
Assure      Initiate    Responsible for
Attend      Insure      Serve as
Check       Maintain liaison   Store
Communicate  Monitor    Submit
Confer with  Participate in  Support
Contribute to  Process    Work closely with
Control
```

Consult the list of standard NODAC action verbs contained in Appendix C when you have a choice of verb to make or when you are searching for an acceptable synonym for a vague or ambiguous verb.

- Short words should be used in preference to long words or expressions (e.g., "Write production and control reports" NOT "Accomplish necessary reports involved in the process of maintaining production and control procedures").

- When a task concerns the completion of a form, the task statement should be written to include the verb, then the exact title of the form, and finally the form number in parentheses (e.g., "Prepare advancement worksheet (NAVPERS 1430/2)").
Task Statement Format To Facilitate Analysis. Each task statement must appear in a format that is consistent with a functional orientation and is compatible with the computer programs (CODAP System 80) that have been developed to analyze the data obtained. The following guidelines should be followed:

- Task statements should be limited to 240 characters and not more than four lines, each containing a maximum of 60 characters.

- Each task statement must be specific and capable of standing alone. An item such as "Operate other types of equipment" is meaningful to a job incumbent if listed at the end of a series of "Operate...equipment" tasks. However, later, in the consolidated job descriptions to be prepared from the results, the tasks are not printed in the same order as in the inventory. Thus, the original context is destroyed, and an item like "Operate other types of equipment" cannot now be interpreted.

- Each task statement must be a complete sentence. Do not use an action subheading followed by a series of objects. For example:

  USE: 1. Balance shafts
        2. Balance rotors
        3. Balance gears

  NOT: Balance the following equipment:
        1. Shafts
        2. Rotors
        3. Gears

- The period at the end of a task statement is omitted.

- Use "such as" followed by two or three examples. Avoid "and/or" and "etc." (e.g., "Weight test lifting gear such as strongbacks and slings," NOT "Weight test lifting gear such as strongbacks and/or slings, etc." or "Weight test lifting gear (strongbacks, slings, etc.").

- If separate supervisory tasks are included in the inventory, each task being supervised should almost certainly have a related task which is performed. Also, equipment being inspected probably will have some kind of maintenance task performed.
Use simple statements without qualifiers unless the qualifier is essential to the meaning of the statement (e.g., "Use X-Y plotter" NOT "Use X-Y plotter to plot X-Y coordinates" but "Manufacture outriggings for booms and gangways" NOT "Manufacture outriggings").

In general, there are four different types of qualifying phrases/modifiers:

1. Multiple ways of doing a task (e.g., digging a firebreak by hand, using a backhoe, or using a bulldozer);
2. Multiple purposes for performing a task (e.g., check Widgit XYZ for evidence of overheating, metal fatigue, or physical damage);
3. Stating the scope of the task (e.g., supervise hands-on on-the-job training (OJT), lecture large groups of recruits in basic training, or give news briefings to the media); and
4. Stating where and under what conditions the task is performed (e.g., corrosion prevention tasks might differ near the salt spray of sea coasts as opposed to inland regions; or separate tasks may need to be stated for driving an official naval vehicle in dense fog, in a sand storm, or in the snow). Certain enlisted ratings (e.g., Aviation Boatswain's Mate (AB), Hospital Corpsman (HM) under battle conditions, and Torpedoman's Mate (TM)) may have more critical, nonroutine performance conditions than others (e.g., Personnelman (PN) and Yeoman (YN)) whose work is more predictable and less subject to nonroutine performance conditions.

If a modifier is needed for greater specificity, be sure to include all other significant tasks with comparable modifiers. For example, in an automotive mechanic inventory, "Repair transmissions" would not be specific enough. Therefore, if the statement were modified to read "Repair automatic transmissions," then "Repair standard transmissions" and "Repair transmissions with overdrive" should also be added.

Avoid tasks that are obviously too specific or trivial (e.g., "Operate fork lift" NOT "Turn ignition key," "Shift gears," or "Elevate fork"). These three are subtasks or steps in the task, not tasks in themselves.

Avoid tasks that are too general. Such tasks will not differentiate job types (e.g., "Repair carburetors" or "Repair standard transmissions" NOT "Repair motor vehicles").

In general, avoid multiple verbs in a task statement unless several actions are invariably performed together (e.g., "Adjust/align optical equipment" or "Remove/replace relays" but NOT "Witness, document, and verify reinstallation of electrical equipment on nuclear submarines").
In general, avoid multiple objects acted upon unless several objects or elements are invariably acted upon together by the job incumbent (e.g., "Lubricate front and rear suspension" but NOT "Adjust carburetors, brakes, and headlights"). Multiple objects used to clarify or give examples of a type of object acted upon are acceptable (e.g., "Order typewriting supplies such as ribbons, carbon paper, and correction fluid").

As far as possible, tasks included in the task inventory should be independent (mutually exclusive of every other task statement in the inventory). Avoid overlapping task statements such as the first task being one step in the performance of some other task (e.g., "Solder multiconductor wiring" might be one step in the task "Fabricate interconnecting cables").

As far as possible, all task statements in a task inventory should be written at the same level of work specificity.

Avoid redundant qualifying phrases such as "when appropriate," "as required," or "in accordance with prescribed directives" (e.g., "Maintain logs" NOT "Maintain necessary logs in accordance with prescribed naval or local regulations and directives"). These phrases are often found in source materials but serve no useful purpose in task inventories.

Do not use semicolons (;) because they are delimiters in the CODAP System 80 control language. The following signs are permissible:

+ Plus  - Comma  ( Open Parenthesis
- Minus  : Colon  ) Close Parenthesis
/ Diagonal - Period  $ Dollar Sign
= Equals  " Apostrophe  & Ampersand
* Asterisk

Always use commas before conjunctions in a series (e.g., "Weld high, low, or medium carbon steel").
Indicate which of the following action descriptions are tasks because they have all the necessary characteristics of a task statement.

1. Troubleshoot radar antenna motion system to major component.
2. Have knowledge of correct repair procedures.
3. Change windshield wiper blades.
4. Conduct traffic investigations.
5. Assure work center morale.
6. Inspect aircraft for hot brakes.
7. Align receiver for maximum sensitivity.
8. Understand nuclear weapons.
10. Jack up vehicle.
11. Operate winch on the ABC cargo loader.
12. Perform artificial respiration using the mouth-to-mouth method.
13. Solder various components.
15. Enforce regulations.

Check your responses with the feedback on the next page.
1. Troubleshoot radar antenna motion system to major component. This is a task. It is a specific action with a beginning and end.

2. Have knowledge of correct repair procedures. There is no definite beginning and end to a person's "knowledge" of something.

3. Change windshield wiper blades. This is an activity that can be performed over an observable and measurable short period of time.

4. Conduct traffic investigations. This is probably a duty area.

5. Assure work center morale. "Assure" is such a broad term that we cannot say it has a definite beginning and end.

6. Inspect aircraft for hot brakes. This is a task. It is a specific action, has a beginning and end, and can be performed over a short period of time.

7. Align receiver for maximum sensitivity. This is a task. It is a specific action qualified by the modifier "for maximum sensitivity."

8. Understand nuclear weapons. It is impossible to tell when someone's "understanding" begins and ends.

9. Perform military duties. This is a vague statement. At best, it is a duty area.

10. Jack up vehicle. Most likely this is an element of some task such as "rotate tires" or "change flat tire." Ask yourself why workers would jack up a vehicle unless they were in the process of doing something that required this action.

11. Operate winch on the ABC cargo loader.

12. Perform artificial respiration using the mouth-to-mouth method.

13. Solder various components.

15. Enforce regulations.

Describing Supervisory, Managerial, and Leadership Tasks

One of the more challenging efforts in task inventory construction is stating the tasks performed by supervisory and managerial personnel in an enlisted rating or officer specialty. Information processing and communication functions are common features of many jobs dealing with the supervision or management of personnel. However, it is insufficient to state generally that supervisors "Supervise subordinate personnel," "Control flow of work," "Monitor safety programs," "Supervise training programs," or "Attend meetings."

Several tasks need to be generated to describe what observable activity is being done in accomplishing each general function. For example, instead of stating, "Counsel personnel," it should be possible to identify such component tasks as:

1. Counsel personnel on pay and allowances.
2. Counsel personnel on financial problems.
3. Counsel personnel on correspondence courses.
4. Counsel personnel on overseas transfer.

The goal is to describe the actual, observable activities that must be performed to accomplish each supervisory, managerial, or leadership function. In some cases, the job activities may not be readily discernible by a person other than the worker. Even though these activities are not readily observable, there should always be an observable outcome, end product, or service. It is through these observable outcomes, end products, or services that you infer that some mental behavior has in fact occurred.

Supervisory, managerial, and leadership tasks often use action verbs of a more mental rather than physical nature. Consequently, these tasks will more likely reflect such appropriate and relevant actions as:

- Appraise
- Approve
- Assign
- Chair
- Check
- Compare
- Conduct
- Contact

- Counsel
- Decide
- Determine
- Draft
- Estimate
- Evaluate
- Explain
- Forecast

- Guide
- Inform
- Interpret
- Investigate
- Lead
- Negotiate
- Plan
- Predict

- Process
- Recommend
- Review
- Schedule
- Set
- Study
- Submit
- Verify
PRACTICE EXERCISE

Write several (4-5) task statements that describe supervisory tasks you perform in your job. If you are not a supervisor, describe tasks that your supervisor performs. Then show these task statements to a co-worker or your supervisor. Rewrite any task statements that need revision. Use the space below for writing your task statements.

1. Counsel personnel on educational opportunities available within State. (Rev. Nov. 6)

2. Conduct weekly personnel inspections.

3. Counsel personnel on their performance.

4. Assign personnel to various tasks.

5. Evaluate personnel performance.
Recognizing Faulty Task Statements

Several kinds of errors commonly occur in the stating of tasks. These problem areas need special attention to assure effective statements of each task of an enlisted rating, consistent with their intended use in occupational surveys. Six of the most common faults are the following.

- More than one task in a single statement.
- Activity is stated as a general function or responsibility.
- Unclear statement of the action.
- Overly dependent upon duty context for meaning.
- Too many limits placed on how the task is performed.
- Substitution of method of performance for the task itself.

Each of these typical faults is explained and illustrated in the pages that follow, using examples from three occupations—Automotive Mechanic, Business Data Programmer, and General Secretary. These examples should be useful in training task inventory developers to state tasks, to assess the merits of statements previously prepared and made available by other agencies, to review statements prepared in-house, or to use as standards against which to compare statements for possible faults.

The material presented in the pages that follow is taken from the following source:

FAULT: More than one task in a single statement.

Task statements including multiple job activities may make it impossible to determine which activity is associated with task survey data or is of training concern. They may also confuse survey respondents who would prefer to rate each activity differently, such as when one of the activities is performed by another type of worker or its job significance differs quite a bit from the other work cited in the statement.

Variations of this fault are:
1. Use of more than one action verb.
2. Use of more than one object acted upon.
3. Linkage of several tasks in one compound sentence.

EXEMPLARY USE OF SOME MULTIPLE ACTIONS AND OBJECTS

Composites of more than one action verb or object acted upon are acceptable and appropriate in a single task statement when they:
1. Tend to occur together as a whole unit of work.
2. Serve to clarify a single type of work activity, and reasonably involve the same training.

Examples of Acceptable Tasks:

- Test and rewire electrical dash units.
- Inspect and replace defroster hose.
- Adjust, repair, or replace back-up light switches.
- Repair or replace wheel cylinder.
- Plan and conduct on-the-job training of data processing procedures.
- Review and prepare cost estimates of equipment.
- Edit and review a report.
- Select or order furnishings for office.

- Repair ignition switch, resistor, wiring, coil points, and condenser of the primary circuit.
- Lubricate vehicles and equipment.
- Prepare cost report or cost estimate for data processing equipment.
- Prepare a briefing or visual presentation.
- Evaluate files, reports, or correspondence.
- Develop procedures for the maintenance of news files and reference libraries.

- Pressure test, performance test, and leak test the air conditioning system.
- Inspect vehicles and apply materials for corrosion and rust control.
- Analyze core dumps, evaluate, and recommend solutions.
- Plan programming work loads, make work assignments, and organize shifts.

More Than One Action Verb:

- Test and rewire electrical dash units.
- Inspect and replace defroster hose.
- Adjust, repair, or replace back-up light switches.
- Repair or replace wheel cylinder.
- Plan and conduct on-the-job training of data processing procedures.
- Review and prepare cost estimates of equipment.
- Edit and review a report.
- Select or order furnishings for office.

More Than One Object Acted Upon:

- Repair ignition switch, resistor, wiring, coil points, and condenser of the primary circuit.
- Lubricate vehicles and equipment.
- Prepare cost report or cost estimate for data processing equipment.
- Prepare a briefing or visual presentation.
- Evaluate files, reports, or correspondence.
- Develop procedures for the maintenance of news files and reference libraries.

Separate Tasks Joined in One Sentence:

- Inspect vehicles and apply materials for corrosion and rust control.
- Analyze core dumps, evaluate, and recommend solutions.
- Plan programming work loads, make work assignments, and organize shifts.

- Pressure test, performance test, and leak test the air conditioning system.
- Inspect vehicles and apply materials for corrosion and rust control.
- Analyze core dumps, evaluate, and recommend solutions.
- Plan programming work loads, make work assignments, and organize shifts.

- Inspect money orders and checks as to amount, dates, signatures.
- Inspect material received for completeness and damages.
- Record time card or time clock data on payroll forms.
- Stuff, bundle, sort, and/or label outgoing mail.
- Address letters and packages.

ACCEPTABLE USE OF SOME MULTIPLE ACTIONS AND OBJECTS

Composites of more than one action verb or object acted upon are acceptable and appropriate in a single task statement when they:
1. Tend to occur together as a whole unit of work.
2. Serve to clarify a single type of work activity, and reasonably involve the same training.

Examples of Acceptable Tasks:

- Test and rewire electrical dash units.
- Inspect and replace defroster hose.
- Adjust, repair, or replace back-up light switches.
- Repair or replace wheel cylinder.
- Plan and conduct on-the-job training of data processing procedures.
- Review and prepare cost estimates of equipment.
- Edit and review a report.
- Select or order furnishings for office.

- Repair ignition switch, resistor, wiring, coil points, and condenser of the primary circuit.
- Lubricate vehicles and equipment.
- Prepare cost report or cost estimate for data processing equipment.
- Prepare a briefing or visual presentation.
- Evaluate files, reports, or correspondence.
- Develop procedures for the maintenance of news files and reference libraries.

- Pressure test, performance test, and leak test the air conditioning system.
- Inspect vehicles and apply materials for corrosion and rust control.
- Analyze core dumps, evaluate, and recommend solutions.
- Plan programming work loads, make work assignments, and organize shifts.

- Inspect money orders and checks as to amount, dates, signatures.
- Inspect material received for completeness and damages.
- Record time card or time clock data on payroll forms.
- Stuff, bundle, sort, and/or label outgoing mail.
- Address letters and packages.
FAULT: Activity is stated as a general function or responsibility.

Statements of general work functions or job responsibilities do not provide adequate specificity for use in making decisions about training content. They also confuse raters of task performance surveys because a variety of tasks enter into the accomplishment of the function or responsibility. Typically, such general activities are of an ongoing nature in a job assignment, with no definite ending or times of performance.

EXAMPLES OF FAULT

- Maintain washer rack equipment.
- Train individuals on the job.
- Resolve technical problems.
- Monitor safety programs.
- Prepare forms and correspondence.
- Do preliminary work for income tax return.
- Supervise clerk typists.
- Control and manage filing system.
- Act as cashier or teller.
- Perform operator maintenance on ADP equipment.
- Identify problem areas in the system.
- Perform non-linear programming.
- Evaluate deviations from standards.
- Optimize program execution times.
- Supervise documentation of programs.
- Design operating systems.
- Coordinate scheduling of machine workload.
- Maintain current run tapes.
FAULT: *Unclear statement of the action.*

General or vague action words for task statements do not allow the person providing task ratings to be certain of the intended meaning of the statement. Nor can the person interpreting the training implications of such ratings be certain of what work activity the rater had in mind. Occasionally it is possible to clarify a task by including its purpose or the method to be used.

**EXAMPLES OF FAULT**

- Inspect lubrication and service guide.
- Follow-up on requisitions.
- Perform road service.
- Check exhaust systems.
- Review records for compliance with labor laws.
- Inspect steering.
- Correct bearing fit.
- Coordinate with staff in the development of new systems.
- Extract figures needed for special analyses.
- Make switch settings.

- Exploit parallel processing capabilities.
- Develop subroutines.
- Trace mail.
- File materials.
- Extract information from files.
- Implement employer's directives.
- Help organize office or company committees.
- Make preparations for meetings.
- Keep card indexes.
**FAULT:** *Overly dependent upon duty context for meaning.*

While brevity is desired in task statements, sufficient description of a task activity must be included to permit the task to be reasonably meaningful when not grouped with functionally related tasks. This might be necessary when subsequent analyses rank the tasks on some issue.

**EXAMPLES OF FAULT**

- Performance test the system.
- Complete unsatisfactory reports.
- Evaluate suggestions.
- Replace system regulators.
- Evaluate deviations from standards.
- Plan layout and makeup.
- Make out monthly statements.
- Diagnose malfunctions.

**FAULT:** *Too many limits placed on how the task is performed.*

Though task modifiers are sometimes useful to clarify the meaning of an activity statement, some modifiers may be unduly prescriptive and place too many unnecessary limits upon the intended performance statement.

Variations of this fault are:

1. Stating how often or when a task is to be performed.
2. Use of all-inclusive terms, such as "all," "every," "always."

**EXAMPLES OF FAULT**

*Stating How Often or When:*

- Change dates on time stamp machine or calendar daily.
- Prove cash daily.

*Use of All-Inclusive Terms:*

- Initiate all computer operating notes, technical bulletins, etc. for job performance improvements.
- Order all publications for library.
FAULT: *Substitution of method of performance for the task itself.*

Stating how a task is performed, with the actual task sometimes following as a modifier of the method, causes the emphasis to be misplaced. This can lead to undue attention upon the method instead of upon the work activity as the training objective. It also may cause uncertainty as to which part of the statement a survey respondent is attending. And, there may be a tendency to omit the task activity altogether, stating only the method of performance. The same problem occurs when the purpose of an activity is substituted for the task to be performed.

**EXAMPLES OF FAULT**

- Write shorthand.
- Work with operations supervisor to determine best operating procedures to be followed.
- Optimize program execution times.
- Resolve technical problems.
- Incorporate standard routines into programs.
- Use linear programming techniques.
- Control system input and output.
- Perform analog programming.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY ENLISTED RATINGS

APPENDIX E
HOW TO CONDUCT JOB
ANALYSIS INTERVIEWS
HOW TO CONDUCT JOB ANALYSIS INTERVIEWS

This appendix was prepared to help first-time interviewers develop enough skills and experience so that they will be ready to participate in 061 trips. Individuals who have had some interviewing experience will also find it helpful for review and for learning more about the specific skills required for job analysis interviews.

Practice exercises are spaced throughout the appendix to help you apply what you are learning. If you are a new interviewer, you will want to have your own copy of this appendix so you can work the practice exercises. Most of the exercises have feedback following them, so you can work through them by yourself. For others, you will need the help of a coworker or your supervisor. Time spent working on these exercises will make your first interviews easier to do.

Introduction to Interviewing

Interviews are more than mere conversations. They are planned dialogues about specific subject areas, conducted and controlled by an interviewer. In addition, each interview is conducted for a specific purpose. For job task analysts, that purpose is to gather data about some parts of a job. The kinds of data that may be collected by job task analysts are listed below:

- Information about the duties performed.
- Information about the systems and equipment used on the job.
- Descriptions of job-related tasks and work activities.
- Descriptions of operator/maintenance activities performed on a new weapon or equipment system.
- Documentation of training deficiencies, the differences between what a worker has been trained to do and the actual requirements of the job.
- Descriptions of job supervisors' estimates of the actual requirements of the job.
- Descriptions of the population performing the job.

Planning for the interview begins when the specific purpose of the interview is determined. While all interviews conducted by analysts are for the purpose of collecting job information, the ones you conduct for NODAC have a more specific purpose, to develop items for revising NOTAP surveys. For example, information may be needed on tasks that are not described in existing resource documents, or on new equipment or procedures. Special areas of interest for each rating will be discussed during the 061 Predeployment Meeting.
PRACTICE EXERCISE

Describe in your own words the purpose for conducting job analysis interviews in your rating.

State your answer in the space below.

Check the feedback on the next page.
Your reasons for conducting job analysis interviews will depend on the current problems in the rating. Here are some general reasons for conducting interviews:

- Need to add information to incomplete descriptions of duties.
- Need for information on a new system.
- Need to determine how much change has occurred in a rating since the last survey.

Any questions? If so, check with your supervisor.

Three types of skills are required in a good interviewer—asking questions, listening, and observing. Although asking the right questions is critical to the success of an interview, being an active listener and an alert observer are important as well. This appendix will give you information and practice to help you develop each type of skill.

**Asking Questions**

Asking questions is the active part of interviewing. The interviewer must know what to ask and how to ask it to get the best information. He or she must be able to begin the interview by establishing rapport, move the interview along to cover the required material and keep it on track, and close the interview when the information has been gathered. To do this, good interviewers use many different techniques. The particular techniques used depend on the preferences of the interviewer and the requirements of each individual interviewing situation. Using these techniques does not guarantee success, but it does increase the likelihood that useful information will be gathered.

**Developing Questions.** Before you begin an interview, you will want to prepare, at first on paper, and then in your mind, a series of general questions that could be used to obtain job information. Different questions will be needed, depending on the specific purpose or purposes of the interview. In most interviews, you will not want to read this prepared list of questions. As you gain experience you will not need it, and using it may interrupt the flow of the interview or not allow you to take advantage of asking about what you observe. The more practice you get preparing questions
ahead of time, however, the easier it will be for you to ask good questions during the interview itself.

The questions must clearly communicate the intended meaning by using correct job-specific terms at appropriate times. Here is an example of questions which might be asked during a typical O&I interview:

- What are the major duties of your position?
- What exactly do you do in each of them?
- What tasks do you perform in an emergency drill?
- Who is responsible for doing preventive maintenance on this equipment?

**PRACTICE EXERCISE**

Imagine you are going to interview several job holders about a duty category in your rating. Make a list of at least six questions you would use to collect information about the tasks performed in that duty.

If you had the answers to these, would you have a complete picture of what is done? What else would you need to ask?
Techniques for Asking Questions

1. Ask only one question at a time.

2. Begin with an easy topic.
   - Avoid dealing initially with complex topics.
   - Gradually work from simple to complex topics.

3. Use appropriate vocabulary level.
   - Avoid impressing the interviewee with your vocabulary.
   - Avoid talking down to the interviewee.

4. Avoid leading questions.
   - Avoid questions that hint at an expected outcome.
   - Avoid questions that place the interviewee in a "no win" situation.

   EXAMPLE

   "Are you still behind on your reports?"

   Leading questions usually begin with "Don't you agree that ..........." or Aren't you in favor of ........

   Any question that begins with a loaded phrase or otherwise causes the subject to give a particular answer is a leading question. Such questions almost force the person to agree with the interviewer. These questions seldom reveal useful information and usually destroy any existing rapport.

5. Use comparative questions.
   - Helps to focus the interviewee's attention on relevant topics.
   - Useful for discovering things the interviewee finds difficult or distasteful.

   EXAMPLES

   "Which do you perform first—A or B?"
   "Which procedure is easier to perform—A or B?"
6. Use indirect open-ended questions
   - Avoid questions that can be answered with only a "yes" or "no."
   - Subtle questions are preferred over sharp, direct questions.
   - Open-ended questions leave the interviewee with a free choice of answers.

   **EXAMPLES**
   - "Tell me about ..............."
   - "What would you do if ...............?"
   - Avoid hypothetical questions like, "If you were the Commanding Officer of the ship, what would you do to improve or change this?"

7. Explore the interviewee's reason for an answer.
   - Probe to bring out evidence and reasons.
   - Avoid taking answers at face value.

8. Avoid reading facts or questions from a form.

9. Ask encouraging questions.
   - Help direct the interviewee's thought toward a specific area.
   - Indicate to the interviewee that more information is needed.

   **EXAMPLES**
   - "Tell me more about ..............."
   - "I'd like to hear more about that."

10. Use pause and silence.
    - Avoid talking every time the interviewee stops talking.
    - Give the interviewee time to respond to a question before speaking.

**Beginning the Interview.** Begin to establish rapport with the interviewee as soon as you make contact. Your greeting should be friendly and
pleasant. Remember that you serve as an ambassador for NODAC to the operational Navy. Their cooperation, which is required for NODAC to do its job, depends on how professional and courteous you are with them.

Most people are somewhat tense at first, especially if they do not know why they are being interviewed. Do not assume that the interviewees have been told by their supervisor why they were selected. Begin with a few sentences explaining what NODAC is and why you need to collect information from them. Here is an example of what you might say:

EXAMPLE

I am here from the Navy Occupational Development and Analysis Center to interview you to find out what people in your rating actually do on the job. This information will help us develop a survey that will go to a large number of people in your rating. Perhaps you took one of these NOTAP surveys when it was given four years ago?

The Navy needs to know what people are actually doing on the job so the training people can train for the right things in A-School, and people come to you better trained. The information is used to write occupational standards which are used to develop rate training manuals and advancement exams. Sometimes the information is used to combine two service ratings to create a new rating. So, you see, the information you provide us is very important.

Allow the interviewees time to ask questions about the interview.

In addition to explaining the purpose of the interview, you can help establish a good relationship with the interviewee in many other ways. The following is a list of some other things you can do:

- Talk to the interviewee at his or her level. Avoid using an impressive vocabulary.
- Use appropriate technical language.
- Sit facing the interviewee and maintain eye contact.
- Be courteous. Never tell the interviewees how to do their jobs.
- Begin with an "easy to talk about" topic.
- Be honest in your answers to interviewees' questions.
- Use a minimum of examples from your own experience or "sea stories." Although they are a common technique for establishing and maintaining rapport, too much use of them can waste everyone's time.
When interviewees hear that you are from Washington, they often ask questions or complain about some matter that is unrelated to job analysis. Politely listen to them, and give them information (such as detailer's phone number) that will let them know you are interested in helping them, but that you are really not the person who can solve their problem. As soon as possible, guide the interview back to the appropriate topic.

PRACTICE EXERCISE

List some of the techniques you would use to establish rapport with an interviewee. Include a brief summary of the purpose for conducting the interview.

Check the feedback on the next page.
Here are some of the techniques you could use to establish rapport:

- Talk to the interviewee at his or her level. Avoid using an impressive vocabulary.
- Use appropriate technical language.
- Sit facing the interviewee and maintain eye contact.
- Be courteous.
- Be honest in your answers to an interviewee's questions.

Do you have others?

Your summary of the purpose for conducting the interview should include information about:

- What NODAC is.
- How interviews are related to NOTAP surveys.
- How the Navy uses the information.

Any questions? If not, continue.

Maintain Control of the Interview. Most interviews will be useless if you cannot direct the flow. Try to use only the minimum amount of control necessary to keep the interview flowing smoothly and on the appropriate topics. Avoid excessive controls because they tend to place stress on the interviewee. Using the following pointers should help you conduct successful interviews:

1. Avoid interrupting the interviewee.
   - Hurts rapport.
   - Cuts off a chain of thought.
   - May antagonize the person.

2. Use pause or silence.
   - This helps to avoid a steady stream of conversation.
   - Gives both interviewer and interviewee time to think.
3. Handle delicate issues carefully and as opportunity occurs.
   - Avoid open discussion of personal affairs, politics, etc. that may cause distress, embarrassment, or emotional reactions.
   - Try to understand what the interviewee is saying or feeling even if you do not agree with it.

4. Be flexible.
   - Adapt to situations quickly.
   - Avoid rigidly using a predetermined format or plan.

5. Avoid bias.

6. Avoid correcting or ridiculing the subject.
   - Destroys rapport.
   - Does not contribute to the collection of data.

7. Work from general topics to specific topics.

8. Manage silent and open hostility.
   - Recognize when the interviewee is alienated or upset.
   - Encourage the interviewee to open up and express his or her point of view.
   - Try to summarize the points of disagreement.
   - Listen to opposing ideas with respect.
   - Allow the interviewee to ventilate his or her feelings.
   - Avoid taking sides in a disagreement.
   - Finish the interview quickly and go on to someone else if the person continues to be hostile. Remember to thank the person, anyway.
You have established good rapport with the interviewee. However, as you start to discuss an area for which you need information, she begins to evade questions. She appears somewhat irritated at the questions. This is an important topic and you need the data. Describe the questioning techniques you would use to collect this data. Use the space below to explain why you would use these techniques.

Check the feedback on the next page.
Here are some questioning techniques you could use to collect data from an interviewee who is evading questions:

- Use comparative questions—Ask "Which procedure do you perform—A or B?"
- Use indirect open-ended questions. Say "Tell me about the tasks you perform in duty position A."
- Ask encouraging questions. Say "I'd like to hear more about the tasks you perform when you operate vehicle Y."

Review the list to identify other techniques you could use. If you have any questions, ask your supervisor.

PRACTICE EXERCISE

You have been assigned to interview several workers in one shop. Earlier you overheard them discussing their feelings about having to stop work to be interviewed. Several appeared very annoyed at being taken away from their work when they were busy. The Chief said he had planned to take off that afternoon. He said this interview stuff is a lot of bull and he will not cooperate. How would you handle his potential hostility during the interview?

State your answer below.

Check the feedback on the next page.
Here are some ways you might control someone's hostility during an interview.

- Explain why the information is important and how it will be used.
- Let the interviewee talk and "blow off steam."
  - Do not interrupt
  - Do not ridicule
  - Use silence
- Listen to his or her ideas.
- Try to focus the interview on the subject at hand.

Concluding the Interview. Knowing how to end an interview is as important as knowing how to begin it. Once started, people like to talk about their jobs, and they often have many things to tell the people from Washington. When you think you have covered just about all your questions, bring the interview to a close. Be certain not to run over into people's lunch hour or free time. You will want to review your notes to make certain you have covered everything, as well as give the interviewee an opportunity to add points at the end. Remember to thank the interviewees for their time and tell them how helpful they have been in assisting the Navy in learning more about what people actually do on the job.

Active Listening

Getting the Interviewee to Talk. Listening is more than just not talking. It is the part of the interview where you learn the information you need. The opportunity to get this information occurs only when the interviewee talks. The first step in active listening, then, is to ask questions in such a way that the interviewee does most of the talking.

EXAMPLE

A question such as "Do you use all the equipment in this room to do your job," can be answered with a simple "Yes" or "No." A question such as "Which pieces of equipment haven't been used in the last year?" followed by "why not?" makes the interviewee give more information.
Restating and Summarizing. Although you may listen intently, sometimes answers to questions may not be clear or may not give you the needed information. Lack of clarity may be due to the interviewee's lack of understanding of the question or his or her use of jargon or slang with which you are not familiar. When this happens, test your understanding of what has been said by restating it in the simplest language possible. When you have finished with a task or group of tasks, summarize what has been said to make sure you understand it.

EXAMPLES

"If I understand you, you're saying............."

"Let me see if I have it straight. There are five steps in the process, and different people do each step."

Using the Time Gap. Concentration during listening is more difficult than during most other human activities. The reason for this is that we think about six or seven times as fast as we talk. When we listen, therefore, we continue thinking at a high speed while the words we are listening to arrive at a low speed. In other words, we can listen and still have considerable spare time for thinking. How well we use this spare thinking time makes the difference between listening effectively or poorly.

Good listeners perform four mental activities while listening. These activities are well coordinated and direct attention to the message being received. Little time is left for daydreaming or side excursions leading away from the speaker's thought. The four helpful activities are:

- Think ahead of the speaker and try to anticipate where the conversation is heading and what conclusions will be drawn from the words spoken at the moment.
- Weigh the evidence used by the speaker to support the points being made, asking mentally, "Is this point valid? Is the evidence complete?"
- Throughout the conversation, "listen between the lines" for meaning not necessarily spoken. Do this by paying close attention to nonverbal signals, facial expressions, gestures, tone of voice, and emphasis to see if they alter the meaning in some way.
- Periodically review and mentally summarize the points presented.

The time gap created by the difference in speeds of talking and listening permits plenty of time to accomplish these four mental tasks. However, they do require practice before the habit of listening effectively can be acquired.
PRACTICE EXERCISE

You are interviewing someone from a rating very different from yours. He uses a lot of technical jargon that does not make sense to you. You find your mind wandering. What should you do? Write your answer in the space below.

Check the feedback on the next page.
FEEDBACK

Here are some things you can do to keep your attention on the speaker.

- Ask the interviewee to explain terms you do not understand.
- Mentally summarize and outline what is being said as the interview proceeds.
- From time to time, stop and summarize for the interviewee your understanding of the job. Ask additional questions until you have it right.
- Think at two levels—what is being said, and how it fits into your larger picture.
- Listen for clues to whether you are being told how tasks are supposed to be performed or how they are really done.
- Practice keeping slightly ahead of the speaker.

Observing People on the Job

Good interviewers use their eyes as well as their ears to gather job-related information. Careful observations of people at their work help interviewers ask good questions, gather more complete data, and check the validity of what people say they do.

EXAMPLES

A torpedoman's mate says he has told the interviewer about all of his duties. The interviewer sees a chain fall rigged in the spaces. When the interviewer asks what it is used for, the torpedoman's mate describes a whole series of tasks he forgot to mention.

At the start of an interview, an electronics technician describes her job in very general terms, "We repair radar equipment, whatever kind they send us." The interviewer looks around the shop and asks, "What do you do with this equipment?"

A Chief has just told the interviewer, "We don't do any paperwork in this shop. That's done by the supply office." The interviewer observes someone at a workbench filling out a form, and asks the Chief about it.
As an interviewer, you will have many opportunities to observe people. In addition to observing people while you interview, you will have opportunities to observe while waiting for interviewees, while touring spaces, and going and coming at the command. Pay special attention to:

- What, specifically, people are doing.
- Who, by rating and pay grade is doing the task.
- What equipment is being used.

Two factors are especially important in being a good observer. They are paying attention and being aware of how much characteristics of the observer (YOU!) affect what you observe.

**Paying Attention.** Any observer must learn to pay attention. How is this done? Here are three requirements:

- Place yourself in a state of readiness to observe specific task-related facts and to ignore other facts.

**EXAMPLE**

An interviewer is observing a mechanic perform an installation task. About halfway through the performance of the task, the interviewer begins to wonder about putting in a suggestion to change the installation procedure.

Although your suggestion about a new procedure may be a good idea, you may have missed some important information while you were thinking about it. Don’t let your attention wander from the interviewee.

- Become interested yourself in the job and task area to be observed. This helps you watch with an active inquiring mind, and directs your attention. To cultivate your own interest, read about the job, and think about how it fits into the Navy’s mission. Studying existing training material used by that rating is also helpful.

- Develop self-control so that observations can be made with minimal interference from the interviewer. Questions about a task and the requirements for its performance are an essential part of OIC. However, questions such as "Do you like working here?" are inappropriate, because they distract both the interviewer and the interviewee.
PRACTICE EXERCISE

In two or three sentences, tell how you would train and prepare yourself to pay attention to tasks you observe. Write your sentences in the space below.

Discuss your comments with a coworker. Now try it out.

"Observer effects. When looking at the same object or action, everyone does not "see" the same thing. When preparing to see what really is happening during an observation, remember:

- Past experience can cause an observer to jump to a conclusion.
- Anticipating an event can cause a false observation.
- Strong personal interests can cause the observer to see only those things he or she want to see, and overlook other information.
- Emotions, motivation, prejudices, mental sets, sense of values, or physical condition of the observer can affect the quality of the observation.
- A person tends to see what he or she knows."
PRACTICE EXERCISE

Get together with a coworker and observe some people on the job. Record what you observe.
FEEDBACK

Now compare notes and discuss the differences in what you each "saw." These differences are due to the differences in attention and background of different observers. What can you do to minimize these differences? One way is to be very clear about what you actually saw and what you inferred from your observations.

Interview Practice

In Appendix E, you have learned many specific techniques for conducting O&I interviews. More details about what to ask are included in Chapter 6, Step 10 of the Handbook itself. Before you go on an O&I trip, do one or more practice interviews until you feel at ease. The following exercise will help you put all the specifics together.

PRACTICE EXERCISE

Select one of the experienced interviewers at NODAC who is in a different rating from yours. Prepare some interview questions about what he or she did at his or her last duty station. Then conduct an information-gathering interview with him or her to learn about the tasks performed in that rating. In only one interview you will not be able to cover the rating completely. You may want to limit your discussion to one duty category only.

Using the "Self Evaluation" job aid in Figure E-1, rate yourself on your interviewing skills. You should use this check list after your first several interviews to help you improve your skills.
Self-Evaluation Check List

The following check list should be completed as soon as possible after your interview. It should be used as a feedback tool to improve your interviewing skills.

Figure E-1. Self-Evaluation Job Aid.
Why Interviews are Used

In performing job task analysis, NODAC uses both interviews and surveys. This is because both methods have advantages and limitations. Knowing them helps an analyst choose which method to use in any particular situation.

Advantages of Interviewing. Interviews provide opportunities to clarify and explain questions to the person being interviewed. The need to interpret and explain questions depends on the complexity of the questions and job area. People have few problems with questions that ask for recall of personal history or recent events. However, questions that ask the person to recall difficult operator or maintenance procedures may need interpreting or rephrasing. Interviews are especially useful when the reading skill of interviewees is low. Also, the more varied the target population, the greater the need to interpret and explain the interview questions.

A second advantage of interviewing is that the answers to questions can be clarified. This is usually necessary when a particular work activity can be performed in various ways. The interviewer can encourage the interviewee to give additional information that clarifies a previous answer. This allows for greater flexibility in the types of questions asked and is a good technique for increasing the possible range of answers.

A third advantage is that the interviewer provides greater control over the information-gathering situation. You are right there in control! When mailing out surveys and questionnaires, you lose some control because someone else is administering the survey for you.

A fourth advantage of interviews is that they provide an opportunity to determine if the information is valid and reliable. Information is valid if it is realistic in terms of the job being analyzed. During an interview you can tell if a worker is giving realistic information. You cannot control this when the worker completes a survey at some location miles from your office. Information is reliable if it is obtained over and over again from many different people. In other words, if you interview many workers and they all say about the same thing, you are getting reliable data. Because interviews allow you to clarify both questions and answers, you can constantly evaluate the reliability of the data you are collecting.

For all of these reasons, interviews are a particularly useful way to gather data. They are especially useful as a step in developing surveys, because they help ensure that the survey items are clear and complete.

Limitations of Interviewing. The quality of the interview is limited by the abilities of both the interviewer and the interviewee. The interviewer must be capable of planning, conducting and controlling the interview situation. Such skill comes through a good training program and experience. Interviewing may also be limited by the ability of the interviewee to communicate factual information. Untrained or unskilled workers usually cannot describe their job as well as skilled, experienced workers.
Usually, interviews are held with only a few people in each job specialty. If these people are not typical or if the specialty is very diverse, the picture that emerges from the interviews may not be very accurate for the job specialty as a whole.

Because interviews provide for flexible responses from interviewees, the information gathered from them cannot be combined and summarized as easily as that from surveys. This becomes a major problem when information from many people must be gathered and analyzed.

Finally, interviews are expensive. They require trained people to spend a large amount of time with each interviewee, as well as additional time and money in traveling to the interviewees. If interviewees are scattered all over the world, interviews become very impractical.

Advantages and Limitations of Surveys. Many of the limitations of interviews are advantages of surveys. Surveys are relatively inexpensive, they can be given to all the people in the job specialty or a random sample to get more complete coverage, and responses can be combined easily to get a good overall picture of the job specialty. They do not require highly trained administrators, although when good monitors give surveys, more and better information is produced.

Many advantages of interviews are limitations of surveys as well. For example, if the respondent does not understand the item, or if the survey is incomplete, information is lost, and that loss may not be known when results are tallied.

A combination of interviews, followed by surveys, uses the advantages of both methods while minimizing their limitations. Both the interviews themselves and the surveys that follow are critical steps in job task analysis. When you conduct O&I interviews, you are performing a key part of the process.
HANDBOOK FOR CONSTRUCTION OF TASK INVENTORIES
FOR NAVY ENLISTED RATINGS

APPENDIX F

ALTERNATIVE TECHNIQUES
FOR POSSIBLE USE IN STEP 12
(CONSTRUCTION OF TASK INVENTORY)
Six alternative techniques for task inventory development that may be appropriate to try out in Step 12, depending on the nature of the rating being surveyed, are described below. Pilot testing of the procedures is recommended to evaluate their suitability for use in constructing MODAC task inventories and for conducting occupational surveys of Navy enlisted ratings.

Blocking. The grouping of task statements and other inventory items into blocks can be a useful technique for organizing the contents of a task inventory if the blocking is done appropriately and the labeling of the blocks is accurate and comprehensive. Explicit instructions help the respondent skip quickly over blocks of items that do not apply to his or her work in the rating. The respondent can answer a blocked inventory more quickly and probably provides more carefully considered responses than those to a lengthy unblocked inventory containing many tasks that the respondent does not perform. When blocking is used, a job incumbent should be able to respond to a maximum number of items in the amount of time allotted for administration of the survey. This may mean that the content of the inventory can be prepared at a greater level of detail and specificity than has been possible before.

To take maximum advantage of the blocking feature, titles or labels for the blocks should be included in the format of the task inventory so that the respondent can skip blocks that do not apply. However, choosing an appropriate title or label for a block is critical. If the title does not accurately and completely reflect all of the items in the block, the respondent may skip the block when in fact he or she may perform some of the tasks. Duty titles or block labels should begin with an action word ending in "ing" (gerunds)—for example, PERFORMING CORROSION CONTROL AND MATERIAL PRESERVATION. In addition to their use in guiding a respondent through an inventory booklet, duty titles or block labels aid the occupational analyst in identifying job groups.

The organization of United States Air Force job inventories relies heavily on the blocking feature, whether the block can be skipped or not. Common tasks which everyone in a particular Air Force specialty performs are placed at the beginning of the inventory, right after the Background Information section, and everyone responds to these initial blocks of items. Four Air Force duty categories that are common to all specialties represent natural blocks and appear first in USAF inventories. These four blocks are ORGANIZING AND PLANNING, DIRECTING AND IMPLEMENTING, INSPECTING AND EVALUATING, and TRAINING. (In Navy task inventories, probably the most suitable blocks to appear first would be those containing rating-related tasks that E-3s and E-4s are likely to perform rather than tasks at the supervisory levels.) How the remaining tasks are grouped into blocks in USAF inventories depends on the nature of the specialty and is left up to the judgment of the inventory developer. A group of tasks associated with a particular piece of equipment or system—for example, the F-16 aircraft—might be made into a
block that the respondent could skip if he or she did not work on that aircraft. At the beginning of this block of tasks, the respondent might be instructed as follows.

_IF YOU DO NOT WORK ON THE F-16, SKIP TO BLOCK X ON PAGE XX._

Examples of selected block labels from the USAF Navigational Aids Technician specialty job inventory are listed below.

- PERFORMING MAINTENANCE MANAGEMENT FUNCTIONS
- MAINTAINING TEST EQUIPMENT
- MAINTAINING RADIO BEACON SYSTEMS
- MAINTAINING INSTRUMENT LANDING SYSTEMS (ILS) NON SOLID STATE
- MAINTAINING LONG RANGE AIR NAVIGATION (LORAN) SYSTEMS

Other examples of the use of blocking can be found in a draft copy of an Office of Personnel Management (OPM) survey of apprenticeable trades. The examples selected here are for the welder and electrician trades. Portions of two blocks (DUTY C for welders and DUTY N for electricians) are reproduced below for their idea value.

**DUTY C - TESTING, PREPARING AND CLEANING MATERIALS, EQUIPMENT, AND SHOP AREAS**

Test metals for identification and classification using:

1. a Spark test.
2. a Heat and Quench test.
3. a Chemical test.
4. a Flame test.
5. by non-destructive method.
6. Cut heavy gauge metal stock.
7. Cut pipe of various sizes.
8. Cut various angles.
9. Cut channels of many sizes.
10. Cut I-beams or other metal extrusions.
11. Bend parts by hot process.
12. Bend parts by cold process.
13. Shape and form parts by hot process.
14. Shape and form parts by cold process.

23. Clean metal parts with sonic cleaners.

24. Prepare metal joints for welding.

**DUTY N - PERFORMING ELECTRICAL INSPECTIONS ON NUCLEAR SUBMARINES, NUCLEAR AND NON-NUCLEAR SURFACE SHIPS**

Inspect and document a variety of highly complex and sophisticated systems and components such as:

1. Electric power generation systems.
2. Missile fire control systems.

7. Make visual and dimensional inspection reports.
8. Certify repair work
9. Witness, document, and verify reinstallation and complete the re-entry forms.
10. Document, certify, and audit sub-safe hull fittings for correct size, fit-up, material, torquing, and markings.

15. Identify all items requiring correction prior to commencement of system tests.

16. Cross-check calibrated electrical instruments with portable standard instruments to insure system accuracy of very critical measurements.

17. Make "on the spot" controversial accept and reject decisions both orally and in writing.

18. Sign and document satisfactory and unsatisfactory inspections on legal work.

19. Plan and inspect systems and components to coincide with production shop's work.

20. Prepare a withhold report for critical deficiency, components, materials, and procedures when they do not meet specifications.
Notice that in the DUTY N block for the OPM survey of the electrician trade, there are many multi-verb task statements (for example, WITNESS, DOCUMENT, AND VERIFY; DOCUMENT, CERTIFY, AND AUDIT; PLAN AND INSPECT; INSPECT (or SIGN) AND DOCUMENT). The Office of Personnel Management takes a quite different approach to task analysis in that they use complex, multi-part task statements which are difficult for the Comprehensive Occupational Data Analysis Programs to analyze. In addition, the respondent becomes frustrated trying to decide on a single response when the answer to one part of the task statement may be yes, yet the answer to the other part(s) may be no. However, multi-part task statements can and should be broken down into multiple task statements, each having only one action verb and one object of the action verb. This would remove much of the objection to the OPM approach to task analysis. What is significant about the OPM examples is how they have grouped tasks into larger functional blocks or duties.

Equipment/Systems Matrix. The currently followed procedure in Section C of the Response Packet of having the task inventory respondent consider how often he or she uses (Section C-1) and repairs (Section C-2) a separate list of equipment/tools/systems makes it difficult during the process of analysing inventory response data to relate the use and repair of equipment/tools/systems to the relative time spent performing the tasks (Section D) of the rating. If the functions performed for each equipment, tool, and system could be written as task statements, then it would be possible to analyze them along with all of the other tasks in the inventory using the Comprehensive Occupational Data Analysis Programs (CODAP). This would make the work of the NODAC occupational analyst a great deal easier and would result in a more meaningful description of the work of the rating.

At one time, the total number of items in a task inventory that could be manipulated at the same time by certain CODAP programs was 2000, and the total number of duty categories was limited to 26. These limitations placed a severe constraint on the level of detail and specificity that could be achieved in constructing a NODAC task inventory booklet. Now, however, a new version of CODAP (called CODAP System 80) has been prepared under the sponsorship of the DoD Executive Agent for Joint Task Analysis Support because of the limitations in the earlier IBM CODAP system that the United States Navy, Marine Corps, and Coast Guard had been using. The new system can accommodate any rating scale, not just relative time spent. In addition, the maximum number of items that can be included in a job/task inventory has been increased from 2000 to 5000, and the total number of duty categories (or blocks) is theoretically unlimited, constrained only by the maximum storage limits of the IBM computer being used to run the CODAP programs.

If the equipment/tools/systems (ETS) used in a rating were presented in a two-way matrix that listed the ETSs along one dimension (either horizontal or vertical) and the functions performed on these ETSs along the other dimension, a task statement could be derived from each combination of ETS and function. But, if the number of ETSs were large (say, 300) and the number of possible functions were 12, the resulting matrix would use up 3600 items of the 5000 total inventory items possible with the new CODAP System 80.
Clearly, that would not be an efficient way to collect ETS data in the high technology Navy anticipated for the future. But not all 300 items in the example mentioned above need to be or should be placed in the matrix format. All common tools and equipment could be extracted from the ETS list and organized as task statements in a single block. An example worked up from the April 1975 Electronics Technician (ET) task inventory booklet (the last survey of this rating) of a block of common tools and equipment might look like the following.

### BLOCK X. USING COMMON TOOLS AND EQUIPMENT

1. SCREWDRIVERS (SUCH AS JEWELERS, PHILLIPS, FLAT)
2. ABRASIVES (SUCH AS FILES, EMERY CLOTH, SANDPAPER)
3. WRENCHES (SUCH AS ADJUSTABLE, PIPE, OPEN END)
4. ALLEN WRENCHES
5. BRISTO WRENCHES
6. HAMMERS/MALLETS
7. LONG-NOSED PLIERS
8. SAFETY GLOVES (SUCH AS RUBBER, ATH'RM PALM)
9. CLEANING SOLVENTS
10. VACUUM CLEANER [perhaps with a qualifier/modifier]
11. MIRRORS [perhaps with a qualifier/modifier]

In addition, not all of the functions specified in the matrix format necessarily are performed for each equipment/system type. For example, if it was established during O&I that TEST and TROUBLESHOOT were the only two functions performed by ETs on Widgit XYZ, then two task statements could be written to cover these functions. When all common tools, and equipment/systems limited to just a few functions have been removed from the initial list of 300 items in the previous example, the remaining number of items might prove to be quite manageable to present in equipment/systems matrix format. However, instead of using the equipment/systems matrix format with low technology ratings, the actual functions performed on each equipment/system probably could better be written directly as task statements. Use of the equipment/systems matrix format with high technology ratings would require some very careful judgments in order to fit within the CODAP System 80 limit of 5000 total inventory items.

Figure F-1 shows one possible format for an equipment/systems-by-functions matrix for the ET rating in which both the equipment/systems and functions are defined. The reason for including definitions of the functions is to ensure that each function will mean the same thing to all respondents.

Figure F-1. One Possible Format for an Equipment/Systems-by-Functions Matrix in Which Both the Equipment/Systems and Functions Are Defined.
The inclusion of definitions can be expected to improve the validity of responses to task inventories. However, when function definitions are included in the matrix, they take up page space that could be allocated to additional columns for enumerating equipment/systems. The result of the trade-off shown in Figure F-1 is that only five equipments/systems can be surveyed per vertical page. Use of smaller type or photo-reduction in preparing the equipment/systems matrix template would allow room for additional columns of equipment/system items, but probably no more than seven or eight columns altogether or the print would be too small to read.

Perhaps the definitions for the equipment/systems functions only need to be stated once—in the instructions for that section or block of the inventory. If so, then it should be possible, using smaller type or photo-reduction, to place at least ten items on each matrix page. However, the respondents might forget the definitions and not refer back to them in the instructions. To refresh their memory, the definitions could be repeated intermittently, say, every fifth page, in the format shown in Figure F-1. Another possibility is to include the definitions in only the first five to ten pages and then to eliminate them, on the assumption that by then the respondents would have been exposed to the definitions often enough to remember what each one means. An additional possibility might be to use fold-back overlays of the definitions, visible for all pages of the equipment/systems-by-functions matrix.

Because responding to an equipment/systems matrix requires a different response set than that required for the rest of the inventory items, this section or block probably should be the last one in the booklet, preceded by the block of common tools and equipment and the block(s) of equipment/tools/systems that have been made into direct task statements. The last block then would be the equipment/systems matrix in which the most frequently used equipment and systems would appear first. The instructions at the beginning of the matrix block would show examples of how to mark on the appropriate page of the Response Packet (1) if the respondent assists in, performs, or supervises the function (secondary factors), and (2) the relative time spent in performing the task. The numbers in the cells of the matrix (see Figure F-1) would correspond to the task numbers of the columns in the Response Packet where the responses are marked. However, since no consumers of NODAC data appear to be using secondary factors information, it seems justified to consider omitting them to reduce the complexity of the decision for the inventory respondent and the time required to respond.

Another possibility in designing the format of the equipment/systems matrix might be to exclude the troubleshooting function from the matrix. The reason for considering this option is that troubleshooting of equipment and systems as a task is defined differently at different pay grades. E-3s and E-4s generally perform troubleshooting at the black box level, E-5s generally troubleshoot at the module level, and E-6s at the component level. Thus, as one moves up in pay grade, the job incumbent is expected to be able to troubleshoot at an increasing level of specificity in the system/equipment/assembly or module/component/part hierarchy. Organizational maintenance is performed at the equipment/system or black box level while intermediate
maintenance is performed at the module/component/part level. If it is
desirable to capture these differences in troubleshooting tasks across the
pay grades of a rating, then it makes sense to write a group of task state-
ments reflecting these differences and to place them in a separate block
called BLOCK X. TROUBLESHOOTING, or make TROUBLESHOOTING a major heading
with subheadings for the three levels. This block also would precede the
equipment/systems matrix.

If the equipment/systems matrix concept is ever pilot tested on a se-
lected rating, it would be valuable to coordinate the development of the
experimental task inventory booklet with a training importance survey of the
same rating. If a training importance survey of the rating is under develop-
ment by CNET or if one has been recently conducted, it is likely to have a
more extensive equipment list than typical NODAC task inventories have. The
training importance survey equipment list would serve as a good point of
departure in developing an equipment/systems matrix for a NODAC occupa-
tional survey of the same rating.

Action Verb Lists of Task Statements. When a computer database of task
statements exists for a set of task inventories, for a single task inventory,
or for the duty categories or blocks of an inventory, it is possible to sort
the database alphabetically by the action verb in the left-hand position of
the task statement and to print the resulting reordered list of task state-
ments. This rearrangement brings together all task statements in a duty
category or block, an inventory, or set of inventories that begin with the
same action verb. For example, if DAMAGE CONTROL were the duty category of
interest, then an alphabetical action verb list for the NODAC database of
task statements across all ratings might look like the following for the verb
PERFORM.

<table>
<thead>
<tr>
<th>11006</th>

</tr>
</tbody>
</table>
The leading 5-digit code in the list above is the number of the occupational standard to which the task statement corresponds. The rate(s) at which the task is performed is(are) listed under the number of the occupational standard. From this list of eight task statements it is possible to determine what most of the damage control procedures performed in the fleet are. Seven of them are performed by Hull Maintenance Technicians (HTs) since damage control is an important part of the work of their rating. Six of these seven procedures are performed by HTs at the E-3 pay grade level and one is performed at the E-2 pay grade level. The eighth procedure—radiological monitoring and surveying—is performed by job incumbents at the E-3 and E-2 pay grade levels in four ratings: Boiler Technician (BT3), Engineman (EN3), Hull Maintenance Technician (HT2), and Machinist's Mate (MM3).

The production of user-specified, alphabetized action verb lists by computer or by certain word processors is relatively easy, given that a database of task statements exists. Possible users of such lists might be the following.

- Task inventory developers when they are finalizing the list of task statements for an updated task inventory booklet.
- The NODAC Standardization Committee as an aid in their efforts to standardize the wording of task statements across ratings and pay grades and to map task statements onto their corresponding occupational standards.
- NODAC analysts who might be interested in seeing at a quick glance all the items for a particular occupational survey associated with such action verbs as, for example, HANDLE, INSPECT, PLAN, RIG, SERVE AS, etc. to provide clues for guiding the analysis process.

Noun Lists of Task Statements. The noun list technique for reordering task statements is the extension of a concept formulated by inventory developers at the USAF Occupational Measurement Center for standardizing the wording of task statements within an individual job inventory. The syntactic structure of a task statement is as follows:

ACTION VERB + OBJECT OF ACTION VERB (NOUN) + QUALIFIER (if essential to the meaning)
In the noun list technique, the action verb is moved to the end of the task statement, leaving the object of the action verb (or noun of the task statement) in the left-hand position. Now it is possible to alphabetize a list of task statements by their nouns rather than by their action verbs. If the database of task statements were large enough and had been accumulating over time, it would be possible to retrieve, for example, all task statements ever written that had CANOPIES, CATAPULTS, TORPEDOS, MINES, LOGIC DIAGRAMS, or whatever as their object.

In the USAF use of this technique, all of the preliminary task statements developed before O&I are reordered by their nouns (objects of the action verb), either for the entire inventory or by duty categories/blocks within the inventory. Since the USAF practice is, if at all possible, to write task statements for equipment/systems rather than putting them in a list, the alphabetical noun list for a job inventory under development pulls together all tasks related to the same piece of equipment or system. Any inconsistencies in how these tasks are worded are immediately obvious, and any functions that normally are performed for a piece of equipment or system which are not included in the list become an area to be probed during O&I.

For example, the alphabetized noun list for DUTY CATEGORY J - MAINTAINING INSTRUMENT LANDING SYSTEMS (ILS) NON SOLID STATE might bring together the following list of seven task statements pertaining to low frequency beacon (LFB) systems.

<table>
<thead>
<tr>
<th>Item No.</th>
<th>Reordered Task Statement</th>
<th>Duty Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td>LFB TRANSMITTER OUTPUT FREQUENCIES - MEASURE</td>
<td>J</td>
</tr>
<tr>
<td>22</td>
<td>LFB TRANSMITTER PERCENT OF MODULATION - MEASURE</td>
<td>J</td>
</tr>
<tr>
<td>5</td>
<td>LFB TRANSMITTER POWER OUTPUTS - ADJUST</td>
<td>J</td>
</tr>
<tr>
<td>23</td>
<td>LFB TRANSMITTER POWER OUTPUTS - MEASURE</td>
<td>J</td>
</tr>
<tr>
<td>9</td>
<td>LFB TRANSMITTER RF OUTPUTS - ALIGN</td>
<td>J</td>
</tr>
<tr>
<td>13</td>
<td>LFB TRANSMITTERS - INSPECT</td>
<td>J</td>
</tr>
<tr>
<td>31</td>
<td>LFB TRANSMITTERS - REMOVE OR REPLACE</td>
<td>J</td>
</tr>
</tbody>
</table>

After studying the noun list, the inventory developer might realize that certain tasks related to LFB systems had been overlooked in preparing the inventory. The developer then could add new task statements to cover these areas of omission as shown below.

- LFB REMOTE MONITOR RECEIVER - ALIGN
- LFB REMOTE MONITOR RECEIVER - ISOLATE MALFUNCTIONS
- LFB REMOTE MONITOR RECEIVER - REMOVE OR REPLACE
A noun list like the one illustrated above can be used during O&I to make certain that the inventory covers all of the tasks that a job incumbent performs on a piece of equipment or system. Noun lists may also prove to be a useful aid to the work of the NODAC Standardization Committee and to NODAC occupational analysts.

A functional flowchart of the logic to be followed in preparing a computer program to produce a list of task statements sorted alphabetically on their objects (nouns) is shown in Figure F-2. Some action verbs consist of two words, with the second word being a preposition. Therefore, the second word of a task statement needs to be compared to a list of prepositions to decide whether to move just the first word or the first two words to the end of the task statement. When the action verb has been moved to the end of the task statement, it leaves the noun (object of the verb) in the left position of the task statement. Alphabetizing on the word in the left position then produces the noun list.

A preliminary list of prepositions is also shown in Figure F-2. Some of the entries in this list are not good action verbs. Nevertheless, they do occur in some NODAC task inventories. Any other prepositions that should be included in the list would be very apparent once actual noun lists were being produced since these prepositions would list in the left position of the task statement. Adding any prepositions found in the left position to the preposition list would take care of the problem.

KWIC Indexes and Text Editors. Other computer software is available to search and manipulate text in order to produce useful printouts of textual databases. Information scientists have long used Keyword-In-Context (KWIC) computer programs to produce permuted indexes. A KWIC index lists each substantive word or keyword in a prescribed segment of text, and each keyword in the segment becomes an entry point in a printed index. The keyword is positioned successively, that is, in the order of every occurrence in some body of text, in a fixed position which is the center of one index line. The keyword is surrounded on either side by the other words in the text segment to form one index line. An example page from a KWIC index to the Human Resources Research Indexing Vocabulary used in the Research and Development Information System at the Navy Personnel Research and Development Center is shown in Figure F-3. Task statements and/or occupational standards could be treated in a similar manner. In a KWIC index of task statements or occupational standards, the user would scan down the center column of words, which are in alphabetical sequence, to locate the word of interest, whether it be a verb, noun, adjective, or adverb. KWIC indexes of task statements and occupational standards would pull together similar task statements and/or occupational standards, and might be a useful tool in the work of the NODAC Standardization Committee.

Several versions of a KWIC index are available. The Defense Technical Information Center uses a KWIC program written in COBOL. The Research and Development Information System at the Navy Personnel Research and Development Center also uses one in COBOL, written for the IBM 370 computer.

F-13
Another useful tool for manipulating textual databases is a computer-based text editor. WYLBUR was the first flexible, truly interactive text editor to be created, and was developed at Stanford University around 1970. Powerful interactive text editors such as WYLBUR permit the user to interact with a database in order to retrieve, sort, and edit text. The Army Research Institute (ARI) is using WYLBUR to study a database of all task statements included in the Army's job inventories for military occupational specialties (MOSs) prepared during the last fiscal year. This database consists of approximately 20,000 task statements. ARI researchers can retrieve all task statements in this database containing, for example, the word TRUCK, CARBURETOR, AMMUNITION, MAPS, M16 RIFLE, etc. The objective is to discover the redundancy and overlap among similar task statements and to produce a body of standard task statements, many of which will apply to more than one MOS.

Another powerful text editor is the Conversational Monitor System - CMS/EDIT that runs under VS/370. The Computer Center of the University of Waterloo in Canada has expanded the capabilities of this text editor for IBM computers, and the software is in the public domain. Another text editor, designed primarily to be used by computer programmers, is the Programmers' Work Bench. This software was developed by the Bell Telephone Laboratories to run on Digital Equipment Corporation (DEC) hardware.
