UPGRADE AND ENHANCEMENT OF THE AS DEPARTMENT FINANCIAL MANAGEMENT INFORMATION SYSTEM; DEVELOPMENT OF THE FMIS PROPERTY MANAGEMENT MODULE

The Administrative Sciences (AS) Department of the Naval Postgraduate School (NPS) maintains a large amount of plant and minor property to support its vast and varied operations. This property requires accurate record keeping to assure accountability of each item throughout its lifetime, from initial acquisition through disposal. The AS Department implemented a Financial Management Information System (FMIS) through the work of prior NPS students, at the commencement of FY 91. This thesis develops and integrates the Property Management Module into the FMIS to support the management and accountability of the AS Department property. The new expanded version is named FMIS 2.0. An outline covering software maintenance analysis, the Property Management system requirements analysis, and system design methodology is provided. The system was written using dBASE IV, version 1.1 and will transition to operational status from the current FMIS at the beginning of FY 92.
ABSTRACT

The Administrative Sciences (AS) Department of the Naval Postgraduate School (NPS) maintains a large amount of plant and minor property to support its vast and varied operations. This property requires accurate record keeping to assure accountability of each item throughout its lifetime, from initial acquisition through disposal. The AS Department implemented a Financial Management Information System (FMIS), through the work of prior NPS students, at the commencement of FY 91. This thesis develops and integrates the Property Management Module into the FMIS to support the management and accountability of the AS Department property. The new expanded version is named FMIS 2.0. An outline covering software maintenance analysis, the Property Management system requirements analysis, and system design methodology is provided. The system was written using dBASE IV, version 1.1 and will transition to operational status from the current FMIS at the beginning of FY 92.

I. INTRODUCTION

A. BACKGROUND

The need for a computerized data base system for the Administrative Sciences (AS) Department of the Naval Postgraduate School (NPS) has been an ongoing subject of thesis study by several previous NPS students. A basic requirement for the system is to process related resource data in four functional areas: Personnel, Property, Supply, and Travel. The prior theses [Ref. 1,2,3,4] varied in their approaches toward developing a system and culminated in the FY 91 implementation and use of the first version of the Financial Management Information System (FMIS) developed by Neil Ford and Nicholas Zimmon [Ref. 4].

This initial version of the FMIS, developed using dBASE IV, has proven operationally satisfactory. However, it did not include a property management module which is required to track plant and minor property during its lifetime in the AS department. The requirement for this property module was recognized during development of the initial system and was planned to be incorporated as a software maintenance enhancement update through follow-on thesis work. This thesis accomplishes that work and includes a brief overview of software maintenance and the database application development process.
B. FMIS VERSION 2.0

The major change to the FMIS in developing the second version is the integration of a property management system module into the original application. To effectively assimilate the enhancement, the system architecture developed for the initial system was followed as closely as possible. This required close attention to detail during the requirement, evaluation, and design phases of the application development. This ensures that the property management subsystem when completed, could be incorporated into the FMIS. It was crucial to ensure that the common fields needed to link the relations between objects were identical in structure. For these reasons this thesis study does not explore new software tools, instead it concentrates on expanding the existing architecture.

The system was developed using Ashton-Tate's dBASE 4, version 1.1. After extensive personal interviews with the departmental staff, a prototype system was rapidly developed and presented for critique by all expected users. The final property module system incorporated functional and data requirement changes identified during prototype testing. It required programmer coding with the dBASE programming language to obtain the advanced features required of the system as well as procedures required for the successful integration with the original FMIS.
The Property Management sub-system provides new record entry for various fields as illustrated in Appendix E. It also provides retrieval of specific records for editing, deletion of records, and selection of the following property reports:

1. Property Custody Log
2. Property Disposal Report
3. Property Custody History Report
4. Minor Property Inventory Report
5. Plant Property Inventory Report
6. Property Location Report

In addition to its original functions, FMIS version 2.0 now provides an accurate, user-friendly, and efficient means of tracking accountable property custodianship throughout the Administrative Sciences Department.

C. CHAPTER DESCRIPTION

Chapter II reviews basic fundamentals of software maintenance. Operating in a dynamic environment, software must continually be modified in order to perform its required function to meet user satisfaction. These changes can often exceed the effort required to develop the initial system. The type of maintenance in developing FMIS 2.0 will be examined.

Chapter III will review the database application development methodology and outline the methods as used in developing the Property Management Sub-system (PMS). The definition, requirements, evaluation, design, and implementation
phases will be covered. The soundness of the new property
database relation structure as to which level of normal form
it satisfies will be discussed.

A description of all new reports generated by the PMS in
FMIS 2.0 will be laid out in chapter IV.

Chapter V, Conclusions, discusses usability of the system
and areas for further development. There may be enough
perfective maintenance to warrant further changes, possibly as
study for another thesis study.

Appendices A through E include sections on requirements
documentation, data dictionary, custom programming procedures,
application documentation, and a user’s guide.
II. SOFTWARE MAINTENANCE

Development of the Property Management sub-system and its subsequent integration into the FMIS program falls under the classification of software maintenance. Maintenance requires a different approach towards development as well as presenting a different set of problems than those that would be encountered when developing an initial system.

A. MAINTENANCE EFFORT REQUIRED

In contrast to the "finished" product of an initial software (s/w) system, maintenance of that system is an ongoing concern. This maintenance effort can easily exceed the entire effort expended on the original project, often exceeding over 60 percent of the total effort exerted on the system throughout its life. Why is there a need for so much maintenance? Rochkind [Ref. 5] provides some insight:

Computer programs are always changing. There are bugs to fix, enhancements to add, and optimizations to make. There is not only the current version to change, but also last year's version (which is still supported) and next year's version (which almost runs). Besides the problems whose solutions required the changes in the first place, the fact of the changes themselves creates additional problems.

The reason that maintenance is a consistent ongoing effort is that the users are usually never completely satisfied with the product they are using. Additional desired or required features are needed to make the system perform as wanted.
One of the many factors increasing the complexity of s/w maintenance is the turnover of personnel involved in the development of the original system. The time required of the new maintenance programmers to learn the system (the learning curve) is a factor that cannot be underestimated nor overlooked. With all factors considered, changes are often more complex to execute than might appear. The changes incorporated in developing FMIS 2.0 could have been accomplished in considerably less time by the original developers (Ford and Zimmon). The study of code and documentation took approximately a third of the entire maintenance time for the system enhancement. The complete maintenance effort distribution in development of FMIS 2.0 is shown in Figure 2.1. This large percentage of the total effort emphasizes the need for highly accurate and complete system documentation to aid future maintenance efforts.

Figure 2.1  FMIS 2.0 Maintenance Effort Distribution
Ensuring a complete software configuration in the original development allows a structured maintenance approach. This is much more efficient than performing unstructured maintenance (maintenance from scratch) which causes a high degree of wasted effort and human frustration. Use of standard dBASE IV configuration (through use of the dBASE control center) in the majority of the initial development provided a sufficient framework for a structured maintenance approach in the upgrade, see Figure 2.2. The only unstructured items to be analyzed were original programming code procedures in the ACCTSPROC.PRG file (see Appendix C) used in the original FMIS.
B. TYPES OF SOFTWARE MAINTENANCE

There are three major categories of software maintenance as outlined below. Although each type is often interrelated, requiring accomplishment at some or many points during the system lifecycle, each specific maintenance function can easily be categorized.

1. Corrective Maintenance

Corrective Maintenance is the effort involved in correcting errors after initial system delivery. It is practically impossible to discover all errors during system testing. When they eventually occur during system use, they should be recorded by the users and reported to whoever is tasked with maintaining the s/w. The errors must then be diagnosed and corrected. Corrective maintenance usually takes up about 20 percent of the total maintenance effort. No corrective type maintenance was performed on the original system in the development of the new FMIS.

2. Perfective Maintenance

Requiring approximately 10 percent of total maintenance effort, perfective maintenance takes the least amount of programmer attention of the three major categories. This term applies to maintenance performed making improvements of the systems performance and/or quality through modification to existing functions (fine tuning). This is accomplished on systems that have already been proven operationally successful. An example of this might be the reformatting of
a report for better readability. About 10 percent of the FMIS 2.0 development was perfective maintenance to the original FMIS.

3. Software Update Maintenance

Update maintenance accounts for the largest chunk of the total maintenance effort, approximately 70 percent. It is divided into two sub-categories as described below.

a. Adaptive Update

This is the work required to modify software to properly interface with an operating environment that may undergo a variety of change. The changing environment may constitute hardware or software reformation. Examples could be either the introduction of a new operating system or hardware upgrades. Adaptive maintenance was not required for the FMIS.

b. Enhancement Update

Enhancements account for about two-thirds of all updates and 45 percent of total maintenance. As successful software is used, requirements for new capabilities beyond the scope of the original system are discovered. Enhancements usually consist of new functional modules to be developed and integrated to the original code.

The Property Management sub-system enhancement accounts for almost all of the work in developing FMIS 2.0.
III. DATABASE APPLICATION DEVELOPMENT

The five phases utilized in the development of the FMIS enhancement will be discussed in this section. Each phase methodology will be discussed followed by how that phase was applied in generating the Property Management sub-system.

A. PHASE I, DEFINITION PHASE

1. Methodology

The definition phase includes preliminary activities with a major goal of simply finding out what needs to be done. The development team must be formed, scope of the project established, and feasibility (cost, technical, and schedule) assessed. This is the simplest phase in the development process.

2. Application

The goal of this project was to develop a Property Management system and integrate it as an enhancement into the FMIS currently in use in the A.S. department office. It was decided that the scope of this work warranted development as an individual thesis project. All feasibility items were met satisfactorily. Work would be performed on a 386, 25 Mhz IBM compatible PC owned by the thesis student. This resulted in negligible cost factors. A time span of eight months with commencement in January 1991 and system completion by August 1991 was considered feasible. Phase I was accomplished during
a single interview with Professors Tung Bui and Shu Liao that took approximately one hour.

B. PHASE II, REQUIREMENTS PHASE

1. Methodology

Identifying the objectives of the proposed system in detail is the goal of the requirements phase. Requirements are the blueprint that will be used to design and implement the new system. Before being able to move on to development, the developer must know exactly what the system is supposed to do. It is not only important that the system is built correctly, but vital that the right system is built. Proper definition of the requirements can prevent future maintenance nightmares.

There are two major tasks in defining database requirements. The first is to identify the objects. Objects are a collection of properties which depict an item to be implemented in the database. An object instance is an example of a specific object. The second step is to determine what functions each application will perform in the database. These requirements are most effectively identified by conducting a series of interviews with the expected users. After initial interviews a prototype may be built and demonstrated to receive further user design input.

2. Application

Interviews commenced the first week of February 1991 with the three expected users of the system: Chan Burns-
research technician, Jan Evans—administrative officer, and Pearl Murray—Supply clerk. A factor to remember when planning interviews during this phase is that interviewees typically will have full time job duties and schedule interruptions must be expected. Group interviews were beneficial to minimize receipt of conflicting data requirements from the various users.

The initial interviews lasted approximately two and a half weeks. Working with initial data requirements, a prototype Property Management System (PMS) application with sample input screen and reports was developed and presented to the users for review on March 27, 1991. Several changes to the initial requirements were requested by the users and the prototype was reworked with these changes. This cycle was repeated several times over the next two months. Fortunately the time schedule for delivery of the final product had ample flexibility permitting these constant changes.

a. Data Requirements

The PROPERTY object, as determined through the interview/prototype process is shown in the Object Diagram, Table 1, Appendix A. This single new object was the only one required for the system enhancement. All properties of the object listed in the diagram represent an important characteristic of department property items to be tracked. The Personnel property is an object property, which means that this entity characteristic is actually another object. The
PERSONNEL object developed in the first FMIS [Ref. 4] will contain properties of the person for whom the department property is assigned custodianship. Additional PROPERTY object data information is supplied in Appendix A, Tables 2 and 3. Table 2 provides the Object definition which lists all of the objects properties and each properties domain. Table 3 is the Domain definition which specifies formats of each domain. This information is used for the database design in Phase IV.

b. Application Functional Requirements

In order to track departmental property items assigned to various custodians, a property clerk must assign a unique tag number to each individual item to be entered into the system. This tag number will identify that particular piece of property entered in the database. Functions required by the PMS were patterned after the existing applications already incorporated into the FMIS. These functions include record entry, display, editing, deletion, and report generation.

The data flow diagram (DFD), Figure 3.1, shows a graphic model of the PMS system to be used as an aid in design. The DFD is comprised of four elements: the data flow, represented by an arrow; the process, represented by a circle; the data store, represented by an open ended rectangle; and the source/sink, which is shown as a closed box.
Figure 3.1 Data Flow Diagram
Property items to be tagged and assigned to a staff or faculty member for custodianship are received by the property clerk. Each item ordered under a document number. However, this number cannot be used as a unique identifier since several property items may have been ordered under the same document number. The tag numbers are used as unique property identification. Only one tag number will be assigned to any one item. Tag numbers are not in strict sequence and may occasionally change depending on the current stock of available tags. Sequences can also vary between minor and plant property.

As shown in Figure 3.1, the ENTER NEW RECORD process requires the input of new property information data along with the custodian's Personnel ID. The process will validate the personnel ID with the PERSONNEL database and retrieve the new custodian's first and last names. The process will not enter a new record with an invalid personnel ID (IDs that do not exist in the PERSONNEL records). The newly assigned property info data record will be stored in the PROPERTY data file.

The EDIT RECORD process requires the entry of a valid tag number. This process searches the PROPERTY data file and retrieves that property record for manipulation or deletion. The edited record will then be stored in the file replacing the original record.
A final process is required to produce the desired reports. Upon receiving a report request, the PRINT REPORTS process will retrieve relevant report data from the PROPERTY and PERSONNEL data files and generate the report. Table 4 and 5, Appendix A, summarize the update and display mechanism requirements for the PROPERTY object.

C. PHASE III, EVALUATION

1. Methodology

Using the information gathered during the requirements phase, this development stage typically consists of an evaluation of several items of concern to the developer and customer.

First is the identification of alternative application system architectures. The question needs to be asked, "Are there other system architectures that would better serve our needs than the one we are planning to use?" Determining the availability of the alternative architecture also needs to be done. Quite often an organization cannot afford the most efficient, state of the art technology.

Another concern that must be evaluated is the feasibility of the project. Can it actually be developed? The detail of the completed requirements may provide insight that preclude further development. Additional time and resources should not be spent on a system that will never be completed. Several large corporations, as well as the government, have abandoned development of poorly evaluated systems after
investing tens of millions of dollars. Careful evaluation of the requirements may prevent this from occurring.

A final area of appraisal is the scope of the project. Given the stated time constraints for final delivery, can all functional areas laid out in the requirements be developed? Priorities must be determined and some requirements may need to be postponed and developed at a later date.

2. Application

The Evaluation Phase was simplified by constraints that contribute to the pre-determination of the required architecture as well as a good understanding of the expected requirements during the Definition Phase. As an enhancement to an existing program, it was decided that the new Property Management module would be developed using the same software package (dBASE IV) for ease of integration into the FMIS application. Another factor was the availability of dBASE IV tools on a large number of computers at NPS. The hardware platform was not a consideration either. The system would be run on the AS department office's IBM compatible PC (Northgate 386).

Using the structured maintenance approach it was clear that the planned system upgrade could be accomplished. Feasibility was not a problem. It was evaluated that all requirements as documented in the requirements phase could be completed and delivered on time. This was determined by examining the scope of the original FMIS project (a joint...
project of two NPS students) and estimating the time required for a single student to perform the less extensive enhancement upgrade. One undocumented requirement that needs to be performed at a later date (possible follow-on thesis work) is the development of a security system for the FMIS. A password type system is desired to prevent unauthorized users from gaining access to all FMIS database files.

D. PHASE IV, DESIGN PHASE

1. Logical Database Design

In logical database design, the initial information laid out during the requirements phase will be developed into a set of plans for the database structure. Logical database design is generic, specific design requirements for programming with dBASE IV will be covered by the Physical Database design procedure. The requirements determine what we want and the design determines how to accomplish those goals. Logical design plans developed from the object diagrams and object definitions consist of relation diagrams, relation definitions, and the constraints on the relations.

The PROPERTY object was transformed into the PROPERTY relation as seen in Figure 3.2. The PROPERTY relation uses Property-tag-number (TAGNR) as its primary key. A key is an attribute that functionally determines the non-key attributes. The PROPERTY relation is related to the PERSONNEL relation in a one-to-many binary relationship. The "fork" at the PROPERTY
end of the relationship line means that there are potentially many property items for each person in PERSONNEL. The absence of a fork at the other end indicates that each property item can be assigned to at the most, one person at any one time. The circle on the line means that the relationship from PERSONNEL to PROPERTY is optional. A PERSONNEL member doesn’t have to have any property assigned to them. The bar on the line at the other end indicates that a PERSONNEL record must correspond to a PROPERTY record. PROPERTY is linked to SUPPLY in much the same manner.

The relational database model is based on the concept that data is stored in two-dimensional tables referred to as
relations. Each row in the table represents a record. Each column represents a field. The entire table (relation) is what is roughly known as a file. A row is called a tuple and a column (field) is called an attribute. [Ref. 6]

The relational structure afforded by dBASE IV allows linking these separate data files through use of a common field. The common field linking PROPERTY and PERSONNEL relations is Personnel-ID-code (IDCODE). The common field linking PROPERTY to SUPPLY is the Supply-document-number (DOCNR). The database hierarchy, updated from the original design [Ref. 4:p. 9], incorporates the new PROPERTY relation as shown in Figure 3.3.

Figure 3.3 Revised Database Hierarchy
2. The Normalization Process

When designing relations from object diagrams, careful attention to the normalization process must be observed to prevent building anomalies into the database structure. Anomalies are weaknesses and flaws in the relations that cause undesirable effects when modifying a database. Types of modification anomalies include deletion and insertion anomalies. Deletion anomalies refer to problems that occur when the deletion of facts from one relation entity inadvertently deletes facts about another entity. Insertion anomalies describe the restriction of ability to insert information about one entity until additional facts are received about some other entity. Minimization of modification anomalies was of major concern when designing the PROPERTY relation. The "normalization process" is the method to identify and eliminate modification anomalies. Dividing a relation may be required to eliminate any discovered anomalies.

The normalization process consists of testing the relation along a series of normal forms. The term normal form refers to the class of relations and techniques for preventing anomalies. There are seven normal forms, the highest level being Domain/Key Normal Form (DK/NF). When a relation is in DK/NF it is guaranteed not to have any anomalies. A relation might fall in any of the normal forms depending on its structure. The normal forms are described below along with
the determination of which form requirements the PROPERTY relation satisfies.

a. First Normal Form

The only requirement of this normal form is that the relation has no repeating groups. The PROPERTY relation meets this requirement.

b. Second Normal Form

All non-key attributes must be dependent on all of the key. PROPERTY has a single attribute key (Property-tag-number), therefore it is automatically in second normal form.

c. Third Normal Form

The relation must be in second normal form and have no transitive dependencies. No apparent transitive dependencies could be detected in PROPERTY so it meets this form requirements.

d. Boyce-Codd Normal Form

A relation is in this form if every determinant is a candidate key. However, PROPERTY does not make it past this normal form, a deletion anomaly still exists at this point. If a property item assignment record is removed from the file then the historical information as well as the property details are lost. An alternative approach would be to split the relation into separate PROPERTY-ASSIGNMENT, PROPERTY-DETAIL, and PROPERTY-HISTORY relations. This was not deemed necessary for the PMS system since once a property item is tagged and entered into the file the record should never be
The record is maintained even when the item is disposed. This will prevent the problem of the deletion anomaly from occurring.

e. Fifth Normal Form

No clear definition identifies this form, but it is known that even at this level obscure anomalies can occur. This led to the creation of the DK/NF.

f. Domain/Key Normal Form

As stated earlier, this is the final form. All possibility of relation modification anomalies have been removed. A relation is in the DK/NF if every constraint on the relation is a logical consequence of the definition of keys and domains [Ref. 6:p. 149].

3. Physical Database Design

This stage of the design phase will transform the logical database design into a physical blueprint to meet specific data element patterns required for programming the application in the dBASE IV dbms. The logical PROPERTY relation attribute names will need to be changed to meet dBASE IV's field name requirement to not exceed 10 characters. The field names must start with an alpha character, but can then be followed by numbers. The underscore (_) is the only non-alphanumeric character allowed in the name. Each field must also be categorized as one of six data types used in dBASE IV:

1. Character - textual information
2. Numeric - any true numeric value

23
3. Float - useful for numbers with no fixed number of decimal places.

4. Date - date stored in the mm/dd/yy format

5. Logical - contains either a true or false value

6. Memo - large volumes of text (up to 64K)

The total number of fields in the PROPERTY data file numbers 59 (40 of these used for historical data) which easily meets dBASE IV's maximum limitation of 255 fields for any single database record. Table 6 in the Data Dictionary (Appendix B) lists all the PROPERTY data file elements in proper form.

4. Property Management (PMS) Application Design

An application is the collection of menus, forms, reports, and programs that perform the functions of the system required by the users. Before proceeding to the Implementation phase the final task is to design the application. Once the basic designs for the PMS were laid out on paper, a quick prototype was developed to demonstrate the menus, input form screen, and reports to the users. User requested modifications to the prototype were incorporated to form the final application design.

a. Menu Design

Since the development of the PMS system was to be an enhancement to the FMIS already in use, it was decided to follow the current structure in designing the PMS menus. This would allow easier program integration in the implementation phase and ease the user transition to the new system. The
menu hierarchy design is illustrated in Figure 3.4. Main menu options from the first FMIS version are shaded. The PROPERTY selection from the main menu produces a pop-up type menu with the selections as shown in the figure. The PRINT REPORTS selection from the pop-up menu produces a pull-down menu with the six various report options. A final pull-down menu (not illustrated) provides the user with choosing either the screen, LPT1, LPT2, or writing to a file as destination options for the chosen report.

![Figure 3.4 PMS Menu Hierarchy](image-url)
b. Screen design

Variations in the screen layout design can either ease or impede system use. Screen design begins with determination of the information and fields that will be placed on the screen and then effectively designing the arrangement so that the data will fit within the screen's physical limitations.

The ENTER NEW RECORD and EDIT/VIEW RECORD form screens had to be laid out to meet dBASE IV's physical application design requirements. Custom forms in dBASE can be as wide as the screen, 80 columns. The number of rows, however, should be limited to 21 to allow room at the bottom of the screen for pop-up program messages. The screen design for the PMS involves a two-page form. The first page consists of all current property and custodian information. The second page contains historical data fields. An entry screen should be designed to minimize the number of keystrokes required by the data entry operator. An efficient design saves entry time and is less frustrating to use. Keeping this in mind, all entries requiring eventual editing were placed at the top of the form. Information required for entry on the second page is automatically transmitted in flashing fields to allow the user to enter historical data without having to refer back to the first page. Another characteristic of good screen design is the varying use of colors. Fields requiring data entry are of a uniform color that is different from information only
fields (see Appendix E). This aids in easy identification of entry fields. Another design feature incorporated was the use of default field entry when possible. Several fields identified in the following paragraph automatically fill themselves with predetermined data. This data can be accepted as is, or changed by entering something new.

Various features were desired of certain form screen fields. The following features were designed for the first form page. The TAG NUMBER field was designed to verify that the new number entered had not been previously used in another record. Validation of CUSTODIAN ID with IDs in the PERSONNEL database is required for the form to accept the entry. When a valid ID is entered, the individuals LAST NAME and FIRST NAME fields are automatically filled. Since the majority of AS department personnel utilize offices in Ingersoll Hall, a default entry of "I" is entered for the location room number. The DATE ASSIGNED entry field has a default setting of the current date, entered by the system. ADP CODE has a default entry of "0" for non-ADP property. A default of "M" (minor property) is entered for PROPERTY TYPE. The DISPOSED field gets an automatic value of "N" and also prevents any entry into the DISPOSAL DATE field until it is changed to "Y".

The second page of the form flashes the current CUSTODIAN ID, LOCATION, and DATE ASSIGNED fields transmitted from the first page. These flashing fields cannot be edited
which prevents interference of data entered on page one. The final default entries are the first set of historical data fields, CUSTODIAN1, LOCATION1, and ASSIGN DATE1. These are filled with the initial data upon creation of the record.

c. View and Report design

The initial application design prototype consisted of the following four reports: Property Custody Log, Minor Property Inventory, Plant Property Inventory, and the Property History. A final review of the PMS prototype before system implementation resulted in the request for two additional reports, the Property Disposal Record and the Property Location report. A dBASE view file was designed for each report. The view is a representation of a relation using only the fields required for the views intended use. Tables 7 and 8, Appendix B, detail the views and reports.

The basic report designs were drawn up on paper during interviews with the users. Report titles, field locations, groupings, and calculations were decided on at this time. The reports were designed to be printed on 11 by 14 7/8 inch paper which is consistent with reports generated by the original FMIS. As a maintenance enhancement, a major design goal was for the PMS reports to be similar in format to other system application reports. dBASE IV offers three general report layouts: the column layout, the form layout, and the mailmerge layout. The column layout format which includes subtotals and totals was used in all PMS reports.
E. PHASE V, IMPLEMENTATION

1. System Programming

Constructing the system in accordance with the design is the fundamental task of implementation. The control center incorporated by dBASE IV provides most of the tools required for building the various parts of the system. A code generator automatically writes program code to perform each system function constructed in the control center. The database, views, screen form, and reports in the Property Management System must all be created first, then the system can be integrated into the overall FMIS application program. Several special functions and procedures that needed to be coded manually are provided in Appendix C and explained below.

The SRCHTGNR procedure is called by the EDIT/VIEW RECORD property menu option. It searches the PROPERTY database for the record corresponding to the entered tag number and returns either that record or a message stating that the tag number doesn’t exist.

PROPOPEN is a procedure that opens the PERSONNE and PROPERTY databases for linked use in the PROPERTY form. This is required to allow simultaneous access of information in both data files. IDCODE is used as a common field between files.

The IsCust function validates the input custodian ID with the PERSONNE file. If valid it returns the corresponding last and first name, if not it produces an error message.
RECRENDX is a procedure to rebuild index files in case they become corrupted by a power failure or some other problem.

The final special procedure, RESTORE, restores the current system drive with a previous backup of all system databases. All of these procedures and functions are contained under one overall procedure file named ACCTPROC.PRG which is opened when the FMIS program is executed.

The dBASE IV application generator provided the tools to make the necessary changes to the original FMIS program and integrate the new PMS module. The sign-on banner was also updated to reflect the new version of the program. Program documentation (Appendix D) was generated as a concluding programming task. Accurate documentation is vital to provide an effective reference for future program maintenance.

2. Testing

Each section of the system was thoroughly checked for correct function using a black box type testing procedure. Black box testing is a testing method where inputs are provided to the system with subsequent checking of the outputs to ensure that the systems overall function is as expected. This testing method does not concern itself with internal functions, rather it checks the correctness of the system as a whole. The PMS system was tested alone and as part of the FMIS 2.0. Approximately 20 various test records were entered into the system for testing. Minor errors were detected and
corrected in the entry form and in some of the reports. One of the entry form errors resulted in the necessity of the PROPOPEN procedure discussed in the previous section. A group test was the last stage to see if there were any final functional problems that the programmer may have overlooked. This test went smoothly and any additional changes were agreed to be made as corrective maintenance after implementation.

3. Installation

The final stage of development is Installation. There are two main methods to install a new system. One method is to abandon the old system and start using the new one all at once. The second method, and the one to be used in installing FMIS 2.0, is to run the two systems in parallel. Running the two systems in parallel will allow time for undetected errors in the new system to surface and be corrected before total conversion. This is the preferred method since the original reliable system will still be in place in case of any unexpected problems. The planned time span for parallel operation is 9-30 September, 1991. This is an ideal schedule because the planned conversion will coincide with the start of the new fiscal year (FY 92).
IV. CONCLUSIONS

The initial FMIS has proven itself in actual use through the current fiscal year. FMIS 2.0, a software maintenance enhancement, was the central topic of this thesis. It consisted of the successful development of a Property Management module and integration of this module into the original system. Minor perfective maintenance was also performed on the original system, consisting mainly of report reformatting. FMIS 2.0 is on schedule to replace the original system at the start of fiscal year 92.

The changes incorporated into FMIS 2.0 originated from user requests over the first six months of initial system use. As discussed in section II, software maintenance is an ongoing task throughout system life. Additional desired changes to the program surface constantly, often discovered while performing other maintenance functions. Many of these new requirements and corrections could be incorporated as material for future thesis work. Specific ideas for follow on work are discussed in the following paragraphs.

Within each module in the current system architecture, the same screen form is utilized for both entering and editing records. The development and integration of separate edit forms for each database would alleviate screen congestion during the editing function and also protect permanent data from erroneous changes.
Midway through development of FMIS 2.0 the A.S. department initiated a small microcomputer Local Area Network (LAN). Currently there are only two stations connected, one in I-231 and one in I-231A. The availability of personnel data on this new network brings forth the need for development of database security. As the number of stations expand, access to certain system files must be restricted to authorized users.

Further perfective maintenance can be performed to discover and reduce any remaining anomalies in the system. The goal would be to raise the system to the fourth normal form or higher.

A final suggestion would be to explore the feasibility and benefits of performing an adaptive maintenance change. Specifically, changing the system from dBASE IV to a new software development platform. Alternate database development packages may offer desired features not available in the current system.

</table>
D. TABLE 4: PROPERTY UPDATE MECHANISMS

I. Add new PROPERTY data
   A. Inputs
      * Supply information from purchase order
      * List of available tag numbers
      * Information of prospective custodian and location
   B. Outputs
      * New PROPERTY object instance in database
      * New screen for next record entry
   C. Processing notes
      * Tag number must be unique
      * Prospective custodian must exist in PERSONNEL file
      * Property-cost is actual price paid
   D. Volume
      * Will vary. Approximately 200 per FY
   E. Frequency
      * Daily

II. Edit data in PROPERTY
   A. Inputs
      * Tag number of item to be edited
      * List of information to be changed
      * PROPERTY object instance from database
   B. Outputs
      * Modified object instance to database
   C. Processing notes
      * Tag number must be valid to enter request
      * Invalid tag number results in opportunity to try again
      * Tag number is constant, do not change
   D. Frequency
      * Semi-weekly

III. Delete PROPERTY data
   A. Inputs
      * Tag number of record to delete
      * Information to confirm correct record for deletion
   B. Outputs
      * Screen message of record deleted
   C. Processing notes
      * Record for deletion will be retrieved through the Edit process
      * Records should rarely be deleted since historical property item data is required to be maintained in data file. Delete only erroneous records.
   D. Frequency
      * Bi-weekly
### E. TABLE 5: PROPERTY DISPLAY MECHANISMS

#### I. Query on PROPERTY
- **A. Output description**
  - Form showing all data for a property item
- **B. Source data**
  - PROPERTY and PERSONNEL objects
  - Tag Number keyed by clerk
- **C. Processing notes**
  - Used by AS department administrative workers
- **D. Volume**
  - 25 per week
- **E. Frequency**
  - Daily

#### II. Minor Property Inventory Report
- **A. Output description**
  - Report of Minor property assigned AS tag numbers
- **B. Source data**
  - PROPERTY and PERSONNEL objects
- **C. Processing notes**
  - Report to be chosen from menu selection
  - Ordered by tag number
- **D. Frequency**
  - Bi-weekly

#### III. Plant Property Inventory Report
- **A. Output description**
  - Report of Plant property assigned AS tag numbers
- **B-D. Same as II**

#### IV. Property Custody Log Report
- **A. Output description**
  - Report of property items assigned to custodian
  - Grouped and sorted by custodian
- **B-D. Same as II**

#### V. Property Disposal Report
- **A. Output description**
  - Report of disposed property, grouped by ADP code
- **B. Source data**
  - PROPERTY object
- **C-D. Same as II**

#### VI. Property Location Report
- **A. Output description**
  - Report of tagged property grouped by room location
- **B-D. Same as II**

End of Application Documentation
APPENDIX E
FMIS 2.0 USER’S GUIDE UPDATE

A. INTRODUCTION

This guide is an update to the original FMIS user’s manual provided as Appendix D in reference 4. This update will cover the changes to the first FMIS version and should be used in conjunction with the original user’s guide. The major change reflected in FMIS version 2.0 is the addition of a Property Management System (PMS). The new system was integrated into the original program utilizing the existing system architecture resulting in little change to the program interface. Users familiar with operating the original FMIS should have no problem operating FMIS 2.0. Installation of the system should be in accordance with instruction provided in reference 4.

B. STORAGE REQUIREMENTS

The incorporation of the PMS into FMIS 2.0 results in slightly larger storage requirements than the original system. The initial FMIS program without data files was approximately 1.04 MB and could be stored on a single high density 5 1/4" floppy disk. Version 2.0 at 1.42 MB requires two 5 1/4" high density disks or a single 1.44 MB high density 3 1/2" disk. A copy of the original system disk should always be kept in a safe place in case system restoration is required. Hard
disk requirements for the entire application, including dBASE program and data file storage, still require a minimum of approximately 10 MB.

C. OPERATION

Once the FMIS program is started in the normal manner, the "Welcome Screen" will appear. The screen should be identical to that shown in Figure E.1. If there is a discrepancy, the user should check to ensure version 2.0 is the current program being executed.

![Welcome to the Administrative Science Dept's Financial Management Information System - FMIS - Ver. 2.0](image)

**Figure E.1** FMIS 2.0 Introduction Screen

D. MAIN MENU

The only noticeable change to the main menu is the addition of the PROPERTY module located to the right of the TRAVEL option (see Figure E.2). Access the desired option
Select desired property module option.

Figure E.2 Main Menu / Property Pop-Up Menu

by pressing the left or right arrow keys. As each successive module is highlighted the associated pop-up menu will appear.

E. THE PROPERTY MODULE

The PROPERTY module is used for management and tracking of accountable minor and plant property assigned in the A.S. Department. It provides a method to maintain an active database of the tagged property item’s assigned custodian, location, cost data, classification information, and historical data. Selections included in the PROPERTY pop-up menu allow for the entry of new records, specific record editing or viewing, deletion of marked records, and report printing. The PROPERTY module links to the PERSONNEL module for retrieval of current custodian information.
1. Add New Property Item

To add a new property record, select "Add New Property Item" from the PROPERTY menu. To execute this option use the arrow keys to move the highlight to this choice and press <Enter>. Choosing this selection will clear the current screen and a formatted data entry screen (Figure E.3) will appear. The screen should display an empty record with the cursor in the Tag Number field. Each property record input form consists of two pages. Check the upper left corner to verify that you are on page one. Several fields have unique features which will be explained below. Note, fields accepting data entry are colored blue, Gray fields only display information and do not require entry.

![Property Screen, Page One](image-url)
a. Entry Screen Page One

Enter the Tag Number of the new property item to be tracked. The system will verify the entry to ensure that you are not entering a number already assigned to another piece of property, sounding a beep and displaying a message to enter a new number if this occurs. The field will automatically right justify the number so you may enter it without the leading zeros.

Enter the two character personnel ID in the Custodian ID field. The entry will be validated against personnel codes in the personnel file. If a valid code was entered, the corresponding name will automatically appear in the adjacent display field. If an invalid code was entered the system will beep and an error message requesting you try again will appear.

The "I-" appears in the location box as a default since most A.S. department property will be located in Ingersoll Hall. Simply fill in the room number, or if desired the building character can be overwritten. A default value of "0" appears in the ADP Code field for non-ADP property, it can be written over if an ADP code (1-5) is desired. Numbers greater than "5" are invalid and will not be accepted. The Property Type field will have a default value of "M" for minor property. The Item Disposed Of field will default to "N" (no). Until this is changed to "Y", the Disposal Date field will be bypassed.
Upon pressing the \texttt{<Tab>} or \texttt{<Enter>} keys at the Remarks field the screen will advance to page two of the entry form. The \texttt{<PgDn>} key can also be used to advance to page two.

\textbf{b. Entry Screen Page Two}

The second page of the entry screen (Figure E.4) is used to enter historical tracking data for the tagged property item. When adding a new property item no operator entry is necessary. The system will automatically fill the first custodian, first location, and first date fields by copying the related data entered by the operator on the first page. Current data from the first screen is shown in flashing fields to verify the entries in the historical fields.

\includegraphics[width=\textwidth]{property_screen_page_two.png}
\caption{Property Screen Page Two}
\end{figure}
To enter another new record press <PgDn> to obtain a clear screen. To save newly entered records and return to the Main Menu press the <Ctrl><End> keys simultaneously. Pressing the <Esc> key will abandon the new record and return to the Main Menu without saving it.

2. View/Edit Tagged Item

To view or edit a specific tagged property item choose this option from the Property pop-up menu. Once this selection is made, the search screen shown in Figure E.5 will be displayed. This screen queries the user to input the Tag Number of the desired property record to be viewed or edited. The entered number will be justified to the right, so the user doesn't need to input the leading zeros. If a valid tag number (number corresponding to an existing record) is entered

![Property Record Search Screen](image)

Figure E.6  Property Record Search Screen
the system will go directly to that record and display it's data. If the tag number is not valid, a message will appear asking the user to try again. Pressing the <Enter> key with no input will cause the system to display the property record with the lowest value tag number.

The Enter/Edit screens shown previously in Figures E.3 and E.4 will display the requested record. The arrangement of the fields is designed to permit routine editing with a minimum of keystrokes. Normal change of custodian editing will consist of entering modifications in the Custodian ID, Location, and Date Assigned fields all located above the dotted line on the edit screen. When changing custodian information be sure to advance to page two and update the historical data by filling in the next available line with the information supplied in the flashing display fields. Editing can be aborted with no changes to the original record data by pressing <Esc> before advancing to the next record (advancing to the next record using PgDn will save changes). To save changes and return to the main menu press <Ctrl><End>. New records may not be added from any edit screen in the system.

Deleting a property record follows the same procedures used to delete records in other FMIS modules. If you are displaying the record you wish to delete, press <Ctrl><U> to mark the record. Marking does not interfere with further viewing or editing operations. Pressing <Ctrl><End> saves the deletion mark as well as any editing changes. Returning to
the marked record and pressing <Ctrl><U> again will unmark the record. A marked record is not actually deleted until the "Remove Marked Items" option is chosen from the Property pop-up menu.

3. Remove Marked Items

This selection in the pop-up menu performs the final record deletion. After completing this option, the marked record(s) will be permanently removed from the database. Extreme care should be taken when deleting records. Since the system was designed to maintain property records even after disposal, record deletions will not be performed routinely. After a record deletion the screen will scroll various file specifications as the system automatically re-sorts and indexes the database. Once this is complete the system will return to the main menu.

4. Choose Report to Print

When highlighting this option and pressing <Enter> a pull-down menu (Figure E.6) will appear offering a choice of the six various reports described below. To choose one, simply highlight the desired report and <Enter>. This will invoke a final menu (Figure E.7) allowing the user to direct the output to the screen console, a printer (LPT1 or 2), or to a file. The normal choice will usually be the LPT1 printer port to produce a hard copy. To move back up the menu hierarchy to the Main Menu press <Esc>.
Select Property Report for printing.

Figure E.7 Report Destination Menu
a. *Custody Log*

This general purpose report lists all current tagged property in the A.S. department, sorted in alphabetical order by the property custodian's last name and ID code. A cost subtotal for all property assigned to each custodian is provided. A grand total of all tagged property tracked in the system is provided as well, with the exception of disposed property which is not reflected in this report.

b. *Disposal Report*

The Disposal Report lists all recorded disposed of property. These items are grouped by ADP code (0-5), with a subtotal for each disposed ADP group. A grand total is computed for all disposed of property.

c. *History Report*

This report lists historical custodian, location, and possession dates for each property item in tag number sequence.

d. *Locatic Report*

This report provides the same basic information as the custody log. However, current property items are grouped by location with custodians subgrouped within each location. Subtotals are provided for each location and a grand total for all current tagged items.

e. *Minor Property Inventory*

All current minor property is listed in tag number sequence along with the current custodian, location, and
latest inventory date. A handy block for writing dates and initials makes this report useful when conducting visual inventories.

f. **Plant Property Inventory**

This report is identical to the previous one except that it lists only current plant property items.

F. **TOOLS AND OTHER FMIS FUNCTIONS**

Operation of the tool utilities and other module functions provided by FMIS 2.0 are identical to the original FMIS. If a review of any of these procedures is necessary, refer to the original FMIS user's guide provided as Appendix D in Reference 4.
