Award Number: W81XWH-09-1-0638

TITLE: Reducing Prostate Cancer Disparities Through Behavioral and Biologic Epidemiologic Approaches

PRINCIPAL INVESTIGATOR: Bettina Drake, MPH, PhD

CONTRACTING ORGANIZATION: The Washington University
Saint Louis, MO 63130

REPORT DATE: September 2011

TYPE OF REPORT: Annual Summary

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for public release; distribution unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.
Reducing Prostate Cancer Disparities Through Behavioral and Biologic Epidemiologic Approaches

Bettina Drake, MPH, PhD

The Washington University
Saint Louis, MO 63130

Purpose: This study seeks to define the optimal dose of vitamin D supplementation in Blacks needed for future intervention efforts in the prevention of prostate cancer. Scope: Study subjects were randomized to placebo, 1000IU, 2000IU, or 4000IU of vitamin D3 per day to determine the minimum dose of vitamin D needed to achieve an optimal level. After 3 months of supplementation, plasma levels of 25(OH)D and PSA are determined and compared to baseline levels. We also assessed of 25(OH)D and PSA 6 months. The goal was to enroll 320 participants, including 100 men, into the study. A 3-phase eligibility and consent process was use. 1. Only people who were AA, English-speaking, and 30-80 years old were approached to participate in the study; 2. Basic non-clinical eligibility criteria were assessed; 3. Primary care were contacted to assess clinical eligibility. To encourage retention, a case-manager approach was implemented which included biweekly calls and monthly pill bottle exchange visits.

UP-TO-DATE FINDINGS: We consented 572 individuals and exceeded our recruitment goals with 329 participants enrolled in the study, including 107 men. Retention for the 3- and 6-month assessment was 90.54% and 89.13%, respectively. The supplementation and follow-up periods for this study have recently completed and manuscript preparation is in progress.

INTRODUCTION
For my cancer epidemiology research to flourish, the next phase of my training should include mentorship and training on the use of behavioral and biologic epidemiological methods concurrently. I seek to utilize this award to accomplish four main objectives: 1) To increase knowledge in and integrate the application of biologic and behavioral epidemiological methods in prostate cancer disparity research; 2) To increase my publication record; 3) To seek and obtain additional funding, specifically an R01, by the end of year four; 4) To strengthen skills in managing research teams and to develop relationships with colleagues who might serve as co-investigators on future projects. The main goal of the project I am proposing for this career development award is to determine the impact vitamin D has on prostate-specific antigen (PSA) levels. We will be able to assess behaviors such as adherence to vitamin supplementation, diet and well as sun exposure. The future potential of this project is great. We will be able to demonstrate in the highest risk group for prostate cancer, a tangible prevention strategy that is supported by sound epidemiology and has strong potential for dissemination.

BODY
Training Plan
Dr. Giovannucci, my mentor, has included me into his research team. In addition to guiding my research efforts, he has also been instrumental in making important connections for me within our field, allowing me to develop relationships with researchers that I otherwise would not. Currently, I am an Assistant Professor at Washington University in St. Louis; however, I maintain an active collaboration with Dr. Giovannucci and other investigators at Dana-Farber Cancer Institute and Harvard School of Public Health.

Dr. Giovannucci and I meet by phone on a regular basis to discuss methodological and analytical approaches, interpret outcomes, and outline manuscript ideas. We continue to work closely on the vitamin D supplementation project presented in this proposal. When we meet by phone we discuss the following topics: 1) Progress on manuscript and grant writing projects; 2) How my research is addressing prostate cancer disparities through biologic and behavioral approaches; 3) What is missing from my research program to address #2; 4) New research ideas. These discussions have resulted in an institutional award through the Nutrition Obesity Research Center at Washington University as well as the submission of an R03 on the prognostic effect of vitamin D on prostate cancer.

At Washington University, I meet monthly with a vitamin D work group which consists of clinicians, an epidemiologist, and basic scientists all with interest and experience in the effects of vitamin D on cancer. I have also established active collaborations with additional investigators and have collaborated on cancer disparities and vitamin D related grants and manuscripts.

The objectives of this training award include: 1) To increase knowledge in and integrate the application of biologic and behavioral epidemiological methods in prostate cancer disparity research; 2) To increase my publication record; 3) To seek and obtain additional funding, specifically an R01 by the end of year four; 4) To strengthen skills in managing research teams and to develop relationship with colleagues who might serve as co-investigators on future projects.

Objective 1: This objective is being met through the conduct and participation in the research plan outlined below. We have just begun analysis of this project and are in the manuscript preparation phase.

Objective 2: At the start of this award, I had a number of papers in progress. I have published 7 publications since the start of this award, one in the Journal of the American Medical Association. I have 3 currently under review and 3 vitamin D supplementation papers currently in progress.
Objective 3: Over the previous year, I have had numerous experiences in grant-writing and have also been successful in both federal and institutions grants. This June, I submitted an application for a Health Disparity Award through the PCRP at DOD in the summer of 2011. If funded, this project will build on the project conducted through this training award as well as related, institutionally funded research. In addition to grant-writing experience, I had the opportunity to participate as a reviewer on local foundation, NIH, and an international foundation grants. These experiences has positively impacted my approach to writing grants.

Objective 4: With my recently funded projects, I have the opportunity to hire and manage research assistants, study protocols and budgets. Through my collaborations with Dr. Giovannucci, as well as my current faculty appointment, I have established collaborations with other investigators and am currently collaborating on research projects, grant proposals and manuscripts.

Research

The research project proposed will examine differences in PSA levels associated with vitamin D intake (oral supplementation in three doses) and uptake (plasma measured 25(OH)D) among Black participants. PSA levels will be assessed, in men only (N=100), at baseline, 3-, and 6-month follow-up.

Our aims and hypotheses are as follows: Aim 1. To examine the influence of oral vitamin D supplementation on PSA levels. We will examine whether vitamin D supplementation is associated with plasma levels of PSA, and whether a threshold effect exists within this association.

Hypothesis 1.1: Higher levels of vitamin D supplementation will be associated with lower PSA levels.

Hypothesis 1.2: Vitamin D uptake (i.e. 25(OH)D levels) will be inversely associated with PSA levels.

The supplementation and follow-up periods for this study has recently completed. We are currently in the manuscript preparation phase.

This study addresses the critical areas of cancer prevention and racial disparities by defining the optimal dose of vitamin D supplementation in Black men needed for future large intervention efforts in the prevention of prostate cancer. Study subjects were randomized to placebo, 1000IU, 2000IU, or 4000IU of vitamin D3 per day to determine the minimum dose of vitamin D needed to achieve an optimal level. Supplementation occurred during the winter months, to reduce sun exposure. After 3 months of supplementation, plasma levels of 25(OH)D and PSA levels are determined and compared to baseline levels. We also assessed vitamin D and PSA levels 3 months post supplementation.

The recruitment goal was to enroll 320 participants, including 100 men, into the study. A 3-phase eligibility and consent process was used to reach this goal. 1. Only people who were AA, English-speaking, and 30-80 years old were approached to participate in the study. 2. Among these individuals, basic non-clinical eligibility criteria were assessed. 3. Primary care physicians of the remaining individuals were contacted to assess clinical eligibility. Targeted recruitment efforts focused on obtaining individuals who met the first phase eligibility criteria. Potential participants were identified at public housing sites, faith-based organizations, community organizations and through participant referrals (See Table 1). To encourage retention, a case-manager approach was implemented and research assistants made biweekly phone calls and monthly pill bottle exchange visits with participants.

Through our recruitment efforts, we approached 811, consented 572 individuals and exceeded our recruitment goals with 328 participants enrolled in the study, including 106 men (See Figure 1). During year 1, with 2.5 months of recruitment, we enrolled 46 participants. During years 2 and 3 with 6 months of recruitment each year, we enrolled 166, and 117.
participants, respectively. Retention for the 3- and 6-month assessment was 90.54% and 89.13%, respectively (See Table 2).

Our strategies and lessons learned are relevant to other researchers conducting research in a population, such as this one, that has historically been challenging to recruit and retain into clinical studies.

Data analyses have begun. The primary outcome for the parent study is to determine the impact of supplementation on plasma 25(OH)D levels at three months. The primary outcome paper was recently submitted for publication. The main outcome is that 4,000 IU/day was needed to raise plasma 25(OH)D to a level predicted to reduce cancer and cardiovascular disease risk in prospective observational studies. These results can serve as a reference for dietary guidelines in African-Americans and inform future trials in disease prevention.

For the PSA and vitamin D aim, we are examining the influence of 25(OH)D uptake on the difference between baseline, 3-month, and 6-month PSA levels as well as the difference between baseline and 6-month PSA level to assess if lack of significant change may be attributable to vitamin D supplementation. All analyses will be conducted first as intent-to-treat and include all subjects, followed by analyses of only compliers. In the primary analysis, we will utilize the randomized trial structure to assess the association between vitamin D intake and PSA change. As a secondary analysis, we are assessing the association between 25(OH)D uptake, categorized in tertiles ((below 32 ng/mL), acceptable (32 - 40 ng/mL) and optimal (40 ng/mL and over)), and PSA change.

KEY RESEARCH ACCOMPLISHMENTS
- Successful recruitment and retention of participants into the study. We met and slightly exceeded our recruitment efforts of 329 (320 proposed) participants of which 107 (100 proposed) were men. Our 3-month retention rates exceeded 90%.
- Funding from the Nutrition Obesity Research Center at Washington University School of Medicine to conduct a nested case-control study that will assess the effects of pre-treatment vitamin D and leptin levels on prostate cancer recurrence titled, “Obesity and vitamin D related effects on prostate cancer recurrence”

REPORTABLE OUTCOMES
- Assistant Professor position at Washington University School of Medicine
- An R03 submission to the Cancer Epidemiology Section of NCI
- DOD PCRP Health Disparity Award Submission
- Funding from the Nutrition Obesity Research Center at Washington University School of Medicine to conduct a nested case-control study that will assess the effects of pre-treatment vitamin D and leptin levels on prostate cancer recurrence titled, “Vitamin D related effects on prostate cancer recurrence”
CONCLUSION

The proposed study will be among the first to examine the impact of vitamin D supplementation/uptake on PSA among Blacks in a non-patient sample. As a result of our work, we will learn more about the complicated biological relations between vitamin D and PSA. Additionally, this work will make an important contribution to our understanding of the role of vitamin D as a possible pathway for racial/ethnic prostate cancer disparities. We may derive preliminary public health messages regarding the association between vitamin D and these important cancer biomarkers. Further, it provides an excellent vehicle for the development of my skills in behavioral and social science, while continuing development of my expertise in epidemiology. The types of interventions that may evolve from my research program are prostate cancer prevention interventions targeting diet (vitamin D) consumption among the most at-risk groups. With the knowledge and experience gained from this award, I will make significant contributions to the development of effective studies that focus on the interactions between biologic and behavioral factors that contribute to prostate cancer disparities and how we can address the problem through a transdisciplinary approach to reduce the cancer burden.

There are many factors associated with vitamin D and its effects on prostate cancer. My future research will begin incorporating genetic polymorphisms within the vitamin D pathway as well as additional behavioral factors such as dietary intake and sun exposure behaviors that will provide a more complete representation of the mechanisms behind vitamin D effects.

Bettina Fisher Drake, MPH, PhD

SUMMARY: My work focuses on the interactions between the social/behavioral and biological determinants of cancer disparities, an understanding of which may lead to the development of more effective disease prevention strategies. The objectives of my research program are: 1) to identify the modifiable and non-modifiable risk factors for cancer as well as the at-risk groups for these factors; 2) to utilize epidemiologic methods to understand the interactions between behavioral and biologic determinants of adverse cancer outcomes; 3) to contribute to the translation of epidemiological findings into behavioral interventions at the individual and population level.

Title: A Community-Based Participatory Approach to Improving Breast Cancer Services for African-American Women Living in St. Louis, Missouri
The long-range goal of this application is to decrease the African American and white disparity in breast cancer mortality that exists in St. Louis, Missouri. Our goal is to identify shortfalls in the breast cancer treatment of African American women living in North St. Louis that will help to explain their disproportionate rates of mortality compared to white women, with an ultimate goal of remedying these shortfalls.
