The Armed Forces Casualty Assistance Readiness Enhancement System (AF-CARES) Version 1.0

Lieutenant Colonel Dale L. Henderson, Ph.D.
Assistant Professor, Department of Systems Engineering

Approved by
Colonel Timothy Trainor, Ph.D.
Professor and Head, Department of Systems Engineering

Prepared by
Operations Research Center of Excellence
West Point, New York 10996
March 2007

The Operations Research Center of Excellence is a joint research activity of the Department of Systems Engineering and the Department of Mathematical Sciences at the United States Military Academy at West Point, New York. The Operations Research Center of Excellence is supported by the Assistant Secretary of the Army (Financial Management & Comptroller).

Distribution A: Approved for public release; distribution is unlimited.
Executive Summary

This report provides details of the implementation of a forms assistance tool designed to help personnel charged with carrying out the United States Army’s Casualty Assistance mission. The need for this tool has arisen with the expansion of casualty operations in the Global War on Terror (GWOT), the growing complexity of the system of benefits provided to the surviving family members of soldiers who are killed, and the high level of emphasis placed on executing this mission with compassion and precision.

The software tool, called the Armed Forces Casualty Readiness Enhancement System (AF-CARES 1.0), provides form filling assistance and access to case data in a stand alone application. The system uses a run time data representation of the case and an extensible markup language specification for the library of supported forms to automate the routing tasks common to every case of filling out a significant number of forms. The software automatically fills forms and provides access to the forms for viewing, printing, and editing. The software also provides a persistent save file format and case file reader for managing cases over time.

AF-CARES 1.0 has been deployed to all of the regional Casualty Assistance Centers (CACs) with 76 users participating in an Army Knowledge Online (AKO) knowledge center implemented to facilitate deployment, support, and the identification of capability gaps against an objective software assistance capability.
About the Author

Lieutenant Colonel Dale L. Henderson is operations research, systems analyst currently assigned as an assistant professor of systems engineering and deputy director of the Operations Research Center of Excellence at the United States Military Academy at West Point, New York. LTC Henderson is a rated United States Army Aviator and has a M.S. in Operations Research from the Naval Postgraduate School and Ph.D. in Systems and Industrial Engineering from The University of Arizona. He has experience as a military analyst modeling the army officer personnel system.

Acknowledgements

This work seeks to improve the casualty assistance system. That system is run by a small group of exceptionally professional and caring individuals who must perform a difficult task with remarkable compassion and unwavering attention to detail. The authors would like to acknowledge their extraordinary contribution to their nation.

This work is built on original work done by Major Ernie Wong during his assignment to the Operations Research Center.

Chapter 1. Introduction

The United States Army manages casualty operations from the Casualty and Mortuary Affairs Operations Center (CMAOC) at the United States Army Human Resources Command (HRC) in Alexandria, Virginia. The mission of the CMAOC is “to assist Army families in an emotionally stressful time of bereavement”\(^1\). This mission is given a high level of command emphasis by the senior leadership of the Army. It is executed by individual Causality Assistance Officers (CAOs) through the system of 35 regional Casualty Assistance Centers (CACs) shown in the Table 1.

| Ft. Stewart, GA | | West Point, NY |

The CAO is the personal representative of the Secretary of the Army to the family of the deceased service member\(^3\).

The casualty assistance system has expanded rapidly with the Army’s mobilization for the Global War on Terror (GWOT). The number of Army deaths in Operations Enduring Freedom (OEF) and Operation Iraqi Freedom (OIF) as of 23 December 2006 is 2260\(^4\). The casualties from the GWOT have approximately doubled the number of soldiers who die on active duty from the rate that we observed throughout the 1990s. In addition to a higher overall load on the system, the war has seen an expansion to the benefits and information routinely made available to the families of service members who die on active duty. Policy on casualty assistance has also evolved as a consequence of the perception that the public demands a very high level of emphasis on casualty assistance and a high level of support to the families of fallen soldiers.

2 https://www.hrc.army.mil/site/Active/TAGD/CMAOC/CACLOCATOR/CACLOCATORINDEX.htm
3 Army Regulation 600-8-1
Complexity in casualty case management arises from several sources. The first is the inherent complexity of administering a program that crosses agency boundaries and provides assistance and benefits under several distinct regulations and laws. A second source of complexity in the system arises from the uniqueness of each case. Every service member who is killed has a unique set of family circumstances which require a careful application of the rule set governing assistance and benefits. In the simplest case, a single service member with no dependents has two living parents who are married to each other, and are named as beneficiaries on properly executed and up to date notification and beneficiary forms. Many soldiers who become casualties have more complex family situations including spouses, children, ex-spouses, children from ex-spouses, divorced, or deceased parents and step parents, improper or inaccurate notification and beneficiary data and a host of other unique considerations for which the assistance system must account. The diagnostic tree that can provide a taxonomic representation of every possible case circumstance is quite large. Consider a diagnostic tree that asks the questions in table shown here:

<table>
<thead>
<tr>
<th>Marital Status</th>
<th># of Marriages</th>
<th>Children</th>
<th>Parents</th>
<th>Siblings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single, never married</td>
<td>Married multiple times</td>
<td>No Children</td>
<td>Both parents living and married to each other</td>
<td>No siblings</td>
</tr>
<tr>
<td>Currently married</td>
<td>Married once</td>
<td>One or more children from one other partner</td>
<td>Mother deceased</td>
<td>One or more siblings</td>
</tr>
<tr>
<td>Divorced</td>
<td></td>
<td>Children from several partners</td>
<td>Father deceased</td>
<td>Half and step siblings</td>
</tr>
<tr>
<td>Widowed</td>
<td></td>
<td></td>
<td>Parents Divorced</td>
<td></td>
</tr>
</tbody>
</table>

Answering the questions in this table from left to right gives rise to a tree structure with 315 different unique circumstances that a particular case can fall under. Even under this diagnostic tree there are several case types that would require further diagnosis. The nature of the case as diagnosed by such a tree is critical to many decisions including:

- Who is the Primary next of kin?
- To whom is the death gratuity paid?
- Who is entitled to specific benefits?
- Who is authorized to be given information about the circumstances of the soldier’s death?
- Who is entitled to travel at government expense to funeral services?
Even in the simplest cases, the next of kin is shocked and grieving over the sudden loss of a loved one. The primary next of kin is faced with a series of decisions about benefits, interment, and the disposition of personal effects. The family is entitled, by policy to any unclassified information the Department of the Army is able to obtain about the circumstances surrounding the death of their loved one. This information is provided in the form of accident investigations, chain of command initiated investigations under AR 15-6\(^5\), and reports of medical examinations. Under certain circumstances specific members of the family are authorized to travel at government expense to funeral services. A specific person, named by the soldier is given the responsibility of making decisions about the funeral service and increment. A specific person is responsible for receiving the soldier’s personal effects. The CMAOC case managers, CAC personnel, and the CAO work together to make sure the Army has all of the information it needs to make an accurate determination of all of the people who have some legal or regulatory interest in the case.

Finally, the assistance system is executed by soldiers who are assigned and trained for the mission of providing casualty assistance, but who normally have little experience performing this duty, and who are not trained as financial planners, legal advisors, or grief counselors. The focus of this effort is on automating routine tasks associated with filling forms and assuring the quality of the information on those forms, so that CACs and CAOs can focus more on the needs of the grieving family members and less on administrative tasks.

**Previous Work**

A considerable amount of previous work was done as part of this project over the period August 2005 to August 2006 by MAJ Ernie Wong. This work is documented in Operations Research Center (ORCEN) Technical Report DSE-TR-0619\(^6\). This report gives a thorough explanation of the problem solving process used by the ORCEN when undertaking a project of this type. The most current documentation for this Systems Decision Process is in the text “Decision Making in Systems Engineering and Management”\(^7\). The Systems Decision Process is a structured approach to problem solving that emphasizes careful problem definition and thorough stakeholder centered needs analysis. A diagram of the process is shown at Figure 1.

---

\(^5\) Army Regulation 15-6, 2 October 2006.
The process begins with problem definition and proceeds through the design of solution alternatives, the decision to proceed with a particular alternative, and the implementation of the decision. The process is iterative and makes use of feedback and assessment mechanisms to continuously gather information and refine alternatives. At this point in the project we are implementing a software solution that meets some of the identified needs of the system.

A stakeholder analysis for this system was prepared as part of earlier work, along with a functional analysis of the flow of casualty assistance officer duties through the management of a case. This previous work identified areas for improvement in the casualty management system including the need for standardized training and training products and for a software assistance tool for case management. The stakeholders identified in this previous work included:

- Soldiers
- Units
- Families
- The Congress
- The Army Leadership
- The Casualty and Mortuary Affairs Operations Center
- The Regional Casualty Assistance Centers
- Casualty Assistance Officers
- Administrators of the Personnel System
- Administrators of the Defense Casualty Information Processing System
- Other Agencies (e.g. Veteran’s Administration, Citizenship and Immigration Service)
- Private Organizations

The work also led to the development of a prototype forms filling assistance tool that demonstrated the capability to receive data from the Defense Casualty Information Processing System (DCIPS) database and use this data to fill electronic forms.
Deployment

The software developed in this work has been deployed to the regional CACs and is currently being used in an operational test basis. Deploying a new piece of software for use in a mature system like the casualty system presents a unique set of challenges. First, casualty assistance personnel are not necessarily expert computer users. The installation procedure for the software was complicated by the requirement to download, extract and install the software. Computer users operating within Department of Defense (DoD) information technology systems are not generally authorized to install software on their systems. In many cases installation required administrator privileges or a system administrator to physically install the software. Downloading the software was challenging for many users. Initially the software package was posted to the DCIPS web portal. A picture of the DCIPS portal is shown at Figure 2.

![DCIPS Portal](image)

**Figure 2: DCIPS Portal.**

The second and third functions in the upper left of the portal (under Application Listings) provide for downloading a data query for the case in Microsoft Excel Format and for downloading the application for local installation on a client computer. The view of the portal is not common to every user, and therefore initially not all users could see the option for downloading the software. Software download is now multi-modal, with identical versions of the software posted to the DCIPS portal and to an AKO knowledge center.
In order to facilitate getting the software into the hands of more users, we established an Army Knowledge Online\textsuperscript{8} (AKO) Knowledge Center. Participation in this knowledge center grew rapidly to over 70 users. We strongly recommend the continued use of this mechanism for distributing future version of the software and for maintaining a support relationship with users. Appendix B describes the Knowledge Center.

**Organization of the Report**

This report is a detailed description of the software tool, AF-CARES 1.0, developed to assist with managing forms as a case is worked from the time a soldier becomes a casualty until the case is completed. Chapter 2 is a description of the casualty case management process. Chapter 3 describes the electronic forms formats and database structure. Chapter 4 describes the software including the underlying run time object representation of the case and the user interface. Chapter 5 provides conclusions and recommendations for further work. Appendix A is a set of installation instructions provided with the initial release of the software. Appendix B is a simplified set of instructions developed in response to difficulty with the installation process. Appendix C describes the AKO Knowledge Center.

\textsuperscript{8} https://www.us.army.mil
Chapter 2. The Casualty Case Management Process

The management of an individual casualty case is a complex process that occurs across three basic echelons: the CMAOC, the regional CACs, and the CAOs. The process must ensure cooperation across several agencies within the Department of the Army, and must also provide for cooperation with other agencies of the federal government, state and local governments, and private organizations. The process requires coordination between CAOs working with family members who may be geographically separated from one another. Each case requires a custom application of a basic rule set.

The notification process is carried out separately from the casualty assistance process, but these two critical functions must also be tightly coordinated. Once notification has occurred, the casualty assistance process begins. The casualty assistance process begins with a telephone contact from the CAO to the primary next-of-kin (PNOK) within 4 hours of notification. Assistance is rendered through in-person visits in which information is exchanged, decisions are made, and forms are completed and signed. The major milestones in the process are:

- Initial Contact
- Initial Visit
- Interment
- Disposition of Benefits
- Disposition of Personal Effects
- Disposition of Investigative Reports
- Case After Action Report

These milestones are achieved through a series of personal visits and telephone contacts. The order in which particular milestones are met is unique to each case.

The casualty assistance process is considered complete when a set of conditions are met:

- The disposition and interment of the casualties’ remains is complete;
- The disposition of the casualties’ personal effects is complete;
- Persons authorized access to all relevant investigative reports into the death have been provided these reports; and
- All benefits have been paid (or payment by allotment initiated) to all beneficiaries.

The integration across the echelons of the casualty assistance system is facilitated by a single database system, DCIPS. DCIPS is maintained at United States Army Human Resources Command (HRC) and provides all Department of the Army (DA) agencies involved with case management a common view of the case data.
Phases of the casualty assistance process

Casualty assistance officers complete the case in three Phases. In Phase I, the assistance officer is designated, and reviews and verifies the known information about the case. In accordance with IAW AR 600-8-1, the CAO makes a telephone call to the PNOK within 4 hours of notification unless notification occurs very late in the evening. The CAO coordinates a face to face meeting with the PNOK within 24 hours of notification. This meeting serves as an introduction and as an opportunity to confirm data about the case. Within 72 hours of notification the death gratuity is paid. The CAO also confirms an address for the next of kin that will be valid for 45 days. These actions complete Phase I. Phase II of the assistance process concerns the return and disposition of the soldiers remains. The CAO coordinates specifically with the person authorized to direct disposition (PADD) who is the decision making authority for the place and manner of the funeral and burial of the soldier. This coordination includes decision about funeral benefits and coordination for the return of the remains. These decision can be complicated by several factors including:

- The desires of the PADD
- The availability of military airlift returning the remains from theater
- The condition of the remains
- Authorized travel to the service if the soldier will be interred at a national cemetery
- Authorized transportation of remains by military or contract aircraft.
- Assuring the remains are treated with dignity at each phase of their transportation

This phase occurs during a sensitive and emotional time for the family. Phase II is complete when the soldier is interred.

Phase III of the assistance process concern the payment of benefits and the return of the soldier’s personal effects the person eligible to receive effects (PERE). The benefits phase can be complicated by the number of benefit decisions that must be made and documented on an array of forms from several agencies. Phase III is complete, and the case is closed with the payment of all benefits and the submission of the Casualty Assistance Officer After Action Report. After the assistance case is closed, long term support to the next of kin is provided by the family first call center at HRC.

Process Flow

Figure 3 is a diagram of the basic program flow of the CARES System. Not all of the functionality in this process flow is implemented in AF-CARES 1.0.

---

9 Army Regulation 600-8-1, paragraph 6-7.
The case timeline in Figure 3 shows the overall steps that occur in the management of a case, however each case is different, and some of these processes must be executed out of order or partially completed at various times during case management. This problem arises due to scheduling conflicts, delays in forms processing, decision that must be jointly made by several family members and other case specific considerations. A major area for future enhancement is the implementation of a persistent case state attribute that tracks progression through this work flow and informs intelligent system or “wizard” type advice to the user.

Figure 3: Casualty Process Flow and Case Timeline.
Chapter 3. Electronic Forms and Database Structure

This chapter discusses the formats used by the electronic forms supported by AF-CARES 1.0. The software provides electronic form filling assistance to a set of electronic forms that are stored in the portable document format. A list of these forms is shown below.

Table 3: Supported Forms.

Portable Document Format

The portable document format (PDF) is a proprietary electronic forms specification developed by the Adobe corporation\(^\text{10}\). PDF files have the advantage of portability. They may be viewed, edited, printed, and saved using the freely distributed Acrobat Viewer. All of the forms supported by the AF-CARES 1.0 software are available in PDF format, however, the forms are maintained by different agencies and each form has a unique underlying field structure. The PDF specification goes beyond form rendering and field filling and includes the capability to electronically sign documents. This electronic

---

signing feature is not implemented in AF-CARES 1.0, but is a consideration for future enhancements to the software system.

**DCIPS Data Interface**

The initial load of case data is generated as an Excel Spreadsheet extracted from the DCIPS database and downloaded to the host computer from the DCIPS portal. The fields in this query are shown at Table 4 below.

Future versions of the software may require alterations to this query, however, early in the case the DCIPS database may be populated with incomplete or incorrect information. The CAO verifies data early in the assistance process, and the run time and save file representations of the case permit correcting information and adding new information to
the case file. Figure 4 provides a schematic of the way the software interfaces with the DCIPS portal through the case query.

The DCIPS portal provides an initial set of case data as an Excel file. The working save file format for the case is an Extensible Markup Language file that is generated, saved and read by the software. Figure 5 is a more detailed diagram of functions that are implemented in AF-CARES 1.0 or are planned for implementation in AF-CARES 2.0. The AF-CARES 1.0 software provides the forms assistance functions shown in this diagram. Journaling is completed outside the software, and case assistance is still provided by subject matter experts at the CAC and CMAOC case manager level.
Figure 5 indicates some additional functionality that has been identified through feedback from users of the AF-CARES 1.0 software. Specifically, these areas include journaling, archiving, and intelligent case diagnosis and management assistance. The existing runtime representation of the case and the forms management functionality in AF-CARES 1.0 will form the basis for enhanced revisions to the software.
Chapter 4. AF-CARES Version 1.0 Software

The objective of this work is to provide a software tool to the people providing assistance to the families of deceased soldiers. The software tool developed in this work is called Armed Forces CARES version 1.0. This chapter provides an overview of the architecture, objects, and functionality in the software.

Architecture

The AF-CARES software provides form filling assistance to the user by defining an interface between a set of electronic forms and the data elements provided by the DCIPS database or obtained by casualty assistance officers. The software is written in the C# programming language. The user interface was designed using the Microsoft Visual Studio 2005 integrated development environment.

Objects

The software architecture is firmly object oriented. The objects defined in the software encompass the state variable definitions and functions needed to define the roles of each object. The objects are generated as needed at run time, and populated with data through three possible sources:

- An initial case data load in Microsoft Excel format. This file is generated by a query of the DCIPS database, and serves as an initial set of information about the casualty and one or more next of kin. The Excel data file is read at run time by the C# application through the Microsoft Open Database Connectivity (ODBC) layer provided by the C#.NET framework in the OleDataAdaptor Class.
- A saved case file. As case management progresses, the software permits saving and loading a working case file in XML format. These case files contain all of the information read from the initial DCIPS database query and any information that has been added by the case managers.
- Information gained during case management. As the management of the case progresses additional information is gained about next of kin, casualty assistance officers, and decisions about disposition and benefits. This information is added to the object model through the user interface and is stored in the XML case files.

As forms are filled and edited they are stored in a case unique directory with unique file names in PDF format. These forms can be further edited, saved, and printed for signature and disposition.

---

Case Data

The case data object contains information about the case and the directories in which data and forms are stored. The case data object holds a reference to the forms library, the Casualty Object and one or more next of kin and casualty assistance officer objects.

Casualty

The casualty object contains information about the individual casualty. This information includes for example, the name, social security number, and rank of the deceased. Because this information is stored in only one place in the data representation, and because this information is placed in form fields from this object representation, the likelihood of error in placing, for example, the same social security number on several forms is minimized.

Next of Kin (NOK)

A next of kin is a family member of the casualty. Next of Kin objects contain information about individual family members including their relationship to the deceased. The Primary Next of Kin is a special case of the class of Next of Kin individuals. The determination of an individual’s status as Primary Next of Kin is made outside the scope of the software. The determination is already made at the time the case data is loaded from a query on the DCIPS database. The same data assurance advantages of holding, for example a next of kin social security number in only one place for use on several forms is facilitated by the object design.

Casualty Assistance Officer (CAO)

A casualty assistance officer is the individual who provides direct assistance to the family members of the deceased service member. Several CAOs may be assigned to any one case. The casualty assistance officer data is used to generate travel documents. Additionally, because of existing policy on the way in which reports of investigations may be provided to families, the CAO contact information is used in automatically generating requests for these investigative reports.

Form

A form object permits the mapping of object data onto form fields. The PDF format forms are maintained by several agencies. The Army Publishing Agency 14 maintains electronic forms in PDF format. The Veterans Administration also maintains a library of relevant forms 15. All of these forms are provided with the application as a forms library, but as policy and form format changes over time, the software will need to be adapted to account for new forms and new form formats. The forms object, and the forms library

14 http://www.usapa.army.mil/
15 http://www.va.gov/vaforms/
definition document described below permit changes to the forms library without requiring changes to the AF-CARES 1.0 application. In essence the form object is an abstract representation of what a form must do in order to be useful to the application.\footnote{Gamma, E., et al., “Design Patterns, Elements of Reusable Object-Oriented Software”, Addison Wesley, 1995.}

**PDF4NET API**

The PDF4NET\footnote{http://www.o2sol.com/pdf4net/products.htm} application programmer’s interface (API) specification provides all of the functions necessary to fill and edit the electronic forms supported by AF-CARES 1.0 from within the application. The API was developed by O2 Solutions and licensed to this project as an embedded distributable .dll library.

**XML Forms Library**

The supported forms library is defined in a single extensible markup language (XML) document. This document provides a mapping between the field names in a particular electronic form portable document format file and the object names used in the object representation of case information. An example of a form specification in this xml library definition is shown here:

```
<form>
  <name>SF180</name>
  <fileName>SF180.pdf</fileName>
  <title>Request Pertaining to Military Records</title>
  <description>... .</description>
  <special>False</special>
  
  <formField>
    <formFieldName>NameUsed</formFieldName>
    <objectFieldName>casualty_lfmi</objectFieldName>
  </formField>
  ...
  ...
</form>
```

**XML Save File Format**

Working case files are saved in an XML format. The save file contains a complete representation of the know object data. The software contains reader and writer functions that use the standard C# .NET XML management objects.\footnote{Esposito, D., “Applied XML Programming for Microsoft .NET”, Microsoft Press, 2003.}
User Interface

The user interacts with the AF-CARES 1.0 software through a graphical user interface. This interface is designed to follow the basic flow of managing the forms for an individual case. The interface provides for reading an initial case data set, saving, and opening working cases, and manipulating case data as it becomes available throughout the management of the case.

The interface uses a tabbed layout with tabs for:

- Start
- Instructions
- Forms Management
- Resources
- Casualty Data
- NOK Data
- CAO Data

Figure 6: AF-CARES 1.0 Start Tab.

The start screen provides an introduction to the user (Figure 6). The instruction screen (Figure 7) gives a very simple overview of the way a case is managed using the tool. The instructions tab also provides a direct email link to the developer.
The forms management tab provides access to all of the supported forms for filling, editing, and printing. As forms are filled for a particular case they are added to the list of filled forms. This list is maintained on save and load of the case. The forms management tab also provides a function for adding a next of kin to the case. As forms are filled they are copied to a uniquely named file specific to the case and next of kin. The forms management tab provides a function to batch print the entire set of blank or filled forms. As forms are filled by the application the Adobe Acrobat Reader\textsuperscript{19} is launched for inspection and further editing of the forms. AF-CARES 1.0 requires Adobe Acrobat for forms manipulation outside of the application.

\textsuperscript{19} http://www.adobe.com/
Figure 8: AF-CARES 1.0 Resources Tab.

The resources tab (Figure 8) contains an embedded web browser with links to casualty assistance and forms resources, and to the Adobe Acrobat download web site.

The casualty data tab (Figure 9) contains information about the casualty.

Figure 9: AF-CARES 1.0 Casualty Tab
The NOK data tab (Figure 10) contains a separate tab pane on which each NOK appears as a tab.

![AF-CARES 1.0 NOK Data Tab](image)

**Figure 10: AF-CARES 1.0 NOK Data Tab.**

The CAO data tab (Figure 11) contains information about the CAO assigned to this case. The menu bar provides for creating a new case from data, saving and opening cases from saved case files, and exiting the application. The help menu provides an about dialog box and a dialog with explanations of known issues in usage.

![AF-CARES 1.0 CAO Data Tab](image)

**Figure 11: AF-CARES 1.0 CAO Data Tab**
The user interface is designed to be simple, but it can be expanded to encompass additional functions in later versions. The control objects in the user interface (e.g. text fields, check boxes) are linked to the underlying object model through the C# data binding framework. This means that as the user manipulates the fields in the user interface, he is also manipulating the state of the underlying run time object representation. As an example of the use of the data binding functionality in C# user interface design, the software provides a control for adding a new NOK. When the user adds a NOK to the existing collection of NOKs, the software generates a new NOK control, adds this control to a new tab in the NOK Tab page, and then sets this control’s binding source to the new NOK object:

```csharp
private void addNokButton_Click(object sender, EventArgs e){
    int i = theCase.theNOK.Count;
    if (i == 0){
        NOK n = new NOK(theCase);
        theCase.theNOK.Add(n);
        NOKControl nk = new NOKControl(n);
        this.NOKTabs.TabPages.Add(theCase.theNOK[i - 1].Nok_FML,
            theCase.theNOK[i - 1].Nok_FML);
        this.NOKTabs.TabPages[i].Controls.Add(nk);
        this.NOKTabs.TabPages[i].DataBindings.Add(new Binding("Text",
            nk.nOKBindingSource, "nok_FML");
        nk.nOKBindingSource.DataSource = theCase.theNOK[i - 1];
        nk.nOKBindingSource.ResetBindings(false);
    }
    else{
        NOK n = new NOK(theCase);
        theCase.theNOK.Add(n);
        NOKControl nk = new NOKControl(n);
        this.NOKTabs.TabPages.Add(theCase.theNOK[i].Nok_FML,
            theCase.theNOK[i].Nok_FML);
        this.NOKTabs.TabPages[i].Controls.Add(nk);
        this.NOKTabs.TabPages[i].DataBindings.Add(new Binding("Text",
            nk.nOKBindingSource, "nok_FML");
        this.NOKTabs.TabPages[i].DataBindings.Add(new Binding("Name",
            nk.nOKBindingSource, "nok_FML");
        nk.nOKBindingSource.DataSource = theCase.theNOK[i];
        nk.nOKBindingSource.ResetBindings(false);
    }
}
```

---

Chapter 5. Conclusions & Recommendations

This work provides a functioning software tool to the people who execute the casualty assistance process. It is a first milestone in the process of fielding usable software assistance that meets the defined needs of users at several echelons in the casualty assistance system.

Lessons Learned from Deployment

The test software developed in previous work\(^{21}\) was alpha tested for usability and functionality by members of the Department of System Engineering and by selected personnel at the CMAOC during August and September of 2006. Based on these tests the project managers at CMAOC decided to proceed with the development of a stand-alone forms assistance tool for deployment to the CACs. The initial version of the software described in this report was deployed to six CACs in December of 2006:

- Fort Huachuca
- Fort Campbell
- Fort Lewis
- Fort Meade
- Fort Stewart
- Fort Drum

Several lessons were learned in this preliminary deployment.

- The software had rigid working directory management.
- The users were not authorized to perform the installation.
- Local policies among the regional CACs varied with respect to installing software applications built by an Army agency.
- The installation instructions were in a readme.txt file embedded in the zipped deployment archive. Users who did not know how to open this archive could not access the installation instructions.
- The software did not handle less than perfect data sets, it would break on a missing casualty social security number or badly formed Excel spreadsheet tab label in the DCIPS extract.

Using lessons learned from this deployment, minor upgrades were incorporated into the software, and a larger scale deployment, using the DCIPS and AKO portals was conducted during February of 2007. A more thorough installation guide (Appendix A) was also made available through the AKO portal. The CACs using the software have provided feedback through the AKO portal and through surveys administered by the Operations Research Center, and through informal communications with the development

\(^{21}\) Technical Report DSE-TR-0619, DTIC# ADA4490018, August 2006
team. This feedback is being incorporated into the development of AF-CARSE 2.0. The current list of users by AKO username is shown in the following table:

**Recommendations for Future Work**

The assistance provided by the tool is limited to forms filling, and is limited by the electronic forms formats supported. The future of Army electronic publishing is in the e-forms initiative. The principal recommendation of this work is the development of Armed Forces Casualty Assistance Readiness Enhancement System 2.0 software that meets more of the needs of the users and incorporates the functionality of the emerging electronic forms architecture.

The following areas of additional functionality should be considered for incorporation into the 2.0 version of the software.

- Word Document management
- XFDL document management
- Journaling
- Address book and contact management
• Intelligent case diagnosis
• Intelligent case management flow advising
• Case Archiving
• In line help screens

The functional requirements of this future work are shown in the functional hierarchy at Figure 12.

The AF-CARES 2.0 release should also incorporate in-line help functionality and should include a brief instruction guide.
AF-CARES 2.0 Functions

Provide easy installation and software update

- Provide a single file or package installation
- Provide a user-friendly installer
- Provide a software updater
- Provide for installation on a broad user system base

Provide an Interface to the Casualty System

- Provide an Excel File Reader

Provide Forms Development

- Provide forms analysis
- Provide form field mapping
- Enable .pdf forms
- Enable .xlsd forms
- Enable MS Word form documents

Provide an Extensible Architecture

- Provide forms analysis
- Provide form field mapping
- Enable .pdf forms
- Enable .xlsd forms
- Enable MS Word form documents

Provide Intelligent System Case Assistance

- Provide advice on incomplete case tasks
- Provide a tree description of the casualty case
- Assess the current status of the case against the tree description
- Display Benefits Progress
- Display Interment Progress
- Display Reports Progress
- Display overall progress

Provide for a simple user interface

- Provide display of available forms
- Provide Display of Case Progress
- Provide Display of Journaling Functions
- Provide Embedded Help Menus

Provide display of available forms

- Provide display of available forms

Figure 12: Functional Hierarchy.
Conclusions

The development of a useable software tool for deployment to the community of personnel who execute the casualty assistance mission presents unique challenges that extend beyond those challenges associated with any software development effort. This work has provided functioning software, but more importantly has defined the system, its functions, boundaries, interfaces and processes within which the software is designed to operate. It has defined a software architecture based on a run time object representation of the system and its major components. It has provided the framework under which to make major design decision decisions about the software including:

- User modality,
- Architecture,
- Development Environment,
- System Interface,
- Deployment,
- Support, and
- Upgrade Path.

These definitions and decisions should be used in the development of a more comprehensive software solution that meets a larger set of user needs, and ultimately leads to enhancement of our collective performance of the casualty assistance mission.
Appendix A Installation Instructions

Installation instructions for ARMED FORCES CARES 1.0
(Instructions current as of 5 Feb 07)

Introduction

These instructions should provide you with enough information to download and install the Armed Forces Casualty Assistance Readiness System Version 1.0 Software.

IN ORDER TO INSTALL THE SOFTWARE YOU MUST BE A SYSTEM ADMINISTRATOR OR HAVE ADMINISTRATOR PRIVILEGES ON YOUR COMPUTER.

Installation requires you to:

1. Download the software from either DCIPS or the AF-CARES Knowledge Center on AKO.
2. Extract the downloaded zip file or zipped folder using winzip or the default Microsoft file compression software.
3. Run the software installation.
4. Install Microsoft .NET 2.0 Framework (if it is not already installed on your computer).

IF YOU HAVE A VERY STRANGE COMPUTER CONFIGURATION, YOU MAY RUN INTO PROBLEMS WITH INSTALLING. IF YOU HAVE VERY LITTLE EXPERIENCE WITH INSTALLING SOFTWARE YOU SHOULD GET HELP FROM AN EXPERIENCED USER OR FROM YOUR IT STAFF.

The following pages will take you through the installation steps

Downloading the Software

You can download the software from two different locations. The first is the DCIPS portal. If you have a DCIPS login and password you should be able to see the option: “AF-CARES Application Download” under the APPLICATION LISTINGS heading.
Once you have this zipped folder you can transfer it freely among local computers (for example using a memory stick).

If you are having problems getting the folder from DCIPS, there is an alternative download site on Army Knowledge Online. Contact LTC Henderson dale.henderson@usma.edu or dale.l.henderson@us.army.mil for access to the AKO site. In order to get the file from AKO, you need to search for and navigate to the AF-CARES KNOWLEDGE CENTER on AKO. On the right side of the AF-CARES page, there is a folder with the title “Software.” Click on the word “Software” to open the folder. The folder contains a zipped archive of the software titled “Deployment.” If you click this file, you will be given the option to download it.

Download the zipped folder “Deployment” from DCIPS or AKO onto your desktop.

You can not install the software from the zipped folder. You must extract it first.

**Extracting the Folder**

These instructions will take you through two possible ways to unzip the zipped file called “Deployment.zip” that should now be on your desktop.

**Using the Microsoft zip software**

On some computers you may extract the folder by right clicking on it.
Select “Extract All.” This brings up the folder extraction wizard.

Select Next>.  

Welcome to the Compressed (zipped) Folders Extraction Wizard

The extraction wizard helps you copy files from inside a ZIP archive.

To continue, click Next.
To extract to a folder on the desktop select next again.

You will get an extracting progress bar as the folder extracts.

Select finish to close the folder extraction wizard.
The extracted folder should open.

If the folder does not open automatically, there should be a new folder on your desktop called “Deployment.” The zipped folder will still be there, but the new folder will not have the zipper symbol.

Using WinZip

IF YOU ARE USING Winzip. The downloaded zipped folder will have a different icon:

Right click on the DEPLOYMENT zipped folder.
Extract the folder to your desktop.

If you double click the DEPLOYMENT zipped file it will extract the folder to a different location.

It should open this folder. You will need to drag the DEPLOYMENT folder to your desktop.

[Image: WinZip Wizard - Select Activity [DEPLOYMENT.zip]]

Click next.
click unzip now.

Once you have an unzipped deployment folder on your desktop you can proceed with the installation.
Installing the Software

YOU NEED ADMINISTRATOR PRIVILEGES OR AN ADMINISTRATOR TO INSTALL THE SOFTWARE.

Open the “DEPLOYMENT” folder by double clicking it.

Moving the Forms Directory

The “FORMS” directory must be moved to the root of the C: drive C:\.

To do this, double click My Computer.
Now drag the folder “Forms” to the folder “Local Disk (C:)”.

This will copy the AF-CARES Forms directory to the correct place on your hard drive.

**Running Setup.exe**

Next: Double click on setup.exe.

You get an installation warning.
We do not have a publishing certificate for this program. It is in development at the Operations Research Center in the Department of Systems Engineering at West Point. The lead developer is LTC Dale Henderson. dale.l.henderson@us.army.mil.
If your local policy permits you to install it, click “install.” You need administrator privileges to install.

.NET Framework 2.0

IF YOUR COMPUTER ALREADY HAS THE .NET FRAMEWORK 2.0 INSTALLED, THE APPLICATION SHOULD INSTALL AND LAUNCH.

IF IT DOES NOT HAVE THE .NET FRAMEWORK 2.0 INSTALLED YOU WILL NEED TO INSTALL IT.

Click accept to begin the .NET installation.

You will get a progress bar as .NET downloads the required files from Microsoft. This takes some time. You have to be connected to the internet for it to work.

Once .NET is installed you will get the AF-CARES installation message.
Click install. The application will install (very quickly) and should then open.

The application start window looks like this:

Start Menu and Icons

You should also now have a START MENU ITEM for the software.
To run AF-CARES you should be able to go to Start > AF-CARES 1.0 > and select the program AF-CARES 1.0.

**Making a Desktop Shortcut:**

Right click on the AF-CARES 1.0 Program Menu item and select “CREATE SHORTCUT.”

Now there should be 2 Icons. Drag the second icon to your desktop.

You can now launch AF-CARES 1.0 from your desktop by double clicking the program icon (purple heart).
Problems and Fixes

Here are some known issues with the installation.

1) One user found that the downloaded zip folder had no subfolders in it. Winzip basically tool away all the sub folders. The best solution I can think of for that is for you to write me and I can burn you a disk and mail it to you.

2) Some users do not have local permission to install software on their computers, and their IT personnel can not get permission from their Directorate of Information Management (DOIM) to install it. I am working with our DOIM to get some kind of certificate for general installation. Until I can work that out you may have your DOIM folks contact me directly to see if they can let you install and run the software as an exception. This appears to be a matter of local policy, as many installations are allowing CACs to install and use the software.

3) Some users are not seeing the download option on their DCIPS portal. I think DCIPS has fixed this. The quick fix is to use AKO. If you can’t find the AKO site, email me.

4) The program crashes or can’t find the forms library. The forms library has to be at C:\Forms. It may be in some other place. The best fix is to drag the whole folder “Forms” to the root (C:\) as shown in the instructions.

Please be patient and provide feedback with this. This is the first cut a deploying useable – rather than test— software. We can and will improve it over time, and it will evolve very quickly into something that will provide a lot of utility.

Please contact me with your problems and bugs.

LTC Dale L. Henderson, Ph.D.
Assistant Professor and Deputy Director,
Operations Research Center
W: 845 938 5539
C: 845 238 1234
dale.henderson@usma.edu
dale.l.henderson@us.army.mil
dale.l.henderson@us.army.smil.mil
dalehenderson@mac.com
Appendix B Simplified Installation

These instructions tell you how to install the AF-CARES software from the file “AF CARES.msi”.

Installation is now a two set process:

1. Download the AF CARES.msi Microsoft installer file from the AKO Knowledge Center.

2. Double click on the file. You will be taken to the AF-CARES Setup Wizard.
Click NEXT.

You can just click NEXT on this screen to accept the defaults. The defaults will install the program to the directory shown, and make the program available for all users.

You will get a Confirm Installation screen:

Click NEXT
The installer should add an AF-CARES shortcut icon to your desktop and install the forms library in the C: directory.

The program itself is installed in C:\Program Files.

You will get an Installation Complete screen:

![Installation Complete](image)

Click Close to close out the installer.

The AF CARES 1.0 Shortcut Icon looks like this.

![Shortcut Icon](image)

Double click to run the software.
Appendix C AKO Knowledge Center

Distribution and maintenance of the software has been facilitated by the creation of a knowledge center under Army Knowledge Online (AKO). This knowledge center provides for software download, discussion, and group member management. Group membership grew rapidly to 76 members, and continues to grow.

Users obtain authorization to participate in the knowledge center by contacting the administrators, currently LTC Henderson. Users are added to the knowledge center through the group management functions of the web site. Authorized users can access the AKO Knowledge center by searching in the main AKO portal for “Armed Forces Cares Casualty Assistance Readiness Enhancement System” and then clicking through on the provided link. Depending on the individual settings for the user’s AKO account, the knowledge center will appear under their “My Workspace” tab on their personal AKO start page. Future versions of the software should continue to leverage the contact list and software distribution capability in this resource.

**4. TITLE AND SUBTITLE**
The Armed Forces Casualty Assistance Readiness Enhancement System (CARES): Design for Flexibility

**6. AUTHOR(S)**
LTC Dale L. Henderson

**7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES)**
Operations Research Center of Excellence
Dept. of Systems Engineering
USMA
646 Swift Rd.
West Point, NY 10996

**9. SPONSORING / MONITORING AGENCY NAME(S) AND ADDRESS(ES)**
COL Mary Torgersen
Director, US Army CMAOC
Human Resources Command
Washington, DC 20310-0200

**12. DISTRIBUTION / AVAILABILITY STATEMENT**
Distribution A. Approved for public release; distribution is unlimited.

**14. ABSTRACT**
This report provides details of the implementation of a forms assistance tool designed to help personnel charged with carrying out the United States Army’s Casualty Assistance mission. The need for this tool has arisen with the expansion of casualty operations in the Global War on Terror (GWOT), the growing complexity of the system of benefits provided to the surviving family members of soldiers who are killed, and the high level of emphasis placed on executing this mission with compassion and precision.

The software tool, called the Armed Forces Casualty Readiness Enhancement System (AF-CARES 1.0), provides form filling assistance and access to case data in a stand-alone application. The system uses a run time data representation of the case and an extensible markup language specification for the library of supported forms to automate the routing tasks common to every case of filling out a significant number of forms. The software automatically fills forms and provides access to the forms for viewing, printing, and editing. The software also provides a persistent save file format and case file reader for managing cases over time.

AF-CARES 1.0 has been deployed to all of the regional Casualty Assistance Centers (CACs) with 76 users participating in an Army Knowledge Online (AKO) knowledge center implemented to facilitate deployment, support, and the identification of capability gaps against an objective software assistance capability.
