Preface

The purpose of this study was to evaluate corrective action team (CAT) leader training, a group problem solving and team dynamics course offered as part of the growing quality initiatives at Aeronautical Systems Division (ASD). I chose the subject because I believe in the idea of providing the worker with tools that improve their effectiveness both in and out of the work environment. Since I was planning on spending the next ten months of my life on a research project, I thought it important to find a relevant subject where I could make an immediate contribution. Evaluating CAT leader training met my requirements.

In the course of the research I was involved in several different training classes and reviewed the responses of over 200 course graduates. I found each class to be a unique group of professionals consisting of employees with an honest desire to improve themselves and the organization. An impressive fifty-seven percent of the graduates surveyed took time from their schedules to respond to the questionnaire showing a true desire to improve the training provided by the Total Quality office. Many graduates provided excellent comments regarding the training.

This thesis was a team effort and would not have been possible without the help of many. I would like to thank the ASD Total Quality Office for all their support, time,
and effort both for this research and the culture change they are facilitating at ASD. Especially helpful were Dale, Betty, KeeKee, and Maybelle.

I appreciate the guidance of Lt Col Art Rastetter, my advisor, who believed in the research and made room for me in his busy schedule as a director of logistics for a major program office. More than once, he scoured his own library to find information helpful for this research and provided continual encouragement and advice throughout the effort. Thanks also to Dr. Guy Shane from AFIT's Department of Communication and Organizational Sciences. As a true expert on research, he made numerous contributions through his review of many drafts and revisions.

On a personal note, I would like to thank my future wife Mary, who endured both the AFIT program and often a stressed-out fiance over the past fifteen months. She was always encouraging and has taken on the majority of the wedding plans to free up my time for school. I cannot imagine a bigger supporter or a finer mate.

Final thanks go to the God who rules my life. To him who is able to keep you from falling and to present you before his glorious presence without fault and with great joy-- to the only God our Savior be glory, majesty, power and authority, through Jesus Christ our Lord, before all ages, now and forevermore! Amen. (Jude 24,25)

Abstract

This study evaluated corrective action team (CAT) leader training, a team dynamics and group problem solving course provided by an Air Force product division. A pre/post knowledge test, using developed behavioral objectives, was administered to 61 participants as part of an internal evaluation while 373 past participants were provided a questionnaire for a field evaluation.

Results from the internal evaluation indicated that students learned the majority of training material presented in the course. Self-efficacy increased in most cases showing an improved self-perception regarding the ability to perform training related tasks. Predictors for a pre-test score model were identified, but overall provided limited explanatory power to predict a student's pre-score.

The field evaluation showed that the majority of graduates, 152 out of 208 (73%), do not function as CAT leaders. Those who do lead CATs, are assigned an issue within three months of training and consider the issues worked relevant to a group problem solving approach. Half of the ten tools and techniques taught in training were used by the majority of graduates, while the other half saw little use. All are perceived as having at least some degree of usefulness by the majority of respondents.
EVALUATION OF CORRECTIVE ACTION TEAM (CAT) LEADER TRAINING IN AERONAUTICAL SYSTEMS DIVISION

I. Introduction

General Issue

Aeronautical Systems Division (ASD) leadership has embraced the concept of Total Quality Management (TQM) for the organization (Roth, et al., 1990:iii,2). The corrective action team (CAT) is one initiative that encourages employee involvement in TQM. CATs are formed on an as needed basis to look into improvement opportunities in the work environment (ASD/TQ, undated:3). As problems are identified in an organization, management can use a pool of trained CAT leaders to facilitate problem resolution by collecting and working with a team of people involved in the process.

Training for CATs is provided to the CAT leader and involves a four day off-site seminar program in group problem solving and team dynamics (ASD/TQ, undated:3). This training program and the associated resources for the four day seminar represent a serious commitment from management to provide employees of ASD with the tools to effectively solve problems at their level.

Currently, over 1,600 people or 15% of the ASD population is involved in some form of quality related team (Roth, et al., 1990:11). ASD's ultimate goal is increasing
the "empowerment, involvement, effectiveness, and productivity of all employees." (Roth, et al., 1990:12) CAT leader training is recognized as one of the methods to accomplish this.

To work toward that end, this study was proposed and accomplished to identify the effectiveness of the current CAT leader course, and propose improvements for the future. As with any training program, the key to effective implementation is a continual evaluation of the product to ensure it is accomplishing its objective (Gagne and Briggs, 1979:36-38).

Specific Problem

Nineteen ASD CAT Leader training sessions have been held involving over 440 participants. To date, there has been no formal review of the program. This deficiency was noted in a recent evaluation of their Total Quality program by the Federal Quality Institute when ASD competed for the Quality Improvement Prototype (QIP) Award. The report identified "little evidence of evaluations done on effectiveness of training programs" (Franke, 1990). In addition to this report, Lieutenant General Thomas R. Ferguson, the Commander of ASD, has placed a strong emphasis on the development of metrics both in the area of quality initiative results and the organizational effects of quality training and programs (Roth et al., 1990:5).
Both the need for training evaluation and the development of quality related metrics are addressed by this study. It provides a beginning for a comprehensive evaluation of the training program that includes both an internal and field evaluation. In addition, it provides a set of measurements that identify the current status of CAT training and implementation and lays the groundwork for future longitudinal studies on those same areas. The specific objectives that describe the research accomplished are identified below.

**Research Objectives**

This research had six major objectives designed to improve the quality and effectiveness of the CAT leader training program. These six objectives were:

1. Identify and document the specific material provided as part of the current course curriculum.

2. Determine if the CAT leader training course facilitates learning of the course material and improves a trainee's self-efficacy regarding application of course material.

3. Determine the characteristics of current corrective action teams and the involvement of graduates.

4. Identify the level of self-efficacy of past attendees regarding application of course material.

5. Identify how past attendees perceive and apply the problem solving tools and techniques provided in the course.

6. Based on the above objectives, provide the Commander of ASD with recommendations for improvements to the current CAT leader training curriculum.

These objectives provide a guideline for the research and determine the scope of the work proposed. To further
define research requirements and reach the above objectives, more specific research questions are proposed.

**Investigative Research Questions**

The investigative research questions provided the specific guidelines for the research and represented a more detailed breakdown of the research objectives identified above. Each is individually addressed in the presentation and discussion of results chapter of the paper. The investigative questions include:

1. Is the basic curriculum described by the information in the CAT leader notebook taught by all course facilitators?

2. Does CAT leader training improve the knowledge of participants in each of the training blocks presented?

3. Are the following antecedent variables significant predictors of a student's performance in the knowledge pre-test (Y)?
   
   - X1. Involvement in previous CATs (Experience)
   - X2. Previous problem solving/team dynamics training (Training)
   - X3. Education Level (Education)

4. Is there an overall increase in self-efficacy in the application of course material as a result of attending CAT leader training?

5. Are a significant number of CAT leaders assigned CAT issues within three month of training?

6. Are there a significant number of training participants becoming members of CATs?

7. Is there a noticeable decline in self-efficacy regarding application of training material as time since training increases?

8. Are problem solving tools and techniques being used in the organizational and CAT environments?
9. Are problem solving tools and techniques perceived as being used frequently in the CAT and organizational environment?

10. Are problem solving tools and techniques perceived as being useful tools for team problem solving?

11. Do a significant number of CAT leaders rate the use of a CAT as appropriate in addressing the CAT-related issues assigned?

Scope

This study was limited to evaluating CAT leader training in Aeronautical Systems Division. Conclusions drawn cannot be applied to other organizations. Review of the current training program was specifically emphasized in the research with sources of information that included the CAT leader notebook (ASD/TQ, undated), the course syllabus, past course evaluation forms, and discussions with instructors.

Research consisted of three parts: development of objectives, a pre/post knowledge test administered during the course and a field questionnaire for past participants. The purpose of developing course objectives was primarily to formalize the current desired behavioral outcomes of the training rather than to evaluate the syllabus currently in place. This resulted in observations regarding material in the course curriculum, but did not involve discussing what should be in a course for CAT leaders.

Knowledge testing accomplished during the training as part of this project focused primarily on the knowledge and comprehension levels of learning in the cognitive domain.
(Bloom, et al., 1971). Research into higher levels of learning such as analysis, synthesis and evaluation is reserved for follow-on projects.

The field questionnaire solicited feedback on the use of CAT leader course material and the current conditions and procedures of CATs in ASD. Of major interest was the applicability and use of the problem solving tools and techniques currently part of the course curriculum. The majority of the participants were from Aeronautical Systems Division with other participants representing Air Force Systems Command, Air Force Logistics Command, and Defense Electronic Systems Center. While over 400 individuals have received CAT leader training, the field research only dealt with those 373 Air Force personnel who report to the commander of ASD, whose organization sponsors the training. This simplified the research, since coordination with other Air Force organizations was not required to gather data.

**Summary**

This research was only the first step in evaluating CAT leader training and hopefully provides a basis for more in-depth study to improve the course curriculum and ultimately its effect on the organization.

The following chapter provides background to TQ and CAT leader training in Aeronautical Systems Division. Chapter 3 provides a literature review associated with learning theories and training program evaluation. Chapter 4
describes the research methodology used. Chapter 5 then discusses the results of the evaluation that lead to conclusions and recommendations provided in Chapter 6.
II. Background

Introduction

This chapter provides the background of CAT leader training. While the training is applicable to many organizational situations, its primary emphasis has been for use in the organizational total quality structure. A brief discussion of that structure follows, along with information on the development, format, and content of the course itself.

Total Quality in Aeronautical Systems Division

Aeronautical Systems Division (ASD) leadership has embraced the concept of Total Quality Management (TQM) for the organization (Roth, et al., 1990:iii,2). The ASD definition of Total Quality Management was identified in an executive off-site in 1988 as:

A leadership philosophy that creates a working environment which promotes trust, teamwork, and the quest for continual improvement. (Roth, et al., 1990:1)

As a result of this definition and the vision that ASD would strive to remain "the center of excellence for research, development and acquisition of aerospace systems," (Roth, 1990:1) ASD developed a set of TQ principles to describe how it will operate to encourage a TQ environment (Roth, et al., 1990:2). These principles include:

1. Know and satisfy the customers' needs.

2. Delegate responsibility and authority - accept accountability.
3. Give EVERYONE a stake in the outcome.

4. Set goals, compete, measure progress, and reward.

5. Create a climate of pride, professionalism, excellence, and trust.

6. Strive for continuous improvement - Make It Better! (Ridgely, undated:6)

To facilitate incorporating these principles into the ASD organizational culture a TQ structure was created in each reporting organization. Over the next two years, ASD senior leadership focused their efforts on several key issues to improve the quality culture. These included emphasis on the following areas: quality environment, quality measurement, quality improvement planning, employee involvement, employee training and recognition, quality assurance, and customer focus (Roth, et al., 1990:1-17).

Progress in the Total Quality program in ASD prompted management to submit an application and be selected as one of ten finalists for the 1991 Quality Improvement Prototype (QIP) Award (Franke, 1990). The structure for the TQ organization established is described below.

Organizational TQ Structure

Within each reporting organization in ASD, a TQ structure has been developed to facilitate the incorporation of the quality principles discussed above into the organizational culture (Ridgely, undated:12). These organizations mainly consist of system program offices (SPOs) that manage a particular weapon system, functional
deputies that provide matrix support to SPOs, research and development laboratories and a flight test wing. Each organization has the same general total quality management structure as shown in Figure 1 and defined below:

![Diagram of TQ Structure in ASD](image)

Figure 1. Generic TQ Structure in ASD (Roth, et al., 1990:3; Ridgely, undated:12)

**The Executive Steering Committee (ESC).** The Executive Steering Committee (ESC) consists primarily of the organization's main leaders and develops the policy and strategic plans regarding TQ. It establishes the organization's vision, goals, and objectives and oversees TQ by providing resources and demonstrating management commitment (Roth, et al., 1990:4).
The TQ Team. The TQ Team is seen as the primary instrument in the TQ structure. It is made up of a cross section of organizational personnel and is responsible for designing, implementing and managing a system to facilitate solving organizational problems (Ridgely, undated:12). To accomplish this, four subsystems are normally implemented. These include the Education subcommittee to energize and educate the organization on Total Quality, the Search for Opportunities (SFO) subcommittee that focuses on generating employee-related ideas, the Corrective Action subcommittee that uses corrective action teams to solve problems identified by employees, and the Measurement subcommittee that measures progress in solutions and key objectives (Roth, et al., 1990:4).

The Corrective Action Team (CAT). In problem resolution, the corrective action team (CAT) is commissioned by the Corrective Action subcommittee or Executive Steering Committee to work specific problems. The team is comprised of individuals inside the organization who are knowledgeable about aspects related to the problem. The CAT is led by a CAT leader who has received specific training in group problem solving techniques and team dynamics via CAT leader training. Other team members receive no training, but look towards the CAT leader to teach the methodology needed to facilitate team effectiveness. The CAT is formed to address a specific problem, and after problem resolution, is disbanded. Once the CAT is dissolved, the CAT leader is
then available for reassignment to another issue (ASD/TQ, undated:3).

The Critical Process Team (CPT). The final team involved in the TQ structure is the critical process team (CPT), which is chartered by the ESC to investigate "high level, cross-organizational processes which have a critical impact on satisfying the customer's requirement." (Roth, et al., 1990:4) These teams are similar to CATs, except the issues addressed are more complex and the entire team receives problem solving training together (Ridgely, undated:14).

Search For Opportunity (SFO). The Search For Opportunity (SFO) is a method of encouraging participation by soliciting employee ideas and improvements through the formal TQ structure. The employee inputs are normally submitted on a form designed specifically by the organization and placed in accessible locations throughout the work area. A completed form receives prompt attention and is formally tracked to ensure a submitter's concerns, ideas or suggestions receive adequate consideration. SFOs fall into one of three types. These "types" of SFOs aid in tracking and assigning issues to the appropriate owners and organizations. The three types of SFOs include:

Type 1: The issue falls within the control of a single office that has the power to make changes, if appropriate.

Type 2: The issue may involve coordination by several offices in an organization and normally is a prime candidate for a corrective action team (CAT).
Type 3: The issue is beyond the scope of influence for an organization and is sent up to the ASD level (or higher) to be addressed. These SFOs are formally tracked by ASD/TQ. (ASD/TQ, undated:10)

The SFO is the basis of employee involvement in the TQ culture and is the first form of documentation that defines an issue. They often provide the rationale used to establish a CAT or CPT. Unlike a suggestion system, solutions are not a requirement when the SFO is submitted (Roth, et al, 1990).

Now that the TQ structure has been discussed, further detail on the specifics of CAT leader training are provided.

**CAT Leader Training**

Currently, training is accomplished monthly in a 4-day off-site seminar format that begins Tuesday morning and ends Friday afternoon. The overall objective involves developing CAT leaders who can successfully "lead a CAT through the problem solving process to implementation of a solution to an organizational issue." (ASD/TQ, undated:Tab) Specific course objectives currently include training a CAT leader:

1. To be able to organize a corrective action team and manage the group dynamics so that the CAT develops into and remains an effective, functioning team.

2. To be able to explain the TQ structure and philosophy to individual members and how the CAT fits into the overall TQ process.

3. To be able to teach the problem solving methodology and the appropriate tools and techniques to CAT members so that they are able to effectively use them in the problem solving process. (ASD/TQ, undated:Tab)
As noted by the above three objectives, CAT leader training focuses on three key issues: group or team dynamics, the TQ structure and philosophy, and the problem solving process.

**Background and Transition to Internal Training.** The majority of ASD's transition to a TQ-focused culture was facilitated by the Cumberland Group, a former subsidiary of AARMC0 Steel that formed their own TQ consulting company. Initially Cumberland accomplished all TQ-related training for ASD through a support contract (ASD/TQ, undated:1). Early on, a plan to transition the education and training responsibility from Cumberland to ASD was developed to establish an eventual ASD self-contained training program that encouraged a TQM culture working for constant improvement.

CAT leader training was the first training program scheduled to be completely supported by ASD personnel, which included a group of specially trained facilitators for the program.

**Course Facilitators.** With the plan to transition the CAT leader training responsibilities in 1989 from Cumberland to ASD, an organization-wide request for facilitator volunteers was conducted. Those individuals interested in becoming a facilitator required the approval of their management to submit an application. Twelve part-time CAT leader course facilitators were chosen in ASD and in July of
1989 attended a 1 week off-site dry run for the pilot program (Ball, 1991).

On September 1 of 1989, the first ASD sponsored CAT leader training was conducted. The exclusive use of part-time facilitators was continued until April of 1990 when full-time coordinators were added to the ASD Commander's Office for Total Quality (ASD/TQ) staff (Ball, 1991). In addition to working with part-time facilitators on CAT leader training, these full-time facilitators also conducted other TQ related training, served as a facilitator resource for individual ASD organizations, and supported various management functions on quality at the ASD level.

As of February 1991, five of the 12 original part-time facilitators were still involved in CAT leader training. Two have become full-time facilitators for ASD and continue with their involvement in the training.

New facilitators are introduced to the training by attending the CAT leader course as a student and then at least once as an observer. Once the new facilitator feels thoroughly comfortable with the material and the presentations, he/she may start leading course discussions. The materials provided to facilitators for class preparation include: an instructor's notebook (developed by the Cumberland Group), a CAT leader course notebook provided to all participants, and various material associated with training exercises. Additional support for new personnel is provided by current course instructors and a Cumberland
Group facilitator training course that is included in its current support contract with ASD (Wissman, 1991).

**Course Administration.** A CAT leader training course is normally scheduled several months in advance by the ASD Commander's Office for Total Quality and follows the format provided by the syllabus in Appendix A. Each course averages approximately 19 attendees and is facilitated by two to three instructors with course experience. Normally two facilitators are assigned to each course, but others may be added to account for previous scheduling conflicts, new instructors, or group size.

The facilitator team meets prior to the course and agrees on team norms which define roles, responsibilities and procedures for the course. Team norms often include allocation of facilitator duties and briefing responsibilities, selection of specific problem exercise examples to reinforce course topics and determining meeting times to discuss possible schedule changes.

A syllabus defines the course material, but facilitator teams have a large amount of flexibility to tailor the training material for each course offering. Several team exercises are available for use during the training to emphasize important topics and provide hands-on reinforcement of training concepts.

**Course Content.** The course runs for four consecutive days and covers six different training blocks that are identified in Figure 2. They include an overview of TQM,
effects of personal values, group dynamics, the problem solving process, problem solving tools and techniques and meeting effectiveness. This curriculum is designed to accomplish the 3 terminal objectives identified at the beginning of this section.

1. Overview of Total Quality Management (TQM)
2. Effects of Personal Values
3. Group Dynamics
4. The Problem Solving Process
5. Problem Solving Tools and Techniques
6. Meeting Effectiveness

Figure 2. CAT Leader Training Blocks (ASD/TQ, undated)

Exercises and videos are also an important part of the curriculum and are used after many presentations to reinforce the topics discussed. Often the exercises involve small teams of participants getting together to practice techniques by working a realistic problem scenario.

The last day of the course involves a large exercise where three to four teams are provided a problem that involves reduced attendance to the base cafeteria. Each group is encouraged to use the material learned during the week to make recommendations to management. Facilitators take on several roles during the exercise to provide information to the teams and then represent management during the out brief. Feedback is provided to all groups.
with the use of material being emphasized rather than the final conclusions.

**Current Status.** CAT leader training has now been taught by an ASD cadre to over 440 personnel in 23 different course offerings. As of 1990, more than 160 quality related teams including CATs, CPTs, and TQ Teams have been functioning in ASD (Roth, et al., 1990:11). To date, there has been no formal evaluation of the course to assess its effectiveness in ASD. As noted earlier, ASD was selected as one of ten finalists for the 1991 Quality Improvement Prototype (QIP) Award. One area of needed improvement noted by the Federal Quality Institute, who judged the QIP competition, regarded the evaluation of training effectiveness. As a result of this finding, and Lieutenant General Ferguson's desire to identify metrics for evaluating TQ effectiveness in ASD, the Commander's Office for Total Quality agreed to sponsor this research. This research, along with the course evaluations that have been utilized throughout the training program should provide an avenue for assessing training effectiveness and improving the current course.

**Summary**

ASD Total Quality structure and CAT leader training specifics were discussed to familiarize the reader with the research topic. Discussion of the current status of the CAT leader course identified the level of training accomplished
to date and provided a background and rationale for this effort. Chapter 3 follows with a background discussion on learning and evaluating training programs.
III. Literature Review

Introduction

The literature on learning, behavior, instructional theory and training evaluation is extensive and cannot possibly be covered in this brief review. However, relevant highlights to key theories will provide a background and summary of important concepts of the research that dictated the approach taken in the effort.

Theories of learning and how learning is evaluated and applied will provide a basis for the discussion of the instructional system design and the systems approach to training. Training evaluation will be specifically emphasized because of the research focus as will the use of research design in course evaluation.

General Theories of Learning

The desired learning outcome is often to invoke a relatively permanent change in behavior that results from experience (Daft and Steers, 1986:48). While the behavior change is a central issue, both the behavioral and cognitive aspects of learning provide for a more complete definition and theory foundation (AFM 50:62, 1984:2-1; Luthans, 1979:100-101). Luthans identifies an expanded concept of learning as follows:

1. Learning involves a change, though not necessarily an improvement, in behavior.

2. The change in behavior must be relatively permanent in order to be considered learning.
3. Some form of practice or experience is necessary for learning to occur.

4. Finally it should be stressed that the practice or experience must be reinforced in some way in order for learning to occur. (Luthans, 1977:281)

Daft and Steers provide a brief review of the three theories identified as fundamental to learning and related to the four points identified above. These are: 1) classical conditioning; 2) operant conditioning; and 3) cognitive learning theory. Both classical and operant conditioning focus on a stimulus response condition in the learning process (Daft and Steers, 1987:49) which places a significant emphasis on the manipulation of the environment to promote learning. Cognitive theory focuses not on environment, but on how a learner "remembers and retrieves information from memory." (Richey, 1986:65) The three theories are summarized below.

Classical Conditioning Theory. Classical conditioning theory originates from the Russian physiologist Pavlov's experiments with dogs. In Pavlov's famous experiments, dogs were taught to salivate at the sound of a bell. In this case, a link between a conditioned stimulus (a bell) and an unconditioned stimulus (meat) was reinforced by introducing both stimuli simultaneously. Since a dog's natural response is to salivate at the sight of meat it represented no learned behavior; however, repeated linking of the bell and meat resulted in the dog salivating at the sound of the bell even when the meat was absent. In this case, Pavlov
concluded that learning had occurred because the dog now associated two normally unrelated objects (Daft and Steers, 1986:50).

**Operant Conditioning Theory.** Skinner in his article Operant Behavior (1963) introduces the concept of rewards into the realm of learning by noting that an organism is behaving a given way because it expects a given effect (503). His position is an extension of Thorndike's "law of effect" which introduced the principle that the effect of action itself causes future action to occur (Skinner, 1963:503). This "law" argues that behavior resulting in positive reinforcement will likely be repeated, and behavior with negative consequences will be avoided (Daft and Steers, 1986:51). In effect, learning occurs as a consequence of behavior (Luthans, 1977:284). Daft and Steers identify three important concepts of this model that must be present for it to apply:

1. **Drive:** A felt need exists and must be present before learning can take place.

2. **Habit:** The ability to develop an experienced bond or connection between stimulus and response.

3. **Reinforcement or reward:** The feedback or consequence individuals receive as a result of action. (Daft and Steers, 1986:51)

The drive and habit concepts are both considered part of the stimulus-response bond and the stronger each is, the stronger the motivation of the individual to respond in a certain way. Both classical and operant conditioning are considered behaviorist theories and are important in that
manipulating the environment is a key aspect of promoting learning (Fogg, 1990:19).

Cognitive Theory. Cognitive learning theorists contend that much learning does not involve the stimulus-response bond but is the result of acquisition, analysis and insight of known facts (that can include abstract concepts and generalizations) that allow more sophisticated learning to occur in the proper environment (Daft and Steers, 1986:52). Concepts such as expectancy, demand, and incentive are utilized as the cognitive model emphasizes the positive and free will aspects of humans (Luthans, 1977:100).

Luthan's statement itself identifies the contrast in the theories. While much of the research that deals with behavioral principles involves some use of animal research, cognitive theory has focused primarily on human subjects (Richey, 1986:65).

While the initial acceptance of cognitive theory was limited, it has recently received more attention. Richey (1986) identifies one major example by noting the increased attention given to instructional design. She also references the work of Gagne and White (1978) in identifying the role of cognitive theory as a key element of instruction leading to learning and a change in performance (66).

Evaluation of Learning

Although learning is not a directly observable phenomena (Daft and Steers, 1986:49), criterion standards
that allow you to measure the amount of learning that has occurred are necessary. The Taxonomy of Educational Objectives is a classification system of educational objectives that was developed to facilitate communication among researchers and others regarding objectives, test items, and test procedures (Bloom, et al., 1971:39).

The three specific taxonomies include cognitive, affective and psychomotor. Of specific importance in this research are the taxonomies regarding the cognitive and affective domains identified in Figures 3 and 4.

Figure 3. Bloom's Taxonomy of Educational Objectives (AFM 50-62, 1984:2)

The cognitive domain taxonomy was initially proposed by Bloom (1956) and involves intellectual responses of the learner and the level of mental activity regarding the learned material. The affective domain (Krathwohl, et al., 1964) involves more the internalization or level of acceptance of the learned material (Bloom et al., 1979:39; Knirk and Gustafson, 1986:80-81). The taxonomy levels
provide a hierarchical framework to the process where behaviors progressively get more complex, abstract and internalized (Bloom, et al., 1971:39).

Figure 4. Krathwohl's Taxonomy of Educational Objectives (AFM 50-62, 1984:2)

The use of these taxonomies allows a more universal means of measuring behavioral outcomes and determine the appropriate level of instruction for students (Knirk and Gustafson, 1986:82). This fact seems critical in considering the level and type of instruction students should receive and how to measure the impacts of that instruction.

Ultimately, the taxonomies provide a useful tool both to translate broadly stated objectives into operational terms and build items to measure "higher order mental processes or affective outcomes of instruction." (Bloom, et al., 1971:40)
Application of Learning

Even though the cognitive theory focuses on the internal processing that results in learning, both recognize the effects of learning on the environment. As a matter of fact, Skinner poses that the reason we are interested in behavior at all is because of those effects on the environment (Skinner, 1963:503). So, it is not exclusively the environment in which the learning occurs that matters, it is the environmental impact of the learned behavior. Thorndike's discussion of transferability from Crooks assessment of classroom evaluation practices (1988) states the point well:

The crucial indicator of a student's understanding of a concept, a principle, or a procedure is that he is able to apply it in circumstances that are different from those under which it was taught. Transferability is the key feature of meaningful learning. So if we are to test for understanding, we must test in circumstances which are at least part new. (Crooks, 1988:442-443)

Crooks points out above that a student's learning needs to be tied with the ability to transfer what is taught into a new environment. Several factors are important to the amount of transference that occurs and relate to the amount of learning made by the student. Three such factors are retention, self-efficacy, and attitudes.

Retention. Retention is seen as a principal effect of learning and is an important determinant of the amount of transfer that will eventually occur in a job situation (Goldstein, 1986:80). Goldstein identifies several effects
on the retention process that can effect transference in the area of personnel training:

1. The degree of original learning. Any effect that limits original learning will affect retention. These include whole vs part learning, massed vs spaced practice, overlearning, and knowledge of results.

2. Meaningfulness of the material. The more meaningful the material, the more it is retained.

3. The amount of interference. Both material learned before (proactive) and after (retroactive) can interfere with the recall of original material.

4. Motives, perceptions, and retention. Memory is often affected by our perceptions of events and the state of mind during the original occurrence.

(Goldstein, 1984:87-88)

Self-Efficacy. Bandura identifies self efficacy as a students' perception of his/her capability to perform courses of action with respect to a certain situation (Bandura, 1982:122). Crooks (1988) notes that perceptions of self-efficacy in an area have a high correlation with ultimate success in that area. Even with difficult tasks or encounters with failure, a higher self-efficacy often results in a stronger effort and a higher level of task success (Crooks, 1988:462).

Attitudes. The two classes of attitudes that relate to learning involve attitudes that relate to how readily an individual learns and attitudes that are established or changed as a result of learning (Gagne and Briggs, 1979:84-85). Since the philosophy of TQM involves a change in the organizational culture (Roth, et al., 1990:1), attitudes play an important part in TQM success. This is highlighted
by Gagne and Briggs' (1979) identification that values function to affect "approaching" or "avoiding" specific behaviors (85). One important result of this condition is that specific behavioral outcomes result from changes in attitudes.

The Learning Theory and Training Gap

The application of learning theory developed over the past decades would seem to support an efficient and effective transition to the modern training and instructional environment, but Goldstein (1984) along with others have found that the significant progress made in learning theory has focused in the laboratory environment making application difficult and slow (Goldstein, 1984:64). Three reasons specifically identified include:

1. The learning theorists have tended to focus on highly specific laboratory experimentation, which has made generalizations to field settings extremely difficult.

2. Until recently, the learning theorist has ignored the complex areas of human behavior. Thus there is relatively little information available on problem solving, perceptual motor learning, concept learning, and other topics directly relevant to the needs of the training specialist.

3. The training specialist often demands quick answers and ready solutions to complicated problems (McGehee and Thayer, 1961). When easy solutions are not immediately apparent, the practitioner often assumes that the learning theorist's entire program is irrelevant... [and]...ignores learning theory and contributes little information of his own. (Goldstein, 1984:64)
To deal with the transition from learning theory to training application the Instructional System Design was developed and is described below.

**Instructional System Design Theory**

In the realm of an instructional setting, objectives that define the level of learning desired are required to establish methods of measuring that learning. In discussing the learning environment, Goldstein (1984) referenced Gagne's paper *Military Training and Principles of Learning* (1962) noting that developed learning principles were "strikingly inadequate to handle the job of designing effective training situations" (p. 85). From this deficiency developed Gagne's instructional design theory.

Instructional design attempts to use knowledge from learning research and theory to develop an instructional system that "will optimize learning, retention, and transfer" (Goldstein, 1984:99). Below are summaries of the five categories of learning outcomes that form a basis for the objectives of instruction:

1. **Intellectual Skills.** The capabilities for making a human individual competent. It involves the knowledge of how to do something and draws on concepts, rules, and procedures. It is sometimes referred to as procedural knowledge.

2. **Verbal Information.** The "facts" that comprise much of the information passed on in an instructional environment. Alone they have little meaning, but they provide direction to learning and aid in the transfer of learning.
3. **Cognitive Strategies.** Describes the cognitive ability of individuals to know how and when to integrate intellectual skills and verbal information.

4. **Motor Skills.** Involves the physical act of human performance ranging from writing to steering an automobile.

5. **Attitudes.** Attitudes can often influence the choice of action of an individual. 
   
   (Gagne and Briggs, 1979:49-55; Goldstein, 1984:99)

To be effective, the objectives of instruction (that dictate the method) need to consider the different levels of learning outcomes identified above by breaking up a total task into distinct components that are defined by the five types of learning (Goldstein, 1984:65). A more effective transfer of learning from instructional setting to the work environment will result if tasks are broken out and properly defined and uniquely taught. In Gagne and Briggs' Principles of Instructional Design (1979), the use of the taxonomies developed by Bloom and Krathwohl described earlier are referenced as useful tools for this purpose.

Integrating the tasks required of a particular job only covers one aspect of the training environment. Gagne and Briggs (1979) also identify design instruction as part of the effort to emphasize learning outcomes as the goals of an instructional system and bring a knowledge of the learning process to bear on the design of instruction. This concept is known as the systems approach.

**The Systems Approach.** A systems approach to training instruction is identified as the most effective method for training development and evaluation (Goldstein, 1974:17;
Ford and Wroten, 1984:651; Carnevale and Schultz, 1990:S-16) and involves the integration of organizational goals and training objectives. Essentially, the entire training program is an instructional system driven by the assessment of an instructional need within the organization. This need is then used to identify behavioral objectives that emphasize matching "training environments to required behaviors." (Goldstein, 1974:22)

**Instructional Systems Development Process.** The Instructional Systems Development (ISD) Process defines a specific systems approach to training development that includes evaluation. Gagne and Briggs (1979) define the ISD process as a series of iterative and cyclical stages that define an instructional system first at the system level, then course level, and finally lesson level (20-23).

Its structured methodology makes it well suited for Air Force use. Air Force requirements for an instructional system to equip members to perform a wide variety of jobs led to the development of its first major instructional system in 1965. The evolution of that system which covers a broad range of students, course lengths and subjects has produced the Air Force ISD model. Demonstrated gains in the efficiency of instruction that have resulted from this model has led to Air Force policy that directs the use of the ISD process (AFM 50-2:4).

**The USAF ISD Model.** The Air Force defines the ISD process as A deliberate and orderly, but flexible, process
for planning and developing instructional programs which ensure that personnel are taught in a cost effective way the knowledges, skills, and attitudes essential for job performance (AFM 50-2:74). This process is implemented in the form of a five step model identified in Figure 5 that includes the following areas:

1. Analyze System Requirements. Involves determining what the skilled performer does while doing the job, how well he or she must do it, and under what conditions.

2. Define Education/Training Requirements. Determining if instruction is needed and, if so, determining what instruction to give the untrained personnel so they can do the job well.

3. Develop Objectives and Tests. Involves expressing instructional needs as specific objectives and devising test items for objectives to determine if they are met.

4. Plan, Develop, and Validate Instruction. Includes the selection of media and methods, and also developing validating and revising the instructional materials.

5. Conduct and Evaluate Instruction. Actually conducting the instruction and then evaluating the program by measuring the student's ability to accomplish the above test items. (AFP 50-58, 1978:1-5)

**ISD Model Application to CAT Leader Training.** Research into the history of CAT leader training has not indicated a comprehensive systems approach in the course development—which would include plans for evaluation. However, although no complete instructional system was initially set up, the established curriculum and syllabus allow the use of the ISD model in CAT leader training evaluation and improvement.

As noted earlier, specific behavioral objectives (system requirements) were identified relating to the
transfer of learning to the organization (ASD/TQ, undated: Tab), these system requirements led to a course notebook and syllabus (training requirements) that have been established and implemented. This study constitutes addressing the final three steps in the ISD process that include testing, validating and evaluating instruction.

In chapter 1, the research scope was identified to include mainly evaluation of the current syllabus. Specific emphasis regarding analyzing system requirements (step 1), and defining training requirements (step 2) are left for future efforts. This leads to course evaluation being the
primary issue of this paper. The next section provides more background relating to this requirement.

Training Evaluation

This section considers issues related to the evaluation of a training program. The following paragraphs identify several underlying issues that relate to training evaluation and are designed to provide a general overview of evaluation approaches. Goldstein (1984) was found to provide the most comprehensive view of training evaluation found and is a highly encouraged reference for work in this area.

The Need for Training Evaluation. Training evaluation is an issue that is highly encouraged by most organizations, but seems to draw very little support in application. (Bunker and Cohen, 1988:4; Fisher and Weinberg, 1988:73). Reasons to evaluate are overshadowed by the many reasons given not to evaluate, or at least to do a cursory job. These reasons often include the fact that programs were developed by experts (Bell and Kerr:70; Bunker and Cohen, 1988:4), that good evaluation is too expensive (Zenger and Hargis, 1982:10; Bunker and Cohen, 1988:73; Fisher and Weinberg, 1988:73) or significant findings will not result (Arvey, et al., 1985:494). Unfortunately several sources identified fear of negative findings as another main reason for lack of evaluation (Bunker and Cohen, 1988:4; Fisher and Weinberg, 1988:73).
The perceived drawbacks to an evaluation program need to be examined with respect to advantages. The need to justify productive training as well as reduce the amount of ineffective training provides a strong basis to support evaluation (Zenger and Hargis, 1982:11; Bell and Kerr, 1987:70; Bunker and Cohen, 1988:5; Fisher and Weinberg, 1988:73) as does the emphasis on evaluation in the development of instructional systems and the systems approach to training (Goldstein, 1984; Gagne and Briggs, 1987).

Along with the justification for evaluation is the identified availability of standard research methodology that allows for meaningful evaluation of programs (Zenger and Hargis, 1982:11; Zammit, 1987:262; Bunker and Cohen, 1988:4).

**Summative vs Formative Evaluation.** Often when evaluation is considered, the focus is on an established system and just looking at the results it produces. Evaluation involves much more. To be comprehensive, evaluation must include the learner, the teacher, and the instructional design used to both develop and run the course (Knirk and Gustafson, 1986:215).

Formative evaluation focuses on the development of the course and then on improvements. It often is used to determine if the training program is operating as designed (Goldstein, 1984:148). Summative evaluation, on the other hand, involves the appraisal of an established program.
through investigating the effectiveness of instruction. Ideally, the use of both evaluations on a program would provide a good evaluation format. A formative evaluation would look at how close the program being implemented is to its design, and it would also investigate areas of improvement in instructional design. This would provide a firm basis for a summative evaluation to determine if stated course objectives are met.

In the summative area, several levels of criteria for evaluation are identified and are useful in defining the level of detail regarding training effectiveness and transfer. These four levels are defined below.

Kirkpatrick's Four Levels of Criteria for Evaluation. This model is used extensively by authors when considering evaluating training programs (Goldstein, 1974; Kirkpatrick, 1978; Ford and Wroten, 1984; Carnevale and Schultz, 1990). Kirkpatrick's four levels of criteria for evaluation include reaction, learning, behavior and results. Weeks (1986) provides a good summary of the criteria:

1. Reaction. Measures the degree to which people are satisfied with the training program. It often provides feedback on how course content, methodology, materials and instructors were received by participants, but does not measure learning (emphasis added).

2. Learning. Involves assessing whether or not trainees have acquired any new knowledges, skills or abilities during the classroom experience.

3. Behavior. Involves a measurement of a trainees performance at a job site. It attempts to identify and document changes in behavior which can be attributed or related to training experiences.
4. Results. Involves measuring the impact of training activities to results regarding organizational goals and changes. (Weeks, 1986:22-23)

As indicated earlier, the ultimate issue involves the transference of learned behavior from the classroom to the work environment. Although the desired evaluation to measure effectiveness would continually point towards Kirkpatrick's Level 4 evaluation criteria (Results), that summative level of assessment is relatively difficult to obtain. The result is a reliance on the lower levels of evaluation that are easier to develop and implement, but provide less information (Weeks, 1986:23).

Goldstein identified a Catalanello and Kirkpatrick study which found that out of 154 companies surveyed, 77 percent stressed evaluation studies related to reactions (Goldstein, 1974:61). Prior to this research effort, CAT leader training fell into this category of evaluation since the only substantive evaluation involved review of critique forms provided at the end of the course.

Part of the problem for the reaction level emphasis is the level of difficulty in higher level assessments and the large number of factors beyond classroom training that affect both job performance and organizational results (Weeks, 1986:23).

Research design is a major issue that relates to many of the factors that can confound an evaluation. The selection of a design and methodology and the implementation of the research provide a means to effectively meet
evaluation objectives of time, money, and information. The next section discusses the use of a research design in training evaluation.

Research Design

Research design discussions were prominent in training evaluation literature (Goldstein, 1974; Bunker, 1978; Kirkpatrick, 1978; Zenger and Hargis, 1982; Zammit, 1987; Carnevale and Schultz, 1990). Almost all discussions involved the use of designs proposed by Campbell and Stanley (1963). These include pre-experimental designs, true experimental designs, and quasi-experimental designs. The use of pre- and post-testing was also highly recommended for evaluating learning in a training program, as was the use of control groups (Goldstein, 1974; Bunker and Cohen, 1978; Zenger and Hargis, 1982; Kirkpatrick, 1978; Carnevale and Schultz, 1990).

Research rigor does come at a cost, and requirements or resources must be considered when reviewing possible evaluation approaches. No more rigorous design should be used than required (Kirkpatrick, 1978; Carnevale and Schultz, 1990).

Often a main criticism of research deals with the issue of validity. In Mitchell's article An Evaluation of the Validity of Correlational Research Conducted in Organizations (1985), one anonymous respondent to a Campbell, Daft, and Hulin paper (1982) was quoted describing
the major concern of using very powerful and computer-related statistical techniques to draw conclusions from questionable measurement instruments (Mitchell, 1985:192). Clearly, any research conclusions need to be considered with respect to the validity of the instruments and research methods.

**Internal/External Validity.** Evaluation is mainly directed at two specific issues: internal and external validity. Internal validity involves the degree of in-class learning that results from training and external validity involves the accuracy of applying training behavior to actual on-the-job performance (Bunker and Cohen, 1978).

**Content Validity.** Content validity refers to the applicability of training related criteria to on-the-job application and addresses some aspects of external validity.

A quantitative approach to assess job-relatedness was developed by Lawshe (1975) and involved measuring the content validity of individual test items of a selection test by having "subject experts" rate each test item as it was applicable to a specific job.

The Content Validity Ratio (CVR) rates training specific knowledges, skills, abilities and other personal characteristics (KSAOs) as having job application. The usefulness of this approach involves two assumptions. The first assumption is if more than 50% of the "subject experts" rate a particular KSAO as important, it has some degree of job relatedness. The second assumption is that
the more experts who rate it as important, the greater
degree of content validity (Lawshe, 1975; Ford and Wroten,
1984).

The following formula describes the linear
transformation that defines the CVR:

\[
CVR = \frac{N_f - N_i}{N_f}
\]

Where \( N_i \) is the number experts who rate a task as
essential and \( N_f \) is the total number of raters.

Each training item is identified as a task that will be
rated by the content experts as either essential (1), useful
but not essential (0), or not necessary (-1).

The CVR was originally introduced to aid in identifying
content valid test items (Lawshe, 1975). Its application to
training evaluation was identified by research regarding
police recruit training (Ford and Wroten, 1984). Several
research applications have modified the CVR approach to
measure content validity of a training post-test (Distefano,
et al., 1980), the content validity of training elements
(Ford and Wroten, 1984), and the content validity of
behavioral rating scale criterion (Distefano, et al., 1983).

The application of the content validity ratio to
training related areas has demonstrated the usefulness of
this procedure in supporting the content validity
conclusions in several research efforts.
Summary

This chapter reviewed the general theories of learning and several aspects of the instructional system design approach. Since this research involves the evaluation of a training program, emphasis was placed on this area of instructional system design and included specific literature dealing with training evaluation and research design.

Chapter 4 will now take much of the information just discussed and provide a methodology that focuses specifically on the research accomplished for CAT leader training.
IV. Method

Introduction

This chapter discusses the methods used in accomplishing the research objectives. It describes the identification of a training approach and the development of behavioral objectives. These objectives were the basis for developing a knowledge test for an internal course evaluation, and were also used for developing a questionnaire for a field evaluation. Statistical analysis was used on the data collected to answer the majority of the research objectives.

Restatement of the Research Objectives

The following objectives identified in Chapter 1 form the basis for the research direction. For reference, the research objectives are again provided:

1. Identify and document the specific material provided as part of the current course curriculum.

2. Determine if the CAT leader training course facilitates learning of the course material and improves a trainee's self-efficacy regarding application of course material.

3. Determine the characteristics of current corrective action teams and the involvement of graduates.

4. Identify the level of self-efficacy of past attendees regarding application of course material.

5. Identify how past attendees perceive and apply the problem solving tools and techniques provided in the course.
6. Based on the above objectives, provide the Commander of ASD with recommendations for improvements to the current CAT leader training curriculum.

**General Research Direction**

The general research method involved using data from several sources to address the research objectives and answer the research questions. Since only past course critiques were available on the training to date, secondary data sources were not available, making primary data the principal source of information.

The Commander's Office for Total Quality (ASD/TQ) is the host of the ASD CAT leader training program and sponsored the course evaluation research. They made available all necessary resources for support. For data collection, ASD/TQ supported an in-class evaluation of four courses and provided attendance rosters for all previous classes that identified the course population of 440 individuals.

The following paragraphs identify the specifics associated with the effort.

**Identifying Training Objectives**

Currently, CAT leader training has three overall objectives that were first identified in Chapter 2. They include training a CAT leader:

1. To be able to organize a corrective action team and manage the group dynamics so that the CAT develops into and remains an effective, functioning team.
2. To be able to explain the TQ structure and philosophy to individual members and how the CAT fits into the overall TQ process.

3. To be able to teach the problem solving methodology and the appropriate tools and techniques to CAT members so that they are able to effectively use them in the problem solving process. (ASD/TQ, undated: Tab)

These objectives explain the goals of the training well as it relates to ASD and could properly be named "terminal objectives," because they identify what a CAT leader should be able to accomplish after completion of the program (Goldstein, 1974:21). However, to measure the terminal objectives by a test instrument, the identification of subobjectives is required to measure individual criteria of the training. Subobjectives measure subskills necessary to master terminal objectives (Zammit, 1987:252). Since no subobjectives previously existed, the initial step in the research required their development.

**Developing Specific Subobjectives.** Both terminal and subobjectives (hereafter both referred to as "objectives") are behavioral objectives that make statements about behaviors and content (Zammit, 1987:255).

Behavior statements include action verbs that identify requirements of students (e.g., understand, describe, select, etc.). Content statements involve specific subject matter, like steps in a process. The three behavior statements proposed for CAT leader training objectives included:
1. Have an appreciation for
2. Identify the steps, functions, diagrams and definitions
3. Know the principles of

The content statements proposed for CAT leader training objectives included:

1. The steps in a technique.
2. The stages in a model.
3. The steps in a process.

These statements were used to develop objectives relating to the CAT leader training blocks identified in Figure 2. These blocks included: Overview of Total Quality Management, Effects of Personal Values, Group Dynamics, the Problem Solving Process, Problem Solving Tools and Techniques and Meeting Effectiveness. The CAT leader notebook provided to all attendees since training began in 1989 was thoroughly reviewed to generate a comprehensive list of proposed course objectives. Recommendations for additional objectives not identified were requested during the review cycle.

Review of Proposed Objectives. Objectives developed from the content of the training blocks described above were initially provided in the form of a questionnaire to twelve employees of ASD with recent CAT leader training experience. They included four past course instructors and eight recent attendees. Since the objectives were to mirror the current course (and not to identify improvements), reviewers were
instructed to make comments related only to the current course curriculum. They were also asked to apply the following criteria to their review:

1. Are all objectives applicable to the training?
2. Is the scope of required knowledge (have an appreciation for, identify, and know) for each objective appropriate?
3. Are there missing objectives?
4. Are the objectives clear and concise?

Comments were collected and an updated set of proposed objectives (with changes noted) were again distributed to the same individuals. In addition, proposed objectives with the same review guidelines were also provided to several experts in organizational research knowledgeable in training programs.

Format and content changes were reviewed and incorporated from the comments received. Objectives were categorized into training blocks as they are organized in the CAT leader notebook and the course syllabus (ASD/TQ, undated: Syllabus). A set of developed course objectives is provided in Appendix B. Only objectives dealing with the current course curriculum were allowed.

Content Validity of the Objectives. Since a validated set of objectives is required to ensure the development of a reliable knowledge test and questionnaire, it was necessary to ensure that actual instruction addressed those objectives. To accomplish this, questionnaires were
provided to the 12 members of the current course instructor cadre. The instructors were asked to review the objectives and rate each on the scale identified in Figure 6 as they relate to their own presentations:

<table>

Figure 6. Instructors Options to Identify What Objectives are Taught in CAT Leader Training (modified from Lawshe, 1975)

Since the course is team-taught, option four was included to account for those instructors who have never presented a particular training block.

Nine of 12 instructors returned the objectives rating form (including the four facilitators who normally conduct the training). The rating forms were scanned and the raw data analyzed using a modified version of Lawshe's (1975) Content Validity Ratio (CVR) technique discussed in Chapter 3. Specific objectives were considered to be completely covered in class by all instructors if the corresponding CVR was greater than or equal to an established minimum CVR standard (p < .05). This standard value is drawn from Schippers' computations that considered both the confidence desired and the number of reviewers (Lawshe, 1975:568). Because of the small sample size (N=9), CVR frequency
calculations were performed using the software package Statistix on a 386SX personal computer.

The values of individual CVRs for objectives are located in Appendix C and form the basis for answering investigative question 1 that relates to the curriculum taught by course facilitators. Since the proposed objectives were the basis for the knowledge test, the results of the content validity calculations became useful both to identify valid course objectives and validate test items. A discussion of the knowledge test development is provided in the following section.

**Development of Knowledge Test**

The knowledge test was the primary instrument for the internal evaluation of the course. It was designed as a summative evaluation instrument to assess the effectiveness of the course design and delivery (Zammit, 1987:252), and address research objectives 2, 3 and 4.

A knowledge test is a criterion-referenced test that measures specific behavioral objectives (Goldstein, 1984:134). It involves pre-testing and post-testing the training subjects to assess how well students master the objectives developed for a course. As discussed in the scope of the research project in Chapter 1, the knowledge test involved the knowledge and comprehensive levels of learning (Bloom, et. al, 1971). As a result, the questions
were developed from those objectives where the requirement was to know or be able to identify course material.

Testing Design. Variables measured during testing are associated with the behavioral learning objectives of training (Goldstein, 1974:73), and involve the following experimental design format:

\[ O_1 \times O_2 \]
\[ X \times O_2 \]

Where \( O_1 \) was the pre-test, \( X \) the training, and \( O_2 \) the post-test (Campbell and Stanley, 1963:7). This design is a derivative of the pre-test/post-test pre-experimental design commonly used in instructional settings that provides a measure of comparison to the same group of subjects (Goldstein, 1974:79). The control group involved one class of subjects who took only the post-test after training, but not the pre-test. Data was collected from this group to indicate effects of student questions prompted by the pre-test. The short time duration of training should limit the internal validity threats due to maturation and history. However, the impact of pre-test sensitizing on post-test scores is a concern.

Test Writing. Questions were placed in two separate sections of the knowledge test located in Appendix D. Section 1 involved personal/organizational topics and collected demographic data and the student's past experience with teams and training associated with portions of the
course curriculum. At the end of this section, 5 questions related to self-efficacy were also provided. These self-efficacy questions were again repeated in the questionnaire given to past course attendees.

Section 2 of the exam addressed CAT leader training material identified by the training blocks in Figure 5. Questions were developed based on those objectives that required a "knowledge of" or an "appreciation for" the material. Sixty-three questions were written by the researcher under the following guidelines:

1. Ensure each test item matches an objective.
2. Ensure all information required for an appropriate response is provided.
3. Ensure each test item is clearly stated.
4. Ensure only relevant material is provided.
5. Review all test items for content.
6. Have instrument reviewed and pretested.

(Zammit, 1987:257; Emory, 1985:228)

Guidelines 1, 2 and 4 involved question content, 2 and 3 involved question wording, and 5 and 6 involved item review (Zammit, 1987:257).

The test was reviewed by Air Force Institute of Technology (AFIT) faculty who are experts in testing and organizational theory and included issues such as: test question content applicability to behavioral objectives, the presence of unstated or misleading assumptions, the presence
of wording bias, and question scope and clarity (Emory, 1985:228).

Since the knowledge test was written prior to validating behavioral objectives, sixty-three questions were developed for the test instrument. Of those sixty-three questions, seven were related to objectives which had negative CVR values. The results of these items were not considered in any assessment of student performance.

Pre-testing. Pre-testing was accomplished with ten AFIT graduate students to identify test question clarity and completeness and also ease of answering (Emory, 1985:207). The students were selected based on availability and were screened to ensure they had not previously received CAT leader training. Current CAT leader training instructors were not included in the review to preclude their bias toward teaching test material during data collection.

Improvements were made to the exam that included increasing the age options available for demographics, highlighting negative response questions, and providing more of a random order to the matching portions of the test.

Knowledge Test Data Collection. Each exam began with an administrator providing instructions to the students. Four classes were tested in consecutive months. A post-test was given to the control group in March, followed by three groups receiving both the pre-test and post-test set in April, May, and June.
The researcher administered the test for the first two classes and provided instructions for the third. The two instructors who facilitated all three classes tested were provided instructions and administered the third exam.

Each participant received an exam, an optical score sheet (AFIT Form 11D), and a #2 lead pencil. In all cases, the classes were told the general scope of the research and it was stressed that individual raw scores were not an important part of the research requirements. These steps were taken to limit threats to validity by participants who might interpret the knowledge test as a source of criticism or grading (Bloom, et al., 1971). The first set of data collected involved the post-test group that completed CAT leader training on 29 March 1991. Testing results coded on optical scan sheets were read into a file for analysis.

Knowledge Test Population. The post test control group consisted of 17 students from the Special Forces System Program Office (ASD/VX). They contained a slightly higher proportion of middle management, but still covered all ranges of personnel. The population tested both before and after training consisted of forty-four students in three classes from organizations throughout ASD. Nine students were military a third of whom were enlisted, with officers representing the ranks of lieutenant through major. Thirty-two civilians were included in groups ranging from GS-03 to GM-14. Three contractors attended. The median age of all
subjects was 36-40 years with a nearly equal representation of both men and women.

Knowledge Test Reliability. Reliability involves determining how well an instrument can consistently produce the same results over time. High reliability indicates that variance in the scores is not due to chance arising from a flawed measuring instrument (Guion, 1965:27).

Reliability calculations were used to determine Cronbach's alpha coefficient that is interpreted as the average of all possible split-half reliabilities. Using the Fifty-five test items developed from validated objectives provided a Cronbach alpha coefficient of 0.89, indicating a good to excellent reliable test instrument (Shane, 1991). Review of the frequency distributions for the questions showed a range of responses for each test item that gave no indication of overly easy or poorly written test questions. Additionally, no significant changes in reliability were identified when individual items were removed and reliability re-calculated.

Based on the promising post-test results, three experimental groups receiving CAT leader training during the months of April, May, and June were given the knowledge test on both the first and last days of training. These three groups were selected to improve statistical power. In addition to an increased sample size for statistical purposes, several groups were selected to measure any
effects that result from a particular instructor. However, measuring the effects of particular instructors was not possible since the same instructors actually taught all the classes tested. These instructors reviewed the course objectives, but were not exposed to the test instrument.

Each class took a pre-test on the Tuesday morning opening of the course and concluded Friday's course requirements with the same knowledge test now representing a post-test. The Cronbach’s alpha coefficients are identified in Table 1 for each of the sets of tests. As shown, each course reliability figure indicates a highly reliable test instrument.

Development of CAT Leader Training Questionnaire

The questionnaire was the primary instrument for the field evaluation. It was designed to address objectives 3, 4 and 5 of the research in determining the extent that training material is applied and how it is perceived by CAT.
leaders in the ASD environment. Since there was a reasonably small population of past attendees (440 students), the use of a short questionnaire was viewed as the most efficient and economical option to collect the data to address the objectives (Emory, 1985:158). Confidential responses and guidelines required by the Privacy Act of 1973 also promoted an honest response to questionnaire items.

**Testing Design.** Variables measured during field evaluation are associated with the transfer of the behavioral learning objectives of training (Goldstein, 1974:73). This testing involves a pre-experimental design of a one-shot case study having the format:

\[ X \rightarrow O_2 \]

Where \( X \) is the training, and \( O_2 \) is the questionnaire (Campbell and Stanley, 1963:6). Since no previous data was available, the one-shot case study was chosen to collect perceptions from CAT leaders. While it is possible to measure the application of course material, measuring any change in attitude or perception is not possible (Weisberg and Bowen, 1977:88). As a result, this portion of the research is limited to only providing a snapshot of material application. The ability to then conclude that the training received was the responsible factor leading to the behavior change is very difficult to support. However, future research may use this data to draw such conclusions.
Questionnaire Population. The population of interest were those ASD employees who had received CAT leader training. As of May 1991, 440 individuals have received CAT leader training from 23 different course offerings. While many Air Force organizations have sent personnel to CAT leader training, questionnaires were distributed only to the 373 individuals associated with ASD, the sponsor of the research.

The population included members of all military and civilian ranks and grades. Military members ranged in rank from enlisted to the rank of colonel and civilian attendees included GS-03 through GM-15. Five contractors also responded to the questionnaire. The median age of respondents was between 36-40 years. Men represented almost 2 out of 3 respondents.

Questionnaire Format. The entire questionnaire package consisted of five parts: the cover letter, one questionnaire, an optical scan response form (AFIT Form 11C), a list of definitions, and an addressed return envelope. The package was reviewed and approved by the Commander's Office for Total Quality (ASD/TQ). The cover letter that introduced the questionnaire was signed by the Commander's Assistant for Total Quality and provided the respondent with a brief background on the project and encouraged participation.
The questionnaire itself was divided into six separate sections identified in Figure 7. Each section title was followed with a brief summary which identified to the respondent the type of information that was being furnished in that section. This additional information was supplied to further inform the respondents and encourage their cooperation in completing the instrument (Emory, 1985:158-159).

Figure 7. Sections of CAT Leader Training Questionnaire (Appendix E)

Section 1 requested general demographic information regarding the characteristics of respondents who have taken CAT leader training. Section 2 requested information regarding the date of training for the respondent and whether that individual was still in the organization that sponsored their training slot. Section 3 requested information on the level and type of CAT involvement and the current status. Section 4 measured each respondent's level of self-efficacy in regard to performing tasks related to the CAT leader training curriculum. Section 5 provided
information on the level and frequency of use of problem solving tools and techniques that were introduced in CAT leader training. Since many respondents may not have recognized some of the tools and techniques identified, a reference was made to a list of definitions provided as an attachment in the questionnaire package (Appendix F). Section 6 solicited feedback on any of the previous sections of the questionnaire and the CAT leader training course itself.

Items were written by the researcher using the following guidelines:

1. Ensure all information required for an appropriate response is provided.
2. Ensure each test item is clearly stated.
3. Ensure only relevant material is provided.
4. Review all test items for content.
5. Have instrument reviewed and pretested. (Zammit, 1987:257; Emory, 1985:228)

Guidelines 1 and 3 involved question content, 2 involved question wording, and 4 and 5 involved item review (Zammit, 1987:257). The test was reviewed by AFIT faculty who are experts in testing and organizational theory and included issues such as: the presence of unstated or misleading assumptions, the presence in bias of wording and question scope and clarity (Emory, 1985:228).

Pre-testing. Pre-testing was accomplished with three CAT leader training facilitators, the CAT leader training
course director, the ASD/TQ focal point on measurement, and four employees of ASD with experience in TQM. A set of proposed hypotheses was also provided with the questionnaire and each test candidate was requested to complete the survey and review each item for clarity, ease of answering, and applicability (Emory, 1985:207).

Improvements were made to the questionnaire that included adding section titles and summaries, modifying the training date options from two questions to three questions and dividing the tools and techniques options into three categories (level of use, frequency of use, and usefulness) with corresponding changes in their associated Likert scales. A general comments section was also added to solicit additional feedback from the respondents.

**Questionnaire Data Collection.** Several days prior to questionnaire distribution, a summary of the research plan and objectives was sent to all TQ coordinators in ASD. The goal was to notify ASD personnel associated with TQ about the research and encourage them to notify past CAT leader training attendees to expect a questionnaire.

The entire questionnaire package was mailed out via the ASD internal mail system in the first week of May 1991 to all past attendees of CAT training in ASD. The mailing list was developed from the attendance lists for the training classes and included ranks when provided. Each envelope identified the course graduate, his/her organization, the
training date, and a request to forward. The training date was provided on the label so that information could be collected in Section 2 and conclusions drawn for different classes. The return envelope was addressed to ASD/TQ with responses requested by 14 June 1991. This five-week time period allowed for questionnaire responses that considered mail delivery, response time, and possible forwarding to reassigned ASD personnel. As stated earlier, 373 questionnaires were distributed. After 2 weeks, 166 (45%) were returned with a total after 5 weeks reaching 222 (60%). Of the 222 returned, 13 were not completed due to changes in address, unavailability of the individual, and resignations. This provided an overall response rate of 208/373 (56%) and was considered an excellent response considering that some of the class rosters used to develop the mailing list were over 1 1/2 years old. Responses were received and coded into a data file. Questionnaire responses were collected on the AFIT Form 11C that allowed for optical scanning of the data for coding and analysis. Additional comments were collected in Section 6 of the questionnaire and are provided in Appendix G.

Data Analysis

Analysis of the data from both the knowledge test and questionnaire was defined by the requirements of the specific research questions identified in Chapter 1. As described earlier, the content validity requirements for the
objectives was established using a modified version of Lawshe's (1975) content validity ratio (CVR) and content validity index (CVI). This provided a basis for the credible analysis of the knowledge test and questionnaire data.

Both sets of data were collected on optical scan sheets (AFIT Forms 11D and 11C respectfully) with calculations being handled on a VAX 6420 computer using the Statistical Analysis System (SAS) software (version 6.0). Table 2 identifies the 11 research questions and the associated statistical tests that were required to address each question.

The above questions require several statistical techniques to provide a confident analysis. Since parametric tests were used, the assumption of normality was required. All variables which contained a Wilk-Shapiro statistic for goodness-of-fit to the normal distribution in excess of .70 were considered to meet the normality requirement (Shane, 1991).

**T-test.** The t-test involves the comparison of two sets of sample data to draw conclusions regarding the association of their underlying distributions. The two types of t-test that are used in this research are the independent-sample and paired t-tests.

An independent-sample t-test can be performed to determine if the sample data was probably drawn from different distributions. Assumptions regarding this application are that both populations that provided the samples are normally distributed and the population variances are equal. Since the estimate of the variance is drawn from both sample data sets, often a pooled estimator is used to identify the common variance. This pooled estimator provides a weighting to the variance that considers the relative size of each sample (Devore, 1987:334-336).

The sample means and common variance are used to compute a t-statistic for a two sided test. High t-
statistics translate a lower probability that the samples are from the same distribution.

While the normal t-test uses independent samples, the paired t-test involves the comparison of two separate but dependent samples. In this research, many of the comparisons involve pre/post test data where the measuring instrument and test subject are the same and the effect of treatment (training) is what is being measured. In this case, the two sets of data are dependent and the t statistic developed provides insight as to whether the treatment had a significant effect on the subject.

The statistic of interest is the difference between the mean values for each measurement. The pre/post test approach is designed to remove the effects of factors other than the treatment to determine a measurable difference (Hamburg, 1977:306). No change due to the treatment would mean that there was no statistically discernable difference in the paired observations (i.e. the treatment had no impact on what was measured). The assumptions underlying the paired t-test are that the selected pairs are independent and the difference in pairs are normally distributed. A common variance is not required in this case since the variable of interest is the difference in sample means, and this variable has its own variance that can estimate the population variance (Devore, 1987:344-345).
Regression. Regression analysis involves determining the statistical relationship between two or more variables (Devore, 1987:451). In simple linear regression analysis, values of independent variables are often helpful in predicting the value of a dependent variable. In CAT leader training specifically, investigative research question number 3 involves the ability of three variables to predict the value of the subject's knowledge pre-test score. Those three predictors are past training, past education, and past experience.

The equation of interest is linear and is defined as: \( Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon \). \( Y \) is the dependant variable and each portion of the right hand side of the equation defines the corresponding slope (\( \beta \)) associated with the three independent variables. The \( \epsilon \) represents the error term of the model and is assumed to be normally distributed with a mean of zero. Each of the independent variables is considered a significant predictor of the knowledge test, if its slope is greater than zero.

It is important to examine the aptness of the model for the data being used before extensive analysis is performed (Neter, et al., 1990:113). Aptness provides confidence that the regression model is competent for use (Reynolds, 1991).

Study of the residuals is one method to ensure that the model assumptions fit the data being examined. Plots of residuals against independent variables, fitted values,
time, and omitted independent variables are methods to visually check data trends that result in model departures. (Neter, et al., 1990:117). Informal diagnostic review of residual plots provide information on whether departures from the simple linear regression model would preclude its use.

**Chi-square test.** The chi-square ($\chi^2$) distribution is a probability distribution that is defined by the parameter $v$ (degrees of freedom). Often the chi-square distribution is used to identify the goodness of fit between observed frequencies and theoretical frequencies (Hamburg, 1977:318). In some of the investigative questions considered, the issue of whether individuals meeting specific criteria are represented by categories that are randomly distributed.

In this research, each category of a variable being investigated is considered to be mutually exclusive, collectively exhaustive, and randomly distributed. If this is not the case, then some categories of a variable will have a disproportionate level of subjects. The chi-square goodness of fit test is a method that allows you to test if a disproportionate level exists. The chi-square test requires that each category contain at least five observations.

These three testing techniques defined above represent the statistical approach used in drawing conclusions to the
investigative questions from the research data. These results will be addressed in the next chapter.

Summary

This chapter outlined the methodology associated with accomplishing the research objectives and answering the specific research questions. The development and validation of a set of behavioral learning objectives provided the framework for both an internal and field evaluation of the training through the use of a knowledge test and questionnaire, respectively.

With Chapters 1 through 4 as a background and the data collected by the knowledge test and questionnaire, results and recommendations can now be addressed and discussed.
V. Presentation and Discussion of Results

Introduction

As stated in Chapter 1, the investigative questions provided the specific guidelines for the research and were a means for a detailed breakdown of the research objectives. Consequently, they are the primary topics of discussion regarding results.

Each investigative question will now be identified and discussed based on the data collected and statistical tests performed.

Investigative Question 1

Is the basic curriculum described by the information in the CAT leader notebook taught by all course facilitators?

Chapter 4 discussed the development of learning objectives both to measure the three course terminal objectives and to provide a basis for development of a knowledge test and questionnaire. The information to develop the learning objectives came from the CAT leader notebook which contained the course syllabus and related material. Nine of the 12 instructors responded to the list of proposed objectives located in Appendix B and provided the data for content validity ratio (CVR) calculations. The values of individual CVRs for objectives is located in Appendix C.

Table 3 identifies that of the 62 objectives proposed, 55 had a positive CVR which indicates that the majority of
instructors completely taught those objective when responsible for that training block during class. The 7 items with a negative CVR were not considered valid objectives taught by instructors since less than half stated they completely covered the objective in the course. These seven included:

Objective 4: Identify the expected life of the four major sub-systems that make up an organizations' TQ structure from a list of options.

Objective 6: Have an appreciation for the difference between maintenance factors and motivational factors identified by Herzberg.

Objective 23: Have an appreciation for the strategies of managing difficult people developed by Manning and Haddock.

Objective 24: Identify some barriers to effective communication.

Objective 26: Know the principle for giving and receiving feedback.

Objective 57: Identify a diagram in the CAT leader notebook which represents a Solution Selection Matrix.

Objective 60: Identify a diagram in the CAT leader notebook which represents a Force Field Diagram.

The content validity index (CVI) which is the arithmetic mean for all positive CVR items, had a value of .73. It represents the extent of perceived overlap existing between the objectives identified and the material taught in the course. This high value indicates that there is a substantial overlap between the objectives and the course content.

Results indicate fifty-five of the 62 objectives were completely taught by the majority of instructors with 36 of
Table 3

</tbody>
</table>

Content Validity Index of top 55 objectives = 0.73

those covered by all instructors (p < .05). This indicates that the instructors rated the content of their presentations as sufficient to cover the fifty-five objectives. Whether the student actually did perform to a level required by the objectives is a topic for investigative question 2.

It should be stressed that this was a self-rating scale based on the material as presented by an instructor. Some concern about self-rating is warranted, but not totally supported by the data. First, a wide range of CVRs was noted, indicating that instructors did not provide the maximum rating of 1 in all cases, and did identify where objectives were not completely covered. Second, the rating list in Appendix B was provided to the facilitators as a set of "proposed" objectives. "Proposed" carries less of an evaluation stigma which may impact the instructors' scoring. If instructors perceived their review of objectives as an evaluation tool, they would be more likely inflate their scores. Requesting anonymous responses to a list of "proposed" objectives attempted to limit this problem.
While three of the part-time facilitators did not respond to follow-up, these results do provide confidence that these objectives properly reflect course material since the respondents who did respond represent over 85% of the instructor cadre and teach above that proportion of the total course.

Conclusion. The CVR and CVI scores indicate that 55 of the 62 proposed objectives developed from the material in the CAT leader notebook are presented by the facilitators during the four day course. They represent an initial set of validated objectives and are useful in developing the knowledge test and questionnaire. The seven objectives not taught completely by instructors are not necessarily improper for the course, but do not receive the same emphasis as other material. As a result, test items developed from these seven objectives will not be considered in the analysis of overall knowledge test results.

Investigative Question 2

Does CAT leader training improve the knowledge of participants in each of the training blocks presented?

The validated objectives discussed in investigative question 1 provide a basis for determining if knowledge increased as a result of the course. Of the 55 objectives, 27 required more than just an appreciation for a concept. Those objectives provided the basis for the knowledge test and began with the word "identify" or "know".
The knowledge test scoring results are divided into two areas: topics related to training blocks and individual tools and techniques.

Table 4 identifies the overall results from the three classes (N=44) evaluated by the knowledge test. Total score results are identified in the first row and then material is broken down by topics tested. The last four entries describe methods of testing tools and techniques. The number of questions, mean score change from the pre-test to the post-test, and paired t-test results are provided in columns two to four. A t-test result lower than 0.05 in row number four indicates a 95% confidence that a significant improvement is made in the post-test score.

All variables associated with valid objectives (positive CVR) were checked for normality using the Wilk-Shapiro statistic. Since the variables measured the improvement in score from the pre-test to the post-test, a discrete distribution resulted. Even though the normal distribution is continuous, the range of discrete responses allowed comparison to a normal distribution.

In all cases but two, variables were found to very closely approximate a normal distribution (Wilk-Shapiro statistic > .90). The two variables that had distributions that less closely resembled the normal distributions involved the Strength Deployment Inventory (SDI) (Wilk-Shapiro=.68) and Leadership (Wilk-Shapiro=.71). Each of these variables were represented by one question on the
knowledge test which limited the range of values in their
discrete distributions. Since Wilk-Shapiro values in excess
of .70 were considered acceptable in assuming normality, all
topics, except SDI, met the established normality criteria
for parametric tests (Shane, 1991).

Table 4
Training Block Results - Overall

| Training Block       | No. of Questions | Mean | Prob>|T;|
|----------------------|------------------|------|------|
| Total Score          | 56               | 9.90 | 0.00 |
| Total Quality        | 12               | 1.61 | 0.00 |

** = did not meet normality assumption for t-test

Overall Score Improvement. The mean change in overall
score for the three classes was 9.9 for the 56 question
test. This shows that the average student improved their
correct response score by almost 10 questions from the pre-
test to the post-test.
The concern about test sensitizing due to the short time between pre-test and post-test is addressed by the post-test only group. The knowledge test design was based on a pre-test/post-test pre-experimental design involving a control group. This control group was not exposed to the knowledge test until after the course was completed. Their post-test results (N=17) were compared to the combined post-test results (N=44) from the other classes and a pooled t-test was performed on the overall test score. The pooled t-test involves two distributions assumed to be normally distributed and uses a pooled estimator of the common variance. (Devore, 1987:334-336).

The resulting t-statistic produced a p-value equal to .07 and does not indicate that a significant improvement in score is attributable to exposure to the knowledge test prior to the course. The positive t-value does indicate a slightly improved post-test score from the control group, but not one large enough to draw a separate conclusion (p < .05).

**Individual Training Material Improvement.** The results in the total score row of Table 4 involve all the test questions that make up the overall score. All training blocks are represented except Block 6 (meeting effectiveness) which had no objectives measurable by pencil and paper testing. Of the nine sets of questions identified that met the normality assumption, six showed significant
improvement and three showed no significant improvement (\(P < .05\)). SDI t-test results were not computed.

The six showing improvement questions relating to: total quality, Tuckman's stages of group development, steps in the problem solving process, tools and techniques definitions, the steps of specific tools and techniques, and diagrams associated with specific tools and techniques. These six sets represented 52 of the sixty-three questions in the knowledge test.

The three sets of questions that did not indicate a significant improvement consisted of nine of the 10 remaining questions. They included the subjects of: functions of a leader, types of data, and uses for specific tools and techniques.

The types of data test questions involved differentiating between qualitative and quantitative data. The knowledge test had four questions addressing types of data. Two questions required students to identify problem solving tools and techniques associated with either qualitative or quantitative data. Two additional questions required students to differentiate between the types of data from a list of examples. Since the scores did not improve significantly (\(P < .05\)), students appeared to have a limited improvement in understanding the definitions and applications of data types.

Also, use of specific tools and techniques did not show improvement. Four test items required the student to
identify from a list the inappropriate tool or technique associated with a problem solving step (defining a problem, gathering information, etc.). The appropriateness of specific tools and techniques was defined by a summary sheet provided in the CAT leader notebook. Since scores did not improve significantly ($p < .05$), students appear to have a limited improvement in understanding the appropriate use of tools and techniques in specific problem solving steps.

Review of both sets of test item scores indicates that lack of improvement was not due to relatively high pre-test scores which would have left little room for improvement.

Since only one question each in the test involved SDI and leadership, their lack of improvement may partially be explained by the small number of questions which limited the range of scores for each subject. Limiting this range results in overall smaller variation among scores, making it more difficult to identify significant changes.

Another method to identify significant changes (or lack of) in the testing group is to review the results by individual classes.

**Individual Class Results.** Individual class scores were combined to determine the overall results. Since each class had its own population and teaching environment, their individual results show several aspects of training impacts not visible in the overall scores. Table 5 breaks down the training material results per class.

X = Improvement  * = Overall Improvement (p < .05)

In every case where an overall improvement was noted, at least two of the three individual classes showed a significant improvement. This would indicate that no specific class significantly biased overall results by extreme scores.

Several factors were considered to explain the lack of improvement in areas by all classes. Student apathy toward taking the post-test was considered as a possible reason for the lower scores; however, improved scores in later test sections did not support that assertion. The lack of improvement was not due to different instructors since the same instructors were used for each course offering.
Discussions with one of the course facilitators indicated no departures from teaching methods for any of the classes. However, one unique aspect of the June class involved the training environment. Both the May and June classes were held in a renovated school building that used loud and less efficient window air conditioners. For the May class, the distractions were minimized by cooler weather. However, for the June class, the facilitator identified these window units as distracting during presentations and resulting in a warmer training environment. The results of the June class scores may be partially a result of this environment, but this possibility cannot be substantiated with the data provided.

Overall, since there was no significant change in score \( p < .05 \), the lack of improvement should not be contributed (necessarily) to teaching methods, testing methods, or environment. However, all of these issues should be investigated when considering a means to increase and measure learning in these areas.

Of the thirty improvements possible (all three classes in each of ten questions sets) for those meeting the normality criteria, twenty-one improvements were noted. Twelve of these improvements occurred in the section covering the problem solving tools and techniques presented in the course. Since they represent a large portion of both the course and test material, their results are broken out separately.
Tools and Techniques Results. Twenty-two of the 56 questions involved the use of problem solving tools and techniques. To provide insight into the learning of this specific material, the associated questions were re-scored by the type of tool or technique. The overall and individual class results are provided in Tables 6 and 7, respectively.

Table 6
Tools and Techniques Results -- Overall

| Tool or Technique          | No. of Questions | Mean Score | Prob>|T| |
|---------------------------|------------------|------------|------|
| Total Score               | 22               | 4.98       | 0.00 |
| Brainstorming             | 2                | 0.04       | 0.56 |
| Nominal Group Tech        | 2                | 0.34       | 0.01 |
| Cause and Effect          | 2                | 0.95       | 0.00 |
| Pareto Analysis           | 3                | 1.16       | 0.00 |
| Check Sheets              | 4                | 0.91       | 0.00 |
| Flow Charting             | 2                | 0.09       | 0.35 |
| Solution Sel Matrix       | 2                | 0.32       | 0.04 |
| Force Field Diagrams      | 3                | 1.20       | 0.00 |
| Action Plans              | 2                | 0.39       | 0.00 |

Wilk-Shapiro statistics were computed for these variables to ensure the normality assumption was proper. Values in excess of .70 were noted for all variables making the use of a paired t-test valid in all cases.

The total score was provided by combining the twenty-two associated tools and techniques questions. Table 6

* = Overall Improvement (p < .05)

shows that the average improvement from the pre-test to post-test was 4.98 questions per student (23%). This indicates a significant improvement in scores relating to this material (p < .05). Of the ten tools and techniques involved, only two, brainstorming and flow charting, did not show a significant improvement after training.

Brainstorming and flow charting also represented the only two tools or techniques where none of the three classes showed any significant improvement. While the lack of overall improvement for training material described earlier (Types of Data and Use of Tools) is partially explained by the decrease in scoring by individual classes, this condition is not apparent here. However, it is noteworthy
that brainstorming and flow charting both represent the highest pre-test scores for any tool or technique as shown in Table 8.

</tbody>
</table>

This means that a very large increase was needed in an already good score to show a statistically significant improvement. Since two questions were associated with brainstorming and flow charting, the concern over a limited number of categories in the discrete distribution is less of an issue here than with the variables for SDI and leadership. The limited number of categories does pose a slight problem, but it seems it is compounded by the high pre-test scores for both variables.

The June class showed the smallest improvement (3 out of 10 topics) of any of the three classes. As described
earlier, a noisy and less comfortable classroom environment was present and may have contributed to the lower scores.

**Conclusion.** Tables 5 and 7 provide good summary charts for training material and tools and techniques performance results. Those areas where improvement is statistically significant represent topics where knowledge appears to be increased by training. Areas where no significant improvement is noted represent topics that facilitators can focus on to improve course effectiveness. No conclusions were drawn from the data concerning SDI, since it failed to meet the criteria for assuming a normal distribution.

The ranked pre-test results provided in Table 8 indicated that the highest level of competence for tools and techniques prior to training were in brainstorming and flow charting. Students did very well initially in these two areas and did much worse in other areas that may need more emphasis in the future.

**Investigative Question 3**

Are the following antecedent variables significant predictors of a student's performance in the knowledge pre-test \((Y)\)?

\[ X_1. \text{ Involvement in previous CATs (Experience)} \]
\[ X_2. \text{ Previous problem solving/team dynamics training (Training)} \]
\[ X_3. \text{ Education Level (Education)} \]

A general linear regression model was developed from these three predictors involving training, experience, and education. Experience ranged from no involvement to involvement in three or more CATs. The training predictor
was based on how the participant answered 5 items relating to past training that addressed current course material. Education level was scaled on the highest degree received to date ranging from high school diploma to a doctoral degree.

To measure predictive capability, the all-ways regression procedure was used to allow variables with a 0.05 significance level entry into the model.

Model aptness was tested by several factors that were identified in the regression model discussion in Chapter 4. Testing of residuals indicated a normal random distribution (Wilk-Shapiro = 0.95) with a mean of zero and no trends with respect to predictors. As shown in Table 9, multicollinearity was not a problem since none of the predictor variables exhibited a very high correlation with other variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Degree</th>
<th>Training</th>
<th>CAT Involvement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Degree</td>
<td>1</td>
<td>.413</td>
<td>.278</td>
</tr>
<tr>
<td>Training</td>
<td>.413</td>
<td>1</td>
<td>.113</td>
</tr>
<tr>
<td>CAT Involvement</td>
<td>.278</td>
<td>.113</td>
<td>1</td>
</tr>
</tbody>
</table>

Since aptness tests regarding residuals indicated no deviation from model requirements, the regression analysis using the pre-test score as the dependant variable was performed. Results are shown in Table 10 and indicate that the independent variables for education (degree) and
previous training (training) were significant predictors while previous CAT involvement (experience) was not a significant predictor ($P < .05$).

Table 10
Summary of the Regression Model

<table>
<thead>
<tr>
<th>Variable</th>
<th>Partial $R^2$</th>
<th>Model $R^2$</th>
<th>Prob&gt;F</th>
</tr>
</thead>
<tbody>
<tr>
<td>Degree</td>
<td>0.09</td>
<td>0.09</td>
<td>0.04</td>
</tr>
<tr>
<td>Training</td>
<td>0.11</td>
<td>0.20</td>
<td>0.02</td>
</tr>
</tbody>
</table>

Conclusion. While the variables for training and degree are significant predictors, the overall $R^2$ value for the model including these two variables is .20, indicating it can only account for 20% of all the variance found in the scores. Previous CAT involvement is not a significant predictor. As a result, past training and education may be useful in a more comprehensive model, but alone provide limited explanatory power in predicting an individual's pre-test score.

Investigative Question 4

Is there an overall increase in self-efficacy in the application of course material as a result of attending CAT leader training?

As part of both the pre-test and post-test, each student was asked to rate their ability to perform various tasks related to the application of CAT leader training material. These tasks included having the capability to: lead a group through the problem solving process, explain
the TQ structure and philosophy, use the tools and techniques of problem solving, prepare and facilitate an effective meeting, and understand the subject of group dynamics enough to build an effective team.

Since all five relate to training material, the scores from a seven-point Likert scale of each were combined to provide an overall self-efficacy rating. Wilk-Shapiro statistics on the related variables indicated approximately normal distributions which allowed the use of the paired t-test for comparison. These scores are provided in Table 11.

Table 11
Self Efficacy Results - Per Class

| Group  | Pre-test Score | Change | Prob>|T| | Improved |
|--------|----------------|--------|--------|----------|
| Overall| 17.5           | 5.72   | 0.00   | X        |
| April  | 17.8           | 6.19   | 0.00   | X        |
| May    | 17.0           | 7.50   | 0.00   | X        |
| June   | 18.0           | 2.54   | 0.45   |          |

An increase in self-efficacy relating to the training material is observed across all three classes. A paired t-test shows that the overall score and the classes tested in April and May increased their self-efficacy score significantly. The June class showed less than a significant improvement in this area.

Comparison of the pre-test scores rules out the possibility that the June class had a significantly higher
score which left little room for improvement. On the contrary, the June class had only a slightly higher score but showed a significantly lower improvement in the post-test.

This finding also correlates with the absolute decrease in scoring for test items involving types of data and use of tools. As discussed earlier in the overall results broken down by class, the June class' warmer and noisier training environment was the only area specifically identified by one of the course facilitators that seemed different from the other two classes. However, since this class did exhibit some improved scores in certain areas, environment does not seem to have had a detrimental impact in all data measurements. As a result, the training environment can be considered as a possible influence on test scores and self-efficacy ratings, but data does not support it as the only factor that may explain the variance between classes.

Individual Subject Self-Efficacy Scores. The five tasks that were used to provide the overall self-efficacy score were broken out to investigate any trends in this data for the combined group of three classes. Normality requirements were met in these areas which allowed paired t-test to be performed. Table 12 provides the self-efficacy scores by task.

Results indicated that in four of the 5 individual tasks, the overall group showed a significant improvement. The remaining task (leading a group through the problem
Table 12
Individual Task Self-efficacy Results – Overall

| Self-efficacy Subject                  | Pre-test Mean | Mean Change | Prob>|T| |
|----------------------------------------|---------------|-------------|------|
| Overall                                | 17.54         | 5.72        | 0.00 |
| Lead a group                           | 4.34          | 0.45        | 0.06 |
| Explain TQ                             | 3.11          | 1.34        | 0.00 |
| Use tools and techniques               | 3.50          | 1.02        | 0.00 |
| Run an effective meeting              | 3.50          | 1.11        | 0.00 |
| Build an effective team                | 3.07          | 1.60        | 0.00 |

solving process), while not showing a significant improvement, did have the highest pre-test score.

Conclusion. Overall improvement in self-efficacy for two of the 3 classes was large enough to indicate a significant improvement for the entire group. Investigation of individual task self-efficacy showed an improvement in four of the five task scores showing that a large portion of the course improves the students' perception of their capability to perform specific tasks.

Investigative Question 5

Are a significant number of CAT leaders assigned CAT issues within three months of training?

Investigative question five begins the field evaluation portion of the research by looking at data relating to the past course participants. Of the 208 responses to the questionnaire, 56 past attendees indicated that they have served as a CAT leader since training. These individuals are the focus of this investigative question.
To determine whether the majority of CAT leaders are assigned a CAT issue soon after training, those who indicated they have served as a CAT leader since training were asked to identify the time gap between training and being assigned a CAT issue. Table 13 identifies the frequency of responses by those surveyed.

Table 13
Gap Between Training and CAT Leader Assignment

| CAT assigned prior to training | 12 |
| Cat assigned 0 - 1 months after training | 12 |
| CAT assigned 2 - 3 months after training | 14 |
| CAT assigned 4 - 6 months after training | 13 |
| CAT assigned 7 - 12 months after training | 4 |
| CAT assigned over 1 year after training | 1 |

A chi-square test was preformed to determine if the responses followed a homogeneous distribution. Three groups were formed by combining the first three and the last two categories to test whether a significant number of CAT leaders were assigned issues within three months of training. Combining the first three categories was required because they represented the time period of less than three months. The last two categories were combined to meet the requirement of having at least five responses in each category to obtain a valid chi-square statistic.

Results yielded a chi-square statistic of 7.14 which was sufficiently large to reject the homogeneous
distribution test ($P < .05$). This indicated that, of those receiving CAT assignments, a significant number of CAT leaders were assigned CATs within three months of training.

Further review of the data showed almost a homogeneous distribution over the first four categories. To determine if the training gap supported this observation, another chi-square test was performed. This time the last three categories were combined to represent those leaders who were assigned a CAT four or more months after training. Results yielded a chi-square statistic of 1.72 which was sufficiently small enough not to reject the homogeneous distribution hypothesis ($p < .05$).

Conclusion. A significant number of those training participants who become CAT leaders are assigned a CAT issue within three months of training. Additionally, the underlying distribution describing the time interval of assignments follows a homogeneous distribution where one quarter of the assignments are made in each of the following categories: before training, within a month of training, between two and three months after training, and over four months after training.

Investigative Question 6

Are there a significant number of training participants becoming members of CATs?

CAT leader training was designed to support the total quality initiatives in Aeronautical Systems Division. However, the concepts, tools and techniques of the training
are useful in many organizational situations. This has encouraged the attendance of individuals who do not plan on being a CAT leader, but wish to improve their problem solving skills. Investigative question 6 addresses the issue of CAT participation by past course participants.

Of the 208 respondents to the questionnaire, 116 (57%) indicated that they have not been involved as either a leader or participant in a corrective action team. Of those participating in CATs, 57 have been involved in only one, 19 have been involved in two, and thirteen have been involved in three or more.

A chi-square test was performed to determine if a significant number of training participants became involved with corrective action teams. Those who have not participated represented one category and those who were involved represented a second category. Results yielded a chi-square statistic of 3.56 which was small enough to indicate an even distribution of past participants that both do and do not get involved in CATs after training.

Conclusion. A significant number of training participants do not become members of CATs after the training is completed. The number who do get involved is approximately the same number as those who do not get involved.

Investigative Question 7

Is there a noticeable decline in self-efficacy regarding application of training material as time since training increases?
This question involves investigating the self-efficacy score trend of each training group with respect to the length of time between responding to the questionnaire and attending CAT leader training. Even though samples were independent making longitudinal tests impossible with the one-shot case study format, review of self-efficacy scores between groups was accomplished to identify any possible time related trends.

Between Training Groups. A two sample t-test approach was used to determine if the scores varied significantly from one group of classes to the next. To increase the size of each sample and investigate longer term time trend results, the twenty-one classes were combined chronologically into seven training groups. Each group contained three classes. The class dates, group size, self-efficacy means and standard errors for each group are identified in Table 14.

A two-sample t-test was performed on every combination of group scores to determine if there was a noticeable decline in self-efficacy with an increase in time since training. Results of all combinations, showed that only the comparison between groups 2 and 5 indicated a significant difference in mean scores (p < .05). Visual inspection of Table 14 confirms this result since these two self-efficacy scores showed the widest variation between all groups.

Investigating trends between training groups provides an indication that there is not a significant decrease in

</table>

self-efficacy over a time period of several months, but it does not address the change in self-efficacy that occurs immediately after training. The investigation of training classes was briefly considered to examine this issue. However, scores between classes had so much variation, that comparisons between separate classes was inappropriate. A longitudinal study of the same class over time is recommended to investigate short term self-efficacy changes.

Conclusion. Data does not show that self-efficacy exhibits a significant trend between classes as the time
since training increases. The large range of self-efficacy scores and the lack of longitudinal data for a specific class do not permit any conclusions for short term or intra-group score impacts resulting from time.

Investigative Question 8

Are problem solving tools and techniques being used in the organizational and CAT environments?

In Chapter 3, the application of learning was emphasized as the reason for the training provided. Since the problem solving steps and the related tools and techniques constitute a large portion of the CAT leader training program, specific emphasis is being placed on whether these tools are being applied after training has occurred. The steps of problem solving were considered a tool or technique for this section of the research.

Overall Level of Use. Section 5 of the questionnaire involved the application of tools and techniques. Items involving the levels of use constituted the first portion of this section. Respondents were requested to note the level of use of the problem solving tools and techniques provided in the course. A summary version five-point Likert scale used to measure responses in the questionnaire is identified in Figure 8.

Table 15 identifies the frequency of responses, in both the CAT and organizational environment, for each of the 10 problem solving items. Categories of use correspond with the Likert scale identified in Figure 8, except that the CAT

A chi-square test for goodness of fit was performed on all topics to determine if the responses followed a homogeneous distribution. In every case, that hypothesis was rejected because of a disproportionate number of
responses in a specific category ($p < .05$). These large response categories represented two extremes. The first involved five items where a significant number of respondents indicated they had not seen the tool or technique used at all. The second extreme involved the other five items where a significant number of respondents indicated they had personally used the tool or technique. There was no case where the largest response concerned seeing a tool or technique used, but not using it personally.

Table 16 identifies those topics where "no use" was the most significant category noted by the respondents. Force field analysis was identified as the least used of all the topics discussed where 63% of the respondents stated that they have never seen or used force field analysis in either a CAT or organization setting. The other topics included: cause and effect analysis, pareto analysis, and the solution selection matrix.

Table 17 identifies those topics where "personal use" was the most significant category noted by respondents. Brainstorming was identified as the most used of all topics addressed. 86% of the respondents stated that they have personally used brainstorming in either the CAT or organizational setting. The other topics personally used by a significant number of those surveyed included: steps in problem solving, nominal group technique, flow diagrams, and action planning.

**Conclusion.** Results indicate that of the ten topics that respondents addressed, half did not see a significant amount of use outside of the classroom, while half of them did. As noted earlier, the CAT leader training forum is not the only place where individuals are exposed to the problem solving tools and techniques discussed. But it is designed to promote their continued and effective use. From the data collected, no observation can be provided about the increased use of these tools and techniques that result from
Training, since longitudinal data is not available. However, the level of current use noted here can provide a basis for the focus of future course offerings.

Investigative Question 9

Are problem solving tools and techniques perceived as being used frequently in the CAT and organizational environment?

Frequency of use was another item measured as part of Section 5 of the questionnaire. Respondents were requested to note the frequency of use over the last three years of each of the problem solving tools. The frequency of use involved a four point Likert scale that included: never, once, twice, and three or more times.

Table 18 identifies the frequency of responses for each of the ten problem solving items of interest.

A chi-square test for goodness of fit was performed on all topics to determine if the responses followed a homogeneous distribution. In every case, that hypothesis was rejected because of a disproportionate number of responses in a specific category \((p < .05)\).

**Frequency vs. Level of Use.** Comparison of the frequency data with the level of use data showed several trends. As expected, the topics which were not used by a significant number of people, also had a corresponding low frequency of use. Additionally, those topics that were used by a significant number of respondents, also had the highest level of use (three or more times).

**Overall Frequency of Use.** All topics receive some use in the organizational environment. Even on those topics which are not used by a significant number of individuals, a minimum of 50 people have indicated they have seen the topic used at least once in the organization. As in the discussion regarding level of use, longitudinal data is not available to draw conclusions on the impact of CAT leader training on the use of these tools and techniques in the field. However, this data does show that the tools and techniques are used in ASD.

**Recent Use.** Since these tools and techniques have been taught for years, one concern involved respondents who indicated they had seen a tool or technique used, but during a time period that preceded CAT leader training. To determine the number who had seen it used recently and
possibly as a result of CAT leader training (in the last three years), the size of response of those who have never seen a tool or technique used outside training was compared to the size of response of those who had seen no use in the past three years. The data indicated that a portion of those who have seen a tool or technique used, had not seen it used during the past three years. This information is provided for each tool and technique in Table 19 and is ordered by the largest percentage of respondents who have not seen it used recently.

* - % computed based on total number of respondents

Pareto Analysis ranked first out of the topics in the percentage of individuals who have not seen a specific topic used in the last three years. Brainstorming was the lowest
topic where almost all individuals exposed to it, have seen it used in the last three years. Since missing data results in different sample sizes for individual questions, percentages were based on the total number of respondents.

**Conclusion.** In those cases where the level of use was significantly high, a higher frequency of use was noted. Likewise, the least used tools and techniques had the lowest frequency of use. Use of all the tools and techniques have been witnessed by at least 50 individuals indicating that these subjects are being practiced in the field. For those who indicated they had not seen a tool or technique used, the large majority (over 80% in all cases) have seen it used in the last three years. While this corresponds with the approximate beginning of CAT leader training, the specific impact of CAT leader training toward use cannot be determined with the case study data.

**Investigative Question 10**

Are problem solving tools and techniques perceived as being useful tools for team problem solving?

Now that the level and frequency of use for problem solving tools and techniques has been discussed, the perception of usefulness will be addressed. Respondents were requested to note the usefulness of the topics as tools for team problem solving. The responses involved a five point Likert scale that described items as: very useful, somewhat useful, undecided, rarely useful, and not useful.
Table 20 identifies the frequency of the level of usefulness responses for each of the items of interest.

1=Very useful  2=Somewhat useful  3=Undecided  4=Rarely useful  5=Not useful

A five-point Likert scale was used to develop an interval rating of the degree of usefulness of each item listed. Since the options represented a range of responses possible, a weighted linear transformation was performed to provide a relative scale of usefulness for each item. The scale went from very useful (+2) to not useful (-2) with even intervals of one in between. Table 21 provides those results along with the percentage of respondents who rated the item "rarely useful" or "not useful".

</tbody>
</table>

All topics had a positive mean indicating that the respondents found some degree of usefulness in every topic. Brainstorming and the steps to problem solving were seen as very useful by the vast majority of those surveyed. Action planning, flow charting, nominal group technique, and pareto were perceived as the next most useful set of tools and techniques. In this group, the majority of respondents rated the items as either very or somewhat useful. Check sheets, cause and effect diagrams, the solution selection matrix, and force field diagrams constituted the remaining items. In three of these four cases, the largest response category was "undecided", indicating that many of those surveyed had not yet formed an opinion on the degree of usefulness for those tools and techniques.
Rarely or Not Useful Ratings. The last column of Table 21 provides the percentage of those surveyed who rated the item as "rarely useful" or "not useful". This data provides insight into the perception of respondents regarding the material provided in the course. Force field analysis and cause and effect diagrams represented items that had the largest number of low ratings. However, in all cases, the majority of respondents rated the tool or technique useful or was at least undecided. This indicates that no tools or technique taught in the course was perceived as inappropriate for use in the organizational environment.

Conclusion. The transformation ratings indicate that all tools and techniques have some degree of usefulness as problem solving tools. While some items (Check sheets, pareto analysis, cause and effect diagrams, the solution selection matrix, and force field analysis), have a large number of "undecided" responses, no item was found to have no use in problem solving.

Investigative Question 11

Do a significant number of CAT leaders rate the use of a CAT as appropriate in addressing the CAT related issues assigned?

CATs are often assigned based on the "type" of issue involved. Chapter 2 described three categories that were used to aid in assigning and tracking issues to the appropriate owners and organizations. Type 2 issues involved coordination by several offices in an organization.
and normally is a prime candidate for a corrective action team (ASD/TQ, undated:10). This investigative question involves whether the respondents involved with a CAT perceive its use as appropriate in addressing the issue.

Forty-six of the respondents who were participating in a CAT rated it as very applicable for the issue involved, 33 rated it somewhat applicable, 9 rated it as not very applicable, and 6 provided a rating of not applicable. These categories were combined into two groups with very and somewhat applicable making up the first group and not very and not applicable making up the second.

A chi-square test was performed to determine if the frequency of responses for these two groups followed a homogeneous distribution, indicating at least half of the respondents did not see the use of a CAT as appropriate. Results yielded a chi-square statistic of 68.8 which was sufficiently large to reject the homogeneous distribution test.

Conclusion. A significant number of past training participants who have been involved in at least one CAT perceive the use of a CAT as appropriate in addressing the issue assigned.

Questionnaire Written Comments

Section 6 of the questionnaire solicited feedback regarding areas not covered or insufficiently covered by previous items. Respondents were asked to use their
experience as graduates of CAT leader training who are now involved in organizational issues to suggest course changes and improvements.

Nine categories for comments were provided to encourage specific feedback on each facet of the training. These categories included: TQ background, personal values, group dynamics, steps of problem solving, tools and techniques, exercises, movies, final exercise, and other. Sixty-nine of those surveyed provided written comments. Appendix G contains those written comments broken out by topic. The overall comments provided by respondents will first be discussed followed by feedback on specific sections.

Only those comments that have universal application to the current syllabus will be discussed in this chapter. The summaries below are designed to overview the responses made by course graduates. Appendix G represents the source of those summaries.

Overall comments. Fifty-two comments that were classified as overall (or other) were made by respondents. Twenty-four positive overall comments were made in this section compared with four negative. Most positive comments addressed the respondent's agreement on the current course content and delivery. Negative comments involved the lack utilization as a CAT leader training graduate, length of the training (too long), the lack of follow-up, and the need to discuss more ASD related issues.
The main recommendations involved increasing the trained population to include all personnel, developing a refresher course and/or making training more timely, providing periodic surveys to past attendants, and emphasis on team dynamic issues involving conflict and management resistance.

**Total Quality Comments.** Eighteen comments represented the range of responses on the TQ background section. The majority of those making recommendations indicated that the material needs to be tailored to the individual group. Many recognized the need for information on total quality, but stated that it was redundant for some of the participants. Those with minimal TQ training stated that more of the basics were needed.

Negative comments involved too much time spent on fundamentals. Additionally, some of the material was described as outdated and too narrow in focus since it didn't include more discussion of individuals such as Deming, Crosby, etc.

**Personal Values Comments.** Of the twelve comments on the personal values section, ten were overwhelmingly positive. Several of those who responded indicated it was helpful both in understanding themselves, and those around them. A recommendation by one past attendee included using the Myers-Briggs Type Indicator as a substitute for the Strength Deployment Inventory.
Group Dynamic Comments. Seven individuals responding with comments on group dynamics were mostly favorable. Several identified the need to spend more time on the subject and include as a stronger focus on what makes a successful team and a recommendation to use role playing in learning to deal with difficult team members.

These comments are supported by the negative content validity ratio (CVR) related to dealing with difficult team members that was discussed in Chapter 4.

Steps of Problem Solving Comments. The smallest group size of six provided comments for problem solving steps. Overall, the comments were positive and two of the six who responded recommended a summary handout of the related material for use as a reference.

Tools and Techniques Comments. Sixteen separate comments were provided for the tools and techniques. Recommendations included focusing on the most used items, updating the manual, and providing more information on the when to use specific tools and techniques. Again, a summary handout was recommended of the material for use as a reference.

Exercise and Movie Comments. Nine individuals responded with comments and suggestions on the use of exercises in the course. The most frequent response involved the need to make the exercises more relevant to the work environment.
Eight responses were provided to the movies category. One respondent thought they were not useful while another indicted they were redundant because he/she had seen some in other training classes. The "Paradigm" film, Meeting Robbers, and The Abilene Paradox were all specifically referenced as great movies.

**Final Exercise Comments.** Fifteen comments were collected on the final exercise. Comments mostly involved the need for a more relevant subject. Those with opinions on use of a final exercise to reinforce material learned during the week were positive on that approach. Comments were also made on the time wasted while waiting to collect information from facilitators and the problems associated with being located too closely to other groups.

The written comments provided by those surveyed were generally positive and involved many recommendations that may be used to improve the course. Several individuals provided typed comments to this section indicating the investment of both time and thought in responses.

**Summary**

Chapter 5 provided a discussion of the data collected from the objectives, the knowledge test, and the questionnaire and formally concludes the requirements of the first five of the six major research objectives. Investigative questions identified in Chapter 1 were addressed and conclusions were drawn for each. In addition,
written questionnaire comments were discussed and summarized at the end of the chapter.

Chapter 6 now addresses the final research objective involving recommendations for improvements to the CAT leader training curriculum based on the information just discussed.
VI. Conclusions and Recommendations

Introduction

The developed objectives, knowledge test results and questionnaire responses provide a basis for a comprehensive study into the effectiveness of CAT leader training. The conclusions and recommendations that follow, are based on a combination of the results in chapter 5 and the experience of the researcher in ASD total quality initiatives and CAT leader training.

A discussion regarding how the six research objectives were addressed is given below. General conclusions are then provided to summarize the study results. Recommendations relating to changes in the current course and follow-on research ideas are then discussed.

Meeting Research Objective Requirements

Chapter 1 identified the six research objectives for the study. These were followed by investigative questions that focused the effort and allowed individual hypothesis to be tested and discussed. The study addressed each research objective. Validating a set of proposed objectives (objective 1) provided a framework for a knowledge test that measured learning and self-efficacy in CAT leader training (objective 2). Identifying the characteristics of current CATs and the involvement of past course attendees was measured by a questionnaire (objective 3). The results of
this questionnaire also addressed both the self-efficacy of past graduates and their perception and application of problem solving tools and techniques (objectives 4 and 5).

This chapter now draws conclusions involving the study, and then addresses the final research objective involving recommendations to the Commander of Aeronautical Systems Division (ASD) for improvement of the current CAT leader course (objective 6).

**General Conclusions**

General results from the evaluation indicate that the training is accomplishing the majority of its desired behavioral objectives and that training related material is being used in by graduates. Below are general conclusions on several aspects of the evaluation.

**The Internal Evaluation.** Results from the internal evaluation indicate that learning has occurred with the majority of training material presented in the course. Self-efficacy increased in most cases showing an improved self-perception to perform training related tasks. Predictors for a pre-test score model were identified, but provided limited explanatory power to predict a student's pre-score.

Limited focus for the research was placed on the areas of personal values and team dynamics mainly because of the need to limit the scope of study. However, many of the written responses placed a strong emphasis on these subjects.
in the course. This points to their strong influence on the effectiveness of the training and the need for future (and more thorough) evaluation in this area.

The Field Evaluation. The field evaluation showed that most of the CAT leaders are assigned an issue within three months of training and consider the issues worked relevant to a group problem solving approach. Half of the ten tools and techniques taught in training were used by the majority of graduates, while the other half saw little use. This result corresponds with the frequency of use for tools and techniques. All the tools and techniques in the current curriculum are perceived as having at least some degree of usefulness by those who responded.

Only 56 of 208 respondents (27%) have become CAT leaders in their organizations. This should be a major concern if the primary goal is to develop trained personnel for this purpose. Current terminal objectives provided in the CAT leader notebook support this purpose; however, recent discussions have disclosed a plan to change the training title to "Team Leader Training" which would place less of an emphasis on TQ affiliation (Wissman, 1991).

The Use of Specific Tools and Techniques. The high level and frequency of use for several tools, especially brainstorming and flow diagrams, should be seen as a positive result shown by this research. However, this situation may exist because many students have been trained
in these techniques prior to CAT leader training. Consequently, this training should eliminate or reduce the emphasis on these techniques. The growth in use for all tools and techniques should be encouraged, but not mandated. While some tools and techniques have seen limited use by graduates of CAT leader training, it does not necessarily mean that they deserve more use. CAT leader training should ensuring that they are understood and used properly.

Many tools and techniques are provided in the course so that options are available to appropriately address a myriad of organizational issues. However, the study shows that many students have not demonstrated an ability to identify the type of data involved (quantitative or qualitative) and the appropriate tool or technique for a specific problem solving step. This knowledge is essential for effective application of the material in a CAT.

**Terminal Objectives.** The terminal objectives are the three major objectives currently identified in the CAT leader notebook. To summarize, they include ensuring graduates are able to: 1) organize and manage a CAT to become and remain an effective functioning team, 2) explain the TQ structure and process effectively, and 3) teach the problem solving methodology and the appropriate tools and techniques to CAT members.

The study indicates that students are learning the material and important methods to develop and run an
effective CAT. However, timeliness of training and the small amount of feedback from graduates, currently limits the ability of training to be even more effective.

Regarding objective 1 that involves organizing and running and effective CAT; only 56 of 208 (27%) respondents to the questionnaire indicated they have performed as a CAT leader. This data shows that the majority of graduates do not fill this role. If developing CAT leaders is a primary objective, then efforts to promote more graduates into these positions is required. This may include educating organizations in their use, modifying the selection criteria for training and perhaps introducing changes in the course format to include even more specific CAT leader exercises and examples.

For the second objective involving explaining the TQ process, the roles and membership of the TQ structure is understood by most individuals. Students have learned the material; however, their ability to synthesize and explain the process represents a higher level of comprehension than that measured in this study.

Finally, the ability of graduates to teach group problem solving and team dynamics material is still an open issue. This study showed that the material was understood via knowledge test results, but a far more complicated measurement is required to demonstrate the ability to teach the material. Indeed, the conclusion that previous CAT
experience is not significantly related to a pre-test score supports the possibility that CAT leaders do not train members to use the problem solving tools. Review of the entire course seems to show a lack of congruency regarding this objective. Class discussions and exercise do not openly support this final objective. The researcher's observation is that students are taught to use the tools and techniques--they are not taught to teach them.

Recommended Changes

Recommended changes are supplied while acknowledging the limitations and advantages of an outside perspective. Clearly, none of the ideas provided should be made without the understanding and concurrence of the course facilitators. These individuals have a wealth of knowledge and experience that cannot be documented within these pages. They are responsible for the successes of the training to date. Recommendations for their consideration are provided below.

Review Course Terminal Objectives. As stated in the general conclusions section, both the first and third terminal objectives are not completely met by the current course. The first objective of training CAT leaders is not met since only 27% of graduates go on to fill that role. The third objective involving the student's ability to teach the material, is not supported by the current training methods. Either the training methods need to be changed, or
the terminal objectives need to be modified. The second terminal objective coincides with the current training program, but should still be reviewed to determine if it remains appropriate. All objectives should be considered with respect of the organizational needs currently present.

**Incorporate Training Block Objectives.** Training behavioral objectives were developed as part of this research and should be incorporated into the syllabus. These objectives formally describe both the material and level of learning desired by the current syllabus. They communicate expectations to the learner and provide a standard of measurement for training effectiveness (Goldstein, 1984:59).

Changes in course structure and content should consider current emphasis, overall course constraints, and terminal objectives. Clearly, if adding additional material is considered, then a corresponding decrease in the current syllabus or an increase in course length is required. The behavioral objectives provide a guideline to accomplish this task.

**Investigate Areas Showing Little Improvement.** When reviewing areas to focus improvement from knowledge test data, facilitators should investigate any area where a significant improvement in score was not made by all classes. While unique characteristics exist among each class, different conditions introduced by facilitators may
have an impact on performance and effectiveness. If this is the case, then they need to be identified and addressed.

**Review Objectives Not Emphasized.** Seven of the proposed objectives had negative content validity ratio (CVR) scores. This indicates that there is material in the CAT leader notebook that is not being taught by the majority of instructors during the class. This would be expected since the CAT leader notebook holds substantially more information than can be provided in a four-day course.

All objectives have a CVR score that provides a relative scale of emphasis by instructors. It would be useful in reviewing and in determining the desired mix in course content. A formal decision on any change in priorities should be discussed and agreed upon by both facilitators and the course director. Field units and current CAT leaders should also be queried to identify current system requirements.

In addition to the use of content validity ratios, the knowledge test data regarding comprehension of specific tools and techniques may be useful to identify those subjects understood by students prior to the class (pre-test results). This information may allow the facilitators to de-emphasize some material by providing a summary of the relative information. This would allow more time for other areas. The use of the instructional systems development
The ISD model would be an excellent tool to coordinate this process.

Measure Student Self-Efficacy. The five question scale developed in this research covers the main areas of task transference in the course related to personal use and application. This overall score can be computed for each class to provide an indication of the level of confidence it has in accomplishing course related tasks.

Easily computed averages for each class the first day may provide some indications as to the level of self-confidence of each class, allowing facilitators the ability to tailor their presentations. Additionally, a more quantitative measurement (as opposed to a critique) of training effectiveness could be provided from a pre-test/post-test comparison. Self-efficacy measurements dealing with higher levels of transference (i.e. teaching or explaining) could also be useful in future evaluations.

Results of self-efficacy measurements in the research data indicated that the June class showed the least (if any) improvement. Their corresponding scores in the knowledge test also showed a lower levels of learning, especially related to tools and techniques. These results may be the result of ineffective instruction, improper test measurement constructs, or environmental conditions. Self-efficacy scores related to future test results may provide more insight into this problem.
Develop a Tools and Technique Workbook. A tools and techniques workbook should be developed. This workbook could provide more work-related examples, an in-depth discussion of data types and collection, and summary information for reference during meetings.

Many of the comments collected by past participants involve the use of problem solving tools and techniques. Specific comments involved knowing when to use a specific item, a desire for more work-related examples, and the need for a summary handout to reference in meetings. These comments and the researcher's review of the current CAT leader notebook support the need for a more comprehensive set of references regarding specific uses of tools and techniques. Additionally, current CAT leaders in ASD organizations would be prime candidates for identifying and developing organizationally related examples.

One final point that supports a tools and techniques workbook involves the application of material. Knowledge test results indicated a lack of understanding between the concepts of qualitative versus quantitative data. This understanding is critical to the proper use of tools and techniques and needs to be emphasized more both in class and in reference material.

Investigate Training Format and Improve Follow-up. Comments made by several of the past participants involved the excessive length of training and the need for a
refresher (or follow-up) course for participants.
Currently, time gaps in training often occur for each class in different areas of the course. Videos and exercises are used well by facilitators to compensate for the different needs and schedules of each group. Unfortunately, a four-day course requires a significant commitment from ASD/TQ personnel which conflicts with the desire to offer a refresher (or follow-up) course.

If an objective of CAT leader training is to continue producing the current number of graduates, then a one week CAT seminar is recommended for study to address training length and follow-up. The one-week program would include two sessions: the first involving initial training, and the second as a refresher course. The initial training course would last three days and constitute the majority (but not all) of the current course emphasis. The second session would involve specific work issues from ASD. The second session could include several categories of participants that include: members of the first session that have already been assigned a CAT issue, past participants recently assigned an issue, leaders experiencing problems with their current CAT, personnel with past experience and training in the area, and others desiring more exposure to tools and techniques.

Small groups can provide support in determining approaches for addressing specific problems and tools and
techniques to use. Complete CATs may be able to use this time as an off-site to begin their own group with necessary support from roaming facilitators during those two days. Such a program would require a great deal of flexibility from the facilitators, but would address many concerns felt by graduates who have no formal follow-on program. Additionally, it would require only one additional day in a training location (although more time planning).

Follow-on Research

As discussed earlier, this research involved both an internal and a field evaluation of CAT leader training; however, the limited time frame and lack of secondary data limited the scope of the effort. Specifically in the field evaluation, the one shot case-study approach precluded any conclusions about training impacts to the organization. Below are several ideas for follow-on research to build on the body of knowledge already developed and account for limitations in the research.

Study the Current Training Syllabus. This research did not specifically address the appropriateness of the current training syllabus. Course material was assumed to be necessary for training a CAT leader.

One recommended follow-on effort involves the use of the Air Force instructional systems development (ISD) model in reviewing the course from a system requirements perspective. Steps 1 and 2 of the ISD model involves
analyzing system (organizational) requirements and then defining a training requirement. This has been accomplished for the current program in a less formal way and would be a good basis for validating the current syllabus and identifying necessary changes. The organizations involved in CAT leader training have many unique requirements that may require changes in the focus of CAT leader training and the introduction of additional material. In the April class, the concept of storyboarding was introduced. Perhaps this tool and others could be reviewed for applicability to CAT leader training and appropriately incorporated. The ISD model provides an excellent framework to accomplish this purpose.

Develop a Pre-test Predictor Model. Currently, training is provided to a broad range of personnel with different levels of experience and competence. A goal would be to tailor each course (or provide two or more levels) to meet the needs of individual classes and allow facilitators to proceed at a comfortable pace for all members.

The regression analysis performed indicated that there was a noticeable difference in pre-test scores based on the level of education and past training experience of an individual. However, these predictors are not sufficient to accurately predict an overall score. If future course offerings are planned to tailor course material, then a more comprehensive predictor model is required. Predictors that
include more specific demographic, training, and time relative information are required in the model and could be useful in explaining a larger portion of the score variance.

**Perform a Longitudinal Study of Course Performance.**
The pre-test/post-test data collection was accomplished within three days. Even though the control group indicated no significant impact that resulted from test sensitization, the short time span does not address the retention of material in the time period following the training. Administering the same knowledge test to recent graduates of CAT leader training should provide some insight into this area.

If the knowledge test approach is attempted in the future, recommend that several questions are developed for each variable of interest. Some limitations to this study were the result of only two or three test questions per variable. This limited the discrete distribution categories making it more difficult to approximate the normal distribution.

**Perform a Longitudinal Study on Tools and Techniques.**
The use of a one-shot case study as the questionnaire research design does not provide insight into the culture change involving the use of specific tools and techniques. However, it does provide a basis for future research in this area. Additional data collection from the respondents may show time related trends indicating the use and perceived
usefulness of individual tools and techniques. Since the data from the questionnaire allows grouping by training class, it would be very useful. Also, data collection from the ASD population as a whole, can provide information regarding the perceptions and actions of past course graduates with respect to those not exposed to the training.

**Evaluate Other Courses.** This research represents the most comprehensive evaluation of a quality related course in ASD. Several other courses provided by ASD/TQ have not received either an internal or field evaluation. Although, these courses have not been reviewed as part of this research, many of the work accomplished here may be beneficial to other existing classes. Specific research emphasis recommended for other courses includes developing behavioral objectives, measuring self-efficacy of course related tasks, identifying the level of learning that occurs, and investigating field use and acceptance of course materials.

Evaluation of Corrective Action Team (CAT) Leader Training

CAT Leader Training Facilitators

I am currently evaluating the CAT leader training provided by ASD. Part of this evaluation involves the development of a knowledge test for the course and a survey of past attendees. The knowledge test is designed to identify a participant's mastery of course objectives through examining what they knew before the course and what they learned as a result of the course. The survey is designed to identify how course material is used in the organizational environment. Both tools will be useful in making future course improvements.

A set of validated objectives is required to ensure the development of a reliable knowledge test and survey. Because of the different training approaches of each facilitator, your review is required to ensure these objectives are applicable to the course. Some objectives may only relate to material in the CAT leader notebook, but your participation is necessary to see what is addressed in the discussions. You do not need to identify yourself since only group statistics are required.

Please read the instructions and return the completed package to the TQ office NLT 28 Mar 1991. My goal is to have a knowledge test prepared for the April CAT training course. If you have any comments or concerns regarding the attached objectives, please identify them in the space following the objectives. Thank you for your time.

KIRK J. STREITMATER, Capt, USAF

1. Instructions
2. List of Objectives
3. APIT Form 11C
4. List of Definitions
5. Return envelope
Attachment 1: Instructions

1. Review each of the attached objectives (Attachment 2) and provide the response on the AFIT Form 11C that is most applicable to the way you normally facilitate the course. Use the scope definitions below to gauge the knowledge level required for each objective.

Scope Definitions

The following statements identify the scope of required knowledge proposed to each objective and relate specifically to developing questions for the knowledge test.

Have an appreciation for:

Be exposed to a concept, but not required to recount it.

Identify:

Have the ability to select the answer from a group of options, or properly order a list of items.

Know:

Have the ability to properly describe a process or provide a definition.

2. After responding to each objective using the AFIT Form 11C, follow directions for Sections 2, 3, and 4 on the last page of List of Objectives (Attachment 2).

3. Make any comments regarding definitions on the list of definitions provided.

4. Return the response sheets and list of definitions using the pre-addressed return envelope no later than 28 March 1991.

Note: The objectives developed are meant to describe the current training course as identified by the training syllabus and CAT leader notebook. Some objectives may only relate to material that is never openly discussed in the course but is provided in the book. Specific recommendations for improvements or additional objectives that have not been addressed can be identified on the last page of the list of objectives.
Identify the extent to which you cover each of the objectives below in your presentations of a particular training block.

(1) I completely cover this objective
(2) I partially cover this objective
(3) I do not cover this objective
(4) I have never taught this section of the course

Block: Overview of Total Quality Management

1. Identify the four major sub-systems that make up an organization's TQ structure from a TQ structure chart.
2. Identify the primary role of the four major sub-systems in an organization's TQ structure.
3. Identify the membership of the four major sub-systems that make up an organization's TQ structure from a list of options.
4. Identify the expected life of the four major sub-systems that make up an organization's TQ structure from a list of options.

Block: Values

5. Have an appreciation for the importance of values in day to day interactions that relate to both work and social environment.
6. Have an appreciation for the difference between maintenance factors and motivational factors identified by Herzberg.
7. Have an appreciation for what the Strength Deployment Inventory (SDI) describes and depicts.
8. Identify that the Strength Deployment Inventory (SDI) is based on personal inputs.

Block: Group Dynamics

9. Identify the 5 stages in Tuckman's model for group development.
10. Identify the characteristics of each stage in Tuckman's model for group development.
11. Identify the functions of a leader.
12. Have an appreciation for what does and does not constitute a leader.
Identify the extent to which you cover each of the objectives below in your presentations of a particular training block.

(1) I completely cover this objective  
(2) I partially cover this objective  
(3) I do not cover this objective  
(4) I have never taught this section of the course

Identify the extent to which you cover each of the objectives below in your presentations of a particular training block.

(1) I completely cover this objective
(2) I partially cover this objective
(3) I do not cover this objective
(4) I have never taught this section of the course

30. Have an appreciation for the tools associated with problem definition. (1) (2) (3) (4)
31. Have an appreciation for why data is collected and the difficulties often involved. (1) (2) (3) (4)
32. Identify the differences between qualitative and quantitative data. (1) (2) (3) (4)
33. Have an appreciation for the tasks and tools associated with gathering information. (1) (2) (3) (4)
34. Have an appreciation for the objectives of problem analysis. (1) (2) (3) (4)
35. Have an appreciation for the tasks and tools that can be associated with problem analysis. (1) (2) (3) (4)
36. Identify problem analysis tools as they relate to quantitative and qualitative data. (1) (2) (3) (4)
37. Identify problem analysis tools as they relate to data gathering and analysis. (1) (2) (3) (4)
38. Have an appreciation for the objectives in evaluating alternate solutions. (1) (2) (3) (4)
39. Have an appreciation for the tasks and tools that can be associated with evaluating alternate solutions. (1) (2) (3) (4)
40. Have an appreciation for the role objectives play in planning to implement a solution. (1) (2) (3) (4)
41. Have an appreciation for the tasks and tools that can be associated with planning to implement a solution. (1) (2) (3) (4)
42. Have an appreciation for the objective and concerns in planning to implement a solution. (1) (2) (3) (4)
43. Have an appreciation for the tasks and tools that can be associated with implementing a solution. (1) (2) (3) (4)
Identify the extent to which you cover each of the objectives below in your presentations of a particular training block.

(1) I completely cover this objective
(2) I partially cover this objective
(3) I do not cover this objective
(4) I have never taught this section of the course

Block: Tools and Techniques

44. Identify the operational definition of brainstorming. (1) (2) (3) (4)
45. Identify the operational definition of Nominal Group Technique (NGT). (1) (2) (3) (4)
46. Identify the operational definition of Cause and Effect Analysis. (1) (2) (3) (4)
47. Identify the operational definition of Check Sheets. (1) (2) (3) (4)
48. Identify the operational definition of Pareto Analysis. (1) (2) (3) (4)
49. Identify the operational definition of Flow Charting. (1) (2) (3) (4)
50. Identify the operational definition of Solution Selection Matrix. (1) (2) (3) (4)
51. Identify the operational definition of Force Field Analysis. (1) (2) (3) (4)
52. Identify the operational definition of Action Planning. (1) (2) (3) (4)
53. Identify how a specific tool or technique may be used in the problem solving process. (1) (2) (3) (4)
54. Identify a tool or technique when presented with the steps of that tool or technique. (1) (2) (3) (4)
55. Identify a diagram in the CAT leader notebook which represents a Cause and Effect diagram. (1) (2) (3) (4)
56. Identify a diagram in the CAT leader notebook which represents a flow chart. (1) (2) (3) (4)
57. Identify a diagram in the CAT leader notebook which represents a Source Selection Matrix. (1) (2) (3) (4)
58. Identify a diagram in the CAT leader notebook which represents a Pareto chart. (1) (2) (3) (4)
59. Identify a diagram in the CAT leader notebook which represents a Check Sheet.
Identify the extent to which you cover each of the objectives below in your presentations of a particular training block.

(1) I completely cover this objective
(2) I partially cover this objective
(3) I do not cover this objective
(4) I have never taught this section of the course

60. Identify the diagram in the CAT leader notebook which represents a Force Field Diagram. (1) (2) (3) (4)

Block: Meeting Effectiveness

61. Have an appreciation for the requirements of holding an effective meeting. (1) (2) (3) (4)

62. Have an appreciation for the requirements in making an effective management presentation. (1) (2) (3) (4)

This concludes the objectives in Section 1

Section 2

Please circle all objectives in Section 1 that are not always addressed solely due to time constraints.

ex. ( ) Have an appreciation for...

Section 3

If you responded with a 3 or 4 for any objective, please briefly indicate the rationale for that response by that objective in section 1 (i.e. not relevant, uncomfortable with topic, never enough time, etc.).

Section 4

Are there any comments regarding these objectives or are there subjects that were missed? If so, please elaborate (use back if necessary).
Attachment 4: List of Definitions

**Brainstorming** - Verbal generation of ideas in a group that they key specific details of a topic through encouraging spontaneous, rapid and creative input. Judgement is deferred.

**Nominal Group Technique (NGT)** - A method of reaching consensus that is a refinement of brainstorming. It involves the individual written recording of ideas followed by a group discussion that ranks and prioritizes.

**Cause and Effect Diagrams** - A graphical refinement of brainstorming designed to help identify the root causes of a problem. Individuals propose causes to a problem that are graphically represented as branches or twigs that feed into the problem.

**Checksheets** - A method of accumulating and documenting data to assist in the detection of patterns or frequency of occurrence of events.

**Pareto Analysis** - A prioritization tool involving a graphical technique where data is arranged in descending order to rank the contributors to a problem by their order of importance.

**Flow Charting** - A pictorial representation of all major sequential steps in a process.

**Solution Selection Matrix** - A numerically comparative chart that rates each proposed solution with respect to solution selection criteria. The sum of ratings for each solution against the criteria provides a structured method for comparison of solutions.

**Force Field Analysis** - A graphical technique that identifies the driving and restraining factors that contribute to the current status of a problem. A vertical line represents the current situation and drivers and restrainers are opposed to each other on opposite sides of the line to represent the reason for the current status.

**Action Planning** - A written plan of action for accomplishing a stated goal. It includes specific objectives, required major activities, personnel assignments and responsibilities, and an established schedule for accomplishment.

Appendix D: CAT Leader Training Knowledge Test

Corrective Action Team (CAT) Leader Training Evaluation

CAT leader training is currently receiving a major evaluation to introduce improvements into the course. You are one of three classes to support in class measurements.

This portion of the evaluation of CAT leader training is designed to identify the knowledge of course material by participants both before and after training. You do not need to identify yourself since only group statistics will be used.

Results should provide a foundation for:

- tailoring the TQ overview where material is already understood.
- investigating the impact of prior experience, training, and education on course material.
- identifying areas of strength to tailor discussions.
- deleting redundant material.
- emphasizing the proper topics.

The test is divided into two parts. Section 1 addresses demographic issues while section 2 relates to your knowledge of course material. This package covers more information than what is presented during training to measure topics that may be included in the future.

Please follow the instructions below:

1. Note your start time at the bottom of the page.

2. Using a number 2 pencil, mark the response sheet (APIT Form 11D) to answer the questions in the package provided.

   Answer all questions (unless otherwise directed)

3. Note your finish time at the bottom of this page.

START TIME: 

FINISH TIME: 

THANK YOU
Section 1: Personal/organizational

1. If Military, what is your current rank (leave blank if civilian)?
   A. WO (E-1 to E-3)   D. Captain
   B. WO (E-4 to E-9)   E. Major
   C. Lieutenant        F. Lt Col/Col

2. If civilian, what is your current grade (leave blank if in military)?
   A. GS-3 thru GS-5     E. GM-13 thru GM-14
   B. GS-6 thru GS-8     F. GM-15
   C. GS-9 thru GS-11    G. Other
   D. GS-12 thru GS-13

3. What was your age at your last birthday?
   A. Under 21          I. 56 or older
   B. 21-25             J. 57 or older
   C. 26-30             K. 60 or older
   D. 31-35             L. 60 or older

4. What is your gender?
   A. Female            B. Male

5. What is your highest achieved education level?
   A. High School Diploma
   B. Associate’s Degree
   C. Bachelor’s Degree
   D. Master’s Degree
   E. Doctoral Degree

6. Are you currently leading a Corrective Action Team (CAT)?
   A. Yes
   B. No
   C. I am an assistant leader

7. How many CATs or Critical Process Teams (CPTs) have you been involved with (as a leader or participant)?
   A. 0
   B. 1
   C. 2
   D. 3 or more

8. Do you currently have a CAT topic assigned to you by your organization? (Note: Leave blank if you are not planning to function as a CAT leader.)
   A. Yes
   B. No
   C. No, but one will be assigned upon my immediate return from training.

136
Have you received any of the following training/education related to group problem-solving and team dynamics?

9. Initial TQ Team Training with Cumberland
A. Yes  B. No

10. Transition TQ Team Training with ASD/Cumberland
A. Yes  B. No

11. Critical Process Team (CPT) Training with ASD/Cumberland
A. Yes  B. No

12. Quality Leadership Workshop training with Cumberland
A. Yes  B. No

13. AFIT - Quality Circle Facilitator/Leader Course (1979-1990)
A. Yes  B. No

14. APLC - Process Action Team (PAT) Training
A. Yes  B. No

15. ALC - Quality Circle Facilitators Training
A. Yes  B. No

16. Other (please specify) __________________________
A. Yes  B. No

Use the following rating scale for the next 5 statements to express your own feelings on your ability to perform various tasks.

A. Means you strongly disagree with the statement
B. Means you moderately disagree with the statement
C. Means you slightly disagree with the statement
D. Means you neither disagree nor agree with the statement
E. Means you slightly agree with the statement
F. Means you moderately agree with the statement
G. Means you strongly agree with the statement

17. I feel I have the capability to lead a group of individuals through the problem-solving process to resolve an organizational issue.

18. I feel I have the capability to explain the TQ structure and philosophy to individuals in my organization.

19. I feel comfortable using the tools and techniques of problem-solving in a group environment to address an organizational issue.

20. I feel I have the capability to prepare and facilitate an effective meeting.

21. I feel I understand the subject of group dynamics enough to build an effective team and solve an organizational issue.
Knowledge Evaluation

In the following diagram, match the major sub-systems of a "generic" Total Quality (TQ) structure in an ASD organization.

22. Critical Process Team
23. TQ Team
24. Corrective Action Team
25. Executive Steering Committee

Correctly match the TQ sub-system with its role:

<table>
<thead>
<tr>
<th>Sub-System</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>26. Critical Process Team (CPT)</td>
<td>A. Design and implement a system to continuously improve a designated high-level cross divisional/functional process.</td>
</tr>
<tr>
<td>27. TQ Team</td>
<td>B. Provide overall planning coordination and guidance of the improvement process. Monitor executive action plans and coordinate labor/management involvement.</td>
</tr>
<tr>
<td>28. Corrective Action Team (CAT)</td>
<td>C. Design, implement, and manage a system to cause improvements in an organization.</td>
</tr>
<tr>
<td>29. Executive Steering Committee</td>
<td>D. Address a specific problem in an organization and make recommendations to management for action.</td>
</tr>
</tbody>
</table>

Correctly match the TQ subsystem with its membership:

<table>
<thead>
<tr>
<th>Subsystem</th>
<th>Membership</th>
</tr>
</thead>
<tbody>
<tr>
<td>31. TQ Team</td>
<td>B. An entire specially trained team with owners of various elements of a process, plus others who would be helpful.</td>
</tr>
<tr>
<td>32. Corrective Action Team (CAT)</td>
<td>C. Cross section of organizational personnel with varying ranks and grades.</td>
</tr>
<tr>
<td>33. Executive Steering Committee</td>
<td>D. Individuals who are knowledgeable of the problem. Coordination is by a specially trained leader.</td>
</tr>
</tbody>
</table>
Correctly classify each TQ sub-system as one of the following structures in an organization:

34. ___ Critical Process Team  
   A. Permanent Organization  B. Temporary Organization

35. ___ TQ Team  
   A. Permanent Organization  B. Temporary Organization

36. ___ Corrective Action Team  
   A. Permanent Organization  B. Temporary Organization

37. ___ Exec Steering Committee  
   A. Permanent Organization  B. Temporary Organization

38. The Strength Deployment Inventory is best described by the following:
   A. A tool to describe observable behavior and depict general orientations/styles based on an individual's self-perception.
   B. A judgement test of the strengths and weaknesses of an individual.
   C. A management tool for matching the strength of an individual with possible job positions to maximize productivity.
   D. A group tool where members rate each other on a strength/weakness scale to identify possible personality conflicts prior to undertaking a major effort.

Properly order the 5 stages in Tuckman's model of group development:

39. ___ Stage I  
    A. Performing
40. ___ Stage II  
    B. Norming
41. ___ Stage III  
    C. Adjourning
42. ___ Stage IV  
    D. Forming
43. ___ Stage V  
    E. Storming

Correctly identify the characteristics of the individual stages of Tuckman's model identified below:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Characterized by:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performing</td>
<td>A. Testing and Dependence</td>
</tr>
<tr>
<td>Norming</td>
<td>B. Attempts at closure and ending</td>
</tr>
<tr>
<td>Adjourning</td>
<td>C. Development of team cohesion</td>
</tr>
<tr>
<td>Forming</td>
<td>D. Intra-team conflict</td>
</tr>
<tr>
<td>Storming</td>
<td>E. Functional Role relatedness</td>
</tr>
</tbody>
</table>

49. Which of the following is not a function of a leader:

   A. Guides a team in delineating a vision and setting goals.
   B. Mobilizes support and resources for goal achievement (helps translate goals into actions)
   C. Manages the interaction among members so that the energies of the team remain focused on problem solving.
   D. Provides a charismatic role model that encourages resolving group conflict and creating an atmosphere to meet common objectives.
50. Which of the following is not a barrier to effective communication:

A. Expectations  
B. Assumptions  
C. The receiver is a supervisor  
D. The receiver may not be listening  
E. The receiver may not understand  

Out of the following list, identify the first 3 steps of the 6 steps of problem solving (order not important):

51. __  
52. __  
53. __  
A. Establish the desired goal  
B. Document the specifics  
C. Define the problem  
D. Document a plan of action  
E. Gather information  
F. Analyze the problem  

Out of the following list, identify the last three steps of the 6 steps of problem solving (order not important):

54. __  
55. __  
56. __  
A. Evaluate alternate solutions  
B. Obtain management buy-in  
C. Plan the implementation  
D. Implement the solution  
E. List solution options  
F. Document a plan of action  

57. Which one of the following lists of tools and techniques is associated with the collection of qualitative data:

A. Check Sheets and questionnaires  
B. Graphs, histograms and Pareto charts  
C. Brainstorming, Interviews and Force Field Analysis  

58. Which one of the following lists of tools and techniques is associated with the collection of quantitative data:

A. Graphs and histograms  
B. Brainstorming and interviews  
C. Nominal Group Technique  

59. Out of the following list, identify that item that is not considered quantitative data:

A. The time to coordinate a letter  
B. The types of priorities in an action plan  
C. The number of clerks in an office  
D. The total cost of a weapon system  

60. Out of the following list, identify the item that is not considered qualitative data:

A. The names of each member of a team  
B. The approval steps in signing out a letter  
C. The factors that are considered in a promotion  
D. The amount of a raise
Match each specific tool or technique with its corresponding operational definition:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>61</td>
<td><strong>Cause and Effect</strong></td>
<td>A. <strong>Diagrams</strong></td>
<td>A pictorial representation of all major sequential steps in a process.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>B. <strong>A prioritization tool involving a graphical technique where data is arranged in descending order to rank the contributors to a problem by their order of importance.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>62</td>
<td><strong>Force Field Analysis</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>63</td>
<td><strong>Check Sheets</strong></td>
<td></td>
<td>C. <strong>A written plan of action for accomplishing a stated goal. It includes specific objectives, required major activities, personnel assignments and responsibilities, and an established schedule for accomplishment.</strong></td>
<td></td>
</tr>
<tr>
<td>64</td>
<td><strong>Nominal Group Technique (NGT)</strong></td>
<td>D. <strong>Verbal generation of ideas in a group that they key specific details of a topic through encouraging spontaneous, rapid and creative input. Judgement is deferred.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>65</td>
<td><strong>Flow Charting</strong></td>
<td>E. <strong>A method of accumulating and documenting data to assist in the detection of patterns or frequency of occurrence of events.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>66</td>
<td><strong>Solution Selection Matrix</strong></td>
<td>F. <strong>A graphical technique that identifies the driving and restraining factors that contribute to the current status of a problem. A vertical line represents the current situation and drivers and restrainers are opposed to each other on opposite sides of the line to represent the reason for the current status.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>67</td>
<td><strong>Action Planning</strong></td>
<td>G. <strong>A graphical refinement of brainstorming designed to help identify the root causes of a problem. Individuals propose causes to a problem that are graphically represented as branches or twigs that feed into the problem.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>68</td>
<td><strong>Pareto Analysis</strong></td>
<td>H. <strong>A numerically comparative chart that rates each proposed solution with respect to solution selection criteria. The sum of ratings for each solution against the criteria provides a structured method for comparison of solutions.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>69</td>
<td><strong>Brainstorming</strong></td>
<td>I. <strong>A method of reaching consensus that is refinement of brainstorming. It involves the individual written recording of ideas followed by a group discussion that ranks and prioritizes.</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
70. Identify the tool or technique that is not appropriate for defining a problem:
   A. Brainstorming
   B. Cause and Effect Diagrams
   C. Flow Charting
   D. Force Field Analysis

71. Identify the tool or technique that is not appropriate for gathering information:
   A. Solution Selection Matrix
   B. Check Sheets
   C. Pareto Analysis
   D. Cause and Effect Diagrams

72. Identify the tool or technique that is not appropriate for analyzing a problem:
   A. Flow Charting
   B. Nominal Group Technique (NGT)
   C. Action Planning
   D. Pareto Analysis

73. Identify the tool or technique that is not appropriate for planning to implement a solution:
   A. Brainstorming
   B. Force Field Analysis
   C. Flow Charting
   D. Check Sheets

In the next five questions, given the steps in the process, identify the tool or technique. Key concepts for each tool or technique are highlighted.

74. The steps on the right describe which tool or technique?
   A. Cause and Effect
   B. Check Sheets
   C. Nominal Group Technique (NGT)
   D. Flow Charting

   Step 1  Identify exactly what event is to be observed
   Step 2  Decide on the time period for data
   Step 3  Design a form that is clear and easy to use. Clearly label columns and leave enough space to enter data.
   Step 4  Collect data consistently and honestly
   Step 5  Total results

75. The steps to the right describe which tool or technique?
   A. Pareto Analysis
   B. Brainstorming
   C. Check Sheets
   D. Cause and Effect Diagrams

   Step 1  Determine how to collect and classify your data.
   Step 2  Collect data for a specified period of time.
   Step 3  Summarize recorded data in a table. Arrange from largest to small frequencies.
   Step 4  Set up chart. Category=Horizontal axis Quantity=vertical axis
   Step 5  Plot the data in descending order with highest value category on the far left.
   Step 6  Draw bars.
   Step 7  Plot Cum line (if used) to scale
76. The steps to the right describe which tool or technique?

A. Flow Charting
   - Step 1: Appoint a recorder

B. Nominal Group Technique (NGT)
   - Step 2: Make a list of all items
   - Step 3: Generate as many ideas as possible
   - Step 4: Encourage freewheeling
   - Step 5: No criticism or discussion allowed
   - Step 6: All members have an equal opportunity
   - Step 7: Rapid movement around the group
   - Step 8: Let ideas incubate

C. Force Field Analysis
   - Step 3: Generate as many ideas as possible

D. Brainstorming
   - Step 5: No criticism or discussion allowed
   - Step 6: All members have an equal opportunity
   - Step 7: Rapid movement around the group
   - Step 8: Let ideas incubate

77. The steps to the right describe which tool or technique?

A. Cause and Effect Diagram
   - Step 1: Select an undisturbable meeting place
   - Step 2: Prepare question and post on flip chart

B. Nominal Group Technique (NGT)
   - Step 3: Participants sequentially share ideas, one at a time, without discussion.

C. Brainstorming
   - Step 4: Record all ideas openly and visibly exactly as suggested

D. Force Field Analysis
   - Step 5: Continue process until no more ideas are generated
   - Step 6: Conduct a brief discussion only to clarify each idea
   - Step 7: Participants silently choose their top 5 - 8 ideas and rank order them
   - Step 8: Record the choices on 3X5 cards or post-its
   - Step 9: Repeat until the top 5 items are agreed to by all participants

78. The steps to the right describe which tool or technique?

A. Force Field Analysis
   - Step 1: Identify problem and/or solution

B. Cause and Effect Diagrams
   - Step 2: Identify the driving factors which result if the change is activated

C. Check Sheets
   - Step 3: Identify the restraining factors that tend to keep the change from occurring

D. Solution Selection Matrix
   - Step 4: Estimate strength of each
   - Step 5: Identify each as Type I, Type II, or Type III issue
   - Step 6: Develop Strategy to implement the change
     - Maximize driving forces
     - Minimize restraining forces
   - Step 7: Change restrainer to a driver
   - Step 8: Summarize results

79. This diagram is associated with which of the following tool or technique?

A. Cause and Effect Diagrams

B. Pareto Analysis

C. Action Planning

D. Check Sheets

<table>

HEADQUARTERS AERONAUTICAL SYSTEMS DIVISION (AFSC)
WRIGHT-PATTERSON AIR FORCE BASE, OHIO 45433-6503

30 April 1991

Corrective Action Team (CAT) Leader Training Effectiveness
Research

ASD CAT Leader Training Participant

1. This package is part of a coordinated research effort designed to evaluate and identify metrics for Corrective Action Team (CAT) leader training. Please take a few minutes to complete the attached questionnaire and return it in the enclosed envelope by 14 June 1991. The questionnaire was specifically designed to take less than 20 minutes to complete.

2. As individuals who have received the training and had the opportunity to apply what was presented, you provide a unique source of information that can guide future course improvements to make CAT leader training more effective in the ASD organization.

3. Your responses will be combined with those from other respondents and will not be attributed to you personally. Any information you can provide through feedback and suggestions will be useful. Copies of the final results for the entire evaluation will be available in September at ASD/TQ. If you have any questions, please contact Capt Kirk Streitmater, AFIT/LSG, 255-4437 or Mr Dale Wissman, ASD/TQ, 255-1755. Thank you for your consideration.

Ronald A. Fuller, Colonel, USAF
Commander's Assistant
for Total Quality

1. Questionnaire
2. AFIT Form 11C
3. Definitions
4. Return Envelope
Privacy Act

In accordance with paragraph 30, AFR 12-35, the following information is provided as required by the privacy act of 1974:

a. Authority:

(1) 5 U.S.C. 301, Departmental Regulations; and
(2) 10 U.S.C. 8012, Secretary of the Air Force, Powers, Duties, Delegation by Compensation; and
(3) DOD Instruction 1100.13, 17 Apr 68, Surveys of Department of Defense Personnel; and
(4) AFR 30-23, 22 Sep 76, Air Force Personnel Program.

b. Principle purposes. The research is being conducted to collect information to be used in evaluating the corrective action team (CAT) leader training conducted at Aeronautical System Division and improve the Total Quality (TQ) program effectiveness in that organization.

c. Routine uses. The data will be converted to information for use in research of management related issues dealing with TQ. Results of the research, based on data provided, will be included in published articles, reports, or texts. Distribution of the results of the research, based on the data collected, whether in written form or presented orally, will be unlimited.

d. Participation in this research is entirely voluntary.

e. No adverse action of any kind may be taken against any individual who elects not to participate.

Instructions

1. Review each item and answer appropriately.
   - You may mark on the package.
   - Refer to definitions in Attachment 3 (if necessary).

2. Transfer your responses onto the AFIT Form 11C.
   - Do not identify yourself in the response sheet.
   - Use a number 2 pencil to respond.

3. Place the response sheet in the envelope provided.
Section 1: Personal/organizational

This section will provide general background information regarding characteristics respondents who have taken CAT leader training.

1. If military, what is your current rank? (leave blank if civilian)
   1. Enlisted (E-1 to E-5)
   2. Enlisted (E-6 to E-9)
   3. Lieutenant
   4. Captain
   5. Major
   6. Lt Cpl/Colonel

2. If civilian, what is your current grade? (leave blank if military)
   1. GS-3 thru GS-5
   2. GS-6 thru GS-8
   3. GS-9 thru GS-10
   4. GS-11 thru GS-12
   5. GS-13 thru GM-14
   6. GM-15
   7. Other

3. What was your age at your last birthday?
   1. Under 21
   2. 21-25
   3. 26-30
   4. 31-35
   5. 36-40
   6. 41-45
   7. 46-50
   8. 51-55
   9. 56 or older

4. What is your sex?
   1. Female
   2. Male

5. What is your highest achieved education level?
   1. High school Diploma
   2. Associate's Degree
   3. Bachelor's Degree
   4. Master's Degree
   5. Doctoral Degree

Section 2: Training Information

This section will provide information that will allow time trend analysis for CAT leader training applications.

6. Are you currently in the organization that sponsored you for CAT leader training?
   1. Yes
   2. No

7. Select training date (Note: training date is on your mailing label)
   1. 1 Sep 89
   2. 29 Sep 89
   3. 13 Oct 89
   4. 17 Nov 89
   5. 8 Dec 89
   6. 12 Jan 90
   7. 9 Feb 90
   8. Other - item 8 or 9
   9. Other - item 7 or 9

8. Select training date (Note: training date is on your mailing label)
   1. 9 Mar 90
   2. 6 Apr 90
   3. 4 May 90
   4. 8 Jun 90
   5. 13 Jul 90
   6. 20 Jul 90
   7. 10 Aug 90
   8. Other - item 8 or 9
   9. Other - item 7 or 9

9. Select training date (Note: training date is on your mailing label)
   1. 14 Sep 90
   2. 12 Oct 90
   3. 16 Nov 90
   4. 7 Dec 90
   5. 8 Feb 90
   6. 22 Mar 90
   7. 12 Apr 90
   8. Other - item 7 or 8
   9. Other - item 6 or 8
Section 3: Assignments and status of CATs

This section will provide information on CAT involvement and status.

10. How many CATs have you been involved with (as a leader or participant)?
   1. 0 (SKIP to item 21)
   2. 1
   3. 2
   4. 3 or more

11. Which of the following best describes the status of your most recent CAT?
   1. CAT currently open.
   2. Recommendations made and implemented and CAT disbanded.
   3. Recommendations made but not yet implemented and CAT disbanded.
   4. CAT approach found inappropriate and other approaches pursued and CAT disbanded.
   5. Unknown - I am no longer in that organization.

12. Regarding your most recent CAT affiliation, how would you rate the applicability of using a CAT problem-solving approach in addressing that specific issue?
   1. The CAT problem-solving approach is/was very applicable.
   2. The CAT problem-solving approach is/was somewhat applicable.
   3. The CAT problem-solving approach is/was not very applicable.
   4. The CAT problem-solving approach is/was not applicable.

13. Have you served/are you serving as a CAT leader since receiving training?
   1. Yes
   2. No - Not yet assigned an issue, but planned (SKIP to item 15).
   3. No - No plans to function as a CAT leader (SKIP to item 15).

14. What was the time gap between training and assignment as a CAT leader?
   1. Was assigned CAT issue prior to training
   2. 0 - 1 month
   3. 2 - 3 months
   4. 4 - 6 months
   5. 7 months - 1 year
   6. Over 1 year

15. Are you currently involved in a CAT?
   (Give highest level of involvement applicable)
   1. No (SKIP to item 21)
   2. Yes, I am leading a CAT.
   3. Yes, I am an assistant leader.
   4. Yes, I am a participant, but not a leader.

16. Is the CAT identified in item 15 the first that you have been involved with since training?
   1. Yes
   2. No
17. How long has it been since the CAT was formed?
   1. 0 - 1 month
   2. 2 - 3 months
   3. 4 - 6 months
   4. 7 months - 1 year
   5. Over 1 year

18. Generally, how frequently does the CAT meet?
   1. One or more times per week.
   2. At least every other week.
   3. At least once a month.
   4. As the need arises.

19. How long has it been since the last meeting?
   1. Less than a week.
   2. Less the two weeks.
   3. Less than a month.
   4. more than a month.

20. How often is the CAT status briefed to the organizational leader?
   1. At least every week.
   2. At least every other week.
   3. At least once a month.
   4. A period longer than a month, but regularly scheduled
   5. As the need arises.

Section 4: Perceived abilities

This section will provide information of perceived abilities to perform different tasks.

Use the following rating scale for the next 5 statements to express your own feelings on your ability to perform various tasks.

1. Means you strongly disagree with the statement
2. Means you moderately disagree with the statement
3. Means you slightly disagree with the statement
4. Means you neither disagree or agree with the statement
5. Means you slightly agree with the statement
6. Means you moderately agree with the statement
7. Means you strongly agree with the statement

21. I feel I have the capability to lead a group of individuals through the problem-solving process to resolve an organizational issue.

22. I feel I have the capability to explain the TQ structure and philosophy to individuals in my organisation.

23. I feel comfortable using the tools and techniques of problem-solving in a group environment to address an organizational issue.

24. I feel I have the capability to prepare and lead an effective meeting.

25. I feel I understand the subject of group dynamics enough to build an effective team to solve an organizational issue.
Section 5: Use of Tools and Techniques

This section will provide information on the level and frequency of use of problem-solving tools and techniques.

Please identify the highest level of use for each of the following items. (1=lowest, 5=highest) in settings other than training courses.

Note: Definitions for each item are provided in Attachment 3.

### Level of Use

1. Have not used personally and have not seen used.
2. Have not used personally but have seen used in a CAT setting.
3. Have not used personally but have seen used in an organization setting.
4. Have personally used in a CAT setting.
5. Have personally used in an organization setting.

THANK YOU FOR YOUR TIME
Appendix F: CAT Leader Training Applicable Definitions

Steps in Problem Solving - A logical, systematic process aimed at understanding a problem issue and making an informed data based decision to solve the problem or optimize the opportunity. It includes six steps that are: defining the problem, analyzing the problem, evaluating solutions, planning the implementation, and implementing the solution.

Brainstorming - Verbal generation of ideas in a group that key the identification of specific details of a topic through encouraging spontaneous, rapid and creative input. Judgement is deferred.

Nominal Group Technique (NGT) - A method of reaching consensus that is a refinement of brainstorming. It involves the individual written recording of ideas followed by a group discussion that ranks and prioritizes.

Cause and Effect Analysis - A graphical refinement of brainstorming designed to help identify the root causes of a problem. Individuals propose causes to a problem that are graphically represented as branches of twigs that feed into the problem. Also known as fishbone diagrams.

Pareto Analysis - A prioritization tool involving a graphical technique where data is arranged in descending order to rank the contributors to a problem by their order of importance.

Checksheets - A method of accumulating and documenting data to assist in the detection of patterns or frequency of occurrence of events.

Flow Charting - A pictorial representation of all the major sequential steps in a process.

Solution Selection Matrix - A numerically comparative chart that rates each proposed solution with respect to solution selection criteria. The sum of rating for each solution against the criteria provides a structured method for comparison of solutions.

Force Field Analysis - A graphical techniques that identifies the driving and restraining forces that contribute to the current status of a problem. A vertical line represents the current situation and drivers and restrainers are opposed to each other on opposite sides of the line to represent the reason for the current status.
Action Planning - A written plan of action for accomplishing a stated goal. It involves specific objectives, required major activities, personnel assignments and responsibilities, and an established schedule for accomplishment.
Appendix G: CAT Leader Graduate Questionnaire Comments

Subject: Overall Comments

1. The training program provided for CAT Leaders is, by textbook example, very good. However, for resolving most of the types of problems that many individuals at the organizational level are asked to work, the CAT Training Program is overkill.

   Recommend that ASD/TQ conduct a survey in ASD, requesting Program Offices to identify the most common types of problems encountered. That is, if it has not yet been accomplished. Then restructure training for individuals based on commonality of problems to resolve.

   The current program is excellent for those personnel that are directly involved in the re-organization/coordination of the AFLC and ASD organization. Those Structures/tasks/problems are very complex.

2. Everything okay.

3. This (as I said in my evaluation of the course) was the best course on this subject (problem solving techniques) that I have ever encountered. I believe (some how) we should equip all our personnel with these tools.

4. I have my first CAT involvement within the next week. Looking forward to it. It was hard to get selected--no one wants to allow secretaries activities away from their office. Not even those working for their Master's degree.

5. I have not been fully utilized as a CAT Team Leader, therefore the training is becoming fuzzy. I feel the money spent training me has been wasted thus far.

6. Future courses may want to include decision making processes where consensus is not a requirement or reaching a consensus is difficult.

7. Taking the course material and making it work in your groups requires education of the group. Any education materials (plan) you could provide for the new CAT leader would be helpful. Copying the CAT manual is not appropriate, but I have made selected copies of material in this manual.
8. Excellent training... the problem is applying in the organizational environment! Still too many layers of management decision...

9. I feel that the participants of the CAT leader course should be from the same organization rather than several different ones. That way people get to know one another from the same unit and work on a final exercise that pertains or is related to their organization.

10. I feel the course is good and adequate.

11. Don't have any specific comments--other than I have enjoyed the course very much--thought it was very useful.

12. Need more guidance on how to deal with managements' resistance when teams try to make things happen. i.e. Education showing movies monthly on TQ working in organizations outside the government.

13. There was no follow up! Need references and other sources! I am interested in the outcome of this research.

14. TQ seems to be falling from popularity already. It may only be in the organization that I'm in.

15. The initial CAT leader training or a refresher course should be taken immediately prior to the leading of a CAT Team.

Future CAT leaders should first be participant's or first hand observers in on going CAT teams prior to being on the firing line as a CAT leader.

More former CAT team leaders should be used to teach parts of the leader training course.

This survey should be done incrementally: 1) shortly after the course; 2) after CAT team participation; 3) after CAT team leader experience.

16. Our office has practices brainstorming as well as NGT on our off-site meetings but nowhere else. The mind set is such that these valuable techniques be only applied to TQ related activities, not training others to use them in day-to-day activities. Promote these techniques via training all the unwashed masses.

17. I think you are pretty much on target with everything.
18. Overall a good course.

19. Need more specific direction in conducting a CAT and dealing with problems encountered during a CAT. Also, how it interfaces with management.

20. The training, instructor, class materials and environment are all exceptional.

The biggest obstacle to overcome is not the actual training, which is actually the second challenge, but the attitudes and "thinking" of our current work force. Most individuals attending the training are people from the "old" school of thinking. By this I mean...gone is the day when a person can achieve a job or task "alone". No more can a person exist in a world of their own, in a little office doing one specialized mission. Each individual must be diversified and have a clear understanding of many processes that effect their mission.

Achievement of this can only be accomplished by working "together". Thus, you have the birth of not only TQ, but a whole new way of thinking. When people are convinced that without working together we will not only "not survive", but also will not be able to achieve "a Total Quality" environment, only then will they accept and "use" these wonderful tools that ASD has endeavored to equip us with to achieve this goal.

As I have told many people, [organization]'s chief was "TQ" before it became a household word in ASD. But, he perceived his mission was to "convince" his people there was no other way to achieve our mission without working together, which in turn inspired us to strive for excellence through teamwork! We have a group of people with good "attitudes" and a new way of thinking. They are progressive thinkers, and are not afraid to try new methods. Many of our people attended your CAT training. They came back truly inspired. I felt part of it because they saw that our way of thinking was now becoming the norm. ASD was now on the road to providing the tools for all people to have this "new thinking."

Once people accept the idea as a "way of life", they will use the wonderful "tools" that ASD is providing.

21. Some sort of follow-up training should be accomplished. I have volunteered myself as a CAT leader member and never had the opportunity of using any of the skills I have learned at the CAT course.
22. I haven't been involved in a CAT yet, so much of my answers were either undecided or could have been answered better if I was more involved. Seems like the same people do the CATs all the time.

23. Need something on difficult people. Management needs to be educated--implementation of recommendations is their department not the CAT teams. "Don't kill the messenger because you don't like the findings."

24. [organization] middle management not sold/not using. Upper level?

25. It made me a believer in using intervals! Way to go!

26. All sections very good. They reinforced my belief that the biggest roadblock to getting the job done is interpersonal relations, not technical inadequacies.

27. CAT leader training has proven to be the most useful training I have had at ASD. Strongly recommend this training for everyone.

28. I thought the course and lessons were fine but haven't had the opportunity to employ them. I believe TQ at ASD has taken a serious setback in the last 8-9 months.

29. Have not been selected to support CAT effort and would require a review on all areas before I could be a significant team member. I endorse the CAT initiative but feel that many people are afraid to make a decision. Also maybe the teams are too large to be effective.

30. 1) [more info on] how to recruit CAT team members; 2) a little more emphasis should be made regarding "how to wrap-up a CAT" besides recommendations and presentations; 3) [more info on] how to get support from 2-letter.

31. Enjoyed it!

32. All sections excellent. TQ problem solving not big in [org]. TQ education is good in [org].

33. How about a "fun" test or exam so we can be challenged to be kept current. Could be on AMS and you could monitor trends by answers received. Sponsor a Wright-Patt wide CAT leader alumni association and have someone record lessons learned and shared.
34. CAT leader training should be 3 days and not four days long.

35. It took me 40 minutes to complete this survey with one 2-minute interruption.

36. Give a framework for starting teams. Trainers just presented tools, taught how to use them and said go "build a house." When we asked "where do we start?" they said, "nothing is right or wrong just do what feels right." Suggestions of minimum start-up tasks would be good.

37. I see no reason to change anything!

38. Overall, I believe the CAT leader training was very useful training for ASD personnel. The lessons on problem solving techniques were very useful.

Widely providing training on methods for fixing processes suggests there might be a correspondingly wide opportunities for fixing processes...

Many processes we use are dictated externally through regulation, law, etc. I know of no significant processes or problems which have been changed as a result of CAT leader training or TQ...

[I tried group consensus on my project team with poor results]... Team consensus works if the team is only composed of reasonable people, with like viewpoints, who are willing to compromise. That would be a rare and probably unimaginative team. I have concluded that team leaders need to try to reach consensus, but must be allowed and willing to make decisions after careful consideration of team viewpoints. Undoing consensus approach, once started is difficult. I recommend CAT leader training be very careful about encouraging consensus building as a sole method of problem solving to the exclusion of decision making.

39. Overall, it was an excellent training opportunity.

40. Good coverage (both time and material) of all sections.

41. Necessary to take the time to use skills learned, its common to have the desire to use techniques but difficult to rearrange busy schedules to implement.

42. Need to send this survey out sooner, say less than two weeks after completion. My memory is somewhat vague on making recommendations for improvements to TQ class.
43. Keep enthusiastic teachers for the course. "Enthusiasm is contagious."

44. I found the overall training valuable outside the context of a specific CAT situation. (even useful in my community volunteer work!) Thanks.

45. Overall Super job

46. Generally useful

47. Class too long (4 days) Bring more real (ASD) issues into discussion.

48. My biggest problem is I was a CAT leader before training and now I haven't been given a CAT recently. The training needs to be given right before the team is commissioned.

49. Can this course be distilled/shortened at all? I experienced a tough time getting four days off for training from my boss, TQ or not.

50. I have used many of the things I learned in CAT training in my work and in my personal life. I recommend it for everyone whether they are TQ related or not.

51. Not every SFO or problem requires the long, tedious CAT process to apply an effective solution. In most cases -- a single action officer can solve and implement a very effective fix to a process problem. The democracy fails at times. Socialism is often abused by individuals seeking power and attention. The CAT process takes an inordinate amount of time-- much too tedious and long.

52. I thought the CAT leader training was excellent and should be made mandatory for all EN branch chiefs. Everything we do at ASD involves working with teams of people. Therefore, the CAT leader training should be given throughout ASD/EN.

Subject: TQ Background Section

1. Course I went to - discussion centered on Japanese quality initiatives and on. Feedback I received from others who had same training, but different instructors was that too much time was spent covering the fundamentals AGAIN!

2. Should be shorter--an overview.
3. Old hat for many, but must be reviewed for folks new to TQ.

4. Too lengthy.

5. Tailor to the group.

6. Explain more about the Cumberland Group, where they started and how we got 'em.

7. Most important for SPO wide CAT training.

8. Improve presentation, book was not organized logically when I took the course.

9. Should be separate from CAT leader training.

10. Give us some examples of some successful CATs and CATs in progress for motivation.

11. Terrible, need to get with TQ office and get up to date.

12. People with similar levels of TQ exposure should be grouped together for classes and this topic structured accordingly.

13. Better definition of the process. Who are the points of contact.

14. Should have more (all employees need a 40 hour course explaining the TQ process).

15. Too narrow a view. The Cumberland Group approach is a misapplication of factory TQM to white collar TQM organizations. A broader overview with specific references to Deming, Crosby, etc. would be more valuable.

16. Do not assume everyone is completely familiar with TQ.

17. More on basics of TQ. I was sent to CAT training with zero info on what TQ was functionally.

18. Needed to go into more depth and not assume people were all knowledgeable on TQ.

Subject: Personal Values

1. Excellent. A root cause of many team problems and disagreements. Not fully appreciated or used by most trainees. The personality tests red-green-blue was not
very helpful-- Myers-Briggs would be better, more usable, and widely recognized.

2. Interesting. Good.
3. Good input.
4. Informative.
5. Showing how values related to lifetime goals was important. Then, I was better able to understand the goals setting process in the work place.
6. Excellent-- sets the stage.
7. Good section to help people better understand how the way people are raised affects how they will work together on a team.
8. Inappropriate and unprofessional examples used to make a point. Why "not have sex with others"?
9. Important to learn about oneself.
10. Very valuable
11. No preaching
12. Terrific-- opened my eyes.

Subject: Group Dynamics
1. Needed more time.
2. OK, but could be much improved by reviewing current research and books on high performance teams. The focus on the stages the teams go thru is not enough.
3. How about role playing to deal with difficult team members?
4. This was especially interesting to me, because it clarified to me how I come across to others (clarifying/dominating).
5. Sometimes kind of technical.
7. Terrific-- opened my eyes.

162
Subject: Steps of Problem Solving

1. Needed more time.
2. Condensed handout for group distribution.
3. Some seem more useful than others.
4. Extremely important. Able to use if able to remember this process. Suggest a summary card be printed and handed out to students. Could post card on desk.
5. Vital.
6. Now I know how to approach problem solving in an orderly and logical way.

Subject: Tools and Techniques

1. Good coverage.
2. Condensed handout for group distribution and education of team.
3. OK. Need more examples and explanation of when to use. Why should you choose one method over another.
4. The fishbone diagrams, pareto analysis, solution selection matrix, and force field analysis are nice concepts but do not work like the human mind so they seem like more work than they are worth. Nobody ever uses them.
5. More background info would be useful. I knew what was going on because of previous training, but others were lost.
6. Need to weed out least used ones and spend more time on others.
7. Skinny down, clean up manual.
8. Could have been explained better. In some cases, oversimplification complicated explanation.
9. If you try to use any of these techniques in a non-TQ meeting, people think you are trying to "force TQ" upon them. Suggest application methods in meeting situations.
10. One of the most helpful.
11. Emphasize this more. As new techniques are learned, make sure all CAT leaders are educated.

12. Don't overload people all at once.

13. Need better examples or explanations—especially Pareto Analysis.

14. Vital (could use a summary card for quick reference at the job site).

15. Copier problem overworked.

16. So-so.

Subject: Exercises

1. Not all related to our environment.

2. OK, but rushed. Instructor with our group didn't seem interested and wasn't helpful.

4. Would rather work on [examples] more relevant to the work place.

5. Desert Storm exercise was inappropriate example for synergy. Scoring system was flawed.

6. Good for working through the process without a lot of stress.

7. Very effective.

8. Some good, some very flimsy data to begin with.

9. This above all, probably gives greatest applicability back to the work environment. However the exercises need to be related to work (applicable) and substantial (not fluff).

Subject: Movies

1. Good examples.

2. There is a definite lack of QUALITY TQ movies available for general use. The movies in the CAT course weren't too bad.

3. A waste of time.
4. Paradigm film was outstanding.

5. All movies should be shown in one type of training course or another--too much duplication.

6. Don't remember seeing any movies. Would be a good tool (ex: CAT team in action solving a problem).

7. Meeting Robbers is great.

8. The Abilene Paradox--great.

Subject: Final Exercise

1. Good approach.

2. This exercise was great in that it tied all the information into practice. A true synergy example.

3. Our group presentation was a disaster because of one individual. I don't know what you can do to correct those types of problems.

4. Took my group all day and still had problems. In the final problem, the number of customers at the base cafeteria was declining. I had difficulty grasping why this was a problem. If one base cafeteria is no longer needed, then that's a savings to the U.S. taxpayers. Others in the group didn't seem to have any difficulty in seeing the problem, perhaps because we were required to have a solution in a few hours. Something needs to be done to get a clear concept of the mission. At one point in the class, visiting CAT team leaders were asked to give their experiences as a CAT leader using TQM. One individual was quite proud of her accomplishment of pushing routine paperwork away from a secretary making $10/hr onto a manager making $50/hr. As it turned out, the occurrence of declining customers at the cafeteria was due to a safety problem. Up front, the goal of the group should have been to discover in any health or safety dangers existed at the cafeteria and not to increase clientele.

5. Need a more relevant problem than bad coffee.

6. Overhearing other groups' progress ruins the effectiveness of the exercise.

7. Excellent! Could apply everything that was taught--brought everything together.

8. Would rather work one more relevant to work place.
9. This exercise was good. However, I would schedule it around lunch. The final day should include a time when cohesiveness of class members should materialize without stress. A working lunch is very stressful to me. People need a break during the day to renew themselves so that they can operate at peak performance (TQ) during the afternoon as well as during the morning.

10. Interesting.

11. Well done and vital to get the hand-on experience that fixes the concepts in your mind.

12. Needs work.

13. Certainly brings group dynamics into use.

14. This above all, probably gives greatest applicability back to the work environment. However the exercises need to be related to work (applicable) and substantial (not fluff).

15. Had to wait on other groups to see the leader (facilitator) which impacted time spent on exercise.

Vita

Captain Kirk J. Streitmatter was born on 3 April 1964 in Lowell, Massachusetts. He graduated from Londonderry High School in Londonderry, New Hampshire in 1982 and attended the U.S. Air Force Academy, graduating with a Bachelor of Science degree in Astronautical Engineering (specialty: guidance and control theory) in May 1986. He began his acquisition career upon assignment to Wright-Patterson AFB in January 1987 as a configuration control manager for the B-1B weapon system that was currently in production. During the next two years, his responsibilities included coordinating the waiver and deviation process for the entire program and serving as the senior configuration manager for the B-1B offensive avionics technical baseline. In November of 1989, he was assigned as a B-1B Special Projects Manager and oversaw a fleet retrofit of the offensive avionics system and a safety related high priority electrical multiplexing system project. In addition to his other duties, in the summer of 1989, he was selected as the first chairman of the B-1B Total Quality Team charged with implementing a quality program in the organization. He served in this regard until entering the School of Systems and Logistics, Air Force Institute of Technology, in May 1990.

Permanent Address: 5 Pine Street
Londonderry, NH 03053
This study evaluated corrective action team (CAT) leader training, a team dynamics and group problem solving course provided by an Air Force product division. A knowledge test was administered to 61 participants as part of an internal evaluation while 373 past participants were provided a questionnaire for a field evaluation. Results from the internal evaluation indicated that students learned the majority of training material presented in the course. Self efficacy increased in most cases showing an improved self-perception regarding the ability to perform training related tasks. Predictors for a pre-test score model were identified, but overall provided limited explanatory power to predict a student's pre-score result. The field evaluation showed that the majority of graduates, 152 out of 208 (73%), do not function as CAT leaders. Those who do lead CATs, are assigned an issue within three months of training and consider the issues worked relevant to a group problem solving approach. Half of the ten tools and techniques taught in training were used by the majority of graduates, while the other half saw little use. All the tools and techniques in the current curriculum are perceived as having at least some degree of usefulness by those who responded.
AFIT RESEARCH ASSESSMENT

The purpose of this questionnaire is to determine the potential for current and future applications of AFIT thesis research. Please return completed questionnaires to: AFIT/LSC, Wright-Patterson AFB OH 45433-6583.

1. Did this research contribute to a current research project?
   a. Yes     b. No

2. Do you believe this research topic is significant enough that it would have been researched (or contracted) by your organization or another agency if AFIT had not researched it?
   a. Yes     b. No

3. The benefits of AFIT research can often be expressed by the equivalent value that your agency received by virtue of AFIT performing the research. Please estimate what this research would have cost in terms of manpower and/or dollars if it had been accomplished under contract or if it had been done in-house.

   Man Years __________________   $__________________

4. Often it is not possible to attach equivalent dollar values to research, although the results of the research may, in fact, be important. Whether or not you were able to establish an equivalent value for this research (3 above), what is your estimate of its significance?

5. Comments
