METHOD OF CALCULATING THE LATERAL MOTIONS OF AIRCRAFT

BASED ON THE LAPLACE TRANSFORM

By Harry E. Murray and Frederick C. Grant

SUMMARY

The lateral motions of aircraft are obtained by means of the Laplace transform which gives solutions expressed in terms of elementary functions for the free and forced motions. These equations permit the calculation of the free motion of an aircraft following any initial condition or the forced motion following the application of constant external forces and moments. These forced motions can be used to obtain by means of Duhamel's integral the response to any arbitrary forcing function. All the classical stability concepts can be deduced from these same solution equations largely by inspection. These equations for the lateral motion are applied to the calculation of the lateral stability of a specific airplane and to the calculation of certain of its free and forced motions.

INTRODUCTION

The lateral motions of aircraft are represented by three simultaneous differential equations which are generally assumed to be linear. The fundamental problem of lateral dynamics involves the solution of these differential equations in terms of the aerodynamic and mass parameters of the airplane. The solutions can then be used to obtain numerically the motion of the airplane as a function of time.

The recent application of the Laplace transform to the solution of systems of linear differential equations permits a more general analysis of the problem of airplane motion than that of reference 1, which is based upon Heaviside's operational calculus. Heaviside's operational calculus permits a calculation of the forced motion, which is the motion following the application of external forces and moments. The Laplace transform permits these same calculations and also permits the direct calculation of the free motion, which is the motion following finite initial values of the variables and their first derivatives in the
absence of externally applied forces and moments. This calculation cannot be made by use of Heaviside's operational calculus. The Laplace transform solutions, which include both the free and forced motions, may be written in a closed form from which all the classical stability concepts can be deduced largely by inspection. The form of the equations of motions of the airplane is independent of such aerodynamic parameters as Reynolds number and Mach number, and these parameters enter the equations only as they effect the values of the aerodynamic constants or stability derivatives appearing in the equations. The values of the stability derivatives must be obtained by actual measurements during physical tests or from aerodynamic theory before motion calculations can be attempted.

Investigations of some of the possibilities of applying the Laplace transform to the study of aircraft motion have been reported in references 2 and 3, and in two British reports, one by K. Mitchell, the other by J. Watham and E. Priestley. The British papers do not give final equations in a form suitable for calculation purposes. The analysis of reference 2 closely parallels that of the present paper until the point of taking the inverse Laplace transform is reached. At this point, reference 2 indicates that the inverse Laplace transform can be taken either by means of the relatively simple partial-fraction expansion (used in the present paper) or the more complicated inversion theorem of the Laplace transform. Neither approach in reference 2 is carried to the point of final equations containing only elementary functions and in a form particularly suited for computation. A solution similar to that of the present paper is indicated in reference 3. Only the form of the analysis is shown in reference 3, however, and all the details necessary for practical applications have not been carried out.

The present paper presents an analysis based on the representation of the lateral motion of an aircraft by differential equations. The results of the analysis are solutions in closed form expressing the free and forced motions in terms of elementary functions. These equations permit the calculation of the free motion of an aircraft following any initial condition or the forced motion following the application of constant external forces and moments. These forced motions can be used to obtain, by means of Duhamel's integral, the response to any arbitrary forcing function as shown in references 4 and 5. The solutions are readily adaptable to calculation by digital-type calculating machines and the calculation is an arithmetical process requiring no knowledge of the theory of the Laplace transform. The solution equations of motion have been applied on an automatic calculating machine to the calculation of the lateral stability of a specific airplane and to the calculation of certain free and forced motions as illustrative examples.
COEFFICIENTS AND SYMBOLS

$C_L$ trim lift coefficient \((W \cos \gamma/qS)\)

$C_L$ rolling-moment coefficient \((L/qSb)\)

$C_n$ yawing-moment coefficient \((N/qSb)\)

$C_Y$ lateral-force coefficient \((Y/qS)\)

$W$ airplane weight, pounds

$L$ rolling moment

$M$ pitching moment

$N$ yawing moment

$Y$ lateral force

$H_a$ aileron hinge moment

$H_e$ elevator hinge moment

$H_r$ rudder hinge moment

$q$ dynamic pressure \((\rho V^2/2)\)

$S$ wing area, square feet

$b$ wing span, feet

$\gamma$ inclination of flight path to horizontal (positive in climb), degrees

$\alpha$ angle of attack, degrees

$\theta$ angle of pitch, degrees

$\rho$ mass density of air, slugs per cubic foot

$V$ free-stream velocity, feet per second

$m$ airplane mass, slugs \((W/g)\)

$g$ acceleration due to gravity, feet per second per second
\( s_b \)  
non-dimensional time \((tV/b)\)

\( t \)  
time, seconds

\( D_b = \frac{d}{ds_b} \)

\( \eta \)  
inclination of principal longitudinal axis of inertia  
(positive for axis above flight path at nose),  
degrees

\( \mu_b \)  
airplane relative-density factor \((m/\rho S_b)\)

\( \phi \)  
angle of bank, radians \( \left( \int_0^t p \, dt \right) \)

\( \psi \)  
angle of yaw or azimuth, radians \( \left( \int_0^t r \, dt \right) \)

\( p \)  
rolling velocity about stability X-axis, radians per second

\( r \)  
yawing velocity about stability Z-axis, radians per second

\( \beta \)  
angle of sideslip, radians

\( C_{\tau c} \)  
rolling-moment coefficient of forcing-function couple in roll

\( C_{\nu c} \)  
yawing-moment coefficient of forcing-function couple in yaw

\( C_{Yc} \)  
lateral-force coefficient of lateral forcing function

\( P, P' \)  
periods of oscillatory modes, seconds

\( T_{1/2}, T_{1/2}' \)  
times to damp to half-amplitude of oscillatory modes,  
seconds

\( N_{1/2}, N_{1/2}' \)  
cycles to damp to half-amplitude of oscillatory modes

\( \delta_a \)  
sileron deflection, degrees

\( \delta_r \)  
rudder deflection, degrees
$\delta_e$  elevator deflection, degrees

$K_X$  nondimensional radius of gyration about stability X-axis \( \left( \sqrt{K_X^2 \cos^2 \eta + K_Z^2 \sin^2 \eta} \right) \)

$K_Z$  nondimensional radius of gyration about stability Z-axis \( \left( \sqrt{K_Z^2 \cos^2 \eta + K_X^2 \sin^2 \eta} \right) \)

$K_{XZ}$  nondimensional product of inertia between stability X- and Z-axes \( \left( K_Z^2 - K_X^2 \right) \sin \eta \cos \eta \)

$K_{X0}$  nondimensional radius of gyration about principal X-axis \( \left( k_{X0} / b \right) \)

$K_{Z0}$  nondimensional radius of gyration about principal Z-axis \( \left( k_{Z0} / b \right) \)

$k_{X0}$  radius of gyration about principal X-axis, feet

$k_{Z0}$  radius of gyration about principal Z-axis, feet

$\sigma$  Laplace transform of $s_0$

$\Delta$  stability quartic

$\lambda_1, \lambda_2, \lambda_3, \lambda_4$  roots of $\Delta = 0$

$P_\sigma, q_\sigma$  polynomials in $\sigma$

$q_{\sigma}' = \frac{dq_\sigma}{d\sigma}$

$\lambda_n$  roots of $q_{\sigma} = 0$

$R_1$  real part of $\lambda_3$ and $\lambda_4$ when $\lambda_3$ and $\lambda_4$ are complex conjugates

$I_1$  imaginary part of $\lambda_3$ and $\lambda_4$ when $\lambda_3$ and $\lambda_4$ are complex conjugates

$R_1'$  real part of $\lambda_1$ and $\lambda_2$ when $\lambda_1$ and $\lambda_2$ are complex conjugates
\(I_1'\) \(\text{imaginary part of } \lambda_1 \text{ and } \lambda_2 \text{ when } \lambda_1 \text{ and } \lambda_2 \text{ are complex conjugates}\)

\(A,B,C,D,E\) \(\text{coefficients of stability quartic}\)

\(R\) \(\text{Routh's discriminant}\)

\(A_1,A_2,A_3,A_4,A_5,A_6\) \(\text{amplitude coefficients for } \phi\)

\(B_1,B_2,B_3,B_4,B_5,B_6\) \(\text{amplitude coefficients for } \psi\)

\(C_1,C_2,C_3,C_4,C_5\) \(\text{amplitude coefficients for } \beta\)

\(R_A\) \(\text{real part of } A_3 \text{ and } A_4 \text{ when } \lambda_3 \text{ and } \lambda_4 \text{ are complex conjugates}\)

\(I_A\) \(\text{imaginary part of } A_3 \text{ and } A_4 \text{ when } \lambda_3 \text{ and } \lambda_4 \text{ are complex conjugates}\)

\(R_B\) \(\text{real part of } B_3 \text{ and } B_4 \text{ when } \lambda_3 \text{ and } \lambda_4 \text{ are complex conjugates}\)

\(I_B\) \(\text{imaginary part of } B_3 \text{ and } B_4 \text{ when } \lambda_3 \text{ and } \lambda_4 \text{ are complex conjugates}\)

\(R_C\) \(\text{real part of } C_3 \text{ and } C_4 \text{ when } \lambda_3 \text{ and } \lambda_4 \text{ are complex conjugates}\)

\(I_C\) \(\text{imaginary part of } C_3 \text{ and } C_4 \text{ when } \lambda_3 \text{ and } \lambda_4 \text{ are complex conjugates}\)

\(R_A'\) \(\text{real part of } A_1 \text{ and } A_2 \text{ when } \lambda_1 \text{ and } \lambda_2 \text{ are complex conjugates}\)

\(I_A'\) \(\text{imaginary part of } A_1 \text{ and } A_2 \text{ when } \lambda_1 \text{ and } \lambda_2 \text{ are complex conjugates}\)

\(R_B'\) \(\text{real part of } B_1 \text{ and } B_2 \text{ when } \lambda_1 \text{ and } \lambda_2 \text{ are complex conjugates}\)

\(I_B'\) \(\text{imaginary part of } B_1 \text{ and } B_2 \text{ when } \lambda_1 \text{ and } \lambda_2 \text{ are complex conjugates}\)
$R'_C$ real part of $C_1$ and $C_2$ when $\lambda_1$ and $\lambda_2$ are complex conjugates

$C'_I$ imaginary part of $C_1$ and $C_2$ when $\lambda_1$ and $\lambda_2$ are complex conjugates

$K_A$ amplitude coefficient for $\phi$ oscillation corresponding to complex conjugate roots $\lambda_3$ and $\lambda_4$

$$\left(2 \sqrt{R_A^2 + I_A^2}\right)$$

$K_B$ amplitude coefficient for $\psi$ oscillation corresponding to complex conjugate roots $\lambda_3$ and $\lambda_4$

$$\left(2 \sqrt{R_B^2 + I_B^2}\right)$$

$K_C$ amplitude coefficient for $\beta$ oscillation corresponding to complex conjugate roots $\lambda_3$ and $\lambda_4$

$$\left(2 \sqrt{R_C^2 + I_C^2}\right)$$

$K'_A$ amplitude coefficient for $\phi$ oscillation corresponding to complex conjugate roots $\lambda_1$ and $\lambda_2$

$$\left(2 \sqrt{R_A'^2 + I_A'^2}\right)$$

$K'_B$ amplitude coefficient for $\psi$ oscillation corresponding to complex conjugate roots $\lambda_1$ and $\lambda_2$

$$\left(2 \sqrt{R_B'^2 + I_B'^2}\right)$$

$K'_C$ amplitude coefficient for $\beta$ oscillation corresponding to complex conjugate roots $\lambda_1$ and $\lambda_2$

$$\left(2 \sqrt{R_C'^2 + I_C'^2}\right)$$

$\omega_A$ phase angle for $\phi$ oscillation corresponding to conjugate complex roots $\lambda_3$ and $\lambda_4$, radians

$$\left(\tan^{-1} \frac{I_A}{R_A}\right)$$

$\omega_B$ phase angle for $\psi$ oscillation corresponding to conjugate complex roots $\lambda_3$ and $\lambda_4$, radians

$$\left(\tan^{-1} \frac{I_B}{R_B}\right)$$
\( \omega_c \)  
phase angle for \( \beta \) oscillation corresponding to conjugate complex roots \( \lambda_3 \) and \( \lambda_4 \), radians
\[
\left( \tan^{-1} \frac{I_C}{R_C} \right)
\]

\( \omega_a' \)  
phase angle for \( \phi \) oscillation corresponding to conjugate complex roots \( \lambda_1 \) and \( \lambda_2 \), radians
\[
\left( \tan^{-1} \frac{I_{A'}}{R_{A'}} \right)
\]

\( \omega_b' \)  
phase angle for \( \psi \) oscillation corresponding to conjugate complex roots \( \lambda_1 \) and \( \lambda_2 \), radians
\[
\left( \tan^{-1} \frac{I_{B'}}{R_{B'}} \right)
\]

\( \omega_c' \)  
phase angle for \( \beta \) oscillation corresponding to conjugate complex roots \( \lambda_1 \) and \( \lambda_2 \), radians
\[
\left( \tan^{-1} \frac{I_{C'}}{R_{C'}} \right)
\]

\( c_{lr} = \frac{\partial c_l}{\partial \left( \frac{r_b}{2V} \right)} \)  

\( c_{lp} = \frac{\partial c_l}{\partial \left( \frac{p_b}{2V} \right)} \)  

\( c_{l \beta} = \frac{\partial c_l}{\partial \beta} \)  

\( c_{nr} = \frac{\partial c_n}{\partial \left( \frac{r_b}{2V} \right)} \)  

\( c_{np} = \frac{\partial c_n}{\partial \left( \frac{p_b}{2V} \right)} \)
\[ c_{n\beta} = \frac{\partial c_n}{\partial \beta} \]

\[ c_{Yr} = \frac{\partial c_Y}{\partial \left( \frac{rb}{2v} \right)} \]

\[ c_{yp} = \frac{\partial c_Y}{\partial \left( \frac{pb}{2v} \right)} \]

\[ c_{Y\beta} = \frac{\partial c_Y}{\partial \beta} \]

\( a_0, a_1, a_2, a_3, a_4, a_5 \) coefficients appearing in numerator terms of amplitude coefficients for \( \phi \)

\( b_0, b_1, b_2, b_3, b_4, b_5 \) coefficients appearing in numerator terms of amplitude coefficients for \( \psi \)

\( c_0, c_1, c_2, c_3, c_4 \) coefficients appearing in numerator terms of amplitude coefficients for \( \beta \)

Subscripts:

0 initial value

\( \sigma \) transformed variable

**ANALYSIS**

The linear equations of motion, referred to the axis system shown in figure 1 and representing the lateral motion of an airplane are
\[
\begin{align*}
2\mu_b K_x^2 D_b \phi - \frac{1}{2} c_{I_p} D_b \phi & + 2\mu_b K_{xz} D_b \psi - \frac{1}{2} c_{I_T} D_b \psi - c_{I_P} \beta - c_{l_c} = 0 \\
2\mu_b K_{xz} D_b \phi - \frac{1}{2} c_{n_p} D_b \phi & + 2\mu_b K_z^2 D_b \psi - \frac{1}{2} c_{n_T} D_b \psi - c_{n_P} \beta - c_{n_c} = 0 \\
-\frac{1}{2} c_{Y_p} D_b \phi - c_{l_c} \phi + 2\mu_b D_b \psi - c_L \tan \gamma \psi - \frac{1}{2} c_{Y_T} D_b \psi - c_{Y_P} \beta + 2\mu_b D_b \beta - c_{Y_c} = 0
\end{align*}
\]

The terms \( c_{l_c}, c_{n_c}, \) and \( c_{Y_c} \) are forcing functions which represent disturbances imposed upon the state of motion of the airplane by control movement or atmospheric turbulence. These terms, in general, are arbitrary functions of time, but for the purpose of this analysis, they are considered to be constants applied at zero time. After a solution has been obtained in terms of constant forcing quantities this solution can be used to obtain a new solution for an arbitrary forcing function by Duhamel’s integral as explained in references 4 and 5.

**Transformation of Equations**

When the Laplace transform is applied (reference 6, p. 8), the transformed equations become after multiplying through by \( \sigma \)

\[
\begin{align*}
(2\mu_b K_x^2 \sigma^3 - \frac{1}{2} c_{I_p} \sigma^2) \phi_\sigma & + (2\mu_b K_{xz} \sigma^3 - \frac{1}{2} c_{I_T} \sigma^2) \psi_\sigma + (-c_{l_c} \sigma) \beta_\sigma = r_1 \\
r_1 = (2\mu_b K_x^2 \sigma^2 - \frac{1}{2} c_{I_p} \sigma) \phi_0 & + (2\mu_b K_{xz} \sigma^2 - \frac{1}{2} c_{I_T} \sigma) \psi_0 + (2\mu_b K_x^2 \sigma) (D_b \phi)_0 + (2\mu_b K_{xz} \sigma) (D_b \psi)_0 + c_{l_c}
\end{align*}
\]

\[(2a)\]
\[
\left(2\mu_bK_{XZ}\sigma^3 - \frac{1}{2}C_{np}\sigma^2\right)\phi_\sigma + \left(2\mu_bK_{Z}\sigma^3 - \frac{1}{2}C_{nt}\sigma^2\right)\psi_\sigma + \left(-C_{nB}\right)\beta_\sigma = r_2
\]

\[
r_2 = \left(2\mu_bK_{XZ}\sigma^2 - \frac{1}{2}C_{np}\sigma\right)\phi_0 + \left(2\mu_bK_{Z}\sigma^2 - \frac{1}{2}C_{nt}\sigma\right)\psi_0 + \left(2\mu_bK_{XZ}\sigma\right)(D_b\phi)_0 + \left(2\mu_bK_{Z}\sigma\right)(D_b\psi)_0 + C_{nc}
\]

\[
\left(-\frac{1}{2}C_{Yp}\sigma^2 - C_L\sigma\right)\phi_\sigma + \left(2\mu_b\sigma^2 - \frac{1}{2}C_{Yr}\sigma^2 - C_L\tan\gamma\sigma\right)\psi_\sigma + \left(2\mu_b\sigma^2 - C_{Yb}\sigma\right)\beta_\sigma = r_3
\]

\[
r_3 = \left(-\frac{1}{2}C_{Yp}\sigma\right)\phi_0 + \left(2\mu_b\sigma - \frac{1}{2}C_{Yr}\sigma\right)\psi_0 + \left(2\mu_b\sigma\right)\beta_0 + C_{Yc}
\]

**Solution of Transformed Equations**

After equations (2) are solved by determinants, the expression for \(\phi_\sigma\) is

\[
\phi_\sigma = \frac{a_0\sigma^5 + a_1\sigma^4 + a_2\sigma^3 + a_3\sigma^2 + a_4\sigma + a_5}{\sigma^2\Delta}
\]

where

\[
\Delta = A\sigma^4 + B\sigma^3 + C\sigma^2 + D\sigma + E
\]
and the constants are given by

\[
a_0 = \phi_0 \begin{pmatrix} 8\mu_b^3 \\ K^2 \\ K_{XZ} \\ K_{Z^2} \end{pmatrix}
\]

\[
a_1 = \phi_0 \begin{pmatrix} 2\mu_b^2 \\ K^2 \\ K_{XZ} \\ K_{Z^2} \\ C_{n_T} \end{pmatrix} - 2\mu_b^2 \begin{pmatrix} C_{l_P} \\ K_{XZ} \\ K_{Z^2} \\ C_{n_P} \end{pmatrix} + (D_b\phi)_0 \begin{pmatrix} 8\mu_b^3 \\ K^2 \\ K_{XZ} \\ K_{Z^2} \end{pmatrix}
\]

\[
a_2 = \phi_0 \begin{pmatrix} \mu_b \\ C_{n_B} \\ C_{n_P} \\ K_{Z^2} \\ C_{Y_P} \\ 0 \end{pmatrix} + \mu_b \begin{pmatrix} C_{l_B} \\ K_{XZ} \\ C_{n_T} \end{pmatrix} - 4\mu_b^2 \begin{pmatrix} C_{l_B} \\ K^2 \\ K_{XZ} \\ C_{n_B} \end{pmatrix} + \\
\frac{1}{4\mu_b^2} \begin{pmatrix} C_{l_B} \\ C_{l_T} \\ C_{n_P} \\ C_{n_T} \end{pmatrix} + (D_b\phi)_0 \begin{pmatrix} 2\mu_b^2 \\ K_{XZ} \\ K_{Z^2} \\ C_{n_T} \end{pmatrix} + \\
(D_b\phi)_0 \begin{pmatrix} 2\mu_b^2 \\ C_{l_T} \\ K_{XZ} \end{pmatrix} + \beta_0 \begin{pmatrix} 4\mu_b^2 \\ C_{l_B} \\ K_{XZ} \end{pmatrix} + 4\mu_b^2 \begin{pmatrix} C_{l_C} \\ K_{XZ} \end{pmatrix}
\]
\[
a_3 = \phi_0 \left( \begin{array}{ccc}
C_{l_\beta} & C_{l_p} & K_x^2 \\

\end{array} \right)
\]
\[ a_4 = \phi_0 \left( -\frac{1}{2} \tan \gamma C_L \begin{bmatrix} C_{l\beta} \\ C_{l_p} \end{bmatrix} \right) + (D_b \phi)_0 \left( 2 \mu_b \tan \gamma C_L \begin{bmatrix} C_{l\beta} \\ C_{n_b} \end{bmatrix} \right) + \psi_0 \left( -\frac{1}{2} \tan \gamma C_L \begin{bmatrix} C_{l\beta} \\ C_{n_b} \end{bmatrix} \right) + (D_b \psi)_0 \left( 2 \mu_b \tan \gamma C_L \begin{bmatrix} C_{l\beta} \\ C_{n_p} \end{bmatrix} \right) + \psi_0 \left( \begin{bmatrix} C_{l\beta} \\ C_{n_b} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n_c} \end{bmatrix} - 2 \mu_b \begin{bmatrix} C_{l\beta} \\ C_{n_b} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n_c} \end{bmatrix} \right) \]

\[ a_5 = \tan \gamma C_L \begin{bmatrix} C_{l\beta} \\ C_{l_c} \end{bmatrix} \begin{bmatrix} C_{n_b} \\ C_{n_c} \end{bmatrix} \]

\[ A = 8 \mu_b^3 \begin{bmatrix} K_X^2 & K_{XZ} \\ K_{XZ} & K_Z^2 \end{bmatrix} \]

\[ B = 2 \mu_b^2 \begin{bmatrix} K_X^2 & K_{XZ} & C_{l_r} \\ K_{XZ} & K_Z^2 & C_{n_r} \\ 0 & 1 & -2\gamma \beta \end{bmatrix} - 2 \mu_b^2 \begin{bmatrix} C_{l_p} \\ C_{n_p} \\ C_{n_c} \end{bmatrix} \begin{bmatrix} K_{XZ} \\ K_Z^2 \end{bmatrix} \]

\[ C = \mu_b \begin{bmatrix} C_{l\beta} \\ 0 \end{bmatrix} \begin{bmatrix} K_X^2 & K_{XZ} \end{bmatrix} + \mu_b \begin{bmatrix} C_{l_p} \\ C_{n_p} \end{bmatrix} \begin{bmatrix} K_{XZ} \\ K_Z^2 \end{bmatrix} + \mu_b \begin{bmatrix} C_{l_r} \\ C_{n_r} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{l_c} \end{bmatrix} - 4 \mu_b^2 \begin{bmatrix} C_{l\beta} \\ C_{n_b} \end{bmatrix} \begin{bmatrix} K_X^2 \\ K_{XZ} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n_b} \end{bmatrix} + \frac{1}{2} \mu_b \begin{bmatrix} C_{l_p} \\ C_{n_p} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{l_c} \end{bmatrix} - 4 \mu_b^2 \begin{bmatrix} C_{l\beta} \\ C_{n_p} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n_r} \end{bmatrix} \begin{bmatrix} K_{XZ} \\ K_Z^2 \end{bmatrix} \]
\[ D = 2\mu_b C_L \begin{bmatrix} C_{l\beta} & K_X^2 & K_{XZ} \\ C_{n\beta} & K_{XZ} & K_{Z}^2 \\ 0 & 1 & \tan \gamma \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n\beta} \\ 0 \end{bmatrix} + \frac{1}{4} \begin{bmatrix} C_{l\beta} & C_{l\beta} & C_{l\beta} \\ C_{n\beta} & C_{n\beta} & C_{n\beta} \\ C_{Y\beta} & C_{Y\beta} & C_{Y\beta} \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n\beta} \\ C_{Y\beta} \end{bmatrix} + \mu_b \begin{bmatrix} C_{l\beta} \\ C_{n\beta} \\ C_{Y\beta} \end{bmatrix} \]

\[ E = -\frac{1}{2} C_L \begin{bmatrix} C_{l\beta} & C_{l\beta} & C_{l\beta} \\ C_{n\beta} & C_{n\beta} & C_{n\beta} \\ 0 & 1 & \tan \gamma \end{bmatrix} \begin{bmatrix} C_{l\beta} \\ C_{n\beta} \\ 0 \end{bmatrix} \]

The expression for \( \psi_0 \) is

\[ \psi_0 = \frac{b_0 \sigma^5 + b_1 \sigma^4 + b_2 \sigma^3 + b_3 \sigma^2 + b_4 \sigma + b_5}{\sigma^2 \Delta} \]  \( (5) \)

where the constants are given by

\[ b_0 = \psi_0 \begin{bmatrix} 8\mu_b^3 K_X^2 & K_{XZ} \\ K_{XZ} & K_Z^2 \end{bmatrix} \]

\[ b_1 = \psi_0 \begin{bmatrix} K_X^2 & K_{XZ} & C_{l\beta} \\ K_{XZ} & K_Z^2 & C_{n\beta} \\ 0 & 1 & -2C_{Y\beta} \end{bmatrix} - 2\mu_b^2 \begin{bmatrix} C_{l\beta} & K_{XZ} \\ C_{n\beta} & K_Z^2 \end{bmatrix} + (D_b \psi_0) \begin{bmatrix} 8\mu_b^3 K_X^2 & K_{XZ} \\ K_{XZ} & K_Z^2 \end{bmatrix} \]
\[ b_2 = (D_b \phi)_0 \left( -2 \mu_b^2 \begin{pmatrix} c_{l_p} & K_{X^2} \\ c_{n_p} & K_{XZ} \end{pmatrix} \right) + \psi_0 \begin{pmatrix} \mu_b & 0 & K_{X^2} & K_{XZ} \\ c_{n_b} & c_{n_p} & c_{n_r} \\ c_{Y_b} & c_{Y_p} & c_{Y_r} \end{pmatrix} + \mu_b \begin{pmatrix} c_{l_p} & c_{l_r} & c_{l_b} \\ 0 & K_{XZ} & K_{Z^2} \\ c_{Y_b} & c_{Y_p} & c_{Y_r} \end{pmatrix} \]

\[ 4 \mu_b^2 \begin{pmatrix} c_{l_b} & K_{X^2} \\ c_{n_b} & K_{XZ} \end{pmatrix} + \frac{1}{2} \mu_b \begin{pmatrix} c_{l_p} & c_{l_r} \\ c_{n_p} & c_{n_r} \end{pmatrix} + (D_b \psi)_0 \begin{pmatrix} K_{X^2} & c_{l_p} & K_{XZ} \\ c_{n_b} & K_{XZ} & c_{n_p} & K_{Z^2} \\ 1 & -2c_{Y_b} & 0 \end{pmatrix} \]

\[ \beta_0 \left( -4 \mu_b^2 \begin{pmatrix} c_{l_b} & K_{X^2} \\ c_{n_b} & K_{XZ} \end{pmatrix} \right) \]

\[ b_3 = \phi_0 \left( -2 \mu_b c_L \begin{pmatrix} c_{l_b} & K_{X^2} \\ c_{n_b} & K_{XZ} \end{pmatrix} \right) + (D_b \phi)_0 \begin{pmatrix} \mu_b & c_{n_b} & c_{n_p} & K_{XZ} \\ c_{Y_b} & c_{Y_p} & 0 \end{pmatrix} \]

\[ \psi_0 \begin{pmatrix} \mu_b & c_{n_b} & c_{n_p} & K_{XZ} \\ 0 & 2c_L & 1 \\ c_{Y_b} & c_{Y_p} & c_{Y_r} \end{pmatrix} + (D_b \psi)_0 \begin{pmatrix} \mu_b & c_{n_b} & c_{n_p} & K_{Z^2} \\ c_{Y_b} & c_{Y_p} & 0 \end{pmatrix} \]

\[ \beta_0 \begin{pmatrix} c_{l_b} & c_{l_p} \\ c_{n_b} & c_{n_p} \end{pmatrix} + \psi_0 \begin{pmatrix} c_{l_b} & c_{l_c} & K_{X^2} \\ c_{n_b} & c_{n_c} & K_{XZ} \\ c_{Y_b} & c_{Y_c} & 0 \end{pmatrix} + \mu_b \begin{pmatrix} c_{l_c} & c_{l_p} \\ c_{n_c} & c_{n_p} \end{pmatrix} \]
\[ b_4 = \phi_0 \left( \frac{1}{2} CL \begin{bmatrix} C_{l_\beta} & C_{l_p} \\ c_{n_\beta} & c_{n_p} \end{bmatrix} \right) + (D_b \phi)_0 \left( -2\mu_b CL \begin{bmatrix} C_{l_\beta} \\ c_{n_\beta} \end{bmatrix} \frac{K_{X^2}}{K_{XZ}} \right) + \psi_0 \left( \frac{1}{2} CL \begin{bmatrix} C_{l_\beta} & C_{l_r} \\ c_{n_\beta} & c_{n_r} \end{bmatrix} \right) + \right. \\
\left. (D_b \psi)_0 \left( -2\mu_b CL \begin{bmatrix} C_{l_\beta} \\ c_{n_\beta} \end{bmatrix} \frac{K_{XZ}}{K_{Z^2}} \right) + \frac{1}{2} \begin{bmatrix} C_{l_\beta} & C_{l_p} & C_{l_c} \\ c_{n_\beta} & c_{n_p} & c_{n_c} \\ C_{Y_\beta} & C_{Y_p} & C_{Y_c} \end{bmatrix} \right) \\

b_5 = -CL \begin{bmatrix} C_{l_\beta} & C_{l_c} \\ c_{n_\beta} & c_{n_c} \end{bmatrix} \\

The expression for \( \beta_\sigma \) is

\[ \beta_\sigma = \frac{c_0 \sigma^4 + c_1 \sigma^3 + c_2 \sigma^2 + c_3 \sigma + c_4}{\sigma \Delta} \tag{6} \]

where the constants are given by

\[ c_0 = \beta_0 \left( \delta \mu_b^3 \begin{bmatrix} K_{X^2} & K_{XZ} \\ K_{XZ} & K_{Z^2} \end{bmatrix} \right) \]
\[ c_1 = \phi_0 \left( \begin{array}{c} K_x^2 \\ 2 \mu_b^2 \tan \gamma_c L \\ K_{xz} \\ K_{zz}^2 \end{array} \right) + (D_b \psi)_0 \left( \begin{array}{c} K_x^2 \\ 2 \mu_b^2 C_{y_c} L \\ K_{xz} \\ K_{zz}^2 \end{array} \right) + \psi_0 \left( \begin{array}{c} K_x^2 \\ 2 \mu_b^2 \tan \gamma_c L \\ K_{xz} \\ K_{zz}^2 \end{array} \right) + (D_b \psi)_0 \left( \begin{array}{c} K_x^2 \\ 2 \mu_b^2 (C_{y_c} - 4 \mu_b) \\ K_{xz} \\ K_{zz}^2 \end{array} \right) + \beta_c \left( \begin{array}{c} C_{l_{c}} \\ 2 \mu_b^2 C_{l_{c}} \\ K_{xz} \\ K_{zz}^2 \end{array} \right) - 2 \mu_b^2 \left( \begin{array}{c} C_{l_{p}} \\ C_{n_{p}} \\ K_{xz} \\ K_{zz}^2 \end{array} \right) + 4 \mu_b^2 C_{x_c} \left( \begin{array}{c} K_x^2 \\ K_{xz} \\ K_{zz}^2 \end{array} \right) \]

\[ c_2 = \phi_0 \left( \begin{array}{c} C_{l_{c}} \\ K_{xz} \\ C_{n_{c}} \\ K_{zz}^2 \end{array} \right) - \mu_b C_{l_{c}} \left( \begin{array}{c} C_{l_{p}} \\ C_{n_{p}} \\ K_{xz} \\ K_{zz}^2 \end{array} \right) + (D_b \psi)_0 \left( \begin{array}{c} K_x^2 \\ C_{l_{p}} \\ C_{l_{c}} \\ K_{xz} \\ C_{n_{p}} \\ C_{n_{c}} \end{array} \right) - \frac{1}{2} \mu_b \left( \begin{array}{c} K_{xz} \\ C_{l_{p}} \\ C_{l_{c}} \\ K_{xz} \\ C_{n_{p}} \\ C_{n_{c}} \end{array} \right) \]

0 & 1 & \tan \gamma
\end{pmatrix}
\end{align*}
\]

\[
c_4 = \frac{1}{2} C_L \begin{pmatrix}
C_l_c & C_l_p & C_l_r \\
C_n_c & C_n_p & C_n_r \\
0 & 1 & \tan \gamma
\end{pmatrix}
\]

All the determinants given in this paper are expanded in the appendix.

In order to obtain the actual variables \( \phi, \psi, \) and \( \beta \) from the transformed variables an inverse Laplace transformation must be applied to \( \phi_\sigma, \psi_\sigma, \) and \( \beta_\sigma \). The expressions for \( \phi_\sigma, \psi_\sigma, \) and \( \beta_\sigma \) are of the form \( p_\sigma / q_\sigma \) where \( p_\sigma \) and \( q_\sigma \) are polynomials, the degree of \( q_\sigma \) being higher than that of \( p_\sigma \). Reference 6, page 45, indicates that the inverse transform of a function of this type is (in terms of the variables used herein)

\[
L^{-1} \left( \frac{p_\sigma}{q_\sigma} \right) = \sum_{n=1}^{m} \frac{p_\sigma(\lambda_n)}{q_\sigma'(\lambda_n)} e^{\lambda_n S_b}
\]

This equation assumes all the roots \( \lambda_n \) of \( q_\sigma = 0 \) to be distinct. All roots of \( q_\sigma = 0 \) are distinct for \( \beta_\sigma \); however, for \( \phi_\sigma \) and \( \psi_\sigma \), \( q_\sigma = 0 \) has double zero roots. (See equations (3), (5), and (6).) The
terms in the equations for $\phi$ and $\psi$ resulting from the two zero roots
of $q_0 = 0$ are given according to reference 6, page 49, by

$$\frac{d\Omega}{d\sigma} + \Omega(0)s_b$$

where

$$\Omega = \frac{Dq_0}{q_0}$$

The analysis takes three forms depending upon the character of the
nonzero roots of $q_0 = 0$ which are the same as the roots of $\Delta = 0$.
Four real roots, two real roots plus a pair of conjugate complex roots,
or two pairs of conjugate complex roots may exist.

Four Real Roots

The inverse Laplace transform of $\phi_0$ is

$$\phi = A_1\lambda_1 s_b + A_2\lambda_2 s_b + A_3\lambda_3 s_b + A_4\lambda_4 s_b + A_5 s_b + A_6$$  \hspace{1cm} (7)

where the constants are

$$A_1 = \frac{a_0\lambda_1^5 + a_1\lambda_1^4 + a_2\lambda_1^3 + a_3\lambda_1^2 + a_4\lambda_1 + a_5}{6A\lambda_1^5 + 5B\lambda_1^4 + 4C\lambda_1^3 + 3D\lambda_1^2 + 2E\lambda_1}$$

$$A_2 = \frac{a_0\lambda_2^5 + a_1\lambda_2^4 + a_2\lambda_2^3 + a_3\lambda_2^2 + a_4\lambda_2 + a_5}{6A\lambda_2^5 + 5B\lambda_2^4 + 4C\lambda_2^3 + 3D\lambda_2^2 + 2E\lambda_2}$$

$$A_3 = \frac{a_0\lambda_3^5 + a_1\lambda_3^4 + a_2\lambda_3^3 + a_3\lambda_3^2 + a_4\lambda_3 + a_5}{6A\lambda_3^5 + 5B\lambda_3^4 + 4C\lambda_3^3 + 3D\lambda_3^2 + 2E\lambda_3}$$
\[ A_4 = \frac{a_0 \lambda_4^5 + a_1 \lambda_4^4 + a_2 \lambda_4^3 + a_3 \lambda_4^2 + a_4 \lambda_4 + a_5}{6A_1 \lambda_4^5 + 5B_1 \lambda_4^4 + 4C_1 \lambda_4^3 + 3D_1 \lambda_4^2 + 2E_1 \lambda_4} \]

\[ A_5 = \frac{a_5}{E} \]

\[ A_6 = \frac{1}{E} \left( a_4 - a_5 \frac{D_1}{E} \right) \]

The inverse Laplace transform of \( \psi \) is

\[ \psi = B_1 e^{\lambda_1 s} + B_2 e^{\lambda_2 s} + B_3 e^{\lambda_3 s} + B_4 e^{\lambda_4 s} + B_5 s + B_6 \] (8)

where the constants are

\[ B_1 = \frac{b_0 \lambda_1^5 + b_1 \lambda_1^4 + b_2 \lambda_1^3 + b_3 \lambda_1^2 + b_4 \lambda_1 + b_5}{6A_1 \lambda_1^5 + 5B_1 \lambda_1^4 + 4C_1 \lambda_1^3 + 3D_1 \lambda_1^2 + 2E_1 \lambda_1} \]

\[ B_2 = \frac{b_0 \lambda_2^5 + b_1 \lambda_2^4 + b_2 \lambda_2^3 + b_3 \lambda_2^2 + b_4 \lambda_2 + b_5}{6A_2 \lambda_2^5 + 5B_2 \lambda_2^4 + 4C_2 \lambda_2^3 + 3D_2 \lambda_2^2 + 2E_2 \lambda_2} \]

\[ B_3 = \frac{b_0 \lambda_3^5 + b_1 \lambda_3^4 + b_2 \lambda_3^3 + b_3 \lambda_3^2 + b_4 \lambda_3 + b_5}{6A_3 \lambda_3^5 + 5B_3 \lambda_3^4 + 4C_3 \lambda_3^3 + 3D_3 \lambda_3^2 + 2E_3 \lambda_3} \]

\[ B_4 = \frac{b_0 \lambda_4^5 + b_1 \lambda_4^4 + b_2 \lambda_4^3 + b_3 \lambda_4^2 + b_4 \lambda_4 + b_5}{6A_4 \lambda_4^5 + 5B_4 \lambda_4^4 + 4C_4 \lambda_4^3 + 3D_4 \lambda_4^2 + 2E_4 \lambda_4} \]
\[ B_5 = \frac{b_5}{E} \]

\[ B_6 = \frac{1}{E} \left( b_4 - b_5 \frac{D}{E} \right) \]

The inverse Laplace transform of \( \beta_\sigma \) is

\[ \beta = C_1 e^{\lambda_1 B_5} + C_2 e^{\lambda_2 B_5} + C_3 e^{\lambda_3 B_5} + C_4 e^{\lambda_4 B_5} + C_5 \quad (9) \]

where the constants are

\[ C_1 = \frac{c_0\lambda_1^5 + c_1\lambda_1^4 + c_2\lambda_1^3 + c_3\lambda_1^2 + c_4\lambda_1}{6\lambda_1^5 + 5B\lambda_1^4 + 4C\lambda_1^3 + 3D\lambda_1^2 + 2E\lambda_1} \]

\[ C_2 = \frac{c_0\lambda_2^5 + c_1\lambda_2^4 + c_2\lambda_2^3 + c_3\lambda_2^2 + c_4\lambda_2}{6\lambda_2^5 + 5B\lambda_2^4 + 4C\lambda_2^3 + 3D\lambda_2^2 + 2E\lambda_2} \]

\[ C_3 = \frac{c_0\lambda_3^5 + c_1\lambda_3^4 + c_2\lambda_3^3 + c_3\lambda_3^2 + c_4\lambda_3}{6\lambda_3^5 + 5B\lambda_3^4 + 4C\lambda_3^3 + 3D\lambda_3^2 + 2E\lambda_3} \]

\[ C_4 = \frac{c_0\lambda_4^5 + c_1\lambda_4^4 + c_2\lambda_4^3 + c_3\lambda_4^2 + c_4\lambda_4}{6\lambda_4^5 + 5B\lambda_4^4 + 4C\lambda_4^3 + 3D\lambda_4^2 + 2E\lambda_4} \]

\[ C_5 = \frac{c_4}{E} \]
The quantity $D_b \phi$ can be obtained from equation (7) by differentiation as

$$D_b \phi = A_1'e^{\lambda_1 s_b} + A_2'e^{\lambda_2 s_b} + A_3'e^{\lambda_3 s_b} + A_4'e^{\lambda_4 s_b} + A_5' \quad (10)$$

where the constants are

$$A_1' = \lambda_1 A_1$$
$$A_2' = \lambda_2 A_2$$
$$A_3' = \lambda_3 A_3$$
$$A_4' = \lambda_4 A_4$$
$$A_5' = A_5$$

The quantity $D_b \Psi$ can be obtained from equation (8) by differentiation as

$$D_b \Psi = B_1'e^{\lambda_1 s_b} + B_2'e^{\lambda_2 s_b} + B_3'e^{\lambda_3 s_b} + B_4'e^{\lambda_4 s_b} + B_5' \quad (11)$$

where the constants are

$$B_1' = \lambda_1 B_1$$
$$B_2' = \lambda_2 B_2$$
$$B_3' = \lambda_3 B_3$$
$$B_4' = \lambda_4 B_4$$
$$B_5' = B_5$$
The quantity $D_b \beta$ can be obtained from equation (9) by differentiation as

$$D_b \beta = C_1' e^{\lambda^1_b} + C_2' e^{\lambda^2_b} + C_3' e^{\lambda^3_b} + C_4' e^{\lambda^4_b} \quad (12)$$

where the constants are

$$C_1' = \lambda_1 C_1$$
$$C_2' = \lambda_2 C_2$$
$$C_3' = \lambda_3 C_3$$
$$C_4' = \lambda_4 C_4$$

Collecting the equations of motion (equations (7) to (12)) for the case of four real roots gives

$$\begin{align*}
\phi &= A_1 e^{\lambda^1_b} + A_2 e^{\lambda^2_b} + A_3 e^{\lambda^3_b} + A_4 e^{\lambda^4_b} + A_5 + A_6 \\
\psi &= B_1 e^{\lambda^1_b} + B_2 e^{\lambda^2_b} + B_3 e^{\lambda^3_b} + B_4 e^{\lambda^4_b} + B_5 + B_6 \\
\beta &= C_1 e^{\lambda^1_b} + C_2 e^{\lambda^2_b} + C_3 e^{\lambda^3_b} + C_4 e^{\lambda^4_b} + C_5 \\
D_b \phi &= A_1' e^{\lambda^1_b} + A_2' e^{\lambda^2_b} + A_3' e^{\lambda^3_b} + A_4' e^{\lambda^4_b} + A_5' \\
D_b \psi &= B_1' e^{\lambda^1_b} + B_2' e^{\lambda^2_b} + B_3' e^{\lambda^3_b} + B_4' e^{\lambda^4_b} + B_5' \\
D_b \beta &= C_1' e^{\lambda^1_b} + C_2' e^{\lambda^2_b} + C_3' e^{\lambda^3_b} + C_4' e^{\lambda^4_b}
\end{align*} \quad (13)$$

Two Real Roots and a Pair of Conjugate Complex Roots

If a pair of conjugate complex roots $\lambda_3$ and $\lambda_4$ exists, the coefficients of the terms of $\phi$, $\psi$, and $\beta$ (equation (13)) corresponding to $\lambda_3$ and $\lambda_4$ are conjugate complex. The complex number $\lambda_3^k$ can be written

$$\lambda_3^k = R_k + I_k i$$
Thus,

\[ \lambda_3 = R_1 + I_1i \]
\[ \lambda_3^2 = R_2 + I_2i \]
\[ \lambda_3^3 = R_3 + I_3i \]
\[ \lambda_3^4 = R_4 + I_4i \]
\[ \lambda_3^5 = R_5 + I_5i \]

The coefficients of the terms of \( \phi \) resulting from the complex roots are

\[ A_3 = \frac{a_0R_5 + a_1R_4 + a_2R_3 + a_3R_2 + a_4R_1 + a_5 + (a_0I_5 + a_1I_4 + a_2I_3 + a_3I_2 + a_4I_1)i}{6AR_5 + 5BR_4 + 4CR_3 + 3DR_2 + 2ER_1 + (6AI_5 + 5BI_4 + 4CI_3 + 3DI_2 + 2EI_1)i} \]

or after rationalizing

\[ A_3 = R_A + I_Ai \]

and

\[ A_4 = R_A - I_Ai \]

Similarly, the coefficients of the terms of \( \psi \) resulting from the complex roots are

\[ B_3 = R_B + I_Bi \]

and

\[ B_4 = R_B - I_Bi \]

and the coefficients of the terms of \( \beta \) resulting from the complex roots are

\[ C_3 = R_C + I_Ci \]

and

\[ C_4 = R_C - I_Ci \]
The terms of $\phi$ corresponding to the conjugate complex roots are

$$A_3 e^{\lambda_3 s_b} + A_4 e^{\lambda_4 s_b} = K_A e^{R_1 s_b} \cos(I_1 s_b + \omega_A)$$

where

$$K_A = 2 \sqrt{R_A^2 + I_A^2}$$

and

$$\omega_A = \tan^{-1} \frac{I_A}{R_A}$$

Similarly, these terms for $\psi$ are

$$B_3 e^{\lambda_3 s_b} + B_4 e^{\lambda_4 s_b} = K_B e^{R_1 s_b} \cos(I_1 s_b + \omega_B)$$

where

$$K_B = 2 \sqrt{R_B^2 + I_B^2}$$

and

$$\omega_B = \tan^{-1} \frac{I_B}{R_B}$$

and for $\beta$ are

$$C_3 e^{\lambda_3 s_b} + C_4 e^{\lambda_4 s_b} = K_C e^{R_1 s_b} \cos(I_1 s_b + \omega_C)$$

where

$$K_C = 2 \sqrt{R_C^2 + I_C^2}$$

and

$$\omega_C = \tan^{-1} \frac{I_C}{R_C}$$
The final equations corresponding to two real and two conjugate complex roots are

\[
\begin{align*}
\phi &= A_1 e^{\lambda_{1b}} + A_2 e^{\lambda_{2b}} + K_A e^{R_{1b}} \cos(I_{1b} + \omega_A) + A_5 s_b + A_6 \\
\psi &= B_1 e^{\lambda_{1b}} + B_2 e^{\lambda_{2b}} + K_B e^{R_{1b}} \cos(I_{1b} + \omega_B) + B_5 s_b + B_6 \\
\beta &= C_1 e^{\lambda_{1b}} + C_2 e^{\lambda_{2b}} + K_C e^{R_{1b}} \cos(I_{1b} + \omega_C) + C_5 \\
D_b\phi &= A_1 e^{\lambda_{1b}} + A_2 e^{\lambda_{2b}} + K_A \sqrt{R_{1b}^2 + I_{1b}^2} e^{R_{1b}} \cos(I_{1b} + \omega_A + \\
&\quad \tan^{-1} \left( \frac{I_{1b}}{R_{1b}} \right) ) + A_5 \\
D_b\psi &= B_1 e^{\lambda_{1b}} + B_2 e^{\lambda_{2b}} + K_B \sqrt{R_{1b}^2 + I_{1b}^2} e^{R_{1b}} \cos(I_{1b} + \omega_B + \\
&\quad \tan^{-1} \left( \frac{I_{1b}}{R_{1b}} \right) ) + B_5 \\
D_b\beta &= C_1 e^{\lambda_{1b}} + C_2 e^{\lambda_{2b}} + K_C \sqrt{R_{1b}^2 + I_{1b}^2} e^{R_{1b}} \cos(I_{1b} + \omega_C + \\
&\quad \tan^{-1} \left( \frac{I_{1b}}{R_{1b}} \right) )
\end{align*}
\]
Two Pairs of Conjugate Complex Roots

If two pairs of conjugate complex roots, \( \lambda_1, \lambda_2, \) and \( \lambda_3, \lambda_4 \) exist, another cosine term is introduced into equations (14) in place of the exponentials so that

\[
\phi = K_A' e^{R_L s_b} \cos(I_1 s_b + \omega_A') + K_A e^{R_L s_b} \cos(I_1 s_b + \omega_A) + A_5 s_b + A_6
\]

\[
\psi = K_B' e^{R_L s_b} \cos(I_1 s_b + \omega_B') + K_B e^{R_L s_b} \cos(I_1 s_b + \omega_B) + B_5 s_b + B_6
\]

\[
\beta = K_C' e^{R_L s_b} \cos(I_1 s_b + \omega_C') + K_C e^{R_L s_b} \cos(I_1 s_b + \omega_C) + C_5
\]

\[
D_b \phi = K_A' \sqrt{R_L^2 + I_1^2} e^{R_L s_b} \cos(I_1 s_b + \omega_A' + \tan^{-1} \frac{I_1'}{R_L'}) + K_A \sqrt{R_L^2 + I_1^2} e^{R_L s_b} \cos(I_1 s_b + \omega_A + \tan^{-1} \frac{I_1}{R_L}) + A_5
\]

\[
D_b \psi = K_B' \sqrt{R_L^2 + I_1^2} e^{R_L s_b} \cos(I_1 s_b + \omega_B' + \tan^{-1} \frac{I_1'}{R_L'}) + K_B \sqrt{R_L^2 + I_1^2} e^{R_L s_b} \cos(I_1 s_b + \omega_B + \tan^{-1} \frac{I_1}{R_L}) + B_5

\]
DISCUSSION

The lateral motions of aircraft have been obtained by means of the Laplace transform. This analysis resulted in equations from which the free lateral motion of an aircraft can be calculated for any initial condition, or the forced motion can be calculated for any constant lateral force or moment applied at zero time. In general, the lateral forces and moments applied to the airplane by control movement or atmospheric turbulence are not constant but are arbitrary functions of time. After a solution has been obtained in terms of constant disturbing forces and moments, however, the solution for the arbitrary forces and moments can be obtained by Duhamel's integral as explained in references 4 and 5.

The nature of the motion indicated by equations (13) to (15) depends upon the form of the roots of the polynomial

\[ \Delta = 0 \]

which is commonly referred to as the stability quartic. The roots of the quartic can take three forms - first, all four roots real; second, two real roots and a pair of conjugate complex roots; and third, two pairs of conjugate complex roots. In the case of the lateral motions of airplanes the first form almost never occurs; the second form is very common; and the third form occurs under rather rare conditions. The actual motions indicated by equations (13) to (15) can be seen to be composed, in general, of the sums of terms which are the amplitude coefficients (the A's, B's, C's, and K's of equations (13) to (15)) modulated by exponential and cosine factors.

All the classical stability concepts can be obtained from equations (13) to (15). Because stability is concerned only with the free motion (motion due to initial conditions) the forcing or disturbing quantities \( C'_{1C}, C'_{2C}, \) and \( C'_{3C} \) can be set equal to zero so that the amplitude coefficients \( A_5, B_5, \) and \( C_5 \) vanish. The variation of the amplitude of the motion with time, which determines the stability, is now dependent entirely upon the damping coefficients \( e^{\lambda_1b}, e^{\lambda_2b}, e^{\lambda_3b}, e^{\lambda_4b}, e^{R_1b}, \) and \( e^{R_1'b}. \) The motion diminishes with time (stable) if \( \lambda_1, \lambda_2, \lambda_3, \lambda_4, R_1, \) and \( R_1' \) are all negative. Thus, these criteria for stability are that all real roots of \( \Delta = 0 \) and the real parts of all complex roots be negative. These criteria have been expressed in reference 7 in terms of the signs of the coefficients of the quartic \( \Delta = 0 \) and the sign of Routh's discriminant which is written as

\[ R = BCD - AD^2 - EB^2 \]  \hspace{1cm} (16)
These criteria in the present case can be expressed as follows: The necessary and sufficient conditions for the real roots and the real parts of the complex roots to be negative are that every coefficient of the quartic and \( R \) should be positive.

If the motions contain oscillations, the periods of the oscillations in seconds are from equations (14) and (15)

\[
\begin{align*}
P &= \frac{2\pi b}{I_1 V} \\
P' &= \frac{2\pi b}{I_1' V}
\end{align*}
\]

and the times to damp to half-amplitude in seconds are

\[
\begin{align*}
T_{1/2} &= \frac{b \log_2}{R_1 V} \\
T_{1/2}' &= \frac{b \log_2}{R_1' V}
\end{align*}
\]

and the cycles to damp to half-amplitude are

\[
\begin{align*}
N_{1/2} &= \frac{T_{1/2}}{P} = \frac{I_1 \log_2}{2\pi R_1} \\
N_{1/2}' &= \frac{T_{1/2}'}{P'} = \frac{I_1' \log_2}{2\pi R_1'}
\end{align*}
\]

**APPLICATION**

The equations for the motion of an aircraft resulting from the analysis were used to calculate illustrative examples of certain free and forced motions of an experimental swept-wing airplane, a three-view drawing of which is shown in figure 2. The calculations were made by use of the Bell Telephone Laboratories X-66744 relay computer available at the Langley Laboratory. The calculations were based upon stability derivatives measured on a model of the experimental airplane in the
Langley stability tunnel and presented in reference 8. Motions were calculated for true airspeeds of 140 and 200 miles per hour under standard conditions. The stability derivatives, other related aerodynamic quantities, and the mass characteristics of the experimental airplane as used in the calculations are shown in table I. The coefficients of the stability quartic (equation (4)) and value of Routh's discriminant (equation (16)) were calculated as

<table>
<thead>
<tr>

<td>0.00014875</td>
<td>8.7</td>
</tr>
</tbody>
</table>

The positive signs of all these quantities indicate complete stability of the lateral motion for both airspeeds. The coefficients of the quartic are such as to give two real roots and a pair of conjugate complex roots which are

Discussions of methods of obtaining the roots of the quartic can be found in references 9 to 12.

The first or second powers of $\sigma$ multiplied by $\Delta$ in the denominators of equations (3), (5), and (6) introduce one or two zero roots, respectively, in addition to the roots given in the preceding table. These zero roots lead to the terms containing the amplitude coefficients $A_5$, $A_6$, $B_5$, $B_6$, and $C_5$ of equations (14). For the experimental airplane, the motion can be thought of as composed of three modes - the oscillatory mode resulting from the pair of conjugate complex roots, the rolling-subsidence mode resulting from the large negative real root $\lambda_1$, and the spiral mode resulting from the small negative real root and the zero roots. Stability of the free spiral motion is indicated by the negative sign of the small real root $\lambda_2$. 
The period, time to damp to half-amplitude, and cycles to damp to half-amplitude of the oscillatory motion were calculated by use of equations (17) to (19) from the imaginary and real parts of the conjugate complex roots as

The motions calculated fell into two categories which may be termed free and forced motions.

Free Motions

Free motions are those which exist following an initial condition and in the absence of any forcing function. The five possible initial conditions are $\phi_0$, $\psi_0$, $\beta_0$, $r_0$, and $p_0$. Every free motion that the airplane is capable of executing can be obtained by superposition of the motions following these initial conditions taken separately. Figures 3 to 6 show the calculated free motion following the initial conditions $\phi_0$, $\psi_0$, $r_0$, and $p_0$ for the experimental airplane in level flight according to equations (14). No airplane response to $\psi_0$ occurs when the angle of climb is zero. Table II gives the values of the amplitude coefficients (see equations (14)) corresponding to the motions of figures 3 to 6. These figures show the total airplane motion and show the separate contributions to the motion by the rolling-subsidence and spiral modes when the motion resulting from these modes is appreciable. Figures 3 to 6 indicate that in the case of the experimental airplane the initial condition $\beta_0$ predominately excites the oscillatory mode of motion, $r_0$ excites both the oscillatory and spiral modes, and $\phi_0$ and $p_0$ predominately excite the spiral mode. The rolling-subsidence mode appears for a very short period of time in the initial phases of any motion involving appreciable rolling velocity. The principal effects upon the motions of figures 3 to 6 of increasing the airspeed from 140 to 200 miles per hour is to reduce the period as well as the time and cycles to damp to half-amplitude.

Forced Motions

Forced motions are those which exist during the action of forcing functions upon the airplane. Any forced motion of an airplane can be
built up by proper superposition (Duhamel's integral, reference 4) of the motions following the application at zero time of constant values of the forcing functions $C_{l_C}$, $C_{n_C}$, and $C_Y_C$. Figures 7 and 8 show the calculated response according to equations (14) of the experimental airplane to the constant value 0.02 for $C_{l_C}$ and $C_{n_C}$ applied at zero time. The response to a value of 0.02 for $C_Y_C$ was also calculated but during a time period of 8 seconds was negligible compared with responses resulting from $C_{l_C}$ and $C_{n_C}$. For the experimental airplane, the value $C_{l_C} = 0.02$ corresponds to a total aileron deflection of 21.0°, the value of $C_{n_C} = 0.02$ corresponds to a rudder deflection of 13.7°, and the value $C_Y_C = 0.02$ corresponds to a rudder deflection of 7.5°. The response to $C_{l_C}$ is predominately in the spiral mode of motion; whereas the response to $C_{n_C}$ is predominately in the spiral and oscillatory modes.

A large number of forced motions calculated for the experimental airplane corresponding to various flight conditions are presented in reference 8. These motions were built up by superposition of motions such as those of figures 7 and 8 following the application of the constant forcing functions $C_{l_C}$ and $C_{n_C}$. A large number of comparisons are made in reference 8 between calculations and flight tests for a large variety of flight conditions. The agreement between calculated and flight motions is good and indicates the practicability of analyzing the dynamic lateral flying qualities of aircraft by use of the theory of lateral dynamics such as that herein developed if experimentally determined values of the aerodynamic and mass parameters of the airplane are available. Reference 8 also indicates rather insignificant effects upon the calculated motions that result from a consideration of slight nonlinearities which occur in certain aerodynamic parameters of the experimental airplane.

CONCLUDING REMARKS

The lateral motions of aircraft were determined by means of the Laplace transform which gave solutions expressed in terms of elementary functions for the free and forced motions. These equations permit the calculation of the free motion of an aircraft following any initial condition or the forced motion following the application of constant external forces and moments. These forced motions can be used to obtain the response to any arbitrary forcing function by means of Duhamel's integral. All the classical stability concepts can be deduced from these same
solutions largely by inspection. These equations for the lateral motion were applied to the calculation of the lateral stability of a specific airplane and to the calculation of certain of its free and forced motions.

APPENDIX

EXPANSION OF THE COEFFICIENT DETERMINANTS

The stability quartic coefficients are

\[ A = 8\mu_b^3 \left( k_x^2 k_z^2 - k_{xz}^2 \right) \]

\[ B = 2\mu_b^2 \left[ 2c_{\gamma \beta} \left( k_{xz}^2 - k_x^2 k_z^2 \right) + k_{xz} (c_{l_r} + c_{n_p}) - k_x^2 c_{nr} - k_z^2 c_{l_p} \right] \]

\[ C = 4\mu_b^2 \left( k_x^2 c_{n_{\beta}} - k_{xz} c_{l_{\beta}} \right) + \mu_b k_x^2 \left( c_{n_{\gamma}} c_{\gamma \beta} - c_{n_{\beta}} c_{\gamma r} \right) + \mu_b k_z^2 \left( c_{l_{\gamma}} c_{\gamma \beta} - c_{l_{\beta}} c_{\gamma p} + c_{n_{\beta}} c_{\gamma p} - c_{n_p} c_{\gamma \beta} \right) + \]

\[ \frac{1}{2} \mu_b \left( c_{l_p} c_{n_r} - c_{l_r} c_{n_p} \right) \]

\[ D = 2\mu_b c_L \left[ \tan \gamma \left( k_{xz} c_{l_{\beta}} - k_x^2 c_{n_{\beta}} \right) + \left( k_{xz} c_{n_{\beta}} - k_z^2 c_{l_{\beta}} \right) \right] + \mu_b \left( c_{l_{\gamma}} c_{n_p} - c_{l_{\beta}} c_{n_p} \right) + \frac{1}{2} \left( c_{l_r} c_{n_p} c_{\gamma \beta} + c_{l_p} c_{n_{\beta}} c_{\gamma r} + c_{l_{\beta}} c_{n_r} c_{\gamma p} - c_{l_{\beta}} c_{n_p} c_{\gamma r} - c_{l_{\gamma}} c_{n_r} c_{\gamma \beta} - c_{l_{\beta}} c_{n_p} c_{\gamma p} \right) \]

\[ E = \frac{1}{2} c_L \left[ \tan \gamma \left( c_{l_p} c_{n_{\beta}} - c_{l_{\beta}} c_{n_p} \right) + c_{l_{\beta}} c_{n_r} - c_{l_r} c_{n_{\beta}} \right] \]
The coefficients appearing in the numerator of amplitude coefficients for $\phi$ are

$$a_0 = \phi_0 \left[ 3 \mu_0^3 (K_{XZ}^2 - K_{XZ}^2) \right]$$

$$a_1 = \phi_0 \left[ 2 \mu_0^2 K_{XZ} (C_{r} + c_{np}) + 4 \mu_0^2 c_{Y} (K_{XZ}^2 - K_{XZ}^2) - 2 \mu_0^2 (K_{XZ}^2 c_{nr} + K_{Z}^2 c_{lp}) \right] + (D_0 \phi)_0 \left[ 3 \mu_0^3 (K_{XZ}^2 - K_{XZ}^2) \right]$$

$$a_2 = \phi_0 \left[ \mu_0^2 K_{XZ} (c_{np} c_{Y} - c_{np} c_{Y}) + 4 \mu_0^2 (K_{XZ}^2 c_{nr} - K_{XZ}^2 c_{lp}) + \mu_0^2 K_{Z}^2 (c_{lp} c_{Y} - c_{lp} c_{Y}) + \mu_0^2 K_{Z}^2 (c_{lp} c_{Y} - c_{lp} c_{Y}) + \frac{1}{2} \mu_0 (c_{lp} c_{nr} - c_{lp} c_{np}) + (D_0 \phi)_0 \left[ 4 \mu_0^2 (K_{XZ}^2 - K_{XZ}^2) + 2 \mu_0^2 (K_{XZ} c_{r} - K_{XZ} c_{r}) \right] + (D_0 \psi)_0 \left[ 2 \mu_0^2 (K_{Z}^2 c_{r} - K_{Z} c_{r}) \right] + \phi_0 \left[ 4 \mu_0^2 (K_{Z}^2 c_{lp} - K_{Z} c_{lp}) \right] + 4 \mu_0^2 (K_{Z}^2 c_{lp} - K_{Z} c_{lp}) \right]$$
\[ a_3 = \phi_0 \left[ 2\mu_b \tan \gamma_C \left( k_{XYZ} c_{\lambda \beta} - k_{XZ} c_{n \beta} \right) + \mu_b \left( c_{l \beta} c_{n p} - c_{l p} c_{n \beta} \right) + \frac{1}{4} \left( c_{l r} c_{n p} c_{Y \beta} + c_{l p} c_{n \beta} c_{Y r} + c_{l \beta} c_{n r} c_{Y p} - c_{l \beta} c_{n p} c_{Y r} - c_{l p} c_{n r} c_{Y \beta} - c_{l r} c_{n \beta} c_{Y p} \right) + (D_b \phi)_0 \left[ 4\mu_b 2 \left( k_{X} c_{n \beta} - k_{XYZ} c_{l \beta} \right) + \mu_b k_{XZ} \left( c_{n \beta} c_{Y r} - c_{l \beta} c_{Y \beta} \right) + \psi_0 \left[ 2\mu_b \tan \gamma_C \left( k_{Z} c_{l \beta} - k_{XYZ} c_{n \beta} \right) \right] + (D_b \psi)_0 \left[ \mu_b k_{Z} \left( c_{l \beta} c_{Y r} - c_{l r} c_{Y \beta} \right) + \psi_0 \left[ \mu_b \left( c_{l r} c_{n \beta} - c_{l \beta} c_{n r} \right) \right] + \right] \right] + \beta_0 \left[ \mu_b \left( c_{l r} c_{n \beta} - c_{l \beta} c_{n r} \right) \right] + 2\mu_b k_{XZ} \left( c_{l \beta} c_{Y c} - c_{l c} c_{Y \beta} \right) + 2\mu_b k_{XZ} \left( c_{n c} c_{Y \beta} - c_{n \beta} c_{Y c} \right) + \mu_b \left( c_{l r} c_{n c} - c_{l c} c_{n r} \right) \right] \]
\[
\begin{aligned}
