ABSTRACT

Nitroso gums produced by Thiokol Chemical Corporation and supplied by the U.S. Army Natick Laboratories, Natick Massachusetts, were partially characterized. Linear expansion coefficients of a typical nitroso gum were determined to be 7.6×10^{-5} from -72°C up to the glass transition with the glass transition at -49°C . Density of the nitroso gum as received was 1.937 ± 1 g/cc. A simple "finger printing" technique utilizing Vicat softening temperatures was devised. A typical Vicat temperature was -40°C . Volatile products representing up to 29 percent of the nitroso gum were collected. The products consisted of yet unidentified solvents and lower molecular weight portions. Atypicality (percent deviation from theoretical) was determined for the various gums. Atypicality varied from $\pm 0.5\%$ to $\pm 4.0\%$. A change in typicality of the nitroso gum occurred with time and removal of the volatile product indicating loss of solvent and polymer constituent. Two $\text{CF}_3\text{NO}/\text{C}_2\text{F}_4/\text{C}_2\text{F}_3\text{H}$ terpolymers were examined.

I. INTRODUCTION

The fluorinated nitroso rubber to be characterized in this program is considered to be a highly solvent-resistant, stable, low and high temperature rubber. The degree of its worth in these respects can only be determined through a characterization of its basic physical properties. The purpose of the characterization is to describe the rubber for its use and further improvement or modification.

Nine nitroso gum samples, listed as ZR-561-XP5675, XP5702, XP5812, XP5887, XP5807, XP5704, 0.2 C₂F₃H terpolymer, 0.5 C₂F₃H terpolymer, produced by the Thiokol Chemical Company, and a 3M produced gum were delivered to Monsanto Research Corporation via the Natick Laboratories for characterization.

Characterization consists of density, thermal expansion coefficients, infrared spectroscopy, nuclear magnetic (H¹ and F¹⁹) resonance, elemental analysis, intrinsic viscosity, X-ray diffraction, differential thermal analysis, thermogravimetric analysis, Vicat softening temperature, Clash-Berg shear modulus, and typicality.

II. RESULTS

A. "APPARENT" LINEAR THERMAL EXPANSION COEFFICIENTS

Coefficients of linear thermal expansion by means of a dynamic modification of ASTM D696-44 were conducted on samples XP5675, XP5702, XP5812, and XP5887. A quartz dilatometer was used with specimens as designated in the ASTM specification. The dynamic modification consisted of periodic determinations of expansion as a function of temperature at a rate of about 1°C/minute. Standard procedure consists of end point determinations at an equilibrium temperature. The term "apparent" is used because of the non-equilibrium nature of these determinations. A temperature range from -75°C up to about 100°C above the glass transition temperature was covered.

Glass transition temperatures, T_g , where $\left(\frac{\partial \Delta l}{\partial T}\right) = 0$, were determined as a result of expansion measurements through and above that temperature.

The data is shown in Figures 1 through 4 and the coefficients and T_g 's itemized in Table 1.

B. VICAT SOFTENING TEMPERATURES

A rapid method of fingerprinting gums for variations in initial physical properties has been desired. Toward this end, Vicat softening temperatures and curves were determined. The apparatus and procedure were according to ASTM D1525-58T. A temperature range from -75°C to above the softening temperature was covered.

Samples run were: XP 5675, XP5675 devolatilized 16 hours @ 50°C and 3 mm Hg; XP5702, XP5702 devolatilized 16 hours @ 50°C and 3 mm Hg; XP5812, XP5704, and the 0.5 molar ratio terpolymer. The Vicat softening data is shown in Figures 5 through 8 with Vicat temperatures in Table 2.

C. DENSITIES

Densities by liquid displacement were run on samples XP5675 and XP5702. They were:

5702	1.938	None, As Received

D. CHARACTERIZATION OF VOLATILES OF SAMPLE XP5675

Sample XP5675 exhibited a depressed glass transition temperature, as if plasticized, and gave indications of perhaps being contaminated with a volatile solvent or other similar material (Ref. 1). Isothermal TGA's were run at 125°C and 150°C to determine the weight loss due to volatilization. The TGA data is shown in Figure 9.

A third sample was run at 100°C and the volatiles trapped. A clear non-viscous liquid was recovered from the cold trap, and a viscous gum condensed in the delivery tube leading to the cold trap. The viscous gum was obviously low molecular weight nitroso gum. H¹ and F¹⁹ nuclear magnetic resonance results were obtained for the trapped, clear liquid. The proton resonance disclosed only a trace of water. The F¹⁹ resonance spectrum is shown in Figure 10. F¹⁹ resonance spectrum for Freon 113 and FC-75 are shown in Figures 11 and 12 for comparison.

E. ELEMENTAL ANALYSIS AND "ATYPICALITY"

In Table 3 is reproduced the elemental analyses data from Quarterly Report No. 6 (Ref. 1) with the addition of a column giving the weight percent standard deviation of the sample from theoretical. This quantity we have termed the "atypicality" of the sample and is:

$$\left(\frac{\sum (X - \bar{X})^2}{N-1} \right)^{1/2},$$

where X = analysis weight percent, \bar{X} = theoretical weight percent, and N = number of elements reported. The closer the "atypicality" is to zero, the closer the sample is to theoretical.

F. "ATYPICALITY" AND CONDITIONING (AGING) OF XP5675 NITROSO GUM

Elemental analyses of XP5675 nitroso gum was conducted in December 1964, again in March 1965, and after devolatilizing in March 1965 for 16 hours at 80°C and 3 mm Hg. The analysis and "Atypicality" of these samples are shown in Table 4.

G. ANALYSIS OF NITROSO TERPOLYMER

Two terpolymers of $\text{CF}_3\text{NO}/\text{CF}_2\text{CF}_2/\text{CF}_2\text{CFH}$ containing respective molar ratios of 5/4.8/0.2 and 5/4.5/0.5 were examined by NMR (H^1 and F^{19}) and infrared. 9% solutions in Freon 113 and high concentrations of an evaporated solution were used as samples. The spectra were identical to those of the homopolymer with no proton resonance signal observed.

III. CONCLUSIONS AND SUMMARY

Apparent linear expansion coefficients were measured on the various gums with the most typical gum (theoretically) exhibiting a value of $7.6 \times 10^{-5} \text{ } ^\circ\text{C}^{-1}$ from -72°C up to the glass transition temperature. The less typical gums exhibited a change in their expansion coefficients between -72°C and their glass transition temperature.

The glass transition temperature (expansion coefficient method) for the most typical nitroso gum was -49°C . Other gums varied from -46 to -48°C (after devolatilization).

A rapid technique for "finger printing" to readily determine differences in batches and samples by variations in physical properties was devised using Vicat softening temperatures. Vicat temperature differences of $\pm 0.25^\circ\text{C}$ were shown to be significant. Removal of volatiles and impurities were noted by this technique. Determinations on a rough gum specimen as received could be completed in a period of less than two hours. This technique may not prove conclusive identity but will indicate differences. Relationship to glass transitions should be forthcoming.

Densities of the nitroso gum as received were shown to be $1.937 \pm 1 \text{ g/cc}$. This density includes volatile products.

Collection and analysis of the volatile products in the nitroso gum indicated a substantial low molecular weight portion and a clear liquid. These volatile products represented up to 29% of the weight of the sample. The clear liquid consisted of a yet unidentified solvent and a poorly identified nitroso gum component.

The "Typicality" or nearness of composition to theoretical was determined for the four samples XP5675, XP5702, XP5812, and XP5887. XP5812 and XP5887 were found to be typical within $\pm 0.5\%$ by weight of theoretical. Sample XP5675 deviated by almost ± 4.0 percent. We would judge XP5812 and XP5887 as being most typical of a theoretical nitroso gum, however, not necessarily most typical of the manufactured Thiokol product.

A definite change in typicality with time and removal of volatile product was demonstrated. The typicality, however, decreased both with time and removal of the volatile. The significance of the typicality analysis is that (1) if the solvent alone were volatilizing away, the atypicality would decrease as the atypical contaminant was removed; (2) if monomer is volatilized due to either depolymerization or incomplete conversion, the material either remains unchanged or increases in atypicality depending on whether or not co-monomers are

lost at the same rate. In as much as the atypicality increased on the nitroso sample, both on standing and upon devolatilization, we conclude that whether or not solvent is also being lost, a more important change seems to be the loss of a polymer constituent possibly through spontaneous depolymerization or some elimination reaction. Shultz, Knoll and Morneau (Ref. 2) described the degradation of nitroso gums by heat and radiation.

H^1 and F^{19} nuclear magnetic resonance indicated no difference between the $CF_3NO/CF_2CF_2/CF_2CFH$ terpolymer and the homopolymer. Sensitivities for the hydrogen will have to be improved.

IV. FUTURE PLANS

Further analysis of the 30 percent volatile product will be conducted to determine its characteristics, structure and source. Cleaning up of the various samples as received will be conducted, their typicality determined, and further characterization conducted. A comparison to the 3M gum will be made.

Molecular weight distribution and average molecular weight with light scattering analysis on gum fractions will be conducted. Various solvents will be treated for intrinsic viscosity versus molecular weight.

Analysis of the terpolymers will continue.

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.
- 2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.
- 2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.
5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.
6. **REPORT DATE:** Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.
- 7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.
- 7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.
- 8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.
- 8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.
- 9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.
12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.
13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
