AFPTEF PROJECT NO. 04-P-103
TITLE: Development of the C-17 – Main Landing Gear (MLG) Post Container

ABSTRACT

The Air Force Packaging Technology Engineering Facility (AFPTEF) was tasked with the design of a new shipping and storage container for the C-17 MLG Post in March of 2004. The new container is designed to replace the wood container that was previously used.

The main problem with the wood design was corrosion due to inadequate environmental control and protection. In addition, there were two different container configurations to accommodate a left or right post. AFPTEF applied proven container design methods to solve the corrosion problem as well as simplified the container configuration to accept either right or left posts, eliminating the need for different containers.

The CNU-677/E, designed to SAE ARP1967A, is an aluminum, long-life, controlled breathing, reusable shipping and storage container. The new container, CNU-677/E, protects the Post mechanically and environmentally. The container passed all qualification tests per ASTM D4169.

The CNU-677/E container not only meets user requirements but also provides an economic saving for the Air Force. The savings will be thousands of dollars per MLG post over the twenty-year life span of the container.

Total man-hours: 500

INTRODUCTION

BACKGROUND – The C-17 main landing gear (MLG) post is currently stored in a wood container. The container does not have environmental controls and is not sealed by the nature of its construction. These two factors allow the container to “breathe” with continuously changing environmental conditions. There is no means to control breathing or remove the excess moisture that results, which causes a corrosion problem on the post. There was no damage reported as a result of inadequate shock protection, indicating that the cradle system is adequate. The C-17 post container is one of a family of new AFPTEF container designs to protect items that are being damaged in the shipping and storage cycle. Containers were also designed for the MLG axle beams, full MLG assemblies, nose landing gear assembly, nose radome, HUD, brake assembly, and thrust reversers. Logistics and Sustainment personnel at Robins AFB contacted AFPTEF to request the design of a reusable container that would eliminate the shipping and storage risks.

REQUIREMENTS – AFPTEF and Robins AFB personnel agreed upon a list of requirements during initial design discussions. Many of these requirements were not met by the wood container. The requirements are as follows:

- Sealed/controlled-breathing container that protects against varied environmental conditions and weather during either inside or outside shipping and storage
- No loose packing material
- Post Shock/Vibration limited to 50 Gs
- Reusable and designed for long life (20 years)
- Usable with any post version (left aft, left fwd, right aft, right fwd)
- Low maintenance
- Field repairable hardware
- Forklift capabilities

DEVELOPMENT

DESIGN – The C-17 MLG post Shipping and Storage Container (CNU-677/E) design meets all the users’ requirements. The CNU-677/E is a sealed, welded aluminum, controlled breathing, reusable container. The container is engineered for the physical and environmental protection of the post during worldwide transportation and storage. The container consists of a base and completely removable cover equipped with the special features listed below. The base is a one piece skid/double walled base extrusion with forklift openings, humidity indicator, pressure equalizing valve (1.0 psi pressure/ 1.0 psi vacuum) and desiccant port for easy replacement of desiccant (controls dehumidification). A silicone rubber gasket and quick release cam-over-center latches create a water/air-tight seal at the base-cover interface. Container external dimensions are 77.8 inches length, 62.1 inches width, and 36.9 inches height. Container empty weight is 578 pounds, and 1323 pounds with the post in place.
An aluminum cradle system is integrated into the base design that rigidly mounts the post to the container base (See Appendix 2, Figures 1-2). The post is attached to the cradle system with three large silicone-lined aluminum clamps with quick release handles that make loading and unloading easy and safe. There are no detachable parts on the container other than the container lid, which eliminates FOD risks.

**PROTOTYPE** – AFPTEF fabricated one CNU-677/E prototype container in house for testing. The prototype container was fabricated in accordance with (IAW) all requirements and tolerances of the container drawing package, and had a tare weight of 578 lb. The drawing package used for prototype fabrication has been released for the manufacture of production quantities of the container. Each face of the container was uniquely identified for testing identification as shown below.

QUALIFICATION TESTING

TEST LOAD – The test load was an unserviceable MLG Post, with steel blocks welded onto each of the 3 post ends to simulate bearing housings and post design changes.

TEST PLAN – The MLG Post container was tested in accordance with the Air Force Packaging Technology & Engineering Facility (AFPTEF) standard long life container test plan (See Appendix 1).

The test plan referenced ASTM D 4169 and SAE ARP 1967. The test methods specified in this test plan constituted the procedure for performing the tests on the post container. The performance criteria for evaluation of container acceptability was specified at 50 Gs maximum and an initial and final leak rate of 0.35 kPa (0.05 psi/hr) at 6.9 kPa (1.0 psi). These tests are commonly applied to special shipping containers providing rough handling protection to sensitive items. The tests were performed at AFPTEF, AFMC LSO/LOP, 5215 Thurlow St, Wright-Patterson AFB, OH 45433-5540.

ITEM INSTRUMENTATION – The test load was instrumented with a piezoelectric triaxial accelerometer mounted as close as possible to the MLG post’s center of mass. Accelerometer positive axis orientations were as follows:

- X Axis - Directed through container Forward and Aft sides (Longitudinal motion).
- Y Axis - Directed through container Left and Right sides (Transverse motion).
- Z Axis - Directed through container Top and Bottom (Vertical motion).

See Appendix 4 for detailed accelerometer and other instrumentation information.

TEST SEQUENCES – Note: All test sequences were performed at ambient temperature and humidity, unless otherwise noted in the test procedure.

TEST SEQUENCE 1 – Leak Test

Procedure – The desiccant port cover was removed and replaced with a port cover modified for attachment of the digital manometer and vacuum/pressure pump lines. The container was closed and sealed. The pneumatic pressure leak technique was used to pressurize the container to minimum test pressure of 6.9 kPa (1.0 psi). (See Appendix 2, Figure 3)

Results – The container passed the leak test with a leak rate less than the maximum allowed rate of 0.35 kPa (0.05 psi).
**TEST SEQUENCE 2 – Vibration Test, Resonance Dwell**

Procedure – The container was rigidly attached to the vibration platform (Appendix 2, Figure 4). A sinusoidal vibration excitation was applied in the vertical direction and cyclically swept for 7.5 minutes at 2 minutes per octave to locate the resonant frequency. Input vibration from 5 to 12.5 Hz was at 0.125-inch double amplitude. Input vibration from 12.5 to 50.0 Hz was at 1.0 G (0 to peak). The peak transmissibility values during the up and down frequency sweeps were noted for use in determining the frequency search range for the resonance dwell test.

Acceleration pulses were recorded to determine the maximum accelerations sustained by the packaged item. All signals were electronically filtered using a two-pole Butterworth filter with a 600 Hz cutoff frequency.

The vibration controller swept up the frequency range until the resonant frequency was reached. The controller locked onto and tracked this frequency for the 30 minute resonance dwell test. The resonant frequency and corresponding transmissibility at 1 minute, 15 minutes and 30 minutes into the test were recorded. The test was conducted at ambient temperature.

Results – The initial resonant frequency of the container was 19.4 Hz. The controller was manually locked onto this frequency, and a manually controlled check for a change in the resonant frequency was performed every 10 minutes for the duration of the 30 minute resonance dwell test. During this period, the average transmissibility of the container and cradle/shock mount system was 1.7. This is lower than the maximum allowable transmissibility, 8, when the resonant frequency is between 15 and 25 Hz (See Appendix 3, Table 2 and frequency/transmissibility tables at the end of Appendix 3). The container met the test requirements.

**TEST SEQUENCE 3 – Loose Load Vibration, Repetitive Shock**

Procedure – A sheet of 3/4-inch plywood was bolted to the top of the vibration table, and the container was placed on the plywood. Restraints were used to prevent the container from sliding off the table. The container was allowed approximately 1/2-inch unrestricted movement in the horizontal direction from the centered position on the table (Appendix 2, Figure 5).

The table frequency was increased from 3.5 Hertz (Hz) until the container left the table surface (approximately 4.3 Hz). At one-inch double amplitude, a 1/16-inch-thick flat metal feeler could be slid freely between the table top and the container under all points of the container. Repetitive shock testing was conducted for 2 hours at ambient temperature.

Results – The loaded container was vibrated at 4.3 Hz for 2 hours. The maximum G level (vertical axis) measured during this time was 2.3. At the end of testing
there was no visible damage to the either the container or the item. The container met the test requirements.

**TEST SEQUENCE 4 – Rotational Drops**

*Procedure* – An Assurance Level I drop height of 305 mm (12 in.) was used to perform four corner and four edge drops were onto a one-inch thick steel plate. (See Appendix 2, Figures 6 & 7.)

*Results* – There was no noticeable damage to either the container or item. Although the test item shifted 1.5 mm forward during one impact (forward-right corner) it did not make contact with any interior container surfaces during testing, and no further shifting occurred during any other impacts. The some of the silicone rubber strips lining the hinged clamps did tear loose from the adhesive used; the design engineer will use a stronger adhesive to prevent this from happening in the production containers. The maximum recorded (resultant) impacts ranged from 12 Gs to 27 Gs, well below the item fragility of 50 Gs (See Appendix 3, Table 1). The container met the test requirements.

**TEST SEQUENCE 5 – Lateral Impact (Pendulum Impact)**

*Procedure* – Upon completion of test sequence 4, the container was on the test apparatus and impacted. The container impact velocity was 2.13 m/sec. Each of the four container sides was impacted once time. (See Appendix 2, Figure 8.)

*Results* – No noticeable damage occurred to the container or item. The item did not make contact with any interior container surfaces during testing. The maximum recorded (resultant) impacts ranged from 14 Gs to 27 Gs (See Appendix 3, Table 1), well below the item fragility of 50 Gs. The container met the test requirements.

**TEST SEQUENCE 6 – Leak Test**

*Procedure* – Test Sequence 1 was repeated.

*Results* – The container passed the leak test with a leak rate less than the maximum allowed rate of 0.35 kPa (0.05 psi).

**TEST CONCLUSIONS** – No damage occurred during the above testing to either the container, mounting system or test item. There was no evidence of any contact on impact between the MLG Post and the container walls or lid. All impact levels are well below the item fragility limit of 50 Gs. Therefore, the container and mounting system do provide adequate protection for the MLG Post.

**FIT & FUNCTION TESTING**

Fit and function testing was completed on site at AFPTEF with the MLG post that was supplied for prototype testing. In addition, the packaging process was also verified for all
four post configurations at the Boeing Support Systems Center (BSSC) near San Antonio, TX during the testing phase of the project.

CONCLUSIONS

No damage occurred during the above testing to the container, mounting system or test item. There was no evidence of any contact on impact between the MLG Post and the container walls or lid. All impact levels are well below the item fragility limit of 50 Gs. The CNU-677/E aluminum container was accepted by the users at BSSC. The container met all the user’s requirements. The container can protect a MLG post during worldwide transportation and storage and will save the Air Force hundreds of thousands of dollars in O&M costs.

RECOMMENDATIONS

AFPTEF recommends that new containers be procured and delivered to avoid damage to main landing gear posts, thus mitigating overall shipping risks. All wood crates for the main landing gear posts should be replaced.

### Development of the C-17 Main Landing Gear Post Container

Matthew P. Bozzuto, Project Engineer  
matt.bozzuto@wpafb.af.mil, DSN 787-7166, Comm. (937) 257-7166

Susan J. Evans, Qualification test Engineer  
susan.evans@wpafb.af.mil, DSN 787-7445, Comm. (937) 257-7445

### Abstract

The Air Force Packaging Technology Engineering Facility (AFPTEF) was tasked with the design of a new shipping and storage container for the C-17 MLG Post in March of 2004. The new container is designed to replace the wood container that was previously used. The main problem with the wood design was corrosion due to inadequate environmental control and protection. In addition, there were two different container configurations to accommodate a left or right post. AFPTEF applied proven container design methods to solve the corrosion problem as well as simplified the container configuration to accept either right or left posts, eliminating the need for different containers. The CNU-677/E, designed to SAE ARP1967A, is an aluminum, long-life, controlled breathing, reusable shipping and storage container. The new container, CNU-677/E, protects the Post mechanically and environmentally. The container passed all qualification tests per ASTM D4169. The CNU-677/E container not only meets user requirements but also provides an economic saving for the Air Force. The savings will be thousands of dollars per MLG post over the twenty-year life span of the container.

### Subject Terms

CNU-677/E, C-17 Main Landing Gear (MLG) Post Container, Aluminum Container, Reusable Container, Design, Test, Long-life
