Approved for public release; distribution is unlimited.
**REPORT DOCUMENTATION PAGE**

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

1.0 SCOPE

1.1 Identification

The Computer Software Configuration Item (CSCI), identified as the Advanced Circulation Model for Shelves, Coastal Seas, and Estuaries (ADCIRC) is a hydrodynamic model which implements the generalized wave-continuity equation (GWCE) and momentum balance equations to solve for tidal elevation and current velocity within coastal waters. ADCIRC uses the finite element method, which allows for high resolution of shoreline geometry and increased refinement near shallow, coastal areas and near regions of swiftly changing bathymetry.

ADCIRC can be run in either a two-dimensional depth-integrated (2DDI) form or in 2 alternative three-dimensional forms. This document will describe the two-dimensional depth-integrated form (2DDI). A Cartesian or spherical coordinate system is used for the horizontal solution of the generalized shallow water equations. Elevation is calculated from the solution of the generalized wave-continuity equation (GWCE). This equation can be solved using either a consistent or a lumped mass matrix and a partially implicit or a fully explicit time stepping procedure. Velocity is obtained from the solution of the momentum equations whose specific form depends on whether the model is run in 2DDI or 3D.

ADCIRC-2DDI also computes tidal harmonic constituents during the course of the run using least square analysis routines. This advantage allows the user to avoid writing out long time series for post-processing.

1.2 Document Overview

The purpose of this Software Design Description (SDD) is to describe the software design and code of the Advanced Circulation Model for Shelves, Coastal Seas, and Estuaries (ADCIRC-2DDI). It includes flow charts and descriptions of the programs, subprograms, and common blocks. This document will form the standard documentation used to assist the War Fighting Support Center (WSC).

2.0 REFERENCED DOCUMENTS

2.1 General Technical Documentation

Manuscript approved October 18, 2001.
3.0 CSCI-WIDE DESIGN DECISION

The ADCIRC-2DDI model uses a sequential access file format for all files except hot start output files (fort.67, fort.68) and output files such as fort.61, fort.62, fort.63, fort.64, fort.74, fort.71, and fort.73 that have been specified by the user as direct access (i.e. NOUTGE = 2, NOUTGU = 2, etc.).

4.0 CSCI ARCHITECTURAL DESIGN

4.1 CSCI Components

a) ADCIRC can be divided into three main software units: CSC ADCSETUP, CSC ADCIRC, and CSC SOLVER.

b) **CSC ADCSETUP** - This program is an interactive pre-processor which completely automates the configuration of ADCIRC for a specific application based on information extracted from the grid file (fort.14) and the parameter input file (fort.15). Modifications to the ADCIRC code address dimensioning, input consistency, forcing, and computer platform.

CSC ADCIRC - This program consists of 39 subroutines and 13 common blocks that in combination produce solutions for water elevation and depth-averaged velocity found in coastal regions due to tides and atmospheric forcing. Tidal harmonic constituents are computed throughout the execution of the program, if desired.

CSC SOLVER - A direct banded matrix solver (programs SGBCO and SGBSL from LINPACK) or one of 7 different iterative solvers (from ITPACKV 2D) are used to solve the GWCE. However, if the GWCE is set up using a lumped, fully explicit formulation, no matrix solver is necessary. The selected solver must be compiled and linked to ADCIRC.

c) The ADCIRC model was originally developed by Drs. R. A. Leutttich and J. J. Westerink in 1992 with the support of the Army Corps of Engineers, and has undergone numerous revisions and additions since this form, Version 33.05.

d) The ADCIRC model takes up about 902 KB of disk space. This number includes the files adcsetup.f, adc33_05.for, and srcv2d.for. It does not include additional space that is required for the input files. The size of the input files varies depending on the size of the problem (i.e. fort.14), wind input option (i.e. fort.22), as well as other external data options specified by the user (i.e. within fort.15).

4.2 Concept of Execution

ADCIRC is a platform independent code that may be run on PC systems, UNIX systems, or all HPC platforms. ADCIRC can be forced with elevation boundary conditions (harmonic tidal
constituents or elevation time series), normal flow boundary conditions, external and internal barrier flow boundary conditions, surface stress boundary conditions (wind), atmospheric pressure, tidal potential, or earth load/self-atraction tide.

Prior to execution of the ADCIRC program, the source code pre-processor adsetup.f must be run. This reads the UNIT 14 and 15 ADCIRC input files and prompts the user for additional information. Based on this input, the pre-processor sets the dimensions for all variables and optimizes the code for the specific problem and computer to be used.

Execution of this CSCI begins by prompting the user for the following information:
1) Name of the UNIT 14 input file.
2) Name of the UNIT 15 input file.
3) Implementation of a lumped GWCE matrix foundation, yes or no.
4) Type of computer on which ADCIRC will be run (scalar or vector). If scalar, the make of the computer (SUN or other).
5) Type of compiler, 32-bit (e.g. SUN, CONVEX, IBM RS 6000 etc.) or 64-bit (e.g. CRAY, YMP, DEC ALPHa computers).
6) Name of the initial ADCIRC-2DDI FORTRAN source code file.
7) Name of the modified ADCIRC-2DDI FORTRAN source code file that is specific to the problem and computer on which ADCIRC will be run.

Once the pre-processor has run, the output production source code is compiled and linked to the solver. As configured and implemented at the WSC, an iterative solver is specified by the UNIT 15 input file, requiring that ITPACKV 2D package of subroutines ("srcv2d.for") be linked to the source code during compilation.

For a cold start model setup, time-dependent boundary forcing conditions (specified in UNIT 15) and initial wind stress and pressure forcing are read in to the program. The wind and pressure data are specified by the user. ADCIRC supports direct reads from four sources of wind products: 1) outdated FNMC wind velocity data, 2) PBL/JAG wind model output velocities, 3) NWS AVN model MET files, and 4) NWS ETA-29 MET files. None of these sources are utilized within the WSC. Instead, Navy meteorological products are processed to interface with the ADCIRC fort.22 format under the NWS = 2 option. In addition, initial wet/dry interface nodes are determined and header information is written to output files. Lastly, matrices for harmonic analysis are initialized.

For a hot start model setup, the user must locate the most recently completed hot start file (UNIT 67 or UNIT 68) and set the variable IHOT in UNIT 15 equal to 67 or 68. The program will then locate the appropriate positions in the forcing/output files and re-initialize the model variables.

Prior to time stepping, flags and coefficients used within the time stepping loop are set. Then, in the time stepping procedure, the elevation and velocity are calculated at each node for each time step according to the GWCE and Momentum equations. The results are then written to either global (all nodes) or station (pre-selected nodes) output files. The harmonic analysis matrix and load vectors are also updated. Harmonic analysis completes the
execution of ADCIRC-2DDI by solving the harmonic analysis matrices using a least squares approach and writing the solution to output files. A flow diagram illustrating the basic logic underlying the operation of ADCIRC-2DDI is shown in Figure 4.2-1.
1. **INITIALIZATION**

- Parameter specification
- Dimension statements
- Common blocks/equivalences
- Machine dependent statements
- Constant Definition
- Output header with model configuration
  (fort.16)
- Read and process input files for grid
  (fort.14), and model run parameters
  (fort.15)
- Echo input parameter specifications (fort.16)
- Set up GWCE boundary arrays
- Set up momentum boundary arrays
- Check interior/exterior barrier height against depth
- Compute station interpolation coefficients
- Define harmonic analysis parameters
- Setup direct or iterative solver
- Read self attraction/load tide information if necessary
- Define status of GWCE matrix lumping

2. **MODEL SETUP**

- **Cold Start**
  - Read time-dependent elevation or normal flux boundary forcing
  - Read initial wind stress and pressure forcing if used
  - Determine initial wet/dry interface nodes
  - Output header information to output files
  - Initialize harmonic analysis matrices
  - OR

- **Hot Start**
  - Read hot start model state (fort.67 or fort.68)
  - Locate positions in forcing/output files
  - Set flags and coefficients for time stepping

3. **TIME STEPPING**

- Set or increment time
- Move computed solution to prior time step
- Zero arrays for current time step
- Compute GWCE system matrix at 1st time step or if wetting/drying occurred
- Define ramp function
- Read wind and pressure forcing
- Compute body and boundary forcing

- **GWCE Solution**
  - Compute GWCE load vector by element
  - Assemble GWCE load vector
  - Save elevation at prior time step
  - Impose elevation boundary condition
  - Impose normal flow boundary condition
  - Solve GWCE for elevation at new time step

  - Compute new wet/dry nodal coefficients

- **Momentum Solution**
  - Update non-lumped momentum load vector
  - Update LHS momentum terms
  - Add lumped mass matrix terms to momentum equation LHS and load vector
  - Apply flux boundary conditions
  - Solve momentum for velocity at new time step

  - Update wet/dry elements
  - Write results to output files
  - Update harmonic analysis matrix and load vectors
  - Write hot start files
  - Write max/min solution values

4. **HARMONIC ANALYSIS**

- Solution of the harmonic analysis matrices
- Write solution to files

---

**Figure 4.2.1.** Flowchart illustrating the execution of the ADCIRC-2DDI model.
4.3 Interface Design

4.3.1 Interface Identification and Diagrams

The only Navy standard ADCIRC external interfaces are the input and output files.

There are two standard input files that must be supplied in order to run ADCIRC-2DDI. These are UNIT 14 and UNIT 15, defined by ADCIRC as “fort.14” and “fort.15”. UNITS 19, 20, 21, 22, 200, and 67/68 are supplemental files that may or may not be used under specified conditions.

The interfacing and operational environment for ADCIRC-2DDI, which demonstrates the relationship between the components of the system and associated files, is illustrated in Figure 4.3-1.
Figure 4.3-1. Flow diagram illustrating the relationship between software components of the ADCIRC-2DDI model. Problem_adcirc.f is the ADCIRC code configured for a specific problem.
Figure 4.3-1. Flow diagram illustrating the relationship between software components of the ADCIRC-2DDI model. Problem_adcirc.f is the ADCIRC code configured for a specific problem.
5.0 CSCI DETAILED DESIGN

All routines are written in FORTRAN 77. The CSCI is platform independent and may be run on a PC or UNIX system. It can also be run on all HPC platforms.

The following paragraphs give a detailed description of the purpose, variables, logic, and constraints for the software elements in the CSCI. Description of the components of the program will be divided into design descriptions of ADCSETUP, ADCIRC, and ADCSOLVER.

5.1 CSC ADCSETUP

The program ADCSETUP completely automates the setup of ADCIRC-2DDI for any change in problem (i.e. grid, forcing, or computer). Information to modify the code is obtained from the ADCIRC grid and input files (the names are specified interactively) and from other interactive input.

5.1.1 Constraints and Limitations

None.

5.1.2 Commonly Used Input Parameters

5.1.2.1 File: adsetup.f

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXNOD</td>
<td>Integer</td>
<td>Maximum number of nodes allowable in the nearest neighbor table.</td>
</tr>
</tbody>
</table>

Notes: The neighbor calculation initially assumes every node is an interior node and therefore every element leg belongs to 2 elements. If this is true, each node's neighbors will be specified twice (1 time for each element that contains a particular leg.) To account for this, neighbors around a node are accumulated at only half the actual rate (i.e., every node in a particular element is assumed to have only 1 neighbor rather than 2). The problem is that boundary nodes will always have 2 neighbors that are not shared by 2 elements. Therefore, it is necessary to check which nodes are boundary nodes and add 1 to the number of neighbors for that node.

<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>FFACTOR (if NOLIBF=0)</td>
<td>Real</td>
<td>If NOLIBF=0, Bottom friction coefficient. The standard linear bottom friction coefficient TAU = FFACTOR. Note, in this case FFACTOR should be equal to the specified TAU0. FFACTOR is always read in, however, it is only used in the computations when NWP=0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If NOLIBF = 1, Bottom friction coefficient. The standard quadratic bottom friction coefficient CF = FFACTOR. FFACTOR is always read in, however, it is only used in the computations when NWP=0.</td>
</tr>
<tr>
<td>FGAMMA</td>
<td>Real</td>
<td>A parameter that determines how the friction factor increases as the water depth decreases. Setting this to 1/3 gives a Manning friction law type of behavior (FGAMMA=1/3 is recommended).</td>
</tr>
<tr>
<td>FMV</td>
<td>Real</td>
<td>Fraction of the harmonic analysis period (extending back from the end of the harmonic analysis period) to use for comparing the water elevation and velocity means and variances from the raw model time series with corresponding means and variances of a time series resynthesized from the harmonic constituents. This comparison is helpful for identifying numerical instabilities and for determining how complete the harmonic analysis was (See Appendix II, Section 8.2 for further notes).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>= 0 Do not compute any means and variances.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>= 0.1 Compute means and variances over final 10% of period used in harmonic analysis.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>= 1.0 Compute means and variances over entire period used in harmonic analysis.</td>
</tr>
<tr>
<td>FTHETA</td>
<td>Real</td>
<td>A parameter that determines how rapidly the hybrid relationship approaches each asymptotic limit. (FTHETA=10 is recommended).</td>
</tr>
<tr>
<td>G</td>
<td>Real</td>
<td>Gravitational constant. Note that the code always operates in seconds and that the specified time units for G must be seconds. When ICS = 1 and when either NTIP and or NCOR = 1, G must be specified equal to 9.81 m/sec<em>sec since the program only operates in metric units for this case. When ICS = 2, G must be specified equal to 9.81 m/sec</em>sec since the program only operates in metric units for this case.</td>
</tr>
<tr>

<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>H₀ (if NOLIFA=0 or NOLIFA=1)</td>
<td>Real</td>
<td>Minimum bathymetric depth. All bathymetric depths in the input grid (UNIT 14) are checked against this depth and set equal to H₀ if they are initially less than H₀.</td>
</tr>
<tr>
<td>H₀ (if NOLIFA=2)</td>
<td>Real</td>
<td>Nominal minimum water depth for drying (Typical value = 0.01 M).</td>
</tr>
<tr>
<td>HAFNAM(I)</td>
<td>Real</td>
<td>Alphanumeric descriptor of the constituent name (≤10 characters). See description of HAFF(I), HAFREQ(I), HAFACE(I).</td>
</tr>
<tr>
<td>HAFREQ(I), HAFF(I), HAFACE(I), I=1,NHARFR</td>
<td>Real</td>
<td>Frequency (rad/s). Nodal factor. Equilibrium argument (degrees). Note: This value is preceded by HAFNAM, an alphanumeric descriptor. If a steady component will be included in the harmonic analysis, this must be the first constituent listed (i.e., the constituent corresponding to I=1).</td>
</tr>
<tr>
<td>HBREAK</td>
<td>Real</td>
<td>The break depth. In deeper water the friction relation looks like a standard quadratic relation. In shallower water the friction factor increases as the depth decreases (e.g. like a Manning type friction law). (HBREAK = 1 m)</td>
</tr>
<tr>
<td>ICS</td>
<td>Integer</td>
<td>Parameter that determines in which coordinate system the calculations are performed.</td>
</tr>
</tbody>
</table>

**ICS = 1** Standard Cartesian coordinate form of the governing equations is used in the model. Input coordinates are in standard length units (as determined by G). If NTIP = 1 and/or NCOR = 1, then an inverse Carte Parallélogrammatique Projection is used in order to obtain the coordinates for the nodes in degrees longitude and latitude so that the variable Coriolis and tidal potential forcing function can be computed. However, if the Coriolis parameter varies significantly over the domain and/or the domain is large enough that tidal potential forcing is significant, it is recommended to operate the code with ICS = 2 (with the governing equations based on spherical equations).

**ICS = 2** Governing equations are based on the spherical equations transformed into using a Carte Parallélogrammatique Projection (CPP). The input coordinates are in degrees longitude and latitude that are then transformed using the CPP.

NFFR is only included in the UNIT 15 file if one or more specified (non-zero) normal flow external boundaries were defined in the UNIT 14 input, (IBTYPE = 2,12 or 22).</td>
</tr>
<tr>
<td>NFOVER</td>
<td>Integer</td>
<td>Non-fatal error override option. When NFOVER=1, all checked input parameters which are inconsistent will in most cases be automatically corrected to a default or corrected value and execution will continue. Be sure to read the nonfatal warning messages to see what the program has done. If NFOVER≠1, all checked input parameters which are inconsistent will lead to program termination. Note that NFOVER does not effect all fatal warning checks, which will always stop execution. Furthermore all non-fatal runtime error checks are treated in the same manner as input parameter checks.</td>

5.2 CSC ADCIRC

ADCIRC-2DDI is a finite element, hydrodynamic model that applies tidal and meteorological forcing to produce a depth-integrated velocity field and water elevations. The model is based on the mass and momentum conservation equations, which have been formulated using the traditional hydrostatic pressure and Boussinesq approximations. They have been discretized in space and time using the finite element (FE) and the finite difference (FD) methods, respectively. First, elevation is obtained from the solution of the depth-integrated continuity equation in Generalized Wave-Continuity Equation (GWCE) form. Then, velocity is obtained from a solution of the momentum equations. The ADCIRC code consists of 40 subroutines and 30 common blocks.

The GWCE is solved using either a consistent or a lumped mass matrix as specified through adcsetup.f, and an implicit or explicit time stepping scheme defined by the variable time weighting coefficients specified in UNIT 15. If a lumped, fully explicit formulation is specified, no matrix solver is necessary. In all other cases the GWCE is best solved using the Jacobi preconditioned iterative solver from the ITPACKV 2D package.

The momentum equations are lumped generating a diagonal matrix system that requires no matrix solver.

5.2.1 Constraints and Limitations

The ADCIRC-2DDI code is modular in that switches for various dynamical terms/forcings are set to on or off in the fort.15 file. ADCIRC-2DDI is written in FORTRAN 77.

5.2.2 Initialization

The ADCIRC-2DDI model is initialized by running the program adcsetup.f. Information used to dimension and configure the code is obtained from the ADCIRC grid (fort.14) and parameter input file (fort.15). The names of these files as well as additional information specifying computer platform and compiler type are interactively input.

5.2.3 Boundary Conditions

ADCIRC boundary conditions include:
- specified elevation (harmonic tidal constituents or time series)
- specified normal flow (harmonic tidal constituents or time series)
- zero normal flow
- slip or no slip boundary layer conditions for velocity
- external barrier overflow out of the domain
- internal barrier overflow between sections of the domain
- spatial and temporal surface stress (wind and/or wave radiation stress)
- spatial and temporal atmospheric pressure
- outward radiation of waves in GWCE via a flux integral (Sommerfeld condition)
5.2.4  Logic and Basic Equations

For a complete description of the governing equations, numerical formulation, and implementation of ADCIRC-2DDI, the user is referred to Luetich, Westerink, and Scheffner (1992). ADCIRC-2DDI User’s Manual also offers information about governing equations and is found on the web at:

5.2.5  Commonly Used Input Parameters

5.2.5.1  Dimension parameters

The following table is a list and description of the parameters that must be set within the main code and the subroutines to control the dimensioning of arrays.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MNP</td>
<td>Integer</td>
<td>Maximum number of nodal points.</td>
</tr>
<tr>
<td>MNWP</td>
<td>Integer</td>
<td>1 if no meteorological forcing, = MNP if meteorological forcing.</td>
</tr>
<tr>
<td>MNE</td>
<td>Integer</td>
<td>Maximum number of elements.</td>
</tr>
<tr>
<td>MNBW</td>
<td>Integer</td>
<td>Maximum half band width of wave equation matrix (if an iterative solver is used, MNBW is not used for anything, therefore it can be set to any value or removed from the parameter list).</td>
</tr>
<tr>
<td>MNBFR</td>
<td>Integer</td>
<td>Maximum number of periodic specified elevation boundary forcing constituents.</td>
</tr>
<tr>
<td>MNFFR</td>
<td>Integer</td>
<td>Maximum number of periodic specified normal flow boundary forcing constituents.</td>
</tr>
<tr>
<td>MNTIF</td>
<td>Integer</td>
<td>Maximum number of tidal potential constituents.</td>
</tr>
<tr>
<td>MNBOU</td>
<td>Integer</td>
<td>Maximum number of flow boundary segments including external and internal segments.</td>
</tr>
<tr>
<td>MNVEL</td>
<td>Integer</td>
<td>Maximum total number of flow boundary nodes +1.</td>
</tr>
<tr>
<td>MNOPE</td>
<td>Integer</td>
<td>Maximum number of elevation boundary segments.</td>
</tr>
<tr>
<td>MNETA</td>
<td>Integer</td>
<td>Maximum total number of specified elevation boundary nodes.</td>
</tr>
<tr>
<td>MNSTAE</td>
<td>Integer</td>
<td>Maximum number of elevation recording stations.</td>
</tr>
<tr>
<td>MNSTAV</td>
<td>Integer</td>
<td>Maximum number of velocity recording stations.</td>
</tr>
<tr>
<td>MNSTAC</td>
<td>Integer</td>
<td>Maximum number of concentration recording stations.</td>
</tr>
<tr>
<td>MNHARF</td>
<td>Integer</td>
<td>Maximum number of constituents to include in harmonic analysis of model results (Note: To run on the CRAY, if 4*(MNHARF/4)&lt;MNHARF, MNHARF should be rounded up to the next larger integer that is evenly divisible by 4).</td>
</tr>
<tr>
<td>MNEI</td>
<td>Integer</td>
<td>1 + maximum number of nodes connected to any one node in the finite element grid.</td>
</tr>
</tbody>
</table>
5.2.5.2  File: fort.14

See description of variables in Section 5.1.2.2.

5.2.5.3  File: fort.15

See description of variables in Section 5.1.2.3.

5.2.5.4  File: fort.19

Input variables listed by the line sequence within the file:

ETIMINC  
NETA  
ESBIN

Description of transient elevation data read in for elevation specified boundaries from UNIT 19.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESBIN(I)</td>
<td>Real</td>
<td>Elevation (referenced to the GEOID) at specified elevation node I. The sequencing is assumed to match what is defined in the elevation specified boundary condition part of the UNIT 14 file.</td>
</tr>
<tr>
<td>ETIMINC</td>
<td>Real</td>
<td>Time increment (secs) between consecutive sets of elevation specified boundary condition values contained in this file.</td>
</tr>
<tr>
<td>NETA</td>
<td>Integer</td>
<td>The total number of elevation specified boundary nodes.</td>
</tr>
</tbody>
</table>

NOTES:
- This file is only used if NBFR=0 (UNIT 15 file) and NOPE>0 (UNIT 14 file).
- The first set of elevation values are provided at TIME=STATIM. Subsequent sets of elevation values are provided every ETIMINC.
- Enough sets of elevation values must be provided to extend for the entire model run, otherwise the run will crash!
5.2.5.5  File: fort.20

Input variables listed by the line sequence within the file:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTIMINC</td>
<td>Real</td>
<td>Time increment (secs) between consecutive sets of normal flow boundary condition values contained in this file.</td>
</tr>
<tr>
<td>NFLBN</td>
<td>Integer</td>
<td>The total number of flow boundary nodes that were designated in the UNIT 14 file as having a non zero normal flow.</td>
</tr>
<tr>
<td>QNIN(I)</td>
<td>Real</td>
<td>Normal flow/unit width (e.g., m²/s) at specified normal flow node I. A positive flow/unit width is into the domain and a negative flow/unit width is out of the domain. The sequencing is assumed to match what is defined in the part of the UNIT 14 file specifying non-zero normal flow boundaries.</td>
</tr>
</tbody>
</table>

NOTES:
- This file is only used if one or more specified (non-zero) normal flow external boundaries were defined in the UNIT 14 input, (IBTYPE=2, 12 or 22) and NFFR = 0 in the UNIT 15 file.
- The first set of normal flow values is provided at TIME=STATIM. Subsequent sets of normal flow values are provided every FTIMINC.
- Enough sets of normal flow/unit width values must be provided to extend for the entire model run, otherwise the run will crash!

<tr>
<td>WDIR(I,J)</td>
<td></td>
<td>If NWS = 3, Direction wind blows from in degrees CW from north.</td>
</tr>
</tbody>
</table>

Notes:

NWS = 1
- The first data set is provided at TIME=STATIM+DT. Subsequent data sets are provided at every time step.
- Data must be provided for the entire model run, otherwise the run will crash!!!

NWS = 2
- The first data set is provided at TIME=STATIM. Subsequent data sets are provided every wind time interval.
- Data must be provided for the entire model run, otherwise the run will crash!!!
- The wind time interval must be set in the UNIT 15 file.

NWS = 3
- The first data set must be at or before the date and time listed in the UNIT 15 file as the beginning time of the simulation.
- Data sets are provided every WTIMINC, where this parameter is the wind time interval and is specified in the UNIT 15 file.
- Data must be provided for the entire model run, otherwise the run will crash!!!
- Values for NWLAT, NWLON, WTIMINC, the beginning time of the and several other parameters must be set in the unit 15 file.
- The following transformations are preformed to put this information into usable form for the model calculations.

  \[
  \text{WIND\_STRESS} = \text{DRAG\_COEFF} \times 0.001293 \times \text{WIND\_VEL} \times \text{WIND\_SPEED}
  \]

  \[
  \text{DRAG\_COEFF} = 0.001 \times (0.75 + 0.067 \times \text{WIND\_SPEED})
  \]

  \[
  \text{IF}(\text{DRAG\_COEFF} > 0.003) \quad \text{DRAG\_COEFF} = 0.003
  \]

NWS = 4
- This line must have the format I8,3E13.5.
- This line is repeated for as many nodes as desired.
- A line containing the # symbol in column 2 indicates new wind and pressure fields (i.e., values at the next time increment) begin on the following line.
- Each node that is not contained in the UNIT 22 file is assumed to have zero wind velocity and pressure = 1013.0.
- The following transformations are preformed to put this information into usable form for the model calculations.

  \[
  \text{WIND\_VEL} \ (\text{M/S}) = WSX2 \times 1.04 \times 0.5144, \ WSY2 \times 1.04 \times 0.5144
  \]

  \[
  \text{WIND\_STRESS} = \text{DRAG\_COEFF} \times 0.001293 \times \text{WIND\_VEL} \times \text{WIND\_SPEED}
  \]

  \[
  \text{DRAG\_COEFF} = 0.001 \times (0.75 + 0.067 \times \text{WIND\_SPEED})
  \]

  \[
  \text{IF}(\text{DRAG\_COEFF} > 0.003) \quad \text{DRAG\_COEFF} = 0.003
  \]

  \[
  \text{PR2} \times 100 / \text{GRAVITY} / 1000.
  \]

- The first data set is provided at TIME=STATIM. Subsequent data sets are provided every wind time interval.
- Data must be provided for the entire model run, otherwise the run will crash!!!
- The wind time interval must be set in the UNIT 15 file.
5.2.5.8  

File: fort. 23

Input variables listed by the line sequence within the file:

NODE #, AMP(I, NODE #), PHASE(I, NODE #)

Description of input variables read in from UNIT 23.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Integer</td>
<td>Index of tidal frequency.</td>

5.2.7 Conversion Subroutines

5.2.7.1 Subroutine CPP

CPP transforms longitude and latitude (lambda, phi) coordinates into Cartesian coordinates using a Carte Parallélogrammatique Projection (CPP). Longitude and latitude must be in radians. CPP is called by the main code.

Calling Sequence: Subroutine CPP (X, Y, RLAMBDA, PHI, RLAMBDA0, PHI0)

Data Declaration: Real X, Y, RLAMBDA, PHI, RLAMBDA0, PHI0

Arguments:

- X: X-coordinate in CPP projection.
- Y: Y-coordinate in CPP projection.
- RLAMBDA: Longitude (in radians).
- PHI: Latitude (in radians).
- RLAMBDA0: Reference longitude for CPP projection.
- PHI0: Reference latitude for CPP projection.

5.2.7.2 Subroutine INVCP

This routine transforms Cartesian CPP coordinates to longitude and latitude (lambda, phi) coordinates. Longitude and latitude are given in radians. INVCP is called by the main code.

Calling Sequence: Subroutine INVCP (XXCP, YYCP, RLAMBDA, PHI, RLAMBDA0, PHI0)
Data Declaration: Real XXCP, YYCP, RLAMBDA, PHI, RLAMBDA0, PHI0

Arguments:
XXCP X-coordinate in CPP projection.
YYCP Y-coordinate in CPP projection.
RLAMBDA Longitude (in radians).
PHI Latitude (in radians).
RLAMBDA0 Reference longitude for CPP projection.
PHI0 Reference latitude for CPP projection.

5.2.7.3 Subroutine NEIGHB

NEIGHB generates a neighbor table from an element connectivity table. NEIGHB is called by the main code.

Calling Sequence: Subroutine NEIGHB (NE, NP, NNEIGH, NEIGH, NEIMIN, NEIMAX, NSCREEN)

Data Declaration: Integer NE, NP, NNEIGH, NEIGH, NEIMIN, NEIMAX, NSCREEN

Input Parameters: MNP Maximum number of nodal points.
MNE Maximum number of elements.
MNEI 1 + maximum number of nodes connected to any one node in the finite element grid.

Arguments: NE Number of elements.
NP Number of nodes in grid.
NNEIGH Number of neighbors for each node.
NEIGH 2D array of neighbors for each node.
NEIMIN 1+ minimum number of neighbors for any node.
NEIMAX 1+ maximum number of neighbors for any node.
NSCREEN Parameter which controls output to UNIT 6.

Note: The node itself is listed as neighbor #1. All other neighbors are sorted and placed in CW order from east.
5.2.7.4 **Subroutine TIMECONV**

TIMECONV converts time from year, month, day, hour, min, and sec into seconds since the beginning of the year specified in the arguments, IYR. TIMECONV is called by the main code.

**Calling Sequence:** Subroutine TIMECONV (IYR, IMO, IDAY, IHR, IMIN, SEC, TIMESEC)

**Data Declaration:** Real SEC, TIMESEC
Integer IYR, IMO, IDAY, IHR, IMIN

**Arguments:**

- **IYR** Year specified in Fleet Numeric Wind file.
- **IMO** Month specified in Fleet Numeric Wind file.
- **IDAY** Day specified in Fleet Numeric Wind file.
- **IHR** Hour specified in Fleet Numeric Wind file.
- **IMIN** Minute specified in Fleet Numeric Wind file.
- **SEC** Second specified in Fleet Numeric Wind file.
- **TIMESEC** Total seconds since beginning of the year, specified by IYR.

5.2.8 **Wind and Pressure Field Subroutines**

5.2.8.1 **Subroutine NWS3GET**

NWS3GET reads in wind fields from U.S. Navy Fleet Numeric product wind files and interpolates them onto the ADCIRC grid. Surface pressure is set to zero for this forcing option (Note that this format for Fleet Numeric data is obsolete.). NWS3GET is called by the main code.

**Calling Sequence:** Subroutine NWS3GET (X, Y, SLAM, SFEA, WVNX, WVNY, IWTIME, IWYR, WTIMED, NP, NWLON, NWLAT, WLATMAX, WLMIN, WLATINC, WLCINC, ICS )

**Data Declaration:** Real X, Y, SLAM, SFEA, WVNX, WVNY, WTIMED, WLATMAX, WLMIN, WLATINC, WLCINC
Integer ITWYR, NP, NWLON, NWLAT, ICS

**Input Parameters:**

- **MNWLAT** Maximum number of latitudes in Fleet Numeric Wind file.
- **MNWLON** Maximum number of longitudes in Fleet Numeric Wind file.
Arguments:

X
Y
SLAM
SFEA
WVNX
WVNY
IWTIME
IWYR
WTIMED
NP
NWLAN
NWLAT
WLMAX
WLONMIN
WLATINC
WLONINC
ICS

X-coordinate in the CPP projection.
Y-coordinate in the CPP projection.
Longitude on which CPP projection is centered (in degrees).
Latitude on which CPP projection is centered (in degrees).
Horizontal wind speed (m/s).
Horizontal wind direction (deg.).
Time in U.S. Navy fleet wind file.
Year in U.S. Navy fleet wind file.
Seconds since the beginning of the year.
Number of nodal points in grid.
Number of longitude values in wind file.
Number of latitude values in wind file.
Maximum latitude (deg) of data in the UNIT 22 file (<0 south of the equator).
Minimum longitude (deg) of data in the UNIT 22 file (<0 west of Greenwich meridian).
Latitude increment (deg) of data in the UNIT 22 file (must be >0).
Longitude increment (deg) of data in the UNIT 22 file (must be >0).
Parameter that determines which coordinate system the calculations are performed.

Note: The ADCIRC grid information consists only of the longitudes and latitudes of the nodes. THE LONGITUDES AND LATITUDES MUST BE IN RADIANS! All wind speeds are converted to m/s and all pressures to m of water before they are returned.

5.2.8.2 Subroutine NWS4GET

NWS4GET reads wind fields from the PBL-JAG model onto the ADCIRC grid. NWS4GET is called by the main code.

Calling Sequence: Subroutine NWS4GET (WVNX, WVNY, PRN, NP, RHOWAT, G)

Data Declaration: Real WVNX, WVNY, PRN, RHOWAT, G
Integer NP

Arguments:

WVNX
WVNY
PRN
NP

Surface wind speed values in the X-direction (m/s).
Surface wind speed values in the Y-direction (deg).
Surface pressure at all nodes (Note: Units start in millibars of water and are converted to meters of water).
Number of nodal points in grid.
RHOWAT  Reference density of water kg/m$^3$.
G       Gravitational constant.

Note: Output from this subroutine is X-component of wind velocity, Y-component of wind velocity (m/s) and pressure (m of water) on the ADCIRC grid. Background pressure is assumed to be 1013 mbars.

5.2.8.3 Subroutine NWS10GET

NWS10GET reads in wind fields form the U.S. National Weather Service AVN model SFLUX meteorological files and interpolates them onto the ADCIRC grid. NWS10GET is called by the main code.

Calling Sequence: Subroutine NWS10GET(NWSGGWI, FLON, FLAT, ULL, VLL, PLL, NP, RHOWAT, G, LONB, LATB)

Data Declaration: Real FLON, FLAT, ULL, VLL, PLL, RHOWAT, G
Integer NWSGGWI, NP, LONB, LATB

Input Parameters: MNWLAT
MNWLN
LATB is defined as 190 for Gaussian grid.
LONB is defined as 384 for Gaussian grid.

Arguments: NWSGGWI
FLON  Longitude of node in the ADCIRC grid.
FLAT  Latitude of node in the ADCIRC grid.
ULL   Wind speed in X-direction (m/s).
VLL   Wind speed in Y-direction (m/s).
PLL   Surface pressure at all nodes (initially N/m$^2$
      of water converted to meters of water).
NP    Number of nodal points in grid.
RHOWAT Reference density of water kg/m$^3$.
G     Gravitational constant.
LONB  Number of longitude values in wind file
      (=NWLN).
LATB  Number of latitude values in wind file
      (=NWLAT).

Notes: The input files are in binary and have been created by the GRIB unpacking program unpkgribl.f to extract only the X-component of wind velocity at 10 m, Y-component of wind velocity at 10 m, and surface pressure fields.
The SFLUX files utilize a global Gaussian Longitude/latitude grid that is constructed in these subroutines.
The ADCIRC grid information consists only of the longitude and latitude of the nodes. THE LONGITUDEs AND LATITUDEs MUST BE IN RADIANS!
Output from this subroutine is X-component of wind velocity at 10 m, Y-component of wind velocity at 10 m (m/s) and pressure (m of water) on the ADCIRC grid.
5.2.8.4 **Subroutine GLATS**

GLATS computes the latitudes in a Global Gaussian Longitude/latitude grid with T126 resolution (GRIB Grid type 126). GLATS is called by NWS10GET.

**Calling Sequence:** Subroutine GLATS (LGGHAF, COLRAD, WGT, WGTCS, RCS2)

**Data Declaration:**
- Real COLRAD, WGT, WGTCS, RCS2
- Integer LGGHAF

**Arguments:**
- LGGHAF Half the latitude dimension of the Gaussian grid.
- COLRAD
- WGT
- WGTCS
- RCS2

5.2.8.5 **Subroutine POLY**

The subroutine is used by GLATS.

**Calling Sequence:** Subroutine POLY(N, RAD, P)

**Data Declaration:**
- Real RAD, P
- Integer N

**Arguments:**
- N
- RAD
- P

5.2.8.6 **Subroutine G2RINI**

G2RINI computes the factors to interpolate from a global Gaussian Longitude/latitude grid with T126 resolution (GRIB Grid type 126) onto another grid. The new grid is a series of longitude and latitude points contained in the FLON and FLAT arrays with a total number of points NP. G2RINI is called by NWS10GET.

**Calling Sequence:** Subroutine G2RINI (GCLON, GCLAT, FLON, FLAT, N00, N10, N11 N01, D00, D10, D11, D01, NP, LONB, LATB)

**Data Declaration:**
- Real GCLON, GCLAT, FLON, FLAT, D00, D10, D11, D01
- Integer N00,N10,N11,N01,NP
Arguments:

- GCLON
- GCLAT
- FLON
- FLAT
- N00
- N10
- N11
- N01
- D00
- D10
- D11
- D01
- NP
- LONB
- LATB

- Longitude of node in the ADCIRC grid.
- Latitude of node in the ADCIRC grid.
- Number of nodal points in grid.
- Number of longitude values in wind file (=NWLON).
- Number of latitude values in wind file (=NWLAT).

5.2.8.7 Subroutine NWS11GET

NWS11GET reads in wind fields from U.S. National Weather Service ETA-29 model that have been stripped down and given to us by NOAA and interpolates the data onto the ADCIRC grid. The input files are in binary and have been created by NOAA and contain only the X-component of wind velocity at 10 m, Y-component of wind velocity at 10 m (m/s) and surface pressure fields (mbars). The ETA-29 model uses an E grid and therefore the X and Y-components of wind velocity are not oriented along lines of constant latitude and longitude. These must be converted to be useful in ADCIRC. NWS11GET is called by the main code.

Calling Sequence:

Subroutine NWS11GET (NWSEGWI, IDSETFLG, FLON, FLAT, ULL, VLL, PLL, NP, RHOWAT, G)

Input Parameters:

- MNWLAT
- MNWLN

- LATB defined as 271 for ETA-29 grid.
- LONB defined as 181 for ETA-29 grid.

Data Declaration:

Real FLON, FLAT, ULL, VLL, PLL, RHOWAT, G
Integer NWSEGWI, NP

Arguments:

- NWSEGWI
- IDSETFLG
- FLON
- FLAT
- ULL
- VLL

- Index number.
- Flag to compute only E29 interpolating factors (=0).
- Longitude of node in the ADCIRC grid.
- Latitude of node in the ADCIRC grid.
- Interpolated wind vector in X-direction at all nodes (m/s).
- Interpolated wind vector in Y-direction at all nodes (m/s).
PLL
NP
RHOWAT
G

Surface pressure at all nodes (initially millibars, converted to meters of water).
Number of nodal points in grid.
Reference density of water $\text{kg/m}^3$.
Gravitational constant.

Notes: Output from this subroutine is X-component of wind velocity, Y-component of wind velocity (m/s) and surface pressure (m water) on the ADCIRC grid.

5.2.8.8 *Subroutine E29SEARCH*

E29SEARCH is a routine that finds where a given longitude, latitude falls in the ETA 29 grid and determines the interpolating factors to interpolate ETA 29 fields to that position. It then computes the angle to rotate the ETA 29 velocity field in order to convert to a longitude, lat coordinate system. This routine is called by NWS11GET.

**Calling Sequence:** Subroutine E29SEARCH (NODE, FLON, FLAT, NN1, NN2, NN3, DD1, DD2, DD3, BETAU)

**Data Declaration:**
- Real FLON,FLAT,DD1,DD2,DD3,BETAU
- Integer NODE, NN1, NN2, NN3

**Arguments:**
- NODE: ADCIRC grid node number.
- FLON: Longitude of node in the ADCIRC grid.
- FLAT: Latitude of node in the ADCIRC grid.
- NN1, NN2, NN3: Interpolating factors for ETA29 grid.
- DD1, DD2, DD3: Interpolating factors for ETA29 grid.
- BETAU: Conversion angle between E29 velocity field and a longitude/latitude coordinate system.

5.2.8.9 *Subroutine E29CALC*

This subroutine computes the longitude and latitude of a given I, J position in the ETA 29 grid. E29CALC is called by the subroutines E29SEARCH and BETAUCALC.

**Calling Sequence:** Subroutine E29CALC (I, J, LAMDA, PHI, N)

**Data Declaration:**
- Real PHI
- Integer I, J, LAMDA, N
Arguments: I Longitude indice in ETA29 grid.
J Latitude indice in ETA29 grid.
LAMDA Longitude value at point I.
PHI Latitude value at point J.
N Dimension of point I, J.

5.2.8.10 Subroutine BETAUCALC

BETAUCALC computes the conversion angle between the ETA29 velocity field and a longitude, lat coordinate system. BETAUCALC is called by E29SEARCH.

Calling Sequence: Subroutine BETAUCALC (I1, J1, DD1, I2, J2, DD2, I3, J3, DD3, BETAU)

Data Declaration: Real DD1, DD2, DD3, BETAU
Integer I1, J1, I2, J2, I3, J3

Arguments: I1 Indices of triangle, corner 1.
J2 length of triangle side, 1.
I2 Indices of triangle, corner 2.
J2 length of triangle side, 2.
I3 Indices of triangle, corner 3.
J3 length of triangle side, 3.
DD3 Conversion angle between E29 velocity field and a longitude/latitude coordinate system.

5.2.9 Matrix Solver Subroutines

5.2.9.1 Subroutine LSQPDLHS

This subroutine updates the left-hand side matrix. LSQPDLHS is called by the main code.

Calling Sequence: Subroutine LSQPDLHS(TIME, IT)

Data Declaration: Real TIME, IT

Arguments: TIME Absolute model time (sec).
IT Model time step.
Common Blocks:  LSQFFREQS  
               LSQPARAMS  
               MATRIX  

5.2.9.2  Subroutine LSQUPDES

This subroutine updates the right-hand side load vectors for the elevation station harmonic analysis. LSQUPDES is called by the main code.

Calling Sequence:  Subroutine LSQUPDES (STAE, NSTAE)

Data Declaration:  Real STAE  
                   Integer NSTAE

Arguments:
STAE          Station elevation values used to update load vectors.
NSTAE        Number of tidal elevation recording stations.

Common Blocks:
LSQFFREQS  
LSQPARAMS  
LOADVEC

5.2.9.3  Subroutine LSQUPDV

LSQUPDV updates the right-hand side load vectors for the velocity station harmonic analysis. LSQUPDV is called by the main code.

Calling Sequence:  Subroutine LSQUPDV (STAU, STAV, NSTAV)

Data Declaration:  Real STAU, STAV, NSTAV

Arguments:
load  STAU       Station X-component velocity values used to update vectors.
       STAV       Station Y-component velocity values used to update vectors.
       NSTAV     Number of tidal current recording stations.

Common Blocks:
LSQFFREQS  
LSQPARAMS  
LOADVECVS
5.2.9.4 Subroutine LSQUPDEG

Subroutine LSQUPDEG updates the right-hand side load vectors for the global elevation harmonic analysis. LSQUPDEG is called by the main code.

**Calling Sequence:** Subroutine LSQUPDEG (GLOE, NP)

**Data Declaration:**
- Real GLOE
- Integer NP

**Arguments:**
- GLOE: Global elevation values used to update load vectors.
- NP: Number of points in global grid.

**Common Blocks:**
- LSQFREQS
- LSQPARMS
- LOADVECEG

5.2.9.5 Subroutine LSQUPDVG

LSQUPDVG updates the right-hand side load vectors for the global velocity harmonic analysis. LSQUPDVG is called by the main code.

**Calling Sequence:** Subroutine LSQUPDVG (GLOU, GLOV, NP)

**Data Declaration:**
- Real GLOU, GLOV
- Integer NP

**Arguments:**
- GLOU: Global U velocity values used to update load vectors.
- GLOV: Global V velocity values used to update load vectors.
- NP: Number of points in global grid.

**Common Blocks:**
- LSQFREQS
- LSQPARMS
- LOADVECEVG

5.2.9.6 Subroutine FULSOL

Subroutine FULSOL fills out, decomposes and solves the LSQ system. Solves system A*X=B by L*D*L'(TR) decomposition in full storage mode. FULSOL is called by the main code, LSQSOLES, LSQSOLVS, LSQSOLEG, and LSQSOLVG.
Calling Sequence: Subroutine FULSOL (IDECOM)

Data Declaration: Integer IDECOM

Arguments: IDECOM Flag to fill out matrix and decompose only (=0).

Common Blocks: LSQPARMS MATRIX

5.2.9.7 Subroutine LSQSOLES

LSQSOLES solves the system and writes output for elevation stations. LSQSOLES is called by the main code.

Calling Sequence: Subroutine LSQSOLES (NSTAE)

Data Declaration: Integer NSTAE

Arguments: NSTAE Number of elevation recording stations.

Common Blocks: LSQFREQS LSQPARMS LOADVECES MATRIX

Notes: NF = 0 if no steady constituent.
       NF = 1 if steady constituent.

5.2.9.8 Subroutine LSQSOLVS

Subroutine LSQSOLVS solves the system and writes output for velocity stations. LSQSOLVS is called by the main code.

Calling Sequence: Subroutine LSQSOLVS (NSTAV)

Data Declaration: Integer NSTAV

Arguments: NSTAV Number of velocity recording stations.

Common Blocks: LSQFREQS LSQPARMS LOADVECVS MATRIX
Notes: \[ \text{NF} = 0 \text{ if no steady constituent.} \]
\[ \text{NF} = 1 \text{ if steady constituent.} \]

5.2.9.9 Subroutine LSQSOLEG

LSQSOLEG solves the system and writes output for elevation globally. LSQSOLEG is called by the main code.

**Calling Sequence:** Subroutine LSQSOLEG (NP)

**Data Declaration:** Integer NP

**Arguments:**
- NP: Number of nodal points in grid.

**Common Blocks:**
- LSFREQS
- LSQPARGS
- LOADVECEG
- MATRIX

Notes: \[ \text{NF} = 0 \text{ if no steady constituents.} \]
\[ \text{NF} = 1 \text{ if steady constituents.} \]

5.2.9.10 Subroutine LSQSOLVG

LSQSOLVG solves the system and writes output for velocity globally. LSQSOLVG is called by the main code.

**Calling Sequence:** Subroutine LSQSOLVG (NP)

**Data Declaration:** Integer NP

**Arguments:**
- NP: Number of nodal points in grid.

**Common Blocks:**
- LSQFREQS
- LSQPARGS
- LOADVECEVG
- MATRIX

Notes: \[ \text{NF} = 0 \text{ if no steady constituents.} \]
\[ \text{NF} = 1 \text{ if steady constituents.} \]
5.2.10 Harmonic Analysis Subroutines

5.2.10.1 Subroutine HAHOUT

HAHOUT writes out to the hot start file (UNITS 67 and 68) header information and the left hand side matrix for the harmonic analysis. HAHOUT is called by the main code.

Calling Sequence: Subroutine HAHOUT (NP, NSTAE, NSTAV, ISTAE, ISTAV, IGLOE, IGLOV, IOUNIT, IHOTSTP)

Data Declaration: Integer NP, NSTAE, NSTAV, ISTAE, ISTAV, IGLOE, IGLOV, IOUNIT, IHOTSTP

Arguments: NP Number of nodal points in grid. NSTAE Number of elevation recording stations. NSTAV Number of velocity recording stations. ISTAE Harmonic analysis performance at elevation recording stations (=1). ISTAV Harmonic analysis performance at velocity recording stations (=1). IGLOE Harmonic analysis performance for global elevations (=1). IGLOV Harmonic analysis performance for global velocities (=1). IOUNIT UNIT number of hot start file (UNITS 67 or 68). IHOTSTP Starting record number in the hot start file.

Common Blocks: LSQFREQS LSQPARMS MATRIX

5.2.10.2 Subroutine HAHOUTES

HAHOUTES writes elevation station harmonic analysis right hand side load vector to a hot start file (UNITS 67 and 68). HAHOUTES is called by the main code.

Calling Sequence: Subroutine HAHOUTES (HSTAE, IOUNIT, IHOTSTP)

Data Declaration: Real HSTAE Integer IOUNIT, IHOTSTP
Arguments:  HSTAE  Number of elevation recording stations.
            IOUNIT  UNIT number of hot start file (UNITS 67 or 68).
            IHOTSTP Starting record number in the hot start file.

Common Blocks: LSQPARMS
               LOADVECES

5.2.10.3 Subroutine HAHOUTVS

HAHOUTVS writes velocity station harmonic analysis right hand side load vector to a hot start file (UNITS 67 and 68). HAHOUTVS is called by the main code.

Calling Sequence: Subroutine HAHOUTVS (NSTAV, IOUNIT, IHOTSTP)

Data Declaration: Integer NSTAV, IOUNIT, IHOTSTP

Arguments:  NSTAV  Number of velocity recording stations.
            IOUNIT  UNIT number of hot start file (67 or 68).
            IHOTSTP Starting record number in the hot start file.

Common Blocks: LSQPARMS
               LOADVECVS

5.2.10.4 Subroutine HAHOUTEG

Subroutine HAHOUTEG writes global elevation harmonic analysis right hand side load vector to a hot start file (UNITS 67 and 68). HAHOUTEG is called by the main code.

Calling Sequence: Subroutine HAHOUTEG (NP, IOUNIT, IHOTSTP)

Data Declaration: Integer NP, IOUNIT, IHOTSTP

Arguments:  NP  Number of nodal points in grid.
            IOUNIT  UNIT number of hot start file (UNITS 67 or 68).
            IHOTSTP Starting record number in the hot start file.

Common Blocks: LSQPARMS
               LOADVECEG
5.2.10.5  Subroutine HAHOUTVG

HAHOUTVG writes global velocity harmonic analysis right hand side load vector to a hot start file (UNITS 67 and 68). HAHOUTVG is called by the main code.

**Calling Sequence:** Subroutine HAHOUTVG (NP, IUNIT, IHOTSTP)

**Data Declaration:** Integer NP, IUNIT, IHOTSTP

**Arguments:**
- NP  
  Number of nodal points in grid.
- IUNIT  
  UNIT number of hot start file (UNITS 67 or 68).
- IHOTSTP  
  Starting record number in the hot start file.

**Common Blocks:**
- LSQPARMS
- LOADVECVG

5.2.10.6  Subroutine HACOLDS

HACOLDS initializes parameters for harmonic analysis with a cold start. HACOLDS is called by the main code.

**Calling Sequence:** Subroutine HACOLDS

**Common Blocks:**
- LSQFREQS
- LSQPARMS
- MATRIX

5.2.10.7  Subroutine HACOLDSES

HACOLDSES initializes the elevation station load vectors for harmonic analysis with a cold start. HACOLDSES is called by the main code.

**Calling Sequence:** Subroutine HACOLDSES (NSTAE)

**Data Declaration:** Integer NSTAE

**Arguments:**
- NSTAE  
  Number of elevation recording stations.

**Common Blocks:**
- LSQPARMS
- LOADVECES

68
5.2.10.8 \textit{Subroutine HACOLDSVS}

HACOLDSVS initializes elevation station load vectors for harmonic analysis with a cold start. HACOLDSVS is called by the main code.

\textbf{Calling Sequence}: \text{Subroutine HACOLDSVS (NSTAV)}

\textbf{Data Declaration}: \text{Integer NSTAV}

\textbf{Arguments}: \begin{itemize}
  \item \text{NSTAV} \quad \text{Number of velocity recording stations.}
\end{itemize}

\textbf{Common Blocks}: \begin{itemize}
  \item LSQPARMS
  \item LOADVECVS
\end{itemize}

5.2.10.9 \textit{Subroutine HACOLDSEG}

HACOLDSEG initializes global elevation load vectors for harmonic analysis with a cold start. HACOLDSEG is called by the main code.

\textbf{Calling Sequence}: \text{Subroutine HACOLDSEG (NP)}

\textbf{Data Declaration}: \text{Integer NP}

\textbf{Arguments}: \begin{itemize}
  \item \text{NP} \quad \text{Number of nodal points in grid.}
\end{itemize}

\textbf{Common Blocks}: \begin{itemize}
  \item LSQPARMS
  \item LOADVECEG
\end{itemize}

5.2.10.10 \textit{Subroutine HACOLDSVG}

HACOLDSVG initializes global velocity load vectors for harmonic analysis with a cold start. HACOLDSVG is called by the main code.

\textbf{Calling Sequence}: \text{Subroutine HACOLDSVG (NP)}

\textbf{Data Declaration}: \text{Integer NP}
Arguments: NP Number of nodal points in grid.

Common Blocks: LSQPARMS LOADVECVG

5.2.10.11 Subroutine HAHOTS

HAHOTS reads in and initializes harmonic analysis for a hot start. Checks are made within the subroutine to ensure there is agreement between values read in from the hot start file and values read in from the UNIT 15 file. HAHOTS is called by the main code.

Calling Sequence: Subroutine HAHOTS (INSTAE, INSTAV, INP, IISTAE, IISTAV, IIGLOE, IIGLOV, NSCREEN, IHOTSTP, IHOT)

Data Declaration: Integer INSTAE, INSTAV, INP, IISTAE, IISTAV, IIGLOE, IIGLOV, NSCREEN, IHOTSTP, IHOT)

Arguments: INSTAE Number of elevation recording stations.
INSTAV Number of velocity recording stations.
INP Number of nodal points in grid.
IISTAE Harmonic analysis performance at elevation recording stations (=1).
IISTAV Harmonic analysis performance at velocity recording stations (=1).
IIGLOE Harmonic analysis performance for global elevations (=1).
IIGLOV Harmonic analysis performance for global velocities (=1).
NSCREEN Parameter which controls output to UNIT 6.
IHOTSTP Starting record number in the hot start file.
IHOT Parameter that controls whether the model is hot started.

Common Blocks: LSQFREQS LSQPARMS MATRIX

5.2.10.12 Subroutine HAHOTSES

HAHOTSES reads in and initializes the elevation station load vector for harmonic analysis with a hot start. HAHOTSES is called by the main code.

Calling Sequence: Subroutine HAHOTSES (NSTAE, IHOTSTP, IHOT)
Data Declaration: Integer NP, IOUNIT, IHOTSTP

Arguments:
- NSTAE: Number of elevation recording stations.
- IHOTSTP: Starting record number in the hot start file.
- IHOT: Parameter that controls whether the model is hot started.

Common Blocks: LSQPARMS, LOADVCECS

5.2.10.13 Subroutine HAHOTSVS

HAHOTSVS reads in and initializes the velocity station load vector for harmonic analysis with a hot start. HAHOTSVS is called by the main code.

Calling Sequence: Subroutine HAHOTSVS (NSTAV, IHOTSTP, IHOT)

Data Declaration: Integer NSTAV, IHOTSTP, IHOT

Arguments:
- NSTAV: Number of velocity recording stations.
- IHOTSTP: Starting record number in the hot start file.
- IHOT: Parameter that controls whether the model is hot started.

Common Blocks: LSQPARMS, LOADVCECS

5.2.10.14 Subroutine HAHOTSEG

HAHOTSEG reads in and initializes the global elevation load vector for harmonic analysis with a hot start. HAHOTSEG is called by the main code.

Calling Sequence: Subroutine HAHOTSEG (NP, IHOTSTP, IHOT)

Data Declaration: Integer NP, IHOTSTP, IHOT

Arguments:
- NP: Number of nodal points in grid.
- IHOTSTP: Starting record number in the hot start file.
- IHOT: Parameter that controls whether the model is hot started.

Common Blocks: LSQPARMS, LOADVCECS
5.2.10.15 Subroutine HAHOTSVG

HAHOTSVG reads in and initializes the global velocity load vector for harmonic analysis with a hot start. HAHOTSVG is called by the main code.

Calling Sequence: Subroutine HAHOTSVG (NP, IHOTSTP, IHOT)

Data Declaration: Integer NP, IHOTSTP, IHOT

Arguments:
- NP Number of nodal points in grid.
- IHOTSTP Starting record number in the hot start file.
- IHOT Parameter that controls whether the model is hot started.

Common Blocks: LSQPARMS, LOADVECVG

5.3 CSC Solver

5.3.1 Constraints and Limitations

The iterative solver, ITPACKV 2D, requires machine dependent modifications before it can be compiled and run. The most important are SRELPR, which is machine relative precision, and RPARM, which is stopping criterion. Also change system-dependent routine second. These modifications are located in routines DFAULT and TIMER. If a direct banded matrix solver from LINPACK is used to solve the GWCE, more memory is necessary to run the solver compared to the iterative solver. For example, on small problems, e.g. 1000 nodes, the iterative solver requires about ½ the memory of the direct solver. For larger problems, e.g. > 20,000 nodes, the iterative solver requires about 1/5 the memory of the direct solver.

5.3.2. ITPACKV 2D Iterative Solvers

5.3.2.1 Subroutine JCG

JCG drives the Jacobi conjugate gradient algorithm. JCG is called by the main code.

Calling Sequence: Subroutine JCG (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, IWKSP, NW, IPARM, WKSP, RPARM, IER)

Data Declaration: Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER
Real MAXNZ, COEF, RHIS, U, WKSP, RPARM
Arguments:

N  Input integer of dimension of the matrix.
NDIM  Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer array for sparse matrix representation.
COEF  Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.
RHS  Input vector that contains the right-hand side of the matrix problem.
U  Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.
IWKSP  Integer vector workspace of length 3*N.
NW  Input integer. Length of available WKSP. On output, IPARM(8) is amount used.
IPARM  Integer vector of length 12 that allows user to specify some integer parameters which affect the method.
WKSP  Vector used for working space. Jacobi conjugate gradient needs this to be in length at least 4*N + 4*ITMAX. Here, ITMAX = IPARM(1) is the maximum allowable number of iterations.
RPARM  Vector of length 12 that allows user to specify some parameters which affect the method.
IER  Output integer. Error flag.

Common Blocks:

ITCOM1
ITCOM2
ITCOM3

5.3.2.2 Subroutine JSI

Subroutine JSI drives the Jacobi semi-iteration algorithm. JSI is called by the main code.

Calling Sequence:  Subroutine JSI (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, IWKSP, NW, IPARM, WKSP, RPARAM, IER)

Data Declaration:  Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER
Real MAXNZ, COEF, RHS, U, WKSP, RPARAM

Arguments:

N  Input integer of dimension of the matrix.
NDIM  Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer array for sparse matrix representation.
COEF
Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.

RHS
Input vector that contains the right-hand side of the matrix problem.

U
Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.

IWKSP
Integer vector workspace of length 3*N.

NW
Input integer. Length of available WKSP. On output, IPARM(8) is amount used.

IPARM
Integer vector of length 12 that allows user to specify some integer parameters which affect the method.

WKSP
Vector used for working space. Jacobi SI needs this to be in length at least 2*N.

RPARAM
Vector of length 12 that allows user to specify some parameters which affect the method.

IER
Output integer. Error flag.

Common Blocks:
ITCOM1
ITCOM2
ITCOM3

5.3.2.3 Subroutine SOR

Subroutine SOR drives the Successive over relaxation algorithm. SOR is called by the main code.

Calling Sequence:
Subroutine SOR (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, IWKSP, NW, IPARM, WKSP, RPARAM, IER)

Data Declaration:
Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER
Real MAXNZ, COEF, RHS, U, WKSP, RPARAM

Arguments:
N
Input integer of dimension of the matrix.

NDIM
Row dimension of JCOEF and COEF arrays in calling routine.

MAXNZ
Maximum number of non-zeros per row.

JCOEF
Integer array for sparse matrix representation.

COEF
Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.

RHS
Input vector that contains the right-hand side of the matrix problem.

U
Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.

IWKSP
Integer vector workspace of length 3*N.
NW  Input integer. Length of available WKSP. On output, IPARM(8) is amount used.
IPARM  Integer vector of length 12 that allows user to specify some integer parameters which affect the method.
WKSP  Vector used for working space. SOR needs this to be in length at least 2*N.
RPARM  Vector of length 12 that allows user to specify some parameters which affect the method.
IER  Output integer. Error flag.

Common Blocks:  ITCOM1
                ITCOM2
                ITCOM3

5.3.2.4  Subroutine SSORCG

SSORCG drives the Symmetric SOR-CG algorithm. SSORCG is called by the main code.

Calling Sequence:  Subroutine SSORCG (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U,
IWKSP, NW, IPARM, WKSP, RPARM, IER)

Data Declaration:  Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER
Real MAXNZ, COEF, RHS, U, WKSP, RPARM

Arguments:  
N  Input integer of dimension of the matrix.
NDIM  Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer array for sparse matrix representation.
COEF  Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.
RHS  Input vector that contains the right-hand side of the matrix problem.
U  Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.
IWKSP  Integer vector workspace of length 3*N.
NW  Input integer. Length of available WKSP. On output, IPARM(8) is amount used.
IPARM  Integer vector of length 12 that allows user to specify some integer parameters which affect the method.
WKSP  Vector used for working space. SSORCG needs this to be in length at least 6*N + 4*ITMAX.
RPARM  Vector of length 12 that allows user to specify some parameters which affect the method.
IER  Output integer. Error flag.
Common Blocks:  
ITCOM1  
ITCOM2  
ITCOM3  

5.3.2.5  Subroutine SSORSI

The subroutine SSORSI (Symmetric Successive Over-Relaxation Semi-Iteration) drives the symmetric SOR-SI algorithm. SSORSI is called by the main code.

Calling Sequence:  
Subroutine SSORSI (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, IWKSP, NW, IPARM, WKSP, RPARM, IER)

Data Declaration:  
Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER  
Real MAXNZ, COEF, RHS, U, WKSP, RPARM

Arguments:  
N          Input integer of dimension of the matrix.  
NDIM      Row dimension of JCOEF and COEF arrays in calling routine.  
MAXNZ     Maximum number of non-zeros per row.  
JCOEF     Integer array for sparse matrix representation.  
COEF      Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.  
RHS       Input vector that contains the right-hand side of the matrix problem.  
U         Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.  
IWKSP     Integer vector workspace of length 3*N.  
NW        Input integer. Length of available WKSP. On output, IPARM(8) is amount used.  
IPARM     Integer vector of length 12 that allows user to specify some integer parameters which affect the method.  
WKSP      Vector used for working space. SSORSI needs this to be in length at least 5*N.  
RPARM     Vector of length 12 that allows user to specify some parameters which affect the method.  
IER       Output integer. Error flag.
5.3.2.6 Subroutine RSCG

The subroutine RSCG (Reduced System Conjugate Gradient) drives the Reduced System CG algorithm. RSCG is called by the main code.

**Calling Sequence:** Subroutine RSCG (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, IWKSP, NW, IPARM, WKSP, RPARM, IER)

**Data Declaration:** Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER
Real MAXNZ, COEF, RHS, U, WKSP, RPARM

**Arguments:**
- N: Input integer of dimension of the matrix.
- NDIM: Row dimension of JCOEF and COEF arrays in calling routine.
- MAXNZ: Maximum number of non-zeros per row.
- JCOEF: Integer array for sparse matrix representation.
- COEF: Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.
- RHS: Input vector that contains the right-hand side of the matrix problem.
- U: Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.
- IWKSP: Integer vector workspace of length 3*N.
- NW: Input integer. Length of available WKSP. On output, IPARM(8) is amount used.
- IPARM: Integer vector of length 12 that allows user to specify some integer parameters which affect the method.
- WKSP: Vector used for working space. RSCG needs this to be in length at least N+3*N*NB+4*ITMAX. Here, ITMAX = IPARM(1) and NB is the order of the black subsystem. ITMAX is the maximum allowable number of iterations.
- RPARM: Vector of length 12 that allows user to specify some parameters which affect the method.

**Common Blocks:**
- ITCOM1
- ITCOM2
- ITCOM3
5.3.2.7 Subroutine RSSI

RSSI (Reduced System Semi-Iterative) drives the Reduced System SI algorithm. RSSI is called by the main code.

Calling Sequence: Subroutine RSSI (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, IWKSP, NW, IPARM, WKSP, RPARM, IER)

Data Declaration: Integer N, NDIM, JCOEF, IWKSP, NW, IPARM, IER
Real MAXNZ, COEF, RHS, U, WKSP, RPARM

Arguments:
- **N**: Input integer of dimension of the matrix.
- **NDIM**: Row dimension of JCOEF and COEF arrays in calling routine.
- **MAXNZ**: Maximum number of non-zeros per row.
- **JCOEF**: Integer array for sparse matrix representation.
- **COEF**: Array for sparse matrix representation. JCOEF and COEF use the ELLPACK data structure.
- **RHS**: Input vector that contains the right-hand side of the matrix problem.
- **U**: Input/output vector. On input, U contains initial guess to the solution. On output, it contains the latest estimate to the solution.
- **IWKSP**: Integer vector workspace of length 3*N.
- **NW**: Input integer. Length of available WKSP. On output, IPARM(8) is amount used.
- **IPARM**: Integer vector of length 12 that allows user to specify some integer parameters which affect the method.
- **WKSP**: Vector used for working space. RSSI needs this to be in length at least N + NB. NB is the order of the block subsystem.
- **RPARM**: Vector of length 12 that allows user to specify some parameters which affect the method.
- **IER**: Output integer. Error flag.

Common Blocks: ITCOM1 ITCOM2 ITCOM3
5.3.3 **ITPACKV 2D Solver Subroutines**

5.3.3.1 **Subroutine ITJCG**

ITJCG performs one iteration of the Jacobi Conjugate Gradient algorithm. ITJCG is called by the subroutine JCG.

**Calling Sequence:**

Subroutine ITJCG (N, NDIM, MAXNZ, JCOEF, COEF, U, U1, D, D1, DTWD, TRI)

**Data Declaration:**

Integer N, NDIM, MAXNZ, JCOEF  
Real COEF, U, U1, D, D1, DTWD, TRI

**Arguments:**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>

</table>

**Common Blocks:**

ITCOM1  
ITCOM2  
ITCOM3
5.3.3.2  **Subroutine ITJSI**

The subroutine ITJSI performs one iteration of the Jacobi Semi-Iterative algorithm. It is called by JSI.

**Calling Sequence:**

Subroutine ITJSI (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, U1, D, ICNT)

**Data Declaration:**

Integer N, NDIM, MAXNZ, JCOEF, ICNT
Real MAXNZ, COEF, RHS, U, U1, D

**Arguments:**

N  Input integer. Dimension of the matrix.
NDIM Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ Maximum number of non-zeros per row.
JCOEF Integer sparse matrix representation.
COEF Sparse matrix representation.
RHS Input vector that contains the right-hand side of the matrix problem.
U Input vector. Contains the value of the solution vector at the end of in iterations.
U1 Input/output vector. On input, it contains the value of the solution at the end of the in-l iteration. On output, it will contain the estimate for the solution vector.
D Input vector that contains the pseudo-residual vector after in iterations.
ICNT Number of iterations since last change of SME.

**Common Blocks:**

ITCOM1
ITCOM2
ITCOM3

5.3.3.3  **Subroutine ITSOR**

ITSOR performs one iteration of the Successive Over-relaxation algorithm. It is called by SOR.

**Calling Sequence:**

Subroutine ITSOR (N, NB, NDIM, MAXNZ, JCOEF, COEF, RHS, U, NUP, MOVED, WK, IWK)

**Data Declaration:**

Integer N, NB, NDIM, MAXNZ, JCOEF, NUP, MOVED, IWK
Real COEF, RHS, U, WK
Arguments:  
N  
Input integer. Dimension of the matrix.
NB  
Dimension of the black subsystem.
NDIM  
Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  
Maximum number of non-zeros per row.
JCOEF  
Integer sparse matrix representation.
COEF  
Sparse matrix representation.
RHS  
Input vector that contains the right-hand side of the matrix problem.
U  
Input vector that contains the value of the solution vector at the end of in iterations.
NUP  
Maximum number of non-zeros per row in upper triangle u (for natural ordering only).
MOVED  
Logical variable indicating whether or not was reshuffled.
WK  
Array. Work vector of length 2*N.
IWK  
Integer array giving wave populations.

Common Blocks:  
ITCOM1
ITCOM2
ITCOM3

5.3.3.4 Subroutine ITSRCG

Subroutine ITSRCG performs one iteration of the Symmetric SOR Conjugate Gradient algorithm. It is called by SSORCG.

Calling Sequence:  
Subroutine ITSRCG (N, NB, NUP, NLOW, NDIM, MAXNZ, JCOEF, COEF, RHS, U, U1, C, C1, D, DL, MOVED, WK, TRI, IWK)

Data Declaration:  
Integer N, NB, NUP, NLOW, NDIM, JCOEF, IWKSP, NW, MOVED, IWK
Real MAXNZ, COEF, RHS, U, U1, C, C1, D, DL, WK, TRI

Arguments:  
N  
Input integer. Dimension of the matrix.
NB  
Dimension of the black subsystem.
NUP  
Maximum number of non-zeros per row in upper triangle u (for natural ordering only).
NLOW  
Maximum number of non-zeros per row in the lower triangle l (input for natural ordering only).
NDIM  
Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  
Maximum number of non-zeros per row.
JCOEF  
Integer sparse matrix representation.
COEF  
Sparse matrix representation.
RHS
Input vector that contains the right-hand side of the matrix problem.

U
Input vector that contains the value of the solution vector at the end of in iterations.

U1
Input/output vector. On input, it contains the value of the solution at the end of the in-1 iteration. On output, it will contain the estimate for the solution vector.

C
Input vector that contains the forward residual after in iterations.

C1
Input/output vector. On input, C1 contains the forward residual after in-1 iterations. On output, C1 contains the updated forward residual.

D
Input vector that contains the pseudo-residual vector after in iterations.

DL
Vector that is used in the computations of the acceleration parameters.

MOVED
Logical variable indicating whether or not was reshuffled.

WK
Array. Work vector of length 2*N.

TRI
Vector that stores the tri-diagonal matrix associated with the conjugate gradient acceleration.

IWK
Integer array giving wave populations.

**Common Blocks:**
ITCOM1
ITCOM2
ITCOM3

5.3.3.5  **Subroutine ITRSRI**

ITRSRI performs one iteration of the symmetric SOR Semi-iteration algorithm. It is called by SSORSI.

**Calling Sequence:**
ITRSRI (N, NB, NUP, NLOW, NDIM, MAXNZ, JCOEF, COEF, RHS, U, U1, C, D, CTWD, MOVED, WK, IWK)

**Data Declaration:**
Integer N, NB, NUP, NLOW, NDIM, MAXNZ, JCOEF, MOVED
Real COEF, RHS, U, U1, C, D, CTWD, WK, IWK

**Arguments:**
N
Input integer. Dimension of the matrix.

NB
Dimension of the black subsystem.

NUP
Maximum number of non-zeros per row in upper triangle u (for natural ordering only).

NLOW
Maximum number of non-zeros per row in the lower triangle l (input for natural ordering only).

NDIM
Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer sparse matrix representation.
COEF   Sparse matrix representation.
RHS    Input vector that contains the right-hand side of the matrix problem.
U      Input vector that contains the value of the solution vector at the end of in iterations.
U1     Input/output vector. On input, it contains the value of the solution at the end of the in-1 iteration. On output, it will contain the estimate for the solution vector.
C      Input vector that contains the forward residual after in iterations.
D      Input vector that contains the pseudo-residual vector after in iterations.
CTWD   Vector that is used in the computations of the acceleration parameters.
WK     Array. Work vector of length 2*N.
IWK    Integer array giving wave populations.

Common Blocks:  ITCOM1
                ITCOM2
                ITCOM3

5.3.3.6  Subroutine ITRSCG

ITRSCG performs one iteration of the Reduced System Conjugate Gradient algorithm. It is called by RSCG.

Calling Sequence:  Subroutine ITRSCG (N, NB, NDIM, MAXNZ, JCOEF, COEF, UB, UB1, DB, DB1, WB, TRI)

Data Declaration:  Integer N, NB, NDIM, MAXNZ, JCOEF
                   Real COEF, UB, UB1, DB, DB1, WB, TRI

Arguments:  
N        Input integer. Dimension of the matrix.
NB       Dimension of the black subsystem.
NDIM     Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ    Maximum number of non-zeros per row.
JCOEF    Integer sparse matrix representation.
COEF     Sparse matrix representation.
UB       Input vector that contains the estimate for the solution on the black points after in iterations.
UB1      Input/output vector. On input, UB1 contains the solution vector after in-1 iterations. On output, it will
contain the newest estimate for the solution vector.
This is only for the black points.

DB
Input array. DB(NRP1) contains the value of the
current pseudo-residual on the black points.

DB1
Input/output array. DB1(NRP1) contains the pseudo-
residual on the black points for the in-1 iteration on
input. On output, it is for the IN+1 iteration.

WB
Array that is used for computations involving black
vectors.

TRI
Array that stores the tri-diagonal matrix with conjugate
gradient acceleration.

**Common Blocks:**  
ITCOM1  
ITCOM2  
ITCOM3

5.3.3.7  
**Subroutine ITRSSI**

ITRSSI performs one iteration of the Reduced System Semi-iteration algorithm. It is called
by RSSI.

**Calling Sequence:**  
Subroutine ITRSSI (N, NB, NDIM, MAXNZ, JCOEF, COEF, RHS,
UB, UB1, DB)

**Data Declaration:**  
Integer N, NB, NDIM, MAXNZ, JCOEF
Real COEF, RHS, UB, UB1, DB

**Arguments:**  
N  
Input integer. Dimension of the matrix.

NB  
Dimension of the black subsystem.

NDIM  
Row dimension of JCOEF and COEF arrays in calling
routine.

MAXNZ  
Maximum number of non-zeros per row.

JCOEF  
Integer sparse matrix representation.

COEF  
Sparse matrix representation.

RHS  
Input vector that contains the right-hand side of the
matrix problem.

UB  
Input vector that contains the estimate for the solution
on the black points after in iterations.

UB1  
Input/output vector. On input, UB1 contains the
solution vector after in-1 iterations. On output, it will
contain the newest estimate for the solution vector.
This is only for the black points.

DB  
Input array. DB(NRP1) contains the value of the
current pseudo-residual on the black points.
Common Blocks: ITCOM1
ITCOM2
ITCOM3

5.3.3.8 Subroutine CHGCON

CHGCON computes the new estimate for the largest eigenvalue for Conjugate Gradient acceleration. CHGCON is called by the subroutines ITJCG, ITSRCG, and ITSRSI.

Calling Sequence: Subroutine CHGCON (LDT, TRI, GAMOLD, RHOOLD, IBMTH)

Data Declaration: Integer LDT, IBMTH
Real TRI, GAMOLD, RHOOLD

Arguments:
LDT Leading dimension of TRI.
TRI Tri-diagonal matrix associated with the eigen values of the conjugate gradient polynomial.
GAMOLD Previous value of acceleration parameter.
RHOOLD Previous value of acceleration parameter.
IBMTH Indicator of basic method being accelerated by CG.

Common Blocks: ITCOM1
ITCOM2
ITCOM3

Notes:
IBMTH = 1, Jacobi
= 2, Reduced system
= 3, SSOR

5.3.3.9 Subroutine CHGSI

CHGSI computes new Chebyshev acceleration parameters adaptively. CHGSI is called by the subroutines ITRSSI, ITJSI, and ITSRSI.

Calling Sequence: Subroutine CHGSI (DTNRM,IBMTH)

Data Declaration: Integer IBMTH
Real DTNRM

Arguments:
DTNRM Numerator of Rayleigh Quotient
IBMTH Indicator of basic method being accelerated by CG.

Common Blocks: ITCOM1
ITCOM2
ITCOM3
Notes:  
IBMTH  
= 1, Jacobi  
= 2, Reduced system  
= 3, SSOR

5.3.3.10  Subroutine DFAULT

DFAULT sets the default values of IPARM and RPARM. DFAULT is called by the main code.

Calling Sequence:  Subroutine DFAULT (IPARM, RPARM)

Data Declaration:  Integer IPARM  
Real RPARM

Arguments:  
IPARM  Integer vector of length 12 that allows user to specify some integer parameters which affect the method.

RPARM  Vector of length 12 that allows user to specify some parameters which affect the method.

Common Blocks:  ITCOM1  
ITCOM2  
ITCOM3

5.3.3.11  Subroutine ECHALL

ECHALL initializes the ITPACKV common blocks from the information contained in IPARM and RPARM. ECHALL also prints the values of all the parameters in IPARM and RPARM. ECHALL is called by the iterative solver subroutines JCG, JSI, SOR, SSORCG, SSORSI, RSCG, and RSSI.

Calling Sequence:  Subroutine ECHALL (N, NDIM, MAXNZ, JCOEF, COEF, RHS, IPARM, RPARM, ICALL)

Data Declaration:  Integer N, NDIM, JCOEF, IPARM, ICALL  
Real MAXNZ, COEF, RHS, RPARM

Arguments:  
N  Input integer. Dimension of the matrix.
NDIM  Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer sparse matrix representation.
COEF  Sparse matrix representation.
RHS  Input vector that contains the right-hand side of the matrix problem.

IPARM  Integer vector of length 12 that allows user to specify some integer parameters which affect the method.

RPARM  Vector of length 12 that allows user to specify some parameters which affect the method.

ICALL  Indicator of which parameters are being printed.

Common Blocks:  ITCOM1
                ITCOM2
                ITCOM3

Notes:  ICALL = 1, initial parameters
        ICALL = 2, final parameters

5.3.3.12  Subroutine EQRT1S

EQRT1S computes the smallest or largest M eigenvalues of a symmetric tri-diagonal matrix. As written, the routine computes the M smallest eigenvalues. To compute the M largest eigenvalues, reverse the sign of each element of D before and after calling the routine. In this case, ISW must equal zero. EQRT1S is called by the subroutine ECHALL.

Calling Sequence:  Subroutine EQRT1S (D, E2, N, M, ISW IER)

Data Declaration:  Integer N, M, ISW, IER
                   Real D, E2

Arguments:

D  Input vector of length N containing the diagonal elements of the matrix. The computed eigenvalues replace the first M components of the vector D in non-decreasing sequence, while the remaining components are lost.

E2  Input vector of length N containing the squares of the off-diagonal elements of the matrix. Input E2 is destroyed.

N  Input scalar containing the order of the matrix.

M  Input scalar containing the number of smallest eigenvalues desired (M is less than or equal to N).

ISW  Input scalar meaning as follows:
     ISW = 1 means that the matrix is known to be positive definite.
     ISW = 0 means that the matrix is not known to be positive definite.

IER  Error parameter. (output)
     Warning error:
     IER = 601 indicates that successive iterates to the Kth eigenvalue were not monotone increasing. The value K is stored in E2(1).
Terminal error:
IER = 602 indicates that ISW = 1 but matrix is not positive definite.

Common Blocks:  ITCOM1
ITCOM2
ITCOM3

5.3.3.13  Subroutine ITERM

ITERM produces the iteration summary line at the end of each iteration. If level .GE. 4, the latest approximation to the solution will be printed. ITERM is called by the subroutines ITJCG, ITJSI, ITSOR, ITSRCG, ITSRSI, ITRSCG, and ITRSSI.

Calling Sequence:  Subroutine ITERM (N,COEF,U,WK,IMTHD)

Data Declaration:  Integer N, IMTHD
Real COEF, U, WK

Arguments:  
N  Order of system or, for reduced system routines, order of black subsystem.
IMTHD  Indicator of method:
= 1, JCG
= 2, JSI
= 3, SOR
= 4, SSORCG
= 5, SSORSI
= 6, RSCG
= 7, RSSI
COEF  Iteration matrix.
U  Solution estimate.
WK  Work array of length N.

Common Blocks:  ITCOM1
ITCOM2
ITCOM3

5.3.3.14  Subroutine MOVE

MOVE sets up the I-U-L data structure for the SOR and SSOR methods when natural ordering is used. MOVE is called by the subroutines SOR, SSORCG, and SSORSI.

Calling Sequence:  Subroutine MOVE (N,NDIM, MAXNZ, NLOW, NUP, JCOEF, COEF, LEVEL, NOUT, MOVED, IWKSP)
Data Declaration:  Integer N, NDIRM, NLOW, NUP, JCOEF, LEVEL, NOUT, MOVED, IWKSP
Real MAXNZ, COEF, RHS, U, WKSP, RPARM

Arguments:  
N  Order of matrix.
NUP  Maximum number of non-zeros per row in upper triangle U (output).
NLOW  Maximum number of non-zeros per row in the lower triangle L (input for natural ordering only).
NDIM  Row dimension of JCOEF and COEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer data structure for coefficient columns.
COEF  Data structure for coefficients.
LEVEL  Level of output.
NOUT  Output device number.
MOVED  Logical constant indicating whether or not data structure has been reshuffled.
IWKSP  Integer workspace.

5.3.3.15  Subroutine OMEG

OMEG computes new values for CME, OMEGA, and SPECR for fully adaptive SSOR methods. OMEG is called by the subroutines SSORCG, SSORSI, ITSRCG, and ITSRSI.

Calling Sequence:  Subroutine OMEG (DNRM,IFLAG)

Data Declaration:  Integer IFLAG
Real DNRM

Arguments:  
DNRM  Numerator of Rayleigh Quotient
IFLAG  Indicator of appropriate entry point

Common Blocks:  ITCOM1
ITCOM2
ITCOM3

5.3.3.16  Subroutine PARCON

PARCON computes acceleration parameters for conjugate gradient acceleration methods. PARCON is called by the subroutines ITJCG, ITSRCG, and ITRSCG.

Calling Sequence:  Subroutine PARCON (DTNRM, C1, C2, C3, C4, GAMOLD, RHOSTMP, IBMTH)
Data Declaration:  Integer IBMTH  
                    Real DTNRM, C1, C2, C3, C4, GAMOLD, RHOSTMP, IBMTH 

Arguments:  
            DTNRM  Inner product of residuals. 
            C1    Output -- rho*gamma. 
            C2    Output -- rho. 
            C3    Output -- 1-rho. 
            C4    Output -- rho*(1-gamma). 
            GAMOLD Output -- value of gamma at preceding iteration. 
            RHOSTMP Last estimate for value of rho 
            IBMTH Indicator of basic method being accelerated by CG 
                    = 1, Jacobi. 
                    = 2, Reduced system. 
                    = 3, SSOR. 

Common Blocks:  ITCOM1  
                  ITCOM2  
                  ITCOM3 

5.3.3.17    Subroutine PARI 

PARSI computes acceleration parameters for semi-iterative accelerated methods. PARI is 
called by the subroutines ITJISI, ITSRSI, and ITRSSI. 

Calling Sequence:  Subroutine PARI (C1, C2, C3, IBMTH) 

Data Declaration:  Integer IBMTH  
                    Real C1, C2, C3 

Arguments:  
            C1, C2, C3  Output acceleration parameters. 
            IBMTH     Indicator of basic method being accelerated by SI. 
                    = 1, Jacobi. 
                    = 2, Reduced system. 
                    = 3, SSOR. 

Common Blocks:  ITCOM1  
                  ITCOM2  
                  ITCOM3
5.3.3.18  Subroutine PBSOR

PBSOR computes a backward SOR sweep on U. PBSOR is called by the subroutines ITSRCG and ITSRSI.

Calling Sequence:  Subroutine PBSOR (N, NB, NDIM, MAXNZ, JCOEF, COEF, U, RHS, NUP, NLOW, MOVED, IPOP)

Data Declaration:  Integer N, NB, NDIM, JCOEF, NUP, NLOW, MOVED, IPOP
Real MAXNZ, COEF, RHS, U

Arguments:  
N  Order of system.
NB  Order of black subsystem.

NDIM  Row dimension of COEF and JCOEF arrays in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer array of coefficient columns.
COEF  Array of coefficients.
U  Latest estimate of solution.
RHS  Right hand side of matrix problem.
NUP  Maximum number of non-zeros per row in lower triangle l (input for natural order only).
NLOW  Maximum number of non-zeros per row in upper triangle u (input for natural order only).
MOVED  Logical variable indicating whether or not matrix has been reshuffled.
IPOP  Integer vector giving the wave populations.

Common Blocks:  ITCOM1
ITCOM3

5.3.3.19  Subroutine PERMAT

PERMAT takes the sparse matrix representation of the matrix stored in the arrays JCOEF and COEF and permutes both rows and columns, overwriting the previous structure. This routine is to be called after subroutine SCAL by subroutines JCG, SOR, SSORCG, SSORSI, RSCG, RSSI, and SORWAV.

Calling Sequence:  Subroutine PERMAT (N, NDIM, MAXNZ, JCOEF, COEF, P, WORK, IWORK)

Data Declaration:  Integer N, NDIM, JCOEF, IWORK
Real MAXNZ, COEF, P, WORK
Arguments:  
N  Order of system.
NDIM  Row dimension of arrays JCOEF and COEF in the calling routine.
MAXNZ  Maximum number of non-zero entries per row.
JCOEF  Integer array for data.
COEF  Array for data structure coefficients.
P  Permutation vector.
WORK  Workspace of length N.
IWORK  Integer workspace of length N.

5.3.3.20  Subroutine PERROR

PERROR computes the residual, \( R = \text{RHS} - \text{A*U} \). The user also has the option of printing the residual and/or the unknown vector depending on IDGTS. PERROR is called by the subroutines JCG, JSI, SOR, SSORCG, SSORSI, RSCG, and RSSI.

Calling Sequence:  
Subroutine PERROR (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, WORK, DIGIT1, DIGIT2, IDGTS)

Data Declaration:  
Integer N, NDIM, JCOEF, IWORK, IDGTS
Real MAXNZ, COEF, RHS, U, WORK, DIGIT1, DIGIT2,

Arguments:  
N  Dimension of matrix.
NDIM  Row dimension of JCOEF and COEF in calling routine.
MAXNZ  Maximum number of non-zeros per row.
JCOEF  Integer array of sparse matrix representation.
COEF  Array of sparse matrix representation.
RHS  Right hand side of matrix problem.
U  Latest estimate of solution.
WORK  Workspace vector of length 2*n.
DIGIT1  Output - Measure of accuracy of stopping test.
DIGIT2  Output - Measure of accuracy of solution.
IDGTS  Parameter controlling level of output.

If IDGTS  
< 1 or > 4, then no output.
= 1, then number of digits is printed, provided level .GE. 1.
= 2, then solution vector is printed, provided level .GE. 1.
= 3, then residual vector is printed, provided level .GE. 1.
= 4, then both vectors are printed, provided level .GE. 1.
Common Blocks:  
ITCOM1  
ITCOM2  
ITCOM3

5.3.3.21 Subroutine PERVEC

PERVEC permutes a vector as dictated by the permutation vector P. If \( P(I) = J \), then \( V(J) \) gets \( V(I) \). PERVEC is called by the subroutine JCG.

Calling Sequence:  
Subroutine PERVEC (N, P, V, WORK)

Data Declaration:  
Integer N, P  
Real V, WORK

Arguments:  
N  
Length of vectors P, V, and WORK.
P  
Integer permutation vector.
V  
Vector to be permuted.
WORK  
Workspace vector of length N.

5.3.3.22 Subroutine PFSOR

PFSOR computes a forward SOR sweep on U. PFSOR is called by the subroutines SSORCG, ITSRCG, and ITSRSI.

Calling Sequence:  
Subroutine PFSOR (N, NB, NDIM, MAXNZ, JCOEF, COEF, U, RHS, NUP, MOVED, IPOP)

Data Declaration:  
Integer N, NB, NDIM, JCOEF, NUP, MOVED, IPOP  
Real MAXNZ, COEF, U, RHS

Arguments:  
N  
Order of system.
NB  
Order of black subsystem.
NDIM  
Row dimension of COEF and JCOEF arrays in calling routine.
MAXNZ  
Maximum number of non-zeros per row.
JCOEF  
Integer array of coefficient columns.
COEF  
Array of coefficients.
U  
Latest estimate of solution.
RHS  
Right hand side of matrix problem.
NUP  
Maximum number of non-zeros per row in lower triangle L (input for natural order only).
MOVED  
Logical variable indicating whether or not matrix has been reshuffled.
IPOP  
Integer vector giving the wave populations.
Common Blocks: 
ITCOM1
ITCOM3

5.3.3.23 Subroutine PFSORI

PFSORI computes a forward SOR sweep on U and computes the norm of the pseudo-residual vector. PFSORI is called by the subroutine ITSOR.

Calling Sequence: 
Subroutine PFSORI (N, NB, NDIM, MAXNZ, JCOEF, COEF, U, RHS, NUP, MOVED, WORK, IPOP)

Data Declaration: 
Integer N, NB, NDIM, MAXNZ, JCOEF, NUP, MOVED, IPOP
Real, COEF, U, RHS, WORK

Arguments:
N Order of system.
NB Order of block subsystem.
NDIM Row dimension of COEF and JCOEF arrays in calling routine.
MAXNZ Maximum number of non-zeros per row.
JCOEF Integer array of coefficient columns.
COEF Array of coefficients.
U Latest estimate of solution.
RHS Right hand side of matrix problem.
NUP Maximum number of non-zeros per row in lower triangle L (input for natural order only).
MOVED Logical variable indicating whether or not matrix has been reshuffled.
WORK Workspace vector of length N.
IPOP Integer vector giving the wave populations.

Common Blocks: 
ITCOM1
ITCOM3

5.3.3.24 Subroutine PJAC

PJAC performs one Jacobi iteration. PJAC is called by the subroutines JCG, ITJCG, ITJSI, ITSRCG, and ITSRSI.

Calling Sequence: 
Subroutine PJAC (N, NDIM, MAXNZ, JCOEF, COEF, U, RHS)

Data Declaration: 
Integer N, NDIM, MAXNZ, JCOEF
Real, COEF, U, RHS
Arguments:  
N  
NDIM  
MAXNZ  
JCOEF  
COEF  
U  
RHS  

Order of system.
Row dimension of arrays JCOEF and COEF in the calling routine.
Maximum number of nonzero entries per row.
Integer array for data.
Array for data structure coefficients.
On input -- contains the right hand side of the matrix problem.
On output -- contains B*U + RHS where B = I - A and A has been scaled to have a unit diagonal.

5.3.3.25    Subroutine PMULT

PMULT computes C = A*B, a matrix-vector product. Matrix A is assumed to be stored in the COEF, JCOEF ELLPACK data structure and all entries in the column array JCOEF are assumed to be between 1 and N, inclusive. A is assumed to have a unit diagonal. PMULT is called by the subroutine PERROR.

Calling Sequence:    Subroutine PMULT (N, NDIM, MAXNZ, JCOEF, COEF, B, C)

Data Declaration:    Integer N, NDIM, MAXNZ, JCOEF
Real, COEF, B, C

Arguments:  
N  
NDIM  
MAXNZ  
JCOEF  
COEF  
B  
C  

Order of system.
Row dimension of arrays JCOEF and COEF in the calling routine.
Maximum number of non-zero entries per row.
Integer array for data.
Array for data structure coefficients.
Multiplying vector of length N.
Product vector of length N.

5.3.3.26    Subroutine PRBNDX

PRBNDX computes the red-black permutation vectors P (and its inverse IP) if possible. The algorithm is to mark the first node as red (arbitrary). All of its adjacent nodes are marked black and placed in a stack. The remainder of the code pulls the first node off the top of the stack and tries to type its adjacent nodes. The typing of the adjacent point is a five way case statement which is well commented (see do loop 100).

The array P is used both to keep track of the color of a node (red node is positive, black is negative) but also the father node that caused the color marking of that point. Since complete
information on the adjacency structure is hard to come by, this forms a link to enable the color change of a partial tree when a recoverable color conflict occurs.

The array IP is used as a stack to point to the set of nodes left to be typed that are known to be adjacent to the current father node.

This routine is to be called after the subroutine SCAL by the subroutines JCG, JSI, SOR, SSORCG, RSCG, and RSSI.

**Calling Sequence:**
Subroutine PRBNDX (N, NDIM, MAXNZ, JCOEF, P, IP, NBLACK, LEVEL, NOUT, IER)

**Data Declaration:**
Integer N, NDIM, MAXNZ, JCOEF, IP, NBLACK, LEVEL, NOUT, IER
Real P

**Arguments:**
- **N** Number of nodes. (integer, scalar).
- **NDIM** Row dimension of JCOEF in calling routine.
- **MAXNZ** Maximum number of non-zero entries per row.
- **JCOEF** Array of column indices. It is assumed that for every row where only one element is stored, that element corresponds to the diagonal entry. The diagonal must be the first entry stored. (integer, arrays).
- **P, IP** Permutation and inverse permutation vectors. (integer, arrays each of length N).
- **NBLACK** Number of black nodes. Number of red nodes is N - NBLACK. (integer, scalar).
- **LEVEL** Switch for printing.
- **NOUT** Output tape number.
- **IER** Error flag. (integer, scalar)
  - = 0, Normal return. Indexing performed successfully.
  - = 201, Red-black indexing not possible.

### 5.3.3.27  Subroutine PRSBLK

PRSBLK computes a BLACK-RS sweep on a red vector into a black vector. PRSBLK is called by the subroutines RSCG, ITRSCG, and ITRSSI.

**Calling Sequence:**
Subroutine PRSBLK (NB, NR, NDIM, MAXNZ, JCOEF, COEF, U, V)

**Data Declaration:**
Integer NB, NR, NDIM, MAXNZ, JCOEF
Real COEF, U, V
### Arguments:

- **NB**: Number of black points.
- **NR**: Number of red points.
- **NDIM**: Row dimension of JCOEF and COEF arrays in calling routine.
- **MAXNZ**: Maximum number of non-zeros per row.
- **JCOEF**: Integer data structure for coefficient columns.
- **COEF**: Data structure for array coefficients.
- **U**: Latest estimate of the solution.
- **V**: On input -- Contains the right hand side. On output -- V(NR+1,...N) contains (FR**T)*UR+CB.

#### 5.3.3.28 Subroutine PRSRED

PRSRED computes a RED-RS sweep on a black vector into a red vector. PRSRED is called by the subroutines RSCG, RSSI, ITRSCG, and ITRSSI.

**Calling Sequence:** Subroutine PRSRED (NR, NDIM, MAXNZ, JCOEF, COEF, U, VR)

**Data Declaration:**
- Integer NR, NDIM, MAXNZ, JCOEF
- Real COEF, U, VR

**Arguments:**

- **NR**: Number of red points.
- **NDIM**: Row dimension of JCOEF and COEF arrays in calling routine.
- **MAXNZ**: Maximum number of non-zeros per row.
- **JCOEF**: Integer data structure for coefficient columns.
- **COEF**: Data structure for array coefficients.
- **U**: Latest estimate of solution.
- **VR**: On input -- Contains the right hand side. On output -- Contains FR*UB + CR.

#### 5.3.3.29 Subroutine PSTOP

PSTOP performs a test to see if the iterative method has converged to a solution inside the error tolerance, zeta. PSTOP is called by the subroutines ITJCG, ITJSI, ITSOR, ITSRCG, ITSRSI, ITRSCG, and ITRSSI.

**Calling Sequence:** Subroutine PSTOP (N, U, DNRM, CCON, IFLAG, Q1)

**Data Declaration:**
- Integer N, IFLAG
- Real U, DNRM, CCON, Q1
Arguments: N Order of system.
U Present solution estimate.
DNRM Inner product of pseudo-residuals at preceding iteration.
CON Stopping test parameter (= CCON).
IFLAG Stopping test integer flag.
  = 0, SOR iteration zero.
  = 1, non-RS method.
  = 2, RS method.
Q1 Stopping test logical flag.

Common Blocks: ITCOM1
ITCOM2
ITCOM3

5.3.3.30 Subroutine SBELM

SBELM is designed to remove rows of the matrix for all off-diagonal elements are very small (less than TOL). This is to take care of matrices arising from finite element discretizations of partial differential equations with Dirichlet boundary conditions. Any such rows, corresponding columns are then eliminated (set to the identity after correcting the RHS). This routine is to be called after the subroutine SCAL by the subroutines JCG, JSI, SOR, SSORCG, SSORSI, RSCG, and RSSI.

Calling Sequence: Subroutine SBELM (N, NDIM, MAXNZ, JCOEF, COEF, RHS, WORK, TOL)

Data Declaration: Integer N, NDIM, MAXNZ, JCOEF
Real COEF, RHS, WORK, TOL

Arguments: N Dimension of matrix.
NDIM Row dimension of arrays JCOEF and COEF in calling program.
MAXNZ Maximum number of nonzero entries per row.
JCOEF Integer array of matrix representation.
COEF Array of sparse matrix representation.
RHS Right hand side of matrix problem.
WORK Work array of length N.
TOL Tolerance factor.

5.3.3.31 Subroutine SCAL

SCAL scales original matrix to a unit diagonal matrix. RHS and U vectors are scaled accordingly. The data structure is adjusted to have diagonal entries in column 1. Zero entries in JCOEF array are changed to positive integers between 1 and N. SCAL is called by the subroutines JCG, JSI, SOR, SSORCG, SSORSI, RSCG, and RSSI.
Calling Sequence: Subroutine SCAL (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, WORK, IER)

Data Declaration: Integer N, NDIM, MAXNZ, JCOEF, IER
                  Real, COEF, RHS, U, WORK

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Dimension of matrix.</td>
</tr>
<tr>
<td>NDIM</td>
<td>Row dimension of arrays JCOEF and COEF in the calling program.</td>

</tr>
<tr>
<td>COEF</td>
<td>Array of sparse matrix representation.</td>
</tr>
<tr>
<td>RHS</td>
<td>Right hand side of matrix problem.</td>
</tr>
<tr>
<td>U</td>
<td>Latest estimate of solution.</td>
</tr>
<tr>
<td>WORK</td>
<td>Work array of length N.</td>
</tr>
<tr>
<td>IER</td>
<td>Error flag -- on return, nonzero values mean. 401 -- Zero diagonal element. 402 -- Nonexistent diagonal element.</td>
</tr>
</tbody>
</table>

Common Blocks: ITCOM1
                ITCOM2
                ITCOM3

5.3.3.32 Subroutine SORSCL

SORSCL scales the matrix and RHS vector by FACTOR. SORSCL is called by the subroutines SSORCG, SSORSI, ITSOR, ITSRCG, and ITSRSI.

Calling Sequence: Subroutine SORSCL (N, NDIM, MAXNZ, COEF, RHS, FACTOR)

Data Declaration: Integer N, NDIM, MAXNZ, FACTOR
                   Real, COEF, RHS

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Dimension of matrix.</td>
</tr>
<tr>
<td>NDIM</td>
<td>Row dimension of array COEF.</td>

<td>Maximum number of non-zero entries per row.</td>
</tr>
<tr>
<td>COEF</td>
<td>Array of sparse matrix representation.</td>
</tr>
<tr>
<td>RHS</td>
<td>Right hand side of matrix problem.</td>
</tr>
<tr>
<td>FACTOR</td>
<td>Scaling factor.</td>
</tr>
</tbody>
</table>
5.3.3.33  Subroutine SORWAV

SORWAV determines the wave front reordering for a forward and back SOR pass. The permutation vector corresponding to a wave front ordering is constructed. The matrix and RHS are permuted accordingly. SORWAV is called by the subroutines SOR, SSORCG, and SSORSI.

Calling Sequence:  Subroutine SORWAV (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, P, IP, IWORK, WORK, NUMWAV, ICALL)

Data Declaration:  Integer N, NDIM, MAXNZ, JCOEF, IP, IWORK, NUMWAV, ICALL
                   Real, COEF, RHS, U, P, WORK

Arguments:

N  Order of system.
NDIM  Row dimension of arrays JCOEF and COEF in the calling routine.
MAXNZ  Maximum number of non-zero entries per row.
JCOEF  Integer array for data.
COEF  Array for data structure coefficients.
RHS  Right-hand-side.
U  Solution vector.
P  Permutation vector.
IP  Inverse permutation vector.
IWORK  Integer workspace of length N.
WORK  Real workspace of length N.
NUMWAV  Number of wave fronts.
ICALL  Switch for calling.
       = 1 for initial call.
       = 2 for second call.

5.3.3.34  Subroutine UNSCAL

UNSCAL reverses the scaling done in routine SCAL. UNSCAL is called by the subroutines JCG, JSI, SOR, SSORCG, SSORSI, RSCG, and RSSI.

Calling Sequence:  Subroutine UNSCAL (N, NDIM, MAXNZ, JCOEF, COEF, RHS, U, WORK)

Data Declaration:  Integer N, NDIM, MAXNZ, JCOEF
                   Real COEF, RHS, U, WORK

Arguments:

N  Order of system.
NDIM  Row dimension of arrays JCOEF and COEF in the calling routine.
MAXNZ  Maximum number of nonzero entries per row.
JCOEF  Integer array for data.
COEF   Array for data structure coefficients.
RHS    Right hand side of matrix problem.
U      Latest estimate of solution.
WORK   Work array of length N.

5.3.3.35  Subroutine YPASX2

YPASX2 does the loop
    do 20 J = 1,M
        do 10 I = 1,N
            Y(I) = Y(I) + A(I,J)*X(JA(I,J))
        10   continue.
    20   continue

YPASX2 is called by the subroutines PARSI and PMULT.

Calling Sequence:  Subroutine YPASX2 (NDIM, N, M, A, JA, Y, X)

Data Declaration:  Integer NDIM, N, M, JA
                  Real A, Y, X

Arguments:  NDIM   Row dimension of A and JA arrays.
            N      Order of system.
            M      Number of columns in A and JA arrays.
            A      Real array of active size N by M.
            JA     Integer array of active size N by M.
            Y      Accumulation vector.
            X      Right-hand-side vector.

5.3.3.36  Subroutine YMASX2

YMASX2 does the loop
    do 20 j = 1,m
        do 10 i = 1,n
            y(i) = y(i) - a(i,j)*x(ja(i,j))
        10   continue
    20   continue

YMASX2 is called by the subroutines PBSOR, PFSOR, PFSOR1, PJAC, PRSBLK, and PRSRED.

Calling Sequence:  Subroutine YMASX2 (NDIM, N, M, A, JA, Y, X)
Data Declaration: Integer NDIM, N, M, JA
Real A, Y, X

Arguments:
NDIM Row dimension of A and JA arrays.
N Order of system.
M Number of columns in A and JA arrays.
A Real array of active size N by M.
JA Integer array of active size N by M.
Y Accumulation vector.
X Right-hand-side vector.

5.3.3.37 Subroutine VFILL

VFILL fills a vector, V, with a constant value, VAL.

Calling Sequence: Subroutine VFILL (N, V, VAL)

Data Declaration: Integer N, V, VAL

Arguments:
N Integer length of vector V.
V Vector.
VAL Constant that fills first N locations of V.

5.3.3.38 Subroutine VOUT

VOUT effects printing of residual and solution vectors. It is called from PERROR.

Calling Sequence: Subroutine VOUT (N, V, ISWT, NOUT)

Data Declaration: Integer N, ISWT, NOUT
Real V

Arguments:
N Order of system.
V Vector of length N.
ISWT Labelling information.
NOUT Output device number.

5.3.3.39 Subroutine ZBRENT

ZBRENT finds the zero of a function that changes sign in a given interval (Brent algorithm).
ZBRENT is called by the subroutine ECHALL.

Calling Sequence: Subroutine ZBRENT (N,TRI,EPS,NSIG,A,B,MAXFN,IER)
Data Declaration:  Integer N, NSIG, MAXFN, IER
Real TRI, EPS, A, B

Arguments:
TRI A tridiagonal matrix of order N.
EPS First convergence criterion (input). A root, B, is accepted if ABS(F(B)) is less than or equal to EPS. EPS may be set to zero.
NSIG Second convergence criterion (input). A root, B, is accepted if the current approximation agrees with the true solution to NSIG significant digits.
A, B On input, the user must supply two points, A and B, such that F(A) and F(B) are opposite in sign. On output, both A and B are altered. B will contain the best approximation to the root of F.
MAXFN On input, MAXFN should contain an upper bound on the number of function evaluations required for convergence. On output, MAXFN will contain the actual number of function evaluations used.
IER Error parameter. (output).
Terminal error.
IER = 501 indicates the algorithm failed to converge in MAXFN evaluations.
IER = 502 indicates F(A) and F(B) have the same sign.

Common Blocks:  ITCOM1
ITCOM2
ITCOM3

5.3.3.40  Subroutine WHENIGE

WHENIGE is called by the subroutine PRBNDX.

Calling Sequence:  Subroutine WHENIGE (N, P, INC, ITARG, IP, NPT)

Data Declaration:  Integer N, INC, ITARG, IP, NPT
Real P

Arguments:
N Order of system.
P
INC
ITARG
IP
NPT
5.3.3.41 Subroutine WHENILT

WHENILT is called by the subroutine PRBNDX.

**Calling Sequence:** Subroutine WHENILT (N, P, INC, ITARG, IP, NPT)

**Data Declaration:**
- Integer N, INC, ITARG, IP, NPT
- Real P

**Arguments:**
- N: Order of system.
- P: Permutation vector.
- INC
- ITARG
- IP
- NPT

5.3.3.42 Subroutine SAXPY

SAXPY overwrites single precision SY with single precision SA*SX + SY. SAXPY is called by the subroutine PFSOR1.

**Calling Sequence:** Subroutine SAXPY(N, SA, SX, INCX, SY, INCY)

**Data Declaration:**
- Integer N, INCX, INCY
- Real SA, SX, SY

**Arguments:**
- N: Order of system.
- SA
- SX
- INCX
- SY
- INCY

5.3.3.43 Subroutine SCOPY

SCOPY copies single precision SX to single precision SY. SCOPY is called by the subroutines JCG, JSI, SSORCG, SSORSI, RSCG, RSSI, ITJSI, ITSOR, ITSCRG, ITSRSI, ITRSSI, PERMAT, PERVEC, PFSOR1, SCAL, and UNSCAL.

**Calling Sequence:** Subroutine SCOPY (N, SX, INCX, SY, INCY)

**Data Declaration:**
- Integer N, INCX, INCY
- Real SX, SY
Arguments:  
N       Order of system.  
SX  
INCX  
SY  
INCY

5.3.3.44    Subroutine SSCAL

SSCAL replaces single precision SX by single precision SA*SX. SSCAL is called by the subroutine SORSCL.

Calling Sequence:    Subroutine SSCAL (N, SA, SX, INCX)

Data Declaration:    Integer N, INCX  
Real SA, SX

Arguments:  
N       Order of system.  
SA  
SX  
INCX

8.0 APPENDIX II. Supplementary Notes

8.1 NWS

NWS = 10

The wind velocity and surface pressure data files are named using the following convention:

UNIT 200 - Wind and pressure at the time of a model hot start. This file is not used for a cold start.
UNIT 206 - Wind and pressure 6 hours after a cold or hot start.
UNIT 212 – Wind and pressure 12 hours after a cold or hot start.
UNIT 218 – Wind and pressure 18 hours after a cold or hot start.
....
and so on until the end of the run.

Note: If the model is hot started, it must be done at an even 6 hour interval so that the hot start time corresponds to the time of a wind/pressure field file. The wind/pressure files must also be renamed so that they begin with UNIT 200 at the time of the hot start and continue from there. Enough wind/pressure files must be present to extend through the ending time of the model run.

The first data set must be 6 hours after the beginning of a cold start (UNIT 206) or at the beginning of a hot start (UNIT 200)

Data must be provided for the entire model run, OTHERWISE THE RUN WILL CRASH!!!

The following transformations are preformed to put this info into usable form for the model calculations:

\[ \text{WIND\_STRESS} = \text{DRAG\_COEFF} \times 0.001293 \times \text{WIND\_VEL} \times \text{WIND\_SPEED} \]
\[ \text{DRAG\_COEFF} = 0.001 \times (0.75 + 0.067 \times \text{WIND\_SPEED}) \]
\[ \text{IF} (\text{DRAG\_COEFF} > 0.003) \text{ DRAG\_COEFF} = 0.003 \]
\[ \text{PR2/GRAVITY/1000} \]

NWS = 11

The NWS ETA-29 MET files are in binary and have the format described below. Each file is assumed to contain one day's worth of data (8 data sets, one every 3 hours, beginning at 0300 and continuing through 2400 of the given day) on the ETA grid. The files are named using the following convention:
UNIT 200 - Wind and pressure the day before a model run is hot started. The final data in this file are used as the initial MET condition for the hot start. This file is not used for a cold start.

UNIT 201 – Wind and pressure during Day 1 of the run or Day 1 of a hot start.
UNIT 202 – Wind and pressure during Day 2 of the run or Day 2 of a hot start.
UNIT 203 - Wind and pressure during Day 3 of the run or Day 3 of a hot start.
....
and so on until the end of the run.

Note: The wind data is converted to an east-west, north-south coordinate system inside ADCIRC. If the model is hot started, it must be done at an even day interval so that the hot start time corresponds to the time of a wind/pressure field file. Also, the wind/pressure files must be renamed so that they begin with UNIT 200 at the time of the hot start and continue from there. Enough wind/pressure files must be present to through the ending time of the model run.

The first data set must be 3 hours after the beginning of a Cold start (UNIT 201) or at the beginning of a hot start (UNIT 200).

Data must be provided for the entire model run, OTHERWISE THE RUN WILL CRASH!!!

The following transformations are performed to put this information into usable form for the model calculations:

\[
\text{WIND\_STRESS} = \text{DRAG\_COEFF} \times 0.001293 \times \text{WIND\_VEL} \times \text{WIND\_SPEED}
\]

\[
\text{DRAG\_COEFF} = 0.001 \times (0.75 + 0.067 \times \text{WIND\_SPEED})
\]

\[
\text{IF} (\text{DRAG\_COEFF} \lt 0.003) \text{ DRAG\_COEFF} = 0.003
\]

\[
\text{PR2/GRAVITY/1000.}
\]

8.2 FMV

Notes: The means and variance calculations are only done if the global harmonic calculations are performed. Results are written out to UNIT 55. A summary of the poorest comparisons throughout the domain and the node numbers where these occurred is given at the end of the UNIT 6 output file.

The time series resynthesis from the harmonic constituents can use up a lot of CPU time since this is done for every time step during the specified part of the harmonic analysis period. If the harmonic analysis period extends for only a few days, it is practical to set up FMV = 1. Otherwise, compute means and variances for more than 10 – 20 days. Ultimately, the practical limit to these calculations depends on the number of nodes, the number of constituents in the harmonic analysis, and the size of the time step.
8.3 IBTYPE

IBTYPE = 3, 13, 23

Notes: Outward normal flow per unit width at an external barrier boundary node I is computed as:

\[
\text{IF(ETA2(NNBB),GT,BARLANHT(I))}
\]
\[
Q2(I) = -(2/3)*BRLANCFSF(I)
\]
\[
*(ETA2(NNBB)-BARLANHT(I))^*
\]
\[
*((2/3)*(ETA2(NNBB)-BARLANHT(I))*G)**0.5
\]

\[
\text{IF(ETA2(NNBB),LE,BARLANHT(I))}
\]
\[
Q2(I) = 0
\]

Where

NNBB = NBVV(K,I)  Global node number for external barrier boundary node

ETA2(NNBB)  The known time level surface elevation solution at the external barrier boundary node as computed in the code.

This formula is given by Leendertse (Aspects of SIMSYS2D - A system for two-dimensional flow computation, RAND/R-3572-USGS, 1987) and is simply the formula for a broad crested weir (e.g. see Henderson, open channel flow, Section 6.6). Also see Appendix III.

IBTYPE = 4, 24 (Internal Barrier Type Boundaries)

Notes: Cross barrier normal flow per unit width at internal barrier boundary node I is computed as:

Case 1 - Water level below barrier. Occurs if

((RBARWL1.LT.0.0).AND.(RBARWL2.LT.0.0)).

Results in no flow across the barrier (Q2(I)=0.0).

Case 2 - Water level equal on both sides of barrier. Occurs if

(RBARWL1.EQ.RBARWL2).

Results in no flow across the barrier (Q2(I)=0.0).

Case 3 - Water level greater on front side of the barrier but elevation difference such that cross barrier flow is subcritical. Occurs if

((RBARWL1.GT.RBARWL2).AND.(RBARWL1.GT.0.0).AND. (RBARWL2.GT.RBARWL1F)). Results in subcritical normal flow across the barrier from front to back (Q2(I)= -RAMP*BARINCFSB(I)*RBARWL2* (2*G*(RBARWL1- RBARWL2))**0.5).

Case 4 - Water level greater on front side of the barrier but elevation difference such that cross barrier flow is supercritical. Occurs if

((RBARWL1.GT.RBARWL2).AND.(RBARWL1.GT.0.0).AND.
(RBARWL2.LE.RBARWL1F)). Results in supercritical normal flow across barrier from front to back (QN2(I)=RAMP*BARINCFSP(I)*RBARWL1F*(RBARWL1F*G)**0.5).

Case 5 - Water level lower on front side of the barrier but elevation difference such that cross barrier flow is subcritical. Occurs if ((RBARWL2.GT.RBARWL1).AND.(RBARWL2.GT.0.0).AND.(RBARWL1.GT.RBARWL2F)). Results in sub-critical normal flow across the barrier from back to front (QN2(I)=RAMP*BARINCFSB(I)*RBARWL1 (2*G*(RBARWL2-RBARWL1))**0.5).

Case 6 - Water level lower on front side of the barrier but elevation difference such that cross barrier flow is supercritical. Occurs if ((RBARWL2.GT.RBARWL1).AND.(RBARWL2.GT.0.0).AND.(RBARWL1.LE.RBARWL2F)). Results in supercritical normal flow across the barrier from back to front (QN2(I)=RAMP*BARINCFSP(I)*RBARWL2F*(RBARWL2F*G)* *0.5).

Where

ETA2(J) The known time level surface elevation solution at global node J computed in the code.

NNBB1 = NBVV(K,I) Global node number on the front side of the barrier.

NNBB2 = IBCONN(I) Global node number on the back side of the barrier.

RBARWL1 = ETA2(NNBB1)-BARINHT(I) Relative water height on the front side of the barrier.

RBARWL2 = ETA2(NNBB2)-BARINHT(I) Relative water height on the back side of the barrier.

RBARWL1F=2.0*RBARWL1/3.0
RBARWL2F=2.0*RBARWL2/3.0

Note that the flow on the back side of the barrier is set equal and opposite to the flow on the front side of the barrier. These formulae are given by Leendertse (Aspects of SIMSYS2D - A system for two-dimensional flow computation, RAND/R-3572-USGS, 1987) and are simply the formulae for a broad crested weir (e.g. see Henderson, open channel flow). Also see Appendix III.

8.4 ITITER, ISLDIA, CONVCR, ITMAX

Parameters that provide information about the solver that will be used for the GWCE. (Note: All of the parameters must be input regardless of whether a direct or iterative solver is selected. However, ISLDIA, CONVCR and ITMAX are only used with the iterative solvers) Note: The best luck has been in using the JCG solver (the JSI also works ok). The others either blow up rapidly or don’t work because the grid can not be red/black ordered. Typically use CONVCR=1e-6 on the CRAY and CONVCR=2.98e-5 on a 32 bit machine. After the first few time steps, the solutions usually converge within 5-10 iterations.
9.0 APPENDIX III. General Notes for Normal Flow Boundary Condition Specification

- All external (external no normal flow, external with specified normal flow and external barrier) boundary segments should be listed in consecutive order around the outside of the entire domain before any internal (island with no normal flow or internal barrier) boundary segments are listed.
- All no normal flow internal boundaries should be closed by repeating the first node as the last node.
- An external boundary that completely surrounds the domain (e.g., a lake) should be closed by repeating the first node as the last node.
- Unless the boundary segment is closed, always start a boundary segment where two different types of boundaries meet.
- At a node where an external specified normal flow or an external barrier boundary meets an external no normal flow boundary, the initial leg of the external specified normal flow boundary or external barrier boundary is used to determine the normal and tangential direction.
- External boundaries with specified (non-zero) normal flow boundary conditions and external barrier boundaries must be separated by an external no normal flow boundary segment or an elevation specified boundary segment (i.e. External boundaries with specified (non-zero) normal flow boundary conditions and external barrier boundaries segments can not overlap).
- Internal barrier boundaries can overlap external no normal flow boundary segments. In this case the external no normal flow nodes may be treated in the weak sense and set equal to zero in the GWCE flow integral only, while the internal barrier overlapping nodes are handled as indicated in the input file. Specifically, the following cases are checked for:
  1) The external no flow boundary node is specified as essential with slip (IBTYPE=0) and the internal barrier boundary node is specified as essential with slip (IBTYPE=4). The code resets the external no flow boundary node to be a natural no flow boundary node (IBTYPE=20).
  2) The external no flow boundary node is specified as essential with no slip (IBTYPE=10) and the internal barrier boundary node is specified as essential with slip (IBTYPE=4). The code resets the external no flow boundary node to be a natural no flow boundary node (IBTYPE=20).
  3) The external no flow boundary node is specified as natural with slip (IBTYPE=20) and the internal barrier boundary node is specified as essential with slip (IBTYPE=4). The code takes no action to change user input.
  4) The external no flow boundary node is specified as essential with slip (IBTYPE=0) and the internal barrier boundary node is specified as natural with slip (IBTYPE=24). The code takes no action to change user input.
  5) The external no flow boundary node is specified as essential with no slip (IBTYPE=10) and the internal barrier boundary node is specified as natural with slip (IBTYPE=24). The code resets the external no flow boundary node to be an essential no flow with slip boundary node (IBTYPE=0).
6) The external no flow boundary node is specified as natural with slip (IBTYPE=20) and the internal barrier boundary node is specified as natural with slip (IBTYPE=24). The code takes no action to change user input.

- Internal barrier boundaries can not overlap external specified flow boundary segments, external barrier boundary segments or internal no normal flow boundaries.
- For all normal flow boundaries (i.e. IBTYPE = 0, 1, 2, 3, 4, 10, 11, 12, 13, 20, 21, 22, 23, 24, 30), the flow boundary integral in the GWCE is evaluated with the appropriate (zero, specified or computed) flow. This is a natural boundary condition implementation for some normal flow boundaries (i.e. IBTYPE = 0, 1, 2, 3, 4, 10, 11, 12, 13). The normal direction velocity component is set equal to the appropriate (zero, specified, or computed) flow value by eliminating the normal direction momentum equation (obtained after re-orienting the x-y momentum equations into n-t directions). This momentum equation is replaced with the normal flow value on the boundary expressed in terms of velocity (dividing the normal flow by the actual total water column height). This is an essential boundary condition implementation that also includes the previously described natural boundary condition implementation.

- For some normal flow boundaries (i.e. IBTYPE = 10, 11, 12, 13), the tangential direction velocity component is set equal to zero by eliminating the tangential direction momentum equation and replacing it with a zero prescribed tangential velocity component. This is an essential boundary condition implementation that also includes the previously described natural and essential normal flow boundary condition implementations. Use of this boundary condition implementation requires considerable care since this type of no slip boundary condition is only mathematically justifiable if lateral viscous terms are used in the simulation and only physically justifiable if the lateral boundary layers are sufficiently resolved.
