FOREWORD

The General Electric Company (Flight Propulsion Division) is proposing the GE4/J5 engine as an optimized propulsion system, tailored to the Supersonic Transport. This engine embodies further refinements in the cycle, component technologies, and system integration, relative to the GE4/J4C, proposed in January 1964. Two installation configurations are offered -- the GE4/J5C and GE4/J5H, especially adapted to the aircraft proposed by The Boeing Company and Lockheed Aircraft Corporation, respectively.

Generally, the current volumes contain only new or revised information. Material from the January 1964 Proposal is reproduced only sparingly, to provide necessary continuity, or to emphasize important considerations.

FOREWORD (Page 2)

This Data Submittal builds on the 15 January 1964 Proposal (P-64-1) as a foundation. The following current Volumes are shown with the prior Volume number(s) as a reference:

<u>Current Volume</u>	<u>Title</u>	<u>Primary January 1964 Reference</u>
I-E	Summary	Vol. I(J)
II-E(B)*		
II-E(L)*		Vol. E-II(J)
IV-E	Phase II-A Design Status Report (Evaluation by Factors)	None
IX-E		
Part I	Management	M-I, M-II
Part II	Technical	
II-A(B)*		
II-A(L)*	Engine Performance	E-IV(J)
II-B1	Engine Design -- Summary and Systems	E-V(J)
II-B2	Engine Design -- Basic Engine Components	
II-B3	Engine Design -- Power Control and Accessories	E-VI(J) Part I
II-C	Noise Levels and Suppression	E-VI(J) Part II
II-D	Installation and Inlet System Compatibility	E-VII(J)
II-E	Test and Certification	E-VIII(J)
II-F	Manufacturing Techniques and Materials	
Part III(B)*	Operations and Economics	M-III
III(L)*		
XI-E	Development Costs	M-V(J)
XII-E	Production Costs	M-V(J)
XXI-E(B)*		
XXI-E(L)*	Installation Manual	E-III(J)

NOTE: *Certain of the current volumes contain information applicable only to one of the two installation configurations. Volumes so marked (*) are therefore issued in two parts, with the suffix "B" or "L" denoting respectively, Boeing and Lockheed configurations.

GE4/J5G

SUMMARY

This report Volume IX-E (IIA) presents performance of the General Electric GE4/J5G Turbojet Engine using ASTM D1655 Jet A or A-1 type aviation kerosene fuel conforming to General Electric Company Commercial Jet Fuel Specification M50T968 (S2) dated October 20, 1960, with temperature limitations as specified in Installation Manual, Volume XXI-E. The performance is identical to that given by the Estimated Performance Card Deck, R84FPD243G, October, 1964.

Performance is presented in tabulated form over most of the engine operating range. Accurate performance can be obtained directly for many flight conditions, and simple interpolation will yield engine performance for most flight conditions within the flight envelope. Installation effects can be accounted for by applying the given correction factors.

Flight performance curves are also included to give a compact graphical presentation of engine performance.

GE4/J5G

1.1 **ENGINE DESCRIPTION**

The GE4/J5G turbojet is a lightweight, high performance, augmented engine which has been optimized for the supersonic transport mission. High cycle efficiency in the flight regime of Mach 2.5 to 2.7 has been emphasized in the design. Maximum flight speed capability is Mach 2.7 with a maximum altitude capability of 80,000 feet.

The engine performance presented herein is based on an airflow size of 475 lbs/sec at sea level static, standard conditions. This size gives a maximum take-off thrust of 41,900 lbs. Compressor pressure ratio at take-off is approximately 9.5:1.

The major components of the GE4/J5G turbojet include a variable stator compressor, an annular main combustor, an air cooled turbine, a modulated augmentor, and a convergent-divergent exhaust nozzle which incorporates a thrust reverser.

1.2 **DATA DESCRIPTION**

1.2.1 **Performance Curves**

Flight performance curves are presented on pages 2-1 through 2-8 showing engine net thrust, specific fuel consumption, and airflow as functions of engine power setting and flight Mach number for the following altitudes:

Sea Level	45,000 ft
15,000 ft	55,000 ft
25,000 ft	65,000 ft
36,089 ft	75,000 ft

The performance shown in these curves is based on U.S. Standard Atmosphere - 1962, MIL-E-5008B ram recovery, no bleed or power extraction and the proposed exhaust nozzle.

The purpose of these curves is to provide a quick indication of a reference performance level of the engine at important flight conditions. More detailed and complete performance is available in the tabulations.

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

1.2.2 Tabulated Performance Data

The engine performance data presented in the tabulations are based on U.S. Standard Atmosphere - 1962, MIL-E-5008B ram recovery, zero bleed, zero power extraction, and fuel conforming to G.E. Specification M50T968. The tabulated data include all exhaust nozzle performance effects with the exception of afterbody drag which can be determined from the data provided on boattail geometry. The data presented is based on a schedule of exhaust nozzle area and boattail angle which yields maximum uninstalled thrust and is consistent with the data obtainable from the Estimated Performance Data Deck R64FPD243G, October, 1964, with the boattail fork (BTFORK) set equal to zero, and with the rotor speed locked up at and above Mach 1.5 (MONLU = 1.5). The Data Deck also incorporates provisions for operation of the engine in the rotor unlocked mode and at different boattail angles.

1.2.3 Power Setting Definitions

Performance data are presented for twelve power settings defined as:

P. S. = 1	Maximum thrust, augmented
P. S. = 2	Partial augmentation
P. S. = 3	Partial augmentation
P. S. = 4	Minimum thrust, augmented
P. S. = 5	Maximum thrust, non augmented
P. S. = 7	95% engine RPM*
P. S. = 8	90% engine RPM*
P. S. = 9	85% engine RPM*
P. S. = 10	80% engine RPM*
P. S. = 11	75% engine RPM*
P. S. = 13.8	61% engine RPM (Idle)**
P. S. = 16	45% engine RPM (Low idle)**

*The defined speed schedule for power settings 5 through 11 is adhered to up to the flight Mach number where lockup occurs ($Mo = 1.5$). At or above the lockup Mach number, engine RPM remains constant at 100%.

**For power settings 13.8 and 16 the engine RPM can vary from the defined speed when the idle fuel limitations are used. The engine RPM is not locked or held constant.

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

1. 2. 4 Performance Tabulations

Performance tabulations are presented for nine altitudes and two ambient temperatures.

U. S. Standard, 1962	U. S. Standard, 1962, plus 40°F
Altitude: Sea Level	Sea Level
5,000 ft	5,000 ft
15,000 ft	15,000 ft
25,000 ft	25,000 ft
36,089 ft	36,089 ft
45,000 ft	45,000 ft
55,000 ft	55,000 ft
65,000 ft	65,000 ft
75,000 ft	

The tabulated engine data at each altitude are presented for both ambient temperatures as a function of:

Power Setting (PS)
Flight Mach Number (Mo)

and include correction factors for determining performance at other conditions of ram recovery, bleed extraction and power extraction.

2.2 FLIGHT WINDMILLING OPERATION

2.2.1 Performance

Flight windmilling performance data are presented on pages 2-10 through 2-12.

Windmilling performance characteristics of the engine can be varied within limits by modulation of the jet nozzle area. The jet nozzle can be positioned by the throttle.

Windmilling during supersonic flight is not permitted without deployment of the aerodynamic windmilling brake or adequate fluid cooling provisions.

Maximum available power extraction during windmilling at subsonic flight speeds is presented on page 2-14.

2.2.2 Stator Closure Mechanism

The engine is provided with means for retarding windmilling RPM (windmill brake) sufficiently to allow extended windmilling operation of the engine with recirculatory fuel cooling.

Performance characteristics of the engine with the windmill brake actuated are presented on pages 2-10, 2-11 and 2-13. No power extraction is available.

**4. CALCULATION
PROCEDURES**

CONFIDENTIAL

GE4/J5G

4. CALCULATION PROCEDURE

Calculation instructions are presented in a series of sample calculations which have been prepared to demonstrate the suggested methods for determining engine flight performance between the tabulated flight conditions and for conditions of ram recovery, bleed-air and power extraction other than that contained in the tabulation.

4.1 SAMPLE CALCULATIONS

The sample calculations are divided into two parts, which represent different situations:

- I. Desired: Engine Performance
Known: Engine Power Setting and Airplane Operating Condition
 - A. General
 - B. Interpolating Mach Number
 - C. Interpolating Altitude
 - D. Interpolating Ambient Temperature
 - E. Interpolating Engine Power Setting
 - F. Interpolating for Combinations of Mach Number, Altitude and Power Setting
 - G. Correction for Ram Recovery
 - H. Correction for Bleed-air
 - I. Correction for Power Extraction
 - J. Correction for Combination of Ram Recovery, Bleed-air and Power Extraction

- II. Desired: Engine Power Setting
Known: Thrust Required and Engine Operating Condition
 - A. General
 - Engine performance may be read directly for most tabulated flight conditions.
Linear interpolation may be used to obtain engine performance between tabulated flight conditions.
However crossplotting will yield a more precise interpolation.

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

B. Interpolating Mach Number

If an intermediate Mach number is desired, use linear interpolation.

Example:

Given:	Power Setting	(P. S. = 5. 0)
	Altitude	25, 000 feet
	Type of Day	Standard
	Mach Number	1. 4
	Ram Recovery	MIL-E-5008B (. 978)

From the tabulated performance:

Mo	FN	SFC	TE	PE	W2
1. 2	26100	1. 23	1102	111. 6	398
1. 5	31300	1. 28	1186	146. 4	520

Using linear interpolation, the performance is:

Mo	FN	SFC	TE	PE	W2
1. 4	29600	1. 26	1158	134. 8	478

Note: Linear interpolation for performance of power settings 7. 0 through 11 below Mach number equal to 1. 5. At this flight speed and above, the engine speed is constant therefore introducing a discontinuity in performance across that Mach number.

C. Interpolating Altitude

If an intermediate altitude is desired, use linear interpolation as a function of ambient pressure, P0.

Example:

Given:	Power Setting	(P. S. = 5. 0)
	Altitude	30, 000
	Type of Day	Standard
	Mach Number	1. 2
	Ram Recovery	MIL-E-5008B (. 991)

From the tabulated performance:

Alt	FN	SFC	TE	PE	W2
25000	26100	1. 23	1102	111. 6	398
36089	18300	1. 20	1041	79. 5	262

CONFIDENTIAL

GE4/J5G

From the table of atmospheric conditions for the altitudes involved:

Altitude	P0
25000	5.45
30000	4.37
36089	3.28

Interpolating linearly as a function of P0, the performance is:

Alt	FN	SFC	TE	PE	W2
30000	22200	1.22	1072	92.6	329

D. Interpolating Ambient Temperature

If an intermediate ambient temperature is desired, use linear interpolation.

Example:

Given: Power Setting (P. S. = 5.0)
Altitude 15,000 feet
To 475°R
Mach Number 0.5
Ram Recovery MIL-E-5008B (1.00)

From the tabulated performance:

To	FN	SFC	TE	PE	W2
505	21400	1.19	1073	87.0	310
465	24500	1.16	1024	94.1	336

Using linear interpolation, the performance is:

To	FN	SFC	TE	PE	W2
475	23700	1.17	1036	92.3	329

Note: Linear interpolation can only be utilized providing that neither of the tabulated points is at the compressor corrected speed limit:

$$(\%RPM \times \sqrt{\frac{519}{T_2}} \leq 105.)$$

CONFIDENTIAL

GE4/J5G

E. Interpolating Engine Power Setting

If an intermediate engine power setting is desired, cross-plot to determine the required performance. Crossplotting can only be done between power settings 7.9 to 5 and 8 to 11. Example:

Given:	Power Setting	80% RPM (P. S. = 10.0)
	Altitude	25,000 feet
	Type of Day	Standard
	Mach Number	0.9
	Ram Recovery	MIL-E-5008B (1.00)

From the tabulated performance:

P. S.	%RPM	FN	SFC	TE	PE	W2
8.0	90	10900	1.08	953	66.7	275
9.0	85	6930	1.13	898	54.2	241
11.0	75	20	132	779	30.9	168

Plotting all parameters versus %RPM, the performance is:

P. S.	%RPM	FN	SFC	TE	PE	W2
10.0	80	3460	1.39	840	42.4	205

Performance may be obtained by linear interpolation versus %RPM if less accurate data are adequate.

F. Interpolating for Combination of Mach Number, Altitude, Engine Power Setting and Ambient Temperature

If the desired engine operating conditions are such that all of the above interpolations are required, it is possible to accomplish these interpolations in any order. This procedure is easiest and quickest if the large number of the required interpolations be done linearly. Therefore, it is recommended that the interpolations be accomplished in the following order:

- 1) Intermediate Mach Number - Linear
- 2) Intermediate Altitude - Linear Function of P0
- 3) Intermediate Ambient Temperature - Linear Function of T0
- 4) Intermediate Power Setting - Crossplot

CONFIDENTIAL

GE4/J5G

G. Correction for Ram Recovery

If ram recovery is other than MIL-E-5008B, read P2 and T2 for the tabulated condition:

$$P2 = (\text{Tabulated P2}) \times \frac{\text{Ram Recovery}}{\text{Ram Recovery MIL-E-5008B}}$$

Verify that this point falls within the engine operating limits as described by the P2-T2 envelope. To determine the percentage change in each parameter, multiply its correction factor (line "RAM" of the tabulation) by the difference in ram recovery (desired ram recovery minus MIL-E-5008B ram recovery).

Example:

Given:	Power Setting	(P. S. = 5.0)
	Altitude	25000 feet
	Type of Day	Standard
	Mach Number	1.5
	Ram Recovery	0.951

From the tabulated performance:

NR	P2	T2	FN	SFC	TE	PE	W2
.971	19.44	623	31300	1.28	1186	146.0	520
		RAM	1.29	-.28	.00	1.03	1.03

$P2 = (19.44) (.951/.971) = 19.05 \text{ psia}$

The point falls within the P2-T2 engine operating limit envelope.

The difference in ram recovery is:

$$\Delta NR = NR - NR_{MIL-E-5008B} = 0.951 - 0.971 = -.02$$

The percentage change in net thrust is:

$$(1.29) (-.02) = -.0258 \text{ or } -2.58\%$$

The percentage change in each parameter is:

% Change	FN	SFC	TE	P2	W2
	-2.58	0.56		-2.06	-2.06

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

Net thrust corrected for ram recovery is:

$$FN = 31300 (0.9742) = 30500 \text{ lbs.}$$

All parameters corrected for ram recovery:

FN	SFC	TE	PE	W2
30500	1.29	1186	143.0	509

If a number of interpolations are to be made to obtain engine performance and ram recovery is to be different than MIL-5008B, the ram recovery correction should be applied before interpolating. If this is not done, the ram recovery correction factors for the required flight conditions will also have to be determined by interpolation.

H. Correction for Bleed

To determine the percentage change in each parameter, multiply its correction factor (line "BLEED" of the tabulation) by WB/W2.

Example:

Given:	Power Setting	(P. S. = 5, 0)
	Altitude	25, 000 feet
	Type of Day	Standard
	Mach Number	1.2
	Ram Recovery	MIL-E-5008B (.991)
	WB/W2	0.02

From the tabulated performance:

NR	P2	T2	FN	SFC	TE	PE	W2
.991	13.12	554	26100	1.23	1102	111.6	398
	BLEED	-1.88		1.35	-0.25	-0.89	0.09

The percentage change in net thrust is:

$$(-1.88) (0.02) = -0.0376 \text{ or } -3.76\%$$

The percentage change in each parameter is:

% Change	FN	SFC	TE	PE	W2
	-3.76	2.70	-0.50	-1.78	0.18

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

Net thrust corrected for bleed is:

$$FN = 26100 (.9624) = 25100 \text{ lbs.}$$

All parameters corrected for bleed:

FN	SFC	TE	PE	W2
25100	1.26	1096	109.6	397

$$\text{Calculate } WB = (WB/W2) (W2) = 0.02 (397) = 7.94 \text{ lbs/sec.}$$

Calculate $WB \sqrt{TE/PE}$ using parameters corrected for bleed:

$$WB \sqrt{TE/PE} = 7.94 \sqrt{1096/109.6} = 2.40$$

From the bleed port pressure ratio curve, read PTB/PE = 0.94 for 4 bleed ports or 0.752 for 2 bleed ports.

$$PTB_{2 \text{ ports}} = (PTB/PE) (PE) = 0.752 (109.6) = 82.4 \text{ lbs/sq. in.}$$

$$PTB_{4 \text{ ports}} = (PTB/PE) (PE) - (0.94) (109.6) = 103 \text{ lbs/sq. in.}$$

If a number of interpolations are to be made to obtain engine performance and ram recovery is to be different than MIL-E-5008B, the ram recovery should be applied before interpolating. If this is not done, the ram recovery correction factors for the required flight conditions will also have to be determined by interpolation.

I. Correction for Power Extraction

To determine the percentage change in each parameter, multiply its correction (line "POWER" of the tabulation) by $HP \times 10^{-5}$.

CONFIDENTIAL

GE4/J5G

Example:

Given:	Power Setting	(P. S. = 5.0)
	Altitude	25,000 feet
	Type of Day	Standard
	Mach Number	1.2
	Ram Recovery	MIL-E-5008B (.991)
	HP	400
	WB/W2	

From the tabulated performance:

NR	P2	T2	FN	SFC	TE	PE	W2
.991	13.12	554	26100	1.23	1102	111.6	398
			POWER	-0.31	0.78	0.02	0.08
							-0.01

The percentage change in net thrust is:

$$(-0.31) (400 \times 10^{-5}) = -.00124 \text{ or } -0.124\%$$

The percentage change in each parameter is:

% Change	FN	SFC	TE	PE	W2
	-0.124	0.312	0.008	0.032	-0.004

Net thrust corrected for power extraction is:

$$FN = 26100 (.99876) = 26100 \text{ lbs.}$$

All parameters corrected for power extraction:

FN	SFC	TE	PE	W2
26100	1.23	1102	111.6	398

If a number of interpolations are to be made to obtain engine performance, and ram recovery is to be different than MIL-E-5008B, the ram recovery correction should be applied before interpolating. If this is not done, the ram recovery correction factors for the required flight conditions will also have to be determined by interpolation.

CONFIDENTIAL

GE4/J5G

J. Correction for Combination of Ram Recovery, Bleed and Power Extraction

If all the possible corrections are to be made to engine performance determined from the tabulation, the calculation may be simplified by:

1. Calculate $\Delta\eta_{\gamma}$.
2. Verify that the specified bleed and/or power extraction limits are not exceeded.
3. Read correction factors for all parameters.

	FN	SFC	TE	PE	W2
RAM					
BLEED					
POWER					

4. Multiply RAM correction factors by $\Delta\eta_{\gamma}$.
5. Multiply BLEED correction factors by WB/W2.
6. Multiply POWER correction factors by HP $\times 10^{-5}$.
7. For each parameter, algebraically add the correction factors together to determine the total percentage change due to ram recovery, bleed and power extraction.
8. Correct each parameter.

$$F_N \text{ (corrected)} = F_N (1 + \text{total \% change}), \text{ etc.}$$

4.2 Calculation Aids and Engine Limits

In addition to the performance presentation of the GE4/J5G turbojet engine, certain calculation aids and engine limits are included to assist in the estimation of performance at flight conditions not tabulated.

CONFIDENTIAL

GE4/J5G

4.2.1 Ram Recovery

The flight performance curves and tabulations in this report are represented for MIL-E-5008B ram recovery.

1.35.

NR = 1.00-.075 (Mo-1)

4.2.2 Engine Operating Envelope

The envelope of engine operating capability is represented in both standard day altitude - Mach number form and P2-T2 form including augmentor operating limits. For design limits, refer to the P2-T2 envelope. Data are contained on pages 5-1 and 5-2.

4.2.3 Rotor Speed Schedule

Scheduled maximum percent rotor speed versus compressor inlet total temperature is included in Section 5.

4.2.4 Power Setting - Speed Schedule

A curve of percent rotor speed versus engine power setting is included in Section 3 for operation below the lockup Mach number (Mo = 1.5). Above the lockup Mach number, rotor speed is held constant at 100% for all power settings.

The Mach number at which rotor lockup occurs is a variable that can be changed at the customer's option. The capability of generating performance at various lockup Mach numbers (MONLU) is supplied in the estimated performance data deck with complete details of operation in the data deck instructions. The bulletin performance is produced with a lockup Mach number of 1.5.

During all operation, the self-cooling capability of the engine must be observed.

4.2.5 Bleed Port Pressure

Pressure ratio (PTB/PE) across the air bleed port versus corrected bleed flow is defined on page 4-13 for either 2 port or 4 port operation.

4.2.6 Primary Exhaust Nozzle Area Schedule

The primary exhaust nozzle throat area schedule versus engine power setting is provided for operation at power settings greater than 5. in Section 5.

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

4.2.7 Turbine Exhaust Temperature Schedule

The turbine exhaust temperature versus compressor inlet total temperature is provided for operation at power settings less than 6 in Section 5. (page 5-5).

4.2.8 Reheat Fuel Schedule

The reheat fuel versus compressor discharge static pressure is provided for operation at power settings less than 5 in section 5. (page 5-6).

4.2.9 Exhaust Nozzle Secondary Flow

Corrected secondary nozzle airflow ($W_s/W_2(\sqrt{T_s/T_0})$) versus nozzle pressure ratio (P_8/P_0) is defined on page 4-16 for both augmented and non-augmented operation. The ram drag of this secondary flow is included in the nozzle performance.

4.2.10 Exhaust Nozzle

Bulletin performance is calculated utilizing a specific nozzle switch-over schedule and is denoted by BTANG being printed for each point.

To allow for variations in the calculation of boattail drag, the customer may optimize the nozzle switchover for a particular airframe and flight placard by utilization of a special feature built into the estimated performance data deck. Complete instructions for the generation of performance at desired boattail angles is included in the instructions on the estimated performance data deck operation. Exhaust areas (A9) and boattail angles (BTANG) are as follows:

Exhaust Nozzle Area vs Boattail Angle

<u>Boattail Angle</u>	<u>A₉ Area-in.²</u>
16°	1368
13°	1690
4°	2630
0°	3200

4.2.11 Exhaust Nozzle Data for Noise Calculations

CONFIDENTIAL

CONFIDENTIAL

GE4/J5G

To more accurately predict the perceived noise level of the engine, exhaust nozzle thermodynamics conditions are provided for the normal operating mode of the engine. Tabulated exhaust nozzle data at several flight conditions are contained on page 4-14. Secondary airflow pumping characteristics of the exhaust nozzle at low altitudes and flight speed are contained on page 4-15.

4.2.12 Subsonic Low Power Performance

Engine has a design feature for reducing the cooling air to the turbine at low power subsonic flight conditions. Tabulated performance data and curves include this effect. Figure 4-17 shows the flight conditions at which the cooling airflow is reduced by fail-safe two position valves.

4.2.13 Error Return Indicator (ERI) Definition

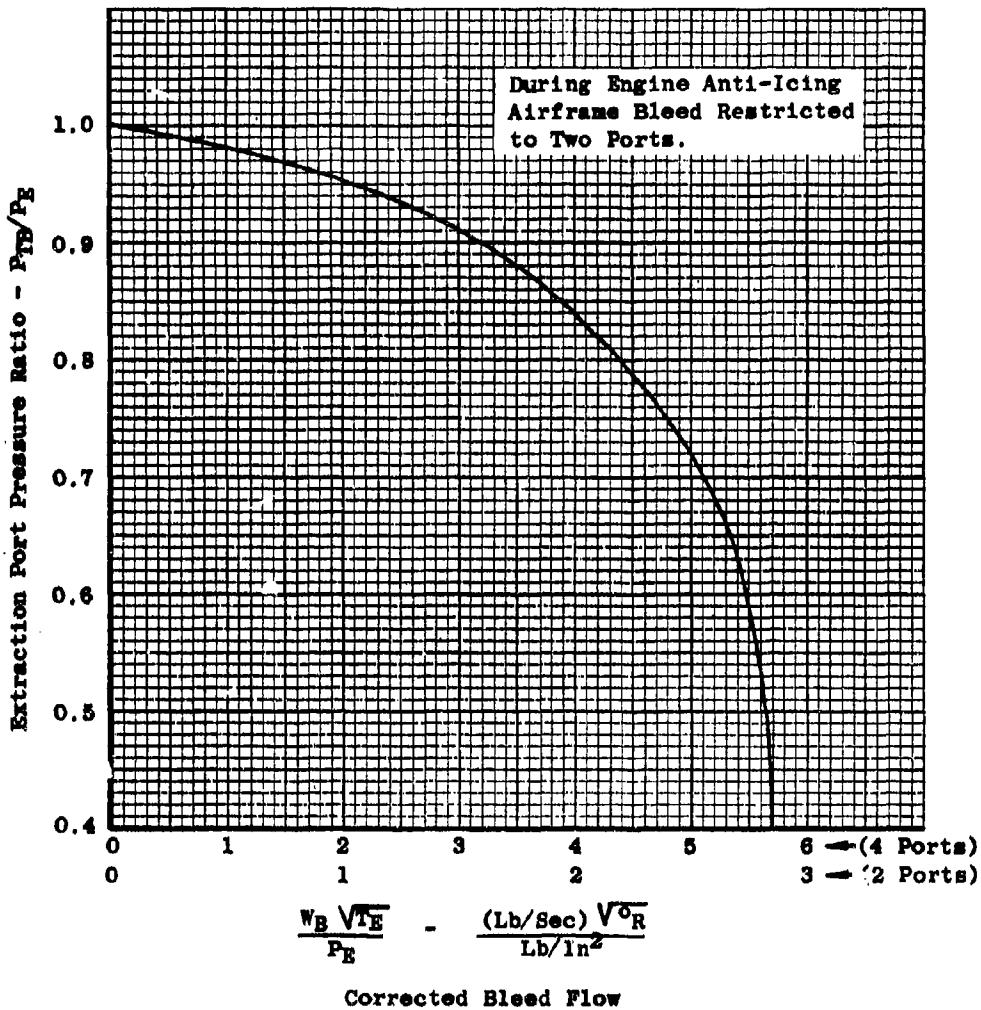

<u>ERI No.</u>	<u>Definition of Limits for Tabulated Data</u>
0	No limit exceeded.
100	Rotor speed reduced to observe corrected speed limit or change in idle RPM, no limit exceeded.
1	Fuel flow reduced to observe nozzle area limit. Maximum exhaust gas temperature limit or power setting reset to 5 if minimum reheat fuel is not achieved. No limit exceeded.
19	Augmentor pressure less than design operation limit. (Para. 4.2.2.)
