NOTICES

When Government drawings, specifications, or other data are used for any purpose other than in connection with a definitely related Government procurement operation, the United States Government thereby incur no responsibility nor any obligation whatsoever; and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication or otherwise as in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto.

Copies of this report should not be returned to the Research and Technology Division unless return is required by security considerations, contractual obligations, or notice on a specific document.
The purpose of this study was to synthesize and evaluate the following compounds as potential additives to lubricants applied to aircraft systems: Mercury (II) acetate derivatives, triphenylphosphine complexes of Mercury (II) acetate derivatives, and Mercury (II) acetamide.
FOREWORD

This first semi-annual report on the internal program, "Synthesis and Evaluation of Mercurial (II) Acetates and Related Triphenyl-Phosphine Complexes as Lubricant Additives," was initiated under Project No. 3044, Task No. 304405, with Captain Stanley M. Dec acting as project engineer.

This report covers work conducted from 1 May 1963 to 31 October 1963.
The synthesis and evaluation of mercury (II) acetate derivatives and related triphenylphosphine complexes as lubricant additives.

1. Introduction

The purpose of this study was to synthesize and evaluate the following compounds as potential additives to new lubricants applied to aircraft systems:

   A. CH₃COO-Hg-00CCH₃
   B. CH₃CH₂COO-Hg-00CCH₂CH₃
   C. CH₃CH₂CH₂COO-Hg-00CCH₂CH₂CH₃
   D. CF₃CF₂COO-Hg-00CFCF₂CF₃
   E. HOC₆H₅COO-Hg-00CCH₂OH
   F. ClCH₂COO-Hg-00CCH₂Cl
   G. BrCH₂COO-Hg-00CCH₂Br
   H. C₆H₅COO-Hg-00CCH₆H₅
   I. CF₃COO-Hg-00CCF₃
   J. CCl₃COO-Hg-00CCCl₃

2. Triphenylphosphine Complexes of Mercury (II) Acetate Derivatives
   A. (C₆H₅)₃P-CH₃COO-Hg-00CCH₃
   B. ((CH₃CH₂COO)₂Hg)₂·((C₆H₅)₃P)₂ (bridge structure 2A)
   C. ((CH₃CH₂CH₂COO)₂Hg)₂·((C₆H₅)₃P)₂ (bridge structure 2A)
   D. ((C₆H₅)₃P)₂·Hg(00CFCF₃)₂
   E. ((C₆H₅)₃P)₂·Hg(00CCH₂OH)₂
   F. ((C₆H₅)₃P)₂·Hg(00CCH₂Cl)₂
   G. ((C₆H₅)₃P)₂·Hg(00CCH₂Br)₂
3. Mercury (II) Acetamide
A. CH$_3$CONH-Hg-HNOC$_2$H

The results are summarized in Tables I and II.

This study was approached through a survey of the literature in specific areas and through experimental investigations of the above compounds.

II. Preparation of Compounds

A. Synthesis of Mercury (II) Acetates

It was found that the mercurial (II) acetates could readily be prepared by the reaction of the organic acid with yellow mercuric oxide:

$$2\text{RCOOH} + \text{HgO} \rightarrow \text{(RCOO)}_2\text{Hg} + \text{H}_2\text{O}$$

The reaction proceeded at room temperature with perfluorobutryric acid.

1. Mercury (II) acetate was a commercial preparation obtained from Matheson, Coleman, and Bell.

2. Synthesis of Mercury (II) propionate. To a solution of 74.04 grams (1 mole) of propionic acid in 150cc. of reagent grade benzene was added 102 grams (0.472 moles) of yellow mercuric oxide. The mercuric oxide was completely reacted after 30 minutes of refluxing. The colorless solution was filtered hot and allowed
to cool to room temperature. The crystallized, colorless plates were collected on a suction filter and gave 100 grams (76.5%) of product, m.p. 111.5-112.5°.

3. Synthesis of mercury (II) butyrate. To a solution of 88 grams (1 mole) of butyric acid in 200 cc. of reagent grade benzene was added 120 grams (0.555 moles) of yellow mercuric oxide. The reaction mixture was refluxed for 20 minutes. During this time all of the mercuric oxide was reacted. An excess of 20 grams of yellow mercuric oxide was then added and the mixture refluxed for an additional 30 minutes. The mixture was filtered hot to remove the excess mercuric oxide. The filtrate was cooled to room temperature and the precipitated solid was collected on a suction filter, yielding 110 grams (29.1%) of white plates, m.p. 95-96°.

4. Synthesis of mercury (II) chloroacetate. To a solution of 40.83 grams (0.432 moles) of chloroacetic acid dissolved in 250 cc. of reagent grade benzene was added 46.8 grams (0.216 moles) of yellow mercuric oxide. The reaction was allowed to reflux for 21 hours. The hot solution was then filtered to remove traces of unreacted mercuric oxide. The hot filtrate was treated with charcoal, refiltered, and cooled. The precipitated white solid was collected on a suction filter in 63 grams (37.7%) yield, m.p. 114-115°.

5. Synthesis of Mercury (II) Perfluorobutyrate. To a solution of 100 grams (0.467 moles) of perfluorobutyric acid in 250 cc. of reagent grade benzene was added 45.3 grams (0.209 moles) of yellow mercuric oxide. The reaction proceeded at room temperature, overnight, for a period of 17 hours. The reaction mixture was treated with activated carbon and filtered. The solvent and unreacted butyric acid were evaporated under vacuum and gave 90 grams (30.7%) of a pale brown liquid.
7. Synthesis of Mercury (II) Benzoate. To 700 cc. of reagent grade benzene was added 40 grams (0.10 moles) of benzoic acid and 10.8 grams (0.05 moles) of yellow mercuric oxide. The reaction mixture was refluxed for two hours, filtered hot, and cooled to room temperature. The precipitated white needles were collected on a suction filter in a 41 gram (93.6%) yield, m.p. 110-112°.

8. Synthesis of Mercury (II) Trifluoroacetate. To a stirred suspension of 47.2 grams (0.218 moles) of yellow mercuric oxide in 100 cc. of reagent grade benzene was slowly added 100 grams (0.435 moles) of trifluoroacetic acid dissolved in 100 cc. of benzene. Additional mercuric oxide was added until a slight excess of unreacted mercuric oxide remained. The reaction mixture was heated and treated with activated carbon. After cooling, the white crystalline solid was collected on a suction funnel and gave a 175 gram (94.3%) yield, m.p. 122-125°.

9. Synthesis of Mercury (II) Trichloroacetate. To a solution of 80.5 grams (0.303 moles) of trichloroacetic acid in 250 cc. of reagent grade benzene was added 30 grams (0.138 moles) of yellow mercuric oxide. The reaction mixture was refluxed for 4 hours. At the end of this time period, the mercuric oxide was completely reacted. The reacted solution was cooled to 15° and the precipitated white crystalline solid was collected on a suction filter in a 50 gram (68.8%) yield, m.p. 127 dec.

10. Synthesis of Mercury (II) Hydroxyacetate. To a solution of 100 grams (1.32 moles) of hydroxyacetic acid in 250 cc. of reagent grade benzene was added 128 grams (0.595 moles) of yellow mercuric oxide. The reaction proceeded at room temperature to give a white solid. Refluxing was continued for an additional hour. After cooling, the white solid was collected on a suction filter, crystallized from hot CCl₄ and gave 85 grams (40.8%) of product, m.p. 114-115.
10. **Synthesis of Mercury (II) Acetamide.** To an Erlenmeyer flask was added 118 grams (2 moles) of acetamide and 108.3 grams (0.5 mole) of yellow mercuric oxide. The mixture was gradually heated above 180°C on a hot plate until all of the mercuric oxide was reacted. After cooling, the white solid was crystallized from hot methanol and gave 110 grams (70%) of white crystalline solid, m.p. 195°C.
B. Synthesis of Triphenylphosphine Complexes of Mercury (II) Acetates.

The synthesis of compounds of triphenylphosphine with mercury (II) acetates was undertaken to develop additives of higher molecular weight. The derivatives synthesized were found to give two classes of compounds:

A 4-covalent complex with tetrahedral structure,

\[(\text{C}_6\text{H}_5)_3\text{P} \overset{\text{Hg}}{\longrightarrow} \text{OOCR}\]

and a 4-covalent trans-symmetric tetragonal bridged structure:

These structural assignments were assigned on the basis of work performed by Mann et al. on the "Addition Compounds" derived from 3-covalent phosphine with Cd and Hg\(^{II}\) halides.

The compounds were conveniently prepared by a reaction of equal molar quantities of triphenylphosphine with the acetate in dry solvent (ether, tetrahydrofuran, or 1,4-dioxane).

1. Synthesis of Diacetato bistriphenylphosphine-w-diacetatodimercury

To a solution of 33.24 grams (0.1042 moles) of mercury (II) acetate in 250 cc. of absolute ether was slowly added 20.43 grams (0.078 moles) of triphenylphosphine. The reaction mixture was shaken and cooled (to prevent product decomposition) during the addition. The reaction mixture was then stirred for 15 minutes. The precipitated white crystals were collected on a suction filter and rinsed twice with 40 cc. portions of dry tetrahydrofuran. The yield of product obtained was 50 grams (82.5\%), m.p., dec.
2. **Synthesis of Dipropianatobistriphenylphosphine-w-dipropianatedimercury.**

To a solution of 5 grams (0.014 moles) of mercury (II) propionate in 40 cc of dry tetrahydrofuran (distilled from L A1H₄) was slowly added 3.8 grams (0.0145 moles) of triphenylphosphine. The reaction mixture was stirred and cooled during the addition to prevent product decomposition. The precipitated white crystals were collected on a suction filter, rinsed with 25 cc of absolute ether and gave 8 grams (47.0% of white solid, m.p. 263-264.5°).

3. **Synthesis of Dibutyratobistriphenylphosphine-w-dibutyratodimercury.**

To a solution of 5 grams (0.013 moles) of mercury (II) butyrate dissolved in 40 cc of dry tetrahydrofuran (distilled from LiAlH₄) was slowly added, 3.5 grams (0.013 moles) of triphenylphosphine. The reaction mixture was stirred and cooled to prevent product decomposition. The precipitated white solid was collected on a suction filter and gave 7 grams (42.3%) of product, m.p., 151-152°.

4. **Synthesis of Diperfluorobutynatelatriphenylphosphinemercury.** To a solution of 10 grams (0.016 moles) of mercury (II) perfluorobutyrate was slowly added, 4.18 grams (0.016 moles) of triphenylphosphine, while the temperature of the reaction flask was kept cooled to room temperature. A white solid settled out immediately. The reaction mixture was stirred and cooled to prevent product decomposition. The white crystalline solid was collected in 11 gram (63.2%) yield, m.p., 220-1°.

6. Synthesis of Dichloracetobistriphenylphosphinemercury. To a solution of 12.01 grams (0.0124 moles) of mercury (II) chloroacetate in 200 cc of dry tetrahydrofuran (distilled from LiAlH₄) was slowly added 13.62 grams (0.0518 moles) of triphenylphosphine. The reaction mixture was stirred and cooled to prevent product decomposition. The precipitated solid was collected on a suction filter in a 11.75 gram (58.2%) yield, m.p., 192° dec.

9. **Synthesis of Ditrichloracetatobistriphenylphosphine mercury.** To a solution of 4 grams (0.0075 moles) of mercury (II) trichloroacetate in 40 cc. of dry tetrahydrofuran (distilled from LiAlH₄) were added 1.96 grams (0.0075 moles) of triphenylphosphine. The reaction mixture was stirred and cooled to prevent product decomposition. The solvent was evaporated and gave 4.5 grams (60.4%) of colorless liquid (this compound decomposes on standing 1-2 days).

10. **Synthesis of Ditrifluoroacetatobistriphenylphosphine-u-diacetato-dimercury.** To a solution of 1.7 grams (0.00526 moles) of mercury (II) trifluoroacetate in 50 cc. of absolute ether was added 5 grams (0.00526 moles) of diacetatobistriphenylphosphine-u-diacetatodimercury. The reaction mixture was stirred and cooled to prevent product decomposition. The precipitated colorless solid was collected in 2.5 gram (65.1%) yield.
Objectives

The objectives of this report are:

1. The preparation and evaluation of the mercurial (II) acetates and the triphenyl phosphine complexes of mercurial (II) acetates as candidate additives for anti-oxidation, extreme pressure, and anti-wear in new lubricants. The synthetic results for the preparation of mercurial (II) acetates are tabulated in Table I. The synthetic results for the preparation of the triphenylphosphine complexes of mercurial (II) acetates are tabulated in Table II. Both series of compounds listed are ready for evaluation as candidate additives.
