Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

FY13 report (year 1 of 5)

LONG-TERM GOALS

The long-term goal is to understand the role of waves and sea state in the Arctic Ocean, such that forecast models are improved and a robust climatology is defined.

OBJECTIVES

The objectives are to: develop a sea state climatology for the Arctic Ocean, improve wave forecasting in the presence of sea ice, improve theory of wave attenuation/scattering in the sea ice cover, apply wave–ice interactions directly in integrated arctic system models, and understand heat and mass fluxes in the air–sea–ice system.

APPROACH

The technical approach is to measure waves, winds, and turbulence in the Arctic Ocean using drifting SWIFT buoys [Thomson, 2012] and moored Acoustic Wave and Current (AWAC) sub-surface instruments. These measurements will be used to estimate the fluxes of momentum and heat between the air, sea, and ice. Results will be integrated with remote sensing products and wave models.

WORK COMPLETED

Work during this first year of the DRI has centered around writing a science plan that encompasses all elements of the program and details the collaborations across the various investigators. The science plan was published in September as a technical report [Thomson et al, 2013]. In addition to significant background material describing the state of the science and previous work, the document establishes the basics of a cruise plan for the 2015 field experiment. The associated UNOLS ship time request has been submitted, and work continues in defining all details of the cruise.

Also completed this year was the fabrication of two new SWIFT buoys that will be dedicated to the Sea State DRI. Several upgrades were made to the SWIFT design, including Iridium telemetry (now hourly), extended mission life (now three months), and improved wave sensor (combined IMU and GPS). A new SWIFT is shown in Figure 1.

Hull	Anodized aluminum
	Power	14 VDC, Alkaline or Lithium D cell packs
	Weight	30 kg in air
	Dimensions	1.25 m draft, 1.0 m mast, 0.35 m diameter
	Shipping crate	1.65 m length, 0.5 m width, 0.5 m depth
	Endurance	20 days (Alkaline), 60 days (Lithium)
	Tracking (RF)	Garmin Astro DC40 collars (10 km range)
	Tracking (Iridium)	Geoforce GT1 (global)
	Telemetry	Iridium SBD
	Processor	Sutron Xpert
	Profiler	2 MHz Nortek Aquadopp HR
	Met	Airmar PB200
	IMU	Microstrain 3DM-GX3-35
	CT	Onset HOBO U24
	Camera	serial uCAM
	Light	Yellow 1s flasher

Figure 1. Newly build SWIFT buoy and specifications.

RESULTS

The result of the first year of the DRI is the integrated Science Plan and the fabrication of new SWIFT buoys.

IMPACT/APPLICATIONS

Improved sea state predictions in the Arctic Ocean will enable safe naval operations in the region.

RELATED PROJECTS

A contract with Scitor Corp. is supporting a graduate student to analyze declassified satellite images for wave information in the Beaufort region.

Resources are data are shared with the “Marginal Ice Zone” DRI. More information is at <http://www.apl.washington.edu/project/project.php?id=miz>
