## **REPRODUCTION QUALITY NOTICE**

**This document is the best quality available. The copy furnished to DTIC contained pages that may have the following quality problems:**

- **Pages smaller or larger than normal.**
- **Pages with background color or light colored printing.**
- **Pages with small type or poor printing; and or**
- **Pages with continuous tone material or color photographs.**

**Due to various output media available these conditions may or may not cause poor legibility in the microfiche or hardcopy output you receive.**

**If this block is checked, the copy furnished to DTIC contained pages with color printing, that when reproduced in Black and White, may change detail of the original copy.**

#### ABSTRACT

A general approach is documented as a guide to aid in the formulation and implementation of on-line, real time computer simulations. A computer program MULNUC1, is developed as an on-line, real time computer simulation of antisubmarine warfare in a multiple burst nuclear environment. The principals of the game are a submarine armed with torpedoes, and two destroyers equipped with stand-off antisubmarine weapons. The simulation is intended as a demonstration of the on-line capabilities of the United States Naval Postgraduate School computer system and as a tool for further study of the factors involved in a representative ASW operational environment.

## 1. INTRODUCTION

Simulation is a useful tool of the operations analyst. This is not a new concept, the first recorded simulations were conducted by the Chinese in the form of "war chess" and were probably used to teach young men some of the concepts of battle without the inherent danger of loss of life. Later accounts of simulations have been recorded by the Prussians, French and Germans [7].

This technique of analyzing a problem by simulation is now employed by all branches of the scientific community. The present day high speed digital computer has given rise to a rapid expansion in the use of simulation as a method of solution to military, scientific, management and many other types of problems.

Convincing the reader or observer that a simulation "models the real world" is one of the primary problems confronting the analyst who uses simulation techniques in the solution of a problem. One way to minimize this doubt is to increase the role of the human in the simulation. This can, in many cases, be done by the techniques of on-line simulation. While on the one hand, on-line simulation increases the complexity of the problem by nature of the man machine interface, at the same time, on-line simulation adds very complex logic (the man) to the problem with minimal effort on the part of the designer.

The design of a simulation, and in particular an on-line simulation, can appear to be a formidable task when first considered. However, if the designer has an approach in mind and proceeds in an organized manner, the problem usually divides into small parts that are each relatively simple. It is the aim of this thesis to take a representative

problem and develop a computer simulation that can be used as a reference for the construction of on-line, real time, computer simulations in general.

## 2. FORMULATION OF ON-LINE SIMULATIONS

In the formulation of on-line simulations the designer must first lay down a good foundation in the form of a well-planned outline. This outline must begin by initializing and setting the scene for the simulation. When this has been accomplished the designer must turn his attention to the development of a loop that will include all the actions and interactions expected to occur in the simulation. Included as an integral part of this loop is a timing mechanism that is flexible enough to allow the simulation to proceed at any rate required. A third part of the formulation is concerned with providing a critique of the simulation, either as a running critique or a compilation of pertinent facts at the end of the simulation.

### INITIALIZING

Initializing is the term applied to that portion of the simulation which is executed before "play" begins. It includes data input, assignment of particular values to the parameters and entering starting values required for indexing the logic. Herein is provided the flexibility required of any useful simulation. In the initializing portion the ground work must be formed for performing sensitivity analysis if such analysis is required. The initializing portion of the simulation must allow enough flexibility to provide for the various scenarios possible in the particular simulation. Clearly then, the initializing portion must be designed with these purposes as primary criteria and subject to boundary conditions, such as equipment capabilities.

## AN ITERATIVE LOOP

In general, many on-line simulations contain an iterative loop that is cycled for each time period. Therefore, one of the first considerations to be made in this phase of the design is the determination of the stepping interval. Several factors are involved in this selection, the most important being the assurance that the stepping interval is compatible with the logic flow of the situation being simulated. The designer must then consider the amount of time required to accomplish the most complicated simulation situation that can occur in one cycle. These considerations complete, the simulator must insure that the cycling is such that the player is not bored with the data/action as presented and also that this data/action is not presented at a rate too rapid for the player to fully comprehend. With these considerations in mind, a tentative looping cycle can be constructed and the designer may continue to develop the necessary routines required to complete the iterative loop.

The loop should now be fashioned in its most elementary form. The designer must consider several tasks that must be accomplished during each cycle. These include, for example, advancing all participants one time cycle, consideration of the possible interactions that can occur due to these moves, tabulation of the results of such interactions, presentation of output to the player, permitting the player to communicate with the simulation, delaying the next cycle until the proper time interval has transpired, and possible other considerations dependent upon the particular simulation.

Care and planning must be exercised in the construction of this loop since this is the foundation upon which the designer is to build his simulation. If logical errors appear in the order of these routines or

a component is not considered in this loop, the remaining portion of the design will be difficult, if not impossible. Planning in this portion of the development will be time well spent.

#### THE CRITIQUE

The critique is that portion of the simulation in which the entire simulation, or any integral part, is analyzed and the results compiled in condensed form. There are several basic techniques that may be explored in this part of the simulation. The least complex of which is, in most cases, a complete "recording" of the game that can be "replayed" at a later time at any speed desired. A more complex approach to the problem of performing a critique of a simulation is that of including a recording/analyzing routine in the iterative loop. This routine would extract the desired information during each cycle of the loop. It is apparent that not every cycle need be recorded, and therefore, a decision logic must be included that will extract all necessary information. Associated with this technique must be a recording routine that can be queried at intervals or at the conclusion of the simulation.

Much care must be exercised in formulating the design and location of the critique routine since this is the major mode of analysis available to the analyst. Flexibility and adaptability are considerations that must be made to allow the simulation to be fully appreciated as an analytical tool and not just a "parlor game."

### 3. PROGRAM MODULARIZATION

In general, programmers attempt to modularize their programs. There are several reasons for this, the most obvious being that of providing logical grouping of ideas. The large scale simulation is usually modularized by the use of subroutines. This use of subroutines is convenient because:

- a. Several separate groups may be working on various sections of the problem, and in many instances the use of subroutines is the best technique.
- b. Computations which are to be called upon several times in the main program are best handled by the use of subroutines.
- c. The program may be of a magnitude such that the entire program cannot be compiled in one pass.

These reasons are valid for the large scale simulation. In simulations which are moderate to small in size the use of subroutines may add unnecessary factors to be considered, with the exception of reason (b) above which is a valid reason for the use of subroutines in most computer applications.

By careful construction of the statement numbering scheme, available in languages such as FORTRAN, the programmer of the moderate to small size simulation can modularize his program without the additional consideration of designating common storage and the other difficulties experienced when programming subroutines.

#### ADVANTAGES

The above technique allows the designer to use the familiar computer languages, such as FORTRAN, in place of special simulation languages.

It also alleviates the requirement of either providing the reader with a description of a special language or causing him to go to another source to interpret the program. Using a "standard" language, such as FORTRAN, the designer can reasonably assume that the reader needs little or no explanation.

#### FLEXIBILITY

The use of modularization with statement numbers gives all the inherent flexibility observed in the special languages when the simulation is of such a magnitude as to allow compilation in one pass. When simulations are in the design and programming stages, the use of the above technique can allow as much flexibility as the simulation requires. Exit from the blocks when programming in FORTRAN can be accomplished at any logical point with nothing more than a simple GO TO or COMPUTED GO TO statement, and thus the logic flow is easily accomplished by this method.

#### 4. SYSTEM VARIABLES, COORDINATES AND NOTATION

Certain special simulation languages provide for dynamic allocation of storage for tables which facilitates the designation of data in a flexible and expandable form. This is not necessarily required by the moderate size simulation. The designer of these moderate size simulations may find the techniques as explained below more desirable, since his problem is not generally one of storage limitations. The criterion for the dynamic versus preset storage decision is felt to be that of program size. In programming the moderate size simulation the programmer may find that constructing a schema for naming variables may create easier to work with variables than the complex tabular form of the special simulation language. This was found to be true in the programming of the example simulation, MULNUC1, of this thesis.

The general approach to the naming of variables in the example program was that of using vectors to represent a given parameter, each component of the vector being representative of the value of that parameter with respect to the unit concerned. An example, that of the X-coordinate of the  $i^{\text{th}}$  destroyer, being DDX(I). Once the schema is understood the programming moves along without a great amount of thought required by the programmer as far as variable names are concerned. Certain variables must be set aside as dummy or temporary and these logically take on forms such as: ITEMP, TEMP3, DUMMY(I), and forms that immediately classify them in this category.

In general, several different coordinate systems are required in simulations. In the war game an overall "area of play" must be established. This can be either rectangular or polar, two or three dimensional. The

axes of the rectangular coordinate system are not necessarily graduated in the same units. In the example program, for instance, it will be seen that the third axis (depth) is dimensioned in feet, while the two major axes are dimensioned in yards. Further, the third axis has the normally negative direction established as positive. These, perhaps unorthodox, measures are taken to facilitate programming; however, they must be spelled out in the documentation of the simulation to prevent possible misunderstanding.

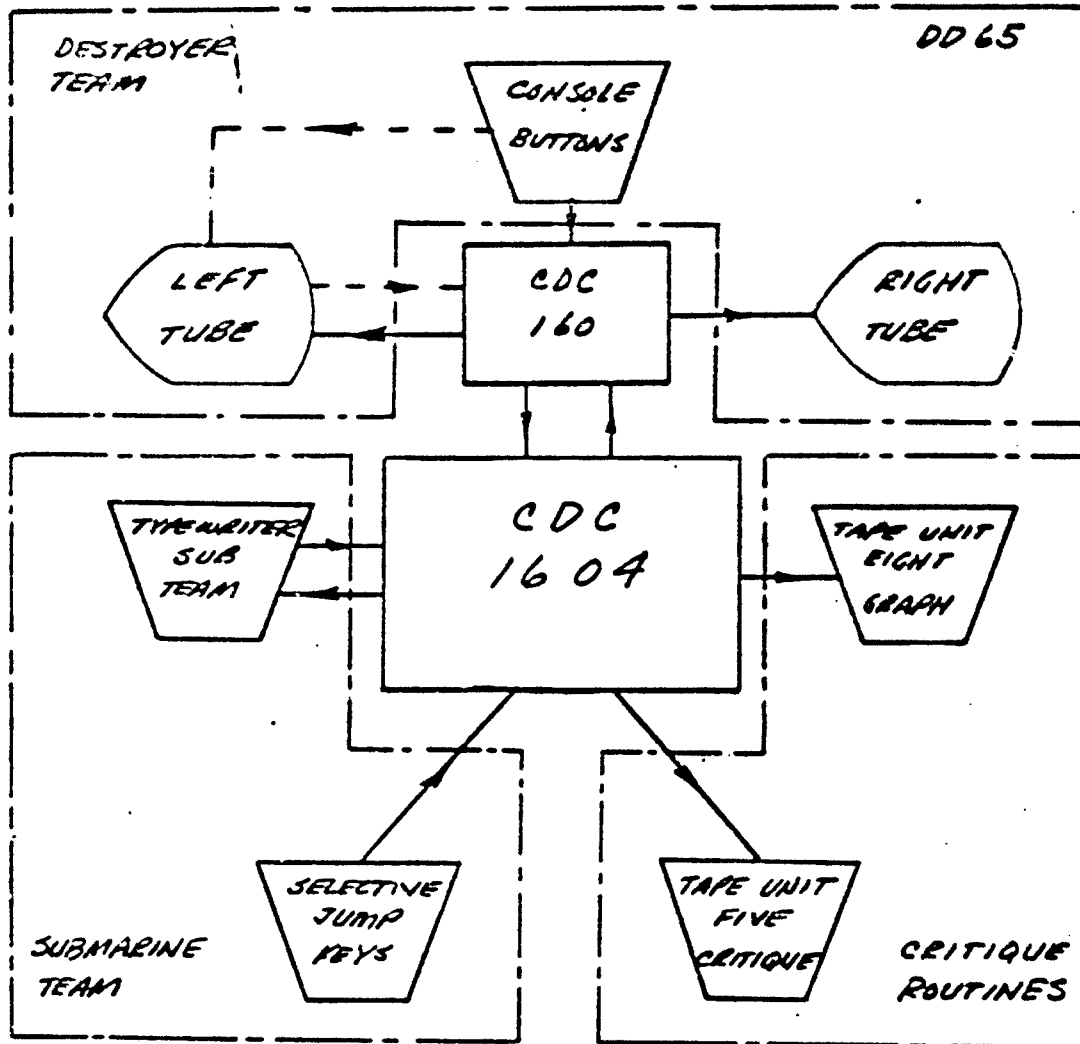

Many simulations require more than one coordinate system to be employed. The overall play is perhaps in a rectangular coordinate system, while range and bearing information may be required during the play of the game. This will necessitate the incorporation of an overlay of one, or perhaps several, polar coordinate systems upon the base system. If a "close-up" view is required during the play a translation and/or expansion to another rectangular system may be required. It can now be seen that, in general, several coordinate systems will be used in a war game type of simulation. Therefore, a plan for the designation of these various coordinate systems and their respective transformations must be established early in the formulation of a simulation.

## 5. MULNUC1 - AN EXAMPLE

MULNUC1 is an on-line, real time simulation used as an example of the application of ideas presented in sections one through four. The simulation had its beginning at the Naval Radiological Defense Laboratory, Hunters Point, in the summer of 1965. During a six-week tour of the Naval Radiological Defense Laboratory, it was found that little had been done in the exploration of tactics and possible reactions of surface antisubmarine destroyers exposed to a self-inflicted multiple burst nuclear environment. At this time the simulation used as an example in this thesis had its beginning. In the example program, MULNUC1, all classified input parameters have been assigned fictitious values so that the computer program, as presented in this thesis, could remain unclassified.

In 1965, Lieutenant J. E. Johnson programmed the on-line display, Display Data Corporation model DD 65, using a rather simple simulation situation [2]. He did make a contribution in the form of an advancement in the techniques of on-line programming of simulations. Having observed a demonstration of Johnson's program, it was felt that the technique of on-line display would be ideal for the envisioned program, MULNUC1.

Several links were missing in the chain necessary to put the envisioned program on-line. The first link was a requirement for a routine to generate circles of arbitrary size and location. This was accomplished with subroutine CIRCLE (see Appendix III). After completing subroutine CIRCLE, attention was turned to the necessity for a random number generator capable of generating several types of random variables. The distributions of random variables required were uniform, normal, and circular normal. These generators were written in the form of subroutines

—→— actual communication link

- - -→ - - apparent communications

FIGURE 1

UNIFORM, NORMAL, and ERROR. The subroutine RANVAR is the basic random number generator called by these subroutines in the generation of their respective random variables. The above routines completed, only the communication routines required to link the Control Data Corporation 1604 and 160 computers remained. This requirement was satisfied by subroutines DCIRCLE, DTRACK, PARAMS and DSTATUS (see Appendix III and Acknowledgements).

At this point the preliminary work was complete and the formulation of the initializing, iterative loop, and critique portions of the simulation was begun. These three basic steps, as discussed in section two, were incorporated into an executive control block.

#### EXECUTIVE CONTROL

The Executive Control routine is flow charted in Appendix II and consists of three major parts. The first of these parts is the initializing portion. It is made up of four blocks:

1. Inputs
2. Set Constants
3. Initialize
4. Enter Input Changes

In this subsection we shall consider the first three, leaving the latter for discussion in the subsection titled Man Machine Interface.

The Inputs block is the one in which "standard" or nominal input parameters are set. These parameters are listed below.

Number of Destroyers

Time Factor

Destroyer and Submarine Maximum Speed

Submarine Hull Parameters

**Initial Positions**

**Initial Courses and Speeds**

**Nominal Yield of Nuclear Weapons**

**Depth of Thermocline**

**Maximum Range of Weapons**

**Detonation Parameters for Weapons**

**Random Number Generator Initializer**

Any of these parameters may be changed in the enter input changes block (see Man Machine Interface subsection). These parameters were chosen as the minimal requirements necessary to produce a simulation that has some realism and yet is not too complex. The structure of this program is such that any block can be expanded to include more parameters, thereby creating a more realistic simulation.

Set Constants in a block used, as the name implies, to initialize non-changeable inputs. In this block, all the logic indicators are set to orient the game. All damage and radiation levels are set at zero. The indices for tracking, firing, and sonar contact are set at zero. This is easily followed by cross referencing Appendices I and IV.

The Initializing block begins by initializing the random number generator subroutine and then calculates the following parameters:

**Water Temperature Gradient**

**Submarine Crush Depth**

**Operational Depth of Submarine**

**Wind Direction and Velocity**

**Minimum Safe Range of Weapons [6]**

**Effective Sonar Range**

**Sea State**

These calculations are straight forward and can easily be followed by cross referencing Appendices I and IV. The block also presents input parameters of interest to the destroyer team, submarine team (if selected), and critique routine.

Subsurface nuclear bursts are divided into four classifications:

1. Very Shallow
2. Shallow
3. Deep
4. Very Deep [4]

The criteria for selection of classification are depth of burst and yield. The determination of classification of burst is made at this point in the program and an index IDEEP is set (see Appendix I). The four matrices of output data are filled with negative zero, since negative zero is programmed not to print on the display. Finally, if the role of the submarine is to be played by the computer, the basic strategy of the submarine is randomly determined (see Submarine Logic Model).

The next major part of the Executive Control Routine is the iterative loop. It is made up of eight blocks:

1. Plot Positions
2. Display Data
3. Plot Generator
4. Interactions
5. Radiation Model
6. Enter Changes
7. Submarine Logic Model
8. Time Loop

The first three of these will be considered now, while the remaining blocks will be explained in later subsections.

The Plot Positions block is utilized to transmit output information to the left tube of the DD 65 (see Figure 2). This output information consists of the following data:

- Destroyer Tracks
- Sonar Contact Plots
- Destroyer Courses, Speeds and Coordinates
- Orientation and Size of Area Displayed
- Important Messages to the Player

This information presentation is covered in more detail in the section on Man Machine Interface.

The Display Data block performs the same function with respect to the right tube of the DD 65 (see Figure 3). Figure 3 lists the data displayed by this block and for this reason it will not be listed at this point.

The final major part of the Executive Control Routine to be considered at this time is the Critique block. This block critiques the simulation by performing several tasks. The entire simulation is recorded on magnetic tape and can be reviewed at a later time. If any significant action or interaction occurs game time and the nature of the action/interaction are recorded by the Critique I block. A narrative print out is made at the conclusion of the simulation by the Critique II block. To correlate this information a graph plot of the tracks of destroyers, submarines, and all pools and clouds of radiation is made. Detail of these operations is documented in Appendix IV.

#### FLOT GENERATOR

The Plot Generator block advances all participants each time step (see Appendix II). The block then determines if there are any clouds or pools of radiation. If there are clouds, they are advanced using wind

velocity and direction to determine motion, and the radius is computed [1]. Pools are considered to be stationary since their drift is negligible.

#### INTERACTIONS

Interaction is the largest block and for clarity has been broken into sub-blocks. These sub-blocks are:

1. Sonar Contact Model
2. Contact Tracking Model
3. Weapon Firing Model
4. Evaluation Model

The interactions block is constructed in the form of a loop that considers the interactions of each unit in succession. The organization is well documented in Appendices II and IV and will not be further explored at this time, however, the details of the four sub-blocks listed will be considered below.

#### SONAR CONTACT MODEL

The Sonar Contact Model uses a ray path theory detection scheme in a deterministic manner [3]. This deterministic detection range then has a variance superimposed upon it. The net result is a fairly realistic sonar detection model. The major limitation of this model is that it only handles the constant temperature gradient case. The inclusion of other gradients causes the sonar detection problem to assume a much more complex nature. Included in the model is a degradation of sonar range due to excessive destroyer speed. The range and bearing given as outputs from this model have range and bearing errors included. The data, with these errors, is then utilized by the tracking and firing models. Doppler is also calculated in the model and sent to the display as:

1. Up Doppler
2. Down Doppler
3. No Doppler

#### CONTACT TRACKING MODEL

The Contact Tracking Model uses as input data the output of the Sonar Contact Model. A simple criteria, requiring three consecutive marks from the sonar model, is used to distinguish non-contacts from contacts. Once three consecutive marks are received, the model determines the contact course and speed. This is done with a simple no parameter track model that considers at least three but no more than five marks. The course and speed of the contact are determined from the first and last of these marks. This track model is unsophisticated but the error induced in the output is fairly realistic. This model is of the first that should be improved upon if more work is to be done on this simulation. The output of this model is in the form of contact course and speed. This model provides dual routing, dependent upon the track. This will be discussed further in the subsection on Block Sequencing. Determination of whether or not the target is in firing range is made just before exiting the routine.

#### WEAPON FIRING MODEL

The Weapon Firing Model takes the last position of the contact from the Sonar Model, the contact course and speed from the Tracking Model, and then determines a firing solution. The range is considered, with time of flight and sink time, and the time of burst is determined. A dead reckoning position of the target is computed from the track data and this position becomes the aim point of the weapon. The model then

calls subroutine **ERROR** from which the true fall of shot is determined. The weapon is given a reliability check in the model and if this test is failed, the player will be notified that the weapon has misfired (see Man Machine Interface subsection).

#### EVALUATION MODEL

The evaluation model initializes the pool and cloud of radiation created by the subsurface nuclear burst. To accomplish this the model takes data from the firing model for the location of ground zero and data from the inputs block for yield, depth of burst, and type of burst. The radius of the radioactive pool is then determined [4] (the cloud parameters are computed in the plot generator model).

A simple criteria for damage to the submarine is used. The lethal range is determined using submarine hull parameters, yield of warhead, and submarine depth as received from the submarine logic model. Slant range to the burst from the submarine is computed. If the submarine is within the lethal range, damage is 100%. If the submarine is outside a radius equal to twice the lethal range, damage is zero. Values of submarine damage between zero and 100% are computed by a linear relationship, then, if at any time the submarine's total damage reaches the 75% level, the game is terminated with the submarine considered as having been sunk.

#### RADIATION MODEL

The Radiation Model determines if any weapons have been detonated. If none have been detonated, the block is bypassed and the program continues. If weapons have been detonated, the model computes the distance of each destroyer from all pools and clouds of radiation. The location

and size of all pools and clouds is received from the plot generator model along with the location of the destroyers. The model then determines if the destroyers are within the perimeter of any pool or cloud. If this condition exists, the radiation level in the cloud or pool is calculated [1, 4]. The total radiation being received by each destroyer is then calculated. The radiation rate and total radiation dose for each destroyer are computed and sent to the display (see Man Machine Interface subsection).

#### SUBMARINE LOGIC MODEL

The submarine can be controlled in two ways:

1. By a submarine team.
2. By the computer.

This decision is made in the enter input changes routine. The program is such that the computer will play the role of the submarine unless the variable ISUB is set equal to one by the enter input changes routine. If ISUB is set equal to one, control of submarine depth, course, speed, and weapon firing is turned over to the submarine team. This team will receive passive sonar bearings and screw beat information from the console typewriter of the CDC 1604. They will be able to control the movements of the submarine and its weapon firing by means of the console typewriter and selective jump keys. The program will query selective jump key number two, once each cycle, to determine if orders to the submarine are to be received. If selective jump key two is set the computer will request orders (see Man Machine Interface subsection). The weapons (torpedoes) can be fired by setting selective jump key three on the CDC 1604 console (see Man Machine Interface subsection). Under this condition the simulation becomes a conflict between two teams:

1. A submarine team using the CDC 1604 console.
2. A destroyer team using the DD 65 display console.

If ISUB is unchanged by enter input changes (inputs block sets this variable equal to zero), the moves of the submarine are controlled by the computer. This being the case, two basic initial tactical situations are available to the player. The first of these places the submarine on the surface, at the origin of the playing area. The submarine knows that he has been sighted and the game proceeds. The second situation has the submarine randomly located in the upper half of the playing area. In this case the submarine's position is not known by the player. It should be noted that this is the initial situation if the submarine is to be controlled by a submarine team.

Initial situation one is selected by setting INITIAL equal to zero, while situation two is selected by setting this variable equal to one. Having selected the initial situation the computer then selects one of three basic strategies:

1. The submarine runs for it.
2. The submarine tries to transit between the two destroyers.
3. The submarine tries an end run, flanking the two destroyers.

These strategies are easily followed in Appendix II and will not be explored further at this point.

#### SEQUENCING OF PROGRAM BLOCKS

The blocks in this simulation are of two basic types:

1. A single point of exit.
2. Multiple points of exit.

The block that has a single exit point might be called a standard block, in that, the block is called upon to perform a computation but no

branching of logic is done within the block. The multiple exit block is one in which the program is routed differently depending upon logic decisions made within the block. The sonar contact block is an example of this type. In this block the routing depends upon the results of a sonar search. If contact is made, the block exits to the contact tracking block. If no contact is made, the block exits to consider the next destroyer.

The executive control routine flow chart in Appendix II illustrates the time sequencing of the major program blocks. The simulation is delayed at four points in the program which are:

1. Enter input changes routine.
2. Enter changes.
3. Submarine logic block.
4. The time loop.

The first of these interruptions takes place only during the initializing portion. At this point any change to the input parameters is made. The second of these interruptions is made once during each time step. This is the point at which destroyer team changes are sent to the CDC 1604. The third of these interruptions takes place if the situation using the submarine team has been selected. In this case the simulation may be interrupted every time step to allow the submarine team to enter changes. The fourth of these interruptions occurs each cycle and maintains the time stepping interval.

It will be noted that in the executive control routine, each block is considered in turn, no block is bypassed. In the interactions block, it will be noted that, sub-blocks are not always considered. No sonar contact by the sonar contact block causes the contact tracking block to be bypassed. The same is true of the weapon firing block if the tracking

block does not generate a satisfactory track.

### MAN MACHINE INTERFACE

This subsection is concerned with communications, both into and out of the computer. These man-machine communications fall into four types:

1. Data to and from the destroyer team.
2. Data to and from the submarine team.
3. Data to the various modes of the critique routine.
4. Input changes.

The first type breaks into three parts:

1. Right tube information.
2. Left tube information.
3. Changes sent to the CDC 1604.

The right tube gives the destroyer team data in tabular form as illustrated in Figure 3. The left tube will display the tracks of the destroyers, any sonar contacts, and all pools and clouds of radiation. Also included in the display on the left tube is a series of windows in which data can be displayed. The windows are numbered as shown in Figure 2. Window data assignments are as listed below.

<u>Window</u>	<u>Data Assignment</u>	<u>Units</u>
1	X-coordinate of destroyer 1	100 yards
2	X-coordinate of destroyer 2	100 yards
3	Y-coordinate of destroyer 1	100 yards
4	Y-coordinate of destroyer 2	100 yards
5	Course of destroyer 1	Degrees true
6	Speed of destroyer 1	Knots

<u>Window</u>	<u>Data Assignment</u>	<u>Units</u>
7	Course of destroyer 2	Degrees true
8	Speed of destroyer 2	Knots
9	X-coordinate of left tube center	100 yards
10	Y-coordinate of left tube center	100 yards
11-14	Available for flash messages	Alfa-numeric
15	Not used	
16	Radius of display on left tube	1000 yards

Windows 5-10 and 16 are controllable from the DD 65 console by means of a discrete digital type control system. In this manner the player is able to change the destroyer course and speed, or "zoom" the display in on any point in the area of play. Let us first consider windows five through eight.

On the DD 65 console (see Figure 4) there are buttons labelled CONN DD 1 and CONN DD 2. By depressing one or both of these buttons the player is given control of the course and speed of the destroyer or destroyers selected. Near the button just selected is a group of four buttons (see Figure 4) labelled RIGHT, LEFT, FAST/UP, and SLOW/DOWN. Depressing one of these buttons will cause the appropriate variable in windows five through eight to change in the desired direction. As an example, if the player depresses both CONN buttons and then the button labelled RIGHT - both destroyers will commence a turn to the right. They will continue this turn until the button labelled RIGHT is released. The player can "come to a course" by depressing the correct button until the desired course is displayed in the respective window. The same procedure is used for changing speed. It should be noted that the windows can be changed to values that are unacceptable, such as -5 knots,

in this case the program will cause this value to be changed back into the acceptable range during the following cycle. The value of course can be increased to values greater than 360 degrees, in which case the program will correct to the acceptable value. For example, if the player increases the course to 390 degrees, the program will convert this to 030 degrees during the next cycle.

The same basic procedure is utilized to "zoom" the display to any location desired. First the player selects the button labelled SHIFT (see Figure 4). He now has control of windows nine and ten. Depressing the button labelled RIGHT will cause the display to shift to the right, LEFT accomplishes the same action but to the left, and similarly with UP and DOWN. To zoom in, the rotary switch in the upper right hand corner of the console is used (see Figure 4). This switch has six positions labelled 4, 8, 16, 32, 64, and 128. Selection of one of the six positions will cause the radius of the displayed area to be that of the value selected, in thousands of yards. As an example, selecting SHIFT and changing windows nine and ten to 240 and 150 respectively, then setting the rotary switch to eight, will cause the area centered at (24000,15000) with a radius of 8000 yards to be displayed on the left tube. Note that window 16 will show the value eight, while windows nine and ten will show 240 and 150 respectively.

Windows 11 through 14 are used to send the player the following flash messages.

SOMAR CONTACT

ASROC FIRED

ASROC MISFIRE

SUB SUNK

DD SUNK

# DD65 CONSOLE ARRANGEMENT

FIGURE 4

TARGET IN RANGE

TARGET TOO CLOSE TO SHOOT

TARGET OUT OF RANGE

Another method of communications is available to the destroyer team. By depressing the DD 1 FIRE button, destroyer number one fires an ASROC. The same procedure is used with the DD 2 FIRE button.

The next type of communications available is that of the submarine team. This is, of course, non-existent if the option is chosen in which the submarine is played by the computer. The submarine team will receive messages each cycle containing bearing and screw beat information. The submarine team may then choose to maneuver the submarine by setting selective jump key number two on the console of CDC 1604. The computer will then type COURSE ORDERS on the console typewriter. This is the indication that the computer is ready to receive course changes. If no change is desired, the old course is typed in. If a change is requested, the new course is typed in. The course typed in should be of the form 090. followed by a carriage return. This will change the course and the computer will return NEW SUB COURSE 090. This completes the course change cycle and the computer will then type SPEED ORDERS, the same procedure is used to enter speed changes. Upon completion of the speed entry the computer will return NEW SUB SPEED 15, followed by DEPTH ORDERS. The new depth is now entered, and the computer will return NEW SUB DEPTH 1050. The routine is now finished and the program continues.

The only other action available to the submarine team is that of firing torpedoes. This is accomplished by depressing selective jump key number three until the typewriter returns TORPEDO FIRED. At this time the selective jump key should be returned to the normal position, unless

DD65 CONSOLE OVERLAY

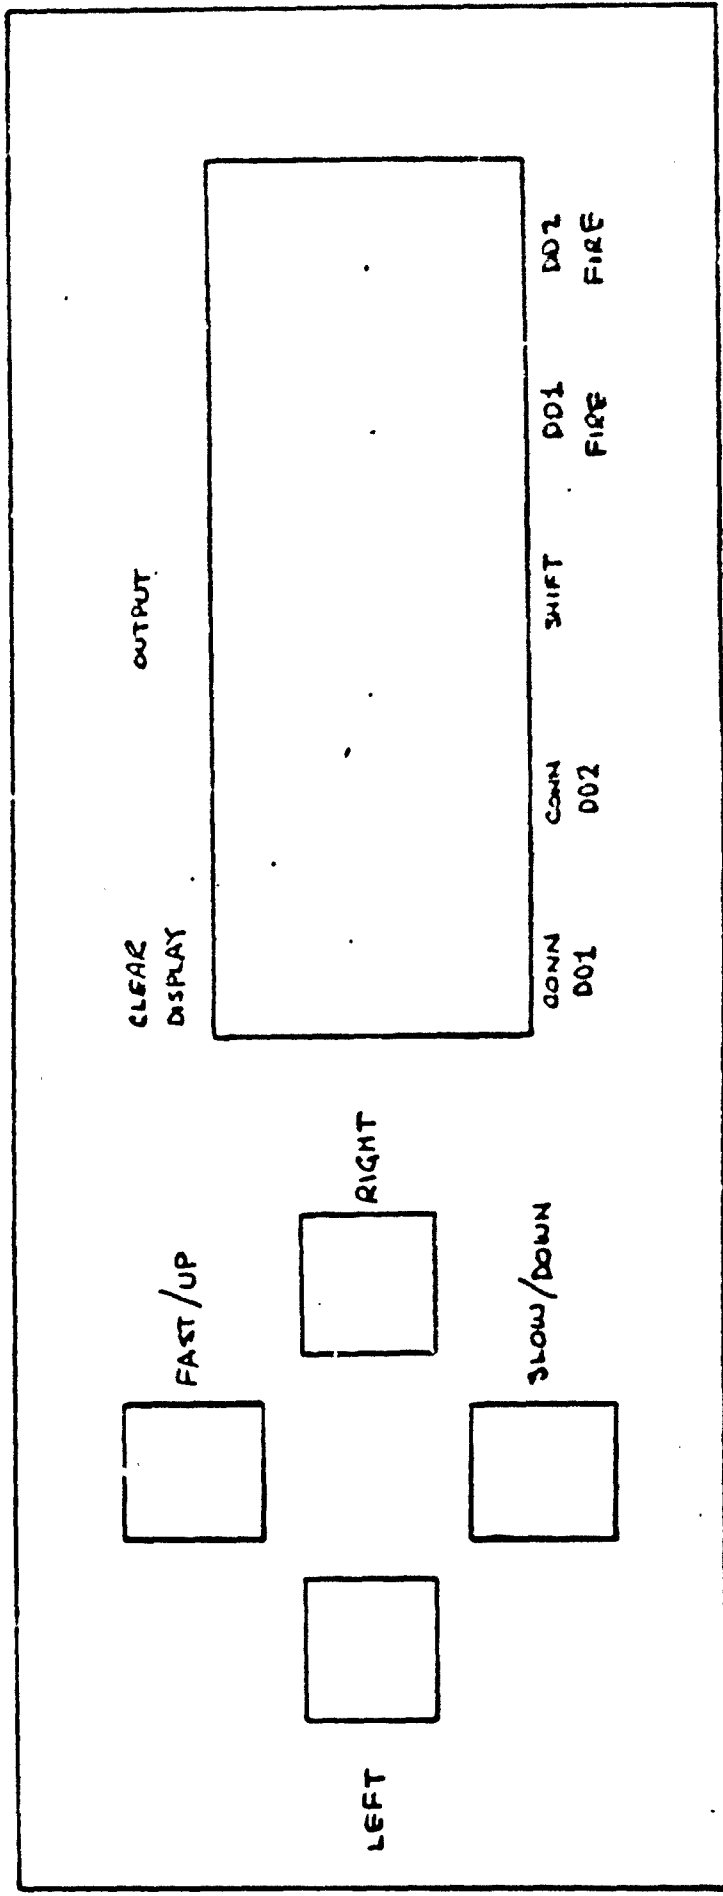

FIGURE 5

another torpedo is desired. If a hit is scored, the typewriter will return DESTROYER SUNK. When both destroyers are sunk the typewriter will return GAME OVER. At the beginning of the game, the typewriter will give the submarine team the following information:

1. Maximum speed available to submarine.
2. Maximum depth allowable.

The third type of communication is with the various critique routines.

Critique is accomplished in three ways:

1. A recording of all information on the DD 55 display is recorded by the tape unit near the DD 65.

2. A graph of the tracks of the DD's, submarine, and all radiation is made on tape unit eight of the CDC 1604 (the graph has game time recorded by each mark to aid in correlating with the various other parts of the critique routine).

3. A critique of all important events and their time is recorded on tape unit five of the CDC 1604 for print out at the conclusions of the game.

These three methods of critique, if correlated, will give an excellent "replay" of the simulation. Any communication with the program other than listed above will be accomplished as described by Leach and Perrella [5].

#### TIMING

The timing of this simulation is done by means of a time loop block. In this block, the contents of call 5006B in the CDC 1604 is tested and stored as ICLOCK. A variable, NEXT, is generated as the sum of ICLOCK and ISTEP, the stepping interval. ISTEP is determined from another variable TFACTOR that is equal to one for real time. TFACTOR equal to three would, for example, cause the game to run at three times real time. When ICLOCK

becomes greater than or equal to ~~NEXT~~ the loop is exited and the simulation continues. This procedure is easily followed in Appendices II and IV.

## 6. CONCLUSIONS AND ACKNOWLEDGEMENTS

The considerations made in the formulation and construction of this simulation have made some observations possible. Only the basic modular structure of the simulation has been considered in detail. Each individual modular block has been designed in as simple a form as possible while maintaining some degree of realism. The simulation is sound in its general organization. New program blocks may be substituted making the simulation as realistic as desired. It is hoped that this simulation will be played with more sophisticated models and on-line equipment of greater capacity so that doctrine and tactics in the area of self-inflicted nuclear environment may be explored.

It was found that the general purpose computer language was completely satisfactory for the construction of this simulation. The modularization technique made the logical organization of the simulation straight forward and is recommended for use in future simulations.

The author wishes to express his appreciation to Professor Mitchell L. Cotton and Professor Alvin F. Andrus for their aid and encouragement in the preparation of this thesis. In addition, the author would like to thank Miss Patricia Hoang for her assistance in programming the linking subroutines and LCDR Richard E. DeWinter for his comments in proofreading the manuscript.

## APPENDIX I

### LIST OF VARIABLES

This Appendix contains a listing of the variables used in the simulation MULNUC1, arranged in alphabetical order.

<u>Variable</u>	<u>Definition</u>
AROCMAX	Maximum range of the ASROC, in yards. This is an input parameter, set equal to 9,000 yards by the inputs block and can be changed in the change inputs block.
AROCMIN	Minimum safe range for the ASROC, in yards. This value is computed in the initializing block, and is a function of warhead size.
B	Last bearing the submarine held of the nearest destroyer, in degrees true.
BNPTS	A dummy variable used in the contact tracking block for the determination of contact speed.
CENTERB	The course such that the submarine will split the channel between the destroyers, in degrees true.
CLOUDR(I)	Radius of the $i^{\text{th}}$ cloud of radiation, in yards.
CLOUDX(I)	X-coordinate of the $i^{\text{th}}$ cloud of radiation with respect to the main coordinate system, in yards.
CLOUDY(I)	Y-coordinate of the $i^{\text{th}}$ cloud of radiation with respect to the main coordinate system, in yards.
CONTR(I)	Bearing of sonar contact of $i^{\text{th}}$ destroyer, in degrees true.
CONTC(I)	Contact course, as computed by the contact tracking block, in degrees true.
CONTR(I)	Sonar range to contact, as measured by the $i^{\text{th}}$ destroyer.
CONTS(I)	Contact speed as computed by the contact tracking model, in knots.
CONTX(I)	X-coordinate of the $i^{\text{th}}$ destroyer's contact, in yards, with respect to the main coordinate system.
CONTY(I)	Y-coordinate of the $i^{\text{th}}$ destroyer's contact, in yards, with respect to the main coordinate system.

<u>Variable</u>	<u>Definition</u>
D	Difference between the true bearing to the submarine from the destroyer and the submarine's true course, in degrees. This is used in the determination of doppler.
DA	Absolute value of D.
DAMAGE	Percent damage to the submarine from the current detonation.
DAMAGEI	Cumulative damage to the submarine, in percent.
DDC(I)	Course of the $i^{\text{th}}$ destroyer, in degrees true.
DDS(I)	Speed of the $i^{\text{th}}$ destroyer, in knots.
DDSMAX(I)	Maximum speed available to the $i^{\text{th}}$ destroyer, in knots.
DDX(I)	X-coordinate of the $i^{\text{th}}$ destroyer, in yards, with respect to the main coordinate system.
DDY(I)	Y-coordinate of the $i^{\text{th}}$ destroyer, in yards, with respect to the main coordinate system.
DETR	Detection range, in yards. This is a random variable with mean DETRM and normally distributed with sigma of .3 times DETRM.
DETRM	Mean detection range, in yards. A function of GRAD SUBED.
DISTC(I,J)	Distance of the $i^{\text{th}}$ destroyer from the center of the $j^{\text{th}}$ cloud of radiation.
DISTP(I,J)	Distance of the $i^{\text{th}}$ destroyer from the center of the $j^{\text{th}}$ pool of radiation.
DCB	Depth of burst, in feet, of ASROC warhead.
DR	Advance of the destroyer considered, in yards, between marks as considered by the tracking model.
DTIME	Total time delay from the firing of an ASROC and the detonation, in seconds. This includes time of flight and time of sinking.
DUMMY	A dummy variable used throughout the program.
DX	East-west advance of the destroyer considered, in yards, between marks as considered by the tracking model.

<u>Variable</u>	<u>Definition</u>
DY	North-south advance of the destroyer considered, in yards, between marks as considered by the tracking model.
ESR	Effective sonar range, in yards. Computed by the initializing block.
GRAD	Water temperature gradient, in degrees per hundred feet of depth.
GTIME	Game time, in minutes. At the start of the game GTIME is zero.
GZX	X-coordinate of ground zero for the detonation considered, in yards, with respect to the main coordinate system.
GZY	Y-coordinate of ground zero for the detonation considered, in yards, with respect to the main coordinate system.
HULL	Submarine hull thickness, in inches of steel.
IASROC	Hull number of the destroyer that fired the last ASROC. If no ASROC has been fired, IASROC is zero.
ICLASS(I)	Sonar classification of the i <sup>th</sup> destroyer's contact. 0 - no contact, 1 - possible submarine, 2 - probable submarine.
ICLOCK	Contents of location 5006B in the CDC 1604. The CDC 1604 steps this cell once every second.
ICIRCX(I)	A dummy vector of X-coordinates of points to transmit circles to the display.
ICIRCY(I)	A dummy vector of Y-coordinates of points to transmit circles to the display.
ICONTB(I)	Fixed point version of CONTB(I), used to transmit to the display.
ICONTC(I)	Fixed point version of CONTC(I), used to transmit to the display.
ICRIT#	A series of critique indicators. 0 - pass.
1	1 - sonar contact
2	1 - ASROC fired

<u>Variable</u>	<u>Definition</u>
ICRIT#	
3	1 - torpedo fired
4	1 - ASROC misfire
5	1 - target in range
6	1 - sub sunk
7	1 - destroyer sunk
8	1 - target too close to shoot at
9	1 - target out of ASROC range
11	1 - game is a draw, submarine escaped
12	1 - submarine wins, destroyer 1 sunk with submarine escaping
13	1 - submarine wins, destroyer 2 sunk with submarine escaping
14	1 - submarine wins, both destroyers sunk
15	1 - destroyers win, submarine sunk by destroyer 1
16	1 - destroyers win, submarine sunk by destroyer 2
17	1 - submarine wins by transiting between the destroyers
IDDC(I)	Fixed point version of DDC(I), used to transmit to the display.
IDDS(I)	Fixed point version of DDS(I), used to transmit to the display.
IDDX(I)	Fixed point version of DDY(I), used to transmit to the display.
IDDY(I)	Fixed point version of DDX(I), used to transmit to the display.
IDEEP	An index used to indicate the classification of nuclear burst. 1 - very shallow, 2 - shallow, 3 - deep, 4 - very deep.
IDOPLER(I)	An index used to indicate the doppler of the i <sup>th</sup> destroyer's contact. 0 - no dopplar, 1 - up dopplar, 2 - down dopplar.

<u>Variable</u>	<u>Definition</u>
IGND	An index used to indicate game over. 0 - game not over, 1 - game over.
IFIRE	An index used to indicate if the submarine has fired a torpedo. 0 - torpedo not active, 1 - torpedo still active.
ILOGIC	A logic index used in the submarine model.
IONE	The lowest destroyer hull number. Equal to 1 at the beginning of the game. If destroyer number one is sunk the IONE is equal to two.
INITIAL	An index of the initial situation. 0 - submarine at the origin, 1 - submarine randomly distributed in the upper half of the playing area.
IR	Radius of display area, in thousands of yards.
IRANDOM	A random number selected to initialize the random number generator. This number must be an odd integer in the interval 1 to 67108863.
ISHOOT1	A flag used to activate the firing sequence for destroyer 1. 0 - do not shoot, 1 - shoot.
ISHOOT2	A flag used to activate the firing sequence for destroyer 2. 0 - do not shoot, 2 - shoot.
ISOL(I)	A progressive index of the quality of the firing solution the $i^{\text{th}}$ destroyer has on its target. 0 - no solution, thru 5 - best solution.
ISS	Sea state.
ISTEP	Fixed point version of TSTEP.
ISTRAT	Submarine basic strategy when the submarine is controlled by the computer. 0 - run for it, 1 - go up the middle, 2 - end run.
ISUBC	Fixed point version of SUBC.
ITURN	Logical index that records the submarine's initial turn. 0 - left turn, 1 - right turn.
IX0	X-coordinate of center of displayed area, in hundreds of yards with respect to the main coordinate system.
IYDD(I,J)	A dynamic table of track data, recording the X-coordinate of the $j^{\text{th}}$ mark of the $i^{\text{th}}$ destroyer. The maximum value of $j$ is eight. Entries are in yards, with respect to the main coordinate system.

<u>Variable</u>	<u>Definition</u>
LXDD1(I)	This variable is equal to LXDD(1, I).
LXDD2(I)	This variable is equal to LXDD(2, I).
LXSUB(I,J)	A dynamic table of track data, recording the X-coordinate of the j <sup>th</sup> mark of the i <sup>th</sup> destroyer's sonar contact. The maximum value of j is eight. Entries are in yards, with respect to the main coordinate system.
LXSUB1(I)	This variable is equal to LXSUB(1,I).
LXSUB2(I)	This variable is equal to LXSUB(2,I).
IY0	Y-coordinate of center of displayed area, in hundreds of yards with respect to the main coordinate system.
IYDD(I,J)	A dynamic table of track data, recording the Y-coordinate of the j <sup>th</sup> mark of the i <sup>th</sup> destroyer. The maximum value of j is eight. Entries are in yards, with respect to the main coordinate system.
IYDD1(I)	This variable is equal to IYDD(1,I).
IYDD2(I)	This variable is equal to IYDD(2,I).
IYSUB(I,J)	A dynamic table of track data, recording the Y-coordinate of the j <sup>th</sup> mark of the i <sup>th</sup> destroyer's sonar contact. The maximum value of j is eight. Entries are in yards, with respect to the main coordinate system.
IYSUB1(I)	This variable is equal to IYSUB(1, I).
IYSUB2(I)	This variable is equal to IYSUB(2, I).
IWINDD	Fixed point version of WINDD, used to transmit data to the display.
MARKS(I)	Number of continuous marks, up to five, the i <sup>th</sup> destroyer has on his sonar contact.
N	A dummy variable.
NCONRER	Number of constant bearing the submarine has on the nearest destroyer.
NEXT	Time of the next cycle, in seconds of computer time.
NMARKS(I)	Same as MARKS(I) except NMARKS(I) does not stop at five.

<u>Variable</u>	<u>Definition</u>
NOSHOOT	Index to limit destroyers to one active weapon at a time. 0 - there are no active weapons, alright to shoot, 1 - there is an active weapon, cannot shoot.
NPTS	Index used to control display data until there are eight point available on destroyer tracks.
NPTS1	A dummy variable.
NPTS2	A dummy variable.
NRDD	The highest destroyer hull number. Equal to 2 at the beginning of the game. If destroyer number two is sunk then NRDD is equal to one.
NSHOTS	Total number of ASROC's fired during the game.
SHIT	A random variable used to determine if a torpedo, fired by the submarine, hit the destroyer.
POOLR(I)	Radius of the $i^{\text{th}}$ pool of radiation, in yards.
POOLX(I)	X-coordinate of the $i^{\text{th}}$ pool of radiation, in yards, with respect to the main coordinate system.
POOLY(I)	Y-coordinate of the $i^{\text{th}}$ pool of radiation, in yards, with respect to the main coordinate system.
R	Radius of the displayed area, in yards.
REL	A random variable used to determine ASROC reliability.
RADDOSE(I)	Total radiation dose the $i^{\text{th}}$ destroyer has been exposed to during the game, in roentgens.
RADRATE(I)	The rate at which the $i^{\text{th}}$ destroyer is receiving radiation, in roentgens/hr.
RANDOM	The random variable used to link the various random generators.
RANGE	A dummy variable used as a temporary storage in range calculations.
RLETHAL	The lethal range of the ASROC warhead, in yards.
SAFETY	Safety factor used to compute submarine maximum operating depth as a function of the crush depth of the hull.
SB(I)	Screw beat count of the $i^{\text{th}}$ destroyer as measured by the submarine.

<u>Variable</u>	<u>Definition</u>
SIGMA	A dummy variable used in the calling of normally distributed random variables.
SR	Sink rate of the ASROC warhead, in feet per second.
SSB(I)	The actual bearing of the submarine from the $i^{\text{th}}$ destroyer, in degrees true.
STRESS	Yield strength of the steel used in the submarine hull, measured in thousands of pounds per square inch.
SUBC	The true submarine course, in degrees true.
SUBD	The actual submarine depth in feet.
SUBDMAX	The maximum allowable operational depth of the submarine, in feet.
SUBS	The actual speed of the submarine, in knots.
SUBSMAX	The maximum speed available to the submarine, in knots.
SUBX	The actual submarine X-coordinate with respect to the main coordinate system, in yards.
SUBY	The actual submarine Y-coordinate with respect to the main coordinate system, in yards.
SUM	A dummy variable used in the computation of radiation dose.
TBURST(I)	Time of detonation of the $i^{\text{th}}$ ASROC warhead, measured in game time.
TEMP	A dummy variable.
TEMP1	A dummy variable.
TEMP2	A dummy variable.
TEMP3	A dummy variable.
TEMP4	A dummy variable.
TEMP5	A dummy variable.
TEMPCR(I,J)	The radiation rate received by the $i^{\text{th}}$ destroyer from the $j^{\text{th}}$ cloud of radiation, in roentgens per hour.
TEMPPR(I,J)	The radiation rate received by the $i^{\text{th}}$ destroyer from the $j^{\text{th}}$ cloud of radiation, in roentgens per hour.

<u>Variable</u>	<u>Definition</u>
TFACTOR	A time factor, 1 - real time, 2 - double time, .5 - half time.
THERMO	Depth of the thermocline, in feet.
THETA	A dummy variable used in the computation of courses and bearings.
TINTER	Time to intercept of a torpedo fired by the submarine, in minutes.
TLOGIC	A time storage point used to control timed logic.
TOB	Time of burst, this includes time of flight and sink time of the ASROC warhead, measured in minutes of game time.
TOF	Time of flight of the ASROC warhead, in seconds.
TOS	Sink time of the ASROC warhead, in seconds.
TSTEP	The time step for each cycle of the game, in seconds.
TXDD(I,J)	A temporary storage of the $j^{\text{th}}$ past position X-coordinate of the $i^{\text{th}}$ destroyer used in preparing track data for the display, measured in yards.
TYDD(I,J)	A temporary storage of the $j^{\text{th}}$ past position Y-coordinate of the $i^{\text{th}}$ destroyer used in preparing track data for the display, measured in yards.
TXSUB(I,J)	A temporary storage of the $j^{\text{th}}$ past position X-coordinate of the $i^{\text{th}}$ destroyer's sonar contact used in preparing track data for the display, measured in yards.
TYSUB(I,J)	A temporary storage of the $j^{\text{th}}$ past position Y-coordinate of the $i^{\text{th}}$ destroyer's sonar contact used in preparing track data for the display, measured in yards.
VEL	The relative velocity of the torpedo fired by the submarine, with respect to the destroyer target, in knots.
W1	A dummy variable used to determine the destroyer that is closest to the submarine.
W2	A dummy variable used to determine the destroyer that is closest to the submarine.
WINDD	Wind direction in degrees true.
WINDV	Wind velocity, in knots.

<u>Variable</u>	<u>Definition</u>
X(I,J)	The X-coordinate of the $i^{\text{th}}$ destroyer's $j^{\text{th}}$ continuous mark on its sonar contact, in yards, with respect to the main coordinate system.
XDD(I,J)	The X-coordinate of the $i^{\text{th}}$ destroyer $j-1$ steps ago, in yards, with respect to the main coordinate system.
XO	The X-coordinate of the center of the displayed area, in yards, with respect to the main coordinate system.
XTEMP	A dummy variable used for temporary storage of X-coordinates.
Y(I,J)	The Y-coordinate of the $i^{\text{th}}$ destroyer's $j^{\text{th}}$ continuous mark on its sonar contact, in yards, with respect to the main coordinate system.
YDD(I,J)	The Y-coordinate of the $i^{\text{th}}$ destroyer $j-1$ steps ago, in yards, with respect to the main coordinate system.
YIELD	The yield of the ASROC warhead in kilotons.
YO	The Y-coordinate of the center of the displayed area, in yards, with respect to the main coordinate system.
ZZX	A vector of destroyer and submarine X-coordinates used by the graph plot routine in Critique I.
ZZY	A vector of destroyer and submarine Y-coordinates used by the graph plot routine in Critique I.

**APPENDIX II**  
**LOGIC FLOW DIAGRAMS**

This Appendix contains a series of logic flow diagrams as listed below.

Executive Control  
Plot Generator  
Interactions  
Radiation Model  
Submarine Logic Model  
    Run for It  
    Up the Middle  
    End Run  
Submarine Team Control  
    Sonar Contact Model  
    Contact Tracking Model  
    Weapon Firing Model  
    Evaluation Model  
    Critique I  
    Critique II

It will be noted that the statement number from the program listing is shown in the upper right hand corner of each symbol in the block diagram. This should aid in correlating this Appendix, with Appendix IV.

### APPENDIX III

#### SUBROUTINES AND CDC 160 EXECUTIVE ROUTINE

This Appendix contains an explanation of the subroutines used in the main program and the CDC 160 executive routine used to connect the CDC 1604 with the DD 65 display. A listing of these subroutines can be found in Appendix IV.

#### SUBROUTINE RANVAR

Subroutine RANVAR is used as the basic random number generator. It generates random floating point numbers in the interval zero to one that are distributed uniformly in that interval. The random variables used in the main program are called from either UNIFORM, NORMAL or ERROR subroutines which in turn call RANVAR for input. The generator is a simple fixed point division utilizing the remainder from the Q register as the random number. This number is then mapped into the zero to one interval. Only one input is required to initialize this generator, namely IRANDOM.

#### SUBROUTINE UNIFORM

Subroutine UNIFORM is a three argument subroutine used to generate uniformly distributed random numbers in any interval. The arguments are:

1. The center of the interval.
2. The half width of the interval.
3. The output random number.

An example would be UNIFORM (5.0, 2.0, SUBS). This call would yield the variable SUBS, submarine speed, uniformly distributed in the interval with center at five knots and plus or minus two knots.

#### SUBROUTINE NORMAL

Subroutine NORMAL is a three argument subroutine used to generate normally distributed random numbers with any mean and standard deviation. This normal distribution is generated by means of the sum of identically distributed (uniform) random variables. Twelve uniform numbers are used because:

1. The truncation is not significant.
2. Twelve reduces the formula to a summation and no division is required.

The arguments to this subroutine are:

1. The mean of the distribution.
2. The sigma of the distribution.
3. The output random number.

#### SUBROUTINE ERROR

Subroutine ERROR is a five argument subroutine used to generate circular normal distributed random variables. This subroutine is used to determine the true fall of shot given the aiming point and CEP or sigma of the distribution of fall or shot. The arguments are:

1. The X-coordinate of the aim point.
2. The Y-coordinate of the aim point.
3. The sigma of the circular normal distribution.
4. The X-coordinate of the fall of shot.
5. The Y-coordinate of the fall of shot.

#### SUBROUTINE CIRCLE

Subroutine CIRCLE is used to generate a series of points, 24 in number, every 15 degrees around the perimeter of a circle of predetermined

center and radius. The circle is then used in the formation of the circular clouds and pools of radiation displayed to the destroyer team.

The arguments are:

1. The X-coordinate of the center of the circle with respect to the main coordinate system.
2. The Y-coordinate of the center of the circle with respect to the main coordinate system.
3. The radius of the circle with respect to the main coordinate system.
4. The X-coordinate of the center of the display with respect to the main coordinate system.
5. The Y-coordinate of the center of the display with respect to the main coordinate system.
6. The radius of the displayed area.
7. A vector of X-coordinates of the 24 points in the circle with respect to the display coordinate system.
8. A vector of Y-coordinates of the 24 points in the circle with respect to the display coordinate system.

#### SUBROUTINE DCIRCLE

DCIRCLE is a subroutine used to transmit the circle coordinates, generated in subroutine CIRCLE, to the CDC 160 from the CDC 1604. The arguments to this subroutine are:

1. ITRKNO - the track of circle number by which this particular circle can be designated.
2. CHAR - a single letter or number in hollow form that is to be displayed as one of the points in the circle.
3. In the program MULNUC1 the letter c and p are used to distinguish between clouds and pools of radiation.

4. NUMPTS - the number of points in the circle.
5. IX - a vector of X-coordinates for the circle.
6. IY - a vector of Y-coordinates for the circle.

#### SUBROUTINE DTRACK

Subroutine DTRACK is used to transmit crack data to the CDC 160 from the CDC 1604. This subroutine will send tracks of up to eight points to the CDC 160. The arguments to this subroutine are the same as those in DCIRCLE, in fact the two routines are identical with the exception of the allowable number of points.

#### SUBROUTINE DSTATUS

DSTATUS is a subroutine used to transmit information to the windows described in the section on Man Machine Interface. This information can be in two forms:

1. Program variables in fixed point form.
2. Messages in hollerith form.

The arguments are:

1. ITYPE - zero represents a numerical program variable is to be sent, while one indicates that an eight hollerith character word is to be sent.
2. NWIND - the number of the window to which the variable or word is to be sent.
3. IW - the field width of the variable.
4. INAME - the name of the variable to be transmitted.
5. IX - the X-coordinate of the lower left hand corner of the window.
6. IY - the Y-coordinate of the lower left hand corner of the window.

It should be noted that windows are 128 display coordinates units long. If a message in the form of words is to be sent to the display and it is longer than eight letters (the length of one window) it can be sent by means of more than one window. These windows should be displaced by 128 units in the X direction, thus the windows may form a continuous word of more than eight characters.

#### SUBROUTINE PARAMS

PARAMS is an eight argument subroutine used to query the CDC 160 as to the contents of eight selected windows. This subroutine allows the main program, in the CDC 1604, to enter changes that have been made to the windows of the display by the player. This is the only method the player has of communicating with the program without interrupting the play. The eight arguments to this subroutine are:

- 1A - the contents of window 5
- 2A - the contents of window 6
- 3A - the contents of window 7
- 4A - the contents of window 8
- 5A - the contents of window 9
- 6A - the contents of window 9
- 7A - the contents of window 16
- 8A - the numeric value of a location in the CDC 160 that is controlled by the DD1 FIRE and DD2 FIRE buttons.

APPENDIX IV  
PROGRAM LISTING

This Appendix contains the computer program listing of the simulation MUMUCI. The program blocks are in numerical order and the logic can be followed by cross referencing this Appendix with Appendix I. In this program all classified input parameters have been assigned fictitious values so that the program, as presented in this thesis, could remain unclassified.

MUL00010  
MUL00020

..JOB\*444F.MCMICHAEL.D.L.  
PROGRAM MULNUCI

IN RUNNING THIS PROGRAM THE PLAYER WILL HAVE THE OPTION  
OF CHANGING THE FOLLOWING INPUT PARAMETERS.

YIELD SIZE OF ASROC WARHEAD  
AROCMAX ASROC MAXIMUM RANGE  
DOB DEPTH OF BURST  
TFACOR 1 - REAL TIME 2 - DOUBLE TIME  
GRAD WATER TEMPERATURE GRADIENT  
DDSMAX(1) DD1 MAXIMUM SPEED AVAILABLE  
DDSMAX(2) DD2 MAXIMUM SPEED AVAILABLE  
SUBSMAX SUBS MAXIMUM SPEED AVAILABLE  
NRANDOM A RANDOM NUMBER TO START GAME  
STRESS YIELD STRESS OF THE SUBMARINE HULL  
HULL SUBMARINE HULL THICKNESS  
DOX(1) DD1 X-COORDINATE  
DDX(2) DD2 X-COORDINATE  
DOY(1) DD1 Y-COORDINATE  
DDY(2) DD2 Y-COORDINATE

C ISUB 0 - COMPUTER CONTROL 1 - SUB TEAM CONTROL  
 C  
 C INITIAL 0 - SUB AT ORIGIN 1 - SUB POSIT RANDOM  
 C  
 C ISTRAT 0 - RUN 1 - UP MIDDLE 2 - END RUN  
 C  
 C THESE PARAMETERS ARE SET TO NOMINAL INITIAL VALUES AND  
 C WILL BE DISPLAYED AS INPUT PARAMETERS. IF A CHANGE OF THESE  
 C VALUES IS DESIRED IT CAN BE MADE AT THE TIME THE SCREEN  
 C DISPLAYS (VARIABLES ARE) AND A LIST OF VARIABLES. AT THIS  
 C TIME THE N-TH VARIABLE IN THE LIST CAN BE CHANGED BY  
 C TYPING A AND THE NUMBER N, AND THEN \*, AND THE NEW VALUE OF  
 C THE SELECTED PARAMETER. AS AN EXAMPLE IF THE THIRD  
 C VARIABLE IS TO BE CHANGED TO 3.1 THE PLAYER WOULD TYPE  
 C A3=3.1 AND THEN DEPRESS THE OUTPUT BUTTON ON THE DD65.  
 C THE COMPUTE WILL THEN RETURN (OK) IF THE PARAMETER IS OF  
 C THE CORRECT FORM. AFTER ALL CHANGES HAVE BEEN ENTERED  
 C THE PLAYER WILL TYPE END AND THE GAME WILL CONTINUE.  
 C HAVING ENTERED ALL PARAMETER CHANGES THE GAME WILL  
 C PROCEED AUTOMATICALLY. THE PLAYER MAY THEN MANEUVER THE  
 C THE DESTROYERS BY THE PROCEEDURE OUTLINED IN THE SECTION

```

DOCUMENT CONTROL DATA - R&D

(Security classification of title, body of abstract and indexing classification must be entered when the overall report is classified)

1. ORIGINATING ACTIVITY (Corporate author)		2a. REPORT SECURITY CLASSIFICATION	
UNITED STATES NAVAL POSTGRADUATE SCHOOL MONTEREY, CALIFORNIA		UNCLASSIFIED	
		2b. GROUP	
		----	
3. REPORT TITLE			
AN ON-LINE SIMULATION OF ASW IN A MULTI-BURST NUCLEAR ENVIRONMENT			
4. DESCRIPTIVE NOTES (Type of report and inclusive dates)			
Master's Thesis			
5. AUTHOR(S) (Last name, first name, initial)			
McMichael, David L.			
6. REPORT DATE	7a. TOTAL NO. OF PAGES	7b. NO. OF REFS	
May 1966	123	7	
8a. CONTRACT OR GRANT NO.		8b. ORIGINATOR'S REPORT NUMBER(S)	
a. PROJECT NO.			
c.		8c. OTHER REPORT NO(S) (Any other numbers that may be assigned this report)	
d.			
9. AVAILABILITY/LIMITATION NOTICES			
Qualified requesters may obtain copies of this report from DDC.			
11. SUPPLEMENTARY NOTES		12. SPONSORING MILITARY ACTIVITY	
		U. S. Naval Postgraduate School Monterey, California	
13. ABSTRACT			
<p>A general approach is documented as a guide to aid in the formulation and implementation of on-line, real time computer simulations. A computer program MULNUCL is developed as an on-line, real time computer simulation of antisubmarine warfare in a multiple burst nuclear environment. The principals of the game are a submarine armed with torpedoes, and two destroyers equipped with stand-off antisubmarine weapons. The simulation is intended as a demonstration of the on-line capabilities of the United States Naval Postgraduate School computer system and as a tool for further study of the factors involved in a representative ASW operational environment.</p>

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parentheses immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system number, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through \_\_\_\_\_."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through \_\_\_\_\_."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through \_\_\_\_\_."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, roles, and weights is optional.
