BuyIt Prototype
Software Requirements Analysis:
A C-BASS Component

by Brian R. Schallhorn, Wade S. Jernigan,
and Dana L. Ulery

Abstract

This document contains the software requirements analysis for a prototype of BuyIt. As a component of the Corporate Business Application Software System (C-BASS), this application automates small purchase requests (under $2,500). The document follows the process of structured analysis, or step-wise refinement of requirements, as applied to the development of BuyIt. The "environmental model" includes a high-level system description, followed by a context diagram and a list of events to which the system must respond. The "behavioral model" includes a data flow diagram (DFD) for each of the seven BuyIt subsystems. From this representation, the basic functional specifications are derived and represented in structured English (or program design language). The final segment of the document includes a data dictionary.

1. Introduction

BuyIt is a component of the Corporate Business Application Software System (C-BASS) family of applications, an integrated set of Lotus Notes and Web-based software to support U.S. Army Research Laboratory (ARL) electronic workflow and task automation. The motivating force behind this project has been ARL downsizing and findings put forth in the Business Process Reengineering (BPR) report on the small purchase process. The BPR “To-Be Model: Small Purchase” [1] identifies potential process improvements—some of which require computer automation—that would increase productivity of purchasing operations at ARL. Development of a full-production BuyIt will proceed in phases, using an incremental, evolutionary approach.

1.1 BuyIt Prototype. The purpose of the BuyIt prototype project is to model a secure client/server system that provides for the processing of small purchase requests. This proof-of-principle prototype will alleviate some of the risks involved in implementing new technologies used to build the ARL Intranet. The project will also refine requirements described in the ARL Business Process Reengineering (BPR) “To-Be Model” [1].

1.2 Development Plan and Project Schedule. The “BuyIt Software Development Plan” [2] states a definition of the problem; gives an overview of technical, management, and reliability issues; and provides a detailed project schedule. The report enclosed herein covers the work accomplished to solidify user requirements (drawn from existing high-level design documents) and the analytical expansions used to derive a data flow model, a pseudocode representation of processing, and a data dictionary. As stated in the project schedule, the analysis represents a 10-working-day effort and was completed within the stated timeframe of 13 January 1997 to 27 January 1997.

1.3 Contents of This Report. This document presents the results of a structured system analysis used to derive the software requirements for BuyIt, starting with the baseline given in the BPR “To-Be Model: Small Purchase” [1]. The body of the report contains five sections.
• **Structured Analysis Overview** - briefly explains the methodology used to extract the software functional specifications.

• **System Overview** - delineates the basic BuyIt concept and outlines the high-level requirements.

• **Requirements** - breaks the generic statements into low-level, derived requirements and describes each in detail.

• **Functional Specifications** - discusses the products of the structured analysis (i.e., the data flow diagrams and structured English narrative) for each subsystem of BuyIt.

• **Data Dictionary** - lists each of the BuyIt data elements, giving a full description and type for the data model.

### 2. Structured Analysis Overview

Modern software engineering utilizes structured analysis [3] as a powerful methodology for developing system specifications. Through a series of step-wise refinements, detailed delineations of the system's components and their behavior are extracted from high-level descriptions of system features and functions. In other words, primary system elements are broken down into progressively more detailed levels of processes, and the data paths between these processes are defined. Three modeling tools facilitate this decomposition: (1) data flow diagrams (DFDs), (2) structured English process narratives (pseudocode or program design language [PDL]), and (3) a data dictionary. Accuracy and precision in progressively expanding design definitions are critical to successful system development.

The results of this analytical approach are systematic elaborations of product requirements, typically expressed as two separate models:

• An environmental model that defines the system's interfaces to the outside world. (See section 3, "System Overview.")
• A behavioral model that defines the internal behavior the system must exhibit in order to
deal with the environment. (See section 4, “System Requirements,” and section 5,
“Functional Specifications.”)

3. System Overview

The environmental model typically consists of three components: (1) a concise statement of
the system’s purpose or required functionality, (2) a context diagram, and (3) an events list. The
context diagram is the highest level DFD. It shows the system as a single process, including user
interaction and communication with external systems, as well as data flow input and output. The
events list creates an index of outside stimuli to which the system responds.

3.1 Required Functionality. As a system, the BuyIt prototype provides a secure,
automated means for the preparation, routing, approval, tracking, and reporting of small purchase
requests. Table 1 lists the high-level requirements for the BuyIt prototype and a general
description of what each requirement involves.

3.2 Context Diagram. Figure 1 shows the context diagram for the prototype. Each square
in the diagram represents an external entity (e.g. users, functional areas, and legacy systems) with
which BuyIt communicates. The arrows indicate the data that flow into and out of BuyIt. A few
elements on the DFD need additional explanation. First, the external entity “User” represents all
users of the system, and the data flow associated with this box is limited to display of information.
Second, all the other external entities (e.g., “Requester” and “Supervisor”), and their
corresponding data flow, show the specific information that is passed to BuyIt either by that user
or by the system. Lastly, the data store EMPLOYEE contains user information such as name,
phone number, address, office symbol, etc.
Table 1. High-Level Requirements for the BuyIt Prototype

</tr>
</tbody>
</table>

3.3 Event List. The following list contains events to which the system must respond.

- Requester initiates new purchase request.
- Requester prepares request.
- Requester corrects rejected request.
- Requester, supervisor, or budget analyst completes fund source.
- Requester or supervisor cancels request.
- Budget analyst certifies fund source.
- SOMARDS certifies and commits funds.
- Special approving official(s) approves request item(s).
- Property book officer attaches item tags.
- Property book officer approves request.
- Contracting officer assigns buyer to request.
- SAACONS downloads purchase order information.
- Supervisor approves actual costs.
- Receiving marks shipment as received.
Figure 1. Context Diagram for BuyIt.
- Receiving checks off tagged items.
- Requester accepts shipment.
- User submit status inquiry.
- User request report.

4. System Requirements

Antecedent studies and legacy systems also contribute to BuyIt's requirements. The “Automation Requirements” [4] and the “To-Be Model: Small Purchase” [1] were produced during the BPR development effort. However, for some areas, these documents lack detail, and necessary elements had to be derived. Additionally, the limited scope of a prototype necessitated leaving out some of the more complicated or vague automation requirements of the “To-Be Model” (e.g., a pull-down product selection) or areas where the requirement already exists in a Department of Defense (DOD) standard system (e.g., functionalities handled by SAACONS). “BuyIt: Software Development Plan” [2] more fully addresses the constraints on the prototype and the requirements of legacy systems.

E1  Security

E11 Prevent unauthorized access

*Description* -- Prevent unauthorized access to the system and its data.

*Source* -- Derived, due to the nature of the system.

*Interfaces to major functions and external entities:*

User.

E12 Enforce role restrictions

*Description* -- Prevent users from performing tasks or accessing/editing data that are out of the scope of their role.

*Source* -- BPR “To-Be Model” document, Automation Requirements section, requirement A12.

*Interfaces to major functions and external entities:*
Purchase request preparation

E21 Create new purchase request

*Description* -- Allow the requester to create a new purchase request with preliminary user information filled-in

*Source* -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A111 and A114.

*Interfaces to major functions and external entities:*

User.

Security.

Employee address book (for user info).

E22 Select items

*Description* -- Provide a means for the requester to enter item descriptions, specifications, quantities, and estimated costs.

*Source* -- BPR “To-Be Model” document, Automation Requirements section, requirement A112.

*Interfaces to major functions and external entities:*

User.

Security.

E23 Complete purchase request

*Description* -- Provide a means for the requester and/or approving supervisor to complete the purchase request.

*Source* -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A114.

*Interfaces to major functions and external entities:*

User.

Security.
E24 Item tag input

Description -- Provide a means for the Property Book Officer to enter item tags.

Source -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A113.

Interfaces to major functions and external entities:

User.

Security.

E25 Edit purchase request

Description -- Provide a means for users to edit certain request details as needed.

Source -- Derived, due to the need for making corrections to rejected purchase request.

Interfaces to major functions and external entities:

User.

Security.

E3 Automated routing

Description -- Automate the process of routing purchase requests to the various functional areas and approving officials.

Source -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A12.

Interfaces to major functions and external entities:

Security.

Employee address book (for default routing).

E4 Electronic approval

Description -- Provide a means for approving officials and functional users to approve or reject a purchase request.

Source -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A12.

Interfaces to major functions and external entities:
User.

Security.

E5  Receive/Accept order

E51  Receive shipment

*Description* -- Provide a means for Receiving to notify purchasers of shipment arrival.

*Source* -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A12.

*Interfaces to major functions and external entities:*

User.

Security.

E52

E53  Tag item

*Description* -- Provide a means for Receiving to attach item tags to received items.

*Source* -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A3.

*Interfaces to major functions and external entities:*

User.

Security.

E54  Accept shipment

*Description* -- Provide a means for the requester to accept or decline the order or items.

*Source* -- BPR “To-Be Model” document, “Automation Requirements” section, requirements A31.

*Interfaces to major functions and external entities:*

User.

Security.

E6  Request tracking

*Description* -- Allow users to track the status of active purchase requests currently in the system.
Source -- User requested.

Interfaces to major functions and external entities:

User.

E7  Legacy system interfaces

E71  Budget legacy system interface

Description -- Provide an electronic interface to the legacy financial system (SOMARDS) that automates the certification and commitment of funds.

Source -- BPR, "To-Be Model" section, process model diagram A12, process A122.

E72

E73  Procurement legacy system interface

Description -- Provide an electronic interface to the legacy procurement system (SAACONS) that automates the uploading of request information to that system and the download of purchase order data.

Source -- Derived. SAACONS is the primary tool the buyers use during the procurement process; therefore, there is a definite need for interfacing with this legacy system in order to eliminate the need for double entry into both BuyIt and SAACONS.

E8  Reporting

Description -- Provide users and management with a means for reporting cycle times and costs.

Source -- BPR "Reports Specifications" document.

Interfaces to major functions and external entities:

User.

Security.

E9  Navigation

Description -- Provide users with a means for navigating to the various functional areas within the system.

Source -- Derived from the requirements previously listed.

Interfaces to major functions and external entities:

User.
5. Functional Specifications

The behavioral model expands the analytical results from the environmental model to more fully define how the system performs prescribed tasks. Typical representations in this model are (1) concise flowcharts showing how information is transformed as it moves through the system and subsystems, (2) a set of structured English statements that form a processing narration based on data types, control structures, and transformations, and (3) a data dictionary defining each data item.

5.1 BuyIt Subsystems. The nine functionalities listed in the previous section identify the major components of BuyIt: (1) security, (2) request preparation, (3) automated routing, (4) electronic approval, (5) status tracking, (6) receive/accept notification, (7) legacy system interfaces, (8) report generation, and (9) navigation. These categories consolidate into seven subsystems.

Figure 2 shows the major functional subsystems of BuyIt, as represented by a DFD. Each of the seven bubbles in the diagram represents a major subsystem or process of BuyIt, with the arrows showing the data flowing into and out of the processes.

The data store ACTIVE—located in the center of the diagram—holds all the active purchase requests, each waiting for the appropriate users to perform their functions on them. The CLOSED and CANCELED data stores contain purchase requests that have been closed out or canceled, respectively. The small squares along the outer edges of this DFD are interfaces to the outside world.

No process bubble for security appears at this level because the application environment (i.e., Lotus Notes) handles unauthorized user security. Additionally, enforcement of role restrictions is handled within each subsystem, as detailed in the following section.
**Figure 2. Major Subsystems of BuyIt.**

5.2 Subsystems Data Flow Diagrams. System objects and operations can be coherently represented as data flow diagrams (DFDs). A DFD can be used to capture system concepts and components at any level of abstraction. Each of the following seven DFDs (Figures 3 through 9) provides more detail for the information flow and functionality of each of the identified BuyIt subsystems.

Figure 3 represents the DFD for the Prepare Purchase Request subsystem. The major inputs to this process (and its basic functions) are the requester information (derived from the user-supplied userid and the EMPLOYEE data store), item details, vendor information (if known
Figure 3. Prepare Purchase Request Process.

at this time), and the date by which the items are required. The fund source completes the information for the request, and the supervisory approval puts the request into the procurement cycle.

Figure 4 shows the DFD for the Approve Funds subsystem. This subsystem, besides having interfaces to users for approvals, also has connections to the SOMARDS legacy system. The Build Block process is executed at the start of the day and creates the transaction block that will be used by BuyIt for the remainder of the day. As certified purchase requests are created during the course of the day, the Certify Funds process queries SOMARDS and grabs the returning message. Depending on the results of this query, the request is either certified or rejected (with explanation). At the end of the day, the Reconcile process is executed to balance the transaction block.

The Approvals process is shown in Figure 5. At this point, the various approving officials attach their approval or rejection to the request. The property book officer also attaches item tags to the individual items in order to flag them during receipt of the shipment.
Figure 4. Approve Funds Process.

Figure 5. Approvals Process.
Figure 6 diagrams the Edit Purchase Request process. The rejected purchase request is displayed for the requester, who then enters the corrections. What fields within the request the user can edit depends on where the rejection came from and how far along in the approval process the request traveled.

![Diagram of Edit Purchase Request Process](image)

**Figure 6. Edit Purchase Request Process.**

The Prepare Purchase Order process is diagramed in Figure 7. The first step of the process is assigning a buyer. This triggers the upload of the purchase request information to SAACONS. The buyer then proceeds to work within SAACONS. The second part of the SAACONS interface is the downloading of information (actual costs, selected vendor, delivery date). The request is then forwarded to Receiving in order to alert that office of the pending shipment.

![Diagram of Prepare Purchase Order Process](image)

**Figure 7. Prepare Purchase Order Process.**
Figure 8 represents the Receive Shipment process. Once the shipment has been delivered to the warehouse, Receiving marks the request as received and checks off any tagged items once each has been properly accounted for. At this point, the system notifies the requester of receipt and allows the user to accept or return items once they have been delivered.

Figure 8. Receive Shipment Process.

The Inquires process is diagramed in Figure 9. The processes shown in this figure are used to display to the user (1) pending actions (inbox), (2) purchase request details, (3) the status of requests, and (4) reports.

Figure 9. Inquires Process.
5.3 Processing Narration. Having captured the flow of information and identified data objects, each transformation can be further expanded by using the stylized notation of structured English. Basic procedural constructs are combined with English phrases to give concise descriptions for each major operation listed in the prescribed tasks analysis given in section 4.

E1 Security

E11 Login

*Input -- userid, passwd*

*Process:*

6. Data Dictionary

While DFDs and pseudocode (structured English) are important to system specification, additional information is required for a complete analytical model. The content of each data or control item should be more fully identified. A data dictionary is a quasi-formalism for describing content of information as it flows through the system. The standard notation conventions are
<table>
<thead>
<tr>

BuyIt Prototype Software Requirements Analysis: A C-BASS Component

Brian R. Schallhorn, Wade S. Jemigan, and Dana L. Uelry

U.S. Army Research Laboratory
ATTN: AMSRL-CL-E
Aberdeen Proving Ground, MD 21005-5067

Approved for public release; distribution is unlimited.

This document contains the software requirements analysis for a prototype of BuyIt. As a component of the Corporate Business Application Software System (C-BASS), this application automates small purchase requests (under $2,500). The document follows the process of structured analysis, or step-wise refinement of requirements, as applied to the development of BuyIt. The "environmental model" includes a high-level system description, followed by a context diagram and a list of events to which the system must respond. The "behavioral model" includes a data flow diagram (DFD) for each of the seven BuyIt subsystems. From this representation, the basic functional specifications are derived and represented in structured English (or program design language). The final segment of the document includes a data dictionary.

USER EVALUATION SHEET/CHANGE OF ADDRESS

This Laboratory undertakes a continuing effort to improve the quality of the reports it publishes. Your comments/answers to the items/questions below will aid us in our efforts.

1. ARL Report Number/Author: ARL-MR-444 (Schallhorn) Date of Report: May 1999

2. Date Report Received: 

3. Does this report satisfy a need? (Comment on purpose, related project, or other area of interest for which the report will be used.) 

4. Specifically, how is the report being used? (Information source, design data, procedure, source of ideas, etc.) 

5. Has the information in this report led to any quantitative savings as far as man-hours or dollars saved, operating costs avoided, or efficiencies achieved, etc? If so, please elaborate. 

6. General Comments. What do you think should be changed to improve future reports? (Indicate changes to organization, technical content, format, etc.)
