FORT EUSTIS, VIRGINIA 23604

The purpose of the effort reported herein was to develop a mathematical model to assist in the design of laminated elastomeric bearings. The approach of the study was based upon the application of large-deformation elasticity and viscoelastic mathematical theories. However, the complexity of the large-deformation elasticity theory and the problems associated with computer solutions of equations of linear or classical elasticity for the particular bearing geometry and for materials that are almost incompressible were such that this analytical work was discontinued.

Although the effort reported herein did not result in attainment of the program objectives, the effort did result in the development of analytical approximations to the application of linear elastic theory and yielded results that are readily applicable and very close to exact solutions for bearings for light loads.

Future efforts by this command toward the development of design formulae for laminated elastomeric bearings will be limited to an experimental investigation approach.

ABSTRACT

The purpose of this study was the establishment of analytical design procedures for laminated elastomeric bearings. This was approached with the application of the linear mathematical theory of elasticity and later with nonlinear large-deformation elasticity theory.

The linear theory yielded analytical approximations that are close to exact solutions and which are easily applied and evaluated. This analysis of one typical lamination yields the distribution of stress and deformation in the elastomer between "rigid" metal lamina. However, the limits of the linear elasticity theory are exceeded for greater than small bearing loads, indicating the need for the application of the more comprehensive large-deformation elasticity theory.

The large-deformation theory was stated and the equilibrium equations were derived, but the solution of these equations was not carried out.

PREFACE

This report was prepared by The Franklin Institute Laboratories, Philadelphia, Pennsylvania, for the U. S. Army Aviation Materiel Laboratories under Contract DA 44-177-AMC-110(T).

The mathematical studies of the laminated elastomeric bearing presented herein, which began in September 1963 and were concluded in December 1964, represent the sole effort of The Franklin Institute, for which Mr. R. Clyde Herrick, Senior Research Engineer, Applied Mechanics Laboratory, was the principal investigator and author of this report. Acknowledgment is made to Mr. T. Y. Chu for the considerable contribution of the analytical approximations and computer solutions for the linear theory of elasticity shown in Appendixes A, B, and C, and for the brief presentation of pure torsion in large deformation elasticity shown in Appendix D. Acknowledgment is also made to Dr. Barry Wolf for the many formulations in large deformation elasticity leading to that presented in Appendix E and for his contributions to the work in linear theory done in conjunction with Mr. Chu. The contributions of Dr. Kishor D. Doshi and Zenons Zudans are also noted.

This constitutes the final report covering the first application of the mathematical theory of elasticity to the problem of design and laminated elastomeric bearings.

SYMBOLS

Coordinate System

- r, θ, z = cylindrical coordinates
- u, v, w = displacement in the radial, tangential and axial directions, respectively
- r_i = inside radius
- r_o = outside radius
- h = one-half the thickness of elastomer per lamination
- $\pm w_o$ = axial displacement at $z = \pm h$

Stress

- σ_{ij} = general component of stress
- σ_{rr} = normal stress in r direction
- σ_{rz} = shear stress parallel to rz plane on a surface whose surface normal is a radial line

Strain

- ϵ_{ij} = general component of strain
- ϵ_{rr} = normal strain, denoted by repeated subscript of coordinate system symbols
- ϵ_{rz} = shear strain
- ϵ_{kk} = dilation, $\epsilon_{rr} + \epsilon_{\theta\theta} + \epsilon_{zz}$, denoted by a repeated subscript with other than the coordinate symbols, r, θ, z

Material Constants

- G = shear modulus
- ν = Poisson's ratio

k = bulk modulus
 λ, μ = Lamé material constants

Nomenclature Unique to Appendixes D and E

τ^{ij} = tensor components of stress
 σ_{ij} = physical components of stress
 $G_{ij}, G^{ij}, g_{ij}, g^{ij}$ = metric tensors
 (r, θ', z') = undeformed coordinates
 (ρ, θ, z) = deformed coordinates
 Φ, Ψ = constants from constitutive relationship
 Γ_i^{jm} = Christoffel symbols
 P = pressure

SUMMARY

The purpose of this work was to establish a design procedure for laminated elastomeric bearings based upon the application of large deformation elasticity and viscoelastic mathematical theories. However, the complexity of the large deformation elasticity theory and certain problems associated with computer solutions of the equations of linear or classical elasticity for the particular bearing geometry and for materials that are almost incompressible were such that this work could not be completed.

In the course of this effort, analytical approximations to the application of linear elasticity theory were developed that not only yield results that are very close to exact solutions but are easily applied and evaluated. However, these approximations are for linear elasticity theory, the limits of which are exceeded for greater than very light bearing loads. While not quantitatively applicable for bearings under full loads, they do give much information concerning elastomer behavior under light loads.

The equilibrium equations for large deformation elasticity theory in cylindrical coordinates were stated for combined axial compression and torsion, but were fully derived for the case of compression only.

CONCLUSIONS

While the objectives of the study were not reached, much useful knowledge about the behavior of the elastomer in each lamination under load was generated. The approximate theories, (a) for incompressible materials and (b) for almost incompressible materials, are useful to indicate the relative effect upon bearing performance of bulk modulus (compressibility), ratio of inside diameter to outside diameter, and width-to-thickness ratio. More important, much was learned with respect to techniques for obtaining a useful solution of the nonlinear large-deformation equations that is necessary to predict adequately the distribution of displacement and stress within the bearing, especially along the bonded surface under realistic loading conditions. The original beliefs that large deformations are present within the elastomer even for very light compressive loads were confirmed. But, although much is known as to the behavior of the elastomer under load from the application of linear elasticity theory, this must be conditioned with the statement that this is qualitative and not quantitative for full loads.

INTRODUCTION

During the experimental development of the laminated elastomeric bearing for low-temperature applications (Technical Documentary Report No. ASD-TDR-63-769, prepared for Wright-Patterson Air Force Base, Ohio, November 1963), the need for a mathematical analysis of the bearing which would form the basis of a design method was recognized. Of primary interest were the magnitude and distribution of shear and normal stresses between the elastomer and the metal lamina. This was not only to enable a designer to specify elastomers with adequate strength and adhesive strength (at bond to metal lamina), but to determine the minimum thickness of metal lamina that could be used. Only by a mathematical analysis could the influence of compressive load, shear load (torsion), ratio of outside diameter to inside diameter, width-to-thickness ratio, and shear and bulk moduli of the elastomer be studied.

It was also anticipated that the deformations and strains within the elastomer were large and that the more general mathematical theories of elasticity would be required for an analysis, especially if the interaction of compressive load and bearing torsion observed in the experimental development were to be studied. Linear or classical theory is made linear by the assumptions that both deformation and strain are infinitesimal, thereby removing the ability to study the interaction of axial compression and torsion.

It was anticipated that in this study the state of stress and strain in the bearing could be investigated sufficiently with the use of large-deformation elasticity and viscoelasticity theories and that a computer program could be devised for the design of optimized bearing laminations for a given application and loading condition.

REVIEW OF EFFORT

When the present program was begun, the intention was to go directly to large-deformation elasticity because it appeared that sufficient theory was at hand. The intention was to use the linear or classical theory only for guidance and to establish certain "known points" in order to check the large deformation work.

Soon after the large-deformation formulation was begun, it was discovered that a simplification could be made if it could be said that plane surfaces in the elastomer parallel to the bonded boundaries remained flat planes after deformation. Some preliminary work with the linear theory of elasticity indicated that these surfaces did not remain flat planes at the free edge where interest in stress and deformation is greater, and so the formulation of the large-deformation problem was made more general. By this time it was apparent that the equations for large deformations would be made up of many terms and that solutions would be time consuming.

At this time during the program, it was believed that an investigation should be made of the effects of small amounts of compressibility of the elastomer upon the displacement pattern and consequently upon stress magnitude and distribution. This was needed because the only constitutive relations (stress-strain relations) that were immediately available were the "Mooney Relations" (Reference 5) that were formulated for incompressible rubber-like materials. No relationships were at hand for compressible materials, because it seems that most rubber-like materials are used under such loading conditions that the hydrostatic component of total stress is relatively small. Hence, volume compression is small and may be neglected.

An investigation into the effect of small amounts of compressibility, using classical elasticity theory, was then begun. First, the literature was searched for solutions to similar elasticity problems (the problems of compression of a cylinder with ends fixed for no radial displacement). One similar problem (Reference 6) was discovered, and although the boundary condition was that of no radial displacement at the outside edge only, instead of along the whole bonded surface, it was believed that this solution from the literature would be useful. However, although it was an analytical solution, the effort necessary to extract information, even by a computer, for various conditions proved to be considerable. It was

much beyond the effort considered necessary to make an independent solution of the equilibrium equations of elasticity for the real boundary conditions (a bonded surface) by means of a digital computer. Therefore, this latter approach was started.

The first choice was to solve the equations of a compressible material. Appendix A shows the formulation of the equilibrium equations and the complete computer program (in FORTRAN) for the iteration procedure to yield deformations. In the theory of elasticity for homogeneous and isotropic materials, two constants are necessary to describe the material behavior. Of the sets of two constants that can be used, G , the shear modulus, and ν , Poisson's ratio, were chosen because the value of Poisson's ratio reflects the relative amount of compressibility: $\nu = 0.5$ for incompressible materials, and $\nu < 0.5$ for compressible materials. Since the equilibrium equations in terms of displacements contain the coefficient $1/1-2\nu$, which approaches infinity as ν approaches 0.5, it was decided for the first solution that a moderately compressible material, say, $\nu = 0.35$, should be used. The value of ν could then be increased to as close to 0.5 as possible in later solutions, after check-out and proof of the iteration procedure. Except for some initial trouble in programming finite-difference methods for the geometry of a very wide, but thin, annulus, the iteration procedure worked well. However, on subsequent trials, the iteration method would not converge to a reasonable solution of Poisson's ratios greater than $\nu = 0.4$. After this was worked with for a period of time, effort was stopped on this computer solution for the compressible elasticity theory, and all further investigation of compressible materials was accomplished with the use of an approximate solution described below.

The next effort was the formulation of the equations for incompressible elasticity theory and the computer solution thereof. This required a completely new formulation because the coefficient, $1/1-2\nu$, is infinite for $\nu = 0.5$. Consequently, the new formulation introduced a pressure term (Reference 1, page 79, problem 4) in the displacement relations instead of a volume compression term. Appendix B shows the derivation of these partial differential equations and the FORTRAN program for the solution by iteration.

The iteration scheme proved to be erratic. While effort was being made to improve the convergence of the method, an effort was made concurrently toward an approximate solution, also shown in Appendix B. It was not until some results of the approximate theory were used as the starting values for iteration that convergence seemed probable. By this time considerable effort had been expended upon this solution, because the approach was continued inasmuch as each innovation introduced seemed

to improve the results. The last computation made, of which partial computer output is included in Appendix B, appears to have been converging as planned, although the convergence was very slow.

In the meantime, approximate solutions, both analytical and computer, to the compressible cases of linear elasticity were investigated. It was recognized that the exact solution of the partial differential equations of equilibrium was not of major interest in this study but was only to guide the formulation and solution of the large-deformation case. The search for approximate solutions was fruitful. An analytical solution based upon the linear theory of elasticity was derived, not only for the incompressible case but for the compressible case as well; that is, flexible enough to accept Poisson's ratios in the neighborhood of almost negligible compressibility, $\nu = 0.495$ and $\nu = 0.499$. These values represent the order of magnitude of Poisson's ratios for elastomers of interest in the laminated elastomeric bearing. These approximations for incompressible and compressible theory are shown in Appendixes B and C, respectively.

Appendix C, for the approximate compressible theory, includes an attempt made to solve equations (C-17a) and (C-17b) by computer, using the Rung-Kutta-Gill method. The flow chart and computer program (FORTRAN) are shown at the end of Appendix C. The computer solution did not work, however, and the reason was discovered from the analytical solution: the solution consisted of e^{+x} and e^{-x} , with x assuming very large values. Inasmuch as this approximate solution for compressible materials, as shown by the analytical solution in Appendix C, was obtained by applying the variational theorems of linear elasticity, it satisfies equilibrium approximately, and it satisfies the stress boundary conditions on the average, that is, across the thickness.

Appendix D shows the derivation of equations, based upon large-deformation elastic theory, for the case of torsion only. This was done mainly for investigation of the large-deformation problem of combined compression and torsion. Note that it is infinitely less complex than the case of large-deformation compression, as shown in Appendix E.

The real stumbling block in this study is the set of large-deformation equations for axial loading (Appendix E). These involve constitutive relations (stress-strain relationships) that are, as yet, not known for the compressible case although they are generally known for the incompressible case. The real problem is the size and complexity of the highly nonlinear equations and the consequent lack of assurance that a solution is the right solution. This is the basis of the desire to establish solutions for light loads using classical elasticity, the establishment of a check point.

RESULTS OF LINEAR THEORY

While the computer solutions did finally yield satisfactory results for the incompressible case and for the compressible case where Poisson's ratio was 0.4 or less, these displacements or deformations were not translated into stress. By the time that it could have been done with reliable computer solutions, the analytical approximations were available. These yield a solution that is closer to the exact solution of the equations of linear elasticity than the application of linear elasticity theory is to the real bearing. Perhaps it should be mentioned here that the linear theory of elasticity is believed to yield a very close approximation to elastomer stress and deformation for light loads, but only for light loads, as will be shown presently.

SOLUTIONS FOR INCOMPRESSIBLE ELASTOMERS

Results of the computer solution (Appendix A) for the compressible case are not shown here because, for practical elastomers, the ratio of bulk modulus to shear modulus is so very large that the behavior is more like that of an incompressible material. While the computer solution in Appendix A worked, it only worked for materials with a Poisson's ratio up to 0.40. This is too low for elastomers of immediate interest.

Since meaningful results were obtained from the computer solution for an incompressible material and since a useful approximation was also derived, the results of the work shown in Appendix B are summarized as follows:

1. By examining successive iterations, it was found that the iterative procedure as programmed in Appendix B converges. The convergence is much improved if the iterative procedure is started with the results of the approximate solution, but it is still slow. This is evidenced by the fact that the computer output shown in Appendix B is from the 600th iteration, and certain inconsistencies are still present at the inner and outer boundaries. However, this disturbance is seen to exist at the free boundaries and propagates only about one-half a thickness ($2h$) into the bearing from either boundary; therefore, this was accepted as a good solution.

2. The influences of the boundaries $r = r_i$ and $r = r_o$ are manifested only near those boundaries. Away from the boundaries by, say, 5 thicknesses, the approximate solution and the computer coincide. Thus, the approximate solution can be used to predict all regions of the bearing except near the boundaries $r = r_i$ and $r = r_o$. These can be investigated by computer solutions using much finer gridworks.
3. Within the limits of the linear theory of elasticity, which has been grossly exceeded in the computer example, the analytical approximation, as shown in equations (B-7) through (B-23), is a very accurate method.

Figures 1 through 4 present data gained from the analytical approximations. Figure 1 shows for incompressible materials the relationship between average pressure, width-to-thickness ratio, and ratio of axial displacement to elastomer thickness. Thus, for

$$G = 80 \text{ psi (shear modulus)}$$

$$\frac{r_o - r_i}{2h} = 250 \text{ (width-to-thickness ratio)}$$

$$\frac{w_o}{h} = 0.002 \text{ (ratio of axial deformation to elastomer thickness),}$$

then

$$P_{ave} = 125G = 10,000 \text{ psi.}$$

However, from Figure 2, it is estimated that the associated maximum shear strain is $\epsilon_{rz} = \partial u / \partial z = 1.63$. This strain is far beyond the limits of the linear theory of elasticity because the linear theory is based on the assumption that $\partial u / \partial z$ is very small, as compared to 1.0.

From Figure 3, a measure of what is meant by "light loads" associated with linear elasticity theory can be obtained. Although $\partial u / \partial z = 0.2$ is still much beyond the values acceptable within the linear theory of elasticity, it is not sufficiently large to change the order of magnitude of the results. Assume, then, that $\partial u / \partial z = 0.2$ is accepted. From Figure 3, for a width-to-thickness ratio of 250, $P_{ave} = 15.5 G$. Thus, if $G = 80$ psi, as for the silicone rubber used in previous programs, then average pressure is 1240 psi. A bearing of this geometry and these materials was tested to an average pressure in excess of 40,000 psi. The rubber did not extrude or come unbonded, but the steel lamina broke. Thus, it is

known that elastomers with this geometry are capable of extreme pressures and extreme shear strains.

For strains that are not excessively large, say, $\epsilon_{rz} = 0.2$, a relationship between average pressure and the maximum shear stress as derived from the incompressible elastic approximation can be shown.

When

$$\frac{r_o - r_i}{2h} = 250 \text{ and } \frac{W_o}{h} = 0.00025,$$

then

$$\epsilon_{rz} = \frac{\partial u}{\partial z} = 0.2$$

and

$$\frac{P_{ave}}{G} = 15.5 .$$

Shear stress is

$$\sigma_{rz_{max}} = 2G \epsilon_{rz} = 0.4 G ;$$

then

$$\frac{\sigma_{rz_{max}}}{P_{ave}} = \frac{0.4}{15.5}$$

and

$$\sigma_{rz_{max}} = 0.0258 P_{ave} .$$

This provides some measure of the relationship between shear stress and average pressure, although the limits of linear elasticity have already been exceeded at this strain level.

APPROXIMATE SOLUTION FOR COMPRESSIBLE ELASTOMERS

The approximation shown in Appendix C has also yielded convenient expressions for the investigation of stress and displacement within the elastomer of a lamination. These equations are summarized as follows:

for $\sigma_{z_{average}}$, use equation (C-47);

for $\sigma_{z_{max}}$, use equation (C-48);

for ratio $\frac{\sigma_{z \max}}{\sigma_{z \text{ avg}}}$, use equation (C-49);

and

for ratio $\frac{\sigma_{rz \max}}{\sigma_{z \text{ avg}}}$, use equation (C-50).

Figure 4 shows a comparison of data for compressible and incompressible theory. The relative position of the curves indicates the influence of various amounts of compressibility, although the exact placement of the curves is not necessarily accurate because they have been calculated from linear theory where the strains exceed those allowable.

APPENDIX A

COMPUTER SOLUTION FOR A COMPRESSIBLE ELASTOMER

This is the formulation of the pure axial compression problem of one lamination, following linear (or classical) elasticity theory, that was prepared for computer solution using finite-difference techniques and iteration schemes. The geometry is that of the flat thrust bearing.

Consider a thin disk of elastomer compressed between two rigid plates and assume that the disk is composed of a compressible material with Poisson's ratio, ν . The shape and the dimension of the disk are shown in Figure 5.

Figure 5. Sketch of Coordinates for One Lamination.

Since the disk is circular, it is convenient to use cylindrical coordinates (r, θ, z) . The symmetry property of this problem indicates that stresses and displacements are functions of r, z only.

The equations of equilibrium are thus simplified to

$$\frac{\partial^2 w}{\partial r^2} + \frac{2(1-\nu)}{1-2\nu} \frac{\partial^2 w}{\partial z^2} + \frac{1}{1-2\nu} \frac{\partial^2 u}{\partial r \partial z} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{1-2\nu} \frac{1}{r} \frac{\partial u}{\partial z} = 0 \quad (\text{A-1a})$$

and

$$\frac{1}{1-2\nu} \frac{\partial^2 w}{\partial r \partial z} + \frac{\partial^2 u}{\partial z^2} + \frac{2(1-\nu)}{1-2\nu} \frac{\partial^2 u}{\partial r^2} + \frac{2(1-\nu)}{1-2\nu} \frac{1}{r} \left(\frac{\partial u}{\partial r} - \frac{u}{r} \right) = 0, \quad (\text{A-1b})$$

where u and w are the displacements in radial and axial directions, respectively.

The boundary conditions are

$$\begin{aligned} u &= 0, & w &= -\delta & \text{at } z &= +h \\ u &= 0, & w &= \delta & \text{at } z &= -h \\ \sigma_r &= 0, & \sigma_{rz} &= 0 & \text{at } r &= r_o \text{ and } r = r_i. \end{aligned} \quad (\text{A-2})$$

Since the mid-plane ($z = 0$) is a plane of symmetry, the boundary conditions can be replaced on $z = -h$ by the symmetry conditions at $z = 0$.

$$\text{At } z = 0, \quad w = 0 \quad \text{and} \quad \frac{\partial u}{\partial z} = 0; \quad (\text{A-3})$$

thus, the problem can be solved only for the domain $z = 0$ to h and $r = r_i$ to r_o .

Because of the complexity of this problem, a computer program is written to solve this set of simultaneous equations. The equations of equilibrium and the boundary conditions are written in finite-difference form as follows:

$$\begin{aligned} & \left[1 - \frac{b}{2R(I)}\right] w_{i-1,j} + \left[1 + \frac{b}{2R(I)}\right] w_{i+1,j} + \frac{2(1-\nu)}{1-2\nu} w_{i,j-1} \\ & + \frac{2(1-\nu)}{1-2\nu} w_{i,j+1} + \left(\frac{1}{4}\right) \left(\frac{1}{1-2\nu}\right) (u_{i+1,j+1} - u_{i-1,j+1} + u_{i-1,j-1} - u_{i+1,j-1}) \\ & + \left(\frac{b}{2R(I)}\right) \left(\frac{1}{1-2\nu}\right) (u_{i,j+1} - u_{i,j-1}) - 2 \left(\frac{3-4\nu}{1-2\nu}\right) w_{i,j} = 0 \end{aligned} \quad (\text{A-4a})$$

and

$$\begin{aligned} & \frac{1}{4} \left(\frac{1}{1-2\nu}\right) (w_{i+1,j+1} - w_{i-1,j+1} + w_{i-1,j-1} - w_{i+1,j-1}) + u_{i,j-1} \\ & + u_{i,j+1} + \frac{2(1-\nu)}{1-2\nu} \left(1 + \frac{b}{2R(I)}\right) u_{i+1,j} + \frac{2(1-\nu)}{1-2\nu} \left(1 - \frac{b}{2R(I)}\right) u_{i-1,j} \\ & - 2 \left[\frac{3-4\nu}{1-2\nu} + \frac{b^2}{2R^2(I)} \left(\frac{2(1-\nu)}{1-2\nu}\right)\right] u_{i,j} = 0. \end{aligned} \quad (\text{A-4b})$$

For a general point (i, j) in the body, and boundary conditions

$$\left. \begin{aligned} u_{i,nnn} &= 0 \\ w_{i,nnn} &= -\delta \end{aligned} \right\} z = h \quad (A-5)$$

$$\left. \begin{aligned} w_{i,2} &= 0 \\ u_{i,3} &= u_{i,1} \end{aligned} \right\} z = 0,$$

$$\left. \begin{aligned} r = r_i & \left\{ \begin{aligned} \frac{2(1-\nu)}{1-2\nu} (u_{3,j} - u_{i,j}) + \frac{2\nu}{1-2\nu} \left(\frac{2b}{R_i}\right) u_{2,j} + \frac{2\nu}{1-2\nu} (w_{2,j+1} - w_{2,j-1}) &= 0 \\ u_{2,j+1} - u_{2,j-1} &= - (w_{3,j} - w_{1,j}) \end{aligned} \right. \\ \\ r = r_o & \left\{ \begin{aligned} \frac{2(1-\nu)}{1-2\nu} (u_{nnn+1,j} - u_{nnn-1,j}) + \frac{2\nu}{1-2\nu} \left(\frac{2b}{R_o}\right) u_{nnn,j} \\ &+ \frac{2\nu}{1-2\nu} (w_{nnn,j+1} - w_{nnn,j-1}) = 0 \\ u_{nnn,j+1} - u_{nnn,j-1} &= - (w_{nnn+1,j} - w_{nnn-1,j}) \end{aligned} \right. \end{aligned} \right\} (A-6)$$

for points (i, j) on the boundary, where b is the grid size and

$$R(z) = r_i + i \times b.$$

It is noted that since the material is compressible, there is a region in the body where the material experiences only hydrostatic compression. This knowledge permits further reduction in the domain of the problem by combining the two end conditions into one. That is to say, the set of equations is solved from both ends ($r = r_i$ and $r = r_o$) simultaneously, and the condition of hydrostatic compression is used as a boundary condition.

Denote ends $r = r_i$ and $r = r_o$ by $k = 1$ and $k = 2$, respectively, and define coefficients as shown in expressions (A-7) through (A-9). Then simplify the set of equations to those that appear.

Coefficients for the computer program are

$$\begin{aligned}
 A(1) &= 1-v \\
 A(2) &= v/(1-v) \\
 A(3) &= 3-4v \\
 A(4) &= 1-2v \\
 A(5) &= H/FM \\
 A(6) &= 1/(3-4v) \\
 A(7) &= A(4) \times A(6) \\
 A(8) &= A(1) \times A(6)
 \end{aligned}
 \tag{A-7}$$

$$k=1 \quad R\phi(I,K) = RZER\phi + (FI-2.0) A(5)$$

$$\begin{aligned}
 C1(I,K) &= A(5)/R\phi(I,K) \\
 C2(I,K) &= C1(I,K) ** 2 \\
 C3(I,K) &= 1.0 + 0.5 * C1(I,K) \\
 C4(I,K) &= 1.0 - 0.5 * C1(I,K) \\
 C5(I,K) &= A(3) + A(1) * C2(I,K) \\
 C6(I,K) &= 1.0/C5(I,K) \\
 D1(K) &= + 1.0
 \end{aligned}
 \tag{A-8}$$

k=2

$$\begin{aligned}
 R\phi(I,K) &= R\phi_{OUT} - (RI - 2.0) * A(5) \\
 C1(I,K) &= A(5)/R\phi(I,K) \\
 C2(I,K) &= C1(I,K) * C1(I,K) \\
 C3(I,K) &= 1.0 - 0.5 * C1(I,K) \\
 C4(I,K) &= 1.0 + 0.5 * C1(I,K) \\
 C5(I,K) &= A(3) + A(1) * C2(I,K) \\
 C6(I,K) &= 1.0/C5(I,K) \\
 D1(K) &= - 1.0
 \end{aligned}
 \tag{A-9}$$

Note that in the following expressions the double sign \pm or \mp appears. The upper sign refers to the case where $k = 1$, while the lower sign refers to that where $k = 2$.

Boundary conditions are

$$\left. \begin{aligned} w_{i,j} &= w_{3,j} \pm (u_{2,j+1} - u_{2,j-1}) \\ u_{i,j} &= u_{3,j} \pm \frac{v}{1-v} \left(\frac{2b}{R(I,K)} u_{2,j} + w_{2,j+1} - w_{2,j-1} \right) \end{aligned} \right\} \quad (A-10)$$

Field equations are

$$\begin{aligned} w_{I,J} &= \frac{1}{2(3+\frac{\lambda}{\mu})} \left\{ \left[\mp \frac{b}{2R\phi(I,K)} \right] w_{I-1,J} + \left[\pm \frac{b}{2R\phi(I,K)} \right] w_{I+1,J} \right. \\ &+ (2 + \frac{\lambda}{\mu})(w_{I,J-1} + w_{I,J+1}) \pm \frac{1}{4} (1 + \frac{\lambda}{\mu})(u_{I+1,J+1} \\ &- u_{I-1,J+1} + u_{I-1,J-1} - u_{I+1,J-1}) + \frac{b}{2R\phi(I,K)} (1 + \frac{\lambda}{\mu}) \\ &\left. (u_{I,J+1} - u_{I,J-1}) \right\} \end{aligned} \quad (A-11a)$$

$$\begin{aligned} u_{I,J} &= \frac{1}{2} \left[\frac{1}{(3+\frac{\lambda}{\mu}) + (2+\frac{\lambda}{\mu}) \left(\frac{b^2}{2R\phi^2(I,K)} \right)} \right] \left\{ \pm \frac{1}{4} (1 + \frac{\lambda}{\mu})(w_{I+1,J+1} \right. \\ &- w_{I-1,J+1} + w_{I-1,J-1} - w_{I+1,J-1}) + u_{I,J-1} + u_{I,J+1} \\ &\left. + (2 + \frac{\lambda}{\mu}) \left[(1 \pm \frac{b}{2R\phi(I,K)}) u_{I+1,J} + (1 \mp \frac{b}{2R\phi(I,K)}) u_{I-1,J} \right] \right\}. \end{aligned} \quad (A-11b)$$

Substituting $\lambda/\mu = 2v/1-2v$,

$$\begin{aligned}
 w_{I,J} &= \frac{1-2v}{2(3-4v)} \left\{ \left[1 \mp \frac{b}{2R\phi(I,K)} \right] w_{I-1,J} + \left[1 \pm \frac{b}{2R\phi(I,K)} \right] w_{I+1,J} \right\} \\
 &+ \frac{1-v}{3-4v} (w_{J,J-1} + w_{I,J+1}) \pm \left(\frac{1}{4} \right) \frac{1-v}{2(3-4v)} (u_{I+1,J+1} - u_{I-1,J+1} \\
 &+ u_{I-1,J-1} - u_{I+1,J-1}) + \frac{1-v}{2(3-4v)} \left(\frac{b}{2R\phi(I,K)} \right) (u_{I,J+1} - u_{I,J-1}) \quad (A-12a)
 \end{aligned}$$

$$\begin{aligned}
 u_{I,J} &= \frac{1}{2} \left\{ \frac{1}{[(3-4v) + (1-v) \frac{b^2}{R\phi^2(I,K)}]} \right\} \left\{ \pm \frac{1}{4} (w_{I+1,J+1} - w_{I-1,J+1} \right. \\
 &+ w_{I-1,J-1} + w_{I+1,J-1}) + (1-2v)(u_{I,J-1} + u_{I,J+1}) \\
 &+ 2(1-v) \left[\left(1 \pm \frac{b}{2R\phi(I,K)} \right) u_{I+1,J} + \left(1 \mp \frac{b}{2R\phi(I,K)} \right) u_{I-1,J} \right] \right\}. \quad (A-12b)
 \end{aligned}$$

From the definitions of the coefficients,

$$\begin{aligned}
 w_{I,J} &= 0.5 * A(7) * \{ C4(I,K) w_{I-1,J} + C3(I,K) w_{I+1,J} \} \\
 &+ A(8) * (w_{I,J-1} + w_{I,J+1}) + D1(K) * 0.125 * A(8) * (u_{I+1,J+1} \\
 &- u_{I-1,J+1} + u_{I-1,J-1} - u_{I+1,J-1}) + 0.25 * A(8) * C1(I,K) * \\
 &(u_{I,J+1} - u_{I,J-1}) \quad (A-13a)
 \end{aligned}$$

$$\begin{aligned}
 u_{I,J} &= 0.5 * C6(I,K) * D1(K) * 0.25 * (w_{I+1,J+1} - w_{I-1,J+1} + w_{I-1,J-1} \\
 &- w_{I+1,J-1}) + A(4) * (u_{I,J-1} + u_{I,J+1}) + 2 * A(1) \\
 &*(C3(I,K) u_{I+1,J} + C4(I,K) u_{I-1,J}). \quad (A-13b)
 \end{aligned}$$

Boundary conditions (end equation) are

$$\begin{aligned}
 w_{1,J} &= w_{3,J} + D1(K) * (u_{2,J+1} - u_{2,J-1}) \\
 u_{1,J} &= u_{3,J} + D1(K) * A(2) * (2 * C1(2,K) u_{2,J} + w_{2,J+1} - w_{2,J-1}). \quad (A-14)
 \end{aligned}$$

Computation of stresses is as follows:

From the stress-strain relation

$$\sigma_{ij} = \lambda \Delta \delta_{ij} + 2G \epsilon_{ij}$$

and the strain-displacement relation, stresses can be calculated at any point in the body when the displacement field is known. Since the displacements are given by numerical values, finite-difference methods must be used to calculate strains.

At the top and bottom boundaries, the strains are

$$\epsilon_r = \frac{\partial u}{\partial r} = 0$$

$$\epsilon_\theta = \frac{u}{r} = 0$$

$$\epsilon_z = \frac{\partial w}{\partial z}$$

$$\epsilon_{rz} = \frac{1}{2} \left(\frac{\partial u}{\partial z} \right)$$

and the stresses are

$$\sigma_z = (\lambda + 2G) \epsilon_z = \frac{2G(1-\nu)}{1-2\nu} \frac{\partial w}{\partial z}$$

$$\sigma_{rz} = G \frac{\partial u}{\partial z} .$$

In order to evaluate the derivatives there, backward or forward differences must be used. At the top surface, backward difference is used.

$$\frac{\partial f}{\partial z} = \frac{1}{2\Delta z} (3f(I,J) - 4f(I,J-1) + f(I,J-2))$$

Since in the computer result u and w are nondimensionalized with respect to h , $\Delta z = h/m$.

For $m = 4$,

$$\frac{\partial w}{\partial z} = 2(3w(I,mmm) - 4w(I,m) + w(I,m-1))$$

$$\frac{\partial u}{\partial z} = 2(3u(I,mmm) - 4u(I,m) + u(I,m-1));$$

hence,

$$\sigma_z = \frac{4(1-\nu)}{1-2\nu} G(3w(I,mmm) - 4w(I,m) + w(I,m-1))$$

$$\sigma_{rz} = 2G(3u(I,mmm) - 4u(I,m) + u(I,m-1)).$$

APPENDIX B

ANALYTICAL APPROXIMATION AND COMPUTER SOLUTION FOR AN INCOMPRESSIBLE ELASTOMER

Governing equations are again written in cylindrical coordinates, as shown in Appendix A. The equations of equilibrium remain the same, but the stress-strain relations become

$$\sigma_{ij} = P \delta_{ij} + 2G\epsilon_{ij} \quad (\text{B-1})$$

where an additional unknown pressure, P , is introduced into the relation due to incompressibility. Furthermore, since there is no volume change,

$$\epsilon_{ii} = 0 \quad (\text{B-2})$$

and strains are deviatoric. Taking into account the axial symmetry property, the nonvanishing strains are

$$\epsilon_r = \frac{\partial u}{\partial r}$$

$$\epsilon_\theta = \frac{u}{r}$$

$$\epsilon_z = \frac{\partial w}{\partial z}$$

$$\epsilon_{rz} = \frac{1}{2} \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right) \quad (\text{B-3})$$

Substituting the stress-strain relation and the strain-displacement relation into the equilibrium equation, we obtain the governing equation in terms of displacement.

$$\frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} - \frac{u}{r^2} + \frac{\partial^2 u}{\partial z^2} = - \frac{1}{G} \frac{\partial P}{\partial r} \dots \quad (\text{B-4a})$$

$$\frac{\partial^2 w}{\partial r^2} + \frac{1}{r} \frac{\partial w}{\partial r} + \frac{\partial^2 w}{\partial z^2} = - \frac{1}{G} \frac{\partial P}{\partial z} \dots \quad (\text{B-4b})$$

Since there are three unknowns, $u, w,$ and $P,$ three equations are needed; the third equation is furnished by equation (B-2),

$$\epsilon_{ii} = 0$$

or

$$\frac{\partial u}{\partial r} + \frac{u}{r} + \frac{\partial w}{\partial z} = 0 \dots \quad (\text{B-4c})$$

Equations (B-4a, b, and c) coupled with boundary conditions

$$\begin{array}{ll} u = 0 & z = \pm h \\ w = -w_0 & z = +h \\ w = w_0 & z = -h \\ \sigma_{rz} = 0 & r = r_i \text{ and } r_o \\ \sigma_{rr} = 0 & r = r_i \text{ and } r_o \end{array} \quad (\text{B-5})$$

completely define the problem. However, the deformations are extremely complex, owing to the imposed boundary conditions, and the mathematical analysis becomes intractable. Thus, the use of approximate methods and computer solutions becomes necessary.

APPROXIMATE SOLUTION

Because of the geometry of one lamination, $[h \ll (r_o - r_i)]$, the boundary conditions $\sigma_{rr} = 0$ and $\sigma_{rz} = 0$ may be replaced by an average condition.

Let

$$\left. \begin{array}{l} \sigma_{rr} = \frac{1}{2h} \int_{-h}^h \sigma_{rr} dz = 0 \\ \sigma_{rz} = \frac{1}{2h} \int_{-h}^h \sigma_{rz} dz = 0 \end{array} \right\}; \quad (\text{B-6})$$

that is to say, the system of forces acting on the boundary is replaced by an equivalent system. By Saint Venant's principle, this replacement will produce negligible influence at some distance away from the boundary.

Consider a solution of the form

$$u = (ar - br^{-1}) (1 - z^2/h^2) \dots \quad (\text{B-7})$$

$$w = -2az \left(1 - \frac{z^2}{3h^2}\right) \dots \quad (\text{B-8})$$

where a and b are constants. Substituting equations (B-7) and (B-8) into the governing equations, it is found that equation (B-4c) is identically satisfied and that equations (B-4a) and (B-4b) yield

$$P/G = a \frac{r^2}{h^2} - \frac{2b}{h^2} \ln r + 2a \left(1 - \frac{z^2}{h^2}\right) + C_2 \dots \quad (\text{B-9})$$

where C_2 is a constant.

This solution satisfies boundary conditions on $z = \pm h$, identically, provided

$$a = \frac{3}{4} \frac{w_0}{h} \quad (\text{B-10})$$

The average boundary condition on $r = r_i$ and r_o gives

$$\frac{2}{2h} \int_{-h}^h \frac{\partial u}{\partial r} dz + \frac{1}{2h} \int_{-h}^h P/G dz = 0 \dots \quad (\text{B-11})$$

$$\frac{1}{2h} \int_{-h}^h \frac{\partial u}{\partial z} dz + \frac{1}{2h} \int_{-h}^h \frac{\partial w}{\partial r} dz = 0 \dots \quad (\text{B-12})$$

Substituting equations (B-7), (B-8), and (B-9) into (B-11) and (B-12), the last equation is satisfied identically and equation (B-11) yields

$$\frac{4}{3} (a + br^{-2}) + \frac{2}{h^2} \left(\frac{ar^2}{2} - b \ln r \right) + \frac{4a}{3} + C_2 = 0$$

or

$$\frac{ar^2}{h^2} - \frac{2b}{h^2} \ln r + \frac{4}{3} br^{-2} + \frac{8}{3} a + C_2 = 0 \quad (\text{B-13})$$

Hence,

$$\left\{ \begin{array}{l} a \frac{r_i^2}{h^2} - \frac{2b}{h^2} \ln r_i + \frac{4}{3} b r_i^{-2} + \frac{8}{3} a + C_2 = 0 \\ a \frac{r_o^2}{h^2} - \frac{2b}{h^2} \ln r_o + \frac{4}{3} b r_o^{-2} + \frac{8}{3} a + C_2 = 0 \end{array} \right. \quad (\text{B-13a})$$

$$b = \frac{a h^2 \left(\frac{r_o^2}{h^2} - \frac{r_i^2}{h^2} \right)}{2 \ln r_o / r_i + \frac{4}{3} \left[\frac{h^2}{r_i^2} - \frac{h^2}{r_o^2} \right]} \quad (\text{B-14})$$

$$C_2 = - \left[a \frac{r_i^2}{h^2} - \frac{2b}{h^2} \ln r_i + \frac{8}{3} a + \frac{4}{3} b r_i^{-2} \right]. \quad (\text{B-15})$$

The pressures at the top and bottom boundaries (bonded surface) can be calculated from equation (B-9).

$$P/G \Big|_{z = \pm h} = a \frac{r^2}{h^2} - \frac{2b}{h^2} \ln r + C_2 \quad (\text{B-16})$$

where a is substituted from (B-10) and b and C_2 from above.

The total axial force on the bearing is computed by integrating equation (B-16) over the surface of $z = h$ (the bonded surface).

$$\begin{aligned}
F/G &= \int_{r_i}^{r_o} (P/G) r dr d\theta \\
&= 2\pi \int_{r_i}^{r_o} \left[\frac{ar^3}{h^2} - \frac{2b}{h^2} r \ln r + C_2 r \right] dr \\
F/G &= \pi \left[r^2 \left(\frac{ar^2}{2h^2} - \frac{2b}{h^2} \ln r + \frac{b}{h^2} + C_2 \right) \right]_{r_i}^{r_o}. \quad (B-17)
\end{aligned}$$

Average pressure on the bonded surface is the total force divided by the area, or

$$\frac{P_{ave}}{G} = \frac{1}{r_o^2 - r_i^2} \left[r^2 \left(\frac{ar^2}{2h^2} - \frac{2b}{h^2} \ln r + \frac{b}{h^2} + C_2 \right) \right]_{r_i}^{r_o}. \quad (B-18)$$

To find the maximum pressure on the bonded surface ($z = h$), radius is found at which pressure is maximum by differentiating equations (B-17) and then substituting that radius into equation (B-16).

$$\frac{1}{G} \frac{dP}{dr} = \frac{2ar}{h^2} - \frac{2b}{h^2} \frac{1}{r} = 0$$

and

$$r = \sqrt{\frac{b}{a}}. \quad (B-19)$$

Now

$$\left. \frac{P_{max}}{G} \right|_{z=h} = \frac{b}{h^2} \left[1 - 2 \ln \sqrt{b/a} \right] + C_2. \quad (B-20)$$

The stress distribution at the inner and outer radial boundaries is now approximated by

$$\frac{\sigma_r}{G} = 2 \frac{\partial u}{\partial r} + \frac{P}{G}, \quad (\text{B-21})$$

where from equation (B-7)

$$\frac{\partial u}{\partial r} = \left(a + \frac{b}{r^2} \right) \left(1 - \frac{z^2}{h^2} \right),$$

and by

$$\frac{\sigma_{rz}}{G} = \frac{\partial u}{\partial z}, \quad (\text{B-22})$$

where from equation (B-7)

$$\frac{\partial u}{\partial z} = - \left(ar - \frac{b}{r} \right) \frac{2z}{h^2}.$$

Consider now a typical example:

$$r_i = 0.75 \text{ inch}$$

$$r_o = 1.125 \text{ inches}$$

$$h = 0.75 (10^{-3}) \text{ inch}$$

(width-to-thickness ratio of 250).

If the ratio of axial compressive deformation to the elastomer thickness is chosen as

$$\frac{w_o}{h} = (10^{-3}),$$

then

$$a = 0.75 (10^{-3})$$

$$b \approx 1.156 (10^{-3}) h$$

$$c_2 \approx -1.415 (10^{-3}).$$

The pressure on the bonded surfaces can be computed from equation (B-9):

$$P/G \Big|_{z=h} = a \frac{r^2}{h^2} - \frac{2b}{h^2} \ln r + C_2$$

$$= 0.75(10^{-3}) \frac{r^2}{h^2} - 2.312(10^{-3}) \ln r - 1.415(10^{-3})$$

and

<u>r</u>	<u>r/h</u>	<u>ln r</u>	<u>P</u>
0.75"	10 ³	-0.2877	0
0.825"	1.1 (10 ³)	-0.1924	0.0629(10 ³)G
0.90"	1.2 (10 ³)	-0.1054	0.0915(10 ³)G
0.975"	1.3 (10 ³)	-0.0253	0.0892(10 ³)G
1.05"	1.4 (10 ³)	+0.0488	0.058(10 ³)G
1.125"	1.5 (10 ³)	+0.1178	0

Average pressure is computed from equation (B-18):

$$\frac{P_{ave}}{G} \Big|_{z=h} = \frac{1}{r_o^2 - r_i^2} \left[r^2 \left(\frac{ar^2}{2h} - \frac{2b}{h^2} \ln r + \frac{b}{h^2} + C_2 \right) \right]_{r_i}^{r_o}$$

$$= - 0.0629 (10^{-3})$$

or, in magnitude,

$$P_{ave} = 0.0629 (10^{-3})G \quad (\text{psi when } G \text{ is in units of psi}).$$

The total axial force applied is the average pressure multiplied by the cross-sectional area of 2.2 inches².

$$F = 0.1384 (10^3) G \quad (\text{pounds when } G \text{ is in units of psi})$$

Maximum pressure occurs from equation (B-19) at

$$r = \sqrt{-b/a} = 0.931 \text{ inch}$$

and is of magnitude, from equation (B-20),

$$P_{\max} = -0.0941 (10^3) G \text{ (psi)}.$$

The ratio of $\frac{P_{\max}}{P_{\text{ave}}}$ is 1.5.

Radial stress on the inner radial boundary is

$$\frac{\sigma_r}{G} = 2 \frac{\partial u}{\partial r} + \frac{P}{G}$$

z/h	σ_r
0	$1.812 (10^{-3}) G$ (midway between bonded surface)
1/4	$1.427 (10^{-3}) G$
1/2	$0.485 (10^{-3}) G$
3/4	$-1.176 (10^{-3}) G$
1	$-3.5 (10^{-3}) G$.

Shear stress on the inner radial boundary is, from equation (B-22),

$$\frac{\sigma_{rz}}{G} = \frac{\partial u}{\partial z}$$

or

$$\sigma_{rz} = 0.812 \frac{z}{h} G \text{ (psi)}.$$

This example is also a test of the approximation. From the above calculations for stress on the inner boundary, it can be seen that radial stress, σ_r , is of the order of $(10^{-3} G)$; and with $G = 100$, for example, the radial stress is still of the order 0.1 psi. This is small as compared to the pressure developed within the bearing. Shear stress on the boundary varies from zero to 0.812 G. This is not small as compared to other shear stresses; but since a shear stress on this boundary does not influence greatly the pressure within the bearing, this is not a source of serious error. The approximation is considered to be very good for a wide, thin annulus.

COMPUTER SOLUTION

Due to symmetry with respect to $z = 0$, only half of the bearing need be considered; if z is positive, the symmetry condition then states

$$\left. \begin{aligned} w(r, 0) &= 0 \\ \left. \frac{\partial u}{\partial z} \right|_{z=0} &= 0 \\ \left. \frac{\partial P}{\partial z} \right|_{z=0} &= 0 \\ w(r, 0^+) &= -w(r, 0^-) \end{aligned} \right\} \cdot \quad (\text{B-23})$$

To solve this set of equations (B-4a, b, and c) by the finite-difference method, it is convenient to find an equation involving P explicitly. This can be achieved by differentiating between equations (B-4a) and (B-4b) rather than by using equation (B-4c). Thus,

$$\frac{\partial^2 P}{\partial r^2} + \frac{1}{r} \frac{\partial P}{\partial r} + \frac{\partial^2 P}{\partial z^2} = 0 \dots \quad (\text{B-24})$$

It is noted that equation (B-24) implies

$$\nabla^2 \left(\frac{\partial u}{\partial r} + \frac{u}{r} + \frac{\partial w}{\partial z} \right) = 0 \quad (\text{B-25})$$

rather than

$$\frac{\partial u}{\partial r} + \frac{u}{r} + \frac{\partial w}{\partial z} = 0. \quad (\text{B-26})$$

It is thus necessary to specify $\frac{\partial u}{\partial r} + \frac{u}{r} + \frac{\partial w}{\partial z} = 0$ on the boundary.

Written in finite-difference form, equations (B-4a), (B-4b), and (B-24) become

$$\left[2 \left(1 + \frac{D^2}{C^2} \right) + \frac{D^2}{R(I)} \right] u_{i,j} = (u_{i+1,j} + u_{i-1,j}) + \frac{D}{2R(I)} (u_{i+1,j} - u_{i-1,j})$$

$$+ \frac{D^2}{2C} (u_{i,j+1} + u_{i,j-1}) + \frac{D}{2H} (P_{i+1,j} - P_{i-1,j}) \quad (\text{B-27a})$$

$$2 \left(1 + \frac{D^2}{C^2} \right) w_{i,j} = (w_{i+1,j} + w_{i-1,j}) + \frac{D}{2R(I)} (w_{i+1,j} - w_{i-1,j})$$

$$+ \frac{D^2}{C^2} (w_{i,j+1} + w_{i,j-1}) + \frac{D^2}{2C,H} (P_{i,j+1} - P_{i,j-1}) \quad (\text{B-27b})$$

$$2 \left(1 + \frac{D^2}{C^2} \right) P_{i,j} = (P_{i+1,j} + P_{i-1,j}) + \frac{D}{2R(I)} (P_{i+1,j} - P_{i-1,j})$$

$$+ \frac{D^2}{C^2} (P_{i,j+1} + P_{i,j-1}) \quad (\text{B-27c})$$

where

$$P = P/G \quad ; \quad U_{i,j} = \frac{u}{H} \quad ; \quad w_{i,j} = \frac{w}{H} \quad ; \quad \text{and}$$

$$H = h.$$

Treatment of equations at boundary:

Since the boundary conditions involve derivatives, fictitious points are introduced outside. The values of those points are found from boundary conditions.

At $r = r_i$

$$\left. \begin{aligned} w_{1,j} &= w_{3,j} - u_{2,j+1} + u_{2,j-1} \\ P_{2,j} &= u_{1,j} - u_{3,j} \\ u_{1,j} &= u_{3,j} + \frac{2}{R(Z)} u_{2,j} + \frac{D}{C} (w_{2,j+1} - w_{2,j-1}) \end{aligned} \right\} \quad (B-28)$$

At $r = r_o$

$$\left. \begin{aligned} w_{NNN,j} &= w_{NE,j} + u_{NN,j+1} - u_{NN,j-1} \\ P_{NN,j} &= u_{NE,j} - u_{NNN,j} \\ u_{NNN,j} &= u_{NE,j} - \frac{R}{R(NN)} u_{NN,j} - \frac{D}{C} (w_{NN,j+1} - w_{NN,j-1}) \end{aligned} \right\} \quad (B-29)$$

These equations, coupled with field equations (B-4a) and (B-4b), are enough to solve for the values at boundaries r_i , r_o and the fictitious points. However, it is not desirable to introduce any fictitious points with P as unknown. Hence, $\frac{\partial P}{\partial r}$ is written in terms of forward or backward differences, and equation (B-4a) is modified accordingly.

$$\frac{\partial P}{\partial r} = \frac{1}{2D} (r P_{i+1,j} - 3 P_{i,j} - P_{i+2,j}) \quad (\text{forward difference}). \quad (B-30)$$

$$\frac{\partial P}{\partial r} = \frac{1}{2D} (3 P_{i,j} - 4 P_{i-1,j} + P_{i-2,j}) \quad (\text{backward difference}). \quad (B-31)$$

At $z = h$, u and w are given but P is found through equation (B-24). In order to achieve this, it is necessary to introduce a fictitious point for P . The value of P at this point is found by using equations (B-4c) and (B-4b).

This set of finite-difference equations is solved by using the successive relaxation method. Values of u , w , and P at one point are calculated from values at neighboring points; they are u^{eva} , w^{eva} , and P^{eva} . New values of this point are obtained from u^{eva} , etc., through

$$u^{new} = \alpha u^{eva} + (1 - \alpha) u^{old}.$$

These new values can then be substituted for the old values immediately; then one can proceed to the next point.

Note on computer data:

Owing to the limitation of computer memory, the dimension of the bearing has been changed to

$$\begin{aligned} r_i &= 0.75 \text{ inch} \\ (r_o - r_i)/2h &= 50 \\ h &= 1 \times 10^{-3} \text{ inches.} \end{aligned}$$

The approximate solution is used as the first guess.

ENLARGED VIEW SHOWING GRIDWORK

Notes

1. Upper case letters on grid, Figure 8 refer to columns on computer output.
2. Lower case letters refer to row from either end as noted.
3. U array denotes radial displacement.
example: 0.73755702 E - 01 means $u = 0.073755h$
4. W array denotes axial displacement.
example: 0.43044931 E - 02 means $w = 0.004304h$
5. P array denotes pressure.
example: 0.13768537 E - 00 means $P = 0.13768G$

APPENDIX C

APPROXIMATION FOR A COMPRESSIBLE ELASTOMER

Consider a thin disk of rubber bonded between two rigid plates, the rubber being assumed as compressible.

The dimensions of the bearing are denoted by

r_i - inner radius

r_o - outer radius

$2h$ - thickness.

Owing to the difficulties encountered in solving the equations of equilibrium, an approximate solution through variational methods will be derived. In this case, the theorem of minimum potential energy is used. A displacement field, u , w , satisfying the displacement boundary condition, is assumed and put into the potential energy:

$$U = \frac{1}{2} \int_V \sigma_{ij} \epsilon_{ij} dV. \quad (C-1)$$

The theorem of minimum potential energy states that

$$\delta U = 0. \quad (C-2)$$

Thus, by taking the first variation of the expression U , two differential equations and the associated natural boundary conditions are obtained.

Assuming that

$$u = f(r) \left(1 - \frac{z^2}{h^2}\right), \quad (C-3)$$

$$w = \frac{W_0}{h} z + g(r) z \left(1 - \frac{z^2}{h^2}\right) \quad (C-4)$$

$$\frac{\partial u}{\partial r} = f'(r) \left(1 - \frac{z^2}{h^2}\right)$$

$$\frac{\partial u}{\partial z} = -\frac{2z}{h^2} f(r)$$

$$\frac{\partial w}{\partial r} = g'(r) z \left(1 - \frac{z^2}{h^2}\right)$$

$$\frac{\partial w}{\partial z} = \frac{W_0}{h} + g(r) \left(1 - 3 \frac{z^2}{h^2}\right)$$

$$\frac{u}{r} = \frac{f(r)}{r} \left(1 - \frac{z^2}{h^2}\right).$$

Let

$$\Delta = \frac{\partial u}{\partial r} + \frac{u}{r} + \frac{\partial w}{\partial z}. \quad (C-5)$$

Then

$$\sigma_{ij} \epsilon_{ij} = W = \lambda \Delta^2 + 2G [\epsilon_r \epsilon_r + \epsilon_\theta \epsilon_\theta + \epsilon_z \epsilon_z + 2\epsilon_{rz} \epsilon_{rz}] \quad (C-6)$$

where

$$\Delta = \left(f'(r) + \frac{f}{r}\right) \left(1 - \frac{z^2}{h^2}\right) + \frac{W_0}{h} + g(r) \left(1 - 3 \frac{z^2}{h^2}\right),$$

and

$$\Delta^2 = \left[f'(r) + \frac{f}{r}\right]^2 \left(1 - \frac{z^2}{h^2}\right)^2 + \frac{W_0^2}{h^2} + g^2(r) \left(1 - 3 \frac{z^2}{h^2}\right)^2$$

$$+ 2\left[f'(r) + \frac{f}{r}\right] \left(1 - \frac{z^2}{h^2}\right) \left(\frac{W_0}{h}\right) + 2 \frac{W_0}{h} g(r) \left(1 - 3 \frac{z^2}{h^2}\right)$$

$$+ 2\left[f'(r) + \frac{f}{r}\right] g(r) \left(1 - \frac{z^2}{h^2}\right) \left(1 - 3 \frac{z^2}{h^2}\right).$$

The following are expanded for substitution into equation (C-1):

$$\epsilon_r \epsilon_r = [f'(r)]^2 \left(1 - \frac{z^2}{h^2}\right)^2$$

$$\epsilon_\theta \epsilon_\theta = \frac{f^2}{r^2} \left(1 - \frac{z^2}{h^2}\right)^2$$

$$\epsilon_z \epsilon_z = \left(\frac{W_0}{h}\right)^2 + g^2(r) \left(1 - 3 \frac{z^2}{h^2}\right)^2 + 2 \left(\frac{W_0}{h}\right) g(r) \left(1 - 3 \frac{z^2}{h^2}\right)$$

$$\begin{aligned} \epsilon_{rz} \epsilon_{rz} &= \frac{1}{4} \left[-\frac{2r}{h^2} f(r) + g'(r) z \left(1 - \frac{z^2}{h^2}\right) \right]^2 \\ &= \frac{1}{4} \left[4 \frac{z^2}{h^4} f^2(r) + g'^2(r) z^2 \left(1 - \frac{z^2}{h^2}\right)^2 - 4 \frac{z^2}{h^2} f(r) g'(r) \left(1 - \frac{z^2}{h^2}\right) \right] \end{aligned}$$

$$\begin{aligned} \int_{-h}^h \left(1 - \frac{z^2}{h^2}\right)^2 dz &= \int_{-h}^h \left[1 - 2 \frac{z^2}{h^2} + \frac{z^4}{h^4}\right] dz \\ &= \left[z - \frac{2}{3} \frac{z^3}{h^2} + \frac{1}{5} \frac{z^5}{h^4} \right]_{-h}^h \\ &= 2 \left[h - \frac{2}{3} h + \frac{1}{5} h \right] = \frac{16}{15} h \end{aligned}$$

$$\int_{-h}^h \left(1 - 3 \frac{z^2}{h^2}\right) dz = \left[z - \frac{z^3}{h^2} \right]_{-h}^h = 0$$

$$\int_{-h}^h \left(1 - \frac{z^2}{h^2}\right) dz = \left[z - \frac{1}{3} \frac{z^3}{h^2} \right]_{-h}^h = \frac{4}{3} h$$

$$\begin{aligned}
\int_{-h}^h \left(1 - 3 \frac{z^2}{h^2}\right)^2 dz &= \int_{-h}^h \left(1 - 6 \frac{z^2}{h^2} + 9 \frac{z^4}{h^4}\right) dz \\
&= \left[z - 2 \frac{z^3}{h^2} + \frac{9}{5} \frac{z^5}{h^4} \right]_{-h}^h \\
&= 2\left(h - 2h + \frac{9}{5}h\right) = \frac{8}{5}h
\end{aligned}$$

$$\begin{aligned}
\int_{-h}^h \left(1 - \frac{z^2}{h^2}\right)\left(1 - 3 \frac{z^2}{h^2}\right) dz &= \int_{-h}^h \left(1 - 4 \frac{z^2}{h^2} + 3 \frac{z^4}{h^4}\right) dz \\
&= \left[z - \frac{4}{3} \frac{z^3}{h^2} + \frac{3}{5} \frac{z^5}{h^4} \right]_{-h}^h \\
&= 2\left(h - \frac{4}{3}h + \frac{3}{5}h\right) = \frac{8}{15}h
\end{aligned}$$

$$\int_{-h}^h z^2 dz = \left[\frac{z^3}{3} \right]_{-h}^h = \frac{2}{3}h^3$$

$$\begin{aligned}
\int_{-h}^h z^2 \left(1 - \frac{z^2}{h^2}\right)^2 dz &= \int_{-h}^h \left(z^2 - z \frac{z^4}{h^4} + \frac{z^6}{h^4}\right) dz \\
&= \left[\frac{1}{3} z^3 - \frac{2}{5} \frac{z^5}{h^2} + \frac{1}{7} \frac{z^7}{h^4} \right]_{-h}^h \\
&= 2\left(\frac{h^3}{3} - \frac{2}{5}h^3 + \frac{1}{7}h^3\right) = \frac{16}{105}h^3
\end{aligned}$$

$$\begin{aligned}
\int_{-h}^h z^2 \left(1 - \frac{z^2}{h^2}\right) dz &= \left[\frac{1}{3} z^3 - \frac{z^5}{5h^2} \right]_{-h}^h \\
&= 2\left(\frac{1}{3}h^3 - \frac{1}{5}h^3\right) = \frac{4}{15}h^3
\end{aligned}$$

$$\int \Delta^2 dz = \frac{16}{15} h [f'(r) + \frac{f}{r}]^2 + 2 \frac{w^2}{h} + \frac{8}{5} h g^2(r) + \frac{8}{3} h \left(\frac{w_0}{h}\right) [f'(r) + \frac{f}{r}] + \frac{16}{15} h [f'(r) + \frac{f}{r}] g(r)$$

$$\int \epsilon_r \epsilon_r dz = \frac{16}{15} h [f'(r)]^2$$

$$\int \epsilon_\theta \epsilon_\theta dz = \frac{16}{15} h f^2/r^2$$

$$\int \epsilon_z \epsilon_z dz = 2h \left(\frac{w_0}{h}\right)^2 + \frac{8}{5} h g^2(r)$$

$$\int \epsilon_{rz} \epsilon_{rz} dz = \frac{4}{3h} [f^2(r) + \frac{16}{105} h^3 g'^2(r) - \frac{16}{15} h f(r) g'(r)] \cdot$$

Equation (C-1) is equivalent to

$$\begin{aligned} \int W dV &= [\lambda \Delta^2 + 2G (\epsilon_r \epsilon_r + \epsilon_\theta \epsilon_\theta + \epsilon_z \epsilon_z + 2\epsilon_{rz} \epsilon_{rz})] dV \\ &= \int \{\lambda \Delta^2 + 2G (\epsilon_r \epsilon_r + \epsilon_\theta \epsilon_\theta + \epsilon_z \epsilon_z + 2\epsilon_{rz} \epsilon_{rz})\} r dr d\theta dz \\ &= 2\pi \int \lambda \left\{ \frac{16}{15} h [f'(r) + \frac{f}{r}]^2 + 2 \frac{w_0^2}{h} + \frac{8}{5} h g^2(r) + \frac{8}{3} h \left(\frac{w_0}{h}\right) [f'(r) + \frac{f}{r}] + \frac{16}{15} h [f'(r) + \frac{f}{r}] g(r) \right\} r dr \\ &\quad + 2\pi \int 2G \left\{ \frac{16}{15} h [f'^2(r) + \frac{f^2}{r^2}] + 2h \left(\frac{w_0^2}{h^2}\right) + \frac{8}{5} h g^2(r) + \frac{4}{3h} f^2(r) + \frac{8}{105} h^3 g'^2(r) - \frac{8}{15} h f(r) g'(r) \right\} r dr; \end{aligned} \quad (C-7)$$

but

$$\delta \int W dV = 0 \quad (C-8)$$

and

$$\begin{aligned}
& \int \lambda \left\{ \frac{32}{15} h \left[f'(r) + \frac{f}{r} \right] \left[\delta f'(r) + \frac{\delta f}{r} \right] + \frac{16}{5} h g(r) \delta g(r) \right. \\
& \quad + \frac{8}{3} h \left(\frac{W_0}{h} \right) \left[\delta f'(r) + \frac{\delta f}{r} \right] + \frac{16}{15} h \left[\delta f'(r) + \frac{\delta f}{r} \right] g(r) \\
& \quad + \left. \frac{16}{15} h \left[f'(r) + \frac{f}{r} \right] \delta g(r) \right\} r dr \\
& + \int 2G \left\{ \frac{32}{15} h \left[f'(r) \delta f'(r) + \frac{f}{r^2} \delta f \right] + \frac{16}{5} h g(r) \delta g(r) \right. \\
& \quad + \frac{8}{3h} f(r) \delta f(r) + \frac{16}{105} h^3 g'(r) \delta g'(r) - \frac{8}{15} h f(r) \delta g'(r) \\
& \quad \left. - \frac{8}{15} h g'(r) \delta f(r) \right\} r dr = 0. \tag{C-8a}
\end{aligned}$$

Expanding,

$$\begin{aligned}
& \int \lambda \left\{ \frac{32}{15} h \left[f'(r) + \frac{f}{r} \right] + \frac{8}{3} h \left(\frac{W_0}{h} \right) + \frac{16}{15} h g(r) \right\} \delta f'(r) r dr \\
& \quad + \int 2G \left\{ \frac{32}{15} h f'(r) \right\} \delta f'(r) r dr \\
& \quad + \int \lambda \left\{ \frac{32}{15} h \left[f'(r) + \frac{f}{r} \right] \left(\frac{1}{r} \right) + \frac{8}{3} h \left(\frac{W_0}{h} \right) \frac{1}{r} + \frac{16}{15} h \frac{g(r)}{r} \right\} \delta f(r) r dr \\
& \quad + \int 2G \left\{ \frac{32}{15} h \frac{f}{r^2} + \frac{8}{3h} f(r) - \frac{8}{15} h g'(r) \right\} \delta f(r) r dr \\
& \quad + \int 2G \left\{ \frac{16}{105} h^3 g'(r) - \frac{8}{15} h f(r) \right\} \delta g'(r) r dr \\
& \quad + \int \lambda \left\{ \frac{16}{5} h g(r) + \frac{16}{15} h \left[f'(r) + \frac{f}{r} \right] \right\} \delta g(r) r dr \\
& \quad + \int 2G \left\{ \frac{16}{5} h g(r) \right\} \delta g(r) dr = 0. \tag{C-8b}
\end{aligned}$$

From the first line of equation (C-8b),

$$\begin{aligned}
 & \int \lambda \left\{ \frac{32}{15} h \left[f'(r) + \frac{f(r)}{r} \right] + \frac{8}{3} h \left(\frac{W_0}{h} \right) + \frac{16}{15} h g(r) \right\} \delta f'(r) r dr \\
 &= \int \lambda r \left\{ \frac{32}{15} h \left[f'(r) + \frac{f(r)}{r} \right] + \frac{8}{3} h \left(\frac{W_0}{h} \right) + \frac{16}{15} h g(r) \right\} \delta f(r) \Big|_{r_i}^{r_o} \\
 & - \lambda \int \frac{1}{r} \left\{ \frac{32}{15} h \left[\frac{\partial}{\partial r} [r f'(r)] + f'(r) \right] + \frac{8}{3} h \left(\frac{W_0}{h} \right) + \frac{16}{15} h \frac{\partial}{\partial r} (r g(r)) \right\} \delta f(r) r dr \\
 &= \lambda r \left\{ \frac{32}{15} h \left[f'(r) + \frac{f(r)}{r} \right] + \frac{8}{3h} \left(\frac{W_0}{h} \right) + \frac{16}{15} h g(r) \right\} \delta f(r) \Big|_{r_i}^{r_o} \\
 & - \lambda \int \left\{ \frac{32}{15} h \left[f''(r) + \frac{2}{r} f'(r) \right] + \frac{8}{3} h \left(\frac{W_0}{h} \right) \frac{1}{r} + \frac{16}{15} h \left[g'(r) \right. \right. \\
 & \quad \left. \left. + \frac{g(r)}{r} \right] \right\} \delta f(r) r dr.
 \end{aligned}$$

From the second line of equation (C-8b),

$$\begin{aligned}
 & \int 2G \left\{ \frac{32}{15} h f'(r) \right\} \delta f'(r) r dr \\
 &= 2Gr \left\{ \frac{32}{15} h f'(r) \right\} \delta f(r) \Big|_{r_i}^{r_o} - 2G \int \frac{32}{15} h \frac{1}{r} \frac{\partial}{\partial r} [r f'(r)] \delta f(r) dr \\
 &= 2Gr \left\{ \frac{32}{15} h f'(r) \right\} \delta f(r) \Big|_{r_i}^{r_o} - 2G \left(\frac{32}{15} h \right) \int \left[f''(r) + \frac{f'(r)}{r} \right] \delta f(r) r dr.
 \end{aligned}$$

From the fifth line of equation (C-8b),

$$\begin{aligned}
 & \int 2G \left\{ \frac{16}{105} h^3 g'(r) - \frac{8}{15} h f(r) \right\} \delta g'(r) r dr \\
 &= 2Gr \left\{ \frac{16}{105} h^3 g'(r) - \frac{8}{15} h f(r) \right\} \delta g(r) \Big|_{r_i}^{r_o} \\
 & - 2G \int \frac{1}{r} \frac{\partial}{\partial r} \left\{ \frac{16}{105} h^3 r g'(r) - \frac{8}{15} h f(r) \right\} \delta g(r) r dr.
 \end{aligned}$$

Grouping terms in equation (C-8b), we have the differential equations for f and g :

$$\lambda \left\{ \frac{32}{15} h \left[f'' + \frac{1}{r} f' - \frac{f}{r^2} \right] + \frac{16}{15} h g' \right\} + 2G \left\{ \frac{32}{15} \left[f'' + \frac{f'}{r} - \frac{f}{r^2} \right] - \frac{8}{3h} f + \frac{8}{15} h g' \right\} = 0 \quad (\text{C-9a})$$

$$\lambda \left\{ \frac{16}{15} h g + \frac{16}{15} h \left[f' + \frac{1}{r} f \right] \right\} + 2G \left\{ \frac{16}{5} h g - \frac{16}{105} h^3 \left[g'' + \frac{1}{r} g' \right] + \frac{8}{15} h \left[f' + \frac{1}{r} f \right] \right\} = 0. \quad (\text{C-9b})$$

After rearrangement, the equations become

$$f'' + \frac{1}{r} f' - \frac{1}{r^2} f - \frac{5}{2h^2} \frac{G}{\lambda+2G} f + \frac{1}{2} \frac{\lambda+G}{\lambda+2G} g' = 0 \quad (\text{C-10a})$$

$$g'' + \frac{1}{r} g' - \frac{21}{2h^2} \frac{\lambda+2G}{G} g - \frac{7}{2h^2} \frac{\lambda+G}{G} \left[f' + \frac{1}{r} f \right] = 0. \quad (\text{C-10b})$$

The appropriate boundary conditions are

$$f' + \frac{\lambda}{\lambda+2G} \left\{ \frac{f}{r} + \frac{1}{2} g + \frac{5}{4} \left(\frac{W_0}{h} \right) \right\} = 0 \quad (\text{C-11a})$$

$$\frac{2}{7} h^2 g' - f = 0 \quad (\text{C-11b})$$

at $r = r_i$ and r_o .

For the sake of convenience, these equations are nondimensionalized with respect to h .

Defining

$$\bar{f} = \frac{f}{h}$$

$$\bar{r} = \frac{r}{h}$$

$$\bar{g} = g \left(\frac{r}{h} \right),$$

(C-12)

the set of equations becomes

$$\bar{f}'' + \frac{1}{\bar{r}} \bar{f}' - \frac{1}{\bar{r}^2} \bar{f} - \frac{5}{4} \frac{1-2\nu}{1-\nu} \bar{f} + \frac{1}{4} \frac{1}{1-\nu} \bar{g}' = 0 \quad (\text{C-13a})$$

$$\bar{g}'' + \frac{1}{\bar{r}} \bar{g}' - \frac{21(1-\nu)}{1-2\nu} \bar{g} - \frac{7}{2} \frac{1}{1-2\nu} (\bar{f}' + \frac{1}{\bar{r}} \bar{f}) = 0, \quad (\text{C-13b})$$

and at r_0 and r_i ,

$$\bar{f}' + \frac{\nu}{1-\nu} \left\{ \frac{\bar{f}}{\bar{r}} + \frac{1}{4} \bar{g} + \frac{5}{4} \left(\frac{W_0}{h} \right) \right\} = 0 \quad (\text{C-14a})$$

$$\frac{2}{7} \bar{g}' - \bar{f} = 0, \quad (\text{C-14b})$$

where prime denotes $d/d\bar{r}$, ν - Poisson's ratio and the following relation is used:

$$\lambda = \frac{2G\nu}{1-2\nu}. \quad (\text{C-15})$$

In the following, the bar will be dropped from quantities b, q , etc., with the understanding that they are nondimensional.

Define

$$a = \frac{5}{4} \frac{1-2\nu}{1-\nu}$$

$$b = \frac{1}{4} \frac{1}{1-\nu}$$

$$c = \frac{21(1-\nu)}{1-2\nu}$$

$$d = \frac{7}{2} \frac{1}{1-2\nu}. \quad (\text{C-16})$$

The differential equations can be written as

$$f'' + \frac{1}{r} f' - \frac{1}{r^2} f - af + bg' = 0 \quad (\text{C-17a})$$

$$g'' + \frac{1}{r} g' - cg - d(f' + \frac{1}{r} f) = 0. \quad (\text{C-17b})$$

Consider

$$\begin{aligned} f &= A I_1(kr) \\ g &= B I_0(kr). \end{aligned} \tag{C-18}$$

Where I's are modified Bessel functions of the first kind,

$$\begin{aligned} I_1' &= k I_0(kr) - \frac{1}{r} I_1(kr) \\ I_1'' &= k^2 I_1(kr) + \frac{2}{r^2} I_1(kr) - \frac{k}{r} I_0(kr) \\ I_0' &= k I_1(kr) \\ I_0'' &= k^2 I_0(kr) - \frac{k}{r} I_1(kr). \end{aligned} \tag{C-19}$$

Substituting into equations (C-17a) and (C-17b),

$$[(k^2 - a)A + kbB] I_1 = 0 \tag{C-20a}$$

$$[(k^2 - c)B - kdA] I_0 = 0 \tag{C-20b}$$

or

$$k^4 - (a + c - bd)k^2 + ac = 0. \tag{C-21}$$

It is noted that this equation is the same as equation (C-24); hence, the same k_1, k_2 will satisfy this equation and

$$F = - \frac{dk_i}{k_i^2 - c} E. \tag{C-22}$$

Now the general solution of equation (C-17) can be written as

$$f = A I_1(k_1 r) + B I_1(k_2 r) + E K_1(k_1 r) + F K_1(k_2 r) \tag{C-23}$$

$$\begin{aligned} g &= \frac{dk_1}{k_1^2 - c} A I_0(k_1 r) + \frac{dk_2}{k_2^2 - c} B I_0(k_2 r) - E \frac{dk_1}{k_1^2 - c} K_0(k_1 r) \\ &\quad - \frac{dk_2}{k_2^2 - c} F K_0(k_2 r). \end{aligned} \tag{C-24}$$

The derivatives are

$$f' = A[k_1 I_0(k_1 r) - \frac{1}{r} I_1(k_1 r)] + B[k_2 I_0(k_2 r) - \frac{1}{r} I_1(k_2 r)] - E[k_1 K_0(k_1 r) + \frac{1}{r} K_1(k_1 r)] - F[k_2 K_0(k_2 r) + \frac{1}{r} K_1(k_2 r)] \quad (C-25)$$

$$g' = \frac{dk_1}{k_1^{2-c}} A I_1(k_1 r) + \frac{dk_2}{k_2^{2-c}} B I_1(k_2 r) + \frac{dk_1}{k_1^{2-c}} E K_1(k_1 r) + \frac{dk_2}{k_2^{2-c}} F K_1(k_2 r). \quad (C-26)$$

Thus,

$$\begin{aligned} (k^2 - a)A + kbB &= 0 \\ -kdA + (k^2 - c)B &= 0. \end{aligned} \quad (C-27)$$

In order to have a solution, it is required that

$$\begin{pmatrix} k^2 - a & bk \\ -dk & k^2 - c \end{pmatrix} = 0 \quad (C-28)$$

or

$$k^4 - (a + c - bd)k^2 + ac = 0 \quad (C-29)$$

$$k^2 = \frac{1}{2}[(a + c - bd) \pm \sqrt{(a + c - bd)^2 - 4ac}]$$

$$k = \pm \left\{ \frac{1}{2}(a + c - bd) \pm \frac{1}{2} \sqrt{(a + c - bd)^2 - 4ac} \right\}^{\frac{1}{2}}. \quad (C-30)$$

Since $I_p(kr) = -I_p(-kr)$, it is noted that there are only two independent solutions corresponding to

$$k_1 = \left\{ \frac{1}{2}(a + c - bd) + \frac{1}{2} \sqrt{(a + c - bd)^2 - 4ac} \right\}^{\frac{1}{2}} \quad (C-31a)$$

and

$$k_2 = \left\{ \frac{1}{2}(a + c - bd) - \frac{1}{2} \sqrt{(a + c - bd)^2 - 4ac} \right\}^{\frac{1}{2}}. \quad (C-31b)$$

In both cases,

$$B = \frac{k_1 d}{k_1^2 - c} A. \quad (C-32)$$

Consider next

$$f = E K_1(kr)$$

$$g = F K_0(kr). \quad (C-33)$$

Where K's are modified Bessel functions of the second kind,

$$K_1' = -k K_0(kr) - \frac{1}{r} K_1(kr)$$

$$K_1'' = k^2 K_1(kr) + \frac{2}{r^2} K_1(kr) + \frac{k}{r} K_0(kr) \quad (C-34)$$

$$K_0' = -k K_1(kr)$$

$$K_0'' = k^2 K_0(kr) + \frac{k}{r} K_1(kr).$$

Substituting into equations (C-17),

$$[(k^2 - a)E - bkF] K_1 = 0$$

$$[(k^2 - c)F + dkE] K_0 = 0. \quad (C-35)$$

Thus,

$$\begin{aligned} (k^2 - a)E - bkF &= 0 \\ dkE + (k^2 - c)F &= 0. \end{aligned} \quad (C-36)$$

In order for this set to have a solution,

$$\begin{pmatrix} (k^2 - a) & -bk \\ dk & (k^2 - c) \end{pmatrix} = 0. \quad (C-37)$$

Substituting into equations (C-11),

$$\begin{aligned} \left(\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1\right) [A I_1(k_1 r_i) + E K_1(k_1 r_i)] + \left(\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1\right) [B I_1(k_2 r_i) \\ + F K_1(k_2 r_i)] = 0 \end{aligned}$$

$$\begin{aligned} \left(\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1\right) [A I_1(k_1 r_o) + E K_1(k_1 r_o)] + \left(\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1\right) [B I_1(k_2 r_o) \\ + F K_1(k_2 r_o)] = 0 \end{aligned}$$

and

$$\begin{aligned} A[k_1 I_o(k_1 r_i) - \frac{1}{r_i} I_1(k_1 r_i) + \frac{v}{1-v} (\frac{1}{r_i} I_1(k_1 r_i) + \frac{1}{2} \frac{dk_1}{k_1^2 - c} I_o(k_1 r_i))] \\ + B[k_2 I_o(k_2 r_i) - \frac{1}{r_i} I_1(k_2 r_i) + \frac{v}{1-v} (\frac{1}{r_i} I_1(k_2 r_i) + \frac{1}{2} \frac{dk_2}{k_2^2 - c} I_o(k_2 r_i))] \\ - E[k_1 K_o(k_1 r_i) + \frac{1}{r_i} K_1(k_1 r_i) - \frac{v}{1-v} (\frac{1}{r_i} K_1(k_1 r_i) - \frac{1}{2} \frac{dk_1}{k_1^2 - c} K_o(k_1 r_i))] \\ - F[k_2 K_o(k_2 r_i) + \frac{1}{r_i} K_1(k_2 r_i) - \frac{v}{1-v} (\frac{1}{r_i} K_1(k_2 r_i) - \frac{1}{2} \frac{dk_2}{k_2^2 - c} K_o(k_2 r_i))] \\ = \frac{5}{4} \frac{v}{1-v} \frac{w_o}{h} \end{aligned} \quad (C-38)$$

$$\begin{aligned}
& A[k_1 I_0(k_1 r_0) - \frac{1}{r_0} I_1(k_1 r_0) + \frac{\nu}{1-\nu} (\frac{1}{r_0} I_1(k_1 r_0) + \frac{1}{2} \frac{dk_1}{k_1^2 - c} I_0(k_1 r_0))] \\
& + B[k_2 I_0(k_2 r_0) - \frac{1}{r_0} I_1(k_2 r_0) + \frac{\nu}{1-\nu} (\frac{1}{r_0} I_1(k_2 r_0) + \frac{1}{2} \frac{dk_2}{k_2^2 - c} I_0(k_2 r_0))] \\
& - E[k_1 K_0(k_1 r_0) + \frac{1}{r_0} K_1(k_1 r_0) - \frac{\nu}{1-\nu} (\frac{1}{r_0} K_1(k_1 r_0) - \frac{1}{2} \frac{dk_1}{k_1^2 - c} K_0(k_1 r_0))] \\
& - F[k_2 K_0(k_2 r_0) + \frac{1}{r_0} K_1(k_2 r_0) - \frac{\nu}{1-\nu} (\frac{1}{r_0} K_1(k_2 r_0) - \frac{1}{2} \frac{dk_2}{k_2^2 - c} K_0(k_2 r_0))] \\
& = - \frac{5}{4} (\frac{\nu}{1-\nu}) \frac{w_0}{h}. \tag{C-39}
\end{aligned}$$

For very large values of kr , the modified Bessel functions have the asymptotic behavior

$$\begin{aligned}
I_\rho(kr) & \sim \frac{e^{kr}}{\sqrt{2\pi kr}} & (kr \rightarrow \infty) & \tag{C-40} \\
I_\rho(kr) & \sim \frac{e^{-kr}}{\sqrt{\frac{2}{\pi} kr}}.
\end{aligned}$$

Using this and a set of new constants defined by

$$\begin{aligned}
A' & = e^{k_1 r_0} \frac{1}{\sqrt{2\pi k_1 r_0}} A & B' & = e^{k_2 r_0} \frac{1}{\sqrt{2\pi k_2 r_0}} B \\
E' & = e^{-k_1 r_0} \frac{1}{\sqrt{\frac{2}{\pi} k_1 r_0}} E & F' & = e^{-k_2 r_0} \frac{1}{\sqrt{\frac{2}{\pi} k_2 r_0}} F,
\end{aligned} \tag{C-41}$$

the four boundary conditions are written as

$$\begin{aligned}
 A' \left(\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1 \right) \sqrt{\frac{r_o}{r_i}} e^{k_1(r_i - r_o)} + B' \left(\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1 \right) \sqrt{\frac{r_o}{r_i}} e^{k_2(r_i - r_o)} \\
 + E' \left(\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1 \right) + F' \left(\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1 \right) = 0
 \end{aligned} \tag{C-42a}$$

$$\begin{aligned}
 A' \left(\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1 \right) + B' \left(\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1 \right) + E' \left(\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1 \right) \sqrt{\frac{r_i}{r_o}} e^{-k_1(r_o - r_i)} \\
 + F' \left(\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1 \right) \sqrt{\frac{r_i}{r_o}} e^{-k_2(r_o - r_i)} = 0
 \end{aligned} \tag{C-42b}$$

$$\begin{aligned}
 A' \left[k_1 - \frac{1}{r_i} + \frac{v}{1-v} \left(\frac{1}{r_i} + \frac{1}{2} \frac{dk_1}{k_1^2 - c} \right) \right] \sqrt{\frac{r_o}{r_i}} e^{k_1(r_i - r_o)} + B' \left[k_2 - \frac{1}{r_i} + \frac{v}{1-v} \right. \\
 \left. + \frac{1}{2} \frac{dk_2}{k_2^2 - c} \right] \sqrt{\frac{r_o}{r_i}} e^{k_2(r_i - r_o)} - E' \left[k_1 + \frac{1}{r_i} - \frac{v}{1-v} \left(\frac{1}{r_i} - \frac{dk_1}{k_1^2 - c} \right) \right] \\
 - F' \left[k_2 + \frac{1}{r_i} - \frac{v}{1-v} \left(\frac{1}{r_i} - \frac{dk_2}{k_2^2 - c} \right) \right] = - \frac{5}{4} \left(\frac{v}{1-v} \right) \frac{w_o}{h}
 \end{aligned} \tag{C-42c}$$

$$\begin{aligned}
& A' \left[k_1 - \frac{1}{r_0} + \frac{v}{1-v} \left(\frac{1}{r_0} + \frac{1}{2} \frac{dk_1}{k_1^2 - c} \right) \right] + B' \left[k_2 - \frac{1}{r_0} + \frac{v}{1-v} \left(\frac{1}{r_0} + \frac{1}{2} \frac{dk_2}{k_2^2 - c} \right) \right] \\
& - E' \left[k_1 + \frac{1}{r_0} - \frac{v}{1-v} \left(\frac{1}{r_0} - \frac{1}{2} \frac{dk_1}{k_1^2 - c} \right) \right] \sqrt{\frac{r_i}{r_0}} e^{-k_1(r_0 - r_i)} - F' \left[k_2 \right. \\
& \left. + \frac{1}{r_0} - \frac{v}{1-v} \left(\frac{1}{r_0} - \frac{1}{2} \frac{dk_2}{k_2^2 - c} \right) \right] \sqrt{\frac{r_i}{r_0}} e^{-k_2(r_0 - r_i)} = -\frac{5}{4} \left(\frac{v}{1-v} \right) \frac{w_0}{h}. \quad (C-42d)
\end{aligned}$$

For large values of $r_0 - r_i$, A' , B' in equations (C-42a and c) and E' , F' in equations (C-42b and d) can be disregarded.

Hence,

$$E' = - \frac{\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1}{\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1} F',$$

$$\begin{aligned}
& E' \left[k_1 + \frac{1}{r_i} - \frac{v}{1-v} \left(\frac{1}{r_i} - \frac{dk_1}{k_1^2 - c} \right) \right] + F' \left[k_2 + \frac{1}{r_i} - \frac{v}{1-v} \left(\frac{1}{r_i} - \frac{1}{2} \frac{dk_2}{dk_2^2 - c} \right) \right] \\
& = \frac{5}{4} \left(\frac{v}{1-v} \right) \frac{w_0}{h}, \quad (C-43)
\end{aligned}$$

and

$$A' = - \frac{\frac{2}{7} \frac{dk_2^2}{k_2^2 - c} - 1}{\frac{2}{7} \frac{dk_1^2}{k_1^2 - c} - 1} B',$$

$$\begin{aligned}
& A' \left[k_1 - \frac{1}{r_0} + \frac{v}{1-v} \left(\frac{1}{r_0} + \frac{1}{2} \frac{dk_1}{k_1^2 - c} \right) \right] + B' \left[k_2 - \frac{1}{r_0} + \frac{v}{1-v} \left(\frac{1}{r_0} + \frac{1}{2} \frac{dk_2}{k_2^2 - c} \right) \right] \\
& = -\frac{5}{4} \left(\frac{v}{1-v} \right) \frac{w_0}{h}. \quad (C-44)
\end{aligned}$$

In terms of A's, the general solution can be written as

$$\begin{aligned}
 f &= A' \sqrt{\frac{r_0}{r}} e^{k_1(r-r_0)} + B' \sqrt{\frac{r_0}{r}} e^{k_2(r-r_0)} + E' \sqrt{\frac{r_0}{r}} e^{-k_1(r-r_0)} \\
 &\quad + F' \sqrt{\frac{r_0}{r}} e^{-k_2(r-r_0)} \\
 g &= \frac{dk_1}{k_1^2-c} A' \sqrt{\frac{r_0}{r}} e^{k_1(r-r_0)} + \frac{dk_2}{k_2^2-c} B' \sqrt{\frac{r_0}{r}} e^{k_2(r-r_0)} \\
 &\quad - E' \frac{dk_1}{k_1^2-c} \sqrt{\frac{r_0}{r}} e^{-k_1(r-r_i)} - F' \frac{dk_2}{k_2^2-c} \sqrt{\frac{r_i}{r}} e^{-k_2(r-r_i)}. \quad (C-45)
 \end{aligned}$$

When $r_0 - r_i$ is large, the solution can be further simplified:

(1) Region near r_0 ,

$$\begin{aligned}
 f &= A' \sqrt{\frac{r_0}{r}} e^{k_1(r-r_0)} + B' \sqrt{\frac{r_0}{r}} e^{k_2(r-r_0)} \\
 g &= A' \frac{dk_1}{k_1^2-c} \sqrt{\frac{r_0}{r}} e^{k_1(r-r_0)} + B' \frac{dk_2}{k_2^2-c} \sqrt{\frac{r_0}{r}} e^{k_2(r-r_0)}. \quad (C-46)
 \end{aligned}$$

(2) Region near r_i ,

$$\begin{aligned}
 f &= E' \sqrt{\frac{r_i}{r}} e^{-k_1(r-r_i)} + F' \sqrt{\frac{r_i}{r}} e^{-k_2(r-r_i)} \\
 g &= -E' \frac{dk_1}{k_1^2-c} \sqrt{\frac{r_i}{r}} e^{-k_1(r-r_i)} - F' \frac{dk_2}{k_2^2-c} \sqrt{\frac{r_i}{r}} e^{-k_2(r-r_i)}. \quad (C-47)
 \end{aligned}$$

(3) Away from ends,

$$\begin{aligned}
 f &= 0 \\
 g &= 0. \quad (C-48)
 \end{aligned}$$

Calculation of stresses is

$$\begin{aligned}\sigma_z &= (\lambda + 2G) \frac{\partial w}{\partial z} + \lambda \left(\frac{\partial u}{\partial r} + \frac{u}{r} \right) \\ \sigma_{rz} &= G \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right)\end{aligned}\tag{C-50}$$

at points on bonded surfaces ($z = \pm h$)

$$\begin{aligned}\frac{\partial u}{\partial r} = \frac{u}{r} &= 0 \\ \frac{\partial w}{\partial r} &= 0 ;\end{aligned}$$

thus, at $z = h$,

$$\begin{aligned}\sigma_z &= (\lambda + 2G) \frac{\partial w}{\partial z} \\ &= \frac{2G(1-\nu)}{1-2\nu} \left(\frac{w_0}{h} - 2g \right) \\ \sigma_{rz} &= -2G f.\end{aligned}\tag{C-51}$$

Average σ_z at bonded surface is

$$\begin{aligned}\sigma_{z, \text{avg}} \Big|_{z=+h} &= \frac{2}{r_o^2 - r_i^2} \int_{r_i}^{r_o} \sigma_z \Big|_{z=+h} r dr \\ &= 2 \left(\frac{2G(1-\nu)}{1-2\nu} \right) \left(\frac{1}{r_o^2 - r_i^2} \right) \int_{r_i}^{r_o} \frac{\partial w}{\partial z} r dr \\ &= \left(\frac{2G(1-\nu)}{1-2\nu} \right) \left\{ \left(\frac{w_0}{h} \right) - \frac{4}{r_o^2 - r_i^2} \int_{r_i}^{r_o} g r dr \right\},\end{aligned}\tag{C-52}$$

since

$$g = \frac{dk_1}{k_1^{2-c}} [A I_0(k_1 r) - E K_0(k_1 r)] \\ + \frac{dk_2}{k_2^{2-c}} [B I_0(k_2 r) - F K_0(k_2 r)]$$

$$\int_{r_i}^{r_o} g r dr = \left\{ \frac{d}{k_1^{2-c}} [A r I_1(k_1 r) + E r K_1(k_1 r)] \right. \\ \left. + \frac{dr}{k_2^{2-c}} [B I_1(k_2 r) + F K_1(k_2 r)] \right\} \int_{r_i}^{r_o} \\ = r_o \left\{ \frac{d}{k_1^{2-c}} [A I_1(k_1 r_o) + E K_1(k_1 r_o)] + \frac{d}{k_2^{2-c}} [B I_1(k_2 r_o) \right. \\ \left. + F K_1(k_2 r_o)] \right\} \\ - r_i \left\{ \frac{d}{k_1^{2-c}} [A I_1(k_1 r_i) + E K_1(k_1 r_i)] + \frac{d}{k_2^{2-c}} [B I_1(k_2 r_i) \right. \\ \left. + F K_1(k_2 r_i)] \right\}.$$

For very large values of kr ,

$$\int_{r_i}^{r_o} g r dr = r_o \left\{ \frac{d}{k_1^{2-c}} \left[A \frac{e^{+k_1 r_o}}{\sqrt{2\pi k_1 r_o}} + E \frac{e^{-k_1 r_o}}{\sqrt{\frac{2}{\pi} k_1 r_o}} \right] + \frac{d}{k_2^{2-c}} \left[B \frac{e^{k_1 r_o}}{\sqrt{2\pi k_2 r_o}} \right. \right. \\ \left. \left. + F \frac{e^{-k_2 r_o}}{\sqrt{\frac{2}{\pi} k_2 r_o}} \right] \right\}$$

$$- r_i \left\{ \frac{d}{k_1^2 - c} \left[A \frac{e^{k_1 r_i}}{\sqrt{2\pi k_1 r_i}} + E \frac{e^{-k_1 r_i}}{\sqrt{\frac{2}{\pi} k_1 r_i}} \right] + \frac{d}{k_2^2 - c} \left[B \frac{e^{k_2 r_i}}{\sqrt{2\pi k_2 r_i}} + F \frac{e^{-k_2 r_i}}{\sqrt{\frac{2}{\pi} k_2 r_i}} \right] \right\}$$

$$= r_o \left\{ \frac{d}{k_1^2 - c} (A' + E' \sqrt{\frac{r_i}{r_o}} e^{-k_1(r_o - r_i)}) + \frac{d}{k_2^2 - c} (B' + F' \sqrt{\frac{r_i}{r_o}} e^{-k_2(r_o - r_i)}) \right\}$$

$$- r_i \left\{ \frac{d}{k_1^2 - c} (A' \sqrt{\frac{r_o}{r_i}} e^{-k_1(r_o - r_i)} + E') + \frac{d}{k_2^2 - c} (B' \sqrt{\frac{r_o}{r_i}} e^{-k_2(r_o - r_i)} + F') \right\}$$

or

$$\int_{r_i}^{r_o} g r dr = r_o \left(\frac{d}{k_1^2 - c} A' + \frac{d}{k_2^2 - c} B' \right) - r_i \left(\frac{d}{k_1^2 - c} E' + \frac{d}{k_2^2 - c} F' \right)$$

and

$$\sigma_{z \max} \Big|_{z=h} = \frac{2G(1-\nu)}{1-2\nu} \left(\frac{w_o}{h} \right); \quad (C-53)$$

hence,

$$\frac{\sigma_{z \max}}{\sigma_{z \text{ avg}}} = \frac{\left(\frac{w_o}{h} \right)}{\frac{w_o}{h} \left(\frac{4}{r_o^2 - r_i^2} \right) \int_{r_i}^{r_o} g r dr} \quad (C-54)$$

It is also noted that the maximum shear stress occurs at the outer edge; i. e., $r = r_o$.

Hence,

$$\begin{aligned} \frac{\sigma_{rz \text{ max}}}{\sigma_{z \text{ avg}}} &= \frac{+ 2G f(r_o)}{\frac{2G(1-\nu)}{1-2\nu} \left(\frac{w_o}{h} - \frac{4}{r_o^2 - r_i^2} \int_{r_i}^{r_o} grdr \right)} \\ &= \frac{f(r_o)}{\frac{1-\nu}{1-2\nu} \left(\frac{w_o}{h} - \frac{4}{r_o^2 - r_i^2} \int_{r_i}^{r_o} grdr \right)}. \end{aligned} \quad (C-55)$$

This is programmed for the computer as follows:

Let

$$\begin{aligned} \bar{f} &= X1 & \bar{f}' &= Z1 \\ \bar{g} &= X2 & \bar{g}' &= Z2. \end{aligned}$$

The differential equations can be written as

$$(Z1)' + \frac{1}{r} Z1 - \frac{1}{r^2} X1 - \frac{5}{4} \frac{1-2\nu}{1-\nu} X1 + \frac{1}{4} \frac{1}{1-\nu} Z2 = 0$$

$$(X1)' = Z1$$

$$(Z2)' + \frac{1}{r} Z2 - \frac{2(1-\nu)}{1-2\nu} X2 - \frac{7}{2(1-2\nu)} \left(Z1 + \frac{1}{r} X1 \right) = 0$$

$$(X2)' = Z2.$$

Define

$$AA = \frac{1-2\nu}{1-\nu}$$

$$BB = \frac{1}{1-\nu}$$

$$CC = \frac{1}{1-2\nu}$$

$$DRAD = (RADN - RAD\emptyset)/FNR$$

$$RAD = RAD\emptyset + FI * RAD \quad FI = I - 1$$

$$NRR = (NR/NP) + 1.0$$

ND - number of intervals skipped during printing

$$(Z1)' = \frac{1}{RAD} Z1 + \frac{1}{RAD^2} X1 + (1.25 * AA) * (X1) - (0.25 * BB) * Z2$$

$$(X1)' = Z1$$

$$(Z1)' = 1 \frac{1}{RAD} Z2 + \frac{21}{AA} * Z2 + 3.5 * CC * (Z1 + \frac{X1}{RAD})$$

$$(X2)' = Z2 .$$

Define

$$DERZ1F (A,B,C,D) = DRAD * \left(\frac{A}{D} + \frac{B}{D * D} + (1.25 * AA) * B - 0.25 * BB * C \right)$$

$$DERX1F (A) = DRAD * A$$

$$DERZ2F (A,B,C,D,E) = DRAD * \left(-\frac{C}{E} + \frac{21}{AA} * D + 3.5 * CC * (A + \frac{B}{E}) \right)$$

$$DERX2F (A) = DRAD * A .$$

The four independent solutions of X1, Z1, X2, Z2 are

$$X1 \quad S2(1,IJ), \quad S2(2,IJ), \quad S2(3,IJ), \quad S2(4,IJ)$$

$$Z1 \quad S1(1,IJ), \quad S1(2,IJ), \quad S1(3,IJ), \quad S1(4,IJ)$$

$$X2 \quad S4(1,IJ), \quad S4(2,IJ), \quad S4(3,IJ), \quad S4(4,IJ)$$

$$Z2 \quad S3(1,IJ), \quad S3(2,IJ), \quad S3(3,IJ), \quad S3(4,IJ).$$

Where the first index denotes number of independent solutions,

$$F(IJ) = A(1) S2(1,IJ) + A(2) S2(2,IJ) + A(3) S2(3,IJ) + A(4) S2(4,I) = X1$$

$$FF(IJ) = A(1) S1(1,IJ) + A(2) S1(2,IJ) + A(3) S1(3,IJ) + A(4) S1(4,IJ) = Z1$$

$$G(IJ) = A(1) S4(1,IJ) + A(2) S4(2,IJ) + A(3) S4(3,IJ) + A(4) S4(4,IJ) = X2$$

$$GG(IJ) = A(1) S3(1,IJ) + A(2) S3(2,IJ) + A(3) S3(3,IJ) + A(4) S3(4,IJ) = Z2.$$

Since the boundary condition states

$$\bar{f}' + \left(\frac{v}{1-v}\right) \left(\frac{\bar{f}}{r_i} + \frac{1}{2} \bar{g}\right) = -\frac{5}{4} \left(\frac{v}{1-v}\right) \frac{w_0}{h}$$

$$\bar{f}' + \left(\frac{v}{1-v}\right) \left(\frac{\bar{f}}{r_o} + \frac{1}{2} \bar{g}\right) = -\frac{5}{4} \left(\frac{v}{1+v}\right) \frac{w_0}{h}$$

$$2/7 \bar{g}' - \bar{f} = 0$$

$$2/7 \bar{g}' - \bar{f} = 0,$$

using

$$DD = GNU/(1.0 - GNU)$$

$$w\phi = w_0/h$$

and

$$F, FF, G, GG,$$

the following are obtained:

$$\begin{aligned} & \left(S1(1,1) + DD * \left(\frac{S2(1,1)}{RAD\phi} + 0.5 * S4(1,1) \right) \right) A_1 \\ & + \left(S1(2,1) + DD * \left(\frac{S2(2,1)}{RAD\phi} + 0.5 * S4(2,1) \right) \right) A_2 \\ & + \left(S1(3,1) + DD * \left(\frac{S2(3,1)}{RAD\phi} + 0.5 * S4(3,1) \right) \right) A_3 \\ & + \left(S1(4,1) + DD * \left(\frac{S2(4,1)}{RAD\phi} + 0.5 * S4(4,1) \right) \right) A_4 = - DD * w\phi * 1.25 \\ \\ & \left(S1(1,NRR) + DD * \left(\frac{S2(1,NRR)}{RADN} + 0.5 * S4(1,NRR) \right) \right) A_1 \\ & + \left(S1(2,NRR) + DD * \left(\frac{S2(2,NRR)}{RADN} + 0.5 * S4(2,NRR) \right) \right) A_2 \\ & + \left(S1(3,NRR) + DD * \left(\frac{S2(3,NRR)}{RADN} + 0.5 * S4(3,NRR) \right) \right) A_3 \\ & + \left(S1(4,NRR) + DD * \left(\frac{S2(4,NRR)}{RADN} + 0.5 * S4(4,NRR) \right) \right) A_4 = - DD * 1.25 * W\phi \end{aligned}$$

$$\begin{aligned} & \left(\frac{2}{7} S3(1,1) - S2(1,1) \right) A_1 + \left(\frac{2}{7} S3(2,1) - S2(2,1) \right) A_2 \\ & + \left(\frac{2}{7} S3(3,1) - S2(3,1) \right) A_3 + \left(\frac{2}{7} S3(4,1) - S2(4,1) \right) A_4 = 0 \\ & \left(\frac{2}{7} S3(1,NRR) - S2(1,NRR) \right) A_1 + \left(\frac{2}{7} S3(2,NRR) - S2(2,NRR) \right) A_2 \\ & + \left(\frac{2}{7} S3(3,NRR) - S2(3,NRR) \right) A_3 + \left(\frac{2}{7} S3(4,NRR) - S2(4,NRR) \right) A_4 = 0. \end{aligned}$$

Let these equations be represented as

$$\{TRX\} \{A\} = \{B\}.$$

Solving for A,

$$\{TRX\}^{-1} \{B\} = \{A\}.$$

Since B can be written as

$$\begin{aligned} & - DD^* 1.25^* w \begin{Bmatrix} 1 \\ 1 \\ 0 \\ 0 \end{Bmatrix}, \\ \{A\} & = - DD^* 1.25^* w \{TRX\}^{-1} \begin{Bmatrix} 1 \\ 1 \\ 0 \\ 0 \end{Bmatrix}. \end{aligned}$$

Calculation of stresses is

$$\begin{aligned} \sigma_{ij} & = \lambda \Delta \delta_{ij} + 2G \epsilon_{ij} \\ \sigma_z & = \lambda \Delta + 2G \epsilon_z \\ & = (\lambda + 2G) \epsilon_z + \lambda (\epsilon_\theta + \epsilon_r) \\ & = (\lambda + 2G) \frac{\partial w}{\partial z} + \lambda \left(\frac{\partial u}{\partial r} + \frac{u}{r} \right). \\ \sigma_{rz} & = 2G \epsilon_{rz} \\ & = G \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right). \end{aligned}$$

Consider points on flat surface ($z = \pm h$),

$$\frac{\partial u}{\partial r} = \frac{u}{r} = 0$$

$$\frac{\partial w}{\partial r} = 0.$$

Thus,

$$\begin{aligned}\sigma_z &= (\lambda + 2G) \frac{\partial w}{\partial z} = (\lambda + 2G) \left[\frac{w}{h} - 2g(r) \right] \\ &= (\lambda + 2G) (w\dot{\phi} - 2G) = \frac{2G(1-\nu)}{1-2\nu} (w\dot{\phi} - 2G)\end{aligned}$$

$$\sigma_{rz} = G \frac{\partial u}{\partial z} = -2G \frac{f(r)}{h} = -2G \bar{f}.$$

APPENDIX D

PURE TORSION IN LARGE-DEFORMATION ELASTICITY OF AN INCOMPRESSIBLE ELASTOMER

Take as a reference frame cylindrical coordinates r, θ, z in the deformed body. Then a point r, θ, z was initially at the point $\rho, \theta - \zeta z, z$, where ρ is assumed to be a function of r only, and the point of the undeformed body is given by

$$\begin{aligned} x_1 &= \rho \cos(\theta - \zeta z), \\ x_2 &= \rho \sin(\theta - \zeta z), \\ x_3 &= z, \end{aligned} \tag{D-1}$$

where ζ is the angle of rotation in the z direction.

The components G_{ij}, G^{ij} of the metric tensor of the deformed body are

$$G_{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix}, \quad G^{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1/r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix}. \tag{D-2}$$

&
(D-3)

The components g_{ij}, g^{ij} of the metric tensor of the undeformed body are

$$g_{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & r^2 & -\zeta r^2 \\ 0 & -\zeta r^2 & 1 + \zeta^2 r^2 \end{pmatrix}, \quad g^{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \zeta^2 + 1/r^2 & \zeta \\ 0 & \zeta & 1 \end{pmatrix}. \tag{D-4}$$

&
(D-5)

Since $G = g = r^2$, the incompressibility equation $I_3 = 1$ is satisfied.

Consider the Mooney stress-strain relation for which the strain energy functions are given in terms of two constants, C_1 and C_2 .

$$W = C_1(I_1 - 3) + C_2(I_2 - 3). \tag{D-6}$$

Thus, from equations (E-7) and (E-7a),

$$\begin{aligned} \Phi &= 2C_1, & \bar{\Psi} &= 2C_2 \\ Q_{ik} &= \left\{ \begin{array}{ccc} 2+\zeta^2 r^2 & 0 & 0 \\ 0 & \zeta^2 + \frac{2}{r^2} & \zeta \\ 0 & \zeta & 2 \end{array} \right\}. \end{aligned} \quad (D-7)$$

The contravariant stress tensor is

$$\left. \begin{aligned} \tau^{11} &= 2(C_1 + 2C_2) + 2C_2 \zeta^2 r^2 + P \\ r^2 \tau^{22} &= 2(C_1 + 2C_2) + 2(C_1 + C_2) \zeta^2 r^2 + P \\ \tau^{33} &= 2(C_1 + 2C_2) + P \\ \tau^{33} &= 2(C_1 + C_2)\zeta \\ \tau^{31} &= \tau^{12} = 0 \end{aligned} \right\} \quad (D-8)$$

The equilibrium equations are

$$\tau_{i \quad i}^{ik} + \Gamma_{ir}^i \tau^{rk} + \Gamma_{ir}^k \tau^{ir} = 0. \quad (D-9)$$

From the metric tensor for a deformed body,

$$\begin{aligned} \Gamma_{22}^1 &= -r \\ \Gamma_{12}^2 &= \Gamma_{21}^2 = 1/r. \end{aligned} \quad (D-10)$$

The rest are zero.

The equilibrium equations are

$$\left. \begin{aligned} \frac{\partial \tau^{11}}{\partial r} + \frac{1}{r} \tau^{11} - r \tau^{22} &= 0 \\ \frac{\partial \tau^{22}}{\partial \theta} &= 0 \\ \frac{\partial \tau^{33}}{\partial z} &= 0 \end{aligned} \right\} \quad (D-11)$$

or

$$\left. \begin{aligned} \frac{\partial P}{\partial r} + 4C_2 \zeta^2 r + \frac{1}{r} \{2C_2 \zeta^2 r^2 - 2(C_1 + C_2) \zeta^2 r^2\} &= 0 \\ \frac{\partial P}{\partial \theta} &= 0 \\ \frac{\partial P}{\partial z} &= z \end{aligned} \right\} \quad (D-12)$$

From equation (D-7),

$$\frac{\partial P}{\partial r} + (4C_2 - 2C_1) \zeta^2 r = 0$$

and

$$P = (C_1 - 2C_2) \zeta^2 r^2 + \alpha. \quad (D-13)$$

Since

$$\tau^{11} = 0 \quad \text{at } r = r_o \quad (\text{outer radius})$$

$$P = -2(C_1 + 2C_2) - 2C_2 \zeta^2 r_o^2$$

$$\alpha = -2(C_1 + 2C_2) - C_1 \zeta^2 r_o^2 \quad (D-14)$$

$$\therefore P = -2(C_1 + 2C_2) - C_1 \zeta^2 r_o^2 + (C_1 - 2C_2) \zeta^2 r^2 \quad (D-15)$$

$$\left. \begin{aligned}
 \tau^{11} &= -c_1 \zeta^2 r_o^2 + c_1 \zeta^2 r^2 = c_1 \zeta^2 (r^2 - r_o^2) \\
 r^2 \tau^{22} &= 3c_1 \zeta^2 r^2 - c_1 \zeta^2 r_o^2 = c_1 \zeta^2 (3r^2 - r_o^2) \\
 \tau^{33} &= -c_1 \zeta^2 r_o^2 + (c_1 - 2c_2) \zeta^2 r^2 \\
 \tau^{23} &= 2(c_1 + c_2) \zeta
 \end{aligned} \right\} \quad (D-16)$$

The physical components of stress are

$$\sigma_{ij} = \sqrt{G_{ij}/G^{ii}} \tau^{ij} \quad (\text{no sum}) \quad (D-17)$$

$$\left. \begin{aligned}
 \sigma_{11} &= \tau^{11} = c_1 \zeta^2 (r^2 - r_o^2) \\
 \sigma_{22} &= r^2 \tau^{22} = c_1 \zeta^2 (3r^2 - r_o^2) \\
 \sigma_{33} &= \tau^{33} = c_1 \zeta^2 (r^2 - r_o^2) - 2c_2 \zeta^2 r^2 \\
 \sigma_{23} &= r \tau^{23} = 2(c_1 + c_2) r \zeta \\
 \sigma_{31} &= \sigma_{12} = 0
 \end{aligned} \right\} \quad (D-18)$$

The surface tractions at plane end (bonded surface) are

$$\left. \begin{aligned}
 T_r &= 0 \\
 T_\theta &= r \tau^{22} \\
 T_z &= \tau^{33}
 \end{aligned} \right\} \quad (D-19)$$

The moment required for the twist is

$$\begin{aligned}
 M &= \int (rT\theta) r dr d\theta = \int r^3 \tau^2 dr d\theta \\
 &= 2\pi \int_b^a C_1 \zeta^2 (3r^3 - r_o^2) dr \\
 &= 2\pi C_1 \zeta^2 \left[\frac{3r^4}{4} - \frac{r_o^2 r^2}{2} \right]_{r_i}^{r_o} = 2\pi C_1 \zeta^2 \left[+ \frac{r_o^4}{4} - \frac{r_i^4}{4} + \frac{r_o^2 r_i^2}{2} \right] \\
 M &= \frac{\pi}{2} C_1 \zeta^2 [r_o^4 - r_i^4 + 2r_o^2 r_i^2] . \tag{D-20}
 \end{aligned}$$

Force is also required to prevent elongation:

$$\begin{aligned}
 N &= 2\pi \int_a^b \tau^3 r dr = 2\pi \int_a^b [C_1 \zeta^2 (r^2 - r_o^2) - 2C_2 \zeta^2 r^2] r dr \\
 &= 2\pi \left\{ -C_1 \zeta^2 r_o^2 / 2 (r_o^2 - r_i^2) + (C_1 - 2C_2) \zeta^2 \frac{1}{4} (r_o^4 - r_i^4) \right\} \\
 &= 2\pi \zeta^2 \left\{ -\frac{C_1}{4} r_o^4 + \frac{C_1}{2} r_o^2 r_i^2 - \frac{C_2}{2} (r_o^4 - r_i^4) \right\} . \tag{D-21}
 \end{aligned}$$

It is found that in order to maintain this state of deformation, pressure must be applied at the inner curve surface. The magnitude of the pressure is

$$-C_1 \zeta^2 (\Gamma_o^2 - \Gamma_i^2)$$

where

Γ_i = inner radius

Γ_o = outer radius.

APPENDIX E

LARGE-DEFORMATION ELASTICITY THEORY FOR AXIAL COMPRESSION

In order to characterize the deformation of an elastic body, the position of each point in the body before and after deformation must be described. That is, if a point in the undeformed body is at y^1, y^2, y^3 , then in the deformed body it will occupy the point x^1, x^2, x^3 . For the current problem, it is convenient to employ cylindrical coordinates for this description; therefore, an undeformed system (r, θ', z') is defined by

$$y^1 = r \cos \theta', \quad y^2 = r \sin \theta', \quad y^3 = z \quad (\text{E-1})$$

and a deformed system (ρ, θ, z) by

$$x^1 = \rho \cos \theta, \quad x^2 = \rho \sin \theta, \quad x^3 = z. \quad (\text{E-2})$$

In particular, since the loading in the present problem is axially symmetric, the deformation may be considered in the form

$$\rho = \rho(r, z'), \quad z = z(r, z') \text{ and } \theta = \theta' + t(r, z'). \quad (\text{E-3})$$

In order to determine these functions, it is useful to consider another description of the deformation. For this purpose, the distortion which the initial polar coordinate system undergoes as the body deforms can be taken into account if these coordinates are considered to be embedded in the material. To characterize this distortion, the metric tensors G_{ij} and g_{ij} , which are associated with the polar coordinates before and after deformation, are defined as

$$G_{ij} = \frac{\partial y^r}{\partial \varphi^i} \frac{\partial y^r}{\partial \varphi^j} \quad \text{and} \quad g_{ij} = \frac{\partial x^r}{\partial \varphi^i} \frac{\partial x^r}{\partial \varphi^j} \quad (\text{E-4})$$

where $\varphi^1 = r$, $\varphi^2 = \theta'$, $\varphi^3 = z'$. Using equation (E-1), we obtain

$$G_{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix}; \quad (\text{E-5})$$

and from equations (E-2) and (E-3),

$$g_{ij} = \begin{pmatrix} [(\frac{\partial \rho}{\partial r})^2 + \rho^2 (\frac{\partial t}{\partial r})^2 + (\frac{\partial z}{\partial r})^2] & \rho^2 \frac{\partial t}{\partial r} & [\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \rho^2 \frac{\partial t}{\partial r} \frac{\partial t}{\partial z'} + \frac{\partial}{\partial r} \frac{\partial z}{\partial z'}] \\ \rho^2 \frac{\partial t}{\partial r} & \rho^2 & \rho^2 \frac{\partial t}{\partial z'} \\ [\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \rho^2 \frac{\partial t}{\partial r} \frac{\partial t}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'}] & \rho^2 \frac{\partial t}{\partial z'} & [(\frac{\partial z}{\partial z'})^2 + \rho^2 (\frac{\partial t}{\partial z'})^2 + (\frac{\partial \rho}{\partial z'})^2] \end{pmatrix}. \quad (E-6)$$

In terms of the above metrics, G_{ij} and g_{ij} , the stresses τ^{ij} in the body may now be determined. As a first approach to the solution of the problem under consideration, we will consider the material to be incompressible and use constitutive relations given by

$$\tau^{ij} = \phi G^{ij} + \psi Q^{ij} + g_{ij} \quad (E-7)*$$

where

$$Q^{ij} = G^{rs} g_{rs} G^{ij} - G^{ir} G^{is} g_{rs}, \quad (E-7a)*$$

ψ and ϕ are constants, and ρ is a scalar function of position. Furthermore, from equations (E-5) and (E-6), the contravariant components of the undeformed and deformed coordinates which appear in equation (E-7) are found to be

$$G^{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1/r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (E-8)$$

and

$$g^{ij} = \begin{pmatrix} \text{Matrix where each component} \\ \text{is the cofactor of the cor-} \\ \text{responding component in array} \\ \text{(E-6). This is shown later as} \\ \text{(E-21).} \end{pmatrix}. \quad (E-9)$$

*See reference 2, equations 1.15.13 and 1.15.9, page 28.

Since the stresses are defined, it is now possible to obtain a set of equations whose solution will yield the desired functions (E-3). These equations are obtained by using the equilibrium equations

$$\tau_{,i}^{ij} + \Gamma_{ri}^i \tau^{rj} + \Gamma_{im}^j \tau^{im} = 0 \quad (E-10)$$

where the Γ_{st}^r are the Christoffel symbols of the second kind defined by

$$\Gamma_{st}^r = \frac{1}{2} g^{kr} [g_{sk,t} + g_{tk,s} - g_{st,k}] \quad (E-11)$$

and the stresses are given by equations (E-7).

It may be observed that, due to the complexity of the tensors g^{ij} and g_{ij} , the equilibrium equations as defined above will be extremely cumbersome (see Appendix D equations). It may also be observed that if we had, in relation (E-4), identified φ^i 's with the deformed rather than the undeformed coordinates, the resulting form of the equilibrium equations would have been greatly simplified. The following considerations, however, indicate that this approach is not practical, since it introduces difficulties in the boundary conditions. If the undeformed coordinates appear as the independent variables in the equilibrium equations, as is currently the case, the boundary is located by specifying its undeformed position. If, however, the equilibrium equations are simplified, as described above, the deformed coordinates will appear as the independent variable and the boundary must be located by specifying its deformed position, which is unknown until the problem has been solved. It is observed that the three equations (E-10) contain four unknowns: ρ , t , z , and P . However, using the fact that the material is incompressible, a fourth equation is obtained,

$$\frac{|G_{ij}|}{|g_{ij}|} = 1, \quad (E-12)$$

which states that the volume of any portion of the body remains constant.

Up to this point, the loading history of the body has not been discussed. However, it is apparent that unlike in a linear elastic theory, the order of loading must be specified. In order to build this information into the equations, the following considerations are used: Let ρ , t , z , and P be made up of contributions due to compression and torsion (i. e., let $\rho = \rho_c + \rho_t$, $z = z_c + z_t$, etc., where ρ_c and ρ_t represent components

after compression and tension, respectively). Since the compression is applied first, equations (E-10) are solved for ρ_c, z_c , and ρ_c (i. e., $t_c = 0$) with $\rho_t = t_c = z_t = P_t = 0$. Having solved for the compression contribution, the torsion contribution is now determined. It is observed that the torsion considerations are influenced by the initial compression by way of the compression-torsion coupling terms which appear in the equilibrium equations.

Having set up the field equations, we must now consider the boundary conditions.

Figure 15. Sketch of Coordinates for One Lamination.

For the compression problem, the boundary conditions which must be satisfied are as follows:

at

$$z' = \pm h, \quad z_c = \pm (h - \delta_o), \quad \rho_c = r \quad (\text{E-13})$$

at $r = R_o, R_i$, traction is zero, or in terms of a coordinate system on the boundary, $\tau^{nn} = \tau^{ns} = 0$,

or

$$\begin{aligned} \tau_c^{nn} &= \frac{\left(\frac{d\rho}{dz}\right)^2 \tau_c^{rr} + 2 \left(\frac{d\rho}{dz}\right) \tau_c^{rz'} + \tau_c^{z'z'}}{1 + \left(\frac{d\rho}{dz}\right)^2} = 0 \\ &= \tau_i^{ns} = \frac{-\left(\frac{d\rho}{dz}\right) \tau_c^{rr} + \left[\left(\frac{d\rho}{dz}\right)^2 - 1\right] \tau_c^{rz'} + \left(\frac{d\rho}{dz}\right) \tau_c^{z'z'}}{1 + \left(\frac{d\rho}{dz}\right)^2} = 0. \quad (\text{E-14}) \end{aligned}$$

And for the torsion problem,

$$\text{at } z' = \pm h, \quad z_t = z_c \pm (h - \delta_0), \quad \rho_t = \rho_c = r$$

$$\tau_t = \tau_0 \quad (\text{specified twist angle})$$

$$\text{at } r = R_o, R_i, \quad \tau_t^{nn} = \tau_c^{nn} = 0, \quad \tau_t^{ns} = \tau_c^{ns} = 0 \text{ and } \tau_t^{\theta'\theta'} = 0.$$

Having formulated the problem, a method for obtaining the solution will now be considered. For this purpose, consider rewriting the equilibrium equations and boundary conditions using the displacements

$$\rho_c - r = u_c, \quad \rho_t - r = u_t$$

$$z_c - z' = w_c, \quad z_t - z' = w_t, \text{ etc.,}$$

rather than the deformed positions, as dependent variables.

If it is considered now that the linear elastic equations are given in the form

$$f(u, w, P) = 0, \quad g(u, w, p) = 0, \quad h(u, w) = 0,$$

then, with the above change of variables, the nonlinear equations will be

$$f(u, w, P) = F(u, w, P), \quad g(u, w, P) = G(u, w, P)$$

and

$$h(u, w) = H(u, w)$$

where F, G, and H represent nonlinear contributions. The solution to these equations can now be obtained by using a numerical technique similar to that used in the solution of the linear equations. To do this, the nonlinear terms, F, G, H, which appear in the equations are treated as if they represent a nonhomogeneous portion of the linear elastic equations. That is, in each iteration it is considered that the nonlinear terms are known, the value being given by the value obtained from the previous iteration.

Combined Compression and Torsion

Assume that a rubber annulus is placed under axisymmetric compression followed by torsion. Consider deformation described by

$$\begin{aligned} \text{deformed coordinates} & \quad (\rho, \theta, z) \\ \text{undeformed coordinates} & \quad (r, \theta', z') \\ \text{where} & \quad \rho = \rho(r, z') \\ & \quad z = z(r, z') \\ & \quad \theta = \theta' + t(r, z'). \end{aligned}$$

The metric of φ in the undeformed coordinates is

$$G_{ij} = \frac{\partial y^r}{\partial \varphi^i} \frac{\partial y^r}{\partial \varphi^j} \quad (\text{E-15})$$

where

$$\begin{aligned} y^1 &= r \cos \theta' \\ y^2 &= r \sin \theta' \\ y^3 &= z' \end{aligned}$$

and

$$\begin{aligned} \varphi^1 &= r \\ \varphi^2 &= \theta' \\ \varphi^3 &= z'; \end{aligned}$$

then

$$G_{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (\text{E-16})$$

$$|G_{ij}| = r^2 \quad (\text{E-16a})$$

and

$$G^{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1/r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (\text{E-17})$$

$$|G^{ij}| = 1/r^2. \quad (\text{E-17a})$$

The metric of φ in the deformed coordinates is

$$g_{ij} = \frac{\partial x^r}{\partial \varphi^i} \frac{\partial x^r}{\partial \varphi^j} \quad (\text{E-18})$$

where

$$\begin{aligned} x^1 &= \rho \cos\theta \\ x^2 &= \rho \sin\theta \\ x^3 &= z. \end{aligned}$$

Expanding the separate derivatives in equation (E-18) yields

$$\frac{\partial x^1}{\partial \varphi^1} = \frac{\partial x^1}{\partial r} = \frac{\partial x^1}{\partial \rho} \frac{\partial \rho}{\partial r} + \frac{\partial x^1}{\partial \theta} \frac{\partial \theta}{\partial r} = \cos\theta \frac{\partial \rho}{\partial r} - \rho \sin\theta \frac{\partial \theta}{\partial r}$$

$$\frac{\partial x^2}{\partial \varphi^1} = \frac{\partial x^2}{\partial r} = \frac{\partial x^2}{\partial \rho} \frac{\partial \rho}{\partial r} + \frac{\partial x^2}{\partial \theta} \frac{\partial \theta}{\partial r} = \sin\theta \frac{\partial \rho}{\partial r} + \rho \cos\theta \frac{\partial \theta}{\partial r}$$

$$\frac{\partial x^3}{\partial \varphi^1} = \frac{\partial x^3}{\partial r} = \frac{\partial x^3}{\partial z} \frac{\partial z}{\partial r} = \frac{\partial z}{\partial r}$$

$$\frac{\partial x^1}{\partial \varphi^2} = \frac{\partial x^1}{\partial \theta} = \frac{\partial x^1}{\partial \theta} \frac{\partial \theta}{\partial \theta'} = -\rho \sin\theta$$

$$\frac{\partial x^2}{\partial \varphi^2} = \frac{\partial x^2}{\partial \theta'} = \frac{\partial x^2}{\partial \theta} \frac{\partial \theta}{\partial \theta'} = \rho \cos\theta$$

$$\frac{\partial x^3}{\partial \varphi^2} = \frac{\partial x^3}{\partial \theta'} = 0$$

$$\frac{\partial x^1}{\partial \varphi^3} = \frac{\partial x^1}{\partial z'} = \frac{\partial x^1}{\partial \rho} \frac{\partial \rho}{\partial z'} + \frac{\partial x^1}{\partial \theta} \frac{\partial \theta}{\partial z'} = \cos\theta \frac{\partial \rho}{\partial z'} - \rho \sin\theta \frac{\partial t}{\partial z'}$$

$$\frac{\partial x^2}{\partial \varphi^3} = \frac{\partial x^2}{\partial z'} = \frac{\partial x^2}{\partial \rho} \frac{\partial \rho}{\partial z'} + \frac{\partial x^2}{\partial \theta} \frac{\partial \theta}{\partial z'} = \sin\theta \frac{\partial \rho}{\partial z'} + \rho \cos\theta \frac{\partial t}{\partial z'}$$

$$\frac{\partial x^3}{\partial \varphi^3} = \frac{\partial x^3}{\partial z'} = \frac{\partial x^3}{\partial z} \frac{\partial z}{\partial z'} = \frac{\partial z}{\partial z'} ;$$

then

$$g_{ij} = \begin{pmatrix} [(\frac{\partial \rho}{\partial r})^2 + \rho^2 (\frac{\partial t}{\partial r})^2 + (\frac{\partial z}{\partial r})^2] & \rho^2 \frac{\partial t}{\partial r} [\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \rho^2 \frac{\partial t}{\partial r} \frac{\partial t}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'}] & \\ \rho^2 \frac{\partial t}{\partial r} & \rho^2 & \rho^2 \frac{\partial t}{\partial z'} \\ [\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \rho^2 \frac{\partial t}{\partial r} \frac{\partial t}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'}] & \rho^2 \frac{\partial t}{\partial z'} [(\frac{\partial z}{\partial z'})^2 + \rho^2 (\frac{\partial t}{\partial z'})^2 + (\frac{\partial \rho}{\partial z'})^2] & \end{pmatrix},$$

(E-19)

which implies

$$\begin{aligned} |g_{ij}| &= -\rho^2 t_r \{ \rho^2 t_r [z_{z'}^2 + \rho^2 t_{z'}^2 + \rho_{z'}^2] - \rho^2 t_{z'} [\rho_r \rho_{z'} + \rho^2 t_r t_{z'} + z_r z_{z'}] \} \\ &+ \rho^2 \{ [\rho_r^2 + \rho^2 t_r^2 + z_r^2][z_r^2 + \rho^2 t_{z'}^2 + \rho_{z'}^2] - [\rho_r \rho_{z'} + \rho^2 t_r t_{z'} + z_r z_{z'}][\rho_r \rho_{z'} \\ &+ \rho^2 t_r t_{z'} + z_r z_{z'}] \} - \rho^2 t_{z'} \{ \rho^2 t_{z'} [\rho_r^2 + \rho^2 t_r^2 + z_r^2] \\ &- \rho^2 t_r [\rho_r \rho_{z'} + \rho^2 t_r t_{z'} + z_r z_{z'}] \} \\ &= \rho^2 [\rho_r^2 z_{z'}^2 + z_r^2 z_{z'}^2 + \rho_r^2 \rho_{z'}^2 + z_r \rho_{z'}^2 - \rho_r^2 \rho_{z'}^2 - z_r^2 z_{z'}^2 - 2\rho_r \rho_{z'} z_r z_{z'}] \end{aligned}$$

and

$$|g_{ij}| = \rho^2 \left[\frac{\partial \rho}{\partial r} \frac{\partial z}{\partial z'} - \frac{\partial z}{\partial r} \frac{\partial \rho}{\partial z'} \right]^2 \equiv [\rho h(r, z')]^2. \quad (E-20)$$

Thus,

$$\begin{aligned}
 \varepsilon_{ij} = \frac{1}{[\rho h]^2} & \left(\begin{aligned}
 & \rho^2 \left[\left(\frac{\partial z}{\partial z'} \right)^2 + \left(\frac{\partial \rho}{\partial z'} \right)^2 \right] & \rho^2 \left\{ \frac{\partial t}{\partial z'} \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] + \frac{\partial t}{\partial r} \left[\left(\frac{\partial z}{\partial z'} \right)^2 + \left(\frac{\partial \rho}{\partial z'} \right)^2 \right] \right\} \\
 & \rho^2 \left\{ \frac{\partial t}{\partial z'} \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] + \frac{\partial t}{\partial r} \left[\left(\frac{\partial z}{\partial z'} \right)^2 + \left(\frac{\partial \rho}{\partial z'} \right)^2 \right] \right\} & \rho^2 \left[\left(\frac{\partial \rho}{\partial r} \frac{\partial t}{\partial z'} - \frac{\partial t}{\partial r} \frac{\partial \rho}{\partial z'} \right)^2 + \left(\frac{\partial t}{\partial r} \frac{\partial z}{\partial z'} - \frac{\partial t}{\partial z'} \frac{\partial z}{\partial r} \right)^2 \right] + \left(\frac{\partial \rho}{\partial r} \frac{\partial z}{\partial z'} - \frac{\partial t}{\partial r} \frac{\partial \rho}{\partial z'} \right) \\
 & - \rho^2 \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] & \rho^2 \left\{ \frac{\partial t}{\partial z'} \left[\left(\frac{\partial \rho}{\partial r} \right)^2 + \left(\frac{\partial z}{\partial r} \right)^2 \right] + \frac{\partial t}{\partial r} \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] \right\} \\
 & & - \rho^2 \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] \\
 & & \rho^2 \left\{ \frac{\partial t}{\partial z'} \left[\left(\frac{\partial \rho}{\partial r} \right)^2 + \left(\frac{\partial z}{\partial r} \right)^2 \right] + \frac{\partial t}{\partial r} \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] \right\} \cdot \quad (E-21) \\
 & & \rho^2 \left[\left(\frac{\partial \rho}{\partial r} \right)^2 + \left(\frac{\partial z}{\partial r} \right)^2 \right]
 \end{aligned} \right)
 \end{aligned}$$

Now the strain invariants are

$$I_1 = G^{ij} \varepsilon_{ij} = \varepsilon_{11} + \frac{1}{r^2} \varepsilon_{22} + \varepsilon_{33} \quad (E-22)$$

and

$$I_3 = \frac{|G_{ij}|}{|\varepsilon_{ij}|} = \frac{r^2}{\rho^2 h^2}, \quad (E-23)$$

but for incompressibility, $I_3 = 1$; hence,

$$\rho = \frac{r}{h(r, z')}. \quad (E-24)$$

Also, from equation (E-7a),

$$Q^{ij} = I_1 G^{ij} - G^{ir} G^{js} \varepsilon_{rs}$$

where G^{ij} is the diagonal $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1/r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix}$.

Thus, the components of G^{ij} are

$$Q^{11} = I_1 G^{11} - G^{11} G^{11} \varepsilon_{11} = 1/r^2 \varepsilon_{22} + \varepsilon_{33}$$

$$Q^{22} = I_1 G^{22} - G^{22} G^{22} \varepsilon_{22} = 1/r^2 (\varepsilon_{11} + \varepsilon_{33})$$

$$Q^{33} = I_1 G^{33} - G^{33} G^{33} \varepsilon_{33} = \varepsilon_{11} + 1/r^2 \varepsilon_{22}$$

$$Q^{12} = Q^{21} = G^{11} G^{22} \varepsilon_{12} = -1/r^2 \varepsilon_{12}$$

$$Q^{13} = Q^{31} = -G^{11} G^{33} \varepsilon_{13} = -\varepsilon_{13}$$

$$Q^{23} = Q^{32} = -G^{22} G^{33} \varepsilon_{23} = -1/r^2 \varepsilon_{23}$$

(E-25)

Thus,

$$\begin{array}{c} \tau^{ij} = \phi G^{ij} + \psi Q^{ij} + p \varepsilon^{ij} \\ \downarrow \qquad \downarrow \qquad \downarrow \\ \text{deformed} \quad \text{undeformed} \quad \text{deformed} \\ \text{coordinates} \quad \text{coordinates} \quad \text{coordinates} \end{array}$$

which is then substituted into the equilibrium equations, (E-10).

Compression Only

For the problem of axial compression only, the formulation is carried further as follows:

For the case of notation, let

$$\left. \begin{aligned} u_c &= u \\ z &= z' + \\ \rho &= r + \end{aligned} \right\} \quad (\text{E-26})$$

From equation (E-17),

$$G^{ij} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1/r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix}.$$

From equation (E-20),

$$h = \left(\frac{\partial \rho}{\partial r} \frac{\partial z}{\partial z'} - \frac{\partial z}{\partial r} \frac{\partial \rho}{\partial z'} \right) = \left[\left(1 + \frac{\partial u}{\partial r} \right) \left(1 + \frac{\partial w}{\partial z'} \right) - \frac{\partial w}{\partial r} \frac{\partial u}{\partial z'} \right]; \quad (\text{E-27})$$

and from equation (E-23), h is also given by

$$h = r/\rho. \quad (\text{E-27a})$$

From equation (E-21), the components of g^{ij} are

$$\left. \begin{aligned} g^{11} &= \frac{1}{h^2} \left[\left(\frac{\partial z}{\partial z'} \right)^2 + \left(\frac{\partial \rho}{\partial z'} \right)^2 \right] = \frac{1}{h^2} \left[\left(1 + \frac{\partial w}{\partial z'} \right)^2 + \left(\frac{\partial w}{\partial z'} \right)^2 \right] \\ g^{22} &= \frac{1}{\rho^2 h^2} \left[\frac{\partial \rho}{\partial r} \frac{\partial z}{\partial z'} - \frac{\partial z}{\partial r} \frac{\partial \rho}{\partial z'} \right]^2 = \frac{1}{\rho^2} = \frac{1}{r^2 (1 + \frac{u}{r})^2} = \frac{h^2}{r^2} \\ g^{33} &= \frac{1}{h^2} \left[\left(\frac{\partial \rho}{\partial r} \right)^2 + \left(\frac{\partial t}{\partial r} \right)^2 \right] = \frac{1}{h^2} \left[\left(1 + \frac{\partial u}{\partial r} \right)^2 + \left(\frac{\partial w}{\partial r} \right)^2 \right] \\ g^{13} &= g^{31} = \frac{1}{h^2} \left[\frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} \right] = - \frac{1}{h^2} \left[\left(1 + \frac{\partial u}{\partial r} \right) \frac{\partial u}{\partial z'} + \frac{\partial w}{\partial r} \left(1 + \frac{\partial w}{\partial z'} \right) \right] \\ g^{12} &= g^{21} = g^{23} = g^{32} = 0 \end{aligned} \right\}.$$

(Since torsion is zero, $\dots = 0$)

(E-28)

From equation (E-19), the components of g_{ij} are

$$\begin{aligned}
 g_{11} &= \left(\frac{\partial \rho}{\partial r}\right)^2 + \left(\frac{\partial z}{\partial r}\right)^2 = \left(1 + \frac{\partial u}{\partial r}\right)^2 + \left(\frac{\partial w}{\partial r}\right)^2 = h^2 g^{33} \\
 g_{22} &= \rho^2 = (u + r)^2 = r^2(1 + u/r)^2 = r^2/h^2 \\
 g_{33} &= \left(\frac{\partial z}{\partial z'}\right)^2 + \left(\frac{\partial \rho}{\partial z'}\right)^2 = \left(1 + \frac{\partial w}{\partial z'}\right)^2 + \left(\frac{\partial u}{\partial z'}\right)^2 = h^2 g^{11} \\
 g_{31} &= g_{13} = \frac{\partial \rho}{\partial r} \frac{\partial \rho}{\partial z'} + \frac{\partial z}{\partial r} \frac{\partial z}{\partial z'} = \left(1 + \frac{\partial u}{\partial r}\right) \frac{\partial u}{\partial z'} + \frac{\partial w}{\partial z'} \left(1 + \frac{\partial w}{\partial z'}\right) = -h^2 g^{31} = h^2 g^{13} \\
 g_{23} &= g_{32} = g_{21} = g_{12} \equiv 0
 \end{aligned}$$

(E-29)

Now the components of τ^{ij} from equation (E-7), by substituting from equations (E-17), (E-25), (E-28), and (E-29), are

$$\begin{aligned}
 \tau^{11} &= \phi + \frac{\psi}{h^2} + \left[\left(1 + \frac{\partial w}{\partial z}\right)^2 + \left(\frac{\partial u}{\partial z'}\right)^2\right] \left(\psi + \frac{P}{h^2}\right) \\
 \tau^{22} &= \frac{\phi}{r^2} + \frac{\psi}{r^2} (g_{11} + g_{33}) + P \frac{h^2}{r^2} \\
 &= \frac{1}{r^2} \left\{ \phi + \psi \left[\left(1 + \frac{\partial u}{\partial r}\right)^2 + \left(1 + \frac{\partial w}{\partial z'}\right)^2 + \left(\frac{\partial w}{\partial r}\right)^2 + \left(\frac{\partial u}{\partial z'}\right)^2\right] + Ph^2 \right\} \\
 \tau^{33} &= \phi + \psi (g_{11} + 1/r^2 g_{22}) + P \frac{g_{11}}{h^2} = \phi + \frac{\psi}{h^2} \\
 &\quad + \left[\left(1 + \frac{\partial u}{\partial r}\right)^2 + \left(\frac{\partial w}{\partial r}\right)^2\right] \left(\psi + P/h^2\right) \\
 \tau^{13} &= \tau^{31} = \left(\psi + \frac{P}{h^2}\right) \left[\left(1 + \frac{\partial u}{\partial r}\right) \left(\frac{\partial u}{\partial z'}\right) + \frac{\partial w}{\partial r} \left(1 + \frac{\partial w}{\partial z'}\right)\right] \\
 \tau^{23} &= \tau^{32} = \tau^{12} = \tau^{21} \equiv 0
 \end{aligned}$$

(E-30)

The equilibrium equations are now

$$\tau^{ij}/_i = 0 \quad (\text{E-31})$$

or

$$\tau^{ij}/_i + \Gamma_{ri}^i \tau^{rj} + \Gamma_{im}^j \tau^{im} = 0,$$

as shown in Equation (E-10),

where

$$\Gamma_{st}^r = \frac{1}{2} g^{kr} [g_{sk,t} + g_{tk,s} - g_{st,k}]. \quad (\text{E-32})$$

Note: $\Gamma_{st}^r = \Gamma_{ts}^r.$

In the current problem of compression only, the only nonzero Christoffel symbols are

$$\left. \begin{aligned} \Gamma_{11}^1 &= \frac{1}{2} [g^{11} g_{11,1} + g^{13} (2g_{13,1} - g_{11,3})] \\ \Gamma_{22}^1 &= -\frac{1}{2} (g^{11} g_{22,1} + g^{13} g_{22,3}) \\ \Gamma_{13}^1 &= \Gamma_{31}^1 = \frac{1}{2} (g^{11} g_{11,3} + g^{13} g_{33,1}) \\ \Gamma_{33}^1 &= \frac{1}{2} [g^{13} g_{33,3} + g^{11} (2g_{13,3} - g_{33,1})] \\ \Gamma_{12}^2 &= \Gamma_{21}^2 = \frac{1}{2} g^{22} g_{22,1} \\ \Gamma_{23}^2 &= \Gamma_{32}^2 = \frac{1}{2} g^{22} g_{22,3} \\ \Gamma_{11}^3 &= \frac{1}{2} [g^{13} g_{11,1} + g^{33} (2g_{13,1} - g_{11,3})] \\ \Gamma_{22}^3 &= -\frac{1}{2} [g^{31} g_{22,1} + g^{33} g_{22,3}] \\ \Gamma_{33}^3 &= \frac{1}{2} [g^{33} g_{33,3} + g^{31} (2g_{13,3} - g_{33,1})] \\ \Gamma_{31}^3 &= \Gamma_{13}^3 = \frac{1}{2} [g^{13} g_{11,3} + g^{33} g_{33,1}] \end{aligned} \right\} \quad (\text{E-33})$$

Now the equilibrium equations become

$$\begin{aligned} \tau_{11}^1 + \tau_{22}^1 + 2 \Gamma_{11}^1 \tau_{11}^1 + 3 \Gamma_{31}^1 \tau_{31}^1 + \tau_{12}^2 + \Gamma_{32}^2 \tau_{31}^1 \\ + \Gamma_{33}^3 \tau_{31}^1 + \Gamma_{13}^3 \tau_{11}^1 + \Gamma_{33}^1 + \tau_{22}^2 = 0 \end{aligned} \quad (\text{E-34a})$$

and

$$\begin{aligned} \tau_{33}^3 + \tau_{11}^1 + 2 \Gamma_{33}^3 \tau_{33}^3 + 3 \Gamma_{13}^3 \tau_{13}^1 + \Gamma_{32}^2 \tau_{33}^3 + \tau_{12}^2 \\ + \Gamma_{11}^1 \tau_{13}^1 + \Gamma_{31}^1 \tau_{33}^3 + \Gamma_{11}^3 \tau_{11}^1 + \Gamma_{22}^3 \tau_{22}^2 = 0. \end{aligned} \quad (\text{E-34b})$$

(Note: The quantities underlined are those that contribute linear terms.)

The third equilibrium is satisfied identically, as expected, since there is no dependence upon angle θ (axisymmetric). Now consider rewriting the stress component in the form of linear terms plus the nonlinear contribution. To do this, consider first the continuity equation from equations (E-27) and (E-27a).

For convenience, the following notation will be used:

$$\frac{2u}{2r} = u_r, \quad \frac{2u}{2z'} = u_{z'}, \text{ etc.} \quad (\text{E-35})$$

From equations (E-27) and (E-27a)

$$(1 + u_r) (1 + w_{z'}) - w_r u_{z'} = \frac{1}{1 + \frac{u}{r}}$$

or

$$(1 + u_r) (1 + w_z) (1 + \frac{u}{r}) - w_r z' (1 + \frac{u}{r}) = 1. \quad (\text{E-36})$$

Expanding, this yields

$$u_r + w_{z'} + \frac{u}{r} = - (u_r w_{z'} + \frac{u}{r} w_{z'} + \frac{u}{r} u_r + u_r w_{z'} \frac{u}{r} + w_r u_{z'} (1 + \frac{u}{r}))$$

or

$$u_r + w_{z'} + \frac{u}{r} = A \quad (\text{E-37})$$

where $A = -u_r w_{z'} + \frac{u}{r} w_{z'} + \frac{u}{r} u_r + u_r w_{z'} \frac{u}{r} + w_r u_{z'} (1 + \frac{u}{r})$.

Let (r, z) be initial coordinates and

(r', z') be final coordinates.

Equilibrium equations are written with r and z as independent variables. A location is then described by its initial coordinates; one then solves for r' and z' . The stresses are expressed in the final coordinates; and on the traction-free boundary, the free inner and outer edge, the normal and shear stresses, σ_{nn} and σ_{ns} , are required to be zero. To express this in terms of $\sigma_{r'r'}$, $\sigma_{z'z'}$, and $\sigma_{z'r'}$, which are in turn functions of the coordinates, one needs the boundary shape. That is, the quantity $\frac{dq}{dz}$ is needed where the boundary location is given as $r = R$. If a finite-difference method is to be employed, the derivative, $\frac{dq}{dz}$, is equivalent to $\frac{p_{i+1} - p_{i-1}}{z_{j+1} - z_{j-1}}$.

With this approach, the grid shape is constant and the equilibrium equations are written in the deformed coordinates, which is the more convenient form.

$$\text{Now, if we let } P = P' - (\phi + 2\psi), \quad (\text{E-38})$$

then expressions (E-30) yield

$$\begin{aligned} \tau^{ll} &= \phi + \psi \left(1 + \frac{u}{r}\right)^2 + (1 + 2w_{z'} + w_{z'}^2 + u_{z'}^2) \left[\psi + (P' - \phi - 2\psi) \left(1 + \frac{u}{r}\right)^2\right] \\ \tau^{ll} &= (\phi + \psi + 2\psi \frac{u}{r} + \left(\frac{u}{r}\right)^2 \psi) + \left[\psi + P' - \phi - 2\psi + 2 \frac{u}{r} P' - 2 \frac{u}{r} (\phi + 2\psi) \right. \\ &\quad \left. + (P' - \phi - 2\psi) \left(\frac{u}{r}\right)^2\right] + 2w_{z'} \psi + 2w_{z'} (u' - \phi - 2\psi) + 2w_{z'} (P' - \phi - 2\psi) \left[2 \frac{u}{r} + \left(\frac{u}{r}\right)^2\right] \\ &\quad + (w_{z'}^2 + u_{z'}^2) \left[\psi + (P' - \phi - 2\psi) \left(1 + \frac{u}{r}\right)^2\right]. \\ \tau^{ll} &= 2\psi \frac{u}{r} - 2 \frac{u}{r} (\phi + 2\psi) + 2w_{z'} (\phi + 2\psi) + P' + B \end{aligned} \quad (\text{E-39})$$

where

$$\begin{aligned} B &= \left(\frac{u}{r}\right)^2 \psi + 2 \frac{u}{r} P' + (P' - \phi - 2\psi) \left(\frac{u}{r}\right)^2 + 2w_{z'} (P' - \phi - 2\psi) \left[2 \frac{u}{r} + \left(\frac{u}{r}\right)^2\right] \\ &\quad + (w_{z'}^2 + u_{z'}^2) \left[\psi + (P' - \phi - 2\psi) \left(1 + \frac{u}{r}\right)^2\right]. \end{aligned}$$

Then

$$\tau^{ll} = -2(\phi + \psi) \left(w_{z'} + \frac{u}{r}\right) + P' + B, \quad (\text{E-40})$$

and from continuity, equation (E-37),

$$\phi - (w_{z'} + \frac{u}{r}) = u_r - A$$

or

$$\tau^{11} = \frac{2(\phi + \psi) u_r + P'}{2(\phi + \psi)A + B}; \quad (E-41)$$

↓
 linear terms can
 identify Lamé's
 constant
 $\mu = \phi + \psi$

 ↓
 nonlinear
 contribution

also,

$$\begin{aligned} \tau^{13} &= - [\psi + (P' - \phi - 2\psi)(1 + \frac{u}{r})^2] [u_{z'} + w_r + u_r u_{z'} + w_r w_{z'}] \\ &= - \{ -(\phi + \psi)(u_{z'} + w_r) + [P'(1 + \frac{u}{r})^2 - (\phi + 2\psi)(2\frac{u}{r} + (\frac{u}{r})^2)] \\ &\quad [u_{z'} + w_r + u_r u_{z'} + w_r w_{z'}] + \psi [u_r u_{z'} + w_r w_{z'}] \} \\ &= \frac{(\phi + \psi)(u_{z'} + w_r)}{\mu = \phi + \psi} + C \quad \text{nonlinear contribution} \end{aligned} \quad (E-42)$$

where

$$C = - \{ [P'(1 + \frac{u}{r})^2 - (\phi + 2\psi)(2\frac{u}{r} + (\frac{u}{r})^2)] [u_{z'} + w_r + u_r u_{z'} + w_r w_{z'}] + \psi [u_r u_{z'} + w_r w_{z'}] \};$$

also,

$$\begin{aligned} \tau^{22} &= \frac{1}{r^2 (1 + \frac{u}{r})^2} \{ \phi (1 + \frac{u}{r})^2 + \psi (1 + \frac{u}{r})^2 [z + z u_r + 2w_{z'} + u_r^2 + w_{z'}^2 \\ &\quad + w_r^2 + u_{z'}^2] + P' - \phi - 2\psi \} \\ &= \frac{1}{r^2 (1 + \frac{u}{r})^2} \{ 2\frac{u}{r} (\phi + 2\psi) + 2\psi(u_r + w_{z'}) + P' + 2\psi (\frac{u}{r})^2 \\ &\quad + \psi [2\frac{u}{r} + (\frac{u}{r})^2] [2u_r + 2w_{z'} + u_r^2 + w_{z'}^2 + w_r^2 + u_{z'}^2] \} \end{aligned}$$

from continuity $u_r + w_{z'} = A - \frac{u}{r}$, or

$$\tau^{22} = \frac{1}{r^2 (1 + \frac{u}{r})^2} [2(\phi + \psi) \frac{u}{r} + P' + 2\psi A + D] \quad (E-43)$$

↓ linear ↓ nonlinear

where

$$D = 2\psi \left(\frac{u}{r}\right)^2 + \psi \left[2\frac{u}{r} + \left(\frac{u}{r}\right)^2\right] [2u_r + 2w_{z'} + u_r^2 + w_{z'}^2 + w_r^2 + u_{z'}^2].$$

It is seen here that the factor $\frac{1}{r^2 (1 + \frac{u}{r})^2}$ causes the linear terms in τ^{22}

to be different from the expression for τ^{22} encountered in a linear analysis. This is due to the fact that the physical and tensoral (τ^{22}) components of the stress tensor are different. Their contribution in the equilibrium equations, however, will be the same.

Also, from the similarity in the form of τ^{33} and τ^{11} , the following is immediately obtained:

$$\tau^{33} = 2(\phi + \psi) w_{z'} + P' - 2(\phi + \psi) A + E \quad (E-44)$$

where

$$E = \left(\frac{u}{r}\right)^2 + 2\frac{u}{r} P' + (P' - \phi - 2\psi) \left(\frac{u}{r}\right)^2 + 2u_r (P' - \phi - 2\psi) \left[2\frac{u}{r} + \left(\frac{u}{r}\right)^2\right] \\ + (u_r^2 + w_r^2) [\psi + (P' - \phi - 2\psi) (1 + \frac{u}{r})^2]$$

and the first of the equilibrium equations, (E-34a and b), yields

$$2(\phi + \psi) \frac{\partial^2 u}{\partial r^2} + \frac{\partial P'}{\partial r} - 2(\phi + \psi) \frac{\partial A}{\partial r} + \frac{\partial B}{\partial r} + (\phi + \psi) \left(\frac{\partial^2 u}{\partial z'^2} + \frac{\partial^2 w}{\partial z' \partial r}\right) + \frac{\partial C}{\partial z'} \\ + \frac{2}{r} (\phi + \psi) \frac{\partial u}{\partial r} + \frac{P'}{r} + \left[\frac{\partial u}{\partial r} - \frac{u}{r}\right] \left[\frac{1}{r (1 + \frac{u}{r})}\right] [2(\phi + \psi) \frac{\partial u}{\partial r} + P'] \\ + \left[1 + \frac{\partial u}{\partial r}\right] \left[\frac{1}{r (1 + \frac{u}{r})}\right] [-2(\phi + \psi) A + B] - 1/r [2(\phi + \psi) \frac{u}{r} + P']$$

$$\begin{aligned}
& - \frac{1}{r^2} \left\{ \left[1 + \frac{\partial w}{\partial z'} \right]^2 + \left(\frac{\partial u}{\partial z'} \right)^2 \right\} \left[\frac{\partial u}{\partial r} \left(1 + \frac{u}{r} \right) + \frac{u}{r} \right] + \left[2 \frac{\partial w}{\partial z'} + \left(\frac{\partial w}{\partial z'} \right)^2 \right. \\
& + \left. \left(\frac{\partial u}{\partial z'} \right)^2 \right] \left[\left(1 + \frac{u}{r} \right) \left(1 + \frac{\partial u}{\partial r} \right) \right] \left\{ 2(\phi + \psi) \frac{u}{r} + P' + 2\psi A + D \right\} \\
& - \frac{1}{r} [2\psi A + D] + \frac{1}{r^2 \left(1 + \frac{u}{r} \right)^2} g^{13} g_{22,3} \left[2(\phi + \psi) \frac{u}{r} + P' + 2\psi A + D \right] \\
& + \text{[other nonlinear terms from expression E-34a]}.
\end{aligned}$$

This equilibrium equation may be written

$$\begin{aligned}
& 2(\phi + \psi) \frac{\partial^2 u}{\partial r^2} + \frac{\partial P'}{\partial r} + (\phi + \psi) \left(\frac{\partial^2 u}{\partial r^2} + \frac{\partial^2 w}{\partial z' \partial r} \right) + \frac{2}{r} (\phi + \psi) \left(\frac{\partial u}{\partial r} - \frac{u}{r} \right) \\
& - 2(\phi + \psi) \frac{\partial A}{\partial r} + \frac{\partial B}{\partial r} + \frac{\partial C}{\partial z'} + \left[\frac{\partial u}{\partial r} - \frac{u}{r} \right] \left[\frac{1}{r \left(1 + \frac{u}{r} \right)} \right] \left[2(\phi + \psi) \frac{\partial u}{\partial r} + P' \right] \\
& - \left[1 + \frac{\partial u}{\partial r} \right] \left[\frac{1}{r \left(1 + \frac{u}{r} \right)} \right] \left[2(\phi + \psi) A - B \right] - \frac{1}{r^2} \left\{ \left[\left(1 + \frac{\partial w}{\partial z'} \right) + \left(\frac{\partial u}{\partial z'} \right)^2 \right] \right. \\
& \left. \left[\frac{\partial u}{\partial r} \left(1 + \frac{u}{r} \right) + \frac{u}{r} \right] + \left[2 \frac{\partial w}{\partial z'} + \left(\frac{\partial w}{\partial z'} \right)^2 + \left(\frac{\partial u}{\partial z'} \right)^2 \right] \left[\left(1 + \frac{u}{r} \right) \left(1 + \frac{\partial u}{\partial r} \right) \right] \right\} \\
& \left\{ 2(\phi + \psi) \frac{u}{r} + P' + 2\psi A + D \right\} - \frac{1}{r} [2\psi A + D] + \frac{1}{r^2 \left(1 + \frac{u}{r} \right)^2} g^{13} g_{22,3} \\
& \left[2(\phi + \psi) \frac{u}{r} + P' + 2\psi A + D \right] + 2\Gamma_{11}^1 \tau^{11} + 3\Gamma_{31}^1 \tau^{31} + \Gamma_{32}^2 \tau^{31} + \Gamma_{33}^3 \tau^{31} \\
& + \Gamma_{13}^3 \tau^{11} + \Gamma_{33}^1 \tau^{33} = 0,
\end{aligned}$$

(E-45)

and the second of the equilibrium equations, (E-37b), yields

$$\begin{aligned}
 & 2(\phi + \psi) \frac{\partial^2 w}{\partial z'^2} + \frac{\partial P'}{\partial z'} - 2(\phi + \psi) \frac{\partial A}{\partial z'} + \frac{\partial E}{\partial z'} + (\phi + \psi) \left(\frac{\partial^2 u}{\partial z'^2} + \frac{\partial^2 w}{\partial z' \partial r} \right) \\
 & \quad + \frac{\partial C}{\partial z'} + \frac{1}{r} (\phi + \psi) \left(\frac{\partial u}{\partial z'} + \frac{\partial w}{\partial r} \right) + \frac{C}{r} + \left(\frac{\partial u}{\partial r} - \frac{u}{r} \right) \left[\frac{1}{r(1 + \frac{u}{r})} \right] \\
 & [(\phi + \psi) \left(\frac{\partial u}{\partial z'} + \frac{\partial w}{\partial r} \right) + C] + 2\Gamma_{33}^3 \tau^{33} + 3\Gamma_{13}^3 \tau^{13} + \Gamma_{32}^2 \tau^{33} + \Gamma_{11}^1 \tau^{13} \\
 & \quad + \Gamma_{13}^1 \tau^{33} + \Gamma_{11}^3 \tau^{11} + \Gamma_{22}^3 \tau^{22} = 0. \tag{E-46}
 \end{aligned}$$

13 ABSTRACT <p>The purpose of this study was the establishment of analytical design procedures for laminated elastomeric bearings. This was approached with the application of the linear mathematical theory of elasticity and later with nonlinear large-deformation elasticity theory.</p> <p>The linear theory yielded analytical approximations that are close to exact solutions and which are easily applied and evaluated. This analysis of one typical lamination yields the distribution of stress and deformation in the elastomer between "rigid" metal lamina. However, the limits of the linear elasticity theory are exceeded for greater than small bearing loads, indicating the need for the application of the more comprehensive large-deformation elasticity theory.</p> <p>The large-deformation theory was stated and the equilibrium equations were derived, but the solution of these equations was not carried out.</p>

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.
- 2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.
- 2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.
5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.
6. **REPORT DATE:** Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.
- 7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.
- 7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.
- 8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.
- 8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.
- 9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:
 - (1) "Qualified requesters may obtain copies of this report from DDC."
 - (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
 - (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
 - (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
 - (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.
12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.
13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C) or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
