To give a comprehensive picture of worker exposure to sound in the wood products industry and to demonstrate the effect of machine and operating characteristics on sound-pressure levels, 23 plants, both large and small, were selected from three major segments of the industry: saw and planing mills, miscellaneous wood products factories, and furniture factories. A total of 461 sound survey meter readings and 144 octave-band analyses were taken. The data were analyzed in terms of number of workers exposed to various ranges of sound pressure levels and average sound-pressure levels according to type of machine.

Farrack, H.O. NOISE, VIBRATION, AND PEOPLE. Noise Control, Nov. 1956, 2(6), 10-24.

10,326

In this paper the acoustic energy concept (interactions among acoustic energy sources, transfer paths, and receivers) is proposed for dealing with problems of acoustic energy from aircraft operations and its effect on people. Data from previous investigations on human responses and the parameters of the acoustic energy field to which they may be exposed are reviewed. The characteristics of some acoustic energy fields in which men must work are examined in terms of acoustic energy sources and the transfer characteristics of the atmosphere. Some conclusions are drawn from these data with respect to the people--aircraft passengers, crew, maintenance and support personnel, men outside airports--in these noise fields. Future problems are discussed.

Olorig, A., & Quiggle, R. A HEARING CONSERVATION DATA CARD. Noise Control, Nov. 1956, 2(6), 34-35.

10,327

A hearing conservation data card, based upon two years of study and consultation with many large industrial companies and groups such as the Armed Services - National Research Council Committee on Hearing and Bio-Acoustics, is presented and discussed. The card is designed for general use and allows for recording only the minimum amount of data necessary to study the relations of hearing loss to noise exposure. The card has been precoded to facilitate transfer of data to punched cards. Information on the card can be used for a meaningful interpretation of the subject's audiogram.

Beranch, L.J. REVISED CRITERIA FOR NOISE IN BUILDINGS. Noise Control, Jan. 1957, 3(1), 19-27.

10,328

This paper summarizes a detailed study of noise in office space made to determine the maximum noise level at which personnel feel they can work without loss of efficiency. Two independent field checks were made of the conclusions. Based upon an analysis of these data, noise criteria and octave-band noise criteria curves are recommended for use in specifications for offices and rooms of various types. These criteria represent a revision of earlier ones published by the author. An appendix gives directions and nomograms for computing loudness levels from sound pressure level.

House, H.P. GUIDE FOR CONSERVATION OF HEARING IN NOISE. Noise Control, May 1957, 3(3), 23-31. (Research Center, Subcommittee on Noise in Industry, Los Angeles, Calif.).

10,330

The purpose of the Guide is to assist members of the industrial community in their efforts to protect hearing. The information presented is based on both clinical and industrial experience and from research. Included are a summary of basic information about hearing loss and noise exposure, an outline of a hearing conservation program, and a discussion of procedures for carrying out the program. This letter contains technical information on assessment and control of noise-exposure and measurement of hearing methods and equipment.

Hayes, S.B. MEDICAL ASPECTS OF NOISE; BLAST AND VIBRATION. Noise Control, May 1957, 3(3), 39-41, 62.

10,331

This paper discusses the concern of the Medical Services with high levels of noise and hearing conservation programs, with keeping vibration within the limits of tolerance for human operators of military equipment, and with effects of repeated low-level shock waves as well as the effects of high-level shock waves at greater intervals. Medical aspects of each condition are treated briefly and typical hazardous situations in the Army where each arise are described. Research should aim for protection of military personnel as well as appropriate therapeutic procedures and measures.

10,332
Dentler, W.C. OPERATIONAL PROBLEMS AND ASPECTS OF NOISE. Noise Control, May 1957, 3(3), 41-43, 52.

10,332
This paper discusses the loadings imposed upon military operations by the great amount of noise produced by equipment and activities. The fundamental military need is for more power and thus more noise can be expected. Examples of situations where advances in performance are allowed by noise and vibration problems are given. Present noise abatement and protection procedures are related to new problems of maintenance, lubrication, public relations, and the like. The need for greater effort in the future is emphasized.

10,333
Bennett, E. RESEARCH REQUIREMENTS AND TECHNIQUES. Noise Control, May 1957, 3(3), 43-44.

10,333
Three major areas in hearing and bio-acoustics where research and development are urgently required are discussed: (1) effects of noise on human beings and protection from such effects, (2) the need for more engine power with less noise, and (3) development of instrumentation for high-level noise measurements. Examples from each area are given and the need for new approaches to the problem is stressed.

10,334
Lane, E.V. NOISE CONTROL IN SCHOOLS. Noise Control, July 1957, 3(4), 27-34. (Somer and Lane, Consultants in Acoustics, Austin, Tex.).

10,334
The major steps in noise control for schools are outlined and discussed: (1) location of building site, (2) locating noisy rooms, such as music rooms and gymnasiums, in relation to classrooms and other spaces where comparative quiet is needed, and (3) control of sound and noise inside and between the various spaces. Wall transmission loss caused by various factors of layout, construction and materials are treated with suggested corrective procedures to meet standard noise criteria. Problems specific to such areas as auditoriums, gymnasiums, music and shop rooms are explored.

10,335
Loye, J.P. NOISE CONTROL IN HOTELS, HOSPITALS, AND MULTIPLE DWELLINGS. Noise Control, July 1957, 3(4), 35-37, 54.

10,335
The fundamental aspects of noise control for building in which many people live are presented. Noise control is here considered as an integral part of architectural planning and reduction techniques applying to control of outside noises (selection of site, noise survey, and building plans) and control of inside noises (people, radio and television sets, and machinery noise) are discussed. Recommended acceptable average noise levels are given for unoccupied rooms. Some acoustical control problems peculiar to the three types of buildings, particularly hospitals, are considered.

Perry, D.R. & Hayes, J.F. PREDICTION OF SOLDIERS' FOOD PREFERENCES BY LABORATORY METHODS. *J. appl. Psychol.*, Feb. 1957, 41(1), 2-5. (Quartermaster Food & Container Institute, Chicago, Ill.).
- 10,345
To compare food preference ratings of laboratory panels and soldier-consumer panels, 12 foods were selected for testing. All physical factors such as food source, methods of preparation, time of day, number of foods sampled per day were kept identical. Preference was measured by marking a nine-interval rating scale ranging from like extremely to dislike extremely. Forty laboratory personnel participated in each session in the laboratory testing rooms and fifty soldiers in each session at an army base dining hall. Mean preference ratings for laboratory and field were studied by correlational methods. Practical implications of the results for methods of food acceptance evaluation are discussed.

Smith, A.A. & Hayes, G.E. VISIBILITY ON RADAR SCREENS: THE EFFECT OF CRT BIAS AND AMBIENT ILLUMINATION. *J. appl. Psychol.*, Feb. 1957, 41(1), 15-18. (Defence Research Medical Labs., Toronto, Canada).
- 10,345
To determine the optimal cathode-ray tube (CRT) bias and its interaction with ambient illumination, a series of experiments were conducted on a "noise-free" Plan-Position Indicator fitted with a 12-inch CRT. Visibility thresholds (minimum signal strength of target of first appearance) were measured in all the following tests: 1) CRT bias and ambient illumination were varied jointly over a range of values; 2) a suggested optimal CRT bias was determined in (1) and held constant while ambient illumination was varied to find an upper limit. Threshold visibility (decibels) was analyzed in terms of the variables. The findings are discussed in relation to those from earlier studies.

Klare, G. R., Nichols, W.H. & Shuford, E. H. THE RELATIONSHIP OF TYPOGRAPHIC ARRANGEMENT TO THE LEARNING OF TECHNICAL TRAINING MATERIAL. *J. appl. Psychol.*, Feb. 1957, 41(1), 41-45.
- 10,346
To investigate the relationship of two newly developed methods of typographic arrangement (square span and spaced unit) to the learning of technical material, a 1,206-word printed lesson from an aircraft mechanics training course was divided into "thought units" and set up in both types of arrangement. A second version was constructed using shorter units than the first. The subjects (599 male airmen) were randomly assigned to one of the test versions (normal version included). Reading efficiency acceptability (preference for experimental or normal arrangement) and immediate retention (test following reading) were analyzed for differences due to versions.

Bessey, E.G. & Machen, G.S. AN OPERATIONAL TEST OF LABORATORY DETERMINED OPTIMA OF SCREEN BRIGHTNESS AND AMBIENT ILLUMINATION FOR RADAR REPORTING ROOMS. *J. appl. Psychol.*, Feb. 1957, 41(1), 51-52. (Defence Research Medical Labs., Toronto, Canada).
- 10,347
To test the validity of laboratory findings on optimum screen brightness and room illumination for radar reporting, six regular service operators worked at a radar sight. They searched for targets, reported their positions for plotting and faced all conditions typical of an operational situation. In one condition the bias was set to give a just visible sweep line (VRI) and no ambient illumination; in a second the bias was seven volts positive from VRI and room illumination was 0.1 foot-candle. Performance (number of plots, aircraft tracks) was compared for the two conditions.

Bartz, A.E. ATTENTION VALUE AS A FUNCTION OF ILLUMINANT COLOR CHANGE. *J. appl. Psychol.*, April 1957, 41(2), 82-84. (North Dakota University).
- 10,348
To study the effect of several characteristics of the visual task upon the speed and accuracy of visual search, two situations were investigated. Using a simulated instrument panel of 16 dial faces, the first situation required the subjects (64) to identify the number of dials deviating from normal position (from one through eight) with the normal red illumination. In the second, the error dials were accompanied by a change in illuminant from red to green. Performance (response time and number of errors) was analyzed as a function of number of dials in error and for effect of illuminant change.

Thores, D.R. EXPOSURE TIME AS A VARIABLE IN DIAL READING EXPERIMENTS. *J. appl. Psychol.*, June 1957, 41(3), 150-152. (Duke University, Durham, N.C.).
- 10,352
To compare the relative legibility of horizontal, vertical, round, semi-circular, and open-window dials at four different exposure times (.50, .10, .04, and .02 seconds), 80 subjects were tested on nine settings of each dial at each exposure time. The dials were small, the round dial had a diameter of 7/8" with the others proportionately drawn, so that differences due to eye-fixation would be minimized. Error data were analyzed in terms of exposure time and dial type. The findings are discussed in relation to the validity of the tachistoscopic method of stimulus presentation for studies of this type.

Roby, T.B., & Lanzetta, J.T. CONFLICTING PRINCIPLES IN MAN-MACHINE SYSTEM DESIGN. *J. appl. Psychol.*, June 1957, 41(3), 170-178. (Institute for Applied Experimental Psychology, Tufts University; Fels Group Dynamics Center, University of Delaware).

10,354

To investigate the concurrent operation of two principles in system design (autonomy and load balancing), 16 three-man teams operated simulated aircraft controls as indicated from readings on specific pairs of instrument displays. Each subject sat in a separate booth with interphone connection to the others. The two principles of design were varied by manipulating the number of displays and controls assigned to each subject with three resultant structures. Each team responded to 18 instrument changes (three repetitions) under each structure. Error scores (number of times a given control was not correctly set) were studied for differences due to experimental treatment. The findings are related to design of systems.

Scheiss, E.H. THE EFFECTS OF SLEEP DEPRIVATION ON PERFORMANCE IN A SIMULATED COMMUNICATION TASK. *J. appl. Psychol.*, Aug. 1957, 41(4), 247-252.

10,358

To study the effects of loss of sleep on ability to send and receive complex instructions, twenty subjects were tested before, during, and after 55 and 70 hours without sleep. The sending task required the subject to observe the arrangement of a set of colored blocks (ten or twenty-five pieces) and to give oral instructions for reproducing the pattern, one piece at a time; the receiving task was to reproduce the pattern from recorded instructions. Accuracy of performance was analyzed in terms of decrement during the deprivation period. Qualitative observations on performance and feelings of fatigue and an analysis of performance and intelligence level were reported.

Murray, J.E. DEPTH PERCEPTION IN A STEREOSCOPIC DISPLAY AS A FUNCTION OF NUMBER OF STIMULI, DEPTH RANGE, AND NUMBER OF SCALE MARKERS. *J. appl. Psychol.*, Dec. 1957, 41(6), 414-418. (Fordham University, Fordham, N.Y.).

10,363

To determine the effectiveness of presenting three-coordinate data stereoscopically for use in an operational situation (targets on a radar display), subjects were tested on two tasks - ranking dots in order of depth and specifying the actual depth of dots in space. The stimuli, photographic slides containing two disparate pictures of dots in space, were presented by means of a stereoscopic projector. In the ranking task, number of dots (from ten to forty) and depth range (from five to fifteen miles) were varied; the second task included reference rings (one, two, or five). Time and error scores were studied by analysis of variance for effects of variables on depth discrimination.

Balke, B., Wells, J.G., & Clark, R.T. IN-FLIGHT HYPERVENTILATION DURING JET PILOT TRAINING. *J. Aviat. Med.*, June 1957, 28(3), 241-246.

10,372

To determine whether true over-ventilation exists during flight, in-flight sampling of expired air during three phases of jet training in the T-33, F-86, and F-100 aircraft were taken on 65 pilots. Estimations of carbon dioxide tensions were derived from samples of the distributions and studied in relation to measures taken directly from subjects during sitting rest and during a coordination test. Incidence of hyperventilation in relation to the high performance capabilities of the three aircraft were also analyzed.

10,373

Domanski, T.J. THE STRESS CONCEPT APPLIED TO FLYING. *J. Aviat. Med.*, June 1957, 28(3), 249-252.

10,373

Stress response is defined as the product of the interaction of a stress with a susceptible individual. Fatigue is treated as a stress response associated with duration of job performance. Studies using eosinopenia (preflight to post-flight decrease in blood count of at least 50 per cent) as an emotional stress response in flying are reviewed. Two categories of problems are included: (1) individual differences in response to a given stress and (2) the relative severity of a particular inflight stress or stress complex.

Greider, H.R., & Santa Maria, L.J. SUBJECTIVE THERMAL COMFORT ZONES OF VENTILATED FULL PRESSURE SUIT AT ALTITUDE. *J. Aviat. Med.*, June 1957, 28(3), 272-276.

10,374

To determine the limiting ambient temperatures characterizing comfort zones for subjects wearing a full pressure suit in simulated flight conditions, 50 two-hour runs were made (two subjects) with a ventilating flow of 140 liters per minute under standard conditions at 18,000 feet simulated altitude. Ventilating temperatures were 60, 75, and 90 degrees Fahrenheit; ambient temperatures (constant for a run) ranged from 40 to 120 degrees Fahrenheit. Subjects rated comfort on a seven-point scale; physiological measurements were taken before and after each trial. Additional runs were made without the ventilating flow for comparative analysis of data.

Hinchcliffe, R., & Wheeler, L.J. AN INVESTIGATION OF THE EFFECT OF FLYING ON SPEECH INTELLIGIBILITY IN NOISE. *J. Aviat. Med.*, June 1957, 28(3), 277-280.

10,375

To assess the influence of flying on telecommunications efficiency of aircrewmembers, the Royal Air Force hearing efficiency test (a phonetically balanced word list against a background of aircraft noise) was administered to eighteen aircrewmembers before and after a long operational flight of from ten to fifteen hours. A control series of eighteen subjects were given the test 48 hours apart with no interim flying. The efficiency scores were analyzed for losses that could be attributed to impairment due to long flights. Application of the results to aviation otology are discussed.

Barron, C.I. AUDIOMETRIC STUDIES OF FLIGHT LINE MECHANICS. *J. Aviat. Med.*, June 1957, 28(3), 295-302. (Lockheed Aircraft Corp., Burbank, Calif.).

10,378

This report presents the results of serial audiometric studies of a group of 470 flight line mechanics exposed to reciprocating and turbojet engine noise for periods up to seven years during employment by an aircraft manufacturing company. Testing consisted of pure tone audiometry, checking eight frequencies from 500 to 8000 cycles per second. Threshold data were analyzed for changes due to years of exposure to noise, to age, and to use of ear plugs. The results are discussed in relation to the need for a closely supervised hearing conservation program.

Bhatia, B. EYE MOVEMENT PATTERNS IN RESPONSE TO MOVING OBJECTS. *J. Aviat. Med.*, June 1957, 28(3), 309-317.

10,379

To study eye movement patterns of trained and untrained persons while they viewed moving objects, a test object (black letter from Snellen chart mounted on white background) was fixed to an endless belt that could be moved downward in the vertical direction. Two subjects viewed the test object through a slit as it moved at certain uniform speeds and eye movements were recorded by the corneoretinal potential method. One subject was trained in such observations, the other was naive. Eye movement records were analyzed for response patterns due to different velocities and to training.

Noble, Rosalie, & Lezo, J. INVESTIGATIONS OF THE OPTIMAL CHARACTERISTICS OF VISUAL LIGHT INDICATOR SYSTEMS. *J. Aviat. Med.*, June 1957, 28(3), 318-321. (Naval Air Material Center, Philadelphia, Penn.).

10,380

This report is a brief summary of a series of experiments in which the optimal visual characteristics of a master caution and warning system for aircraft are considered. Three types of stimulus lights were used - steady, flashing, and alternating in a manner to produce apparent movement. Effect of background (homogeneous versus heterogeneous), lighting (day and night), various positions within and without the visual field, and shape of signal lights were investigated. The use of these results in future indicator systems is discussed.

Bradley, J.V. CONTROL KNOB ARRANGEMENT CAN SAVE AIRCRAFT INSTRUMENT PANEL SPACE. *J. Aviat. Med.*, June 1957, 28(3), 322-327.

10,381

This report compares the efficiencies of two methods of saving panel space, both of which involve gauging the control knobs of several instruments: (1) shielded knobs on concentric shafts, and (2) several knobs side by side in a straight line. A graph, based on experimental data, is presented in which, for a variety of multiple-knob arrangements, relative likelihood of accidental operation is plotted against aircraft instrument panel space required for the arrangement used. Recommendations for space-saving arrangements are made.

Schmidt, Ingeborg. VISIBILITY OF ARTIFICIAL SATELLITES OF THE PLANET EARTH. *J. Aviat. Med.*, Oct. 1957, 28(5), 435-446. (Indiana University).
- 10,386
To investigate the visibility of an artificial satellite with the unaided eye, calculations were made based upon data available in the literature about the first satellite of the project Vanguard. The visibility of such a satellite (polished aluminum surface of reflectance .09, 20 inches in diameter, with an illuminance of the sun of 12,700 foot-candles and with a perigee of 200 miles) was treated as a problem of brightness discrimination. By computing visual ranges for the satellite in eight meridians for several positions of the sun below horizon, "spaces of potential visibility" were determined for observation at sea level, latitude 30 degrees, and clear air.

Clark, B., & Graybiel, A. VERTIGO AS A CAUSE OF PILOT ERROR IN JET AIRCRAFT. *J. Aviat. Med.*, Oct. 1957, 28(5), 469-478. (San Jose State College and USN School of Aviation Medicine, Pensacola, Fla.).
- 10,386
To obtain information on the occurrence of vertigo in jet pilots, individual interviews and a check list were used to obtain descriptions of these experiences from 13 naval and Marine Corps jet pilots. Vertigo was defined as an error or illusion of spatial orientation. Incidents were classified as vertigo of attitude and motion, visual vertigo, and vertigo involving geographical disorientation. The number of responses to items on the check list considered to describe vertigo were analyzed for relationships to such things as emotional factors, flying hours, and flight conditions. The results were compared with similar studies of pilots in propeller driven aircraft.

Conrad, R. & Hills, B.A. SELF-PACING PERFORMANCE AS A FUNCTION OF PERCEPTUAL LOAD. *J. exp. Psychol.*, Jan 1957, 53(1), 52-54. (Applied Psychology Research Unit, Cambridge, England).
- 10,391
To investigate performance on a self-paced multi-channel sensorimotor task as a function of perceptual load (number of signal sources were 8, 10, 12, 14, and 16), eighteen subjects were tested. The task was to judge in advance which channel would provide the next signal and to respond accordingly, the interval between signals being near random. The subjects were instructed to drive at the rate which would give them the best score: correct responses and errors were integrated and result continuously presented on a clock invisible to the subject. Driving rate was the total number of signals per minute. The data were studied by analysis of variance techniques.

Smith, W.M. & Gulick, W.L. DYNAMIC CONTOUR PERCEPTION. *J. exp. Psychol.*, Feb. 1957, 53(2), 145-152. (Princeton University, Princeton, N.J.).
- 10,392
To study the perception of contour of a moving stimulus in relation to how long the stimulus was seen before or after it moved or both, five subjects observed the stimulus (black concentric and eccentric hands on large white disk) through an aperture (horizontal or vertical) and reported contour if stimulus appeared with sharp edges and homogeneous blackness throughout. Velocities of movement up to 30 degrees per second and varied durations of exposure of fixed stimulus before and after movement were used and the time to make the judgment recorded. The data were analyzed for most effective conditions for maintenance of contour. A theoretical exploration of the results is proposed.

Alluisi, E.A., Paul, F., Jr. & Fitts, P.M. AN INFORMATION ANALYSIS OF VERBAL AND MOTOR RESPONSES IN A FORCED-PACED SERIAL TASK. *J. exp. Psychol.*, March 1957, 53(3), 153-158. (Ohio State University, Columbus, Ohio).

10,393

To determine whether the rate of information transmission in a forced-paced serial task is a function of rate of stimulus presentation, uncertainty per stimulus or joint effect of both (rate of information presentation) ten highly practiced subjects responded to Arabic numeral with both verbal and motor (key pressing) responses. Three levels of stimulus complexity (1, 2, and 3 bit per stimulus) were combined with three rates of presentation (1, 2, and 3 stimuli per second). The data (correct responses) were analyzed for absolute and relative rates of information transmission as functions of rate and complexity. Interaction effects are discussed. T. I. R 10

Nicely, Patricia E. & Miller, G.A. SOME EFFECTS OF UNEQUAL SPATIAL DISTRIBUTION ON THE DETECTABILITY OF RADAR TARGETS. *J. exp. Psychol.*, March 1957, 53(3), 195-198. (Harvard University, Cambridge, Mass.).

10,395

To investigate some factors in the decline in a radar operator's performance during a prolonged watch, isolated target pips were introduced on a simulated radar display that was speckled with a background of random noise. Ten subjects reported the position of the target in terms of numbers on a clock face over an observation period of 90 minutes. In one quadrant, targets appeared approximately once in every five rotations. In all others only about once for every 30 rotations. Photographic records were made of the display and used for a repetition of the experiment. The data (percent targets detected) were analyzed as functions of location and time during the watch. T. G. Gerathewohl, S.J., Strughold, H., & Taylor, W.F. THE OCULOMOTORIC PATTERN OF CIRCULAR EYE MOVEMENTS DURING INCREASING SPEED OF ROTATION. *J. exp. Psychol.*, April 1957, 53(4), 249-256.

10,397

To record and analyze the basic pattern of guided circular eye movements with regard to increasing velocity, nine subjects attempted to keep their eyes fixated on a target attached to the periphery of a rotating disc. Photographic records were made of eye movements: 1) at a constant rotational speed of 15 rotations per minute, 2) during gradually increasing speeds from 20 to 45 rotations per minute, and 3) from 40 to 85 rotations per minute over periods of 30 seconds. All experiments included clockwise and counterclockwise rotations. The number and extent of saccadic deviations from the prescribed pursuit pattern were used as indices of accuracy in visual tracking. T. I. R 10

10,398

Conklin, J.E. EFFECT OF CONTROL LAG ON PERFORMANCE IN A TRACKING TASK. *J. exp. Psychol.*, April 1957, 53(4), 261-266.

10,398

To study the effect of delay between the control and display on tracking activity, lag was introduced by two different electrical filter networks--a single network (asymptotic lag) and two networks in cascade. Three skilled subjects performed on both a pursuit and compensatory display for four different target courses with delays of 0, 0.25, 1.0, 4.0, and 16.0 seconds. The criterion of tracking efficiency was the ratio of the root mean square error of the signal to that of the subject. The data were analyzed for effects of the experimental variables. The results are discussed in terms of the part predictive behavior of the operator plays in skilled performance. T. G. R 12

10,399

Teichner, W.F. EFFECTS OF FOREPERIOD, INDUCED MUSCULAR TENSION, AND STIMULUS REGULARITY ON SIMPLE REACTION TIME. *J. exp. Psychol.*, April 1957, 53(4), 277-284.

10,399

To study the effects on reaction time of several factors, four experiments were performed. In Experiment I, constant, regularly presented foreperiod-load combinations were used with a ten- or thirty-second foreperiod. Experiments II and III were split plots conducted with mass trials--foreperiods varied from two to eleven seconds, tension loads from five to 35 pounds. In one the magnitude of tension was constant with foreperiods varying irregularly; the other was the reverse. In Experiment IV, both tension magnitude and foreperiod length were presented irregularly. The data were analyzed for effect of foreperiod, induced muscular tension, and stimulus regularity. T. G. 10,408

Gibson, J.J. & Gibson, Eleanor, J. CONTINUOUS PERSPECTIVE TRANSFORMATIONS AND THE PERCEPTION OF RIGID MOTION. *J. exp. Psychol.*, Aug. 1957, 54(2), 129-136. (Cornell University, Ithaca, N.Y.).

10,408

To study various factors in the perception of rigid motion from continuous perspective transformations, twenty subjects were presented with two-second cycles of four patterns (irregular texture and form, and regular texture and form) at five degrees of transformation (semi rotation of 15, 30, 45, 60, and 70 degrees). The subjects observed the stimuli on the visibly flat surface of a translucent screen and judged the amount of change of slant by means of a protractor. The same patterns were presented motionless at the end of transformation sequence to 30 control subjects. Judgments of slant were analyzed as a function of change of slant in optical stimulus and for effects of form and texture.

10,409

Garvey, W.D. OPERATOR PERFORMANCE AS A FUNCTION OF STATISTICAL ENCODING OF STIMULI. *J. exp. Psychol.*, Aug. 1957, 54(2), 103-114.

10,409

To determine the relative advantage of statistical encoding of stimuli during different stages of practice, 30 subjects (five matched groups) were given 29 trials of 750 stimuli on a display-control system (ten by ten matrix of lights and a corresponding matrix of push buttons). Based upon preliminary studies of an operator's "channel characteristics", five different encoding procedures were established one of which was designed for maximum flow of information, the others deviated in a systematic manner. One group was assigned to each program. Efficiency of performance was measured in terms of mean transmission time per signal and analyzed in terms of relative advantages of the different coding patterns.

Engen, Trygg & Tulvay, U. SOME SOURCES OF ERROR IN HALF HEAVINESS JUDGMENTS. *J. exp. Psychol.*, Sept. 1957, 54(3) 208-212. (Brown University, Providence, R.I.).

10,410

To investigate possible sources of error in fractionation judgments, half-heaviness judgments were obtained by the method of constant stimuli and the method of adjustment. In a series of three experiments the following factors were studied: sophistication of subjects, the context provided by range of comparison weights, preliminary practice, and method of obtaining judgments. Errors in psychophysical judgments were analyzed as affected by the foregoing variables. The findings are discussed in relation to previous studies.
T. G. R 8

10,411

Klerner, E.T. SIMPLE REACTION TIME AS A FUNCTION OF TIME UNCERTAINTY. *J. exp. Psychol.*, Sept. 1957, 54(3), 195-200.

10,411

To study the role of time uncertainty in simple reaction time (RT), two test series (one RT and one prediction) were given to five subjects. Ten RT tests, each with a different mean foreperiod (0.5 to 8.0 seconds) and/or foreperiod variability (0.0 to 1.82 seconds) were given - once in practice and five experimental trials. Using intervals equal to mean foreperiods of RT tests and same number of trials, each subject attempted to predict the occurrence of the stimuli (single runs of each at a given interval). Total time uncertainty (foreperiod variance plus prediction variance) was converted to an informational measure and analyzed for relation to reaction time.

10,412

Briggs, G.E., Fitts, P.M. & Bahrick, H.P. EFFECTS OF FORCE AND AMPLITUDE CUES ON LEARNING AND PERFORMANCE IN A COMPLEX TRACKING TASK. *J. exp. Psychol.*, Oct. 1957, 54(4), 262-268.

10,412

To assess the influence of force and amplitude cues from a control column on learning and performance in a two-dimensional compensatory tracking task, four groups of subjects served for 60 training and 30 transfer trials. Group I trained with a control in which the force-displacement relation was known to permit good performance; this relation was varied: Group II, one-fourth force, same displacement; Group III, same force, one-fourth displacement; Group IV, one-fourth force and displacement. The transfer trials were on the control column of Group I. Tracking proficiency (time on target over final three seconds of each trial) was analyzed for comparative improvement over training trials and percent transfer for each group was calculated.

Jenkins, N. EFFECTS OF VARIED DISTANCE ON SHORT-RANGE SIZE JUDGMENTS. *J. exp. Psychol.*, Nov. 1957, 54(5), 327-331. (University of New Brunswick, Fredericton, Canada).

10,413

To study the trend in size judgments at two short viewing distances, judgments of a standard object twenty feet away were obtained by means of a comparison series at distances of two and ten feet from four groups of 12 subjects each. Equidistance judgments at ten feet were obtained--two groups made these judgments before and two after the disparate distances. The data (mean size judgments) were studied by analysis of variance for effects of the different variables. The findings are discussed in relation to other studies in the literature.

DeW, Margaret, E. & Gordon, Jesse, E. THE INTERACTION OF ASSOCIATION VALUE AND STIMULUS CONFIGURATION IN SIZE ESTIMATION. *J. exp. Psychol.*, Nov. 1957, 54(5), 332-335. (University of Wisconsin, Madison, Wisc. & Montana State University, Missoula, Mont.).

10,414

To investigate the effect of association value (pleasantness, unpleasantness) and stimulus configuration (curved-line, angular-line) in perception of size, forty subjects each made five size estimations by varying a blank stimulus until it matched a standard. Concepts selected by each subject as pleasant or unpleasant were then associated with either curved-line or angular-line designs. Two other groups associated nonsense syllables or had no associations. Size estimations were again made. The data were studied by analysis of variance for effects of associations, designs and their interactions.

Liberman, A.M., Harris, Katherine S., Hoffman, H. S., & Griffith, B.C. THE DISCRIMINATION OF SPEECH SOUNDS WITHIN AND ACROSS PHONEME BOUNDARIES. *J. exp. Psychol.*, Nov. 1957, 54(5), 358-368.

10,415

To investigate the relation between phonemic identifications of certain synthetic speech sounds and the extent to which the sounds can be discriminated as being different, two-formant approximations to consonant-vowel syllables (b, d, g) were prepared. They varied in the extent and direction of the second-formant transitions. These sounds were presented (1) singly and in random order for identification of b, d, or g; and (2) in ABX groups for matching of X with A or B (A and B differed by two or three steps). The data (per cent identification and per cent correct discriminations) were compared for discrimination ability within and across phoneme boundaries.

Stevens, S.S. & Galanter, E.H. RATIO SCALES AND CATEGORY SCALES FOR A DOZEN PERCEPTUAL CONTINUA. *J. exp. Psychol.*, Dec. 1957, 54(6), 377-411. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

10,416

Ratio scales of subjective magnitude are compared with category rating-scales on several judgmental continua. Two classes of continua (prothetic and metathetic) are distinguished and the way in which each class behaves relative to the type of scale is described using experimental data from various sources. The continua examined include apparent length, duration, numerosness, area, weight, loudness, brightness and lightness in Class I and visual position, inclination, proportion, and pitch in Class II.

Rosenzweig, M.R. & Postman, L. INTELLIGIBILITY AS A FUNCTION OF FREQUENCY OF USAGE. *J. exp. Psychol.*, Dec. 1957, 54(6), 412-422. (University of California).

10,417

To determine whether intelligibility of words masked by noise varies with the frequency of usage of the words, parallel experiments were performed in English and French. Stimulus words, homogeneous in syllabic length, were selected in four ranges of frequency. Seven randomly ordered lists were presented at progressively decreasing signal-to-noise ratios (from -12 decibels to quiet). There were 109 English and 60 French subjects. The first correct transcription of each word was considered the threshold value. Meaningful, nonsense, and failure to respond were also recorded. These data were studied for effect of word frequency. Practical applications of the results are discussed. T. G. P 17

10,418

Teichner, W.H. CUTANEOUS DISCRIMINATION OF RADIANT HEAT. *J. exp. Psychol.*, Dec. 1957, 54(6), 438-444.

10,418

To investigate stimulus-response relations involved in cutaneous thermal subjective responses to radiant heat exchange, the method of single stimuli was utilized. Six subjects responded to randomly arranged stimulus combinations of heat intensity and exposure time by assigning each to one of five subjective response categories (no sensation, warmth, heat, pricking pain, and burning pain). The data were analyzed in terms of the relation of the responses to heat intensity, exposure time, dosage and skin temperature. The results are compared to those in the literature. T. G. R 9

Goldstein, A.G. JUDGMENTS OF VISUAL VELOCITY AS A FUNCTION OF LENGTH OF OBSERVATION TIME. *J. exp. Psychol.* Dec. 1957, 54(6), 457-461. (University of Missouri).

10,419

To determine whether exposure to moving visual stimuli for various duration times would result in different apparent velocities, 24 subjects were required to reproduce the speed of a moving band of stripes by moving a stylus across an electrical contact bar. Physical velocities of approximately 2.4, 4.8, or 14.3 centimeters per second were viewed for 2, 8, 15, 22, 30, and 60 seconds. Perceived velocity (time in seconds of the arm movement response) was analyzed as a function of observation time. An explanation of the results in terms of negative after effects is proposed. G. R 9

Tiffany, W.R., & Hanley, C.N. ADAPTATION TO DELAYED SIDETONE. *J. Speech Hearing Disorders*, June 1956, 21(2), 164-172. (University of Washington).

10,420

To study adaptation to the distorting effects of delayed sidetone, differences among subjects as well as differences with subjects over successive readings were investigated. Twenty normal hearing subjects were subjected to 80 decibel sidetone delayed 0.18 seconds during 24 readings of a 45 word prose passage. Twelve successive readings were given the first week and twelve the following. Measures of reading time, reading fluency (number of syllable and word repetitions or omissions) and ratings of speech effectiveness (obtained before experiment started) were analyzed and discussed in relation to use of delayed sidetone as a clinical test for auditory malingering. G. R 5

Black, J.W., & Polhurst, G.C. INTELLIGIBILITY AS RELATED TO THE PATH OF AIRBORNE SIDE-TONE. *J. Speech Hearing Disorders*, June 1956, 21(2), 173-178. (USN School of Aviation Medicine, Pensacola, Fla.).

10,421

To find whether systematic alterations to the path of airborne side-tone might affect intelligibility, the following variables were investigated: (1) binaural application of ear defenders, (2) monaural application of ear defenders with open ear alternately facing or away from reflecting surface, (3) conditions of (2) with normal room noise, and (4) large convex and concave acoustic reflectors positioned one foot from head. Twelve panels of 15 subjects participated in each of the four conditions; 12 subjects in each panel read speaker lists from multiple-choice intelligibility tests for a round robin administration and the remaining three served as listeners. Intelligibility scores served as index of voice change. T. P 11

Diehl, C.F., & McDonald, E.T. EFFECT OF VOICE QUALITY ON COMMUNICATION. *J. Speech Hearing Disorders*, June 1956, 21(2), 233-237. (University of Kentucky & Pennsylvania State University).

10,423

To study the effect of voice quality on communication, a 14-minute lecture was presented to six matched groups (35 subjects each) by means of phonograph recordings. The lecture varied for each group only in voice quality types (hoarse, harsh, breathy, nasal quality, and freedom from these) produced by one speaker. Subjects completed a response sheet composed of simple recall-type completion questions based on the lecture and a rating scale for judging the voice quality of the lecturer. Mean comprehension scores were compared to determine effect of voice quality on communication effectiveness and ratings were analyzed. T. R 4

10,424

House, A.S., & Stevens, K.N. ANALOG STUDIES OF THE NASALIZATION OF VOWELS. *J. Speech Hearing Disorders*, June 1956, 21(2), 218-232. (Massachusetts Institute of Technology).

10,424

To investigate the phenomenon of nasality on three levels of discourse - acoustical, articulatory, and perceptual, an electrical analog of the nasal structures (nose and naso-pharynx) was designed and coupled with an electrical analog of the vocal tract already available. The activities of these systems were observed in a series of physical studies and then manipulated to produce vowel-like stimuli to be used in perceptual tests. Twenty-four untrained subjects and ten professional linguists made both relative and absolute judgments as to the nasality of the sounds. Results of the listening tests and descriptions of the physical characteristics of the sounds are presented. T. G. I. R 26

10,425

Feldman, E.W. SPEECH ARTICULATIONS PROBLEMS ASSOCIATED WITH PLACEMENT OF ORTHODONTIC APPLIANCES. *J. Speech Hearing Disorders*, March 1956, 21(1), 34-38. (University of Pittsburgh).

10,425

To examine the effect on speech of the insertion of orthodontic appliances, 32 patients (age range nine to eighteen) wearing bite plates or labio-lingual appliances were studied. Three articulation tests were given - previous to, one hour after, and one to three weeks after insertion of the appliance. The tests were transcribed by two judges, either from direct speech or from a tape recording. Articulation errors for each test were compared for short term and long term effects of the appliances. Further comparisons were made between groups wearing the two different types of appliances. Need of speech therapy for such patients is discussed. T. R 3

Jerger, J.P. RECOVERY FROM AUDITORY FATIGUE.
J. Speech Hearing Disorders, March 1956, 21(1),
36-45. (Northwestern University).

10,426
To investigate the pattern of recovery of the auditory threshold for varying levels of intense stimulation (from 80 to 110 decibels), eight young adults were tested. In each session (one for each intensity level) the subject traced his threshold for a 4000 cycle per second (CPS) short tones for two minutes, listened to a 3000 cps tone for two minutes at one intensity level, then resumed threshold tracing for ten minutes. Threshold shift (in decibels) was analyzed as a function of post-exposure time for each intensity of the fatiguing tone. The bounce phenomenon is discussed and some explanatory suggestions are advanced.

Lightfoot, C., Carhart, R., & Goeth, J.H.
MASKING OF IMPAIRED EARS BY NOISE. J. Speech Hearing Disorders, March 1956, 21(1), 56-70.

10,427
To investigate the masking effects of white noise on ears with different types and degrees of hearing loss, pure-tone and speech thresholds, in quiet and in two levels of white noise (60 and 80, 80 and 95 decibels), were obtained on 31 normally hearing and 59 hypacusic (impairment primarily of either conductive or perceptive mechanism) subjects. Masking discrepancies, based upon the amount of masking and the effective level of the masking noise, were calculated from the threshold data and were analyzed in terms of spectral characteristics of signal and type of hearing loss. The "critical band" concept is discussed in relation to the results.

Peters, R. EFFECT OF ACOUSTIC ENVIRONMENT UPON SPEAKER INTELLIGIBILITY. J. Speech Hearing Disorders, March 1956, 21(1), 88-93. (USN School of Aviation Medicine, Pensacola, Fla.).

10,429
To investigate the effect upon speaker intelligibility of various acoustic signals heard by the speaker while reading, signals were selected to represent conditions that might confront speakers in communication systems (same, similar, unrelated and nonsense words; five-syllable phrases; and babble). Thirty-six subjects each read speaker lists taken from multiple-choice intelligibility tests while simultaneously hearing each of the acoustic signals. Percent intelligibility scores were obtained from panels of 12 to 15 listeners and studied by analysis of variance techniques.

Fairbanks, G., Guttman, N., & Miron, M.S. EFFECTS OF TIME COMPRESSION UPON THE COMPREHENSION OF CONNECTED SPEECH. J. Speech Hearing Disorders, March 1957, 22(1), 10-19.

10,430
To investigate the relationship between comprehension of spoken messages and the rate at which they were heard, a pair of independent message-test units were prepared. The messages were read by an experienced speaker at 141 words per minute and compressed automatically in time by 0, 30, 40, 50, and 70 per cent. Groups of 36 subjects, equalized for technical ability, were assigned to each of the above conditions and tested for factual comprehension. One group was tested without hearing the material. Comprehension was analyzed as a function of message time. Listener aptitude and message effectiveness were evaluated.

Fairbanks, G., Guttman, N., & Miron, M.S. AUDITORY COMPREHENSION OF REPEATED HIGH-SPEED MESSAGES. J. Speech Hearing Disorders, March 1957, 22(1), 20-22.

10,431
To investigate the effectiveness of increasing auditory comprehension by repetition at high speeds, two relatively long technical messages were read by an experienced reader at 141 words per minute recorded and compressed automatically in time by 50 per cent. Four groups of 36 subjects, equalized for technical ability, were assigned to each of the following conditions: one reading of one of the messages at zero or 50 per cent compression; two repetitions at zero or 50 per cent compression. Factual comprehension was tested. Mean percentages of correct scores were analyzed for differences due to single and double presentations at the two compression rates.

Fairbanks, G., Guttman, N., & Miron, M.S. AUDITORY COMPREHENSION IN RELATION TO LISTENING RATE AND SELECTIVE VERBAL REDUNDANCY. J. Speech Hearing Disorders, March 1957, 22(1), 23-32.

10,432
To examine the possibility that auditory comprehension might be increased by selective verbal redundancy combined with high-speed messages, a recorded technical message at 141 words per minute together with a test of factual comprehension were available from a previous experiment. The test yielded two sets of items matched for difficulty. For one set only, the content was augmented by non-repetitive restatement of sampled fact, recorded and spliced into the original. Both versions were heard by independent groups of subjects at zero and 30 per cent time compression. Comprehension test scores were studied by appropriate analyses of variance.

O'Neill, J.J. RECOGNITION OF INTELLIGIBILITY TEST MATERIALS IN CONTEXT AND ISOLATION. J. Speech Hearing Disorders, March 1957, 22(1), 87-90. (USN School of Aviation Medicine, Pensacola, Fla.).

10,433
To investigate the effects of context and isolation on the relative recognition of intelligibility test items, 39 subjects listened to 50 sentences (part of a standard intelligibility test) and 291 words (same words taken out of context). Five speech-to-noise ratios were used: 0, -12, -6, +6, +12 decibels. Comparisons were made of the recognition of words in context and in isolation at the various speech-to-noise ratios. The stability of intelligibility scores of individual words was further analyzed.

To investigate the relative performance of the two ears of 22 patients with unilateral Meniere's disease accompanied by a marked loss of acuity for high frequencies in the opposite ear, audiometric measure were made: a pure-tone audiogram, a test of binaural loudness balance, a determination of the difference limen for intensity at ten and forty decibels above threshold, and a series of speech-reception tests. The data were analyzed for evidence of recruitment in both ears and for the comparability of results from the various tests. The validity of the difference limen as a test of recruitment is discussed.
G.R 10
- 10,435
To investigate the production of nasal consonants, electrical analogs of the nasal and vocal tracts were used to simulate the articulation of the three nasal consonants of American English - m/, n/, and ng/. The coupled analogs were manipulated to produce synthetic sounds that were used to construct perceptual tests. The tests were administered to trained listeners. Results of the listening tests and a description of the physical characteristics of the sounds are presented and discussed.
T.G.I.R 19
- 10,436
To determine the just-discriminable differences for the amplitude of the second formant (F2) of a synthetic vowel sound (E), pairs of sounds were produced by a 'terminal analog' electrical synthesizer. Four listeners judged whether the quality of the second sound of each pair was the same as or different from the first. Two patterns of fundamental frequency were examined: 120 cycles per second monotone and linear inflection from 95 to 105 cycles per second at one sound pressure level of 70 decibels. Percentages of judgments called different were analyzed as function of magnitude of change in F2 amplitude. The use of the results in speech transmission systems is discussed.
G.R 7
- 10,437
This report describes the construction of 23 equivalent multiple-choice intelligibility tests, Forms C and D, which supplement existing tests, Forms A and B. The possible "listener choices" are grouped on two answer forms. The materials from which the tests may be reproduced are presented together with instructions for the speakers and listeners.
T. G. I. R 16
- 10,438
To quantify the relative contributions of controlled amounts of context upon the predictability of missing words in sentences, from one to six words were omitted from each of 130 sentences. The remaining portions, both with and without indications of where words had been deleted and with residual words in original and scrambled order, were presented to more than 700 subjects. Each one worked only once with words from one sentence in an attempt to reconstruct the original. Two sets of scores, number of original words supplied and original "idea" preserved, were derived and analyzed in terms of experimental conditions.
T. R 8
- 10,439
To study durational aspects and articulation differences of speech, two procedures were followed: 1) multiple-choice intelligibility tests were recorded by a single voice in three manners (normal, prolonged, and staccato) with rate and sound pressure level constant; word reception scores and preferences were obtained (12 panels of listeners, 12-15 per panel) in 114 decibels of noise, and 2) the same speaker recorded alternate test forms with three degrees of precision (precise, normal, and slovenly). Subjects heard the recorded test items and repeated them to panels of listeners; other listeners responded to the recording. Judgments were later made of paired items (as recorded and as repeated) as to articulation.
T. G. I. R 9
- 10,440
To test the correctness with which a speaker hears the pitch of his voice, 32 subjects (29 trained musicians) recorded vowels at four sound level pressures (75, 85, 95, and 105 decibels). The vowels were played back at distorted pitches and subjects attempted to correct the pitch by altering speed of playback mechanism as they revocalized the vowels. Mean fundamental frequencies of the sustained vocalization and of the matched variable stimulus were determined and compared for each of the four levels of sound pressure.

- 10,441
This article reviews the problem of audiometric reference level for zero hearing loss and is based on papers and discussions of a symposium on the subject given at the 1955 Armed Forces-National Research Council on Hearing and Bio-Acoustics. The bases of the present American standard and the new British standard for audiometric reference zero are reviewed and compared. The influence of masking noise, age, and previous noise exposure on the audiogram is discussed. Methods for determining sound pressure at the ear and the problems of accuracy are pointed out. Finally, a reassessment of the problem involved in establishing an International Standard is presented.

Stearns, Dorothy, & Hooley, Catherine E. PSYCHOLOGICAL SCALING METHODS APPLIED TO AUDIOMETRIC DEFICIENCIES. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 810-822. (State University of Iowa).

10,443

To evaluate and compare the usefulness of several psychological scaling methods (equal appearing intervals, successive intervals, paired comparisons, and constant sums) applied to short segments of the continuous speech of children with defective articulation, test items of such speech, five seconds in length, were recorded. The segments represented a range in articulation from normal to severely defective. Independent groups of 100 or 125 observers were used for judging the samples. Correlations between sets of calculated scale values, demonstrations of linear or non-linear relationships between sets of values and internal consistency measures were used for evaluation of methods.

Usher, J.P. PROBLEMS IN MILITARY AUDIOMETRY: A CHABA SYMPOSIUM. I. INTRODUCTION TO THE PRESENTATIONS. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 729-730.

10,443

This paper presents the background for this symposium. Since the Armed Forces are establishing programs for more accurate testing of hearing of candidates for military service many problems have arisen. The papers in the symposium are devoted to a discussion of these problems.

10,445

Hooley, G. PROBLEMS IN MILITARY AUDIOMETRY: A CHABA SYMPOSIUM. III. DIAGNOSTIC AUDIOMETRY. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 734-735. (Syracuse University).

10,445

This paper deals with methods of assessing hearing loss so that the exact type of loss and the probable cause for it can be determined. Information derived from the necessary tests for diagnostic audiometry are necessary, not only for treatment but also for establishing any claim for service-connected injury.

10,446

Hirsch, I.J. PROBLEMS IN MILITARY AUDIOMETRY: A CHABA SYMPOSIUM. IV. A CLASSIFICATION OF HEARING TESTS. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 736-743. (Washington University).

10,446

This paper examines the reasons why a military agency should test hearing and proceeds to classify presently available hearing tests according to these military requirements. A simplified scheme for the selection and employment of appropriate tests is presented and discussed.

10,447

Carhart, R. PROBLEMS IN MILITARY AUDIOMETRY: A CHABA SYMPOSIUM. V. REVIEW OF THE REPORT BY THE WORKING COMMITTEE ON AUDIOMETRY. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 744-747. (Northwestern University).

10,447

The Working Group on Military Audiology reviewed a number of questions presented by the three Armed Services and concluded that the goals in testing and research needs were common to all the Services. The functions of military audiology were defined, special problems in testing were recognized, and steps for the improvement of testing were proposed. The Glorig screening method was evaluated and recommendations made concerning automatic self-recording techniques.

10,448

Webster, J.C. PROBLEMS IN MILITARY AUDIOMETRY: A CHABA SYMPOSIUM. VI. AUTOMATIC AUDIOMETRY. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 748-749. (Navy Electronics Lab., San Diego, Calif.).

10,448

This paper reviews the problems presented by automatic audiometry and lists the audiometers now in operation (Navy): Binyon, Holmes, Brown, Dickster, West, Glorig, and Navy audiometers. The basis for choice among these machines is discussed.

10,449

Glorig, A. PROBLEMS IN MILITARY AUDIOMETRY: A CHABA SYMPOSIUM. VII. PRACTICAL LIMITATIONS IN MILITARY AUDIOMETRY. *J. Speech Hearing Disorders*, Dec. 1957, 22(5), 750-751.

10,449

The most important limitations in military audiometry are given as personnel, equipment, and test environment. A plan for correcting these limitations is proposed and discussed.

10,450

The CHABA Council. PROBLEMS IN AUDIOMETRY: A CHABA SYMPOSIUM. VIII. AUDIOMETRY IN THE ARMED FORCES. *J. Speech Dis.*, Dec. 1957, 22(5), 752-756.

10,450

This report represents the official statement of the CHABA Council concerning the status of audiometry in the military services as of the year 1955. Purposes and objectives are reviewed and the various kinds of audiometry discussed. Recommendations are presented concerning the use of monitoring audiometry and the need for the Armed Services to establish audiometric standards that their personnel must meet so that specifications can be developed.

Smith, P.A., & Smith, K.A. EFFECTS OF SUSTAINED PERFORMANCES OF HUMAN MOTIONS. *Percept. Mot. Skills*, 1955, 5, 23-29. (University of Wisconsin).

10,452

This study was designed to assess the effects of sustained movement on various components of human action and to investigate the role of the muscular cycle in the definition of duration of various movements. A panel control task was utilized to assess the component movements of manipulation and travel of 23 female subjects under conditions of initial and sustained (eight weeks) practice. Data on muscular cycle were obtained. An electronic action analyzer was employed to obtain the relevant measures of movement. The results are treated in terms of the relative effects of phase of muscular cycle and amount of practice on the duration of the component movement.

Bartley, S.H., Clifford, J.T., & Calvin, A.D. EFFECT OF VISUAL IMAGERY ON TACTILE AND KINESTHETIC SPACE PERCEPTION. *Percept. Mot. Skills*, 1955, 5, 177-184. (Michigan State University)

10,454

In order to assess the role of visual imagery in tactile and kinesthetic space perception, ten normal vision were compared with ten congenitally blind children on performance of a size-judging test in which some 90 pairs of forms were varied in terms of size (small, medium, and large). Another variable was distance of form from the subject (5 inch, 10 inch, and 13 inch). The sighted subjects were blindfolded. The location of the control and variable stimuli was fixed in one part of the experiment and varied in another. The resultant data are analyzed in terms of the relative effectiveness of tactile and kinesthetic cues where visual imagery is varied.

Slater - Kessel, A.T. ESTIMATION OF MOVEMENT AS A FUNCTION OF THE DISTANCE OF MOVEMENT PERCEPTION AND TARGET DISTANCE. *Percept. Mot. Skills*, 1955, 5, 201-204. (Indiana University).

10,456

This study was designed to determine the effects of perceptual display distance and target distance upon estimation of movement. A three by three factorial design was utilized in the assessment of nine groups of subjects estimating the movement of a moving marker to a target marker under nine experimental conditions (i.e., movement display versus target distances of 2 5/8, 5 1/4, and 7 7/8 inches). The results are presented and discussed in terms of degree of absolute and constant error as a function of variation in target and display distances.

Moucrieff, R.W. OLFACTORY ADAPTATION AND ODOR INTENSITY. *Amer. J. Psychol.*, March 1957, 70, 1-20. (Chichester, England).

10,457

This article presented the results of a series of experiments on the relation between olfactory adaptation and odor-intensity. The general methodology consisted of presenting Ss with a series of test or diluted solutions of a variety of odorants either prior to or following presentation of an undiluted or control odorant. The results were discussed in terms of the definition and determination of odor-intensity, the adapting effect of odor-intensity, and the relation between odor-intensity and olfactory threshold concentration.

Dinnerstein, Dorothy, & Wertheimer, M. SOME DETERMINANTS OF PHENOMENAL OVERLAPPING. *Amer. J. Psychol.*, March 1957, 70, 21-37. (Sania Street College of Education, University of Colorado).

10,458

Several experiments are reported covering the phenomenal overlapping of visual planes with the primary goal of defining some of the determinants of this function. The general procedure consisted of presenting a series of overlapping forms (e.g., squares, square and crosses, line patterns, and so forth) to groups of subjects instructed to describe the content and designate the surfaces appearing to go behind the other surfaces. The distributions of descriptions for the various figures are analyzed and discussed in terms of the role of symmetry, simplicity, and similarity as determinants of phenomenal overlapping.

Kleiner, E.T. RHYTHMIC DISTURBANCES IN A SIMPLE VISUAL MOTOR TASK. *Amer. J. Psychol.*, March 1957, 70(2), 55-63. (Operational Application Lab., ARDC, Bolling AFB, Washington, D.C.).

10,459

This study was designed to investigate several factors involved in the rhythmic disturbances experienced in reaction-time tests. Five subjects were trained on a five-light-five-key task with single light-flashes. In the experimental test three classes of stimuli and three classes of response were utilized with all tests made with a stimulus-repetition rate of two per-second. The results are analyzed and discussed in terms of the relative degree of rhythmic disturbance as a function of the various modifications of stimulus and/or response employed in the study.

Andrews, B., Gerall, A.A., Green, R.P., & Murphy, D.P. PERFORMANCE IN FOLLOWING TRACKING AS A FUNCTION OF THE SENSITIVITY OF THE AIRPLANE - TYPE CONTROL STICK. *J. Psychol.*, April 1957, 43, 169-179. (University of Rochester).

10,460

This study was designed to assess the effect of control stick sensitivity upon performance of a following tracking task and to determine the transfer effects of change in control sensitivity. Utilizing the Rochester Generalized Tracking Apparatus, 64 subjects were required to perform a following tracking task by manipulating an airplane stick control varied in sensitivity to provide the following display - control movement ratios: 1 to 1, 1 to 1, 15 to 1. The results are analyzed in terms of mean time on target as a function of sensitivity ratios under both training and transfer trials. Accuracy of tracking as a function of control sensitivity is discussed.

Bartley, S.H., Paczewitz, G., & Valsi, E. BRIGHTNESS ENHANCEMENT AND THE STIMULUS CYCLE. *J. Psychol.*, April 1957, 43, 187-192. (Michigan State University).

10,461

This study was designed to assess the relation of brightness enhancement to the pulse-to-cycle-fraction (PCF) of intermittent retinal stimulation. With two trained observers serving as subjects, the PCF of an intermittent target, a disk-ring combination was varied from 0.2 to 0.9 for two different photic pulse rates, 10.6 and 32 cycles per second, and the effect on brightness enhancement determined. The effects of shortening the pulse on brightness enhancement are discussed in terms of the implication concerning the neurophysiology of the optic pathway.

Einfestetter, F.R., & Primm, D.W. COLORS AND THE COLOR BLIND. *J. gen. Psychol.*, Oct. 1957, 57, 229-240. (Catholic University of America).

10,462
An experiment is reported in which an attempt is made to determine the relations between the conceptual patterns of color experiences for normal and color-blind subjects. Eleven "green blind" and 25 normal subjects were required to rate 15 stimuli, i.e., four colors, the names of these colors, and eight symbolic concepts of colors, on Osgood's semantic differential. Realizing the Osgood-Oser distance function, the similarities between the color-blind and normal experiences of the different colors were analyzed. Primary differences in color experience are discussed.

Baker, P., & Krets, P. RELIABILITY OF TIME ESTIMATES. *Percept. Mot. Skills*, March 1957, 7(1), 23-24. (Michigan State University).

10,463
To study the reliability of time estimates, 55 subjects estimated five different time intervals: 15, 30, 60, 120, and 240 seconds. Verbal reports were given of estimated lapses of time from the sounding of a click and the work stop. Two sessions were held one week apart, and in each session there were two identical series of time intervals. The stability of the time estimates within a session and between sessions were studied by correlational methods.

Wilson, E.T. EFFECTS OF SIZE AND SHAPE DIFFERENCES IN STIMULI ON DISJOINTIVE REACTION TIME. *Percept. Mot. Skills*, June 1957, 7(2), 93-96. (Duke University).

10,468
To compare the effects on asymptotic reaction time of increasing differences in size and shape alone and of various combinations of such differences, four subjects were studied. The pre-exposure field contained two alternate stimuli on the left and right of a fixation point. Upon presentation of one stimulus in the center of the exposure field, the subject pressed either a left or right button to indicate its pre-exposure position. The standard stimulus (0.50 by 0.50 black square) was in left position throughout with the variable in the right. Average reaction time and amount of information transmitted as affected by stimulus differences were analyzed.

10,473

To trace the course of changes in reaction time of eye movements with periodically repeated presentation of a visual stimulus, two subjects were instructed to move their eyes in synchrony with the alternation of a pair of alternately exposed (every second) light spots. Two other subjects were instructed to change fixation after the new stimulus appeared. Five one-minute sessions were given on five successive days; eye movements were recorded photographically. Latencies (interval between stimulus change and concomitant eye movement) were analyzed in terms of the precision that can be expected of such responses.

Brown, Ruth, A. AGE AND 'FACED' WORK. *Occup. Psychol.*, Jan. 1957, 31(1), 11-20. (Suffield Unit for Research into Problems of Aging, Psychological Lab., Cambridge, England).

10,476

To discover the nature of the difficulties that arise in 'paced work' and at what ages they become apparent, a grid-matching apparatus was used. The task was to position a pointer on one grid to match a target on the corresponding grid over a series of trials. Two groups of subjects (64, 130) ranging in age from 20 to over 70 performed the task under both paced and unpaced work conditions in counterbalanced order. Each phase of the work cycle was recorded as well as successful attempts and errors. The data were analyzed in terms of age differences. Aspects of the work cycle which changed with age are discussed with regard to production line work in industry.

Provine, K.A., Stockbridge, W.C.W., Forrest, B.W., & Anderson, S.A. THE REPRESENTATION OF AIRCRAFT BY PICTORIAL SIGNS. *Occup. Psychol.*, Jan. 1957, 31(1), 21-32. (Ministry of Supply Clothing & Equipment Physiological Research Establishment, Farnborough, England).

10,477

To discover the best set of pictorial symbols to represent the activities of hostile and friendly aircraft, two methods of matching signs to words were tried. First, a set of verbal descriptions was ranked in order of merit for each of 23 symbols; a rank correlation analysis yielded a series of signs to fit the symbols. Second, from the subjects' introspections another series was constructed. The two series were then tested against each other in a learning situation (123 subjects). A shortened version of the second series was tested in a like manner against a series based on understandable but arbitrary principles. Number of trials and errors during learning were analyzed for the various comparisons.

Amsett, J., and Fay, H. KNOWLEDGE OF RESULTS AND 'SKILLED PERFORMANCE'. *Occup. Psychol.*, April 1957, 31(2), 69-79. (Institute of Experimental Psychology, University of Oxford).

10,479

This paper presents a reassessment of some of the problems of knowledge of results in light of an approach to motor skills which regards the operator performing a task as a communication channel receiving signals from both his internal and external environment and on the basis of these signals regulating his responses. The perceptual approach to skills is considered in terms of this approach. Some different kinds of knowledge of results are outlined - directional indicator, suggested feedback - and some training problems raised by them are discussed. The relation of motivation to knowledge of results is discussed.

Holding, D.H. THE EFFECT OF INITIAL POINTER POSITION ON DISPLAY-CONTROL RELATIONSHIPS. *Occup. Psychol.*, April 1957, 31(2), 126-130. (Suffield Department of Industrial Health, King's College (Newcastle-upon-Tyne), University of Durham).

10,481

To investigate the effect of the position from which a display indicator begins its travel on the direction in which the control is moved by an operator unfamiliar with the equipment, settings were made on a vertical scale by means of a rotary knob. Half the settings were made upwards and half downwards with the initial position at nine different distances along the scale. There were 360 subjects in 18 groups of 20; each subject made only one setting at one pointer position. Direction of rotation was recorded and analyzed in terms of dominant display-control relationships for each position.

Siddall, G.J., Holding, D.H., & Draper, J. ERROR OF AIM AND EXTENT IN MANUAL POINT TO POINT MOVEMENT. *Occup. Psychol.*, July 1957, 31(3), 155-195. (Ministry of Supply, Clothing and Stores Experimental Establishment, Farnborough, England).

10,482

To compare the magnitudes of errors of aim with errors of extent in simple discrete movements, 18 subjects were required to draw four lines in succession from a starting point to a target as fast as possible. Distance between points was 30 centimeters; four targets, requiring movements from left to right, right to left, outwards from front of body and inwards toward body, were used. Errors in extent and deviations to left and right of target, and durations of movement were recorded and analyzed for differences in type of errors and for effects of direction and speed. Implications for equipment design are discussed.

Berlyne, D.E. CONFLICT AND CHOICE TIME. *Brit. J. Psychol.*, May 1957, 48(2), 105-119. (Psychology Dept., Univ. of Aberdeen).

10,493

To explore the usefulness of reaction time (RT) as a convenient measure of conflict or the study of thought processes, three experiments were carried out testing the effects of four variables: (1) the number, (2) the sameness to equality in strength, (3) the absolute strength, and (4) the degree of incompatibility, of competing response tendencies. Two types of choice RT were recorded: forced-choice, one stimulus was presented at a time, each with its appropriate responses; and free-choice RT, two or more stimuli were presented together and responses made to any one of them. The data were studied by analysis of variance methods and these findings are discussed in relation to theoretical models of behavior.

Schlanderer, P.F., Hammel, H.L., Andersen, C.L., & Loring, J. METABOLIC ADAPTATION TO COLD IN MAN. *J. Appl. Physiol.*, Jan. 1958, 12(1), 1-6. (Institute of Biophysics, University of Oslo, Blindern, Norway).

10,501

This experiment studied the process of metabolic adaptation to cold in the human organism. Eight subjects spent six weeks on a mountain plateau in Norway. During the day they could exercise and they wanted to the problem of keeping warm pertained largely to sleeping hours when temperature was at least degrees fairly constantly. It was assumed acclimation would be either (1) metabolic - the men would sleep with an increased heat production and a normally warm surface, or (2) insulative - they would sleep with a basal heat production and a cold surface. Results on the following measurements are discussed in terms of the differences between the control (non-acclimated) and experimental groups: skin and rectal temperature, oxygen consumption, heat flow, shivering, sleep, and so forth. Miller, A.T., Jr. & Bluth, C.S. LACK OF INSULATING EFFECT OF BODY FAT DURING EXPOSURE TO INTERNAL AND EXTERNAL HEAT LOADS. *J. Appl. Physiol.*, Jan. 1958, 12(1), 17-19. (University of North Carolina)

10,503

This experiment assessed the insulating effect of subcutaneous fat. Subjects (14 normal weight and 14 obese) performed under three experimental conditions: (1) resting exposure to heat for 90 minutes, (2) treadmill walking in the heat at three miles per hour, zero grade, for 45 minutes, and (3) treadmill walking at normal ambient temperature (25 degrees Centigrade) at four miles per hour, ten percent grade, for 60 minutes. Data were obtained on skin and rectal temperature, heart and sweat rate, blood pressure, and body fat contents. The results are discussed in terms of the differences in these measurements for the normal weight and obese groups as indicative of relative recovery rates and metabolic costs of work with different dispositions of subcutaneous fat. 10,504

This experiment attempts to determine the interrelationships of certain simple tests of physical fitness and certain bodily measurements. Fifty male subjects ranging from varsity athletes to sedentary individuals participated in a battery of tests. In the first day data were obtained relative to weight, height, birth of chest during inspiration and expiration, vital capacity, leg length and Ruffe Pulse-Rate test. In the second day data relative to the flammeter and Harvard Steptest were received. Coefficients of correlation between these various tests were obtained and results are discussed in terms of the interrelationships of these tests.

Teichner, W.H. ASSESSMENT OF MEAN BODY SURFACE TEMPERATURE. *J. Appl. Physiol.*, March 1958, 12(2), 169-176. (USA Quartermaster Research & Engineering Center, Natick, Mass.).

10,506

This experiment examined the minimum number of points required to obtain the mean weighted skin temperature. Subgroups of 323 soldiers, each wearing a 13-point thermocouple harness, were assigned to 14 different ambient conditions of wind and low temperature. The Quartermaster Corps 10-point mean weighted skin temperature was the standard. Three analyses were conducted: (1) a comparison of five other methods for obtaining a mean skin temperature in terms of the precision with which they estimated the 10-point mean, (2) an analysis of the relation between the 10-point mean and each of the individual points to determine which points might be eliminated without loss of precision, and (3) an analysis of the degree to which a single point might provide an estimate of the 10-point mean. Buskirk, E.R., Impietro, P.F. & Bass, D.E. WORK PERFORMANCE AFTER DEHYDRATION: EFFECTS OF PHYSICAL CONDITIONING AND HEAT ACCLIMATIZATION. *J. Appl. Physiol.*, March 1958, 12(2), 189-194. (USA Quartermaster Research & Engineering Center, Natick, Mass.).

10,507

This experiment studies the effects of physical conditioning and heat acclimatization upon physical performance during dehydration. Three groups of five men each were dehydrated overnight (110.5 degrees Fahrenheit) on two occasions. Three weeks prior to this one group was acclimatized to heat and physically conditioned, a second was physically conditioned, and a third remained sedentary. Performance consisted of grade walking and running on a treadmill. Indicators of performance response were: pulse rate, rectal temperature, and maximal oxygen intake. Results are discussed in terms of the relative effects of physical conditioning and acclimatization upon physical performance.

Robinson, S., Robinson, D.L., Mountjoy, R.J. & Bullard R.M. INFLUENCE OF FATIGUE ON THE EFFICIENCY OF MEN DURING EXHAUSTING RUNS. *J. Appl. Physiol.*, March 1958, 12(2), 197-201. (Medical School, Indiana University).

10,510

The purpose of the present experiment was two-fold: (1) to determine in runners the oxygen requirement at different periods of exhausting runs at constant speed and (2) to determine oxygen requirements and study the effects on fatigue when the running pace is varied (i.e., slow beginning pace with fast finish, and vice versa) during exhausting runs of fixed distance and time. Four college men participated in a series of running experiments (1) at constant speed, (2) with first part faster and last part slower than average speed, and (3) the reverse of the second variation. Data were obtained on basal oxygen consumption prior to run, during each minute of run, and so forth. Results are discussed in terms of the relationship between changes in oxygen consumption and the progressive development of fatigue. I. G. R 10

Grande, F., Anderson, J.T. & Keys, A. CHANGES OF BASAL METABOLIC RATE IN MAN IN SEMISTARVATION AND REFEEDING. *J. Appl. Physiol.*, 1958, 12(2), 230-238. (Physiological Hygiene Lab., University of Minnesota).

10,511

The results of two experiments on the physiological effects observed in subjects subsisting on a hypocaloric carbohydrate diet while maintaining a fairly high level of physical activity are reported in this study. Twenty-five male subjects performed under control, semistarvation, and recovery conditions during which measurements were made of basal heat production, total body water, extracellular fluid space and nitrogen balance. Results are discussed in relation to existing theories, e.g., changes in the various measurements are due (1) to a reduction of the metabolic activity of the body cells or (2) to the loss of actual tissues inherent to the loss of weight of the body.

Balke, B., Ellis, J.P. Jr. & Wells, J.G. ADAPTIVE RESPONSES TO HYPERVENTILATION. *J. Appl. Physiol.*, 1958, 12(2), 265-277. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

10,512

This experiment studied the possible existence and nature of adaptive mechanisms to hyperventilation. A standardized hyperventilation test procedure was used to determine the response to mechanically induced hyperventilation in terms of psychomotor performance, cardiovascular and respiratory functions, and so forth. Normal control patterns were established on six subjects who were retested under the following experimental conditions: 1) after two weeks' training in hyperventilation, 2) after eight weeks' training for physical conditioning, 3) under conditions of extreme fatigue, 4) after acclimatization at 14,000 feet, and 5) after return to sea level. Changes in hypoxic tolerance under these conditions and the potential of biochemical compensatory mechanisms in hyperventilation are discussed. I. G. R 11

10,513

This study was designed to evaluate the magnitude and direction of fixation disparity under conditions approximating the normal visual situation. Fifty-seven subjects with 20/20 visual acuity in each eye were presented (monocularly) with a series of polarized lines at the fixation area. Fixation disparity was determined by a vernier acuity technique. Both distance and near fixation disparity measurements were obtained. Adjustment of two vernier line segments against a field of printed material comprised the primary task. Heterophoria measurements were obtained and related to near and distance fixation disparity. Hypotheses are offered to explain the relation between heterophoria and fixation disparity.

- 10,515
A clinical evaluation of monaural and binaural hearing aids was done on ten clinical otosclerotic subjects (presented as "ideal" hearing aid candidates) at the Hearing and Speech Center, New York University-Bellvue Medical Center. Two loudspeakers were placed four feet away from the subject in center of room at 45 degree angles to left and right respectively. One delivered a signal, noise, or signal and noise at calibrated levels; the other produced recorded noise at calibrated levels. Hearing aids were set by the subject to a comfortable listening level for 50 decibels of connected discourse. Test material consisted of spondee words and phonetically-balanced word lists. Comparisons are made between the two types of aids at various signal noise ratios.

This paper presents a study on post-stimulatory auditory fatigue in normal subjects and in cases with various types of hearing loss. Utilizing a self-recording Bakesy type audiometer, subjects were instructed to record pre-stimulatory thresholds during a one-minute period until a stable threshold was obtained. A 30-decibel sensation level tone was then turned on for three minutes and, following this the subject recorded a second threshold. Frequencies ranging from 250 to 6000 cycles per second were used with six normal and 40 hard-of-hearing subjects. The results are presented and discussed in terms of the role of recruitment in recovery and the relation between frequency and amount of post-stimulatory fatigue.

Ogle, K.N. & Well, M.P. STEREOSCOPIC VISION AND DURATION OF STIMULUS. *AMA Arch. Ophthalmol.*, June 1958, 52(6), 4-17.
- 10,518
To understand the processes underlying stereoscopic depth perception, an experiment was conducted to study the relationship between exposure time and stereoscopic acuity. Comparisons were made of stereoscopic thresholds (three subjects) obtained by the following methods: 1) constant stimuli, 2) forced choice, two-category type, and 3) one-category constant stimuli. The effects of the following variables upon the thresholds were examined: 1) differences in the luminance of the stimulus with constant short exposure time, 2) changes in duration of exposure of the test object, and 3) the constant disparity of reference and test lines. Involuntary eye tremors as a basis for the results is hypothesized.

- 10,519
Differential thresholds were obtained for perception and pupil reflex (one subject) under conditions of varying brightness and color. Both the entoptic and direct observation (through an infrared converter) methods were used. Variables considered were: 1) the relationship between area of test spot and background brightness in a) the pupil reflex and b) the foveal region, 2) the effect of increasing background brightness on the visual and pupil reflex thresholds, and 3) the ratio between brightness content of the test flash and the energy content of the background as it affects perception and visual reflex. The effect of these variables upon the light reflex system of the pupil was discussed.

Dimick, F.L. & Wienke, R.E. HOW RED IS RED? *Amer. J. Psychol.*, March 1958, 71(1), 298-304. (USN Medical Research Lab., Naval Submarine Base, Conn.).
- 10,521
This experiment studies the effect of the cancellation of green produced by a stimulus at 562 mμ in determining the relative redness of stimuli in the long-wave end of the spectrum. Observations of a bipartite field into the right half of which yellow light was presented were made by six subjects who then (1) adjusted the red and green components in the left half until this combination matched the right half, (2) with the green of the above match held constant, adjusted the red only, and (3) reversed (2). Discussion concerns the amount of red of the several wavelength bands used at three brightness-levels necessary to cancel a fixed amount of green and the use of anomaloscope in measuring red-green ratios.

Genelli, A. THE VISUAL PERCEPTION OF MOVEMENT. *Amer. J. Psychol.*, March 1958, 71(1), 291-297. (Catholic University of Milan, Italy.).

10,522

This article represents a preliminary paper on movement-perception and the variables affecting it. The experiment reported examines the perception of an object accomplishing a movement of translation. By photographing a black disc on a white rectangle with a motion-picture camera used as a still camera and moving the disc along the rectangle, photographing anew for each movement. It is possible to obtain a sequence of exposures which can be manipulated in various ways. Subjects were instructed to fix a central point in the rectangle or follow the movements of the object. Aspects of movement-perception discussed are: the interrelation of speed and direction, perception and assessment of speed and direction, and so forth. Implications for further experimentation are indicated. R 7

Helson, H. & Wilkinson, A.E. A STUDY OF THE MITTE-KONIG PARADOXICAL FUSION-EFFECT. *Amer. J. Psychol.*, March 1958, 71(1), 316-320. (University of Texas).

10,524

The purpose of this experiment was to test the hypothesis that the Mitre-Konig paradoxical fusion-effect is a contrast-effect and to gain further information on this phenomenon. Subjects (15) were presented with outline-circles, one a complete circle, the other with a gap of varying widths, and responded as to the presence or absence of the gap. Size of gap, width of outline, and reflectance of variance were varied within each stimulus presentation. Data were analyzed by analysis of variance and the results are discussed in terms of their relevance to the contrast-effect hypothesis, their addition to information regarding underlying physiological mechanisms, and their implications for contrast and angular separator aspects of visual acuity. Jones, F.W. SCALES OF SUBJECTIVE INTENSITY FOR ODOORS OF DIVERSE CHEMICAL NATURE. *Amer. J. Psychol.*, March 1958, 71(1), 305-310. (University of California at Los Angeles).

10,525

This experiment subjectively scales the intensities of n-butanol, sec-butanol, iso-butanol, ethyl acetate, cyclohexane, and pyridine by the method of magnitude-estimation. Thirty-six Ss in separate groups gave two judgments at each level of concentration of each substance. Results are presented and discussed in terms of their fit into a simple exponential curve obtained by Stevens in an experiment on nonpolar substances and their effect upon existing stimulus-receptor interaction data. G. R 4

10,527

Corso, J.F. ABSOLUTE THRESHOLDS FOR TONES OF LOW FREQUENCY. *Amer. J. Psychol.*, June 1958, 71(2), 367-374. (Pennsylvania State University).

10,527

Two experiments are discussed which determine 1) the monaural threshold for low frequencies (5 to 200 decibels) and 2) the effect on the results of two- and five-decibel size steps in the method of limits. Stimulus frequencies of 5, 25, 50, 75, 100, 125, 150, 175 and 200 decibels were used in each experiment. In Experiment I the stimuli were presented to each subject (15 in all) individually by the serial order of the method of limits with the steps between successive trials in increments of five decibels. In Experiment II the increments were two decibels. The absolute thresholds obtained at the nine frequencies are presented. The results are compared with those of earlier investigations and are discussed with relation to those findings. T. G. R 13

10,528

Mulholland, T.B. THE "SWING DISK" ILLUSION. *Amer. J. Psychol.*, June 1958, 71(2), 375-382. (Clark University).

10,528

This experiment studies the effect upon the "swinging disk" illusion of 1) reflectance of the background and 2) accessory auditory stimulation. The stimulus object, shaped like a "T", had a white and black disk at either end of the crossbar. Five subjects reported 30 times on the motion perceived under each of 24 conditions--12 values of background-reflectance each presented with "tone" and "no-tone". The tone (steady) was at 600 decibels. Results are reported in terms of: types of motion perceived, statistical tests used, sequence of reports of motion, frequency of motions reported, effect of brightness background on the perception of the illusion, and so forth. G. R 7

10,529

Coombs, C.H. & Komorita, S.S. MEASURING UTILITY OF MONEY THROUGH DECISIONS. *Amer. J. Psychol.*, June 1958, 71(2), 383-399. (University of Michigan).

10,529

In this experiment three subjects had to determine which of three bets they most and least preferred in four series of eight bets. The probability of winning or losing each bet was always 50 per cent. The intuition was to obtain metric relations from the first three series and test the additivity condition on the fourth series. The results are discussed in terms of their support of a hypothesis that an ordered metric scale for measuring the utility of money can be obtained and can adequately predict gambling-choice behavior. T. I. R 9

10,530

Cohen, W. COLOR-PERCEPTION IN THE CHROMATIC GANZFELD. *Amer. J. Psychol.*, June 1958, 71(2), 390-394. (University of Buffalo).

10,530

This experiment studies the appearance of color and changes resulting from adaptation when a small differentiated area is present in the Ganzfeld. One red, one blue and two green filters provided chromatic illumination. Sixteen subjects participated in two tasks. In Task I they were asked to compare two situations, each presented for 20 seconds, with a five second interval between each item of a pair and 15 seconds between pairs. In Task II subjects reported on the same phenomenon for three minutes with two minute rest intervals. Subjects' reports on fog density, distance, distinctiveness of figure, hue and saturation are reported and discussed with respect to the homogeneous and inhomogeneous Ganzfeld. T. R 9

10,531
Krus, D.M., Wagner, S. & Werner, H. STUDIES IN VICARIOUSNESS: EFFECT OF MUSCULAR INVOLVEMENT ON VISUAL THRESHOLD. *Amer. J. Psychol.*, June 1958, 71(2), 395-398. (Clark University).

10,531
Two experiments are presented which examined the effects of muscular involvement on visual threshold. In Experiment I one group of subjects participated in a pushing exercise for 20 seconds and then fixated on a screen, six feet away while the control group only fixated on the screen. Both groups were to report the recognition of the figure exposed, as soon as possible. In Experiment II visual words, rather than pictured objects, were presented at 1/25 second, rather than being present constantly, and the intensity of the stimulus was systematically increased for each successive presentation. Results were subjected to an analysis of variance. The relationship between muscular involvement and perceptual sensitivity is discussed.

10,532
Lotsof, E.J. EXPECTANCY FOR SUCCESS AND DECISION-TIME. *Amer. J. Psychol.*, June 1958, 71(2), 416-419. (University of California at Los Angeles).

10,532
The relationship between decision-time and expectancy of success is studied in this experiment. Subjects (67) were put into three groups. Their task was to decide which one of two red lights on a panel would go on. The percentage of times they would choose correctly was predetermined by the experimenter (25, 50 and 75 percent respectively for the three groups). Decision-time represented the period from the extinguishing of the red light to the pressing of the buzzer signifying a choice made. Results were treated by analysis of variance. Discussion is related to the hypothesis that decision-time shortens as the expectancy for a positive reinforcement grows.

Kohler, W. & Adams, Pauline A. PERCEPTION AND ATTENTION. *Amer. J. Psychol.*, Sept. 1958, 71(3), 489-503. (Swarthmore College).

10,534
Several experiments studied the relationships between attention and 1) articulation and 2) satiation. Subjective descriptions were obtained of a dotted pattern 1) used as a background "covered" by figures (20 subjects), and 2) presented directly (10 subjects). A word and its mirror-image were observed under similar conditions in two experiments (40 subjects in each). The importance of organizational versus elementary visual factors to articulation is discussed. Subjects (19) judged distance of objects when two test objects were imposed before two satiation objects. The last experiment (42 subjects) substituted kinesthetic attention for visual. The influence of attention upon satiation in visual and kinesthetic areas is discussed.

Brozek, J. & Taylor, H.L. PSYCHOLOGICAL EFFECTS OF MAINTENANCE ON SURVIVAL RATINGS. *Amer. J. Psychol.*, Sept. 1958, 71(3), 517-528. (University of Minnesota).

10,536
This experiment studied the effects of a brief, severe restriction of food (1,010 calories per day) on the individuals' sensory, manipulative, and personality areas. Thirteen subjects took part in control, dietary restriction, and refeeding periods covering 65 days. Carbohydrate was the only food substance taken during the restriction, although adequate vitamin and salt supplements were given. Tests of sensory functions, motor and manipulative abilities, and personality variables were administered. The results are discussed in terms of changes within these categories. Methodological suggestions and implications for research are given.

10,537
Smith, O.W. JUDGMENTS OF SIZE AND DISTANCE IN PHOTOGRAPHS. *Amer. J. Psychol.*, Sept. 1958, 71(3), 529-538. (Cornell University).

10,537
To study the effects of distance of subjects from a photograph upon judgments of size, subjects judged the height and distance of objects under three viewing conditions: 1) when stimulus and standard objects (varying in height and distance from camera) were photographed against a rolling field, 2) when visual cues of the photograph had been eliminated, and 3) when the "abstracted" photographs were viewed from varying distances. Fifty-two subjects, divided into five groups, were used. The results consider the effects of viewing conditions upon size and height judgments, the relationship between distance, size, and height judgments, and so forth.

Adams, Pauline A. & Haire, M. STRUCTURAL AND CONCEPTUAL FACTORS IN THE PERCEPTION OF DOUBLE-CUBE FIGURES. *Amer. J. Psychol.*, Sept. 1958, 71(3), 548-556. (Stanford University & University of California).

10,538
This experiment studies the effect on perception of double-cubes of 1) the type of figure observed and 2) the joinings of the cubes. Ninety-five versions of the double-cube figure were used (shifted-cube, perpendicular gap, and so forth). Each of 67 subjects was shown a series of from nine to sixteen cards. Their task was to report their first impression of figured position, positions during reversal, versions perceived, and ease of perception. The results are concerned with the influence on perception of the relative position (up or down), the manner of joining, and corner-cube figures. Individual differences and consistencies are also discussed.

Gaydos, H.F. SENSITIVITY IN THE JUDGMENT OF SIZE BY FINGER-SPAN. *Am. J. Psychol.*, Sept. 1958, 71(3), 557-562. (USA Quartermaster Research & Engineering Center, Matlack, Mass.).

10,539
The method of adjustment was used in a series of three experiments in which subjects matched a variable cylinder to a standard by surrounding the stimulus-objects with thumb and forefinger. In Experiment I (50 subjects) 25, 50, and 100 millimeter standard lengths were used. Lengths of 35.4 and 70.8 millimeters were added for the second experiment (50 subjects) and a 17.7 millimeter length was added for the final experiment (20 subjects). The variable was two 20 millimeter diameter disks. The results are treated by analysis of variance and discussed in terms of their relation to Weber's law. T. G. R 6

10,540
Lyman, J. & Groth, Hilde. PREHENSION FORCE AS A MEASURE OF PSYCHOMOTOR SKILL FOR BARE AND GLOVED HANDS. *J. appl. Psychol.*, Feb. 1958, 42(1), 18-21. (University of California at Los Angeles).

10,540
An exploratory experiment was performed which attempted to distinguish some of the variables affecting prehension force. The task of the six subjects was to grasp a cylinder with thumb and first two fingers, place it in a specified location, release it, grasp it again and place it in its original location. The variables which were manipulated were weight (18.1, 45.4, 118.0, 30.5, and 426.4 grams), direction (0, 30, 60, 90, 120, 150, and 180 degrees), distance (9.0, 30.8, and 52.5 centimeters as measured from the center), and hand coverings (bare, latex surgeons' gloves, and leather army glove). The results discuss the effect of these variables on prehension force. G. I. R 4

Solom, A.R. AN EVALUATION OF TWO ATTITUDINAL APPROACHES TO DELEGATION. *J. appl. Psychol.*, Feb. 1958, 42(1), 36-39. (University of Maryland).

10,541
Two problems were presented to 456 subjects in an attempt to evaluate the effectiveness of two methods of delegating responsibility. The subjects, in groups of approximately 40 each, were given lectures on material appropriate to the problem. The groups were then broken down into smaller role-playing components in which one member was a supervisor and the others subordinates. Data as to how the problem was handled, the satisfaction of the leader and subordinates with the solution, and so forth, were obtained. The effectiveness of the full versus the limited method of responsibility designation is discussed. T. P 19

Loeb, M. & Jeantheau, G. THE INFLUENCE OF NOXIOUS ENVIRONMENTAL STIMULI ON VIGILANCE. *J. appl. Psychol.*, Feb. 1958, 42(1), 47-49. (USA Medical Research Lab., Fort Knox, Ky.).

10,542
The effects of heat, noise, and vibration, singly and combined, on vigilance are studied in this experiment. The task of the 12 subjects was to detect randomly occurring, obscure signals. During the experimental sessions the following combinations were used: (1) Control, temperature 65-75 degrees Fahrenheit, ambient noise level 65-75 decibels re .0002 dyne per square centimeter, no vibrations; (2) Noise and vibration, temperature the same, noise 115 to 125 decibels, considerable vibrations; (3) heat, noise, and vibration, same as (2) but temperature 110-125 degrees; (4) heat same as in (3) but all other conditions were the same as in the control period. The effects and interrelations of heat, noise, and vibration on vigilance are discussed. T. J. R 11

10,543
Teichner, W.H. REACTION TIME IN THE COLD. *J. appl. Psychol.*, Feb. 1958, 42(1), 54-59. (USA Quartermaster Research & Development Center, Natick, Mass.).

10,543
This experiment tests the effects of ambient temperature, windspeed, and wind chill on reaction times. Reaction time measurements of 620 subjects, divided into 14 groups, were obtained after 45 minutes of exposure to the various conditions and again, following mild exercise, after 65 minutes of exposure. Also obtained were mean area-weighted skin temperatures from ten body areas. The results discuss the effects of the varying windspeeds, mild exercise, temperature, and wind chill on reaction times. T. G. R 6

10,544
Torrance, E.P. SENSITIZATION VERSUS ADAPTATION IN PREPARATION FOR EMERGENCIES: PRIOR EXPERIENCE WITH AN EMERGENCY RATION AND ITS ACCEPTABILITY IN A SIMULATED SURVIVAL SITUATION. *J. appl. Psychol.*, Feb. 1958, 42(1), 63-67. (Survival Methods Branch, Air Force Personnel & Training Research Center, Lackland AFB, Tex.).

10,544
An experiment was undertaken to determine whether a previous introduction to a "meat bar" survival ration elicited a more favorable reaction to it. The subjects (416) were supplied with eight meat bars (permincan) plus a supplementary diet during a seven-day simulated survival exercise. The subjects included an inexperienced group, men previously acquainted with the meat bar who (1) liked it, and (2) disliked it. Data included a hedonic rating scale, meat bar consumption, supplementary diet consumption, physiological reactions to eating the meat bar, and so forth. The results are discussed in terms of adaptation versus sensitization in emergency preparation. T. R 12

10,545
Alluisi, E.A. & Martin, H.B. AN INFORMATION ANALYSIS OF VERBAL AND MOTOR RESPONSES TO SYMBOLIC AND CONVENTIONAL ARABIC NUMERALS. *J. appl. Psychol.*, April 1958, 42(2), 79-84. (Laboratory of Aviation Psychology, Ohio State University).

10,545
This experiment studied the relative efficiency of conventional Arabic numerals versus a straight line symbolic set by comparing the information-handling performance of 48 subjects. Both motor response and verbal response procedures were used. Data were collected from responses during two days of trial, and the ten subjects continued for ten more days in order to obtain the effects of longer-term practice. The results discuss the amounts of information handled during the presentation of the two symbolic forms, the effectiveness of motor versus verbal response to these symbols and the effects of longer-term practice upon productivity. T. G. I. R 15

10,546
Jenkins, M.L. THE SUPERIORITY OF GLOVED OPERATION OF SMALL CONTROL KNOBS. *J. appl. Psychol.*, April 1958, 42(2), 97-98. (Lehigh University).

10,546
An experiment was performed which tested the effectiveness of gloved versus bare hand operation of control knobs. Twenty subjects participated in a task which consisted of making 40 least turns of the knob to left or right and 40 linear scale settings under each set of conditions. The variables manipulated were knob position, knob orientation, knob diameter, and gloved-barehand operation. The results discuss the effect of the gloved-barehand factor under all the conditions. T. R 3

10,547

Conklin, J.E. & Lindquist, O.R. RECOVERY FROM UNUSUAL AIRCRAFT ATTITUDES UNDER THE INFLUENCE OF VERTIGO. *J. appl. Psychol.*, April 1958, 42(2), 136-138.

10,547

This experiment studies the effect of the conventional aircraft attitude indicator versus the moving drone concept on recovery performance from unusual attitudes under the influence of vertigo. Two pilots participated in six experimental sessions each. The subject was rotated to induce vertigo before each recovery trial. Head positions and rotation directions were mixed for eight combinations. The results discuss the transfer of effects from an outside-in to an inside-out display and recovery performance with the moving drone display and moving horizon indicator.

10,548

Bamford, H.E., Jr. & Ritchie, M.L. COMPLEX FEEDBACK DISPLAYS IN A MAN-MACHINE SYSTEM. *J. appl. Psychol.*, June 1958, 42(3), 141-147.

10,548

This experiment studies the effects of an integrated roll and turn indicator, which combined distinct and anticipatory indication, upon the performance of the man-machine system of which it is an integral part. Nine pilots participated in a task in which they had to maintain a constant heading and altitude in simulated flight, during the following conditions: (1) reference in which non-emergency flight was simulated with the full instrument panel available to the subject; (2) control was similar to reference except that the attitude indicator had "failed"; and (3) experimental differed from control in that the integrated roll and turn indicator took over. The effects of these three conditions on performance are discussed.

10,549

Spar, R.S. NUMERAL FORM AS A VARIABLE IN NUMERAL VISIBILITY. *J. appl. Psychol.*, June 1958, 42(3), 158-162. (Vanderbilt University).

10,549

Data from prior experiments indicating which numerals are most frequently confused with which were used as a basis for developing three new sets of numerals in which unique elements were maximized. A set by McLaughlin plus a conventional set of numerals were added to make up the stimulus variables. Subjects (100) provided 20 replications of the five conditions. Results discuss the visibility of each numeral in the five sets and the factors of boldness, stroke width, and so forth, which aid visibility.

Benson, P.H. & Peryam, D.R. PREFERENCE FOR FOODS IN RELATION TO COST. *J. appl. Psychol.*, June 1958, 42(3), 171-174. (USA Quartermaster Food & Container Institute, Chicago, Ill.).

10,551

Preference rating for meat dishes were gathered from 1950-1954 by the Quartermaster Corps. The preferences stated by a group of subjects (varying in size from 1500 to 4000) for each meat item were compared with the cost of these items, and a regression curve was fitted to a plot of the preference ratings and cost estimates. An interpretation of the meaning of the curve is included as well as conditions, such as frequency of serving, which might alter its use. Uses for a preference-cost analysis are discussed.

10,552

Schultz, H.G. & Kammetzky, J. RESPONSE SET IN MEASUREMENT OF FOOD PREFERENCE. *J. appl. Psychol.*, June 1958, 42(3), 175-177. (USA Quartermaster Food & Container Institute, Chicago, Ill.).

10,552

An experiment was designed to determine the set used by survey respondents in rating foods according to preference. Naval enlisted men (305) were divided into three groups and each group was presented with a questionnaire rating 54 foods under one of the following sets of instructions: (1) circle the reply which tells how much you like or dislike each food item (based on a nine-point like-dislike preference scale); (2) rate the "best serving" of each food ever eaten; and (3) rate the "poorest serving" ever eaten. The results discuss the effect the various instructions have upon subjects' responses as well as the type of set which determines the responses.

T. R 2

Greek, D.C. & Small, A.M., Jr. EFFECT OF TIME LIMITATION ON MAKING SETTINGS ON A LINEAR SCALE. *J. appl. Psychol.*, Aug. 1958, 42(4), 222-226. (Lehigh University).

10,553

This experiment studies the cursor positioning performance on a linear scale as a function of (1) reduced time intervals, (2) control ratio, (3) direction of initial cursor displacement from target, and (4) distance of cursor travel. Twelve subjects were asked to make settings as quickly and accurately as possible. Measurements were taken of the error (size of the final discrepancy between target and cursor) time in travelling to the approximate location of the target, and time for final adjustments. The results are discussed in terms of a time pressure-control ratio interaction hypothesis.

Groth, Hilde & Lyman, J. EFFECTS OF SURFACE FRICTION ON SKILLED PERFORMANCE WITH BARE AND GLOVED HANDS. *J. appl. Psychol.*, Aug. 1958, 42(4), 273-277. (University of California at Los Angeles).

10,554

To assess the effects of surface friction upon prehension force, speed of performance and rate of output, 12 subjects participated in a manipulative task (moving a cylinder from one lighted area to another). Each subject participated under all of the following conditions: 1) bare hand, 2) wiped with alcohol, b) coated with wax - benzene paste, c) coated with silicone grease, and 2) gloved hand (leather) a) untreated, b) and c) same as above. The results are treated by analysis of variance and are related to three hypotheses which predicted relationships between friction and effort, speed and output rate.

Mozell, M.M. & White, D.C. BEHAVIORAL EFFECTS OF WHOLE BODY VIBRATION. *J. Aviat. Med.*, Oct. 1958, 29(10), 716-724. (USC Aviation Medical Acceleration Lab., NADC, Penn.).

10,555

To study the effect of whole body vibration on ability to: 1) read digits of an aircraft mileage indicator and 2) do a tracking task, eight subjects (17 to 38 years) read 7 inch white on black numerals (0.25 milliamperes) while vibrating at 0, 8, 13, 18 and 23 cycles per second, four with double amplitude of 0.05 inch, four with 0.1 inch; five subjects also ran at 10, 20, 30, 40, 50 cycles per second; next all subjects kept a trace line in center of oscilloscope by manipulating a control stick at each of first set of frequencies at three amplitudes. Errors on each task were analyzed by analysis of variance.

Green, A.C. IMPACT THRESHOLDS OF BRAIN CONCUSSION.
J. Aviat. Med., Oct. 1958, 29(10), 723-732. (Cross
Research Laboratories, Inc., Longwood, Calif.).

10,555
This analysis of resonance-cavitation theory of head
concussion was aimed at: 1) establishing impact thresh-
olds of brain concussion, 2) determining the physical
factors involved, 3) developing instrumentation tech-
niques for determination of cavitation thresholds in hu-
man cadavers. These aims were accomplished and impact
experiments were conducted on simulated skulls to dem-
onstrate the technique and apply the data to the formula
developed for computing impact threshold for concussion
condition.

Blument, S. PREVENTION OF DEGENERATIVE VISUAL DEFECTS
IN AGING AIRLINE PILOTS. *J. Aviat. Med.*, Oct. 1958,
29(10), 733-738.

10,557
To determine causes of defective vision in airline
pilots in the pre and presbyopic years, and to explore
the possibility of avoiding it in the proper early selec-
tion of pilots, two groups (one with and one without de-
fects) of pilots were studied. Both groups were examined
as to degree of hyperopia and available accommodative
amplitude periodically during their years of duty. The
findings are related to initial hyperopic reserve and op-
timum refraction at an earlier age.

Moseley, H.G. & Zoller, A.F. REACTION OF EXERTION TO
FORCES AND DIRECTION OF ACCELERATION IN AIRCRAFT
ACCIDENTS. *J. Aviat. Med.*, Oct. 1958, 29(10), 739-
749.

10,558
A review of all major cargo and transport type air-
craft accidents in the United States Air Force during a
two year period was made in order to determine the path
that such aircraft follow during actual crashes and to
relate this to variations in aircraft altitude and to
force of occupants. This path, the deceleration course,
was analyzed in terms of lateral deviation, pitch, roll
and yaw for the two major categories of accident—take
off and other than take off. Injuries were analyzed in
terms of the important related factors for these two cat-
egories. Also measures to alleviate such injuries are
suggested.

Bergess, B.F., Jr. EFFECT OF HYPOXIA ON TOLERANCE TO
POSITIVE ACCELERATION. *J. Aviat. Med.*, Oct. 1958,
29(10), 754-757.

10,560
To determine the effects of breathing low concentra-
tions of oxygen on tolerance to positive acceleration,
four trained centrifuge subjects received positive ac-
celeration from 2.5 G up to the point they did not per-
form their task of turning off peripheral lights, while
breathing oxygen-nitrogen mixtures simulating altitudes
from about 16,000 to 21,000 feet (9.5, 10.0, 10.5, 11.0,
11.5 and 21 percent oxygen). Individual variations in
tolerance and general symptoms of hypoxia with accelera-
tion stress are noted.

10,562
Rutledge, H.C. EFFECTS OF HYPERVENTILATION ON SPEECH
AND HEARING. *J. Aviat. Med.*, Oct. 1958, 29(10),
763-766.

10,562
To determine the effect of hyperventilation on audi-
tory acuity and speech intelligibility, eight healthy
young adult males wearing an oxygen mask, read lists into
a microphone under three conditions: 1) in resting state,
2) after five minutes hyperventilation, 3) after 13 min-
utes hyperventilation. These lists were played back to
24 listeners who marked what they heard on a score sheet.
Auditory thresholds for a 4000 cycle per second tone were
taken during each condition. Continuous electroencephalo-
graphic and electrocardiographic recordings as well as
occasional reflex measures and carbon dioxide levels were
taken also. Analysis of variance was employed to test
the significance of the speakers, listeners, conditions
variables.

Wood, C.C. HUMAN FACTORS ENGINEERING IN AIRCRAFT
CONCEPT ENGINEERING'S VIEWPOINT. *Ergonomics*, Aug. 1958,
1(4), 294-300.

10,563
The six essential features of effective human
factors engineering are set forth and discussed. These
are: 1) application of information obtained from
research, 2) requirement for objective quantitative in-
formation, 3) incorporation of information during the
design stage, 4) use of system effectiveness and cost
as decision criteria, 5) consideration of effectiveness
and cost in terms of operational use, 6) human factors
engineering in system support activities.

10,564
Kraft, J.A. INDUSTRIAL APPROACHES TO HUMAN ENGINEER-
ING IN AMERICA. *Ergonomics*, Aug. 1958, 1(4), 301-306.

10,564
Examples are presented of some of the numerous ways
in which human engineering programs are introduced,
staffed and developed within industry. The scope of
these programs in the aircraft industry is outlined and
the future prospects of human engineering studies are
touched upon briefly.

10,565
Lehmann, G. PHYSIOLOGICAL MEASUREMENTS AS A BASIS
OF WORK ORGANIZATION IN INDUSTRY. *Ergonomics*, Aug.
1958, 1(4), 328-344.

10,565
Three methods of work-load measurement are described:
1) an exact time-study covering the whole working day and
including details of all accessory operations and all
rest pauses, 2) measurement of energy cost of work by
use of respirometer, 3) measurement of pulse rate by
Müller pulse counter. A number of examples of the use of
these methods in several forging shops and in a motor car
factory are presented. These include instances of under-
and overloading with reasons and remedies for some.

10,566
Lifson, K.A. PRODUCTION WELDING IN EXTREME HEAT.
Ergonomics, Aug. 1958, 1(4), 345-346.

10,566
This is a brief study aimed at measuring decrement in
productivity of heavy labor performed in extreme heat by
comparing daily productivity figures for a group of
welders with daily temperature maxima during an unusually
hot summer. Correlation between temperature and produc-
tivity was made.

10,567

McKinnon, D. STUDY OF THE INFLUENCE OF VIBRATION ON MAN. *Ergonomics*, Aug. 1958, 1(4), 347-355.

10,568

To study the influence of horizontal and vertical mechanical vibrations (up to 150 cycles per second) on the human body in standing and sitting positions, physical and physiological methods as well as subjective assessments were employed. Resonance phenomena are described and a strain scale is given for these vibration excitations. Using these techniques, a man sitting on a seat in a rail-car is described.

Hallowell, D., Hoople, G. & Farrick, E.O. THE MEDICAL PRINCIPLES OF MONITORING AUDIOMETRY. *Arch. Industr. Health*, Jan. 1958, 17(1), 1-20.

10,574

Monitoring audiometry as an essential feature of any effective conservation program is discussed in terms of the medical principles on which it is based. A general plan for disposition of cases of hearing loss consistent with these medical principles is presented. Its central features include: (1) reference audiograms, (2) routine monitoring audiometry, (3) a diagnostic center or qualified otologist, and (4) "hearer limits" of hearing that make referral to such medical authority mandatory. A discussion and clarification of terms and concepts is also included as well as medical data relevant to a hearing conservation program.

Grimaldi, J.V. A GLANCE BACKWARD, THEN A LOOK TO THE FUTURE - IN SAFETY. *Arch. Industr. Health*, May 1958, 17(5), 377-382.

10,576

This paper presents a brief historical review of the role private industry has played in promoting industrial safety. Comparisons between safety plans used in some present-day industries are made and related to their accident rate and net returns. The need for continued management effort in industrial safety planning is emphasized.

10,577

Henry, J.P. SOME CORRELATIONS BETWEEN PSYCHOLOGIC AND PHYSIOLOGIC EVENTS IN AVIATION BIOLOGY. *J. Aviat. Med.*, March 1958, 29(3), 171-179. (European Office, Air Research and Development Command, Brussels, Belgium).

10,577

Recent discoveries in neurophysiology have imparted a greater understanding of the role played in psychological events by the reticular activating system and such temporal lobe structures as the amygdala, hippocampus and pyriform cortex. Attention, sleep, and such emotional responses as the "breakoff phenomenon", "freezing", and "fainting" are discussed in this article in terms of their relationship to the integrating role of the central internuncial system and the occurrence of differential subcortical inhibition. It is hoped that the analysis presented in this article will help to explain the limitations shown by some operators in the performance of their duties, and thus aid in the development of more ideal man-machine systems.

10,570
 Meloy, C.O. & Morgan, J.E. STRESSES AFFECTING THE
 PILOT DURING POST-STALL MANEUVERS OF HIGH PERFORMANCE
 AIRCRAFT. *J. Aviat. Med.*, March 1958, 29(3),
 180-184. (Chance Vought Aircraft, Dallas, Tex.).

10,578
 The stall-spin type of accident is a major problem
 in current high-performance aircraft. Positive evi-
 dence exists that pilot error is a basic factor in
 such accidents. This article presents representative
 data on high performance aircraft which indicates that
 such aircraft exhibit post-stall flight characteristics
 which can exceed the pilot's ability to perceive,
 judge, and cope with the situation. Disorientation and
 other physiologic reactions are discussed in relation
 to malfunctions of equipment, larger forces, greater
 rotation rates, and more severe accelerations. Also
 discussed are recommendations for research to provide
 the design parameters necessary for safe flight.

 Lewis, S.T. & Stapp, J.P. HUMAN TOLERANCE TO AIR-
 CRAFT SEAT BELT RESTRAINT. *J. Aviat. Med.*, March
 1958, 29(3), 187-196. (USAF Aero Medical Field
 Lab., Holloman AFB, N.M.).

10,579
 Prior to the tests reported in this article, no ex-
 periments had been reported on human tolerance to crash
 forces with lap belt restraint only. Three devices
 were used for this study: (1) an aircraft seat hinged
 by cables to form a swing-pendulum, (2) a 120-foot
 track along which a sled was propelled by an ejection
 seat catapult and decelerated by water inertia brakes,
 and (3) a rubber shock cord catapult decelerated by
 friction brakes. Human subjects were decelerated in
 these devices in the forward-facing position while re-
 strained by a lap belt three inches in width. The rate
 of onset, magnitude and duration of force for 30 trials
 are tabulated and analyzed, and the implications for
 air-transport crash protection are discussed.

 Zeller, A.E. HUMAN FACTORS IN SELECTED MULTI-ENGINE
 JET AIRCRAFT ACCIDENTS. *J. Aviat. Med.*, March 1958,
 29(3), 197-205. (USAF Directorate of Flight Safety
 Research, Norton AFB, Calif.).

10,580
 This report, based upon almost ten years of USAF
 experience with multi-engine jet aircraft, stresses
 the importance of considering human parameters in at-
 tempting to improve the overall reliability of the man-
 machine complex in future manned flight. By means of
 tables and graphs, comparisons are drawn between the
 causes of multi-engine jet and comparable non-jet ac-
 cidents. Pilot error, pilot age and experience, air-
 craft performance and its concomitant demands on the
 pilot, and unsafe conditions in major accidents are
 some of the variables analyzed. Traffic control and
 integration of the information presented to the pilot
 with higher performance of the aircraft with regard to
 altitude, speed and range are also discussed.

 Taylor, A.A. PREVENTIVE MEDICINE ASPECTS OF FLIGHT
 FEEDING. *J. Aviat. Med.*, March 1958, 29(3), 206-
 211. (Air Research and Development Command, Andrews
 AFB, Washington, D.C.).

10,581
 This report discusses the role of food during flight
 as it relates to preventive medicine. Research has
 shown that improper food intake during flight, together
 with anxiety, irritation, fatigue, monotony, drowsiness
 and discomfort decrease flying safety. However, these
 physical and psychological stresses were found to be
 greatly alleviated by the intake of the appropriate food
 and drink. Preventive medicine, in this case, deals
 not only with the physiologic role of food, but its emo-
 tional value as well. Nutrition, sanitation, size of
 meals, time interval between meals, and palatability are
 taken into account. Two new meal systems, developed to
 meet current flight feeding needs, are described and
 their merits discussed.

 Klein, S.J. & Gell, C.F. ATTENTION HUMAN ENGINEERING
 IS A SCIENTIFIC SPECIALTY. *J. Aviat. Med.*, March
 1958, 29(3), 212-219. (USAF Air Crew Equipment Lab.,
 NAE, Philadelphia, Penn.).

10,582
 The goal of human engineering is to improve opera-
 tor efficiency and safety by minimizing the stresses in-
 duced by the machines created by the engineer. Since
 the increasing complexity of modern aircraft threatens
 to exceed the operator's capacities, this article sug-
 gests a bilateral approach to human engineering in which
 specialists in the medical, biologic, and physiologic
 sciences would work in close cooperation with design
 engineers, thus improving operator safety, efficiency,
 morale, and confidence in his equipment. It is empha-
 sized that human engineering is a scientific specialty
 because its data must be derived from experimentation.
 Conditions are described which have led to a shortage of
 such specialists and a solution is proposed to allevi-
 ate the shortage. R. 12

 Webb, H.S., Miller, E.E. & Seale, L.H. FURTHER
 ATTEMPTS IN CODING AIRCRAFT ACCIDENTS. *J. Aviat.
 Med.*, March 1958, 29(3), 220-225. (USAF School of
 Aviation Medicine, Naval Air Station, Fla.).

10,583
 The complete accident reports of 38 pilot-caused
 accidents of students in the carrier qualification phase
 of basic training were coded by three aviation psycholo-
 gists. Code categories consisted of the following five
 causative factors: (1) errors in speed-distance per-
 ception; (2) applied faulty technique; (3) failed to
 take corrective action; (4) confusion; and (5) faulty
 division of attention. After each of the four coding
 sessions the coding process, the codes, and the acci-
 dents themselves were discussed and the differences in
 coding resolved. The results were tabulated and com-
 pared with previous attempts at accurate coding.

 Simons, D.G. PILOT REACTIONS DURING "WARRIOR II"
 BALLOON FLIGHT. *J. Aviat. Med.*, Jan. 1958, 29(1),
 1-16. (USAF Aero Medical Field Lab., Holloman AFB,
 N.M.).

10,584
 To investigate the human factor problems of
 flight under space equivalent conditions, the author
 piloted a solo balloon flight which lasted thirty-two
 hours and reached an altitude of more than 100,000
 feet. The conditions encountered are discussed in
 terms of (1) the sealed cabin atmosphere and its
 attendant problems, (2) reactions to isolation in a
 space environment, (3) the effects of heavy primary
 cosmic radiation on a human subject, and (4) the
 effects of various emotional and psychological factors
 on the pilot's efficiency and productivity. The sig-
 nificance of these factors with regard to future
 manned satellites is briefly discussed.

 Sealey, J.R. RELATION BETWEEN TIME OF DAY AND AIR-
 CRAFT LANDING ACCIDENTS. *J. Aviat. Med.*, Jan. 1958,
 29(1), 33-36. (Royal Canadian Air Force Institute
 of Aviation Medicine, Toronto, Ontario, Canada).

10,585
 In order to determine whether any association ex-
 ists between time of day and aircraft accidents, a
 year's study was made on one type of aircraft at one
 flying school. It was decided to restrict this study to
 landing accidents, thus avoiding much of the extraneous
 variability involved in computing rates according to ac-
 cidents per unit of flying time. An accident was defined
 as any deviation from a normal landing. Accident rates
 were computed for each half-hour of the day. These and
 the corresponding landing frequency were graphed, and
 the relationship between them analyzed, the results
 being expressed per one thousand landings. A possible
 relationship between accidents and a state of relative
 hypoglycemia in pilots is also briefly discussed.

Baker, B. & Mills, J.G. CERVICAL ALTITUDE TOLERANCE FOLLOWING PHYSICAL TRAINING AND ACCLIMATIZATION. *J. Aviat. Med.*, Jan. 1958, 29(1), 40-47. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

10,586

To determine the physiologic flexibility of human beings regarding hypoxic tolerance, six subjects were tested in a low pressure chamber before and after physical conditioning training, and after acclimatization to an altitude of 14,000 feet. Psychometer and writing tests were employed to determine the critical hypoxic threshold. The psychometer test scores obtained at various levels of simulated altitude were correlated with control scores taken at ground level. "Ceiling studies", in which the subject remained at a simulated altitude of 50,000 feet for three minutes, breathing 100 per cent oxygen under a mask pressure of 30 mm Hg, were conducted to investigate the combined effects of pressure breathing tolerance and hypoxic tolerance at very high altitudes. T. G. R 7

Erwin, J.L. & Burke, R.E. THE EFFECT OF POSITIVE ACCELERATION ON VISUAL REACTION TIME. *J. Aviat. Med.*, Jan. 1958, 29(1), 48-50. (USAF Aviation Medical Acceleration Lab., MACC, Dayton, Ohio, Tenn.).

10,587

To investigate the relations of both G tolerance and reaction time to test light incidence under positive acceleration, centrifuge experiments were conducted in which the subject attempted to maintain fixation on a red center light during runs of 2G, 2.5G, and 2.6G. A visual signal, consisting of a white light in the far periphery of the subject's left eye, was turned on and off at random intervals during each run. The criterion of visual impairment which was used as a criterion of G tolerance consisted of the subject's failure to respond to the visual signal within an interval of 1.5 seconds after its onset. The results of these and successive runs are analyzed and graphed, and the subjective reports of the testees discussed. T. G. R 12

10,588

Menzies, G.W. & Witmer, R.G. NOISE PROBLEMS IN MILITARY HELICOPTERS. AN EVALUATION OF EAR PROTECTION IN H225-1 AIRCRAFT. *J. Aviat. Med.*, Jan. 1958, 29(1), 51-65. (US Marine Corps Air Station, Va.).

10,588

To determine the effect of noise level on the combat efficiency of troops being transported by military helicopters, hearing tests were performed on 33 subjects before and after 157 flights in an H225-1 helicopter. The subjects, all with normal hearing, were tested primarily in terms of hearing loss, but mental and physical effects of exposure to noise were also recorded and evaluated. Various types of protective devices were worn during the flights. Results, obtained by audiometer and microphone tests, questionnaires, and interviews, are presented and discussed in terms of the relative hearing loss incurred when a particular protective device was employed. Hess, J.L. & Lombard, C.F. THEORETICAL INVESTIGATIONS OF DYNAMIC RESPONSE OF MAN TO HIGH VERTICAL ACCELERATIONS. *J. Aviat. Med.*, Jan. 1958, 29(1), 66-75. (Douglas Aircraft Co., El Segundo, Calif.).

10,589

This article employs the mathematical theory of deformity to determine the safety of higher ejection velocities in the design of upward-ejecting jettisonable seats for future aircraft. Since the structural strength of the spine is the chief limiting factor, a homogeneous elastic rod was used as a mathematical model to represent the spinal column. Oscillograph records of ejection tests on human subjects were obtained, and the acceleration of the free end of the elastic rod was computed as a function of time, assuming the prescribed acceleration of the other end to be equal to the acceleration of the seat bucket as taken from the oscillograph. Comparisons of experimental and theoretical accelerations are shown in graphs and tables. G. R 2

10,590

Pappas, J.M. SUPPORT OF UPPER BODY AGAINST ACCELERATIVE FORCES IN AIRCRAFT. *J. Aviat. Med.*, Jan. 1958, 29(1), 76-86. (Douglas Aircraft Co., El Segundo, Calif.).

10,590

This article, based on an analysis of the structural support and mass distribution of the upper part of the body, offers general principles to be applied in the design of a harness to support the upper part of the aviator's body against increasing vertical forces. The objectives of such support are: (1) to lessen the dynamic response between the central and lateral masses of the body in order to lessen the compressive impact loads on the lumbar spine; and (2) to permit the use of greater thrust, higher velocities, and higher trajectories in upward ejection seats. The results of preliminary tests on the suggested harness are recorded and compared with test results of the standard military harness. G. R 9

10,591

Holmstrom, F.M.G. COLLAPSE DURING RAPID DECOMPRESSION. REPORT OF THREE CASES. *J. Aviat. Med.*, Feb. 1958, 29(2), 91-96. (7112th Central Medical Group, USAF in Europe, APO 633, New York, N.Y.).

10,591

Safe limits of tolerance to rapid decompression have been defined by taking actual measurements of the peak intrathoracic pressures sustained by subjects undergoing rapid decompression. Although the ability of the lungs to withstand sudden pressure changes is a major factor in such tolerance, the limits as defined are valid only when gas in the lungs is free to escape through open airways. This article discusses three new cases showing unusual reactions to rapid decompression, each characterized by varying degrees of neurological and vasomotor collapse. The varying intensities of symptoms suggests a qualitative relationship to the intrapulmonary pressure sustained. T. G. R 11

10,592

Speelman, C.R. & Cherry, J.C. MIDDLE EAR PERCEPTION OF PRESSURE AND PAIN IN DESCENT FROM ALTITUDE. *J. Aviat. Med.*, Feb. 1958, 29(2), 106-110. (Medical Div., CAA, Washington, D.C.).

10,592

To determine whether the sensory apparatus for the perception of descent from altitude adapts to slowly-developing pressure differentials, experiments simulating descent were performed on nine subjects who were instructed not to yawn or make any movements that might ventilate the middle ear. Beginning at a simulated altitude of between 8,000 and 9,000 feet, descents were made at rates which varied between 300 and 14,000 feet per minute. Both rates and amounts of descent were employed in a random manner and were interspersed with several control runs to check the accuracy of the subjects' responses. Two of the subjects were then tested to determine the threshold pressure change for persistent pain. The results are graphed and briefly analyzed. G. R 6

10,593

Talbot, J.V. UNEXPLAINED AIRCRAFT ACCIDENTS IN THE U.S. AIR FORCES IN EUROPE. *J. Aviat. Med.*, Feb. 1958, 29(2), 111-116. (7112th Central Medical Group, USAF in Europe, APO 633, New York, N.Y.).

10,593

This report presents data and opinions about aircraft accidents in the United States Air Force in Europe, based upon a questionnaire survey of Air Force flyers who received physiologic training at the 7112th Central Medical Group. The questionnaire covered the following six areas of interest: hypoxia, spatial disorientation, hyperventilation, rapid or explosive decompression, decompression sickness, and personal protective equipment. The tabulated results are compared with the results of a previous study by Nuttal and Sanford. A probable relationship between these hazards and the high incidence of cause-undetermined aircraft accidents is also discussed. T. R 4

10,594
Tiller, P.R. & Goshier, H.R. EFFECTS OF ACTIVITY ON METABOLIC RATE OF SUBJECTS WEARING THE AVIATOR'S FULL PRESSURE SUIT. *J. Aviat. Med.*, Feb. 1958, 29(2), 117-121. (USAF Air Crew Equipment Lab., HMC, Philadelphia, Penn.).

10,594
Because previous pressure suit studies were primarily concerned with heat stress due to environmental conditions, this experiment was conducted to determine the metabolic rates and oxygen consumption of subjects wearing: (1) a summer flight suit, (2) pressure suit unpressurized, and (3) pressure suit pressurized while performing a simple simulated pilot task in a mock-up of the F71 aircraft cockpit. Two states of activity - sitting-resting versus simple pilot task - were used. Three male subjects were exposed to all test conditions twice, for a total of 16 trials. Room temperature was 65 degrees Fahrenheit. DeLisle's formula was used to determine oxygen consumption and metabolic rate. Results are recorded on bar graphs comparing basal and work conditions.

Sealer, H.W. A NEW AVIATION OXYGEN MASK WITH ALTITUDE-CONTROLLED SUSPENSION ADJUSTMENT. *J. Aviat. Med.*, Feb. 1958, 29(2), 130-135. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

10,595
The necessity for prolonged oxygen pressure breathing in current and future flight requires a leakproof and comfortable oxygen mask. This report describes the development of such a mask, the MC-1, in accord with quite rigid specifications which required a single mask size to fit all faces, a single built-in, pressure-compensated, combined inhalation-exhalation valve, and a noise-cancelling microphone. In order to have a comfortable mask seal at any altitude and pressure, a manually adjusted harness was developed as well as an altitude-controlled harness tension compensating system. During its development, cold-chamber and centrifuge tests were performed on the MC-1 mask. The results of those tests and their implications are briefly discussed.

Roth, J.G., Cohen, S.L., Silverman, A.J., Johnson, G.E., et al. BIOELECTRIC MEASURES DURING FLIGHT. A PRELIMINARY REPORT. *J. Aviat. Med.*, Feb. 1958, 29(2), 139-144. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

10,596
Preliminary experiments were conducted to determine the feasibility of in-flight bioelectric measurements. A JC-131B (Convair) aircraft was modified to permit the installation of a Galvanic Skin Response apparatus, an Electroencephalograph, and a pen and ink oscillograph. Although the components were too large for operational bombers and fighters, it was hoped that the design of smaller components would be aided by the results of this experiment. It is believed that bioelectric measures will provide greater insight into the stresses and requirements for successful operation of high performance aircraft.

Carlson, L.D., Hsieh, A.C.L., Fullington, F., & Eisner, R.W. IMMERSION IN COLD WATER AND BODY TISSUE INSULATION. *J. Aviat. Med.*, Feb. 1958, 29(2), 145-152. (School of Medicine, University of Washington).

10,597
This experiment arose as an attempt to explain the wide variation in survival times during cold water immersion. Nine subjects, who had previously been immersed in water at 33 degrees Centigrade for an hour, were immersed to the neck in water which was gradually lowered over a period of twenty minutes. Rectal temperature was measured with a thermistor probe, respiration was measured by a flowmeter and a paramagnetic oxygen analyzer. Expired gas was collected in a Douglas Bag and analyzed by the Scholander technique. Skin fold measurements, specific gravity, and the percentage of fat were measured for each subject, and correlated with the data from the experiments in terms of Burton's caloric equations.

Dandane, A., Hofstetter, H.W., & O'Connor, J.P. CRITICAL FLICKER FREQUENCY IN LIGHT- AND DARK-ADAPTATION. *J. Gen. Psychol.*, Jan. 1958, 56, 11-16. (Dept. of Psychology, Catholic University of America).

10,598
This experiment examined the hypothesis, derived from Hecht's biochemical theory of vision, that critical flicker frequency (CFF) in the dark-adapted state is lower than in the light-adapted state. This hypothesis was analyzed in terms of inter-individual differences with a primary variable being manifest anxiety as defined by Taylor. Seventy-eight subjects, (19 to 22 years of age) representing the two extremes on the Taylor anxiety scale, were tested for CFF frequencies in a photographic dark room on three ascending and descending trials of a Stratostat under dark and light-adapted conditions. Results are discussed in terms of a correlation between CFF and Taylor scores and related to Hecht's biochemical theory.

Auble, D. & Britton, Nancy. ANXIETY AS A FACTOR INFLUENCING ROUTINE PERFORMANCE UNDER AUDITORY STIMULI. *J. Gen. Psychol.*, Jan. 1958, 56, 211-214. (Dept. of Psychology, Western College for Women).

10,599
This experiment studies the relationship of anxiety to performance under auditory stimuli. Subjects, 174 women divided into low and high anxiety groups on the basis of the Taylor Anxiety Scale, were subdivided into experimental (high anxiety) or control groups (low anxiety) of eight persons each. Recordings played at an average of 80 decibels represent the auditory stimuli. A routine clerical number and time check task was used. A pretest measure of performance was obtained for each subject under quiet conditions. Differential conditions of quiet and noise were then introduced with a reward given for subjects showing greatest improvement over initial performance. Results are discussed in terms of the interrelation between noise and anxiety as factors effecting performance.

Jones, F.P., O'Connell, D.N., & Hanson, J.A. COLOR-CODED MULTIPLE-IMAGE PHOTOGRAPHY FOR STUDYING RELATED RATES OF MOVEMENT. *J. Psychol.*, April 1958, 45, 247-251. (Institute for Applied Experimental Psychology, Tufts University).

10,600
This report presents a method for studying certain human movements as patterns of response by recording both the stimulus and response by multiple-image photography and coding the pattern with color. This method provides an exact second of the latency, direction and rate of movement for each trajectory within the pattern. The movement of a board with the field represents a stimulus pattern, with the beginning of the movement serving as a signal to the subject. An aluminum wheel with five apertures rotates in front of the camera in synchrony with the flashes. All phases of the action are recorded as a single time-space pattern in which direction of movement and time relations between the trajectories are indicated by the sequence of colors.

Smith, O.W. & Smith, P.C. INTERACTION OF THE EFFECTS OF CUES INVOLVED IN JUDGMENTS OF CURVATURE. *Amst. J. Psychol.*, Sept. 1957, 1XX(3), 361-375. (Cornell University).

10,601
This experiment tests the effects of the interactions of variables of stimulation upon judgments of the curvature of a three-dimensionally curved object. Eleven subjects were randomly assigned within a factorial design permitting a total of 132 observations. The variables were: monocular versus binocular vision, number of spots on the surface of the semicylinder (three patterns consisting of 135, 45, and 9 block spots of mixed round and elliptical shapes); and position (two distances of observation at 116.3 centimeters and 232.6 centimeters). The results are discussed in terms of the relation between ocularity, position, number of surface elements, distance, and so forth, and the judgment of curvature.

Burton, R.M. INTER-EYE DIFFERENCES IN COLOR PERCEPTION. *Amer. J. Psychol.*, Sept. 1957, LXX(3), 386-394. (Color Technology Div., Eastman Kodak Co., Rochester, N.Y.).

10,602

This report discusses a method for determining the differences in color sensitivity of the two eyes of an observer, dealing specifically with intrinsic differences in color sensitivity when both eyes are adapted to the same illumination. Data used were incidental to two previous studies reporting on the effects of chromatic adaptation on color appearance. A binocular system technique was so used that a test color could be presented to one eye adapted to a standard illumination while a variable matching color could be presented to the other eye adapted to the same or a different illumination. Data from ten subjects on the two tests were used. Equations are obtained and presented to show how color appearances to one eye may be predicted from a knowledge of what the other eye sees. T. G. R. 9

10,603

Caslin, J.E. THE INFLUENCE OF FIGURAL INSPECTION ON THE AUTOKINETIC ILLUSION. *Amer. J. Psychol.*, Sept. 1957, LXX(3), 395-402. (Minneapolis-Honeywell Aeronautical Div.).

10,603

This report presents two experiments assessing the influence of figural inspection on the autokinetic illusion and is designed to test several specific deductions derived from Kohler and Wallach's cortical satiation theory. Six subjects were used in the first experiment and 96 in the second. The independent I-figure variables studied were size, filled, outlined I-figures and the orientation of I-figures. Twelve stimulus-figures were used. Quantitative measures of latency, direction, extent and rate of autokinetic movements were obtained by recording the subjects' open-loop pursuit-tracking responses. Results are presented and discussed in terms of the relation between I-figure variables and autokinetic movement. T. I. R. 8

10,604

Cohen, W. SPATIAL AND TEXTURAL CHARACTERISTICS OF THE GANZFELD. *Amer. J. Psychol.*, Sept. 1957, LXX(3), 403-410. (University of Buffalo).

10,604

This experiment describes the "mode of appearance" and spatial characteristics of the Ganzfeld (entire visual field). Special apparatus was designed to eliminate physical microstructure and to prevent the subject's face obstructing uniform stimulation of the entire retina. Both a uniform and differential Ganzfeld could be manipulated and a spot introduced into the field. Subjects (13) were involved in two tasks: (1) to compare two situations with respect to fog density, distance, distinctiveness of figure, hue, and saturation, and (2) to report on the effects of adaptation by remaining in the experimental situation three minutes. Results are discussed in terms of how changes in stimulus-distribution of the several variables determine the subject's perception of the Ganzfeld. T. I. R. 10

10,605

Nachman, H. THE INFLUENCE OF SIZE AND SHAPE ON THE DISCRIMINATION OF VISUAL INTENSITY. *Amer. J. Psychol.*, June 1957, LXX(2), 211-218. (University of Colorado).

10,605

Two experiments were designed to test a theory reported by Hecht and associates which suggests that differential thresholds are determined by boundary dimensions of a stimulus rather than by its area. In Experiment I the differential thresholds for 24 rectangles of different dimensions were obtained for each of two subjects. Half of these rectangles were so selected that their boundary dimensions would lead to predictions of equal thresholds although their total area differed considerably. Experiment II involved testing the same predictions on one subject for figures composed of two rectangles. Results are discussed in terms of their predictability by the Hecht theory, the Graham theory, and by theories which relate the differential threshold to the area of stimulus. T. G. I. R. 13

10,605

Jones, F.M. AN ANALYSIS OF INDIVIDUAL DIFFERENCES IN OLFACTORY THRESHOLDS. *Amer. J. Psychol.*, June 1957, LXX(2), 27-322. (University of California at Los Angeles).

10,606

This experiment attempts to determine the way in which the human organism classifies odors, using as the method of determination the analysis of individual differences in olfactory thresholds. A factor analysis was made of the absolute olfactory thresholds for 20 substances and 84 Ss, obtained by means of a controlled-blast technique. The results are discussed in terms of the nature of individual differences in olfactory thresholds, the probable receptors involved, and the relevance of existent odor-classification schemes to the actual process of odor classification. T. R. 18

10,607

Reag, C.M. CHARACTERISTICS OF NEURAL IMPAIRMENT IN HYPOXIA. *Amer. J. Psychol.*, June 1957, LXX(2), 243-247. (Office of Naval Research, Washington, D.C.).

10,607

This experiment on the effect of hypoxia on performance was designed to test the hypothesis that there is a steady state of efficiency following the initial decline with hypoxia and that it persists until the time of collapse. This steady state is interspersed with "blocks" (i.e., periods of inadequate performance). Ten subjects each performed on the Conceptual Reasoning Test over a 14-day period, at sea level and at 13,000, 16,000, 17,000 and 18,000 feet above sea level. Results are presented as an evaluation of performance from normalcy to unconsciousness under constant degrees of stress and discussed in terms of their applicability to the steady state of efficiency hypothesis. T. R. 8

10,608

Gulick, W.L. & Stake, R.E. THE EFFECT OF TIME ON SIZE-CONSTANCY. *Amer. J. Psychol.*, June 1957, LXX(2), 276-279. (Princeton University).

10,608

This experiment studied the effects of limited exposure time on size constancy. Twelve subjects made estimates of size of triangles at 20, 30, 40, 50 and 60 feet with cues to distance limited to accommodation, convergence, and binocular retinal disparity. The role of time in size constancy was investigated by obtaining these size estimates at exposures of 0.1, 0.8, and 4.0 seconds. Data are examined by analysis of variance. The results are discussed in terms of the relationship between exposure time and size constancy. G. R. 2

10,609

Smith, O.W. & Gibson, J.J. APPARATUS FOR THE STUDY OF VISUAL TRANSLATORY MOTION. *Amer. J. Psychol.*, June 1957, LXX(2), 291-294. (Cornell University).

10,609

This article describes an apparatus for use in the study of visual translatable motion. It was designed to fulfill specifications such as: the dimensions of the moving field should be so large that a stimulus-field of wide visual angle may be used when desired; the range in the speed of movement should be large; the velocity of the surface should be variable by continuous rather than discontinuous steps, and so forth. Some problems which this apparatus might handle are (1) the effects on the accuracy of reproduction of velocity of the direction of the moving fields, the mode of observation used in comparison, and so forth, (2) the investigation of constant errors when the subject matches the variable and standard fields, and many others. T. R. 2

10,610

Rock, I. & Neisser, W. THE EFFECT OF RETINAL AND PHENOMENAL ORIENTATION ON THE PERCEPTION OF FORM. *Amer. J. Psychol.*, Dec. 1957, LXX(4), 493-511. (New School for Social Research).

10,610

This article presents four sets of experiments (totaling eight) designed to study the relative importance of retinal and environmental orientation in form perception. Experiments I-III used a technique in which the subjects (15) were required to indicate from a tilted position whether single figures looked like those seen previously from an upright position. Experiments IV-VI investigated the part played by difficulty in recognition. Forty subjects had to identify complex figures in both upright and tilted positions. Experiments VII-VIII investigated the role of retinal orientation with orientation in the environment held constant. Results are presented and discussed in terms of the differential role of retinal, environmental, and phenomenal factors in form perception. T. R 8

10,611

Bilodeau, E.A. PATTERNS OF INTERNAL CONSISTENCY IN MULTIPART SKILLED PERFORMANCES. *Amer. J. Psychol.*, Dec. 1957, LXX(4), 550-559. (Tulane University).

10,611

This experiment was designed to analyze events within a psychomotor tracking task ranging from one to four parts by systematically varying the number of components defining the task. An experienced subject, who had shown a stable level of performance during practice, attempted to keep centered all uncovered meter pointers all of the time. The task was broken down into the following: attending to one meter, two meters, three meters and, finally four meters. Results are reported and discussed in relation to: (1) knowledge of the functional relationship between performance on a part and the number of components and (2) the rules of compositions of an aggregate of individual parts of a task.

10,612

Clausen, J. & Vanderbilt, Christa. VISUAL BEATS CAUSED BY SIMULTANEOUS ELECTRICAL AND PHOTIC STIMULATION. *Amer. J. Psychol.*, Dec. 1957, LXX(4), 577-585. (The Training School at Vineland).

10,612

To determine the conditions necessary to produce visual beats the following variables were studied in six experiments: 1) the relationship between frequency and intensity of the light source, 2) the relationship between stimulus intensity and beat frequency, 3) at frequencies from 5 to 45 cycles per second, the minimal intensity of the electrical stimulus, 4) the minimal luminance level of the photic stimulus, and 5) the interaction between intensities of electrical and photic stimulation. One experiment was concerned with 1) varying the frequency difference between the two sources and 2) establishing multiples of the basic frequency necessary to produce beats.

10,613

Weinstein, S. THE PERCEPTION OF DEPTH IN THE ABSENCE OF TEXTURE-GRADIENT. *Amer. J. Psychol.*, Dec. 1957, LXX(4), 611-615. (New York University).

10,613

This experiment tests the Gibson hypothesis that the perception of depth is impossible in the absence of a "retinal gradient of texture." Sixty subjects were tested under the following conditions: 1) 30 were tested with the gradient photographs, 2) 15 were tested with nongradient photographs, and 3) 15 were tested as in 2 but were not given any practice trials preceding the testing. Testing was done under normal illumination. The subject was to choose the stake in the comparison array which he considered equal to the target stake in height. A mixed analysis of variance evaluated the effects of three variables and their interactions: 1) presence or absence of the gradient, 2) the stake size, and 3) distance of target stake.

Verplanck, W.S. & Blough, D.S. RADIOLIZED STIMULI AND THE NON-INDEPENDENCE OF SUCCESSIVE RESPONSES AT THE VISUAL THRESHOLD. *J. Gen. Psychol.*, Oct. 1958, 58, 263-272. (Dept. of Psychology, Harvard University).

10,614

This experiment studied the dependence of responses on both the preceding stimulus and the preceding response to visual stimuli near the absolute threshold. Four subjects each were presented with four ascending-descending series of 91 stimuli on eight experimental days. Each stimulus was presented at one of six fixed brightnesses. Data are presented and discussed in terms of the probability of sighting the visual stimulus as a function of: (1) stimulus brightness alone, (2) preceding response, (3) the preceding brightness, and (4) both the preceding stimulus and the preceding response. Threshold curves were obtained for both ascending and descending thresholds.

Venables, P.H. APPARATUS FOR PRESENTATION OF STIMULI AND MEASUREMENT OF RESPONSE TIMES IN REACTION TIME EXPERIMENTS. *J. Gen. Psychol.*, Oct. 1958, 58, 295-298. (Social Psychiatry Research Unit, Medical Research Council, London, England).

10,615

This article illustrates and describes apparatus which has been developed in relation to reaction time experiments. This design includes a delay "flip-flop" which gives time for clock-reading before reset for the next "on" signal. A feature of particular importance for testing abnormal subjects is a latch relay which prevents subsequent operation of the time clock by the subject making a later movement of the key after his initial response. The apparatus also allows for remote control if only one experimenter is available.

Nuttall, J.B. THE PROBLEM OF SPATIAL DISORIENTATION. *J. A.M.A.*, Feb. 1958, 166(5), 431-438. (Aviation Medicine Div., Office of the Surgeon General, Washington, D.C.).

10,616

Eighteen cases of spatial disorientation due to illusions of attitude and motion are summarized in this article and used to illustrate the frequency with which this type of disorientation causes aviation accidents. The following factors contributing to the illusions of attitude and motion are considered: (1) misinterpretation of gravitational forces, (2) erroneous sensations of rotation, and (3) Coriolis acceleration, or the illusion caused by head movement. The recommendations which are made concern the more thorough indoctrination of pilots in the causes of spatial disorientation and the necessity for better cockpit designs.

Glorig, A. & House, H.P. NEW, PRACTICAL CONCEPT OF HEARING TESTING FOR USE OF THE GENERAL PHYSICIAN. *J. A.M.A.*, April 1958, 166(14), 1719-1721. (School of Medicine, University of Southern California).

10,617

This article discusses a rapid, simple auditory screening test which is presented in terms of its usefulness in mass screening situations, e.g., schools, military. Audiograms of approximately 4500 persons were studied and two procedural tests evolved from the significance of these data: (1) a single frequency screening test (at 4000 cycles per second), and (2) a double-frequency screening test (2000 and 4000 cycles per second). Both tests are discussed in terms of their usefulness in different types of mass screening situations.

Mitt, R.K., Morveth, S.H. & Spurr, C.B. INFLUENCE OF VARYING DEGREES OF PASSIVE LIMB MOVEMENTS ON RESPIRATION AND OXYGEN CONSUMPTION OF MAN. *J. appl. Physiol.*, 1958, 12(2), 297-300. (College of Medicine, State University of Iowa, Ames, Iowa).

10,618

This experiment attempts a delineation of the role which hyperpnea resulting from "passive" movements of the limbs plays in hyperpnea of active exercise by clarifying the following: 1) the relationship between the number of moving joints and the increase in minute volume, and 2) the persistence or possible decay in the potency of the stimulus and the energy cost of "passive" movements. Ten subjects participated in 17 experiments in which passive movements of wrist, shoulder, elbow, hip, knee, ankle, and combinations of these six were made by trained operators. Measurements of respiratory minute volumes, oxygen and carbon dioxide consumption were made and differences among these rates related to the effects of the various limb manipulations.

Benzinger, T.H., Huebscher, R.G., Minard, D. & Kitzinger, Charlotte. HUMAN CALORIMETRY BY MEANS OF THE GRADIENT PRINCIPLE. *J. appl. Physiol.*, 1958, 12(2), S1-S28. (USN Medical Research Institute, Bethesda, Md.).

10,619

This article describes the application of the gradient principle of calorimetry for use with human subjects. The following were considered as essential to the building of the calorimeter: 1) complete coverage with measuring sites of uniform characteristics in a uniform distribution, 2) the use of a large number of measuring sites to lessen errors introduced by the uneven spatial distribution of heat flow, 3) the use of solid material to establish a reproducible thermal resistance and gradient-response, and 4) the use of thin layers to insure isothermal characteristics of the measurement and a rapid response. "Cold" uses to which this equipment has been put include determination of changes of heat loss with the onset of convection, heat loss during hyperventilation, and so forth. G. R. 29

Tampietro, P.F., Bass, D.E. & Buskirk, E.R. HEAT EXCHANGES OF NUDE MEN IN THE COLD: EFFECT OF HUMIDITY, TEMPERATURE AND WINDSPEED. *J. Appl. Physiol.*, 1958, 12(3), 351-356. (USA Quartermaster Research & Engineering Center, Natick, Mass.).

10,620

This experiment studies the effects of several environmental conditions on body heat exchanges in order to determine whether it is possible to infer a physiological basis for the subjective sensation of chill in cold-wet conditions. Six male subjects were exposed nude in a constant temperature room to various combinations of the following: dry bulb (60 and 50 degrees Fahrenheit), relative humidity (95 and 30 percent), windspeed (ten and 21 miles per hour). Measurements were made of skin and rectal temperature, and oxygen consumption. The results are discussed in terms of the interactions between the three environmental conditions, the physiological changes observed under these varying conditions, and the effects of the various exposures on heat production, heat debt, and so forth. Kreider, M.B., Buskirk, E.R. & Bass, D.E. OXYGEN CONSUMPTION AND BODY TEMPERATURES DURING THE NIGHT. *J. Appl. Physiol.*, 1958, 12(3), 361-366. (USA Quartermaster Research & Engineering Center, Natick, Mass.).

10,621

This experiment studies the changes in metabolic rate and heat exchange of 19 men sleeping under comfortable, ambient conditions (78-82 degrees Fahrenheit). Measurements of rectal temperature, mean weighted skin temperature, and oxygen consumption were made frequently during the sleeping period. The results are presented in terms of intra- and inter-individual variations in metabolic activity. Attempts are made to relate these variations to basic physiologic mechanisms.

Gaydos, H.F. EFFECT ON COMPLEX MANUAL PERFORMANCE OF COOLING THE BODY WHILE MAINTAINING THE HANDS AT NORMAL TEMPERATURES. *J. Appl. Physiol.*, 1958, 12(3), 373-376. (USA Quartermaster Research & Engineering Center, Natick, Mass.).

10,622

This experiment studies the effect of normal hand temperature on complex manual performance while the rest of the body has been maintained at subnormal temperature levels. During the experimental sessions 12 subjects performed with their hands in a warming box (90-100 degrees Fahrenheit). Knot-tying and block-stringing tasks were administered three times: (1) when the subject first entered the room, (2) when his mean weighted skin temperature had dropped to between 81-82 degrees Fahrenheit, and (3) when the latter had dropped to between 78-79 degrees Fahrenheit. Changes in performance are related to the various temperatures involved as well as to underlying physiological mechanisms.

Gaydos, H.F. & Dusek, E.R. EFFECTS OF LOCALIZED HAND COOLING VERSUS TOTAL BODY COOLING ON MANUAL PERFORMANCE. *J. Appl. Physiol.*, 1958, 12(3), 377-380. (USA Quartermaster Research & Engineering Center, Natick, Mass.).

10,623

This experiment studies the effects of localized cold on complex manual performance. Sixteen male subjects performed knot-tying and block-stringing tasks under two experimental conditions: (1) with the remainder of the body exposed to comfortable ambient temperatures, the hands and wrists alone were exposed to cold and (2) with the subject fully clothed, except for bare hands, the subject performed entirely in a cold environment. The experimental equipment was so designed that the subjects had to rely entirely upon their sense of touch during performance. Results are discussed in terms of changes of performance under the two experimental conditions.

Randall, W.C., Peiss, C.N. & Rawson, R.O. SIMULTANEOUS RECRUITMENT OF SWEATING AND PERCEPTION OF WARMTH IN MAN. *J. Appl. Physiol.*, 1958, 12(3), 385-389. (Strich School of Medicine & Graduate School of Loyola University).

10,624

This experiment investigates the discrepancies between recruitment of sweating and sensation of warmth as reported by 13 nude male subjects. Skin temperatures and sweat responses were recorded simultaneously from four to eight cutaneous regions. Control observations were made while the subject was resting in a cool environment (14-18 degrees Centigrade). The temperature was then slowly raised. In a second experiment the subject was chilled and then he abruptly stepped into the climate chamber heated to 45-50 degrees Centigrade. The results, representing subjects' responses and recordings of skin temperature and sweat rates, are related to various hypotheses concerning the underlying psychological mechanisms (e.g., the hypothesis of separate receptors). Gregory, R.L. & Wallace, Jean G. A THEORY OF NERVE DEAFNESS. *The Lancet*, Jan. 1958, 1, 83-84. (Psychological Lab., Cambridge, Mass.).

10,625

This article examines the hypothesis that nerve deafness is due to raised neural noise by comparing differential intensity discrimination over a wide range of intensities and frequencies in (1) nerve-deaf ears showing various degrees of impairment and (2) the normal ear in the presence of white noise masking. Data, in the form of curves relating intensity of the tone pip to the continuous tone, for both types of ears, are presented. Recommendations are made based on the theoretical findings for improvements in hearing aids to compensate for the effects of nerve deafness.

Burch, W.R. & Greiner, T.H. DRUGS AND HUMAN FATIGUE: GSR PARAMETERS. *J. Psychol.*, Jan. 1958, 45, 3-10.

10,626
Three experiments on drug simulated fatigue and human fatigue attempted to demonstrate the adequacy of the galvanic skin reflex (GSR) response as a measure of fatigue. Both specific and non-specific responses were obtained for a single subject given pentobarbital to the point of sleep and then aroused with Metrazol. Three subjects participated in a 56-hour, prolonged confinement run during which time their GSR responses were recorded, subjective evidence of their state of consciousness was obtained, and observations of their psychomotor performance were made. GSR responses were also obtained from 15 subjects who participated in a 30-hour prolonged wakefulness test in which two drugs (amphetamine and cortisone) were tested for their anti-fatigue action.

Barthol, R.P. THE MOVEMENT OF GROUND OVER FIGURE: A NEW FORM OF APPARENT MOVEMENT. *J. Psychol.*, Jan. 1958, 45, 85-91.

10,627
In this article a new kind of movement (apparent movement of the ground rather than the figure) is described along with the apparatus and experimental conditions which gave rise to it. Individually tested subjects (206) were seated 14 feet from two neon lights three inches apart, told about the phi phenomenon, and asked to tell what they saw including any changes which occurred. Phi apparatus was begun at "slow" and gradually moved to "fast" until simultaneity was reported. Discussion is concerned primarily with investigating the aspects of the apparatus and experimental procedure which gave rise to this phenomenon as well as its implications for existing theories of perception.

Corso, J.F. & Cohen, A. METHODOLOGICAL ASPECTS OF AUDITORY THRESHOLD MEASUREMENTS. *J. exp. Psychol.*, Jan. 1958, 55(1), 8-12. (The Pennsylvania State University).

10,629
The two experiments reported here study the effects of methodology on auditory threshold measurements. In Experiment I, which studied the magnitude of inter- and intra-subject variability in measurements of the intensive auditory threshold, 38 subjects were given audiometric tests by the method of limits on both ears. Frequencies were from 250 to 8000 cycles per second (cps) in each of three experimental sessions. In Experiment II, which examined the effects of practice on threshold values, the right ears of ten subjects were tested ten times at 125 cps in each of two testing sessions. Data are treated by analysis of variance. Results are compared with those of past studies and discussed in terms of the effect which the methodology has upon the thresholds obtained. T. R 17

De Soto, C. TWO-CATEGORY JUDGMENTS OF SEQUENCES OF STIMULI OF TWO VALUES. *J. exp. Psychol.*, Jan. 1958, 55(1), 34-38. (University of Wisconsin).

10,630
In this experiment attempts were made to relate two-category judgments to some sequences of stimuli restricted to two values. Selected descriptions of items of human behavior, drawn from the high and low ends of a previously scaled group of items, were judged by 128 subjects as "more" or "less bizarre." Data were treated by analysis of variance. Results are discussed in terms of the hypothesis that the subjects recenter their judgment scale by a continual re-averaging of the stimuli presented so that during a run of stimuli of the same value their judgment scale will gradually be recentered on this stimulus value.

Faust, W.L. FACTORS IN INDIVIDUAL IMPROVEMENT IN SOLVING TWENTY-QUESTIONS PROBLEMS. *J. exp. Psychol.*, Jan. 1958, 55(1), 39-44. (Pomona College).

10,631
This experiment investigates the changes in the types of questions asked during solution of Twenty Questions problems which are related to improvement in solving these problems. Twenty subjects were so assigned that each of five lists of four questions was undertaken by four subjects. Data are presented in the following ways: the change in the number of questions asked from Day I to Day V; the relation between the amount and the kind of recurring questions asked and improvement in solving the problems; the number of questions asked which elicited useful information; and the percentage of questions asked which elicited "yes" answers. The results are discussed in terms of their relation to ways of learning solutions to problems.

Thompson, R.F., Voss, J.F. & Brogden, W.J. EFFECT OF BRIGHTNESS OF SIMULTANEOUS VISUAL STIMULATION ON ABSOLUTE AUDITORY SENSITIVITY. *J. exp. Psychol.*, Jan. 1958, 55(1), 45-50. (University of Wisconsin).

10,632
Auditory thresholds (to a tone of 1000 cycles per second) were obtained during the simultaneous presentation of eight conditions of a visual stimulus for two experimental groups given different instructions as to the presentation of the lights and the manner of reporting on same. Auditory thresholds were also obtained from a control group in order to check on practice effects. Each subject in the two experimental groups had three thresholds taken for each of the eight light conditions. One experimental group was told to respond to the light or "yes" the other, to respond to the light and the tone. The effects of instructions upon subjects' responses and the relevance of their data to the literature on intersensory facilitation and inhibition is discussed.

Becker, S.W. & Siegel, S. UTILITY OF GRADES: LEVEL OF ASPIRATION IN A DECISION THEORY CONTEXT. *J. exp. Psychol.*, Jan. 1958, 55(1), 81-85. (The Pennsylvania State University & Center for Advanced Study in the Behavioral Sciences).

10,633
The experiment reported on here tests two hypotheses drawn from Lewin's integrated definition of level of aspiration. Twenty-three students elected to gamble for their mid-term grade in lieu of an examination. By selecting from a series of alternative gambles they supplied data from which their levels of aspiration were derived. Further validation of their aspiration levels is obtained through an interview. Results are discussed in terms of their substantiation of the hypotheses: 1) if a subject aspires for less than a mark of C, he will be satisfied with a C, and 2) there will be a positive correlation between the level of aspiration obtained during the interview and that given by their scales of utility of grades.

Kruse, G.K. SOME INFORMATIONAL ASPECTS OF FORM DISCRIMINATION. *J. exp. Psychol.*, Feb. 1958, 55(2), 143-149. (Case Institute of Technology).

10,634

Distance thresholds were determined for the discrimination of a specially constructed set of 16 forms. Threshold values (eight subjects) were obtained for both the complete set of forms and for each set of binary discriminations (large square vs. large circle, semicircles facing either up or down, and so forth). In Experiment II six subjects were: (1) asked to ignore the dimension with the most difficult discrimination and (2) led to expect a set of alternatives including a more difficult discrimination than was really necessary in order to examine the effect on threshold values of varying the subjects' perceptual set. Experiment III tested the effect upon the results of elimination of the most difficult dimension from the total task.

Sheriff, M., Taub, D. & Nevlund, C.I. ASSIMILATION AND CONTRAST EFFECTS OF ANCHORING STIMULI ON JUDGMENTS. *J. exp. Psychol.*, Feb. 1958, 55(2), 150-155. (University of Oklahoma & Yale University).

10,635

This experiment tested two hypotheses: 1) when a standard is placed at the end points of a series of graded stimuli (weights) this causes a displacement of judgments of the series stimuli in the direction of the standard, and 2) when the standard is placed at increasing distances from either end of the series, the judgment distribution will be away from the standard and will tend to be constructed. Six subjects judged weights on a six-point scale by the method of single stimuli, with anchoring stimuli at the top level of the series and without anchoring stimuli (standards). A second experiment introduced anchors at the lower end of the original stimulus series and at increasing distances from it. Results are discussed in terms of their relation to assimilation and contrast effects. G. R 14

10,636

Sidowski, J.B., Morgan, R. & Eckstrand, G. INFLUENCE OF TASK COMPLEXITY AND INSTRUCTIONS UPON SIMPLE AND DISCRIMINATION REACTION TIMES. *J. exp. Psychol.*, Feb. 1958, 55(2), 163-166. (San Diego State College & USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

10,636

To study the effect of task complexity and instructions upon simple and discrimination reaction times, 48 subjects reacted to a stimulus light with one of three responses varying in task complexity: 1) removing finger from a key, 2) releasing the key and manipulating one switch, and 3) releasing the key and operating all three panel switches. All subjects performed similarly; however, one group (24 subjects) was told the experiment was to test reaction times while the other half were told it was to test the speed of total movement. Mean reaction time measures are given. Movement time measures are treated by analysis of variance. Results are discussed in terms of the relation between these measures and 1) task complexity, 2) instructions, and 3) reaction type (simple or discrimination). T. G. R 8

10,637

Shore, M.F. PERCEPTUAL EFFICIENCY AS RELATED TO INDUCED MUSCULAR EFFORT AND MANIFEST ANXIETY. *J. exp. Psychol.*, Feb. 1958, 55(2), 179-183. (Boston University).

10,637

To test the relationship between the effect of effort and drive level on visual recognition three groups of six males were chosen from their scores on the Taylor Manifest Anxiety Scale (low, medium, and high anxiety). The subjects were asked to recognize non-effective resolution targets shown at varying speeds as well as describe whatever they saw after each exposure if it differed from the targets. After each response the subject was to indicate his confidence in his judgment. A dynamometer, which the subject squeezed as hard as he could after each session, was used to induce graded series of muscular effort conditions. The results are discussed in terms of the interaction between drive level and effort on perceptual efficiency, and various hypotheses considered in explanation of these interactions. T. G. R 11

10,638

Klemmer, E.T. TIME SHARING BETWEEN FREQUENCY-CODED AUDITORY AND VISUAL CHANNELS. *J. exp. Psychol.*, March 1958, 55(3), 229-235. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

10,638

This experiment tests the hypothesis that relative degradation due to time-sharing is correlated with differences in channel difficulty. Seven subjects participated in a high-speed key-pressing task in which they: (1) responded to a frequency-coded auditory channel (tone coded); (2) responded to a frequency-coded visual channel (color coded); (3) alternated regularly between visual and auditory channels; (4) alternated randomly between them; and (5) responded to simultaneous visual and auditory channels presenting redundant stimuli. Mean reaction times were taken during all tests. Some questions answered by the data follow: Are frequency-coded lights or tones more difficult? How does rapid alternation between channels affect performance? Which channel suffers more from alternation? T. G. R 3

10,639

Nembrough, J.R. INTERACTION BETWEEN TOTAL STIMULUS INFORMATION AND SPECIFIC STIMULUS INFORMATION IN VISUAL RECOGNITION. *J. exp. Psychol.*, March 1958, 55(3), 297-301. (University of Utah).

10,639

This experiment investigates the effect of stimulus interaction upon perceptual behavior by examining: 1) the interaction of the specific stimulus information values among themselves, and 2) the interaction of the total stimulus information and specific stimulus information values. Thirty-six subjects, performing in three groups of 12 each, were presented tachistoscopically with 2-, 4-, 5-, 6-, and 7-word series for a total of 40 exposures each. Subjects recorded a word only if certain of its identity. The results were evaluated by a missed-score measure. Discussion revolved around reaction time as a linear function of the total number of alternatives, and the presence or absence of an interaction among the stimuli themselves, and between total and specific stimulus information. T. G. R 6

10,640

Smith, O.W. DISTANCE CONSTANCY. *J. exp. Psychol.*, April 1958, 55(4), 388-389. (Cornell University).

10,640

This experiment studies a type of distance constancy problem - judging a far small extent as longer or shorter than a standard, near extent - which had not been studied previously. The standard stimulus, a white sheet of oilcloth, had its far edge 25 feet in front of the subject's position. The variable stimulus, 25 feet of the same oilcloth, had its back edge 125 feet from the subject and was exposed to the subject in lengths which were multiples of three inches. Each subject (23) made a series of such judgments. An approximation method to determine the validity of the subjects' judgments was used. Results are discussed in terms of the reliability of this method in determining distance constancy. R 1

10,641

Brackmann, J. & Collier, G. THE DEPENDENCE OF PROBABILITY OF RESPONSE ON SIZE OF STEP INTERVAL IN THE METHOD OF LIMITS. *J. exp. Psychol.*, May 1958, 55(5), 423-428. (Sacramento State College & University of Missouri).

10,641

This experiment studies the effect of the size of the step interval between successive stimulations upon the probability of a response at visual threshold. Four trained subjects participated in three experiments determining absolute thresholds in which three variations of the method of limits were used. For each absolute threshold determination (four) one of four step-intervals was used. The results are related to the hypothesis that if the amount of association is a decreasing function of the difference in magnitude between successive stimuli then the error of habituation might result from this association and the size could be manipulated by varying the size of the step interval. 10,642
Finkbeiner, A.A. **PERFORMANCE ANALYSIS OF MOVEMENT REACTION.** *J. exp. Psychol.*, May 1958, 55(3), 429-438. (Ohio University).

10,643
This study represents a replication of Rosen and Judson's experimental work on static, postural, and movement reactions, with three added features: 1) emphasis is on the manner in which the movement is made, and 2) an attempt is made to ascertain the relationship between the types of movements identified and performance on a complex task performed under different conditions of difficulty. Seven types of movement (flex control sensitivity, rate-control, reaction time, and so forth) were studied in 21 tasks (two-hand coordination, pursuit, conclusion, motor judgment, and so forth). All of the tasks were given to 284 subjects. Results are discussed in terms of the identifiable features and their common ability requirements.

Tulving, E. **THE RELATION OF VISUAL ACUITY TO CONVERGENCE AND ACCOMMODATION.** *J. exp. Psychol.*, June 1958, 55(6), 530-534. (Harvard University).

10,645
This experiment attempts to relate the phenomenon of visual acuity being less for very close targets than for far ones to convergence-accommodation theory. Seven subjects participated in a task in which they had to fuse two separate fixation points and then present the acuity target to themselves by pressing a key. Sixty judgments of each of five angles of convergence were determined for each subject. In a second part of the experiment practice sessions were introduced in making judgments under the two extreme convergence angles. The results are discussed in terms of the effect of convergence, accommodation, and practice in the experimental task upon acuity.

Gross, L.W. **CHANGES IN DISTRIBUTION OF MUSCULAR TENSION DURING PSYCHOMOTOR PERFORMANCE.** *J. exp. Psychol.*, July 1958, 56(1), 70-77. (Carnegie Institute of Technology).

10,649
Two experiments were designed to study the relationship between changes in the distribution of muscular tension and changes in proficiency of performance. An arm-hand steadiness task and a tapping-sliding task were used in both experiments to evaluate task differences. In Experiment I, 12 subjects received practice for five days on both tasks. On days III and IV, a 57-pound pack was attached to each subject. Muscle-action potentials were recorded from five separate body locations. In Experiment II, 60 subjects performed the same tasks with other tasks introduced which were designed to produce a decrease in the proficiency of the tasks. Task effects, load and fatigue effects, and generalized tension as related to proficiency of performance are the main topics

10,650

Flanagan, E.A. A RELATIONSHIP BETWEEN INCLUSIVE
EXPERIENCE AND ABILITY LEVEL IN PSYCHOMOTOR LEARNING.
J. Gen. Psychol., July 1958, 26(1), 70-81.
(Wash. University).

10,651

This experiment studies the relationship between ac-
tivation and ability level in a psychomotor task. Each
of 400 subjects received training at the Complex Condi-
tioned Test after which they were then divided into high
and low ability groups. Half of the low and high abili-
ty subjects formed a "motivated" group while the other
half was used as controls. Motivation was induced by
verbal exhortations to improve and discussion of the im-
portance of the results to each subject. The results are
discussed in terms of the effect of incentive motivation
upon psychomotor performance for both the high and low
ability groups.

Harvey, C.M. RECOGNITION OF NOVEL VISUAL CONFIG-
URATIONS WITH AND WITHOUT EYE MOVEMENTS. J. Gen.
Psychol., Aug. 1958, 26(2), 120-130. (Indiana
Research Medical Lab., Toronto, Canada).

10,653

Four experiments explore the recognition of novel
visual figures with eye movements and with a single
brief fixation. Experiments I-III examine the amount of
viewing time necessary to recognize these objects when
presented the second time I as originally shown, and in
a reversed position (24 subjects); II as originally
shown in a negative (black-white) state (24 subjects);
III as originally shown and negative (black-white) in
original and reversed (left-right) positions (48 sub-
jects). Experiment IV studied the effects of single
glances and continuous viewing time on recognition of
structured or unstructured figures. A discussion of
the effects of the various positions, times, and types
of eye movements upon recognition is presented.

Marrie, J.D., Philis, A.G., Kiffman, H.S. & Elmer,
R.M. THE INTERACTION OF PITCH AND LOUDNESS DISCRIM-
INATIONS. J. Gen. Psychol., Sept. 1958, 26(3), 232-
238. (Naval Medical Research Lab., Naval Submarine
Base, Conn.).

10,655

This experiment examines the interaction of pitch
and loudness discriminations when both cues are present
in the same stimulus. Five subjects made 120 judgments
as to whether a third tone was closer to the first or
second of two previous tones. The standard was a 125-
cycles per second (cps) tone one second in duration at
ten decibels sensation level. The second stimulus was
either 0, .5, .75, 1, or 1.25 cps greater in frequency
and either 0, .4, .8, 1.2, or 1.6 decibels higher in in-
tensity. The third stimulus was identical with either
the first or second stimulus. The results are discussed
in terms of the nature of the interaction of the cues,
and the joint discrimination probabilities of the com-
bined pitch and loudness cues.

Murray, E.J., Williams, M.L. & Lubin, A. BODY TEM-
PERATURE AND PSYCHOLOGICAL RATINGS DURING SLEEP DEP-
RIVATION. J. Gen. Psychol., Sept. 1958, 26(3), 271-
273. (USA Walter Reed Army Institute of Research,
Walter Reed Army Hospital, Washington, D.C.).

10,657

This experiment compares psychological ratings of
sleepiness with body temperature measurements. Subjects
(15) were deprived of sleep for 98 hours, during which
time oral temperatures were taken 41 times for each sub-
ject. Each time the subject's temperature was taken he
rated himself as to both sleepiness and fatigue. Ob-
servers (15 in all) also gave ratings. The results are
discussed in terms of the correlations between the sub-
jective scales and body temperature, both of these and
hours of sleep deprivation, and subjects' ratings versus
the observers' ratings of sleepiness and fatigue.

Colbert, E.C. FACILITATION OF REVERSE-IMAGE WORD IDENTIFI-
CATION BY REVERSE-IMAGE PERCEPTUAL SET. J. Gen. Psychol.,
Oct. 1958, 26(4), 344-348. (University of Washington,
Seattle, Wash.).

10,659

The role of perceptual set in the rapidity of identi-
fication of reversed words was tested in three experi-
ments the hypothesis being that mirror image words seen
on a field which itself is seen as reversed are easier to
identify than mirror image words appearing on a non-re-
versed field. In Experiment I (17 subjects) a non-re-
versed field was presented and then abruptly reversed
with a mirror image word appearing on it. In Experiment
II the field was reversed more slowly by widening it
through a semicircle before the mirror image word ap-
peared on it. In both experiments, 17 control subjects
were used. Experiment III compared the recognition of
mirror image words vs. the same words read from a mirror.

Forsyth, D.M. & Chapuis, A. COUNTING REPEATED LIGHT
FLASHES AS A FUNCTION OF THEIR NUMBER, THEIR RATE OF
PRESENTATION, AND RETINAL LOCATION STIMULATED. J.
Gen. Psychol., Nov. 1958, 26(5), 385-391. (The Johns
Hopkins University).

10,663

This experiment investigates the ability to estimate
the number of repeated light flashes as a function of 1)
the number of flashes presented (1-20), 2) the rate of
presentation (2.5, 5, 10, 15, 22.5, and 30 cycles per
second) and 3) the retinal location stimulated (0, fovea,
2.5, 5, 10, 20, and 40 degrees). Thirty subjects made
720 judgments, that is, one trial each for the 1 to 20
flashes at every one of the 36 combinations of frequency
and retinal displacement. Results are analyzed in terms
of the slopes of the obtained curves of mean estimated
number versus the three major variables and their inter-
actions as well as the variability of judgments.

Esman, W.B. BI-DIRECTIONAL GENERALIZATION TO AUDITORY
STIMULI. Psychol. Mon. Skills, Dec. 1958, 2(4),
p. 306. (USA Medical Service School, Fort Sam Houston,
Tex.).

10,665

The present study is concerned with investigating
generalization where approach and avoidance conditions
exist within the same stimulus dimension. Sixty-eight
subjects were conditioned to respond to the central tone
in the middle piano octave. A correct response was sig-
nalled by a bell. Sixty-eight subjects were conditioned
to avoid this tone, the stimuli and reinforcement being
presented in the same manner. A modified sequential an-
alysis of response frequencies under both approach and
avoidance conditions was performed and the results are
discussed.

Kremer, G.L. A THRESHOLD-METHOD FOR MEASURING THE
ATTENTION-DEMAND VALUE OF STIMULI. Amer. J. Psychol.,
March 1958, 71(1), 111-122. (Washington University).

10,667

This article presents a method designated as the
"double ramp method" designed to determine the attention
value of stimuli. The method is based on the magnitude
of the stimulus necessary to obtain a constant response
while the subject is involved in a task demanding his
constant attention. The details and rationale of the
method are presented fully, including reasons as to why
conventional threshold determination methods are inade-
quate. Recommendations are made for use in setting up
military warning systems and for use in education, es-
pecially in learning problems with children who have dif-
ficulty in the "attention-span" areas.

10,659
Zigler, H.J. & Wolf, E. SCOTOPIC AND SCOTOPIC-SCOTOPIC SENSITIVITY. *Brit. J. Psychol.*, March 1958, 49(1), 108-116. (Gallun College & The Bates Foundation).

10,659
Two subjects participated in this experiment in which both scotopic and mesopic scotopic sensitivity were studied. A two-degree-square test-field was presented for 0.04 seconds at the center, and 2.5, 5, 7.5, 10, 12.5, 15, 17.5, 20, 25, and 30 degrees from the center to the right, left, above, and below fixation. Data are presented in the form of threshold-sensitivity curves for the horizontal and vertical meridians. Thresholds were also obtained for the blind spots in both eyes. Discussion of the data is in terms of the compensation effects of the various fields and the theoretical implications of the differences in mesopic sensitivity along the horizontal and vertical meridians.

Leonard, J.A. PARTIAL ADVANCE INFORMATION IN A CHOICE REACTION TASK. *Brit. J. Psychol.*, May 1958, 49(2), 89-96. (Applied Psychology Research Unit, MRC, Cambridge, England).

10,661
This experiment studied the effect of partial advance information on performance of a sensory-motor task. One subject had to respond to 48 signals, each new signal appearing 1.5 seconds after a correct response. The control conditions were a six-choice and a three-choice task and the experimental conditions were a three-choice task preceded at varied amounts of time by a two-choice one. Data represented reaction times and correct responses. The results are discussed in terms of the influence of the duration period on performance. Recommendations for future investigations are included.
T. G. I. R 9

Talland, G.A. THE EFFECT OF SET ON ACCURACY OF AUDITORY PERCEPTION. *Brit. J. Psychol.*, May 1958, 49(2), 117-130. (Massachusetts General Hospital, Harvard Medical School).

10,662
Two experiments are presented on the facilitatory effects of set on accuracy of auditory perception. Experiment I (54 subjects) examined: 1) explicit, implicit, and counter set, and 2) single and double set, both under conditions of complete and partial confirmation. Experiment II (24 subjects) examined: 1) the number of correct responses obtained under conditions of complete and partial confirmation, 2) the differential effects (distributed, delayed, or spaced) of partial confirmation, and 3) the possible emergence of an implicit set if suggested by presenting padding words. In the control series (36 subjects) word count rating as a predictor of auditory intelligibility was tested. The facilitatory effects of set, padding, and differences between double and single set are discussed.

10,664
Machworth, H.M. & Machworth, J.F. VISUAL SEARCH FOR SUCCESSIVE RESEMBLANCE. *Brit. J. Psychol.*, Aug. 1958, 49(3), 218-221. (Applied Psychology Research Unit, MRC, Cambridge, England).

10,664
Two experiments examine the relationship between display load and speed in decision making. In experiment I (20 subjects) 20 conditions were examined - five demands speeds of decision and four levels of display load. In experiment II (24 subjects) 12 conditions were examined - two speeds and six levels of load. In the discussion the demands made by the order search task are examined as well as the relationship between speed and load, search time and load in static displays and so forth. Recommendations are made for improvements in control panel displays, as utilized in various systems.

10,665
Eysenck, H.J. & Slater, P. EFFECTS OF PRACTICE AND REST ON FLUCTUATIONS IN THE MULLER-LYER ILLUSION. *Brit. J. Psychol.*, Aug. 1958, 49(3), 246-256. (Institute of Psychiatry, University of London, London, England).

10,665
This experiment tested 50 subjects for 60 trials on the Muller-Lyer illusion in order to determine the effects of practice and rest. The trials were given in a series of ten with the first 40 following without interruption, the next ten following a 30 second pause for fixation, and the last ten following a 30-minute rest period. Data are presented in terms of the mean from trial to trial on each individual and the mean variations between individuals. The results are discussed in terms of the effects of practice and rest on these fluctuations, the various theories which might explain the fluctuations, and the significance of personality variables.

10,666
Baker, C.H. ATTENTION TO VISUAL DISPLAYS DURING A VIGILANCE TASK. I. BIASING ATTENTION. *Brit. J. Psychol.*, Nov. 1958, 49(4), 279-288. (Applied Psychology Research Unit, MRC, Cambridge, England).

10,666
This report presents five experiments designed to study (1) visual search behavior in a radar-like situation, and (2) methods of biasing search behavior in attempts to compensate for "peripheral blindness." Each of sixteen subjects searched the display for the appearance of a light and pressed a switch whenever the light was seen. The light appeared at random time intervals during a 64-minute period at one of 16 positions. The condition in each experiment varied as follows: (1) a blank display (no sweepline), (2) a full sweepline, (3) small dot at half radius of sweepline and green light one inch above display, (4) a box sweep. The results discuss the existence of "peripheral blindness" and the effects of the various display conditions on percentage of misses.

10,667
Cohen, J., Deauxley, E.J. & Hansel, C.E.M. SKILL AND CHANCE: VARIATIONS IN ESTIMATES OF SKILL WITH AN INCREASING ELEMENT OF CHANCE. *Brit. J. Psychol.*, Nov. 1958, 49(4), 319-323. (Department of Psychology, University of Manchester, England).

10,667
Two experiments are presented which assess the influence upon estimates of success in performance of (1) the subjective evaluation of the degree of skill required to succeed in a task, and (2) subjective chance. In experiment I, 38 subjects reported their estimates of their success for each dart thrown at a target which varied in size (1) when all darts were known to be sharp, and (2) when their chances of drawing a blunt dart were varied. In experiment II, eleven subjects threw a red bead, from a population of varying red and green beads, into beakers of varied sizes. The results are discussed in terms of the relationship between a subject's evaluation of his skill and the chance involved in drawing an implement which might influence his skill.

Goldstone, S., Boardman, H.K. & Isaac, M.T. EFFECT OF QUINALBARIUM, DEXTRO-AMPHETAMINE, AND PLACEBO ON APPARENT TIME. *Brit. J. Psychol.*, Nov. 1958, 51(4), 324-328. (Department of Psychiatry, Baylor University College of Medicine).

10,666

This experiment studies the effects of quinalbaram (saccharin), dextro-amphetamine, and placebo on subjective determinations of time. Ninety subjects were divided into groups of 30 and given one of these three items. Their task was to determine whether audible durations of time were more or less than 1.0 second. They were tested by a method of limits technique prior to, 30 minutes following, and 60 minutes following drug administration. The results are correlated with those of similar experiments and related to the effects of these drugs on personal standards of time.

Hardy, H.C. FOLDING PARTITIONS APPRAISED FOR NOISE. *Architectural Rec.*, Oct. 1958, 124(4), 220-223. (Consultant in Acoustics, Chicago, Illinois).

10,670

This article discusses the use of folding partitions as room dividers in areas where it might be necessary to have both halves of a room used for meetings at the same time. Data gathered from field studies or the performance of various types of partitions in various localities is presented and discussed. The amount of noise reduction required for partitions and the effects of acoustical absorption are also discussed. Conditions necessary to obtain maximum efficiency from the partitions are included.

Margaria, R. WIDE RANGE INVESTIGATIONS OF ACCELERATION IN MAN AND ANIMALS. *J. Aviat. Med.*, Dec. 1958, 29(12), 855-871. (University of Milan, Italy).

10,671

This article discusses many aspects of the problem of accelerative forces on man and animals. The viewpoint presented is that much more information can be gathered with less troublesome experimental situations than the gravity-free or free-fall situation. Several examples of simpler data-gathering circumstances are included. Discussion also considers protection from acceleration forces, disadvantages of a gravity-free condition, sensitivity of the labyrinth to gravitation, and effects of gravitation upon various animals. The author includes several experiments conducted under non-free-fall conditions, especially underwater studies.

Reidman, S., Blanchard, H.G., Clarke, H.P. & Moore, F. EFFECT OF WATER IMMERSION ON HUMAN TOLERANCE TO FORWARD AND BACKWARD ACCELERATION. *J. Aviat. Med.*, Dec. 1958, 29(12), 872-878. (Aero Medical Lab., Wright-Patterson AFB, Ohio).

10,672

To determine the magnitude of protection and technical problems associated with acceleration of subjects immersed in water, subjects were studied under the following conditions: 1) five subjects, erect position, 25 accelerations in the forward position; 2) same as 1) but accelerations were in a backward position; and 3) six subjects, spine tilted forward at a 35 degree angle. The results are discussed in terms of magnitude and direction of tolerance, limitations such as chest pain, dyspnea, and blackout, the effectiveness of various breathing masks, e.g., full face, and semi-face (eyes uncovered), and respiratory rate.

Liderer, L.G. & Putnam, L.E. COMPARISON OF DROWSINESS INDUCED BY BONAMINE AND MAREZINE. *J. Aviat. Med.*, Dec. 1958, 29(12), 885-890. (George Washington University).

10,674

The extent to which Bonamine and Marezine induce drowsiness is studied. Second-year medical students (100) were divided into four groups. Marezine (50 milligrams), Bonamine (25 and 50 milligrams), and placebo were given to each of the four groups on four different days, with two- to four-day intervals. Subjects were to report effects on each system (gastrointestinal, central nervous system, and so forth). Subjects participated in their normal routine during the experiment. A statistical analysis of the results is included.

Fletcher, Dorothy E., Collins, C.C. & Brown, J.L. EFFECTS OF POSITIVE ACCELERATION UPON THE PERFORMANCE OF AN AIR-TO-AIR TRACKING TASK. *J. Aviat. Med.*, Dec. 1958, 29(12), 891-897. (Aviation Medical Acceleration Lab., USN Air Development Center, Johnsville, Penn.).

10,675

The effects of different levels and durations of positive acceleration on the human centrifuge are studied in this experiment. Four subjects each participated in 72 runs of 141-seconds. The subjects' task was to keep the target aircraft centered during each run, center the target at the 91st second, then press a button on the control stick as soon as possible. The three variables which were manipulated during the runs were 1) the presence of either a centrally-located or a right-hand control stick; 2) the introduction of one of the following during the missile guidance phase of each run: 1, 2, 3, or 4 G of acceleration, and 3) the introduction of one of nine different patterns of acceleration in the target acquisition phase. The results discuss the interrelations of these variables.

Wren, J. L. & Collins, C. C. AIR TO AIR TRACKING DURING CLOSED LOOP (CROSSFIRE) OPERATION. *J. Aviat. Med.*, Nov. 1958, 29(11), 794-804. (Aviation Medical Acceleration Lab., USAF Air Development Center, Johnsville, Penn.).

10,676

To evaluate performance of a simulated air-to-air tracking task during acceleration, five subjects practiced this task in a static centrifuge, then participated in dynamic acceleration runs of one minute each. The centrifuge was operated in the facing-forward and reverse directions at two and one-half G. Subjects were also instructed to fly in a coordinated fashion and attain an altitude of approximately 8000 feet. Both errors in tracking and flight coordination are included in the results. Differences between performance in (1) a tracking task and (2) flight coordination under static and dynamic centrifuge conditions are discussed. Recommendations for further discriminating experiments are included.

Astrand, Irma. PHYSIOLOGICAL METHODS FOR ESTIMATING THE PHYSICAL WORK CAPACITY IN WORKERS ESPECIALLY OF THE OLDER AGE GROUPS. *Ergonomics*, Feb. 1958, 1(2), 129-136. (Department of Physiology, Central Gymnastic Institute, Stockholm, Sweden).

10,685

A submaximal test, which is a modification of the Harvard Step-test, was developed for estimating the physical work capacity and its reliability was tested by comparing it with work on the Krogh bicycle ergometer. Sixty subjects (male and female 20-30 years of age) worked on both the step test and bicycle. Measurements of heart rate, pulse rate, and oxygen intake were made. Step height, number of steps per minute, and subject's body weight were used as indicators of the working intensity of the step test. Physiological measurements were also taken from 25 male subjects (40-65 years of age) with less severe tests. Situations in which this test could be used are discussed.

10,689
Bailey, A.W. SIMPLIFYING THE OPERATOR'S TASK AS A CONTROLLER. *Ergonomics*, Feb. 1958, 1(2), 177-181. (USN Research Lab., Washington, D.C.).

10,689
Two experiments are reported which evaluate the usefulness of applying the display quickening technique to helicopter instrumentation. In the preliminary experiment, in which the hovering equation for pitch was simulated on an analog computer, the subject's task was to stabilize pitch attitude while subjected to simulated sudden wind disturbances during hovering. A second experiment compared a "conventional", "integrated", and "quickened" display system in an attempt to assess their relative contributions to hovering accuracy. The longitudinal, lateral, and heading equations of motion for a helicopter were simulated on an analog computer in this experiment.

Marrell, K.F.H., Laurie, W.D. & McCarthy, C. THE RELATIONSHIP BETWEEN DIAL SIZE, READING DISTANCE AND READING ACCURACY. *Ergonomics*, Feb. 1958, 1(2), 182-190. (Department of Psychology, University of Bristol, Bristol, England).

10,690
To gather more information on the optimum size of dial to be used at different reading distances, six subjects read from five dial sizes (2, 3, 4, 6, and 8 inch diameter) at distances of 2, 6, 9, 12, 18, and 24 feet from the dials. The results discuss the scores of the readings after the first seven trials. Also tested was the hypothesis that dials could be read after practice from distances greater than those at which they could read the numerals on the dials.

Lehmann, G. PHYSIOLOGICAL BASIS OF TRACTOR DESIGN. *Ergonomics*, May 1958, 1(3), 197-206. (Max-Planck-Institut für Arbeitsphysiologie, Dortmund, Germany).

10,691
This paper is concerned with the principles underlying the design and positioning of tractor controls and seats so that performance and efficiency will be improved. Energy consumption and electrical skin capacity of the operator were measured during tractor driving with a number of different types of seats. In addition, a study of positioning relative to the operator of brake, clutch pedals, footrest, steering column and wheel was made. A standard tractor was modified according to derived principles and tests were repeated to evaluate the effects of the changes made.

Müller, E.A., Vetter, K. & Elmal, E. TRANSPORT BY MUSCLE POWER OVER SHORT DISTANCES. *Ergonomics*, May 1958, 1(3), 222-225. (Max-Planck-Institut für Arbeitsphysiologie, Dortmund, Germany).

10,692
In this study of the efficiency of different ways of transporting loads by muscle power over short distances, the energy expenditure for piling up loads and shifting loads in a horizontal plane was measured. The height above the ground from which the load is moved and the size of the units in which the load is moved were also varied. Implications for house-building are mentioned.

Platonov, K.K. MAN IN FLIGHT. FTS 9381/V, 1957, 286pp. USAF Technical Documents Liaison Office, Wright-Patterson AFB, Ohio.

10,694
The principal questions of aviation medicine with which the pilot must be acquainted are discussed in this book. The book is intended for students of aeroclubs and flying schools, and for flight personnel of the regular military units of the Soviet Army Air Force. It should also be useful to physicians serving aviation units. The various chapters treat the history of aviation medicine, the influence of altitudes on man in flight, the effects of speed and accelerations, all-weather flights, vibrations and noise, night flying, conditions for preserving flying efficiency, and the qualities of a pilot.

Fosberry, R.A.C. MEASUREMENTS OF VISIBILITY FROM THE DRIVING SEAT OF MOTOR VEHICLES. *Ergonomics*, May 1958, 1(3), 240-250. (The Motor Industry Research Association, Lindley, Warwickshire, England).

10,695
The work described in this paper is the measurement of visibility from the driver's seat of a fairly wide range of vehicles. Two lamps were positioned to correspond with the eyes of the average driver and visibility was measured by the shadows cast by structural members of the vehicle on a forward screen and by the light reflected back by the mirror. The chief points of comparison between vehicles are the extent of forward and rearward vision.

Siegel, A.I. & Brown, F.R. AN EXPERIMENTAL STUDY OF CONTROL CONSOLE DESIGN. *Ergonomics*, May 1958, 1(3), 251-257. (Applied Psychological Services, Wayne, Penn.).

10,696
This study was concerned with a systematic evaluation of the best angular orientation for the side panels of a computer control console which could be used by a single operator or a pair of operators. Eleven single operators and six pairs went through 12 operating programs on a mock-up: three for each of four side panel angles (35, 45, 55, and 65 degrees). Preference ratings were obtained in addition to measurements of number and distance of seat movements, number of body movements and arm extensions, and frequency of visual block.

 Beck, R.D. REMARKS ON THE TEST OF SIGNIFICANCE FOR THE
 METHOD OF PAIRED COMPARISONS. *Psychometrika*, Dec.
 1958, 23(4), 323-334. (University of Chicago).

10,699
 In this paper, a three-component model for compara-
 tive judgment which allows for individual differences in
 preference is proposed. An implication of the model is
 that errors in the observed proportions due to sampling
 individuals in paired comparisons experiments are corre-
 lated. It is shown that bounds may be set for the cor-
 relation effect which make a valid test possible in some
 cases and provide useful standard errors for the esti-
 mated values.

 Brayfield, A.H. & Crockett, W.H. EMPLOYEE ATTITUDES
 AND EMPLOYEE PERFORMANCE. *Psychol. Bull.* Sept.
 1955, 52(5), 396-424. (Kansas State College).

10,701
 This review summarizes empirical studies of relation-
 ships between employee performance and employee attitudes.
 Studies were analyzed in several ways: 1) those involving
 performance on the job, and those involving absence from
 the job; 2) in terms of research design, those relating
 attitudes of individuals to performance as individuals,
 and those which relate attitudes of members of group to
 performance as groups; and 3) those employing a single
 index of attitudes and those using multiple indices.
 Limitations of design were discussed, including problems
 of sampling, criterion measures, procedural problems and
 so forth. Implications for future research are noted.

 Karpinos, B.D. HEIGHT AND WEIGHT OF SELECTIVE
 SERVICE REGISTRANTS PROCESSED FOR MILITARY SERVICE
 DURING WORLD WAR II. *Hum. Biol.*, Dec. 1958, 30(4),
 292-321. (Office of the Surgeon General, Department
 of the Army, Washington, D.C.).

10,702
 This findings presented in this paper are based on an
 analysis of height-weight data abstracted from about one
 half-million physical examination forms selected at ran-
 dom from five million forms on men processed for military
 service in World War II. Frequency distributions of
 height and weight and quartiles for this group (age range
 18-37) are given as well as mean heights and weights and
 modes of weight. Comparisons are made for white and
 negro examinees and height and weight are discussed as a
 function of geographic distribution, size of community,
 and occupation. Finally, comparison is made with World
 War I data and for registrants with and without tubercu-
 losis.

 Gafo, J. & Gifford, E.C. COMPONENTS OF VARIANCE IN
 ANTHROPOMETRY. *Hum. Biol.*, May 1958, 30(2), 123-127.
 (USAF Air Crew Equipment Lab., Philadelphia, Pa.).

10,704
 The purpose of this study is stated as being that of
 determining the morphological features which are impor-
 tant in determining aircraft work space dimensions and the
 arrangement of equipment. Eleven features (including
 height, weight, and arm reach) were selected as the ones
 most likely to be critical and each of three anthropome-
 trists measured 14 subjects three times using standard
 anthropometric techniques. An analysis of variance tech-
 nique was used to assess the percentage of total variance
 contributed by each component of variance (inter-subject,
 intra-subject, and intra-anthropometrist).

 Milks, S.S. & Balke, B. INCREASED TOLERANCE TO PRESSURE
 BREATHING BY UTILIZING ADEQUATE BREATHING MECHANICS.
J. Aviat. Med., April 1958, 29(4), 301-306. (USAF
 School of Aviation Medicine, Randolph AFB, Tex.).

10,706
 In an attempt to study individual tolerance to pres-
 sure breathing without the use of counterpressure, three
 investigations were conducted. The first investigation
 was carried out on four subjects who were placed in a
 respirator and then subjected to an increase in the
 intrapulmonary pressure by lowering the pressure in the
 tank. A second series of experiments was performed on
 six subjects by enclosing the head of each subject in a
 leak-proof helmet which was attached to the blower unit
 of a respirator. The third series of experiments was
 performed on three subjects, using the pressure helmet
 in conjunction with an abdominal bladder. Pulse rate and
 blood pressure measurements were recorded at varying
 pressures for ten minute intervals in each series.

 STUDIES IN AEROEMBOLISM. *J. Aviat. Med.*, April 1958,
 29(4), 291-300. (Aeromedical and Physical Environment
 Lab., Univ. of Illinois, Chicago, Ill.).

10,707
 This study reports on the incidence of decompression
 sickness in fifteen healthy male subjects who partici-
 pated in a total of 75 flights in a low-pressure chamber
 to simulated altitudes of 12,000 feet, 18,000 and finally
 38,000 feet. The total volume of expired air exhaled
 by each subject was recorded by a continuous flowmeter.
 Nitrogen content in venous blood of each subject was es-
 timated before the experiment, and after denitrogenation.
 Susceptibility to altitude pains were tested at 38,000
 feet with subjects breathing 100 percent oxygen immedi-
 ately following denitrogenation, and the data compared
 with the response of each subject to the same altitude
 without a prior period of denitrogenation.

 Moseley, H.G. AIRCRAFT ACCIDENT INJURIES IN THE
 U.S. AIR FORCE. *J. Aviat. Med.*, April 1958, 29(4),
 271-282. (Directorate of Flight Safety Research,
 Norton AFB, Calif.).

10,708
 This article is based on a review of the major air-
 craft accidents in the United States Air Force during
 the years 1953 and 1955. The review is primarily con-
 cerned with the phenomenon of the crash and the trauma to
 the aircraft occupants. The cases were evaluated in
 terms of the following categories: (1) fatalities, (2)
 major injuries, (3) cause of injuries, (4) seat reten-
 tion, (5) seat belts, (6) shoulder harnesses, and (7)
 body position. Alternate instead of consecutive years
 were chosen to determine whether there were any changes
 in injury patterns. The installation in aircraft of
 certain safety features is proposed as a result of the
 information gleaned from this survey.

Knight, L.A. AN APPROACH TO THE PHYSIOLOGIC SIMULATION OF THE NULL-GRAVITY STATE. *J. Aviat. Med.*, April 1958, 29(4), 283-286. (Mq. Military Air Transport Service, Scott AFB, Ill.).

10,709

While studying the physiological effects of prolonged weightlessness the similarities between the condition of a body floating in space and that of a body floating in water were noted, and the conclusion was drawn that weightlessness is the absence of external forces acting on the body. It was assumed that a physiologic condition approaching that observed in the null-gravity state could be simulated by obscuring vision, immersing the subject in water to eliminate tactile and proprioceptive cues, and positioning him in the supine, head-down orientation. A preliminary experiment (three subjects acquainted with conditions of null-gravity) was conducted to investigate the matter of spatial orientation during immersion in water, and to establish values for the threshold of sensitivity of the otolith organ to change in position. Sarnoff, C.A. & Mehana, J.C. EPISODIC PSYCHOGENIC G FORCE INTOLERANCE. *J. Aviat. Med.*, April 1958, 29(4), 287-290. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

10,710

This report presents three cases in which G force intolerance occurred in the absence of the usual predisposing factors. Each patient was given an evaluation which included: a complete neurological examination, complete flying physical examination, psychiatric interview, roentgenograms of the skull, and an electroencephalogram including rest, photic stimulation, hyperventilation and sleep records. The amount of sleep, alcohol intake, and the state of nutrition at the time of G intolerance were determined for each patient. Since none of the patients exhibited abnormal physical or neurological findings, psychogenic factors such as: the degree of parental stability, the emotional stability of the patient, and presence of life stresses were studied. T. R 5

Von Beckh, H.J. MULTI-DIRECTIONAL G PROTECTION IN SPACE FLIGHT AND DURING ESCAPE. A THEORETICAL APPROACH. *J. Aviat. Med.*, May 1958, 29(5), 335-342. (USAF Aero Medical Field Lab., Holloman AFB, N.M.).

10,711

The re-entry phase of orbital and space projects, as well as changes in direction of the flight paths of supersonic atmospheric crafts require vehicle designs which will be capable of producing appreciable G loads for extended periods of time. Since protection by anti-G suits cannot be greatly increased, this report proposes a device called the "anti-G capsule", which is pivoted about the lateral axis of the craft, and which automatically assumes positions that would render the resultant of all acting accelerations perpendicular to the heart-head line of the occupant. This device would also be designed to serve as an ejection capsule, affording G protection during and after escape from aircraft or space vehicle within the atmosphere. T. R 22

10,712

Herrick, R.M., Meyers, J.L., & Burke, R.E. DISCRIMINATIVE BEHAVIOR FOLLOWING REPEATED EXPOSURE TO NEGATIVE ACCELERATION. *J. Aviat. Med.*, May 1958, 29(5), 343-349. (USN Aviation Medical Acceleration Lab., Naval Air Development Center, Johnsville, Penn.).

10,712

This report describes the first in a series of animal experiments designed to obtain quantitative information regarding the effect of repeated exposure to negative acceleration on discriminative behavior. For this experiment, rats were trained to make a simple light-dark discrimination and then, on successive days, were exposed for three minutes to a given negative G. Fifty-five minutes later they were tested on the discrimination. After five days at the given G level, the negative G was increased one G unit. This procedure continued until death occurred. The data at each level were compared with the animal's performance prior to exposure. Also discussed is the possibility of increasing tolerance to higher negative G by repeated exposure. T. G. R 6

Simons, D.G. & Archibald, E.R. SELECTION OF A SEALED CABIN ATMOSPHERE. *J. Aviat. Med.*, May 1958, 29(5), 350-357. (USAF Aero Medical Field Lab., Holloman AFB, N.M.).

10,713

This report discusses the various physiologic variables to be considered in the design of a manned sealed cabin to operate at space equivalent altitudes. This sealed cabin should operate entirely from self-contained sources without attempt to pressurize from ambient air and be designed for zero leakage. Among the factors discussed are: selection of oxygen supply, carbon dioxide and water vapor removal systems, and determination of the cabin atmosphere pressure and composition based on a flight duration of 24 hours. Environmental control equipment should be designed to maintain an atmosphere that provides for no performance decrement rather than comfort or survival. The basic considerations that govern selection of cabin environment used in Operation Meridian ascents (1957) are presented. G. I. R 10

10,714

Readman, C.H. & Limburg, C.C. HUMAN FACTORS IN WEAPON SYSTEM DEVELOPMENT. *J. Aviat. Med.*, May 1958, 29(5), 366-370. (USAF Human Factors Division, Directorate of Research & Development, Department of the Air Force, Washington, D.C.).

10,714

The human factor is often the weak link in weapon system development and performance. To deal with this problem, this article proposes an increase in multidimensional studies relating human factors to combat capability and readiness in a realistic configuration of equipment within an operational environment. Among the subjects discussed are: the reliability and availability of personnel; the timely assembly of compatible units of equipment in a suitable operational environment; and the importance of management in designing new organizational patterns and administrative systems to cope with increasingly complex weapon systems. T. G. R 2

10,715

Ross, M.D. & Lewis, M.L. THE STRATO-LAB BALLOON SYSTEM FOR HIGH ALTITUDE RESEARCH. *J. Aviat. Med.*, May 1958, 29(5), 375-385. (Office of Naval Research & Bureau of Aeronautics, Navy Department, Washington, D.C.).

10,715

This report discusses the Navy Balloon research system, Strato-Lab, which provides a zero velocity constant level platform for personnel to make high altitude observations. The Strato-Lab program involves three systems: a low-altitude system, having a gondola, for flights up to an altitude of about 12,000 feet; an intermediate altitude system, with cold weather equipment and a suitable oxygen supply in the gondola, for altitudes up to 42,000 feet; and the high altitude system which employs a sealed cabin to provide the necessary artificial atmosphere. The implications of Strato-Lab are discussed in relation to aviation medicine research and the evaluation of certain military components, techniques, and equipment. T. G. I. R 15

10,716

Finkelstein, Beatrice & Pippitt, R.G. EFFECT OF ALTITUDE AND OXYGEN UPON PRIMARY TASTE PERCEPTION. *J. Aviat. Med.*, May 1958, 29(5), 386-391. (USAF Aero Medical Lab., Wright Air Development Center, Dayton, Ohio).

10,716

To determine whether taste perception levels, taste identification levels, or the ability to identify tastes are affected by altitude or breathing pure oxygen, ten healthy subjects were subjected to tests comparing their taste perception at ground level with that at 25,000 feet while breathing 100 percent oxygen. Distilled water solutions of chemically pure sodium chloride, lactic acid, caffeine citrate, and sucrose were used. All solutions were colorless and odorless. Varying intensities of the dilutions were used. The experiment was designed to yield the following comparisons: 1) the level at which taste was first perceived; 2) the level at which positive identification of taste occurred; and 3) the ability to identify the taste correctly. T. G. R 2

Ades, M.W., Graybiel, A., Merrill, S.M., Tolhurst, G.C. et al. NON-AUDITORY EFFECTS OF HIGH INTENSITY SOUND STIMULATION ON DEAF HUMAN SUBJECTS. *J. Aviat. Med.*, June 1958, 29(6), 454-467. (USN School of Aviation Medicine, Pensacola, Fla. & University of Texas Southwestern Medical School).

10,717
Because the levels at which the non-auditory effects of sound occur are well above those known to be damaging to hearing, completely deaf subjects were used in this experiment. The subjects were exposed to pure tone and wide-band noise at sound pressure levels up to 170 decibels. By noting the words used by the subjects in describing their sensations, a scale of subjective values was developed to determine the subjects' responses to vibration, tickle, warmth, pain, and dizziness; thresholds for each type of sensation were determined for some subjects at each test frequency. Frequency-intensity curves showing the thresholds of nystagmus are presented, as well as subjects' subjective reports on the associated dizziness and observation of apparent movement when fixating on a luminous vertical line. T. G. I. R 7

Diamond, S. THE EFFECT OF UNILATERAL ACQUIRED MYOPIA ON DEPTH PERCEPTION IN AIRLINE PILOTS. *J. Aviat. Med.*, June 1958, 29(6), 468-474.

10,718
The increasing demands of high performance aircraft make a high degree of stereoscopic acuity an essential requirement in the aircraft operator. In order to determine the extent to which unilateral visual loss affects the stereoscopic threshold, this study reviews the depth perception findings in five pilots before and after the onset of myopia in one eye. The data used were the standard Howard-Dolan findings at a testing distance of 20 feet gleaned from the pilot records of periodic examinations. The findings discussed include: deviations (maxima and minima) and averages of five test determinations, expressed in millimeters and in arc seconds of parallax disparity. Because these findings occurred over a number of years, the mutual decrease of depth perception with age was considered. T. G. R 17

Beischer, D.E. POTENTIALITIES AND RAMIFICATIONS OF LIFE UNDER EXTREME ENVIRONMENTAL CONDITIONS. *J. Aviat. Med.*, July 1958, 29(7), 500-503. (USN School of Aviation Medicine, Pensacola, Fla.).

10,719
In preparation for the time when man takes his first step onto another planet, this article suggests that we re-evaluate life from the standpoint of heredity and environment to determine how living matter will cope with the shock of leaving its birthplace and facing the possible extreme conditions of another world. The author suggests that we scan the potentialities of life on our own planet, as we find them today and as they have developed during the last billion years. The knowledge thus gained should then be supplemented by laboratory experiments. Citing some of the unusual environmental conditions that exist on this planet, the author discusses their implications to such a study. R 1

10,720
Gerathwohl, S.J. & Stallings, H.D. EXPERIMENTS DURING WEIGHTLESSNESS: A STUDY OF THE OCULO-AGRAVIC ILLUSION. *J. Aviat. Med.*, July 1958, 29(7), 504-516. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

10,720
To investigate the phenomenon known as the "oculo-agraivic illusion", an observer was placed in the rear seat of an F-94C-type aircraft, which was then flown through various maneuvers including: turns, push-overs, pull-ups, and aileron rolls. These maneuvers produced accelerations of different directions and magnitudes. Parabolas and double parabolas were performed to produce short periods of weightlessness because the oculo-agraivic illusion can be best observed in the zero-gravity state. The observers experienced strong visual after-images, and their descriptions of these after-images were recorded during the maneuver. By this means, the apparent motion and displacement of the after-images were correlated with their associated maneuver. G. I. R 18

10,721
Beeson, E.E. DESIGN CONSIDERATIONS OF A BALLOON-BORNE PRESSURIZED CAPSULE FOR HIGH ALTITUDE BAILOUT STUDY. *J. Aviat. Med.*, July 1958, 29(7), 516-525. (Balloon Department, Mechanical Division of General Mills, Inc., Minneapolis, Minn.).

10,721
This report describes the design of a pressurized balloon-capsule system which could carry a two-man crew to a "jumping-off altitude" of 90,000 feet, and which could, if necessary, return them safely to earth by controlled parachute descent. Safety was the primary concern of the design. In line with this view, the following factors are discussed: (1) optimum configuration for stable parachute descents; (2) the capsule as a pressure cell; and (3) the capsule suspension system. Because of the need for an "artificial climate", the design also encompasses the factors of: (1) oxygen supply and capsule pressurization; (2) humidity control; (3) carbon dioxide absorption; and (4) capsule temperature control. A complete communications system is an integral part of this design as well. I. R 4

Muttali, J.B. TOXIC HAZARDS IN THE AVIATION ENVIRONMENT. *J. Aviat. Med.*, Sept. 1958, 29(9), 641-649. (Office of the Surgeon General, Washington, D.C.).

10,722
This article, which discusses some of the toxic hazards in flight that constitute a serious threat to the safety of air operations, is based on a review of base aircrew effectiveness reports and reports of aircraft accidents. Among the hazards discussed are: carbon monoxide and exhaust fumes, contaminated oxygen, oil pyrolysis smoke and fumes, fuel fumes, and electrical fire, smoke, and fumes. Some miscellaneous hazards are also mentioned. Tables are included in this report, showing: (1) the infrequent reporting of toxic hazard incidents; (2) the actual involvement of these hazards in a survey of 332 major aircraft accidents; and (3) the frequency of reported symptoms related to each of the hazards. T. R 5

10,723
Berry, C.A. THE ROLE OF PHYSICAL STANDARDS IN JET AND ROCKET AIRCRAFT FLIGHT. *J. Aviat. Med.*, Sept. 1958, 29(9), 631-640. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

10,723
Physical standards for flying personnel--their history, major purposes and development--are presented. Separate discussions of the standards for the cardiovascular system, pulmonary system, neuropsychiatric system, weight and vision also are included, which revise some of the older standards. The problem of revision in light of new developments is considered. The special requirements for space flight are speculated upon briefly. R 26

10,724
Mullinax, P.E. Jr. & Beischer, D.E. OXYGEN TOXICITY IN AVIATION MEDICINE. *J. Aviat. Med.*, Sept. 1958, 29(9), 660-667. (Grace-New Haven Hospital, New Haven, Conn. & USN School of Aviation Medicine, Pensacola, Fla.).

10,724
This is an analysis of the data on oxygen toxicity in man that may be of importance in aviation. The discussion covers: 1) mechanisms of toxicity--lungs, blood, central nervous system; 2) symptoms and signs of toxicity--cardiorespiratory system (substernal stress, nasal congestion, lower respiratory changes) and neuromuscular disturbances (deterioration of performance, constitutional symptoms), and 3) safe limits of exposure to oxygen. T. I. R 26

Groth, Hilde, & Lyman, J. ADEQUACY OF THE RESIDUAL SENSORY CUES FOR PSYCHOMOTOR PERFORMANCE OF ARM-AMPUTEES. *J. appl. Psychol.*, Oct. 1958, 42(5), 323-328. (University of California at Los Angeles).

10,726

To investigate the extent of the usefulness of remaining sensory cues for prosthesis performance on two visuo-motor tasks, 15 unilateral amputees and 20 non-amputees performed a manipulation task and a pursuit tracking task. The amputees consisted of eight below-elbow amputees with cineplastic control and three above-elbow amputees with harness control. Mean performance and variability of amputees and non-amputees was estimated in order to evaluate three possible sources of performance decrement in the amputees: a) inadequate sensory information, b) increase in duration of mechanical motions, and c) increase in "central integration time" due to the complexity added by the prosthesis.

Buffa, E.S. & Lyman, J. THE ADDITIVITY OF THE TIMES FOR HUMAN MOTOR RESPONSE ELEMENTS IN A SIMULATED INDUSTRIAL ASSEMBLY TASK. *J. appl. Psychol.*, Dec. 1958, 42(6), 379-383. (University of California at Los Angeles).

10,729

To attempt to resolve previous experimental findings on the problem of additivity of motor response elements and extend the applicability of this additivity concept to more complex motion patterns, 16 male subjects performed a light manual assembly task requiring 16 motion elements. Three variables: completeness of cycle, visual discrimination (use of only marked components), hands used were tested. The results were handled by analysis of variance and discussed in terms of validity of the additivity concept.

Earch, A.M. JUDGMENTS OF SPEED ON THE OPEN HIGHWAY. *J. appl. Psychol.*, Dec. 1958, 42(6), 362-366. (Michigan State University).

10,730

To determine the accuracy with which judgments of speed could be made by a passenger car driver while decelerating and the influence of increasing amounts of exposure to a given speed on these judgments, 44 males (22 to 52 years) with considerable driving experience made speed judgments while decelerating after driving at varying amounts (5 seconds, and 8 minutes 35 seconds) of constant speed of 35 or 50 miles per hour. Accuracy and consistency of judgments were analyzed by analysis of variance and correlation techniques. The results were discussed in terms of speed adaptation.

McFarland, R.A., Warren, B.A. & Karis, C. ALTERATIONS IN CRITICAL FLICKER FREQUENCY AS A FUNCTION OF AGE AND LIGHT:DARK RATIO. *J. exp. Psychol.*, Dec. 1958, 56(6), 529-536. (Harvard School of Public Health and Northeastern University).

10,731

To establish more precisely the nature of the relationship between foveal critical flicker frequency (CFF) and chronological age, binocular CFF thresholds were obtained on 108 males, age 13 to 89 years, using light-dark ratios (square wave) in which the light portion was 2, 5, 10, 25, 40, 50, 75, 90, 95, and 98 percent. The circular test area (mean luminance 21.19 millilamberts) subtended 36 minutes of arc and the surround (23.6 and 0.04 millilamberts), 17 degrees. The threshold curves were fitted with straight lines and the slopes compared.

Kunnapas, T.M. INFLUENCE OF HEAD INCLINATION ON THE VERTICAL HORIZONTAL ILLUSION. *J. Psychol.*, Oct. 1958, 46(Second Half), 179-185. (Department of Psychology, University of Stockholm, Sweden).

10,732

To investigate how the inclination of the head to the horizontal position influences the vertical-horizontal illusion, 20 subjects adjusted either the vertical or horizontal line of the test figure (an L) until it appeared equal to the standard horizontal line under two head position conditions: vertical and horizontal (85 degrees to the right). Six subjects also did this with the head inclined horizontally to the left. The data were examined by analysis of variance and the results were discussed in terms of previous findings by the author.

- 10,736
This paper reports on an attempt to determine the effect on performance of a continuous tracking task of altering the force required to rotate the controls. One group of thirteen subjects was required to work against two pounds of coulomb friction during original practice and fourteen pounds during transfer. A second group of thirteen subjects had the same frictional loadings but in reversed order. The change in mean time-on-target for the two groups during original practice and transfer periods is plotted and the results are discussed in some detail.

- 10,737
Changes in apparent size, during inspection of both a circular and certain quasi-circular figures were studied. Four groups of 100 subjects inspected either an outline circle, a dot rotating continuously in a circular path, a dot moved stepwise around a circular path, or a stationary dot. Comparison stimuli were a series of complete outline circles which varied in diameter. Total inspection time was varied by requiring half the subjects to fixate the stimuli at all times except when making a size judgement, while the remaining subjects looked at the stimuli only when making a judgement. Results are related to neural satiation theory.

Bilodeau, Ina McD. & Bilodeau, E.A. TRANSFER OF TRAINING AND PHYSICAL RESTRICTION OF RESPONSES. *Percent. Mot. Skills*, June 1958, 8(2) 71-78. (Tulane University).
- 10,738
This paper is concerned with the effects of physical restriction of potential responses upon transfer of training. On a two-hand tracking device, subjects practised a coordinated tracing within the confines of a walled pathway. In this way, the range of errors which the subjects could commit was drastically reduced. A control group, practicing without walls, was free to commit and then to correct error responses. Transfer of skill was measured after training with and without response restriction.

- 10,740
The effects of display scale and illumination on tracking performance were measured in this study using an electronic pursuit apparatus. A target and cursor having the same dimensions were presented on a five-inch cathode ray tube. Control scale was held constant while the display scale varied between one-half inch and four inches. The cursor moved one-half inch for 20 degrees of arm rotation in the one-half inch display and four inches for the larger display. The two conditions of illumination were complete darkness and dim illumination. A single trained subject tracked 150 one-minute trials for five days.

Adair, H. & Bartley, S.H. NEARNESS AS A FUNCTION OF LATERAL ORIENTATION IN PICTURES. *Percent. Mot. Skills*, June 1958, 8(2), 135-141. (Michigan State University, Ann Arbor, Mich.).
- 10,743
This is one of a series of studies on space perception. To test the supposition that objects in the left field and right portions of the visual field do not have equal properties when viewed as objects in three dimensional space, 20 observers each made a total of 72 observations. Four prints of each of five scenes were used: one four by four, one eight by eight, and two which were mirror images of the first two. Observations were monocular, and observer was to adjust the metric distance of the large print so it appeared to be at the same distance as the smaller print which was placed at a fixed metric distance. Results are discussed as they relate to previous studies.

Barron, C.I., Collier, D.R., Jr. & Cook, T.J. OBSERVATIONS ON SIMULATED 12-SECOND DECOMPRESSIONS TO 32,000 FEET. *J. Aviat. Med.*, Aug. 1958, 29(8), 563-574. (Lockheed Aircraft Corporation, Burbank, Calif.).

10,748

To study the effects of relatively slow decompressions such as might occur in larger transport aircraft, 154 subjects were exposed to 12 second decompressions in 29 separate chamber flights. The decompressions involved a change in pressure altitude encompassing a range of 8,000 to 32,000 feet. Exposure varied from 10 seconds, including time of decompression and stay at altitude, to 60 seconds. Descent involved change of 4,000 feet the first minute and 7,000 feet the second, with chamber leveled at 14,000 feet. Some subjects wore A-13A pressure demand masks. Results are tabulated on the basis of subjective response and observation by instructors. Frequency of hypoxia is also given.

Miller, E.F., II. EFFECT OF BREATHING 100 PER CENT OXYGEN UPON VISUAL FIELD AND VISUAL ACUITY. *J. Aviat. Med.*, Aug. 1958, 29(8), 598-602. (USN School of Aviation Medicine, Naval Air Station, Fla.).

10,750

To test for decrease in field of vision or in visual acuity during prolonged breathing of 100 percent oxygen, six male subjects were studied under conditions approaching those experienced in actual flight. A tangent screen, perimeter, and Glason acuity meter were used to examine each subject before and after each hour of a four hour test run. A control study was made by having the subjects breathe air instead of 100 percent oxygen during one test run. Significance of differences between results under the two conditions, as well as changes in thresholds as a function of breathing oxygen are discussed.

Schuster, R.E. RESPIRATORY PATTERN AND RESPIRATORY RE-
SPONSE TO CO₂. J. Appl. Physiol., July 1958, 11(1), 1-
14. (Naval Medical Research Lab., New London, Conn.).

10,755
To estimate the combined carbon dioxide (CO₂) and
oxygen effects on respiration, 65 subjects were exposed
to various concentrations of CO₂ (1.5, 3.3, 5.4, and 7.5
percent CO₂) for 15 minutes followed by a recovery period
of 15 minutes. Individual differences in the response
to CO₂ were related to the respiratory pattern of the
individual for air. On the basis of differences in the
response to 5.4 percent and 6.5 percent CO₂, subjects
were classified in a high and low ventilation group and
characteristics of the groups discussed. Possible use
of the respiratory response to CO₂ as a selection test
for underwater swimmers and pilots is discussed.

Clark, G.M. ACOUSTICS AND LIGHTING. Illum. Engng., Feb.
1958, 111(2), 99-102.

10,756
To acquaint the illuminating engineer with certain
basic concepts of acoustical engineering the author de-
fines and illustrates application of: noise reduction
coefficients, absorption coefficients, loudness reduction
reverberation time, and noise isolation. Tables showing
typical absorption and noise reduction coefficients for
luminous compared with acoustical ceilings, and for vari-
ous room surfaces, and showing acoustical characteristics
of six different lighting and acoustical systems are given.
Knowledge of these terms has become necessary due to
competition of illuminating and acoustical engineers
for ceiling space, and in order that unnecessary compro-
mise of good lighting will not be made by illuminating
engineers.

Craig, F.N. & Cummings, E.G. BREATH HOLDING DURING
EXERCISE. J. Appl. Physiol., July 1958, 11(1), 30-34.
(USA Chemical Warfare Labs., Army Chemical Center, Md.).

10,757
The product of intensity of exercise, measured by
oxygen uptake, and of voluntary breath holding time was
measured for one subject under the following nine condi-
tions: sitting, standing, walking at 1.5, 2.5, and 3.0
miles per hour on the level, walking at 3.0 miles per
hour on grades of six and 12 percent, and running on
the level at six and nine miles per hour. Measurements
were made either on the last step of the walk or run or
during it. Carbon dioxide concentration and breath
holding time are analyzed as a function of grade of work.

Froese, G. EFFECT OF BREATHING O₂ AT ONE ATMOSPHERE ON
THE RESPONSE TO COLD IN HUMAN SUBJECTS. J. Appl.
Physiol., July 1958, 11(1), 66-74. (University of
Western Ontario, London, Canada).

10,758
To see whether breathing O₂ decreases the O₂ con-
sumption during exposure to cold, ten subjects were
measured when dressed normally at usual room temperature
(25 degrees Centigrade) and at room temperature of ten
degrees Centigrade when covered with blankets or after
being exposed for 20 minutes in shorts only. Movements
of a suspended bed were recorded as well as measurements
of air and O₂ breathing and electromyograph readings.
The results are evaluated in terms of the effects of
breathing O₂ on responses to cold.

Hall, J.F., Jr., Kearney, A.P. & Polite, J.W. RDY
COOLING IN WET AND DRY CLOTHING. J. Appl. Physiol.,
July 1958, 11(1), 121-128. (SAF Aero Medical Lab.,
Wright Patterson AFB, Ohio).

10,760
The feasibility of using "wet" survival suits, which
have certain advantages, for personnel who may, in an
emergency, be exposed to extremely cold water, was in-
vestigated in this study. Skin, rectal, and extremity
temperatures of five subjects were measured before im-
mersion in cold water (zero degree Centigrade) and ex-
posure to air temperatures ranging from -4.4 degrees to
-28.9 degrees Centigrade while resting in a life raft.
Body cooling curves were plotted for wet-clothed and
dry-clothed subjects under these conditions. Finally,
the data are used to predict tolerance (or potential
rescue) times, with the two types of clothing, as a
function of air temperature at water temperature of
zero degree Centigrade.

Specht, H. RELATION OF INCREASED AIRWAY RESISTANCE
TO BREATHING WORK AND BREATH VELOCITY AND ACCELERATION
PATTERNS WITH MAXIMUM AND NEAR MAXIMUM BREATHING EFFORT.
J. Appl. Physiol., Sept. 1958, 11(2), 194-204. (Na-
tional Institutes of Health, Bethesda, Md.).

10,761
This is a study of the oxygen cost of breathing, the
mechanical work done in breathing, the efficiency of
breathing, and breath patterns at various resistance
levels with maximum breathing effort. The efficiencies
were calculated from two different viewpoints of the
breathing mechanism as a machine for doing work. Breath
velocity patterns, volume patterns, and acceleration
patterns were derived. Finally, oxygen cost of external
work, peak pressures and velocities, and changes in
functional residual capacity are discussed.

Driver, Audrey, F.M. PHYSIOLOGICAL CHARACTERISTICS IN RELATION TO CLIMATIC PREFERENCE. *J. appl. Physiol.*, Nov. 1958, 13(3), 430-434. (University of Hong Kong, Hong Kong, China).

10,772

This is an attempt to trace the physiological differences between those who like living in the tropics and those who prefer a cooler environment. Basal metabolic rate, oral temperature, blood pressure and sweating rate were determined for eight Chinese males during the tropical summer of Hong Kong. Differences in these measures for those with each type of climatic preference were evaluated statistically.

Simonson, E. EFFECT OF LOCAL COLD APPLICATION ON THE FUSION FREQUENCY OF FLICKER. *J. appl. Physiol.*, Nov. 1958, 13(3), 445-448. (University of Minnesota Medical School, Minneapolis, Minn.).

10,773

The effect of local cold application (immersion of one arm in ice water) on monocular flicker fusion frequency (FFF) was studied in 106 healthy older men. Two brightness levels differing by one to ten and two ambient light ratios (zero and 95 per cent) were used. Light-dark ratio (50 to 50), size of the test patch (1.5 degrees of visual angle), and surrounding illumination (one foot-candle) were kept constant.

McKenna, A.E. THE EXPERIMENTAL APPROACH TO PAIN. *J. appl. Physiol.*, Nov. 1958, 13(3), 449-456. (Universite de Louvain, Louvain, Belgium).

10,774

Pain thresholds were obtained by using a modification of the Hardy-Wolff-Goodell method of stimulation by thermal radiation and response was measured, not only by the judgment of the subjects, but also by electroencephalogram, electrocardiogram, and psychogalvanic reflexes and changes in respiration. The validity of the experimental approach in the difficult area of pain research is questioned.

10,775
To study spatial summation for pain, three approaches were used with five subjects: (1) cutaneous pain threshold was determined on the forehead over areas from 2.5 square centimeters (cm^2) to 15 cm^2 by recording skin temperatures during exposure to thermal radiation, (2) time and temperature at which pain occurred from immersion in cold water was compared for one hand and both hands and, (3) a needle scratch method was attempted. The three methods are discussed as indicators of spatial summation of pain.

10,776
This paper is on the effects of dehydration on the response to passive tilt after physical conditioning, with and without heat acclimatization. Pulse rate and blood pressure response to passive tilting were measured for 15 young male subjects who were dehydrated overnight in a hot, dry atmosphere after a rigorous program of physical conditioning in addition to acclimatization to heat, physical training alone, or a sedentary schedule. Results and related observations are presented and discussed.

Dempster, W.T. ANALYSIS OF TWO-HANDED PULLS USING FREE BODY DIAGRAMS. *J. appl. Physiol.*, Nov. 1958, 13(3), 469-480. (University of Michigan).

10,777
This study examines the assumption that the magnitude of pull forces exerted by the body is a reflection of muscular strength. A nude subject was photographed while making a number of maximum effort, two-handed isometric pulls (standing, braced, and seated) on a dynamometer that could be attached above, forward, or below. Free body diagrams were constructed on the enlarged photos and analyzed for evidence regarding the functions which the limb and trunk muscles perform in this type of activity.

Berger, Eda, Graham, C.H. & Hsia, Y. SOME VISUAL FUNCTIONS OF A UNILATERALLY COLOR-BLIND PERSON. I. CRITICAL FUSION FREQUENCY IN VARIOUS SPECTRAL REGIONS. *J. opt. Soc. Amer.*, Sept. 1958, 48(9), 614-622. (Department of Psychology, Columbia University).

10,779
As a demonstration of the way in which vision functions in the unilaterally deuteranopic individual, critical fusion frequency in various spectral regions was determined for both eyes of a subject of this type. Functions for a centrally fixated 28 minute field were obtained in ten spectral regions (ranging from one having a spectral centroid at 52 mμ to one at 682 mμ) and for white light. Measurements extended over a range of approximately 5.5 log millilamberts. Some measurements with a one degree green and a two degree white field are also reported.

Lordahl, D.S. & Archer, E.J. TRANSFER EFFECTS ON A ROTARY PURSUIT TASK AS A FUNCTION OF FIRST-TASK DIFFICULTY. *J. exp. Psychol.*, Nov. 1958, 56(5), 421-426. (University of Wisconsin).

10,782
To investigate the effects of varying first task difficulty on transfer to a second task, two pursuit-rotor experiments were run simultaneously, i.e., two methods of varying difficulty were used (speed of rotation of target varied and radius of target orbit varied). In the speed experiment, three groups practiced with different speeds on the first day (40, 60, and 80 revolutions per minute) and transferred to 60 rpm the second day. Radius was constant at 5.0 inches. In the radius experiment, speed was held at 60 rpm and three groups practiced with radius 2.0, 3.5, or 5.0 inches the first day and 3.5 inches the second day. Time on target is presented for the various conditions.

Snodde, A.F. LEARNING AND PERFORMANCE IN A TRACKING TASK UNDER TWO LEVELS OF ACHIEVEMENT INFORMATION FEEDBACK. *J. exp. Psychol.*, Oct. 1958, 56(4), 297-304. (Ohio State University, Columbus, Ohio).

10,784

The present experiment was designed to assess performance effects and learning effects in a compensatory tracking task as a function of the method used in providing cumulative information as to achievement level. A transfer design was used, differentiating high and low information feedback schedules of the training phase into eight experimental subgroups in the transfer phase. On transfer trials, one-half of the subjects continued to receive the same type of information while one-half changed; one-half continued the same target course while one-half changed. The high and low information conditions differed in the amount of information presented, the sensory mode of presentation, and the temporal characteristics of presentation. Comparison of groups is made. T. G. R 30

Archer, E.J. & Namikas, G.A. PURSUIT ROTOR PERFORMANCE AS A FUNCTION OF DELAY OF INFORMATION FEEDBACK. *J. exp. Psychol.*, Oct. 1958, 56(4), 325-327. (University of Wisconsin).

10,785

This is a study of pursuit rotor performance as a function of delay of information feedback. Five groups of fifteen men each learned a rotary pursuit task for 45 trials. During the first 30 trials, subjects heard a 1000 cycles per second tone after being on target continuously for one of five durations. These delay of information feedback intervals were .0, .2, .4, .8, and 1.6 seconds. During the last fifteen trials no tone was heard. The effects are analyzed and an explanation in terms of different motivational effects of information feedback is offered. G. R 3

Levi, L. ACCURATE METHOD FOR CORRECTION OF SLANT RANGE DISTORTION IN HIGH-ALTITUDE RADARS AND A CONTRIBUTION TO THE OPTICS OF REFLECTING CONICAL SURFACES. *J. opt. Soc. Amer.*, Oct. 1958, 48(10), 680-686. (Fairchild Camera and Instrument Corporation, Syosset, N.Y.).

10,798
An optical method for the correction of slant range distortion in high-altitude radar recordings is presented. The line image of the scan is converted into a circular disk by rotation about the zero slant range point and an appropriate line from this disk is selected. The method is strictly geometrical and readily accommodates altitude changes. A reflecting cone is employed as an optical element and the laws of reflection and image formation for this element are formulated. A simple method for testing the quality of the conical surface is also given.

Blough, Patricia McBride. DIFFERENCE LIMEN AS A FUNCTION OF RETINAL ECCENTRICITY AND BACKGROUND BRIGHTNESS. *J. opt. Soc. Amer.*, Oct. 1958, 48(10), 731-735. (Department of Psychology, Tufts University).

10,800
The purpose of this experiment was to obtain difference limens at several combinations of background brightness and retinal eccentricity. Background brightnesses were 0.0001, 0.001, 0.01, 1, and 10 foot-lamberts; retinal locations were the fovea and 2, 6, and 10 degrees in the nasal portion. Monocular difference limens were determined using a one degree test stimulus superimposed at the center of a 27 degree background. The technique of threshold determination was the ascending series of the method of limits. Curves describing log A (delta) B versus log background brightness are presented and discussed.

Glasser, L.G., McKinney, A.H., Reilly, C.D. & Schnelle, P.D. CUBE-ROOT COLOR COORDINATE SYSTEM. *J. opt. Soc. Amer.*, Oct. 1958, 48(10), 736-740. (Engineering Department, E.I. du Pont de Nemours & Co., Inc., Wilmington, Del.).

10,801
A visually uniform color-coordinate system, based on simple mathematical formulas, is described. The system resembles the Adams chromatic-value system but replaces the quintic-parabola function with a cube-root function. For colors having reflectances greater than 0.5 per cent, the color spacing obtained agrees with Munsell spacing also. The cube-root equations can be solved directly in terms of differences in colorimeter readings or tri-stimulus values.

Dillon, D.J. & Zegers, R.T. QUANTAL DETERMINATION AND STATISTICAL EVALUATION OF ABSOLUTE FOVEAL LUMINOSITY THRESHOLDS AND OF THRESHOLD VARIABILITY. *J. opt. Soc. Amer.*, Dec. 1958, 48(12), 877-883. (Fordham University).

10,803
Foveal luminosity thresholds for 31 stimulus wavelengths of light were obtained from five observers and expressed in radiometric units. The wavelengths ranged from 400 mμ to 700 mμ at intervals of 10 mμ. Flash duration and test patch size were 50 milliseconds and one degree of arc. Each observer sat for ten experimental sessions. One complete luminosity curve based upon five determinations at each stimulus wavelength was determined at each session. Variability values, in terms of coefficients of variation, were computed for each observer, session, and wavelength. These values were based on quantal determinations at the cornea.

10,804
Luria, S.M. ABSOLUTE THRESHOLD FOR EXTREMELY WIDE
FIELDS. *J. opt. Soc. Amer.*, Dec. 1958, 48(12): 884-
886. (USM Medical Research Lab., New London, Conn.).

10,804
To see whether threshold falls with an increase in
the size of the stimulus beyond ten degrees, the absolute
visual threshold for an area 40 by 100 degrees of visual
angle at a color temperature of 2050 degrees Kelvin was
obtained for seven observers. Thresholds were obtained
under two conditions: (1) turning the light on and
2) turning the light on and off before a judgment was
made. In addition to comparing results for these condi-
tions, rank order correlations were obtained between
threshold and size of the dark adapted pupil and between
threshold and age.

Newhall, S.M., Burnham, R.W. & Evans, R.M. COLOR
CONSTANCY IN SHADOWS. *J. opt. Soc. Amer.*, Dec. 1958,
48(12): 976-984. (Color Technology Division, Eastman
Kodak Company, Rochester, N.Y.).

10,806
The purpose of this study was to make evaluations of
color constancy, both over-all and by attributes, of ten
color samples viewed one at a time under a standard shadow.
The shadow was an obvious one of daylight quality
which fell on the color sample and part of a surrounding
white field. In some trials there was shadow, in some
none, and in some sample luminance was simply reduced
proportionately. The color samples (in the surface mode
of appearance) were matched with a colorimeter (the field
of which was also perceived in the surface mode). Match
data were converted to the Munsell system of notation and
constancy ratios obtained for hue, saturation, and
brightness. An estimate of over-all color constancy was
also made.

Corso, J.F. PROPOSED LABORATORY STANDARD OF NORMAL
HEARING. *J. acoust. Soc. Amer.*, Jan. 1958, 30(1),
14-23. (Department of Psychology, Pennsylvania State
University).

10,807
To determine whether differences found between pre-
sent references for normal hearing may be related to e-
quipment and testing conditions, audiometric measurements
were made on three groups of otologically normal subjects:
18-24 years old. Two groups (72 and 49 subjects) were
tested on an ADC audiometer equipped with ANB-H1A ear-
phones and a five decibel step testing procedure in the
method of limits; one group (39 subjects) was tested on
a Beltone Audiometer equipped with Permaflex PDR-8 ear-
phones and a two decibel step testing procedure. Tests
of significance were applied to differences in mean
threshold values and variances between groups and between
sexes. Results of this study are compared graphically
with those of other selected studies.

Shaw, E.A.G. & Thiesse, G.J. IMPROVED CUSHION FOR
EAR DEFENDERS. *J. acoust. Soc. Amer.*, Jan. 1958,
30(1), 24-26. (Division of Applied Physics, National
Research Council, Ottawa, Canada).

10,808
This paper is primarily concerned with the physical
properties of a cushion for circumaural ear defenders as
mechanical devices. Evidence is presented for advantages
claimed for the defender described here over other types.
The cushion developed was required to meet two apparently
contradictory conditions: (1) high adaptability to head
contours to provide good air seal and (2) sufficient
"spring" to minimize cup vibration. Elementary theory is
summarized as a theory of cushion behavior applicable to
the new cushion is presented. Experiments leading to
design of this cushion are described. Flesh impedance
and some practical aspects of ear defender design are
discussed.

Dolansky, L.O. STUDIO FOR LISTENING TESTS. *J. acoust.
Soc. Amer.*, March 1958, 30(3), 175-181. (Electronic
Research Project, Northeastern University).

10,809
To demonstrate that environmental conditions may af-
fect scores obtained in problems of speech analysis and
synthesis articulation, tests were administered to six
male students in a conference room and in the especially
designed studio room described. Design problems and con-
struction of the room are given in some detail and in-
cludes: reverberation time and frequency response of the
studio, transmission of sound into the room through walls
and ducts, and the quieting of noise in the adjacent room.
The formula for computing reverberation time (T) is de-
rived. Curves of reverberation time obtained under five
different methods of measurement (e.g. white-noise) are
presented. Room response was measured using two differ-
ent methods. Results are given of articulation tests
used to compare influence of the two rooms. T. G. I. R 9

Hawley, M.E. NOISE SHIELD FOR MICROPHONES USED IN
NOISY LOCATIONS. *J. acoust. Soc. Amer.*, March 1958,
30(3), 188-190. (Radio Corporation of America, Moores-
town, N.J.).

10,810
This paper describes a rubber noise shield developed
to improve speech to noise ratio at a military microphone.
Approach to the development of the shield was empirical.
A succession of models were sculptured in plasticarve
from which latex models were then made. Experiments were
conducted to test: (1) optimum size, shape and location of
the vent, (2) need for inclusion of damping material and,
(3) methods of measuring noise exclusion performance.
Graphs of noise exclusion-frequency characteristics are
given.

Moser, H.M. & Oyer, H.J. RELATIVE INTENSITIES OF
SOUNDS AT VARIOUS ANATOMICAL LOCATIONS OF THE HEAD AND
NECK DURING PHONATION OF THE VOWELS. *J. acoust. Soc.
Amer.*, April 1958, 30(4), 275-277. (Department of
Speech, Ohio State University).

10,811
To determine the relative intensities of the signal
from sixteen anatomical locations on head and neck, each
of three subjects (of thin, medium and stocky build),
intoned each of the twelve vowel sounds, sustained at a
specified level for five seconds. Although the present
investigation was concerned solely with the plotting of
anatomical locations according to the intensity of the
signal, the investigators view this as a preliminary step
to certain aspects of instrument development, e.g., posi-
tion of microphone on speaker's body.

von Békésy, G. FUNNELING IN THE NERVOUS SYSTEM AND ITS ROLE IN LOUDNESS AND SENSATION INTENSITY ON THE SKIN. *J. Acoust. Soc. Amer.*, May 1958, 30(5), 399-412. (Harvard University).

10,813

This article reports a series of experiments designed to establish rules for estimation of the funneling action (when stimulation produces both summation and inhibition in the sense organ simultaneously) on the skin. The vibration loudness produced by a point vibrator was compared with the loudness produced by stimulation of larger areas of the skin; difference limen for amplitude variation was investigated under different conditions, and lateral spread of skin sensations was determined. These phenomena were compared with analogous sensation in hearing (rotating tones - Dreighton) and in vision (Mach's law of contrast). Characteristics of a good observer and methods by which he may be trained are also discussed. G. I. R 15

Griffith, J.W., Arner, W.J. & Wenzler, O.F. PRACTICAL DAYLIGHTING PREDICTION. *Illus. Engng.*, April 1958, LIII(4), 185-190.

10,814

This paper describes a simplified method for predicting the work plane distribution of daylight through clear glass fenestration applicable to overcast sky or clear sky conditions with no sun on the fenestration. Tables are given for using the technique where sun is on the fenestration. The method permits prediction of multilateral daylight design by investigating each fenestration independently. It is based on the total illumination on the fenestration from above and from below the horizon; the prediction equation is given. Some data on reliability were included. Discussion of the paper is appended. T. R 7

Solomon, L.N. SEMANTIC APPROACH TO THE PERCEPTION OF COMPLEX SOUNDS. *J. Acoust. Soc. Amer.*, May 1958, 30(5), 421-425. (USN Electronics Lab., San Diego, Calif.).

10,815

To test experimentally whether or not complex tones have identifiable attributes other than pitch and loudness, 50 Navy Sonarman with median sonar experience of one year rated recordings of 20 passive sonar sounds. A multi-dimensional scaling technique (The Semantic-Differential) was used which required subjects to rate each of 20 sounds on each of 50 scales. When factor analyzed the resultant 50 times 50 correlational matrix yielded eight factors, seven of which are described. Once isolated, clusters of sounds having the "same connotative meaning" may then be analyzed physically to determine the physical correlate of psychological judgments of similarity. The author is currently engaged in this task. T. R 21

O'Neill, J.J. & Dreher, J.J. MASKING OF ENGLISH WORDS BY PROLONGED V. EL SOUNDS. *J. Acoust. Soc. Amer.*, May 1958, 30(5), 539-543. (OSU Research Foundation, Columbus, Ohio).

10,817

To test the hypothesis that, when a word is heard against a masking noise or the same character as the vowel it contains, maximum masking will result, 110 monosyllabic words and 72 spondee words were tape recorded by three male speakers. The speakers also intoned in trio ten seconds of each of nine vowels, recorded as masking agents. Test word and masking tapes were played back in combination to nine listening panels of 302 Air Force ROTC Cadets. Analysis of effectiveness of the masking agent was made both by a half-octave band analysis and by a series of spectrographic displays. Most and least intelligible test words were also analyzed for possible language dimensions associated with resistance or susceptibility to masking. G. R 12

Fairbanks, G. TEST OF PHONEMIC DIFFERENTIATION: THE RHYME TEST. *J. Acoust. Soc. Amer.*, July 1958, 30(7), 596-600. (Speech Research Lab., University of Illinois).

10,818

A completion-type test to meet the need for experimental material in which 1) the spoken word would be the stimulus unit, 2) response is recognition of the word, 3) response would depend on the initial consonant and on consonant-vowel transition, and 4) the task would bear valid relation to discrimination demands of real speech. Results were analyzed for relations between word recognition, V/M ratio and power of the phonemic factor. Method of choosing stimulus words is given in detail and suggestions for other uses are made. Broadbent, D.E. EFFECT OF NOISE ON AN "INTELLECTUAL" TASK. *J. Acoust. Soc. Amer.*, Sept. 1958, 30(9), 824-827. (Applied Psychology Research Unit, MRC, Cambridge, England).

10,819

To investigate the (a) effect of noise on tasks requiring complex thought, and (b) whether aftereffects were obtained following a period of working in noise, 18 men were divided into three equal groups (QQ, QM, NQ) and asked to perform simple arithmetic problems under varying conditions on two successive days: QQ performed in 70 decibel noise both days, QM had 70 decibel noise the first day and 100 decibel noise the second day, NQ had 100 decibel noise the first day and 70 decibel noise the second day. Groups were compared in terms of differences in trend (calculating time). Individual differences in error scores were related to intelligence. Personality differences (introversion-extroversion) were related to deterioration scores (calculating time). G. R 12

Hirsh, I.J. & Burgeat, M. BINAURAL EFFECTS IN REMOTE MASKING. *J. Acoust. Soc. Amer.*, Sept. 1958, 30(9), 827-832. (Central Institute for the Deaf, St. Louis, Mo.).

10,820

To investigate the way in which remote masking (low-frequency tones masked by a high-frequency band of noise) responds to changes in phase of signals presented to the two ears, four trained listeners responded to a series of tones presented under each of seven phase conditions in two experiments (wide-band and narrow-band noise). Relations between thresholds for pure and for masked tones obtained under each of the phase conditions are discussed as they relate to high frequency band of noise and are compared with results obtained under ordinary masking by wide band noise. A second paper is planned in which individual differences which were found for remote masking will be discussed. T. G. R 7

Hirsh, I.J. MONAURAL TEMPORARY THRESHOLD SHIFT FOLLOWING MONAURAL AND BINAURAL EXPOSURES. *J. Acoust. Soc. Amer.*, Oct. 1958, 30(10), 912-914. (Central Institute for the Deaf, St. Louis, Mo.).

10,821

To ascertain whether temporary threshold shift (TTS) and recovery curve for a single ear would be different depending upon whether that ear alone or both ears simultaneously were exposed to sound, three series of experiments were undertaken. In the first two experiments both ears of each of ten subjects were used. The first series was concerned with TTS for 1000 cycles per second after one minute exposure to a continuous pure tone of the same frequency at 20, 80, and 100 decibels. The second series was concerned with TTS at 1400 cycles per second at 100 decibels. The third series (nine subjects) involved three minute exposure to white noise at 110 decibels and subsequent TTS at 4000 cycles per second. G. R 11

Kirk, R.E. DIFFERENCE LINES FOR TONE DIMINUTION. *J. Acoust. Soc. Amer.*, Oct. 1958, 30(10), 915-918. (Baldwin Piano Company, Cincinnati, Ohio).

10,822

To assess the discriminatory capacity of observers for tone diminution, two tones whose diminution rates were independently adjustable were alternately presented to seven subjects, each of whom made a minimum of 20 judgments for each standard and comparison rate (seven diminution rates between 6 1/2 and 9% decibels per second were used). The method of constant stimuli was used in determining the difference lines. Relations between diminution rate, fundamental frequency and tonal complexity were explored. The data were analyzed by an unweighted least squares method. An equation is given which describes the relationship between difference lines and diminution rate.

Tanner, W.P., Jr. WHAT IS MASKING? *J. Acoust. Soc. Amer.*, Oct. 1958, 30(10), 919-921. (Electronic Defense Group, University of Michigan).

10,823

Is masking a unitary concept which applies to a phenomenon which remains constant under varied conditions? To determine the change in detectability of a tone 1) through the introduction of additional white noise, 2) in the presence of an additional pure tone, and 3) when the observer knows that it might have been a different tone, three masking experiments were undertaken using white noise, alternate frequency, and pure tone for masking. A masking index is presented which makes comparison possible over the three types of experiment. The "temporal forced choice" method is employed in all three experiments. Results are discussed in terms of differences observed in the masking under the three conditions.

Ward, W.D., Giorgi, A. & Sklar, D.L. DEPENDENCE OF TEMPORARY THRESHOLD SHIFT AT 4KC ON INTENSITY AND TIME. *J. Acoust. Soc. Amer.*, Oct. 1958, 30(10), 944-954. (Research Center, Subcommittee on Noise in Industry, Los Angeles, Calif.).

10,824

To explore behavior of Temporary Threshold Shift (TTS) as a function of: a) exposure, b) recovery time, c) initial threshold, d) intensity of noise level, e) on-fraction (R), f) frequency of test tone, and g) two level noise, 13 subjects were tested over nine sessions. TTS's were calculated in reference to the median pre-exposure threshold determined from all nine sessions. Equations for relations which hold under the various conditions are given. Certain consistent individual differences among subjects are discussed, and comparisons between TTS in auditory and other sense modalities are made. Results are considered a first step toward determination of laws governing growth and disappearance of TTS; suggestions are given for future studies.

Pickett, J.M. & Pollack, I. PREDICTION OF SPEECH INTELLIGIBILITY AT HIGH NOISE LEVELS. *J. Acoust. Soc. Amer.*, Oct. 1958, 30(10), 955-963. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

10,825

The present study extends previously reported work on speech intelligibility in white noise, at levels from 25-130 decibels over a wide range of speech-to-noise (S/N) ratios. Additionally, the effects of high sound levels on prediction of speech intelligibility are considered. Each of four talkers read 25-word lists in two separate tests (total of 1000 words) to five experienced listeners under each of five combinations of speech and noise spectra (speech frequency-emphasis of 0 decibels and +6 decibels per octave; random noise spectra with slopes of 0, +6, and -12 decibels per octave). Results are discussed in terms of additional corrections that might be applied to intelligibility prediction procedures.

Trittipoe, W.J. RESIDUAL EFFECTS OF LOW NOISE LEVELS ON THE TEMPORARY THRESHOLD SHIFT. *J. Acoust. Soc. Amer.*, Nov. 1958, 30(11), 1017-1019. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

10,826

To measure temporary threshold shifts (TTS) following two conditions of high level noise exposure: 1) a control condition in which high level noise is preceded by silence and 2) the experimental condition where high level noise is preceded by different noise levels which alone would not produce TTS, four listeners were fully trained and exposed (one ear at a time) to the noise conditions. Pre-exposure tests were run to establish that the highest pre-exposure noise levels produced no apparent TTS after several minutes post-exposure time. Results are presented in a series of graphs, and are discussed as they relate to the problem, to the meaning of back-to-normal recovery following exposure, and in terms of certain individual differences.

Veniar, Florence A. SIGNAL DETECTION AS A FUNCTION OF FREQUENCY ENSEMBLE. I. *J. Acoust. Soc. Amer.*, Nov. 1958, 30(11), 1020-1024. (Electronic Defense Group, University of Michigan, Ann Arbor, Mich.).

10,827

To explore the detectability of auditory signals as a function of 1) signal ensemble size (number of signals of different frequencies that are equally likely to occur and which the observer must try to detect) and 2) ensemble frequency range, four observers completed approximately sixteen runs (100 trials equaled a run) for each condition used. All trials were two-interval forced-choice, presented binaurally. The data obtained was compared with predictions made on the basis of three models: 1) a narrow-band scaling model, 2) a multiple-band model, 3) the null hypothesis. Predictions obtained by the various models are compared, using non-parametric statistics. Effect of pattern on performance also is tested.

Hoffman, H.S. STUDY OF SOME CUES IN THE PERCEPTION OF THE VOICED STOP CONSONANTS. *J. Acoust. Soc. Amer.*, Nov. 1958, 30(11), 1035-1041. (Pennsylvania State University).

10,829

To investigate the contribution which each of three cues (frequency shift or transition of the second formant; transition of the third formant; burst frequency) make to the perception of the voiced stop consonants /b/, /d/, and /g/, synthetic speech sounds containing one cue, all possible combinations of two cues, and all possible combinations of the three cues were presented to 26 subjects from whom 52 judgments were obtained for each of the 336 stimuli. Effects on perception of the consonants were inferred from shifts in response curves which were plotted for the various combinations investigated. The data also were analyzed to determine whether cues retain their separate effects when combined, and these effects are discussed in terms of certain vector-like properties.

Veniar, Florence A. SIGNAL DETECTION AS A FUNCTION OF FREQUENCY ENSEMBLE. II. *J. Acoust. Soc. Amer.*, Dec. 1958, 30(12), 1075-1078. (Electronic Defense Group, University of Michigan).

10,830
This second investigation of the detection of a signal in noise as a function of signal ensemble size and of ensemble frequency range extends ensemble size to eight, and signals used cover a greater frequency range. Three observers were used. Experimental conditions were so presented as to include at least one run (100 trials) of every ensemble size in every experimental session (eight runs). The data are compared with predictions made on the basis of three models: a Narrow Band Scanning Model; a Multiple-Band Scanning Model; and the null-hypothesis. Results are discussed in terms of effect of increased ensemble size and increased signal frequency range on performance, and in terms of adequacy of the models to handle the data.

Veniar, Florence A. EFFECT OF AUDITORY CUE ON DISCRIMINATION OF AUDITORY STIMULI. *J. Acoust. Soc. Amer.*, Dec. 1958, 30(12), 1079-1081. (Electronic Defense Group, University of Michigan).

10,831
To: 1) compare discrimination of four signals closely spaced on the frequency scale with discrimination of four signals widely separated and 2) determine the effect of auditory cue on discrimination of auditory stimulus as a function of frequency difference between cues and subsequent stimuli, three subjects were used in three experiments. Using a forced-choice method three cue-tones and five stimulus frequencies were independent variables; percent of correct discriminations was the dependent variable. Results are discussed as they relate to theoretical presence of a narrow-band scanning mechanism in the auditory system, and are compared with results from previous studies reported by the same author.

Pollack, I. & Tecce, J. SPEECH ANNUNCIATOR WARNING INDICATOR SYSTEM: PRELIMINARY EVALUATION. *J. Acoust. Soc. Amer.*, Jan. 1959, 30(1), 58-61. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

10,833
To explore the potential usefulness of a speech annunciator as a warning signal indicator system, six operators were employed in three experimental sessions using a counterbalanced experimental design among three warning signal indicators (none, buzzer, and speech) and three warning signal densities. Each operator was given two tasks: a self-paced tracking test and the guarding of 24 "Magic Eye" tubes. In a second experiment the speech indicator system was tested in a situation where there were additional speech communications. In a third experiment a buzzer was added to the speech annunciator. Effectiveness of speech and speech-plus-buzzer indicators are compared with effectiveness of a master buzzer warning indicator.

Crüger, E.M. & Huggins, W.H. CREATION OF PITCH THROUGH BINAURAL INTERACTION. *J. Acoust. Soc. Amer.*, May 1958, 30(5), 413-417. (The Johns Hopkins University).

10,834
To investigate the perception of pitch-like sound which occurs under certain conditions of binaural interaction as a function of a) band center, b) band width, and c) intensity, six subjects each were required to make forced-choice discriminations as to direction of change in pitch after each of 40 combinations of conditions (four pairs of band centers, five half band widths, two intensity levels, which were partially counterbalanced and randomized). Data for heterophasic noise are plotted as a function of the experimental variables, intensity, half band width and band center. Implications of the results for pitch perception models are presented.

Heath, G.G. LUMINOSITY CURVES OF NORMAL AND DICHROMATIC OBSERVERS. *Science*, Oct. 1958, **128**(3327), 775-776. (Indiana University).

10,845

To afford a basis for comparison of observers in terms of photopic luminosities as the basis for determining relative heights of luminosity curves of normal and color blind persons the present study employed equality of the critical frequency of flicker-fusion (not to be confused with flicker photometry) as criterion of equality of brightness. Nine normals, six deuteranopes, and five protanopes made critical flicker frequency judgments at each of 14 narrow spectral regions, for four frequencies each. Curves are shown for each and are shown as they compare with the Council of the Illuminating Engineering Society luminosity curve. Some implications of results for theory of color vision are presented.

Rosenzweig, M.R. & Postman, L. FREQUENCY OF USAGE AND THE PERCEPTION OF WORDS. *Science*, Feb. 1958, 127(3293), 263-266. (University of California at Berkeley).

10,850

To answer the questions "What makes some words more intelligible than others?" and "How should groups of words be chosen for maximum intelligibility?" results from French and English studies all using the same technique to measure intelligibility (words presented one by one in the presence of a masking noise) are discussed. Results include intelligibility measured as a function of frequency of use, as related to length of list of text words, and as a function of length of word. These are discussed and interrelationships are presented graphically. A suggestion is made for a way in which more highly intelligible alphabet equivalents might be selected and 22 changes in the United States-British list were recommended.

Dye, E.R. & Smith, M.D. IMPACT PROTECTION WITH FOAM PLASTICS. *Mech. Engrg.*, Dec. 1958, 80(12), 65-67. (Cornell Aeronautical Laboratory, Inc., Buffalo, N.Y.).

10,851

To select a low-density cellular plastic to protect the head in impact, tests were conducted with the body attitude and angle of impact surface to flight path of the head varied to five positions in simulated automobile accidents. Mechanical properties of low energy foam as energy absorbers were compared with those of one and three-quarter pound per cubic foot polystyrene rigid forms. General conclusions are presented in two graphs.

Olmstead, P.S. RUNS DETERMINED IN A SAMPLE BY AN ARBITRARY CUT. *Bell Sys. Tech. J.*, Jan. 1958, XXXVII (1), 55-82.

10,853

Certain nonparametric measures for use in detecting the presence of assignable causes in experimental data are discussed, and the literature here is reviewed critically. Charts, tables, and formulas relating to sample arrangement distributions for runs above and below any selected and all possible cuts or demarcation values are presented. A simple application is discussed.

Sobel, M. & Huyett, Marilyn J. NONPARAMETRIC DEFINITION OF THE REPRESENTATIVENESS OF A SAMPLE—WITH TABLES. *Bell Sys. Tech. J.*, Jan. 1958, XXXVII(1), 135-161.

10,854

The problem of determining how large a random sample is needed to attain a preassigned probability that the sample will possess a certain degree of representativeness of the true, unknown distribution under study is dealt with by a nonparametric (distribution-free) solution. Definitions of representativeness and degree of representativeness are given and tables presented which give the sample size required to guarantee this preassigned probability. The formulas used in computing the tables are derived.

Gilmore, A.C., Gray, P.R. & Irving, W.S. NEW DEVELOPMENTS IN MILITARY SWITCHING. *Bell Sys. Tech. J.*, March 1958, XXXVII(2), 375-400.

10,856

A manual switchboard of advanced design which mechanizes many of the manual procedures is described in detail. Its features include: minimized call delays, considerable flexibility in size of switching center and rapid installation or dismantling of equipment.

10,857

Sheppard, D. READING FROM A DIAL WITH A MOVING POINTER. *Occup. Psychol.*, Jan. 1958, 32(1), 34-49. (University of Reading, England).

10,857

To show what differences occur between observers reading from the same dial where instrumental measurements have to be taken from scales with a moving pointer, three observers took readings from the same dial. Variations in technique for taking the observation were made over a series of seven experiments. Tables showing extent of observer agreement, bias between observers when taking the readings, interpretation errors by different observers with different methods, and errors in relation to position of the pointer are included. Scores are for the most part based on the mean variations between readings given by the three observers. Analysis of variance was used on these raw scores for comparison purposes.

McKinnell, A.C. WOOL QUALITY ASSESSMENT: ITS SENSORY AND PSYCHOPHYSICAL BASIS. *Occup. Psychol.*, Jan. 1958, 32(1), 50-60. (University of Glasgow, Glasgow, Scotland).

10,858

Two series of experiments are reported in this paper. To assess the relative importance of vision and touch, three groups of six subjects each were required to test a wool top against a series of samples for quality under each of three conditions of judgments: 'tactilevisual', 'vision-only', and 'touch-only'. In a further experiment visual discrimination between single fibers was tested. To examine the tenability of the Weber-Fechner law and the concept of subjective scale in the wool sorting context, a paired comparison experiment was carried out using nine subjects. Results from both series of experiments are discussed as they relate to previous work in the field.

11,007

To determine relative intelligibility characteristics of three military respirators (Field Protective Masks M-9, E-13, and M-9 with E-20 Voice-mitter) under field conditions, a simulated combat exercise involving two field artillery gun crews and their executive officer was conducted. The executive officer read the specially devised artillery practice problems for each of three mask conditions to the two crew chiefs who, in turn, relayed them to the gunners. All commands were without benefit of electronic amplification and with a noise background. Total elapsed time for each problem and number of errors made in communicating the problems were compared for each mask. The results are related to laboratory findings.

11,009

To determine the number of aircraft necessary to operate a specific airline needed by the Air Force Missile Test Center, the problem was analyzed mathematically as a stochastic "birth and death" process. Assumptions for the mathematical model and detailed solution of the problem are presented. The parameters (rates of malfunction and periodic inspection, duration of repair intervals and inspections, and flying hour rate) are discussed in relation to the specific situation at Air Force Missile Test Center. General curves are given that enable calculation of number of aircraft needed for other conditions than the sample shown.

Hewes, D. ON THE RELATION BETWEEN THE INTELLIGIBILITY AND FREQUENCY OF OCCURRENCE OF ENGLISH WORDS. J. Acoust. Soc. Amer., Feb. 1957, 29(2), 296-305. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

11,011

To investigate the effect of word frequency and word length on the intelligibility of spoken words, 279 words for experimental use were selected from the Long Magazine Count: frequencies (number of occurrences) in approximately equal ratios (decimal multiples of 1, 2, and 5) and lengths (number of letters) for odd numbers from 1 to 21. One speaker recorded the words (four lists) with speech-to-noise ratios from -9 to +20 decibels. A panel of five listeners responded by writing the word they heard. Critical speech-to-noise ratios (ratios at which a proportion P of the pooled words were correctly reported) were analyzed. Implications for intelligibility testing procedures are discussed.

Jerison, H.J., Cransell, C.W., & Pownall, Dorothy. ACOUSTIC NOISE AND REPEATED TIME JUDGMENTS IN A VISUAL MOVEMENT PROJECTION TASK. Proj. 7193-71816, WADC TR-57-54, March 1957, 24pp. Aero Medical Lab., WADC, AFSC, Wright-Patterson AFB, Ohio. (Miami University).

11,017

To investigate the effect of noise on time judgments, four groups (50 subjects) worked on a visual projection task in which a moving target disappeared and a guess had to be made as to when the target was under a crosshair. Noise was at a high level (110 decibels) either during the visible or invisible periods for two groups and either high throughout or at a masking level (70) for two groups. Each subject worked individually, repeating his task for ten successive trials. Measured judgment times were analyzed as functions of noise and successive trials. The results are discussed in relation to other findings on the effect of noise on performance.

Bartle, R.M., Shoro, V., & Gerlough, D.L. STARTING DELAY AND TIME SPACING OF VEHICLES ENTERING SIGNALIZED INTERSECTIONS. Highway Res. Board Bull. 112, Reprint 42, 1956, 33-41. (Institute of Transportation and Traffic Engineering, University of California at Los Angeles).

11,021

To study some specific quantities involved in a proposed formula for optimum timing of traffic signals, starting delays (time in seconds required for first vehicle to enter intersection after green signal appears) and time spacings (average time headway in seconds between successive vehicles in an entering platoon) were measured at thirteen heavily traveled intersections. Observations were made on five consecutive weekdays by five observers. Analysis of the data was in terms of variability of the parameters from intersection to intersection and from day to day at the same intersection. These values were related, where possible, to physical and traffic conditions. The use of these parameters in determining signal timing is discussed.

Pipes, L.A. AN OPERATIONAL ANALYSIS OF TRAFFIC DYNAMICS. J. appl. Physics, March 1953, 24(3), 274-281. (Dept. of Engineering, University of California at Los Angeles).

11,024

This is a mathematical study of the dynamics of a line of traffic composed of n vehicles. The assumption is made that the movements of the vehicles are controlled by an idealized "law of separation" (each vehicle maintains a certain prescribed "following distance" from the preceding vehicle and that this distance is the sum of a distance proportional to the velocity of the following vehicle and a certain given minimum distance of separation when the vehicles are at rest). Differential equations governing the dynamic state of the system are obtained by application of the law to the motion of a line of vehicles. Solutions of the dynamical equations for several types of movement of the lead vehicle are obtained by the operational or Laplace transform method.

Haber, H., Brenner, R., & Hulbert, S. PSYCHOLOGY OF TRIP GEOGRAPHY. Highway Res. Board Bull. 91, Reprint 35, no date, 20pp. (Institute of Transportation and Traffic Engineering, University of California at Los Angeles).

11,026

To explore possible causes of highway accident focal points in terms of driver behavior, a deductive analysis is made of a specific section of a Federal highway. A concept is developed called "psychology of trip geography" which demonstrates that known psychological behavior patterns can combine with the geography of the area over which a particular trip is planned to produce driver conditions conducive to accidents. Some of the psychological behavior patterns considered are: level of aspiration, rigid adherence to previously made plans, and general performance let-down incident to nearing a goal. Reduced tactile sensitivity, highway hypnosis and hypoxia are demonstrated to fit into the concept as causative factors. Plans for a statistical analysis of accidents are appended.

Tolhurst, G.C. THE RELATIONSHIP OF SPEAKER INTELLIGIBILITY TO THE SOUND PRESSURE LEVEL OF CONTINUOUS NOISE ENVIRONMENTS OF VARIOUS SPECTRA AND OCTAVE-BAND WIDTHS. Prepared under Contract N6onr-22525, Proj. NR 145-993, Rep. 69, March 1957, 12pp. USN School of Aviation Medicine, Pensacola, Fla.

11,028

To determine the effects of ambient noise spectra (six tilted and six octave-band noises) upon the speech efficiency of talkers, each spectrum was presented at six sound pressure levels (42 through 125 decibels). Constant level recordings were made of 48 speakers (lists from Multiple-Choice intelligibility tests) in the noises and these were subsequently played back to panels of listeners. Mean speaker intelligibility data were studied by analysis of variance testing speech score differences attributable to spectra and sound pressure level.

Miller, J.W., & Ledwith, E. AN ANALYSIS OF CERTAIN FACTORS INVOLVED IN THE LEARNING PROCESS OF DYNAMIC VISUAL ACUITY FOR 1000 NAVAL AVIATION CADETS. Prepared under Contract Nonr-566(00), Proj. NM 17 01 99, Rep. 13, April 1957, 8pp. USN School of Aviation Medicine, Pensacola, Fla.

11,029

To examine certain aspects of the learning process of dynamic visual acuity, 1000 naval aviation cadets were tested. Five successive thresholds were established at 20 degrees per second and ten at 110 degrees per second angular velocity of test object. Observed means (minutes of arc) were analyzed as a function of number of trials. Comparisons were made of the data for the 100 best, the 100 poorest, and the entire group of 1000. The results were put into a semi-empirical equation descriptive of the data. The value of the findings for selection and training of naval aviators is discussed.

Buskirk, E.R., Dee, T.E., Welch, B.E., Levy, L.W., & Consoazio, C.F. CALORIC INTAKE ASSOCIATED WITH PROLONGED HAND WORK IN THE COLD. Proj. 7-83-01-004C, Tech. Rep. RP-58, May 1957, 24pp. USA Quartermaster Research and Development Center, Natick, Mass.

11,030

To obtain information concerning "maximal" caloric requirements for men existing on a self-sufficient basis in the Arctic and performing hard work for extended periods, caloric intake, fluid balance, and body composition were studied in a group of 26 men during a 28-day stay at Fort Churchill, Manitoba, Canada. Seven days were spent preparing for bivouac and the remaining time was spent in a moving bivouac. Camp was broken and established each day and equipment hauled on sleds for nine to twelve mile per day. Data were collected and analyzed for changes in body weight, body density, food consumption, nitrogen balance, water balance, sweat loss on trail, physical performance, and energy expenditure.

Sanders, Virginia L., Cohen, J., & Arginteanu, Mary. THE EFFECTS OF ABSOLUTE AND CONDITIONAL PROBABILITY DISTRIBUTIONS ON INSTRUMENT READING: II. A COMPARISON OF A LINEAR AND A LOG-ARITHMIC SCALE. Contract AF 18(600)-50, Proj. 7186, WADC TR-54-253, Part 2, July 1955, 33pp. Wright Air Development Center, ARDC, Wright-Patterson AFB, Ohio. (Antioch College).

11,032

To compare the readability of a logarithmic and a linear scale, sixteen subjects were given preliminary training and then tested. Variables, in addition to scales, were: distribution of pointer settings (one skewed and one approximately rectangular), and order of presentation of settings (regular ascending or descending progressions and random). The stimuli were presented tachistoscopically for exposures of 0.8 second and each subject was tested under every condition. The results expressed in terms of total error in scale units and total angular error in response were studied by analysis of variance for differences due to scales, distributions and orders of settings. Recommendations for appropriate use of the logarithmic scale are made.

Du Mas, P., & Worthel, P. THE INFLUENCE OF THE SPATIAL CONTEXT ON THE RELEARNING OF A ROTATED PERCEPTUAL MOTOR TASK. J. gen. Psychol., 1956, 54, 65-80. (University of Texas).

11,034

To investigate the effect of alteration in spatial context on relearning a rotated stylus-maze problem, 40 subjects were assigned randomly to two groups. All subjects learned two stylus mazes (a multiple T-maze and an irregular maze) to a criterion of two errorless trials. Group I learned the T-maze first; the maze was rotated 180 degrees and was relearned. They then learned the irregular maze, took a rest on the opposite side of the maze and relearned it in the new position. The procedure for Group II was reversed. Error scores were analyzed for differences between groups on initial learning, between maze-rotated and subject-rotated relearning and between relearning on the two types of maze.

Blake, R.R., Rhead, C.C., Wedge, B., & Mouton, Jane S. HOUSING ARCHITECTURE AND SOCIAL INTERACTION. Sociometry, 1956, 19(2), 133-139. (University of Texas).

11,035

To investigate relations between internal differences in the architecture of military barracks and social interactions among occupants, recruits undergoing the same standard training program, half of whom lived in open and half in closed cubicle barracks, were studied. An interaction questionnaire (number of acquaintances, knowledge of bunk location, degree of interaction with acquaintances during free periods, and buddy preferences) was administered to occupants of three open and three closed barracks (approximately 350) upon completion of the sixth, eleventh, or fourteenth day of training. The data were analyzed for effects of type of barracks and length of training on social structure.

Holtzman, W.H., & Bitterman, M.E. A FACTORIAL STUDY OF ADJUSTMENT TO STRESS. J. abnormal soc. Psychol., 1956, 52(2), 179-185. (University of Texas).

11,036

To search for common factors in a variety of measures believed on the basis of previous research to be of value in the prediction of adjustment to stress, 135 subjects (Air ROTC cadets) were given a series of individual and group tests. The variables selected for analysis were derived from ratings of personality and officer aptitude, objective and projective personality tests, measures of performance in stressful situations, the conditioning of galvanic skin response, perceptual tests, and analysis of urinary components. Test intercorrelations were computed and analyzed by Thurstone's centroid method of factor analysis. Factors thus derived were defined and discussed in relation to predictive values.

Harbold, G.J. PITCH RATINGS OF VOICED AND UNVOICED VOWELS. Prepared under Contract N6onr-22525, Proj. Designation NR 145-993, Balled & Surg Proj. NM 18 02 99, Subtask 1, Rep. 67, Feb. 1957, 6pp. USN School of Aviation Medicine, Pensacola, Fla.

11,037
To investigate the relative pitch of voiced and unvoiced speech, four trained speakers recorded 132 pairs of vowels (12 vowels paired to effect all combinations with each vowel represented in both initial and final position) in both types of speech. Listeners (69) responded to the paired signals by indicating which of each pair sounded higher in pitch. Data were tested by a paired comparisons method and rank order correlation. The results are discussed in terms of factors that determine pitch judgments.

Peters, R.W. A RATING SCALE TECHNIQUE FOR THE MEASUREMENT OF SPEAKER INTELLIGIBILITY. Prepared under Contract N6onr-22525, Proj. Designation NR 145-993, Joint Proj. NM 18 02 99, Rep. 66, Subtask 1, Feb. 1957, 6pp. USN School of Aviation Medicine, Pensacola, Fla.

11,038
To evaluate the technique of measuring speaker intelligibility through listener ratings of voice samples on an equal-appearing intervals scale, recordings were made (24 speakers) of multiple-choice intelligibility word lists and selected prose materials. Ten second voice samples were prepared from the prose reading. The word lists were played for seven listener panels (20 persons each) and a percent intelligibility score obtained. The voice samples were played under various signal-to-noise ratios (+5, 0, -5 decibels) to the panels and a scale value intelligibility score obtained. The scores were correlated to provide an estimate of validity and analysis of variance was used to test significance of differences for noise conditions.

Tolhurst, G.C. THE EFFECTS OF DISRUPTING THE SIMULTANEITY OF VISUAL-AURAL COMMUNICATION CHANNELS TO A SPEAKER. Prepared under Contract N6onr-22525, Proj. Designation NR 145-993, Joint Proj. NM 18 02 99, Subtask 1, Rep. 66, Dec. 1956, 9pp. USN School of Aviation Medicine, Pensacola, Fla.

11,039
To investigate the effects of a lack of synchrony between the visual and aural communication channels to a speaker, 48 subjects individually received messages in a face-to-face situation with the reader. For half the subjects the aural channel was delayed 0.23 seconds from that of the visual. The speakers repeated each message as soon as it was heard to a panel of listeners who heard only the speaker, not the reader. Mean percent intelligibility scores, mean sound pressure level in decibels of speakers voice, and mean duration in seconds of the messages were studied by analysis of variance for effect of delayed aural signal on the speech signal.

Churchill, E., Kuby, A. & Daniels, G.S. NOMOGRAPH OF THE HAND AND ITS RELATED DIMENSIONS. Contract AF 33(616) 3841, WADC TR 57-198, April 1957, 49pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College, Yellow Springs, Ohio).

11,040
This report brings together actual dimensions of the hand and interrelationships among these dimensions. Dimensional data for the hands of both male and female USAF personnel are summarized in tabular and graphic form. Intensities of the interrelationships within each of the two groups of dimensions are given in the form of tables of correlation coefficients. A series of tables supplies estimates of the other dimensions for the appropriate ranges of values of hand length, hand breadth at metacarpale, hand breadth at thumb, and fist circumference. Nomographic charts are presented for estimating the related dimensions of likely combinations of hand lengths and breadths.

Harber, G.S. THE INTERRELATION OF VERNIER AND STEREOSCOPIC ACUTIES IN THE MAKING OF AN EQUIDISTANCE JUDGMENT. Proj. 6-95-20-001, Rep. 278, May 1957, 25pp. USA Medical Research Lab., Fort Knox, Ky.

11,041
To study the interrelation of vernier and stereoscopic acuities in depth discrimination, retinal stimulation combining variable ratios of vertical displacement of horizontal edges to lateral displacement of vertical edges in the relative depth adjustment of two panels was generated through varying the display slope surface (from 25 to 200 mills). The binocular depth acuity for equidistance adjustment of the panels with angle of slope was derived by trigonometric and probability considerations from vernier acuities obtained for monocular viewing and an estimate of stereoscopic acuity obtained under a no-slope condition (26 subjects). These findings are considered in relation to similar acuities obtained for binocular viewing under field conditions.

Miller, K.S., & Worchel, P. THE EFFECTS OF NEED-ACHIEVEMENT AND SELF-IDEAL DISCREPANCY ON PERFORMANCE UNDER STRESS. J. Pers., 1956, 25 (2), 176-190. (University of Texas).

11,042
To investigate the effect of interaction between need-achievement and the individual's evaluation of the adequacy of past responses to threat on performance under stress, 98 subjects were assigned to nine groups. High, medium, and low groups were formed on the basis of a need for achievement test (McClelland); these were further subdivided into high, medium, and low self-ideal discrepancy groups on the basis of the Self Activity Inventory (Worchel). The McKinney Reporting Test served as a measure of performance under stress (threat of failure induced by telling subject he is failing to meet standards). Performance scores for pre-stress, stress, and post-stress periods were analyzed for differences among the various groups.

Senders, J.W., & Bradley, J.V. EFFECT OF BACKLASH ON MANUAL CONTROL OF PITCH OF A SIMULATED AIRCRAFT. Proj. 7182-71555, WADC TR-56-107, March 1956, 4pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,043
To investigate the effects upon flight of "nonkinesthetic" backlash in which no accelerative forces were operating, five subjects operated a simulated aircraft in pitch with various amounts of simulated backlash in the control system. Each subject performed for five sessions with five one-minute trials for each of five backlash conditions (from zero to 1.83 degrees of stick movement). Their integrated error, generated in attempting to compensate for an external disturbance, was analyzed as a function of backlash. Implications of the findings in the fields of control and trainer design are discussed.

Jenkins, W.L., & Karr, A.C. THE INFLUENCE OF VIEWING DISTANCE IN MAKING SETTINGS ON A LINEAR SCALE. Contract AF 18(600)-24, Proj. 7182, Task 71512, Tech. Note 55-204, Nov. 1955, 9pp. Wright Air Development Center, ARDC, Wright-Patterson AFB, Ohio. (Lehigh University).

11,044
To determine the influence of viewing distance on optimal ratios when making settings on linear scales, a series of experiments were performed. Distance between the operator and a ten-inch scale were varied (14, 36, 72, and 144 inches) by changing length of control shaft. A control knob (2-3/4 inches) was used to move pointer to a designated setting within a tolerance of .050 inch; travel distances were one or 4-1/2 inches. Twelve subjects performed under these conditions. For another experiment all conditions were perceptually proportional at viewing distances of 14 and 144 inches. Fifteen subjects were tested. Adjusting time and travel time are analyzed for effect of the various conditions.

Metzger, R.L. & West, E.D. A FEEDBACK SYSTEM FOR HUMAN ERROR INFORMATION. Contract AF 29(601) 124, Proj. 7800, AFSCMTR-55 12, Aug. 1955, 16pp. USAF Special Weapons Center, Kirtland AFB, N.M. (American Institute for Research, Pittsburgh, Penn.).

11,045

This report is based on the assumptions that reliability of special weapons systems can be increased through reduction of human errors and that reduction can be accomplished through a continuous flow of error data from operational sites to a central agency for evaluation and correction. A study of present practices in reporting was made to establish the frequency and consistency of human error reports within the Air Force. A field tryout of a special human error report form was conducted at an operating site for a three-week period. An analysis of the results led to a recommendation for a reporting system.

Eckhardt, R.T., Hedberg, R.D., & Meade, R.D. HUMAN ENGINEERING ASPECTS OF RECOILLESS RIFLE DESIGN I: M18 AND T66 SERIES. Proj. T34-4018, Rep. R-1295, Human Engng. Rep. 8, Nov. 1955, 24pp. Pittman-Dunn Labs., Frankford Arsenal, Philadelphia, Penn.

11,046

This investigation was concerned with an examination of 57 millimeter shoulder-fired recoilless rifles (M18A1 and T66E2) from the standpoint of design for optimal use by human operators. Design features were considered in terms of operation by both the gunner and assistant gunner (loader), drawing upon pertinent literature and actual manipulative tests. Evaluation included portability and operational effectiveness, with particular attention given to anthropometric measurements, comfort, naturalness of motions involved, and general efficiency of perceptual-motor relationships of weapon operation. The findings, suggestions, and recommendations were formulated with the intention of minimizing other engineering problems concerned with the design of these rifles.

Perry, D.R., & Dyer, L.C. INCIDENCE, NATURE, AND EXTENT OF INJURY IN CRASH LANDINGS AND BAILOUTS. Proj. 8-7956, Rep. 1, Nov. 1956, 101pp. Arctic Aeromedical Lab., Ladd AFB, Alaska.

11,048

To determine the incidence, nature, and extent of injury in crash landings and bailouts, a survey was conducted using accident reports of the United States Air Forces. Areas covered were the Arctic region (1950-1954) and all areas in the world where Air Force aircraft operate (1952-1954). After screening, 667 reports remained that could be classified as major accidents. The number and extent of injuries for both situations were analyzed to show the effects of (1) type of aircraft, (2) type of terrain, and (3) altitude at which emergency warning came. A limited treatment of survival data was made. Recommendations are included.

Smith, O.W. JUDGED DISTANCE AND SIZE CONSTANCY. Prepared under Contract Nmr-401(14), Sept. 1956, 24pp. Cornell University.

11,049

To study the relation between judged distance and size constancy, test objects (stakes of different heights arranged in an arc) were presented in photographs. The photographs were viewed monocularly and the subject required to make size matches (separate photographs of single stakes), judgments of distance in yards to same test objects for which size matches were made, and judgments of height in feet. The portrayed distance was either 75 or 250 percent of the original distance (two groups, 26 subjects each). Two abstract (no detail except horizon and shadows) photographs were also judged in the same manner. Judgment data were analyzed and compared for all conditions.

Harnqvist, K. ON THE EFFICIENCY OF MATCHED-GROUPS DESIGN. No. 40, Oct. 1956, 5pp. Psychological Lab., University of Stockholm.

11,050

This paper discusses the efficiency of matched-groups design for controlling interindividual differences in experiments. It is pointed out that matching must result in minimum correlation within pairs of the dependent variable for the matched groups design to be as efficient as a simple randomized design for a given number of degrees of freedom and on a given level of significance. This minimum is calculated, and the relation between the correlation within pairs of the dependent variable and between matching and dependent variable derived.

Moody, J.A., Jerome, E.A., Flynn, J.P., & Connor, T.J. AN AUTOMATIZED TECHNIQUE OF INVESTIGATING DIFFERENTIAL SENSITIVITY TO AUDITORY INTENSITIES. I. THE INFLUENCE OF STEP SIZE AND INTERVAL BETWEEN STIMULI. Proj. NM 000 019.02.02, July 1956, 7pp. Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

11,052

To supply a measure of sensitivity obtained by automation of the "staircase" method (modified form of method of limits of threshold determination) to be compared with data obtained by more usual methods, measurements of differential sensitivity to auditory intensities were made on four subjects. A completely automatic control system that permitted presentation of stimuli at any rate within the subject's capacity to respond was used. A tone of standard intensity (1000 cycles per second) was used with varied steps in decibels (1.0, 1.5, 2.0 and 3.0 decibels) and intervals between decrements (1.0, 1.5, 2.0 and 3.0 seconds). The data were analyzed to find effects of decremental steps and time intervals. The advantages and shortcomings of the method are discussed.

USAF Operational Test Center. JOINT (U.S. NAVY AND U.S. AIR FORCE) COMPARATIVE OPERATIONAL SUITABILITY TEST TO DETERMINE A STANDARD AIRFIELD APPROACH LIGHTING CONFIGURATION. FINAL REPORT. Proj. APC/CSC/800 A, Dec. 1955. 18pp. USAF Operational Test Center, Eglin AFB, Fla.

11,053

To determine, by operational suitability testing, an adequate standard military airfield approach lighting system configuration, sixteen patterns were compared. Except for one centerline system all patterns included features agreed upon by the Joint United States Navy-United States Air Force Ad Hoc Committee on Airfield Approach Lighting. Operational test conditions were used with a wide variety of aircraft under both instrument and visual flight conditions. Pilot preferences were determined by analysis of tape recordings of communications between aircraft and controller and from questionnaires. Three preferred configurations were further evaluated on economic considerations of installation, maintenance, and personnel requirements.

Ruon, P.J., Griggs, T., Sampson, P.B. & Tiedman, D.V. A STUDY OF ASSISTANCE FOR LOW FREQUENCY INSTRUMENT APPROACHES. FINAL REPORT. Contract CCA 29186, ERC Proj. 30, Nov. 1951, 99pp. Educational Research Corporation, Cambridge, Mass.

11,056

A comparative study was made of standard low-frequency range approaches flown by pilots of minimum recent experience unassisted, with the help of an ADF (visual indicator), and in pairs, as pilot and copilot. Each of 36 pilots, all of whom had instrument ratings from the Civil Aeronautics Administration, flew three scored approaches, one for each condition. Flight proficiency was checked by a ground observer and a safety pilot on items classified under three headings: control of aircraft, radio procedures, flight procedures and planning. The value of the two types of assistance was evaluated by comparing unassisted with assisted performance.

Mathewson, J.H., & Brenner, R. ANALYSIS OF ACCIDENT STATISTICS. J. Amer. Soc. Safety Engineers, National Safety News, Aug. 1956, 6pp. (Institute of Transportation and Traffic Engineering, University of California at Los Angeles).

11,061

This paper presents statistical theory underlying various techniques of accident control charts (an analytical tool for making meaningful interpretations of accident rates). Five basic elements are discussed: (1) selecting the quality index, (2) estimating the range of variation of the index, (3) initial setting up of charts, (4) judging as to assignable causes, and (5) revising charts to reflect changing conditions. These techniques are extended to situations where there are wide variations both in severity and amount of exposure. An example is given to demonstrate the techniques.

Cation, W.L., Mount, G.E., & Brenner, R.
VARIABILITY OF REACTION TIME AND SUSCEPTIBILITY TO AUTOMOBILE ACCIDENTS. J. 822.
Psychol., 1951, 35(2), 101-107. (University of California).

11,062
To test the hypothesis that variability of reaction time is positively correlated with susceptibility to automobile accidents, simple reaction-time measurements (time required to move foot from accelerator pedal to brake in response to red stimulus light) were made on a sample of 104 Radio Patrol Officers. Means and standard deviations were computed for each subject's distribution of ten reaction times. Criterion data (official reports of accidents while on duty) were subjectively classified into three categories: (1) officer at fault, (2) responsibility doubtful, and (3) officer not at fault. An analysis of these data (age factor also included) was made by correlational techniques. The results are discussed in relation to the hypothesis tested.

Haber, H. SAFETY HAZARD OF TINTED AUTOMOBILE WINDSHIELDS AT NIGHT. J. Opt. Soc. Amer., June 1955, 45(6), 413-419. (Institute of Transportation and Traffic Engineering, University of California at Los Angeles).

11,064
This paper presents a theoretical analysis of the effects of tinted optical media, particularly heat absorbing automobile windshields, upon visibility distances on the highway at night. The loss percentages in visibility distances caused by replacing clear windshields with tinted ones are calculated as functions of the variables involved: (1) transmittance of the tinted optical medium; (2) isocandela profile of the headlamp; (3) angular size and reflectance of the target. The results are compared with data obtained experimentally. Discussion is in terms of the safety hazard involved in night driving. A recommendation is made for reconsideration of minimum transmittance requirements for windshields in the American Safety Code.

Kryter, K.D. A CRITERION FOR NOISE CONTROL. J. Acoust. Soc. Amer., Feb. 1957, 29 (2), 311. (Operational Applications Lab., AFMRC, Bolling AFB, Washington, D.C.).

11,065
This note attempts to rationalize a possible single criterion that will define acceptable levels of noise in office buildings, satisfactory both with respect to interference with speech communication and to annoyance. Basic interrelations among loudness, masking, and the perception of speech are examined and a tentative conclusion reached that a single criterion for noise control would be feasible.

Miller, G.A. THE HUMAN LINK IN COMMUNICATION SYSTEMS. Pres. Nat. Elec. Conf., 1956, 12, 1-6. (Contract AF 33(033)-14343, AFMRC-15-56-63. Harvard University).

11,066
This article argues that man is an inseparable link in every communication system and, therefore, since he cannot be abolished, he must be carefully studied and measured. The mathematical theory of communication is advocated as providing a means of measurement and a theory so general that any device - human, electrical, or mechanical - must conform to the theory if it is to perform the function of communication. In illustration, a few tentative generalizations about man's capacity to handle information are given. These generalizations were derived from psychological experimentation which has applied the concepts of communication theory to the human link in the system.

Martin, V.E. CHILDREN'S BODY MEASUREMENTS FOR PLANNING AND EQUIPPING SCHOOLS. A HANDBOOK FOR SCHOOL OFFICIALS AND ARCHITECTS. Office of Education Special Publication No. 4, 1955, 113pp. Office of Education, US Dept. of Health, Education and Welfare, Washington, D.C.

11,067
To secure reliable and current information on the body measurements of children in working positions that are characteristic of the varied learning experiences engaged in by pupils in school, a total of 52 different measurements were made (70 additional were computed from these) on a sample of 3,318 children ranging in age from five to 21 years in all grades from kindergarten through high school. Tables are presented giving the mean, standard deviation, and range for 130 measurements by age groups and by school grades. Other tables give percentage distributions for some standard furniture measurements, correlations of selected measurements, and handedness distribution. A glossary of terms is appended.

USA Board NR 1. SERVICE TEST OF TARGET LIGHT, POLE, RANGING. DA Proj. 8 35 10 117, Proj. FA 456, Dec. 1956, 15pp. USA Board NR 1, Fort Sill, Okla.

11,068
To determine the suitability of Target Light, Pole, Ranging for field artillery use in night surveying operations, various tests were carried out: (1) physical characteristics of the test target light carrying cases were determined, (2) characteristics of light source were determined by viewing the light under various conditions and from various angles and distances, (3) operational characteristics were studied during use on traverse and triangulation courses and in flash ranging, weapon location radar and weapon orientation during clear and instrument radar, and (4) ruggedness and resistance to forces of nature were checked by various tests. Deficiencies and suggested modifications were discussed.

Brown, W.C., & Douglass, L.N. TEST OF A COMMUNICATION CONSOLE FOR RAPCON CENTERS. WADC TN-56-407, Dec. 1956, 17pp. Wright Air Development Center, ARDC, Wright-Patterson AFB, Ohio.

11,069
This report describes a repackaged version of the AN/PMA-4 Communication Console for use in Radar Approach Control Centers and fabricated to provide a smaller more compact unit that could be placed close to controller at his operating position. The redesigned console was evaluated for use with a 12-inch vertical radar indicator and a 22-inch horizontal radar indicator. Advantages and disadvantages were listed and discussed. Comparisons with the standard design were made. Recommendations are included.

Boynton, R.M., & Kandel, G. ON RESPONSES IN THE HUMAN VISUAL SYSTEM AS A FUNCTION OF ADAPTATION LEVEL. J. Opt. Soc. Amer., 1957, 47(4), 275-286. (Prepared under Contract Nonr-556(06), University of Rochester).

11,070
To investigate visual responses as a function of adaptation level, thresholds were determined (three subjects) at various intervals before and after (-0.02 to +0.03 seconds) the onset of a 30-millisecond conditioning stimulus in the dark-adapted eye, and following six levels of pre-adaptation (from 0.0005 to 3000 millilamberts). Within each session there were two conditions used: (1) conditioning stimulus "on" as described above, and (2) conditioning stimulus "off" or not present. Threshold data were analyzed as functions of pre-adapting luminance and conditioning interval for both "on" and "off" conditions. The relation between "masking" and those effects attributable to photochemical bleaching is assessed and discussed.

Harberger, J.P., Kemp, W.R., Kadetz, W., et. al. STUDIES IN AEROEMBOLISM. Rep. 57-44; Feb. 1957, 11pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Aeromedical and Physical Environment Lab., University of Illinois).

11,071
To study the incidence of decompression sickness under conditions of limited desaturation, 15 male subjects were observed during a total of 75 flights in a low-pressure chamber to simulated altitude of 38,000 feet. At high altitude each subject participated in a standard exercise while breathing 100 percent oxygen for 30 minutes or until aviator's bends pains were reported. Desaturation conditions were: (1) four hours, 12,000 feet, breathing ambient air; (2) four hours, 18,000 feet, breathing mixture of oxygen and nitrogen; (3) two hours, 18,000 feet, breathing 100 percent oxygen; and (4) control run without desaturation. Quantitative estimates of gaseous nitrogen and total volume of expired air and incidence of pains were compared for the various conditions.

Bowler, J.W. Jr. ELECTROMYOGRAPHIC FACTORS IN AIRCRAFT CONTROL. A MUSCULAR ACTION POTENTIAL STUDY OF "CONFLICT". Rep. 55-125, Dec. 1956, 24pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,073
To compare muscular activity involved before and during final reactions in a series of discrimination situations in which the response requirements varied, muscle action potential records were obtained on three groups of subjects (20 each). Each group discriminated between two tones (standard tone of 1500 cycles per sec; variable tones, 1500, 1525, 1550, 1575, and 1600 cycles per sec). The response varied from group to group: (1) press right hand key (six-ounce pressure) if two tones were same; (2) press right hand key for same and left hand key for difference tones; and (3) same as preceding except that key required a six-pound pressure. The distribution and temporal course of tension levels were analyzed for differences in both arms attributable to the type of response made.

Miller, J.D. ELECTROMYOGRAPHIC FACTORS IN AIRCRAFT CONTROL. DIFFERENTIAL MUSCLE TENSION DURING A DELAYED RESPONSE. Rep. 55-129, Jan. 1957, 8pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,074
To study the distribution and temporal course of muscular activity during a two-choice spatial delayed response, muscle action potential records were obtained from the muscle groups closely involved in right and left hand key pressing. The stimulus consisted of a sequence of two tones, the first indicated which hand was to respond and the second was the reaction signal. 19 subjects participated in 18 trials, with records taken from both arms. Action potentials (mean highest peak in 100 x log microvolts) were analyzed graphically to show response patterns from a state of rest through the key-pressing for both right and left response trials. The results are discussed in relation to previous studies of muscle activity with general consideration of the physiologic mechanisms involved.

Brebba, D.R., Goldman, R.F., & Buskirk, E.R. WATER VAPOR LOSS FROM THE RESPIRATORY TRACT DURING OUTDOOR EXERCISE IN THE COLD. Proj. 7-64-12-004C, Tech. Rep. EP-57, May 1957, 10pp. USA Quartermaster Research and Development Center, Natick, Mass.

11,076
To determine the quantities of water vapor contained in expired air when men work in the subarctic, measurements were made on three men in 26 experimental periods. Activity ranged from resting engine in a sleeping bag to running at rates up to 370 feet/minute over packed snow. Exercise periods varied in duration from 15 to 90 minutes. Expired air was collected from which water (grams) was measured. Heat loss attributable to vaporization of water from respiratory tract was calculated as a percentage of total energy expenditure. The importance of the results for proper design of Arctic clothing and face masks is indicated.

Brown, B.P. GROUND SIMULATOR STUDIES OF THE EFFECTS OF VALVE FRICTION, STICK FRICTION, FLEXIBILITY, AND BACKLASH ON POWER CONTROL SYSTEM QUALITY. NACA TN 3998, April 1957, 45pp. Langley Aeronautical Lab., NACA, Langley Field, Va.

11,079
Ground simulator tests were made to study the effects of various ratios of valve friction to stick friction on power control system quality. Boundaries were determined for good, tolerable, and unsatisfactory ranges of valve and stick friction for a rigid control system and a system with flexibility between the source of stick friction and the valve. The effect of various friction ratios with flexibility between the pilot and the source of stick friction is presented. The effect of backlash with various friction ratios is also presented.

Martens, B.O. THE EFFECT OF JOYSTICK LENGTH ON PURSUIT TRACKING. Proj. 6-95-20-001, Rep. 279, Nov. 1956, 11pp. Dept. of Psychology, USA Medical Research Lab., Fort Knox, Ky.

11,081
To determine the effect of joystick length on the manual tracing of a continuous simple pursuit task, eight subjects tracked a one-dimensional simple sine wave using eight lengths of joystick shaft (6, 9, 12, 15, 18, 21, 24, and 27 inches). Performance measures (cumulative time-on-target and graphic records) were taken on the last of eight sessions of 15 three-minute trials. Only on the first and last sessions were the subjects required to operate at each stick length; intervening sessions consisted of training at one length. Mean time-on-target scores, mean number of hits, and on-target durations were analyzed as functions of stick length. Design recommendations are given.

Peacock, L.J., & Marks, R.A. BEHAVIORAL CONCOMITANTS OF COLD ADAPTATION: I. RATE OF RESPONDING AT 2.5° C. Proj. 6-95-20-001, Rep. 283, Dec. 1956, 7pp. Dept. of Psychology, USA Medical Research Lab., Fort Knox, Ky.

11,082
To investigate the feasibility of developing a behavioral index of acclimatization to cold, normal and acclimatized rats responded to an operant conditioning apparatus that delivered radiant heat as a reward for tests conducted at 2.5 degrees Centigrade. Normal or control rats lived at a temperature of 22 degrees Centigrade before testing; experimental rats were exposed nine days at test temperature. Operant level was measured (days 10 and 11); two daily sessions of regular reinforcement were followed by four sessions of three to one ratio reinforcement. Response rates of the two groups were analyzed for differences due to acclimatization. Possible reasons for behavioral differences are discussed.

USN Bureau of Aeronautics. WEATHER DISPLAY AND PRESENTATION. Proj. ARMA (TED UNL MA 501), Task 23, Tech. Rep. 1, Aug. 1956, 24pp. USN Bureau of Aeronautics, Norfolk Air Station, Va.

11,085
To determine current deficiencies of United States Naval Air Station Aerology Office facilities and functions, a survey was conducted by questionnaire and by visitation. The questionnaire was sent to all users of Aerological services requesting information on display and layout, briefing techniques, and inflight reporting. An informal on-the-spot survey was made by a group of officer investigators of ten offices selected at random. The data were analyzed in terms of operational aviation as well as Aerological requirements. The best physical location for Aerology, new equipment available or under evaluation, and detailed recommendations for improving and standardizing displays and briefings are discussed.

Alexander, M., & Hertzberg, H.T.E. A COMFORT EVALUATION OF A FORM-FITTING HIGH ALTITUDE HELMET. Proj. 7214, WADC TR-56-404, Feb. 1957, 15pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,086
This report describes comfort tests on an experimental pressure helmet assembly, consisting of an outer rigid shell and an inner compressible, form-fitting liner of polyurethane foam. Seventy-two subjects (21 rated military pilots) with head and face measurements representing 98 per cent of the Air Force flying population were fitted with a helmet of such a size that it fitted snugly without pressure or discomfort. After three to seven minutes wearing time, the subjects were questioned about specific comfort points. Four subjects wore the helmets from two to four hours to ascertain longer-range effects. Fabricational requirements for comfort and acceptability are discussed and their applicability to most forms of headgear indicated. Recommendations are included.

Hambacher, W.O. HUMAN ENGINEERING INVESTIGATIONS OF THE INTERIOR LIGHTING OF NAVAL AIRCRAFT: PART 5 EXPERIMENTAL EVALUATION OF A PROPOSED THEORY OF WHITENESS CONSTANCY. TED NAM EL-52004, Rep. NAMC-ACEL-297, Aug. 1956, 11pp. Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,087
To evaluate a proposed theory of whiteness constancy for application to aircraft work-space lighting (emphasis on cockpit), two experiments were performed under the condition of homogeneous backgrounds of a standard and of a variable disc. In one experiment, the stimuli were Munsell discs on a color wheel, the other were rings and discs of light. Eight subjects were required to match the whiteness of the variable disc to that of the standard by method of average error (ten trials per day on three consecutive days, for each experiment). Illumination for standard disc was 100 foot candles; for the variable disc, 50 foot candles. Mean brightness settings were analyzed in terms of whiteness ratios of disc to background for both variable and standard under the experimental conditions. T. R. 5

Gallup, H.F. & Hambacher, W.O. HUMAN ENGINEERING INVESTIGATIONS OF THE INTERIOR LIGHTING OF NAVAL AIRCRAFT: INVESTIGATIONS INTO THE OPTIMAL CHARACTERISTICS OF VISUAL LIGHT INDICATOR SYSTEMS. AN EXPERIMENTAL INVESTIGATION OF THE EFFECTS OF VARIATION IN TEMPORAL CHARACTERISTICS OF LIGHTS ON THEIR ATTENTION-GETTING VALUE, WITH REFERENCE TO MASTER WARNING AND CAUTION SYSTEMS. TED NAM EL 52004, Rep. NAMC ACEL 298, Aug. 1956, 8pp. USN Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,088
To evaluate their possible usefulness for light indicator warning and caution systems in aircraft, the effectiveness of three types of lights (steady, flashing, and alternating) as attention gainers was studied. Nine subjects, engaged in the counting of randomly spaced dots of light appearing directly in front of them, were required to respond as quickly as possible to the stimulus lights, presented peripherally and against a homogeneously dark background. Presentations were random. Reaction times to the onset of the lights were recorded and studied by analysis of variance for differences due to type of light used. Recommendations are presented with suggestions for both a master warning and a Master Caution System.

Olow, M.F., & Douthett, S. EFFECT OF AMBIENT NOISE ON TRAINING IN DOPPLER DISCRIMINATION. NEL Rep. 677, April 1956, 12pp. USC Electronics Lab., SDC, San Diego, Calif.

11,090
To determine the effects of different noise conditions during training on the accuracy of making doppler discrimination (psychophysical judgments) under conditions of high ambient noise such as exist in helicopters (110 to 115 decibels), 50 enlisted men were given a pre-test, ten training drills, and a post-test. Noise conditions varied as follows: (1) low ambient noise (60-70 decibels), (2) low ambient noise for first seven drills; high (110 decibels) for last three, (3) progressive increments of ambient noise throughout training from 70 to 110 decibels, and (4) high ambient noise (110 decibels) for all training. Both tests were given at high ambient noise except for one subsection of the control group (1). Data were analyzed for differences due to training conditions. Recommendations are included. T. G. R 10

11,091
Stiles, G.J. PREDICTION OF THE APPARENT MAGNITUDE OF DISTANT MISSILES IN SUNLIGHT. Proj. 580306011, TB3-0538, Rep. 1008, June 1956, 30pp. USA Ballistic Research Labs. Aberdeen Proving Ground, Md.

11,091
A method of predicting the amount of light received from a missile observed at long range at low angle of elevation is presented. Results are expressed in astronomical magnitude units. The uncorrected magnitude is determined from a chart as a function of distance and missile size. Corrections are made for geometric aspect, atmospheric transmission, and missile reflectance and combined with the uncorrected magnitude to give the apparent magnitude photographic, photoelectric, and visual observations may be predicted. T. G. R 6

11,092
Lanzetta, J.T., & Roby, T.B. EFFECTS OF WORK-GROUP STRUCTURE AND CERTAIN TASK-VARIABLES ON GROUP PERFORMANCE. J. abnorm. Soc. Psychol., 1956, 53(3), 307-314. (Proj. 7713, APPTTC-TM-57-45, April 1957, APPTTC, ARDC, Lackland AFB, Tex. University of Delaware).

11,092
To investigate effects of work-group structure and certain task variables on group performance, three-man group were presented with a simple information-processing control-adjustment task. Detection and communication of changes in display readings were made and control switches adjusted accordingly. By varying the display-control relationships and the location of displays and controls at operator station, two work structures were produced differing both in volume of information to be transmitted and in extent of dispersion of information over group members. Two input parameters were varied: rate of change of instrument readings, and predictability of the changes. The performance data (number of errors made by group in control adjustments) were studied by analysis of variance and information theory techniques. T. G. R 9

11,093
Debons, A., & Crannell, C.W. FACILITATING IDENTIFICATION OF AIRCRAFT BY USE OF REFLEX-REFLECTIVE ("SCOTCHLITE") MATERIAL. Contract AF 33(616)-2844, Proj. 71e6, WADC TR-57-130, April 1957, 24pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Miami University).

11,093
To assess the value of reflex-reflective (Scotchlite) material as a means for enhancing the readability of digits of the size and type utilized in aircraft identifications (Standard Army-Navy Design, 8 by 10 inches), a study was conducted under night-time conditions utilizing a spotlight. Subjects (13) were required to read the digits presented for four seconds in groups of five. Variables were: horizontal lines of sight (from 18 to 90 degrees to surface viewed), viewing distance (144 to 500 feet), and targets (black digits on white, aluminum, or Scotchlite and Scotchlite digits on black background). Percent correct responses were analyzed for differential legibility of the digits under each condition. T. G. R 11

11,094
Green, R.F. THE EFFECTS ON PERFORMANCE OF A COMPENSATORY TRACKING TASK OF INTER-CHANGING THE CONTROL OF THE AXES OF MOVEMENT BETWEEN THE HANDS. Prepared under Contract N6onr-241, T.O. 6, Proj. 20-M-1d, Tech. Rep. 241-6-23, Aug. 1955, 6pp. Special Devices Center, Fort Washington, N.Y. (University of Rochester).

11,094
To investigate the effects of transferring control of each dimension of a two-dimensional compensatory tracking task to the opposite hand from the one previously controlling that dimension, 112 subjects were randomly divided into four groups. Crank arrangements were used which yielded (1) complete continuity between control and target movements, (2) partial continuity, and (3) complete discontinuity. Each subject was given 12 one-minute trials with 15 seconds rest between trials followed by five trials with the same crank arrangement but with each crank now controlling the dimension previously assigned to the other crank. The average time on target and variability of the scores were analyzed for the interference effects. Design recommendations are given. T. G. R 1

11,095
Weiss, B., Coleman, P.D., & Green, R.F. TIME-ORDERED EFFECTS IN LONG SERIES OF KNOB CONTROL ADJUSTMENTS. Prepared under Contract N6onr-241, T.O. 6, Proj. 20-M-1d, Tech. Rep. 241-6-19, Aug. 1955, 5pp. Special Devices Center, Fort Washington, N.Y. (University of Rochester).

11,095
To investigate time-ordered effects in long series of knob control adjustments, twenty subjects were required to make 120 consecutive bisections of a 40 degree angle on each of two successive days. The subjects were blindfolded and were given no information about performance accuracy (bonuses of money were given at end of experiment as motivating device). The data were studied by autocorrelation and power spectrum analysis. A mark-off process formulation was used to describe the underlying process of the time series data. The implications of such a model for evaluations of equipment and operators is pointed out. G.

Hill, J.E. EFFECTS OF ENVIRONMENT IN REDUCING DOSE RATES PRODUCED BY RADIOACTIVE FALLOUT FROM NUCLEAR EXPLOSIONS. RM-1285-1, Sept. 1954, 10pp. USAF Proj. RAND, Rand Corp., Santa Monica, Calif.

11,096
This paper summarizes the factors by which the infinite plane dose rate of fission product gammas would be reduced in these situations: open fields, parks, and so forth, streets of built-up urban areas, and various types of buildings and shelters. The reduction of the intensity of gamma radiation by various materials as a function of thickness is shown graphically. The reduction factors for dose rates in various sizes and types of buildings are tabulated. Locations offering maximum protection from gamma radiation are indicated. Discussion is in terms of the use of these facts for civilian defense. T. G. R 6

11,097 Hamacher, W.O. & Gallup, H.F. HUMAN ENGINEERING INVESTIGATIONS OF THE INTERIOR LIGHTING OF NAVAL AIRCRAFT: INVESTIGATIONS INTO THE OPTIMAL CHARACTERISTICS OF VISUAL WARNING AND CAUTION SYSTEMS. THE EFFECTS OF VARIATION IN TEMPORAL CHARACTERISTICS OF WARNING LIGHTS PRESENTED AGAINST A HETEROGENEOUS BACKGROUND, WITH THE LIGHT "HONEY" OCCURRING BOTH WITHIN AND OUTSIDE OF THE VISUAL FIELD. NANC ACCL 300, TED NAH EL 52004, Part 8, Aug. 1956. 11pp. USN ALC Crew Equipment Lab., NAMC, Philadelphia, Penn.

To investigate the attention-getting value of three kinds of stimulus lights (steady, flashing, and alternating), a mock-up of the F7U Cockpit was illuminated for night conditions according to military specifications and for day conditions with two daylight flood lamps. Ten Ss, while engaged in a tracking task, were required to respond as quickly as possible to the stimulus lights under two conditions: 1) onset of light occurring within the visual field at angle of 75° from line of sight; and 2) onset of light occurring outside visual field and brought in after five-second delay. All Ss performed under both day and night conditions. Reaction times were analyzed for differences due to type of stimulus under the various experimental conditions.

11,099 USA Board NR 1. SERVICE TEST OF CAMOUFLAGE NET DRAPE SET FOR 240-MM HOWITZER. DA Proj. 8 31-02 100, Proj. FA 955, Oct. 1955, 14pp. USA Board NR 1, Fort Sill, Okla.

11,099 To determine the suitability of Camouflage Net Drape Set for 240 millimeter Howitzer for field artillery use, tests were conducted as follows: (1) physical characteristics, components were weighted, measured, and examined; (2) stowage, set was stowed and carried to and from test sites with time and effort recorded; (3) ease of handling, time and effort recorded for erection and dismantling in daylight and darkness; (4) concealment, aerial photographs taken and analyzed of gun positions covered by nets; (5) service of the piece, time to open and close embrasures with weapons in place was recorded, freedom of movement noted and effects on service of the piece observed; and (6) durability, stability and maintenance were observed throughout testing. Deficiencies and suggested modifications are listed with recommendations.

11,100 Rinehart, W.E., & Jacobson, E.H. THE ODOR DETECTION OF PHOSPHORUS TRICHLORIDE, PHOSPHORUS OXYCHLORIDE AND HYDROGEN CHLORIDE BY MAN. Rep. 374, ML5-374-(53), CNLRE-ML-82, NLRAR 374, July 1956, 11pp. Army Chemical Center, Md.

11,100 To determine the concentrations of phosphorus trichloride (PCl₃), phosphorus oxychloride (POCl₃), and hydrogen chloride (HCl) detectable by odor, sniff tests were used in establishing median detectable concentrations. Each S (19, 19, and 23 in age) sniffed increasing concentrations of a given compound in a geometric series of two starting from zero until he indicated that an odor or sensation had been detected. Concentration levels from Ss were treated by a time-response method to determine median thresholds for each compound. Descriptions of each odor were given. The findings were discussed in relation to concentrations considered safe for chronic exposure. Detectability and smoking habits were also discussed.

11,101 Price, A. SHIPBOARD EVALUATION OF EXPERIMENTAL COLD WEATHER CLOTHING. (AIRCRAFT CARRIER PHASE). Proj. NT001-002 & NT001-008, Rep. 3, May 1955, 19pp. Bureau of Supplies and Accounts, Dept. of the Navy, Washington, D.C.

11,101 To determine the functionality and general utility characteristics of Navy experimental cold weather clothing items (utilizing the double moisture barrier principle of insulation), an evaluation was performed aboard a carrier operating in the North Atlantic area for a four-week period. The clothing was issued to a group of 25 subjects selected to represent a cross section of flight deck personnel. Combinations of standard and experimental issue could be worn. Analysis was made of observations of clothing use and wear throughout the period and questionnaires completed by all subjects on ability to perform tasks, insulation and warmth, comfort and fit, and preferences for experimental or standard issue.

11,102 D'Amico, S. DEVELOPMENT OF AN AIR CIRCULATING UNIT FOR VENTILATION OF IMPERMEABLE SUITS. Proj. NT001-053, Rep. 5, July 1955, 6pp. Bureau of Supplies and Accounts, Dept. of the Navy, Washington, D.C.

11,102 The problem of providing ventilation and other means of cooling for the wearer of impermeable protective suits is reviewed. The shortcomings of supplying air and relying on present evaporative cooling techniques are discussed. An experimental air circulating unit that is small and battery powered is described. Some results of a preliminary investigation of this unit as used with a suit having modified ventilating openings are presented. Recommendations are included.

11,103 Brucato, J. DEVELOPMENT OF A NEW OXFORD FOR NAVY WOMEN. Proj. NT-001-018, June 1955, 15pp. Bureau of Supplies and Accounts, Dept. of the Navy, Washington, D.C.

11,103 To develop an oxford that would provide the comfort, durability, and style required by Navy women, a preliminary survey of commercially available shoes was conducted and nine models were selected and tested locally for six months. On the basis of subjective evaluations, one model was selected for development. Two service trials were conducted at the United States Naval Training Center Bainbridge, Maryland. Subjects were primarily recruits in basic training with some permanent personnel included. In the first test (eight-week period) the shoes were evaluated primarily for acceptability with durability factors noted. In the second test, the same design with more durable components was evaluated. Recommendations are included.

Farber, J.P., Jr., & Hestman, R.C. THE PREDICTION OF A CRITERION OF FLIGHT SAFETY IN NAVAL AVIATION. Proj. NM 001 056-08-01, Aug. 1955, 45pp. Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

11,105

To evaluate the use of four rating procedures as a means of establishing criteria of differential accident liability among naval flight personnel, 30 pilots assigned to a United States Navy aircraft carrier rated the other members of their squadron both as to "influence and skill." A criterion of accident reliability was derived from the ratings and tested for reliability. The following variables were measured and studied for their relationships to the criterion: (1) attitudes towards various aspects of naval flying (questionnaire), (2) subjective evaluations of flight safety procedures (six-point scale), and (3) galvanic skin response of pilots recorded as they viewed statements concerning these same items of flight safety procedures.

Chang, S.H., Stabbs, H.L., Dolansky, L.O., et al. VISUAL MESSAGE PRESENTATION. Contract AF 19(604)-1009, AFPC TX 55-580, Rep. 3, March-Aug. 1955, 33pp. Electronics Research Lab., AFPC, Cambridge, Mass. (Northeastern University).

11,105

This report describes work done on a research program directed toward designing an analyzer for a speech compression system. Two plans for the programming of the analyzer are described: a combined discrete-continuous-parameter system and a discrete-identification system. For the first plan, a "V" filter for measuring dispersion of turbulent-sound spectra has been developed and listed. Under the second plan, several steps in the automatic classification of nonstationary sounds by fractional power have been completed, using commercial computing equipment. Measurements of duration and total zero-crossing have been made to investigate whether either parameter could be used to separate stops from fricatives.

Moser, H.M. POSITION AND WEATHER TELLING METHODS. Contract AF 18(600)-316, AFPC TX 55-62, Tech. Rep. 27, July 1955, 9pp. Air Force Cambridge Research Center, Cambridge, Mass. (Ohio State University).

11,106

To compare the relative accuracy of three methods in telling digit encoded messages, 12 messages of 14 items each in standard sequence were spoken by one trained speaker. The methods of telling were: tag-word (separation by tag-word and minimum pause), plain telling (separation by distinct pause), and fast telling (separation by minimum pause). Three groups of listeners (one for each style of telling) transcribed the messages read half again as fast as the fast-telling method. The number of correct messages was compared for each method and the effect of practice in the three methods on reception of an impossibly rapid message was analyzed.

Schwartz, R. EVALUATION OF THE EFFECTIVENESS OF THE ACOUSTIC TREATMENT INSTALLED IN HANGAR BAYS OF USS SARATOGA. Lab. Proj. 5522-3, Final Rep., Sept. 1956, 12pp. Material Lab., New York Naval Shipyard, Brooklyn 1, N.Y.

11,107

To determine the effectiveness of acoustic treatment installed in the hangar bays of the USS Saratoga (CVA-60), objective and subjective measurements were made and compared with similar measurements obtained on the USS Forrestal (CVA-59) which did not have acoustic treatment. Measurements included ambient noise analysis, reverberation time, sound level distribution, frequency response, and speech intelligibility. The data from each measurement were summarized and compared for the two ships. The limitations of the method of assessment are discussed. Recommendations are included.

Sleasin, H.B., Gillespie, D.G., & Harold, W.E. PEAK OXYGEN UPTAKE OF TRAINED HEALTHY YOUNG MEN AS DETERMINED BY A TREADMILL METHOD. Proj. NM 001 105 104, Rep. 1, Oct. 1956, 11pp. USN School of Aviation Medicine, Pensacola, Fla.

11,108

To determine the peak oxygen uptake of healthy young men, 50 naval aviation cadets (18 to 25 years of age) were tested by the treadmill method. Speed was held constant at 3.5 miles per hour and the tests at each grade (20, 24, 28, 28 1/2 until failure to complete a test) were of six minutes duration. Peak oxygen uptake was defined arbitrarily as the highest value obtained for rate of oxygen uptake as determined by measurement and analysis of expired gas collected during the sixth minute of exercise (liters per minute) and was correlated with other variables, such as body surface area, expiratory minute volume, respiratory rate, tidal volume and heart rate. Results are discussed in relation to data from previous studies.

Armstrong, J.V. VECTOR ANALYSIS OF INTERCEPTOR POSITIONING ERRORS. Tech. Memo. 15, Nov. 1955, 24pp. USAF Office of Operations Analysis, Eglin AFB, Fla.

11,110

One objective of the ground environment is to vector an interceptor aircraft out to an effect point where the interceptor performs a standard turn until a specific attack heading is reached (the rollout point). This paper determines the error in the position of the rollout point by analyzing the vector connecting the correct to the actual rollout point and by comparing the correct heading of the interceptor at rollout. Vectors are used to define the interception process and vector error expressions are developed which show the effect of any error in any of the various inputs used to solve the interception problem.

Anderson, A.R. THE FORMAL ANALYSIS OF NORMATIVE SYSTEMS. Contract SAR/Monr 609(16), Tech. Rep. 2, Nov. 1955, 99pp. Interaction Lab., Yale University, New Haven, Conn.

11,111

This monograph presents a number of new systems of symbolic logic, which are intended, (as one of their principal applications) to shed light on the logical structure of normative systems, as currently studied by social scientists. The systems are proposed as "explications" of a variety of normative concepts (including obligation, permission, prohibition, and commitment); and, more specifically to the normative structures developed by small groups in the process of solving problems. The fundamental ideas of the logistic method are treated; all the formal "theorems" are translated into English, and examples given showing how formal proofs may be constructed.

Newell, A. & Kruskal, J.B., Jr. FORMULATING PRECISE CONCEPTS IN ORGANIZATION THEORY. Res. Memo. RM-619, June 1951, 14pp. USAF Project RAND, Rand Corp., Santa Monica, Calif.

11,112

This report presents a partial step in the formulation of precise concepts in organization theory. A rather general model of "reality" is constructed. The symbols that appear in it form the basic terms of the language. Organizational concepts are to be defined in terms of these symbols by use of the algebra of sets and the calculus of relations, and the usual concepts of mathematics.

11,115
Abrams, J.W. MILITARY APPLICATION OF OPERATIONAL RESEARCH. Nat. Convention Transactions, 1954, 107-113. (Royal Canadian Air Force, Ottawa, Ontario, Canada).

11,113
This paper endeavors to show how operational research, defined as a method by which management (or command) is provided with a quantitative aid in formulating decisions, has found its place in the military organization. The complementary in background of the scientist and the executive is stressed as an important factor. A brief account of the development of operational research is related, with specific examples from warfare. Recent developments in the use of "game theory" are discussed.

Bellows, P. TECHNICAL STUDIES IN CARGO HANDLING. I. FORMULATION OF RECURRENCE EQUATIONS FOR SHUTTLE PROCESS AND ASSEMBLY LINE. Contract No. 223(87), Rep. 56 53, Nov. 1956, 21pp. Engineering Dept., University of California.

11,114
This is the first in a series of reports devoted to the study of the flow of men and materials in space and time. Two specific processes, one arising in cargo-handling (a "shuttle" process) and the other arising in industrial production (assembly line), are discussed. Two types of mathematical processes are identified in both: deterministic and stochastic. The method of recurrence relations, a mathematical technique, is applied to two mathematical models, the link-node model of cargo-handling and an assembly line model to study the processes. Basic recurrence relations are derived which may be used to describe the process.

Hayne, J.V. & Armstrong, J.C. SOME CANADIAN ARMY PARATROOP IN-FLIGHT FEEDING TRIALS. Activities Rep., no date, 8(1), 27pp. (Defence Research Board, Ottawa, Canada).

11,117
To determine whether paratroopers would care to eat enroute to a dropping zone, and, if so, the nature and amount of food items that would be acceptable, in-flight feeding trials were conducted. Two types of food items were used: box lunch meals and candy type food. Thru winter training paratroop exercises were used each of which varied in length of time in flight, time of day, and reaction to regular meal times. After the in-flight meal was served, the paratroopers completed a questionnaire on preferences and amounts eaten. The troopers were allowed to carry to the ground any items not eaten. Analysis of data was in terms of acceptability of food items, food consumption patterns, need for flight feeding time for feeding and food for use after the drop. Recommendations are given. T. I. Peters, G.A., & Drums, L.R. VISUAL DETECTION OF TRIPMINES FOR ANTI-PERSONNEL MINES. Proj. TBI-1000, DA Proj. 595-20-COL, Tech. Rep. 2415, June 1957, 21pp. Samuel Peltzman Ammunition Labs., Picatinny Arsenal, Dover, N.J.

11,119
To study the visual detectability of anti-personnel mine tripwires, a simulated mine field was constructed. Sixteen tripwires (10, 25, 50, or 100 feet long) were placed at two levels (3-6 and 7-13 feet) above ground at intervals along a 600-foot path. Each subject (35) searched visually for the wires as he traversed the path. The number of tripwires detected, not detected but inadvertently avoided, and of mines actuated (wire contacted with sufficient force to set off an attached mousetrap) were analyzed for effect of length and height of tripwires. The findings are discussed in relation to practice and familiarization procedures.

Houston, J.M., & Peacock, L.J. THE EFFECTS OF AUXILIARY TOPICAL HEAT ON MANUAL DEXTERITY IN THE COLD. Proj. 6-95-20-001, Rep. 285, June 1957, 33pp. USA Medical Research Lab., Fort Knox, Ky.

11,120
To assess the effects of auxiliary topical heat on manual dexterity under conditions of low ambient temperature, 23 subjects were given a pegboard test of finger dexterity. They performed the task at room temperature (about 24 degrees Centigrade) with no auxiliary heat and at low ambient temperature (-15.5 degrees Centigrade) with no auxiliary heat, with low auxiliary heat, and with high auxiliary heat. Heat was applied through a heating pad strapped to the forearm. Skin temperatures were measured by copper-constantan thermocouples attached to the back of the hand. Pegboard scores and skin temperatures were analyzed for differential effects of the conditions. Practical significance of the findings are discussed.

Allen, E.G. RESPONSE REVERSAL AND FATIGUE. Proj. 6-95-20-001, Rep. 289, June 1957, 13pp. USA Medical Research Lab., Fort Knox, Ky.

11,121
To study the influence of a fatigue-inducing performance situation on the acquisition of a simple psychomotor skill and upon subsequent interference created by changing the response requirements of the task, 36 subjects (four groups) practiced a self-paced multiple-reaction time task in which four keys controlled a progression of colors in the signal light. Interference was produced by changing the order of progression. The variables were assessed (500 correct responses) or distributed (eight trials of 100 correct responses, ten-second rest between trials) practice. Latency of correct responses, errors, and blocks (latency equal to or exceeding median latency) were analyzed. Psychological blocking was discussed as an indicator of fatigue.

MacLeod, S., Berah, F.J., Freeman, H.I., et al. THE ACQUISITION AND RETENTION OF ODOR IDENTIFICATIONS. RADC TR-57-7, Jan. 1957, 25pp. Human Factors and Intelligence Labs., RADC, Griffiss AFB, N.Y.

11,123
To investigate the relationships between human performance in learning and subsequent retention of olfactory identifications, 15 odorants were metered into a chamber where they were sniffed by groups of four or five Ss at one time. The four groups differed with respect to the number of signal odors they were required to distinguish from background odor as follows: 10-5, 8-7, 6-7, and 4-11. Identification was by alphabetic label aided by written associations of the Ss. All groups were given the same training schedule and retention tests followed at intervals of three minutes, two hours, twenty hours, one week, and five weeks. The percent correct identifications for learning and retention were analyzed in terms of effect of number of signal odors and kind of odorant. T. G. R 6

Boynton, R.M., & Bush, W.R. LABORATORY STUDIES PERTAINING TO VISUAL AIR RECONNAISSANCE. Contract AF 33(616)-2565, Proj. 7157, WADC TR-55-304, Part 2, April 1957, 48pp. Wright Air Development Center, ARDC, Wright-Patterson AFB, Ohio. (University of Rochester).

11,124
This is the second part of a three-stage program investigating relevant variables of visual air reconnaissance. The subject's task was to search for and identify a target (any one of six rectilinear forms) appearing in a background of curvilinear forms. Variables investigated were: (1) brightness contrast (five steps ranging from 100 to 18 per cent), (2) distance (4 to 40 meters), (3) response tendencies of subjects (as governed by reward probabilities), (4) numbers of figures in an array (8, 16, 32, 64, 128, 256), (5) exposure time (3, 6, 12, 24 seconds), and (6) experience with an array. The results were presented primarily as per cent correct recognition. Practical implications of the results are indicated.

Ritchie, M.L., & Bamford, H.E. THE EFFECT UPON THE OUTPUT OF A COMPLEX MAN-MACHINE SYSTEM OF QUICKENING AND DAMPING A DERIVATIVE FEEDBACK DISPLAY. Contract AF 33(616)-3000, Proj. 6190-71573, WADC TR-57-103, April 1957, 25pp. Wright Air Development Center, ARDC, Wright-Patterson AFB, Ohio. (University of Illinois).

11,125
To investigate the effect of quickening and damping an aircraft turn indicator display upon performance (maintenance of straight and level flight), a series of experiments were performed in an electronic flight simulator. Qualified jet pilots served as subjects. Quickening was produced by tilting the after end of the gyro assembly down. Various angles of tilt (zero to ten per cent), damping levels for indicator needle (100 to 700 per cent of normal) and combinations of these factors were used and performance compared with that which would have occurred in straight and level flight. The findings are discussed in relation to a simplified model of the experimental man-machine system.

Kendler, H.H., & Mayzner, M.S. Jr. NONREVERSAL SHIFTS IN CARD-SORTING TWO OR FOUR SORTING CATEGORIES. J. exp. Psychol., April 1956, 51(4), 244-248. (New York University).

11,129
To test a mediational stimulus-response (S-R) formulation of concept-formation behavior; (that superiority of a reversal shift over a nonreversal shift decreases as the number of categories increases) a concept-formulation test of the card-sorting variety was developed which could be used for two or four sorting categories. Experimental procedures were such that half of the subjects learned the concepts and then were required to learn the reverse by sorting cards in a manner opposite to that required for direct learning, the other half learned new concepts on each trial. Each of these groups were divided into two and four sorting categories. The number of trials to learn the concept (criterion: 15 consecutive correct) were compared for the various conditions.

Licklider, J.C.R., & Guttman, M. MASKING OF SPEECH BY LINE-SPECTRUM INTERFERENCE. *J. Acoust. Soc. Amer.*, 1957, 29(2), 287-296. (Massachusetts Institute of Technology).

11,135
To investigate the extent to which the theory of intelligibility that stems from the critical-band hypothesis and importance-function hypothesis accounts for the masking of speech by interference consisting of discrete time components of known frequencies and amplitudes, two series of intelligibility tests were conducted. Speech was presented against a background of (1) continuous-spectrum random noise, and (2) line-spectrum noise of from four to 256 sinusoids superposed in a linear adder, three different spacings of the components in frequency, and several distributions of power among components were studied. The findings are discussed in relation to intelligibility theory and prediction from physical parameters.

Jonger, J.F., & Carhart, R.T. CONTINUOUS VERSUS INTERRUPTED STIMULI IN AUTOMATIC AUDIOMETRY. Rep. 56-58, March 1957, 4pp. *USAF School of Aviation Medicine*, Randolph AFB, Tex. (Northwestern University).

11,136
To provide some information on the temporal nature of the stimulus most suitable for automatic audiometry, Bekesy-type threshold tracings were obtained for 30 young adults at frequencies of 250, 1000, and 4000 cycles per second. Both continuous and discontinuous (short-train tone of 100 milliseconds at intervals of 1200 milliseconds) stimulus tones were used. Threshold values and amplitude of oscillation around the threshold were analyzed and compared for the two stimulus patterns. The results are interpreted in terms of their significance for the general problem of automatic audiometry.

Randall, A.W., & McIntire, O.E. CHARACTERISTICS OF MAGNESIUM FLUORIDE AND P7 PHOSPHOR FOR RADAR PPI APPLICATIONS. Tech. Dev. Rep. 211, June 1957, 4pp. *Technical Development and Evaluation Center, CAA, Indianapolis, Indiana*.

11,138
To compare magnesium fluoride and P7 phosphor for radar plan position indicator applications, tests were made on three cathode-ray tubes (two had magnesium fluoride screen phosphors and one, the standard P7, a zinc sulphide and cadmium screen phosphor). One group of tests included static characteristics, phosphor decay, and brightness. A second group included visual observations of relative brightness, target signal trials, resolution, and eye fatigue. The performance of each of the two magnesium fluoride phosphors is compared to that of the standard and evaluated in terms of operational requirements. Life expectancy and needed protective circuits for the new tubes are discussed.

11,141
This case study includes (1) a description of some of the human factors involved in a weapons systems analysis of the effectiveness of anti-personnel mines, (2) an a priori (theoretical) solution for a component of the system, (3) the actual empirical results obtained from a field test of this component, and (4) how this relates to the methodological applications of human factors in operations research. Discussion emphasizes the importance of human components of man-machine systems in operational analysis, acceptable levels of component validity for decision-making, and the sometimes erroneous nature of common-sense and logic when applied to the human variable.

Goldard, F.A. ADVENTURES IN TACTILE LITERACY. Ann. Psychol., March 1957, 12(3), 115-124. (University of Virginia, Charlottesville, Va.).

11,142

This paper discusses the human integument as a receiving source for several forms of energy and the possibility of using some of the sensory channels as a communication network. Chemical, electrical, and mechanical stimuli are analyzed from the above viewpoint and a series of experiments on vibratory communications are described. The development of a vibratory language and its practical application are discussed and illustrated.

Barter, J.T. ESTIMATION OF THE MASS OF BODY SEGMENTS. WADC Tech. Rep. 57-262, April 1957, 10pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,143

The present study is concerned with the reanalysis of the data on the mass of body segments from two previously published reports: SPACE REQUIREMENTS OF THE SEATED OPERATOR, Dempster, 1955 and THE CENTER OF GRAVITY OF THE HUMAN BODY AS RELATED TO THE EQUIPMENT OF THE GERMAN INFANTRY, Braune and Fischer, 1889. Regression equations for computing the mass of body segments for any known weight are presented along with data on estimated weights of body segments of Air Force flying personnel.

Emanuel, I., & Barter, J.T. LINEAR DISTANCE CHANGES OVER BODY JOINTS. Contract AF 18(600)-30, Proj. 7214, WADC TR-56-364, Feb. 1957, 38pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,144

To provide data on linear distance changes over joints resulting from specifically defined changes in limb positions, measurements were made on 30 young males. The sample was compared statistically to the Air Force flying personnel. Joints and joint complexes included: head and neck, shoulder, elbow, wrist, fingers, trunk, hip, knee, and ankle. Summary statistics and design values are presented for 48 linear distance changes measured over these joints. The uses of these data for the design of close fitting altitude clothing and for determining easement factors in all types of clothing are discussed.

Deutsch, S. SOME STATISTICS CONCERNING TYPE-WRITTEN OR PRINTED MATERIAL. Contract AF-30(602)-1471, Proj. 4519, Rep. R-526, PIB-456, Task 45350, RADC-TN-57-22, Oct. 1956, 13pp. Microwave Research Institute, Polytechnic Institute of Brooklyn.

11,145

This report discusses some statistics associated with a sample of typewritten or printed material for facsimile transmission. Based on the assumption of discrete quantized square (.01 inch) elements, curves are presented giving the probability of occurrence of combinations of black and white elements versus the length of each combination; the entropy of various blocks of symbols is calculated for vertical and horizontal scan; and the saving in time-bandwidth product is calculated for vertical and horizontal scan. Assuming that the sample is binary quantized and continuously scanned in a vertical direction along lines .01 inch apart, smoothed curves are presented that give the relative probability of binary messages versus length of each message.

Williams, A.C., Adelson, M., & Ritchie, M.L. A PROGRAM OF HUMAN ENGINEERING RESEARCH ON THE DESIGN OF AIRCRAFT INSTRUMENT DISPLAYS AND CONTROLS. Contract AF 33(616)-3000, Proj. 6190, Dec. 1956, 34pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,146

This report outlines a program of research on the human factors in the design of aircraft instrument displays and controls. The effort is intended as a source for the Air Force Integrated Display-Integrated Control Program. Three major approaches are listed and discussed: (1) longitudinal studies of particular weapon systems to produce actual designs of displays and controls and to initiate research on general problems uncovered in the process; (2) cross-sectional studies of general problems of design that apply to many types of systems; and (3) formal conceptual systems studies that may have some promise of general applicability such as tracking and servo theory, information and communication theory, game theory, decision theory, and probability theory.

Fry, E.I., & Churchill, E. BODILY DIMENSIONS OF THE OLDER PILOT. Contract AF 18(600)-30, Proj. 7214, Task 71728, June 1956, 39pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,147

To investigate age differences in body dimensions, a comparison of 132 such dimensions on selected groups of older (over 30) and younger (under 30) multi-engine aircraft pilots was made. Data were obtained from the 1950 Anthropometric Survey of Flying Personnel (Air Force). Comparisons were made of mean values and five percentile distributions between the groups. Differences were tested for statistical significance. All comparisons are presented in tabular form. The implications for the design of Air Force clothing and personal equipment are discussed.

Fullinwider, E.G. (Dir.). LONGSHORE SAFETY SURVEY. A SURVEY OF OCCUPATIONAL HAZARDS IN THE STEVEDORE INDUSTRY. Contract N7CNR 29151, Publ. 459, Sept. 1956, 79pp. Maritime Cargo Transportation Conference, National Academy of Sciences-National Research Council, Washington, D.C.

11,148

This report is a study of occupational hazards in the stevedore industry. An analysis of longshore safety data obtained from industrial and governmental sources was made of the degree of hazard involved, nature and extent of injuries to the worker, types of accident, causes of accidents, and estimated cost of accidents. The activities by management, labor, and the government to reduce the accident rates were reviewed. On the basis of the study, definite recommendations are made for methods of improving longshore safety practices to protect the work force and to improve the industries' service to the general public. Actions to be taken by labor, industry and government are specified.

Gyory, E. DEVELOPMENT OF AN ARCTIC PERSONNEL HEATING DEVICE. Contract DA19-129-QM-355, Proj. D053, Final Rep., Sept. 1956, 69pp. Armour Research Foundation, Illinois Institute of Technology.

11,149

This is the final report on the design and development of an Arctic personnel heating device. The device is self-powered and delivers a controlled amount of heat to an inactive person dressed in Arctic ensemble under Arctic weather conditions. Three phases of the research are discussed: (1) an evaluation of various proposed systems in terms of feasibility and practicality, (2) development of the design for the selected system, and (3) testing the performance of the experimental model. Basic design parameters were established for the future construction of a prototype.

American Power Jet Co. ADVANCED METHODS OF
CARGO HANDLING: FUTURE DEVELOPMENTS. Con-
tract DA 44-177-TC-242, APJ Rep. 128-4, Sept.
1955, 176pp. American Power Jet Co., Ridge-
field, N.J.

11,150
This study recommends in detail a series of improve-
ments in the cargo handling process (covering loose
cargo, unitized pallets, containers, vehicles, and heavy
lifts) for future implementation to aid in increasing
the efficiency of military cargo handling, primarily
within the areas of port and beach operations. Each
recommendation is evaluated and justified on its own
merits, and each item of equipment or change is thor-
oughly described in terms of problem area, impacts on opera-
tions, required development efforts, costs, and effect
on Transportation Corps operations.

Bess, B.H. INTERRELATIONS AMONG MEASUREMENTS OF LEADER-
SHIP AND ASSOCIATED BEHAVIOR. Contract W70nr-35609, Tech.
Rep. 5, Dec. 1955, 21pp. Louisiana State University,
Baton Rouge, La.

11,151
To explore relationships of various factors of leader-
ship and behavior in groups, data were taken from a pre-
vious experiment wherein 19 groups of five members each
participated in leaderless group discussions. The method
of metagame-alometry-measurement of relations between and
within individuals' rank order judgments before and after
discussion of the items to be ranked had been used to ob-
tain the data on successful public and successful private
leadership. The extent to which each of these components
contributed to the composite scores was analyzed by cor-
relational methods. The reliability and validity of the
measures used are discussed.

Booth, C.R. THE FACTORS INVOLVED IN THE DE-
VELOPMENT OF A PANORAMIC SEXTANT. Proj. 55-10,
June 1955, 17pp. Senior Observer Section,
Mather AFB, Calif.

11,154
This paper presents a staff study (Senior Observer
Technical Specialist School) of the factors involved in
the development of a panoramic sextant for Air Force
use. The need for such an instrument is present and
future aircraft is stated; the compatibility of such a
sextant with design trends in equipment, and the time
cost factor of development are pointed out. These fac-
tors are evaluated and discussed. Recommendations are
included. Appendix are Air Force Regulation, Numbers
57-2, 60-6, and 60-13 concerning qualitative operational
requirements, classification of Air Force equipment, re-
search and development testing, and operational suitabil-
ity testing.

11,155
Miller, B.T., Lohr, D.J., & Donley, H.L.
AIRCREW EVALUATION OF MD-1 INTEGRATED FLYING
CLOTHING ASSEMBLY. July 1955, 7pp. Human
Factors Operational Engineering Section,
Strategic Air Command, MacDill AFB, Tampa,
Fla.

11,155
To provide aircrew evaluation of the modified MD-1
Integrated Flying Clothing Assembly (constant wear, anti-
exposure suit), flight tests were conducted on crews in
B-47 and F-84 aircraft. Duration of flights ranged
from two to seventeen hours. Test personnel supervised
the donning of the assembly and checked the blower system
(one part of assembly is a ventilation suit) and upon
landing inspected for dryness of clothing and fatigue.
Each crew was questioned about findings relative to equip-
ment during flight. One crew (three) was immersed in the
ocean to test the impermeability and flotation qualities.
The data were analyzed in terms of adequacy of (1) blower
system, (2) suit liner, (3) anti-exposure suit, (4)
gloves, and (5) knife. Fatigue factors are discussed.
Recommendations are included.

11,156
Haythorn, W.W. A REVIEW OF RESEARCH ON GROUP
ASSEMBLY. Proj. 7713, Res. Rep. APFTRC TN-57-
62, May 1957, 14pp. Crew Research Lab., APFTRC,
ARDC, Randolph AFB, Tex.

11,156
This paper reviews research pertaining to relations
between group composition and group effectiveness, espe-
cially emphasizing the assembly of individuals into
crews. This problem occurs in the Air Force whenever a
manpower pool must be formed into teams (3-29 crews,
two-man fighter-bomber crews, Air Defense Direction Cen-
ter crews). The research was categorized as pertaining
to (1) nomination techniques, (2) homogeneity of group
members, (3) distribution of technical and social skills,
(4) interaction of personalities, and (5) mathematical
problems in assembly. On the basis of available evidence
three general principles are stated regarding crew assem-
bly procedures. Some directions for further research
are indicated.

West, L.J. RECOMMENDATIONS FOR TYPEWRITING
TRAINING. Proj. 7714, Devel. Rep. APFTRC TN-
57-68, June 1957, 16pp. Maintenance Lab.,
APFTRC, ARDC, Lowry AFB, Colo.

11,157
This report presents recommendations for typewriting
training -- instructional procedures, materials, and
equipment -- that are based on research evidence
(abstracted from a more comprehensive review) and are
considered in the light of psychological knowledge about
learning. In order to provide a convenient reference
document for the instructor, the recommendations are
given in brief, numbered paragraphs under eleven major
headings. Concepts for learning and for assessment are
related to these procedures.

Howell, W.D., & Edwards, T.M. DETERMINATION OF SOME GEOMETRIC RELATIONSHIPS PERTAINING TO COLLISION FLIGHT PATHS. Tech. Develop. Rep. 259, June 1955, 138pp. Technical Development and Evaluation Center, CAA, Indianapolis, Ind.

11,158
To develop a basic means for permitting a better understanding of cockpit visual and aircraft conspicuity problems as they relate to mid-air collisions, formulas are derived and visual-angle distance charts are presented for certain combinations of straight-and-level, climbing, descending, and turning flight conditions. Visual angles and distances between aircraft may be determined using only aircraft headings and speeds; critical collision courses may also be determined. Tables are presented showing actual airplane altitudes during flight. Actual flight paths recorded in the vicinity of airports are presented. Some performance parameters used in the design of the charts were established from these flight-path data.

Peak, Helen. ANNUAL REPORT OF ATTITUDE CHANGE PROJECT. Contract Monr. 1224 (10), Task NR 171 039, Nov. 1956, 11p. University of Michigan, Ann Arbor, Mich.

11,159
This annual report (1956) describes the activities on a project devoted to determining the conditions of attitude change, or the conditions under which people come to accept or reject some person or group, or some issue or policy. Research efforts thus far have been concerned primarily with using knowledge about cognitive structure as a means for changing attitude, along with the allied problem of generalization. The development and adaptation of methods of measurement have also been of concern. Specific studies have explored the areas of attitude change, information and personality variables.

11,160
Perkin-Elmer Corp. REDESIGN AND MODIFICATION OF MACHINE GUN PERISCOPE SYSTEM. Contract DAI-19-059-507-ORD(P)-2245, Proj. TT2-689, Nov. 1955, 7pp. Perkin-Elmer Corp., Frankford Arsenal, Philadelphia, Penn.

11,160
This is a final narrative summary report of the steps taken in the redesign and modification of the Perkin-Elmer Corporation's Model 100,48 degree Machine Gun Periscope. A final step, a redesign of the modification to provide for ease of manufacture and maintenance was made. The modifications requested by the Army are listed and performance data compiled during tests are presented.

11,161
Brown, A. TESTING AMERICAN CHAIN AND CABLE FORCE TRANSMISSION SYSTEM. Tech. Rep. 5673, Dec. 1956, 3pp. Army Prosthetics Research Lab., Walter Reed Army Medical Center, Washington, D.C.

11,161
To evaluate the frictional and wear characteristics of a modified American Chain and Cable's force transmission system of prosthetic arms, a mock-up arm was constructed and tested by a reciprocating tester under simulated service conditions. The wear life of the new cable system was determined and compared to systems previously tested. Frictional characteristics of the system were measured and compared. The life and wearability of a new type of nylon-coated housing (used in the new model) was further determined. Recommendations concerning further developments are made.

Cook, E.B. THE EPIDEMIOLOGY OF FROSTBITE. Lecture and Review Series 54-5, Sept. 1956, 411-426. Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

11,162
To examine the multiple causation of the trauma of cold injury, all (716) cases of frostbite among the American forces in Korea (1951-1952) were studied using the techniques of epidemiology. Factors included: (1) agent factor (cold, loss of body heat, and others), (2) environmental factors (weather, duration of exposure, condition of ground, combat action, shelter, clothing, and others); and (3) host factors (age, rank, previous injury or illness, nutrition, fatigue, tobacco, cold weather training and others). Control subjects were also interviewed. The data were analyzed for the contribution of the various factors and for interactions among them. Recommendations for minimizing the incidence of frostbite are included.

Ragsdill, R.A. (Proj. Officer). SUITABILITY TEST OF THE 35,000 FPM VERTICAL VELOCITY INDICATOR. FINAL REPORT. Proj. MOODY 56 20, Nov. 1956, 6pp. USAF Training Analysis & Development Div., Moody AFB, Ga.

11,163
To determine the operational suitability of the 35,000 FPM Vertical Velocity Indicator, the Indicator was installed in a T-33 type aircraft and flown 47 hours and 35 minutes (seven hours of night flight). A total of 13 instructor pilots participated in the evaluation flights, all of which were flown either in weather or under hooded VFR conditions. A questionnaire concerning specific performance aspects of the Indicator was answered by the pilots. The data (answers to questions) were analyzed as a basis for recommendations concerning acceptance of the instrument by the Air Force.

Baker, L.E., Mansfield, H.W. & Edwards, S.P. (Chm.). ARMY HUMAN ENGINEERING CONFERENCE REPORT. THE PENTAGON, 14-15 DECEMBER 1955. 97pp. USA Office of the Chief of Staff, Washington, D.C.

11,165
This report is the record of the Army Human Engineering Conference called to provide improved interchange of information on this subject among the various agencies concerned. Addresses "On Human Engineering" and "Army Policy Affecting Human Engineering Research" are given in full, abstracts of technical service presentations to the conference and summaries of conference and summaries of conference discussions and conclusions are included. Appendices contain Army policy documents and texts of conference presentations which include: Army participation in the "Human Engineering Guide"; exchange of human factors information between equipment testing and human engineering research agencies; and improvement of communications among various agencies.

11,166
White, C.S., Whitby, R.D., & MacGregor, J.B. INVESTIGATION OF COCKPIT SEATING. Proj. TED No. PTA 25124, Feb. 1946, 11pp. Tactical Test Div., Naval Air Test Center, Patuxent River, Md.

11,166
To evaluate pilot comfort during long flights with various cockpit seating arrangements, 12 different test flights (from 1.5 to 5.8 hours duration) were made. Seating arrangements included: (1) rubber foam or hair filled seat cushion, (2) seat and back pad, and (3) vibratory seat cushion, on top of life raft and seat pack and seat type parachute. The pilot and one observer acted as experimental subjects with the observer keeping a log of his own and the pilot's impressions. After each trip the subjects were examined for reactive hyperemia (redness) particularly in skin of buttocks, lumbosacral regions, perineal region, and thigh. Analysis and discussion is in terms of seat design, operation of controls, and distracting discomfort. Recommendations are included. T. I.

11,167

Andrea, R.E. PRINT QUALITY FOR AIR PHOTO INTERPRETATION. Thesis, Submitted in Partial Fulfillment of the Requirements for the Degree of Master of Arts, 1955, 213pp. Boston University.

11,167

To investigate various characteristics of photographic reproductions for air photo interpretation, 18 military photo interpreters were asked to choose between paired photographs on the basis of information content. Sixteen stereographs were printed from one pair of negatives (scale 1:8,400), each printed differently to emphasize one or more of 13 targets in the scene - transparency versus print, collimated versus diffuse light printing, glossy versus unglazed surface, light versus dark appearance, steep versus shallow curve gradient, and type of paper. Paired comparisons were made with and without a stereoscope. The data were analyzed as percent preferences shown for the various reproductive factors. Four subsidiary studies on various aspects of photography are appended. T. G. I.

11,168

Slawitz, A. REPORT OF AIRBORNE NOISE SURVEY IN USS TIMBERMAN (EAG 152). Lab. Proj. 528C-6, Final Rep., Sept. 1956, 15pp. Material Lab., N.Y., Naval Shipyard, Brooklyn, N.Y.

11,168

An airborne noise survey was conducted in the USS Timberman (an experimental ship of advanced design that incorporates the use of high pressure and high temperature steam conditions, high rotative speeds, and so forth) during November 1955, en route from Boston Shipyard to Key West Naval Base. Microphones were placed at ear height for all measurements in the selected stations: operating stations within machinery spaces, Captains Cabin, Combat Information Center, working stations by propulsion units, engine rooms, and others. Noise levels for each station were tabulated for speeds of 0, 10, 20, and 25 knots. Specification criteria were included for comparison. Comfort levels, speech interference levels, and deafness risk hazards are discussed and recommendations made. T. I.

Usawa, R. ON THE LOGICAL RELATION BETWEEN PREFERENCE AND REVEALED PREFERENCE. Prepared under Contract N6onr-25133, Proj. NR 047-004, Tech. Rep. 38, Nov. 1956, 20pp. Stanford University.

11,169

This note clarifies the logical relation between preference and revealed preference as it relates to the theory of consumer's choice. Mathematical proof is offered to support the stated theorems. R 8

11,170

Welch, B.E., Marcinek, J.G., Mann, J.B., Grotheer, M.P., et al. CALORIC INTAKE AND ENERGY EXPENDITURE OF ELEVEN MEN IN A DESERT ENVIRONMENT. Proj. 6-60-11-080, Rep. 190, Aug. 1956, 22pp. Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,170

This study is one of a series of experiments designed to quantitate caloric intake and expenditures in several environments with a well-defined regimen of physical activity. The test site for this study was the hot-dry environment of Arizona (Yuma Test Station); mean ambient temperature, 33 degrees Centigrade; mean relative humidity, 35 per cent. Caloric intake and expenditure were studied in 11 men. All foods were weighed, time-motion studies performed, and energy expenditures for all activities in the field determined. Measurements of body stores of fat and weight changes were made and used in assessment of caloric intake and expenditure. These results are compared with those from a subarctic environment. T. R 17

11,171

Lawrence, W., Stead, L.G., Jones, E.T., McLean, D.J., & Clark, J.A. METHODS AND PURPOSES OF SPEECH SYNTHESIS; REPORT OF THE COLLOQUIUM HELD AT S.R.D.E. ON THE 8th & 9th of SEPTEMBER 1955. U.D.C. 534.79, Rep. 1100, March 1956, 61pp. Ministry of Supply, London, England.

11,171

This report is an account of the proceedings of a colloquium held at the Signals Research and Development Establishment, Christchurch, Hants, England. Each of five speakers discussed the methods and purposes of speech synthesis and analysis from the point of view of their particular program, unsolved problems, and future plans. Abbreviated transcripts of these talks and subsequent discussions are included. A bibliography, with abstracts, is appended. T. I. R 87

Arnold, W.O., Bower, M.M., Crane, R.L., Erickson, J.R., et al. SYSTEMS ENGINEERING STUDY OF SEMIAUTOMATIC AIR TRAFFIC CONTROL AND DATA COMMUNICATIONS. Contract DA 36-039-ec-64567, Final Rep., Task A, Part 3, Vol. 1, Nov. 1954-Dec. 1955, 159pp. Bell Telephone Labs., New York, N.Y.

11,173

This report represents one phase of a study of air traffic control aimed at crystallizing planning for an improved Common System. The scope of work summarized in this report was limited to systems study effort designed to analyze the need for automation of communications and display in air traffic control, to explore promising means for its accomplishment, and to consider its potential use in an operational system. Technical and operational factors that influence selection of major system elements and help determine their characteristics were analyzed. An air-ground data link was studied in detail. Promising approaches to development and design of a semi-automatic system are included. T. G. I.

Gray, R.P. RELATIONSHIPS BETWEEN OCULOGYRAL ILLUSIONS AND NYSTAGMUS. NADC MA 5609, Proj. NM 001 111 302, Rep. 1, Aug. 1956, 14pp. Aviation Medical Acceleration Lab., NADC, Johnsville, Penn.

11,175

To investigate relations among the several responses of humans to rotation which are used as indices of response to vestibular stimulation, four subjects were exposed to rotation during 228 runs on a human centrifuge. Various angular accelerations were utilized as stimuli while nystagmus and reports of oculogyral illusions (OGI) and feelings of rotation were continuously recorded from the time the centrifuge started until one and one-half minutes after it stopped. The time relationships among OGIs, nystagmus, and feelings of rotation were analyzed. The results are discussed in terms of causal factors of the oculogyral illusion. T. G. I. R 8

11,176

Kirsch, H.A. AN AIDED-TRACKING SYSTEM SIMULATOR. NITS TM 1778, June 1954, 39pp. USN Ordnance Test Station, China Lake, Calif.

11,176

To obtain an aided-tracking system suitable for high speed tracking, controllable by one operator, and reliable for use on missile test ranges under adverse weather conditions, this study was initiated. Derivations of the transform functions representing four aided-tracking systems were shown: 1) displacement-plus-velocity; 2) lead-displacement; displacement-plus-velocity; 3) displacement; velocity-plus-acceleration; and 4) lead-displacement; displacement; velocity-plus-acceleration. A description was included of the design and development of an aided-tracking-system simulator, a servomechanism capable of converting a linear input displacement into four basic output-motion components which form the required systems when combined suitably.

Fleishman, E.A. PSYCHOMOTOR SELECTION TESTS: RESEARCH AND APPLICATION IN THE UNITED STATES AIR FORCE. Personnel Psychol., 1956, 9(4), 449-467. (AFPTRC, ARDC, Lackland AFB, Tex.).

11,178

This paper presents an overview of several lines of research carried out in the United States Air Force in the area of psychomotor testing. Psychomotor tests which have been most successful as predictors of pilot success are described (Complex Coordination, Rudder Control, Rotary Pursuit, Two Hand Coordination) and several new tests are discussed. The current status of the pilot selection program is indicated. A brief summary of fundamental research includes discussion of attempts to isolate and define important dimensions of human abilities in the area of psychomotor skills, and studies relating these aptitudes to efficiency in learning complex tasks.

Gaydos, H.F. & Dusek, E.R. EFFECTS OF LOCALIZED COOLING OF THE HANDS VS. TOTAL BODY COOLING ON PERFORMANCE OF A COMPLEX MANUAL TASK. Proj. 7 83 01 005, Tech. Rep. EP 65, Aug. 1957, 7pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

11,179

To investigate the nature of environmental factors that produce detrimental effects on manual performance in the cold, 16 subjects were tested on complex manual performance tasks (knot tying and block stringing without visual cues) under two different environmental conditions after a period of training to control learning effects. Under one condition, only the subject's hands were cooled while the rest of his body was exposed to comfortable ambient temperatures; in the other the subject worked in total in a low ambient temperature. Tests were given in both cases when skin temperatures reached certain predetermined levels. The performance data were studied by analysis of variance techniques.

General Electric Co. FOURTH INVITATIONAL CONFERENCE FOR VISUAL RESEARCH SPECIALISTS. PAPERS IN BRIEF. April 1956, 73pp. General Electric Co., Nela Park, Cleveland, Ohio.

11,180

This report presents summaries of twenty reports on research in light, vision, and seeing. The reports were given at an Invitational Conference for Visual Research Specialists held for the purpose of exchange of ideas, experiences, techniques, and results of research being done in various laboratories.

Gregg, L.W. CHANGES IN MUSCULAR TENSION DURING PSYCHOMOTOR PERFORMANCE. Contract DA 19-129-QM-250, Proj. 7-83-01-003A, Tech. Rep. EP-54, May 1957, 27pp. USA Quartermaster Research and Development Center, Natick, Mass. (Carnegie Institute of Technology).

11,181

To determine whether a feasible measure of generalized muscular tension could be derived from separate muscle action potentials obtained from various muscle groups, changes in the magnitude of such potentials were observed in two separate experiments. A total of 72 subjects performed fatiguing tasks (arm-hand steadiness, tapping, carrying 67 pound packboards, squeezing hand dynamometer and weight-lifting) while the muscle action potentials were being obtained. The action potential measures were analyzed for the effects of load, fatigue, rest, and their relation to performance changes.

Groth, Hilde, & Lyman, J. PREHENSION FORCE AS AN EFFORT INDEX FOR EVALUATING LIGHT MANIPULATORY PERFORMANCE. Contract DA 19-129-qm-525, Rep. EP-57-39, June 1957, 57pp. USA Quartermaster Research and Development Center, Natick, Mass. (Dept. of Engineering, University of California at Los Angeles).

11,182

To examine prehension force (grasp force exerted by the finger pads upon the manipulated object - a pressure sensitive cylinder) as a practical index of effort, 20 subjects performed a manipulation task requiring discrete movements. One group used right hand only, another the left hand. Conditions varied were: (1) pace: self-paced, rhythmical (two-second intervals), arrhythmical (one-to-five-second intervals); (2) pattern: regular or random; (3) noise: 70 and 90 decibels sound pressure level; and (4) a speed trial. Measurements were made of mean prehension force, pulse rate increase, effort rating scale scores, time per transport, and errors. Relationships between prehension force and the other measures were analyzed; effects of experimental conditions were studied and stability of measure was established.

Guetzkow, H., & Dill, W.R. FACTORS IN THE ORGANIZATIONAL DEVELOPMENT OF TASK-ORIENTED GROUPS. No date, 52pp. Graduate School of Industrial Administration, Carnegie Institute of Technology.

11,183

To study the mechanisms by which task-oriented groups develop interaction structures for task performance, various degrees of communication restriction were imposed upon the group (all channel, circle, and hub communication nets) for periods of task performance and periods of organizational planning activity. The processes involved in the organizational development were analyzed and two theories proposed - local learning and insightful planning. A second experiment was carried out to test these conclusions and the results analyzed the manner in which the various communication structures affected these processes and, hence, the degree of organization achieved.

Hale, H.B., Sayers, G., Sydnor, Katherine L., Sweet, M.L., & Van Fossan, D.D. BLOOD AGTH AND PLASMA CORTICOSTEROIDS IN MAN DURING EXPOSURE TO SIMULATED ALTITUDE AND HIGH AMBIENT TEMPERATURE. Rep. 57-55, Feb. 1957, 16pp. Department of Physiology and Biophysics, USAF School of Aviation Medicine, Randolph AFB, Tex. (Western Reserve University).

11,184

To evaluate the effect of exposure of healthy human subjects to adverse environmental influences (simulated altitude and high ambient temperature) on blood AGTH and on blood corticosteroids, a series of tests were conducted: (1) short exposures of 2, 15, or 45 minutes with hypoxia induced by gas mixture, heated metal chamber of 52 degrees Centigrade, exposures to altitude and temperature separately and combined, one control condition; (2) three-hour exposure to hypoxia induced by decompression (14,000 feet) in heated chamber; and (3) two hour exposure with same conditions but different subjects. Blood samples and other physiologic measures (circulation, respiration, temperature, and so forth) were analyzed for changes from normal.

Hoffman, H.S. THE DETECTION OF SIGNALS AND THEIR ATTRIBUTES. Proj. NM 003 041.55.02, Rep. 277, Sept. 1956, 6pp. USK Medical Research Lab., Naval Submarine Base, New London, Conn.

11,185

To study the relation between detection of a signal and detection of separate attributes of that signal, a series of signal-like noises was presented against a background of noise. Listeners were required to detect these signals and specify their separate attributes. Attributes were: chopping or periodic interruption of signal, and modulation or periodic change in signal bandwidth. A given signal was either chopped, modulated, chopped and modulated, or steady. Comparisons were made of the percentage of times the four types of signals were detected. The findings are discussed in terms of cues involved in signal detection behavior.

Kobrick, J.L. QUARTERMASTER HUMAN ENGINEERING HANDBOOK SERIES: III. DIMENSIONS OF THE LOWER LIMIT OF GLOVED HAND SIZE. Proj. 7-83-01-004, Tech. Rep. EP-43, Feb. 1957, 185pp. USA Quartermaster Research and Development Center, Natick, Mass.

11,187

This report presents human engineering information on the hand dimensions of the soldier wearing various ensembles of Quartermaster protective handwear. The data are compiled for use by engineers and designers as a handbook for establishing size and space allowances in the design and sizing of hand operated equipment. The criterion used is the point below which the smallest five percent of hand sizes fall - the lower limit of hand size. The information is presented in pictorial form with index scales, so that dimensions can be measured on the pictures and referred to the index scale to establish actual size.

Pohlmann, H.F., & Katchmar, L.T. AN EVALUATION OF SELECTED RIFLE SIGHTS UNDER TWO LEVELS OF ILLUMINATION. Proj. TBI-1300, Tech. Memo. 7-57, July 1957, 8pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Aberdeen, Md.

11,189

To determine the accuracy permitted by a series of rifle sights under live firing conditions for high (50 footcandle) and low (one footcandle) illumination, a repeated measurements design employing ten subjects was used. The sights were a standard M1 and two experimental sights that had been reported to permit a high degree of sighting accuracy for both high and low illumination under laboratory conditions. Each subject was given six trials of four ten-shot groups; one trial for each sight-illumination condition. All shot groups were scored and measured in inches; mean scores were analyzed for differences due to sights and illumination.

Kurke, M.L., & McCain, C.W. Jr. LOW POWER OPTICAL SYSTEMS AND AERIAL TARGET DETECTION. Proj. TBI-1000, Tech. Memo. 5-57, June 1957, 14pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Aberdeen, Md.

11,190

To determine minimum visible thresholds in detecting airborne targets, several monocular optical systems were investigated. The first experiment used an F-56 aircraft target with one, three, five, six and seven power optics; subjects (30) signalled for detection and again for confirmation when details of the target became visible. A second experiment used fixed targets of varying sizes against an empty field background and a terrain background with one, two and one-half, and three power optics in addition to an open tube and the bare eyes. The data (mean detection distance in yards of mean size of target detected at 100 yards) were analyzed for differences due to optical system and type of background.

Lang, D.A. SOME ADVANTAGES AND DISADVANTAGES OF VARIABLE AND NON-LINEAR GEARING BETWEEN THE PILOT'S CONTROL AND THE CONTROL SURFACE. Current Paper 253, Rep. 283, 1956, 15pp. Aeronautical Research Council, Ministry of Supply, London, England.

11,191

The advantages and disadvantages arising from the use of variable and non-linear gearing between the pilot's control and the corresponding control surface are considered. Possible methods of incorporating such gearing into control systems are outlined together with an analysis of resulting stick forces and movements. Reasons for desiring variable or non-linear gearing are discussed and methods for obtaining the required characteristics reviewed. Various possible applications are discussed.

Lieberman, A.M., Delattre, P.C., Cooper, F.S., & Gerstman, L.J. THE ROLE OF CONSONANT-VOWEL TRANSITIONS IN THE PERCEPTION OF THE STOP AND NASAL CONSONANTS. Psychological Monographs, 1954, 68(8), 13pp. (Haskins Labs., New York, N.Y.).

11,192

To study the role of consonant-vowel transitions (frequency shifts observed on spectrograms of such syllables) in the perception of the stop and nasal consonants, two series for each (stop and nasal) of simplified, handpainted spectrograms of transition-plus-vowel and vowel-plus-transition were prepared and converted into sound by a special purpose playback. The transitions were varied in steps of 120 cycles per second above and below the second formant (from 720 to 480 cycles per second). Groups (33 each) of listeners were asked to judge, variously, whether the sounds were (1) b, d, or g; (2) p, t, k; (3) m, n, or ng. Analysis was made of the distributions of judgments for the various stimuli.

Mathews, C.W. ANALOG STUDY OF THE EFFECTS OF VARIOUS TYPES OF CONTROL FEEL ON THE DYNAMIC CHARACTERISTICS OF A PILOT-AIRPLANE COMBINATION. NACA Res. Abstr. 116, June 1957, 13pp. National Advisory Committee for Aeronautics, Washington, D.C. (Langley Aeronautical Lab., Langley Field, Va.).

11,193

To investigate the intrinsic features of various types of control feel (forces on the pilot's stick that provide him with cues to the airplane response), a closed-loop type of analysis was made utilizing an analog of the human pilot. Types of feel forces considered were those obtained from the pilot's control inputs (stick centering springs) and those obtained from the airplane's response (bobweight feel). The usefulness and limitations of these sources for the longitudinal control system of an airplane are discussed.

Wiscloff, Christine. EFFECTS OF CLOTHING ON RANGE OF MOTION IN THE ARM AND SHOULDER GIRDLES. Proj. 7-83-0044, Tech. Rep. EP-49, June 1957, 31pp. USA Quartermaster Research and Engineering Center, Natick, Mass. (State University of Iowa).

11,194

To determine the effects of clothing on range of motion in the arm and shoulder girdles, measurements were taken of the range of movement combining shoulder flexion, abduction, and adduction and of elbow flexion on 359 male subjects, with and without an arm and shoulder harness simulating clothing restriction. A retest was given 87 subjects as a check on reliability of measurements. Ranges, means, and standard deviations were computed and compared for movements with and without restriction. Relations between the various motions were computed.

Hart, K.G. AUTOMATIC FLIGHT CONTROL SYSTEMS FOR PILOTED AIRCRAFT. Contract NDAS 51-514(C), BUAER Rep. AE 61 4.VI, April 1956, 340pp. USN Bureau of Aeronautics, Washington, D.C. (Northrop Aircraft Inc., Hawthorne, Calif.).

11,196

This volume is devoted primarily to methods for designing automatic flight control systems for piloted aircraft. It is written for the college graduate who has had some training in systems engineering. The history of the development of automatic aircraft control and a discussion of general functions performed by present day control systems are presented in Chapter I. Succeeding chapters include (1) a description of automatic flight control systems and, where possible, derivations of their transfer functions, (2) a recommended design procedure accompanied by an illustrative example, and (3) a discussion of the concept of systems engineering along with some other useful design considerations.

USN Physiological Psychology Branch. BIBLIOGRAPHY ON MOTION SICKNESS. Rep. 2, ONR Rep. ACR 3, Jan. 1956, 29pp. USN Physiological Psychology Branch, ONR, Washington, D.C.

11,197

This bibliography on motion sickness represents the literature up to and through the year 1954. Compilation was made preliminary to organizing a comprehensive study of the evaluation of drug protection against motion sickness in its many forms. References were selected that were felt to be of value to those concerned with the broad organization of the study as well as those undertaking various aspects of the program.

Schipper, L.M., Kraft, C.L., Smode, A.P., & Pitts, P.M. THE USE OF DISPLAYS SHOWING IDENTITY VS. NO-IDENTITY. A STUDY IN HUMAN ENGINEERING ASPECTS OF RADAR AIR TRAFFIC CONTROL. Contract AF 33(616)-3612, Proj. 7192, WADC TR-57-21, Feb. 1957, 22pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University Research Foundation).

11,199

This experiment is the sixth in a series of systems studies of air traffic control. The purpose was to evaluate the efficiency of a one-controller system with (1) an omnipresent clock-type identity code versus (2) the absence of identity on the radar blips. A series of simulated return-to-base missions (32 for each condition) were used; each mission was composed of ten fighter-type and ten bomber-type planes and accepted for entry to the final 50 miles to GCA gate at separations of 60, 75, 90, or 105 seconds. Four experienced United States Air Force controllers served as subjects. Measures of fuel consumption, control time, conflicts (failures to achieve specified separations) and missed approaches were analyzed as functions of rate of entry for both conditions of identification. Sidorsky, R.C. PRECISE CONTROL MANIPULATION AS A FUNCTION OF CONTROL LOCATION. Proj. 6-95-20-001, Rep. 288, Jan. 1957, 9pp. Dept. of Psych., USA Medical Research Lab., Fort Knox, Ky.

11,200

To determine the relative efficiency of rotary control manipulation as a function of the location of the control with respect to the operator's body, ten subjects performed a compensatory tracking task using a rotary knob control. The location of the control was varied randomly over eleven positions distributed over an area that could be reached comfortably with the right arm (0, 45, and 90 degrees to the right at shoulder level, 45 degrees above and below shoulder level, and one position at 90 degrees above and one 80 degrees below shoulder level). Three trials of 33 seconds were given at each location daily for eight days. Mean error scores (millimeters) were analyzed for effect of control location. Recommendations are included.

11,201

Versace, J. THE EFFECT OF EMERGENCIES AND COMMUNICATIONS AVAILABILITY WITH DIFFERING ENTRY RATES. A STUDY IN HUMAN ENGINEERING ASPECTS OF RADAR AIR TRAFFIC CONTROL. Contract AF 33(616)-3612, Proj. 7192, WADC TR-56-70, Dec. 1956, 72pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University Research Foundation).

11,201

This experiment is fifth in a series of systems studies of air traffic control. Two controllers were required to move a group of 32 jet bombers and fighters through the terminal zone extending for a radius of 50 miles from the Ground Control Approach (GCA) gate. Variables were: (1) presence or absence of direct, face-to-face communication between controllers, (2) presence or absence of emergencies, and (3) traffic load. Average separation of 45, 60 and 90 seconds per aircraft. An electronic air traffic control simulator was used with partially optimized displays - blips bright and clear and carrying identification coding. Control performance, as measured by fuel consumption, control time, and safe separations at the GCA gate, was analyzed for the effect of the experimental variables. T. G. I. R 26

11,202

Allen, W.H., & Megbitt, F.H. ANALYSIS OF SURVIVAL EQUIPMENT (AU 387-54-RSI, REVISED). ADIC-0-106, May 1958, 78pp. Aretia, Desert, Tropics Information Center, Research Studies Institute, Maxwell AFB, Ala.

11,202

This report analyzes the effectiveness of individual items of sea and land survival equipment used in survival kits of the United States Air Forces. The material for the study was obtained primarily from official reports of more than 2000 survival incidents. Some data were obtained from interviews with Air Rescue personnel, survival training instructors, personal equipment technicians, and others who use survival equipment. The material represents a sampling of survival experience for the period June 1950 to June 1954. Each article is listed alphabetically with accompanying case histories. Capabilities of the equipment are emphasized.

11,203

van den Brink, G. RETINAL SUMMATION AND THE VISIBILITY OF MOVING OBJECTS. No date, 104pp. Institute for Perception RNO-TNO, National Defence Research Council TNO, National Council for Applied Scientific Research in the Netherlands.

11,203

In this report both theory and experiments are described on: summative properties of the retina, thresholds for moving point sources for a dark-adapted eye, and visual acuity for moving objects. (1) The chance on summation of two subliminal effects (light flashes) was determined as a function of distance and time between the effects. A number of brightness and color combinations of flashes and adapting field were used at various retinal locations. (2) Thresholds for moving point sources were measured for a number of color and brightness combinations over a wide interval of velocities and exposure times. (3) Detail vision for moving objects was determined for a number of velocities as a function of exposure time. G. I. R 58

11,204

Wilbanks, W.A. THE MEASUREMENT OF COLOR BLINDNESS. Rep. 2, Aug. 1956, 44pp. USN School of Aviation Medicine, Pensacola, Fla.

11,204

This monograph provides a reasonably nontechnical introduction to the theoretical basis of tests of color blindness for persons who have had no formal training in color theory. The system of color specification accepted by the Optical Society of America, the CIE system, is described and color vision defects are then described and classified in terms of this system. A number of tests of color blindness involving the use of printed colored plates are discussed and the limits of these polychromatic tests examined. T. G. I. R 16

11,205

Ward, J.R. A NOTE ON THE INTERMITTENCY OF A HUMAN OPERATOR IN A CONTROL SYSTEM. ARL/HE Note 2, June 1957, 12pp. Aeronautical Research Labs., Research & Development Branch, Dept. of Supply, Sydney, Australia. (University of Sydney, Australia).

11,205

This report summarizes the early stages of an investigation into the characteristics of a human operator in a control system. Two approaches for a mathematical formulation of these characteristics--linear theory and the intermittency hypothesis--were examined critically. A model of the human operator was synthesized based upon the sampling hypothesis and tested by recording tracking errors of three human subjects and of the synthetic subject, using an analogue computer and arbitrary function generator. The records were analyzed for agreement between the human and the model. G. I. R 6

11,206

Aukes, L.E., & Simon, G.B. THE RELATIVE EFFECTIVENESS OF AN AIR FORCE TRAINING DEVICE USED INTACT VS. WITH ISOLATED PARTS. Proj. 7709, Rea. Rep. 57-77, June 1957, 15pp. Maintenance Lab., APPINC, ARDC, Lowry AFB, Colo.

11,206

To determine whether a training device used with isolated parts is superior to the device used intact in certain learning situations, three equivalent groups of elementary technical-course Air Force students (144 total) were given instruction by a tape-recorded lecture on the B-47 rudder power control system. A visual portrayal of the system was utilized in two forms: (1) intact--all parts involved in the various subsystems, and (2) isolated parts--relevant parts presented in each case. One group was taught by lecture alone; a second with the intact device, and a third with the isolated parts. Criterion paper-and-pencil tests of achievement were given and the scores for the three groups compared for differences attributable to method of training. T. I. R 3

Baker, P.T. SPATIAL DYNAMICS OF THE NECK-SHOULDER REGION. Proj. 7-83-01-004A, Tech. Rep. EP-56, May 1957, 17pp. USA Quartermaster Research and Development Center, Natick, Mass.

11,207

To study the dimensional changes in the shoulder-neck area caused by movement, 21 men were photographed (each in seven poses) and measurements were made on enlarged photographs. The poses were selected on the basis of those arm, head, and shoulder movements required for an infantry soldier to perform his duty. Measurements of total shoulder length, effective shoulder length, total shoulder area, and effective shoulder area were summarized in tables, and their utility in clothing and equipment design pointed out. Baker, C.A., & Carter, G.H. DESIGN OF AN AIRCRAFT CLOCK DIAL. Task 71549, WADC TN-54-22, Dec. 1954, 8pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,208

To design a display providing the time information required by operators of military aircraft, studies were first undertaken of the various time measures used in operating an aircraft and the methods of clock dial presentation. Design recommendations are made for a display presenting time of day, total elapsed time, and working elapsed time. Specific recommendations are included on scales, numerals, letters, pointers, and setting controls. I. R 4

11,209

Benjamin, F.B. THE EFFECT OF SKIN TEXTURE ON THE HEATING OF THE HUMAN SKIN BY THERMAL RADIATION. Proj. NM 001-103-301, Rep. WADC MA-5515, Dec. 1955, 13pp. Aviation Medical Acceleration Lab., WADC, Johnsville, Penn.

11,209

To determine the effect of skin texture on the heating of the human skin by thermal radiation, the rates of heating and cooling of skin surface were measured for normal "white skin" and for skin painted with India ink when exposed for a short period to intense thermal radiation. Areas of exposure were volar surface of forearm and palm of hand. One series of measurements was made with surfaces covered with olive oil. Subjects were eight laboratory workers with age range from 19 to 42 and four of 80 years or over. The data were analyzed for effects produced by cutaneous site, sex, age, and oiliness or dryness of skin. T. G. I. R 17

11,210

Borch, P.J., Patterson, J.M., & Sheinfeld, W.M. THE EFFICIENCY OF PERFORMANCE DURING EMERGENCY-INDUCED ANXIETY. Rep. 57-20, April 1957, 6pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Columbia University).

11,210

To study problems of psychological stress upon performance, a trace conditioning procedure that involved pairing a one-second tone with a six-second shock after a lapse of six seconds was used. Twenty tone-alone (pre-stress), eleven tone-shock (conditioning), and eleven tone-alone (extinction) trials were administered to ten subjects. A pursuit-rotor task was superimposed on the regular Pavlovian procedure. Heart rate changes (recorded simultaneously with conditioning) and performance measures (percent of total trace time on target) were analyzed for differences during the various phases - pre-stress, conditioning, and extinction.

Bolt Beranek and Newman Inc. A STUDY OF THE JET NOISE PROBLEM IN RELATION TO AIRCRAFT CARRIER CONSTRUCTION. Contract NMs 61502, July 1955, 134pp. Bureau of Naval Affairs, Navy Dept., Washington, D.C. (Bolt Beranek and Newman Inc., Cambridge, Mass.).

11,211

To study the problem of jet noise aboard aircraft carriers and its effect on communications in important ship's spaces, the steps described below have been taken and are presented in this preliminary report: (1) Information on the noise source characteristics of carrier-based jet aircraft was obtained during an acoustical survey with free-field noise measurements of four different types of aircraft; (2) a detailed acoustical survey under normal operating conditions was made on the USS Franklin D. Roosevelt. Noise measurements were made in and around spaces, standard operating procedures were observed, and discussions were held with ship's personnel; (3) general methods of noise control applicable to carrier construction are presented and discussed.

Clarke, F.R. CONSTANT-RATIO RULE FOR CONFUSION MATRICES IN SPEECH COMMUNICATION. J. Acoust. Soc. Amer., 1957, 29(5), 715-720. (Contract AF 19(506) 1957, Rep. AFRC TR 56 72. USAF Operational Applications Lab., AFRC, Cambridge, Mass.) (Indiana University, Bloomington, Ind.).

11,212

To devise a simple means for predicting entries in a closed confusion matrix for any subset of items drawn from a master set of items with a known confusion matrix, three experiments are reported. Stimulus materials for the first experiment were three sets of six consonant-vowel syllables, one of which was subdivided into two groups of three items. Four listeners, limiting their responses to items on the list, responded to every item as delivered through earphones with speech-to-noise ratio selected to give 50 percent articulation. Analysis of the matrices led to formulation of a constant-ratio rule for predicting entries. Two experiments using monosyllables and digits were conducted to test the applicability of the rule to analysis of speech communication errors.

11,213

Davis, R.C. ELECTROGALVANIC FACTORS IN AIRCRAFT CONTROL: EXPERIMENTAL INVESTIGATION OF THE EFFECT OF A MUSCLE TENSION REFLEX UPON SIMPLE INSTRUCTED MOVEMENTS. Rep. 55-123, Dec. 1956, 21pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,213

To investigate the relation between a particular muscle tension reaction and particular forms of external reaction, three types of responses were evoked: a muscle tension reflex, an instructed right wrist extension, and an instructed left wrist extension. The corresponding stimuli were: brief (0.2 sec.) intense (90 db) tone, weak (50 db of either 500 or 1500 cps) tone, the significance of which alternated from subject to subject; administration was in all possible combinations evoking each response singly and in combinations in which the reflex began a few tenths of a second before instructed movement. Analysis was in terms of tension levels, muscular activity, and reaction times for each condition.

T. G. R 16

11,214

Davis, R.C. ELECTROGALVANIC FACTORS IN AIRCRAFT CONTROL: MUSCULAR ACTIVITY DURING SPOONY HOUSE AND ITS RELATION TO INSTRUCTED RESPONSES INDUCED BY VISUAL SIGNALS. Rep. 55 126, Jan 1957, 2pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University, Bloomington, Ind.).

11,214

To study muscular tension effects of noise and their relation to instructed flexion and extension movements, measurements of action potentials were made for anterior and flexor regions of both arms for 32 subjects under both noise (90 db) and quiet conditions. Subjects were instructed to move a lever with wrist action to one side or the other in response to specified visual signals, then immediately return it to center position. Action potentials and response times were analyzed for effects of noise, serial position, direction, and instructions. Results are compared to previous findings for auditory signal. Implications for operation of controls are discussed.

T. G. R 2

11,215

Davis, R.C. ELECTROGALVANIC FACTORS IN AIRCRAFT CONTROL: MUSCULAR TENSIONS DURING SIMULTANEOUS PERFORMANCE OF TWO TASKS AND THEIR EFFECT ON PERFORMANCE. Rep. 55 128, Dec. 1956, 12pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University, Bloomington, Ind.).

11,215

To study the effects of simultaneous performance of two tasks, measurements of muscular action potentials were made from six different regions (both arms, legs, and trapezius) for 26 subjects while performing two tasks (separately and simultaneously). The tasks were: supporting a 500 gram weight and the SMI Discrimination Reaction Test. The records were analyzed in terms of: muscle tension patterns for each response and combination of responses, temporal sequence effects, and the relation of both to response time. The findings are discussed in relation to non-laboratory situations.

T. G. R 12

11,215

Davis, R.C. ELECTROGALVANIC FACTORS IN AIRCRAFT CONTROL: MUSCULAR TENSION WHEN TASK REQUIREMENTS ARE CHANGED. Rep. 55 131, Jan. 1957, 12pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University, Bloomington, Ind.).

11,215

To investigate the relation of muscular tension and transfer of training effects, two tasks were used: SMI Discrimination Test (run in the usual fashion and the same test run with the significance of half the signals reversed). Two series of 40 trials were given to four groups (50 subjects), two of which practiced only one task while the other two changed tasks between trial series. Muscle action potentials were recorded from various muscle groups and studied by analysis of variance techniques for differences in inter-stimulus tension among the groups. Reaction time data were analyzed in the same way. Implications for aircraft controls are indicated.

Dease, J. CHANGES IN VISUAL PERFORMANCE AFTER VISUAL WORK. Contract AF 33(938) 22542, WADC TR 57 285, April 1957, 24pp. USAF Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (The Johns Hopkins University, Baltimore, Md.).

11,217

This report presents a critical review of representative experimental and field studies on the effects of prolonged visual work. Two basic kinds of work are differentiated, one primarily involving search for infrequently occurring signals (vigilance tasks) and the other involving continuous use of the oculo-motor system accompanied by more or less continuous mental operation (active task). Contrasts between these two types of tasks and the kinds of impairment resulting from work on each are discussed. Recommendations for further field study and eventual application to work situations are made.

Betsch, W.R., & Stalder, L.H. PROBABILITY AND WORK AS DETERMINERS OF EFFICIENCY IN NAVIGATION. J. exp. Psychol., 1957, 53(2), 73-81. (Contract AF 33(600)-25726, Rep. 57-83. Training Aids Research Lab., AFTRC, AFSC, Lackland AFB, Tex. University of Illinois).

11,219
To investigate the effects which two features of problem-solving tasks - probability and work - have upon behavior, two similar, but not identical, tasks were used. Each task required 12 subjects to locate the component that was defective out of three that could be on each of 12 test trials. Each component was different in the probability with which it was defective (1, 2, and 3) and the amount of work required to check it (task 1: 3, 2, and 1; task 2: 7, 4, and 1). First and second choice preferences for all trials were tabulated and the resulting proportions, per block of trials, were compared for the two tasks. In addition, verbalized preferences obtained at the end of the trials were analyzed and compared. Implications for training methods are discussed. T. G. R 2

11,221
To study the radiation hazard resulting from fission product contamination of aircraft, aircraft parts, and aircraft facilities, an analysis of data available in current literature was made. Hazards are classified as inhalation, ingestion, and external. Suitable monitoring techniques for determining these hazards are suggested. Limits of external and internal radiation levels are recommended for those items of material released for general usage and for items kept in a controlled area; also, dosage limits for personnel working in such areas, and limits applicable to emergency situations are given. Domaszki, T.J. HUMAN STRESS RESPONSE IN JET AIRCRAFT OPERATIONS. Rep. 57-16, Dec. 1956, 4pp. Dept. of Pathology, USAF School of Aviation Medicine, Randolph AFB, Tex.

11,225
To study human stress response in jet aircraft operations, the blood eosinophil count was used as an objective index of such stress. Preceding and following one-hour flights, blood counts were made on jet pilots differing with respect to their prior flying experience in the aircraft concerned (F-80D and F-94): 1. two groups engaged in different stages of transition training, 2. experienced pilots engaged in new in-flight learning, and 3. experienced pilots and radar observers flying routine missions. Student pilots operating the F-80D simulator were also studied. The data were analyzed for differences that could be associated with the various experience levels. T. R 7

Egan, J.P. MONITORING TASK IN SPACE COMMUNICATION. J. Space Res., 1957, 22(6), 482-489. (Contract AF 12(600)-571, Rep. 56-45, Operational Applications Lab., AFTRC, Balling AFB, Washington, D.C. Indiana University).

11,227
This paper defines the monitoring task in space communication involving several relay channels where only certain ones carry relevant information to a given operator or monitor. A quantitative description of the monitor's behavior in receiving and identifying a restricted number of messages and ignoring others is given in terms of the operating characteristic (relation between probabilities of acceptance of correct and of incorrect messages) and the articulation-error function. The role of the criterion was investigated in two experiments in which 1. the criterion of acceptance was varied and 2. the degree of conflict among the messages was varied. T. G. R 6

Cookley, J.D. DETECTION OF AIRCRAFT BY RADAR SUBJECTS TO RADAR INTERFERENCE. Contract AF 36-630-SC-64667, Proj. 3-78-01-022, Final Rep., May 1957, 17pp. Signal Corps Engineering Lab., Fort Monmouth, N.J. (Dunlap and Associates, Inc., Stamford, Conn.).

11,229
This monograph examines some of the consequences of radio interference for the operator. Primary consideration is given to a typical FV scope used as a display for radar signals. Reasons for the neglect or underestimation of the results of interference are discussed under three related topics: 1. signal versus visual displays, 2. visibility versus detectability, and 3. interference versus spatial limitations, defects, and weaknesses affecting from operational use of the screen in detecting targets are brought out. The final section deals with suggestions for improvement in design and in operation that will be of advantage to the operator in detecting targets. C.

HEMISPHERES. Proj. 6-95-20-001, Rep. 304, Aug.
1957, 14pp. Experimental Psychology Dept.,
USM Medical Research Lab., Fort Mon, Ky.

11,225
To investigate the ability of human subjects to localize the distance of sounds, 20 subjects with normal hearing adjusted a variable tone until they judged it to be at the same distance from them as a standard reference tone. Variables were: Distance of standard tone from subject (10 or 20 ft.), frequency of signal (400 and 1000 cps), and auditory angle between the tones (5° and 30°). Sound pressure level was 78 db for 1000 cps and 94 db for 400 cps signal; one signal was always attenuated 15 db relative to the other. The standard tone was on the right for half the trials and on the left for the other half. Mean settings and error scores were analyzed for effects of the main variables.

Fox, Katherine. THE EFFECT OF CLOTHING ON
CERTAIN MEASURES OF STRENGTH OF UPPER EXTRE-
MITIES. Proj. 7-85-0044, Tech. Rep. EP-47,
June 1957, 33pp. USA Quartermaster Research
and Engineering Center, Natick, Mass.

11,226
To investigate the effect of clothing on measures of strength, 35 MCC students were tested. The following measurements were made: (1) maximum strength and endurance for pushing, with and without an arm and shoulder harness simulating clothing restriction, and (2) maximum strength and endurance of five types of grips chosen to represent the effect of harness upon grip formation (normal, thumbless, thumb and finger, wide, and padded grips). Strength scores (in pounds) were analyzed for differences due to simulated clothing restriction and simulated harness. The relation of strength differences and age was studied. Replications for clothing design are indicated.

Graham, W.J., & Iven, R.L. PROPELLER FOR T-6
AIRCRAFT, NOISE LEVEL SURVEY. Note 52-56,
EDC 695-33, Sept. 1952, 19pp. Aero Medical
Lab., WADC, AFCC, Wright-Patterson AFB, Ohio.

11,227
To investigate noise spectra generated by two different models of propellers (12 JAC/612A-12 and 6931A-19) for T-6 aircraft, propellers were mounted on aircraft and subjected to static and flight tests. Measurements of noise were made under "free field" conditions as arches located 25, 50 and 100 feet from propeller hub for engine settings of 1500, 2000, and 2250 rotation per minute. Flight tests were conducted over the microphones at altitude of 100 feet at various engine settings. These data were analyzed and compared for the two propellers. In addition a comparison was made with human tolerance criteria. Recommendations are made concerning necessary protection of service personnel.

TEXTURE AND DEPTH PERCEPTION. Rep. 57-24,
April 1957, 13pp. Dept. of Ophthalmology,
USAF School of Aviation Medicine, Randolph
AFB, Tex. (Cibus; Washington University).

11,228
To study the role of irregular surface texture in depth perception, a plate-stereometer was used to measure true and apparent differences. Five test panels (surfaces varying in grain size and density) were viewed binocularly by 20 subjects in such a manner that the upper half of the contourless panel was seen by the naked eye and the lower half through glass plates. The task was to adjust the glass plates so that the upper and lower half appeared equidistant, or so that the lower half appeared to be just behind the upper half under two conditions of luminance (bright and dim). Errors (deviations of glass plates from zero) were analyzed for effects of separate texture elements--grain size, density, and distribution of light points--upon depth perception.

ADAPTATION EFFECTS IN VESTIBULAR REACTIONS.
Proj. 6-95-20-001, Rep. 293, Jan. 1957, 14pp.
Dept. of Psychology, USA Medical Research Lab.,
Fort Mon, Ky.

11,229
To determine whether adaptation effects in vestibular reactions are manifest during the course of prolonged reactions, 20 subjects were subjected to three series of six angular decelerations of different magnitude (from 1.90 to 10.02 degrees per second squared). The duration of each deceleration was calculated to produce a theoretical cupula deviation which would be the same for all decelerations. Measurements of (1) time from termination of deceleration to cessation of primary apparent rotation effect, (2) time from onset of deceleration to subject's signal of onset of apparent rotation, and (3) total time from onset of apparent rotation until effect subsided. These data were analyzed for adaptation effects and for rate of development of this process.

Hardy, J.D. THE NATURE OF PAIN. WADC DA-5607,
June 1956, 49pp. Aviation Medical Accel-
eration Lab., WADC, Johnsville, Penn. (Uni-
versity of Pennsylvania).

11,231
This paper summarizes present knowledge about the pain sense and evaluates its role in human life. An historical review of the concepts of pain and its importance as a moral force is presented. "Physical" and "mental" pain are described in terms of reactions to noxious stimulation and reactions to pain which together constitute the pain experience. Methods used for the study of pain are described - thermal radiation and pressure - and evidence presented for the uniformity of pain thresholds. Further topics treated are pain intensity and tissue injury, reactions to noxious stimulation, reactions to pain, and the effect of analgesic agents upon pain.

ATING PROCEDURE. Contract AF 18(600)-1051,
Proj. 7713, Res. Rep. 57-64, May 1957, 49pp.
Operator Lab., AFFTRC, ARDC, Randolph AFB, Tex.
(Ohio State University).

11,232
To measure the extent to which crew members agree with each other on RE-47 crew operating procedures (those not included in standard operating procedures) and to determine relationship of this measure to independent criteria of crew effectiveness, photo-reconnaissance crews were used. A questionnaire concerning crew operating procedures in four task areas was developed and administered to crew members. Responses indicated who did what, when. Indexes of agreement were computed. The criteria measures included ratings by supervisors and objective data of crew performance. The data were analyzed by correlational methods. Possible uses for use of this measure for prediction are discussed.

Pearson, H.G., & Byars, G.E. Jr. THE DEVELOPMENT AND VALIDATION OF A CHECKLIST FOR MEASURING SUBJECTIVE FATIGUE. Rep. 56-115, Dec. 1956, 16pp. Dept. of Psychology, USAF School of Aviation Medicine, Randolph AFB, Tex.

11,233.
To construct a subjective measure of fatigue the scale discrimination method was adopted. Selected items (15) for the scale were selected in a developmental study. The 15-item experimental forms were constructed and administered to both an experimental group (150 subjects) and a control group (150 subjects - no task). The scale was studied for reliability (equivalent form correlation) and validity (change in scores within group and discrimination between groups). A related study used the checklist to investigate differences among subjects taking multiple, dependent, and placebo drug treatments.

Flatzer, H.L. THE PHASE-PLANE AS A TOOL FOR THE STUDY OF HUMAN BEHAVIOR IN TRACKING PROBLEMS. Contract AF 33(035)-10420, Proj. 7182, WADC TR-55-444, Nov. 1955, 10pp. Aero Medical Lab., WADC, AFSC, Wright-Patterson AFB, Ohio. (Franklin Institute, Philadelphia, Penn.).

11,235.
This report presents the background and the results of experiments performed to determine the applicability of phase-plane techniques to the study of human response in tracking problems. A mathematical description of phase-plane technique is given and its advantage as a tool for determining non-linearities in human response pointed out. In the experiments described the display presented to the operator was the error signal which was controlled by a spring-centered stick yielding the possibility of continuous control. Experimental results are then analyzed by the phase-plane technique. Indications of the usefulness of this technique are discussed.

Ruger, S.N., & Voots, R.J. EXPERIMENTAL DETERMINATION OF THRESHOLD RELIABILITIES FOR FOUR METHODS OF AUTOMATIC SELF-TESTING, PULSE-TONE ADDUCTION. Rep. 57-63, March 1957, 10pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (State University of Iowa).

11,237.
To investigate suitable psychophysical procedures for obtaining threshold measures on an automatic, self-testing, pulse-tone adductor, apparatus was designed and constructed to test four of the most promising methods. In all methods, a first approach to threshold was made by 5, 10, 15, and 20 decibel steps from above and below threshold. Subjects (132), randomly assigned, were tested at three frequencies (500, 2000, and 6000 cycles per second) on each of two consecutive days. The data were analyzed to provide an estimate of precision and reliability of the four methods.

Pollock, Y. INTENSITY DISCRIMINATION THRESHOLDS UNDER SEVERAL PSYCHOPHYSICAL PROCEDURES. J. Acoust. Soc. Amer., 1954, 26(6), 1056-1059. (Operational Applications Lab., AFSC, Bolling AFB, Washington, D.C.).

11,240.
To examine the range among discrimination thresholds for the detection of change in the sound level of a tone obtained by different experimental procedures, a series of experiments were carried out. The primary variable was temporal duration between successive bursts of a tone (from 0.31 to 20 seconds). Five procedures differing in terms of presence or absence of an objective comparison tone and in stability of test conditions were used: floating standard, single standard, roving standard, single comparison standard, and roving comparison standard. Detection thresholds for criteria of 60, 75, and 90 percent correct detection were analyzed and graphic comparisons among methods were made. Discussion is in terms of molar concepts pertinent to the listener.

Pollack, I. SOUND LEVEL DISCRIMINATION AND VARIATION OF REFERENCE TESTING CONDITIONS. *J. acoust. Soc. Amer.*, 1955, 27(3), 474-480. (Operational Applications Lab., AFRC, Bolling AFB, Washington, D.C.).

11,241
To establish the accuracy of sound level discrimination as a function of the magnitude, temporal and dimensional aspects among reference testing conditions, a series of tests were conducted. All tests paired two successive tone bursts for discrimination between sound level of the second as compared to the first. The first, or reference signal, was varied systematically in regard to: (1) intensity difference, (2) temporal patterning, (3) temporal interval, (4) dimensional variability, (5) interaction of frequency and intensity variability, (6) varying frequency of occurrence, and (7) predetermined vs. random external testing conditions. The results are considered in terms of psychological dimensions in auditory discrimination.

Pollack, I. METHOD OF REPRODUCTION AND THE IDENTIFICATION OF ELEMENTARY AUDITORY DISPLAYS. *J. acoust. Soc. Amer.*, 1954, 26(6), 1060-1063. (Operational Applications Lab., AFRC, Bolling AFB, Washington, D.C.).

11,242
To develop a psychophysical procedure that might improve identification of aspects of elementary auditory displays, the salient features of the classical discrimination and identification experiments were combined. The method consisted of presentation of a step on the stimulus scale, listener's response, presentation of the step represented by the listener's response, and another listener response (method of reproduction). The original sequence was repeated (recycle) and a control procedure consisting of repeated identification without correction was used. Two auditory stimulus aspects were examined: sound level and frequency of a tone. The data were analyzed in terms of average information transmitted (bits) as a function of the number of successive responses.

Pollack, I. MASKING BY A PERIODICALLY INTERRUPTED NOISE. *J. acoust. Soc. Amer.*, 1955, 27(2), 353-355. (Operational Applications Lab., AFRC, Bolling AFB, Washington, D.C.).

11,243
To examine the effect of a wide range of intermittent noise conditions upon the masked threshold of a 1000-cycle tone and the intelligibility of monosyllabic words, two experiments were conducted. Three variables were manipulated: burst repetition rate, inter-burst ratio (difference between burst level and interval between bursts, in decibels), and burst-time fraction (portion of each cycle occupied by noise bursts) of an interrupted white noise. With noise burst level constant (91 decibels), masked thresholds for a 100-cycle tone were determined by eight listeners as each variable was manipulated. PB (phonetically balanced) lists were substituted for the tone in the intelligibility tests. The data were analyzed as functions of interrupted noise as compared with continuous noise. G. I. R 4

Delattre, P.C., Liberman, A.M., & Cooper, P.S. ACOUSTIC LOCI AND TRANSITIONAL CUES FOR CONSONANTS. *J. acoust. Soc. Amer.*, 1955, 27(4), 769-773. (Haskins Labs., New York, N.Y.).

11,244
To investigate the acoustic loci (a fixed frequency position) and transitional cues (frequency shifts) for consonants, acoustic stimuli were produced by converting hand painted spectrograms into sound for evaluation by the ear. Stimulus patterns having a straight transition of the second formant and varied degrees of rising transition of the first formant and producing 65 vowels of differing color were identified and evaluated to find the positions of the second formant loci of stop consonants b, d, and g and to test their independence of vowel color. The patterns of the first and second formants were then reversed to identify first formant locus. A third series of stimuli were designed to determine whether transitions start from the locus and move to steady-state level of the vowel or merely point to the locus. I. R 6

Pickett, J.M. PERCEPTION OF VOWELS HEARD IN NOISES OF VARIOUS SPECTRA. *J. acoust. Soc. Amer.*, 1957, 29(5), 613-620. (USAF Operational Applications Lab., AFRC, Bolling AFB, Washington, D.C.).

11,245
To study the perception of vowels spoken in syllables and heard in noises of various spectra, two sets of test syllables were used: one artificial set in which vowels occurred with equal probability and one Harvard PB (phonetically balanced) set in which the vowels matched the frequency of speech sounds in English. Four noise signals were used: high frequency, flat, low frequency, and very low frequency. Practiced listeners wrote the words or the syllables under each noise condition. The response data were analyzed by means of confusion matrices for shifts due to changes in the noise spectrum. The shifts in vowel confusions were further analyzed in terms of a current theory of vowel perception, and as a basis for selecting vowels for use in noise.

Secker, L.R. & Pickett, J.M. VISUAL INDICATION OF SPEECH AS AN AID TO HEARING IT IN NOISE AND DAPPLE. *J. acoust. Soc. Amer.*, Jan. 1957, 29(1), 150-151. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

11,246
To determine whether visual indication of speech would improve its intelligibility under conditions of low signal-to-noise ratios, six trained listeners were presented with 300 phonetically balanced (PB) words. Each listener heard half of the words while watching a meter indication of the noise-free speech signal and half without watching the signal. Noises tested were multi-voiced babble (4, 8, 15, and 32 voices) with four signal-to-noise ratios (+3, 0, -3, and -5 decibels) and random noises with four signal-to-noise ratios (0, -5, -9, and -12 decibels). Percentage of words heard correctly were analyzed for differences due to listening with meter indication.

Fairbanks, G., Guttman, N., & Miron, M.S. THE EFFECTS OF TIME COMPRESSION UPON THE AUDITORY COMPREHENSION OF SPOKEN MESSAGES. *J. Speech Dis.*, 1957, 22(1), 10-19, 20-22. (University of Illinois).

11,248
To explore methods of increasing the efficiency of communication of information through spoken messages, a series of three experiments were conducted. Message comprehension was measured under the following conditions: (1) rate of presentation varied from 141 to 270 words per minute, yielding time compressions of 0, 30, 50, 60, and 70 percent; (2) double presentation of same material at a time compression of 50 percent and single presentation at zero percent; (3) message length increased 43 percent by non-repetitive restatements of selected portions with presentation time same as for uncompressed. The data (test scores) were analyzed for effects of rate of presentation and varied repetition upon auditory comprehension.

Pink, J.B. ELECTROKYMOTGRAPHIC FACTORS IN AIRCRAFT CONTROL: THE DEVELOPMENT AND LOSS OF A MUSCLE TENSION SET TO AN INCIDENTAL STIMULUS. Rep. 56-130, Dec. 1956, 15pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,249

To investigate acquisition and extinction of a muscle tension set to an incidental stimulus, a Pavlovian conditioning paradigm was used. Subjects were instructed to press a right-hand key to a high-pitched signal tone, preceded by a special warning tone, and a left-hand key to a low-pitched signal tone (no special warning tone). A second group was given the same instructions, however, a low-level tone was given preceding the left-hand response contrary to instructions (30 training trials, 10 extinction trials). Measurements were obtained of left arm extensor digitorum muscle action potentials and studied by analysis of variance techniques to evaluate time and trial effects. Replications of incidental motor sets for control movements in practical situations are indicated. T. G. R 31

McKee, Mary Ellen. THE EFFECT OF CLOTHING ON THE SPEED OF MOVEMENT IN THE UPPER EXTREMITY. Contract DA-44-109-QM-1760, Proj. 7-83-01-004A, Tech. Rep. EP-48, June 1957, 38pp. USA Quartermaster Research and Engineering Center, Natick, Mass. (State University of Iowa).

11,252

As part of a larger study of the effect of clothing restriction upon movement, 339 ROTC students were given speed tests of overhead and forward cranking and horizontal striking, with and without an arm and shoulder harness simulating clothing restriction. The tests were repeated for 60 of the subjects. Speed was measured as the total movement time (cranking) and number of hits in one minute (horizontal striking). The data were analyzed for test-retest reliabilities, for relations among the three types of speed test, for differences in speed due to clothing restriction and for differences due to age. Warm-up phenomena and fatigue effects were noted. T. R 24

Neumann, Ego, & Ammons, R.B. ACQUISITION AND LONG-TERM RETENTION OF A SIMPLE SERIAL PERCEPTUAL-MOTOR SKILL. J. exp. Psychol., 1957, 52(5), 159-161. (University of Louisville).

11,254

To determine some characteristics of the acquisition and retention of a simple serial perceptual-motor task, 100 subjects learned a circular sequence of eight randomly paired toggle switches to a criterion of two consecutive perfect trials. Groups of 20 subjects each were tested for retention (relearning to the same criterion) after one minute, 20 minutes, two days, seven weeks, or one year. Performance curves for acquisition and retention were constructed and analyzed. Serial position curves were also studied. Reports of subjects on the methods they used to learn the task had been gathered during acquisition trials and these were analyzed for effects of verbalization in task performance. G. R 2

11,255

Patton, R.M. ELECTROKYMOTGRAPHIC FACTORS IN AIRCRAFT CONTROL: THE EFFECT OF INDUCED TENSION UPON MUSCULAR ACTIVITY DURING SIMPLE VOLUNTARY MOVEMENT. Rep. 55-133, Jan. 1957, 20pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,255

To investigate the relation between amount of muscular tension present at specific locations and the quality (reaction times) of responses in which the muscles at these locations are involved, action potential recordings were made over the extensor and flexor digitorum muscles of the right arm. Tensions were varied requiring the subject to make a flexion movement with his left wrist and subsequently presenting a signal for movement of right wrist at varying intervals of time (seven intervals from 0.4 to 4.0 seconds). The right arm task was a discrimination between two tones, one for flexion and one for extension. Muscle tension and reaction time data were analyzed in terms of temporal relations, facilitation effects, and type of movement. T. G. R 20

Roby, T.B., & Lanzetta, J.T. A REPLICATION STUDY OF WORK GROUP STRUCTURE AND TASK PERFORMANCE. AFTRC-TN-57-85, Proj. 7713, Task 27101, June 1957, 12pp. Operator Lab., AFTRC, ARDC, Randolph AFB, Tex.

11,256

To investigate effects on performance in three-man groups of varying communication structures, 12 such groups (men in Air Force basic training) were studied. Subjects were seated in three booths, arranged to prevent direct visual and auditory communication, containing two simulated aircraft instruments and two simple switches. The group task was to detect changes in instrument readings, relay the necessary information to the proper individual (telephone circuit) and execute switch adjustments based on relayed or directly available information. Communication structure was varied by the units of information directly available to the control agent (0, 1, 2, and 3 units). Group performance (error scores, number and duration of calls over each channel) was examined in relation to the experimental conditions. T. I. R 1

Cagel, W.C., & Schnaps, J.A. PERCEIVED FRONTAL SIZE AS A DETERMINER OF PERCEIVED STEREOSCOPIC DEPTH. Proj. 6-95-20-001, Rep. 296, Feb. 1957, 81pp. Experimental Psychology Dept., USA Medical Research Lab., Port Knox, Ky.

11,257
To investigate some factors involved in the process by which a stereoscopic extent is perceived as a depth extent, different frontal sizes of the same familiar objects (playing cards) were presented with a ring of light between and behind. Distances between objects were always constant. The subject's task was to throw darts (in separate throwing alley) to the distance of the cards and then the ring. Verbal estimates were also given. Two groups of 12 subjects were used, one with cards of normal size and one with double-size cards. The data (means and standard deviations of perceived distance scores) were analyzed for differences in the two conditions.

Spilth, W. DOWNWARD SPREAD OF MASKING. J. Acoust. Soc. Amer., 1957, 29(4), 502-505. (Proj. 7591, AFPC TX-56-11. Operational Applications Lab., AFPC, Bolling AFB, Washington, D.C.).

11,258
To investigate the low-frequency masking function of noise bands, pulsed pure-tone audiograms were obtained in quiet and in the presence of narrow bands of noise centered at 500, 1000, 2000, and 4000 cycles per second at several sound pressure levels. Threshold data were compared graphically and the amount of masking shown. The results are discussed in relation to masking produced by a single pure tone and related to an hypothesis that ear-produced distortion products is the mechanism producing the effects noted.

Sell, R.G. & Box, A. THE POSITIONING OF THE CONTROLLERS ON THE 48 IN. MILL AT STEWARTS AND LLOYDS, CORBY. FE/SE/73/57, March 1958, 12pp. Plant Engineering and Energy Division, The British Iron & Steel Research Association, London, England.

11,259
This report describes a test carried out in the steelworks of Stewarts and Lloyds, Corby, to determine the optimum positions of the controllers for their new 48 inch mill. (The type of controllers and their general positioning had been decided before this ergonomics test was made.) The trial was carried out by means of a mock-up of the mill controls. This consisted of full size models of the controllers which could be adjusted and fixed in position to suit the convenience of each operator. Recommendations are made on the basis of this trial for the positioning of controllers in the actual mill situation.

Whitt, C.B., Johnson, P.J., & Hertzberg, H.T.E. REVIEW OF ESCAPE HATCH SIZES FOR BAILOUT AND DITCHING. RDO 695-75, TN WCRD 52-81, Sept. 1952, 4pp. Library, Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,260
To review vertine specifications of escape hatches in terms of current (1952) and experimental flying equipment, a mock-up consisting of a plywood panel having a large opening which could be varied in size by means of movable slats was constructed. Seven subjects, representing a range in size from the 5th to 95th percentile of Air Force personnel, wearing the full flying equipment in present use, or experimental Arctic clothing (both with survival kits) made simulated bail-out and ditching tests from the side, bottom and top hatches. Exits were timed and opening increased until greatest possible speed was attained. Recommendations are included.

Miller, E.T. (Proj. Officer). AIR CREW EVALUATION OF INTEGRATED FLYING CLOTHING ASSEMBLY. NCES 220 7(15), Sep. 6, Oct. 1954, 9pp. USAF Human Factors Operational Engineering Section, MacDill AFB, Fla.

11,262
To provide air crew evaluation of the integrated flying clothing assembly for Strategic Air Command use in the B-47 aircraft, 15 assemblies were worn by crew members (five crews) for flights of five, ten, and fifteen hours duration. Test subjects were familiarized with use of equipment prior to the test flights. Each flight was met upon landing and the crew inspected for dryness of clothing and fatigue. The crews were then questioned as to their findings relative to the equipment. Immersion tests were also made to test for leakage and the suitability of flotation gear. Test data were analyzed in terms of functioning of each assembly item: blower system, ventilation suit, suit liner, anti-exposure suit, life preserver, gloves, and knife. Recommendations are included.

Zeitlin, L.R. THE RELATIVE LOUDNESS OF PURE AND COMPLEX TONES. Proj. 6-95-20-001, Rep. 285, Sept. 1957, 20pp. Experimental Psychology Dept., USA Medical Research Lab., Port Knox, Ky.

11,264
To investigate the relative loudness of pure and complex tones, 15 subjects equated (by method of adjustment) the loudness of a variable intensity pure tone (sine wave) with a reference standard complex tone (square wave). Loudness matches were obtained at 100, 150, 200, 300, 400, 700, 1000, 2000, and 4000 cycles per second. A harmonic analysis of the complex wave form was obtained by a photographic method that is fully described. The results are shown in curves based on the differences between the pure and complex tones - tone voltage, power ratios, and acoustic differences. Methods of obtaining a rough approximation of complex tone loudness by summing the loudness of its harmonics are discussed.

USN Physiological Psychology Branch. BIBLIOGRAPHY OF UNCLASSIFIED RESEARCH REPORTS, SUPPLEMENT NO. 31. JULY 1956-JULY 1957. 12pp. USN Physiological Psychology Branch, CGO, Washington, D.C.

11,267

This bibliography of physiological and psychological reports covers the period July, 1956 to July, 1957. Five areas (31 research contracts) are covered: (1) psychophysiology of sensory mechanisms - vision, audition, chemoreception, modulation of vibratory forces; (2) problems of perception and orientation in space - visual acuity for moving objects, visual perception of space and motion, factors in human orientation and disorientation, voice communication; (3) neurophysiological aspects of performance - studies of the brain and human behavior, autonomic and central nervous system, muscle system, hearing losses; (4) psychophysiological factors in human tasks - display, control and transmission of information, both visual and auditory, tracking performance; and (5) effects of high intensity noise. Miller, J.W. A REVIEW OF THE METHODS PREVIOUSLY EMPLOYED TO PRODUCE A HOMOGENEOUS VISUAL FIELD AND THE DESCRIPTION OF A NEWLY DEVISED TECHNIQUE. Contract Wonn-568 (00). Joint Proj. XM 17.01.99, Subtask 2, Rep. 14, Aug. 1957, 10pp. USAF School of Aviation Medicine, Naval Air Station, Pensacola, Fla. (Kresge Eye Institute, Detroit, Mich. & USN School of Aviation Medicine).

11,268

This report reviews various methods that have been used to produce homogeneous visual fields. A new method is then described that permits the manipulation of the hue, saturation, brightness, and density of the whole visual field. Details of the apparatus are given. A number of problems are mentioned which have not been investigated previously due to instrumentation difficulties but which may be examined utilizing this apparatus. Autokinesis in an illuminated field, detection of moving and stationary targets in a homogeneous field, empty field myopia, and the determination of the minimum perceptible velocity in a uniform field.

11,270

Jerison, H.J., & Wallis, R.A. EXPERIMENTS ON VIGILANCE: PERFORMANCE ON A SIMPLE VIGILANCE TASK IN NOISE AND IN QUIET. THIRD IN A SERIES. Contract AF 33(616)-3404, Proj. 7193, WADC TR-57-318, June 1957, 12pp. Aero Medical Lab., WADC, ANDC, Wright-Patterson AFB, Ohio. (Antioch College).

11,270

To study the effect of noise on performance of a simple vigilance task, each subject (2) monitored a clock for double jumps which occurred at irregular intervals interspersed with single jumps. Work time was 13 1/4 hours in both noise and quiet (112.5 and 79 decibels sound pressure level). Percent correct responses in successive time periods were studied by analysis of variance techniques for differences due to the experimental variables. A further analysis of number of subjects responding to each double jump stimulus was made to study performance decrements. The findings are related to previous studies in terms of the components of the vigilance task used.

Gerathwohl, S.J. BRIGHTNESS AND BRIGHTNESS CONTRAST ON THE INTENSITY MODULATED RADAR SCOPE. A CALIBRATION STUDY. Rep. 56-68, June 1957, 39pp. Dept. of Ophthalmology, USAF School of Aviation Medicine, Randolph AFB, Tex.

11,271

This paper reports the measurement of brightness and brightness contrast of sweep, various kinds of targets, and background on the 5 FT 7 and 5 FT 14 cathode ray tubes using a Radar Flight Simulator AN/APQ13-T1A as the research device. Target appearance and identification thresholds were also studied using various electrical parameters, filters and sweep characteristics. In spite of operator and display variation, some generalizations are made with regard to the design, improvement, and operation of intensity modulated radar display.

Weldon, R.J. ERROR REDUCTION IN COMPUTATIONS. Engng. Res. Rep. SC-4074(1R), Nov. 1956, 132pp. Sandia Corp., Albuquerque, N.M. (Dept. of Psychology, University of New Mexico).

11,273

To determine ways to reduce errors in computations done without the aid of a machine, a series of experiments were performed in which subjects, type, and amount of computations were controlled. A provisional unit of measure (dit) was developed as a control for amount of computation. Procedures studied included type of worksheet used, correcting procedures used and checking procedures. All computations were timed. Proficiency of performance (error and time data) were analyzed as a function of worksheet, checking and correcting procedures, and of computers. Appendices contain a review of related literature, forms and methods used in the investigation.

Hauty, G.T., Payne, R.B., & Bauer, R.O. EFFECTS OF OXYGEN AND DEXTRO-AMPHETAMINE UPON WORK DECREMENT. Rep. 56-127, Jan. 1957, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,274

To study the effects of oxygen and dextro-amphetamine upon skill fatigue, 72 young, male subjects were tested. Following 50 minutes of practice at a compensatory pursuit task, subjects were randomly assigned to the six combinations provided by three mixtures of air (60, 21, and 12 per cent oxygen) and two drug conditions (placebo and five milligrams dextro-amphetamine) and then required to perform the task for four consecutive hours. Proficiency scores were studied by comparing performance curves and by analysis of variance techniques for the single and joint effects of oxygen and dextro-amphetamine. Physiologic costs attributable to the analeptic are discussed.

Garvey, W.D. THE EFFECTS OF TASK-INDUCED STRESS ON MAN-MACHINE SYSTEM PERFORMANCE. Proj. NR 401-000 and NR 401-002, NRE Rep. 5015, Sept. 1957, 11pp. Naval Research Lab., Washington, D.C.

11,275
A series of experiments were conducted to determine the effect of stressing the human element in a man-machine tracking system on the performances of three systems: (1) acceleration control, (2) acceleration-aided control, and (3) position control system. First, equated groups of subjects (16) were trained on systems (1) and (2) followed by a series of task-induced stress conditions. Second, the same two systems were equated by selecting the best operators for the poorer system and vice versa. Both training and stress conditions were then imposed. Last, equated groups performed on (1) and (5) as in the preceding. Performance data were analyzed in terms of stress effects on balanced systems achieved by selection, training and human engineering.

Crowder, N.A. A PART-TASK TRAINER FOR TROUBLE SHOOTING. Proj. 7709, Task 37301, Rep. AFFRC TN-57-71, June 1957, 15pp. Maintenance Lab., AFFRC, AADC, Lowry AFB, Colo.

11,276
This article describes the development and use of a part-task trainer for trouble shooting (the Malfunction Information Trainer) on the Sperry K- and MA-6 and MA-7 Bomb-Ray systems. The device permits the student to obtain, for a specific malfunction, coded "test results" at any of 478 test points in the system under any of 26 different combinations of control settings and signal injection procedures. The feasibility of such a coding system, and of physical methods of manufacturing and displaying the coded information were investigated by trial procedures. The acceptability and comprehensibility of the trainer by students were observed in informal trials.

Brown, J.L. & Burke, R.E. THE EFFECT OF POSITIVE ACCELERATION ON VISUAL REACTION TIME. Proj. NM 17 01 12.1, NADC MA 5712, Rep. 4, Aug. 1957, 21pp. USN Aviation Medical Acceleration Lab., NADC, Johnsville, Penn.

11,278
To investigate the effect of positive acceleration (g) on visual reaction time, two subjects responded to visual test signals during exposure on a human centrifuge. Visual signal was presented at random intervals throughout a run or until g-tolerance (failure to respond within 1.5 seconds after onset) was reached. Two test light luminances (4560 and 0.025 millilambert) and two regions of the retina (28' 22minutes and 7' 24 minutes along nasal meridian) were investigated. Reaction time data were analyzed in relation to acceleration level, test light luminance, test light position, and visual effect (g-tolerance). Subjective reports on early loss of form vision are discussed.

McKnight, F.S. A PRELIMINARY STUDY OF OPERATIONAL ADVANTAGES OF PICTORIAL NAVIGATION DISPLAYS. Proj. 6 2 5, Tech. Dev. Rep. 241, June 1954, 26pp. Technical Development & Evaluation Center, CAA, Indianapolis, Ind.

11,281
In the preparation of an evaluation program for three types of pictorial computers, a study of possible applications of these navigation displays to operational problems was made with particular emphasis on application to air traffic control problems. The three pictorial computers (or displays) had a common principle in that they display omnibearing-distance information in pictorial form with the position of an aircraft plotted directly on an aeronautical chart by a position indicator. The advantages of these displays when compared to conventional symbolic instrumentation are discussed. The effects of possible navigation errors when the displays are used with very-high-frequency omnirange/distance-measuring equipment (VCR/DME) are considered.

Phillips, C.B. & Morse, A.L. A REVIEW OF AIRCRAFT EXTERNAL LIGHTING ACTIVITIES. Rep. 215, Sept. 1953, 10pp. Technical Development & Evaluation Center, CAA, Indianapolis, Ind.

The initial advent of night flying required external aircraft lights. The marine practice was adopted in the form of steady-burning, red and green wing-tip lights and a white tail-light. However, in the early days, intensities and fixture designs were not uniform. These lights became less and less adequate as speeds and traffic densities increased. Until, in 1938, growing concern resulted in the expressed need for improvements. Since that time, the Technical Development and Evaluation Center of the Civil Aeronautics Administration and its predecessor organizations have collaborated in much of this work. This report reviews the major activities in this field and, in particular, outlines the trends over the past 14 years in thinking and in development. Mainly, this has been a highly co-operative activity with private concerns and individuals making major contributions at their own expense. Coordination of effort is indicated by an orderly process of evolution. The combined opinions and suggestions of all concerned have guided the TDEC in its development and evaluation work.

11,283
Blount, E., Dowling, C.E., Kay, H., McCormick, R.E., et al. TECHNICAL AND OPERATIONAL EVALUATION OF THE TYPE IV PICTORIAL-DISPLAY EQUIPMENT. Proj. 6 2.5, Tech. Dev. Rep. 242, June 1954, 32pp. Technical Development & Evaluation Center, CAA, Indianapolis, Ind.

11,283
This report describes the technical and operational evaluation of the Type-IV rotatable-panel pictorial display, a navigational aid for use in aircraft equipped with visual omnirange and distance measuring equipment and with a Gyro-syn compass. The display plots the track of the aircraft on a map and simultaneously indicates the heading; course-line-computer indications are also available. Laboratory tests were made of bearing, distance, and heading accuracy as well as physical aspects of the equipment. Accuracy of the display under actual flight conditions was determined and the ability of the pilot to comply with current navigation and traffic-control procedures was established. Recommendations are included.

Milton, A.W. PROBLEMS OF MEASURING THE PROFICIENCY OF E-4 FIRE CONTROL SYSTEM MAINTENANCE MECHANICS. PARTS I-IV. Contract AF 18(600) 144, Research Proj. 21.07.012, RAD Proj. 507 007 0001, EPC Proj. 38, March 1955, 15pp. Educational Research Corporation, Cambridge, Mass.

11,285
The equipment and organizational problems encountered in developing a trouble shooting performance test for the E-4 fire control system are discussed and compared to those of the E-24 system. Five general techniques for inserting malfunctions also are considered.

11,286
O'Rourke, G.G. VERTIGO ALLEY. The Atlantic Monthly, Aug. 1955, 196 (2), 54-57.

11,286
This is an account of a routine night flying mission during which pilot vertigo occurred given by a highly experienced Army pilot. The conditions giving rise to vertigo and the consequences in loss of mastery over the aircraft are portrayed in graphic language.

11,287
Tiedemann, A.T. LIGHTING PATTERN DISTORTION CAUSED BY RAIN ON AN AIRPLANE WINDSHIELD. Tech. Devel. Rep. 160, Jan. 1953, 8pp. Airport Division, Technical Development and Evaluation Center, CAA, Indianapolis, Ind.

11,287
To study the effectiveness of airport lights and light patterns when viewed through an airplane windshield during rainfall, a limited series of observations (direct and photographic) were made. Actual airport approach lights were observed and photographed from a ground station where possible distortion factors could be controlled: (1) rain in atmosphere between observer and lights, (2) rates of waterflow on windshield, (3) air stream on water on windshield, and (4) anti-wetting agent on windshield. Photographic records were analyzed in terms of factors contributing to distortion and maximum rainfall rates that can be tolerated without windshield wipers.

Gilbert, M.S., & Pearson, H.J. Coryn. A STUDY OF THE VISIBILITY AND GLARE RANGES OF SLOPE-LINE APPROACH LIGHTS. Tech. Devel. Rep. 150, Nov. 1951, 29pp. Airport Division, Technical Development and Evaluation Center, CAA, Indianapolis, Ind.

11,288
This report includes a mathematical and graphical analysis of the visibility distribution of the slope-line approach-light system (airport) using the standard civil aeronautics 250 PAR-56 lamp. Some consideration is given to the standard of the United States Air Forces. The analysis, based on Allard's Law, determines the distance from which a slope-line light can be seen by approaching pilots and the distance from which it will be excessively glaring under a variety of visibility conditions and lamp brightness settings. These data are used for a study of the angular settings of the lamps and possible modifications of lamp sizes. Recommendations are included.

Beck, L.H. EXPERIMENTAL EVALUATION ON THE ELGEET IMAGE-STABILIZED BINOCULARS FOR TANK USE. Memo 2144-785-M, May 1955, 6pp. Engineering Research Institute, University of Michigan.

11,289
To evaluate the Elgeet Image-Stabilized Binoculars for tank use, target visibility with these and with conventional binoculars was compared under various conditions of use. Three observers were used. Both binoculars were further compared in terms of general convenience of use. Other engineering interpretations of the concept of image-stabilization are discussed briefly.

11,290

Beck, L.H. AN EXPERIMENTAL STUDY OF GALILEAN TELESCOPIC SPECTACLES. Memo 2144-792-M, June 1955, 11pp. Engineering Research Institute, University of Michigan.

11,290

To explore possible uses of Galilean telescopic spectacles, two experiments were performed. Six observers wore two-power telescopic spectacles for one hour and reported subjective feelings of dizziness or eye-strain. One observer made quantitative tests of range gain by the method of matched visibility. The second experiment compared three sets of spectacles. Data on the range gain of each set over the unaided eye were obtained for two trained observers under controlled laboratory conditions by the method of matched visibility. Recommendations for further study are made.

Beck, L.H. APPROPRIATE UNITS FOR DESCRIBING VISIBILITY DATA. Memo 2144-823-M, July 1955, 11pp. Engineering Research Institute, University of Michigan.

11,291

Appropriate units for describing visibility data on charts for military use are discussed. Considerations involved in making quantitative specifications of the three major visual variables contributing to visibility contrast, background luminance, and size - are discussed. Size specification is seen as the variable involving the most problems; therefore considerations involved in making a choice are detailed: stadimetric use factors, range estimation factors, intelligence, and stress. Recommendations are included.

Beck, L.H. AN EXPERIMENTAL STUDY OF A 13.3 x 125 x 2.4° MONOCULAR TELESCOPE. Memo 2144-793-M, July 1955, 23pp. Engineering Research Institute, University of Michigan.

11,292

To evaluate the overall optical-visual efficiency of a 13.3 x 125 monocular telescope, the telescopic gain (ratios of the distances at which the same target can be detected with the naked eye and the telescope) was determined for three trained observers by the method of matched visibility. Identical procedures were used with the conventional 7 x 50 binocular. The detection efficiency of the instruments was then figured as the ratio of the observed gains to the theoretical magnification. A theoretical analysis of visual-optical efficiency is presented.

Meeker, W.R., May, A.J., Carrell, R.M. & Simshauser, E.D. STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS. Contract DA 36 039 SC 64469, SIGEL Proj. 1320, CMS Proj. 843-D, Rep. 7, May 1956, 39pp. Radio Corporation of America, Camden, N.J.

11,293

This is a progress report on a research program designed to provide information leading to improvement in design of Signal Corps voice communication systems used in high-level noise environments of armored vehicles and helicopters. Articulation tests were conducted on communication systems comprised of a mixture of components from the present system (VHC-7) and equivalents from the recommended system. Studies and measurements on systems of electronic noise reduction were made. One ear phone system (H-101 headset) was investigated for stability of performance. Plans for further work are given.

USA Board NR 6. EVALUATION OF BRITISH-DESIGNED CENTRAL COLLECTIVE PITCH CONTROL. FINAL REPORT ON PROJECT AVN 2756. Rep. ATDEV 6 452/98, Aug. 1956, 17pp. USA Board NR 6, Fort Rucker, Ala.

11,294

To determine the feasibility of a single central collective pitch control in Army helicopters and test the suitability of the British-designed Central Collective Pitch Control for such use, the British system was installed in an H-13C Helicopter and flown a total of 59 test hours. Fifteen experienced helicopter pilots and two student pilots were given training and orientation flights from both pilot and co-pilot seat. Proficiency in various maneuvers was analyzed in relation to the length of training and previous experience. Installation and maintenance problems were studied. Recommendations are included.

Seligson, A.L. RESEARCH REPORT ON TRANSIENT DISTORTION IN LOUSPEAKERS. Lab. Proj. 5247-4, Final Rep., June 1956, 19pp. Materiel Lab., N.Y. Naval Shipyard, Brooklyn, N.Y.

11,295

To study the factor of transient distortion in loudspeakers as it affects subjective judgments of loudspeaker quality, frequency response harmonic distortion and transient distortion measurements were compared for six representative loudspeakers. These measures were correlated and studied for significant relationships. Listeners ranked the loudspeakers on basis of quality after hearing both speech and music. These results were compared with the physical measurements of transient distortion. Finally, a variable degree of transient distortion was introduced into a sound system and effect upon sound quality and amount perceived was observed. Recommendations are given.

Stewart, H.D., & Rail'snyder, M.H. ORIENTATION AND FAMILIARIZATION WITH RADAR AIR TRAFFIC CONTROL. Task 64541, April 1956, 89pp. Directorate of Flight and All Weather Testing, WADC, ARDC, Wright-Patterson AFB, Ohio.

11,296

This booklet was written as an orientation and familiarization aid to all personnel on supervised tours of the Wright-Patterson Radar Approach Control Center. Part I presents a history of the air traffic control program, explains the basic system objectives and the various sections of the organization developed to meet the objectives. Photographs and/or drawings of radar equipment, operational layouts and procedures are included. Part II gives a general description of Traffic Control, Approach, and Landing System in terms of equipment and procedures, both present and future. The function of ground and airborne equipment is explained.

Emanuel, I., & Alexander, M. HEIGHT-WEIGHT SIZING AND FIT-TEST OF A CUTAWAY G-SUIT, TYPE CSU-3/P. - Proj. 7214, WADC TR-57-432, July 1957, 22pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,297

Body size data from the 1950 Air Force Anthropometric Survey have been reanalyzed to yield a statistical sizing program based on height and weight. This six-size program was incorporated into the Type CSU-3/P Cutaway Anti-G Garment, which was tested from the standpoint of fit and comfort on a representative sample (73) of subjects. Suit selection was accomplished simply by asking each subject his height and weight. Conclusions concerning the feasibility of using this sizing procedure are made based on fitting and procurement procedures.

HEARING ACUITY OF AIR FORCE FLIGHT-LINE PERSONNEL. Prelim. Rep. 57-73, July 1957, 13pp.
USAF School of Aviation Medicine, Randolph AFB, Tex. (University of Texas).

11,299
As part of study of relationships between Air Force specialties or job assignments and hearing acuity of individuals involved in these jobs, pure-tone audiometric tests and job, acies, and medical history questionnaires were administered to 996 personnel from Air Force Base flight-line personnel. The audiometric data were analyzed and mean thresholds for all test frequencies calculated for 16 Air Force specialties. Hearing losses at 4000 cycles per second were examined in terms of specialties. Hearing loss was further analyzed in relation to age and exposure. The use of ear protection devices was examined.

Felton, Jean Spencer, & Spencer, Carol.
MORALE OF WORKERS EXPOSED TO HIGH LEVELS OF OCCUPATIONAL NOISE. No date, 59pp. Office of the Surgeon, Air Materiel Command, and the University of Oklahoma School of Medicine.
(University of Oklahoma School of Medicine).

11,300
To study the morale of workers exposed to high levels of noise, 100 jet engine testers were studied and compared with a control group of 100 welders and grinders, matched for age, race, sex, pay status and length of service. Both groups were drawn from workers at the Tinker Air Force Base, Oklahoma. Noise conditions for the two groups measured 119 versus 76 decibels sound pressure levels with 112 and 56 decibels speech interference levels respectively. Techniques included personal interviewing, psychological testing, sociometric investigations, review of illness absence, injury experience, and frequency of visits to medical dispensaries. Analyses of data were made in terms of factors determining morale and behavior on the job.

Griggs, T. & Rulon, P.J. INTERNATIONAL LANGUAGE FOR AVIATION INSTRUMENT FLIGHT. Summary Report. Contract CCA 29581, ERC Proj. 37, Jan. 1953, 174pp. Educational Research Corporation, Cambridge, Mass.

11,301
The objective of this research was to provide a language for radiotelephone communications connected with instrument flight which can be used universally in all language zones. The language should be clear and intelligible against background noise, easy to learn and pronounce, and structurally simple and consistent. Part I of this report discusses the research project-objectives, methods, findings, and recommendations. Part II presents first phrase-by-phrase and then analytically, the actual language for instrument flight. The language is based on English and has a vocabulary of less than 800 words.

Erlick, D.E., & Hunt, D.P. EVALUATING AUDIO WARNING DISPLAYS FOR WEAPON SYSTEMS. Proj. 7189-71570, WADC TR-57-222, April 1957, 23pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,302
This report outlines and discusses the major variables and problem areas that should be given consideration in the evaluation and use of audio warning displays in weapon systems. The problem areas relate to the determination of criticality of events, the human and equipment characteristics involved in the selection of audio warning displays and the task dimensions essential to evaluate them. Operational and research implications are discussed for a two step audio warning display: the first step designed to bring about detection, maintain attention, and identify a general category; the second to isolate the specific malfunction. A general program of research is discussed.

Bamford, H.E., & Ritchie, M.L. INTEGRATED INSTRUMENTS: A ROLL AND TURN INDICATOR. Contract AF 33(616)-3000, Proj. 6190-71573, WADC TR-57-205, May 1957, 18pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (University of Illinois).

11,303
This report is one of a series concerned with the development of effective standby instrumentation for the directional control of an aircraft in case of attitude indicator failure. To evaluate an integrated roll and turn indicator, simulated flight performance of nine Air Force pilots was studied in the YF102 electronic flight simulator under three conditions: (1) with full standard panel (reference condition); (2) attitude indicator covered (control condition); and (3) integrated roll and turn indicator substituted for standard turn indicator (experimental condition). Errors in the direction channels, bank and heading, were compared for each condition. Three principles of display design are offered and discussed.

Rend, F.A., Birmingham, E.P., Tipton, C.L., & Garvey, W.B. THE UTILITY OF QUICKENING THE-
SINES IN IMPROVING TRACKING PERFORMANCE WITH
A BINARY DISPLAY. Proj. DA 368-610, MIL Rep.
3023, Sept. 1957, 6pp. Naval Research Lab.,
Washington, D.C.

11,308
To compare the relative effectiveness in improving
tracking performance of a binary (two lights) and a con-
tinuous (cathode-ray tube) visual error display under
conditions of partial, full, and super-saturation of
the display-control relationship, six subjects performed
under all conditions on two consecutive days. To allow
for tracking performance adaptations, only the last five
of ten trials for each condition was scored. The track-
ing task was compensatory and in one dimension and re-
quired keeping the target centered on scope face or keep-
ing the lights flickering back and forth as rapidly as
possible. Average performance (error scores) curves
were constructed and analyzed for differences due to
experimental conditions.

Clark, M.A. & Farley, D.C. GENERALIZATION OF PATTERN
RECOGNITION IN A SELF-ORGANIZING SYSTEM. Proc. Western
Joint Computer Conference, March 1955, 86-94. (Lincoln
Lab., Massachusetts Institute of Technology, Lexington,
Mass.).

11,312
A self-organizing system reported in a previous paper
is described briefly. The behavior of the system was
simulated by means of a digital computer--the Memory Test
Computer of the Lincoln Laboratory. Two further experi-
ments are described here: the first to demonstrate that
self-organization still takes place even if the input
patterns are subjected to considerable variation; the
second to show that after organization with the usual
fixed patterns, the system classifies other input patterns
statistically according to a simple preponderance pattern.
The significance of the results as a generalization in
pattern recognition is discussed and some remarks are
made on simulation of such systems and its relation to
computer design.

Cohen, E. GROUP SITUATIONAL PERFORMANCE TESTS:
THEIR USES AND CONSTRUCTION. Personnel
Psychol., Spring, 1957, 10 (1), 61-69.

11,314
This article defines a group situational performance
test and summarizes some of the research conducted on
this type of test in the military situation. Six func-
tions that can be served by such tests are discussed and
illustrated: to establish leadership criteria, as train-
ing devices, to determine training needs, to evaluate
training methods, work methods, and organizational struc-
tures. Problems of construction, administration, and
scoring are discussed; some of the possibilities for in-
dustrial use of the tests are suggested.

Murrell, H., Marsh, S.J., Sedfield, H.G.,
McCarthy, C., & Marley, W.J. THE DISPLAY
OF HEADING AND RANGE INFORMATION. Rep. 43,
July 1951, 6pp. Naval Station Study Unit,
Depts. of Operational Research and of the
Senior Psychologist, London, England.

11,312
To determine the various factors involved in the dis-
play of heading and range information, 25 subjects were
each given 30 stimuli on each of two problems with head-
ing information and one problem with range information.
The methods of display were used: pictorial and numeri-
cal. The problems called for comparison of headings and
of ranges. The facts (time to make the judgments and per-
cent correct judgments) were analyzed for speed and ac-
curacy differences between the two methods of display.

Kly, J.N., Schneider, R., Kelly, C.R., &
Chamell, R.C. TRACKING TRAINING I: AN AF-
FIRMAGE. Prepared under Contract Nanz-1900(00),
Proj. 20-7-12, May 1957, 6pp. SEE Training
Device Center, Fort Washington, N.Y. (Dunlap
and Assoc., Inc., Stamford, Conn.).

11,312
To study human tracking performance to elicit aspects
critical to operational success and that are amenable to
training, a survey of tasks containing tracking elements
was conducted through literature surveys and visits to
field operational and training activities. An analysis
of these tasks led to the development of a descriptive
model of tracking behavior designed to encompass all
tracking tasks. Based on the survey and model, a review
of literature, discussions with personnel in tracking
research and a synthesis of the authors' experience, a
group of hypotheses was developed concerned with transfer
of training in tracking tasks.

USAF Office of the Inspector General. VISIBILITY FROM
THE REAR COCKPIT OF F-33 AIRCRAFT. FIELD 1 JANUARY
1952 - 31 DECEMBER 1953. Publ. 24 54, June 1954, 20pp.
USAF Office of the Inspector General, Norton AFB, Calif.

11,313
To determine the extent of obstruction and distortion
affecting the visibility of a pilot seated in the rear
cockpit of a F-33 aircraft, three methods of measurement
and observation were used: 1) ground areas of vision ob-
struction were plotted for various attitudes and fuel
loads and corrected for perspectives that would exist at
prescribed distances and heights from runway touchdown
points; 2) photographs of visible forward areas were taken;
and 3) day and night flights conducted to verify computa-
tions and ascertain further areas of distortion and ob-
struction under a variety of weather conditions. These
data were analyzed and discussed in terms of needs of in-
structor pilot occupying the rear seat. Accident studies
are included.

TRAINEE BODY DIMENSIONS: A CORRELATION MATRIX.
Contract AF 33(516)-3641, WADC TR-57-197,
April 1957, 75pp. Aero Medical Lab., WADC,
AMDC, Wright-Patterson AFB, Ohio. (Antioch
College).

11,314
To add to the stockpile of anthropometric data that
provides a basis for planning and executing design pro-
grams involving body dimensions, correlation coefficients
expressing the degree of relationship between the 1830
pairings of 61 Women Air Force basic trainee body dimen-
sions are presented. Multiple correlation coefficients
expressing the degree of relationship between each of
these dimensions and several pairs of them are given. Re-
gression equations for estimating all other dimensions
from specified values of stature, of weight, and of stature
and weight together are listed. Values are tabulated
for the most frequently occurring values of stature,
weight, and stature-weight.

USAF Human Factors Operations Research Lab. HUMAN ENGINEERING ANALYSIS OF THE USES OF B-47 AIRCRAFT REMOTE. Sept. 1955, 118pp. USAF Human Factors Operations Research Lab., Bolling AFB, Washington, D.C.

11,316

This report presents summary and detailed descriptions of the work performed by B-47 aircraft personnel. It also outlines in detail the characteristics (such as knowledge, initiative, mental alertness, and judgment) required of each crew member. These job analyses were developed by studying all printed documents pertaining to the program, through intensive interviewing of personnel connected with the program, and by direct observation. Preliminary drafts were submitted to experienced B-47 aircraft men for review. The uses to which such job analyses might be put are discussed.

11,317

Tufts University. REPORT ON THE EFFECT OF AMBER FILTERS ON VISUAL ACUITY. Rep. 22, May 1944, 13pp. Tufts University, Medford, Mass.

11,317

To study the effect of amber filters on visual acuity, a series of experiments were conducted under outdoor daylight conditions. In all tests observers judged the orientation of the open end of the test letter (E) with and without a filter as follows: 1) white test object at each of four distances (1.16, 1.66, 2.14, and 2.83 miles); 2) colored test object (white, red, yellow, light green, and blue) on medium green at two distances (765 and 1095 feet); and 3) small white test object against two large colored grounds (blue and red) at same distance as before. Performance (per cent correct judgments) with and without filters was analyzed for differential effects of distance and color.

Tufts University. THE EFFECT OF GREEN AND AMBER FILTERS ON DETAIL VISION DURING THE TRANSITION FROM DAYLIGHT TO DUSK. Rep. 15, March 1943, 7pp. Department of Psychology, Tufts University, Medford, Mass.

11,318

To study the effect of green and amber filters on detail vision during the transition from daylight to dusk (from about 8.5 to 6.4 log microfootlamberts), acuity determinations were made by four observers with a green filter (Lumalith 0-4403, ten gauges), with an amber filter (Polaroid X166AFA), and with the naked eye of test objects at 200 feet. Determinations were made at 15-minute intervals from about 5:30 to 7:15 p.m. Brightness was measured photometrically at the start and end of each test. Tests were repeated on two dark overcast days. Acuity data are compared for vision with and without filters and acuity losses calculated in terms of decreases in brightness producing them.

Seashore, R.E., & Slavinske, A.J. A MESSAGE ANALYSIS OF STRATEGIC AIR COMMUNICATIONS. Contract W33-036-ec-21289, Tech. Rep. 5015, Oct. 1949, 33pp. Air Materiel Command, Wright-Patterson AFB, Ohio. (University of Virginia).

11,319

To ascertain the nature of information being exchanged on long-range strategic flight operations, a preliminary message content analysis was conducted at four operating bases of the Strategic Air Command. Samples of communications from three types of missions (simulated bombing, photo and weather reconnaissance) were included in the analysis. Chief sources of data were interviews with operating personnel and analyses of aircraft radio logs. The messages were classified as to type of report; tentative "message units" were derived, based on items of information, and were used for a more detailed analysis. The results are discussed in relation to a system of visual message presentation.

Cookley, J.D., Abbott, W.C., & Bishop, E.W. HUMAN ENGINEERING REVIEW OF REQUIREMENTS FOR THE RADIO SET AN/GRC-53 (1) ANTENNA AND MAST. PART I: THE ANTENNA ASSEMBLY. Contract DA-36-039-SC-64647, Proj. 3-99-01-022, Sept. 1957, 30pp. USA Signal Engineering Labs., Fort Monmouth, N.J. (Dunlap & Assoc., Inc., Stamford, Conn.).

11,320

To review the requirements for an antenna to be used with the Radio Set AN/GRC-53 from a human engineering viewpoint and make recommendations for design which will facilitate its use, specifically for reduction of time and manpower required for assembly in the field, several types of antenna were considered. The one that was most adaptable to the specified requirements was selected, and various design alternatives were evaluated in a detailed examination of the manual operation involved in setting up and operating the equipment. From this information the best design features and operating procedures were selected and are presented as recommendations.

Nealy, I.L., Macpherson, P.A., & Thrasher, D.H. A STUDY OF THE SPEECH TRANSMISSION CHARACTERISTICS OF LOUDSPEAKER EQUIPMENT. DMR Proj. 216, Rep. 216-1, April 1957, 9pp. Defence Research Medical Lab., Toronto, Ontario, Canada.

11,324

To evaluate the speech transmission characteristics of a loudspeaker system proposed for use in the CL-25 aircraft to transmit emergency information to off-duty crewmen not wearing earphones, two systems (LS 104/AC 10 and HI-44) were studied. Multiple-choice intelligibility test forms were presented to 15 listeners under subject noise conditions comparable to those in flight during cruising conditions (105 and 110 decibels). Other conditions varied were position (0 or 60 degrees from loudspeaker), distance (3-12 feet from loudspeaker), and wearing headsets with and without speech signals. Mean per cent intelligibility scores were analyzed for the various conditions. Recommendations for the use of a loudspeaker system on aircraft are given.

Bryan, G.L. A STUDY OF RELATIONSHIPS BETWEEN TRUE AND RELATIVE MOTION AS PERCEPTUAL TASKS IN TWO DISPLAY CONTEXTS. Prepared under Contract Nour-228(NE), Proj. NR 153-093, Tech. Rep. 20, May 1957, 39pp. Psych. Dept., University of Southern California.

11,325

To explore some relationships between the perception of true and relative motions, two displays involving the motion of two ships, were constructed. Variables studied were: angular difference between true courses (0, 30-60, and 120-150 degrees), and true speeds difference (one to one and five to two ratios). In one display relative motion was presented (one ship stationary and the second moving) and 16 subjects estimated the direction of true motion; in the other, true motion of both ships was presented (both were moving) and a second group of 16 subjects estimated the direction of relative motion between the two ships. The data were analyzed for effects of type of motion, courses, speeds, and their interactions. Implications for training are discussed.

11,326

Stirner, F.W., Siegel, A.I., & Fox, B.H. CAUTION AND WARNING LIGHT INDICATORS FOR NAVAL AIRCRAFT: III. AN EXPERIMENTAL INVESTIGATION INTO THE ADVANTAGES OF A "MASTER" CAUTION INDICATOR. Contract NAMX-ACEL-339, May 1957, 24pp. Air Crew Equilib. Lab., NANC, Philadelphia, Penn. (Applied Psychological Services, Villanova Penn.).

11,326

To investigate the advantages of a centralized master indicator to convey information that one or more peripherally located signals are illuminated, seven subjects were given a multiple compensatory tracking task (simulated flight task) to perform. A collateral task was responding to randomly presented "caution" signals on peripherally located panels. Reaction time to the peripheral indicators and the number of misses (lights not responded to within 4.75 seconds) were recorded. Two peripheral locations of cautionary light panels (on the right at different distances from subject) under simulated day and night flight conditions, with and without the master indicator, were tested. Reaction times and "misses" were analyzed for differences due to the presence of the master indicator. T. I. R 3

Jackson, J.P., & Kuratani, Y. PRODUCTION SCHEDULING RESEARCH: A MONTE CARLO APPROACH. Discussion Paper 61, presented to Seminar on Techniques of Industrial Operations Research, Illinois Institute of Technology, June 1957, 117p. University of California at Los Angeles.

11,327

This is a progress report on work aimed at a variety of problems arising in the operations of job-order machine shops. Exploratory studies are reported in which shop activities have been simulated computationally. Emphasis in these first studies is largely on comparisons of various decision rules in an effort to develop one "good enough" to be incorporated as part of a model in experiments on other aspects of the shop. Plans for future experimentation are discussed.

Campbell, P.A. THE EFFECT OF WEARING EAR COTTON STOPS HEARING ACTIVITY. Proj. 10, Rep. 1, Feb. 1942, 6pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,328

To study the effect of wearing cotton in the ear upon hearing acuity, audiometric tests were made on both ears of 25 young male subjects without and with cotton placed in the external canal of the ear. The two audiograms were compared for differences due to the wearing of cotton. The degree of protection from noise afforded by this device is discussed.

Hansley, A.C., & Tully, F.P. INFLUENCE OF COLORANT SYSTEMS ON THERMAL PROTECTION. PART I: STUDIES ON A SINGLE LAYER FABRIC SYSTEM. PART II: STUDIES ON A 3-LAYER FABRIC SYSTEM AT ONE EXPOSURE LEVEL. Proj. 7-12-01-0020, Rep. 97, May 1957, 55pp. Textile, Clothing & Footwear Division, USA Quartermaster Research and Development Center, Natick, Mass.

11,329

To study the effect of colorants on the power in which thermal energy is used in clothing systems, two experiments were conducted. In the first, single layers of cotton (undyed and vat-dyed in five different colors) were exposed to four levels of irradiance for 0.5 seconds. Temperature rise was analyzed in relation to spectral reflectance, transmittance and absorption. In the second, a three-layer system (resin backed vinyl applied to cotton poplin or a plain vat-dyed poplin, with inner layers of dyed cotton and standard (se-shirt fabric) was exposed to 8.6 calories per square centimeter for 0.5 seconds. Resultant time-temperature curves were analyzed as a function of spacing between layers.

Scobee, R.G. A COMPARISON OF TESTS FOR HETEROPHORIA. Proj. 375, Rep. 1, April 1945, 5pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,330

To study the Screen-Maddox Rod test in relation to other widely used tests for heterophoria, measurements were made on 50 subjects. Three tests (Screen-Maddox Rod, Diplopia E, and Screen and Parallax) were administered at both 20 feet and 13 inches. At the latter distance two additional tests (Maddox Wing and Thorington) were given. The test data were compared by correlational methods for degree of relationship. The Screen and Parallax test data were used as criteria for the analysis. A second study was made of the reliability of the Screen-Maddox test by comparing measurements made by two examiners on the same groups of subjects.

Scobee, R.C. THE EFFECT OF EXHAUSTION AND OF MODERATE ANOXIA ON OCULAR MUSCLE PALANCE. Proj. 252, Rep. 1, July 1944, 3pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,332

To study the effect of exhaustion and of moderate anoxia on ocular muscle balance, 14 healthy white males were selected on the basis of previous finding of a vertical phoria of one prism Diopter (Hobbs, et al). All subjects ran on a treadmill (seven miles per hour on a ten per cent grade) to exhaustion and phoria measurements were made at both 20 feet and 13 inches immediately. Six of the men were taken to simulated height of 15,000 feet in a low pressure chamber for 30 minutes without oxygen. Phoria determinations were made at 13 inches. The measurements were analyzed for changes due to exercise or anoxia.

Weitz, J. EFFECT OF THE SHAPE OF HANDLES AND POSITION OF CONTROLS ON SPEED AND ACCURACY OF PERFORMANCE. Proj. 266, Rep. 1, June 1944, 6pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,332

To determine the relative effect on performance of changing the position and the shape of the handles on aircraft controls, a mockup control column was used with four interchangeable control handles (barrel, sphere, tube, and truncated cylinder). The controls were used to operate a discrimination reaction time test by five groups of subjects (45 each) for three control positions and control shapes. The groups were given two practice periods on two conditions with control groups practicing on only one. Comparisons of speed and accuracy scores were made for interference effects of position and shape changes in learning the new task.

Fougnet, H.B. EVALUATION OF EAR PLUG EFFECTIVENESS. Proj. 257, Rep. 2, July 1944, 3pp. USAF School of Aviation Medicine, Randolph Field, Tex.

11,333

To determine the effect of various types of ear plugs on the middle and external ear when worn at high altitude, 490 subjects were tested in small groups. Four types of plugs were selected: molded impermeate, wax impregnated impermeate, molded perforate, and dry cotton dental roll. Experiments were conducted in the altitude chamber at ground level, 10,000, 24,000, and 38,000 feet with standard pressure rates of ascent and descent in the presence of 107 decibels noise. Immediately following the tests each subject completed a comfort questionnaire and was examined for evidence of middle or external ear pathology and graded according to the severity of the signs on a four-point scale. The data were analyzed for effects of type of ear plug and altitude.

Loucks, R.B. LEGIBILITY OF AIRCRAFT INSTRUMENT DIALS: A FURTHER INVESTIGATION OF THE RELATIVE LEGIBILITY OF TACHOMETER DIALS. Proj. 265, Rep. 2, Oct. 1944, 6pp. USAF School of Aviation Medicine, Randolph Field, Tex.

11,334

To investigate the influence of size and thickness of division numerals on the relative legibility of four types of aircraft tachometer dials, comparisons were made under conditions of reflected and ultraviolet light. Numeral sizes in inches were: 3/16 times 1/32, 9/32 times 3/64, 3/16 times 3/64, and 1/8 times 1/64; one dial with numerals at each 100 revolution per minute division mark and three at each 500 revolution per minute mark. Twenty subjects were required to read settings to the nearest ten revolutions per minute for 1.5 and 0.75 second exposures. Error data were analyzed to provide objective information about specifications and markings for such dials. Problems of maintaining dark adaptation while preserving legibility are discussed.

Jorgar, J.F. AUDITORY ADAPTATION. Rep. 87-19, Jan. 1957, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Northwestern University).

11,335

To investigate adaptation for pure tones, ten young adults served as subjects. Each of 12 experimental conditions consisted of measurement of adaptation (by auditory plane localization) for a given frequency and intensity at one-minute intervals over a five-minute period. Seven frequencies (from 152 to 8000 cycles per second) and seven intensities (from 30 to 90 decibels) were explored. Amount of adaptation (decibels) was computed and mean adaptation curves derived. The influence of frequency, intensity and duration on adaptation were analyzed. Adaptation in relation to loudness was studied by converting the unit of measure to sones.

Madson, E.M. EVALUATION OF AIRCRAFT INSTRUMENT DIAL MARKINGS FOR ACCIDENT INVESTIGATION. Proj. TED ADC/AE-7686, Rep. NADC-41-5675, March 1957, 12pp. USN Air Development Center, Johnsville, Penn.

11,336

To investigate the reliability of a thin coating of paint on the back of instrument pointers as an accident investigation aid, experimental tests were conducted to determine the bending characteristics of various types of pointers. The "g" forces necessary to make pointers strike the dial face were computed by mathematical methods and checked on a centrifuge. The range of "g" forces developed in various types of aircraft accidents were computed and compared with data based upon investigations of actual accidental and experimental crashes. All data were analyzed to determine whether the pointer would touch the dial under crash forces. Recommendations are included.

Criggs, T. & Bulon, P.J. INTERNATIONAL LIAISON FOR ILA. Summary Report. Contract CCA 29395, EBC Proj. 32, Dec. 1951, 26pp. Educational Research Corporation, Cambridge, Mass.

11,337

This report is one of a series issued during a study of an International Language for Aviation. Arrangements for international liaison and cooperation in collecting recordings of radiotelephone communications are described. Informal discussions with communication specialists from nine different countries representing eight different languages are reported.

11,338

Townsend, J.C. DEVELOPMENT AND EVALUATION OF TELEMETRY OF ALL-WEATHER INTERCEPTOR PILOTS IN THE PROFICIENCY MEASUREMENT. Proj. 7716, Devel. Rep. AFPTAC-TN 57 118, Task 57051, Sept. 1957, 74pp. USAF Operator Lab., AFPTAC, Randolph AFB, Tex.

11,338

To develop and evaluate a telemetry station as a research tool for securing in-flight E-4 radar fire-control system performance data for all-weather interceptor pilots of single-place aircraft, the basic Bendix TGRS-2 FM/FM station was supplemented by locally designed and constructed circuitry to permit the telemetering and ground reproduction of airborne radarscope display information. Fifteen flights were flown during which the feasibility of the concept and the actual operation of the telemetry station were evaluated in light of the requirements of a tool for proficiency measurement research and for training. Suggested uses of information gained by this method are offered.

Troutman, D.L., Davis, N., Bollfron, J., et al. ANALYSIS AND SIMULATION OF VEHICULAR TRAFFIC FLOW. Res. Rep. 20, Dec. 1954, 74pp. Institute of Transportation and Traffic Engineering, University of California at Los Angeles.

11,340

This report delineates the phenomena of vehicular traffic flow with particular attention given to relating vehicle delay at intersections to traffic control (such as signalization). The concept of vehicle rate is studied by analysis and simulation: (1) a model involving both the structure and dynamics of intersecting streams of vehicles in terms of flow paths and the operations of queuing, waiting, and proceeding (or turning) subject to cross-traffic and pedestrian interference is constructed; (2) the statistical behavior of congested merging traffic is investigated; (3) simulation with general-purpose computers is considered; and (4) logical designs for a digital and analog computer for simulation purposes are discussed. Recommendations for further study are made. G. I. R 87

Reiner, G.M. DECISION-MAKING: OBJECTIVE MEASURES OF RISK AND CRITERIA. Paper presented to the American Psychological Assoc., Sept. 1957, 7pp. (N.Y., N.Y.) Electric Boat Div., General Dynamics Corp., San Diego, Calif.

11,341

To make a preliminary study of the risks people take when they make decisions, eight subjects were tested over a period of eight weeks. The subject drew a sample of items and decided from which of two or more populations it originated. Descriptions of the possible parent populations were presented on a card. The sample could be as large as subjects needed to make his decision. The data were analyzed by comparing performance with predicted performance following a sequential ratio test. Effects of ambiguity and complexity (2-, 3-, 4-, and 5-choice problems) were further studied in terms of hit and risk probabilities. Differences between subjects were analyzed.

11,342

The effects of cold stress on caloric intake and energy expenditure of five men were studied. Cold stress consisted in living in a chamber at 60 degrees Fahrenheit for 14 days. The men wore only shorts and were allowed minimal physical activity (playing cards, reading, writing, watching television or movies). The cold period was preceded and followed by two weeks at 80 degrees Fahrenheit. Activity and dietary composition were the same for both periods. Accurate records were kept of each item of food eaten and caloric intakes calculated. Resting oxygen consumption was measured at intervals and nude body weight taken each morning. Comparisons were made between data from the cold stress period and from the control and recovery periods.

11,343

Effects of continuous cold stress on daily patterns of oxygen consumption and rectal temperature were studied in five men. Cold stress consisted of living continuously in a chamber at 60 degrees Fahrenheit for 14 days wearing only shorts and taking minimal physical activity. Resting oxygen consumption and rectal temperature were measured at 8 a.m., 12 noon, 4 p.m., and 8 p.m. The cold period was preceded and followed by two weeks at 80 degrees Fahrenheit. Activity and dietary composition were the same for all periods. The data were studied for diurnal patterns that might be attributed to continuous cold exposure.

Russell, R.W. EFFECTS OF VARIATIONS IN AMBIENT TEMPERATURE ON CERTAIN MEASURES OF TRACKING SKILL AND SENSORY SENSITIVITY. Proj. 6-95-20-001, Rep. 300, Nov. 1957, 69pp. USA Medical Research Lab., Fort Knox, Ky.

11,345

To obtain information regarding the effects of ambient temperatures ranging from -10 to +40 degrees Centigrade on five different measures of human performance (skill in using movement and pressure tracking controls, tactile and kinesthetic sensitivity, and strength of hand grip), 12 groups of six subjects each were tested. The groups were divided into two sets, one set using movement and the other pressure controls for tracking. Both sets were required to perform four cycles of all the tasks at one of the six temperatures. A control and a recovery session were given preceding and following each experimental session. Performance data were analyzed as functions of degree and exposure time of temperature. Discussion relates to the use of these data in equipment design.

Guedry, F.E., & Richmond, G. DIFFERENCES IN RESPONSE LATENCY WITH DIFFERENT MAGNITUDE ANGULAR ACCELERATION. Proj. 6-95-20-001, Rep. 301, Nov. 1957, 8pp. USA Medical Research Lab., Psychology Dept., Fort Knox, Ky.

11,346

To determine the latency of detection of rotation when cues to motion other than vestibular stimuli are weak or absent, 15 subjects (seated at the center of a large turntable) received eight angular accelerations (from 0.8 to 10.6 degrees per square second) during each of five sessions. The subjects signalled the onset of apparent rotation as quickly as possible. Only a small target light, secured to the turntable, was visible. The response latencies (time between onset of acceleration and subject's signal of apparent rotation) were analyzed as a function of the magnitude of angular acceleration. Discrepancies between the obtained results and predictions, derived from theoretical mechanics of the semicircular canals, are discussed.

Mackinson, C.M. AUTOMOBILE DRIVING SIMULATOR FEASIBILITY STUDY. FINAL REPORT. Contract DAM 59672, Rep. YR 1344 T 6, Nov. 1958, 177pp. Cornell Aeronautical Lab., Inc., Buffalo, N.Y.

11,347
A study of the feasibility of developing an automobile driving simulator suitable for research is reported. General types of simulators were examined for applicability. The broad engineering requirements were then established and methods of simulating each of the major portions of the total driving environment were examined. It was concluded that development is feasible but that visual display would not be totally adequate until certain new developments in the television industry are reached to practice. Initiation of a research, design, and development program is recommended.

Westinghouse Electric Corp. PILOT ASSIST DEVICE FOR ARMY FIXED-WING LIAISON AIRCRAFT. Contract DA 36-039-sc-63202. EA-40Q-TR109. Quarterly Engng. Rep. 1, Nov. 1954, 46pp. USA Signal Corps, Fort Monmouth, N.J. (Westinghouse Electric Corp., Air Arm Division, Friendship International Airport, Baltimore, Md.)

11,349
This is a report of progress on an analytical study of pilot assist devices undertaken to establish a basic philosophy of aircraft control in relation to pilot requirements. During the reporting period, a sampling of pilot viewpoint was secured by interview with 17 pilots familiar with the general categories of pilot assist systems. Five of the six known manufacturers of autopilots were consulted and a study made of their assist systems. Sufficient data to conduct a dynamic analysis of the L-19 airplane was obtained and a control stick-instrument makeup was partially completed. Plans for further work are given.

Karlin, S., & McGregor, J. MANY SERVER QUEUEING PROCESSES WITH POISSON INPUT AND EXPONENTIAL SERVICE TIMES. Prepared under Contract Nonr-225(28), Proj. MR 047-019, Tech. Rep. 1, May 1957, 51pp. Dept. of Statistics, Stanford University.

11,353
This paper presents analyses of non-stationary problems associated with the many server queueing process, subject to the special assumptions of exponential service time and Poisson input. The analyses rely primarily upon the theory of recurrence and absorption for a birth and death process. The problem is defined, related problems are described, factors in the infinite server queueing process are determined and specialized to the one and two server process. Various probability distributions associated with queueing problems of one and two servers are studied, and corresponding results for the many server queue are written out. Proofs are given in the appendix. The distribution of the maximum length of line during a busy period is derived.

Yiller, P.R., & Greider, H.R. EFFECTS OF ACTIVITY ON METABOLIC RATES OF SUBJECTS WEARING THE FULL PRESSURE SUIT. Proj. TED NAM AE 5109, Rep. NAMC ACEL-345, July 1957, 6pp. USN Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,354
To determine the effects of activity on metabolic rates of subjects wearing the full pressure suit, three subjects performed a simple pilot's task (pushing the stick and two throttles forward and backwards every ten seconds for six minutes) while seated in a F7U mock-up. Metabolic rates and oxygen consumption were obtained while subjects were wearing three suit types (summer flying, unpressurized pressure suit, and pressure suit pressurized at 2.0 pounds per square inch) and either sitting at rest or performing the pilot's task. The data were analyzed for differences due to suit type and to activity. The findings are discussed in relation to need for knowledge of effect of prolonged wear of pressurized suit on energy expenditure.

Allen, R.C., & Armstrong, R.C. MEASURES OF PILOT TOLERANCE TO A HIGH THERMAL-NOISE ENVIRONMENT. Rep. 12-001, Rev. 1957, 11pp. Convair, General Dynamics Corp., San Diego, Calif.

11,355

To test the effects of high heat and noise levels on pilot efficiency, eight subjects performed a task which simulated some of the functions of actual flight, under four conditions: (1) 90 decibels noise, cockpit and wall temperature 80 degrees Fahrenheit; (2) 115 decibels noise, 80 degrees temperature; (3) 90 decibels noise, air temperature 100 degrees and wall temperature 300 degrees; and (4) 115 decibels noise, air temperature 100 degrees and wall temperature 300 degrees. Physiological measures (skin, rectal and oral temperatures, systolic and diastolic pressures, pulse and respiratory rates) and performance measures (task time, errors) were analyzed for effects of test environments. Findings are discussed in relation to design standards for cockpit thermal conditions. T. G. R 3

Stroessler, J.H., Clarke, J.H., Martin, P.A., & Gries, P.T. HUMAN FACTORS IN THE DESIGN AND UTILIZATION OF ELECTRONICS MAINTENANCE INFORMATION. JEL Res. Rep. 782, May 1957, 35pp. USN Electronics Lab., San Diego, Calif.

11,365
To study human factors in the design and utilization of Navy electronics maintenance information, a two-man team interviewed Navy and civilian maintenance personnel at a representative selection of Navy ships, shore establishments, and commands. Data on strengths and weaknesses were presented under the following headings: competence of personnel as technical manual users; uses of technical manuals in maintenance situations; for non-maintenance functions; and by features (schematics, theory of operation, block diagrams, and so forth); effectiveness of current Navy technical manuals (size, inclusiveness, text schematics, systems data, organization, repair and installation data, accuracy); and use and effectiveness of supplements. Recommendations for improvement are included. T. R 11

11,365
USA Arctic Test Branch. ARCTIC TEST OF AA OPERATIONS CENTER AM/MQ-1. REPORT OF PROJECT NR TF 3053 (ARCTIC). Jan. 1955, 12pp. USA Arctic Test Branch, Big Delta, Alaska.

11,365
To determine the suitability and adequacy of Anti-aircraft Operations Center AM/MQ-1 (communication and plotting equipment installed in a 30-foot semi-trailer van) for use in extremely cold weather, arctic tests were conducted. At sub-zero temperatures, tests were made of the time required to raise the temperature of the van to 70 degrees Fahrenheit, of the ability of the heater to maintain this temperature, of heating distribution, of fuel consumption, and of acceptability to user personnel. Mobility tests were made by hauling the van over primary and secondary snow-covered roads; and van components inspected for damage due to extreme cold. Recommendations are included. R 1

11,366
Egan, J.P. MESSAGE REPETITION, OPERATING CHARACTERISTIC AND CONFUSION MATRICES IN SPEECH COMMUNICATION. Contract AF 19(604) 1962, AFRC TR 57 50, June 1957, 164pp. USAF Operational Applications Lab., AFRC, Bolling AFB, Washington, D.C. (Hearing & Communication Lab., Indiana University, Bloomington, Ind.).

11,366
This report describes various terms, concepts, and functional relations that have been found useful in the analysis of certain aspects of the behavior of communication operators when they are attempting to transmit and listen to the spoken word in the presence of noise. The material relates primarily to the operators' estimates of their own accuracy in communications. The results of a variety of experiments are presented and a substantial bibliography is appended. T. G. R 48

Fletcher, Dorothy E. THE EFFECTS OF MODERATE AND LOW LUMINANCES AND VARIOUS DURATIONS OF PRE-EXPOSURE ON DARK ADAPTATION. NADC TA 5708, BU Med Surg NM 001 110 300, Rep. 3, May 1957, 30pp. Aviation Medical Acceleration Lab., NADC, Johnsville, Penn.

11,367
To measure the effects of moderate and low luminances and various durations of pre-exposure on dark adaptation, monocular dark adaptation data for two observers were obtained with the Hecht adaptometer fitted with a two millimeter diameter pupil, as absolute thresholds taken by ascending series of the method of limits. After 30 minutes in the dark, the pre-exposure was presented at a luminance of from 0.000608 to 971 millilamberts and at a duration of from 0.01 to 20 minutes. The white pre-exposure field was 35 degrees in diameter, centered ten degrees nasally. The test field was green, one degree in diameter; ten degrees nasal and 0.02 seconds in duration. The resulting dark adaptation curves are discussed and the data are compared with those of related studies. T. G. R 10

11,368
Miller, G.A., & Friedman, Elizabeth A. THE RECONSTRUCTION OF MUTILATED ENGLISH TEXTS. Information and Control, Sept. 1957, 1(1), 38-55. (Harvard University).

11,368
To further understanding of message transmission problems (in such systems as teletype), a study was performed to determine how much mutilation an ordinary text can tolerate. The ability of 50 human operators to correct mutilations was tested for a variety of mutilations such as inadvertent abbreviation and substitution. The possibility of reducing the redundancy inherent in English orthography is discussed. T. G. R 9

Klemmer, E.T. A FURTHER STUDY OF INFORMATION TRANSMISSION WITH MATRIX PATTERNS. AFRC TR 57-1, Sept. 1957, 6pp. Operational Applications Lab., AFRC, Bolling AFB, Washington 25, D.C.

11,370
To study information transmission with matrix patterns, eleven subjects were shown dot patterns on a four times five matrix for a tachistoscopic exposure of .03 seconds. The subjects reported the positions of lighted bulbs by placing pencil marks in cells of four times five matrices on paper forms. Information transmission scores for the various subjects are presented and there is some discussion of the problem of computing scores in a situation of this sort. T. R 1

Miller, G.A., & Beebe-Center, J.G. SOME PSYCHOLOGICAL METHODS FOR EVALUATING THE QUALITY OF TRANSLATIONS. Mech. Translation, Dec. 1956, 53-80. (Contract AF 33(038)-14343, AFRC TR 56-61, Harvard University).

11,371
This article attempts to survey some of the possible methods for evaluating the quality of translations. The methods discussed are: asking the opinion of competent judges, comparing translations with one of excellence by statistical means, and asking a person who has read only the translation to answer questions based on the original. The advantages and disadvantages of each method are illustrated by examples. T. R 2

11,372
Moser, H.M., Dreher, J.J., & Schwartzkopf, L.J. AN EAR-MOUTH VOICE TRANSDUCER. Contract AF 19(604) 1577, Proj. 7681, AFRC TR 57-54, RP Proj. 864, Tech. Rep. 43, July 1957, 14pp. Operational Applications Lab., AFRC, Bolling AFB, Washington 25, D.C. (OSU & Research Foundation).

11,372
This report describes an ear-mouth voice transducer which operates with sufficiently good signal-to-noise ratio to be used without circumaural protection in the noise field generated by propeller-driven aircraft. Spectral measurements and articulation results for trained listeners with this experimental microphone-receiver are presented as well as some suggestions for possible improvement of the device. T. G. I. R 6

11,373
Mozer, H.M., Droher, J.J., & G'Neill, J.J.
THE MASKING OF ENGLISH WORDS BY PROLONGED VOWEL
SOUNDS. Contract AF 19(604)-1577, Proj. 7661.
APCRC TR 56-74, Proj. RF 664, Tech. Rep. 40,
May 1957, 17pp. Operational Applications Lab.,
APCRC, Bolling AFB, Washington 25, D.C. (OSU
& Research Foundation).

11,373
To investigate the effectiveness of prolonged vowel
sounds for masking English words, 110 monosyllabic words
were selected from the Thorndike list to represent equally
each of the ten vowels and were presented to 300
American listeners in an articulation test. Also tested
were 70 Spondee words representing the same vowel sounds.
Masking was done by recordings of each of the prolonged
vowels by a male trio. The number of correct responses
for each word under each condition of masking was noted
and analyzed. The rank order of vowel masking effective-
ness is given.

Stevens, K.W., Pietrasanta, A.C., & The Staff
of Bolt Beranek and Newman, Inc. PROCEDURES
FOR ESTIMATING NOISE EXPOSURE AND RESULTING
COMMUNITY REACTION FROM AIR BASE OPERATIONS.
Contract AF 33(616)-2151, Proj. 7210, WADC
TR-57-10, April 1957, 74pp. Aero Medical Lab.,
WADC, ARDC, Wright-Patterson AFB, Ohio.
(Bolt Beranek and Newman, Inc., Cambridge,
Mass.).

11,374
This paper presents detailed engineering procedures
for computing noise exposure in communities near jet
air bases. Both ground run-up and take-off operations
of all types of jet aircraft are considered. Graphical
aids for computing noise exposure are provided with cor-
rections to be applied to account for normal background
noise in the community, the previous noise exposure of
the community, and so forth. Tentative means for esti-
mating the complaint behavior of a community are also
included.

Boes, Anita. BIBLIOGRAPHY OF RESEARCH REPORTS
AND PUBLICATIONS ISSUED BY THE BIO-ACOUSTICS
BRANCH (1947-1957). Sept. 1957, 22pp. Aero
Medical Lab., WADC, ARDC, Wright-Patterson AFB,
Ohio.

11,376
This bibliography of research reports and publications
issued by the Bio-Acoustics Branch of the Aero Medical
Laboratory at Wright Air Development Center contains re-
ports on the following major topics: sound sources and
noise fields, sound propagation, acoustic instrumentation,
noise control, hearing and physiology of the ear, speech,
effects of noise, ear protection, and response of the
human body to vibration.

11,377
Westheimer, G. RETINAL LIGHT DISTRIBUTIONS FOR DEFO-
CUSSED TARGETS IN MAXWELLIAN VIEW. Contract NMR 495
(09), Proj. NR 140-105, RF Proj. 654, Tech. Rep. 3,
Nov. 1957, 13pp. Ohio State University Research
Foundation.

11,377
The general theory of images of coherently-illumin-
ated objects is applied to various types of targets seen
by the eye in Maxwellian view. Circular, slit, and
grating targets are considered and special attention is
given to the retinal light distribution pattern when the
targets are defocused. Equations for these are given
but the actual evaluation of the patterns requires the
use of computational devices. Experimental verification
of some of the conclusions was accomplished with Ronchi
line gratings as targets.

Barron, F. THE DISPOSITION TOWARD ORIGINALITY. J. ab-
norm. psychol., Nov. 1955, 51(3), 478-485. AFPC
TR 56-122 (Institute of Personality Assessment & Res-
earch, University of California, Berkeley, Calif.).

11,379
To explore relationships between originality and
personality organization, a study of two groups of 100
Air Force captains was made. A consistently original
group and a consistently unoriginal group were selected
on the basis of responses to eight tests which could be
scored objectively or rated reliably. An original re-
sponse was defined as one that is both uncommon to the
sample under study and, at the same time, adequate for
the realistic demands of the problem. Five major hy-
potheses and the 15 derived predictions concerning orig-
inality, which had been suggested by previous related
findings, were tested by comparing the two groups in
terms of relevant personality data gathered during a
three-day, living-in assessment study.

Foley, P.J. & Scott, D.M. LEGIBILITY OF LEROY DIGITS
AS A FUNCTION OF SIZE, DISTANCE, ANGLE OF VIEW, AND
ILLUMINATION LEVEL. DRML Proj. 76, Rep. 76 3, PCC
Proj. D 77 94 20 21, HR 143, June 1957, 7pp. Defence
Research Medical Labs., Toronto, Ontario, Canada.

11,380
A study was made of the legibility of 12 sizes of
digits drawn with the Leroy standard Gothic Lettering
guide. Digit sizes ranged from 0.06 to 0.50 inches in
height; five viewing distances (2, 4, 8, 16, and 32
feet); three viewing angles at each distance (normal and
45 degrees right and left); and three conditions of il-
lumination (one, ten, and fifty foot-candles) were used.
Results are presented showing per cent of the popula-
tion (30 subjects) reading each digit size with 100 per
cent accuracy, for each of the experimental conditions.

11,381
British Iron and Steel Research Association. THE
DESIGN OF CONTROL POINTS IN STEELWORKS. Summary 83,
Oct. 1955, 2pp. British Iron & Steel Research Associa-
tion, London, England.

11,381
A brief summary of the human engineering studies con-
ducted by the British Iron and Steel Research Association
is presented. Concentration has been primarily on the
design and layout of controls where an operator has sev-
eral controls to coordinate, particularly in overhead
travelling cranes and mill pulpits which require from
three to seven movements to control. Three main consid-
erations are discussed: 1) type and design of controller,
2) layout of controllers, and 3) identification of con-
trols.

Halbrook, J.W. TEST AND EVALUATION OF THE DIRECT
VIEWING STEREO PLOTTER, WERNSTEDT-MAHAN TYPE. Sub-
Proj. 8 35 03 208, Tech. Rep. 1471 TR, Feb. 1957,
20pp. USA Engineer Research & Development Labs.,
Fort Belvoir, Va.

11,382
This report summarizes engineering and service
tests of the Portable Topographic Stereoplotter, de-
veloped as a replacement for the stereocomparagraph.
Recent trends toward the use of 20 degree convergent
photography to produce maps from high altitude are dis-
cussed with reference to the portable plotting equip-
ment that will accommodate only near vertical photo-
graphs. Recommendations concerning need for further
development are made.

 USA Library. GLOSSARIES. A PRELIMINARY SURVEY OF
 SELECTED TITLES OF TECHNICAL AND SCIENTIFIC, DOMESTIC
 AND FOREIGN TERMS AND DEFINITIONS EMPLOYED BY THE DEPART-
 MENT OF DEFENSE. Spec. Biblio. 3, May 1956, 27pp. USA
 Library, Adjutant General's Office, Washington,
 D.C.

11,383
 A preliminary list of official reports and publica-
 tions of the Department of Defense and other Federal
 agencies is presented. These reports and publications
 are either glossaries in their entirety or do contain
 definitions or glossaries. The page numbers are includ-
 ed in the latter case. Although emphasis was placed on
 glossaries appearing since 1947, some older glossaries
 are included because of their additional contribution.
 In general, the glossaries are 1) pertinent to the field
 of supply and logistics, 2) used in administrative,
 technical, and scientific fields, and 3) used in connec-
 tion with research requiring the knowledge of foreign
 languages.

 Seitz, L.F., Byrd, W.H., Jr. & Williams, R.R. FINAL
 REPORT OF PROJECT NR AVN-756 SERVICE TEST OF THE U-1A
 AIRPLANE. ATDEV 6 452 1/230, June 1957, 45pp. USA
 Aviation Board, Fort Rucker, Ala.

11,384
 To determine the suitability of the U-1A Airplane for
 Army use as a light, cargo, troop-carrying, and medical e-
 vacuation aircraft, service tests were conducted. The air-
 plane was flown for a total of 475 hours under various
 load, field, and weather conditions. Various maneuvers re-
 quired for the services the U-1A was to serve were execut-
 ed. Maintenance was accomplished by two enlisted mechan-
 ics. Tests were also conducted to determine the suitabil-
 ity of the U-1A for parachute delivery of personnel and
 cargo. Observations on general characteristics, transi-
 tion training required, tactical suitability, maintenance,
 and associated equipment are summarized with recommenda-
 tions.

 Worchel, P. & Mauney, J. THE EFFECT OF PRACTICE ON
 THE PERCEPTION OF OBSTACLES BY THE BLIND. *J. exp. Psychol.*, March 1951, 41(3), 170-176. (University of
 Texas).

11,385
 In order to determine the effect of training in the
 perception of obstacles, seven totally blind subjects,
 who had failed previously in an obstacle test course,
 were given 210 training trials under conditions favorable
 for learning. Pre- and post-practice test series are
 compared for the subjects and certain recommendations for
 the training of the blind are made.

11,386
 Turin, G. COMMUNICATION THROUGH NOISE. RANDOM-
 MULTIPATH CHANNELS. Contract AF 19(122)-458,
 Tech. Rep. 116, May 1956, 98pp. Lincoln Lab.,
 Massachusetts Institute of Technology.

11,386
 Statistical methods are applied in this report to the
 problem of communication through a multi-path channel
 which has random or unknown path characteristics and
 which has additive random noise present at the receiver
 end. In an introductory chapter the transmitter and re-
 ceiver for such a system are defined. The first problem
 dealt with is that of establishing an a priori statistical
 model of the channel, exploring its adequacy, and dis-
 cussing (a posteriori) information about the channel.
 The problems of determining the operational form of the
 receiver's probability computer and of generation of an
 optimal set of message wave forms are investigated. Pos-
 sible future extensions of the work are discussed.

11,387
 McGinnis, J.M. EFFECTIVENESS OF PROTOTYPE
 COLD WEATHER FACE MASKS FOR MILITARY ACTIVI-
 TIES. Proj. 7-85-20-005, Tech. Rep. EP-80,
 June 1957, 51pp. USA Quartermaster Research
 and Engineering Center, Natick, Mass.

11,387
 To review the problem of cold weather face protective
 devices for Army use, Quartermaster research was surveyed
 and information secured concerning the need and military
 requirements for face and eye protection. Two new face
 masks (Coldwar and Wood-Hufferty) were studied to gain
 information concerning the advantages and disadvantages
 for use by men engaged in various activities. The masks
 were issued to equipment operators, gunners, armor per-
 sonnel, and others engaged in work that exposed them to
 low temperatures and severe windchill. From subsequent
 interviews information was secured concerning desirable
 and undesirable characteristics, effectiveness under
 various conditions, and improvements needed. Specific
 recommendations are made for further developmental work.

11,388
 Zwillocki, J. IN SEARCH OF THE BONE-CONDUCTION
 THRESHOLD IN A FREE SOUND FIELD. *J. acoust. Soc. Amer.*,
 1957, 29(7), 795-804. (Prepared
 under Contract Nonr-1866(15), Psycho-Acoustic
 Laboratory, Harvard University).

11,388
 To establish a bone-condition (body conduction)
 threshold in a free sound field, thresholds of audibility
 were first established on six subjects. These data were
 compared with threshold curves of the American Standard
 in order to establish the adequacy of the general acous-
 tic conditions used. An automatic step attenuator was
 used for threshold measurements. Two methods of attenu-
 ating sound were compared: (1) semiplastic earplug plus
 ear muff, and (2) perforated semiplastic earplug con-
 nected to a resonator. Using both methods, thresholds of
 audibility were determined on the same six observers over
 the same frequency range (125 to 10,000 cycles per sec-
 ond). The bearing of the results on protection of the
 ear against noise is indicated.
 G. I. R 17

11,389
 Zwillocki, J. SOME MEASUREMENTS OF THE IMPED-
 ANCE AT THE EARDRUM. *J. acoust. Soc. Amer.*,
 1957, 29(3), 349-356. (Prepared under Con-
 tract Nonr-1866(15), Psycho-Acoustic Lab.,
 Harvard University).

11,389
 Three methods are described for measuring acoustic
 impedance at the eardrum. Two methods are psychophysical
 (attenuation and binaural balance) and the other is purely
 physical. Preliminary data taken by all three methods
 were compared. Further values for impedance at the ear-
 drum were made by the physical method and compared with
 results of other investigations. The practical impli-
 cations of the findings for coupler cavities for minia-
 ture earphones and in calculations on the sound attenua-
 tion afforded by ear protectors are indicated.
 G. I. R 12

11,390
 Zwicker, E., Glottorp, G., & Stevens, S.S.
 CRITICAL BAND WIDTH IN LOUDNESS SUMMATION.
J. acoust. Soc. Amer., 1957, 29(5), 548-557.
 (Prepared under contract Nonr-1866(15), Psycho-
 Acoustic Lab., Harvard University).

11,390
 To investigate the concept of critical band width in
 loudness summation, a series of experiments were conduc-
 ted in which the signals were presented binaurally
 through a pair of earphones to the subject seated in an
 anechoic chamber who adjusted the level of a comparison
 signal to match the loudness of a standard signal. The
 major problems explored were: (1) how the loudness of a
 group of tones (four equally intense) depends on the
 spacing (frequency difference between the highest and
 lowest) of tones in the complex; and (2) how the loudness
 of a band of constant sound pressure level depends on the
 width of the band. The data were compared with those
 from other methods. The relation of the critical band
 to other functions is noted.
 G. I. R 17

11,381
Stevens, S.S. CONCERNING THE FORM OF THE
LUMINOUS FUNCTION. J. optom. Soc. Amer.,
1957, 52(6), 688-690. (Prepared under con-
tract Navy-1000(15), Psycho-Acoustic Lab.,
Harvard University).

11,382
To examine certain possible irregularities in the
luminous function, the method of adjustment was used by
each of 22 subjects to judge and double the luminance of
a 1000 cycle sine at luminance levels of 34, 64, 94, and
120 decibels (on 0.0002 meter) presented in random
order. The data (double change required to judge or
double luminance) were analyzed graphically to show the
form of the distribution of both types of judgments.
These findings are compared with evidence from other
types of estimations. A rule for expressing the relation
of luminance to intensity in a first approximation is
offered.
T. G. R 5

11,383
van Boven, G. VIBRATIONS ON THE SKIN SIMILAR
TO DIRECTIONAL HEARING, BEATS, AND HARMONICS
OF THE EAR. J. optom. Soc. Amer., 1957, 52(4),
482-484. (Prepared under contract Navy-1000
(15), Psycho-Acoustic Lab., Harvard University).

11,384
To compare sensations on the skin to phenomena in
hearing, a mechanical model of the cochlea in which the
skin of the arm is used as a sense organ was used to ap-
plicate, insofar as possible, directional hearing, beats,
and harmonics of the ear. Interaction between two similar
stimuli with a time delay was investigated for vibra-
tions (skin) and clicks (ear). Frequency changes during
beats were investigated on the model and compared with
earlier observations of Becholtz. Concerning harmonics
the method of beat beats of sinusoidal oscillations was
studied (1) on the fingertip, (2) on the model of the
ear, and (3) in hearing.

11,385
Clark, W.E., Pietrasanta, A.C., Calloway, W.J.,
et al. NOISE PRODUCED BY AIRCRAFT DURING
GROUND RUN-UP OPERATIONS. Contracts AF 33(616)
2151, CALL 18 and AF 33(616)-3335, TASK 23,
Proj. 7210, WADC TR-56-60, June 1957, 142pp.
Aero Medical Lab., WADC, AFMPC, Wright-Patterson
AFB, Ohio. (Bolt Beranek and Newman, Inc.,
Cambridge, Mass.).

11,391
Measurements of the noise field around six turbojet
aircraft (F-4A, F-4B, F-4C, F-4D, F-4E, and F-4F)
and one propeller aircraft (C-124) during ground run-up
operations are reported. Sound pressure levels in octave
bands of frequency were obtained for different operating
conditions of the aircraft engines at distances ranging
from 100 to 1600 feet. These data were analyzed and the
results reported in terms of acoustic power level, direc-
tivity, and noise spectra. An empirical procedure is
described for making engineering estimates of the charac-
teristics of the noise field produced during ground run-
up operations of jet aircraft.

11,392
Smith, A.A. & Boyes, G.E. A NEUTRAL DENSITY FILTER
FOR SETTING OPTIMAL BIAS ON RADAR DISPLAYS EMPLOYING
MAGNESIUM FLUORIDE PHOSPHORS. DRL Proj. 163, Rep.
163 12, POC Proj. D77 94 20 22, HR 145, April 1957,
4pp. Defense Research Medical Labs., Toronto, Ontario,
Canada.

11,394
To determine the appropriate filter for setting opti-
mal bias when the CV 429 cathode-ray tube (magnesium
fluoride) is in use, five filter densities were tested:
0.5, 1.0, 2.0, 3.0 and 4.0. Five subjects made judg-
ments of the bias voltage at which the sweep-line could
just be seen through each filter density as the bright-
ness was increased in small (one volt) increments. Each
subject also made a determination of VRI--the bias volt-
age at which the sweep was just visible--with no filter
in place. Filter density was plotted against mean volt-
age averaged over all subjects for five replications and
the desired information taken off the curve.

11,385
Scott, A.L. VISIBILITY OF RADAR SCREENS:
CHANGES DURING OPERATIONAL OPERATION. DRL
Proj. 153, POC Proj. D77-94-20-22, DRL Rep.
153-7, April 1957, 6pp. Defense Research
Medical Labs., Defense Research Board, Toronto,
Ontario, Canada.

11,386
To determine the effect of off centering the Posi-
tion Indicator (PI) radar scopes on target visibility,
20 subjects were tested under three conditions of the
base length (defined as to radius as: constant, one
radius; offset one-half, 1.5 radius; fully offset, two
radius) and seven PIC (picture ray tube) sizes (24 to 30
inches). The task was to report a "seen", "not seen" each
time the sweepline passed through a designated square.
Brightness of target signals was controlled in steps of
one decibel. Performance was evaluated by analysis of
variance for differences attributable to subjects, the
base length and PIC size.

11,395
Baker, S. ROYAL CANADIAN MOUNT ELECTRICAL MAINTENANCE
CONTROL SYSTEM. DRL Proj. 156, POC D77-97-75-65,
DRL Rep. 156-1, October 1955, 36pp. Defense Research
Medical Labs., Defense Research Board, Toronto, Ontario,
Canada.

11,396
This report discusses three phases of a fourfold
electrical maintenance control system for the Royal Ca-
nadian Mount (RCM). The system is based on certain as-
pects of the new Royal Electrical Register, modified to
meet the needs of the RCM and to standardize the method
of keeping electrical records. The system is composed
of (1) history sheets of all electrical gear, (2) a rec-
ord of occurrence of defects, (3) a system of reporting
maintenance activity, and (4) a method of regulating
routine preventative maintenance. An introduction to the
system is given and a detailed description of the form
and method of operation of the first three phases. Spec-
imen copies of the forms are shown in appendix.

11,397
Fletcher, Dorothy E. HUMAN ENGINEERING INVESTIGATIONS
OF AIRCRAFT COCKPIT VISUAL DISPLAYS. PART 8, SUGGES-
TIONS FOR THE FORM OF THE AIRCRAFT SILHOUETTE OF THE
YEARFOOT DIRECTIONAL HORIZON. DRL Proj. 156 AE 7047,
DRL Rep. 156 1 224, Rep. 1954, 16pp. USN Aero Medical
Development Lab., WADC, Philadelphia, Penn.

11,397
This report considers the design of the aircraft
silhouette which appears on the Yearfoot Directional
Horizon Instruments, 6L-1AX and 6L-1EM. These instru-
ments combine attitude and directional information in
one display; attitude appears as a relatively pictorial
display as compared to the more symbolic display of di-
rectional information. The aircraft silhouettes are
analyzed in terms of legibility improvements that might
be made. Suggested changes are discussed with photo-
graphs attached.

Regan, J.J. & Ely, J.H. "FLYING" THE SUBMARINE. Res.
Rep. Nov. 1957, 6-10. (USN Training Device Center,
N.Y.).

11,398
This is a popularly written article discussing a
research project concerned with the development of a
new control system for maneuvering a submarine through
water in three dimensions at high speed. A modifica-
tion of the system, for the experimental submarine USS
Albatross, in which one man (or three) operates airplane-
type control devices is described. Techniques used in
the research study are discussed and future needs in-
dicated.

Cooper, C.G. STEREO ELEVATION METER: TEST REPORT OF MARINE CORPS EQUIPMENT BOARD. MCDC Proj. E-1227, 29 Feb 1957, 13pp. Marine Corps Development Center, Marine Corps Schools, Va.

11,402

The Stereo Elevation Meter was tested and evaluated to determine its suitability for replacing the Stereocomparograph as an aerial photographic interpretation instrument in Fleet Marine Force units. Tests included ease of operation, maintenance and repair, portability, accuracy in use, comparative performance with Stereocomparograph, durability, and suitability. Recommendations are included.

11,401

Seydick, R.P. CHAIR, FOLDING, METAL: TEST OF. Proj. E-1221, March 1954, 23pp. MCDC Development Center, Marine Corps Schools, Va.

11,401

A folding metal chair was tested and evaluated in comparison with the standard Marine Corps Chair, Folding (Canvas) for suitability for Marine Corps use. The following tests were conducted: 1) physical characteristics, 2) stowability, 3) durability and stability, 4) maintenance requirements, 5) user acceptability, and 6) suitability for Marine Corps use. Recommendations regarding acceptance of the new chair are made.

11,402

Ehrenfried, A.B. GENERAL OPERATING PRINCIPLES OF THE A-1 GUN-BOMB-ROCKET SIGHT. Rep. R 10, Feb 1951, 33pp. Instrumentation Lab., Massachusetts Institute of Technology, Cambridge, Mass.

11,402

This report presents the general operating principles of the A-1 Gun-Bomb-Rocket Sight as employed in fixed-gun fighter aircraft to control gunfire, rocketfire, and the dropping of bombs. The A-1 Sight is described and important elements are shown graphically. The various sections of the report then present general methods for generating lead, gravity-drop, velocity-jump, and cross-roll corrections for gunfire operation; overall gunfire calibration procedure; and the principles of rocketfire and bombing.

Davis, R.A. CAMOUFLAGE TESTS OF ARMY AND MARINE CORPS SHELTER HALF-TENTS. Proj. EE-1282, Proj. DA 8-31-01-001, June 1957, 9pp. Marine Corps Equipment Board, MCDC, Marine Corps Schools, Quantico, Va.

11,403

To study camouflage coloration to be used on an Army and Marine Corps standardized shelter half tent, six models (both Army and Marine Corps standard models and experimental patterns) were evaluated. The tents were set up in a straight line at six foot intervals in an open field. Aerial photographs and observations were made and ground visual observation was made up to 900 yards. Thresholds for detection were analyzed for best coloration pattern. Marine Corps uniforms and helmet covers were evaluated at the same time and special consideration was given to the problem of a cover to camouflage body configuration of the combat clad Marine. Recommendations are included.

National Education Association. WHAT CAN YOU DO? RESEARCH NEEDS IN TRAFFIC SAFETY EDUCATION. May 1954, 20pp. National Education Association, National Commission on Safety Education, Washington, D.C.

11,404

To determine the major problems in traffic safety education, a selected group of 2545 persons in the public schools, colleges, and universities, and other interested agencies were polled for their opinions on the relative values of listed studies. The questionnaire listed both experimental and survey type studies and called for a rating of very useful, useful, of little or no value, and no answer. Space was provided for the respondents to suggest topics for research. The data from 944 returns were analyzed to show per cent distribution among assigned values for survey and experimental studies. The priority given to proposed studies by colleges and university respondents was studied and other research topics summarized.

Snodgrass, F.T., Teople, J.B., & Sleight, R.B. EFFECTS OF FATIGUE ON PERFORMANCE OF VISUAL-MOTOR TASKS: AN ANNOTATED BIBLIOGRAPHY. Contract DA 36-039-sc-67912, Aug. 1957, 27pp. Applied Psychology Corp., Washington, D.C.

11,405

This is an annotated bibliography on the subject of fatigue. The studies collected are primarily concerned with the relation of fatigue that may be experienced under normal operating conditions to the performance of complex visual-motor tasks. Some studies deal with fatigue resulting from task performance. The abstracts are presented in terms of purpose, materials and procedures, results and conclusions.

Davis, D.A., Ayer, J.E., & Mayfield, R.N. GLOVES FOR PROTECTIVE ENCLOSURES. Contract W-31-109-eng-38, Final Rep. ANL-5743, May 1957, 22pp. University of Chicago. (Argonne National Lab., Lemont, Ill.).

11,407

A study of the problem of protective gloves for use in enclosed systems where pyrophoric, radioactive, toxic, or poisonous materials are handled was made as a necessary prerequisite to any attempt at coordination or standardization. Materials, methods of manufacturing, and general properties of gloves were described. Glove design was analyzed and suggestions made in regard to an acceptable standard. Permeability characteristics of various glove compounds were reviewed and the effect of moisture contamination upon hypothetical systems tabulated. An electrical test is proposed for determination of glove soundness.

Carver, W.J., & Nitsch, L.L. A COMPARISON BETWEEN THE PPI-SCOPE AND THE 360° B-SCOPE FOR THE PURPOSES OF TARGET EVALUATION. Proj. NO 284-112, NRL Problem Y02-10, NRL Rep. 4511, March 1955. 15pp. Naval Research Lab., Washington, D.C.

11,409
To compare the plan position indicator (PPI) display (polar coordinates) and a 360 degree B-scope (rectangular coordinates) in a target designation system (TDS), the latter display was designed so that an operator could quickly obtain information related to ships heading and target position relative to own ship's position. Under conditions that simulated a TDS aboard a destroyer-type vessel, eight naval enlisted men observed a tactical situation as it developed on the displays and assigned appropriate gun directors to the target which constituted the greatest threat. Performance on ten problems was scored as number of correct director assignments and director-target ratio, and analyzed for differences due to displays. Problems other than tactical evaluations are discussed. G. I. E 1

McGuire, J.C. EFFECT OF TRAFFIC CONFIGURATIONS ON THE ACCURACY OF RADAR AIR TRAFFIC CONTROLLER JUDGMENTS. Contract AF 33(616)-3612, Proj. 7192, WADC TR-56-73, May 1957, 18pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University).

11,410
To investigate the relationship between traffic configurations and radar air traffic controller judgments of "collision possibility", six skilled operators adjusted a movable target to a position judged to be one that would result in simultaneous arrival of the adjustable and standard targets at a reference. Each trial consisted of five blips. The two aircraft were simulated as flying at different speeds (180, 240, and 300 knots); three traffic configurations were used, and two types of trails (constant brightness or fading brightness of blips). The results were analyzed for both constant and variable errors and studied as functions of configuration and type of trail.

Harter, G.A., & Gain, P. AN ELECTRONIC TARGET SIMULATOR FOR USE WITH OPERATIONAL RADAR SURVEILLANCE SYSTEMS. Contract AF 33(616)-3612, Proj. 7192, WADC TR-57-277, May 1957, 33pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University).

11,411
This report describes an Operational Target Simulation (OTS) system for simulating targets and mixing them with "live" targets on operational plan position indicator (PPI) radar displays. Three designs are proposed; each is composed of an electronic target generator and the additional circuitry required to convert rectangular-coordinate output signals to polar-coordinate signals compatible with the video-type intelligence required for radar display. The method to be used for this transformation differs among the three designs and is fully reported here. A prototype unit of one design has been constructed and tested at the RAPCON Center, Wright-Patterson Air Force Base.

Mohl, J.C. AIRCRAFT FLEXIBLE GUNNERY CONTROL SYSTEMS: HUMAN ENGINEERING OF. PART III. DESIGN OF TARGET ACQUISITION UNIT FOR USE WITH PERISCOPE MK 48 AND AUTOMATIC TARGET TRACKING DEVICE. NRL Problem R13-13, BuOrd TR Re8e-52, NRL Memo. Rep. 76, Oct. 1952. 16pp. Radio Division III, Naval Research Lab., Washington, D.C.

11,412
This report is the last in a series of three dealing with interaction between the human operator (tracker) and various elements in an aircraft flexible gunnery control system. The tracker's task is analyzed on the basis of relevant human engineering considerations and recommendations made for improved effectiveness. This report concerns the part of the task called target acquisition and design of a unit for use with the Periscope MK48 and the Automatic Tracking Device. The present design is criticized on the basis of its inflexibility and incompatible spatial relationships. Requirements for an adequate design are listed, and two units which meet these requirements are described.

11,413
Mohl, J.C. HUMAN ENGINEERING OF AIRCRAFT FLEXIBLE GUNNERY CONTROL SYSTEMS. PART I. DISPLAY OF CONDITION INFORMATION IN PERISCOPE MK 48 MOD 0. NRL Problem R13-13, BuOrd TR Re8e-3-52, NRL Memo. Rep. 22, June 1952, 14pp. Radio Division III, Naval Research Lab., Washington, D.C.

11,413
This is the first in a series of three dealing with interaction between the human operator (tracker) and various elements of an aircraft flexible gunnery control system. A brief description of the Periscope MK48 Mod 0 and a detailed account of the tracker's task are presented. The primary concern here is with presentation of information on the condition of various components of the system to the tracker while he is tracking with the periscope. Possible methods of signalling the information are discussed. A list is presented of human engineering requirements which the signals must meet and specific design recommendations are made concerning characteristics and means of mechanization of a set of signals meeting these requirements.

Chang, S.H., Dolansky, L.O., Stubbs, H.L., Jiren, J., & Bach, R.E. VISUAL MESSAGE PRESENTATION. Contract AF 19(604)-1033, Item 1. AFPC-TR-57-150, March 1957, 93pp. Air Force Cambridge Research Center, Bolling AFB, Washington, D.C. (Electronics Research Lab., Northeastern University).

11,416

This report summarizes three years of research directed toward the specification of important parameters of speech for use in visual message presentation and in speech-compression systems. A working model of the Formoder (Formant-Mimic-Coder), a speech-compression system, is described with details of the circuits used in analysis and synthesis. Tracking curves and spectrograms are presented along with results of articulation tests as evidence of quality of performance. Improvements for the Formoder are discussed. An alternative approach to the speech-compression problem, based on automatic classification of phonemes into groups by successive binary selections, is discussed. The design for an acoustic room for articulation testing and recording is given. T. G. I. R 17

Eggert, W.W. PHASE V (ALL-WEATHER) FLIGHT TEST OF L-20A AIRCRAFT. TR WCT-53-20, March 1953, 30pp. Directorate of Flight and All-Weather Testing, WADC, ARDC, Wright-Patterson AFB, Ohio.

11,417

To determine the capabilities and limitations of the L-20A Aircraft during night and adverse weather operations and to determine optimum piloting techniques and procedures for instrument and night flight, 27 hours of flight tests were conducted on 18 flights. The tests encompassed flights at all altitudes up to the operational ceiling (12,000 feet) with all combinations of gross weights and center of gravity locations that could be located. Conditions included visual and instrument flight rules and hooded flight. The results were evaluated for each of the following: cockpit (general layout, visibility, lighting), instrumentation (arrangement, lighting, operation), auxiliary equipment, and handling characteristics. Specific recommendations are listed. I.

Hay, W.W. CLIMATIC CRITERIA DEFINING EFFICIENCY LIMITS FOR CERTAIN INDUSTRIAL ACTIVITIES. SECTION 2d. THE EFFECT OF WIND ON RAILROADS. Contract AF 19(604)-416, 15pp. Geophysics Research Div., Air Force Cambridge Research Center, Bolling AFB, Washington, D.C. (University of Illinois).

11,418

This report considers the effect of wind and wind combined with snow, rain and ice storms and with excessive dust and sand on railroad operations. The various sections of the report are devoted to the effects of these climatic conditions on efficiency of personnel, locomotives, cars, roadway and track, train and yard operations and maintenance. The appendix presents several reports of sample wind storms and their effects of efficiency of railroad operations.

11,419

Churchill, A.V. MANIPULABILITY OF BRAILLE CONTROL KNOBS. Canad. J. Psychol., 1955, 9(2), 117-120. (Defence Research Medical Labs., Toronto, Ontario, Canada).

11,419

To evaluate the comparative manipulability of eight differently shaped control knobs, 72 subjects were required to move a pointer to a given setting on a dial scale (300 degree unit marks one degree apart, numbered in tens) by manipulating the knobs (concealed from sight) with fingertip control. Eight settings were made with each knob using a control-knob-pointer ratio of approximately four to one. Data were recorded in terms of time and errors and studied by analysis of variance techniques. The results are discussed in terms of a control coding system for knob shapes which would consider manipulability as well as tactual discriminability. T. I. R 3

11,420

Siegel, A.I., & Stinson, F.W. CAUTION AND WARNING LIGHT INDICATORS FOR NAVAL AIRCRAFT: IV. BACKGROUND VARIATION, LETTER SIZE, AND THE ADVANTAGE OF A MASTER INDICATOR WITH YELLOW CAUTIONARY SIGNALS IN A RED ILLUMINATED ENVIRONMENT. TED NAM EL 52004, NAMC-ACEL-347, Part 16, August 1957, 22pp. Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,420

To investigate some aspects of digits for presenting cautionary and warning information, ten subjects performed multiple complementary tracking and responded to randomly presented cautionary signals. Digits to convey information as to location of signal appeared on an indicator bank (lower right) in one of three heights (1/8, 1/4 or 3/8 inch) in positive (background-illuminated) or negative (digit illuminated) displays. In half the trials a centrally located "Master" indicator was air-illuminated whenever a signal appeared. All signal lights were presented through aviation yellow filters with surround illumination in aviation red. Response times and number of signals missed were analyzed for effect of digit size, positive or negative display, and for the usefulness of a "Master" indicator.

11,421

Slivinske, A.J., & Crumley, L.M. THE EFFECTS OF CONTRAST, COLOR AND VIEWING ILLUMINATION ON THE LEGIBILITY OF LETTERS AND NUMERALS. NAMC-ACEL-329, TED NAM AE-7047, Part 16a, Feb. 1957, 13pp. Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,421

To evaluate the effects of contrast, color, and viewing illumination on the legibility of letters and numerals, 50 subjects identified the stimuli by call-out procedures. The stimuli, five letters and five numerals were selected from speed of perception data (Tinker) to give a representative difficulty range. They were presented under three degrees of contrast (46.45, 15.30, and 5.16), two colors (white or red on black), and under conditions of day viewing (.09 foot-candles). The data (response times) were evaluated by analysis of variance for effects of the experimental variables. Hand orders for legibility were obtained. Practical implications of the results for cockpit installations are discussed. T. G. R 3

11,422

Galanter, E. INVESTIGATIONS OF THE CHARACTERISTICS OF ATTENTIONAL AND INFORMATIONAL TRANSMITTING VALUES OF AIRCRAFT SIGNAL INDICATORS: II. THE WARNING SIGNAL PROBLEM: CLARIFICATION AND EXPERIMENTAL DESIGN. Contract N156-33966, NAMC-ACEL-366, TED NAM EL52004, Part 16, Oct. 1957, 16pp. Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,422

This paper presents an analysis of the warning signal problem as it exists in high speed aircraft. Two quite general experimental problems are raised: (1) the relation between reaction latency and choice probability; and (2) distraction and attention as related to signal level and motivational payoff. Experimental procedures for investigating these problems are outlined and discussed. The employment of a new technique of functional simulation is advocated. G. I. R 1

11,423

Slivinske, A.J., Crumley, L.M., & Connon, Helen. THE EFFECTS OF CONTRAST, COLOR AND VIEWING ILLUMINATION ON SCALE READING. Contract N156s-32041, NAMC-ACEL-324, TED NAM AE-7047, Part 16, Feb. 1957, 34pp. Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,423

To study the effects of contrast and color of dial marks under different levels of illumination on scale reading performance, two experiments were conducted using a common group of four trained subjects. The dial scale was a 36-degree sector of a standard 2.75-inch multirotational dial with standard-size major, intermediate, and minor dial marks. Five light on black contrast ratios (46.45 to 1.90) were combined with two colors (white or red on black) and viewed under illumination conditions of simulated daylight (30 foot-candles) and night (.05 foot-candle). Each subject read 101 scale settings under each experimental condition. Errors and accumulated time scores were evaluated by analysis of variance and information measures. T. G. I. R 22

 Harrell, K.F.M. TWO STUDIES OF DECREMENT OF PERFORMANCE WITH TIME: (i) IN PLOTTING TELEPHONED INFORMATION AND (ii) IN RADAR REPORTING. Rep. 42, Feb. 1951. 11pp. Naval Motion Study Unit. Dept. of Operational Research, London, England.

11,425
 To study the effect of time on performance of complex tasks, two experiments were conducted: (1) information was sent over five channels simultaneously to subjects who plotted range and bearing information (9.5 plots per minute) for one hour; three noise conditions (low, medium and high) were used; each of seven subjects performed at each channel under each condition; (2) performance (plots correct) was analyzed as a function of time and noise; and (2) subjects (24) reported range and bearing of targets from a plane position presentation of radar information for varying numbers of echoes (6 to 21) for six half-hour runs and one two-hour run; performance (number of correct reports per minute) was analyzed as a function of time and speed.

 Godwin, A.C. THE DAMAGING EFFECTS OF NOISE AND NOTES ON PROTECTION AGAINST THEM. RNP 53/758. OES 239. Rep. 57. August 1953. 8pp. Naval Motion Study Unit; Depts. of Physical Research and of the Senior Psychologist, London, England.

11,426
 This report discusses various sources of high intensity noise levels in the Royal Navy, such as ship and aircraft propulsion units, ventilation systems, industrial equipment, gunfire, and other sources of shock waves. The damaging effect of noise on hearing, both temporary and permanent, is treated at some length. Other effects such as bodily effects harmful to health or safety, output and work efficiency, and subjective effects such as fear and annoyance are treated more briefly. Protective devices such as insert ear plugs, noise occluding pads, and helmets are considered together with the possibility of procedures for reducing noise at the source.

 Fulkerson, S.C. ADAPTABILITY SCREENING OF FLYING PERSONNEL. RESEARCH ON THE MINNESOTA MULTIPHASIC PERSONALITY INVENTORY. TR 57-106. July 1957. 17pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,427
 To investigate the usefulness of the Minnesota Multiphasic Personality Inventory (MMPI) for prediction of adjustment to flying stress, two approaches were made: use of combinations of scales already developed and development of new scales. Samples of Air Force pilot trainees representing various levels of training from primary through aircraft commanders enrolled in Combat Crew Training were given the group form of the MMPI. The criterion of adjustment to flying training was based on a psychological examination and amount of flying experience. Eleven previously developed scales and two empirical keys were analyzed by correlational procedures for degree of relationship to the criterion. Further validation studies are discussed.

 USAF Operational Test Center. OPERATIONAL SUITABILITY TEST OF TYPE O-11A CRASH FIRE TRUCK. Proj. APG/CSC/228 ABC. July 1954. 54pp. USAF Operational Test Center, Eglin AFB, Fla.

11,428
 To determine the operational suitability of the type O-11A crash fire truck, its fire-fighting capability and other operational aspects were tested in temperate and arctic winter conditions. Specific tests included simulated crash fire-fighting, mobility and maneuverability over various types of terrain, acceleration and braking, and (under controlled low temperatures) tests of draining, heating, pumping, and the like. Maintenance was performed by test personnel. The results are presented and discussed in terms of personnel requirements for operating and maintaining the equipment, capabilities, and limitations, and operational techniques. Detailed recommendations for design changes are included.

 Marcus, E.R. VISUAL RECOGNITION ALONG FOUR MERIDIANS OF THE VISUAL FIELD: PRELIMINARY EXPERIMENTS. Contract DA-36-039-SC-62654. Proj. NR-3-99-10-024. Rep. 2144-50-7. June 1957. 15pp. Vision Research Labs., Engineering Research Institute, University of Michigan.

11,429
 To investigate visual recognition capabilities for targets along four meridians (the array of visual receptors stimulated by a linear target with fixation at center) of the retina, nine observers were required to reproduce linear patterns of nine filled and unfilled ellipses presented at angular inclinations on the frontal plane of 0, 45, 90, and 135 degrees from vertical. Fixation was maintained on center ellipses. Targets were presented binocularly with background luminance approximately five foot lamberts, exposure time 0.20 and 0.25 seconds, and angular extent of total pattern 3.4 degrees. Reproduction errors were analyzed with respect to angle of inclination. The results are discussed in terms of neural sets established by reading habits.

 Mason, H.M. A COMPARATIVE EVALUATION OF TWO APPROACHES TO JOB-KNOWLEDGE TEST CONSTRUCTION. J. appl. psychol. 1954. 38(6). 384-389. (Contract AF 33(038)-25) 6. University of Illinois).

11,430
 To evaluate two approaches to construction of job-knowledge tests, a series of tests for airplane and engine mechanics were classified as (1) job-requirement approach (mastery of formal statements from training courses and job handbooks), or (2) job-experience approach (mastery of distinctive learning opportunities on the job). The tests were administered to 204 working airplane and engine mechanics. Criteria were length of aircraft maintenance experience and peer ratings. Each subject ranked for competence the six men whose work habits he knew best. Results were evaluated to show degree to which tests assigned to each approach were consistent to criteria and differences between patterns of relationships to criteria.

Pollock, M. TECHNICAL STUDIES IN CARGO HANDLING - IV. METHODS OF COMPUTING DELAYS IN A N-STAGE SHUTTLE PROCESS. Prepared under Contract Nonr 233(07), Rep. 57-37, May 1957, 21pp. Dept. of Engineering, University of California at Los Angeles.

11,435

As a part of a basic investigation of material handling operations in the loading and unloading of maritime cargo, methods of computing delays in a N-stage shuttle process with random working times are studied. Two approaches, simulation and recurrence equations, are each investigated for two variations to determine the best computational form to use on a high speed digital computer, with emphasis on the amount of storage (memory) space required.

Oliver, R.M. THE MATHEMATICAL DESIGN AND ERROR ANALYSIS OF A PRODUCTION AND INVENTORY CONTROL SYSTEM. Contract DA-19-C20-080-3684, Proj. 599-01-004, Interim Tech. Rep. 6, June 1957, 106pp. Massachusetts Institute of Technology.

11,436

The mathematical aspects of an inventory and production control system are analyzed. The mathematical expression for the cost-rate of storing, producing and changing the production rate is derived. The minimization of the cost-rate is accomplished by analytical methods of the discrete calculus of variations for different conditions. Quadratic cost curves are compared to previous studies in quadratic programming models and simple approximations of real and discontinuous cost curves are made. The production and control model is analyzed for the effect of errors in sales forecasts and unit costs of each time period, also for effect of replacing cost-rate problem by finite mathematical approximations which lend themselves to practical numerical computations. G. I. R 26

11,437

Olsonaki, J.J. TESTS OF CARRIER APPROACH ATTITUDE ALIGNMENT LIGHT SYSTEM FOR THE MODEL S2F-1, -2, AND TF-1 AIRPLANES. REPORT NO. 1, FINAL REPORT. Proj. TED PTR EL-5022, May 1957, 6pp. Naval Air Test Center, Patuxent River, Md.

11,437

To test a proposed carrier approach attitude alignment light system for model S2F-1, -2 and TF-1 airplanes, the system was installed in a TF-1 airplane. Several combinations of color and light intensity were evaluated during 26 simulated carrier approaches at the Naval Air Test Center airfield. Two experienced landing officers observed the approaches with test lights "on" and "off". The extent to which the system provides the landing officer with adequate information as to position, attitude, and direction is discussed. Recommendations as to color and candlepower appropriate for the system are made.

Clark, T.B. COMPARATIVE EVALUATION OF ALTIMETERS; COUNTER-POINTER VS. DRUM-POINTER. FINAL REPORT. Proj. TED PTR AE 7058.2, ST312 55, Rep. 1, March 1957, 8pp. USN Air Test Center, Patuxent River Air Station, Md.

11,438

To make a comparative evaluation of the counter-pointer altimeter (Kollsman production) and the drum-pointer altimeter (Kollsman with Air Force specifications), the instruments were installed in a TV-2 airplane and evaluated by 15 pilots during 116 flight hours. A cover was provided to blank off one instrument to permit individual evaluation of each. At the termination of each flight the pilots completed a questionnaire concerning presentation and performance of each altimeter. A summary of the findings is presented and discussed with recommendations for correcting deficiencies of drum-pointer altimeter.

11,439

Duerfeldt, C.H. EVALUATION OF LIGHTED AIRCRAFT INSTRUMENTS. INTERIM REPORT. Proj. TED PTR AE 7051, ST312 354, Rep. 1, Dec. 1956, 16pp. USN Air Test Center, Patuxent River Air Station, Md.

11,439

This interim report reports the evaluation of two types of integrally lighted aircraft instruments: flat glass and wedge-shaped glass. Instruments were mounted in a model TV-2 airplane and flown for a total of 30.5 hours during 22 flights by 13 pilots. Ambient lighting conditions normally encountered during fleet operations including instrument weather were sampled. Four hours of evaluation during ground operations were conducted. Pilot reaction was gained through questionnaires, qualitative reports and interviews. Results were analyzed for differences between experimental and standard instruments. Recommendations for further development are included.

Keegan, E.J., Schloter, J.C., Neas, Gladys M., & Hall, W.A. SPECTROPHOTOMETRIC AND COLORIMETRIC STUDY OF COLOR TRANSPARENCIES OF SOME NATURAL OBJECTS. Contract AF 33(616)-82-21, WBS Proj. 0801-50-2385, Rep. WBS-4794, March 1957, 139pp. National Bureau of Standards, Dept. of Commerce, Washington, D.C.

11,440

This is a comparison of the effect that natural formations or objects have upon the various emulsion layers that comprise color positive and color negative photographic films. Spectral transmittance measurements and colorimetric computations were made of these effects. Visible and near infra-red spectral directional reflectance measurements were made for photographed sand, soils and bark of trees. Chromaticity coordinates, Munsell notations, daylight reflectances or transmittances, color designations (Inter-Society Color Council-National Bureau of Standards), Lovibond notations of these materials and color differences between wet and dry sand and their corresponding color transparencies are reported. T. G. I. R 27

11,441

Kidd, E.A. ARTIFICIAL STABILITY INSTALLATIONS IN B-26 AND F-94 AIRCRAFT. Contract AF 33-038-20639, Proj. 1364, TR-70501, WADC-TR-54-441, Sept. 1954, 66pp. Aeronautical Research Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Cornell Aeronautical Lab., Inc., Buffalo, N.Y.).

11,441

To establish acceptable and optimum boundaries of flexible longitudinal stability and control characteristics in aircraft, artificial stability installations were made in a B-26 and an F-94 airplane. These installations provide variable period and damping of the short period and phugoid modes of longitudinal motion with variable stick force and stick position gradients. The equipment used is described in this report. G.I.R 4

11,442

George Washington University. QUARTERLY RESEARCH REPORT, JULY-SEPTEMBER 1956. Oct. 1956, 16pp. Human Resources Research Office, George Washington University, Washington, D.C.

11,442

This is a quarterly report (July-September 1956) of research in the following areas: conservation of training time in infantry weapons instruction, map using proficiency of Army personnel, development of methods and techniques for improving tank driving and maintenance, improvement of tank crew team effectiveness, improvement of communications efficiency of armor personnel, development of methods and techniques for improving tank gunnery performance, improvement of skills required for tank crew in night operations, and a study of human factors influencing span of control within the armor battalion.

11,443

Birnbaum, A.B., Sharp, L.H., Armore, S.J., & Sprunger, J.A. PREDICTION OF SUCCESS IN ORDINANCE JOBS. PRB Proj. D-15-201-21, 22, 25, PRB Tech. Res. Note 58, Oct. 1956, 8pp. Personnel Research and Procedures Div., Adjutant General's Office, Washington, D.C.

11,443

To evaluate the effectiveness of composites of Army Classification Battery (ACB) tests for predicting success in jobs for which personnel were trained at Ordnance School, ACB scores were compared with ratings of job success of 671 men. The six jobs were: Ordnance Storage Specialist, Small Arms Repairman, Light or Heavy Artillery Repairman, Machinist, and Welder. The two-test composite with the highest validity coefficient in each sample of each job was identified and unbiased estimates of validity (validity-generalization correlation coefficients were obtained in remaining job samples). These data were used to select the most promising composites for predicting success in Ordnance jobs. T. R 3

11,444

Carpenter, V.J., & Miller, M.D. STUDY OF VISUAL STEREOSCOPIC ACTIVITY. Contract DA-44-000-ENG-2082, Proj. 8-36-03-118, Interim Tech. Rep. 3, March 1957, 30pp. The Engineering Research & Development Lab., The Engineer Center, Fort Belvoir, Va. (Institute of Optics, University of Rochester).

11,444

This study is concerned with determining the optimum conditions of viewing for stereophotogrammetric map compilation. This, the third interim report, describes the photography of artificial targets and the start of taking data on the training of observers. Forty-one subjects were screened through a stereoscope tester and thirty accepted for training. Complete training curves have been found for four observers and a basis of observer selection determined. T. G. I.

11,445

Bolt Beranek and Newman Inc. CAPABILITIES AND LIMITATIONS INVESTIGATION OF LONG-RANGE PUBLIC ADDRESS EQUIPMENT. FINAL REPORT. PHASE 4. FIELD TESTING. Contract DA-36-039-SC-64503, Proj. 3-29-12-022 and 3-27-01-015, Rep. 466, June 1957, 76pp. Bolt Beranek and Newman Inc., Cambridge, Mass.

11,445

This is the fourth report in a research project on the determination of the capabilities and limitations of long-range public address equipment for transmission of intelligible speech under varied meteorological and terrain conditions. The body of experimental data accumulated during several series of field measurements were considered. Test sites, measurement procedures, relevant micrometeorological information, and equipment were described. The acoustic data were analyzed in terms of sound propagation over open level terrain, through dense forest and in hilly terrain with accompanying analysis of micrometeorological data. Computational procedures developed were applied to several typical examples of calculated expected attenuation of sound and compared with the experiment. T. G. I. R 18

11,446

Bolt Beranek and Newman Inc. CAPABILITIES AND LIMITATIONS INVESTIGATION OF LONG-RANGE PUBLIC ADDRESS EQUIPMENT. FINAL REPORT. INSTRUCTION MANUSCRIPT ON FIELD CALCULATION SYSTEM. Contract DA 36-039 SC 64503, Projs. 3 99 12 022 & 3 27 01 015, Job 865, Rep. 493, July 1957, 25pp. Bolt Beranek and Newman Inc., Cambridge, Mass.

11,446

This is the fifth and concluding report from a research project concerning the capabilities and limitations of long-range public address equipment for the transmission of intelligible speech under varied meteorological and terrain conditions. A calculation procedure is presented that is basically designed to enable a loud-speaker team in the field to predict with a high degree of probability the success or failure of his assignment to cover a given target area with intelligible speech. Necessary validation procedures before being put to military use are outlined; recommendations for micrometeorological instruments necessary for the system and loud-speaker modifications are listed. Appendices give the necessary firing maps, alignment charts, and tables. T. G. I.

11,447

Churchill, E., & Truett, B. METRICAL RELATIONS AMONG DIMENSIONS OF THE HEAD AND FACE. Contract AF 18(600)-30 & AF 33(616)-3841, Proj. 7214, WADC TR-56-621, June 1957, 127pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Antioch College).

11,447

To contribute to the basic data that the engineer can use in designing masks, helmets, and other special devices for the head and face, correlational data for the head and face dimensions of two groups of United States Air Force personnel were computed. Forty-one dimensions of flying personnel (sample of 4000) and six dimensions of Women's Air Force trainees (sample of 852) are reported. Coefficients of correlation for 620 and 15 pairs of data from the first and second samples, respectively, are given. Multiple regression coefficients for each dimension and selected pairs of dimensions with over 70 bivariate frequency tables are given. The utility of correlational statistics in the design of personal equipment is discussed. T. I. R 11

11,446

Barker, R.A. SURVEY OF VARIOUS NAVIGATIONAL AIDS DEVELOPED IN GREAT BRITAIN AND FRANCE. Contract AF 19(604) 1508, AFRC TR 57 161, May 1957, 38pp. USAF Cambridge Research Center, Bedford, Mass. (Stavid Engineering, Inc., Plainfield, N.J.).

11,448

This report summarizes and discusses information gathered from a survey of various navigational aids developed in Great Britain and France. These navigation systems are Decca (and Dectra), Radio Mob, Vorac, and the crossbar approach-lighting system. Decca and Radio Mob are both essentially low frequency techniques. The former is older and has a reputation for accuracy; the latter is new and has potential application for both navigation and air traffic control. Vorac is similar to the hearing portion of the Federal Telecommunications Laboratories Tacan system. The crossbar approach lighting system is standard in most countries except the United States and has achieved success in reducing under-shoots and go-arounds. T. I. R 6

11,449

Barker, R.A., & Hertz, R.C. INVESTIGATION OF TECHNIQUES FOR DISPLAYING INFORMATION IN AN AIR TRAFFIC CONTROL CENTER. Contract AF 19(604)-1508, AFRC TR-57-160, May 1957 30pp. Air Force Cambridge Research Center, Bedford, Mass (Stavid Engineering, Inc., Plainfield, N.J.).

11,449

Several types of display equipment were studied in an effort to determine their suitability for use in an en route air traffic control center. These devices fall into four categories: (1) large screen projection displays, both photographic and optical-electronic; (2) character writing techniques; (3) three-dimension presentation; and (4) special or miscellaneous displays. The physical and operating characteristics of the various equipments are presented from the viewpoint of the operational requirements. This is a continuing investigation. T. I.

11,450

USAF Strategic Air Command Headquarters. RB 36 RECONNAISSANCE OBSERVERS MANUAL. SAC Manual 50 22, March 1954, 145pp. USAF Strategic Air Command Headquarters, Offutt AFB, Neb.

11,450

This manual provides training and educational assistance for experienced and inexperienced Reconnaissance Observers in RB-36 aircraft. The objective is to supply background information explaining the why behind the how. Various sections treat the mission of reconnaissance, the RB-36 aircraft, the primary navigator, the photorecognizer, the radar observer, and the weather navigator. Sample record sheets are included in the appendix. T. I.

11,451

Aeroplane & Armament Experimental Establishment. AN ASSESSMENT OF THE GYRO-STABILIZED B6 DRIFFMETER. Rep. AAE/Inst/110, June 1957, 8pp. Aeroplane & Armament Experimental Establishment, Boscombe Down, England.

11,451

To assess the suitability of the gyro-stabilized B6 Driftmeter for use in the Royal Air Force, the instrument was installed in Avro Ashton MK.1 WB. 490. Trials were carried out to determine the device's function in maritime operations and for high speed high altitude transport operations. The defects, as well as the good points, of the device are discussed. T. I. R 1

11,452

National Education Association. A CRITICAL ANALYSIS OF DRIVER EDUCATION RESEARCH. 1957, 60pp. National Education Association, National Commission on Safety Education, Washington, D.C.

11,452

This report is a critical analysis of previous and current studies of the effectiveness of driver education programs in secondary schools. Research on the problem of youth and accidents is summarized. Previous analyses of driver education research are presented. In later sections of the report, the problems of experimental design in this area of research are discussed and various studies are evaluated in terms of how well they meet criteria of good design. T. G. R. some

11,453

USA Headquarters. MOTION ECONOMY THROUGH USE OF OPERATION CHARTS AND MAN-MACHINE CHARTS. Pamphlet 20 302, Oct. 1957, 33pp. USA Headquarters, Washington, D.C.

11,453

This pamphlet describes and illustrates motion economy techniques. Man-machine charts and operation charts and their use are presented in full. Examples of the use of the charts for work simplification analysis are given. Finally, suggestions are given for teaching supervisors to use motion economy techniques. T. I.

11,453

Bausch & Lomb Optical Co. PHASE I (STUDY) OF PROCUREMENT OF A STEREOSCOPIC RANGE FINDER-SIGHT (MODIFICATION OF FINDER, RANGE M-12 OR FINDER, RANGE T-46). Contract DA1-30-115-567-ORD-(P)-693, Ord. Proj. TT2-689, Final Prog. Rep., Jan. 1957, 14pp. Bausch & Lomb Optical Co., Rochester, N.Y.

11,454

The object of this study was to determine the feasibility of producing a stereoscopic range finder sight, using ballistic reticles, by modification of the Finder, Range M-12 or Finder, Range T-46. Specifically, the following were considered: (1) the projection, from a single reticle, of a right and left reticle image; (2) provision for foresighting the range finder weapon combination; and (3) provision of four sets of ballistic reticles to be introduced into the system as required at the will of the operator. On the basis of the success of the study, initiation of detailed design engineering was recommended. T. G. I.

11,455

Wiener, J.B., Harvey, G.O., & Zimmermann, H.J. QUARTERLY PROGRESS REPORT. April 1957, 171pp. Research Lab. of Electronics, Massachusetts Institute of Technology.

11,455

This is a quarterly progress report, for early 1957, from the Research Laboratory of Electronics at the Massachusetts Institute of Technology. The research activities of interest to psychologists are reviewed under the following topics: statistical communication theory, process analysis and synthesis, processing and transmission of information, speech analysis, communications biophysics, and neurophysiology. T. G. I. R. some

11,456

Weiss, G.H. RELIABILITY IN COMMUNICATIONS SYSTEMS. NAVORD Rep. 5664, Proj. 401-664/46005/03040, June 1957, 16pp. USN Ordnance Lab., White Oak, Md.

11,456

This paper discusses the definition of reliability for communications systems. The first part of the analysis deals with the case in which the distribution of possible messages is known; the second, with the case in which the distribution is not known. In the first case, reliability is defined allowing for permutations between messages and the minimum possible reliability for a finite number of messages can be determined. When the distribution of messages is not known, the situation is more complex. A formal extension of these results is made to the case where the signal space can be a continuum. G. R 7

11,457

Stoddard, J.C. MEASUREMENT OF SECOND-ORDER PROBABILITY DISTRIBUTIONS OF PICTURES BY DIGITAL MEANS. Tech. Rep. 302, July 1955, 21pp. Research Lab. of Electronics, Massachusetts Institute of Technology.

11,457

This paper approaches the transmission of a picture from the point of view of statistics and information theory; transmission of a picture is reduced to the problem of sending a number which indicates which of the possible intensity levels occurred in the sample. Equipment that measures the second-order probability distribution of a video wave-form from a facsimile transmitter by digital means was built. System tests were made to permit evaluation of the potential accuracy of measurement. T. G. I. R 9

11,458

Schipper, L.M. PREDICTION OF CRITICAL EVENTS IN CONTEXTS OF DIFFERENT NUMBERS OF ALTERNATIVE EVENTS. Contract AF 33(616)-43. Proj. 7192, WADC TN-55-744, Dec. 1955, 7pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University Research Foundation).

11,458

In the present experiment, subjects predicted the occurrence of the critical event within contexts of three different numbers of alternative events. The critical event was a short flash of a particular light; alternative events were flashes of similar lights. The design was an orthogonal arrangement of the relative occurrences of the critical event, 1/2, 1/4, 1/6, and three levels of alternative events, 1, 3, 5. The hypothesis that as number of alternative events increased the subjects would perceive the occurrence of the critical event as more frequent is evaluated.

Miller, M.H. PROGRESS REPORT OF LOGISTICAL OPERATIONS JUNEAU ICE FIELD RESEARCH PROJECT, ALASKA, 1949, 1950 and 1951. Contract N5onr-83001, NR 307-233, JIRP Rep. 5 Oct. 1951, 45pp. Dept. of Exploration and Field Research American Geographical Society, New York, N.Y.

11,459

This report provides information on equipment and logistics for operations on snow and ice in arctic and subarctic regions gained during the Juneau Ice Field Research Project. The usefulness of selected Quartermaster Corps, Signal Corps, Engineering Corps, Medical Corps, and Air Force items is evaluated. In addition, the problems involved in aerial delivery and field operations of Ordnance Equipment and other heavy units are considered.

11,460

Miller, G.A. THE PERCEPTION OF SPEECH. For Roman Jakobson, 1956, 353-360. (Contract AF 33(636)-14343, AFRCR TN-56-50; Contract N5onr-76, Proj. NR 142-201, Rep. PNR-180. Psycho-Acoustic Lab., Harvard University).

11,460

The thesis of this theoretically-oriented paper is that one of the most fruitful approaches to the study of language or speech perception is the analysis of confusions. What we mean by similarity is demonstrated by behavioral confusions. Examples of situations leading to language confusions and analyses of these situations are scattered through the paper. It is suggested that the distributional techniques of linguistics and the analysis of confusions developed in psychophysics are complementary methods for the study of language.

Gulliksen, H. COMPARATAL DISPERSION, A MEASURE OF ACCURACY OF JUDGMENT. Prepared under Contract Monr 1858(15), National Science Foundation Grant G-642, Tech. Rep., June 1957, 24pp. Princeton University and Educational Testing Service, Princeton, N.J.

11,462

This paper defines a measure of accuracy of judgment. The quantity which represents the ambiguity of total comparative judgment is termed the comparatal dispersion. It is shown that the comparatal dispersion for paired comparison judgments may be used to measure accuracy of judgments made by paired comparisons. A simultaneous solution for scale values and ratios of comparatal dispersion is presented.

Carlough, D.L. SIMULATION OF FREEWAY TRAFFIC BY AN ELECTRONIC COMPUTER. Highway Res. Board Proc., 1956, 35, 545-547. (Institute of Transportation and Traffic Engineering, University of California at Los Angeles.).

11,463

This paper discusses the use of the electronic computer for studying the flow of traffic on freeways. The engineer must quantize time and distance and, for input data, he must have a distribution of desired speeds and a distribution of input time-spacings. Vehicle length, following, passing and time within system could be handled by the computer also. Two different approaches to such problems are discussed. Exploratory studies are used to state the degree of agreement between results and expected behavior.

Deichert, R.W. DAYLIGHT VIEWING CATHODE RAY TUBE INDICATOR FOR AIRCRAFT INSTRUMENTATION PRESENTATION. Contract AF 33(600)-3115, Sci. Rep. 6, Feb. 1957 - April 1957, 13pp. Circuit Research Labs., Allen B. Duffont Labs. Inc., Clifton, N.J.

11,466

This is a report of progress in the development of a compact cathode ray tube package for use in aircraft under conditions of high ambient lighting. Mechanical and electrical features of the device are described, as well as certain problems met in the course of development.

11,467

Berkowitz, S.M. PLANNING AIR TRAFFIC CONTROL. Aviation Age, July 1952, 18(11), 3pp. (Franklin Institute Labs., Philadelphia, Penn.).

11,467

The steps in planning a new system of air traffic control are outlined in this article. The development and use of two graphical simulators (a slide-rule device for final approach problems and a distance versus time plotting technique for analyzing problems in the terminal area) are described. The next step in the evolution of traffic control measures is conceived to be the use of an electromechanical dynamic traffic control simulator to solve traffic problems. C. E.

11,466

Berkowitz, S.M., & Grubmeyer, R.S. REQUIREMENTS FOR A NEW UNIVERSAL AIR TRAFFIC CONTROL SIMULATOR. In: Transactions on Aeronautical and Navigational Electronics, June 1957, ANE-4 (2), 59-64. (Franklin Institute Labs., Philadelphia, Penn.).

11,466

This paper summarizes the role of dynamic simulation in helping solve air traffic control and navigation problems. A brief description is given of the Civil Aeronautics Administration Technical Development Center's electromechanical-optical simulator and some of its present limitations are outlined. The paper concludes with a discussion of areas which require further study if an adequate simulator is to be developed: target generation, communications, displays, and data reduction and analysis. 11,470

Stevens, S.S. CALCULATING LOUDNESS. Noise Control, Sept. 1957, 3(5), 11-22. (Prepared under Contract Nonr-1866(15), Proj. NR 142-201, Rep. PNR-195. Psycho-Acoustic Lab., Harvard University).

11,470

This article describes current problems and methods for measuring loudness reactions. Psychological scaling techniques are discussed and a test of the adequacy of procedures for predicting loudness levels is presented. The use of charts and formulas is illustrated by example. The evidence presented suggests that the errors inherent in the procedures are no greater than the errors obtained in straight forward sound-level measurement. T. G. R 17

11,471

Hurley, H.C., Anderson, S.R., & Keary, H.F. THE CAA VHF OMNIRANGE. Tech. Devel. Rep. 113, June 1950, 65pp. Technical Development and Evaluation Center, CAA, Indianapolis, Ind.

11,471

This report describes the development of a VHF omnirange system for air traffic control. The range furnishes magnetic bearing information with respect to the range station and provides definite track guidance between the station and any point within its service area. The ground and airborne components of the system are described in full. This is followed by a description of the operational characteristics of the system, including statements concerning the accuracy of the system in operation. T. G. I. R 17

11,472

Bausch & Lomb Optical Co. PERFORMANCE TESTS FOR EIGHT 7X50 BINOCULARS. (Contract N00s 67987, Final Rep., Nov. 1956, 15pp. Bausch & Lomb Optical Co., Rochester, N.Y.).

11,472

Optical and Recognition Contrast Resolution Tests were performed on eight standard 7x50 binoculars of four different makes and models. Each barrel was tested a total of six times at representative field angles and target orientations. Each of the six tests resulted in a curve of image contrast versus angular subtense of the bars in a resolution test object. Pertinent data points were selected and analyzed. The data are discussed in terms of field performance and are analyzed diagnostically. C.G.

Yaglou, C.P. HABITABILITY IN CLIMATIC EXTREMES. WORK-REST SCHEDULES FOR DESERT HEAT. Contract DA-49-004-MD-203, Feb. 1957, 13pp. Research & Development Division, Office of the Surgeon General, Washington 25, D.C. (Harvard University School of Public Health).

11,475

As part of a project on habitability in climatic extremes, four associated subjects (1) made marches of 25 to 50 miles in the hot desert sun at three and one-half miles per hour, resting five to ten minutes in the shade between marches, for six hours a day, and (2) made marches of 75 to 150 minutes interspersed with rest pauses of 15 to 30 minutes. The daily mileage was the same for both conditions of the experiment. The incidence of heat exhaustion symptoms, heart rates, and rectal temperatures were compared for the two conditions in order to determine the optimum work-rest schedule for desert heat. T. G.

Stevens, S.S. THE CALCULATION OF THE LOUDNESS OF NOISE. Proc. of the Second ICA Congress, 1956, 26-30. (Prepared under Contract Nonr-1866(15), Psycho-Acoustic Lab., Harvard University).

11,476

This paper discussed the calculation of the apparent loudness (in sones) of a complex noise from measurements of sound pressure levels in separate frequency bands. From the results of numerous experiments, a practical rule is developed for deriving the total loudness of a noise from measurements based on octave bands. The procedure involves the use of charts and a formula for the addition of loudness. G. R 2

Shaw, M.E., Rothschild, G.H., & Strickland, J. P. DECISION PROCESSES IN COMMUNICATION NETS. J. abnorm. soc. Psychol., 1957, 54 (3), 323-330. (Prepared under Contract N5-0ri-166, Task Order 1, The Johns Hopkins University).

11,477
Three experiments dealing with the general problem of decision making in communication nets are reported in this paper: (1) four subjects solved two human relations problems in three different communication nets: the star, the slash, and the concon. Differences between the nets are evaluated; (2) twenty-four groups of four subjects were placed in a star net and required to estimate number of clicks in a series after discussion in order to determine whether a central subject changes a judgment more readily than a peripheral subject; and (3) the effects of the support-opposition variable upon judgmental change in different positions in the star were isolated. Newman, E.B., & Miller, G.A. FINAL TECHNICAL REPORT. Contract AF 33(038)-14343, Rep. FLR-51, Jan. 1957, 23pp. Operational Applications Lab., AFRCG, Bolling AFB, Washington, D.C. (Psychological Labs., Harvard University).

11,478
With the need for increasing the effectiveness of verbal communication systems in mind, this paper explores the factors which may have a part in determining how a receiver decides what message was actually sent to him. In addition to the obviously important physical properties of the received signal, certain characteristics of language itself are considered as basic to successful communication. The redundancy aspect of language is given special emphasis in this study, a new method of estimating redundancy being introduced. Data for statistical analysis were provided by using communication systems that distorted signals or mixed the signal with noise. R 8.

Ragsdill, R.A. EMPLOYMENT AND SUITABILITY TESTING OF COMBINED SENSITIVE AIRSPEED AND MACH INDICATOR. FINAL REPORT. Proj. TR 6 D 56 1, 1957, 3pp. USAF 3550th Combat Crew Training Group (Interceptor), Moody AFB, Ga.

11,479
This is a final report on the suitability testing of the Combined Sensitive Airspeed and Mach Indicator. Ten pilots flew the instrument for a total of 40 hours in T-33 aircraft. Questionnaires were completed by the pilots covering their flights on the instrument. The reactions of the pilots are analyzed and certain recommendations for improvement in the device are given.

Plutchik, R. A CRITICAL ANALYSIS OF THE LITERATURE DEALING WITH THE EFFECT OF INTERMITTENT SOUND STIMULI ON PERFORMANCE, FEELING, AND PHYSIOLOGY, WITH PRELIMINARY WORK TOWARD AN EXPERIMENTAL ANALYSIS OF THE PROBLEM. Prepared under Contract Nonr-2252(01), Oct. 1957, 48pp. Hofstra College.

11,480
This paper contains (1) a critical review of the literature since 1950 on the influence of loud and/or repetitive sounds on behavior, feeling, and physiology, and (2) a report on preliminary work toward an experimental analysis of the problem. The first phase of the research involved the determination of various subjective characteristics of repetitive sound. Four subjects were presented frequencies from 100 to 400 cycles per second in repetition rates from one to 15 pulses per second at increasing intensity. Equal unpleasantness and equal painful contours were obtained for the data. Each subject was later tested on a pursuit-rotor with and without a painful sound. T. G. I. R 80

Fagelley, C.D. MODEL TESTING TECHNIQUES FOR INVESTIGATING JETTISONING OF EVACUATION CAPSULES FROM SUPERSONIC AIRCRAFT. SYMPOSIUM ON THE PROBLEMS OF EMERGENCY ESCAPE IN HIGH SPEED FLIGHT. Sept. 1952, 14pp. Southwest Research Institute, San Antonio, Tex.

11,481
This is a study of model testing techniques that may be used to investigate the characteristics of jettisonable capsules for evacuation from high speed aircraft up to speeds of Mach 3.5. The difficulties involved in providing for complete similarity between model and full scale testing are discussed. Captive wind tunnel models, and also free flight models were studied, both ground launched from a track and air launched from an aircraft at high altitude. G. I.

Hortman, B.O. THE EFFECT OF THE EXTENT OF MOVEMENT (CONTROL SENSITIVITY) ON PURSUIT TRACKING PERFORMANCE. AMRL Proj. 6-95-20-001, Rep. 308, Dec. 1957, 12pp. USA Medical Research Lab., Fort Knox, Ky.

11,482
To determine the effect of changes in movement extent on manual tracking, five subjects tracked a 30 cycles per minute, simple one-dimensional sine signal using a joystick control. The task was to keep target and following cursors aligned by moving the stick from side to side. Extent of movement was varied by changing stick lengths; five steps from 4 to 11.4 inches were used. Each subject had 15 three-minute trials in one session. Performance was analyzed in terms of time-on-target, number of hits and frequency distributions of each movement extent; the latter was taken from graphic records. The concept of control/display ratio for evaluation of control sensitivity is discussed and implications of findings for design of controls indicated. T. G. R 11

11,483
Hartman, B.O., Jaynes, V.E., & Herbert, M.J. ANALYSIS OF ABDUCTIVE AND ADDUCTIVE PHASES OF MOVEMENT IN CONTINUOUS TRACKING. AMRL Proj. 6-95-20-001, Rep. 314, Dec. 1957, 18pp. USA Medical Research Lab., Fort Knox, Ky.

To determine the relative efficiency of abductive and adductive movements in continuous tracking, when the response movement is in the left-right plane, eight right-handed and eight left-handed subjects tracked a simple, one-dimensional sine signal with preferred and with nonpreferred hands using a springless, lightweight joystick. Analyses of performance were made in terms of time-on-target and error amplitude for differences due to type of movement. Efficiency of performance was further studied as a function of locus, direction and reversals. A summary of the four functions was constructed in terms of lead-lag error. Recommendations are included for further investigation of a directional factor in tracking performance. T. G. R 12

Kreider, M.B., & Baskirk, E.R. EFFECT OF SUPPLEMENTAL FEEDING ON BODY TEMPERATURE DURING SLEEP IN THE COLD. Proj. 7-83-01-004C, Tech. Rep. KP-73, Oct. 1957, 10pp. USA Quartermaster Research and Engineering Center, Mattick, Mass.

11,485

This is a report of an investigation of the effect of supplemental feeding on body temperature during sleep in the cold. Skin temperatures (T_{sk}) and rectal temperatures (T_{re}) were taken on six men sleeping 12 nights in Arctic sleeping bags at -34.5 degrees Centigrade. Oxygen consumption was measured for two of these men sleeping six nights. For the first eight days, half of the men received a supplement to the usual three meals of 600 calories (20 per cent protein and 40 per cent each of fat and carbohydrate). For the last four days, half of the men received no evening meal but a 1200 calorie supplement before retiring. The effects are noted.

Green, D.H., Birdsall, T.G., & Tanner, W.P. SIGNAL DETECTION AS A FUNCTION OF SIGNAL INTENSITY AND DURATION. Contract DA-36-039-SC-63203, Proj. 3-99-04-042, Tech. Rep. 42, Feb. 1957, 42pp. Engineering Research Institute, University of Michigan.

11,489

The object of this study was to determine how signal amplitude and duration effect the detectability of a pure tone partially masked by random noise. Three experiments were performed, all employing the same observers. In the first, signal duration was held constant while amplitude was varied. In the second, signal energy was held constant while various pairs of values for duration and amplitude were tested. Finally, amplitude was held constant while duration was varied. A three parameter equation was determined and compared with data of previous research. The predictions generated by a single filter model are discussed.

Bryan, G.L., Bond, W.A., Jr., & Hoffman, L.S. TIME REQUIRED TO TROUBLE SHOOT A RADIO RECEIVER AS A FUNCTION OF TYPE OF INFORMATION PROVIDED. Prepared under Contract Nonr-228(02), Proj. NR 153-093, Tech. Rep. 21, April 1957, 34pp. Dept. of Psychology, University of Southern California.

11,489

To study the time required to trouble-shoot a radio receiver as a function of the type of information provided, two experiments were performed in which the check readings provided the trouble-shooters were systematically varied. For both experiments, 42 experienced Navy technicians served as subjects. Synthetic problem materials were employed. First, the extent to which difficulty level of a problem is dependent on the size of deviations presented was studied; the second experiment determined the effects of manipulating the type of interpretive information available at each test point. The results are the topic of a general discussion section at the end of the report.

Fraser, D.C. A STUDY IN FATIGUE IN AIRCREW. IV. OVERVIEW OF THE PROBLEM. FPRC 504, Feb. 1957, 5pp. RAF Institute of Aviation Medicine, Flying Personnel Research Committee, Farnborough, Hants, England.

This study employs a test of variability of judgment under vigilance conditions to investigate the effects of fatigue in aircrew. Crews of piston-engined aircraft and jet-engined aircraft were tested before and after long flights. Comparisons were also made between the fatigue effects of night vs. daylight flights of similar duration. In addition cumulative fatigue effects were studied, not only by performance measures but by physiological measures as well. Some of the conclusions reached are as follows: a) A significant fatigue effect occurs after a flying continuously in a piston-engined aircraft for more than 10 hrs.; b) No significant fatigue effect occurs after 3-4 hr. continuous sorties in a jet bomber during the day; c) A significant fatigue effect occurs after 3-4 hr. sorties in a jet fighter during the day or after 2-3 hr. sorties at night; d) The fatigue effect involved in night flying is greater than in day flying of equivalent length; e) Subjective reports of fatigue in the individual scores of the Ss in this investigation are significantly correlated with objective deterioration of vigilance; f) Marked changes in performance and subjective states of Ss after prolonged, repeated flights can occur without extensive detectable physiological changes. Larkin, L. & Connel, F.A. RESEARCH ON THE DESIGN OF TELEPHONE STATIONS FOR HIGH AMBIENT NOISE LEVELS. Lab. Proj. 567 4, Final Rep. NML 683 894, March 1957, 11pp. NML Material Lab., New York Naval Shipyard, Brooklyn, N.Y.

11,496
To study the performance characteristics of the Cal-Phone Dial Telephone Station and to determine those factors that contribute to this performance with a view to devising simpler means of achieving similar performance, pertinent information from previous evaluations of the Cal-Phone Station was abstracted. Two design possibilities were suggested: 1) a noise-cancelling transmitter and receiver amplifier fitted into conventional handset, and 2) a noise-cancelling carbon cartridge. Comparison of performance was made by determining the frequency response, sensitivity, random noise discrimination, and measured word articulation scores for the two designs. The results were related to Cal-Phone Station performance. Recommendations are included.

THE EVALUATION OF ENERGY EXPENDITURE BY INDIRECT CALORI-
METRY. I. A COMPARISON OF RESULTS BY MOUTH PIECE VS. FACE
MASK COUPLING. II. A COMPARISON OF FACTORIAL AND DIRECT
MEASUREMENT. Proj. 6 60 11 620, Rep. 100, Aug. 1954,
12pp. Medical Nutrition Lab., Fitzsimons Army Hospital,
Denver, Color.

11,500
To further develop techniques of indirect calorimetry
with the Miller-Peans portable respirometer, two methods
(face mask and mouth piece coupling) of collecting re-
quired air were used under two conditions: constant
temperature and humidity room with rigidly prescribed
activities, and a normal temperature-humidity room with
routine activities. Ventilation rate, per cent oxygen
in expired air and calculated caloric cost of work element
per unit of time were compared for the two methods (one
subject). A second part of the study compared total en-
ergy expended as determined by time-motion and work-
element energy cost techniques (factorial) and as deter-
mined by continuous measurement of oxygen consumption.
Recommendations for further development are made.

Webster, J.C. & Solomon, L.M. EFFECTS OF RESPONSE COM-
PLEXITY UPON LISTENING TO COMPETING MESSAGES. J. acoust.
soc. Amer., Nov. 1955, 27(6), 1199-1203. (Rep. 638,
USN Electronics Lab., San Diego, Calif.)

11,503
To determine the effects of response complexity on
listening to competing messages, three groups of 12 men
listened to sequences of 2, 3, or 4 messages under four
different conditions (filters in, filters out, channels
split, channels together). They responded, on different
occasions, to one or two messages of a set. The first
group wrote the content of the message(s) while the
second group spoke the contents to a partner who wrote
the message. The third group transposed (decoded) the
message content before writing it down. Performance
under the different conditions is evaluated.

MESSAGE RECEPTION RESULTING FROM "SEQUENCING"
COMPETING MESSAGES. J. acoust. soc. Amer.,
1955, 27(6), 1194-1196. (USN Electronics Lab.,
San Diego, Calif.)

11,504
This experiment was designed to find out how much
faster and more accurately competing messages (2, 3, or
4 occurring every 14 seconds with varying degrees of
overlap) can be handled if delayed (stored) temporarily
and listened to on the operator's own call. Ten Naval
personnel heard five-second messages in control tower
phonology over four channels during half-hour sessions.
Playback could be controlled by the operator. Listening
conditions ranged from having operator responding to one
station with nothing to answering three stations without
nothing and results are compared for the various condi-
tions.

Webster, J.C. A RECORDED MARBLE TONE AUDIO-
METER TEST SUITABLE FOR GROUP ADMINISTRATION
OVER LOUDSPEAKERS. J. Speech & Hearing Dis-
orders, 1952, 17, 215-223. (Rep. 546, USN
Electronics Lab., San Diego, Calif.)

11,505
This paper reports the development of a pulsed-tone
group hearing test which (1) uses variable tones (tones
that vary in frequency at a given rate - 5 cycles per
second - and over a given extent as from 885 to 1125
cycles per second), (2) uses within-group attenuation
(each pulse within a group of pulses is softer than the
pulse preceding it), and (3) is recorded on a disc or
tape. This test was tried out on 200 subjects using
loudspeakers and using headsets. The results are com-
pared to those for the more usual type of group test.

Koponen, A., Waters, R.H., & Orlansky, J. THE ASSOCIATIONAL VALUE OF AERONAUTICAL CHART SYMBOLS. Prepared under Contract N8onr-641, Task Order 05, July 1952, 36pp. Dunlap and Associates, Inc., Stamford, Conn.

11,515

As part of a larger series of studies, this paper reports the development of procedures by which meaningful chart symbols, insuring rapid and accurate chart reading, can be devised and evaluated. The associational values of chart symbols were determined through five consecutive steps by the use of tests administered to Naval and civilian subjects. The symbols appearing on WAC charts were evaluated on the basis of the results obtained in the tests described above.

Waters, R.H., & Orlansky, J. THE USE OF MATHEMATICAL AND METEOROLOGICAL DATA IN AERONAUTICAL CHART CONSTRUCTION. Prepared under Contract N8onr-641, Task Order 05, Rep. 641-05-4, May 1951, 33pp. Dunlap and Associates, Inc., Stamford, Conn.

11,516

The purpose of this report is to describe as part of a larger investigation mathematical and meteorological criteria for the selection of features to be shown on aeronautical charts. The relevant literature on visibility of objects from high altitudes was searched, appropriate formulas and graphs on the effects of atmospheric attenuation gathered, mathematical tables and graphs developed from which the relation between an object's size and its angular subtense at the eye from different altitudes can be read, and nomographs for the prediction of object visibility described.

Kishler, J.P., Waters, R.H., & Orlansky, J. THE DEVELOPMENT OF GRAPHIC AIDS TO AIR NAVIGATION. Prepared under Contract N8onr-641, Rep. 641-05-1, May 1951, 27pp. Dunlap and Associates, Inc., Stamford, Conn.

11,517

This report describes the first phase of an investigation directed toward the improvement of aeronautical charts. The historical development of aeronautical charts is reviewed and the need for improved charts is stressed. The WAC chart for cross-country navigation is evaluated and there is a report on various studies having to do with (1) developing a prototype high-speed, high-altitude chart and a tabular navigation form, (2) the visibility of objects from high altitude, (3) chart symbols, and (4) methods of testing charts.

Cramer, R.J., Waters, R.H., & Orlansky, J. A NAVIGATIONAL FORM FOR CROSS-COUNTRY FLIGHTS. Prepared under Contract N8onr-641-05, Rep. 641-05-3, May 1951, 20pp. Dunlap and Assoc-ates, Inc., Stamford, Conn.

11,518

This paper reports the development of a tabular form to display the information necessary to meet the navigational requirements for routine cross-country flights by pilots in single-place aircraft. After conferences with pilots, a preliminary form was constructed and submitted to jet pilots for suggestions which were incorporated in a revised form. This report is part of a larger investigation designed to improve aeronautical charts.

Rigby, M. (Supervisor). METEOROLOGICAL ABSTRACTS AND BIBLIOGRAPHY. Feb. 1957, 2(2), 215-277. American Meteorological Society, Washington, D.C.

11,519

Meteorological Abstracts and Bibliography is a monthly publication of current literature in meteorology and related fields. Part I contains abstracts arranged according to the Universal Decimal Classification. Part II of each issue comprises an annotated bibliography on a special subject. This issue contains such a treatment of "Night Airglow" (sometimes called the nonpolar or permanent aurora). The majority of papers selected for inclusion were written after 1945 although a few from the 1930-1945 period are included. Subject areas treated are: general theory, instruments and equipment, methods of measurement of intensity and height, variations in night sky radiation, physical properties, spectral analysis, and associated phenomena.

Bishop, E.W., Waters, R.H., & Orlansky, J. SPECIFICATIONS FOR A NAVIGATION CHART FOR USE IN HIGH-SPEED, HIGH-ALTITUDE AIRCRAFT (EXPERIMENTAL CHART XDA). Prepared under Contract N8onr-641, May 1951, 26pp. Dunlap and Assoc., Inc., Stamford, Conn.

11,521

The purpose of this study was to develop production specifications for an aeronautical chart to be used for cross-country flight in high altitude, single-pilot aircraft. A job analysis of navigation procedures was prepared from interview and questionnaire data, and additional information was obtained from an analysis of high altitude aircraft characteristics and a study of the objects visible at high altitude. Functional requirements for a prototype chart were derived from these data and production specifications for a chart developed.

Noert, L.O. A SYSTEM FOR MEASURING THE HIGH SOUND PRESSURE LEVELS FROM ROCKETS. Proj. 7210, WADC TR-56-655, Dec. 1956, 38pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,522

This report describes a noise measurement system developed for measuring the high intensity noise produced by rockets. In order to obtain far and near field noise characteristics in the short firing time of rocket engines, a 21 channel recording system was developed. Selection of microphones and other components, testing of the equipment, and its calibration up to 195 decibels re .0002 microbar are discussed. The procedures advisable for field test use are described as well as the system to be used for analyzing the data.

Allais, E.A., & Martin, H.B. COMPARATIVE INFORMATION-HANDLING PERFORMANCE WITH SYMBOLIC AND CONVENTIONAL ARABIC NUMERALS: VERBAL AND MOTOR RESPONSES. Contract AF 33(616)-3612, Proj. 7192, WADC TR-57-196, April 1957, 12pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University Research Foundation).

11,526

To compare the information-handling performance of subjects in making verbal and motor responses to two sets of Arabic numerals - one a set of conventional figures (AND-10400), the other a set of symbolic (generated from an eight-element straight-line matrix) - two groups of 24 subjects were tested. One group responded to the stimuli by pressing its corresponding key, the other by naming the number represented. Each subject responded for one session of five trials (100 presentations of each type of stimuli) on each of two successive days. Five volunteers from each group continued for 12 days. From the data (time and errors) the amount of information transmitted (bits per stimulus) was computed and compared for the two sets of conditions. Effects of longer term practice were also studied. Kobrick, J.L. QUARTERMASTER HUMAN ENGINEERING HANDBOOK SERIES: II. DIMENSIONS OF THE UPPER LIMIT OF GLOVED HAND SIZE. Proj. 7-83-01-004, Tech. Rep. EP-41, Dec. 1956, 185pp. USA Quartermaster Research and Development Center, Natick, Mass.

11,527

This report presents information on the hand size of the soldier wearing various ensembles of Quartermaster protective handwear. It is intended for use as a handbook by engineers for establishing size and space allowances in the design and sizing of hand-operated equipment. The criterion employed is the bare hand size that is equal to or bigger than the hand size of 95% of the Army personnel (95th percentile of Army hand size distribution). The information is presented in pictorial form with index scales. Dimensions can be measured on the pictures and referred to the scales to establish actual size. I. R. 3

O'Connor, J.U., Gerstman, L.J., Liberman, A.M., Delattre, P.C., & Cooper, F.S. ACOUSTIC CUES FOR THE PERCEPTION OF INITIAL /w, j, r, l/ IN ENGLISH. Word, April 1957, 11 (1), 24-43. (Haskins Labs., New York, N.Y.)

11,528

To investigate the physical stimuli essential to the recognition of the phonemes /w, j, r, l/ in initial positions before vowels, hand-painted patterns containing the cues believed to be most important were prepared and converted to sound. In the first part of the experiment, a wide variety of acoustic variations (number of formants, duration of steady-state onsets, starting frequencies of transitions, transition duration) were explored by the experimenters. In the second part, a sampling of the various acoustic dimensions found to be important above were presented to a group of 44 naive listeners for identification. Per cent responses for each phoneme were analyzed for agreement with previous judgments. G. I. R 15

11,529

Lisker, L. CLOSURE DURATION AND THE INTERVOCALIC VOICED-VOICELESS DISTINCTION IN ENGLISH. Language, Jan.-March 1957, 33(1), 42-49. (University of Pennsylvania and Haskins Labs., New York, N.Y.)

11,529

To determine the extent to which a variation in closure duration might be a cue to the intervocalic voiced-voiceless distinction in English, the pair p-b was selected for study. A number of sentences including trochees in position of primary stress and also trochees spoken in isolation were recorded and made into spectrograms. Analysis of the spectrograms recorded consistent differences in closure patterns. A series of tape-splicing experiments on recordings of rupee-ruby were carried out in which the normal closure durations were reduced and lengthened, varied in steps over a range of time, and final portions of the two words reversed. The results of judgments were analyzed in terms of closure-durational differences in the voiced-voiceless stop distinction. G. R. 3

Liberman, A.M. SOME RESULTS OF RESEARCH ON SPEECH PERCEPTION. J. acoust. Soc. Amer., Jan. 1957, 29 (1), 117-123. (Haskins Labs., New York, N.Y., and University of Connecticut).

11,530

This paper describes and attempts to interpret some research with synthetic speech which has succeeded in isolating some of the acoustic cues which underlie speech perception. The methods or techniques of the research are given briefly followed by a discussion of three types of consonant cues - those related to constriction sounds, to transitions from the consonant to the next phone, and to the on-off action of a single fixed resonator. Some data relating to the effects of learning on the distinctiveness of speech sounds are presented and discussed. I. R. 18

Hardy, J.D., & Stroll, Alice M. MEASUREMENT OF THE RADIANT HEAT LOAD ON MAN IN SUMMER AND WINTER ALASKAN CLIMATES. Special Rep., Nov. 1953, 43pp. Arctic Aeromedical Lab., Alaskan Air Command, Ladd AFB, Alaska. (Cornell University Medical College).

11,531

To evaluate the thermal characteristics of the summer and winter climates of interior Alaska, two methods of measurement were used. The first was direct measurement (panradiometer) of the total radiation incident on man and, by computation from these measurements, the mean temperature of the environment. The second was direct measurement of mean radiant temperature of the environment (thermo-radiometer) and, by means of computation, the solar contribution to the total radiation. Variations in solar radiation and environmental temperature and the resultant heat load on man are discussed and shown graphically. Factors involved in observed variations are discussed. T. G. R 14

Vickers, T.K., & Miller, R.S. RECENT DEVELOPMENTS IN THE SIMULATION OF TERMINAL AREA AND ENROUTE AREA AIR TRAFFIC CONTROL PROBLEMS. IRE Transactions on Aeronautical and Navigational Electronics, June 1956, ANE-3 (2), 51-54. (CAA Technical Development and Evaluation Center, Indianapolis, Ind.).

11,532

This paper describes the air traffic simulation facilities that are now in use at the Civil Aeronautics Administration (CAA) Technical and Development Evaluation Center. Some of the important developments in the study of terminal area and enroute traffic control problems which have been achieved through the use of these facilities are reviewed. G. I.

11,533

Glassman, I. A DYNAMIC AIRCRAFT SIMULATOR FOR STUDY OF HUMAN RESPONSE CHARACTERISTICS. Oct. 1952, 6pp. The Franklin Institute, Philadelphia, Penn.

11,533

A dynamic highspeed jet aircraft simulator is described. The simulator is intended for use in psychological experiments designed to determine the transfer characteristics of a pilot under simulated flying conditions. Two major components of the simulator are (1) an analog computer that solves equations on motion of aircraft in response to control movements and target motion relative to aircraft; and (2) a cockpit which includes a display system and three control elements. Validation of the simulator is described. I. R. 2

Felton, W.W. SOME CHANNEL ALLOCATION PROBLEMS IN AIR-GROUND VOICE COMMUNICATIONS. Trans. I.R.E., March 1954, APR-1(1), 41-51. (The Franklin Institute, Philadelphia, Penn.).

11,535

To study problems of channel allocation in air-ground voice communications as used in air traffic control, programs of communications were made at Langley Air Force Base (October to December 1951) and at the Washington National Airport (February to April 1952). All messages on selected frequencies for the channels studied (both IFR, Instrument Flight Rules, and VFR, Visual Flight Rules) were recorded on magnetic tapes and identified as to time of occurrence and length. The data were analyzed to show maximum utilization of a channel (average reaction interval, message length, estimates of channel delay) and the amount of communicating time per aircraft. These factors are discussed in relation to ways to communicate with more aircraft per channel.

Frank, W.E. INSTRUMENTATION REQUIREMENTS IN SENSORY AIDS. Ann. N.Y. Acad. Sci., April 1955, 60(Art. 6), 869-876. (Bioengineering Section, The Franklin Institute, Philadelphia, Penn.).

11,536

This paper discusses instrumentation requirements in sensory aids which lie outside the laboratory or industrial instrumentation. These requirements arise out of the limitations of the information instruments can present, out of the fact that the devices must be closely integrated with actions of people using them, and from psychological and sociological problems over which the researcher has no control.

Grier, G.W. THE INFORMATION CONTENT OF AIR-GROUND MESSAGES. Trans. I.R.E., March 1954, APR-1(1), 5-16. (Contract AF 18(600)-26, Electrical Engineering Div., The Franklin Institute Labs., Philadelphia, Penn.).

11,537

This report on information content of air-ground messages is one of a series in a program of research into the role of air-ground communications in the control of landing aircraft. On-the-spot records of communications between pilots and controllers were made at the Washington National Airport and Langley Air Force Base covering a wide range of air traffic and weather conditions. Messages were transcribed, coded according to information content, and transmission rates calculated. The data were analyzed for effectiveness of voice radio in transmitting information required for traffic control. The findings are discussed in relation to possible changes in design or use for improved effectiveness.

Crook, H.N., Devos, D.B., Hageman, K.C., Hanson, J.A., et al. AGE AND THE JUDGMENT OF COLLISION COURSES. Rep. 57-105, Sept. 1957, 38pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Institute for Applied Experimental Psychology, Tufts University).

11,538

To investigate the effect of age on ability to judge collision courses, an experiment was conducted in which the subject sat in a simulated cockpit and an image representing an approaching aircraft was projected onto a special viewing screen. The task was to judge whether the approaching aircraft was on a collision course with subject's aircraft. The subjects were 165 males with normal vision, good health, and average educational level above the mean of the general population, distributed in age from the middle teens to the late fifties. Responses were scored for (1) errors and (2) time before nearest approach at which correct judgments were made. The results are discussed in terms of their validity for practical application.

Clark, W.B., & Johnson, M.L. THE COURSE OF DARK ADAPTATION AFTER WEARING ORANGE DARK ADAPTOR GOOGLES. Proj. X-430 (Av-230-p), Res. Rep., Feb. 1945, 6pp. Air Training Bases, USN School of Aviation Medicine, Pensacola, Fla.

11,540

To test the effectiveness of orange dark adaptor goggles, the course of dark adaptation was determined in eight previously dark-adapted subjects following exposure to room illumination of 5, 10, and 15 minutes while wearing various types of goggles: Orange Dark Adaptor goggles with both 50 and 5 per cent transmission, standard Navy Red Dark Adaptor goggles, five and ten per cent transmission neutral goggles. The data (elevation of threshold in log micro lamberts and minutes required for return to threshold) were analyzed and shown graphically. The results are discussed in terms of effectiveness of each goggle in protecting dark adaptation at room illumination.

Herman, I.L. THE EFFECT OF TARGET STUDY WITH KNOWLEDGE OF PERFORMANCE UPON AIMING POINT IDENTIFICATION AT DIFFERENT DISTANCES FROM THE TARGET. Proj. 7711, Task 77201, Lab. Note AO 55-2, May 1955, 5pp. Aircraft Observer Research Lab., AFTRC, APDC, Mather AFB, Calif.

11,541

To study the effect of target study with knowledge of performance upon aiming point identification at various distances from the target, error scores (from a previous study) at 30, 20, 15, 10, and 6 miles from the aiming point were analyzed. Five groups of subjects (76 in all) were trained on each one of five different motion picture bomb runs. Half the subjects in each group were informed of the correct aiming point location at 30-second intervals during four trial runs; the other half were not. Both groups were tested immediately and after 72 hours without such knowledge. Differences in error scores at the selected distances were studied for differences between the groups.

11,552
Bell, D.A. THE "INTERNAL INFORMATION" OF ENGLISH WORDS. Unno. Rep. 1952, 6pp. Electrical Engineering Dept., University of Birmingham.

11,552
To study the "internal information" of English words a synthetic method of evaluation according to lengths and frequency of use was carried out. By sampling 20 and only selected pages from the Concise Oxford Dictionary numbers of words containing 3, 4, 5, 6, 7, and 8 letters were counted and proportionate numbers for whole dictionary calculated. One and two-letter words were obtained from Dewey's list of frequently used words. An estimate of frequency of use of various word lengths was also taken from Dewey's list. By appropriate weighting procedures the contributions from word structure to the internal information was obtained in "bits" per letter.

Rodahl, K. NUTRITIONAL REQUIREMENTS OF TROOPS STATIONED IN ALASKA. Proj. 7-7954, Rep. 1, June 1955, 103pp. Arctic Aeromedical Lab., Alaskan Air Command, Ladd AFB, Alaska.

11,553

To determine the nutritional requirements of man in the arctic environment, a series of nutritional surveys (together with detailed clinical, physiological and biochemical examinations) was carried out among a group of airmen and a group of infantry soldiers at Ladd Air Force Base in Alaska. All four seasons of the year were covered during the period 1950-1952. Simultaneously similar studies were made among four groups of Eskimos for comparison. Caloric intake and caloric expenditure (estimated on basis of time-activity data) were studied in relation to health and weight changes. Percentages of calories furnished by protein, fat and carbohydrate are given. Mineral and vitamin consumption figures are given. Discussion is related to requirements of each in the daily diet. T. R. 81

Kossmann, C.E. VENOUS PRESSURE, CIRCULATION TIME, AND CELL-PLASMA RATIO DURING ACUTE PROGRESSIVE ANOXIA IN MAN. Proj. 4, Rep. 1, July 1942, 7pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,554

To determine the effect of a rapidly decreasing oxygen saturation of the blood on venous pressure, circulation time, and cell-plasma ratio, acute progressive anoxia was induced by rebreathing techniques in 19 healthy young male subjects. During the 20 to 25 minute rebreathing period continuous recordings were made of oxygen saturation of the blood, venous pressure, and pulmonary ventilation; pulse rate and arterial blood pressure were determined at frequent intervals; circulation time from right arm to tongue was measured for oxygen saturation of 85 and 75 per cent (approximately); and during last few minutes of rebreathing and first few minutes of breathing room air the electrocardiogram was recorded. These data were compared with similar recordings made under normal circumstances. T. G. R 10

11,555

Mitchell, D.F. A BIBLIOGRAPHY OF AVIATION DENTISTRY. Proj. 391, Rep. 2, April 1946, 8pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,555

This is a bibliography of literature on Aviation Dentistry in the form of an authors index and general subject index. Four main classifications appear: (1) general; (2) aerodontalgia; (3) mandibular mal-position and related symptoms; and (4) others. The last classification includes papers that deal with periodontal disease, saliva, restorative materials, dental identification and flying safety, denture retention, and other less widely studied subjects. Cronay, J. EXPERIMENTS WITH LOGARITHMIC RECEIVERS FOR CLUTTER REDUCTION ON RADAR DISPLAYS. A.S.R.E. Tech. Note TX-53-10, Jan. 1954, 42pp. Admiralty Signal and Radar Establishment, Portsmouth, Gosport, Portsmouth, Hants, England.

11,556

This paper reports experiments with logarithmic receivers for reduction of clutter on radar displays; A theory for the action of such receivers on inherent noise, sea clutter, and rain clutter is developed. Results of experiments on both S and X band radars are given. The important design parameters of a logarithmic receiver are also described. I. R 2

11,557

Hess, G.H. THE PROBLEM OF ESCAPE BY PARACHUTE IN ACUTE AERIAL EMERGENCIES IN FLYING TRAINING. Proj. 417, Rep. 1, Sept. 1945, 9pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,557

This report provides an analysis of the problem of escape in 250 acute aerial emergencies resulting in aircraft accidents which involved 468 personnel in flying training. Factors determining the success or lack of success of escape by parachute are discussed in detail. It is recommended that technical research be undertaken with the principle of mechanical ejection of personnel in mind. T. R 5

11,558

Loucks, R.B. ASSESSMENT OF INSTRUMENT FLYING PERFORMANCE TECHNIQUES FOR AUTOMATIC GRAPHING OF AN AIRCRAFT'S FLIGHT PATH. Proj. 383, Rep. 1, Aug. 1945, 5pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,558

This paper describes four methods for making a permanent tracing of an aircraft's flight path in azimuth by means of equipment carried in the plane. One of the methods was tested in a C-47; the others are to be flight-checked in the hope of developing adequate means of assessing instrument flying performance and evaluating various types of flight instruments. 11,559

Mitchell, D.F. A BIBLIOGRAPHY OF AVIATION DENTISTRY. Proj. 391, Rep. 1, May 1945, 5pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,559

This is a bibliography of 67 titles having to do with dental problems directly related to aviation. The subjects covered are: aerodontalgia, mandibular mal-position and symptoms, periodontal considerations, and other general miscellaneous problems. R 67

11,560

Senturia, B.H. THE EFFECT OF EXPOSURE TO AIRPLANE NOISE ON AUDITORY ACUITY. Proj. 205, Rep. 1, Dec. 1943, 5pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,560

To study the effect of exposure to airplane noise on auditory acuity, pure tone auditory thresholds were obtained on 100 enlisted trainees before entrance into primary pilot training and repeated on the 74 subjects of the group of 100 who had successfully completed nine weeks of training. The percent of ears showing an elevation of threshold of 15 decibels or more is given as well as the frequencies at which this elevation most frequently occurred. T. G. R. 8

11,561

Masland, R.L. REPORT OF ACCIDENTS RESULTING FROM ANOXIA IN AIRCRAFT. Proj. 206, Rep. 1, Nov. 1943, 17pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,561

This report concerns 17 deaths due to anoxia, occurring in flights of heavy bombardment aircraft, and three accidents (two fatal) occurring in pursuit aircraft. Abstracts containing the important facts of these flights and a summary table of essential features are given. The discussion concerns (1) cause of death, (2) personnel involved, (3) time required for death, and (4) suggested indoctrination procedures. T.

11,562

Louska, R.B. DEVELOPMENT OF A SIMPLIFIED TABLE MODEL OF THE SAN MULTIDIMENSIONAL PURSUIT TEST. Proj. 214, Rep. 1, Dec. 1943, 4pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,562

This report describes a modification of the original research model of the Multidimensional Pursuit Test for use in the classification of aircrew candidates. The test samples eye-hand coordination and capacity to attend to a variety of tasks at the same time. The apparatus, calibration procedure, test procedure, rationale of the test, and rationale of the scoring procedure are given. The designation S.A.M. Multidimensional Pursuit Test, Form C is given to the modified test.

11,563

Hase, G. A STUDY OF FACTORS WHICH OPERATE AGAINST THE SUCCESSFUL ESCAPE OF OCCUPANTS FROM AIRCRAFT. Proj. 249, Rep. 1, May 1944, 7pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,563

To determine why occupants of falling aircraft often do not use the parachute, 12 reasons for non-use or unsuccessful use were listed. Three case reports illustrate one reason, namely, immobilization of occupants in aircraft by force generated by spinning of airplane during its fall to the ground. These reports were analyzed and recommendations formulated for escape procedures to be used in these circumstances.

11,564

Rowland, W.M., & Rowland, Louise S. ASPECTS OF NIGHT VISUAL EFFICIENCY. Proj. 106, Rep. 1, AAF School of Aviation Medicine, Randolph AFB, Tex.

11,564

To study the relationships among several aspects of visual function in dim illumination, 103 subjects were adapted to darkness for 20 minutes. The minimum intensity was measured at which each subject could perceive light, locate a dark object (airplane) against a dimly illuminated background, and distinguish its form (identify heading of airplane). Directions were given to use a roving fixation for all tests and no time limitation was set for exposure. Retests were made on 39 individuals. Threshold data were studied by correlational procedures to determine degree of relation. Comparisons were made with measurements of night sky brightnesses and the type of test needed for classification of differences in night visual efficiency discussed.

11,565

Bond, D.D. A STUDY OF THE EMOTIONAL FACTORS INVOLVED IN A GROUP OF THIRTY (30) CONSECUTIVE NAVIGATION CADETS IN THE PROCESS OF ELIMINATION FOR SEVERE AIRSICKNESS. Proj. 136, Rep. 1, April 1943, 12pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,565

To determine the importance of emotional factors in the etiology of airsickness, thirty cadets in the process of being eliminated from flying training for severe airsickness were each interviewed for an hour. The case histories of these men are presented in the report and an attempt is made to order and evaluate the findings.

11,566

Ogden, F.W. STUDY OF ALTITUDE CHAMBER AERO-OTITIS MEDIA. Proj. 147, Rep. 1, May 1943, 3pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,566

This is a report of a study of the incidence and characteristics of altitude chamber aero-otitis media over a period of three months at Randolph Field, Texas. Statistics were obtained on 667 individual student flights in the low pressure chamber at simulated altitude of between 28,000 and 38,000 feet. The tympanic membranes were examined before and after flight and the students reported any aural symptoms which had developed during flight. The number of cases and degree of aero-otitis media are reported for this series.

Grether, W.F., & Smith, P.K. CRITERIA OF ANOXIA TOLERANCE. II. VALIDATION OF A GROUP OF PSYCHOMOTOR TESTS AS MEASURES OF THE EFFECTS OF PARTIAL ANOXIA UPON HUMAN PERFORMANCE. Proj. 89, Rep. 2, Dec. 1942, 8pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,568

To evaluate a group of psychomotor tests as measures of the effects of partial anoxia on human performance, the group of paper and pencil and apparatus tests were given in the altitude chamber while subjects were receiving oxygen by mask at simulation of 18,000 feet and again 15 minutes after the oxygen was turned off. Test scores were analyzed to determine the degree to which the various tests served as measures of the degree of impairment due to oxygen deficiency.

11,573

Swerling, P. SOME FACTORS AFFECTING THE PERFORMANCE OF A TRACKING RADAR. Res. Memo 989-1, Sept. 1954, 62pp. USAF Project RAND, Rand Corp., Santa Monica, Calif.

11,573

This report presents an analysis of tracking errors due to circuit noise in split-gate range tracking and monopulse angle tracking radars, with emphasis on the situation prevailing for low input signal-to-noise ratios. Approximate probability distributions are derived for tracking errors. A performance criterion called "loss rate" is defined which is helpful in defining the maximum range of a tracking radar; equations are given for loss rate in terms of signal-to-noise ratio, repetition rate, servo parameters, and target motion. An analysis of transient errors occurring during lock-on and probability of detection curves are also given.

11,574

Duerfeldt, C.H. THE AERO IA RECORDER AND ASSOCIATED GROUND PLAYBACK EQUIPMENT (NADAR) IN F2H-4: TEST AND EVALUATION OF. PRELIMINARY REPORT. Proj. TED PTR AR 42015-3, Rep. 1, Nov. 1955, 3pp. USN Air Test Center, Patuxent River Air Station, Md.

11,574

To evaluate the usefulness of the Aero IA Recorder and Associated Ground Playback Equipment (NADAR) for recording and reproducing radar scope attack displays, a functional evaluation was made. The NADAR recorder was installed in F2H-4 aircraft and used during 13 flights. Comparisons of the reproduced display with the pilots' impressions of the attack presentation seen in flight, and the film record of the radar scope display with a Hughes Remote Scope Recorder were made. Stability of equipment was noted. Recommendations are included.

11,575

Little, J.D.C. A LINEAR MODEL FOR A SUPPORT PERSONNEL CALCULATION. May 1956, 7pp. Combat Operations Research Group, Continental Army Command, Fort Monro, Va.

11,575

This report considers the problem of calculating the numbers and kinds of support troops (those who provide services) for given numbers and kinds of combat troops (those who man the weapons). A linear model is presented wherein the explicit solving of the problem is equivalent to inverting a matrix. Expressions are set up for showing the effect on given kinds of support personnel of changes in coefficients arising from changes in the level of support.

11,576

Keil, P.C. PUPILLARY SIZE IN RELATION TO DARK ADAPTATION. Proj. 16, Rep. 1, April 1942, 5pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,576

To study the relationship between pupillary size and light or visual acuity threshold under dark adapted conditions, measurements were made on 33 subjects with the Becht Adaptometer and the Miles Illuminous Disc Adaptometer. After 25 minutes of dark adaptation a flashlight photograph taken with an open shutter was made of each subject's eyes. Duration of flash was less than twelve hundredths of a second. Pupil size was then measured by means of a photograph of a millimeter ruler on the same scale as the photograph. The data were analyzed for possible relationships.

Ahles, F.H. Jr. WINTER FIRE-FIGHTING IN THE ARCTIC: STUDY OF CLOTHING, EQUIPMENT, AND METHODS. Proj. 22-1202-0002, Special Rep. 43, June 1952, 23pp. Arctic Aeromedical Lab., Ladd AFB, Alaska.

11,577

To study the equipment, methods, and clothing of winter fire-fighting in the Arctic, one observer was placed with the Ladd Air Force Base Fire Department for 14 days and later with the Fairbanks Fire Department for ten days. He answered all calls during these periods and actually became a member of the department. Temperatures ranged from -33 to -53 degrees Fahrenheit. All articles of clothing were evaluated as to speed of donning, warmth, water repellency, durability, and fireproof qualities; the fire-fighting equipment was evaluated for effectiveness of functioning in the cold; and the methods were evaluated for efficiency. Specific recommendations are made in all three areas.

11,578

Alder, A.V. THE BINOCULARLY INDUCED PHI MOVEMENT AS A METHOD OF MEASURING BINOCULAR FIXATION DISPARITY. June 1957, 4pp. Indiana University.

11,578

To investigate the use of the phi phenomenon in the retinal periphery as a technique for measuring binocular fusion disparity, three series of determinations were made by three subjects. Fusion stimuli (fixation points or peripheral rings 2.9 to 32 1/2 degrees of arc at the eye) were presented in a haploscopic device. Maintaining constant fusion and fixation the subject adjusted a flashing light to a position of fusion with an alternately flashing light and then to a position where the lights appeared to be in the same direction and phi movement was eliminated. This position was taken as the disparity measurement. Six vergence positions from phoria were tested. The data were analyzed for accuracy or repeatability of measurements.

Sidman, M. DRUG-BEHAVIOR INTERACTION. Proj. 6-60-10-016, Subtask 1, WRAIR-120-56, June 1956, 24pp. Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington, D.C.

11,579

This report describes some of the relations between certain temporal characteristics of behavior and such pharmacologic agents as amphetamine, alcohol, sodium pentobarbital, and reserpine. Data are presented from a series of laboratory studies on animals. Types of behavior induced by experimental control were appetitive, aversive, timed, anticipatory and anxiety and the effects of drugs were studied on such behaviors. The need for systematic behavioral investigation prior to drug investigation in an attempt to bring order into the facts of drug-behavior interaction is discussed.

11,581

Neely, K.R. THE MEASUREMENT OF NOISE. Academy of Medicine, Toronto Bull., Dec. 1956, 4pp. (Defence Research Medical Labs., Toronto, Canada).

11,581

This paper discusses the increased noise levels to which people are exposed today and gives some typical overall noise levels in tabular form. The measurement of noise is discussed in terms of standard types of measurements and purposes for which they are used. The noise measuring equipment, factors to be considered in selection, calibration of equipment, errors in measurement, and ways of presenting noise measurement data are considered.

11,582
Francis, S.A. & Hawkins, G.E. RADAR ROOM LIGHTING. A REPORT ON THE EXPERIMENTAL INSTALLATION AT AN AIR DEFENSE DIRECTION CENTER SITE P-10. Contract AF 19(604) 1545. AFRC TN 55-75, Nov. 1955, 25pp. Francis Associates, Marion, Mass.

11,582
This report outlines the problems of an ambient lighting system for a radar room and suggests control methods for producing higher lighting levels than heretofore possible without reducing operator efficiency. The theory and research on which the recommendations are based are detailed under the following topics: (1) methods of reducing the non-specular reflections related to lighting intensity (hood, polaroid filters, and selective spectrum lighting systems); (2) methods of reducing the glare component (lowered ceiling, light source, equipment arrangement), and (3) combined reduction of specular and non-specular reflections (fluorescent materials, wall and floor color). An experimental installation at an Air Defense Direction Center SITE P-10 is described in detail and recommendations for research are made. T. G. I. R 11

11,583
Hortsmann, A.B., Randall, W.C., Peiss, C.N., & Adams, J.G. CUTANEOUS THERMOSENSORY RECRUITMENT OF SWEATING. 15TH OF A SERIES OF REPORTS ON STUDIES ON CUTANEOUS HEAT LOSSES. Contract AF 18(600)-96, RDO 696-69, WADC TR-6680, Dec. 1955, 17pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (St. Louis University).

11,583
To study the effects of sudden changes in ambient temperature (and of local heating and cooling) on sweating, a series of experiments were performed. Sweating was recorded by capillary sample every three minutes or by sweat prints every 30 seconds before, during, and after sudden transfer of subject from one temperature to another. Sublingual, axillary, and skin temperatures were recorded automatically. The same procedures were used when only the hand was heated or cooled. Six subjects were used. The data were analyzed to show rate of change as function of experimental conditions. The findings are discussed in relation to the role of cutaneous thermal receptors in eliciting changes in sweating levels. T. G. R 8

11,584
Bolt Beranek and Newman, Inc. CAPABILITIES AND LIMITATIONS INVESTIGATION OF LONG-RANGE PUBLIC ADDRESS EQUIPMENT. PHASE 3: CONSTRUCTION OF INSTRUMENTATION FACILITY MAY 1955 TO OCTOBER 1955. Contract DA 36-039-sc-64503, Proj. DA 3-99-12-022 and 3-27-01-015, Proj. SC 132B and 2121E, Final Rep. 406, Dec. 1956, 144pp. Bolt Beranek and Newman, Inc., Cambridge, Mass.

11,584
This is the final report of Phase Three of a study of the capabilities and limitations of long-range public address systems for the transmission of speech under varied meteorological and terrain conditions. The construction and operation of a transportable instrumentation facility for gathering data are described in detail and a comprehensive block diagram given. The major part of the report describes the various components, such as the Sound Radiating System, Sound Receiving System, Temperature and Wind Speed Gradient Measuring Systems, Thermistor, Vane, and Cup Anemometer Turbulence Measuring Equipment, Meteorological Equipment, and Power Supplies. Operating procedures, wiring diagrams, schematics, and maintenance instructions are included. T. G. I.

11,585
Reaser, P.B. COOLING GRADIENT CALORIMETRY. A TECHNIQUE FOR STUDYING PERIPHERAL CIRCULATION. I. METHOD AND PROCEDURE. Proj. 6-64-12-028, Rep. 124, Oct. 1953, 8pp. USA Medical Research Lab., Fort Knox, Ky.

11,585
A new approach to the study of vascular response is presented. Three variations of calorimeters based on three variables concerned in cold are described: a disc calorimeter, a titration calorimeter, and a cooling gradient ice calorimeter. The method and procedures for using these calorimeters in studies of cooling rate, heat loss rate, and temperature are described. The application of this technique to the study of a variety of problems is discussed. G. I. R 4

11,585
Reaser, P.B. COOLING GRADIENT CALORIMETRY. III. THE ROLE OF POSITION IN PERIPHERAL VASCULAR RESPONSES. Proj. 6-64-12-028, Rep. 128, Nov. 1953, 7pp. USA Medical Research Lab., Fort Knox, Ky.

11,586
To determine if cooled hands are more susceptible to position change than warm hands; the relationship between cooling and position of hands relative to heart level at temperatures between 23 and ten degrees Centigrade were studied on 13 subjects. An ice calorimeter was used to measure heat output rate at the various temperatures with the hand at, above, or below heart level. Some observations were made of response to venous occlusion (cuff pressure applied to arm). The heat output data are analyzed for effect of position and hand temperature--a possible explanation of the findings on a physical basis is offered--implications for manipulative tasks in cold environment are pointed out. Shambaugh, G. TEMPERATURE RECEPTORS, AN ANNOTATED BIBLIOGRAPHY. Proj. 7-64-12-004C, Tech. Rep. EP-24, April 1956, 55pp. USA Quartermaster Research and Development Center, Natick, Mass.

11,587
This bibliography on temperature receptors is divided into four sections. The first three are introduced by summary comments followed by annotated references listed chronologically. The areas treated are: (1) temperature receptors in man, (2) temperature receptors in other animals, and (3) the effects of chemicals on temperature receptors. A final section presents an alphabetical listing of all references cross-indexed, together with additional pertinent references. T. R 246

11,588
USA Board NR2. TEST OF SCOTCHLITE REFLECTIVE SHEETING FOR VEHICLE REFLECTORS. Proj. 1898, April 1955, 10pp. USA Board NR2, Fort Knox, Ky.

11,588
To determine the suitability of reflective sheeting (Scotchlite) to replace all glass and plastic reflectors on Army motor vehicles, a series of tests were conducted. Methods prescribed by the manufacturer were followed in applying disks to the painted surfaces of vehicles and time was recorded for each method. Reflective characteristics were compared with standard reflectors by measuring the respective distances at which each could be detected under various conditions of night illumination. Evaluations were also conducted over a period of one year of field use and during normal tactical exercises. Observations were made as to adhesive and reflective characteristics, durability, and tactical recognition symbols. Recommendations are included. G. I.

Keys, A., Taylor, H.L., & Brozek, J. NUTRITION AND PERFORMANCE CAPACITY. Contract DA44-109-qm-1526, Proj. 7-84-12-011, Res. Proj. Rep. 8 (Phase), June 1953-Sept. 1956, 88pp. Quartermaster Food and Container Institute for the Armed Forces, Chicago, Ill. (University of Minnesota).

11,589
This report presents data obtained during an investigation of nutrition and performance capacity. The subjects were 13 men divided into "restricted" and "unrestricted" groups. During an 11-day control period all subjects were given 3,190 calories per day; a 12-day restriction period followed with the groups being given 580 and 3,190 calories per day respectively; and finally, a 15-day rehabilitation period where both groups were given 3,988 calories per day. Unlimited water was supplied and a measured amount of exercise. The data include measures of body composition and compartments, basal data, aerobic and anaerobic work, Harvard Fitness Test results, ballistocardiography, and psychomotor performance.

11,590

Swearingen, J.J. DESIGN AND CONSTRUCTION OF A CRASH DUMMY FOR TESTING SHOULDER HARNESS AND SAFETY BELTS. Preliminary Report. April 1951, 15pp. Civil Aeronautics Medical Research Lab., CAA Aeronautical Center, Okla.

11,590

A dummy is described which attempts to simulate human body dimensions, center of gravities, joint movements, muscle resistance, muscle return, and compressibility and resiliency of tissues. It is proposed for studies of crash injury, and the testing of protective devices. T. I. R 8

11,591

Fish, R.E. FINAL REPORT ON VIBRATION TEST OF STANDARD ARMORED INFANTRY VEHICLE (AIV) T73 AND MODIFIED AIV T73. 4th Rep. on Proj. TTI-198, Proj. 548-12-001, Jan. 1957, 67pp. Development and Proof Services, Aberdeen Proving Ground, Md.

11,591

To determine the effects of various suspension and sound absorption modifications of the standard Armored Infantry Vehicle T73 with respect to reduction of fatiguing vibrations and crew compartment noise level, a series of tests were made. An unmodified vehicle was instrumented and operated to provide data on vibration and noise level. The vehicle was modified by installation of crowned support and idler wheels, cushioned sprockets, and interior soundproofing and the measurements were repeated. The data were compared and discussed in relation to comfort levels. Recommendations are included. G. I.

11,592

Hemingway, A. SURVEY OF RESEARCH ON THE PROBLEM OF AIRSICKNESS IN THE ARMY AIR FORCES. Proj. 381, Rep. 1, April 1945, 36pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,592

This report is a survey of research on the problem of airsickness in the Army Air Forces. A brief history of the problem is presented and the symptoms are described. The incidence of airsickness among aviators is discussed. This leads to a chapter emphasizing the importance of selection and outlining the various procedures which have been used to gauge susceptibility to motion sickness. T. G. I. R 48

11,593

Hegnauer, A.H., & Angelakos, E. HAND AND FINGER BLOOD FLOW RATES UNDER DIFFERENT TEMPERATURE CONDITIONS. Contract AF 18(600)-65, WADC TR 55-501, Dec. 1953, 51pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Boston University School of Medicine).

11,593

This is a review of the existing literature on hand and finger circulation under different temperature conditions. What is known about circulation through the hand and fingers, volume flow in relation to ambient temperature and its reflex control and role in body thermal balance is reviewed. The vascular anatomy of the hands and fingers is described and their importance in temperature response emphasized. The two chief methods (calorimetrically or plethysmographically) of estimating blood flow rates are discussed and range of variation included. T. G. R 82

11,594

Rulon, P.J. & Horowitz, M.W. STUDY OUTLINE FOR TRAINING ANALYSIS OF PILOT'S TASK IN TRANSITIONING TO JET VTOL AIRCRAFT. Contract N 61339 74, Letter Order 2, March 1957, 14pp. Educational Research Corporation, Cambridge, Mass.

11,594

This study plan outlines the major operational problems for the pilot involved in making the transition to jet vertical-take-off-and-landing (VTOL) aircraft. It is essentially a plan of study for a man-machine task analysis. Results anticipated are: a statement of training requirements, characteristics of simulators and training aids, and possible recommendations for changes in design and operational procedures.

John A. Hinckley and Associates. HAND WARMING IN UNDERWATER OPERATIONS. Prepared under Contract Monr-1402(00), Final Rep., Feb. 1956, 18pp. John A. Hinckley and Associates, Chicago, Ill.

11,596

This is a final report on an investigation of specific methods which might be used to warm hands in underwater operations. Experiments were made with infrared radiators focused on blackened hands, attempts were made to construct gloves of electrically conducting materials, and the use of high frequency alternating current to develop heat at the hand-water interface was tried out. The potential of these methods is evaluated and compared with that of a method by which warmed water is supplied to the hands. G. I.

Divari, N.B. VARIOUS ARTICLES. (I. RELATION OF THE LUMINOSITY OF THE NIGHT SKY TO THE AZIMUTH. II. EFFECT OF EXTINCTION OF FLUORESCENCE ON THE LUMINOSITY OF THE NIGHT SKY. III. A NEW METHOD OF SEPARATING THE COMPONENTS OF THE NIGHT SKY LUMINESCENCE). Rep. ATIC 242118, 1955, 13pp. Air Technical Intelligence Center, Wright-Patterson AFB, Ohio. (Akademiya Nauk Kazakhskoy SSR Izvestiya Astrfizicheskogo Instituta, 1, 1-2).

11,597

This report contains three papers concerned with luminosity of the night sky. The first describes observations made of night sky brightness on the shore of Lake Issyk-Kul at a point of latitude about 42 degrees, 22 minutes. Calculations of the atmospheric component of the luminescence are related to the azimuth. The second paper considers the question of the possible influence of two-body collisions on the observed intensity of the green line of luminescence of the night sky. The last paper considers a new method of separating the components of the night sky luminescence which has been developed. (Graphs that originally accompanied these papers are omitted in this copy.) Reynolds, S.R.M. SUMMARY OF UNIT OXYGEN OFFICERS' OPINION OF DEMAND EQUIPMENT. Proj. 80, Rep. 1, Sept. 1942, 18pp. USAF School of Aviation Medicine, Randolph Field, Tex.

11,598

This is a summary of opinion on the merits of oxygen demand equipment (including both masks and regulators). The information was derived from questionnaires answered by 418 Unit Oxygen officers upon completion of their course. Tables summarize the results. The questionnaire itself is included in an appendix. T.

11,599

Kotter, R.V., & Holmen, M.G. INFANTRY OCS EVALUATIONS AND COMBAT PERFORMANCE. Tech. Rep. 8, June 1954, 9pp. Human Resources Research Office, The George Washington University.

11,599

The objective of this research was to find out which evaluation devices in Officer's Candidate School (OCS) were useful in predicting future performance of lieutenants in Infantry combat divisions. Ratings by their commanding officers were obtained on the performance of 259 graduates of the OCS who served in divisions in Korea in 1953. These ratings were compared with eight OCS ratings and four pre-OCS ratings. The results are analyzed and conclusions offered. T. G.

11,600
Hall, E.L. A REPORT ON INTEGRAL INSTRUMENT
LIGHTING. Rep. FM-576, May 1955, 24pp.
Cranair, Fort Worth, Tex.

11,601
This report summarizes information that has been
gathered for a study of integral instrument illumination
for aircraft. The topics discussed are: theory, theories
or basic principles of existing lighting systems (ring
lighting, edge lighting, two-panel system, edge lighting,
center lighting, tunnelillumination, and panelmount light-
ing), standards and specifications which exist, techniques
and methods of light measurement, and the objectives of
this particular program. Future plans are indicated.

Miller, E.R. SHIVERING INDUCED BY THE COMBINED
USE OF HYPERVENTILATION AND EXPOSURE TO COLD
AIR. Rep. No. 11 CR, March 1944,
9pp. Fort Monmouth Signal Lab., Signal Corps
Ground Signal Agency, Fort Monmouth, N.J.

11,603
The effect of reduced alveolar carbon dioxide induced
by hyperventilation was investigated in relation to the
mechanism of shivering under the following conditions:
(1) subjects, clothed in indoor winter dress, were kept
in warm room with hands and feet exposed to cold atmos-
phere of ice-jacketed boxes, (2) same as above but hands
and feet were not cooled, and (3) subjects were kept in
a cool room and amount of exposed body surface was varied.
Observations included skin and rectal temperatures,
muscle action potentials, and samples of alveolar air.
The data were analyzed in terms of changes due to hyper-
ventilation and shivering. Some information on control
of shivering is discussed.

11,604
Ablander, K.L., & Henrysson, S. SELECTION OF RANGE
FINDERS IN THE SWEDISH NAVY. Rep. 14, Feb. 1955, 2pp.
Psychological Lab., University of Stockholm.

11,605
This report describes the development of a group test
of depth perception and its use in the selection of range
finders in the Swedish Navy. The individual test from
which the group test was developed was based on a stereo-
scope and the Halfrich pictures produced by Zeiss in
Jena. The same pictures were used for producing a three-
dimensional film which could be viewed by 30 subjects
at a time. Some preliminary data on test validity are
given.

Peterson, G.E. THE INFORMATION BEARING ELEMENTS OF
SPEECH. 1952, 8pp. Bell Telephone Labs., Inc.,
Murray Hill, N.J.

11,607
This study deals with those aspects of speech which
are phonetically significant. A technique is described
which has been developed for obtaining phonetically
equivalent speech samples in different phonetic contexts
and from different speakers. Data on two front vowels
by different types of speakers are discussed (the figures
presenting these data are not included with this report).
The technique has also been applied to the evaluation of
words containing these vowels. The relation of the find-
ings to phonetic theory is discussed.

11,608
Craig, E.R. THE HUMAN CONTROL DYNAMIC ANALYSIS FACILITY.
Res. & Devel. Rep. 615, July 1955, 7pp. USN Electronics
Lab., San Diego, Calif.

11,609
This report describes a facility for the dynamic ana-
lysis of human controller characteristics. The problems
to be investigated are the information handling capaci-
ties, transfer functions, and servo characteristics of
man as related to the control operations, information
processing, and monitoring aspects of electronic equip-
ment and systems. The major items of equipment are de-
scribed; the present status of operations and projected
plans are discussed.

11,610
Rappaport, A., & Schwartz, L.S. THE ROLE OF
COST IN FORMULATING MERIT CRITERIA FOR COMMUNI-
CATION SYSTEMS. Contract AF 33(616)-1540,
presented before meeting of Operations Research
Society of America, May 1956, 9pp. New York
University.

11,611
This paper demonstrates the manner in which cost de-
termines the formulation of merit criteria in communi-
cation systems. The problem treated is one-way communi-
cation between a transmitter and a receiver over a channel
into which noise has been introduced. Cost of operation
is then treated in terms of specified conditions - amount
of information, reliability, noise density, and latency.
Basic parameters which determine cost - power, bandwidth,
time - are defined and a possible set of cost relation-
ships for the three merit parameters developed. Steps
for determining power, bandwidth and time are given.

11,612
Fox, W.R. VISUAL DISCRIMINATION AS A FUNCTION
OF STIMULUS SIZE, SHAPE, AND EDGE GRADIENT.
Contract AF 33(616)-3405, Tech. Note 138, Aug.
1957, 22pp. Physical Research Labs., Boston
University.

11,613
To investigate the effects of stimulus (target) size,
shape, and edge gradient on detection and recognition,
54 targets consisting of six shapes (circle, square,
triangle, star, cross, and irregular) each constructed at
three different edge gradients, three sizes, and five
contrasts were presented randomly to two subjects. The
subjects were asked first to tell whether or not they
saw anything and then to identify the figure. The con-
tract threshold data were analyzed and functions estab-
lished showing their dependence for detection and rec-
ognition on the size, shape and edge gradient of the vi-
sual stimuli. The relation of detection to recognition was
further studied.

11,614
Fisher, V.E. THE EFFECT OF STRIAE ON IMAGE
QUALITY. Contract AF 33(616)-3405, Tech. Note
139, May 1957, 61pp. Physical Research Labs.,
Boston University.

11,615
To investigate the effect of striae in optical glass
on image quality, five optical glass blanks were selected
and prepared so that defects other than striae were at a
minimum. The samples were graded for striae content
(National Bureau of Standards test procedure) and per-
centage of light deviated in the image plane measured
with the Scatterometer. This device measures the light
intensity distribution in the plane of an image of a
point source and time may be used to indicate the amount
of scattered light introduced by a plane-parallel blank
glass. The data were analyzed for effects of amount and
grade of striae. The implications for aerial photo-
graphic reconnaissance are discussed.

11,616
Moffitt, O.P., Jr., Lett, J.E., & Tonndorf, J. AVIATION
OTOLARYNGOLOGY. SAM Textbook 4, April 1956, 135pp.
USAF School of Aviation Medicine, Randolph AFB, Tex.

11,617
This volume is a revision of a textbook published by
the School of Aviation Medicine during World War II. It
was prepared by present and former members of the staff
of the Department of Otolaryngology and is intended for
flight surgeons and students of aviation medicine. Ma-
terial to be found in standard reference works is not
covered. The various parts cover: (1) the otolaryngo-
logical examination, (2) the upper air passages, (3)
otology, and (4) the vestibular apparatus. In all in-
stances, the physiology, testing or clinical examination,
diseases, and injuries are treated and a brief list of
suggested references for further study is given.

11,605

Lieber, L.M., Greider, M.R., & Senceteris, L.J. EFFECTS OF MODERATE HEAT STRESS, ALTITUDE, AND TIME ON THE DEHYDRATION RATE OF SUBJECTS WEARING THE VENTILATED FULL PRESSURE SUIT. *Aviation, Space, and Environmental Medicine*, June 1957, 7pp. Air Crew Equipment Lab., NACA, Philadelphia, Penn.

11,606

To determine the degree of hydration that can be anticipated by ventilated flying personnel wearing impermeable garments under moderate heat stress, two subjects (wearing the ventilated full pressure suit) were exposed to two states of comfort (comfortable and comfortably warm), two altitudes (sea level and 15,000 feet), for two different durations (two and four hours). Each subject went through each condition twice. Total weight loss, body weight deficit, and per cent evaporation were measured to determine extent of dehydration as functions of time, altitude and heat stress conditions. Possible effects of prolonged flights in a comfortably warm environment with high ventilating air flow are discussed. C. R. 3

11,610

Mohler, I. ORIENTATION BY AURAL CLUES. "Die Pyramide". *Wissenschaftliche Monatsschrift*, May 1957, 6 (7), 15pp. (Contract AF 61(514)-585, USAF European Office of AFMC, Brussels, Belgium).

11,610

To explore the possibilities and limitations of orientation by means of sound, an extended series of studies was undertaken. Methods of investigation were developed which permitted measurement of the "obstacle sense" (avoidance of obstacles without visual aid) in large numbers of subjects. Optimum conditions of orientation and the restrictions imposed by the hearing capacity of the human ear were investigated. A sonic guiding device to be worn by the subject was developed and tested for its effectiveness in extending the "acoustic protective zone" both in laboratory and field conditions. The effect of training on the "obstacle sense" was studied. Practical implications of these findings are discussed. C. I. R. 3

11,611

Kibel, E.R. THE RELATIONSHIP BETWEEN LEG STRENGTH, LEG ENDURANCE, AND OTHER BODY MEASUREMENTS. *Unmo. Proj.*, Jan. 1950, 11pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (University of Kansas).

11,611

To investigate the relations between leg strength, leg endurance, and other body measurements, 590 potential pilots and pilots were used as subjects. Using especially designed apparatus, leg strength (pressure, in pounds, that could be exerted by extension of hip and leg on foot pedal) and leg endurance (time, in seconds, that a force of 290 to 310 pounds could be maintained on foot pedal) were measured. In addition, data relative to the following were secured: height, weight, age, and lower leg length. For some groups total leg length, sitting height, girth of thigh and leg, and grip strength were measured. The data were analyzed by correlational techniques to study relations between measures. T. G. I.

Dunlap and Associates, Inc. HUMAN ENGINEERING STUDIES OF THE FLEET BALLISTIC MISSILE SYSTEM. Contract NORD-17719, Prog. Rep. 2, June 1957, 7pp. Dunlap and Associates, Inc., Stamford, Conn.

11,612

This is a progress report on the human engineering studies of the Fleet Ballistic Missile System (FBM). These studies include all aspects of the FBM system - navigation, fire control, launching, instrumentation, environmental factors, systems analysis - where human operators or maintenance personnel are involved. A brief summary of the work to date is given along with plans for future investigation. I.

11,613

Morris, R.C. DEVELOPMENT OF AN EFFICIENT SET OF DIMENSIONS FOR DESCRIPTION OF AIR FORCE GROUND-CREW JOBS: PART II. TECHNICAL APPENDIX. Contract AF 33(038)-13474, Proj. 7700, AFTRC-TN-56-63, June 1956, 36pp. Personnel Research Lab., AFTRC, ARDC, Lackland AFB, Tex. (Teachers College, Columbia University).

11,613

This is a technical appendix for use with Part I, Rating Dimensions, of this study. The following data are presented: (1) intercorrelations between ratings of 130 worker-job characteristics on 150 Air Force jobs; (2) factor loadings of 130 worker-job characteristics; and (3) final rotated factor loadings of 130 worker-job characteristics. T.

11,614

Neely, K.E., Lewis, R.E.P., & MacKinnon, W.D. DESIGN OF CONSOLES AND VOICE COMMUNICATION SYSTEMS FOR AERODROME CONTROL TOWERS. *Canad. Aero. J.*, Jan. 1957, 3(1), 17-20. (Proj. D 77-94-20-37, DRML Rep. 207-1, Defence Research Medical Labs., Toronto, Ontario, Canada).

11,614

To study the problems associated with the introduction of ultra high frequencies and the resultant increase in number of radio channels in Aerodrome Control Towers, studies were made of the literature pertaining to air traffic control procedures and voice communication systems. A mock-up of a Control Tower and associated control consoles was then built. Various arrangements, designs, and procedures were tried out. In light of these procedures, recommendations are made for the design of control consoles and voice communication equipment for use in Control Towers. Principles for the guidance of Control Tower planners are stated. I. R. 1

11,615

Wheeler, L.J., & Dickson, E.D.D. THE DETERMINATION OF THE THRESHOLD OF HEARING. *J. Laryng. & Otology*, Aug. 1952, 66(8), 379-395. (Acoustics Lab., RAF Central Medical Establishment, London, England).

11,615

To determine the absolute value of the threshold of hearing under carefully controlled conditions which can be used as a reference standard for the calibration of audiometers, 514 otologically normal male subjects (age range 18 to 23) were tested. Threshold determinations (minimum audible pressure) were made at seven frequencies from 256 to 8,192 cycles per second for earphone listening. Distribution curves of the data (decibels below a sound pressure level of one dyne per square centimeter) were analyzed to gain figures representing absolute values for threshold of hearing for each of the seven frequencies. Comparison is made with results of other similar studies. T. G. I. R. 1

11,616

Dadson, R.S., & King, J.H. A DETERMINATION OF THE NORMAL THRESHOLD OF HEARING AND ITS RELATION TO THE STANDARDIZATION OF AUDIOMETERS. *J. Laryng. & Otology*, Aug. 1952, 66(8), 366-378. (National Physical Lab., RAF Central Medical Establishment, Teddington, England).

11,616

To provide additional data, obtained under controlled conditions, which may assist in establishing a reference standard for the calibration of audiometers, the normal threshold of hearing (minimum audible pressure) by earphone listening was determined for 99 otologically normal subjects (ages between 18 and 25 years) over a frequency range of 80 to 15,000 cycles per second. The objective basis of calibration as used at the National Physical Laboratory (England) was described. The threshold data obtained were compared with those from other such surveys and the need for international discussion indicated. T. G. I. R. 11

11,617

Wijberg, L. INSTRUCTION MANUAL FOR THE PEAK PULSE BRIGHTNESS PHOTOMETER. LON-0188, April 1955, 15pp. Cornell Aeronautical Lab., Inc., Buffalo, N.Y.

11,617

This manual describes a peak pulse brightness photometer and gives instructions for its use in making brightness comparisons. The various sections describe the optical system, the electronic circuits, principles of operation, operating procedure, and instrument adjustment and calibration. Circuit diagrams, calibration curves, and photographs are included. G-1.

11,618

LePage, W.K., Balabanian, M., & Goldman, S. STUDY AND INVESTIGATION OF METHODS OF COMBATING MULTIPATH TRANSMISSION EFFECTS. Contract AF 30(635)-2862, SUM Rep. EE350-565F, Final Rep., March 1956, 15pp. Rome Air Development Center, Rome, N.Y. (Syracuse University Research Institute).

11,618

This is the final report of a project whose object was to find a reliable means of communication transmission over long ranges (3,000 kilometers maximum) in the two to 30 microcycle carrier frequency range. An analysis of the problem led to a search for a signal in which information could be extracted after going through a link having severe multipath effects. Using various ideas and mathematical techniques of information theory a frequency code communication was developed and described. The solution has not yet been verified by building equipment in accordance with the conclusions of the study. I.

11,619

Smith, P.K., & Hemingway, A. EFFECT OF HYOSCINE (SCOPOLAMINE) ON SLEEP SICKNESS AND ON PERFORMANCE. Proj. III, Rep. I, March 1943, 2pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,619

To determine the effect of hyoscine hydrobromide (scopolamine) on sleep sickness and performance, subjects who became ill during a 20 minute swing were used. One group received one-half milligram of hyoscine and the other a placebo before swinging a second time. From the symptoms exhibited and minutes elapsed before vomiting, if it occurred, an arbitrary score was assigned in which ten represented optimum performance. In addition, a group of psychomotor tests (addition, code, steadiness, and pursuit) were given with and without oxygen in a high altitude chamber (18,000 feet) approximately two to three hours after oral administration of hyoscine or placebo. The data were analyzed for differences between the two groups.

11,620

McCullom, I.W. FINAL REPORT TO THE SCIENTIFIC OFFICER. Prepared under Contract Monr-1268(01), Proj. NR 145-075, Dec. 1956, 10pp. San Diego State College Foundation.

11,620

This is a final report on a program of work in conjunction with development of the Human Engineering Guide for Equipment Design by the Joint Services Committee. A brief summary of assigned tasks and procedures is given. These include provision of supporting service to the chairman of the committee, building a Human Engineering bibliography, development of special bibliographies and abstracts, translation of German publications, participation in experimental studies, special reports and projects, and preparation of illustrations for the Guide. Lists of publications, technical reports, and other materials developed are included. R 13

11,621

Kambacher, W.C., & Gallup, M.P. HUMAN ENGINEERING INVESTIGATIONS OF THE INTERIOR LIGHTING OF NAVAL AIRCRAFT: INVESTIGATIONS INTO THE OPTIMAL CHARACTERISTICS OF VISUAL WARNING AND CAUTION SYSTEMS. Etc. TED MAN EL-62004, NANC ACCL-299, Part 7, Aug. 1956, 13pp. Air Crew Equipment Lab., NANC, Philadelphia, Penn.

11,621

To investigate the effect of varying the temporal characteristics of warning lights on attention-getting and attention-holding values, 12 subjects were given a tracking task and required to respond to both the onset and offset of four small lights on a warning panel. These stimuli consisted of a steady, a flashing, or an alternating light against a homogeneous background at an angle of 31 to 43 degrees from line of sight. Both day and night lighting conditions were used. The data (reaction times to onset and to offset) were studied by analysis of variance techniques for differences due to kinds of light and to offset or onset of lights. T. I. R 2

Gardner, A.J., Gifford, F., Jr., Mitchell, R.L., Giclas, H.L., et al. OPTICAL STUDIES OF ATMOSPHERIC TURBULENCE. Contract AF 19(604)-953, AFRCR-TR-261, 1956, 53pp. Lowell Observatory, Flagstaff, Ariz.

11,623

The studies reported here were concerned both with the properties of telescopic images that are atmospherically induced and with the probable nature of their causes. Scintillation, image motion, and image quality were observed by various electronic and photographic techniques, and the dependence or independence of these observables on one another and on various physical and meteorological parameters were investigated. Other studies included the distribution of light in telescopic images and the effects of terrain and temperature on atmospheric seeing. T. G. I. R 2

11,624

Van Cott, H.P., Berkun, M.M., & Purifoy, G.R. Jr. HOW TO DETERMINE JOB KNOWLEDGE CONTENT: THE APPLICATION OF A PROCEDURE TO SEVERAL AIR FORCE JOBS. Contract AF 18(600)-1205, Proj. 7714, Dec. 1955, 40pp. Training Aids Research Lab., AFTRC, ARDC, Chanute AFB, Ill. (American Institute for Research, Pittsburgh, Penn.).

11,624

This paper reviews the need for encoded "conceptual" or "knowledge" content of a job to support training and job performance. Criteria for a procedure for deriving conceptual supports are listed and reference made to a previous report outlining this procedure. Illustrations are given of the application of the procedure to data from typical Air Force jobs. Behaviors from four different jobs (jet engine and ground control approach equipment maintenance, crash crew operations, and helicopter pilot) were selected and each step involved in determining conceptual support for each behavior is demonstrated. T. G. R 1

Rulon, P.J. & Schweiker, R.F. THE TRAINING OF FLIGHT-SIMULATOR MAINTENANCE PERSONNEL: A PROPOSED COURSE THAT EMPHASIZES TROUBLESHOOTING. Contract AF 18(600) 1325, Proj. 7709, Task 37390, Tech. Mem. ML TM 56-17, July 1956, 77pp. USAF Maintenance Lab., Lowry AFB, Colo.

11,625

From detailed information on required maintenance activities in B-47 flight-simulators and analysis thereof, a training course oriented toward trouble-shooting is outlined. Situational factors (characteristics of trainees, length of training, competence of graduates), course, organization and coverage and instructors' directions are discussed. Training materials devised for the course are described in detail and samples of these presented.

11,626

Carman, P.D., & Brown, H. DIFFERENCES BETWEEN VISUAL AND PHOTOGRAPHIC CALIBRATIONS OF AIR SURVEY CAMERAS. Photogrammetric Engng., Sept. 1956, 623-626. (National Research Council, Ottawa, Canada).

11,626

To explore the effects of spectral differences between visual and photographic calibrations of air survey cameras, a number of special measurements were made on two Wild RC5A cameras. Spectral response curves of (1) the eye to standard illuminant "C" (approximation to daylight); (2) a photographic approximation to the visual condition (Super XX Aero emulsion with Wratten 13 filter to mean noon sunlight); and (3) the combination used in photographic calibration. Chromatic difference of distortion was measured at a number of field angles. The camera was further tested on the photographic calibrator using two different filter arrangements with the usual "mean noon sunlight" and the data compared with simulated visual calibration data plotted on the photographic distortion curve. G. R 2

Riendeau, R.P., Welch, B.E., Crisp, C.E., Crowley, L.V., et al. THE RELATIONSHIPS OF BODY FAT TO MOTOR FITNESS TEST SCORES. Proj. 6-60-11-020, Rep. 209, Aug. 1957, 4pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,627

To examine the role of body fat on motor activities, 61 young men on active duty with the armed forces were selected randomly to serve as test subjects. Body fat was computed from body density which was determined by the Archimedian Principle using specific gravity techniques. A battery of representative motor fitness tests (pushups, squat thrusts, situps, standing broad jump, 75-yard dash, and 220-yard dash) were administered (three times) as outlined in the United States Army Physical Training Manual. The data were analyzed by correlational methods to show relationships between per cent body fat and the selected motor fitness tests. Body weight was similarly analyzed.

Levy, L.M., Bernstein, L.M., Francis, E., Harding, R.S., Krzywicki, H.J., et al. AN ASSESSMENT OF THE POSSIBLE TOXIC EFFECTS TO HUMAN BEINGS OF SHORT-TERM CONSUMPTION OF FOOD STERILIZED WITH GAMMA RAYS. Proj. 6-60-11-020, Rep. 203, March 1957, 16pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,628

To assess possible toxic effects to human beings of short-term consumption of food exposed to gamma rays of three million roentgen-equivalents-physical (rep), 18 volunteers consumed such food for short periods of time (15 days). Four studies were conducted in which 35, 60, 80, and virtually 100 per cent of the calories were supplied by irradiated items of food. These studies were separated by intervals of several months. Careful clinical and laboratory observations for toxic effects were made during and for a year following the feeding. Analysis of the data were made to determine deleterious effects to general health and damage to blood forming organs, liver, or kidneys due to the irradiated food. Recommendations for further tests are made.

Welch, B.E., Crisp, C.E., Isenstein, R.S., & Roemer, W.C. THE EFFECT OF THE LEVEL OF EXPIRATION ON BODY DENSITY MEASUREMENT. Proj. 6-60-11-020, Rep. 207, July 1957, 8pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,629

To determine the effect of the level of expiration on body density measurements, body density was measured for 26 normal healthy adult males by the underwater weighing method. Vital capacities were measured at the same time. Maximum expiration levels were established by several trials under water and when consistent values were obtained body density was determined. The same technique was used to determine body capacity for one-half maximum expiration. Four determinations were made for each subject. The results were analyzed for differences due to level of respiration. Recommendations for measurement procedures are made.

Welch, B.E., Riendeau, R.P., Crisp, C.E., & Isenstein, R.S. RELATIONSHIP OF MAXIMAL OXYGEN CONSUMPTION TO VARIOUS COMPONENTS OF BODY COMPOSITION. Proj. 6-60-11-020, Rep. 208, July 1957, 9pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,630

To study the relationship of maximal oxygen consumption to body weight, body fat, and body weight minus body fat and bone, 26 young men served as subjects. Maximal oxygen consumption was determined by measurements made of expired air while running a treadmill at grades of 6, 8.5, and 11 per cent. Body density was determined by the Archimedian principle using a specific gravity technique; body fat and bone weight were computed. The data were analyzed by correlational techniques for the relation of each component of body composition to oxygen consumption. The results are discussed in terms of the validity of the practice of using maximal oxygen consumption as an index of man's maximal circulatory capacity.

11,631

Welch, B.E., Levy, L.M., Consolazio, C.F., Buskirk, E.R., & DeGee, T.E. CALORIC INTAKE FOR PROLONGED HARD WORK IN THE COLD. Rep. 202, March 1957, 24pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo. (USA Medical Nutrition Lab., & USA Quartermaster Research & Development Command, Natick, Mass.).

11,631

To obtain information concerning "maximal" caloric requirements for prolonged hard work in the cold; caloric intake, fluid balance, and body composition were studied in a group of 26 men during a 28-day stay at Fort Churchill, Manitoba, Canada. The first seven days were spent in a pre-bivouac situation and remaining days in the field in a moving self-sustaining bivouac (camp broken and established each day and equipment hauled by sled cross-country for 9 to 12 miles per day). The data were analyzed for changes at progressive time periods during the study. A maximal caloric consumption is recommended and the need for assessing physical activity level in a given environment in relation to food consumption is stressed.

Bilodeau, E.A. STUDIES OF TARGET SIZE AND THE CONTROL OF PSYCHOMOTOR BEHAVIOR THROUGH SYSTEMATIC TRANSFORMATION OF KNOWLEDGE OF RESULTS. Proj. 7707, AFPTTC TN-56-13, Jan. 1956, 8pp. Skill Components Research Lab., AFPTTC, ARDC, Lackland AFB, Tex.

11,632

This paper summarizes a series of experiments concerned with relations among target size, knowledge of results, and psychomotor skills. The first section discusses skilled behavior as a function of target size. Results from practice on a Rudder Control test with wide or narrow targets and degree of transfer from one to the other are presented and the hypothesis that different targets can elicit the same behavior is stated. Some results from lever displacement and knob turning tasks are offered in support of the hypothesis. A review of the target-size function in terms of inflating or deflating the error leads to a final treatment of scaling of knowledge of results as a function of the response.

Torrence, E.P., & Ziller, R.C. RISK AND LIFE EXPERIENCE: DEVELOPMENT OF A SCALE FOR MEASURING RISK-TAKING TENDENCIES. Proj. 7713, Res. Rep. AFPTTC TN-57-23, Feb. 1957, 38pp. Crew Research Lab., AFPTTC, ARDC, Randolph AFB, Tex.

11,633

To develop and validate a biographical inventory scale to measure risk-taking tendencies against external measures of risk-taking behavior, a preliminary scale, Risk and Strategy, which had been developed through a study of fighter-interceptor combat effectiveness and a Life Experience Inventory were administered to 370 combat aircrewmen. On the basis of item analyses and correlational studies a revised Risk Scale was established. Four external measures of risk-taking behavior were obtained for 73 bomber pilots from a written test and from responses to nine statements of survival and in-flight emergencies encountered by Air Force personnel. Scores on the Risk Scale were studied by correlational procedures for validity in terms of the four criteria measures.

Torrence, E.P. TECHNIQUES FOR STUDYING INDIVIDUAL AND GROUP ADAPTATION IN EMERGENCIES AND EXTREME CONDITIONS. Proj. 7713, Tech. Doc. Rep. series AFPTTC TN-56-17, Jan. 1956, 286-297. Crew Research Lab., AFPTTC, ARDC, Randolph AFB, Tex.

11,634

The need for scientific information about adaptation of individuals and groups to emergencies and extreme conditions is discussed in relation to survival training. Four studies are described that illustrate situations in which quantitative information has been gathered - individual and group behavior in both actual emergencies and in simulated survival conditions. The techniques used in each situation are described and their usefulness evaluated. These techniques include the use of official escape and evasion reports, of the Q-sort technique, of test-retest design (simulated experiences), interviews with all participants or survivors, and observations of group behavior episodes.

Swanson, R.A., Lumsdaine, A.A., & Aukes, L.E. TWO STUDIES IN EVALUATION OF MAINTENANCE TRAINING DEVICES. Proj. 7714, Task 77241, Tech. Doc. Rep. series AFPTTC TN-56-8, Jan. 1956, 267-275. USAF Training Aids Research Lab., AFPTTC, ARDC, Lackland AFB, Tex.

11,635

To demonstrate the need for an analytic approach to the evaluation of classroom training aids, two studies of maintenance training devices are reported. In the first, identical lectures were given to three groups of experienced Air Force mechanics on the rudder control system of the B-47 aircraft using a realistic mock-up, a two-dimensional symbolic diagram, or pictorial charts. Evaluation of the device was based on scores on a post-lecture information test. The second test also used lectures and either a mock-up or a diagram to instruct unskilled men on certain specific training objectives. The findings are discussed in relation to need for incisive analysis of training objectives as a basis for selecting training aids.

Thomas, F.H., French, Elizabeth G., & Travers, R.H.W. VARIABLES RELATED TO PROBLEM-SOLVING EFFECTIVENESS IN TWO DIFFERENT TYPES OF PROBLEM SITUATIONS. Proj. 7703, Tech. Doc. Rep. series AFPTTC TN-56-22, Jan. 1956, 276-185. Personnel Research Lab., AFPTTC, ARDC, Lackland AFB, Tex.

11,636

To investigate variables related to problem-solving effectiveness, mechanical problems of two types were constructed. In one type level of difficulty was mainly a result of complexity (or number of elements involved) while in the second the difficulty was due to inhibitory sets (initial false starts). These problems were administered to 235 subjects together with tests of intellectual ability and rigidity-flexibility. Problem-solving performance (successful solution) on each type of problem was studied by correlational methods for degree of relationship to intellectual ability and rigidity. The findings are discussed in relation to the needs of a program of research in trouble-shooting skills.

French, R.S. EVALUATION OF A K-SYSTEM TROUBLE-SHOOTING TRAINER. Proj. 7709, Task 77152 and Task 77161, Tech. Doc. Rep. series AFPTTC TN-56-15, Jan. 1956, 260-155. Armament Systems Personnel Research Lab., AFPTTC, ARDC, Lackland AFB, Tex.

11,637

This report describes general features of the Malfunction and Circuitry simulator (MAC Trainer) for the K-type Bombing Navigational System of B-47 aircraft. The use of the trainer for demonstration and practice of trouble-shooting procedures in the classroom is discussed. An evaluational study is then reported in which the effectiveness of training conducted on the MAC Trainer alone was compared with training on actual equipment. Forty apprentice mechanics, divided randomly into two groups, were given a battery of written tests before and after a period of training. An additional performance test was given upon completion of training. Gains in knowledge of data flow and system functioning were analyzed and final performance of the two groups compared.

Stallones, R.A., Gauld, R.L., Dodge, H.J., & Lamers, T.F.M. AN EPIDEMIOLOGICAL STUDY OF HEAT INJURY IN ARMY RECRUITS. Proj. 6-61-13-004, Subtask 1, WRAIR 172-56, Oct. 1956, 20pp. Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington, D.C.

11,638

An epidemiological study of heat injury in Army recruits at Camp Chaffee, Arkansas, from 12 June to 27 August 1955 involved 138 cases occurring in 132 persons. The daily maximum dry bulb temperature and various heat stress indices were related to the number of daily cases to find the most reliable index for predicting the likelihood that cases of heat injury would occur. The cases were also analyzed for relationships with acclimatization, age, race, physique (height and weight) and activity at time of occurrence. The findings are discussed in relation to the development of sound preventive measures.

Lippert, S. A COMPREHENSIVE GRAPH FOR THE COLLECTION OF NOISE AND VIBRATION DATA. Rep. SM-18731, no date, 13pp. Santa Monica Div., Douglas Aircraft Co., Inc., Santa Monica, Calif.

11,639

To make possible a consideration of available data on noise and vibration at the same time and to assemble such data rapidly into comparable form, a comprehensive graph is presented and described. Data may be spotted in one set of units and interpreted in other units with grid work possible of extension to include any magnitudes of noise or vibration units. Directions and precautions in the use of the standard reference curves are given. Examples of the assembly of data in the literature are made to illustrate the use of the graph together with some interpretation of data in other units.

11,641

Gold, T., Potter, E., Wiener, B., & Peterson, E. AN OPERATIONAL FLIGHT EVALUATION OF AN APPROACH ZONE SLANT VISIBILITY MEASURING SYSTEM. SUMMARY REPORT. Contract AF 19(604) 1372; AFRC TR 57 270, & Sperry Rep. 3245 4080, May 1957; 43pp. Aeronautical Equipment Div., Sperry Gyroscope Company, Great Neck, N.Y.

11,641

This report summarizes the results of an operational flight evaluation of an approach zone slant visibility measuring system at Newark Airport. The system involves meteorological measurements by ceilometer and transmissometer, photometric measurements by terrain illuminometer and horizon photometer, and relationships combining these measurements with visual data for the human pilot. Approximately 1400 airline pilots reported initial runway threshold contact during instrument approaches between Nov. 1955 and Nov. 1956. These data were compared with threshold contact heights computed by the slant visibility measuring system. Recommendations are included.

Moody, J.A., Jerome, E.A., Flynn, J.P., & Connor, T.J. AN AUTOMATIZED TECHNIQUE OF INVESTIGATING DIFFERENTIAL SENSITIVITY TO AUDITORY INTENSITIES. II. THE INFLUENCE OF CATCH TESTS. Res. Rep. Proj. NM 000 019.02.03, Oct. 1956, 14, 789-794. Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

11,642

To evaluate the influence of "catch tests" (no signal occurring in an otherwise fixed stimulus schedule) on measures of auditory sensitivity obtained with an automatized stimulus schedule controlled by the subject's response, four subjects were tested. Two experimental sessions of 100 ascending and 100 descending series were utilized, five with and five without catch tests. Catch tests occurred on 30 per cent of the trials in the series where used; the regular stimulus schedule was one stimulus every 1.5 seconds. The threshold data were analyzed for differences due to experimental conditions.

11,643

Moody, J.A., Jerome, E.A., Flynn, J.P., & Connor, T.J. AN AUTOMATIZED TECHNIQUE OF INVESTIGATING DIFFERENTIAL SENSITIVITY TO AUDITORY INTENSITIES. III. THE INFLUENCE OF RANDOMIZING THE STARTING POINT OF THE STIMULUS SERIES. Res. Rep. Proj. NM 000 019.02.04, Oct. 1956, 14, 803-808. Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

11,643

To compare two conditions for presenting the stimulus series when measuring differential sensitivity to auditory intensities obtained with an automatized version of the method of limits, measurements were made on three subjects. In one condition stimulus magnitudes were started either 0, 1, 2, or 3 steps beyond terminal stimulus magnitude. In the other, the magnitude of the initial stimulus of an ascending or descending series was determined by the magnitude of the terminal stimulus in the immediately preceding series. Two runs were made for both conditions at rates of 20, 30, and 60 stimulus presentations per minute. Threshold data were compared for differences due to experimental conditions.

Rosenberg, I. CAMOUFLAGE PARACHUTE CANOPIES. Proj. 6104, Tech. Note 57-6, July 1957, 8pp. 6511th Test Group (Parachute), AF Flight Test Center, El Centro, Calif.

11,644

To determine the color combination to be used in parachute canopies which would provide the most effective signaling and camouflage qualities for the rescue or concealment of downed airmen, 14 different combinations were photographed in color from an aircraft in flight. The tests, simulating aerial search operations, were conducted at various times of day, from all cardinal points of the compass, and with colored segments of parachutes displayed against vegetative, desert, and water background. Various methods of handling the canopies on the ground for concealment of the survivor were tried. Selection was made on basis of effectiveness for global operations.

Hall, J.P. Jr., & Polte, J.W. THERMAL INSULATION OF AIR FORCE CLOTHING. A CATALOG AND PART 4 OF A SERIES. Proj. 7155, WADC TR-66-382, Oct. 1956; 66pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,645

Insulation measurements performed with electrically heated copper manikins on standard and experimental Air Force clothing since Dec. 1953 are presented in the first portion of this report. The second part is a catalog of all clothing items that have been tested by this method. The insulation value in clo units is given for each item. All items are arranged by type and in order of increasing clo value within the respective categories of light (0-1.5 clo), intermediate (1.5-3.0 clo) and heavy (more than 3.0 clo) clothing. Finally, the term, mean effective clothing insulation is explained, a comparison of measured vs. calculated values is presented, and advantages of the term are discussed.

Ferguson, I.D., Christensen, Margaret L., Kappel, J.G., & Hertzman, A.B. FACTORS IN VARIABILITY IN AND PREDICTION OF REGIONAL SWEATING RATES OF HUMANS. Contract AF 33(616)-3357, Proj. 7155, WADC TR-66-312, Dec. 1956, 37pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (St. Louis University).

11,646

This report is an analysis of regional sweating rates of humans. The experimental data used here were presented in a previous report. Sweating rates were obtained by the desiccating capsule technique on ten regions of the body over two and one-quarter hour experimental periods following a uniform period of exposure to test climatic conditions (six subjects). The data were studied by factor analytic methods in an effort to determine the factors involved in regional sweating rates. Differences in topographical patterns of variability and of magnitude of rate were analyzed and prediction of rates from multiple correlations compared with actual rates.

Seckel, E. THE VARIATIONS OF STEERING ANGLES OF AUTOMOBILES IN STEADY TURNS. Rep. EE-714-P-1, July 1951, 15pp. Cornell Aeronautical Lab., Inc., Buffalo, N.Y.

11,647

This report represents a first step in the interpretation of data on the characteristics of the pneumatic tire used on the modern automobile and the applications to a quantitative study of the stability and control characteristics of automobiles. Approximate expressions were derived for the variation of steering angle with speed for automobiles in steady, constant radius turns. The tire characteristics are assumed linear except that the effect of normal load on the side forces is represented by a parabolic function. A formula is derived, from which the effects of center of gravity location, tire pressure, and tire loading can be calculated.

Walker, S.H. GUIDANCE FOR A PILOT TRIAL OF SUPPLY CONTROL SYSTEM MODIFICATIONS TO BALANCE SIZED CLOTHING ITEM STOCKS. Staff Paper ORO-SP-23, June 1957, 25pp. Operations Research Office, The Johns Hopkins University.

11,648

This paper presents recommended changes for the Army supply control system as applied to sized clothing items. These recommendations were the results of a study of the system and guidance is given here for a pilot operation of the modified system designed to balance sized clothing items. The modifications require provision of estimates of future stocks on hand by size, which are to be a by-product of present operating procedures; and determination of corrected procurement quantities so as to optimize expected future stock on hand in conformity with regulations. Rules for these procedures are presented as algebraic equations. The relation of the system to electronic computing equipment is discussed.

Hammes, J.A., Kelly, H.E., McPann, H.H., & Ward, J.S. TRAINING II: A NEW COURSE IN BASIC TECHNIQUE OF FIRE AND SQUAD TACTICS. Contract DA 49-106-qm-1, Proj. 095-50-000, Tech. Rep. 41, July 1957, 42pp. Human Resources Research Office, The George Washington University.

11,649
This study is part of an overall research effort directed at improving the effectiveness of combat rifle men. An experimental course in Technique of Fire and Squad Tactical Training was designed and then compared with the conventional training program. Two hundred twenty inductees were randomly divided into two groups: one was trained in the conventional manner and the other received the experimental phase. Comparisons were made following training by means of three proficiency tests: Squad in Day Defense, Squad in Day Attack, and Squad on Day Combat Patrol. A selected bibliography of books, periodical reports, and government reports, publications and films, together with a description of field devices and training aids developed for the study are included. T. I. R 83

USMC Equipment Board. GENTEX PILOT'S PROTECTIVE HELMET, TYPE DH 5-3. Proj. EA 1268, Aug. 1957, 10pp. USMC Equipment Board, Quantico, Va.

11,650
To evaluate the Gentex Pilot's Protective Helmet (Type DH-5-3) in terms of its suitability for service use for helicopter pilots and aircrew personnel, ten experienced helicopter pilots tested the item. Flights were made wearing the helmet. It was compared with the standard M-4 helmet and latest APE-5 helmet on the following physical and functional characteristics: comfort fit, stability, ventilation, radio reception, visibility sound attenuation, visor, ear cup/headset assembly, and chin strap. An analysis of the need for a helmet specifically designed for helicopter pilots is made and the physiological aspect of operating a helicopter in regard to headgear and high noise levels is discussed. Recommendations are included. T. I. R 1

Peacock, L.J., & Marks, R.A. BEHAVIORAL CONCOMITANTS OF COLD ADAPTATION. III. TEMPORAL DEVELOPMENT OF BEHAVIORAL DIFFERENCES. ANML Proj. 6-95-20-001, Rep. 298, July 1957, 5pp. USA Medical Research Lab., Fort Knox, Ky.

11,653
To investigate the time course of development of behavioral differences between normal and cold exposed rats, an operant conditioning situation (Skinner boxes) with radiant heat reward (five second exposure) was used. Six albino rats, shaved over the neck and head, were trained first with regular and then with three to one ratio reinforcement. Two groups were then formed on basis of number of responses given during training. One group continued to live in an ambient temperature of 22 degrees Centigrade, the other in a cold room at 2.5 degrees Centigrade, (test temperature). Fifteen sessions of three to one reinforcement (two each day) followed. Differences in response rate between the two groups were analyzed in relation to time. G. R 5

Rubin, L.S., & Goldberg, M.N. THE EFFECT OF GB ON DARK ADAPTATION IN MAN. III. THE EFFECT OF TERTIARY AND QUATERNARY ATROPINE SALTS ON ABSOLUTE SCOTOPIC THRESHOLD CHANGES ENGENDERED BY GB (U). Proj. 4 08 02 018 04, CWL Rep. 2155, Aug. 1957, 15pp. USA Chemical Warfare Labs., Army Chemical Center, Md.

To test the effect of a tertiary and quaternary atropine salt on the absolute scotopic threshold changes due to exposure to GB (on anticholinesterase), thresholds were measured over the last ten minutes of a 30-minute dark adaptation period. Measurements were repeated at each step of the following sequence: practice (three trials); a two-minute exposure to GB vapor of 2.79 or 2.67 milligrams per cubic centimeter with protective device over eyes; injection with atropine sulphate or atropine methyl nitrate; and post-injection (three hours later). Three subjects were used. Mean absolute threshold measurements and standard deviations were analyzed as functions of practice and experimental conditions. The findings are related to theories of the visual processes. T. G. R 10

Estah, T.F., Walpole, R.N., & Lawson, G.S. OPERATIONS AT HIGH TEMPERATURES: DETERMINATION OF THE AMOUNT OF HEAT TRANSMITTED TO FIGHTING COMPARTMENT OF TANKS UNDER FIELD CONDITIONS. Proj. 2-22, Aug. 1943, 4pp. USA Medical Research Lab., Fort. Knox, Ky.

11,660

To determine the adequacy, from the standpoint of heat dissipation by crew members, of the limited rate of ventilation that is provided through the gas canister in a gas-protected tank, data were collected during actual driving tests on the range with a full crew in the tank. Tests were made on three different days in both a gas-protected and standard tank and included surface, air, and wet-bulb temperature readings at various locations taken at intervals throughout the test. Observations on the crew included weight loss, body temperatures, water consumption and excretion. Climatic data were also gathered. These data were evaluated in terms of maintenance of a tolerable atmospheric environment within the tank. T. G.

Rulon, P.J., Schaeffer, R.F. & Gilbert, A.C.F. ELECTRONICS MAINTENANCE TRAINING: EXPERIMENTAL TRYOUT OF DIAGNOSTIC GRAMS AND BACKTRACKS. Contract AF 18(600) 1355, Proj. 7709, Task 37300, Jan. 1958, 39pp. Educational Research Corporation, Cambridge, Mass.

11,665
This report describes an experimental tryout of a training program for electronics maintenance which derived from an initial study reported elsewhere. The training outline and recommendations were based on certain intellectual tools (job supports) the Diagnostigram and the Backtrack method of trouble shooting. Two groups of subjects (28 high school graduates) were trained; the experimental group received 40 hours of instruction most of which was spent on Backtracks; the control group received 60 hours of instruction most of which was spent in learning basic information with 12 hours on trouble shooting. Both groups were tested on a performance test and a written test and then respective performance compared.

Saul, E.V., Raben, Margaret M., Seronsy, Louise B., Weiner, L., et al. HUMAN ENGINEERING BIBLIOGRAPHY. 1956 - 1957. Contract N6onr 494(13), ONR Rep. ACR 32, Oct. 1958, 210pp. USN Engineering Psychology Branch, ONR, Washington, D.C. (Institute for Applied Experimental Psychology, Tufts University).

11,666
Personnel responsible for the human factors considerations in the design and development of equipment have a major need for rapid and easy access to the literature pertinent to their work. This bibliography is one of a planned series of annual bibliographies of literature pertinent to human engineering designed to meet this need. There are five main parts: 1) a topical outline that defines over 300 topic headings, 2) an index that relates the bibliographic entries with the topic headings, 3) an alphabetic index of search terms, 4) an annotated bibliography, and 5) an index of authors.

Tolhurst, G.C. NOISE ATTENUATION CHARACTERISTICS OF THREE PERSONNEL NOISE PROTECTIVE DEVICES. Prepared under Contract N6onr-22525, Proj. NR 145-993, Special Rep. 55-6, May 1956, 10pp. USN School of Aviation Medicine, Pensacola, Fla.

11,667
To evaluate three personnel noise protective devices (David Clark Co., 372 series) as to their noise attenuation characteristics two methods were used. Physical measures were obtained from the output of a miniature condenser microphone serving as an "artificial ear" shock-mounted within a plastic manikin head. Subjective measures were responses of ten trained observers to four listening tasks (essentially binaural free-field threshold judgments) once with protective off and once with it in place. The data, attenuation values in decibels and threshold shifts were compared with previous values obtained for the V-51R Ear Warden.

Sisson, R.L. RESEARCH IN METHODS OF SCHEDULING A JOB SHOP. Prepared under Contract N6onr 23302, May 1957, 23pp. University of California at Los Angeles.

11,668
This report reviews research in methods of scheduling a job shop. The job shop is characterized by the fact that the sequence of operations performed on any one lot to be fabricated is independent of the sequence required for any other lot. Scheduling, as used here, is the assignment of sequences in which work is performed (also called sequencing and dispatching). Two categories of models for solving scheduling problems are described: mechanical and stochastic (the latter is here called thermodynamic). Scheduling methods based on these models (priority function and Berners-Lee) are considered. Experimental testing and simulation methods are discussed together with the problems involved. A specific example of use of the Las Vegas simulation approach is given.

June, R.K., Batzis, G.W., & Wilcox, J.D. COLOR MEASUREMENTS FOR FIELD EVALUATION OF COLORED SMOKE (U). Proj. 4-04-17-020-04 & 4-04-15-029-03, Rep. 2096, Nov. 1956, 31pp. Chemical Warfare Labs., Army Chemical Center, Md.

11,670
To develop a method for field evaluation of colored smokes, extended chroma Munsell color cards were used to match observed colors of 295 M18-type grenade smokes and the Munsell notations recorded. The importance of subtense angle was considered and a windshed for cloud control described. Results of measurements and several methods of data evaluation are presented. The results are discussed in relation to their usefulness to those working with experimental, developmental, and production lots of colored smoke grenades, and for setting up specifications for grenade colors.

11,672
Slecht, R.F. & Wade, E.A. A COMPARATIVE STUDY OF COMFORT. Sept. 1957, American Psychological Association Convention, New York, N.Y. (Tufts University).

11,672
To test subjective comfort of six seats with widely different structural characteristics eighteen subjects of a wide range of body size were asked to sit in each seat until their state of discomfort reached a point when they felt an intense desire to get up. Seats were counterbalanced among subjects and testing sessions for each subject spaced a week apart. Bar graphs showing average voluntary sitting time are presented; pair-wise comparison of seats also is made. Scattergrams were made of results obtained from a ten-point comfort rating scale, (most to least comfortable). Hourly comfort evaluations were made, using a nine-point scale of comfort-discomfort.

Pinneo, L. THE RADIC VISUAL SENSITOMETER.
Proj. UX 12, RADIC TS-57-256, July 1957, 7pp.
Rome Air Development Center, ARDC, Griffiss
AFB, N.Y.

11,673

This paper describes an apparatus developed for the purpose of studying a wide range of visual problems. The "Sensitometer" provides the capability for investigating problems involving the reaction of the human eye to light stimulation of a small physical area. A brief description of its mechanical and optical construction is given. Some of the capabilities and restrictions of the apparatus are discussed.

11,674

Karpovich, P.V., Keeny, C.E., & Alexander, A.A. PHYSIOLOGICAL AND KINESIOLOGICAL METHODS FOR TESTING FOOTGEAR.
Contract DA-19-129-q-309, O.I. 907, Final Rep., June 1957, 78pp. Dept. of Physiology, Springfield College.

11,674

To develop physiological and kinesiological methods for evaluating the effect of military footwear upon the function of the soldier, 30 subjects were studied by:
(1) measuring the energy cost of walking; (2) measuring and recording the time alignment of foot and lower leg;
(3) determining the speed of sprinting thirty yards, time for running a zig-zag course, and the height of vertical jumping; and (4) measuring the pressure exerted on selected areas of the soles of the feet. Three types each of American, British and Canadian footwear were used. In addition to shoe type, the effects of shoe weight, type of sole and medial inserts were analyzed. Several auxiliary devices and techniques were developed and are described.

Birdsall, T.G., Tanner, W.P. Jr., Ristenbatt, M.P., & Hazeltine, B. APPLICATION OF BASIC SCIENCE TO COUNTERMEASURES RESEARCH. Contract DA-36-039-SC-63203, SC Proj. 1948, Prog. Rep. 16, May 1957, 9pp. Engineering Research Institute, University of Michigan.

11,675

This is a progress report of an investigation concerned with those aspects of science of general interest to the countermeasures field with emphasis on those areas of electrical engineering, mathematics, and psychophysics which may contribute to development of improved equipments and systems. The experimental effort of this period was directed toward a study of the method of measuring and the effectiveness of communication in interference; and the ability of the human observer to detect and recognize signals in noise. The application of signal detection theory problems of search and intercept is continuing and work has begun on "programming" the scan of a rapid scanning panoramic receiver as a means of apparent search-bandwidth control.

11,677

USAF Arctic, Desert, Tropic Information Center. THE DESERT SURVIVAL FIELD TEST. ADIC Publ. D 104, Dec. 1956, 83pp. USAF Arctic, Desert, Tropic Information Center, Maxwell AFB, Ala.

11,677

To evaluate the Air Force survival system under actual field conditions in a desert environment, a B-47 crew served as nucleus with two participant observers added. Libya was chosen as test locale. The test consisted of a desert trek under simulated emergency conditions wherein the crew were taken by truck to a known well and left to make their way by foot over 35 miles of desert to destination. Equipment consisted of parachutes, flight gear, A-1 survival kit, and whatever additional survival equipment normally carried. A pre-trek questionnaire elicited personal data and information about survival training. The observers kept field data cards recording details of the trek, personnel, equipment, and techniques of survival. Analysis was based on these records. T. I. R 18

11,678

American Institute for Research. MATERIALS FOR THE TEAM PERFORMANCE RECORD PROGRAM. (5) Prepared under ONR, no date, 56pp. American Institute for Research, Pittsburgh, Penna.

11,678

This is a packet of materials to be used in recording performance of Navy teams. They provide a method for systematic observation and specific actions displayed by the team, stressing the particular incident rather than a generalization about the team or a particular member. The Record is designed to help supervisors, instructors, and evaluators assess the strengths and weakness of teams over a period of time. Included are a manual for use with team performance records and three records: one for general performance of Navy teams, one for Combat Information Center teams, and one for Gunnery teams.

11,679

Miller, H.R., Grundfest, H., Alper, J.M., Korr, I.M., et al. A SIMPLE PROCEDURE FOR WARMING THE HANDS TO MAINTAIN MANUAL DEXTERITY DURING EXPOSURE TO EXTREME COLD. Engng. Memo 18 CR, July 1944, 6pp. Signal Corps Ground Signal Agency, Climatic Research Unit, Fort Monmouth, N.J.

11,679

To determine the effectiveness of a unit (muff and chemical heat pad) designed to warm the hands and restore manual dexterity of personnel exposed to extreme cold, five subjects were tested under various conditions. The subjects first practiced on a manual dexterity test wearing knitted wool gloves with nylon inserts, then dressed in arctic clothing and seated in a cold chamber (-40 degrees Centigrade) repeated the test until impossible to continue, warmed their hands and repeated test as before. This was repeated until other factors required discontinuation of tests. The entire procedure was repeated with only a muff or another pair of mittens. Dexterity was analyzed by comparing performance on all conditions with practice performance.

Miller, H.R., Grundfest, H., Alper, J.M., Korr, I.M., et al. CHANGES IN MUSCLE TEMPERATURE OF LIMBS EXPOSED TO COLD. Engng. Memo 19 CR, Aug. 1944, 14pp. Army Service Forces, Signal Corps Ground Signal Agency, Climatic Research Unit, Fort Monmouth, N.J.

11,680

To determine muscle temperature reactions of limbs exposed to dry cold air, the upper limbs (two to three inches above elbow) and lower limbs (five to six inches above knee) of young male subjects were exposed to a temperature of minus four to minus ten degrees Centigrade in ice-jacketed boxes. Room temperature where subject was seated was twenty degrees Centigrade. Muscle temperatures of the exposed limbs were measured with copper-constantan needle thermo-couples; finger and toe temperatures and rectal temperatures were also measured. The data were analyzed as a function of time in the cold (190 minutes). Recovery data were also measured and analyzed.

Shatz, R.M. THE OBJECTIVES AND TECHNIQUES OF WEAPONS SYSTEMS ANALYSIS. Jan. 1957. 28pp. Systems Research Dept., Cornell Aeronautical Lab., Inc., Buffalo, N.Y.

11,681

This paper outlines in broad general terms the new field of weapons systems analysis--the explicit use of scientific methods as an aid to military decision-making. The need for such analysis of weapons systems, the historical background, and current status are discussed. Present objectives are listed. The classes of problems dealt with (weapons systems requirements, comparative evaluations of competing systems, employment including tactical use and strategic effect, and creation of systems specifications or conceptual design of new systems) are discussed with illustrative examples. Finally, techniques used, organizational needs and relation to the designer are reviewed.

11,682

Klein, S.J. THE MEASUREMENT OF STRESS AND ITS RELATIONSHIP TO PERFORMANCE. I. THE RELATIONSHIP OF MUSCLE ACTION POTENTIALS TO THREE MEASURES OF ERGOGRAPHIC WORK IN TASK ORIENTED SUBJECTS. Rep. NAMC-ACEL-326, Feb. 1957. 18pp. Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

11,682

To determine whether the relationship between stress and performance is dependent upon the manner in which the subjects are stressed, muscle action potentials (assumed to be measures of systemic stress) were recorded under various conditions. A finger ergographic task was used with (1) application of cold and warm stimuli to working hand and (2) slow and fast rate of lift. Each of 13 subjects performed twice under each condition. Measures of performance were output (total distance weight was lifted), accuracy (average error of individual excursions from deviation line), and precision (variance of error). Muscle action potential data and performance data were studied by analyses of variance for effects of stressors and by correlational methods for relationship to stress. T. R 20

Marcou, P.; & Daguet, J. A SPECIFIC PROPERTY OF THE VOICED SPEECH SOUND AND A FEW PRACTICAL APPLICATIONS. (Une Propriete Particuliere de la Parole et quelques-unes de ses Applications). ATIC-238150-A, June 1954. 9pp. Air Technical Intelligence Center, Wright-Patterson AFB, Ohio. (Centre National d'Etudes des Telecommunications)

11,683

This report shows how a normal telephone current can be transformed into a signal of the form $\cos \phi(t)$ equivalent to it as far as intelligibility and timbre of the voice are concerned. Based on this new property of speech, a few possible applications are given. A summary description of two applications is given: (1) a radio-telephone communication on single sideband, with a Class C transmitter; and (2) a telephone transmitter with very narrow bands.

11,684

Dwyer, P.S. THE PROBLEM OF OPTIMUM GROUP ASSEMBLY. Contract AF 18(600)-1050, Proj. 7713, Tech. Doc. Rep. series AFPTRC-TN-56-18, Jan. 1956, 104-114. Crew Research Lab., AFPTRC, ARDC, Lackland AFB, Tex. (University of Michigan).

11,684

The Air Force problem of the determination of the efficient assignment of crew and subsequent consideration of the general group assembly problem are covered in this report. The mathematical problem involved is stated and the method of reduced matrices, which serves as a basis of the solution, is described. Implications of the research for Air Force problems in group assembly and for other problems are considered. T. R 9

11,685

Nighland, R.W., Neuman, S.E., & Waller, H.S. A DESCRIPTIVE STUDY OF ELECTRONIC TROUBLE SHOOTING. Proj. 7709, Tech. Doc. Rep. series AFPTRC-TN-56-26, Jan. 1956, 173-198. Armament Systems Personnel Research Lab., AFPTRC, ARDC, Lowry AFB, Colo.

11,685

To investigate the knowledge and skills associated with successful trouble-shooting (locating malfunction sources), 360 experienced radar mechanics were required to take written tests covering electronic fundamentals, knowledge of the functioning of an oscilloscope, and reasoning ability. Each mechanic then attempted to locate six malfunctions which had been inserted into an oscilloscope kit. Problem-relevant behaviors (type of measurements, adjustments, and checks made; studying the schematic, wire tracing and visual checks; and time of occurrence of each) were recorded by trained observers and analyzed in terms of their relation to successful trouble-shooting, to technical knowledge, and to reasoning ability. The findings are discussed in relation to training and measurement problems. T. G. R 5

11,686

Arnault, M.D. RECOGNITION OF SHAPES FOLLOWING PAIRED-ASSOCIATES PRETRAINING. Proj. 7706, Tech. Doc. Rep. series AFPTRC-TN-56-12, Jan. 1956, 9pp. USAF Skill Components Research Lab., AFPTRC, ARDC, Lackland AFB, Tex.

11,686

To study transfer of paired-associates pretraining to a recognition task, five groups of subjects (400 total) were given training in relating a nonsense shape to a verbal symbol. The five groups corresponded to five levels of meaningfulness of the responses (familiarization, nonsense syllables, arbitrary, modal, or unique meanings); the frequency with which each shape appeared varied from one to 15 times during 48 trials. Following pretraining all groups took a recognition test in which they had to select the shapes on which they were trained from a group of similar shapes. They were then tested on ability to recall the proper name for each shape. Performance was analyzed as a function of amount of pretraining, meaningfulness of responses, and difficulty of task. T. G. I. R 17

Fitts, P.M., Bennett, W.F. & Bahrack, H.P. APPLICATION OF AUTO-CORRELATION AND CROSS-CORRELATION ANALYSIS TO THE STUDY OF TRACKING BEHAVIOR. Contract AF 33(038) 10528 & AF 18(600) 1201, Proj. 7707, Tech. Doc. Rep. series AFPTRC-TN-56-9, Jan. 1956, 125-141. USAF Skill Components Research Lab., AFPTRC, ARDC, Lackland AFB, Tex. (Ohio State University, Columbus, Ohio).

11,687

This report outlines a rational basis for deriving analytic measures of tracking studies, in particular, correlation functions. Some empirical data are given showing the application of auto-correlation and cross-correlation techniques to a study of tracking behavior. The implications for a general theory of measurement relative to motor performance are considered. G. I. R 8

11,688

Welch, B.E., Marcinek, J.G., Buskirk, E.R. & Iamietro, P.F. CALORIC INTAKE AND ENERGY EXPENDITURE OF EIGHT MEN IN A TEMPERATE ENVIRONMENT. Proj. 6 60 11 020, Rep. 196, Jan. 1957, 11pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,688

This study is one of a series of experiments designed to quantify caloric intake and expenditure in several environments with a well-defined regimen of physical activity. The test site for this study was the temperate environment at Natick, Massachusetts in late August and early September (mean ambient temperature daylight hours, 22.2 degrees Centigrade, mean relative humidity, 68 per cent, mean wind speed, 2.8 miles per hour). Caloric intake and expenditure (marching and other activities) were recorded for eight men over a 12-day period. Body weight, body density, and body fat measurements were made. The data were discussed in terms of need to account for energy expenditure for estimating man's caloric requirements in diverse environments. T. G. R 10

11,682

Wavter, Helen J., & Konishi, F. AN EVALUATION OF FOOD ACCEPTANCE BY SOLDIERS UNDER AN AD LIBITUM REGIMEN. Proj. 6-60-11 020, Rep. 198, Feb. 1957, 54pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,689

To determine the acceptability of individual foods consumed by soldiers under an ad libitum regimen, food consumption was recorded for 100 men for a period of 28 days. The menu included 173 items, all of high quality, prepared in as natural a form as possible under the highest possible standards. Free selection of any of the foods on the day's menu was permitted in as much quantity as was desired. Acceptability of the individual foods was expressed as the percentage of the persons at a meal who took a food item. The average quantity of food consumed was also calculated. The results are discussed in relation to factors affecting food preferences and to previous preference studies.
T. R. 26

Stockbridge, H.C.W. LEARNING TO AIM AT MOVING TARGETS WITH KNOWLEDGE OF RESULTS. Rep. 68, July 1956, 9pp. Clothing and Stores Experimental Establishment, Directorate of Physiological and Biological Research, Ministry of Supply, London, England.

11,690

To investigate the effect of knowledge of results on aiming and tracking, 12 subjects learned to aim a sight bar at a moving target. Two matched groups were formed on the basis of learning trials and given eight days of further practice, one group only being given their numerical score and immediate auditory knowledge of results. Both groups were then given test trials without knowledge of results. Subjects were asked to estimate how well they thought they had done. Time-on-target scores, recorded electrically, were analyzed for differences between the groups. Judgments of performance were compared with actual performance. The implications of the results for acquisition of skill and formation of standards are discussed.
T. I. R. 15

Josephson, D.V. ODOR AND FLAVOR PROBLEMS IN RADIATION STERILIZATION OF FOODS. Contract DA 19-129-qm-375, Proj. 7-84-01-002, Rep. 9, Final Rep., May 1955-Dec. 1956, 31pp. Quartermaster Food and Container Institute for the Armed Forces, Chicago, Ill. (Pennsylvania State University).

11,691

To gain insight into the radiation-induced flavor and odor problem of skim milk, the effects of ionizing (gamma radiation at two dosages (minimal and medium sterilization levels) on skim milk and certain of its fractions were studied. Each lot of radiated samples was evaluated organoleptically by from five to ten experienced judges for changes in odor and flavor. Additional changes in composition were investigated. Volatiles produced were collected by distillation techniques, fractionated by gas chromatography, and individual compounds identified by mass spectrometry. Flavor thresholds for a group of disagreeable compounds were determined and some off-flavor preventive mechanisms noted. Implications of this research for investigative techniques and for food sterilization are discussed. T. G. I. R. 12

11,692

USAF Flight Control Lab. LIGHTING, INTEGRAL, INSTRUMENT, GENERAL REQUIREMENTS FOR. WLSI 4 1, Amendment 1, Oct. 1954, 12pp. USAF Flight Control Lab., Wright-Patterson AFB, Ohio.

11,692

This report covers the general requirements for integral lighting of the indicia of panel mounted aircraft instruments. Applicable specifications, publications, and drawings are listed. Specific requirements, tests to be conducted, picking instructions, and notes relating to test equipment, ordering data, and suggested methods to attain specified lighting requirements are given.
I.

11,693

USAF Air Materiel Command. LIGHTING EQUIPMENT, AIRCRAFT, GENERAL SPECIFICATION FOR INSTALLATION OF MILITARY SPECIFICATION. MIL L 6503A (USAF), March 1954, 29pp. USAF Air Materiel Command, Wright-Patterson AFB, Ohio.

11,693

This specification covers the requirements for the installation of exterior and interior aircraft lighting, except lighting required for instrument illumination. Conventional aircraft, gliders, rotary wing, and amphibious aircraft are included. In addition, a list of references to applicable specifications, standards, drawings, and publications is given along with sampling, inspection and test procedures.
T.I.R. 86

11,694

USA Board MRI. EVALUATION OF UNITED KINGDOM COMPASS. REPORT OF TEST, PROJECT MR FA 3253, Aug. 1954, 3pp. USA Board MRI, Fort Sill, Okla.

11,694

To evaluate the United Kingdom compass (hand-held instrument for measuring magnetic azimuths) for field artillery use, the following tests were performed: (1) physical characteristics determined by observation, by subjecting to normal handling, and by submerging in water for two hours; and (2) operational characteristics determined by measuring azimuths during day and night under various weather conditions for repeatability of measurements, time for operation, and maintenance problems. Comparisons were made in both tests with Compass M-2 and the Swiss Compass. Deficiencies are enumerated and recommendations included.

11,695

USAF Air Materiel Command. LIGHT, PANEL, AIRCRAFT, INDIVIDUAL INSTRUMENT. MILITARY SPECIFICATION. MIL L 5057A, Jan. 1953, 13pp. USAF Air Materiel Command, Wright-Patterson AFB, Ohio.

11,695

This specification, approved by the Department of the Army, Navy, and Air Force, covers individual instrument lights which mount to and illuminate flange-mounted type instruments employed in military aircraft. Individual instrument lights are classified in two types: normal angle of vision and wide angle of vision lights. The following items are included: applicable specifications, standard drawings, and publications; requirements; sampling, inspection, and test procedures; preparation for delivery; and notes on usage, ordering data, provision for qualification tests, and definitions.
T. G. I. R. 25

11,696

USAF Air Materiel Command. LIGHT, RUNWAY MARKER, ELEVATED, TYPE C-1. MILITARY SPECIFICATION. MIL L 5904B, May 1951, 14pp. USAF Air Materiel Command, Wright-Patterson AFB, Ohio.

11,696

This specification, approved by the Departments of Army, Navy, and Air Force, covers one type of high-intensity runway marker light, designated Type C-1, to be used for outlining runways not over 200 feet in width, under all weather conditions. Items included are: applicable specifications and other publications; requirements; sampling, inspection, and test procedures; preparation for delivery; and notes on ordering data and provisions for qualification tests.

Christman, R.J., & Doherty, W.J. HUMAN FACTORS ANNOTATED BIBLIOGRAPHY ON SPEECH COMMUNICATIONS JAMMING. Tech. Rep. 57-25, Feb. 1957, 14pp. Rome Air Development Center, ARDC, Griffiss AFB, Rome, N.Y.

11,697

This report is a non-critical compendium in annotated form of recent (1942-1956) literature related to communications jamming. Studies dealing directly with the specification of signals to be used against voice communications and oriented toward the human operator component of the communications systems are included. The principal section is on jamming of speech; two smaller sections provide partial coverage on intelligibility testing and general reports on both topics.

11,698
Reckow, H.R. EFFECTS OF VIBRATIONS ON CONTROL DEEP-SPACE AND GAIN ON TRACKING PERFORMANCE. Proj. 7199-71635. WADC TR-57-126. Sept. 1957. 12pp. Army Medical Lab. WADC, WDC. Wright-Patterson AFB, Ohio.

11,699
To investigate the effects of joint variations in control response and gain on the efficiency of a first-order manual control system, six experienced subjects performed on a two-dimensional tracking device. Four levels of control response (none, one, two and three degrees) were combined with three levels of gain (1:1, 5:1, and 10:1) to produce twelve conditions. Each subject practiced on all conditions on two separate days. Mean percent time-on-target (the display line was within a 0.2 inch scoring zone at center of display) scores were studied by analysis of variance for significance of differences due to the experimental conditions. Applicability of the findings to use for design engineers is discussed.

Fletcher, J.L., & Silver, C.A. ATTENUATION CHARACTERISTICS OF FOUR EAR PROTECTIVE DEVICES. Proj. 6-95-20-001, Rep. 322. Jan. 1958. 21pp. USA Medical Research Lab Fort Knox, Ky.

11,701
To determine the attenuation characteristics of four ear protective devices (Quartermaster helmet, Centex helmet, H-63 headset, and Radio Corporation of America headset), two tests were conducted. The first was a physical calibration using a condenser microphone in the right ear of a dummy head and measuring the sound pressure level of microphone response with and without the protective devices. An articulation test (96 subjects) was given with masking noise similar to that found at the Commander's station of vehicle T-41-E2. Each subject responded to one list of words wearing each headgear. The data, attenuation in decibels and percentage correct answers, were analyzed for differences due to protective devices.

Hawley, L.K. CRANE CONTROLS FOR IRON-AND STEEL-WORKS. PART III. PROTOTYPE MASTER CONTROLLER TRIALS. FE-5/67/53, March 1954. 10pp. Plant Engineering Division, The British Iron & Steel Research Association, London, England.

11,704
This report gives a final account of evaluations of prototype designs of master controllers for cranes in steelworks. The controllers consisted of new four-start design sponsored by the British Iron and Steel Research Association and other single start designs originated by the manufacturers as alternative answers to the problem. Eleven controllers were installed in steelworks cranes for periods of from one to three years and given extended trials. Installation details and performance data are presented in tabular form.

Mott, R.L. A HIGH-SPEED TIME BASE FOR PPI RADAR DISPLAY. Rep. ERB-289, Aug. 1952. 11pp. Radio and Electrical Engineering Division, National Research Council of Canada, Ottawa, Canada.

11,705
This report describes the development and operation of a high-speed time base featuring a continuously variable scale from 400 to 10,000 yards. Details of a "package-type" radar system which is used in conjunction with the time base are included. Specifications of the console-type Navigational and Docking Radar are given. In addition to schematic diagrams and photographs of the equipment, a number of operational pictures of the Plan Position Indicator display have been included. The use of the equipment for navigation in confined waters and harborways is discussed.

Moseley, H.G. USAF OPERATIONAL EXPERIENCE WITH ESCAPE FROM HIGH PERFORMANCE AIRCRAFT. Pub. no. M-24-56, Sept. 1956. 21pp. Directorate of Flight Safety Research, Norton AFB, Calif.

11,706
This report presents an analysis of emergency escapes from high performance aircraft by use of the ejection seat. The number of known ejections was 877 over a period from August 1949 through May 1956. Causes of ejection fatalities and major injuries are analyzed along with altitudes and airspeeds relative to injury. A review of circumstances leading to fatalities (whether or not escape was attempted) is presented. Problems of aeromedical and design concern are discussed.

Neill, P.C. Jr. USE OF RED LIGHT TO FACILITATE DARK ADAPTATION. Proj. 115, Rep. 1, Feb. 1943, 2pp. USAF School of Aviation Medicine, Randolph Field, Tex.

11,707

To demonstrate that red illumination is feasible for use in alert rooms in place of red pre-adaptation goggles six subjects were exposed to light from a 40-watt natural ruby red Mazda lamp for 20 minutes. The light was directed down on a white card (36 inches square), and the subject was required to read during the adapting period. The rate of adaptation was measured on the Becke Adaptometer. The data were compared with those from a previous experiment with red dark adapter goggles. The advantages of the illumination method are discussed.

Karpovich, P.V. RELATION BETWEEN BEARS AND PHYSICAL FITNESS. Proj. 132, Rep. 1, Oct. 1943, 2pp. USAF School of Aviation Medicine, Randolph Field, Tex.

11,708

To determine whether the incidence and severity of bears occurring at high altitude are related to physical fitness, 197 aviation students were given simulated flights in an altitude chamber at 35,000 feet for three hours. Oxygen was used above 10,000 feet; rate of ascent, 2000 feet per minute; rate of descent 27 millimeters Hg (pressure) per minute. At the same period in their training the students were given the Pre-Flight School Physical Fitness Test. The data were studied by comparing the mean physical fitness scores of the groups that did not get the bears (157) with the group that had to be brought to ground level before end of flight because of bears (30).

Davidson, H.O. Jr. BIOLOGICAL EFFECTS OF WHOLE-BODY GAMMA RADIATION ON HUMAN BEINGS (U). Tech. Memo ORO-T-357, Dec. 1956, 95pp. Operations Research Office, The Johns Hopkins University.

11,711

To estimate the short-term effects on humans of chronic whole-body exposure to gamma radiation and to organize results in a form suitable for fallout defense planning, results of chronic-irradiation experiments on animals together with data on single-pulse irradiation of animals and humans were analyzed. Approximate principles for prediction of human response to fallout radiation were derived and combined with a fallout decay function to permit computation of an effective dose. Graphical solutions are presented for application of this computation to various types of fallout defense problems, and some general conclusions for planning are suggested. The problem of delayed effects is briefly surveyed.

Barfield, C.M. SERVICE ACCEPTANCE TRIALS OF MODEL T-340 AIRPLANE STABILITY AND CONTROL TRIALS. Proj. TED 815 21190, Letter Rep. 1, Final Rep. 1, Final Rep., Sept. 1955, 13pp. Naval Air Test Center, Patuxent River, Md.

11,712

To test the model T-340 airplane (two place tandem, single engine, primary trainer, Beechcraft Aircraft Corporation) for stability and control characteristics, standard flight test methods and data analysis procedures were used. The tests consisted of an evaluation of the following: cockpit and flight control systems; ground handling, take-off, stall, spin, landing and wave-off characteristics; and longitudinal, lateral, and directional stability and control. The results discussed in terms of acceptability and compliance with standard requirements include recommendations.

Wright, L.C., & Thomas, C.F. FLIGHT COMPANION OF A STANDARD A-2 MODEL ZERO READER AND A MODIFIED SLAVED DIAL ZERO READER COMBINED INDICATOR. TM NCT-54-25, 3-655-1604-1, July 1954, 60pp. Directorate of Flight and All-Weather Testing, WADC, AFMTC, Wright-Patterson AFB, Ohio.

11,713

To determine which of two Zero Reader Flight Instrument Combined Indicators (rotating card versus settleable card-rotating needle) best displays required flight information, both indicators were installed in the instrument panel of a C-47 aircraft - one in the pilot's panel and one in the co-pilot's panel. The test consisted of approximately 20 minutes of hooded flight for each of 35 pilots using each instrument. The test pattern flows was the same for each instrument and included a series of turns and a simulated Ground Control Approach landing. A preference questionnaire was completed by each pilot. The results were analyzed for differences between performance on and preference for the indicators. Recommendations are included.

Dunlap and Associates, Inc. HUMAN ENGINEERING EVALUATION OF THE DOPPLER SONAR. Contract N ord-17719, Memo Rep. 2, April 1957, 4pp. Dunlap and Associates, Inc., Stamford, Conn.

11,716

The Doppler sonar was evaluated from the human engineering viewpoint. The following aspects of the equipment are discussed: function, operation (warmup and tuning), and operational difficulties. Recommendations for some equipment modifications are made.

11,717

Hess, G. THE RELATIONS BETWEEN INJURIES DUE TO AIRCRAFT ACCIDENTS AT BROOKS FIELD, TEXAS, IN 1942, AND THE CAUSES AND NATURE OF THE ACCIDENTS. Proj. 144, Rep. 1, April 1943, 13pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,717

To study the relations between injuries due to aircraft accidents at Brooks Field, Texas in 1942 and the causes and nature of the accidents, accident reports of the Aircraft Accident Examining Committee were reviewed. Causes assigned by the committee were tabulated according to frequency and degree of injury. The nature of the accidents were similarly tabulated. The findings were discussed in relation to possible underlying factors such as lack of experience, lack of familiarity with the specific model being flown, stress and strain of long hours of flying, type of training program. Improved techniques for reporting accidents are suggested.

Theilen, E.O., Gregg, D.E., & Rotta, A. JOINT REPORT WITH ANDEAN INSTITUTE OF BIOLOGY, LIMA, PERU. EXERCISE AND CARDIAC WORK RESPONSE AT HIGH ALTITUDE. Proj. 6-60-13-017, Subtask 6, AMSGS-26-55, Sept. 1955, 10pp. Army Medical Service Graduate School, Walter Reed Army Medical Center, Washington, D.C.

11,719

To study the extent and adequacy of the response of the heart of man to the stress of chronic anoxia at high altitudes, 26 male subjects were studied either at Morococha, Peru (elevation 14,900 feet) or at Lima, Peru (elevation 590 feet). These subjects included natives indigenous to both altitudes. Control determinations of hemoglobin, hematocrit, cardiac output, heart rate, systemic blood pressure and oxygen consumption were made with the subject standing on a treadmill. The treadmill was started and rate and duration of work adjusted in attempt to create a heavy cardiac work load (from four to seven miles per hour from three to ten minutes); measurements were then repeated. Comparisons of the data were made between high altitude and sea level subjects.

Swartz, K.T. RELATION OF HEAT PROCESSING LEVELS TO CONSUMER PREFERENCE OF CANNED YORK AND GRAVY AND CANNED BEEF STEW. Proj. 7-84-06-031, Problem 01-32a, Interim Rep., March 1955, 5pp. Quartermaster Food and Container Institute, Chicago, Ill.

11,720

To obtain information concerning the possibilities of utilizing process reduction to improve marginally acceptable canned meat items for ration use, a sensory evaluation of pork and gravy and beef stew was conducted. Three different canners prepared and processed the pork and gravy in accordance with military specifications except that F_0 values (sterilizing values of processes used) were 0.1, 1.0, 3.0, 5.0, 7.0, and 9.0 (usual values range from 3.0 - 6.0). The beef stew was prepared at the Institute. A consumer preference type test was used to evaluate both products. The results were analyzed in terms of relation of heat processing level to consumer preference.

Yustein, S.E. REPORT OF RESEARCH AND DEVELOPMENT OF SURFACE PREPARATION AND PAINT REMOVING METHODS ON BRIM AND CROWN STRENGTHS OF SAFETY HELMETS. Lab. Proj. 4526-30, Final Rep., NS-18-613, Dec. 1955, 7pp. Naval Lab., USN Shipyard, Brooklyn, N.Y.

11,723

To investigate the influence of surface preparation and paint removing methods on the brim and crown strengths of safety helmets, a number of helmets from Navy stock (fibrous glass reinforced polyester and phenolic helmets) were tested. Based upon a survey of methods employed by different Naval shipyards in preparation of helmets for painting, the following representative treatments were used: 1) hand-sanded and sprayed with yellow lacquer, 2) lightly sandblasted and sprayed, 3) immersion in hot caustic soda solution, and 4) application of paint remover liquid. Samples from the brim and crown were tested for strength in flexure. The load producing a break was reported in pounds. An untreated specimen was used for comparison. The findings are discussed in terms of optimum method of treatment.

Audo, P.D., & Ashby, A.T. INVESTIGATION AND STUDY OF A CHAIN RADAR SYSTEM EVALUATOR. Contract DA 36-839-ac-56745, Interim Prog. Rep. 55-3A (Supplement 1), May 1955, 18pp. Cook Research Labs., Skokie, Ill.

11,724

This is a progress report of a research study of the chain radar system at the White Sands Proving Ground to determine the feasibility of incorporating an automatic or semiautomatic evaluation system into the chain. This report contains a description of field tests conducted to determine the relationship between the percent modulation of the echo pulse train at the output of the receiver of a tracking radar set and the angular tracking error as recorded by the bore-sight camera. The tests were conducted with radar sets during missile firing. A description of the equipment used and the results obtained are included. A tentative modification of the originally proposed system for deriving the figure of merit of a tracking radar set and recommended tests are discussed.

Hass, G. AN INQUIRY INTO CIRCUMSTANCES FAVORING THE OCCURRENCE OF A SERIES OF FATAL AIRCRAFT ACCIDENTS ATTRIBUTED TO AN ACUTE LOSS OF ORIENTATION DURING NIGHT TRAINING MISSIONS. Proj. 154, Rep. 1, Sept. 1943, 3pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,725

To inquire into factors that contributed to the occurrence of 14 fatal night accidents of undetermined cause, an analysis of the accident reports was made. For each case the following salient factors were tabulated: time, date, place, atmospheric conditions, orientation, maneuver before fall, manner of fall, attitude on contact, result of accident, type of aircraft, status of pilot, number of pilot hours--day, night, instrument, flight record, accident record, vertigo record. The pattern of contributory causes was examined in terms of the previous findings pointing to acute loss of orientation. A list of aids for the diagnosis of loss of orientation is presented with recommendations for reducing their incidence. T.

Rushmer, R.P., & Hass, G.M. A COMPARISON OF CRASH INJURIES IN MAN AND IN LABORATORY ANIMALS. Proj. 471, Rep. 1, March 1946, 8pp. AAF School of Aviation Medicine, Randolph Field, Tex.

11,726

To determine the usefulness of direct experimentation on laboratory animals in the study of the effects of large decelerative forces on man, a comparison was made of the internal injuries encountered during post-mortem examination of flying personnel killed in aircraft accidents with the pathologic lesions produced by abrupt deceleration of these species of laboratory animals--cats, rabbits, and mice. The post-mortem cases selected were ones in which the victim had apparently been seated facing forward at moment of impact. The laboratory experiments included a variety of positions and restraints. Differences in decelerative forces obtaining during deceleration between the accident victims and animals were unknown. Discussion of the findings is in terms of degree of similarity of injuries. T. G. I.

11,727

Hass, G. RELATIONS BETWEEN THE TIME OF DAY, OCCURRENCE OF AIRCRAFT ACCIDENTS AND INJURIES TO OCCUPANTS OF AIRCRAFTS AT RANDOLPH FIELD, TEXAS, IN 1942. Proj. 120, Rep. 1, Feb. 1943, 2pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,727

To study relations between time of day, occurrence of aircraft accidents, and injuries to flying personnel, 269 accident reports from Randolph Field (1942) were studied. Accidents attributed to failure of personnel (193) were analyzed for effect of: 1) time of occurrence, 2) type of injury to personnel, and 3) event preceding injury. The amount of flying done by a training group of pilots at various periods of day and night and the average number of planes in the air were tabulated for one month and regarded as representative throughout the year. A comparison was made between the two sets of data. The findings are related to the role of fatigue in accidents and re-examination of training schedules. T. G.

Weitz, J. EFFECT OF SHAPE OF HANDLES AND POSITION OF CONTROLS ON SPEED AND ACCURACY OF PERFORMANCE WHEN VISUAL CUES ARE RESTRICTED. Proj. 351, Rep. 1, March 1945, 3pp. AAF School of Aviation Medicine, Randolph AFB, Tex.

11,729

To determine the effect of shape coding on the habit interference resulting from changing the position of controls either coded or uncoded with respect to the appropriate response, the control panel was placed behind a screen that concealed the controls but did not restrict movement. Eight trials were given in the original position followed by eight trials with the position of the controls changed. Control groups practiced only on the second position. Four groups of 50 subjects each practiced on one condition only. Total correct scores and errors were analyzed for changes due to position changes of coded and uncoded controls. The implications for standardizing aircraft controls are discussed. T.

Carriago, E.A. Jr., & Gondek, A.J. REPORT OF PROJECT NR 2738-SERVICE TEST OF FINDER, RANGE, STADIA, T45. Proj. DA 513-05-004, May 1957, 19pp. Rocket and Recoilless Dept., USA Infantry Board, Fort Benning, Ga.

11,731

To determine the suitability of Finder, Range, Stadia, T45 (a hand-held instrument similar in shape to binoculars which enables one man to range in on stationary or moving objects) for Army use, field tests were conducted at Fort Benning, Georgia. The speed and accuracy with which distance of stationary and moving objects could be determined were compared for the test range finder, for a control range finder (Sight, Stadia, M920), and for eye estimation. Determinations were made under varying weather conditions. Further comparisons were made with the Rifle, Spotting, Caliber .50, M6 for accuracy as range determining devices. Additional tests of physical characteristics, ruggedness and durability and general utility were made. Recommendations are included. T. I. R 6

11,732

USAF Directorate of Bombardment-Observer-Navigator Training Research. GRIDS FOR AIMING POINT IDENTIFICATION TESTS. Proj. 21 06 003, Res. Notes AOB 50 2, April 1950, 2pp. USAF Directorate of Bombardment-Observer-Navigator Training Research, Mather AFB, Calif.

11,732

To determine the type of grid that would permit greatest speed and accuracy in locating points, three types of grids were tested; one rectangular coordinate and two designs of a polar coordinate. A printed test for each grid was compiled; each test had five grids with eighteen points to be located and spaces for writing the coordinates. The score was total number of responses given in a six-minute period. Each of three Navigator Class were given a combination of two of the grids in double-fatigue order, and one Bombardier Class was tested. The data were analyzed first for differences due to type of grid and then for differences due to type of testee - bombardier vs. navigator. The use of the results for an "Aiming Point Identification Test" is indicated. T. I.

Lyman, J. SOME ASPECTS OF RESEARCH PLANNING FOR THE PSYCHOPHYSIOLOGICAL ENVIRONMENT IN MANNED SPACE TRAVEL. Dec. 1957, 12pp. Dept. of Engineering, University of California.

11,739

This paper discusses some problems that must be solved in providing for the psychophysiological environment of men in space travel. Taking the stages of manned flight to be global atmospheric flight, global space equivalent flight, circumplanetary space flight, and interplanetary space flight, present progress is discussed. Four major psychophysiological problem areas of space environment connected with prolonged flight are then discussed along with suggestions for needed research. These areas are: weightlessness, man-environment maintenance exchanges, morale and comfort in isolation for prolonged periods, and the effects of radiation.

This report identifies and discusses factors affecting human performance in tracking and watchkeeping (vigilance) tasks, and makes recommendations toward improving the performance of such systems. Whenever these recommendations are the direct outgrowth of published research the appropriate titles are cited. Other recommendations have been developed by the authors from their own experiences. There are three main parts: (1) general information describing closed-loop systems and human responses to various inputs; (2) important design factors in closed-loop systems (pursuit and compensatory displays, intermittency machine dynamics, aided tracking, quickening); and (3) human time lags (basic information, factors affecting watchkeeping). A table of contents and subject index are provided as aids to the user. G. I. R 116

Egly, J.H. COMBAT HELMET DEVELOPMENT. Contract DA 19-129-G-416, Rep. OG-998-D-2, Jan. 1957, 30pp. Cornell Aeronautical Lab., Inc., Buffalo, N.Y.

11,745

This report describes the study and development of a one-piece (shell with no liner) general purpose combat helmet based on designs that had previously been made. The main feature was increased head coverage for maximum protection achieved by movable visors. Following study of requirements for stability, comfort and fit, a prototype was made of the new shell and suspension and checked for compliance with product requirements. Further developmental studies were made of suspension arrangements for the T53-2, M-1, and T54-3 helmets. Noise attenuation experiments were performed to determine modification potential for improving the T54-3 helmet. Recommendations are included.

Rosso, D.A., Jr. DEVELOPMENT OF EMERGENCY FLIGHT DATA PANEL. Proj. TED NAM AE-9140, Rep. NAES-INSTR-24-52, April 1952, 5pp. Aeronautical Instruments Lab., NAMC, Philadelphia, Penn.

11,746

This report describes an emergency flight data panel (Panic Panel) for use in Naval aircraft not equipped with provisions for such information. A human engineering evaluation of a prototype panel is included in this report. Psychological factors relating to the value of the panel in emergency situations are reviewed and limitations of the construction features, mounting, material content and display features of the panel design are listed. Recommendations for changes are included.

11,747

Page, I.H. DETECTION OF RADAR ECHOES. NRL Reprint 36-53, March 1953, 15pp. Naval Research Lab., Washington, D.C.

11,747

This paper presents a method of accounting for operator effects, in any radar system, as a function of indicator and viewing conditions. From a critical study of experimental data in the literature, agreement is found for a number of parameters. Based upon a consideration of these factors an equation is derived that is useful in determining what actual received power is necessary for a given probability, under specified conditions, of an operator detecting a target. A more sophisticated nonlinear approach to the detection problem is further discussed and an equation derived which relates all of the considered parameters.

11,748

Lawrence, W. THE SYNTHESIS OF SPEECH FROM SIGNALS WHICH HAVE A LOW INFORMATION RATE. 1952, 8pp. Signals Research and Development Establishment, Christchurch, England.

11,748

This paper deals with one aspect of the problem of reducing the channel capacity required for the transmission of telephonic speech. From an analysis of an electrical generating system analogous to speech generation, two functions are isolated and the minimum number of parameters needed for synthesizing intelligible speech hypothesized. Experimental apparatus was constructed - the Speech Generator and Controller. Parameters specified the resonant frequencies of the vocal cavity system and the excitation applied to it. A few short phrases were synthesized and evaluated for intelligibility and information content. Future developments are discussed.

11,749

Glaser, R. DESCRIPTIVE VARIABLES FOR THE STUDY OF TASK-ORIENTED GROUPS. Prepared under Contract N70nr-37008, Proj. NR-154-079, Tech. Rep., June 1956, 13pp. American Institute for Research, Pittsburgh, Penn.

11,749

This report describes the development of a set of terms or dimensions for the description of task-oriented groups. A brief review is given of studies of task-related behavior of individuals and resulting group behavior from sociometry, communication network study, graph theory, and activity category analyses. Three classes of descriptive variables are described - communication, time sequence, and process. Illustrations from military groups are presented. Some suggested directions for further research on development of refined measurement procedures and of testable hypothesis are discussed.

Gerstner, H.B. MILITARY AND CIVIL DEFENSE ASPECTS OF THE ACUTE RADIATION SYNDROME IN MAN. Rep. 58-6, Nov. 1957, 29pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,750

To present a unified clinico-pathologic concept of radiation sickness in man (acute effects of human whole-body exposure to penetrating ionizing radiation) from the standpoint of the practical physician and medical officer, a comparative analysis is made of human data derived from nuclear accidents, Japanese bomb casualties, and radio therapy patients. The clinical picture of the acute radiation syndrome with its three subdivisions - hematopoietic, gastrointestinal, and cerebral forms - is described. Dependency of the picture on dose level and individual susceptibility is discussed and the therapeutic management outlined. Problems facing the practical physician - personnel, supplies, housing - under catastrophic conditions are evaluated.

11,751
Keatinge, G.F. RADIATION CATARACT IN INDUSTRY. Summary 96, ca. 1955, 2pp. British Iron and Steel Research Association, London, England.

11,751
This is a brief summary of the original report. The incidence of radiation cataract in iron-rolling mill workers was determined by ophthalmological examination of 44 of these men as compared to 104 "control" men of similar age. The results are stated in percentages for the groups as a whole and as a function of age (below and above 50).

Tinker, M.A. RELIABILITY AND VALIDITY OF INVOLUNTARY BLINKING AS A MEASURE OF EASE OF SEEING. J. educ. Psychol., Nov. 1950, 417-427. (University of Minnesota).

11,752
The results of a number of studies on reliability and validity of involuntary blink rate as a measure of ease of seeing are evaluated and coordinated. For the reliability measure, performance (blink rate) was compared for successive short periods with: 1) lower case versus capital text, 2) book versus newspaper type, 3) dim versus high illumination. For validity, the same experimental conditions also were employed to compare blink rate and rate of reading. These findings and those of other researchers are discussed and conclusions regarding the soundness of blink rate as the aforementioned criterion are reached.

ACF Industries, Incorporated. TRANSLATING FROM ORDINARY DISCOURSE INTO FORMAL LOGIC. A PRELIMINARY SYSTEMS STUDY. Contract AF 19(604) 1582, Sci. Rep. AFRC TN 56 770, Nov. 1956, 110pp. Avion Div., ACF Industries, Incorporated, Alexandria, Va.

11,753
This report presents a study of some problems involved in systematizing translations from ordinary discourse into formal logic. The general characteristics of the process of translation (specified as F translation) are described by contrasting formal logic with natural languages and F-translation with ordinary translation. Three stages of F-translation are defined: developmental paraphrase, analytic paraphrase, and symbolization. A general method is outlined and illustrated for the initial phase, development of sentences from their context. A scheme of patterns and notational system are provided to implement development and serve the needs of the subsequent stages. Intermediate and final stages of translation are considered briefly and from a systems point of view. R 27

Tiffin, J. & Wirt, S.E. DETERMINING VISUAL STANDARDS FOR INDUSTRIAL JOBS BY STATISTICAL METHODS. Trans. Amer. Acad. Ophthalm. & Otolaryng., Nov.-Dec. 1945, 1-25. (Purdue University).

11,758
The need for sound visual standards in industry is shown to be advantageous to employee, employer and professional eye man. The bases for such visual job standards by statistical determination is discussed in terms of: 1) individual differences in visual skills, and 2) individual differences in job performance. Two methods of setting such standards are described and several sample jobs (electric solderers, assemblers, loopers) are analyzed accordingly.

Raffa, S.W. DOCUMENTATION PROCEDURES. Contract AF 33(038)-20568, Proj. XA-3A Flight Test Arms SP-4003, Rev. 3, Jan. 1957, 12pp. Arms Div., American Bosch Arms Corp., Roosevelt Field, Garden City, N.Y.

11,760
This report presents the final procedures for planning and scheduling documentation work concerned with the prosecution of the XA-3A Fire Control System Test Project. The documentation work is divided into two broad categories of information: (1) what is to be done, (2) what has been done. The Project is subdivided into four programs and the programs in turn are subdivided into phases, each of which defines specific objectives and activities. The various portions of this document give information on distribution, reporting, coding, and listing procedures.

Ray, W.S. VERBAL COMPARED WITH MANIPULATIVE SOLUTION OF AN APPARATUS-PROBLEM. Amer. J. Psychol., June 1957, 70(2), 289-290. (Res. Rep. AFPTRC TN-57-117, AFPTRC, ARDC, Lackland AFB, Tex.).

11,768
To investigate the effect on manipulative solution of an apparatus problem of preceding talking about the problem, two groups (6 subjects each) of basic airmen were asked to turn off a light by using switches presented on a panel. There were seven switches and it was necessary to use two simultaneously in order to turn on the light. Only one group was asked to talk about the problem before manipulating the switches. Manual behavior was recorded mechanically (number of trials) and verbal work by the experimenter (criterion of success in latter was appearance of hypothesis of multiple-switches). The data were analyzed for differences between groups on the manipulative solution.

Bramley, L.N. CRANE CONTROLS FOR IRON AND STEEL WORKS. PART II. SUGGESTED CRITERIA FOR THE DESIGN OF CRANE CABS. PE/B/63/51, ca. 1951, 31pp. Plant Engineering Division, The British Iron & Steel Research Association, London, England.

11,769
Part I of this paper presented a comprehensive study of the controllers suitable for use in steelworks crane cabs and control pulpits. The present part deals with the possibilities of designing crane cabs to ergonomic principles using the new controllers. The particular aspects of the layout of the control point considered are seating of the operator, working heights and areas, visibility, realism and pattern of controls, distribution of controls, and distinguishability of control handles. Suggested designs of control layouts for two multi-motion cranes and a charging machine are presented. Items for further investigation are listed.

Duncan, C.P. & Underwood, B.J. THE EFFECT ON TRANSFER OF VARYING STIMULATION DURING TRAINING. Contract AF 33(616) 308, Proj. 7197, WADC TR 56-279, Dec. 1957, 35pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Northwestern University, Evanston, Ill.).

11,770
To study the effect on transfer of variation and amount of training, perceptual-motor paired-association tasks were constructed wherein the motor response remained constant and the stimuli (to be paired with the response) were varied. Different groups of subjects were trained with 1, 2, 5, or 10 tasks (different sets of stimuli) for 2, 5, or 10 days. Some additional groups were trained for a like number of days with ten different re-pairings of the responses to the stimuli within a given task. Following training all groups were tested for transfer to three, in some cases four, new sets of stimuli. The data (correct responses on transfer tests) were analyzed for effects of the training variables. Implications for design of training equipment are discussed. T. G. I. R 29

11,771
Houston, R.C. & Green, M.R. TRAINING EVALUATION OF AN INSTRUMENT PANEL HOMOGENEOUS WITH RESPECT TO THE PRINCIPLE OF THE MOVING PART. Contract AF 33(616) 3000, Proj. 5190, Task 71573, WADC TR 57-551, Nov. 1957, 59pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Illinois, Urbana, Ill.).

11,772
To investigate the effectiveness of the use of an instrument panel on which the moving indices of the individual displays consistently represent aircraft performance in training naive flight students to fly instruments, 20 such subjects were trained in a modified Link trainer to fly ILS (Instrument Landing System) approaches in a C-47 aircraft under simulated instrument conditions. Ten subjects were trained on the experimental panel and ten on a conventional panel. Six subjects in each group flew the C-47 on ILS approaches under simulated instrument conditions. Objective records of performance during ground training and in the air were analyzed for differences attributable to panel design. Effects of learning and stress were discussed.

11,773
Rath, R.R. INVESTIGATION OF A TECHNIQUE FOR IMPROVING AIRCRAFT RESPONSE USING A COMPLEMENTARY OPTIMUM-RESPONSE MODEL. Proj. 1364, WADC TN-56-475, Sept. 1956, 74pp. Flight Control Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,773
The pitch response of an F-89 aircraft to a command input, fed into both the airframe-hydraulic servo combination and a black box represented by an "ideal" transfer function of the same order as the airframe transfer function, was investigated. The two outputs were compared and some function of the difference feedback to the airframe-servo system. The response of the system with a particular feedback was determined analytically for seven different flight conditions of the F-89. A computer solution was obtained and the "best" fixed gains for the seven conditions determined. The results were examined for agreement with "ideal" transfer function.

11,774
Mock, R.O. ACCEPTABILITY TEST OF LIQUID MEATS. Proj. 7156, WADC TN-57-63, Feb. 1957, 7pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,774
To determine the acceptability of liquid meats and to obtain information for improving acceptability to guide future development, a field test was conducted at the Air Force Flight Test Center. Two experimental liquid chicken and two liquid ham formulations were tasted by two groups of pilots on the ground. Each pilot filled out a food preference questionnaire for each item which included a nine-point hedonic rating scale from "like extremely" to "dislike extremely". Mean preference ratings and per cent disliking an item were derived as well as information about specific characteristics of the foods which were liked or disliked.

11,776
Hunt, D.P. & Warrick, M.J. ACCURACY OF BLIND POSITIONING OF A ROTARY CONTROL. Contract AF 18(600) 50, Proj. 7182, WGLD Tech. Note 52 106, March 1957, 9pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,776
To investigate the accuracy of blindly positioning a bar type rotary control knob, four subjects made both right- and left-handed settings with a tapered and with a parallel-sided knob. A reference scale of 180 degrees was visible but the controls were not. The mean, constant error, and average error of five settings made by each subject for each of nine angular positions (from ten to 170 degrees) were recorded. Discrepancies between right- and left-hand performance were compared for both types of knobs at each angular setting. The results are applied to knob design and spacing between discrete positions of the control.

Ewing, Lora M., Karpovich, P.V., & Hale, C.J. THE PHYSIOLOGY OF LOAD CARRYING: XII. THE USE OF STRAP PRESSURE AS A CRITERION FOR EVALUATING ARMY COMBAT PACKS. Proj. 7-83-01-005B, Tech. Rep. EP-69, Oct. 1957, 21pp. USA Quartermaster Research and Engineering Center, Natick, Mass. (Dept. of Physiology, Springfield College).

11,778
To compare army combat packs of different design, measurements were taken of the pressure exerted by the straps of five different packs (40 pounds each) on the front and top of the shoulders of 26 young men. Pressures were taken before, during, and after a walk on a treadmill (2.8 miles per hour). A technique was devised for measuring the area of contact between the strap and chamber of a pressure meter so that total pressure (pounds) could be converted into pressure per unit area (pounds per square inch). These data were analyzed for significant differences among the five packs. The use of this methodology for testing new designs of packs is discussed.

11,779

Hale, C.J., & Karpovich, P.V. THE PHYSIOLOGY OF LOAD CARRYING: XIII. PERFORMANCE TESTS FOR THE EVALUATION OF ARMY COMBAT PACKS. Proj. 7-83-01-0058, Tech. Rep. EP-70, Oct. 1957, 17pp. USA Quartermaster Research and Engineering Center, Natick, Mass. (Dept. of Physiology, Springfield College).

11,779

To evaluate the effect of various army packs upon the performance of selected physical activities comparable to those used by the Infantryman during combat, 12 performance tests were performed by 24 men. Tests were performed without and with each of three packs (United States Standard, United States Experimental 53-8, and British Experimental UK-22). The tests were: running, creeping, rolling, jumping, climbing, throwing, falling, getting up from the ground, changing direction, agility, and balance. Time of performance and reaction time were measured in all tests. The data were analyzed for differences due to pack design. The suitability of such tests for evaluative purposes is discussed.

11,780

Tan, E.H., Hale, C.J., & Karpovich, P.V. THE PHYSIOLOGY OF LOAD CARRYING: XIV. EVALUATION OF ARMY COMBAT PACKS BY MEASURING ENERGY COSTS AND SPEED OF MOVEMENT. Proj. 7-83-01-0058, Tech. Rep. EP-71, Oct. 1957, 15pp. USA Quartermaster Research and Engineering Center, Natick, Mass. (Dept. of Physiology, Springfield College).

11,780

To determine whether the energy cost and the time of performance of selected performance tests could be used as a basis for evaluating pack designs, ten male subjects performed six tests (running, jumping, falling and getting up, creeping, rolling, and climbing) once without a pack and once each with three different combat packs (United States Standard, United States Experimental, and British Experimental). A subjective rating based on comfort and freedom from interference with movements was completed after testing. The data were studied for differences due to pack design.

Groth, Hilde, & Lyman, J. EFFECTS OF SURFACE FRICTION ON LIGHT-MANIPULATORY PERFORMANCE. Contract DA 19-122-gm-525, Rep. 57-83, Nov. 1957, 27pp. USA Quartermaster Research and Development Center, Natick, Mass. (Dept. of Engineering, University of California at Los Angeles).

11,783

To study the effects of surface friction upon performance of a simple manipulatory task, changes in friction were produced by application of either a coat of wax-benzene paste or of silicone grease to the bare finger tip of a leather glove. Twelve subjects performed the task which required discrete movements of an aluminum cylinder on a formboard under all conditions of friction. Mean prehension force, time per transport, and number of transports were recorded. The data were analyzed in terms of relationship of friction to effort (prehension force), to speed, and to output rate of performance. The implications of the findings for hand gear design are discussed.

McCroskey, R.L. Jr. A RESEARCH NOTE ON THE EFFECT OF NOISE UPON FLICKER FUSION FREQUENCY. Joint Proj. Rep. 70, Contract N6onr 22525, Proj. NR 145-993, (Ohio State University Research Foundation); and Bu Med Surg Proj. NM 18 02 99, Rep. 70, July 1957, 6pp. USN School of Aviation Medicine, Pensacola, Fla.

11,784

To explore the effects of noise upon flicker fusion frequency (FFF), forty subjects made fifteen consecutive judgments of FFF in noise (94 decibels) and in quiet. The two conditions were administered in three orders: quiet-quiet, quiet-noise, noise-quiet. The mean of the last ten judgments for each condition were taken as the criterion and analyzed for effect of conditions of quiet and noise and order of their presentation. Implications of the findings are discussed in relation to conditions for operator efficiency.

O'Neill, J.J. A RESEARCH NOTE ON INTELLIGIBILITY UNDER VARIED LEVELS AND SPEECH-TO-NOISE RATIOS. Joint Proj., Contract N6onr 22525, Proj. NR 145-993, (Ohio State University Research Foundation); and Bu Med Surg Proj. NM 18 02 99, Rep. 72, Aug. 1957, 8pp. USN School of Aviation Medicine, Pensacola, Fla.

11,785

To compare listener reception for speed of several speech-to-noise ratios and sound-pressure levels, 105 subjects were divided into six panels. Each panel heard 48 lists of multiple-choice intelligibility tests as recorded by one voice at a constant level through a condenser microphone, linear amplifiers, and an Ampex recording system. Each list represented a randomly chosen condition of the 42 combinations of seven speech-to-noise ratios (from -15 to +15 decibels) and six speech levels (from 50 to 100 decibels). Mean intelligibility listeners scores were determined and compared to results reported in the literature.

Doehring, D.G., & Harbold, G.J. THE RELATION BETWEEN SPEECH DISTURBANCE AND PSYCHOPHYSIOLOGICAL CHANGES RESULTING FROM DELAYED SPEECH FEEDBACK. Joint Proj., Contract Nonr 1151(02), Proj. NR 146-092, (Central Institute for the Deaf, St. Louis, Mo.); and Bu Med Surg Proj. NM 13 01 99, Rep. 5, Sept. 1957, 5pp. USN School of Aviation Medicine, Pensacola, Fla.

11,786

To investigate the hypothesis that severity of speech disturbance is inversely related to the magnitude of changes in psychophysiological responses during delayed speech feedback, twenty subjects read aloud simple printed passages without and with delayed (0.15 second) speech feedback. Three measures of speech disturbance (speech rate, level and fluency) and three of psychophysiological response (forearm tension, skin resistance, and heart rate) were employed. Changes in response were determined and correlations between magnitudes of changes were calculated. The original hypothesis is discussed in light of the findings and reformulated.

Tolhurst, G.C. DELAYED RESPONSE: EFFECTS UPON SPEECH RECEPTION AND SPEAKER INTELLIGIBILITY. Joint Proj., Contract W6006 22525, Proj. NR 145-993, (Ohio State University Research Foundation); and BuMed Surg Proj. NM 18 G2 99, Rep. 74, Aug. 1957, 15pp. USN School of Aviation Medicine, Pensacola, Fla.

11,787
To investigate the effect of response time delay upon speech reception and speaker intelligibility, six incremental steps of delay from zero to five seconds with verbal material of multiple-choice type steps were used. Additional data were obtained on two delay times (one and five seconds) using FB (Phonetically Balanced) word lists. Twelve panels of listeners (15 to 24 per panel) and 48 speakers listened to multiple-choice word groups and delayed response (marking paper or speaking) until a signal tone was heard. Other groups (30 and 24) responded to FB word lists with similar instructions. Mean panel scores were studied by analysis of variance for differences due to delay times.

Chiles, W.D. PSYCHOLOGICAL STRESS AS A THEORETICAL CONCEPT. Proj. 7193, WADC TR-57-457, July 1957, 16pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,789
This paper examines some typical treatments of psychological stress. The approach of construing stress as analogy to physical and physiological concepts is rejected since it has not led to quantifiable insights into the action of stress with respect to human behavior. A systematic approach is then proposed along with the framework for the quantification of psychological stress as a theoretical concept. Some of the implications of this approach with respect to performance variables are discussed.

Brown, J.L. REVIEW OF THE CONE-TO-ROD EFFICIENCY RATIO AS A SPECIFICATION FOR LIGHTING SYSTEMS. Contract AF 33(038)-22616, Proj. 7186, WADC TR-57-448, Aug. 1957, 21pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Columbia University).

11,790
The theoretical basis for the use of red light for systems of illumination to afford maximum stimulation of the eye at low luminances is reviewed. Several methods for the practical specification of illumination, which are based on a cone-to-rod luminous efficiency ratio, are analyzed and compared in terms of the actual physical significance of numerical values yielded. The general problem of specification is related to a number of underlying practical problems and conclusions are drawn concerning the practical uses of the cone-to-rod luminous efficiency ratio. Areas needing further experimentation are discussed.

Pack, C. HIGH-INTENSITY LIGHT SOURCE. Contract AF 33 (616) 3681, Proj. 6332, Task 77653, WADC TR 57 740, Dec. 1957, 48pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Electronics Corporation of America, Cambridge, Mass.).

11,791
A high-intensity light source for use in a study of flash blindness resulting from nuclear detonations is described. The radiant-energy source is a 24-inch Army searchlight modified to permit operation at a higher arc current. The normally divergent beam is highly converged. A system of electronics is integrated with the light source, and a slow-motion camera, to record effect on fundus during exposure, is provided. Details of the modification are discussed and illustrated, and a manual of operating procedures is included.

Chiles, W.D. EFFECTS OF ELEVATED TEMPERATURES ON PERFORMANCE OF A COMPLEX MENTAL TASK. Proj. 7193, Task 71615, WADC TR-57-726, Dec. 1957, 9pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,792
To measure the effects of moderate deviations from normal temperature on the performance of a complex mental task, eleven subjects were tested at four different effective temperatures: 76, 81, 86, and 91 degrees Fahrenheit. The subject's task was to compare each of 20 moving cards with each of ten stationary cards with respect to the number of differences between a set of six symbols appearing on each. Speed of card movement was such that one decision was required every 5.4 seconds; testing session was 25 minutes. The performance data (errors and omissions) were analyzed for differences due to subjects, temperatures and sessions.

Gardner, J.P. THE EFFECT OF MOTION RELATIONSHIP AND RATE OF POINTER MOVEMENT ON TRACKING PERFORMANCE. Proj. 7189-71571, WADC TR-57-533, Sept. 1957, 20pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,793
To study the rate of pointer movement and its interaction with the "fly to" and "fly from" principle of motion indication, 43 subjects, using an aircraft-type control stick, attempted to keep cross-pointers centered on a simulated display despite random disturbances. Four rates of Gaussian output (bandwidths of 0.5, 1.0, 2.0 and 4.0 radians per second) with both types of stick-to-display movement were used. Each subject performed for 40 trials of 50 seconds. The data (error scores) were analyzed for effect of rate of movement and control movement relationship on performance and on learning.

Gardner, J.P., Lacey, R.J., Seeger, C.M., & Wade, J.E. IN-FLIGHT COMPARISON OF PILOT PERFORMANCE ON A STANDARD USAF AND AN EXPERIMENTAL INSTRUMENT PANEL. Proj. 7189-71571, WADC TR-57-270, Sept. 1957, 18pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.

11,794
To compare the ability of United States Air Force pilots to make Instrument Landing System (ILS) approaches on two different panel configurations (standard Air Force and experimental, employing an aircraft reference type of presentation using the "principle of the moving part"), six pilots each flew 24 ILS approaches using each panel. For each series of 24 approaches, half were flown using the ID-249 cross-pointer type instrument and half using a Zero Reader instrument for primary glide path and localizer information. Error scores (glide path, localizer, and end point deviations) were analyzed for differences due to the various modes of presentation.

Heintz, R.M. Jr. RADAR OBSERVER TRAINING DEVICES: I. DEVELOPMENT OF AN AIRBORNE VIDEO RECORDING SYSTEM. Contract AF 18(600)-550, Proj. 7711, Task 47002, AFTRC-TR-57-3, Part I, July 1957, 53pp. Operator Lab., AFTRC, ARDC, Randolph AFB, Tex.

11,796
This report describes the first phase of a program of research on the technical aspects of recording and reproducing radar signals for radar observer training devices. The design and construction of an experimental video recording system for use with the AN/APS-23 radar are detailed. The system is designed to record 360 degrees scan Plan Position Indicator (PPI) radar signals and to provide for future recovery of the signals on one or more conventional radar indicators with sufficient fidelity to permit accurate target identification. Operational tests are described which verify the overall feasibility of the system with respect to the electrical and mechanical parameters considered. Recommendations for future development are included.

11,798
To investigate possible criteria and identify variables that offer some promise for prediction of personal adjustment of airmen assigned to isolated Arctic bases, enlisted personnel (648) in eight such bases in the Northeast Air Command were studied. Supervisory nominations, the criterion measure of adjustment, (defined as ability to function in isolated Arctic environment) were used to establish two criterion groups: "well adjusted" (116) and "poorly adjusted" (83). A series of measures covering personal background, personality characteristics and medical complaints were administered. The data were analyzed for variables differentiating the two groups. Recommendations concerning the use of the findings for screening or selection procedures are included. An annotated bibliography is appended. R 32

Wilcox, L.R. PROBABILITY OF SEEING FUNCTIONS FOR NEAR INSTANTANEOUS FOVEAL THRESHOLDS. RADC-TR-56-104, Sept. 1956, 19pp. USAF Rome Air Development Center, ARDC, Griffiss AFB, N.Y.

11,799
To investigate foveal threshold values obtained within a short period (0.22 seconds) following cessation of adapting luminance, frequency of seeing measurements were made on three subjects. Adaptation luminances ranged from near cone threshold to 10,000 millilamberts; stimulus was a circle 30 minutes in diameter; test flash duration 50 and six milliseconds for a group of 7, 9, or 11 luminances; each flash was presented 20 times. A complete frequency of seeing function was obtained for each adapting luminance (14). The data (percentage of times out of 20 presentations that stimulus was detected) were analyzed as a function of stimulus intensity. The findings are discussed in relation to a "quantal" type of theory of the threshold effect.

Forgays, D.G., & Levy, B.I. COMBAT PERFORMANCE CHARACTERISTICS ASSOCIATED WITH CHANGES IN THE MEMBERSHIP OF MEDIUM-BOMBER CREWS. Proj. 7713, Task No. 77225, Res. Rep. AFTRC-TR-57-140, Dec. 1957, 27pp. Operator Lab., AFTRC, ARDC, Randolph AFB, Tex.

11,802
To describe the effects on combat performance of the changes that were made in the membership of 85 medium-bomber crews during a ten-month period of actual operations, a team of military and civilian psychologists (Air Research and Development Command) gathered performance data in 1953 during the last months of active conflict in Korea. Crew changes were recorded for each B-29 crew during initial crew training; advanced crew training; and part of the combat tour in the Far East. The crews were divided into three groups, nearly equal in size, on the basis of membership changes. An analysis of variance technique was used in comparing low, medium, and high change groups. The findings are discussed in relation to crew integrity policies.

Horowitz, M.W. & Fromer, R. A SET OF DISCRIMINABLE SURFACE COLORS AND SYMBOLS FOR CODING IN ANIMATED TRAINING PANELS. Contract N 61339-294, Proj. 20 CS 52, ERC Proj. 49-3, Letter Order 3, Dec. 1958, 19pp. Educational Research Corporation, Cambridge, Mass.

11,803
The purpose of the present experiment was to develop surface color code systems most appropriate to animated training panels requiring 9 to 14 colors and to select, from conventional and new symbols, codes of from 3 to 8 symbols to be used in conjunction with the colors previously selected. For color coding, Landolt broken rings of various colors in four positions were discriminated against pre-selected background panels. For symbol coding, pairs of symbols presented in two different spatial orders were ranked by two experimenters. The codes are given.

Smith, G.F.M., & Scott, B.N. SOME PHYSICAL PARAMETERS OF PFI DISPLAYS USEFUL IN PREDICTING RELATIVE DETECTABILITY THRESHOLDS OF TARGETS. BuMed Proj. 163, Rep. 163-14, PCC Proj. 877-94-29-22, Nov. 1957, 6pp. Defense Research Medical Lab., Toronto, Ontario, Canada.

11,810
To investigate changes in detectability thresholds of a PFI (Plan Position Indicator) target that are associated with changes of scope size, six subjects were required to detect the same pips on three scope sizes: 7, 10, and 14 inches. Targets were first displayed at brightness below detectability level then brightened one decibel on each successive rotation of the sweep line until reported seen by the subject who then reported its location in range and azimuth. The score was the attenuation of the original signal voltage. Six ranges and azimuths were used in each display size. From the analysis of the data a regression equation was estimated for expressing and predicting detectability threshold from PFI display geometry. T. G. R 2

Fleishman, E.A. COMPARISON OF TWO TYPES OF VERBAL GUIDANCE ON PERFORMANCE OF A PERCEPTUAL-MOTOR TASK. Percept. Motor Skills, 1956, 6, 272. (Yale University).

11,816
To evaluate the relative effectiveness of two types of verbal guidance on performance of a perceptual motor task, 150 basic trainee airmen performed on the Pursuit Confusion Test. The task was to keep a stylus in contact with a variable speed target moving through a slot, visible only by mirror image. Performance scores were time-on-target and number of errors for eight one-minute trials. The subjects were assigned randomly to three groups (perceptual set, motor set, and control) with instructions designed to give the proper set for each. The data were analyzed for differences among the groups due to type of verbal guidance.

11,817
Fleishman, E.A. A COMPARATIVE STUDY OF APPLIED PATTERNS IN UNTRAINED AND TRAINED PSYCHOMOTOR PERFORMANCE. J. exp. Psych., 1957, 51 (4), 263-272. (Yale University).

11,817
To examine aptitudes involved in early and late stages of proficiency in psychomotor performance, a cross-sectional and longitudinal comparison was made. Trained airmen were given to 200 basic trainee airmen on seven different psychomotor tasks, constituting four groups. One group was given on one of these (Complex Coordination Test) and used as a criterion task. A battery of printed reference tests was also administered. Factor analysis techniques were applied to the experimental data. Patterns were defined by the reference tests and the resulting loadings of these in different stages of practice were described. The results are related to previous work and the implications discussed. G. I. R 13

Brown, R.H. THE EFFECT OF EXTENT ON THE INTENSITY-TIME RELATION FOR THE VISUAL DISCRIMINATION OF MOVEMENT. J. Comp. Physiol. Psych., April 1957, 50 (2), 109-114. (Naval Research Lab., Washington, D.C.).

11,820
To determine how extent affects the intensity-time relation for visual discrimination of movement, monocular luminance thresholds were measured for a small circular spot of white light moving at ten speeds (between 6.7 and 4,750 minutes of visual angle per second) and four extents (between 1.7 and 52 minutes). The midpoint of stimulus travel was centered in the dark circle the subject regarded. Travel movement was horizontal (left or right) and the subjects' (four) task was to indicate the direction of movement. The data were analyzed in terms of effect of direction, speed, and extent. The intensity-time relation was examined. The findings were interpreted in terms of visual theory. G. I. R 16

Byrnes, V.A., Brown, D.V.L., Rose, R.W., & Ciolek, P.A. CHROMATIC FLICKER THRESHOLDS PRODUCED BY ATOMIC FLASH. *AMA Arch. Ophthalmol.*, March 1956, 53, 351-364. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

11,821
To study chromatic flicker produced by atomic flash a theoretical consideration of the physical factors involved and the effect of these factors on the eye was made. To verify resultant predictions for distances at which flicker could be expected, 700 projected rabbits were exposed (one time each) during six different night the atomic explosions at the Nevada proving grounds. Distances from detonation point varied from two to 80 miles. Ophthalmological examinations were made to identify and describe retinal lesions. Preliminary pathological findings are reported. The findings are discussed in relation to distances of potential danger to the retina. A therapeutic use for visible and infrared radiation of the eye is suggested.

Brown, J.L. SUBJECTIVE PREFERENCE AMONG DIFFERENT MODES OF CLOSED-LOOP OPERATION OF THE CENTRIFUGE FOR FLIGHT SIMULATION. Rep. TRD ADC AR-1410 (NR 11 02-12.6), NA-3-3535, Dec. 1957, 4pp. *USAF Air Development Center, Dayton, Ohio.*

11,822
To investigate subjective preferences for different conditions of centrifuge operation for realism in flight simulation, four simulations (based on direction of rotation and presence or absence of an input to the inner gimbal which compensated for angular accelerations of the centrifuge arm) were studied. Four subjects (one was an experienced pilot) performed a series of eight maneuvers under each condition. Subjective impressions, recorded after each maneuver, were rated by three trained judges for implied position or lack of it. The four conditions were then ranked in order of total "realism" scores.

Rappeport, X. HUMAN ENGINEERING: AN AID TO IMPROVING ELECTRONIC EQUIPMENT. *IRE Trans. Indust. Elect.*, March 1957, PG-4, 11pp. (Stanford Research Institute, Menlo Park, Cal. 11.).

11,823
This paper presents a fairly broad definition of the term human engineering and outlines some of the general research areas that human engineers have worked on in the past. One specific application is given in detail in the area of pattern discrimination ability of man and its use in converting certain auditory signals into visual presentations. A psycho-statistical relation used frequently for discovering sources of important error variability in systems of man and machines is discussed. And finally other areas where human engineering may be employed to increase the life, reliability, and operational efficiency of electronic equipment are pointed out.

Malcolm, D.G. (Ed.) REPORT OF SYSTEM SIMULATION SYMPOSIUM. 8th National Convention of American Institute of Industrial Engineers, May 1957, 106pp. (New York, N.Y.) *American Institute of Industrial Engineers.*

11,824
Included in this report are brief descriptions and reviews of 18 papers that have as their fundamental purpose the simulation of a system - industrial or military. This method of inquiry into management systems, controlling systems, and integrated systems of men, machines, and facilities is termed System Simulation. Simulations discussed include inventory-control, profit planning, waiting line problems, peak hour bus operation, cargo handling, job shop scheduling, top management decision-making, Air Force training system, Army battalion maintenance, aircraft engine management, Quartermaster problems, and the Rand System Research Laboratory.

Smith, P.G. & Smith, G.W. A RE-EVALUATION OF TRADITIONAL CUES FOR DISTANCE. Contract Nona 601 (14), Dec. 1957, 10pp. *Cornell University, Ithaca, N.Y.*
To determine the effectiveness of traditional "cues" and conditions (when taken singly or in combination) for the visual perception of distance, observations were made by 7 subjects. The test space was the front surface of a perfect semi-cylinder and each cue, condition or combination (linear perspective, binocular disparity, movement parallax, interposition, light and shade, form transformations, gradients of texture, and distance of observation) was drawn on a white paper jacket and fitted to the cylinder. The observer reported verbally what he saw in the test area as well as its shape. Results were analyzed in terms of degree and frequency of departure from veridicality, both in overall reduction of curvature and in flattening of portions of surface. Cf. 11,502

11,826
Whiteside, R.C.D. TARGET DETECTION AND NUMBER OF OBSERVERS. *FFAC 1022*, Oct. 1957, 3pp. *RAP Institute of Aviation Medicine, Farnborough, Hants, England.*

11,826
This report attempts to determine the amount of improvement of target detection obtainable when there are several observers. Based on statistical probability theory, two graphs are presented, showing the increase in probability of seeing when several observers (from two to six) look and the percent increase when a second or third observer takes part in search.

11,827
Truss, C.V. CHROMATIC FLICKER FUSION FREQUENCY AS A FUNCTION OF CHROMATICITY DIFFERENCE. *J. Opt. Soc. Amer.*, Dec. 1957, 47 (12), 1130-1134. (Prepared under Contract NS-DRI 166, Proj. NR 145-089, Rep. 166-I-200, The Johns Hopkins University).

11,827
To measure the chromatic flicker fusion frequency (ccff) as a function of chromaticity difference, fusion points were determined by two subjects for each of fifteen pairs of six colors at equal luminance for five levels of luminance (from nine to 67 trolands). The six colors were of high chromatic purity with dominant wavelengths covering a range of 445 to 67 millimicrons in nearly equal steps. Chromaticity differences were estimated from Judd's Uniform Chromaticity Scale in linear distance (millimeters) between members of each pair. A second set of values were derived from data giving equally noticeable small color steps over the CIE (Commission Internationale de l'Eclairage) chromaticity diagram (Wright). Log reciprocals of ccff were analyzed in terms of luminosity and chromatic separation. T. G. R 13

11,828

Stransted, H.E., Ernst, A.A., & Sigro, J.P. AN ANALOG-DIGITAL SIMULATOR FOR THE DESIGN AND IMPROVEMENT OF MAN-MACHINE SYSTEMS. NBS Proj. 1204-20-5764, NBS Rep. 5719, Dec. 1957, 19pp. Data Processing Systems Div., National Bureau of Standards, Washington, D.C.

11,828

This report describes the design of a simulator facility for research on man-machine systems. The simulator is specifically intended for experimentation on such control systems as air traffic control, ground control of interceptors and control systems in general. It is to be equipped for the dynamic representation and simulation of control systems which have human operators as elements of the closed loop. Some design considerations peculiar to this class of simulator are presented; the present prototype is described, and refinements that might profitably be incorporated in the final facility are indicated.

11,829

Stransted, H.E. COMBINED ANALOG-DIGITAL SIMULATION OF SAMPLED DATA SYSTEMS. Conf. Paper 57-855, ASEE Summer General Meeting, Montreal, Quebec, Canada, June 1957, 7pp. National Bureau of Standards, Washington, D.C.

11,829

This paper describes work in progress at the National Bureau of Standards in constructing a simulator for studying man-machine systems. The development of simulation techniques for automatic systems is described and the characteristics of a simulator for a system which includes the human operator are distinguished. For simulation of this latter system, certain analog-digital techniques are described. Work in interconnecting the Bureau of Standards' digital computer (SAC), an electronic analog computer, and human operator display and control equipment is set forth. The ground controlled interceptor (GCI) problem, as used in the first experiments, is used for illustration.

11,830

Gessett, Lorna J. SPACE ALLOWANCES FOR MEAL PREPARATION AND SERVICE IN THE SOUTHERN RURAL HOME. U. Tenn. Agr. Exp. Sta. Bull., Oct. 1957, 274, 31pp. (University of Tennessee Agricultural Experiment Station, Knoxville, Tenn.).

11,830

To study the space needs related to the meal preparation and meal service area in rural homes in the South, basic information regarding family possessions and patterns of family living from two extensive regional surveys were studied. Based on this information, three kitchen-dining areas were arranged and equipped. Eight homemakers from rural areas of Tennessee, selected on basis of representative body measurements, cooked and served typical meals to members of their own family (three to six) in each arrangement. Activity records (written record, motion picture film, foot-track patterns) of the homemaker were analyzed in terms of space for dining area, space for dish and utensil storage, for food preparation, and most preferred arrangement. T. I. R 29

11,831

Gerard, H.B., & Shapiro, H.W. DETERMINING THE DEGREE OF INCONSISTENCY IN A SET OF PAIRED COMPARISONS. 1955, 24pp. Bell Telephone Labs., Inc., Murray Hill, N.J. (Research Center for Human Relations, New York University).

11,831

This paper describes a method developed to measure an individual's certainty (or uncertainty) concerning the probable success of some future undertaking. The data used were sets of paired comparisons of judgments from a previous experiment. A definition of consistency is given and two types identified - intransitivity and separation. Formulas are developed which enable the counting of each type of inconsistency in a set of data. Proofs are provided.

11,832

Brown, R.N., & Carl, J.M. VISIBILITY IN AN EMPTY VISUAL FIELD. NML Rep. 5072, Proj. NA 433-003, Jan. 1958, 7pp. Naval Research Lab., Washington, D.C.

11,832

To study the relationship of visibility in an empty field to some common visual parameters, measurements of the minimum visible (threshold diameter of a black dot seen against a uniform white background) were made on eight observers. The observer's task was to scan, with binocular vision, the visual field (17 inches in diameter) for a target (two dots varying in size from 1.66 to 0.16 minutes of visual angle) which appeared in various locations (3/4 or 1/2 minutes from center). On half the trials a reticle (ring of dots 1.36 minutes in diameter subtending 60 minutes at the eye) was used. The threshold data, in minutes of visual angle, were analyzed for differences due to observers, position of target, and presence of reticle. The results are discussed in relation to other work. T. G. R 10

11,833

Wayne, H.E. A CLINICAL COMPARISON OF THE SYMPTOMS OF HYPOXIA AND HYPERVENTILATION. Rep. 57-128, Sept. 1957, 8pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,833

To investigate the possibility of differentiating between hypoxia and hyperventilation on clinical grounds, a total of 165 to 183 subjects (approximately half of whom were medical officers) was exposed to hypoxia at 25,000 feet and hyperventilation at ground level. Each subject had as an end point muscular incoordination as evidenced by illegibility of handwriting. Symptoms were recorded in all cases. A comparison was made of the type of symptoms and their frequency for both conditions. Medical and dental group reports were further analyzed. Recommendations are presented to help the pilot having symptoms at high altitude to take the proper corrective action.

11,834

Reuzel, A.A., & Milch, L.S. EFFECTIVENESS OF PROCYCLIDINE HYDROCHLORIDE AND CERCIZINE HYDROCHLORIDE IN THE PREVENTION OF APOXIS. Rep. 53-20, Nov. 1957, 3pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,834

To determine if procyclidine hydrochloride and cercizine hydrochloride, active anti-Parkinson drugs, possessed significant anti-motion-sickness effectiveness, 32 young, healthy, unselected basic airmen were tested. The subjects were divided into four equal groups corresponding to four drug treatments. Placebo and diphenhydramine treatments were provided for controls. The subjects were taken on a flight consisting of an hour of standardized, simulated turbulence. Incidence of vomiting was used as a basis for evaluating the effects of the drugs. The percent protection was calculated for each treatment. Side effects were noted by the subjects upon termination of the flight and were tabulated.

11,835

Pearson, R.G. THE EFFECTS OF MOTION-SICKNESS PREVENTIVES ON ORIENTATION IN SPACE. Rep. 59-7, Nov. 1957, 7pp. USAF School of Aviation, Randolph AFB, Tex.

11,835

To evaluate the effects of three of the more effective motion-sickness drugs - meclizine, cyclizine, and promethazine - on ability to orient one's self in space, 96 subjects were tested in a dark room on a luminous rod-and-frame apparatus under upright and body-tilt conditions. Following this they were randomly assigned in equal numbers to six drug treatment groups (dextroamphetamine sulfate, a mixture of scopolamine with diphenhydramine chloride, and a lactose placebo were added), then were tested again. Analysis of constant errors in adjusting the rod to the perceived vertical for post-treatment data was made to find significant drug effects.

11,836
Shelove, W., & Elford, M. (Eds.) RADIATION AND WAR. Bull. Atomic Scientists, Jan. 1956, 14(1), 64pp.

11,836
This special issue is devoted to papers dealing with radiation and war. The papers are grouped under four headings as follows: (1) basic data - defining radiation; somatic and genetic effects, and global radiation limits; (2) nuclear tests and radiation - distribution and effects of fallout, evaluating fallout from weapons tests, and rice contamination in Japan; (3) peacetime radiation - medical use, exposure incidental to medical practice, and public health aspects of radioactive wastes; and (4) broad studies - reports from National Academy, Medical Council, Congressional hearings, and United Nations. Nuclear weapons and war are discussed in a supplement. A glossary of terms is included. T. G. I. R 19

11,837
Bolt, R.H. (Ed.). ACOUSTICS LABORATORY QUARTERLY REPORT. OCTOBER-DECEMBER 1955. 53pp. Acoustics Lab., Massachusetts Institute of Technology, Cambridge, Mass.

11,837
This report is one of a series of quarterly reports that include brief statements of all significant research progress in the Acoustics Laboratory. Included here are several reports on the production of speech and speech sound systems, the development of various components in communications systems, and some acoustic measurements. Publications, papers, and activities of the laboratory's personnel are listed. T. G. I. R 32

11,838
McGrath, J.E. A FRAMEWORK FOR INTEGRATION OF SMALL GROUP RESEARCH STUDIES. A PILOT STUDY. Contract AF 49(638)-47 (Psychological Research Assoc., Va.), and Contract AF 49(638)-256, AFOSR-TR-57-57, Feb. 1958, 118pp. AF Office of Scientific Research, Washington, D.C. (Human Sciences Research, Inc., Arlington, Va.)

11,838
This is a pilot study, within a long range program of research, concerned with small groups. A working bibliography of items was compiled. A syntactical classification of nine categories was developed and applied to the bibliography. The syntactical principle of classification was extended to develop procedures for compiling research information and applied to a sample (57) of group productivity studies. The information thus compiled was analyzed for significant functional relationships. Gaps in distribution of research effort were also identified as well as productive and unproductive areas. Implications of this study for continuation of the research program are discussed. R 1279

11,839
USN Bureau of Medicine and Surgery. SUBMARINE MEDICINE PRACTICE. NAVMED P 5054, 1956, 357pp. USN Bureau of Medicine and Surgery, Washington, D.C.

11,839
This volume presents a comprehensive guide that can be utilized for training and indoctrinating regular and reserve Medical Department personnel with the many problems connected with submarine medical practice. Discussions include personnel selection and assessment procedures, improvement of submarine habitability factors, solution of human engineering problems aboard submarines, submarine escape and rescue operations, deep sea diving, diving with self-contained underwater breathing apparatus, and the medical aspects of all undersea operational problems directed toward improving the military effectiveness of the Submarine and Amphibious Forces. T. G. I.

11,840
Donaherty, Dora J., Houston, R.C., & Nicholas, D.R. TRANSFER OF TRAINING IN FLIGHT PROCEDURES FROM SELECTED GROUND TRAINING DEVICES TO THE AIRCRAFT. Contract AF-71-16, MATTHEWSON Proj. 20-L-5, Tech. Rep. 71-16-16, Sept. 1957, 91pp. USN Training Device Center, Fort Washington, N.Y. (Aviation Psychology Lab., University of Illinois).

11,840
To obtain information on methods of training pilots to perform in-flight normal and emergency procedures, the effectiveness of four different ground training devices (a photographic mock-up of the cockpit, a partly activated trainer, an aircraft flight simulator, and the combination of a part task, procedures trainer, and time shared tracking task) were compared. Five groups of private pilots were trained, four being given five periods of ground instruction on one of the devices followed by five periods in a T-6 aircraft; the fifth (control) was trained for ten periods entirely in the aircraft. Performance scores (procedural and flight errors) were analyzed for amount of transfer from trainer to aircraft. Implications of the results for training decisions are discussed. T. G. I. R 17

11,841
Hatchinson, R.C. GEOMETRIC EQUATIONS OF A THREE-DIMENSIONAL ENCOUNTER WITH A TWO-DIMENSIONAL DISPLAY. Contract AF 33(616)-3082, Proj. 32-14C, E-576, July 1956, 117pp. Instrumentation Lab., Massachusetts Institute of Technology.

11,841
This report presents a complete geometrical description of an encounter of two aircraft, an interceptor and a target. Equations describing relative location, orientation, and velocity of the aircraft are derived. Included are equations required to present, in a two-dimensional display (oscilloscope screen), a simplified representation of the target as it appears to the interceptor pilot. Consideration is given to ballistic aspects. The equations are general, allowing for twelve degrees of freedom, six for each aircraft; approximations are made only at the end of the derivations. The mathematics consists primarily of coordinate transformations: rotations, translations, and projections. The applicability of the equations and display methods to a variety of problems is suggested. T. G. I. R 5

11,842
Hendler, E., Crosbie, R.J., & Hardy, J.D. MEASUREMENT OF SKIN HEATING DURING EXPOSURE TO INFRARED RADIATION. Proj. DA-17 01 13 2, NANC-ACEL-332, March 1957, 14pp. Air Crew Equipment Lab., NANC, Philadelphia, Penn.

11,842
This report describes a sensitive radiometric device developed for measuring surface temperatures of the skin when exposed to long-wave, non-penetrating infra-red radiation. Measurements were made on the unbleached human skin exposed to 265 millicalories per second per square centimeter and on an inert substance (masonite) for durations of two minutes. The mean value of "thermal inertia for surface heating" for the skin was calculated. Comparison was made between temperature changes obtained and changes predicted from theoretically derived heat flow equations. Further uses for the device are discussed. T. G. I. R 3

11,843
Hierly, E.J., & Goldfein, S. LIGHTWEIGHT CAMOUFLAGE NETS. DAProj. 8-31-02-100, Rep. 1148, May 1956, 112pp. USA Engineer Research and Development Labs., Fort Belvoir, Va.

11,843
This report covers the development of a lightweight camouflage net for the concealment of military vehicles and equipment. Two net materials (woven or saran multifilaments and saran monofilaments) and four garnishing materials (two embossed vinyl films, a mat of bonded saran fibers, and a flexible isocyanate foam) were developed and tested extensively. The physical and optical breaking strength, flame resistance, color, infrared reflectance, texture, light transmission were determined in the laboratory; aurability and effectiveness against aerial and ground visual detection were measured in the field. Comparisons were made with the standard cotton net garnished with strips of colored burlap. Recommendations are given. T. I.

11,844
USN Bureau of Yards & Docks. ARCTIC ENGINEERING...
NAVJAGS TP PW 11, March 1955, 350pp. USN Bureau of
Yards & Docks, Washington, D.C.

11,844
This publication provides the basic data required
by Civil Engineering Corps officers and civilian per-
sonnel concerned with design, construction, maintenance,
and operation of facilities and equipment in areas of
extremely low temperatures. Chapter 1 presents general
information relating to responsibilities and data for
recognizing and evaluating control factors imposed by
the environments. Chapter 2 contains technical data use-
ful in development of engineering design. Chapter 3 pre-
sents information essential to the accomplishment of con-
struction or development projects. Chapter 4 is devoted
to maintenance and repair facilities and engineering
equipment.

USN Aviation Board. TEST OF PRODUCTION MODEL H-13H
HELICOPTER. Proj. NR AVN 2866, May 1957, 22pp. USN
Aviation Board, Fort Rucker, Ala.

11,845
To evaluate a production model H-13H Helicopter in
terms of suitability of design changes or modifications
incorporated as the result of an earlier service test,
the helicopter was flown and maintained by personnel of
the United States Army Aviation Board for 100 hours in
various weather conditions during the period November
1956 through January 1957. Analysis of the results was
accomplished by comparing present performance and design
with deficiencies reported from the previous test.
Recommendations are included.
I. R 2

11,846
Fishering, J.E., & Telbot, J.M. SOME PRACTI-
CAL CONSIDERATIONS IN THE USE OF RADIOISOTO-
PES. Special Rep. 4, March 1951, 44pp.
USAF School of Aviation Medicine, Randolph
Field, Tex.

11,846
This paper discusses the unique problems of me-
chanical laboratories in the design of equipment, facili-
ties, and protective devices. The problem of detection
of radiation is presented and practical rules given for
survey of laboratory operations, air monitoring, survey
of surfaces, personnel monitoring, and hands, feet, and
clothing monitoring. Design features of the laboratory
are considered with specific recommendations for each.
Recommendations for the disposal of radioactive wastes
(e.g., radionuclides, phosphorus 32, carbon 14, or any
radioisotopes) are made. Regulations for work in Radio-
biology Tracer Laboratory and a glossary of terms are
added.
T. R 10

11,847
Neek, R.A. A TECHNIQUE FOR DEVELOPING DEPOT
MAINTENANCE FACILITIES REQUIREMENTS TO SUP-
PORT NEWLY PROGRAMMED AIRCRAFT. Master's
Thesis, June 1957, 54pp. Syracuse University.

11,847
This paper develops and describes a facilities plan-
ning technique for Air Force depot maintenance aircraft
accessories shops. The complexity of the problem is out-
lined and the need discussed. Utilizing certain supply
tables on new aircraft, a method for converting the in-
formation and obtaining workload data on aircraft acces-
sories is developed. From these data it is shown that
shop space, utilities, machinery and equipment, services,
and manpower requirements can be predicted. Methods of
handling the information are described. I. R 23

11,848
Maritime Cargo Transportation Conference. THE SS. MARICE.
AN ANALYSIS OF AN EXPORT TRANSPORTATION SYSTEM FROM SHIP-
PER TO CONSIGNEE. Contract N70R 29149, P-1. 33p, Nov.
1954, 50pp. Maritime Cargo Transportation Conference,
National Academy of Sciences-National Research Council,
Washington, D.C.

11,848
This is an initial study in a program of research
undertaken to provide guidance on means and techniques
leading to improvement in the sea transportation of
general cargo. The military system from points of origin
of the cargo in the United States to delivery at destina-
tion in Germany was studied and analyzed in terms of an
actual operation of a vessel, the S.S. Warrior. The
system was divided into its logical segments - domestic
movement, receipt and storage, loading, voyage, dis-
charge, receipt and handling, and delivery - and each
analyzed from the points of view of time, cost, and man-
power.

Green, D.J., & Lear, W.P. A NEW APPROACH TO
NAVIGATION. PART I. THEORETICAL CONCEPTS OF
NEW AIRBORNE NAVIGATION SYSTEMS. PART II.
NEW PRINCIPLES IN THE DESIGN OF SUPERIOR COM-
MUNICATIONS, NAVIGATION, AND MISSILE GUIDANCE
SYSTEMS. 24pp. Lear Inc., Santa Monica,
Calif.

11,849
Two basic classes of airborne navigation systems,
self-contained and externally referenced, are reviewed
and their present limitations defined. The self-con-
tained class of equipments (primary measurements made
within the moving vehicle) includes inertial and doppler
types as well as dead reckoning; the externally referenced
class (relying on radiations from or communication with
remote data sources) includes all of the radio, radar
and optical methods. A new hybrid class of system is de-
fined and its possible advantages described. The SCAN
(Self-Correcting Automatic Navigator) system and its
philosophy of statistical data filtering is given as an
example. A second paper discusses the use of information
theory, statistical techniques, and computers for the
design of various systems. G. I.

11,850
Warfield, J.W. SYSTEMS ENGINEERING. Contract
NORD-7958, Aug. 1955, 24pp. Ordnance Research
Lab., Pennsylvania State University.

11,850
The aim of this report is to provide the systems en-
gineer with material helpful to him in the engineering
of a system. Material common to most systems problems
are considered with technical discussions omitted. The
introduction sets forth the purpose of system engineer-
ing, defines the system engineer, enumerates the fac-
tors in a typical problem, and outlines the design pro-
cess. The systems survey and organized project plan are
discussed and a check-list given for each. Product de-
velopment is examined from the system-engineering view-
point, system tests are treated, and a check-list is
given. The report closes with a discussion of the com-
pletion and reinitiation of projects.

Sperry Gyroscope Co., Inc. MONTHLY PROGRESS
REPORT ON AIR TRAFFIC CONTROL. Contract W28-
099-ac-189, Rep. 16, Nov. 1947, 14pp. Sperry
Gyroscope Co., Inc., Great Neck, N.Y.

11,851
This is a monthly progress report on a research and
development program for an air traffic control system.
The general status of the program in terms of equipment
improvement and flight testing is set forth. Items of
component apparatus described are a combined R-theta
pilot indicator, and a ground display system. A detailed
report on the status of the ARC/16 modification and
frequency modulation unit for the ground transmitter is
given. Details of antenna development are discussed.

Broadbent, D.E. AN EFFECT OF NOISE ON AN INTELLECTUAL TASK. R.N.P. 57/672, O.E.S. 298, July 1957, 7pp. Royal Naval Personnel Research Committee, Medical Research Council, London, England. (Applied Psychology Research Unit, Cambridge, England).

11,852

To examine both immediate and after-effects of noise on complex intellectual performance, three groups of subjects worked for two sessions each at a subtraction task involving a considerable immediate memory load. One group had both sessions in relative quiet (70 decibels), a second had the first session in noise (100 decibels) and the second in quiet, and the third group had noise and quiet in reverse order. All subjects were given an intelligence test and a personality inventory. Performance scores (time to solve the problem) were analyzed in terms of the various noise conditions. Individual differences were related to performance.

T. G. I. R 5

11,853

Moodhead, Marjot M. EFFECTS OF BURSTS OF LOUD NOISE ON A CONTINUOUS VISUAL TASK. R.N.P. 57/691, O.E.S. 297, July 1957, 10pp. Royal Naval Personnel Research Committee, Medical Research Council, London, England. (Applied Psychology Research Unit, Cambridge, England).

11,853

To discover whether brief loud noise affects operator performance, a visual matching task was given to two groups each of 12 subjects. Task duration was four minutes with four noise bursts (100 decibels) at irregularly spaced intervals. One group received more information about the test than the other and also received verbal encouragement and knowledge of results. Performance scores were analyzed for effects of noise, effects of prior verbal alerting, and instruction. The practical significance of the findings are discussed.

Erwood, M.K. METHOD OF THRESHOLD DETERMINATION IN THE HUMAN CENTRIFUGE. FFSO 1029, Dec. 1957, 9pp. Flying Personnel Research Committee, Air Ministry, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

11,855

A method of threshold determination in the human centrifuge is described. Visual blackout is utilized as the end point with thresholds capable of being varied by the use of suitable filters. The variables can be specified precisely, and thresholds determined with a minimum of discomfort. Some results of initial investigations of the method are presented.

T. G. I. R 5

11,856

Krendel, E.S. THE MECHANICAL POWER OUTPUT OF MAN. Contract NOME 2150(00), Proj. NR 196 006, Final Tech. Rep. F A1962, Jan. 1958, 66pp. Franklin Institute Laboratories, Philadelphia, Penna.

11,856

A scheme for designing man-powered devices for optimal power transfer from the human operator to the mechanism is discussed. Data indicating the feasibility of such a design are presented. Such data as were available for unusually high as well as for average power production in cranking, pedaling, and other tasks are presented in a systematic fashion.

Kurke, M.I. DETERMINING CRITERIA FOR EVALUATING MAN-MACHINE LINKS IN WEAPON SYSTEM ANALYSIS. Operations Pers. Dec. 1957, 2(6): 826-829. (USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.).

11,858

To establish a method for evaluating interactions between operators and equipment in a multi-purpose weapon system (naval tank), instructional materials such as manuals, training films and lesson plans were examined. An analysis of operations, based on these materials, was made in terms of number and type of man-machine links, and their significance in establishing a model for the system. The use of the technique thus developed in place of complete activity analyses is discussed.

Davis, R.C. ELECTROMYOGRAPHIC FACTORS IN AIRCRAFT CONTROL. MUSCULAR ACTIVITY DURING STEADY NOISE AND ITS RELATION TO INSTRUCTED RESPONSES EVOKED BY AUDITORY SIGNALS. Rep. 55-124, Dec. 1956, 14pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,859

To study the effects of a prolonged tone (about 12 minutes duration, 1000 cycles at 90 decibels) upon muscular activity, 32 subjects were run under noise and under quiet conditions. The subject was required to make flexion or extension movements of a lever operated with a wrist-bending according to auditory signals occurring about one per minute. Action potentials were recorded from the right and left extensors and flexors. The data were studied by analysis of variance for effect of noise, serial position, response direction and individuals.

Davis, P.C. ELECTROCARDIOGRAPHIC FACTORS IN AIRCRAFT CONTROL. RESPONSE AND ADAPTATION TO BRIEF NOISES OF HIGH INTENSITY. Rep. 55-127, Dec. 1956, 7pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Indiana University).

11,860

The effects on muscle action potentials of brief auditory stimuli varying from 100 to 117 decibels were examined. Sixteen subjects were given four stimulus intensities four times each in counterbalanced order, with instructions to remain as relaxed as possible. Records of action potentials were taken from both arms and analyzed for their relation to stimulus intensity and repetition.

Hasty, G.T., Payne, R.E., & Bauer, R.O. EFFECTS OF NORMAL AIR AND DEXTRO-AMPHETAMINE UPON WORK DECREMENT INDUCED BY OXYGEN IMPOVERISHMENT AND FATIGUE. Rep. 56-125, Dec. 1956, 6pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,861

To study means by which the deterioration in performance caused by hypoxia and fatigue might be counteracted, 64 subjects were first given extensive practice on a compensatory pursuit task. Following administration of either a placebo or five milligrams of dextro-amphetamine, subjects were required to perform the task for four hours. With the exception of the third hour of work, all subjects were subjected to an insufficiency of oxygen (2012). Performance scores were analyzed for the single and joint effects of dextro-amphetamine and normal air.

Gardner, R.A. PERCEPTION OF RELATIVE FREQUENCY AS A FUNCTION OF THE NUMBER OF STIMULUS AND RESPONSE CATEGORIES. AMEL Proj. 6-95-20-001, Rep. 328, April 1958, 15pp. USA Medical Research Lab., Fort Knox, Ky.

11,864

A prediction response was used to study a form of decision behavior. Categories of stimulus events represented by black letters of the alphabet were presented to 240 subjects (ten groups of 24 each) in a series of 420 trials. The number of categories varied from two to eight and each category was associated with a different response category. The only property of the stimulus-event that could be used for prediction was relative frequency (either .70 or .60 for most frequent). The response data were analyzed for effect of practice and number of categories.

Harbold, G.J. & Deehring, D.G. A RATING SCALE MEASURE OF SPEECH DISTURBANCES THAT ACCOMPANY DELAYED SPEECH FEEDBACK. Joint Proj., Ohio State University Research Foundation Contract NMR 22525, Proj. NR 145 993, and Bu Med Surg Proj. NM 18 02 99, Rep. 71, Dec. 1957, 12pp. USA School of Aviation Medicine, Naval Air Station, Fla.

11,865

The rating scale technique was used to quantify speech disturbances that accompany delayed speech feedback (delayed side-tone). Fluency judgments of both delayed and non-delayed speech (ten speakers) were obtained from three panels of judges (23, 36, and 10). Measures of speech-rate and speech-level were also obtained. The fluency ratings were analyzed for reliability and the speech-rate and speech-level data for relation to the delayed speech condition.

Dusick, E.R. STANDARDIZATION OF TESTS OF GROSS MOTOR PERFORMANCE. Proj. 7-63-01-0058, Tech. Rep. EP-81, Jan. 1958, 43pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

11,866

This report presents a series of studies designed to establish a battery of tests that could be used as standard devices for evaluating the effects of clothing restriction. A series of 13 tests of gross motor performance (body flexion) were performed by 37 subjects on two different occasions. The data were analyzed for test reliability, norms, and the interrelationships exhibited. Four studies were carried out using the Steadiness aiming test with the arm at different elevations, and planes, and with varied amounts of shoulder and arm restriction. Analyses were performed as before. Recommendations are included.

Kiss, J.S. SMALL GROUP EFFECTIVENESS IN THE PERFORMANCE OF COMPLEX TASKS. Contract 49(638)-236, R.F. Proj. 794, Rep. 1, March 1958, 4pp. Ohio State University Research Foundation.

11,868

This is the first quarterly progress report on a research project investigating small group effectiveness in the performance of complex tasks. Work was initiated on three major projects: (1) the development and construction of a low-cost, universal group-task apparatus, (2) the creation of detailed specifications for a set of tasks that would utilize the apparatus, and (3) the first group experiment.

11,869

Solomon, P. SENSORY DEPRIVATION AND THE HUMAN MIND. ONR Res. Rev., April 1958, 9-11. (Harvard Medical School).

11,869

This paper describes briefly an attempt to determine whether living in a respirator leads to transient mental abnormalities. Male volunteers remained in a respirator for periods up to 36 hours. Although data were being processed at the time of writing, certain findings in regard to stress reactions to sensory deprivation are discussed and the implications pointed out.

Gell, C.P., Hays, E.L., & Correale, J.V. Jr. THE NAVY'S FULL-PRESSURE SUIT. ONR Res. Rev., April 1958, 12-21. (Air Crew Equipment Lab., NAMS, Philadelphia, Penn.).

11,870

This paper reviews the development of the Navy's full-pressure suit, going back some 15 years to World War II. The various problems along the way and the manner in which they were solved are presented, as well as full descriptions of the six prototypes and its development by B. F. Goodrich Company. Progress to January 1957 is outlined. Subsequent developments which have led to the light weight high-altitude protective system now in limited operational use are not included.

Wallis, D. AUDITORY AND VISUAL SEARCH PROBLEMS. July 26-27, 1957. 5pp. International Symposium on Military Psychology, Brussels, Belgium. (Dept. of the Senior Psychologist, Admiralty, London, England).

11,871

This paper describes a series of experiments dealing with problems of auditory and visual search. The subjects (12 naval officers and 12 aircrew) were tested, two at a time, in separate mock-up of an aircraft cockpit. Each was required to maintain an intensive watch on two independent search systems - a radar plan-position indicator display and auditory signals through headphones. One group experienced five successive three-hour sessions at weekly intervals; the other group at daily intervals. Measurements included "expectancy" or threshold data and "non-expectancy" or search thresholds. These data were analyzed in terms of effect of interpolated tasks, length of search, area of search, and individual differences.

Johansson, G., Backlund, F., & Bergstrom, S.S. STUDIES ON MOTION THRESHOLDS: I. SHORTEST PERCEPTIBLE LENGTH OF MOTION TRACK AS A FUNCTION OF STIMULUS VELOCITY. Rep. 1, Nov. 1957, 22pp. The Psychological Lab., University of Uppsala, Sweden.

11,875

To determine the length of motion track (displacement) thresholds as a function of stimulus velocity, two experiments were conducted using 14 subjects. Threshold determinations consisted of adjusting the shortest visible displacement of a moving target (dot) with reference to a black static hairline. Five velocities were used ranging from 0.22 to 3.48 minutes of visual angle per second (both infra-perceptible and perceptible motion). The relationship between the displacement threshold and velocity is analyzed and described in terms of its mathematical function.

Webster, J.C., & Thompson, P.O. RECORDED GROUP AUDIO-METER TEST COMPARISONS AT THE 1956 SOUTHERN CALIFORNIA EXPOSITION. J. acoust. Soc. Amer., Aug. 1957, 29(8), 895-899. (USN Electronics Lab., San Diego, Calif.).

11,878

To study various aspects of two group audiometer tests used by the Navy (Medical Research Laboratory, MRL, and Navy Electronics Laboratory, NEL), recorded series of 4000 cycles per second absolute threshold tests were administered over earphones to 1919 people in groups of eight or less. Half of the subjects received a test and retest on the MRL, the other half on the NEL. The data were analyzed in terms of test-retest reliability, differences due to test stimuli (pure versus warble tones), effectiveness of 4000 cycle per second acuity as an indicator of general auditory fitness and relationship of hearing loss to noise history and age.

Warren, M.O., Ford, J.S., & Schuster, D.H. DEVELOPMENT OF A TROUBLE LOCATOR AND EVALUATION OF A GENERALIZED ELECTRONIC TROUBLESHOOTING COURSE. Contract AF 41 (657) W4, Proj. 7709, AFTRC TR 58-1, Jan. 1958, 7pp. USAF Maintenance Lab., Lowry AFB, Colo.

This report summarizes 2 investigations. The first concerned a trouble-locating aid that combined a system-oriented approach with a procedure-oriented approach. Limited evaluation indicates that this type of job aid would facilitate the work of relatively inexperienced mechanics and would be of some value to experienced personnel. In the second study the effectiveness of the Generalized Electronic Troubleshooting (GETS) Trainer, the related training curriculum, and test problems were evaluated. The California Test of Mental Ability and 16 standardized tests of special mental abilities were used. Results obtained for 90 high-school males indicate that this systematic training in troubleshooting developed skill in using symptom information to solve abstract troubleshooting problems and decreased tendency to make redundant actions and to arrive precipitantly at incorrect solutions.

Thorndike, R.L., Hagen, Elizabeth P., Orr, D.B., & Rosner, B. AN EMPIRICAL APPROACH TO THE DETERMINATION OF AIR FORCE JOB FAMILIES. Contract AF 18(600)-1208, Proj. 7719, AFTRC TR 57-5, Aug. 1957, 46pp. Personnel Lab., AFTRC, ANDC, Lackland AFB, Tex.

11,880
This report deals with a new technique for assessing job requirements and for grouping Air Force jobs into homogeneous job families. Men who worked on a particular job were asked to indicate how often they did each of a series of specific activities. These profiles of job requirements were set up for 25 Air Force jobs. Subsequently, job clusters were determined. Finally, the effectiveness of the technique is evaluated.

11,881
Nadel, A.B. HUMAN FACTORS REQUIREMENTS OF A MANNED SPACE VEHICLE. RM 5810P 10, April 1958, 35pp. Technical Military Planning Operation, General Electric Co., Santa Barbara, Calif.

11,881
This report presents an analysis of human factors requirements of a manned space vehicle in light of present knowledge. One section deals with the physical environment of the operator, covering the effects of physical stimuli from space external to the craft, their possible effects on the operator and protective measures needed. Another section is concerned primarily with inputs from space received via the sensory system of the operator. Phenomena apprehended through the perceptual system are described together with their possible effects and practices recommended to avoid undesirable effects. The information processing function (information items needed, displays, and display-control relations) is discussed at length.

Jerison, W.J. & Argenteau, J. TIME JUDGMENTS, ACUSTIC NOISE, AND JUDGMENT DRIFT. Proj. 7193, WADC TR 57 454; Task 71614, Jan. 1958, 29pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,882
To study the effect of noise on performance, six subjects made time judgments in a rate projection situation with five rates and four noise conditions. The task involved observing a target that moved at a constant rate and then disappeared behind a mask, imagining that the target continued on its course, and squeezing a trigger when it was believed to be under a cross-hair on the mask. Noise program included steady high and low noise levels (108.5 and 70 decibels) and noise that shifted from high to low, or the reverse, when target disappeared. Time judgments were analyzed for effects of noise, rates, and practice.

Wood, C.L. & Bitterman, M.E. BLINKING AS A MEASURE OF EFFORT IN VISUAL WORK. Amer. J. Psychol., Oct. 1950, LXIII, 584-588. (Cornell University & University of Texas).

11,884
To test the hypothesis that blink-rate is an inverse correlate of performance, rather than a direct correlate of effort, subjects were instructed to work rapidly, with maximal efforts (on a cross-out test) during one period, and slowly, with minimal effort, during another period. Frequency of blinking was measured continuously during the experimental periods. Significance of the difference between the results under the two conditions was calculated and the results are discussed in relation to the hypothesis selected.

Siechta, R.F., Wade, E.A., Carter, W.K. & Forrest, J. COMPARATIVE EVALUATION OF AIRCRAFT SEATING ACCOMMODATION. Contract AF 33(616) 3068, Proj. 7215, WADC TR 57 136, April 1957, 112pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Bio-Mechanics Lab., Tufts University).

11,885
To investigate the problems of seat comfort, a series of seats currently in use in operational aircraft were tested experimentally for adequacy in limiting pilot and crew fatigue and discomfort. The subjects (18), selected to represent a wide range of body sizes in the Air Force population, were seated in each of six seats for periods up to seven hours duration. Hourly assessment of comfort was made by means of a questionnaire and post-test interviews. The data (sitting time, hourly ratings of degree of comfort, hourly indications of discomfort location, evaluation of seat parts, and so forth) were analyzed in terms of seat design, and for information about nature of seating discomfort.

Mitkin, H.A. PERCEPTION OF BODY POSITION AND OF THE POSITION OF THE VISUAL FIELD. Psychol. Monographs, 1949, 62(7), 1-46. (Brooklyn College).

11,893
To investigate factors involved in perception of body and visual field position, several experiments which employed a tilting room-tilting chair apparatus were performed. These included: 1) judging body and room orientation during changing relations between body and field, 2) adjusting body or room position to true upright, 3) adjusting body position to upright with and without visual field, 4) judging body and room position and adjusting pointer to upright. Qualitative differences in performance including illness brought on by unstable visual field are discussed. Quantitative differences in performance are discussed as a function of the relative importance of visual and postural sensations.

King, H.F., & Speakman, D. AGE AND INDUSTRIAL ACCIDENT RATES. Brit. J. Indust. Med., 1953, 10, 51-58. (Nuffield Research Unit, Psychological Lab., Cambridge, England).

11,894
The methods and results of investigations into the relation of age and industrial accident rates are surveyed and discussed. The following topics are discussed with relation to accident frequency; criterion of accidents, role of occupation, the relationship of age and experience, the handling of physical and physiological conditions (fatigue, falls and lapses), length of absence, and type of injury. The discussion deals with differences of interpretation, methods of recording and collecting data, and errors of omission. Suggestions are made for an approach to the problem which would lead toward a better understanding of the relation between age and accident rates.

 Bash, L.M.W. (Ed.). ERDL-TULANE SYMPOSIUM ON FLICKER. Contract DA-44-009-ENG-2448 (Mod 2), Proj. 8-18-06-003, April 1957, 268pp. (New Orleans, La.). USA Engineer Research and Development Labs., Fort Belvoir, Va., & Tulane University School of Medicine.

11,901
 This is a report of a symposium of flicker sponsored by Tulane and the U. S. Army Engineer Research and Development Laboratories in April 1957. A condensed version of the Tulane experiments on flicker is presented, as well as some twelve papers given at the meetings. A phenomena is given, as well as certain conclusions about the effects of flicker on the functions of the human nervous system.

 Moser, H.M., Dreher, J.J., O'Neill, J.J. & Oyer, H.J. COMPARISON OF MOUTH, EAR, AND CONTACT MICROPHONES. Contract AF 19(604) 1577, Proj. 7681, AFRC TN 56-58, Tech. Rep. 37, Oct. 1956 (revised Jan. 1958), 24pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C. (The Ohio State University Research Foundation).

11,902
 To evaluate existing and easily obtainable transducers and microphones, the efficiency with which speech signals were transmitted was measured on a first-order differential noise cancelling microphone (RCA M-33/AIC) and selected ear, throat, and bone transducers. The noise cancelling microphone was used as control and two simultaneous recordings were made for each of three recording conditions (quiet, 100 decibels and 111 decibels noise) for each of the four comparison microphones. The recordings (Harvard Phonetically Balanced words) were presented to trained listeners in both quiet and noise. The data were analyzed for differences due to type of equipment.

 Bouman, M.A., & Walraven, P.L. SOME COLOR NAMING EXPERIMENTS FOR RED AND GREEN MONOCHROMATIC LIGHTS. J. opt. Soc. Amer., Sept. 1957, 47(9), 834-839. (Institute for Perception RVO-TNO, Soesterberg, The Netherlands).

11,903
 To investigate the predictability of verbal descriptions of monochromatic flashes of light, one observer, a normal trichromat, was studied. The stimuli (wavelengths between 550 and 700 millimicrons) were presented to the dark-adapted right eye each three seconds and the observer indicated whether the perception was reddish, yellowish, greenish, bluish, whitish, colorless or absent. In addition to wavelength, exposure time and area of test stimulus were varied. Frequency of seeing curves are constructed from the data. Comparison is made with quantum theoretical studies previously conducted for absolute threshold data.

Bauer, R., Johnson, J.M. & Goshoff, L.L. A GENERAL METHOD FOR ESTIMATING TRAFFIC FLOW IN A ROAD NETWORK. Report 38, Oct. 1957, 17pp. Institute of Transportation and Traffic Engineering, University of California, Los Angeles, Calif. (Reprinted from Highway Res. Board, Sept. 1957, 22(10), 35-45).

11,905
This paper deals with the license plate method for studying the utilization of a segment of highway network. The theory is outlined and mathematical formulas developed for analyzing percentage flow when entrance and exit (modified origin and destination) data are simultaneously obtained on sampling basis. A procedure is outlined whereby the count of vehicles between any sets of license plate numbers can be readily obtained through the use of a high-speed digital computer. A specific application of the theory to a study of weaving in one section of the Hollywood Freeway in Los Angeles is presented.

Bauer, R.F. DRIVERS' GMS IN TRAFFIC. *Psychol. Sci.* 1957, 2, 389-394. (Institute of Transportation and Traffic Engineering, University of California, Los Angeles, Calif.).

11,907
To investigate the relationship between drivers' galvanic skin response (GSR) and changes in traffic situations, three trained observers made a record of the occurrence of a GSR and a record of the traffic event that presumably elicited the GSR while a subject drove a prescribed route through city streets. Data for 280 traffic incidents were obtained from 21 subjects and analyzed in terms of type of incident (degree of infringement upon an idealized driving path) in relation to degree of clarity in the GSR settings. The results are discussed in terms of the usefulness of this method of studying driver behavior.

Rothman, J.M. & Bauer, R. DRIVERS OF HIGHWAY VEHICLE ACCIDENT INCIDENCE. Bull. 161, 30 data, 5pp. Highway Research Board, Washington, D.C. (Institute of Transportation and Traffic Engineering, University of California at Los Angeles).

11,909
The authors analyze some of the factors that limit or possibly preclude the use of mileage as the risk measure in accident rates when this measure is used to provide bases for technical decisions. They offer arguments for the use of traffic volume-based indexes for the most appropriate representation of motor vehicle rates. Recommendations for such a practice are made.

Cohen, J. & Sanders, Virginia L. THE EFFECTS OF ABSOLUTE AND CONDITIONAL PROBABILITY DISTRIBUTIONS ON INSTRUMENT READINGS. III. A COMPARISON OF A LINEAR SCALE AND TWO SCALES WITH EXPANDED CENTRAL PORTIONS. Contract AF 33(616) 3404, Proj. 7186, WADC TR 57 65, March 1958, 14pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College).

11,907
To determine whether expanding the central portion of a scale would improve overall accuracy of scale reading when a preponderance of settings occur in that portion, two such expanded scales (sigmoid progression of scale intervals and a modified linearly graduated scale with the two ends compressed and center expanded) were each compared to a linear scale. Random and orderly sequences of pointer setting were presented with both a rectangular and normal distribution of settings. Following a practice session, the dials were exposed tachistoscopically; 16 subjects in each comparison. Error scores were analyzed and effects of main variables studied. Implications of the results for nonlinear scale design were discussed.

Cohen, F.A. & Anderson, C.D. PERIOD TEST OF THE CONFUSION-SCALE FILE IN SPEECH COMMUNICATION. J. Acoust. Soc. Amer., Dec. 1957, 29(12), 1748-1752. (Hearing and Communication Lab., Indiana University).

11,909
To determine the value of the constant-rate rule for use in speech communication when relatively unpracticed subjects are used and when the confusion matrix for the master set is obtained with one group of listeners and confusion matrices for the subjects with a different group, a ten-item master set was tested (ten five-item subsets) with 80 naive subjects. The data of 40 listeners were used to determine the master confusion matrix, and of the remaining 40 listeners to determine the subject matrices. Obtained articulation scores and call errors in the subject matrices were compared with predicted values from the constant-rate rule.

Pallack, L. & Torres, J. STANDARDIZED COMMUNICATIONS AND MESSAGE RECEPTION. J. Acoust. Soc. Amer., Dec. 1958, 30(1), 42-44. (NSF Operational Applications Lab., Belling AFB, Washington, D.C.).

11,909
To demonstrate experimentally the effect of standardized communications on message reception, the reproduction of messages, selected from defined information sources, was studied in a multi-channel listening task (identifying and responding to a message carrying a particular identification call sign while listening to two talkers). The subject was required to pilot a simulated airplane and monitor visual displays while responding. Standardization of message procedures was controlled independently of standardization of message reproduction. Accuracy of reproduction was studied for effects of standardization of message, of procedure and joint standardization.

Cohen, J. & Dinnenstein, A.J. A COMPARISON OF A LINEAR SCALE AND THREE LOGARITHMIC SCALES ON THE TIME FOR CHECK READING. Contract AF 33(616) 3404, Proj. 7186, WADC TR 57 63, March 1958; 17pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College).

11,910
To explore some design aspects in the use of non-linear scales, four circular dials three with logarithmic scales with varying degrees of skewness and one with a linear scale, were compared on the basis of the exposure time required to read them. Before each trial a number was read by the experimenter and the subject reported whether or not that reading was correct to the nearest marked scale on the dial exposed; 64 subjects were used. Difference scores between each of the logarithmic scales and the linear scale were studied by analysis of variance. The results are discussed in terms of design and use of logarithmic scales.

Dardano, J.F. & Donley, R. EVALUATION OF RADAR SYMBOLS FOR TARGET IDENTIFICATION. OOD Proj. TBI 100C, Tech. Memo 2 58, March 1958, 27pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.

11,911
To investigate the discriminability of geometric forms for use as radar symbols, five symbols capable of being generated by sine-wave derivation were studied. Other independent variables included density (24 or 48 symbols in display) and proportion (ratio of number of symbol to be discriminated to total number - 1:1, 1:2, and 1:5). Twenty subjects were tested using an optical stimulation of a radar scope. Target symbol omissions were analyzed for the relative discriminability of the five symbols. Implications of the results for use in encoding radar information are discussed.

Harris, J.D. STUDY OF THE EFFECT OF TRAINING ON THE ABILITY TO IDENTIFY ALTITUDE INFORMATION. Proj. 6190-71573, AF 33(616) 3000, March 1958, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,912
To determine the optimum characteristics of a very brief acoustic stimulus used to test auditory ability, six highly experienced subjects were used in a series of three experiments. Threshold judgments were made to series of simple stimuli (controlled by subject) and to continuous stimuli (controlled by experimenter). The test of attack of wave envelope, total energy in stimulus, total stimulus energy, the peak energy, and total peak energy in the stimulus were varied. The threshold data were analyzed for effects of these variables. Recommendations for the kind of stimulus to use for more precise testing are made.

Mengele, R.F. & Houston, R.C. INVESTIGATIONS OF VERTICAL DISPLAYS OF ALTITUDE INFORMATION: I. COMPARISON OF A MOVING-TAPE AND STANDARD ALTIMETER ON A SIMULATED FLIGHT TASK. Contract AF 33(616) 3000, Proj. 6190-71573, AF 33(616) 3000, March 1958, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Illinois).

11,913
As the first study in a series planned to investigate, under dynamic display conditions, some of the problems associated with vertical display of altitude information, a comparison was made of the performance of experienced pilots on a standard altimeter and a vertical, moving tape altimeter. Twenty subjects flew a specified series of flight tasks in a link trainer using each altimeter. Deviations from desired altitudes were recorded and analyzed for differences attributable to type of instrument. The results are discussed in terms of further evaluations of design and training problems.
T. G. 1. R. 6

11,914
Mengele, R.F. & Houston, R.C. INVESTIGATIONS OF VERTICAL DISPLAYS OF ALTITUDE INFORMATION: II. THE EFFECT OF PRACTICE ON PERFORMANCE OF A SIMULATED FLIGHT TASK USING A MOVING-TAPE ALTIMETER. Contract AF 33(616) 3000, Proj. 6190-71573, AF 33(616) 3000, March 1958, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Illinois).

11,914
This is the second study in a planned series of investigations of vertical displays of altitude information. To determine the effects of practice with a moving-tape display on performance of experienced pilots as compared to performance using a standard altimeter, 14 subjects were given practice on the vertical display. The task was to fly a specified series of maneuvers in a link trainer. Following practice the subjects were retested on the same task using both the moving-tape and standard altimeter. Performance was scored as deviations from desired altitude and analyzed in terms of practice effects.

11,915
Mengele, R.F. & Houston, R.C. INVESTIGATIONS OF VERTICAL DISPLAYS OF ALTITUDE INFORMATION: III. THE EFFECT OF AN EXPANDED SCALE ON PERFORMANCE OF A SIMULATED FLIGHT TASK USING A MOVING-TAPE ALTIMETER. Contract AF 33(616) 3000, Proj. 6190, AF 33(616) 3000, March 1958, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Illinois).

11,915
This experiment, third in a series of studies in the vertical display of altitude information, compared an expanded scale moving-tape altimeter with a standard altimeter on a simulated flight task. The scale factor was 2.375 inches per 1000 feet, each 1000-foot level was numbered with index marks every 100 feet. Two groups of subjects, ten from the earlier studies and 12 Air Force pilots, completed a series of maneuvers using each altimeter. Average deviations of five-second observations of altitude were compared for differences due to altimeter used.

Squires, P.C. STRENGTH IDENTIFICATION. Proj. 6190-71573, AF 33(616) 3000, March 1958, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,917
To determine whether some observers can learn to identify apparent steps of stereo distance, cylindrical cues having cylindrical, two subjects (seven failed to qualify on preliminary tests) were tested. The task of the first subject was to identify four apparent distance steps, set into a Stereoscopic Trainer, as they were presented in random order. Twelve training periods were utilized with knowledge of results in some of them. The second subject was trained on a haploscope with three trials conducted under dark room conditions. For each correct identification and number of errors were analyzed. Implications for three-dimensional radar displays are noted.

Squires, P.C. NEW DIGIT DESIGNS FOR USE UNDER REFLECTED RED LIGHT OF LOW BRIGHTNESS. Proj. 6190-71573, AF 33(616) 3000, March 1958, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,918
To design a set of digits uniquely appropriate for use under reflected red light of low brightness, especially for use on rotating dials, an experimental set was designed to conform with number perception habits. Test dials, white digits on black background, were prepared with the experimental digits and the KAMEL designs (Naval Air Material Equipment Laboratory, Philadelphia). Form thresholds for each digit, presented in an upside down position and with red illumination, were obtained by a Luckiesh-Mess visibility meter. The data for the KAMEL digits were used as criterion for evaluating the readability of the experimental set. Suggested applications of the findings are made.

Spatz, Laura H. PRODUCTIVITY: A BIBLIOGRAPHY. Bull. 1226, Nov. 1957, 182pp. US Dept. of Labor, Washington, D.C.

11,919
This bibliography presents the literature on productivity, particularly as it relates production to the input of labor. Excluded is literature on time and motion studies at the job level, and in the field of psychology dealing with aptitudes and individual differences. The time period covered is roughly from 1953 to June 1957 and references are from periodical articles, books, reports, speeches, conferences, conference proceedings, and theses with foreign periodicals. Major sections are: industry and sector measures, productivity at plant level, international studies of productivity, concept and measurement, factors affecting productivity, productivity and the economy, significance of productivity change, wages and prices, and labor management relations.

Tanner, W.P., Jr. & Birdsall, T.G. DEFINITIONS OF d' AND n AS PSYCHOPHYSICAL MEASURES. Contract AF 19(604) 2277, AFOSR TR 57, Tech. Rep. 80, Feb. 1958, 24pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C. (Dept. of Electrical Engineering, University of Michigan).

11,923
The theory of signal detectability is reviewed in sufficient detail for definition of two psychophysical measures d' and n . The efficiency (n) is defined as the ratio of energy required by an ideal receiver to the energy required by a receiver under study when the performance of the two is the same. The measure of d' is that value of $(2E/N_0)^{1/2}$ necessary for the ideal receiver to match the performance of the receiver under study, where E is signal energy, and N_0 the noise power per unit bandwidth. The measure is extended to include recognizability of the two signals. G. I. R 15

11,924
Erkman, R.L. & Myers, R.D. THE EFFECT OF NUMBER OF SIGNAL PULSES UPON SIGNAL DETECTABILITY ON PPI SCOPES. Proj. 7185, AFOSR TR 58 43, March 1958, 17pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C.

11,925
The effect of the number of signal pulses upon detectability was studied for an ACF-75-3 radar indicator with associated simulation and monitoring equipment. The number of pulses contained in the signal ranged from one to 32; each pulse was two microseconds in duration; pulse voltage varied from 0.07 (vacuum-free) to 3.2 volts; and grid bias ranged from plus one to plus six volts from 0V1 (aluminum bias required from sweep detection). Four separate threshold determinations were made on each of two dark-adapted observers for each condition. Analysis was made in terms of detectability as functions of these physical variables and their interrelationships. T. G. I. R 9

Fellack, J. & Yocco, J. SPEECH ANNUNCIATOR WARNING INDICATOR SYSTEM. PRELIMINARY EVALUATION. J. Appl. Soc. Amer., Jan. 1958, 30(1), 58-61. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

11,925
To evaluate the principle of a speech annunciator as a warning signal indicator, three experiments were conducted each using the master warning signal (buzzer) for comparison. The first comparison involved warning signal identification time with the operator engaged in two tasks: self-paced discrete tracking and monitoring 24 instruments, adjusting them when required. The second comparison added a third task, reproduction of speech signals, to test for interference of annunciator with message reception; and the third investigated the effect of combining the two warning signals. Rosen, R.A., Barker, J.J., Oyer, R.J., O'Brien, J.J., & Schenkman, L.J. DISCRIMINATION IN SENSORY DEPRIVATION. Contract # 19(604) 1377, Proj. # 664, Tech. Rep. # 44, AFMFP # 1735, Oct. 1957, 22pp. USAF Human Resources Lab., Bolling AFB, Washington, D.C. (The Ohio State University Research Foundation).

11,928
To determine the effects of pre-exposure upon accuracy of performance in identifying and discriminating messages, listening panels of foreign and American citizens were given printed lists of monosyllabic words, polysyllabic words, and air traffic instructions. They were then asked to decide whether these printed messages agreed or disagreed with correspondingly numbered aural messages which were presented in radio. In addition, different clues on probable occurrence of agreeing or disagreeing stimuli were given. Errors in identification were analyzed for effects of expectancy, differences due to language background, and to type of message.

Leiderman, R., Mendelson, J.H., Moxler, D., & Solomon, P. SENSORY DEPRIVATION: CLINICAL ASPECTS. A.M.A. Arch. Int. Med., Feb. 1958, 101, 389-396. (Harvard Medical School).

11,930
Practical applications in clinical medicine of knowledge derived from investigations in sensory deprivation are presented in this paper. Reports on a number of patients in whom mental abnormality occurred during the course of severe illness are given. In each case there was sensory deprivation in the form of darkness, silence, and solitude, and the treatment consisted of restoring sensory stimulation and subsequent relief of mental symptoms. These observations are discussed, and implications are drawn from them for the fields of general medicine and public health.

Roby, T.B. ON THE MEASUREMENT AND DESCRIPTION OF GROUPS. Behavioral Sci., April 1957, 2(2), 119-127. (Tufts University).

11,932
This report points out crucial issues in group measurement. Data of human groups are examined in terms of the task of prediction. Three classes of measures are distinguished: (1) the raw data of the response aggregate, (2) the behavior indexes, and (3) the so-called "endogenes" comprising the basic character of the group. Various aspects of these measures are discussed. An approach to problems of measurement and prediction is proposed.

Geldard, F. (Chairman). ENGINEERING PSYCHOLOGY: A BRITISH PSYCHOLOGICAL SOCIETY SYMPOSIUM. Q. J. Psychol., Oct. 1957, 9pp. (US Office of Naval Research, London, England).

11,933
Some portions of a symposium on engineering psychology are reported here. The introductory remarks attempt to define the field of this branch of psychology and to clarify its situation with regard to basic and applied research. Comments upon the six papers that were read are also given.

11,934
Tisher, R.A. EFFECT OF COINED TYPE UPON READABILITY OF PRINT. J. Appl. Psychol., 1957, 41(4), 220-221. (University of Minnesota).

11,934
To investigate changes that occur in speed of reading and in visibility of words when the reading copy is curved, 104 subjects were tested individually. The test materials (reading texts and word texts) were presented either flat or on a curved surface (cylinder eight inches in diameter) and horizontally at 45 degree angle or vertically. Mean reading scores (average number of words taken to read 15 paragraphs of 30 words each) and mean visibility scores (four test words) were analyzed for effect of text curvature at various reading angles. The results are discussed in relation to marginal text in large magazines and books.

Brown, J.L., Ellis, W.H.B., Webb, R.G., & Gray, R.F. THE EFFECT OF SIMULATED CATAPULT LAUNCHING ON PILOT PERFORMANCE. Proj. # 11-02-12-2, NADC-NA-5719, Rep. 1, Dec. 1957, 22pp. USAF Aviation Medical Acceleration Lab., NADC, Johnsville, Penn.

11,937
To determine the effect of exposure to transverse accelerations (similar to those encountered in catapulting) on motor performance, four subjects were exposed to acceleration patterns ranging from four to twelve G. Subjects were trained in a task that required stabilization, by manipulation of a control stick, of disturbances of a standard pitch and roll indicator. Scores for performance were obtained during a control period prior to and immediately following acceleration exposure. Heart rate was recorded during the experimental period and subjective comments obtained. The data were analyzed in terms of performance decrements, effect on heart rate, and subjective effects due to acceleration patterns.

Gulfa, A.O.M. NOISE FROM JET ENGINES. Rep. 112, April-May 1957, 4pp. Advisory Group for Acoustical Research and Development, NATO, P. 14, France.

11,939
To investigate jet engine noise in relation to its effect on aircraft structure, four field noise measurements were made for a range of jet engine velocities. Two representative turbojet engines, one of them operating with an afterburner. Contours of equal noise pressure in the horizontal plane containing the axis of the jet are presented for a range of engine velocity for overall noise pressure and for noise pressure in specified octave frequency bands in noise spectra. The results are discussed in relation to problems of the designer: definition of noise loads on a structure and structural response to noise.

Westbrook, C.B., & Schurr, B.T. AIRCRAFT NOISE QUALITIES AND PILOT RESPONSE CHARACTERISTICS. AGARD Rep. 125, May 1957, 21pp. Advisory Group for Acoustical Research and Development, North Atlantic Treaty Organization, Paris, France.

11,940
In this paper the evolution of aircraft handling qualities (stability and control characteristics, flying qualities, and so on) requirements in the United States Air Force is traced. Two approaches are discussed in some detail: the subjective or pilot opinion method and the direct or curve technique. Some of the research techniques that have been or are being pursued to improve the definition of "what makes a good airplane" are outlined.

Lisette, J.T., & Roby, T.B. GROUP LEARNING AND COMMUNICATION AS A FUNCTION OF TASK AND STRUCTURE. "J. Abnorm. Soc. Psychol.", July 1957, 25(1), 121-131. (University of Delaware and Tufts University).

11,941
This study is an extension of earlier experiments on relationships between communication structure and group performance on a forced-choice information processing task. The focus was upon the effect of practice upon performance and communication behavior under two structure conditions (low and high autonomy), three loads (rate of change of information or speeds), and two operation procedures (volunteering and soliciting information). Three-man groups were given nine trials on one of the combinations of experimental conditions. Mean error performance, average number of messages transmitted, average length of message, and proportion of trial interval spent in communication were analyzed as functions of the experimental variables.

11,942
Murrell, K.F.H., Gilew, S., & Tucker, W.A. AGE STRUCTURE IN THE ENGINEERING INDUSTRY: A PRELIMINARY STUDY. Organ. Psychol., July 1957, 19pp.

11,942
To provide information on the age structure of workers in industry, a study was made of seven light engineering firms in the South-West of England. The age, occupations, and length of service of all male employees on the shop floor were analyzed for age differences associated with various jobs. One firm was studied in detail for changes which had taken place over a period of eight years. Some subsidiary aspects of ageing are discussed: age of engagement, internal migration, productive versus non-productive work, and retirement.

Kraft, J.A. A FOLLOW-UP SURVEY OF HUMAN FACTORS IN SEWER IN AIRCRAFT, MISSILES, AND SUPPORTING INDUSTRIES. Feb. 1958, 3pp. Military Operations Research Engineering Div., Lockheed Aircraft Corp., Marietta, Ga.

11,943
To ascertain both the rate of growth and significant changes in human factors research in aircraft and related industries, a questionnaire survey was made of 36 companies. Of these companies, 30 had responded to an earlier survey in 1956. The responses were analyzed for (1) type of company, (2) organizational level at which the group reports, (3) size and specialty composition of the group, (4) present and expected strength, and (5) activities of the group.

Stephani, E.R., & Dwyer, B.C. AIR POLLUTION LAB. REPORTS FROM LOS ANGELES. REPORT II. J. Franklin Inst., Feb. 1958, 265(2), 148-152.

11,944
This note reports selected analyses of the gaseous constituents of the atmosphere in Los Angeles. Long-path infrared spectroscopy was utilized by the Franklin Institute mobile air pollution laboratory for measuring the important pollutants in the atmosphere as a function of time and meteorological conditions. Results of measurements of chosen pollutants (carbon monoxide, hydrocarbon, ethylene, acetylene, nitrogen oxides, ozone and peroxyacetyl nitrate) or made from before the morning traffic rush until well after the evening rush on several days in fall and early winter are presented and discussed.

Stockbridge, M.T.M. THE EFFECT OF THE ANTICIPATORY STARTLE PATTERN ON AIMING A RIFLE. J. Appl. Psychol., 1957, 41(3), 141-149. (Ministry of Supply, London, England).

11,945
To investigate the effect of anticipatory startle pattern on aiming a rifle, nine subjects were studied with a photographic technique. Each subject fired eight live rounds, eight blank rounds, and eight times with an empty firing chamber. Mean traversal and elevation errors were measured in minutes of arc from the photographic records and corrected for observer bias. The data were analyzed for differences attributable to the three conditions and discussed in relation to startle pattern and marksmanship.

11,951
Smith, F.F. INDICES OF HEAT STRESS. Memo. 29, 1955, 51pp. Medical Research Council, London, England.

11,951
To consider two scales of warmth, effective temperature and sweat-rate scale, and their respective advantages, a statistical study was made of previously gathered data. The measurements were (1) those of environmental conditions, (2) amounts of sweat lost by subjects during four hours to these conditions, and (3) rectal temperatures at end of exposure. The subjects were overall and shorts or shorts only for both work and rest conditions. A comparison of the accuracy of prediction of the physiological reactions from the two scales of warmth was made, the limitations of effective temperatures investigated, and a method for making due allowance for work rate in using the effective temperature scale was derived.

11,952
Chambers, E.G. PSYCHOLOGICAL TESTS FOR ACCIDENT PRONENESS AND INDUSTRIAL PROFICIENCY. Memo. 31, 1955, 30pp. Medical Research Council, London, England.

11,952
This memorandum presents a summary of the main conclusions reached in the course of investigations over 15 years on psychological tests for accident proneness. Approximately 4000 subjects were tested and more than 30 different tests used. In this report the tests are classified and described; the interrelations of the tests given and discussed; the concept of and the nature of accident proneness defined; the relationship between accident incidence and sickness, age, experience, temperature, reporting of accidents, and test scores summarized; the relationship between test scores and industrial proficiency pointed out; and finally, the effect of accident incidence of selection for proficiency is discussed.

11,953
Birtle, W.J. THE PHYSIQUE OF YOUNG ENGLISH MALES. Memo. 23, 1949, 64pp. Medical Research Council, London, England.

11,953
To make a statistical examination of the physique of young adult males in Great Britain, the records of the Medical Boards held in England, Scotland and Wales containing the details of examinations of 91,153 men between the ages of 20 and 21 years were obtained. This group, comprising all men examined between the passage of the Military Training Act of 1939 and the outbreak of World War II, are considered representative of this age group in the country. A full analysis of anthropometric measurements, medical grades, and standards of eyesight, first for the whole country, and then by regions, was made. The material is displayed so as to illuminate, wherever justifiable, questions of broad social interest.
T. R 15

11,954
Weston, H.C. THE RELATION BETWEEN ILLUMINATION AND VISUAL PERFORMANCE. Rep. 67, 1953, 51pp. Industrial Health Research Board, Medical Research Council, London, England.

11,954
This report describes three investigations intended to test a method for determining the illumination required for the efficient performance of any kind of work involving visual discrimination. The first study investigated the effect of size of illumination wherein 18 subjects performed a cancellation task (Landolt broken rings) in six sizes (from one to ten minutes of visual angle) and under six illuminations (from 0.16 to 500 foot-candles). Two studies were made of the effect of brightness contrast with 15 and 12 subjects, the same task (black on white and the reverse) with illuminations from 0.5 to 500 foot-candles. Speed and accuracy data were analyzed in terms of the variables.

11,957
Wyatt, S. A STUDY OF VARIATIONS IN OUTPUT. Emergency Rep. 5, 1944, 16pp. Industrial Health Research Board, MRC, London, England.

11,957
To ascertain whether, and to what extent, a reduction in the weekly hours of work in a number of factories (England) in 1942 had a measurable effect on output, weekly records of piecework earnings of a representative group of workers were examined for the week prior to and for three weeks after reduction. Other factors affecting output such as absences, mechanical and material difficulties, technical improvements, reorganization and personal factors were recorded. In a few factories the output on different shifts were compared. The production data were analyzed for differences that might be attributed to a shortened work week. Implications for industry are discussed.

11,958
Committee on Electro-Acoustics, Medical Research Council. HEARING AIDS AND AUDIOMETERS. Special Rep. Series 261, 1947, 71pp. Committee on Electro-Acoustics, Medical Research Council, London, England.

11,958
This is the report of a committee appointed to determine (1) the practicality of designing a single type of electrically-operated hearing aid which would be small, light-weight, reasonably cheap to produce and would benefit the majority of persons who need them, and (2) to determine satisfactory performance specifications for pure-tone audiometers, for use in early diagnosis and assessment of hearing loss. Herein are set forth the committee's work - the background of theory and experiment together with recommended specifications. The appendices contain details of many of the investigations and recommendations.

11,960

Pierson, M.M., Marriott, F.H.C., & O'Doherty, E.F.
INDIVIDUAL DIFFERENCES IN NIGHT-VISION EFFICIENCY.
Special Rep. Series 294, Feb. 1957, 83pp. Medical
Research Council, London, England.

11,960

This report describes a series of investigations
assessing the part played by sensory acuity in percep-
tion with the use of specialized visual tests adminis-
tered at low illuminations to dark-adapted subjects.
In general, the procedure was to measure the luminance
levels required to resolve black Landolt rings of dif-
ferent sizes by young adult male subjects. The fixa-
tion-and-flash method (detailed in appendix) was used.
The findings are discussed in relation to the filter
and quantum theories. A hitherto unpublished war-time
report on methods of carrying out simple tests of
visual efficiency at low illuminations with formulae
for scoring and estimating accuracy of tests is ap-
pendix.

Garry, R.C., Passmore, R., Wainock, Grace M. & Durnin,
J.V.G.A. STUDIES ON EXPENDITURE OF ENERGY AND CONSUMP-
TION OF FOOD BY MINERS AND CLERKS, FIFE, SCOTLAND, 1952.
Special Rep. Series 289, June 1955, 70pp. Medical Re-
search Council, London, England.

11,961

To study diet and energy requirements in two differ-
ent types of work, a complete record was made of the
food eaten by 19 underground miners and by ten colliery
clerks during one week, and of the calorie expenditure
of these men in all their varied activities both at work
and off duty. The individual inventory method was used
in the dietary survey and the Kofranyi-Michaelis respi-
rometer was used to assess energy expenditure. The data
were analyzed in terms of daily intake and expenditure
in energy (calories). An analysis of the nutritive
value of the diet and the principle sources of energy
in the diet was made. Comparisons between sedentary and
hard work are drawn and discussed.

Walls, G.L. AN AUTODEMONSTRATION OF THE "PHYSIOLOGIC
NYSTAGMUS". Amer. J. Ophthalm., Feb. 1952, 35(2), 231-
235. (University of California at Berkeley).

11,962

A brief historical review of "physiologic nystagmus"
and the theories describing its influence on visual reso-
lution indicates the need for further experimentation to
resolve the conflicting data. Because such work has re-
quired very elaborate equipment and definitive study, a
simple means of obtaining a lot of data ("crude-but-val-
uable") was deemed worthy and therefore is described.

11,963

Macnair, K.H. RESEARCHES ON THE MEASUREMENT OF HUMAN
PERFORMANCE. Special Rep. Series 268, April 1950, 156pp.
Medical Research Council, London, England.

11,963

Several series of investigations are reported here
on psychological research problems relating to men
fighting a war. An attempt was made to develop control-
led methods for studying and measuring behavior in se-
quence and for determining the relations of the items
of behavior as they occur in sequence. The experiments
and results are described under the general categories:
(1) vigilance tests or psychological factors in detec-
tion of either faint visual or auditory signals, and
(2) environmental stress, or effects on human performance
of abnormal atmospheric environments (non-lethal war
gases and high temperatures).

McBuer, D.T. & Krendel, E.S. DYNAMIC RESPONSE OF
HUMAN OPERATORS. Contract AF 33(616) 3080, Proj.
1365, and Contract AF 33(616) 2804, Proj. 1182,
MADC TR 56 524, Oct. 1957, 248pp. USAF Flight Con-
trol Lab., and USAF Aero Medical Lab., Wright-Patterson
AFB, Ohio. (Control Specialists, Inc., and The
Franklin Institute, Philadelphia, Penn.).

11,965

This report presents the results of a concerted ef-
fort to arrive at a suitable mathematical description
of human operator dynamic response. Of primary concern
were operations in which continuous closed-loop control
is exerted in a visual input, manual output tracking
situation subjected to excitation by random appearing
forcing functions. A large body of data, available
from earlier studies and also from concurrent experi-
ments, were studied. A portion of the report is devoted
to the mathematical basis for the models derived and
measurements taken, and possible sources of the remnant.

Ballard, S.S. & Knoll, H.A. (Eds.). THE VISUAL FACTORS
IN AUTOMOBILE DRIVING. Summary Report of Vision Research
Symposium Sponsored by the Armed Forces - NRC Committee
on Vision. Publ. 574, Nov. 1957, 25pp. National Academy
of Sciences - National Research Council, Washington, D.C.

11,966

This is a summary report of the papers and
discussion at a symposium called for the task of
delineating the total visual task in driving a car -
to organize what is now known and help define what is
not known. The papers were organized about (1) the
visual requirements for vehicle driving, (2) the
environment (visual effects of atmosphere and light
levels for night driving), and (3) the visual
capabilities of the driver (detection and recognition
by day and night, color vision, highway sign legi-
bility and visibility, effects of glare, and visual
dynamics in driving).

Tanner, W.P., Jr. WHAT IS MASKING? Contract AF 19 (604) 2277, AFRC TM 57 64, Dec. 1957, 13pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C. (Engineering Research Institute, University of Michigan).

11,967

To re-examine the auditory masking concept three types of experiments on the change in detectability of a tone (through the introduction of white noise, in the presence of an additional pure tone, and when the observer knows that it might have been a different tone) were performed. The results were analyzed in terms of a conventional definition of masking and a masking index conforming to this definition. The implication of the findings for the definition of masking is discussed.

Calabi, L. & Parke Mathematical Lab., Inc. Staff. MATHEMATICAL DESCRIPTION AND EVALUATION OF FUNNEL SYSTEMS WITH AN APPLICATION TO THE NEW YORK TERMINAL AREA. Contract AF 19(604) 1399, Tech. Rep. 4, AFRC TM 57 576, July 1957, 75pp. USAF Navigation Lab., Bolling AFB, Washington, D.C. (Parke Mathematical Lab., Inc., Carle, Mass.).

11,968

In an investigation of systems of airways that would solve the landing aspect of the air traffic problem in the vicinity of a group of airports, the "funnel system" (patterns of well delimited airways conveying all the landing aircraft from pre-established town-to-town airways to the desired landing strip) were selected for intensive study. This report presents a mathematical formulation of those properties of a funnel system which are independent of shape and location, indicates how such a system may be evaluated and suggests a procedure to improve the system. An example for the New York terminal area is given in detail.

McGary, Virginia E., Shipman, Margaret E., Levy, L.M., & Bernstein, L.M. ACCEPTABILITY OF IRRADIATED FOOD CONSUMED BY HUMAN SUBJECTS. Proj. 6-60-11-020, Rep. 200, March 1957, 22pp. USA Medical Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

11,970

To estimate the acceptability of radiation preserved food items, nine or ten human subjects participated in four separate studies consisting of two 15-day periods each. During the first period one-half the subjects consumed a diet of irradiated food items while the other half consumed a similar diet of non-irradiated food. The pattern was reversed in the second period. Percentages of irradiated food items in each diet varied as follows: 35, 61, 80, and 100. Acceptability data were obtained by use of questionnaires with an arbitrary hedonic scale and by personal interview. The data were analyzed for differences between irradiated and control food items.

Fickelstein, Beatrice, & Pippitt, R.G. EFFECT OF ALTITUDE AND OXYGEN UPON TASTE. Proj. 7156, WADC TR 57 261, April 1957, 9pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

11,971

To determine whether taste perception and identification are affected by altitude or breathing pure oxygen, ten young adult males made taste determinations on the ground and after one to two hours in an altitude chamber (25,000 feet, breathing 100 percent oxygen). A separate session was devoted to determining sensitivity to each of four primary tastes (salt, sour, sweet, and bitter). The two sets of data were analyzed and compared as to: taste perception levels, taste identification levels, and ability to identify tastes. The results are discussed in relation to food acceptability problems in high altitude flight.

Dunlap and Associates, Inc. REVISED HUMAN ENGINEERING EVALUATION OF THE DOPPLER SONAR. Contract NORD-17719, May 1957, 6pp. Dunlap and Associates, Inc., Stamford, Conn.

11,975

The Doppler sonar whose function is to provide ship speed over ground, was evaluated from a human engineering point of view to determine human operator difficulties. Recommendations are included.

11,976
Dunlap and Associates, Inc. HUMAN ENGINEERING EVALUATION OF THE JOG LOG. Contract NORD-17719, Memo. Rep. 6, May 1957; 6pp. Dunlap and Associates, Inc., Stanford, Conn.

11,976
The Jog Log (Geomagnetic Electrokinetograph), a shipboard navigation system used to determine local surface current velocity and ship's speed through the water, was evaluated from the human engineering point of view to identify human operator sources of error. Techniques for minimizing these errors are recommended.

11,977
David, E.E., Jr. SIGNAL THEORY IN SPEECH TRANSMISSION. Lab. Transmittion & Circuits Theory, Dec. 1956, CT-3, 232-244. (Bell Telephone Lab., Murray Hill, N.J.).

The process of speech production imposes certain well defined constraints upon the resulting acoustic wave. The constraints are derived from the anatomy of the vocal mechanism which can be described quite accurately as a time-varying linear system excited by a source containing only frequencies much higher than the variational rate. Signals produced by such a process can be represented by parameters which change at the slower rate. These parameters, in effect, describe the constants of the dynamic system and its excitation. They make more efficient use of transmission channelspace than does the original speech, and may be used to synthesize a near replica of the original according to a rate procedure. Some of the systems operating on this principle have been described. They form a group of devices designed to handle signals whose properties confine them to a specific class. As such, they represent an application of the philosophy underlying the signal theory approach to the design and analysis of systems and networks. As this philosophy becomes more widely appreciated, it is to be hoped that these techniques will find wider application and that new contributions to solve the many remaining problems particularly on the instrumentation side will be forthcoming.

Ritter, R.M., Payne, R.B., & Mastey, G.T. THE EFFECTS OF DRUGS AND CONTROLLED PROGRESS FEEDBACK UPON TWO-MEMBER TEAM BEHAVIOR. Rep. 57-58, March 1957, 7pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

11,981
To explore experimentally certain popular beliefs concerning adverse effects of clinical doses of d-amphetamine this study examined the hypothesis that stressful factors in a group-task situation constitute sufficient conditions for the occurrence of such effects. Pairs subjects (96 in all) were trained to operate a two-man coordinator which had been modified to allow dual participation. Following training, the pairs were randomly assigned to eight combinations of four drug treatments, and two misinformative progress-feedback designed to impair intratask harmony. Drug effects were evaluated through measures of task proficiency, manual perspiration, and attitudes toward partner's adequacy.

Dreher, J.J. & O'Neill, J.J. EFFECTS OF AMBIENT NOISE ON SPEAKER INTELLIGIBILITY FOR WORDS AND PHRASES. J. acoust. Soc. Amer., Dec. 1957, 29(12), 1320-1323. (Ohio State University Research Foundation).

11,982
To investigate the effects of noise on speaker intelligibility, 15 naive speakers read words and sentences as noise was delivered to their headsets. Five noise conditions (quiet, 70, 80, 90 and 100 decibels) were used. The speech was recorded without noise and then limited to remove effects of increased vocal intensity. Noise was then added to produce a constant speech-to-noise ratio and played to 200 American listeners. Intelligibility scores were analyzed as a function of noise environment of the speaker. Applications of the results to voice communication devices and audiological testing are suggested.

Crocker, W.E. & Hempleman, H.V. THE DECOMPRESSION PROBLEMS OF DIVING TO 600 FEET. R.N.P. 57/887, UPS 136, DP 17, March 1957, 31pp. Royal Naval Physiological Lab., MRC, Alverstoke, Hants, England.

11,983
To learn more about the physiological limitations to the use of helium for diving and to establish the maximum depth at which a diver can do useful work in connection with rescue of survivors from sunken submarines, previous experience with helium diving was first reviewed. The inadequacy of existing tables of helium decompression was demonstrated and a new method for calculating such tables is described. Application of the method to dives of 300, 450, and 600 feet was made. Recommendations for future diving at these depths are included.

11,988
To examine the rate of interaural effects upon speech intelligibility at high noise levels, "mixed" (speech and noise to one ear and noise alone to the other ear), monaural (speech and noise to one ear only), and binaural (speech and noise to both ears) listening conditions were compared. Noise levels were varied over a range of 100 to 130 decibels; interaural noise ratios and phase were also varied. The results (intelligibility scores) were interpreted in terms of interaction between the intelligibility of speech cross conducted to the other ear and apparent localization in space of speech and noise.

11,986
To determine the degree of validity that may be expected with the Equal Discriminability (ED) scaling technique, two experiments were conducted in which subjects made absolute judgments of the sizes of small circles of light. (1) Five subjects made judgments under different conditions of knowledge of results, range of stimulation, spacing between adjacent stimulus categories, and number of categories. (2) Eighteen subjects made absolute judgments of sizes of five, seven, or nine circles selected from an ED scale constructed in (1). Amount of information transmitted and ED scale functions for the varying conditions were analyzed.

11,989
This study examined the role of binaural directional information in listening to speech against a background of voice babble. The reception of monosyllabic words, presented against a babble of one, two, four, or seven talkers, was compared under two conditions: (1) stereophonic listening (two sets of background talkers were presented, one to each earphone, and the test words were presented binaurally, in phase); (2) control listening (a single set of background talkers and the test words were presented to a single ear). The average percentage of words correctly reproduced by five listeners were compared for the two conditions.

FOR MEASURING THE ABILITY TO READ. Technical
Report, No. 7, 1954, Tech. Rep. No. 7, 1954,
Naval Air Station, Jacksonville, Fla.

11,990
This report describes a direct-reading instrument
(range 95 to 125 degrees Fahrenheit) for measurement
of rectal temperature which is simple to use, light-
weight, and portable. It is also adaptable to single
and multi-point recording. Necessary circuit details
are presented as well as allowable tolerances for the
various components, consistent with a measurement accu-
racy of plus or minus 0.1 degree Fahrenheit. The ef-
fects of individual and cumulative inaccuracies are con-
sidered (e.g., tolerance of components, effect of am-
bient temperature, and so forth) and the tolerance
established for each component.

RELATIONSHIP BETWEEN CARDIOVASCULAR RESPONSE AND POSITIVE
G TOLERANCE. Unpublished Res. Proj. No. 11-01-11, Subtask 1
Rep. 11, May 1958, App. USN School of Aviation Medicine,
Naval Air Station, Fla.

11,992
To determine the relationship between several pre-
run clinical measures of cardiovascular response and
criteria of visual impairment occurring during centri-
fuge, 52 subjects, ranging from 18 to 35 years of age,
were studied. Five cardiovascular measures were taken
for each subject and related to: (1) g level of grey-
out, (2) time from onset of peak g to onset of greyout,
(3) g level of blackout, and (4) time from onset of
peak g to onset of blackout. The task was to respond
(press a button) to both central and peripheral lights,
presented randomly, while undergoing acceleration. The
results are discussed in terms of prediction of man's
g tolerance.

Willmuth, H.G., Taylor, E.L., Lichstein, M.B. & Bush, F.L. A FACTOR ANALYSIS OF RATING
SCALE VARIABLES USED AS CRITERIA OF MILITARY LEADERSHIP. Contract AF 18(600) 445, Proj. 2730
(50% 019 0001), Res. Rep. AFPTAC TN 57-104, Dec. 1957, 10pp. NAAC Review for Medical Sciences
Pittsburgh, Randolph AFB, Tex.

Peer ratings of anticipated leadership on a scale covering 14 aspects of effective leaders-
hip and on an over-all leadership ranking were obtained for 117 officers attending the
Squadron Officers Course at Maxwell Field, Alabama. An intercorrelation matrix derived
from these leadership ratings and factual data on rank, age, education, and years of service
was factor analyzed by Thurstone's complete centroid method. The 7 factors obtained were
related orthogonally to the criteria of position, military and single structure, a priori
probable factors were tentatively identified as proficiency in administrative activity,
military service, interpersonal relations, responsibility, ethical officer conduct, and
command presence. Regression weights of the items for the factors were determined as well
as the intercorrelations and reliabilities of the 6 factors identified.

West, L.J. REVIEW OF RESEARCH IN TYPEWRITING LEARNING WITH RECOMMENDATIONS FOR TRAINING.
Proj. 7714, Res. Rep. AFPTAC TN 57-69, June 1957, 101pp. NAAC Review for Medical Sciences
Colo.

This review covers the research in typewriting from the earliest known studies through
mid-1956; it is reported in such a way as to provide explicit guidance for the conduct of
typewriting instruction through the utilization of the training recommendations. The materi-
al is developed and discussed in the following sections: the nature of the typing learning
process; technique aspects of typing learning; learning the typewriter keyboard; developing
typing speed; accuracy development; speed vs. accuracy emphasis; miscellaneous instructional
procedures and materials; equipment factors and the working environment; practice time arri-
gements; fatigue and other motivational factors; typical progress in typing learning; test-
ing, grading and standards of achievement; and summary of recommendations for training.

Walter, J. SELECTING SUPERVISORS WITH PEER RATINGS. *Personnel Psychology*, Spring 1958, 11(1), 75-85.

Four nominations on a 14-item questionnaire were made by a group of life insurance agents. There were 2 general kinds of items: work-oriented and socially-oriented. Some of the agents were subsequently promoted to a supervisory position. After they had been on the job for 6 months, they were rated in terms of how good a job they were doing in their new position. The ranks of peer nominations for each of the items were then related to the criterion rating. It was found that this type of nomination is very useful in identifying potential supervisory personnel and is quite predictive of performance.

Marron, H.B., Schuster, B.M., French, R.S., Latina, R.J., et al. DEVELOPMENT AND EVALUATION OF A TROUBLESHOOTING AID FOR FLIGHT-LINE MAINTENANCE OF A COMPLEX ELECTRONIC SYSTEM. Contract AF 41(657) 44, Proj. 7702, Task 37301, Dev. Rep. AFTRC TN 58-1, Jan. 1958, 29pp. USAF Maintenance Lab., Lowry AFB, Colo.

A study was conducted to determine whether an effective and logical troubleshooting aid for complex electronic systems could be developed for use by relative inexperienced flight-line mechanics. In this study, the investigation of the feasibility of such a troubleshooting aid was made for the K Bombing Navigation System. A Trouble Locator in booklet format was developed and evaluated. A "procedure-oriented" approach to identify malfunctioning loops supplemented by a "symptom-oriented" approach for within-the-loop troubleshooting was found to be desirable; both procedures were incorporated in the final Trouble Locator. A limited evaluation in the field and on a bench mockup demonstrated that this type of troubleshooting aid for complex electronic systems was practical. It is recommended that consideration be given to developing Trouble Locators of this nature as an integral part of position-oriented handbooks.

Marron, H.B., Bossett, V.F. & Ford, J.S. AN EXPERIMENTAL ANALYSIS OF ACHIEVEMENT IN A GENERALIZED ELECTRONIC TROUBLESHOOTING COURSE. Contract AF 41(657) 44, Proj. 7709, Res. Rep. AFTRC TN 57-147, Dec. 1957, 36pp. USAF Maintenance Lab., Lowry AFB, Colo.

This report summarizes an experimental study of the effects of a) 3 levels of generalized training practice on troubleshooting problems and b) 3 levels of general ability (California Test of Mental Maturity) on troubleshooting achievement. 16 standardized tests of special abilities were also given. Achievement was measured by scores on a written test designed to measure conceptual understanding of troubleshooting, and on performance on problems presented in the Generalized Electronic Troubleshooting (GETS) Trainer. 3 performance scores were used: number of actions taken, time taken, and a composite score. Subjects were 90 high-school males, 16-19 years old, with mental ages from 156 to 253 months. Apparent relationships of mental age and training level with troubleshooting achievement varied according to the achievement score used. All the achievement scores were more significantly related to specific mental abilities, especially evaluative reasoning, than to general ability, as measured. Effects of increased practice seemed limited to the more difficult problems. In general, the generalized troubleshooting training increased efficiency in utilizing symptom information.

11,999

To investigate the degree to which Arctic clothing restricts body movements, 15 tests of performance were used. All subjects (71) performed each test under two conditions: in shorts at 70 degrees Fahrenheit and in full Arctic uniform at zero degrees Fahrenheit. Five scores were obtained on each test and analyzed for effects of clothing, interactions and trials. Each test was further evaluated for its usefulness in discriminating clothing effects. The usefulness of the tests as tools in human engineering of clothing and equipment systems is discussed.

Gerlough, D.L. CONTROL OF AUTOMOBILE TRAFFIC - A PROBLEM IN REAL-TIME COMPUTATION. Reprint 66, Dec. 1957, 75-79. Institute of Transportation and Traffic Engineering, University of California at Los Angeles.

12,005

This paper considers the problem of improving automobile traffic by some control system that takes advantage of the abilities of the large-scale automatic computer. The extremes of the control spectrum as seen by the engineer are represented by the manual system (comparing present traffic with stored information on past traffic behavior, and supplying information to the driver as to how to proceed) and the automatic system (driver does not have direct control of the vehicle as long as it is in the system). The advantages and limitations of these systems are discussed and a system of the future is outlined. Problems in development and research are discussed. G. R 15

Blackman, M.M. COMMUNICATION AS A GAME. Contract DA 36 039 SC 71053, Tech. Memo EDL M102, April 1957, 12pp. Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.

12,006

This paper considers the case of the communicator contending with forces that tend to disrupt communication, both natural and man-made effects. Channel capacity C represents the best the communicator can do against a given type of interference, and communication system capacity K is defined as the best the interferer or jammer can do against a given system. Conditions wherein the jammer can cause information loss by appropriate type of interference and where the communicator can prevent this by use of an appropriate system are defined. Conditions for successful and unsuccessful communications are discussed. R. 3

Briggs, G.E., Fitts, P.M. & Bahrick, H.P. TRANSFER EFFECTS FROM A SINGLE TO A DOUBLE INTEGRAL TRACKING SYSTEM. J. exp. Psychol., 1958, 55(2), 135-142. (Ohio State University).

12,008

To investigate the effect of lag characteristics of a physical system on learning and performance of a complex tracking task, a transfer of training study was performed. The basic task was a two-dimensional compensatory tracking situation with a step-function input. Original training involved tracking through a single stage integration in the X-axis (velocity control system) and transfer to a system requiring tracking through a double integration (acceleration system). Amount of practice on the single integral system was varied for 0, 10, 30, and 50 trials. Performance on the transfer task was evaluated in several ways. T. G. I. R 9

Chomsky, N. & Miller, G.A. FINITE STATE LANGUAGES. *Information & Control*, May 1958, 1(2), 91-112. (Massachusetts Institute of Technology).

12,011

A finite state language is defined as a finite or infinite set of strings (sentences) of symbols (words) generated by a finite set of rules (the grammar), where each rule specifies the state of the system in which it can be applied, the symbol that is generated, and the state of the system after the rule is applied. A number of equivalent descriptions of finite state languages are examined and a structural characterization theorem established. The algebra of finite state languages is explored and procedures for calculating the number of grammatical strings of any given length are also described.

Shaw, M.E. SOME MOTIVATIONAL FACTORS IN COOPERATION AND COMPETITION. *J. Pers.*, June 1958, 26(2), 150-169. (Massachusetts Institute of Technology).

12,013

Two experiments are reported which attempt to isolate the motivational factors in cooperation and competition by using a task which is intrinsically interesting to the subject and by making performance dependent upon the subjects own efforts regardless of whether he believed himself to be in a cooperative or in a competitive situation. Two subjects were used in all experiments. A tracking task was utilized in Experiment I with modifications to permit usage by two persons. Experiment II used a drastically modified version of the Yerkes multiple-choice apparatus. Three experimental conditions were induced for each subject in both experiments: (1) a condition perceived as cooperative by the subject, (2) one seen as competitive, and (3) one in which the subject worked alone.

Shaw, M.E. SOME EFFECTS OF INELEVANT INFORMATION UPON PROBLEM-SOLVING BY SMALL GROUPS. *J. Pers. Psychol.*, 1958, 27, 33-37. (Dept. of Psychology, Johns Hopkins University).

12,014

This experiment tested the hypothesis that increasing task complexity will increase the relative inefficiency of the more centralized communication net primarily by enhancing the likelihood of saturation. The star and common net were used with 12 groups of four subjects placed in each net. An arithmetic problem-solving task was used with half of the groups in each net being given only problem-relevant information and the other half problem-irrelevant and problem-irrelevant information. Data were treated by analysis of variance. The effect of irrelevant information upon each net is discussed in terms of differences in time to reach solution, the number of message units transmitted, and ratings of satisfaction by the subjects.

Bass, E.M., Flint, A.W. & Pryor, Margaret W. EFFECTS OF STATUS-ESTEEM CONFLICT ON SUBSEQUENT BEHAVIOR IN GROUPS. Contract N7 ONR-35609, Tech. Rep. 10, April 1957, 10pp. USN Research Lab., Washington, D.C. (Louisiana State University).

12,015

This study attempts to reproduce in the laboratory the hypothesized effects of status-esteem conflict under conditions of varying motivation i.e., group effectiveness will decrease if persons of high status are of low esteem. Groups (34) of five ROTC candidates, varying in degree of interest in entering Advanced ROTC, participated in a rank ordering task. Status was determined by sociometric ratings in which each subject evaluated the other subjects in reference to their candidacy to Advanced ROTC. Esteem was determined by each member's evaluation of the other four in his group. Predictions of subsequent effectiveness, cohesiveness and time to reach a group decision were made.

Ralph, D.C. SPECIAL REPORT ON THE WILLIAMSBURG CONFERENCE. Rea. Rev., June 1956, 2(2), 2-11.

12,018
A conference convened "to generate new ideas for traffic-safety research, particularly in the field of human behavior" is reported here. Three major topics were considered and summary reports prepared: (1) a systems approach to traffic flow and driver behavior; (2) the psychology of driver behavior; and (3) the social context of the automobile, its use and regulation. Appendices amplify the research suggestions that are given in the summaries.

Williams, H.L. RELIABILITY EVALUATION OF THE HUMAN COMPONENT IN MAN-MACHINE SYSTEMS. Elect. Engin., 1956, 76-82. (Nelpar, Inc., Falls Church, Va.).

12,019
The need of the designer of complex systems for quantitative estimates of operator reliability to supplement qualitative estimates is discussed. Probability analysis methods similar to those employed by equipment reliability engineers is proposed as one means of obtaining this information. The use of these methods is illustrated by a specific example. The advantages of the quantitative method are discussed.

Dwyer, P.S. MATHEMATICAL PROCEDURES AND MULTIPLE CRITERIA FOR ASSEMBLY OF LARGE WORK GROUPS. Contract AF 41(657) 9, Proj. 7713, AFTRC IR 57-9, Oct. 1957, 26pp. USAF Operator Lab., Randolph AFB, Tex.

12,020
To develop mathematical procedures for assembling individuals in large work units and multiple criteria for assembly when group scores are known, the following methods were studied: (1) the method of reduced matrices as applied to the group assembly problem, (2) an approximate solution using deviates, (3) the adaptation of both solutions to electronic digital computers, and (4) the use of the methods in handling problems with multiple criteria, assembly scores subject to error, and related problems.

Miller, R.S. AN ANALYSIS OF SOME PHASES OF THE CONTROL OF AIR TRAFFIC. Reprint 173, May 1958, 4pp. Franklin Institute Labs. for Research & Development, Philadelphia, Penn.

12,021
To examine the possibility of using speed control to smooth the flow of air traffic arriving at a terminal area, an analytical study was made of the desirable size of the speed control area and methods for insuring that aircraft will stay on schedule while in the area. General equations were developed and some traffic samples were subjected to various speed control rules. Many of the practical considerations were studied. Recommendations for needed research are made.

Amundson, R.J., & Kroski, J.S. THE GAME-THEORETIC ASPECTS OF AIR DEFENSE. Bell Telephone Labs. Contract AF 18(600)-422 and NEDC Contract 18(600)-332, July 1955, 7pp. Analytical Research Group, Princeton University.

12,022
This study deals with the problem of air defense from a game-theoretic standpoint. The class of problems considered may be described as follows: there is an attack formed by a number of attacking units and a defense which has at its disposal a number of offensive weapons (missiles). The problem is to decide how many missiles the defender must have available in order to be certain of destroying a definite proportion of attack units. The incompleteness of information available to the defender is studied by making various mathematical assumptions.

Craig, J.H., Scaplan, C.C., Stanton, C.L., & Van Wyman, K.G. STUDY OF AIR TRAFFIC IN THE HIGH-DENSITY AREA OF NORTHEASTERN USA AND FORECASTS FOR 1960-65. Contract DA 36-03950-64567, Task 4, Part 4, Interim Rep., Dec. 1956, 47pp. Air Navigation Development Team, CAA, Washington, D.C. (Bell Telephone Labs., Inc., Murray Hill, N.J.).

12,023
As one phase of a task calling for over-all planning of an air-ground communication network suitable for Air Traffic Control, a study was made of air traffic in a high density area of northeastern United States in order to obtain information concerning number of air planes to be served by the Air Traffic Control system. A statistical approach was used to gather traffic data covering 1955, which were then extended into forecasts for 1960 and 1965.

Szandner, F. THE DETERMINATION OF THE PRODUCTION OF INDUSTRIAL CONCERNS. ATIC 258560A, FTS 8677/III, 1954, 19pp. USAF Air Technical Intelligence Center, Wright-Patterson AFB, Ohio. (Budapest, Hungary).

12,024
Production capacity of industrial concerns is here considered to be based upon computations of the production capacities of the single production equipment. The most important elements and procedures of these computations as applied to heavy industry are discussed. An example of these procedures applied in the determination of the capacity of the forging plant of a machine factory is presented.

Dunlap and Associates, Inc. SOME FACTORS PERTINENT TO A MAN-MACHINE SYSTEMS ANALYSIS OF THE SSGN FOR THE FBW SYSTEM. Contract NORD 17719, Memo. Rep. 8, July 1957, 6pp. Dunlap and Associates, Inc., Stamford, Conn.

12,025
This brief report discusses the specific circumstances in the SSGN system which requires a systems analysis evaluation concurrent with human engineering work on the subsystem, Fleet Ballistic Missiles. The general approach to be used, types of information to be derived and the nature of its application to SSGN human engineering problems are discussed.

12,026
Francis, P.G. THE UTILIZATION OF CERTAIN ELECTRONIC SYSTEMS IN PERFORMANCE OF MANAGEMENT FUNCTIONS. M.A. Thesis, 1957, 59pp. The Ohio State University.

12,026
Following a brief history of communications and definitions of management functions, several electronic systems are described in relation to the management function of planning, organizing, and control. These are: (1) the digital electronic data processing system, (2) microwave and forward scatter communications systems, and (3) mobile two-way radio systems.

The RAND Corporation. SECOND TOOLING-UP REPORT OF LOGISTICS SYSTEMS LABORATORY. (JANUARY-FEBRUARY 1957). RM-1961, Aug. 1957, 181pp. The RAND Corporation, Santa Monica, Calif.

12,027

The objectives of this study were primarily concerned with further development of simulation techniques and secondarily with a comparison of the operation of two Weapon Systems having somewhat different support systems: (1) current Air Force distribution and (2) an alternative set of presumably preferable policies and procedures. This report describes the basic structure of the simulated organization and its laboratory set-up; compares it with a previous simulation; describes the various special experimental conditions; analyzes the output data; and draws conclusions for future simulation projects.

Berkowitz, R.S. TRAFFIC LOAD CONSIDERATIONS FOR GRID COMMUNICATIONS SYSTEMS. DA-36-039-sc-63143, Proj. AC-27-U-M-2, May 1957, 37pp. The Institute for Cooperative Research, University of Pennsylvania.

12,029

This report presents a study of some properties of the army grid system for long distance communications. This system consists of a number of exchanges which are regularly spaced (ten to fifty miles apart) with some form of radio communications linking them. Each exchange has an operator, subscribers, and a dialing system to determine route by which calls are completed. To determine relations between traffic handling capability and amount of equipment used, dialing routines are postulated and criteria set up by which different dialing routines can be evaluated. Methods are also developed for comparing relative effectiveness of different grid arrangements.

Legg, J.C., Jr. RADAR-AIR TRAFFIC CONTROL SYSTEMS EXPERIMENT NO. 1, TARGET IDENTIFICATION VS. NO TARGET IDENTIFICATION. NADC TN 57 288, Sept. 1957, 27pp. USAF Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.

12,030

To compare radar control of air traffic using continuous clock-code type identification with radar control using no target identification, tests were given which simulated a high density traffic area utilizing one field, one runway, a Ground Control Approach radar, and one subject controller. Several basic problems were tested under both conditions by each of four experienced controllers. Data recorded and analyzed were fuel consumption and control time per aircraft, general off-scope hold time, number of aircraft, and number of heading requests.

Behrck, H.P., Flitts, P.M., & Briggs, G.E. LEARNING CURVES - FACTS ON ARTIFICIAL INTELLIGENCE. Ball, May 1957, 24(3), 256-268. (Ohio Wesleyan University, Delaware, Ohio).

The purpose of the research reported here was to demonstrate how the form of learning curves might be determined in a large measure by changes in the sensitivity of performance in- dicants at various stages of practice. Empirical learning curves based upon the most commonly used performance measures in tracking tasks were examined. These were "time-on-target" scores which reflected the amount of time during a trial that a S was able to remain within an arbitrarily specified region around a moving target. The curves, obtained by scoring an error voltage simultaneously with reference to 3 target sizes, became differentially sensitive to improvement at various levels of skill. One curve might show a rapid improvement while the other failed to reveal any, and vice versa. It was shown that this problem applied to all situations where learning resulted in diminished variance of a response distribution but performance was scored according to an all-or-none criterion. A statistical method was developed to correct for the changed sensitivity of scoring at different stages of practice. The best single measure of tracking performance was the root mean squared error. Cohen, J., Dearmaley, E.J. & Hansel, C.E.M. THE RISK TAK. IN DRIVING UNDER THE INFLUENCE OF ALCOHOL. Brit. Med. J., June 1958, 1, 1438-1442. (University of Manchester, England).

12,032

To assess the effects of alcohol on the complex psychological processes and performances involved in risks which drivers of automobiles take and the hazards which they incur, three groups of experienced bus drivers were studied. The experimental session began after an eight-hour morning shift and a supervised lunch. Alcohol in the form of Scotch whiskey was given to only two groups in doses of two or six British fluid ounces. The driver's task was first to estimate how successful he would be in driving a bus through gaps of varying widths and then to drive the bus through particular gaps. The performance of the three groups was compared.

Cramer, E.M. & Higgins, M.M. CREATION OF PITCH THROUGH BINOMIAL INTERACTION. *J. acoust. Soc. Amer.*, May 1958, 30(5), 413-417. (Johns Hopkins University, Baltimore, Md.).

This paper is an investigation of the phenomenon which was observed by Higgins in 1953. Higgins found that a binomial stimulus gives a fairly clear perception of pitch although the separate stimuli to the 2 ears give no such perception. The basic stimulus consists of white noise introduced into one ear while the same white noise, phase-transformed in a narrow band of frequencies, is introduced into the other ear. A practiced subject listening to this stimulus reports a faint pitch quality which is judged to sound about the same as narrow-band filtered noise. A forced-choice technique was used in which 6 subjects were asked to judge the direction of the pitch change when the frequency band over which the phase shift occurs was changed. The control consisted of the same stimulus presented to the 2 ears. Data are presented indicating the relationship between the percent of correct judgments and the 3 experimental variables, frequency, band width, and intensity level.

Shoenaker, H.A., Brown, G.H. & Whittenmore, Joan M. ACTIVITIES OF FIELD RADIO REPAIR PERSONNEL WITH IMPLICATIONS FOR TRAINING. Tech. Rep. 48, Task I, May 1958, 116pp. Human Resources Research Office, The George Washington University, Washington, D.C.

In this study data were obtained on the activities of 1,085 field radio repairmen (MOS 296) assigned to a variety of field units in the Continental United States and in the U.S. Army in Europe. Such techniques as questionnaires, check lists, and interviews were used to: a) identify skills and knowledge critical to the repairman's job, b) obtain evaluations from repair and supervisory personnel on training in relation to the job, and c) determine field requirements to be used in developing a field-oriented proficiency test. Recommendations are given for changes in emphasis and modification in the Field Radio Repair Course.

Sedle, L.M. & Webb, W.B. ACCIDENT DATA, INSTRUCTOR COMMENTS, AND STUDENT QUESTIONNAIRE RESPONSES AS INDICATORS OF TRANSITION TRAINING PROBLEM AREAS. Bu Med Surg Proj. NM 14 01 11, Subtask 7, Rep. 1, April 1958, 7pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,036

To determine whether analyses of accident data, instructor comments, and student responses to training difficulty will yield information relevant to transition effects as students change from a common aircraft to two dissimilar aircraft, such data were gathered from students undergoing Naval Air Training. One group was transitioning from a propeller aircraft to jet powered aircraft; the other to a more advanced propeller driven aircraft. Frequency analyses were made and the findings discussed in a post hoc manner within the transfer of training model.

Ray, J.T., Passey, G.E., Adams, O.S., Smader, R.C., et al. A TECHNIQUE OF JOB ACTIVITY DESCRIPTION FOR NEW WEAPON SYSTEMS: TASK-EQUIPMENT ANALYSIS. Proj. 7735, AFMTRC TR 57-13, Dec. 1957, 66pp. USAF Maintenance Lab., Lowry AFB, Colo.

The recognized need for early identification of personnel and training requirements for the effective use and maintenance of new weapon systems has led to efforts to develop new techniques that will yield detailed descriptions of job activities before the equipment which generates those personnel requirements has been developed. This report describes work done under Contract No. AF 41(657)-67 by Lockheed Aircraft Corporation, Marietta, Ga., which produced one feasible procedure for preparing position-oriented behavioral descriptions of job tasks--the task-equipment analysis (TEA). This technique resulted from a logical analysis of the problem and experience in developing prototype TEAs for 3 maintenance positions for the C-130A aircraft. The recommended procedure is described in detail with examples. A cross-index of equipment components and job duties is included. Since the procedure was developed in the context of the C-130A aircraft and for maintenance positions only, it may need to be modified for applications to missile systems and operator duties. Further review and test of the procedure is recommended.

Green, D.M. DETECTION OF COMPLEX AUDITORY SIGNALS IN NOISE, AND THE CRITICAL BAND CONCEPT. Contract AF 19-604-2277, Tech. Rep. 82, April 1958, 78pp. Dept. of Electrical Engineering, University of Michigan.

12,039

This thesis is concerned with a study of the auditory frequency analysis process, in terms of the critical band theory as proposed by Fletcher. Following a critical review of the literature, two experiments concerning the detection of complex auditory signals in noise are presented. The first experiment employed two sinusoidal stimuli as a complex signal with duration and frequency of separation of the signal as parameters. A mathematical model is presented which describes the data obtained. The second experiment used band limited white Gaussian noise as the signal and a statistical model derived. As a result of both experiments a general model of the receiving mechanism is proposed.

Greer, F.L., Pearson, W.O., & Havron, H.D. EVASION AND SURVIVAL PROBLEMS AND THE PREDICTION OF CREW PERFORMANCE. SUPPLEMENT 1: PREDICTOR INSTRUMENTS. Contract AF 41(657) 65, Proj. 7723, AFTRC TR 57 14, Dec. 1957, 29pp. USAF Office for Social Science Programs, Lackland AFB, Tex.

This research was undertaken to develop a criterion evasion-and-survival field problem that would reflect in kind and in relative importance the critical situations a group of men might encounter if they went down behind the enemy lines. An effort also was made to identify questionnaire-type instruments that would predict crew performance, as measured by the criterion problem. The predictor instruments and scoring keys used in this study of crew performance are reproduced here. The rationale for their development from USAF Survival Training School are presented in the Technical Report to which this is Supplement 1, as well as the findings are presented in the Technical Report to which this is Supplement 1.

12,040

Greer, F.L., Pearson, W.O., & Havron, H.D. EVASION AND SURVIVAL PROBLEMS AND THE PREDICTION OF CREW PERFORMANCE. Contract AF 41(657) 65, Proj. 7723, AFTRC TR 57 14, Dec. 1957, 55pp. USAF Office for Social Science Programs, Lackland AFB, Tex.

This report, which has 2, separately bound supplements, summarizes research and development of a criterion evasion-and-survival field problem designed to reflect in kind and in relative importance the critical situations a group of men might encounter if they went down behind the enemy lines. An effort also was made to identify questionnaire-type instruments that would predict crew performance as measured by the criterion problem. The crew survival capability test (CREVSAT) involved a 6-hour problem covering a 2-mile course. This was administered to 76 crews from USAF Survival Training School. Results for the criterion problem and predictor instruments were analyzed for 60 crews. Comparisons with previous Army studies are made.

Fenster, C.B. & Sapon, S.M. AN APPLICATION OF RECENT DEVELOPMENTS IN PSYCHOLOGY TO THE TEACHING OF GERMAN. *Harvard Educ. Rev.* 1958, 28(1), 12pp. (Indiana University Medical Center, & Ohio State University, Columbus, Ohio).

This paper describes a technique for the teaching of German which permits every student to "teach himself" at a rate appropriate to his own skill and which ensures that the student will follow an explicit study process. The reinforcement principle immediately applied to small units of the learner's behavior is the salient characteristic of the instructional materials thus designed. Other psychological principles evident include: small amount of work per reinforcement; controlled introduction of new vocabulary; control of overlearning; conceptual principles learned before verbalized; graded difficulty level; and sufficient practice plus continuous mastery. The material was administered to 28 Ss and each S's performance assessed by vocabulary and English to German translation tests. With a mean time of 47.5 hrs., the Ss learned an amount comparable to that in a first-semester course. Based on specific findings some modifications in the material and methods were derived. (NEIAS)

Garner, W.R. HALF-LOUDNESS JUDGMENTS WITHOUT PRIOR STIMULUS CONTEXT. *J. exp. Psychol.*, May 1958, 55(5), 482-485. (Johns Hopkins University).

12,048
To explore the feasibility of eliminating context effects in obtaining judgments of loudness, 135 different subjects were required to make a single half-loudness judgment with the method of constants. The task was to state whether the second of a pair of tones was more or less than half as loud as the first upon one presentation and with no practice. The first (standard) tone at 90 decibels was the same for all subjects; the second varied from 55 to 85 decibels for different subjects. The data were analyzed as a function of loudness and a least-squares solution of the normal ogive obtained. The half-loudness value thus derived is discussed in relation to other data.

Annett, J., Gilly, C.W. & Kay, H. THE MEASUREMENT OF ELEMENTS IN AN ASSEMBLY TASK - THE INFORMATION OUTPUT OF THE HUMAN MOTOR SYSTEM. *Quart. J. exp. Psychol.*, Feb. 1958, 10(1), 1-11. (Institute of Experimental Psychology, University of Oxford, England).

12,049
To compare two techniques for measuring skilled movements, the performance of three well-practiced subjects on an assembly task was analyzed using both an electrical contact technique and high-speed film recording. The task consisted of transferring a row of pegs into a parallel row of holes eight inches away. Difficulty of task was varied by using four different hole diameters. Differences between the analyses were examined and discussed. An information analysis of the output of the motor response was applied to the data and discussed in terms of the constancy of human channel capacity.

Fletcher, J.L. HEARING LOSSES OF PERSONNEL EXPOSED TO IMPULSE AND STEADY STATE NOISE. AMRL Proj. 6-95-20-001, Rep. 355, Aug. 1958, 9pp. USA Medical Research Lab., Fort Knox, Ky.

12,050
To study hearing loss differences between personnel working for varying lengths of time in impulse or steady state noise, audiograms and hearing - data sheets were collected on a large number of servicemen and civilian employees at Fort Knox, Kentucky. From these records were selected 105 range operators primarily exposed to impulse noise and 60 (Post Ordnance and Automotive Department) primarily exposed to steady noise. Hearing-loss data from the two groups were compared for three different lengths of exposure: one to 39, 40 to 79, and over 80. Recommendations for the practical uses of the results are included.

Miller, R.B., Meister, D. & Feroplia, M.E. SOURCES OF MAINTENANCE JOB INFORMATION: IV. DEVELOPMENT OF INFORMATION FOR ANTICIPATING MAINTENANCE JOB REQUIREMENTS OF NEW ELECTRONIC SYSTEMS. Contract AF 18(600)-1203, Proj. 7709, ASPRL TX 55 16, Aug. 1955, 23pp. USAF Armament Systems Personnel Research Lab., Lowry AFB, Colo. (American Institute for Research, Pittsburgh, Penn.).

12,058
This report presents the implications of a study of the kinds and sources of information required for anticipating, during early stages of equipment development, the job and training requirements for maintenance of electronic equipment. In the study (reported elsewhere) records and other data from the developmental histories of two Air Force electronic systems were analyzed. Included in this report are the following: overview of maintenance job duties-line and ship, maintenance job information, systems products as sources of information, and the usefulness of products in deriving maintenance job information. Poulton, E.C. ON PREDICTION IN SKILLED MOVEMENTS. *Psychol. Bull.*, Nov. 1957, 54(6), 467-478. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,059
This article discusses the role of prediction in skilled movements by first analyzing a single activity, pursuit or two-pointer tracking in one dimension. A tabular presentation is made of the kinds of acquisition involved in tracking, the predictions which have been made to carry out each successfully, and suggests names. The second analysis attempts to show how similar principles are involved in everyday skills. Classification of such skills, the predictions needed in each case, and a suggested terminology are presented. T. R 43

Poulton, E.C. COPYING BEHIND DURING DICTATION. *Quart. J. exp. Psychol.*, Feb. 1958, 11, 47-55. (Applied Psychology Research Unit, Medical Research Council, Cambridge, Eng. and).

Simple prose was presented in groups of 1, 3, or 6 words with silent intervals between groups. The overall rate of presentation was equated for the 3 conditions to about twice as fast as the subjects could print in capital letters. They were instructed to continue printing until they could not remember what came next, and then to start again at once with the next word which they heard. The same passages were presented 3 times. On the first presentation an error-free ear-hand span of 14 words was found. This is within the range of the extreme spans reported by Bryson and Haster, and is larger than the spans reported for other receptors and effectors. Presenting 5 words at a time gave only slightly larger spans than presenting fewer words more frequently. The subjects tended to give up at positions related to punctuation, presumably because they stored the material according to its syntax and meaning. The span size of the differences found between the 3 methods of presentation was partly attributed to this. R 12

 Poulton, E.C. PURSUIT-TRACKING WITH PARTIAL CONTROL OF THE INPUT. *Brit. J. Psychol.*, Dec. 1957, 70(4), 631-633. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,061
 To investigate the effect upon pursuit tracking performance of partial control by the operator of the input, eight subjects were given practice tracking a simple harmonic and a more irregular input on a pursuit tracking device without any input control and with an added handwheel controlling the frequency of the input. A continuous record of the input frequencies and errors for both conditions was made and analyzed for differences. The results are discussed in terms of the role of anticipation in performance of such tasks.

 Conrad, R. & Hille, Barbara A. MEMORY FOR LONG TELEPHONE NUMBERS. *Psych. Office. Telecomm. J.*, Autumn 1957, 10(1), 37-39.

Some experiments are described in which groups of telephone operators were tested to determine how the presentation of long telephone numbers affects their ability to remember them. Numerals vs. letters were first compared using 8-, 9-, and 10-item combinations of all letters, letters and numerals, numerals and letters, and all numerals; all numeral and all letter combinations were found to be inferior to letters and numerals, though all numerals was only slightly inferior and all letters was most difficult. Size of numeral vocabulary--2, 4, or 8--was then varied for 8-, 9-, or 10-digit numbers; memory span was found to decrease not only with longer numbers, but with reduction of vocabulary size. Grouping of digits was then examined; a normal decimal vocabulary of 9-digit numbers was spoken in 1 to 5 subgroups. The 2 sub-group condition was most favorable. Implications for subscriber numbers are described. (NEIAS)

 Bursill, A.E. THE RESTRICTION OF PERIPHERAL VISION DURING EXPOSURE TO HOT AND HUMID CONDITIONS. *Quart. J. exp. Psychol.*, Aug. 1958, X(3), 113-129. (University of Aberdeen, Scotland).

12,063
 To investigate the effects of high thermal condition on attention (defined here as the degree to which an operator can successfully notice and respond to peripheral stimuli while engaged upon a continuous central task), 11 heat-acclimatized subjects were exposed to temperatures of 70/60 and 105/90 degrees Fahrenheit on a dry/wet bulb scale (air velocity 120 feet per minute). They were required to respond to peripheral visual signals, presented randomly in order and time, at six positions, 20, 50, and 80 degrees left and right of point of fixation, while engaged in a continuous pursuit meter task. Performance data on both tasks were analyzed for effects of thermal stress.

 Poulton, E.C. MEASURING THE ORDER OF DIFFICULTY OF VISUAL-MOTOR TASKS. *Ergonomics*, May 1958, 1(3), 234-239. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,064
 To investigate a technique for measuring the relative difficulty of visual-motor tasks, two dial-watching operations in which the subject was required to respond each time the dial-hand reached certain points were studied. A two-dial and a six-dial task, with identical total rate of required responses were performed by a control group of six subjects. A simple listening task was performed by a comparable group of six and then combined with the dial-watching tasks with instructions to give first consideration to the dials. Error scores for the various conditions were analyzed for relative difficulties of the two tasks with and without the subsidiary auditory task.

 Jones, C.E., Kobrick, J.L. & Gaydos, H.F. ANTHROPOMETRIC AND BIOMECHANICAL CHARACTERISTICS OF THE HAND. Proj. 7 83 01 005, Tech. Rep. EP 100, Sept. 1958, 16pp. *USA Quartermaster Research & Engineering Center*, Natick, Mass.

12,065
 Descriptive data are presented on the structural and functional characteristics of the human hand, which are of interest to engineers concerned with the design of handwear and manually operated equipment. The first section deals with the anthropometric dimensions of the hand and shows the centile distribution of component hand sizes in several military population samples. The second section reviews data on the biomechanics of the hand in terms of direction, range, and forces involved in typical functional movements.

 Wilkinson, R.I. THE EFFECTS OF SLEEP LOSS ON PERFORMANCE. A.P.U. 323/58, April 1958, 36pp. *Applied Psychology Research Unit*, Medical Research Council, Cambridge, England.

12,066
 This report presents eight of ten experiments aimed at defining more precisely the task situation in which performance is likely to be impaired by moderate sleep loss (approximately 30 hours without sleep). A wide variety of task situations (e.g., short tests, both complex and simple; vigilance tasks; prolonged complex tasks; and serial reaction tests) were included in the experimental procedure. Data are discussed in relation to the effect of sleep loss on each type of task. Conclusions are discussed in detail and prospective areas for further research are indicated.

 Pepler, R.D. WARMTH AND LACK OF SLEEP: ACCURACY OR ACTIVITY REDUCED? APU 286/58, July 1958, 12pp. *Applied Psychology Research Unit*, MRC, Cambridge, England.

12,067
 Evidence was sought on whether moderate warmth and the loss of sleep would have similar effects on the performance of skilled tasks. Twelve subjects performed a pursuit-tracking task for 30 minutes and a serial-choice task for the following 20 minutes on two successive weeks; in each week the subjects worked once with and once without sleep on the previous night, once in normal and once in a high temperature. Both quantitative and qualitative data were analyzed and compared for the two conditions.

Wickens, D.D. & Cotterman, T.E. THE EFFECT OF DISPLAY INTERRUPTION ON TRANSFER OF TRAINING BETWEEN TASKS OF DIFFERENT CONTROL SENSITIVITY. Contract AF 33(616) 3076, Proj. 7197-71635, WADC TR 57-548, March 1958, 21pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University).

12,068

To investigate the relationship between amount of transfer of skill in two-dimensional tracking and degree of similarity between training and test control sensitivity when the display is interrupted periodically during both, groups of subjects were trained on one of two control-display ratios. All groups were tested while using the lower ratio. In Experiment I, two groups were employed under conditions of interrupted displays; in II, these groups were replicated and two groups added with non-interrupted display. Time-on-target scores were analyzed for effects of these conditions.

Cohen, J. & Dinnerstein, A.J. FLASH RATE AS A VISUAL CODING DIMENSION FOR INFORMATION. Contract AF 33(616) 3404, Proj. 7186, WADC TR 57-64, May 1958, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College).

12,069

To determine the relationship between flash frequency of a light and ability to identify flash rate, ten subjects made absolute judgments of nine flash rates which varied from one flash per four seconds to twelve per second. The stimuli were presented by a high intensity blue-white strobotron tube masked to a point source. The data were analyzed in terms of (1) information transmitted (in bits) for each flash rate, (2) discriminability of the rates, and (3) average response time for identification. The results are discussed in relation to encoding information through flashing signals.

Boynton, R.M., Elworth, C. & Palmer, R.M. LABORATORY STUDIES PERTAINING TO VISUAL AIR RECONNAISSANCE. Part III. Contract AF 33(616) 2565, Proj. 7157, WADC TR 55-304, April 1958, 61pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Rochester).

12,071

This is the third and final part of a three-stage report of an investigation of relevant variables involved in air reconnaissance. A further investigation was made of the variables previously studied - subject-target distance, number of forms in the array, and percent contrast. A mathematical relationship is worked out which yields the contrast required for 60 per cent recognition as a function of these variables. Translating experimental variables into practical terms predictions are made about how performance should vary as a function of altitude. A preliminary attempt is made to investigate parafoveal form recognition, visual acuity, and eye movements in terms of individual differences.

Kidd, J.S., Shelly, R.W., Jeantress, G. & Fitts, P.M. THE EFFECT OF ENROUTE FLOW CONTROL ON TERMINAL SYSTEM PERFORMANCE. A STUDY IN HUMAN ENGINEERING ASPECTS OF RADAR AIR TRAFFIC CONTROL. Contract AF 33(616) 3612, Proj. 7192, WADC TR 57-663, April 1958, 32pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Aviation Psychology Lab., Ohio State University and OSU Research Foundation)

12,072

To determine the effect of regularization of approach traffic in time, place, and sequence upon the safety and efficiency of a human-operated terminal radar air traffic control system, a laboratory study using simulation techniques was performed. Enroute flow control facilities were simulated by preprogramming arrivals at the terminal boundary. The terminal system (OSU Electronic Air Traffic Control Simulator) was manned by a two-man pattern-feeder control team. Six pairs of experienced air force controllers participated. The control zone included two landing fields and each controller handled aircraft for each field. Data were recorded and analyzed for 2880 movements of mixed types.

Rogers, O.E., Webb, M.B. & Gallacher, T.J. EFFECT OF RESTRICTING INFORMATION IN THE VERBAL CONDITIONING SITUATION ON EXTINCTION. Bu Med Surg Res. Proj. MM 14-02-11, Subtask 11, Rep. 1, May 1958, 8pp. USN School of Aviation Medicine, Aviation Medical Center, Pensacola, Fla.

For 120 trials subjects pressed a key if they guessed a light would come on. No response indicated a guess to the contrary. 3 partial reinforcement ratios were used. In a full knowledge condition the light would appear or not appear on each trial. In the partial knowledge condition the subjects were told, "If you do not press the key, you do not find out if you are right or wrong." After this, 100 trials were given with no reinforcement. No differences were found between conditions during training. Significant differences were obtained among reinforcement ratios during both training and extinction. For the partial knowledge group extinction was considerably and significantly prolonged.

SALVENDY, J.H. SOME CONDITIONS GOVERNING THE USE OF THE CUE PRODUCING RESPONSE AS AN EXPLANATORY DEVICE. *Human Factors*, Vol. 1, No. 1, Jan. 1959, 10pp. *Applied Psychology Research Unit, Medical Research Council, Cambridge, England.*

Conflicting studies on the effect which teaching differential responses to cues has on the acquired distinctiveness of these cues produced the following two hypotheses: (a) that the active overt responses attached to stimuli will be used to furnish additional cues for later learning unless the responses are strongly attached (overlearned) to the stimuli; (b) when the overt responses are not strongly attached to the stimuli, the participants' responses made in the attempt to learn the overt responses furnish cues for later learning to the stimuli and hence are more important than the overt responses in determining future transfer. To test these hypotheses one group of 15 learned distinctive overt responses to a set of stimuli; a second group overlearned the same distinctive overt responses to the stimuli; a third group learned equivalent overt responses but distinctive perceptual responses to the stimuli; a fourth group learned equivalent overt responses and equivalent perceptual responses to the stimuli; and a fifth group learned no responses to the stimuli. Immediately after the above training all groups were required to learn a second set of responses to the same set of stimuli. All groups receiving preliminary training did better than the group receiving no training. Both hypotheses were confirmed.

FARMER, D. HUMAN FACTORS RESEARCH IN TRAFFIC ACCIDENTS IN ENGLAND. *Int. J. Road Safety & Traffic Prev.*, Autumn 1957, 2(1), 21-30. (*Applied Psychology Research Unit, Medical Research Council, Cambridge, England.*)

12,076
Research on human factors in highway usage in England is uniquely centralized within the Road Research Laboratory of the Department of Scientific and Industrial Research. The organization and types of research underway are briefly described. Two psycho-physical studies are more fully summarized: an experiment on the effects of small amounts of alcohol on driving and an investigation of "over-taking the car ahead".

12,077
SHEW, K.J. THE HUMAN FACTOR IN ROAD TRAFFIC. *COGNITIVE RESEARCH ON DRIVING SKILL. Int. J. Road Safety & Traffic Prev.*, Autumn 1957, 2(1), 21-30. (*Applied Psychology Research Unit, Medical Research Council, Cambridge, England.*)

12,077
This paper is concerned with variables in the driver which take either for good and safe driving on the one hand or accidents on the other. Two types of such variables - innate characteristics and temporary states such as fatigue - are discussed with reference to types of measurement that have been attempted. It is suggested that driving performance in its entirety as one complex skill needs to be studied before objective measurement can begin. Some pilot studies of a new technique for measurement are presented and discussed.

12,078
PAPROT, E.S. HUMAN FACTORS AND HUMAN-MADE MACHINES. *APPL. PSYCH. RES. J.*, July 1958, 12pp. *Applied Psychology Research Unit, Medical Research Council, Cambridge, England.*

12,078
To investigate the effect of an extreme level of warmth on performance of a difficult manual motor task, six subjects were exposed to a climate with a wet bulb temperature of 135 degrees Fahrenheit. Three exposures of 30 minutes each and spaced at 48-hour intervals were used. During the second and third exposures the subjects worked continuously to keep a pointer aligned with a target as it moved erratically from side to side. Error scores (integrated spatial errors of alignment and time) and number of movements of pointer were analyzed as functions of length of work in the hot environment.

12,079
LEONARD, J.A. THE EFFECTS OF "MACHINE" LAG ON A SERIAL CHOICE TASK WITH BALANCED AND UNBALANCED FREQUENCIES. *APPL. PSYCH. RES. J.*, March 1958, 11pp. *Applied Psychology Research Unit, Medical Research Council, Cambridge, England.*

12,079
To observe the difference in fast serial performance with input frequencies were balanced and when biased, and to observe the effects of imposing an enforced delay between completion of one response and the beginning of the next under both balanced and biased inputs, two groups of subjects performed a self-paced five-alternative task. The making of one response produced the stimulus for the next under all conditions of input frequencies and response lag. Response times and error percentages were analyzed and practical implications discussed.

12,080
HACKWORTH, J.F. PAIRED MEMORISING IN A CONTINUOUS TASK. *APPL. PSYCH. RES. J.*, Jun 1958, 9pp. *Applied Psychology Research Unit, Medical Research Council, Cambridge, England.*

An investigation was made to discover the number of stimuli that Ss could remember in a simple stimulus-response task. The stimulus was an alphabetical letter and the response a button labelled with the name of the letter. According to the instructions the response to a "lag" main stimulus had to be delayed until a definite number of later stimuli had appeared. Ss had to remember a continually changing group of letters. It was found that the nature of the task changed radically as the errors increased. Thus, it was of greater interest to determine the speed at which a pre-determined criterion of performance was reached than to determine the performance levels at various fixed speeds. It was found that the Ss required approx. 1 sec. per stimulus for each member of the group which they had to hold in memory. When the response lag 5 letters behind its stimulus so that 4 letters had to be remembered, the Ss required 4 sec. per stimulus to achieve the 80% performance level.

Poulton, E.C. PREVIOUS KNOWLEDGE AND MEMORY. British Psychological Journal, Nov. 1957, 46(4), 399-370.
(Applied Psychology Research Unit, Medical Research Council, Cambridge, England).

This paper is concerned: a) with the relationship between previous knowledge and memory; b) with differences between recall and recognition; and c) with test for time of memory test while learning. It was found that a test was more likely to be certain that a false statement was false, than that a true statement was true. For both true and false statements, memory was best for statements about where truth the S was certain, and worse for statements about whose truth he had no idea. With memory for a particular word as a criterion, there was no difference between recall and recognition when the word was in a statement about whose truth the S was certain and correct, and memory was tested almost immediately. Recognition was found to be a less sensitive measure of previous knowledge than recall. Immediate memory was best when a test of memory was expected immediately, and worse when no test was expected. (MIA)

Coonan, T.J. SOME PROBLEMS IN THE DESIGN OF HUMAN-OPERATED TARGET DATA PROCESSING SYSTEMS. Final Report. Proj. NE 121 303, BuShips S 1836, NRL Rep. 5219, Sept. 1958, 7pp. USN Research Lab., Washington, D.C.

12,082
In target data processing systems utilizing manual detection and tracking, the design of operator tasks is especially critical. This report examines some tasks commonly assigned to operators in such systems with reference to human capabilities. Two aspects of detection and tracking task design are discussed: (1) type and number of tasks which can profitably be assigned to an operator and (2) some suggestions for facilitating performance of the basic tasks of detection, tracking, and monitoring. The discussion is particularly applicable to semi-automatic systems in which electronic data storage is provided.

Sweeney, J.S., Birmingham, N.P. & Garvey, W.D. A STUDY OF THE EFFECTS OF FILTERING ON THE PERFORMANCE OF A MANUAL COMPENSATORY TRACKING TASK. Proj. NR 401 000, NRL Rep. 5205, Sept. 1958, 6pp. USN Research Lab., Washington, D.C.

12,083
To investigate the effects of filtering on tracking performance, a low-pass filter was inserted ahead of the display or beyond the control in a closed-loop man-machine tracking system. An analog computer was used (1) with a human in the loop and (2) replacing the human operator with a high-gain amplifier and associated noise source. Errors were recorded for filter time constants of 0.10, 0.24, 0.45 and 0.74 seconds for condition (1) and 0.25, 0.50 and 1.0 seconds for condition (2). Data were compared for effect of filter position.

Havron, H.D. & Butler, L.F. EVALUATION OF TRAINING EFFECTIVENESS OF THE 2-PH-2 HELICOPTER FLIGHT TRAINER RESEARCH TOOL. Contract NOME 1915(00), NAVTRADVCN Proj. 20 05 16, Tech. Rep. 1915 00-1, PRA Rep. 56 17, April 1957, 141pp. Psychological Research Associates, Arlington, Va.

This evaluation was conducted to determine the effectiveness of Device 2-PH-2, Helicopter Flight Trainer Research Tool. The device consists of a unique type of visual display, a cockpit with activated instruments and controls, and a generalized flight system computer. It was originally constructed to determine the feasibility of utilizing an internal non-programmed point-source-of-light projection system to create the illusion of three dimensional space on a curved projection screen. The flight computer is designed to approximate in a general way the flight characteristics of the Bell UH-1A Helicopter. The evaluation examined the device's usefulness in the initial training stages, and the attendant problems when transferring to an operational helicopter. The findings indicated no particular advantage in this type of training and, in fact, some negative effects were noted. Some recommendations for analyzing these negative results are indicated.

Ammons, R.E., Farr, R.G., Bloch, Edith, Neumann, Eva, et al. LONG-TERM RETENTION OF PERCEPTUAL-MOTOR SKILLS. J. exp. Psychol., April 1958, 55(4), 318-328. (University of Louisville).

12,086
To measure the retention of perceptual-motor skills, 22 groups, ranging in size from 20 to 36 male college students, were trained to either a moderate or high level of proficiency on either a procedural task (sequential manipulation of a series of controls) or on a compensatory pursuit task (Airplane Control Test). They were then retrained after no-practice intervals up to two years in duration. Learning, retention, and re-learning were measured and analyzed and effect of proficiency level of original learning and length of no-practice interval were evaluated.

Broadbent, D.E. & Ladefoged, P. ON THE FUSION OF SOUNDS REACHING DIFFERENT SENSE ORGANS. *J. acoust. Soc. Amer.*, June 1957, 29(6), 708-710. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,088
The problem of perceptual fusion in hearing is considered and some aspects involved in the explanation of vowel perception by a place theory of hearing are explored. A speech synthesizer was programmed to produce a short sentence and the output recorded on a two-track tape recorder. In some cases the formants were on one track only, in others the first formant was on one track and the second on the other. In some cases the same generator was used for both formants; in others two identical ones were used. Each of the listeners' ears was stimulated by one track and the task was to judge how many voices were heard and from what position. The theoretical implications of the results are discussed. T. I. R 6

12,089
Ladefoged, P. & Broadbent, D.E. INFORMATION CONVEYED BY VOWELS. *J. acoust. Soc. Amer.*, Jan. 1957, 29(1), 98-104. (University of Edinburgh, Scotland).

12,089
To examine features of vowel quality which convey linguistic information enabling the listener to identify the words used, six versions of the sentence "Please say what this word is" were synthesized and varied in only one respect - frequency ranges for the first and second formants. Four test words of the form b - (vowel) - t were also synthesized. Sixty subjects were asked first to identify the words as heard in random order and then to identify them as they occurred immediately following the various versions of the sentence. The relationship between formant frequencies in sentence and word was analyzed. Some psychological implications were discussed. T. I. R 8

Baker, C.H. ATTENTION TO VISUAL DISPLAYS DURING A VIGILANCE TASK: II. MAINTAINING THE LEVEL OF VIGILANCE. *APU 295/58*, Feb. 1958, 10pp. *Applied Psychology Research Unit*, MRC, Cambridge, England.

12,100
To investigate the effect of regularity of signal appearance on vigilance level, 30 subjects participated in a series of tests. The subject faced a circular display of light on which a pip might appear at any moment and pressed a response button when it did appear. The temporal interval between successive appearances ranged from 36 to 196 seconds, the average period being two minutes. Various warning devices and searching aids were used with this regular timing. In the last experiment, irregular intervals were used. Percentage of pips missed was analyzed as a function of time. In addition, motor activity was continuously recorded from the subject's chair and the record related to performance. T. G. R 22

12,101
Baker, C.H. ATTENTION TO VISUAL DISPLAYS DURING A VIGILANCE TASK: I. BIASING ATTENTION. *APU 294/58*, Feb. 1958, 12pp. *Applied Psychology Research Unit*, Medical Research Council, Cambridge, England.

12,101
To determine (1) the nature of visual search behavior in radar-like situations, and (2) ways of biasing search behavior in an attempt to overcome "peripheral blindness", five experiments were performed in which subjects (16 in each) were asked to search a PPI (Plan Position Indicator) and report the appearance, at any location on the display of a pip (spot of light). The five displays were varied as follows: (1) blank (no sweep-line); (2) full sweep-line; (3) small dot on sweep-line at half-radius and a green light appearing randomly above display; (4) outer half of sweep-line only; and (5) box-sweep (two sweep-lines and three arc lines). Percentages of pips detected and response times were analyzed in terms of the objectives under study. T. G. R 9

12,102
Baker, P. EXTROVERSION-INTROVERSION AND IMPROVEMENT IN AN AUDITORY VIGILANCE TASK. *APU 311/57*, Aug. 1957, 8pp. *Applied Psychology Research Unit*, Medical Research Council, Cambridge, England.

12,102
To test the hypothesis that performance on a vigilance task can be improved by introduction of a secondary task that would markedly increase the total number of required responses, an auditory vigilance situation was chosen. Forty subjects were tested under two conditions: 1) they listened to an 80-minute recording of a sequence of digits in order to detect the occurrence of primary signals (three successive odd digits that are all different), and 2) they listened for primary signals as above and also had to detect secondary signals (the digit 6). Primary signals occurred ten times every 16 minutes and there were ten times as many secondary signals. Detection data were analyzed for the two situations and with reference to measures of introversion-extroversion for each subject. G. R 5

Carpenter, A. THE SYNTHESIS OF VOWEL SOUNDS. *A.P.U. 316/57*, Dec. 1957, 15pp. *Applied Psychology Research Unit*, Medical Research Council, Cambridge, England.

12,103
This report describes an apparatus designed as a flexible means of synthesizing complex sounds, by mixing together the component sine waves in known amplitude and phase. By means of the apparatus the effect of different kinds of larynx pulse and of different forms of modulation can be observed, and any desired profile of harmonics can be built up. Block diagrams and calibration graphs are presented for the various units that make up the apparatus. G. I. R 5

Kelley, T.L. DEVELOPMENT OF AN ACTIVITY PREFERENCE TEST. Contract AF 33(038) 13632, Proj. 7700, AFTRC TR 57-107, July 1957, 44pp. USAF Personnel Research Lab., Lackland AFB, Tex.

12,104
In this report, components of individual behavior are identified and measured through responses to a comprehensive questionnaire on activity preferences. This investigation follows up development and analysis of an Activity Preference Test with wartime Army samples by revising the test to make it suitable for the airman age range and for both men and women. The revised form was administered to seven groups of men and two groups of women. Component scores were analyzed for reliability and group differences. A chart form was developed for profiling individual and group component scores. Two alternate forms of the test were developed.

Kreider, M.E., Buskirk, E.R., & Bass, D.E. OXYGEN CONSUMPTION AND BODY TEMPERATURES DURING THE NIGHT. Proj. 7-83.01-005B, Tech. Rep. EP 95, July 1958, 10pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

12,105
To establish baseline data on physiological changes that occur during sleep, simultaneous measures of oxygen consumption, rectal temperature, and mean weighted skin temperature were made on nine young men (32 man-nights) sleeping at night in a "comfortable" ambient environment (25.5-27.8 degrees Centigrade). Some additional measurements were made on ten other subjects. Changes in the measures were analyzed as a function of time. Individual differences were studied. Values for body heat content and cumulative heat debt at the end of the seven-hour sleep period were calculated.

Hoehn, A.J., & Lumsdaine, A.A. DESIGN AND USE OF JOB AIDS FOR COMMUNICATING TECHNICAL INFORMATION. Proj. 7709, AFTRC TR 58-7, Jan. 1958, 34pp. USAF Maintenance Lab., Lowry AFB, Colo.

To reduce the amount of required technical training and increase the efficiency of job performance, improved techniques and principles in the design of job instructions were evaluated. Prototype materials and methods for the maintenance of flight control systems and their components were formulated and tested; several experiments on factors affecting the comprehension of printed verbal instructions were conducted; and exploratory research in audio presentation of instructions was accomplished. A number of conclusions were drawn: carefully designed job-aids can reduce training requirements; improve the utilization of lower-skilled airmen, and increase the reliability of performance; for maximum efficiency in the development of maintenance capabilities, procedures should be closely integrated with training materials; available principles for troubleshooting routines should be refined, in part with the aid of suitable mathematical models; better methods of job-tasks analysis are required for better design of job-aids (through use of learning concepts); an automatic sound-film viewer was demonstrated as technically feasible. Hollander, E.P. VARIABLES UNDERLYING SOCIOMETRIC STATUS: II. GROUP EXPECTANCIES AND LEADERSHIP STATUS. Contract NMR 1849(00), Navy Tech. Rep. 157, May 1957, 6pp. Psychological Labs., Carnegie Institute of Technology, Pittsburgh, Penn.

An attempt is made to integrate conceptions of norm, role, and status within a single framework. It is suggested that norms and roles are both based in behaviors which are expected by relevant others, i.e., members of a group to which one belongs. Status is seen to be related to role in the sense that the group generates a differentiated set of expectancies dependent upon status level; the role may be thought of in terms of these expectancies. Leadership is considered as a role evolved from high status which affords a great deal of latitude for deviation from common expectancies, but which imposes restrictions upon the individual for conformity to the differential expectancies associated with the role.

Larkins, J.T., & Jewell, D.S. ON-THE-JOB TRAINING AND PROFICIENCY OF K-SYSTEM MECHANICS. Proj. 7709, AFTRC TR 58-5, Jan. 1958, 20pp. USAF Maintenance Lab., Lowry AFB, Colo.

A final report on Task 37301, Principles of Effective OJT for Aircraft Maintenance. Research and development studies conducted in the maintenance personnel and training field are described, specifically in the areas of proficiency and performance evaluation of flight-line maintenance personnel for bombing-navigational systems and methods for the improvement of on-the-job training for these personnel. Tests, paper-and-pencil trainers, trainers, and job aids experimentally developed and evaluated under this task are briefly described. These include: K-System MAC-1 Trainer, MAC-2 Trainer, GTS Trainer, the Trainer-Tester, Multifunction-Information Trainer, and trouble Locator.

Lacey, J.J. & Lacey, Beatrice C. THE RELATIONSHIP OF
RESTING AUTONOMIC ACTIVITY TO MOTOR IMPULSIVITY.
CHAPTER V. *Brain and Human Behavior*, 1956, 36, 144-
209.

12,109
To explore the relationship of resting autonomic
activity to motor impulsivity, two experiments were per-
formed. In one, 28 adult women were subjects; heart
rates and plantar-plantar skin resistance were recorded
during 1) relaxation, 2) cyclic driving of autonomic re-
sponses by electric shock at fixed intervals, and 3) a
paper-and-pencil performance test self-paced and at a
speed causing failure. The second used the same record-
ing techniques on 34 male college students with the task
calling for a discrimination response to a series of
lights. The data were analyzed for frequency and level
of autonomic responses in relation to experimental con-
ditions. A neuro-physiological theory is developed in
some detail.

Licklider, J.C.R. STUDIES IN AURAL PRESENTATION OF
INFORMATION. Final Report. Contract AF 18(600)
1219, AFRC-TR 58-53, Oct. 1957, 44pp. *USAF Opera-
tional Applications Lab.*, Andrews AFB, Washington,
D.C. (Department of Economics and Social Science,
Massachusetts Institute of Technology).

12,111
This final report summarizes the results of re-
search aimed at furthering the understanding of some
fundamental characteristics of hearing that govern
auditory reception of radar information and the intel-
ligibility of speech communication. The discussion is
given under four main headings: (1) the stimulus basis
of the perception of pitch, (2) auditory signal detec-
tion, (3) identification of auditory signals, and (4)
effects of interference upon speech intelligibility.
A final section describes a device for demonstrating
the combined aural and visual display of certain types
of radar information.

W.P., & Older, H. AVIATION MEDICAL SAFETY TRAINING:
PROCEDURES, FINDINGS AND RECOMMENDATIONS. (Volume I
of Three Volumes). Contract N-61339 28, NAVTRADEVEN
Proj. 20 B-1, Tech. Rep. NAVTRADEVEN 1339 28 1, Aug.
1957, 41pp. *VSN Training Device Center*, Port Wash-
ington, N.Y. (Psychological Research Associates,
Arlington, Va.).

12,112
This report is the result of a comprehensive survey
of the role of the flight surgeon in aviation medical
safety activities. Various military and civilian facili-
ties were visited to gain information available relating
to the human factor aspects of aircraft accidents and to
determine current practices of flight surgeons with re-
spect to accident prevention procedures and accident in-
vestigations. Analysis of these materials together with
Navy directives relating to the duties of a Naval Flight
Surgeon led to recommendations for training, for the
substantive content of such training, and for training
aids and devices for accident prevention and flight
safety teaching.

Trittipoe, W.J. TEMPORARY THRESHOLD SHIFT AS A FUNC-
TION OF NOISE EXPOSURE LEVEL. *J. Acoust. Soc. Amer.*,
April 1958, 30(4), 250-253. (*USAF Operational Appli-
cations Lab.*, Bolling AFB, Washington, D.C.).

12,114
To investigate temporary threshold shifts (TTS)
as a function of sound level for equal exposure dura-
tions, TTS was measured continuously with a Bekesy-type
audiometer at 4000 and 6000 cycles per second for ten
minutes following a three-minute exposure to a thermal
noise. Five noise levels (from 108 to 128 decibels in
sound pressure level) were used. One ear of each of
nine listeners was tested twice on each condition. The
data were analyzed for the average trend and for individ-
ual patterns.

12,115
Pollack, I. SPEECH INTELLIGIBILITY AT HIGH NOISE
LEVELS: EFFECT OF SHORT-TERM EXPOSURE. *J. Acoust.
Soc. Amer.*, April 1958, 30(4), 282-285. (*USAF Opera-
tional Applications Lab.*, Bolling AFB, Washington,
D.C.).

12,115
To examine the range of conditions over which post-
stimulatory effects of noise exposure upon speech intelli-
gibility (in noise) might be observed, successive word
intelligibility tests were executed at a constant signal-
to-noise ratio over a 13 minute period. The range of
noise levels covered 43 to 130 decibels. For tests of
cumulative effects eight lists were read at a single
noise level with no break between lists; four noise lev-
els (110, 115, 120 and 130 decibels) were used. For
post-stimulatory effects, noise levels increased or de-
creased during breaks between tests. Intelligibility
data from five listeners were analyzed for cumulative ef-
fects of a constant noise and post-stimulatory effects
of noise.

Pollack, I. MESSAGE PROCEDURES FOR UNFAVORABLE COM-
MUNICATION CONDITIONS. *J. Acoust. Soc. Amer.*, March
1958, 30(3), 196-201. (*USAF Operational Applications
Lab.*, Bolling AFB, Washington, D.C.).

12,116
Several message procedures designed to improve
speech communications under extremely unfavorable noise
conditions were examined. One procedure based upon the
informational principle of successive selections was com-
pared with a second procedure using single repetition of
a single selection among a larger number of alternatives.
Under various speech-to-noise ratios the talker repeated
a sequence until the listeners signaled they were reason-
ably confident they had received the message or until
70 seconds had elapsed. A joint time-accuracy analysis
was made and relative efficiency established.

12,117

Pollack, I. & Pickett, J.M. EFFECT OF NOISE AND FILTERING ON SPEECH INTELLIGIBILITY AT HIGH LEVELS. *J. acoust. Soc. Amer.*, Dec. 1957, 29(12), 1328-1329. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,117

This note resolves some apparent contradictions in experimental findings on the effects of high sound levels on the intelligibility of speech. The contradictions are: (1) in absence of noise, substantial losses are observed at high levels for frequency-limited speech but little loss for wide-band speech, and (2) in the presence of noise, substantial losses are observed at high levels for wide-band speech. It is shown that the effects of high sound levels on wide-band speech in noise roughly parallels the effects of high levels on filtered speech. The Articulation Index (AI) encompasses both findings if it is assumed that the effect of high sound levels is to produce an effective change in AI. C.

Pollack, I. SPEECH COMMUNICATIONS AT HIGH NOISE LEVELS: THE ROLES OF A NOISE-OPERATED AUTOMATIC-GAIN CONTROL SYSTEM AND HEARING PROTECTION. *J. acoust. Soc. Amer.*, Dec. 1957, 29(12), 1324-1327. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,118

This paper evaluated two aids for hearing conservation for personnel involved in military speech communications, a noise-operated automatic gain control (AGC) system and an insert ear protection. A noise AGC system was simulated and intelligibility tests carried out with binaural earphones. The ranges of conditions over which a listener might be exposed to fluctuating noise levels and still hear intelligible speech were tested with and without ear defenders (V-SIR) and wax-impregnated cotton plugs under earphones. The results are evaluated in terms of speech intelligibility. G. R. 4.

12,119

Pollack, I. & Decker, L.R. CONFIDENCE RATINGS, MESSAGE-RECEPTION, AND THE RECEIVER-OPERATING CHARACTERISTIC. *J. acoust. Soc. Amer.*, April 1958, 30(4), 286-292. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,119

To obtain independent information about a listener's criterion for message acceptance or rejection, a rating scale of confidence judgments was added to the standard articulation test procedure. Each of three listeners responded to the test words under three speech-to-noise ratios. After writing the word, they marked the six-category confidence-rating scale as to their judged accuracy of reception. Control tests were run without the rating scale judgments. The data were studied in terms of effect of rating-scale on accuracy, the form of the receiver operating characteristic, and effect of noise ratios on this relationship. G. R. 10

Groth, Hilde & Lyman, J. SENSORY PROBLEMS IN PSYCHO-MOTOR PERFORMANCE OF AMPUTEES. AN INVESTIGATION OF THE ADEQUACY OF REMAINING SENSORY CUES FOR PROSTHESIS PERFORMANCE ON TWO VISUO-MOTOR TASKS. Rep. 58 19, Special Tech. Rep. 26, Feb. 1958, 49pp. Department of Engineering, University of California at Los Angeles.

12,120

To isolate and identify those human factors considered to be of importance for the optimal functioning of the amputee-prosthesis system, two visual motor tasks were used: pursuit tracking and manipulation (placing cylinders in formboard at two levels of pace-performance and two levels of movement pattern). Twenty non-amputees and 15 unilateral amputees served as subjects. Performance data (target hits and time-on-target at various time intervals; mean prehension forces and time per transport) were analyzed in terms of adequacy of sensory information, increase of "central integration time" due to prosthesis. Kelley, H.P. A STUDY OF PREFERENCES FOR TYPE OF NAVAL AIR ADVANCES TRAINING. DUMEDSBERG, Res. Proj. NK 16 01 11, Subtask 8, Rep. 1, Jan. 1958, 39pp. USN School of Aviation Medicine, Aviation Medical Center, Pensacola, Fla.

Preference and preference strength ratings for advanced flight training were obtained from several thousand naval aviation pilot trainees. Ratings were obtained at the beginning and end of pre-flight school. It was found that: a) The stability of preference for particular type training was not high. Roughly one-third of the students changed preference between pre-flight and their time of official choice; b) Men assigned against their preference to VPHS training performed more poorly than men assigned by their preference to such training. No other "cross assignments" showed such an effect; c) Men assigned to land-based training (VPHL and VPHS) against their preference attained at twice the rate of men assigned to land-based training (27 men in 1095 assignments). For this small group of men, attrition rates were not significantly high; d) In this sample the average FAA scores and basic flight grades were lower for men preferring and being assigned to land-based type training (VPHL and VPHS).

Dale, H.C.A. SUBJECTIVE PROBABILITY, GAMBLING AND INTELLIGENCE. *Nature*, Feb. 1958, 181, 363-364. (Applied Psychology Research Unit, Medical Research Council, Cambridge, England).

12,122

The experiment reported in this brief note examined the relationships among subjective ideas of probability, the individual's tendency to gamble and his intelligence. Each of forty subjects was given three problems requiring the location of hidden objects. The task could be approached systematically or randomly. The strategy adopted by the subject was related to his intelligence. Also examined was the relative intelligence of subjects with relation to their sophistication concerning the concept of subjective probability. Results are briefly noted and discussed in terms of the relation between intelligence and (1) method of approach to the problem and (2) ideas of subjective probability. R. 5

Hall, J.F. Jr., Kearny, A.P., Polte, J.W. & Quilletts, S. EFFECT OF DRY AND WET CLOTHING ON BODY COOLING AT LOW AIR TEMPERATURES. Proj. 7164, Task 71830, WADC TR 57-769, May 1958, 26pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,124

To determine 1) the general feasibility of extending the "wet-suit principle" to emergency cold-water exposure of Air Force crews, 2) the comparative cooling effect of dry versus wet clothing, and 3) to define, in terms of body-heat-storage change and skin extremity cooling, the safe tolerance time for various air temperatures after exposure to cold water, five clothed subjects were immersed in cold water for brief periods, exposed in a life raft to air temperatures from plus 4.4 degrees to minus 28.9 degrees Centigrade. Skin, rectal, and extremity temperatures were measured. Predictive curves are given, which, applied with caution, permit estimation of human tolerance for subjects clothed in wet and dry garments while exposed to various low temperatures in a life raft. Baddelay, A. THE INFLUENCE OF AN IRRELEVANT CUE ON SEARCHING IN A STRUCTURED SYSTEM. APU 325/58, April 1958, 14pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,125

The present experiment studied the effect of an irrelevant cue on problem solving in a structured situation. Twenty-two subjects were presented with a series of problems analogous to that of locating a fault in electronic equipment. An irrelevant variable was introduced in the form of a right angle bend occurring at various points in a series of 19 stages. The problems were divided into two groups of two straight-line problems: 1) with bend occurring at an odd-numbered stage, and 2) with bend occurring at an even-numbered stage. Only the first stage checked by the subject was used as data. Results are discussed with relation to the effect of the irrelevant cue upon the orientation and general performance of the problem solver. T. G. I. R-7

Conrad, R. ACCURACY OF RECALL USING KEYSET AND TELEPHONE DIAL, AND THE EFFECT OF A PREFIX DIGIT. A.P.U. 322/58, Feb. 1958, 7pp. Applied Psychology Research Unit, Medical Research Council, Cambridge, England.

A test of immediate memory for 8-digit messages was given to 24 female telephone operators, using 4 different recall conditions. It was found that the presence of a redundant prefix significantly worsened recall. When the message was transcribed onto a 10-digit keyset, recall was not significantly better than when transcribed onto a telephone dial. But when a prefix digit was introduced, the dial proved to be an inferior method of transcription. It would seem that at about the level of difficulty when more than half the messages would be forgotten, recall would be improved by use of keyset rather than telephone dial. Recall errors were analyzed digit by digit. All errors could be classified into order errors and omissions. No evidence was found that certain digits would be systematically confused with certain others. R. 8

Mendelson, E.S. EFFECTS OF JET-ENGINE AFTERBURNER NOISE: OBJECTIVE MEASUREMENT OF THE AUDITORY REFLEX IN MAN. BUMED Proj. NM 0011062.05, Rep. 4, Rep. NAMC ACEL 327, TED NAM AE 6513.1, Feb. 1957, 2pp. USN Air Crew Equipment Lab., Air Materiel Center, Philadelphia, Penn.

12,131

An objective method for measuring involuntary reactions in human subjects exposed to loud sounds is described. In some subjects small but consistent muscular contractions may be demonstrated without resort to visual observations. The contractions have been elicited by stimulation of one ear with loud tones, while recording minute pressure changes from the external canal of the opposite ear. Some exploratory observations on this auditory reflex response are presented and the usefulness of the method discussed. T.

Teghtsoonian, R. & Shephard, A.H. REACTIVE AND CONDITIONED INHIBITION IN PERCEPTUAL-MOTOR PERFORMANCE. *Canada J. Psychol.*, 1957, 11(4), 201-211. (University of Toronto, Canada).

The following hypotheses were tested: a) the presentation of a tone at cessation of massed practice on a perceptual-motor task will lead to association of a tendency not to respond (a resting response) with the tone; b) this association will be stronger than if a delay is permitted between cessation of practice and presentation of the tone; c) it will be delayed by the active responding to the tone required in a measurement of reaction time to the tone. 4 groups of subjects were employed, whose reaction time to a tone was measured both before and after the differential treatment. 3 groups practiced for 7 1/2 minute periods separated by 60-second rest intervals on a modified 2-hand coordinator. For Group 1 the tone was presented for the first 15 seconds of each rest period. For Group 2 the tone was not used at all in relation to practice on the coordinator. For Group 3 the tone was presented throughout the last 15 seconds of each rest period. Group 4 was treated like Group 1, but did not perform at all on the coordinator. The hypotheses were tested by comparisons among the groups of differences in reaction time to the tone, measured before and after the differential treatment. All 3 hypotheses were supported by the data. It was concluded that the results provide indirect support for Hull's concepts of reactive and conditioned inhibition, but that the latter concept might be broadened to state that a resting response can become associated with any stimuli present at the cessation of massed practice.

Belanger, D. "GRADIENTS" MUSCULAIRES ET PROCESSUS MENTAUX SUPERIEURS. *Canada J. Psychol.*, 1957, 11(2), 113-122. (Institute of Psychology, University of Montreal, Canada).

12,134
Electromyographic techniques were used in two experiments to measure changes in muscular tension in the forearms of subjects engaged in perceptual-motor tasks of contrasted difficulty. In one experiment, 14 subjects were required to make rapid discriminations between circles of varying sizes and respond by pressing an appropriate button. The second experiment required the subject to press a button whenever he heard a clearly audible click. Muscle tension changes were compared for the two tasks and the results discussed in terms of the adequate stimulus for arousal of muscle-tension gradients. The use of such gradients in the study of higher mental processes is discussed.

Hulbert, S.F., Burg, A., Knoll, H.A. & Matlewson, J.H. A PRELIMINARY STUDY OF DYNAMIC VISUAL ACUITY AND ITS EFFECTS IN MOTORISTS' VISION. Reprint 61, Jan. 1956, 5pp. Institute of Transportation and Traffic Engineering, University of California at Los Angeles.

12,136

The role of dynamic visual acuity (DVA) was explored in relation to reading highway destination signs while driving. First a procedure for measuring DVA was developed wherein a target image (checkerboard) was flashed on a semicircular screen by a projector mounted on a revolving turntable. DVA scores were obtained at 20, 60, 120, and 180 degrees/second angular velocity; four static acuity scores (Keystone Telebinocular, Ortho-rater, and two static exposures on DVA apparatus) were also obtained and analyzed for relationship to dynamic acuity. A comparison of DVA scores and ability to perform on a moving sign test (see 12,137) was then made. Plans for continuing research are discussed.

Hulbert, S.F. & Burg, A. THE EFFECTS OF UNDERLINING ON THE READABILITY OF HIGHWAY DESTINATION SIGNS. Reprint 62, 1957, 14pp. Institute of Transportation and Traffic Engineering, University of California at Los Angeles.

12,137

To investigate the effects of underlining on the readability of highway destination signs, stimuli (destination signs) were prepared and photographed from a moving car. The stimuli conformed to standard highway signs and were varied with respect to underlining (short thick, long thick, long thin, and none), number and length of destination names, and arrow configurations. The accuracy with which the subjects (140) recognized a given destination when presented on the screen was analyzed in terms of the design factors named above. The relation of visual acuity to performance is discussed.

Rohrer, R. THE INFLUENCE OF BOUNDARY SHARPNESS AND CONTRAST ON THE PERCEPTIBILITY OF DETAIL IN PHOTOGRAPHS WITH PARTICULAR REFERENCE TO X-RAY DIAGNOSIS. TIL/T 4778, July 1957, 8pp. Technical Information and Library Services, Ministry of Supply, London, England.

12,139

The perceptibility of detail in X-ray photographs is investigated in terms of how much information is basically provided by the film. A statistical evaluation of the probabilities that differences in film darkening can be attributed to true detail (as distinct from differences due to statistical variation) is made. The dependence of the objective perceptibility of detail on area, contrast, and boundary sharpness is analyzed.

REPORT OF THE WORKING GROUP ON INFRARED BACKGROUNDS.
PART II: CONCEPTS AND UNITS FOR THE PRESENTATION OF
INFRARED BACKGROUND INFORMATION. Contract NMM 1224
(12), 2309 3 S, Nov. 1956, 14pp. Engineering Re-
search Institute, University of Michigan.

12,141
This report describes the concepts and units recom-
mended for the description of infrared backgrounds. A
background is considered to be any distribution of radi-
ance that is capable of interfering with the detection
or identification of a target. The effect of intervening
atmosphere is included.

12,142
Landahl, H.D. ON THE INTERPRETATION OF THE EFFECT
OF AREA ON THE CRITICAL FLICKER FREQUENCY. Bull.
Math. Biophysics, 1957, 19, 157-162. (Committee
on Mathematical Biology, University of Chicago).

12,142
The effects of area and intensity on the critical
flicker frequency, threshold, and reaction time are con-
sidered in terms of neural net theory. An attempt is
made to develop a mechanism that can account for the
phenomena associated with the empirically observed laws
of Ricco, Granit, Talbot, and Ferry-Porter as well as
observations on reaction time and threshold. A simple
model gives results that are substantially in agreement
with observation with a few apparent discrepancies. Ex-
perimental procedures are suggested for determining
whether the discrepancies are apparent or real.

van den Brink, G. THE VISIBILITY OF DETAILS OF A
MOVING OBJECT. Rep. IZF 1958.2, 1958, 12pp. Institute
for Perception RVO-TNO, Soesterberg, The Netherlands.

12,143
To investigate the factors involved in perception
of a moving object, a test object consisting of two
luminous bands separated by a dark band of the same
dimensions and same brightness as the background was
observed as it moved along a circular track around the
fovea with different orientation of the bands and for
a wide range of velocities and exposure times. The
energy required for 60 per cent chance of perception of
the dark band was determined. The threshold data were
analyzed in terms of critical values for displacement
and discussed in terms of the physiological factors of
retinal summation.

AOC SYMBOLS. OOD Proj. TBI 1000, Tech. Memo. 4 58,
May 1958, 27pp. USA Ordnance Human Engineering Lab.,
Aberdeen Proving Ground, Md.

12,144
The relative discriminability of four geometric
shapes (cross, cross-within-circle, circle, and half-
circle), considered for use as radar symbols, were ex-
amined at size levels ranging from 1/8 to 1/2 inch at
intervals of 1/16 inch. The shapes were electronically
generated by an apparatus designed for installation in
the Anti-aircraft Fire Control System M-33 PFI (plan
position indicator). The time taken by each of 36 sub-
jects to scan the display and determine the frequency
of the signal (only one type was used for each display)
was the index of discrimination. Some possible determi-
nants of symbol discriminability are discussed.

Siddall, G.J. THE ACCURACY OF RE-POSITIONING A POINT
ON A CIRCLE AND A HORIZONTAL STRAIGHT LINE. Rep. 62,
March 1957, 14pp. Clothing and Stores Experimental
Establishment, Ministry of Supply, London, England.

12,145
To compare the accuracy of re-positioning a point on
a broken circle and on a horizontal straight line, a spot
of light was exposed on the displays for five seconds.
After it had reappeared elsewhere in the display, the
subject was required to move it back to its previous
position as accurately as possible. Each of six subjects
made a total of 160 settings on each of the two displays.
Low illumination was used to eliminate extraneous visual
cues. Total mean errors were analyzed for differences
due to shape of display, improvement in performance and
errors at different settings were further studied. The
findings are related to A scan radar displays.

Stockbridge, H.C.W. & Chambers, J.B. SIGHTING WITH
AIDED AND UNAIDED VISION. Rep. 85, March 1958, 11pp.
Clothing and Stores Experimental Establishment, Ministry
of Supply, London, England.

12,146
To 1) estimate time required to change from open to
aided vision and vice versa and 2) compare the time re-
quired to use a binocular or monocular sight, using a
laboratory simulator, six subjects (Ss) carried out
three experiments using open vision and vision assisted
by monoculars and binoculars. In experiment one, S gazed
over binoculars until a light bulb was switched on, then
dropped his head and looked through the binoculars at a
Landolt C eight yards away and responded with location of
the break. In the second experiment eyes were removed
from binoculars when the light came on and S looked at
the Landolt C as before. The condition of the third ex-
periment was from open to monocular sight. Results of
the three experiments are compared.

Kleiser, E.T. & Loftus, J.P. NUMERALS, NONSENSE FORMS, AND INTEGRATION. Proj. 7682, AFRC TR 57.2, Feb. 1958, 22pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C.

12,150

To determine whether well-learned symbols are perceived, discriminated, and remembered better than nonsense forms, a series of arabic numerals and a logically related class of nonsense forms were presented tachistoscopically to a group of ten subjects. The task was to reproduce the stimulus-patterns--in some tests the entire pattern, in others only the one out of four indicated by a poststimulus cue (either visual or auditory). Time between stimulus and cue was varied systematically. Performance, percentage of line segments correctly reported and amount of information transmitted, was analyzed and compared for effect of type of stimulus-pattern.

Guarino, L.S. & Sikora, S.J. REPORT ON COMPARISON OF HELICOPTER FLIGHT ATTITUDE INDICATORS. BU AER Proj. TED NAM AE 7362.3, Rep. NAES INSTR 62 53, Nov. 1953, 9pp. USN Aeronautical Instruments Lab., Naval Base Station, Penn.

12,151

To determine the comparative value of several helicopter indicators, flight tests were conducted under simulated instrument flight conditions. The indicators (a conventional gyro horizon type, a rotor attitude type, a rate type, and the Sperry helicopter flight attitude indicator) were installed in a helicopter and two experienced pilots performed flight tests designed to simulate several types of conditions encountered in helicopter flight. Recorded results were inspected and compared for 1) minimum amplitude of attitude displacement in each axis and 2) amount of effort required to maintain attitude (frequency and amplitude of cycles stick and pedal displacement).

Graham, C.H. SENSATION AND PERCEPTION IN AN OBJECTIVE PSYCHOLOGY. Psychol. Rev., March 1958, 65(2), 65-76. (Columbia University).

12,157

Five topics that are of systematic importance in the treatment of sensation and perception are considered from the point of view of an objective or behavioristic psychology. (1) Types of stimulus-response relations are discussed as they relate to introspective or phenomenological descriptions, psychophysical discriminations, absolute judgments, and thresholds. (2) The terms "sensation" and "perception" are considered in terms of operationally specifiable concepts. (3) Problems of terminology are treated. (4) Some recurring problems of perception are described. (5) Perception is regarded in terms of general psychological theory.

Weston, M.C. ON AGE AND ILLUMINATION IN RELATION TO VISUAL PERFORMANCE. Trans. Illum. Engng. Soc., Lond. 1959, XIV(9), 281-297.

12,160
To study visual performance as related to age and illumination, a number of male subjects (age range: 19-47 years) were given tasks to perform which were visually comparable to various practical forms of "close work". Performance was recorded over a range of illuminations and contrasts. Two sets of data separated by a five-year interval were available for analysis which included comparisons of performance of five different aged groups and observations on the effect of an advance in age upon each group's performance. The results are discussed with reference to other findings in the literature and to the importance of providing more illumination for certain age groups.

Gogel, W.C. THE PERCEPTION OF SHAPE FROM BINOCULAR DISPARITY CUES. AMRL Proj. 6 95-20-001, Rep. 331, July 1958, 27pp. USA Medical Research Lab., Fort Knox, Ky.

12,163
To investigate an hypothesized change in the relation between the perceived and physical shape of objects as a function of object distance, shape judgments were determined, in two experiments, for an object having a frontal component and an adjustable depth component. Subjects (18) adjusted the depth component to appear equal to the frontal component at three distances of object from subject. The visual-alley situations differed for the two experiments in the number of cues other than binocular disparity supporting the depth component. The results are discussed in terms of the original hypothesis of depth perception.

McNeynolds, Jeno. APTITUDE LEVELS IN THE ENLISTED HANPOWER POOL OF THE AIR FORCE. Part I. Proj. 7719, WADC TN 58-63(1), Sept. 1958, 30pp. USAF Personnel Lab., Lackland AFB, Tex.

Rapid development of weapon systems has increased the need for highly qualified airman in technical areas and for information concerning their availability. This is the first in a series of reports designed to provide estimates of the aptitude levels of enlisted personnel in the Air Force. From data collected in the May 1957 sample survey, distributions of aptitudes were obtained by career fields, by enlistment plans, by term of enlistment, by skill level, and by grade. Distributions are presented in terms of the total Air Force enlisted population so that estimates can be made not only of the numbers of airman of each aptitude level in any one group, but of the numbers in any other group who have aptitudes levels high enough to permit efficient retraining into shortage areas. For airman in their first term of enlistment, aptitude distributions were typically the normal bell shape with little difference in level between career fields. Airman in later enlistments were typically higher in aptitude, methods of screening for retraining and for promotion build up the quality of career personnel so that the majority of ACOS, and especially those in the highly technical career fields, have high aptitude qualifications and are capable of supporting modern technological advances.

12,169
Flyer, E.S. A FOLLOW-UP STUDY OF NAVAL ACADEMY GRADUATES WHO ENTERED THE AIR FORCE. Proj. 7719, WADC TN 58-64, June 1958, 26pp. USAF Personnel Lab., Lackland AFB, Tex.

Air Force Academy selection and proficiency records cannot be validated against measures of officer effectiveness for some years, but an estimate of the relationship of training grades to officer performance can be obtained from comparable records of Naval Academy graduates who have entered the Air Force. In this study, midshipman training grades were related to Air Force retainability and to officer effectiveness measures. The retention rate in the Air Force of Annapolis graduates, 5 to 8 years after graduation, is about 73 percent. Annapolis graduates who resigned their commissions had lower physical training grades than those officers remaining on active duty, but differed in no other training proficiency measures. Naval Academy grades predict officer effectiveness reasonably well, with Aptitude-for-Service ratings proving the best single predictor of Air Force C-1000 effectiveness. These results support the use of Aptitude-for-Service ratings and academic grades received at the Air Force Academy as intermediate criteria of officer effectiveness.

12,173
A battery of tests was constructed to measure age-related changes in behavior relevant to skilled performance of Air Force officers. The battery, consisting of 14 tests selected from suitable existing tests or newly constructed ones, was administered to 344 flying officers ranging in age from 21 to 50 years. Test data were analyzed by correlational methods for their relationship with age and flying experience. Some longitudinal data were studied for four of the tests in the battery which had been taken by some subjects ten years previously. Final selection of tests for inclusion in a battery for further study is made.

Millen, L.P. & Rosenberg, W. VALIDATION OF POTENTIAL COMBAT PREDICTORS: 21. RESULTS FOR ARTILLERY. FR Proj. 8 6 80 12, Tech. Res. Note 77, DA Proj. 29560000, July 1957, 10pp. USA Personnel Research Branch, Adjutant General's Office, Washington, D.C.

The purpose of this study was to furnish Interim Artillery Branch research information for use in selecting new Combat Arms Aptitude Areas based upon the validity of AGS tests, form 20 information, and a group of experimental predictors. Testing was accomplished in the 10th Infantry Division at the start of the training cycle for 166 enlisted men later assigned to Artillery Branch. 5th-week peer ratings of estimated combat potential were collected as additional predictors, and 16th-week ratings were collected as criteria. The most valid composites included both AGS tests and experimental predictors. Composites including and excluding the 5th-week predictor ratings were both superior in validity to that of the present Combat Arms Aptitude Areas. Validity coefficients for predictor ratings were substantially beyond those of any other single measure tried out, but it is not known to what extent these coefficients were influenced by rating bias factors.

12,179
As part of an evaluational study of special trail or survival rations for use in cold climates, this report brings together information contained in correspondence concerning presently available trail rations. Those items considered to be of particular value have been condensed or quoted directly. Available reports on the trail rations used for Operation Deep Freeze I and II are included. A bibliography of literature references (not considered in this report) is attached.

Torrey, Jane W. EVALUATION OF COLOR VISION TESTS: ANNUAL SUMMARY REPORT OF PROGRESS. Contract NMR 996(03), Nov. 1957, 4pp. Dept. of Psychology, Connecticut College.

12,180
This annual summary reports three-phases of work: 1) A survey of color defect in women, 2) discrimination thresholds of color defectives, and 3) comparison of two different color discriminations in normals. Progress on all three is reviewed separately. Technical reports will be issued after the data are complete.

Kensington, K.M.L. A SUBJECTIVE STUDY OF STRING
VESTS UNDER HOT/DRY CONDITIONS. Rep. 74, Oct. 1956,
19pp. Clothing and Storage Experimental Establish-
ment, Ministry of Supply, London, England.

12,181
To establish whether, and in what way, the string
vest in standard or modified form makes any contribution
to the comfort of the wearer under hot-dry conditions,
24 subjects were required to wear each of three vests
(the standard string, a modified softer version known as
the Shemps, and the cotton singlet) for periods of three
or nine days on all occasions that a Dash Jacket was
worn. All men were engaged in active field duties. Cli-
matic conditions varied between 84 and 98 degrees Fahren-
heit and from 23 to 53 per cent relative humidity. A
questionnaire was issued covering obvious aspects of com-
fort and the analysis compared the three vests.

Koutsoukos, A.M. & Nychal, R.E. FREQUENCY OF OCCUR-
RENCE OF WORDS. A STUDY OF ZIPF'S LAW, WITH APPLI-
CATION TO MECHANICAL TRANSLATION. 2144 147 T, June
1957, 15pp. Engineering Research Institute, Univer-
sity of Michigan.

12,182
This report is concerned with one aspect of an in-
vestigation of the possibility of translating language
by mechanical means—a consideration of a dictionary of
words. Existing laws concerning frequencies of words in
language (specifically Zipf's and Joses' laws) are exam-
ined by means of new formulas which permit comparison of
these laws with easily obtainable data. The empirical
approach to the problem is also considered.

Caldwell, M.V., Coombs, C.H. & Thrall, R.M. EVALUATING
SURVEILLANCE SYSTEMS. Report of Project MICHIGAN. 2144
152 T, June 1957, 40pp. Engineering Research Institute,
University of Michigan.

12,183
The first phases of a long range project for
developing models for evaluating intelligence systems
in terms of measurable outputs is reported. For such
evaluations the number of correct identifications,
false alarms, displacements, and complete misses must
be measured in each of several categories (such as
infantry, artillery, armor, supply lines), sectors
(front line, rear, far rear) and situations (attack or
defense, good or poor mobility). Major results re-
ported on are: experimental techniques, an analytical
model, analysis techniques for evaluating parameters
of model, some preliminary evaluations, and formula-
tions of some concrete unsolved problems.

Hall, I.A. EFFECTS OF CONTROLLED ELEMENT ON THE HUMAN
PILOT. Contract AF 33(616) 2506, Proj. 7182, Task
71510, WADC TR 57 509, Aug. 1958, 204pp. USAF
 Aero Medical Lab., Wright-Patterson AFB, Ohio.
(Princeton University).

12,184
A simulator study of the human pilot performing a
two-dimensional tracking task, with random excitation,
was conducted. The effects on the pilot of various
longitudinal controlled element dynamics were investi-
gated. A technique for representing the pilot's re-
sponse mathematically is reviewed, and the describing
function and remnant term in the representation were
obtained for a wide range of controlled elements.
Pilot opinion of the controlled element's handling
qualities was obtained. Consistent physical explana-
tion for the remnant terms and of the changes in de-
scribing function are presented and found helpful in
understanding pilot opinion.

Inzell, W., Jr. REPORT OF INDIRECT CALORIMETRY BY
NEW TECHNIQUES: A DESCRIPTION AND EVALUATION. Rep.
146, 9937 IV, Dec. 1954, 32pp. USA Medical Nutrition
Lab., Fitzsimons Army Hospital, Denver, Colo.

12,185
This paper describes and evaluates a number of
new techniques for indirect calorimetry: the Miller-
Frank portable respiratory gas meter, Foulke oxygen
analyzer, and Blair formulation of energy metabolism
calculations. The errors encountered with these
methods are described and evaluated and agreement of
results with the older techniques of indirect calori-
metry is discussed.

Colla, J. & Brice, R. PHYSIOLOGICAL PRINCIPLES FOR
THE PROTECTION OF AIRMEN AT HIGH ALTITUDES - THE
FRENCH HIGH ALTITUDE SUIT. ATC 290676, FTS
10073/111, 1955, 9pp. USAF Air Technical Intelligence
Center, Wright-Patterson AFB, Ohio.

12,186
The problem of protecting the aircrew from low atmos-
pheric pressures is discussed in terms of various solu-
tions and the physiological principles applying in each
case. The following solutions are covered: pressurized
cabin, pressurized aircraft, and pressurized respiration
with such additions as an airtight helmet, pneumatic
vest, anti-G suit and various combinations of these.
The French high-altitude suit is described in some de-
tail and the performance attainable with the suit is
given.

Meier, W.M., O'Neill, J.J. & Adler, S. NUMBER-TELLING
METHODS. Contract AF-19(604) 1577, RF Proj. 664.
Tech. Rep. 48, AFRC TR 58-55, July 1958, 19pp. Ohio
State University Research Foundation.

12,187
To investigate number-telling (transmission of nu-
merical information) methods, a study was made of differ-
ent pronunciations of one-, two-, three-, and four-digit
numbers. Stimulus material was recorded by speakers re-
presenting the major American types of speech and the
principal language groups of the International Civil Avi-
ation Organization. Recordings were presented free-field
with an accompanying white noise mask to groups of gener-
al American listeners. Percentage intelligibility values
for the various pronunciations and for the various meth-
ods involving multiple digits were derived. Digit con-
fusions were obtained and effect of foreign speaker on
intelligibility was ascertained.

Gulliksen, H. INTRODUCTORY BIBLIOGRAPHY ON MATHEMA-
TICS AND ITS USE IN PSYCHOLOGICAL THEORY. 8pp.
Educational Testing Service, Princeton, N.J.

12,188
This paper lists titles of selected articles and
books on mathematics and its use in psychological theory.
Some important references are dated as far back as 1927;
however, the majority are of recent publication. The
titles are classified under the headings of general in-
terest, mathematics for psychologists, paired comparison
and the law of comparative judgment, psychological scal-
ing-categories, ratios, graded dichotomies, multidimen-
sional scaling, latent structure and latent class anal-
ysis, test theory, and learning and other psychological
theories in mathematical form.

Guedry, F.E., Cramer, R.L. & Koelle, W.P. EXPERIMENTS ON THE RATE OF DEVELOPMENT AND RATE OF RECOVERY OF APPARENT ADAPTATION EFFECTS IN THE VESTIBULAR SYSTEM. USAMRII Proj. 6 95, 20 001, App. 338, June 1958, 21pp. USA Medical Research Lab., Fort Knox, Ky.

12,189
To study the rate of development and of recovery of adaptation to angular acceleration two experiments were performed. (1) Conditioning stimuli (2.2 degrees square second acceleration) were varied in duration (three to 30 seconds) and standard test stimuli (five seconds acceleration or deceleration) presented five seconds after termination of primary subjective effects from conditioning stimuli; 18 subjects were used; rate of development of adaptation was thus determined. (2) The conditioning stimulus was presented for fifty seconds and test stimuli at various intervals after termination of primary subjective effect (ten to 60 seconds); 14 subjects; rate of recovery was thus determined.

Asher, J.W., Doty, L.A., Hanley, T.D. & Steer, M.D. AN INVESTIGATION OF MONAURAL AND BINAURAL AUDITORY DISCRIMINATION IN NOISE. Contract M6ori-104, NAVTRADEVEN Proj. 20 F 8, NAVTRADEVEN Tech. Rep. 104 2 49, Feb. 1957, 8pp. Purdue University.

12,190
To compare the relative effectiveness of listening to words in noise under monaural and binaural listening conditions, 18 subjects transcribed lists of words heard with a background noise (95 decibels). Three listening conditions were tested: right ear, left ear, and both ears. The data (number of words heard and recorded correctly by each subject for each condition) were analyzed by a repeated measurement analysis of variance for differences due to conditions, lists, and subjects. Implications for communications personnel are discussed.

Woser, H.M., Oyer, H.J. & Wolfe, Susan M. THE RELATIONSHIP OF PHONETIC STRUCTURE TO THE INTELLIGIBILITY OF WORDS SIMULTANEOUSLY RECORDED AT EAR AND LIPS. Contract AF 19(604) 1577, Tech. Rep. 47, AFRC TR 58 54, RF Proj. 664, April 1958, 23pp. Ohio State University Research Foundation.

12,194
To analyze the intelligibility of words relative to the origins (ears and lips) and to interpret these analyses with special attention to word structure, data from a previous study were utilized. The data consisted of 72,000 listener responses to a list of 50 monosyllabic words, recorded from the lips or ear of six speakers (General American dialect), and played back under varying levels of noise. The analysis compared intelligibility data from the two origins for 1) substitutions and omissions through different noise levels, 2) effect of number of sounds per word, 3) vowel and diphthong sounds in word, and 4) patterns of confusion.

Mollenkopf, M.G. A STUDY OF SCORES OTHER THAN NUMBER RIGHT. Contract NONR 694(06), Proj. Des. NR 151 113, Jan. 1957, 23pp. Educational Testing Service, Princeton, N.J.

12,196
To ascertain the properties of several scores, including their consistency, their interrelationships, and their validity for predicting academic grades, test scores of 649 students on three speeded tests in each of three content areas (verbal, arithmetic reasoning, and spatial) were analyzed. Seven scores were studied: errors, attempts, omits, variability of errors, variability of rights, ratio of rights to attempts, and ratio of wrongs to attempts. Intercorrelations were computed for all scores in each area and judged in terms of criterion of academic grades in five course areas.

Miller, H.R., Grundfest, H., Alper, J.M., Margolin, S.G., et al. THE SKIN TEMPERATURE OF THE FACE OF SUBJECTS EXPOSED TO 40° WHILE OPERATING MICROPHONE T-45. Engng. Mem. 15CR, April 1944, 15pp. USA Climatic Research Unit, Fort Monmouth, N.J.

12,198

To ascertain whether the wearing of Microphone T-45 at low temperatures for an extended period of time carries any danger of producing frostbite or other harmful effects, clean shaven subjects were dressed in Arctic costumes and exposed to -40 degree temperature and a turbulent wind velocity of about five meters per second for periods from 50 to 125 minutes. The conditions tested included application of microphone to uncovered face and to face protected by wool mask and no microphone. Temperatures were continuously recorded at different positions on the microphone and on the skin. Observations of ice formation and skin injury were made. Recommendations for operating use are included.

Bamford, H.E., Jr. THE USE OF TRAINING AIDS IN CONCEPTUAL TRAINING. Contract AF 18(600) 1203, July 1955, 56pp. American Institute for Research, Pittsburgh, Penn.

12,199

This report represents an attempt to isolate and identify various classes of training aids and various classes of relationships, a knowledge of which might support job performance, and to formulate hypotheses and working principles as to what form of training aid will be the most effective training medium for a given training aid. Seventeen species of training aid are distinguished, and for each there are considered the relationships which it can teach, its psychological value, its use in training, its advantages, and its disadvantages. Conceptual training is then considered as a process of communication which may vary with respect to its medium, form, content, and redundancy.

Wolfe, D. RESEARCH AND DEVELOPMENT IN HUMAN RESOURCES. Publ. L57 31, Sept. 1956, 20pp. Industrial College of the Armed Forces, Washington, D.C. (American Association for the Advancement of Science, Washington, D.C.).

12,200

This is a transcript of a talk, and of the general discussion which followed, on changing attitudes and present trends in research and development in human resources. The factors underlying the changes and the fields of selection, training, and design of equipment for human use are discussed.

12,201

Ness, J.L. THE APPROXIMATION OF THE RESPONSE OF THE HUMAN TORSO TO LARGE RAPIDLY APPLIED UPWARD ACCELERATIONS BY THAT OF AN ELASTIC ROD AND COMPARISON WITH EJECTION SEAT DATA. Rep. ES 26472, Nov. 1956, 51pp. Douglas Aircraft Co., Inc., El Segundo, Calif.

12,201

It has been noticed that when the human body is subjected to very rapidly applied accelerations, the accelerations at points of the body can be considerably larger than the maximum value of applied acceleration. This paper considers the case in which acceleration is applied along the line of the spine from seat to head as in ejection from aircraft and attempts to approximate the motion of the human torso by that of an idealized, one-dimensional, visco-elastic structure. The simple case of a homogeneous elastic rod is discussed in detail and its predictions compared with ejection seat data. Extensions to more complicated visco-elastic structures are discussed.

Miller, J.D. TEMPORARY THRESHOLD SHIFT AND MASKING FOR NOISE OF UNIFORM SPECTRUM LEVEL. J. acoust. Soc. Amer., June 1958, 30(6), 517-522. (Indiana University).

12,203

To test the hypothesis that differences in the effective noise level from one critical band to the next can account for the typical audiogram showing a temporary threshold shift resulting from an exposure to noise of uniform spectrum levels, eight listeners were exposed to each of four levels of white noise (95, 100, 105, and 110 decibels) for 12 minutes. A reference audiogram, as well as pre- and post-exposure audiograms, were obtained and the recovery of the threshold traced for three and one-fourth minutes after cessation of noise at each of seven test tone frequencies (from 0.5 to 8.0 kilocycle/s). Temporary threshold shifts were analyzed with respect to the hypothesis.

Decker, L. & Pollack, I. CONFIDENCE RATINGS AND MESSAGE RECEPTION FOR FILTERED SPEECH. J. acoust. Soc. Amer., May 1958, 30(5), 432-434. (Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,204

To test the extension of the statistical decision model, which has achieved success in describing the detection of signals in noise, to message reception of filtered speech, three listeners were tested. A speech signal, subjected to low-pass filtering was presented for 1) identification of word from a closed message set, and 2) assignment of a rating reflecting a judgment of the accuracy with which it was received. The relation between correct confirmations and false alarms (the Receiver Operating Characteristic) was determined and compared with that obtained with noise interference.

Pollack, I. LOUDNESS OF PERIODICALLY INTERRUPTED WHITE NOISE. *J. Acoust. Soc. Amer.*, March 1958, 30(3), 181-185. (Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,205

To investigate the possibility of providing a computational procedure for loudnesses of intermittent noises, the burst level of a periodically, abruptly interrupted, white noise, necessary to match a continuous white noise in loudness, was determined by each of seven to ten listeners. The variables were burst duration, burst level, duration of interval and noise level between successive bursts. Equal-loudness contours were derived for the various conditions. A procedure for calculating the required burst level, with knowledge only of time-intensity characteristics of the interrupted noise, is presented.

Stevens, S.S. MEASUREMENT AND MAN. *Science*, Feb. 1958, 127(3295), 383-389. (Psycho-Acoustic Lab., Harvard University).

12,206

This paper treats the problem of measurement as applied to the capacities, attitudes, sensations, or any of the many aspects of man that cannot be directly measured. The relation between measurement and mathematics is discussed and the nature of a scale is defined with a classification of scales of measurement. Measurement in psychophysics is treated with particular emphasis on the measurement of sensation. Today's resolution of the conflicting laws (logarithmic and power) in this area is treated and some insights derived therefrom are discussed.

Miller, J.D. TEMPORARY HEARING LOSS AT 4000 C.P.S. AS A FUNCTION OF A THREE-MINUTE EXPOSURE TO A NOISE OF UNIFORM SPECTRUM LEVEL. *The Laryngoscope*, March 1958, LXVIII(3), 660-671. (Indiana University).

12,207

To investigate some aspects of form of the function relating temporary hearing loss to the intensity of the exposure stimulus, six subjects were tested in eight different sessions. After determination of the absolute threshold at 4000 cycles per second, the listener was exposed to three minutes of noise (eight noise levels ranging from 85 - 120 decibels) and the recovery of the threshold was traced for thirteen and three-fourths minutes at thirty-second intervals. Temporary hearing loss (difference between pre- and post-exposure thresholds) was analyzed as a function of noise intensity and time after exposure. Individual differences in susceptibility were examined.

Miller, G.A. & Newman, E.B. TESTS OF A STATISTICAL EXPLANATION OF THE RANK-FREQUENCY RELATION FOR WORDS IN WRITTEN ENGLISH. *Amer. J. Psychol.*, March 1958, LXXI, 209-218. (Harvard University).

12,209

The form of the rank-frequency relation of words in written English and the various theories accounting for the relation are discussed. In order to test a statistical explanation, materials drawn from three widely divergent sources were studied. Frequency counts of individual words were made for each sample and then for all three combined. Various rank-frequency relations (frequency of a word as a function of its rank with respect to decreasing frequency, average frequency as a function of rank with respect to increasing word length, and for strings of letters between successive occurrences of the letter "e") are presented and discussed.

Stevens, J.C. & Tuving, E. ESTIMATIONS OF LOUDNESS BY A GROUP OF UNTRAINED OBSERVERS. *Amer. J. Psychol.*, Dec. 1957, LXX, 600-605. (Harvard University).

12,210

To compare loudness estimations made by a group of untrained listeners with those made by sophisticated subjects serving alone, 70 inexperienced subjects estimated the loudnesses of a series of white noises (from 65 to 105 decibels) presented through a loudspeaker in a classroom. In the first experiment, no standard was designated, and each subject used a scale of his own choosing; in the second, a numerical value was assigned to a standard noise which preceded the presentation of each variable. The results were analyzed for effects of the two methods and compared to other data in the literature.

Hanley, T.D. & Steer, M.D. INTELLIGIBILITY OF VOICE COMMUNICATION: (A REVIEW OF PAST AND PROJECTED RESEARCH, TRAINING DEVICES AND METHODS). Contract No. orl 104, NAVTRADEVEN Proj. 20 F 8, Task Order II, NAVTRADEVEN-TR 104 2 51, June 1957, 117pp. USN Training Device Center, Port Washington, N.Y. (Voice Communication Lab., Purdue University).

12,211

This is a summary report of speech intelligibility research. Critical aspects of communication are reviewed with attention focused on each link of the transmission chain: talker, message, mode of communication, and listener. Message clarity and understandability provides the frame of reference for the examination of such variables as the talker and his characteristics, the communications environment, instrumentation, training, and training devices. Current research trends and research objectives of the Purdue Voice Communication Laboratory are discussed.

12,213 Roff, M. PRESERVICE PERSONALITY PROBLEMS AND SUBSEQUENT ADJUSTMENTS TO MILITARY SERVICE. THE PREDICTION OF PSYCHONEUROTIC REACTIONS. Rep. 57 136, Nov. 1957, 11pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Institute of Child Welfare, University of Minnesota, Minneapolis, Minn.).

A longitudinal follow-up study is being made of patients of public school child guidance clinics and a nonpatient control group through subsequent military service. The present report compares 2 groups of former patients of the child guidance clinics: one group (55 men) who were diagnosed as neurotic while in service; the other group of 55 represent individuals who attained a grade of sergeant or higher with no adverse indications in their military records. Childhood tendencies to antagonize others to an unusual degree were shown to distinguish the potential neurotic with a high degree of accuracy.

12,212 Zeldner, J., Harper, Bertha P., & Karcher, K. RECONSTITUTION OF THE APTITUDE AREAS. Proj. DA 2956 0000, Pgs Prof. 8 & 250 11, Pgs Tech. Res. Rep. 1095, Nov. 1956, 34pp. USA Personnel Research Branch, Adjutant-General's Office, Washington, D.C.

Simultaneously with the introduction in 1949 of the original Aptitude Area composites of Army Classification Battery test scores, series of studies were initiated to provide additional information on the effectiveness of various composites of ACG tests in classifying men for training and job assignment. Sufficient information has now been accumulated to warrant review of the original Aptitude Area system. The result of the study described in this report was reconstitution of Aptitude Areas. In selecting the new composites, data were used from 42 studies on the validity of ACG composites for predicting success in Army School courses and in Army jobs. Selection was based on considerations of high differential validity. Instead of the original 11 Aptitude Areas, the 7 new Aptitude Areas are 2-test composites involving repeated use of the same tests. The 7 new Aptitude Areas are 2-test composites of the ACG tests and involve the same ACG tests less frequently. The new areas are less intercorrelated. Identify the highest aptitude of a greater percentage of men, and are better able to differentiate levels of aptitude in each man.

12,216 Debons, A. & Chiles, W.D. THE EFFECTS OF COLD ON PSYCHOPHYSICAL WEIGHT JUDGMENTS: A METHODOLOGICAL STUDY. Proj. 7193, WADC TN 57 305, Sept. 1957, 10pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,216 A methodological experiment was carried out to study problems involved in obtaining psychophysical weight-judgment functions at lowered ambient temperatures. Two subjects compared seven variable stimuli, ranging in weight by five gram increments from 185 to 215 grams, with a standard stimulus of 200 grams by the method of constant stimulus differences. Judgments were made at ambient temperatures of 700 and -25 degrees Fahrenheit. The limens, obtained by a least-squares solution, were analyzed as functions of exposure to cold and learning. Implications for methodology are discussed.

12,217 Slingland, C.E. THE FITTING OF OUTER CLOTHING OVER THE MC-3 AND MC-4 PARTIAL PRESSURE SUITS. Proj. 6325, Task 63751, WADC TN 57 306, Dec. 1957, 7pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,217 Tests were conducted to determine the upgrading of outer clothing sizes necessary to allow adequate room for inflation of the partial pressure suit. Two men were selected for each of the 12 sizes of partial pressure suits, each man was: 1) measured for flight clothing over a standard Air Force fatigue coveralls; 2) fitted for a partial pressure suit; 3) outfitted with a ventilating garment; then 4) standard tailors measurements were made following suit inflation to ten pounds square inch. The outer clothing to fit these dimensions were tried on the subject to assure the best fit and comparisons made with sizes normally worn. Recommendations are included.

Berah, P.J., Pottermen, J.M. & Schoenfeld, V.H. A COMPARISON OF INTERNAL VS. EXTERNAL REINFORCEMENT IN MOTOR AVOIDANCE SITUATIONS. Rep. 57-27, April 1957, 7pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Columbia University, New York, N.Y.)

Avoidance training following the establishment of a conditioned heart rate depression resulted in more complete elimination of the conditioned response when an interoceptive cue (light) was used to help the subject distinguish between the occurrence of the avoidance response and ineffective responses than when no cue was used. There was some evidence that increased avoidance training resulted in the exercise of an increased discriminative control over heart rate by the interoceptive cue, while, conversely, such cues as were available to the control group (presumably proprioceptive) lost some of their effect upon the conditioned response.

USMC Development Center. HELMET, TANK, MC-X2, TEST OF. MDC Proj. ET 1193, Nov. 1957, 31pp. USMC Development Center, Marine Corps Schools, Va.

12,219
The MC-X2 Tank Helmet was tested to determine its suitability for Marine Corps use in connection with tracked vehicles. Tests were carried out determining the physical characteristics, ballistics quality, durability, and operational suitability. For the latter two tests, helmets were worn by 20 tank crewmen, for an average of 98.7 operational hours. In addition to periodic examination of the item, each crewman was questioned as to comfort and fit, operation of the communications equipment, adaptability for use with sighting and fire control equipment, and with other items of equipment. The findings are summarized and recommendations are presented.

Stalder, J.J. A STUDY OF AUTOMATIC SIGNAL SELECTION FOR AIRBORNE DIRECTION FINDERS. Final Rep., Contract DA 36 039 SC 72806, Oct. 1957, 83pp. College of Engineering, New York University.

12,221
This is a summary report of an investigation into the feasibility of developing an accurate automatic direction finder for use by the pilot of a small, low-flying, fixed or rotary wing plane. Phase one was a human factor's investigation to determine the psychophysical actions employed in taking aural-null type direction findings in the presence of noise interference. Phase two was an engineering investigation leading to development and preliminary evaluation of an automatic direction finder that would exhibit the advantages of an aural-null operation in the presence of interference. The results of the evaluation are discussed and recommendations for further development are made.

Cogan, E.A., Willmorth, N.E. & Findlay, D.C. A SURVEY OF MAP SKILLS REQUIREMENTS. Contract DA 44 109 qm 650, Proj. DA 095 30 000, Tech. Rep. 43, Sept. 1957, 44pp. Human Resources Research Office, The George Washington University, Washington, D.C. (USA Armor Human Research Unit, Fort Knox, Ky.)

The purpose of this study was to determine the degree to which each of 53 map skills and map skill applications is required for infantry, armor, and reconnaissance combat personnel in each of 7 levels of responsibility ranging from squad members (tank crewmen in armor and reconnaissance units) to battalion commanders. The summary derived as to the relative importance of the 53 skills may be used as a guide in developing or revising training programs pertaining to map skills, and as a means for assessing the degree to which tactical doctrine and actual map using practice correspond.

12,224
To refine the stimulus presentation and scoring technique of radar aiming-point identification group tests, a motion picture of a radar-scope display during a practice bomb run was animated with crosshairs. These crosshairs constituted test items and the subject's task was to place a pencil dot on the crosshair printed on answer sheets which corresponded to correct position of aiming-point on the film. Test score was the sum of circular error scores for each item. Two forms of the test were administered to 90 rated flying officers, an item analysis was performed, and estimates of reliability computed. Grades and ratings of the subjects were studied in relation to test scores as intermediate validity criteria.

Tupas, E.C. & Christal, R.C. STABILITY OF PERSONALITY TRAIT-RATING FACTORS OBTAINED UNDER DIVERSE CONDITIONS. Proj. 7719, WADC TN 58 61, May 1958, 16pp. USAF Personnel Lab., Lackland AFB, Tex.

Peer ratings by officer candidates on specific personality traits have been shown to be predictive of later officer performance. The present study investigated personality trait ratings to determine their factorial structure and the extent to which the factors remained constant in spite of differences in samples, raters, lengths of acquaintanceship, and rating situation. 6 intercorrelation matrices were factored and the resulting factors rotated to orthogonal simple structure. Six clearly defined personality factors were found in each analysis which remained relatively invariant through all analyses. The factors were identified as Surgency, Agreeableness, Dependability, Emotional Stability, and Culture. It was concluded that the factor structure of personality trait ratings is sufficiently invariant that such trait ratings may be regarded as adequate criteria for the study of personality differences and for test development purposes.

Moser, H.H., Dreher, J.J., & Wolfe, Susan H. CONTRASTION OF STANDARD SEQUENCE TO AN AIR DEFENSE TASK. Contract AF 19(604) 1577, Tech. Rep. 39, AFRC TN 56 73, AF Proj. 664, Jan. 1957, 19pp. Ohio State University Research Foundation, Columbus, Ohio.

Typical Air Defense surveillance messages were read with elements in standard order and in random order to 2 groups of listeners. Each group practiced logging data in one particular type of sequence for 7 hour-long training periods; at which time the standard and random orders were interchanged to assess the performance of listeners on an unfamiliar type of presentation. A final proficiency test consisting of extremely rapid telling of messages in regular order was administered to both groups to evaluate the 2 types of training. When using standard vocabulary and one type of message, the message items may be presented in different sequences to trained groups without seriously affecting reception. Initial results produced better intelligibility scores for the standard-ordered material. However, training appeared to negate this original advantage. Groups trained in standard and random sequence, respectively, showed no significant difference when the presentation method was interchanged. Groups trained in standard and random sequence, respectively, showed no significant difference when subjected to speed tests of standard-ordered messages.

Ronchi, Lucia & Bittini, Marcella. ON THE INFLUENCE OF THE SHAPE OF EQUAL ENERGY LIGHT PULSES ON THE CRITICAL FLICKER FREQUENCY. Contract AF 61 (514) 634C, BOARD TN 57, Rep. 10, 1957, 11pp. Istituto Nazionale di Ottica, Arcetri, Firenze, Italy.

12,230
To investigate the critical flicker frequency as a function of the shape of the light pulses, two experienced subjects made judgments with the right eye. Fan-tooth and rectangular pulses (in white, red, green, and blue-violet), at a light-dark ratio equal to one, were presented at central and peripheral (seven to 15 degrees nasal) retinal locations for several durations from 16 to 30 milliseconds. The critical luminances (L) were analyzed and discussed in relation to results from other research studies, in particular, to those obtained taking as response index the b-wave of the electroretinogram elicited by a single flash.

Alt, E.F. & Gordon, L.V. A FLEET VALIDATION OF SELECTION TESTS FOR UNDERWATER DEMOLITION TEAM TRAINING. BuNavPers Tech. Bull. 57 6, Jul 1957, 5pp. USN Personnel Research Field Activity, San Diego, Calif.

In a previous study, a battery of predictor tests was administered to 140 students entering Underwater Demolition Team (UDT) training. Of the entering group, 64 were graduated into fleet teams. Approximately 15 months after graduation of the last of this group, the present follow up was performed to determine the relationship between the predictor battery and fleet success. Basic Test Battery (BTB) scores were significantly correlated with fleet success, while swimming and physical fitness measures were not. 2 personality traits, Objectivity and Masculinity, had significant validities against this fleet criterion. Swimming test scores correlated significantly with rankings of swimming ability in the fleet. Swimming ability and physical fitness are important as predictors of UDT training success, but not of fleet success. Cognitive measures, (BTB), while unproductive of UDT training success, predict fleet success. Therefore, both types of measures should be used for screening in the initial UDT training program.

Underwood, B.J. STUDIES OF DISTRIBUTED PRACTICE: XV. VERBAL CONCEPT LEARNING AS A FUNCTION OF INTRA-LIST INTERFERENCE. *J. exp. Psychol.*, July 1957, 54(1), 33-40. (Northwestern University, Evanston, Ill.).

This study investigated concept learning as a function of degree of intralist interference and intertrial interval. Verbal concept materials were employed in which intralist interference was varied in terms of number of common characteristics shared by the objects symbolized by their respective word stimuli when those stimuli were instances of different concepts. 3 lists were constructed varying in degree of such overlap among concept stimuli. Massed practice consisted of 4 sec. between trials, distributed practice involved 30 sec. between trials. 6 groups of Ss, 51 in each group, were used. The 6 groups represent the 6 conditions, namely, 3 degrees of intralist similarity with a massed and distributed group for each degree. The Ss were given a constant number of learning trials with retention being measured after 24 hrs. The major results were: a) The greater the overlap (intralist interference) the slower the learning up to a point. Beyond this point with the present materials no further change occurred. b) Confirming previous concept formation studies, and studies using rote-learned paired associates, no differences in learning occurred as a consequence of massed vs. distributed practice. c) The forgetting over 24 hrs. was greater for lists with high intralist similarity than for the list with low intralist similarity, but was small in all lists.

Church, S.A. REFINEMENT AND VALIDATION OF AN AIMING-POINT IDENTIFICATION MOTION-PICTURE GROUP TEST. *Proj. 7711, Devel. Rep. AFPRC TN 57 142, Dec. 1957, 16pp. USAF Operator Lab., Randolph AFB, Tex.*

A technique for obtaining group measures of radar aiming-point determination ability developed earlier by this laboratory was refined, and validity data on the newly developed test was obtained. A motion picture of the radarscope display during a bomb run served as the testing device. This filmed bomb run was animated with crosshairs which constituted items of the test. 90 rated officers undergoing upgrading training in the aircraft observer school at Hather Air Force Base served as subjects for this study. A scoring system was empirically derived which quite adequately described and discriminated the subjects' responses. This system provided scores which can be broken down into range error, azimuth error, or circular error. An analysis of the types and kinds of errors made was carried out. An item analysis was performed. The reliability of the test was determined. Equivalent form reliability proved to be .76, and the reliability of the complete test, consisting of 38 items, (19 in each of 2 equivalent forms) was .90. Portions of the test's variance were identified in terms of intermediate validity criteria consisting of grades and ratings by observer instructors. The test is of potential value as a predictor of circular errors made on check-flight missions, and as a predictor of instructor ratings of radarscope interpretation skills. It provides a useful criterion measure for research studies of radarscope interpretation skills.

12,245

To test the importance of sensory stimulation that is dependent upon self-produced movement (re-afference) in the reduction of errors in hand-eye coordination induced by prisms placed in front of the eyes, comparisons were made of shifts in localization following exposures with and without re-afferent visual stimulation of the moving hand. The subjects were required to mark a target location while viewing the target through a prism (hands could not be seen thus visual detection of error was obviated) both before and after exposure conditions: scanning motionless hand, passive movement of hand by experimenter, and self-produced movement. Shifts in localization were analyzed for effects of exposure conditions.

Charlpper, B.A. SHIP CONTROL: VII. JUDGMENT OF
PITCH WITH VISUAL AND NON-VISUAL CUES. Contract
NONR-2512, EB Tech. Rep. 411 HF 14, P58 109, July
1958, 13pp. Electric Boat Div., General Dynamics
Corp., Groton, Conn.

12,251
To investigate man's ability to judge pitch
angles by various sensory cues, 30 subjects were
tested on a tilt-table submarine simulator. Each
subject reported two judgments at each of 20 angles
spaced in four degree intervals over a range of plus
to minus 40 degrees. In one condition only the
vestibular-kinesthetic cues provided by body tilt
were available; in a second condition visual cues
from a contact analog display were added. Mean
judgments and average error scores were compared
for the two conditions and with those from a pre-
vious experiment which used visual cues only.

Graham, C.H. & Hsia, Y. THE DISCRIMINATIONS OF A
NORMAL AND A COLOR-BLIND EYE IN THE SAME PERSON.
Proc. Amer. Phil. Soc., April 1958, 102(2), 168-173.
(Columbia University).

12,252
This paper presents color vision data for a subject
whose color-mixture and hue discrimination functions
show the right eye to be normal and the left eye, di-
chromatic. Sensitivity curves for each eye were obtained
to determine whether there was a loss in the dichromatic
eye. Binocular color matching experiments were made to
establish what colors were seen by this unilaterally
color-blind subject. These results are considered in
terms of theories of color vision. (See also 12,253,
12,254).

Alderson Research Labs., Inc. ANTHROPOMORPHIC TEST
DUMMY MARK II. 1952, 16pp. Alderson Research Labs.,
Inc., New York, N.Y.

12,256
This report describes an anthropomorphic test
dummy (Mark II) that is considered to be a close
approximation to the human body. The uses of such a
life-size dummy in research on seating and harnessing
arrangements to minimize crash effects, in general
safety design, and other areas in which the subject is
an expendable item are discussed. The specifications
and characteristics are presented through discussion,
illustrations, and tables.

Ewert, E.S. A SURVEY OF POTENTIAL MORALE, MOTIVATION, AND RETENTION PROBLEMS AT BALLISTIC MISSILE SITES. Proj. 7719, WADC TR 58-66, Oct. 1958, 36pp. USAF Personnel Lab., Lackland AFB, Tex.

Potential morale, motivation, and retention problems among personnel at ballistic missile complexes are reviewed, together with pertinent research findings in the military and industrial literature. Although morale and motivation problems do not appear particularly unique, there are important considerations of emphasis. Therefore, problem areas and proposed solutions are viewed in the broad context of analogous conditions in other military and industrial situations. This provides a framework for more effective evaluation of personnel actions. It is a major thesis of this report that in the area of improved management and leadership practices lies the greatest potential for enhancing morale and motivation to get things done effectively at ICBM complexes.

Corp., Frances M. RELATIONSHIPS BETWEEN AIRMAN INTERESTS AND CAREER SATISFACTION. Contract AF 41(657) 60, Proj. 7719, WADC TR 58-90, March 1958, 23pp. USAF Personnel Lab., Lackland AFB, Tex. (Trinity University, San Antonio, Tex.).

This study is an attempt to validate a 264-item interest inventory for inclusion in the basic airman battery to improve prediction of general competence in the Air Force situation and in particular Air Force jobs. Assuming that satisfaction is related to effectiveness in a work situation, it was taken as the criterion for this study. Responses of 842 airmen were validated against their answers to Sample Survey questions selected as indexes of satisfaction with the general Air Force situation and with particular Air Force duty. Predictive validity was not demonstrated for existing keys with general Air Force personnel or selected job specialty groups; item analysis did not result in new scales.

Taylor, C.W., Smith, W.R., Ghiselin, B., Sheets, B.V., et al. IDENTIFICATION OF COMMUNICATION ABILITIES IN MILITARY SITUATIONS. Contract AF 18(600) 1211, Proj. 7719, WADC TR 58-92, June 1958, 57pp. USAF Personnel Lab., Lackland AFB, Tex. (University of Utah, Salt Lake City, Utah).

This research was designed to define the dimensions of communication abilities, to provide techniques for measuring performance in communication in military situations, and to determine test predictors of the communication abilities thus defined and measured. A list of communication requirements was abstracted from descriptions of airman jobs. Tests were assembled assumed to be predictive of these abilities. From their administration in 2 large test batteries to samples of airmen the data were analyzed for selection of predictors to include with criterion variables in a validation battery. 18 situation tests were constructed from which were derived 27 criteria of communication effectiveness in military situations. Significant relationships between predictors and criteria demonstrated the practicability of assembling either a general set of predictors or groups of specific predictors. There is evidence that communication abilities are more complex than categorization by communication channel (speaking, writing, reading, listening) implies; integrating abilities are predictive of effectiveness in all channels. The report supplies extensive data useful for the further development of selection and classification procedures for Air Force personnel primarily concerned with communication tasks.

Marks, D.A. & Gronow, D.G.C. A COMPARISON OF THE APPRECIATION OF AIRCRAFT ATTITUDES GIVEN BY FOUR TYPES OF NON-TOPPLING ATTITUDE INDICATOR. FPRC 833, May 1953, 14pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

12,260

To discover the most suitable presentation of aircraft attitude, four non-toppling attitude indicators were compared: the standard artificial horizon, two single dial forms with horizons, and one two-dial form without an horizon. The stimuli were presented tachistoscopically and the subject was required to interpret the information presented. Groups of 24 pilots, 24 cadet pilots and 24 non-pilots were tested and seven types of scores were investigated. A subsidiary experiment was run using motor rather than verbal responses. Recommendations are included.

Duncan, C.H. THE INFLUENCE OF FIELD OF VIEW ON MEASUREMENTS OF ATMOSPHERIC TRANSMISSION. Proj. NR 544-000 & Proj. NR 544 001, NRL Rep. 4917, April 1957, 20pp. USN Research Lab., Washington, D.C.

12,261

To provide atmospheric transmission data for varying sizes of fields of view in the regions of lower transmissions, measurements were made of the ratio of diffuse transmission to collimated transmission for fields of view as large as 50 degrees in diameter. This work was done over a 1.51-mile path with collimated transmission values ranging from 0.75 to 0.01. The obtained data is compared with theoretical values computed from an equation derived from earlier observations in relatively clear atmospheres.

Lanier, L.H. & Tresselt, Margaret E. A FACTORIAL ANALYSIS OF DEPTH PERCEPTION TESTS. Contract WSW 2496, no date, 42pp. Psychological Research Center, New York University.

12,262

To investigate the inter-relationships among the aspects of visual discrimination involved in depth perception, a battery of 28 visual tests covering variables of binocular and monocular depth, visual acuity, phorias, and color was administered in a test and retest series to 228 subjects. The data were studied by factorial analysis and significant factors identified and discussed. Further analysis was made with reference to (1) the form of distribution of scores for different tests, (2) test-retest reliability, and (3) practice effects. Courses for future investigation are suggested.

Willingham, W.A. A NOTE ON THE RELATION OF AGE TO ATTRITION. Bu Med Surg Proj. No 16 of 11.
Subtask 1, Rep. 15, April 1958, 6pp. U.S. School of Aviation Medicine, Naval Air Station, P.O.

It has been noted in previous years that in the Naval Air Training Program older students are more likely to fail. It was the purpose of this study to analyze the relationship between age and different types of failure in order to clarify in what respects age is related to success. The data indicated that age is negatively related to success primarily due to the fact that older men are more likely to withdraw voluntarily. The data showed relatively small relationships between age and other types of failure.

12,265
This report presents the proceedings of a symposium on form discrimination as recorded on tape and later transcribed and edited for publication. Session I deals with the significance of form discrimination in military applications, visual psychophysics, and psychology. Session II provides up-to-date information about some representative technical and procedural aspects of research in this area. Session III presents experimental results relating form to the elementary visual detection process. The final session was a summary discussion by the fifty or more participants. There are 35 papers presented in full.

Lichten, A.M. PSYCHOLOGICAL STUDIES OF THE CONTENT AND METHODS OF PRESENTING CHARTS AND MAPS FOR RADAR OBSERVERS AND NAVIGATORS. Contract AF 19(604) 1209, Proj. 7738, AFFRC IN 58 3, Jan. 1958, 22pp. Naval Ordnance Lab., Randolph AFB, Tex.

12,267
The pilot studies and experiments summarized in this report were undertaken (1) to provide additional knowledge of types of information derived from radar scope displays, (2) to develop an objective test of navigational performance, and (3) to study the influence of certain chart variables on performance. Two techniques for measuring performance were developed: a group form of the "plotter" technique of aiming-point identification and a new "city recognition test" that is also a group method based on use of slides and projectors. The effect of two chart variables—map scales and amount of information—on performance were studied.

Davis, R.C., Landerside, A. & Miller, J.D. THE PATTERNS OF SCATTERED RESPONSE DURING A REVERSIVE MOTOR TASK AND ITS MODIFICATION BY VISUAL STIMULI. J. Comp. Physiol. Psychol., Feb. 1957, 30(1), 53-60. (Indiana University).

12,268
To explore the effects of a simple repetitive motor task on the skeletal and autonomic state of the individual and the effect of additional stimuli imposed during this response, measurements of muscle potentials and various other responses such as skin resistance, pulse rate, breathing, and blood volume were made on 14 subjects. The test routine included rest, sound of metronome, tapping on key at a given rate, tapping during exposure of lantern slides and tapping at maximum rates. The data were analyzed for common response patterns and for departures therefrom.

Baker, P.T. AMERICAN NEGRO-WHITE DIFFERENCES IN HEAT TOLERANCE. Proj. 7 of 01 0058, Tech. Rep. EP 75, June 1958, 19pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

12,270
The physiological responses of American white and negro soldiers were studied under hot-wet and hot-dry conditions. Under hot-wet conditions 40 pairs of men matched for body fat, weight, and stature were walked around a course at three and one-half miles per hour for one hour. Under hot-dry conditions eight pairs of men, matched as before, were studied under eight different conditions which included combinations of clothing, sun, shade, walking and sitting. The data were studied for differences in ability to withstand heat stress between the two types of subjects which might be genetic in origin.

Baldwin Piano Co. COMPUTED VS. MEASURED WORD ARTICULATION: SIMULATED PILOT-TO-CONTROL TOWER COMMUNICATION. Final Engineering Report. Contract AF 33(616) 3325, Task 2, Rep. AFAC 21, March 1957, 84pp. Baldwin Piano Co., Cincinnati, Ohio.

12,272

To determine whether less than the full frequency range could be successfully used in radio communication between pilot and control tower, calculated estimates were made of word articulation for communication systems containing military and commercial microphones, headset, amplifiers, and loudspeakers of types now used in control towers in ten ambient noise environments typical for present aircraft. Experimental articulation values were obtained in a limited number of these and compared with calculated values. The frequency ranges required for 80 percent word articulation were determined.

Brown, Mary B. EVALUATION OF QUALITY AND STABILITY OF TEN MENUS OF PRECOOKED FROZEN MEALS FROM THREE AIR FORCE PROCUREMENTS. Proj. 7156, QMCI Rep. 40 57, Interim Rep. 1, Dec. 1957, 16pp. USA Quartermaster Food & Container Institute for the Armed Forces, Chicago, Ill.

12,275

Ten menus of precooked frozen meals from three Air Force procurements were evaluated for quality initially and at intervals during 12 months storage at zero degrees Fahrenheit. Quality ratings on a nine-point scale were made by a panel of eight to 12 food technologists for three menu items from each of eight menu combinations and two casseroles. One meal was shared by two testers at a single serving. A special questionnaire was also used to evaluate the items. Recommendations as to procurement, packaging, and storage time are made.

Brown, M.K. STRESS SUMMATION IN FLIGHT: III. EFFECT OF BREATHING PURE OXYGEN AT ATMOSPHERIC PRESSURE ON TOLERANCE TO ACCELERATION. EPIC 1043, April 1958, 8pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

12,276

To investigate possible interaction between positive acceleration (g) and breathing of pure oxygen leading to a lowering of the threshold of consciousness, changes in blackout threshold of six experienced centrifuge subjects breathing ten and 100 percent oxygen at atmospheric pressure were determined. The method involved the use of dark adaptation. Respiratory and pulse rates were also measured. Thresholds were determined after five, ten, fifteen and twenty minutes on pure oxygen and compared to two values determined at ten and fifteen minutes while breathing air.

Gaydos, H.F. THE EFFECT ON COMPLEX MANUAL PERFORMANCE OF COOLING THE BODY WHILE MAINTAINING THE HANDS AT NORMAL TEMPERATURES. Proj. 7 83 01 005, Tech. Rep. EP 84, April 1958, 7pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

12,280

To determine whether the impairment of performance of complex manual tasks in the cold can be prevented by maintaining the hands at normal temperature even though the rest of the body becomes cool, 12 subjects were tested on two tasks (knot tying and block stringing) under two conditions. In one the body and hands were cooled simultaneously to 45 degrees Fahrenheit; in the other the body was cooled to the same degree as before while the hands were kept warm (80 degrees Fahrenheit). Tests were administered at intervals as body and/or hand temperatures dropped. Performance scores were analyzed for differences due to experimental variables.

Gerlach, Muriel W. INTERVAL MEASUREMENT OF SUBJECTIVE MAGNITUDES WITH SUBLIMINAL DIFFERENCES. Contract NMR 225(17), Proj. NR 171 034, Tech. Rep. 7, April 1957, 184pp. Applied Mathematics & Statistics Lab., Stanford University.

12,281

This paper presents the view that subjective (psychological, sensory) measurement is possible if certain conditions are met and is concerned with specifying these formal conditions. Adequate criteria for interval measurement of subjective magnitude are specified, that is, axioms on experimentally realizable notions are laid down and proofs offered of their adequacy to guarantee interval measurement. Account is taken of special conditions for sensory measurement such as indifference (psychological indistinguishability), subliminal differences, limited extent of sensation.

Hannigan, J.F. INTERIM REPORT ON CAMOUFLAGE OF ARMY AIRCRAFT. Proj. 8 31 02 110, Tech. Rep. 1508-TR, Jan. 1958, 100pp. USA Engineer Research & Development Lab., Fort Belvoir, Va.

12,282

This report covers camouflage tests for army aircraft in temperate terrain. The L-20, H-21, and H-34 army aircraft were used. Four paint schemes were tested against terrain backgrounds: 1) interim pattern (dark green, forest green, and sand), 2) solid color (lustreless olive drab), 3) field pattern (olive drab and black), and 4) standard. Gray, white, and aluminum undercolors and the standard were compared against sky backgrounds. Four viewing situations were used: air to ground, ground to ground, air to air (above), and ground to air. Photographs using various types of films were taken. Some additional measures for concealing aircraft on the ground were tested.

Tampietro, P.F., Buskirk, E.R. & Bass, D.E. EFFECTS OF FOOD, CLIMATE, AND EXERCISE ON RECTAL TEMPERATURE DURING THE DAY. Proj. 7 83 01 005B, Tech. Rep. EP 76, Dec. 1957, 5pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

12,283

To determine the effect of climate, food intake, and activity level on the diurnal pattern of rectal temperature from eight o'clock in the morning to eight o'clock at night, a series of experiments was performed. All subjects were healthy young soldiers. Data were collected from men 1) living in two climates (subarctic and temperate) performing a daily march of ten miles with regular meals; 2) with and without the daily march; and 3) with different combinations of food and exercise. In all phases rectal temperatures were measured at four periods during the day and analyzed for changes attributable to experimental variables.

Telhurst, G.C. VOCAL PITCH CHANGES: EFFECTS ON INTELLIGIBILITY TEST SCORES. OSU Contract N60MR 22525, ONR Proj. NR 145 993 & Bu Med Surg Res. Proj. NM 18 02 99, Subtask 1, Rep. 76, April 1958, 13pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,294
To explore the generally accepted belief that heightened intelligibility is given to words by a rising inflection, two recordings of multiple-choice tests were made by three speakers. In one recording a single talker spoke a test phrase, inflecting one of the three stimulus words upward in pitch, and in another each of the three test words was spoken by a different speaker. Each recording was heard by 116 to 120 listeners in quiet classroom (62 decibels). Listener data were analyzed for intelligibility advantages due to inflection and the position of the inflected word in the phrase.

Miles, S. OXYGEN SYNCOPE. RSP 57/880, UPS 161, Jan. 1957, 7pp. Royal Naval Personnel Research Committee, Medical Research Council, London, England. (Royal Naval Physiological Lab., Alverstoke, Hants, England).

12,295
To investigate the theory that breathing oxygen will lower the threshold for the occurrence of syncope (loss of consciousness due to an acute decrease of cerebral blood flow) irrespective of its immediate cause, 36 young adults were tested breathing air or oxygen (five minutes), hyperventilation (one minute), changing from prone to upright positions, and blowing into pressure tube attached to mercury manometer for as long as possible. Breath holding time, amount of pressure maintained, and incidence of syncope or symptoms were analyzed. The results are discussed in relation to cases of "Shallow Water Blackout" in divers and episodic unconsciousness in pilots. Recommendations to limit its occurrence are given.

Miller, J.W. & Goodson, J.E. A NOTE CONCERNING "MOTION SICKNESS" IN THE 2-FH-2 HOVER TRAINER. Bu Med Surg Proj. NM 17 01 11, Subtask 3, Rep. 1, Feb. 1958, 19pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,296
To investigate possible factors that contribute to "motion sickness" in the 2-FH-2 helicopter simulator, a review was made of the development of the equipment and two previous evaluations. Individuals, both instructors and students, who had performed on the simulator were interviewed. Finally the equipment was thoroughly studied in an effort to pinpoint trouble areas. The problem of "motion sickness" lies in a combination of several modes of distortion: static and dynamic distortions of projected scenery, errors in perceived directional changes of motion, and errors in perceived angular rate of motion. Suggestions are made for remedying these distortions.

Summy, W.H., Chambliss, D. & Pollack, I. INFORMATION TRANSMISSION WITH ELEMENTARY AUDITORY DISPLAYS. J. Acoust. Soc. Amer., May 1958, 30(5), 425-429. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,297
This study examines the feasibility of employing tonal signals for low rates of information transmission with naive observers. The procedure employed successive selections of tones, each from among two, three, or five alternatives, in order to transmit a target vocabulary of 25 letters. Four stimulus variables were studied: tonal frequency, sound level, location, and duration. The subjects were tested individually on their ability to identify the coded signals against a quiet and a noise background. Estimates of transmitted information were based on the average error scores.

Luce, R.D. A THEORY OF INDIVIDUAL CHOICE BEHAVIOR. May 1957, 51pp. Dept. of Mathematical Statistics and Sociology, & Bureau of Applied Social Research, Columbia University.

12,298
This paper presents a mathematical description of individual choice behavior based on the presupposition that such behavior is probabilistic, not algebraic. A single axiom is developed relating the various probabilities of choices from different finite sets of alternatives. The question of the existence of a comparatively unique numerical scale that reflects choice behavior is investigated and the results applied to some problems in psychophysics and psychometrics, stochastic learning theory, choice reaction time, information theory and utility theory of economics. Other problems needing study are suggested.

Harris, Katherine S., Hoffman, H.S., Liberman, A.M., Delattre, P.C., et al. EFFECT OF THIRD-FORMANT TRANSITIONS ON THE PERCEPTION OF THE VOICED STOP CONSONANTS. J. Acoust. Soc. Amer., Feb. 1958, 30(2), 122-126. (Haskins Labs., New York, N.Y.).

12,299
To investigate the role of third-formant transitions in the perception of the voiced stop consonants /b,d,g/, spectrographic patterns of a variety of third-formant transitions paired with each of a number of second-formant transitions in initial positions before two vowels were converted into sound. The listeners (101) were asked to identify each stimulus as one of the three consonants being tested. Response distributions to each stimulus were analyzed and discussed.

Camp, R.T., Jr. THE PERCEPTION OF MULTIPLE-CHOICE INTELLIGIBILITY ITEMS IN THE PRESENCE OF SIMULATED PROPELLER-TYPE AIRCRAFT NOISE. Contract N60MR 22525, Proj. NR 145 993, & Bu Med Surg Res. Proj. NM 18 02 99 Subtask 1, Rep. 73, July 1958, 51pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,301
To investigate the responses to multiple-choice intelligibility tests under a wide range of noise levels, the per cent word intelligibility of four such tests was obtained from 573 listeners in the presence of 47 decibels (3b) sound pressure level (SPL) of room noise and four levels (88, 108, 118, and 124 db SPL) of simulated propeller type aircraft noise. A wide range of signal-to-noise ratios was tested at each noise level. An exponential curve was fitted to the data from each noise condition. The fitted curves were consolidated into one family showing mean word intelligibility as a function of speech level with ambient noise as a parameter.

Papinsky, Pauline M., Papinsky, H.B., Robin, S.S. & Minor, F.J. MOTIVATIONAL FACTORS IN INDIVIDUAL AND GROUP PRODUCTIVITY: V. THE EFFECTS OF INDUCED ORIENTATION AND TYPE OF TASK UPON GROUP PERFORMANCE AND GROUP MEMBER MORALE. Contract ONR N60R1 17, T.O. III, Proj. NR 171 123, 1957, 126pp. Ohio State University Research Foundation.

12,302
This experiment is fifth in a series designed to investigate motivational factors in individual and group productivity. The question investigated is whether differences occur in group productivity, as measured by task performance, when the initial value-orientation of the group and task itself are varied. Two value-orientations (how the group functions and accomplishment of task) were induced in separate sets of eight four-man groups. Each group then performed two tasks (Treaty Problem and 30 Questions Quiz). Group productivity was measured by objectively scored task performance and analyzed in terms of differences due to orientation and to task.

Rubin, L.S. MANUAL DEXTERITY OF THE GLOVED AND BARE HAND AS A FUNCTION OF AMBIENT TEMPERATURE AND DURATION OF EXPOSURE (U). Proj. 4 08 02 019 01, ONR Rep. 2107, March 1957, 31pp. USA Chemical Warfare Lab., Army Chemical Center, Md.

12,303
To determine the effect of various protective gloves, temperature conditions and durations of exposure on manual dexterity, the standard M3 (nylon/neoprene) glove and the E20 impermeable protective glove were worn in combination with a cotton liner under temperature conditions ranging from 25 to 100 degrees Fahrenheit and for periods of 40, 80, and 120 minutes. Several dexterity tasks were performed (washer nut and bolt, and screwdriver tests and manipulation of contents of chemical kit) by 72 subjects at each temperature with gloved and ungloved hands and the performance data analyzed for differences due to experimental variables. Anthropometric measurements and subjective judgments of comfort were further studied.

Webb, W.B., Berkshire, J.R. & Goodman, I.J. PRE-SOLO FLIGHT GRADES AND CARRIER LANDING ACCIDENTS OCCURRING IN TRAINING. Special Rep. 57 21, July 1957, 4pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,304
This report examines the relationship between pre-solo grades and in-training carrier landing accidents. The pre-solo and field carrier landing practice grades of 62 students involved in pilot-error aircraft accidents during their carrier landing phase of training were compared with those of a non-accident control group. Results are presented in terms of the comparison between the proportion of the accident group falling below given grade levels and the non-accident group. A discussion of "accident-proneness" as a meaningful concept in airplane accidents is presented and recommendations made for its discovery and control.

Alluisi, E.A. & Muller, P.F., Jr. VERBAL AND MOTOR RESPONSES TO SEVEN SYMBOLIC VISUAL CODES: A STUDY IN S-R COMPATIBILITY. J. Gen. Psychol., March 1958, 25(3), 247-254. (Lab. of Aviation Psychology, Ohio State University).

12,307
To measure information-handling performance of subjects responding to conventional Arabic numerals and six other symbolic visual codes (straight line Arabic numerals, three sets of symbols based on visual inclination of a line, a set of colors, and a set of ellipses of differing axis ratios), ten subjects were tested. Both motor (key pressing) and verbal response conditions with self- and forced-paced rates of information presentation, with the latter being varied from two to six bits per second in unit steps, were used. The response data were analyzed for effect of code, type of response, type of presentation and their interactions.

Appley, R.H. (see Appley, R.H. & Moeller, G. MOTIVATION AND PSYCHOLOGICAL STRESS: FINAL PROJECT REPORT. Contract N60R 996(02), Proj. NR 172 228, Sept. 1958, 17pp. Dept. of Psychology, Connecticut College.

12,308
This is a summary of work on a research project undertaken to study the concept of psychological stress within a unified theoretical framework. Psychological stress was defined as a condition produced by a conflict in motives. Following this concept a measure of motivational tendencies, The Behavior Interpretation Inventory (BII) was developed and standardized. An extensive indexed bibliography on psychological stress and related concepts was prepared and some preliminary experimentation on stress was accomplished. Some suggestions are offered of ways in which continued research can be implemented.

Banford, M.E., Hanes, L.F., Ritchie, M.L. & Wilson, S.E. THE OPERATION OF MANNED SPACECRAFT. Contract AF 33(616) 3167, Proj. 6190, WADC TR 58 225, June 1958, 112pp. USAF Flight Control Lab., Wright-Patterson AFB, Ohio.

12,316
In an effort to expose the essential interconnect-
edness of the contributions of many technological spe-
cialties to the control of manned spacecraft, a survey
is made of problems involved. Three categories of prob-
lems are distinguished. (1) The elements of space travel -
vehicle, propulsion system, and energy source - are
examined in relation to requirements for escape, deep-
space operations, and descent. (2) The environmental
needs of protection from hazards of space and ecological
interactions required for survival are discussed. (3)
Allocating the control function between crew and resid-
ual system is held to be the central design problem.

THE SPECTRUM OF INDIVIDUAL INTERACTION CHARACTERISTICS:
AN INTER-DIMENSIONAL ANALYSIS. Psychol. Rep., 1958,
4, 279-319. (Russell Sage Foundation).

12,312
To study the performance of individuals as members of
small groups, 47 graduate students participated in five
groups in roles (leader, observer, recorder) which rotated
among the members. Rankings of peers were made for 16
personality trait names, 24 behavioral descriptive cate-
gories, and other related variables. The groups' behav-
ior was classified by the experimenter during two periods
of direct observation on Bales' category system. Inter-
correlations were calculated and factor-analyzed. The
factors extracted are discussed at length and the concept
of a spectrum of behavioral characteristics is introduced
in explanation. Interaction scores, social perception
measures, and self-reported data are fully analyzed.

THE BREAKING POINT OF TWO BREATH HOLDS SEPARATED BY
A SINGLE INSPIRATION (U). Proj. 4'08 02 019 01,
CMLR 2139, July 1957, 12pp. USA Chemical Warfare
Lab., Army Chemical Center, Md.

12,314
To investigate some of the factors regulating
man's ability to hold his breath, alveolar gas
tensions were measured during six trials for each
of three men at normal resting level, at the end
of the breaking point of a first breath hold, at
the end of a single gasp, and at the breaking point
of a second breath hold. The volume of inspirations
preceding each breath hold and the breath-holding
times were also measured. The data for the two
breath hold breaking points were compared and ana-
lyzed for chemical factors affecting them.

Colman, K.W., Lucier, O. & Courtney, D. HUMAN FACTORS
RECOMMENDATIONS FOR FLIGHT PROGRESS STRIPS. Contract
MONR 2346(00), Memo Rep. 1, Oct. 1957, 18pp. Courtney
and Co., Philadelphia, Penn.

12,317
This report presents recommendations for
changes in printed flight progress strips based on
a human factors study of this segment of the system
for displaying air traffic control information.
The study included observation, informal inter-
view, and intensive review of the state-of-the-
art in this area of human factors. Major sources
of difficulty in using the printed strip are pre-
sented with accompanying recommendations for
modifying the strip. A recommended flight strip
layout is presented. The human capabilities con-
cerned in these problems are discussed at some
length and the limitations of the study of an
isolated segment of a system are noted.

Sargent, F., II & Johnson, R.E. THE PHYSIOLOGICAL BASIS FOR VARIOUS CONSTITUENTS IN SURVIVAL RATIONS. PART IV: AN INTEGRATIVE STUDY OF THE ALL-PURPOSE SURVIVAL RATION FOR TEMPERATE, COLD, AND HOT WEATHER. Contract AF 18(600) 80, Proj. 7156, WADC TR 53 484, Dec. 1957, 17pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Illinois).

12,322

This report summarizes the results and conclusions of five years' intensive investigation on the problem of survival rations for the healthy young castaway in any environment from cold to hot. Three separate studies simulating survival were required: temperate conditions, moderate work; winter cold, moderate and light work; and summer heat, light and hard work. A total of 8698 subject-days yielded results of statistical reliability. The quantitative characteristics of an all-purpose survival regimen were established by physiological, biochemical, nutritional, and clinical observations on the relative effects of water intake, total calorie intake, osmotic intake, ketosis, and ratio of protein, carbohydrate, and fat for 20 different experimental regimens.

Howarth, C.I. & Treisman, M. THE EFFECT OF WARNING INTERVAL ON THRESHOLDS. EPAC 1034, June 1958, 9pp. Flying Personnel Research Committee, Air Ministry, London, England. (Institute of Experimental Psychology, Oxford, England).

12,331
To investigate the relationship between the length of a warning period and threshold level, a series of experiments were performed using different warning signals and threshold stimuli. Warning intervals varied from one to nine seconds and threshold determinations were made by the method of limits for electric phosphene using a light flash, a bell and both together as warning signals; for auditory intensity difference threshold with neon light as warning signal. The data were analyzed for effect of warning interval and a model developed relating threshold level to accuracy of anticipation of the end of the warning interval.

Howland, D. AN INVESTIGATION OF THE PERFORMANCE OF THE HUMAN MONITOR. Contract AF 33(616) 3612, Proj. 7192, WADC Tech. Note 57-431, July 1958, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Lab. of Aviation Psych., Ohio State University).

12,332
To study various aspects of the behavior of the human being acting as monitor, two groups of 12 subjects each were required to monitor for a continuous four-hour period four voltmeters. Meter readings were randomly assigned from a normal distribution with a mean of 12 volts and standard deviation of two volts. Subjects were instructed to report shifts in the mean of each voltmeter reading; only one group kept a written log of readings. The data (number of correct reports, number of false reports and time to report a shift) were analyzed for consistency and the two groups were compared. The results are discussed in relation to theoretical models of monitoring behavior. T. G. I. R 10

Humpton, J. INVESTIGATION OF HELICOPTER AIRSPEED INDICATOR SYSTEM. Final Report. BUAE Proj. TED ADC AE 7226.4, Rep. NADC AI 5751, Aug. 1957, 9pp. USN Aeronautical Instruments Lab., Naval Air Development Center, Penn.

12,333
This report summarizes work on a project established to provide for the development of a means of measuring the low airspeeds required in all-weather helicopter instrumentation for certain types of operations. Particular emphasis was placed on indicated speeds of ten knots or less. A sensitive air-speed indicator with an expanded scale (zero to 150 knots) was developed and tested. Various methods were tested for reducing system perturbations in the range below ten knots in an effort to eliminate undesirable pointer fluctuations. The results are discussed and recommendations made.

Hunsicker, P.A. A STUDY OF MUSCLE FORCES AND FATIGUE. Contract AF 33(616) 3461, Proj. 7214, WADC Tech. Rep. 57-586, Dec. 1957, 47pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Michigan).

12,334
The first part of this research on human arm strength deals with strength which can be exerted with the arms and hands in various positions. Thirty subjects, selected to span the physical characteristics of flying personnel, were seated in a simulated pilot-seat and six movements tested. The data are presented in percentile tables and graphic form. The second part presents data on 25 representative subjects on the amount of strength possible in wrist pronation and wrist supination. The final testing was for strength decrement over a 42-hour period in which subjects were tested hourly. Several recommendations are offered for design of pilot controls.

 Tampietro, P.F., Bass, D.E., Fackirk, E.H. & Vaughan, J.A. HEAT EXCHANGES OF MEN IN THE COLD: EFFECT OF HUMIDITY, TEMPERATURE, AND WINDSPEED. Proj. 7-83-01-0055, Tech. Rep. EP 59, Sept. 1952, 11pp. USA Quartermaster Research & Engineering Center, Natick, Mass.

12,335
 To determine the extent to which high humidity and windspeed alter the rate of body cooling during exposure to temperatures within the cold-dry range, six healthy young men were exposed nude during two hour exposure periods to various combinations of wind (ten and less than one mile per hour), temperature (50 and 60 degrees Fahrenheit), and relative humidity (30 and 90 per cent). Skin and rectal temperatures, oxygen consumption, and subjective responses were recorded and analyzed for relative effects of humidity and windspeed.

 Kydd, G.H. & Stoll, Alice M. G. TOLERANCE IN PRIMATES. I. UNCONSCIOUSNESS END POINT. Bu Med Surg Proj. NM 11 01 12-9, Rep. 1, WADC 44 5717, Dec. 1957, 16pp. USN Aviation Medical Acceleration Lab., Naval Air Development Center, Penn.

12,337
 In this study unanaesthetized monkeys were observed by means of both a movie and television camera during centrifuge runs of from 2.8 to 15.6 positive G (accelerative force) for periods up to three minutes. An end point was found which served to separate the initial period of activity from that which occurred later during the run. The curve resulting from the plot of end points with respect to maximum G was compared with the human tolerance curve with respect to unconsciousness. The results are discussed in terms of a beginning in the systematic correlation of animal and human experimentation.

 Lloyd, L.F. FIELD EVALUATION OF IRON AGE COMPANY BOOTS FOR USE BY NAVAL AVIATORS. Final Report. Proj. TED PTR AE 5207, ST 34 185, Aug. 1957, 9pp. USN Air Test Center, Naval Air Station, Md.

12,338
 To evaluate the Iron Age Company flight boot to determine acceptability for use by Naval aviators and aircrew personnel, comparative tests were conducted with the standard N-1 field shoe. Fifty-two pilots fitted themselves with the boots from the available sizes, wore them during flight, and completed questionnaires as to fitting and sizing, comfort during normal wear and while walking on smooth and rough surfaces, boot weight, ease of donning and doffing, compatibility with stirrups and rudder pedals, protection during bailouts, and hygienic aspects. Recommended changes in design are included.

 Nantlone, P. AIR CONDITIONING NOISE SURVEY REGARDING USS FORRESTAL (CVA 59) SPECIAL TRIALS. Final Report. Lab. Proj. 5281-19, Sept. 1957, 12pp. USN Material Lab., New York Naval Shipyard, N.Y.

12,339
 This is a final report dealing with the air conditioning noise survey of the USS FORRESTAL. Noise level measurements were made in compartments throughout the ship where habitability and good speech intelligibility are important. These data have been previously reported. In addition, the effectiveness of noise reduction measures (duct wrapping to reduce duct vibration, plenums with recirculation openings, intake boxes for vane-axial fans) was investigated. Data on noise transmitted through plenums and intake boxes are presented in this report.

 Miles, S. THE PROBLEM OF HYPERVENTILATION IN DIVERS. R.M.P. 57/889, U.P.S. 165, April 1957, 11pp. Royal Naval Physiological Lab., Alverstoke, Hants, England.

12,340
 To investigate the effect of wearing a mouthpiece and nose clip on respiratory patterns, 32 experienced divers and eight nondivers were tested on a standard breathing program. Measurements were made of the normal respiratory pattern, of breathing with the mouthpiece and nose clip, and again of free breathing. The data included volume of air expired per minute, respiratory rate per minute, and tidal volume. Changes in respiratory patterns were analyzed and the results from the two groups were compared. The importance of the findings in relation to underwater accidents is discussed and the need for a psychological study of the problem is emphasized.

 Hale, F.C., Westland, R.A. & Taylor, C.L. THE INFLUENCE OF BAROMETRIC PRESSURE AND VAPOR PRESSURE ON INSENSIBLE WEIGHT LOSS IN NUDE RESTING MAN. Contract AF 33(616) 3338, Proj. 7155, WADC TR 57 9, Jan. 1957, 28pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dept. of Engineering, University of California).

12,341
 To determine the dependency of human insensible weight loss on barometric and water vapor pressure, two nude subjects were exposed to barometric pressures of 760, 506, and 253 millimeters of mercury (mm Hg) in combination with water vapor pressures of 6, 16, and 26 mm Hg. Chamber temperature was kept constant at 28 degrees Centigrade and air movement at low levels. Subjects were free from sweating under these conditions. Total weight loss was measured directly and analyzed as functions of both pressures. Skin insensible weight loss was calculated and analyzed in a similar manner.

 West, F.J. & Newton, J.M. A GUIDE TO UNDERWAY EQUIPMENT EVALUATIONS. Contract NONR 2324(00), 411 HF 18, P58 040, 52pp. Electric Boat Div., General Dynamics Corp., Groton, Conn.

12,342
 This guide, primarily for operating personnel of submarines, gives the information needed to base evaluations of equipment and procedures on a firm scientific foundation. The underlying premise is that operating personnel can carry out the final phase of new equipment and tactics under operational conditions better than laboratory personnel. Certain details of experimentation to naval problems are described and certain common errors pointed out. Statistical measurement is described in enough detail so that it may become a useful tool. A detailed example of an equipment evaluation is presented.

Morse, P.F. & Goldsmith, C.T. INVESTIGATION OF THE MAXIMUM ALLOWABLE TORQUE FOR ROTARY SELECTOR KNOBS. Proj. SA 12-15 023; Ordnance Proj. TM2 8106; Tech. Rep. 2551, Nov. 1958, 20pp. USA Feltman Research and Engineering Labs., Picatinny Arsenal, N.J.

12,343

To determine the maximum torque an operator can efficiently handle with a rotary selector type knob, ten male subjects were required to make settings on a display with various sized knobs (ranging from 1-1/8 to 2.5 inches long) mounted on a rotary selector switch. Each size knob was used at four torques ranging from 60 to 120 inch-pounds. The time to make a setting and errors were recorded and analyzed for differences attributable to subjects, knobs, and torques. The findings are discussed in relation to the optimum torque for selector knobs when used on missiles so that settings will not be altered by in-flight vibrations.

Maltraver, P.L., Leeboek, H.J. & Bouman, M.A. SOME MEASUREMENTS ABOUT THE FUSION FREQUENCY OF COLORS. Optica Acta, 1958, 5, 4, 4pp. & Acta Electronica, 1957-1958, 2(142). (Instituut voor Zintuigfysiologie R.V.D.-T.M.O., Soesterberg, the Netherlands).

12,344

To investigate the relation between fusion frequency and color discrimination ability, the fusion frequency of alternating white and mixtures of white and spectral lights were determined. Both white and mixtures were of same subjective brightness; the white was illuminant A and the eleven spectral lights ranged from 650 to 480 millimicrons; retinal brightness some 1000 troilands; visual field two degrees in diameter and with dark surround. Observations were made by two subjects. The fusion frequency data were analyzed as a function of saturation and wavelength.

Veghte, J.H. THE MA-2 VENTILATING SUIT AS A PROTECTIVE GARMENT IN COLD. Proj. 7155, WADC TR 57 564; Sept. 1957, 14pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,346

To evaluate the possibility of utilizing the MA-2 ventilating garment, developed by the Aero-Medical Laboratory, in heating aircrew members in cold environments, a series of exploratory experiments was undertaken at ambient temperatures of -30 and -40 degrees Centigrade. The temperature of the ventilating air was varied from 50 to 60 degrees Centigrade; air volumes varied from 290 to 430 liters per minute. Two metabolic levels were simulated: a sitting, resting subject (aircrew member); and a standing, working subject (maintenance personnel). Body storage rates over a period of three hours were used to evaluate maintenance of thermal balance.

Veghte, J.H. & Webb, P. CLOTHING AND TOLERANCE TO HEAT. Proj. 7155, WADC TR 57 759, Dec. 1957, 10pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,347

To determine the effect of clothing on human tolerance to hot environments (90 to 160 degrees Fahrenheit), a series of experiments was conducted. Seven subjects were exposed to heat in five different clothing assemblies that were representative of permeable and impermeable, lightweight and heavily insulated Air Force clothing. The effect of the exposures was measured in terms of physiological strain and the various types of clothing assessed by this index. The extent to which impermeable, as compared with permeable, clothing reduces human tolerance to heat regardless of insulation value is discussed.

van den Brink, G. THE VISIBILITY OF DETAILS OF A MOVING OBJECT. Optica Acta, 1958, 5, 5pp. & Acta Electronica, 1957-1958, 2(1-2). (Institute for Perception RVO-TNO, Soesterberg, The Netherlands).

12,348

To investigate some factors determining the perception of detail of a moving object, a series of experiments was conducted with an object consisting of two luminous bands separated by a dark one. The task was to distinguish the dark band as velocity, exposure time, and brightness were varied. The threshold data were analyzed and interpreted in terms of predictions based on theoretical background on the summing properties of the retina. Critical values for vt (velocity times exposure time) are shown graphically for different duration times.

Andrew, D.K., Miller, T.W. & Lansill, C.P. HUMAN ENGINEERING FIELD SURVEY OF 280 MM GUN AND TRANSPORTERS. Proj. OOD RD T81-1000, Tech. Memo 4 57, April 1957, 86pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.

12,349

This is a study of problems of man-machine relationships on the 280 millimeter gun and transporter M249 and M250. The collection of data proceeded through four phases: 1) familiarization with equipment by observer; 2) observation and discussion with battery personnel to elicit problems; 3) preparation of questionnaires; 4) formal interviewing of user personnel (74 drivers, chiefs of sections, gunners, mechanics, and cannoners). The results--presented in two main sections, one covering transporters and one covering the gun--are derived from number of responses on each question. Deficiencies and recommendations for correction are given. A ranking of most frequently checked problems is presented.

Atkinson, R.C. & Suppes, P. AN ANALYSIS OF A TWO-PERSON INTERACTION SITUATION IN TERMS OF A MARKOV PROCESS. Contract NONR 225(17), Proj. NR 171 034, Tech. Rep. 9, May 1957, 20pp. Applied Mathematics & Statistics Lab., Stanford University.

12,350

This study represents an attempt to describe quantitatively human behavior in a non-zero-sum, two-game situation. The analysis is in terms of a Markov model for learning. Subjects were run in pairs for 210 trials (a single play). On a trial each player made a choice between one of two alternative responses, thereupon the correct choice was announced. Game characteristics were explained and subjects instructed to maximize correct responses. Analysis of results made these comparisons: between theory and data; 1) mean asymptotic response probabilities, 2) one- and two-stage transition probabilities, and 3) variances associated with asymptotic response probabilities.

Baird, H.P. AN ANALYSIS OF STIMULUS VARIABLES INFLUENCING THE PROPRIOCEPTIVE CONTROL OF MOVEMENTS. *Psychol. Rev.*, 1957, 64(5), 324-328. (Ohio Wesleyan University).

12,351
This article describes an indirect approach to the problem of specifying the relations between stimulus and response characteristics in the area of proprioceptive control of movements. The forces required to move a control, and thus also the control forces acting upon the limb, can be specified as a function of four physical properties of the control (mass, viscosity, elasticity, and degree of coulomb friction) all of which can be varied by the experimenter. Some general hypotheses are developed about the effect of these parameters and data are reported which test the hypotheses.

Barri, N.L. A FIELD EVALUATION OF A SYSTEM FOR PREDICTING VISUAL RANGE. BU AER Proj. 71704-56, Res. Rep. NM 18-01-00-02-01, 12, Nov. 1957, 843-872. *USN Medical Research Institute*, Bethesda, Md.

12,352
This paper reports the results of a field evaluation of a system for predicting visual range which involves a prediction equation containing three essential parameters: attenuation coefficient, B, inherent contrast, C₀, and the contrast threshold of the human eye, C_r. Observers viewed balloon targets (of varying reflectivities) against the horizon sky and indicated the pattern of the targets as seen at varying distances. Measurements of sky brightness, target brightness, attenuation coefficient and actual distance of observers from target were made simultaneously. Contrast thresholds were obtained for each observer on outdoor targets. Visual ranges as predicted by the equation were compared with obtained values.

Brennan, J., Dylla, M.F., Tofte, T.E., Parentini, E.J., et al. OPERATIONAL EVALUATION OF THE IF-7 RATION FOR BATTLE STATION FEEDING. Proj. NT 002024, Subproj. CR 53 80(4), Jan. 1957, 12pp. *USN Supply Research & Development Facility*, Bureau of Supplies & Accounts, Bayonne, N.J.

12,353
To determine the acceptability and suitability of the IF-7 food packet as a battle station feeding ration, an evaluation was conducted aboard the USS WISCONSIN during an underway training period. The food packets were served to the crew at battle stations during three separate meal periods. Information was gained by means of a questionnaire and limited oral interrogation of officers and some crew members. Data on acceptability of the ration as a food item, adequacy of quantity, comparisons with past rations, ease of disposal of waste materials and other related problems were analyzed.

Brackmann, J.F. ELECTROMYOGRAPHIC FACTORS IN AIRCRAFT CONTROL: THE ROLE OF MUSCLE POTENTIALS IN TRANSFER OF TRAINING. Rep. 55-132, Jan. 1957, 15pp. *USAF School of Aviation Medicine*, Randolph AFB, Tex. (*Indiana University*).

12,356
To investigate the role of muscle tension in transfer of training, a simple reaction time experiment was designed. Subjects were required to move a lever left or right in response to one of two lights. Different groups practiced for different lengths of time (20, 40, 60, 120 trials) and then for 20 trials on the same task but with the significance of the stimuli reversed. Both reaction time and muscle action potentials were recorded and the data analyzed for effects of variable length of practice and muscle tension on transfer of training. The results are discussed in relation to theoretical formulations on the basis of transfer.

Browne, M.K. STRESS SUMMATION IN FLIGHT: V. THE EFFECT OF INSULIN HYPOLYCAEMIA ON TOLERANCE TO ACCELERATION. FPRC 1044, May 1958, 9pp. *Flying Personnel Research Committee*, Air Ministry, London, England. (*RAF Institute of Aviation Medicine*, Farnborough, Hants, England).

12,357
To study the influence of insulin hypoglycaemia on tolerance to acceleration, six subjects were tested on the human centrifuge. The end point was central light loss with the dark-adapted eye. Two runs were carried out to establish a baseline threshold for each subject and a sample of capillary blood was collected for estimation of blood sugar. Twenty minutes following administration of insulin the procedure was repeated and finally after glucose dosage, the testing procedure was again repeated. Urine samples and pulse rates were obtained. Changes in threshold and blood sugar before and during insulin hypoglycaemia were analyzed. Implications for dietary requirements of pilots are pointed out.

Gordon, L.C. **STIMULI RESPONSE OF MAN.** In the Temp. Proj. 20 20 22.1, Rep. 14, DEC 28 1944, Sept. 1945, 14p. **Wright-Patterson Medical Laboratories, Dayton, Ohio.**

12,328
To substantiate the question of whether optical stimulation for pain (increase with size of area stimulated) exists, three different methods of stimulation were used: thermal stimulation, cold immersion, and needle scratch. Five subjects were tested by each method. Pain thresholds for thermal stimulation were obtained for skin areas varying from 2.5 to 15.0 square centimeters, for one and two hands immersed in water at temperatures of 0.5, 2.2, 4.5 degrees centigrade, and for length of scratch required to produce a first and second report of pain as a needle moved at rate of 2.5 millimeters per second, at angle of 45 degrees, and with a five-gm weight over the skin. Many data were analyzed for differences in threshold due to size of area stimulated.

Hall, F.C. & Sappanfield, L.C., Jr. **THE INFLUENCE OF CHAMBER HUMIDITY ON THERMAL AIR FLOW ON THROAT AND CERVICAL MEMBRANES OF HUMAN SUBJECTS.** Contract AF-33(616) 3021, Proj. 7400, DEC 28 1944, Oct. 1947, 6p. **Wright-Patterson Medical Lab., Wright-Patterson AFB, Ohio. (School of Medicine, Ohio State Univ.)**

12,332
To demonstrate how resistance to breathing, experimentally produced, affects tidal volume, respiratory capacity in normal subjects, nine healthy young men were tested. Their normal vital capacities were determined. Subsequently, four different resistances (expressed as 0.10, 0.20, 0.30, and 0.40 millimeters of water per centimeter of air per second) were interposed between mouthpiece and vitalometer; the volume of air that could be expelled into the vitalometer was then determined. The data were analyzed for effect of the resistances imposed. A few determinations were made during moderate exercise to study this effect. It is suggested that this test can be used to determine the degree of breathing obstruction in pulmonary efficiency tests.

Hepburn, C.O. **HUMAN STEERING DISPLAY STUDIES AT BUSHES AIRCRAFT COMPANY, 1932 TO 1935.** Contract AF 33(600) 32038, RA 17 S, Jan. 1938, 4pp. **Systems Development Lab., Bushes Aircraft Co., Culver City, Calif.**

12,370
This report contains three studies on the effects of radar attack display variables upon pilot steering performance. 1) Four experimental displays were compared with the standard E-series display in an interceptor attack simulator by groups of 12 pilots inexperienced in flying radar-directed attacks. The standard was a moving horizon and error dot display; the others used variations of the moving element to represent the airplane. 2) Ten test pilots were tested in the simulator for effects upon performance of transferring from the standard display to the moving airplane display and then back to the standard. 3) Six experienced pilots performed the same series as above in regular flight tests.

Robson, A. **VISUAL ACUITY AND LIGHT ADAPTATION.** Proj. 7400, Task 4011, DEC 28 1944, Oct. 1947, 14p. **Wright-Patterson Medical, Dayton, Ohio.**

12,374
The time course of visual acuity as a function of light adaptation was determined for adapting retinal illuminances ranging from -0.25 to -4.0 log trolands. Measurements of visual acuity were obtained at periodic intervals between eight seconds (approximately) to 20 minutes following initial exposure to light. Six observers were employed. The results are discussed in terms of their consistency with the data of other experiments on light adaptation. The facts of light adaptation are interpreted in terms of lighting photochemical and neural factors.

Finkbeiner, Eustice. **STUDIES IN THE EFFECTS OF LONG RANGE AIRCRAFT (MILITARY TYPE).** Proj. 7400, DEC 28 1944, May 1947, 14p. **Wright-Patterson Medical Lab., Wright-Patterson AFB, Ohio.**

12,376
A preliminary nutrition study designed to investigate feeding requirements for long range high performance aircraft is described. A group of five men participated in the study. All food was stored in an experimental crew compartment galley. Meals simulating those which would be served in flight were served with between meal snacks available. The adequacy and acceptability of the feeding program were evaluated. In addition, the functional utility of the galley was studied. Suggestions for design improvements are included.

Foley, P.J. **LEGIBILITY OF MOVING DIGITS AS A FUNCTION OF THEIR SEPARATION AND POSITION OF MOVEMENT.** Proj. 76, Rep. 76-4, FCC Proj. E77 94 20 21, MR 147, Aug. 1957, 3pp. **Defence Research Board, Toronto, Ontario, Canada.**

12,378
To investigate the maximum speed of moving digits at which correct identification is possible, five subjects were tested. The digits were presented on a screen by means of a projector modified so that the stimuli could move in four directions: left to right, right to left, up, or down. Three separation distances were used (.75, 1.5 and 3.0 inches subtending visual angles of 6.4, 12.8, and 25.6 degrees). A series of digits was presented and speed was increased until the subject no longer gave correct responses. Legibility thresholds of 100 per cent (in degrees per second) were analyzed for effects of direction, separation, and subjects.

Giles, J. **HEAD MOUNTING EXPERIMENTS OF AIR-
CRAFT COCKPIT VISUAL DISPLAYS. PART II. SIZE AND
SHARP OF VISIONS AND LIGHTS FOR DISPLAYS. I. THE
COCKPIT DISPLAYS WITH SINGLE AND MULTIPLE SHARPEN
AND CHISEL LINE PERS. THE WAR DEPT, Rep. HRC-
ADM 32, Oct. 1957, 24pp. HEADLINE CO. BOSTON
Lab., HRC, Philadelphia, Penn.**

12,376
To determine if either straight or curved lines are
subsequently more perceptible, three experiments are re-
ported. The four stimuli (a single straight line, a
single curved line, two straight lines joining at an
angle of 180 degrees, and three perpendicular straight
lines) were presented in an electronic tachistoscope at
increasing time intervals and at a constant low level of
brightness until the subject correctly identified the
figure. Each form was shown under four orientations
(horizontal, vertical, 45 degrees left and right). The
data (duration of exposure) were subjected to an analy-
sis of variance and a content analysis. Implications
of the results for design of letters and manuals for
aircraft displays are discussed.

Jenkins, H.L. **HEAD MOUNTING AND ITS RELATION TO
READING SETTINGS ON A LINEAR SCALE. Contract AF 33
(604) 2000, Proj. 7762, HRC TR 57 200, May 1957,
24pp. HRC Army Medical Lab., Wright-Patterson AFB,
Ohio. (Lafayette University).**

12,378
This study was concerned with the least time of a
task that can be made on a tachistoscopic basis
without visual guidance. Various conditions of head di-
rection (0.125 to 2.0 inches), inertia (normal, one or
two cheeks added), and friction (normal, moderate, heavy)
were investigated. Also the influence of head shape,
position, orientation, use of gloves and on mean least
time and on the time to make settings on a linear scale
were measured. Group means (from 15 to 20 subjects for
each of nine experiments) are presented together with
differences and indications of their significance. The
results are discussed in terms of the factors that influ-
ence them and related to performance in linear scale set-
tings.

Johnson, E.P. **FLUCTUATIONS IN NIGHT VISION ACTIVITY,
FIRST PROGRESS REPORT. Contract DA 49 007 MD 871,
Jan. 1958, 8pp. Research & Development Div., Office
of The Surgeon General, Washington, D.C. (Colby
College).**

12,379
To examine the character and extent of fluctuations
in night vision acuity, fifty subjects are being given
instruction in the use of the eyes at night and practice
in viewing visual targets at scotopic levels of illumina-
tion. Following training, each subject is to be given
one or more two-hour periods of testing during which the
level of visual performance is continuously measured.
The task requires manual adjustive movements in response
to visually perceived target movements. Target distance
is automatically adjusted to a level at which the subject
is able to remain "on target" 50 per cent of the time.
Target distance is the measure of visual acuity. No data
are given in this progress report.

Johnson, F.M. **AN EVALUATION OF EXPOSURE TO HIGH IN-
TENSITY NOISE BY EQUIVALENT TIME EXPOSURE METHOD.
1957. 17pp. University of North Carolina.**

12,378
This paper considers the problem of expressing noise
hazard by a single exposure value and reference is made
to the convenience and use of Maximum Allowable Con-
centrations (thresholds of exposure to toxic materials)
and to time limits and concentration values of exposure
to radioactive substances. The present tentative stand-
ards of measurement for noise exposure are reviewed.
The Equivalent Energy concept is presented and a method
for expressing noise exposure by a term Equivalent Time
Exposure is developed. A series of charts illustrates
the means of applying this concept to high and low ex-
posures with varied exposure time and to protected and
unprotected ears.

Jucker, F. **THE THRESHOLD CRITERION A "WINDING LINE"
BETWEEN OF HUMAN. Contract AF 49(602) 01, AFOSR TR
57 200, Jan 1957, 24pp. HRC Headquarters of Advanced
Studies, Washington, D.C.**

12,379
The importance of including systems in mechanized in-
formation retrieval and the desirability of criteria crite-
ria for such systems are discussed. The history of in-
formation control is traced and analyzed from the earliest
systems to the latest developments, and the major
problem of such systems is identified. A generalized
theory of including is presented and set forth in careful
detail.

Kahn, H. & Shaw, I. **TECHNIQUES OF SYSTEM ANALYSIS.
IN 1957 I, Dec. 1957, Revised June 1957, 144pp. RAND
Corporation, Santa Monica, Calif.**

12,380
This is a preliminary draft of the first section of
a projected book, **MILITARY PLANNING IN AN UNSTABLE
WORLD**. This section is concerned with techniques of
systems analysis and the major objective of the authors
is to make readers better and more critical consumers
of systems analyses. The various portions illustrate
the techniques and give secondary attention to funda-
mental principles. The chapter headings are: designing
the offense, probabilistic considerations, designing the
defense, the two-sided war, evaluation and criticism.

Kahn, H. & Shaw, I. **TEN COMMON PITFALLS. AN 1957,
July 1957, 24pp. RAND Corporation, Santa Monica,
Calif.**

12,381
This is a preliminary draft of one chapter of a
projected book on systems analysis to be called
MILITARY PLANNING IN AN UNSTABLE WORLD. This chapter
is concerned with identifying and discussing some com-
mon methodological mistakes of the operations and sys-
tems analyst and is placed in a larger section on
"Philosophical and Methodological Comments." The ten
common pitfalls are called: modelism, statistical un-
certainty, real uncertainty, over-concentration, phasing,
over-inhibition, fanaticism, hermitism, and hush.

Lybrand, H.A., Havron, H.D., Gartner, H.B., Scarr, H.A.
et al. **SIMULATION OF EXTRA-COCKPIT VISUAL CUES IN
CONTACT FLIGHT TRANSITION TRAINERS. Contract AF 41
(657) 69, Proj. 7716, AFFTC TR 58 11, Appendix 1,
Feb. 1958, 164pp. HRC Operator Lab., Randolph AFB,
Tex.**

12,382
This bibliography was compiled during a literature
search on the role of visual cues in contact flight and
for information relating to certain characteristics of
visual attachments to flight simulators. Both military
literature produced over the past ten years and non-mil-
itary literature for the years 1954-1956 were searched.
The first three sections list publications, examined but
not abstracted (171); the final section presents abstracts
for those studies reviewed in detail (137). Each list
is arranged alphabetically by author.

Lybrand, H.A., Havron, H.D., Gartner, H.B., Scarr, H.A.
et al. **SIMULATION OF EXTRA-COCKPIT VISUAL CUES IN
CONTACT FLIGHT TRANSITION TRAINERS. Contract AF 41
(657) 69, Proj. 7716, AFFTC TR 58 11, Feb. 1958,
116pp. HRC Operator Lab., Randolph AFB, Tex.**

12,383
To provide information needed to make recommenda-
tions regarding the visual cues that should be presented
in prototype visual attachments to flight simulators, a
survey and analysis of research evidence on the visual
cues utilized by pilots in performing specified flight
tasks was accomplished. Supplementary information was
obtained by an analysis of operational tasks involved,
interviews with pilots, consultations with experts, and
inspection of existing equipment. Recommendations are
made concerning (1) "flying" capability of simulator,
(2) flight conditions to be simulated, (3) natural and
man-made objects to be simulated, (4) fidelity-of-sim-
ulation parameters, and (5) information displays and
controls for instructor.

Wills, A.M. ON THE HUMAN AUDIBLE RANGE. J. Acoust. Soc. Amer., April 1935, 25(4), 237-244. (Psych.-Acoustic Lab., Harvard University).

12,385

The difference limit for the amplitude of a source of pure tones was measured as a function of the frequency of the tone and the direction of the source. Tone pairs between 230 and 10,000 cycles per second were sounded in the horizontal plane around the head of a subject seated in an anechoic chamber. The smallest angular separation that could be detected between the sources of the successive tone pairs (the minimum audible angle) was determined for each of these subjects. These threshold angles were analyzed in terms of the corresponding threshold changes in the phase, time, and intensity of the tone at the ears of the subject.

12,386

Reaney, C.M. SCIENTIFIC ASPECTS OF MILITARY MANAGEMENT. RAND School of Advanced Management, 1937, 7pp. (Defense Research Medical Lab., Edmonton, Ontario, Canada).

12,387

The general assumption upon which this discussion rests is that management of any kind is a decision-making process, specifying operational objectives and governing its enterprises in ways to realize them. Its factors, human and mechanical, which are functionally interdependent, although structurally inseparable at any point, are discussed in relation to effective military management. The scientific techniques that have proven to be useful subjects of management in recognizing the two factors are discussed with illustrations from Air Force management. The particular difficulties of military management, in both peacetime and wartime, are indicated with some suggestions for their solution.

12,388

McCloskey, J.F. & Lindstrom, Florence H. (Eds.) OPERATIONS RESEARCH FOR MANAGEMENT. 1954, 489pp. Johns Hopkins Press, Baltimore, Md.

12,389

This book provides a comprehensive introduction to operations research and is addressed primarily to management. The volume is divided into three main parts. Part One provides a general background by setting forth the scope and history of operations research and discusses the relation between management and the scientist. Part Two deals with methodology—statistics, queueing theory, information theory, symbolic logic, computing machines, linear programming, and game theory. Part Three contains case histories demonstrating the wide variety of ways in which operations research is being used. Included are studies from commercial operations, printing industry, heavy industry, agriculture, and others.

McCloskey, J.F. & Coppinger, J.M. (Eds.) OPERATIONS RESEARCH FOR MANAGEMENT. CASE HISTORIES, METHODS, INFORMATION HANDLING. VOL. II. 1956, 366pp. Johns Hopkins Press, Baltimore, Md.

12,391

This is the second volume on operations research addressed primarily to management (see 12,389). Part One includes papers on actual problems handled by organized groups and includes studies on automobile traffic problems, subway fares, cargo handling, inventory control, mining, and military problems. Part Two adds information on methods—queueing theory with a special bibliography, operational gaming, Monte Carlo models, and the like. The last part is devoted to information handling in organized groups.

MacLennan, R.E.L. & Goetsch, Hans S.T. APPARENT INTENSITY OF COLORED LIGHTS. J. Opt. Soc. Amer., April 1937, 27(4), 192-193.

12,393

To investigate whether the apparent intensity of colored light signals can be computed from a knowledge of its spectral radiant intensity (J lumens), experiments were made of pairs of point sources, one of which was always white and the other colored. The white signal was held constant and the colored varied through five known intensities with the observer judging which signal appeared brighter. The observers made judgments for 17 different colors and several others on only two or three. All observers had normal color vision. The ratio of the observed apparent intensity of the colored signal to the calculated intensity was derived from the data.

12,394

Quastler, H. ed. INFORMATION THEORY IN PSYCHOLOGY. PERCEIVING AND REMEMBERING. 1955, 48pp. Englewood Cliffs, Ill.

12,395

This book is concerned with the problem of how to use information theory in psychology. It is an outgrowth of a conference on this subject and so each represents an author who contributed papers to the various sections. Part One is a summary and concluding review of the opinions of the conference participants. Part Two, Information processing, contains articles on foundations of information management, coding distributions of information functions and structural changes. Part Three deals with information theory and psychology—basic considerations, units, categories and classifications, probability and redundancy, channels and channel capacity. The last part considers utilization of information.

Woolf, R.H., Craik, C.H. & Davis, R.L. (Eds.) INFORMATION PROCESSING. 1956, 382pp. John Wiley & Sons, New York & London & P. 1957. London, England.

12,397

This book presents the proceedings of an eight-week seminar on The Design of Experiments in Decision Processes. In addition, some papers were revised to include empirical research and theory construction stimulated by the seminar. The 19 papers range in character from pure mathematics to experiments in group dynamics, but all are directed at the application of mathematics to behavioral sciences in general and at decision processes in particular. Following the introduction and a consideration of mathematical models and measurement theory are papers on 1) individual and social choice, 2) learning theory, 3) theory and applications of utility, and 4) experimental studies.

Peterson, G.A. HUMANITIES OF OPERATIONS ANALY-
SIS. J. Psychol., Dec. 1957, 2(4),
4pp. (USA Picatinny Arsenal, N.J.)

12,390
This paper considers a potential source of error in
operations analysis particularly germane to the study of
variables involving the human factor. Analytic solutions
based upon what seems to be common sense or theoretic ap-
proach which are not subjected to some check of the
validity of such assumptions in the tradition of the sci-
entific method. A report of the validity of just such a
simplified solution of a human factor component in a
military weapons analysis is described. The implications
of the study for methods of operations analysis are dis-
cussed.

Pickett, J.R. LIMITS OF HUMAN SPEECH COMMUNICATIONS
IN NOISE. J. Acoust. Soc. Am., April 1958, 30(4),
770-781. (USAF Operational Applications Lab., Balling
AFB, Washington, D.C.)

12,394
To establish a quantitative estimate of the effect-
iveness of "person-to-person" speech in noise and a mea-
sure of the noise levels in which such communication be-
comes impossible, tests of sentence intelligibility were
performed in low frequency and white noise at noise lev-
els ranging from 85 to 115 decibels. The speaker and
listener were separated by distances of eight or 16 feet.
No data (percent intelligibility scores at two dis-
tances, vocal effort used on each sentence in decibels,
subject noise level in decibels) were analyzed for rela-
tionships existing among them. Limits of communication
by shouting over noise were estimated.

Pollack, I. & Pickett, J.R. MASKING OF SPEECH BY
NOISE AT HIGH SOUND LEVELS. J. Acoust. Soc. Am.,
Feb. 1958, 30(2), 127-130. (USAF Operational Ap-
plications Lab., Balling AFB, Washington, D.C.)

12,396
To examine the deterioration of word intelligibility
at high sound levels, a series of tests were performed
over a wide range of speech and noise spectra (85 to 130
decibels). Monosyllabic words were presented to trained
listeners who checked each received word against a cor-
rect check-list. For each test all variables were held
constant except the over-all level of the signals. Con-
ditions varied were: signal-to-noise ratio, presentation
(binaural, monaural, checkbone, no background noise, low-
frequency cutoffs of speech channel and peak clipping).
Control tests were run to check on equipment distortion.

Pallick, I., Becker, L.2. & Sakuma, R. **RELIABILITY OF SELECTED MESSAGE-SETS.** *J. Acoust. Soc. Amer.*, July 1958, 32(7), p. 643. (USF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,401

To demonstrate the relative effects on speech intelligibility of word-frequency and phonemic confusion patterns, four message-sets were selected from three word-frequency classes in accordance with known rules of phonemic confusion. The four sets were chosen to yield 1) positive word-frequency effect, 2) a negative effect, 3) lowest scores of intermediate word-frequency, and 4) uniform word-frequency effects. Each set was recorded by one talker and played back over emphasis to a crew of five experienced listeners at three speech-to-noise ratios. The per cent of words correctly identified was compared for the four message sets.

Stevens, S.S. **SOME SIMILARITIES BETWEEN HEARING AND SEEING.** *LARYNGOSCOPE*, March 1958, 68(3), 308-327. (Psycho-Acoustic Lab., Harvard University).

12,405

This paper discusses problems relating to the manner in which the eye and ear respond to the intensity of light and sound. Similarities between the two sense organs are presented on the following areas: electrical effects, sensitivity, dynamic range of intensities to which the organs react, measurement of sensation, recruitment phenomena.
G. R 12

12,406

Stevens, S.S. **PROBLEMS AND METHODS OF PSYCHOPHYSICS.** *Psychol. Bull.*, July 1958, 54(4), 177-196. (Harvard University).

12,407

This review of psychophysics classifies the methods in terms of the problems to be solved. Three psychophysical parameters are distinguished; namely, the task undertaken by the observer (classification, order, intervals, ratios, magnitudes), the manner in which the stimuli are presented (fixed or adjustable), and the statistical measure used to describe the data (measure of location and of variability or confusion). Some of the principal problems, along with some typical methods used in their solution, are considered. The final section treats problems of estimation of objective value.

Stevens, J.C. **STIMULUS SPACES AND THE JUDGMENT OF LOUDNESS.** *J. Acoust. Soc. Amer.*, Sept. 1958, 32(3), 246-258. (Harvard University).

12,409

To determine whether the form of the loudness scale, as determined by magnitude estimation, is independent of stimulus spacing, two experiments were undertaken. 1) The magnitude estimations of stimuli spaced uniformly in decibels was compared with those of stimuli spaced uniformly in loudness (sones). The same spacings were used to generate category scales and the two types were compared. 2) The stimuli were spaced four ways at equal decibel intervals or bunched together toward the high, middle, or low end of the range. Loudness estimations were made for each spacing. The over-all form and slope of the function were studied for effects of spacing.

Spilth, M. & Trittsch, H.J. **PERMANENT AND DURATION OF NOISE INDUCED AND TEMPORARY THRESHOLD SHIFTS.** *J. Acoust. Soc. Amer.*, Aug. 1958, 32(8), 750-752. (USF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,411

To investigate the validity of an hypothesis that the relative importance of duration to intensity of an exposure to thermal noise in producing temporary threshold shifts (TTS) is two to one, both ears of six subjects were tested separately. Thermal noise exposures ranged from 120 decibels of sound pressure level for one minute to 94 decibels for 60 minutes. In the series each doubling of duration was associated with a four-fold decrease in sound level. TTS was measured at 2000, 4000, 6000, and 8000 cycles per second throughout a ten-minute period following exposure. Recovery curves were constructed and analyzed in terms of the hypothesis.

Cooperative Research, University of Pennsylvania.

12,405
To investigate the effect of meaningfulness of a sym-
bol and its position in a display upon responses, the
symbols chosen (A, B, C, and lambda, delta, omega) were
presented to 27 and 25 subjects, respectively, in a man-
ner analogous to the way symbols are presented in a com-
munication system. The two sets of data were analyzed
for evidence of tendencies to choose one symbol over the
others and for positional preferences. The problems in-
volved in presentation of information within communi-
cation systems are discussed at length.

Zaklowski, J. **EAR PROTECTION.** LEXINGTON, March
1956, 11111(3), 496-497. (Psycho-Acoustic Lab.,
Harvard University).

12,412
This paper presents a general discussion of present
knowledge on the problem of personal ear protection,
discusses the basic requirements of ear protectors
(sound attenuation to safe level, comfort, non-toxic,
and so on), and main trends in recent design. Four
classes of ear protectors are: certified ear plugs,
semi-inserts, earmuffs, and helmet.

**ON THE EFFECT OF PRACTICE AND MOTIVATION ON THE
THRESHOLD OF AUDIBILITY.** J. Acoust. Soc. Amer.,
April 1956, 28(4), 234-242. (Psycho-Acoustic Lab.,
Harvard University).

12,414
To investigate the effect of practice and motivation
on the absolute auditory threshold, five groups of ori-
ginally naive subjects were tested by various experi-
mental techniques. Thresholds of audibility were mea-
sured during the course of four to eight sessions, each
session consisting of five test periods six minutes long.
Variables were test tone (100 and 1000 cycles per sec-
ond), method (tracking and forced choice), motivation
(monetary reward and informational feedback). Threshold
changes with practice were analyzed and the implications
of the findings for audibility threshold measurement
practices are discussed.

White, C.S. **CONRAD MEDICAL CORPUSCULE'S REPORT.**
BIOLOGICAL TOLERANCE TO ACCELERATIVE FORCES. Abstract
1. June 1954, 7pp. **Lewisian Foundation for Medical
Education and Research, Alhambra, N.Y.**

12,416
This report on biological tolerance to accelerative
forces (G) presents summaries of four experiments with
appropriate presentation of quantitative data. The pa-
pers deal with 1) the relative G-time relationships be-
tween the several possible means by which accelerative
forces are applied to the human being, 2) experience
with ejection seat controls when exposed to positive G
simultaneously with pitch and roll, 3) man's ability to
move when exposed to radial G forces, and 4) long time
exposure to accelerative forces.

Sally, P. **BIBLIOGRAPHY OF THE LITERATURE ON AIR TRAF-
FIC CONTROL, 1952-1957.** Contract AF 19(604) 1399,
Tech. Rep. 5, AFMTC TR 57 776, Sept. 1957, 21pp.
Enka Mathematical Laboratories, Inc., Carlisle, Mass.

12,418
This report contains titles of papers published in
more than 40 periodicals from January 1952 to August
1957. All pertain to one or more aspects of Air Traffic
Control (ATC) and are grouped into seven categories:
Collision avoidance (hardware and mathematical formula-
tions), communications (ground to air, particularly in
terminal area, and ground to ground), descriptive or
general expositions, remote control (navigational aids,
long range navigational systems, dead reckoning, inertial
and Doppler techniques), landing control (instru-
ment aids, statistical data), theoretical, and weather
considerations affecting ATC.

Smith, C.P. **SPEECH DATA REDUCTION. VOICE COMMUNI-
CATIONS BY MEANS OF BINARY SIGNALS AT RATES UNDER 1000
BITS PER SECOND.** AFMTC TR 57 111, May 1957, 107pp.
USAF Communications Lab., AFMTC, Bedford, Mass.

12,420
This paper is concerned with a new method of instru-
mentation that may be the means of communicating voice
signals in binary messages at digital rates under 1000
bits per second. Some considerations pertinent to the
speech analyzer (Vocoder) and synthesizer design are
considered. Techniques for data reduction are presented
and a semi-automatic data-collecting is described which
will provide statistics of the voice spectrum quickly
and efficiently.

Allen, R.L. (Proj. Officer). ANALYSIS OF SURVIVAL EQUIPMENT. SECOND ANNUAL SUPPLEMENT. 20 SEP 54 EIT, AFIC P44. 6 1954, July 1957, 4pp. HRL Air Mater. Center, Randolph AFB, Ala.

12,416

To supplement an earlier study of the effectiveness of individual items of sea and land survival equipment used in the Air Force survival kits, data from all available accident and rescue reports for the period January 1955 to December 1956 were reviewed. Approximately 300 incidents in which one or more Air Force personnel were placed in a survival situation were selected for detailed analysis as to (1) use made of the various items in the kit, (2) performance of function by item if used, (3) effect of climatic conditions on use, (4) changes indicated, and (5) usefulness of item in escape or evasion. Several complete survival stories are given.

Baker, R.C. & Stegal, A.L. DEVELOPMENT AND TEST OF HYDRAULIC SEAT CUSHIONS; AN OPERATIONAL EVALUATION OF IMPROVED PROTOTYPE SEAT CUSHION ASSEMBLIES. Contract AF 33(616) 3343, AFIC ACN 334, TND RM 33 333.1, Oct. 1957, 24pp. HRL Air Mater. Center, Randolph AFB, Ala.

12,417

Three Trilak covered prototype seat cushion assemblies were evaluated through in-flight test in order to determine the potential of the seats for reducing certain seat discomforts on long flights. Trilak is a three-dimensional plastic fabric. Two seats incorporated an air-cushioning principle plus seat and back pad selections; the third seat was air-cushioned but static and used the standard back pad. Ratings of seat comfort after prolonged flight and preference rankings of the prototype assemblies and the current standard assembly were made by six pilots and five crewmen. Interview data were collected. The data were analyzed for differences due to seat design. Recommendations are included.

Reese, H. & Patten, R.H. SELECTED BIBLIOGRAPHY: FATIGUE, STRESS, SLEEPY COMMA AND BEHAVIOR. Contract AF 33(616) 3343, Proj. 6335, WDC IN 37 123, April 1957, 63pp. HRL Air Mater. Center, Randolph AFB, Ala.

12,418

This bibliography surveys the field of stress and fatigue, and the accompanying behavior and body changes. Since this compilation was made for a study of the stressful effects of five days of confinement and isolation upon crew members performing in-flight duties, the following areas were not covered extensively: physical fatigue, high noise and vibration levels, temperature and pressure effects, and sleep deprivation. A ten-year period, 1946-1956, is covered by the references, which are arranged alphabetically. A topical index is included with classification under a wide range of headings.

Reese, C.H. & Reese, E.V. (Proj. Engineers). A STUDY OF AN AIRCRAFT CARGO-HANDLING SYSTEM. Contract AF 33(616) 3343, Proj. 6335, WDC IN 37 143, May 1957, 73pp. HRL Air Mater. Center, Randolph AFB, Ala. (Long Beach Div., Douglas Aircraft Co., Inc., Long Beach, Calif.)

12,420

This study covers the development of a cargo-handling system for five low-floor, non-landing aircraft (C-119, C-123, C-130, C-132, and C-133). Analysis of the present loading system was made to determine whether more economic methods might be used. Investigations into an optimum-sized pallet and pallet-conveyance methods were conducted. A design is recommended for a system of loading and unloading the aircraft. An economic analysis of the improved system was made in terms of man-hour requirements and aircraft utilization. Proposed design drawings for the system showing installation in the aircraft are included.

Campbell, R.T., Hunt, R.A. & Lewis, Max A. THE EFFECTS OF ASSIMILATION AND CONTRAST IN JUDGMENTS OF CLINICAL MATERIALS. ANN. J. PSYCHOL., Sept. 1957, 70(3), 347-355. (Northwestern University).

12,421

To investigate the effects of contrast in judgments of clinical materials, schizophrenic responses to items in a vocabulary test were presented to 60 judges for rating, on a nine-point scale, the degree of disturbance manifested in each response. The items were arranged in three parts: 1) those from the high end of the scale, 2) those from the low end, and 3) a range from high to low. All parts were rated by each judge, but in varying order. These responses seemed to all three parts were studied for judgment differences due to the contrast in which they appeared. Trends for both assimilation and contrast were noted and discussed.

Carpenter, V.J. & Miller, R.D. STUDY OF VISUAL STEREOSCOPIC ACUITY. JUNE 15, 1956 THROUGH FEBRUARY 15, 1958. FINAL TECHNICAL REPORT. Contract DA 44 009 ENG 2082, Proj. 6 35 08 118, March 1958, 32pp. Institute of Optics, University of Rochester.

12,422

This study was concerned with determining the optimum conditions of viewing for stereo-photogrammetric map compilation. During a series of six experiments 30 observers made 72,000 settings of a floating mark on representative targets (six miniature tents photographed against a model of hilly terrain) with multiplex and stereo-photogram equipment. This report presents the analysis of 47,000 settings made by 30 trained observers using seventeen different viewing conditions (near and far vision, interpupillary distance, illumination intensity, color, and balance, color separation, transparency, and resolving power). An index of accuracy was derived from the setting data and used for evaluating the viewing conditions.

Cheng, S.S.L., Harris, B., Hauptstein, A., Morgan, K., et al. SUPPLEMENTARY NOTES ON EVALUATION AND OPTIMIZATION OF DIGITAL COMMUNICATION SYSTEMS. PART II. FIRST SCIENTIFIC REPORT JANUARY 15, 1957 TO APRIL 15, 1957. Contract AF 19(604) 1964, AFIC IN 57 355, April 15, 1957, 8pp. College of Engineering, New York University.

12,423

Game theory techniques are applied to certain aspects of the communication problem in an effort to show how the decision maker can be benefited in his choice of a communication system. Coded decision feedback is analyzed using Slepian's group representation. A type of information feedback is discussed in which the parity checks are calculated by the receiver and returned to the transmitter for action. The method of linear programming is applied to various problems in communications. The effect of noise in the feedback channel of a binary symmetric decision feedback system and the use of cumulative decision feedback are discussed.

Olsen, S.I., Silvestri, A.J., Zidman, G.D., Johnson, G.E. SKIN RESISTANCE CHANGES DURING ACCELERATION. Proj. 7225, Task 71713, WADC TR 56 397, April 1958, 10pp. Wright-Patterson AFB, Ohio.

12,424
To investigate basal skin resistance changes (gradual drifts or changes) during acceleration stress, a series of experiments were performed on the human centrifuge. Basal resistance changes were measured 1) during acceleration with and without G-suit protection, 2) with rapid and gradual acceleration, and 3) with progressively increased rapid acceleration. The role of blood volume changes and compensatory sympathetic vasoconstrictive activity, the primary determinant of decreases in skin resistance during acceleration was investigated with hemisympathetized dogs. The use of basal resistance changes as a rapid indicator of changes in the psychophysiological state during acceleration is discussed. G. R. 6

Fisher, S. & Rabinstein, I. EFFECTS OF MODERATE SLEEP DEPRIVATION ON SOCIAL INFLUENCE IN THE AUTOKINETIC SITUATION. Proj. 6 60 10 017, Stress, Subtask 2, WATR 63 57, May 1957, 6pp. USA Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington, D.C.

12,428
Changes in autokinetic judgment in a social influence situation were studied as a function of sleep deprivation. The judgments required an estimate of apparent movement of a bright point observed continuously in the dark; social influence was manipulated by using a second observer who had previously been instructed to give his estimates higher than those of the subject. Three groups of subjects (five to seven) were used as follows: (1) sleep-deprived (48 to 54 hours) with influence, (2) sleep-deprived without influence, and (3) normal sleep with influence. Base-line judgments were established for all groups. Differences among the group were analyzed. T. G. R 3

Slegel, A.I. & Taber, E.M. STUDY TO ASSESS THE EFFECTIVENESS AND UTILIZATION OF FULL PRESSURE SUITS: AN OPERATIONAL EVALUATION OF THE MARK II FULL PRESSURE SUIT ASSEMBLY. Part 1. Contract N156 34553, WAC ACPL 373, TED MAN AE 5177, May 1958, 65pp. USA Air Crew Equipment Lab., Naval Air Material Center, Penn.

12,430
This report presents a human factors review of the Mark II full pressure suit. Motion picture, still picture, interview, questionnaire, and direct observational techniques were used to gather information. Six pilot subjects served in all three phases: (1) ground phase in which suit was donned and simulated flight procedures; (2) flight phase; and (3) interview. Analysis of the data led to specific recommendations to pressure suit assembly designers and fabricators, to persons responsible for pressure suit indoctrination, to service and related laboratories, and to airframe manufacturers. Goodnow, Jacqueline J. & Rubinstein, I. EFFECT OF SLEEP LOSS ON PROBLEM-SOLVING BEHAVIOR. Proj. 6 60 10 017, Subtask 2, WRAIR 40 57, March 1957, 13pp. USA Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington, D.C.

12,439

To demonstrate how changes in problem-solving behavior can be quantified, an experiment on the effects of sleep deprivation upon relationships between the choice made on any one trial of a two-choice task and the outcome of one or more previous trials was conducted. Techniques of sequential analysis were applied to the data. The task was to press one of two keys in a slot machine in order to release a chip. Subjects were told that there was a pattern to the order of correct keys which they were to discover. The order of correctness in fact was determined by a 50:50 random schedule. A control period of testing on five consecutive days was followed by sleep deprivation of 72 hours with testing once each day during this period.

Narcum, E.R. & Blackwell, H.R. VISUAL ACUITY FOR CIRCULAR AREA LINE GRATINGS PRESENTED AT VARIOUS INCLINATIONS IN THE VISUAL FIELD. Proj. MICHIGAN, Rep. 2144-318-1, Sept. 1958, 10pp. Vision Research Labs., University of Michigan.

12,440

This paper reports measurements of visual acuity in the frontal plane of the visual field, utilizing a grating consisting of black and white bars at four inclinations within a circular area. Measurements were made both with a sharp-edged circular aperture limiting the grating visible to the observers and with a photographic transparency which produced a graduated rather than a sharp edge for the target pattern. For each observation made by the six subjects, the inclination of the lines in the grating was set at either 0, 45, 90, or 135 degrees to the horizontal. A comparison of results obtained with the two masks was the main experimental task. T. G. I. R 10

Henry, J.P., Eckstrand, G.A., Hessberg, R.R., Simons, D.G., et al. HUMAN FACTORS RESEARCH AND DEVELOPMENT PROGRAM FOR A MANNED SATELLITE. ARDC TR 57 160, Oct. 1957, 4pp. USAF Air Research and Development Command Headquarters, Baltimore, Md.

12,441

This report presents a brief summary of the "state-of-the-art" in human factors research and development in providing a functioning man in space flight. An estimate that man can now be sent out into space for two hours is based upon present knowledge of such factors as habitable atmosphere; accelerations; weightlessness; thermal effects; water, nutrition, and waste disposal; radiation; escape; isolation and confinement; presentation and processing of information; work place layout; crew skills; selection and training; and motivation. In the above factors, areas of the unknown are indicated and estimates of time needed to achieve significant progress are made.

12,442

Hirsch, J.A. ACCOMMODATIVE FATIGUE IN THE AGING RADAR OBSERVER. Proj. 7157, WADC TR 58 24, Task 71808, April 1958, 11pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,442

To study ocular (accommodative) fatigue in aging radar observers, ten subjects ranging in age from 32 to 49 years were tested on a simulated radar observation problem. The subject, at a viewing distance equivalent to the absolute near point, scanned forty successive targets (five concentric circles within which eight letters were randomly placed) and identified the letters in a prescribed manner; period of work was one hour. Fatigue was measured by loss of accuracy of performance, subjective symptoms (discomfort, headache, etc.). The results are considered in relation to presbyopia, ocular fatigue, and aids for alleviation of the condition. I. R 34

Kendler, H.H. & Karasik, A.D. CONCEPT FORMATION AS A FUNCTION OF COMPETITION BETWEEN RESPONSE PRODUCED CUES. Contract NKNR 285(30), Proj. NR 150.064, Tech. Rep. 1, Nov. 1957, 15pp. Dept. of Psychology, New York University, New York, N.Y.

12,445

A mediational stimulus-response formulation was applied to verbal concept formation behavior to test the hypothesis that concept formation depends on implicit response differentiation between relevant and irrelevant words. The material consisted of concrete nouns divided into sense-impression categories. The subjects were required to select four words from a group of eight to form a concept. The four relevant words were always of middle-dominance value. The irrelevant words were varied from high-dominant related to low dominant related, to high-dominant unrelated words. Correct responses on first trial and errors were analyzed for effects of the three conditions. T. R 10

Kidd, J.S. & Kraft, C.L. RESEARCH ON HUMAN ENGINEERING ASPECTS OF AIR TRAFFIC CONTROL, MAY 1958 THROUGH JULY 1958. Contract AF 33(616) 3612, Proj. 7192, R.F. Proj. 690, Rep. 9, Aug. 1958, 14pp. Ohio State University Research Foundation.

12,446

This is the ninth quarterly progress report on a research project on human engineering aspects of air traffic control. The status of the following types of activities is given: operational studies of existing air traffic control systems; systems research on simulated air traffic control operations; technical studies and supporting research, theoretical formulations, design and development of research equipment, liaison activities, and personnel. A list of reports submitted by this project is attached. R 32

12,447

Kidd, J.S. & Kraft, C.L. RESEARCH ON HUMAN ENGINEERING ASPECTS OF AIR TRAFFIC CONTROL, AUGUST 1958 THROUGH OCTOBER 1958. Contract AF 33(616) 3612, Proj. 7192, R.F. Proj. 690, Rep. 10, Nov. 1958, 13pp. Ohio State University Research Foundation.

12,447

This is the tenth quarterly progress report on a research project on human engineering aspects of air traffic control. The status of the following activities is described: operational studies of existing air traffic control systems; systems research on simulated air traffic control operations; technical studies and supporting research, theoretical formulations, design and development of research equipment, liaison activities, and personnel. A list of reports submitted under this project is included. R 35

Kincaid, M.M., Kristofferson, A.E. & Blackwell, H.R. A NEURAL FORMATION OF THE EFFECTS OF TARGET SIZE AND SHAPE UPON VISUAL DETECTION. Contract DA 36 039 SC 52654, Proj. WICHICAN, Rep 2144, 280 p, July 1958, 19pp. Engineering Research Institute, Vision Research Lab., University of Michigan.

12,449

A quantitative general formulation of the effects of target size and shape on visual detection is presented in connection with counter-surveillance. The chief assumptions are that neural impulses originating in retinal receptors converge upon neurons in a central area, and that excitation of the most excited neuron in that area determines the response. It is shown that the hypothesis leads to testable relationships between thresholds for circular targets and for targets of other shapes. Evidence is presented that diffuse neural connections are relatively more important at low background levels and an interpretation is suggested.

Lewis, S.T. & Stapp, J.P. EXPERIMENTS CONDUCTED ON A SWING DEVICE FOR DETERMINING HUMAN TOLERANCE TO LAP-BELT-TYPE DECELERATIONS. Proj. 7850, AFMDC/TN 27 1, Dec 1957, 21pp. USAF Missile Development Center, Holloman AFB, N.M.

12,449

This note describes a device, the swing-test, for use in obtaining human parameters to experimental application of crash-type mechanical forces while restrained with only a lap belt. The swing consists of an aircraft seat, suspended by cables forming a swing-pendulum, which can be raised or dropped through a measured vertical component and arrested by a vertical cable. Rate of onset, magnitude, and duration of deceleration have been recorded for 21 anthropometric dummy tests and 19 human tests in this device.

Marschak, T. CENTRALIZATION AND DECENTRALIZATION IN ECONOMIC ORGANIZATIONS. Contract N60R 25133, (NR 047 004), Tech. Rep. 42, April 1957, 257pp. Dept. of Economics, Stanford University.

12,450

This paper aims to clarify the problem of an organization that must choose between a centralized scheme for coordinating the decisions of its members and a decentralized one, or more generally between many schemes of varying degrees of centralization. Various chapters deal with: 1) descriptions and definitions of the organization and various decision systems; 2) criteria for choice among decision systems; 3) a symbolic treatment; 4) applications of the criteria to several types of organization; and 5) general conclusions about the evaluation of decision systems in general and the ranking of certain types as to the criteria given here.

Milch, L.J., Frank, H.D. & Renzi, A.A. THE EFFECTIVENESS OF DRUGS AGAINST MOTION SICKNESS. PERPHENAZINE AND SYSTRAL. Rep. 59 20, Dec. 1958, 3pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

12,451

To test the effectiveness of the drugs perphenazine and systral against motion sickness, groups of unselected basic airmen were tested aboard a multi-engine aircraft. The subjects were equally divided into drug and placebo groups. The four-hour flight involved simulated turbulence. The endpoint was vomiting. Subsequent to the flight all subjects completed a questionnaire on side effects. Data from 223 subjects were analyzed for differences between drugs and placebo. Also, dogs were swing-tested after the administration of chlorpromazine and perphenazine to test the reliability of extending results of apomorphine inhibition to the relationship of the chemoreceptive zone to motion sickness.

Neibaur, J. & Andrus, F.S. SHIPBOARD EVALUATION OF FLIGHT DECK CLOTHING OPERATION. SMALL. Proj. KT301-052.04. R.C.D. Rep. 18, Airside Rep. 1950 2, Jan. 1953, 11pp. USA Clothing and Textile Office, Bureau of Supplies & Accounts, Brooklyn, N.Y.

12,452

This report deals with evaluation of experimental flight deck clothing for carrier operations in cold weather. Three types of experimental winter identification clothing (sleeveless and sized to wear over foul and cold weather clothing, vest-type, panel-type and commercial-type athletic shirt) were evaluated on a comparative basis for fit and comfort, difficulty in donning and doffing, difficulties in performing duties, and possibilities of wearing personnel. The adequacy and acceptability of other clothing (gloves, shoes, summer wear) are also discussed.

O'Connell, M.M. AUDITORY ACUITY MEASURED BY AUTOMATIC AND MANUAL AUDIOMETRY. Rep. 58-13, Nov. 1957, 3pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

12,453

Auditory thresholds were established for 24 subjects on the Rudense model AR-3 audiometer, on the SAM model 56-2 automatic audiometer, and on the standard Naico H-1 audiometer. The test results are compared by percent agreement and probability of such difference occurring by chance. The result of one retest per subject is also given. Additional test-retest data obtained at the 1953 Wisconsin State Fair, using the SAM model 56-2, are presented.

Pepinsky, H.B., Pepinsky, Pauline N., Minor, F.J. & Robin, S.S. MOTIVATIONAL FACTORS IN INDIVIDUAL AND GROUP PRODUCTIVITY. VI. TEAM PRODUCTIVITY AS RELATED TO THE CONFIRMATION OR CONTRADICTION BY MANAGEMENT OF ITS COMMITMENTS TO AN APPOINTED LEADER. Contract N60R 17, T.O. III (NR 171 123), 1957, 89pp. Personnel Research Board, Ohio State University Research Foundation.

12,454

To test the hypothesis that the productivity of a work team will actually be lower when management is viewed as contradicting than when it is viewed as confirming its production commitments to an appointed team leader, an experiment was conducted in a simulated small industrial plant in which a team of four subjects worked together on a toy manufacturing problem. Their task was to buy parts for, assemble, and sell different kinds of toys. One member of the team, the department head, conducted all transactions with the vice-president, buyer, and seller. In one condition all purchase orders were approved, in another half were disapproved and toy output and sales were compared for 20 different teams.

Pinneo, L.R. THE INFLUENCE OF PRE-EXPOSURE LUMINANCE AND DURATION UPON SHORT-COURSE DARK ADAPTATION. Proj. 7186, RADG TR 50 24, Task 4511, Feb. 1958, 12pp. USAF Rome Air Development Center, Griffiss AFB, N.Y.

12,455

To determine the effect upon human vision of momentary exposures of intensities of light higher than adaptation level, the course of dark adaptation (as measured by contrast sensitivity) was determined for the first 32 seconds following pre-exposure. Two pre-exposure luminances of 1.0 and 10.0 foot-lamberts and three pre-exposure durations of 1, 10, and 100 seconds were used. Contrast thresholds were also determined for each condition of pre-exposure during the last second prior to its termination. The results are compared with those in the literature and the implications for optimum luminances for night visual tasks are discussed.

39pp. WADC Flight Control Lab. & WADC Aero Medical
Lab., Wright-Patterson AFB, Ohio.

12,460
This report presents the results of an effort to de-
termine the difference in pilot tracking behavior result-
ing from differences between flight and ground simulator
control environments. The investigation was centered on
an experiment designed to simulate the quasi-linear de-
scribing functions and linear correlations of eight pi-
lots when engaged in lateral and longitudinal tracking
tasks with random appearing forcing functions. A Kari-
son aircraft was used both in flight and ground simulation
tests. The data are presented in the form of pilot de-
scribing functions and linear correlations. Simple ana-
lytical describing functions are developed and differ-
ences between flight and simulator behavior are discussed.

Huest, A. INVESTIGATION OF THE CO-ORDINATION OF
ORTHOGONAL TO-AND-FRO MOVEMENTS OF THE EXTREMITIES
OF NORMAL SUBJECTS. TIL/T 4579, Aug. 1957, 33pp.
Technical Information and Library Services, Ministry
of Supply, London, England. (University of Freiburg).

12,462
To investigate the regular peculiarities of coordi-
nated-rhythmical voluntary movements, the voluntary to
and fro movements of 15 subjects, including seven pairs
of twins, were recorded. The tests were made uniformly
with each limb and part limb moving simultaneously and
separately at various rates. The data were analyzed in
terms of natural or basic frequencies, maximum frequen-
cies, lateral differences, amplitudes, and coordination
similarities. The importance of these results in motor
coordination is discussed.

INDIVIDUAL DIFFERENCES IN HEAR-VISION EFFICIENCY.
Martins, H.L. & McDonald, F.E. WITH A SECTION ON
"THE FREQUENCY OF SEEING AT LOW ILLUMINATION".
Rep. 294, Feb. 1957, 83pp. Medical Research Council,
London, England.

12,468
To assess the part played by sensory acuity in per-
ception, a series of specialized tests were administered
at low illuminations to dark-adapted subjects. Instance
levels required to resolve black Landolt rings of differ-
ent sizes were obtained and correlated with absolute
thresholds measured by the flicker-and-flash method. A
"filter factor" theory was proposed and further experi-
ments were carried out to test it. Perceptual efficiency
was measured by a score given for a complicated picture
viewed at low illumination and compared to the flash
thresholds. The data were examined from point-of-view of
the quantum theory. A method of carrying out simple
tests of visual efficiency at low illuminations is pre-
sented.

Anderson, Nancy S. & Fitts, P.M. AMOUNT OF INFORMATION
GAINED DURING BRIEF EXPOSURES OF NUMERALS AND SYMBOLS.
J. Exp. Psychol., Oct. 1958, 56(4), 362-369.

12,470
The problem of how much can be perceived during a
brief exposure of a group of subjects was re-examined
from the viewpoint of the relation of amount of infor-
mation transmitted to informational coding and amount of in-
formation displayed. Groups of homogeneous colors, nu-
merals, or combined color-numeric symbols were exposed
for 0.1 seconds; information content varied from 9.51 to
25.36 bits per message (symbol group). The subjects (24)
wrote down estimates of all the symbols in each message
during ten test sessions (36 test messages) with the mes-
sages presented in order of increasing difficulty. Re-
sults were analyzed in terms of information transmitted
at various complexity levels.

Hartman, B. & Fitts, P.M. THE DEVELOPMENT OF TECHNI-
QUES AND PROCEDURES FOR THE STUDY OF ALERTNESS IN
AVIATION PERSONNEL. Nov. 1950, 38pp. The Ohio State
University Research Foundation.

12,472
This report covers two phases of work on the prob-
lem of alertness. The first, a review of literature on
the nature and causes of alertness changes, leads to the
formulation of several hypotheses regarding underlying
factors that lead to loss of alertness. The second
phase is an initial evaluation of the suitability of ob-
servational techniques to the problem of quantifying
alertness changes. The results of this study are dis-
cussed in relation to research necessary to validate
this method.

Brown, R.B., Gorton, W.A., Smith, P.E. & Bradford, R.A. A RESEARCH STUDY OF THE EFFECTIVE TRAINING OF THE INFANTRY RIFLE SQUAD. FINAL REPORT. Subcontract NUMBER 000 007 (50 45 2 50 17), PMA Rep. 34 10, Aug. 1954, 61pp. Psychological Research Association, Washington, D.C.

12,460

To develop training methods and procedures for increasing the effectiveness of infantry rifle squads. Four different methods (control, group participation, combat fundamentals, and team training) were developed. A 40-man group of eight squads was trained by each method and given performance tests to evaluate their comparative effectiveness. Evaluation of the results along with opinion of all involved led to the formation of a final training program that was used to train 40 squads. Instructors with no experience in the project trained half the squads. Performance tests were again used for evaluating the program. Lesson plans for rifle squad unit training are presented.

Murch, R.S. FORMULAS FOR MEASURING AND ESTIMATING HUMAN RESPONSE PERFORMANCE IN MECHANIZED SYSTEMS. RJ 130, Oct. 1953, 6pp. HRL Research Lab., San Jose, Calif.

12,465

This paper discusses the development of a formula for estimating the rates at which human operators, using glass input devices, are able to enter data accurately into a man-machine system. The estimates include error correction but are based on tests during which the operator does not actually stop to correct errors. The underlying assumptions are discussed for two specific input systems and the formulas developed are simplified for certain cases and approximations.

Rees, J.L. STUDIES ON THE ACCELERATION OF A BODY FROM REST. PART I. THE APPROXIMATE CONSISTENCY OF VELOCITIES PRODUCED BY TIME-DEPENDENT ACCELERATIONS HAVING EQUAL MAXIMUMS AND OPERATING OVER EQUAL DISTANCES. Rep. ES 26463, Nov. 1954, 22pp. Douglas Aircraft Company, Inc., El Segundo, Calif.

12,467

This paper is a theoretical investigation of the effect of the shape of the acceleration-versus-time curve on final velocity. The range of final velocities that can be given a point mass (or rigid body) by accelerations having a prescribed maximum and operating over a certain fixed distance are investigated for two special classes of accelerations: linear ramp and power of the elapsed time. Actual velocities obtained in ejection seat tests are compared with those predicted from the analytic study. The findings are discussed in relation to the design of ejection seats.

Thompson, P.O. THE EFFECT OF TEMPORARY HEARING LOSS ON THE MASKED THRESHOLD. MEL Rep. 786, June 1957, 12pp. HRL Electronics Lab., San Diego, Calif.

12,472

To determine the effect of temporary hearing loss due to intense sound upon detection of tonal signals in a noise background, data were obtained from three subjects (monaural listening) using a 400-200 cycle per second band of up to 100 decibels sound pressure level of noise. The masked stimulus was a 4000 cycle tone (interrupted three times a second) which also served to measure auditory fatigue. A test run consisted of pre-exposure tracking of the absolute threshold, 16 minutes of noise exposure interspersed with thresholds for gauging masking and fatigue, and post-exposure thresholds (recovery). Implications of the results for sonar operation are discussed.

Klein, S.J. THE RELATIONSHIP OF MUSCLE ACTION POTENTIALS TO ENDURANCE OF WORK IN TASK ORIENTED SUBJECTS. *Rep. NMC 401-302, No. 17-01 121, Dec. 1958, 14pp. Naval Air Development Lab., Naval Air Materiel Center, Pens.*

12,477
This is one of a series of studies concerned with the development of stress criteria and their effects on and relationship to performance. In the present experiment stress, measured by muscle tension, was induced by 1) varying the rate of lift in an isometric task, and 2) varying the rate of temperature of a thermal stimulus applied to the working hand. Muscle action potentials were recorded and studied in relation to work output on the isometric task. The effects of the stimuli used to induce the various levels of electrical activity were studied in relation to performance.

Nelson, P.B. PERSONAL INFLUENCE AS A FACTOR IN CONTRACT DECISIONS. *Rep. Proj. NMC 401 21, Subtask 1; Rep. 17, Sept. 1958, 8pp. Naval School of Aviation Medicine, Naval Air Station, Fla.*

12,478
To evaluate the relationship between different forms of personal influence and contract decisions made in the pre-flight stage of naval air training, 126 aviation officer cadets (four classes) were studied. At some period between the third and sixth week of training each cadet estimated what his contract decision (length of stay in service) would be and on the fifteenth week final decisions were made. A questionnaire was given asking for the three best friends in the class, whom they would go to for an informed opinion, and what they thought of the class spirit. Friendship patterns and opinion leaders were studied in relation to actual contract decisions.

Pettitt, Julia A., Cohen, S.I., Silverman, A.J. & Zidovus, G. MULTIPLE PSYCHOPHYSIOLOGIC MEASURES DURING GRADUAL ONSET ACCELERATION. *Proj. 015, Task 71713, NMC TM 57 234, Feb. 1958, 20pp. USA Army Medical Lab., Wright-Patterson AFB, Ohio.*

12,479
To investigate psychophysiological factors associated with the response of subjects to gradual onset of acceleration (G), 15 subjects were tested. Prior to the experiment blood was drawn for blood sugar determination, then the subject was exposed to four "stress" periods during which time skin resistance, blood pressure, tracking performance, and pulse were measured. The periods were 1) tracking for 90 seconds with centrifuge at rest, 2) 2G, 3) 4G, and 4) blackout level or 7G. Prior to each G exposure there was a one-minute control period. Subjective symptoms and post-run performance estimates were obtained after each run. The relation between level of central nervous system arousal and vascular changes to blackout and performance decrement were analyzed.

Schultz, B. THE FACILITATION OF WORK THROUGH THE ADAPTATION OF THE MACHINE TO THE HUMAN BEING. *Contract NCMR 1268(01), Aug. 1954, 61pp. San Diego State College Foundation, San Diego, Calif.*

12,480
This volume is concerned with the adaptation of the machine to the worker. Consideration in designing for human work at the machine should be given to 1) understanding of the mechanical relations of the body, 2) adaptation to physiological processes, and 3) observation of psychological happenings. The various chapters give information on 1) the mechanics of body movement, 2) individual physiological data on static and dynamic work, speed of movement, strength, and so forth, 3) the place of work, 4) the relationship between big movements and controls of the machine, and 5) the position of the worker at the machine. A summary of basic principles is given.

12,480
Shimony, A. THEORY OF INFORMATION IN THE DISCRETE COMMUNICATION SYSTEM. SC Proj. NR 10250, DA Proj. No. 145 08 001, Tech. Memo. 1956, Sept. 1955, 61pp. Naval Signal Lab., Fort Monmouth, N.J.

12,481
This report is a revised version of the lectures on the discrete communication system given in a course of Information Theory. It represents an organization of the most useful aspects of the treatment of this subject by several authors. Various chapters are devoted to 1) a precise definition for quantity of information transmitted through a discrete information system; 2) a survey of parts of probability theory; 3) an analysis of the noiseless communication system; and 4) an analysis of the noisy communication system.

Yustein, S.E. REPORT OF EVALUATION OF COLOR DURABILITY OF COLORED SAFETY HELMETS. FINAL REPORT. Lab. Proj. 4526 36, NSM 181 013, March 1957, 5pp. NSM Material Lab., New York Naval Shipyard, Brooklyn, N.Y.

12,484
To determine the durability of colors in colored safety helmets (color molded integrally into the shell), 80 test samples were issued to four groups of workers (electrical, electronics, riggers, laborers) in a Naval shipyard. The helmets were inspected after periods of six months and one year of service. A number of samples were cleaned using soap and water, naphtha, or hand sanding followed by cleaning and polishing. The results as to general condition, color durability, condition of painted brim, and cleaning quality are reported.

Williams, C.C. & Clodding, J.A. THE EFFECTS OF COLD ON HUMAN PERFORMANCE. I. REACTION TIME. II. VISUAL COORDINATION. III. THE VISUAL FIELD. NRC Rep. C 7123, March 1942, 14pp. National Research Council of Canada, Ottawa, Canada. (Hunting and Sport Department of National Research).

12,485
To investigate the effects of cold in relation to a reaction time, visual coordination, and vision, a series of separate experiments were performed. 1) Subjects wearing flying clothing were tested with respect to simple or multiple reaction time at zero and -65 degrees Fahrenheit. Time in the cold varied from one to one and one-half hours (hands in warming box). 2) Subjects were exposed to zero degree temperature for four hours while performing a two-handed coordination task. 3) The visual field was charted in the cold (-60 degrees) at intervals during a two-hour period and also at room temperature. Test results at room temperature were compared with those in the cold.

Seelien, J.M. "SOME OBSERVATIONS ON THE USEFULNESS OF THE INDEX OF WIND AND RAIN IN COMPUTING THE THERMAL BALANCE IN INDUSTRIAL WORK". Acta Physiol. Pharmacol. Scand., Dec. 1956, 7(2), 169-174. (Netherlands Institute for Preventive Medicine, Leiden, Netherlands).

12,486
This note discusses the usefulness of some simplified methods that have been developed to compute thermal balance in industrial work. Measurements were made by the longer but more precise method and also by the simplified method on a group of workers in a brick factory who were exposed to high temperatures. The results were compared and recommendations made regarding the use of the simplification of computing procedures.

Irvine, R.F. & Smith, J.D. MAINTENANCE REQUIREMENTS FOR ELECTRONIC PERSONNEL. I. RECOMMENDED METHOD OF THE QUALIFICATIONS FOR ADVANCEMENT IN RATING FOR ELECTRONIC TECHNICIANS. Study 12-489-6.1, 1948-49, 7th and 8th Rep. 75, May 1950, 74pp. USA Personnel Research Unit, Field Activity of Bureau of Naval Personnel, San Diego, Calif.

12,490
To investigate qualifications for advancement in rating of Navy electronics technicians (qual) and to develop a method for subsequent use in reviewing them, tasks relating to electronics maintenance were studied. Questionnaires containing 125 such tasks were constructed and distributed to 1) 21 technically qualified experts who indicated whether or not the task was essential and, if so, the lowest pay grade that should be held responsible and 2) every electronics technician aboard a sample of 64 ships who indicated which tasks they performed as part of their present assignment. The methods for deriving "qual" from these data are set forth in detail together with a recommended revision obtained by this procedure.

Moran, E.B. VISUAL RECOGNITION ALONG VARIOUS MERIDIANS OF THE VISUAL FIELD. V. HENRY PATTERNS ALONG 12 MERIDIANS. Proj. MCHENR, Rep. 2144 102 I, Nov. 1950, 20pp. Vision Research Lab., University of Michigan.

12,492
As part of a series of investigations of visual recognition along various meridians of the visual field, observers were required to reproduce linear binary patterns presented tachistoscopically at inclinations of 15 degree steps from horizontal about the visual field. Forty target patterns, each composed of four blackened and four open circles, were used, with four elements appearing on either side of fixation. Luminance was approximately 6.8 foot-lamberts and exposure duration was 0.075 second. The function described by the plot of mean error per meridian and per half-meridian was determined with the data for twelve target meridians and seventeen observers.

Moloni, J.F. COCKPIT, INSTRUMENT, AND ANTI-COLLISION LIGHTING FOR ARMY AIRCRAFT (INSTALLATION AND EVALUATION OF COCKPIT AND INSTRUMENT LIGHTING FOR THE L-23 AIRCRAFT). FINAL REPORT. Proj. 9 38 01 000, House Task 12-23, Nov. 1957, 27pp. USAJ Cooperation Research and Engineering Command, Fort Eustis, Va.

12,492
To investigate and evaluate instrument and cockpit lighting for L-23 aircraft, the systems currently in use (combination of fluorescent and red floodlighting) were reviewed in terms of previous findings on the F19 aircraft lighting. Prismatic individual red instrument lights with a cockpit utility light were installed in a test aircraft and subjected to a series of static night tests, night flights, and demonstrations. Recommendations for an improved lighting system are based upon analyses of these data.

Miller, E.F., II. EVALUATION OF CERTAIN VISUAL AND RELATED TESTS V. RETINAL RIVALRY. BMedSurg, Proj. NM 14 01 11, Subtask 6, Rep. 5, Aug. 1950, 8pp. USM School of Aviation Medicine, Naval Air Station, Fla.

12,493
To evaluate the test of retinal rivalry rate as a possible additional visual screening device for visual anomalies that may influence flying efficiency, 112 naval aviation cadets were tested and 12 retested to determine test-retest reliability. A pair of Renshaw oblique line split stereogram targets were used to measure alternation rate. The test was repeated with instructions to attempt to alternate target lines as rapidly as possible. The analysis included frequency distributions of both types of data and comparison with normal curves. Testing significance of ability to change rate at will, and checking on test reliability.

Miller, R.B., Grandstaff, H., Alpert, J.H., Barr, I.H., et al. SIMILARITIES OBSERVATIONS ON DIGITAL AND ANALOG TEMPERATURES IN 12 HOURS BEFORE TO COLD. Rep. 29 01, Aug. 1954, 8pp. USA Climatic Research Unit, Fort Monmouth, N.J.

12,494
To investigate the relationship of the temperature of digits and muscles of limbs exposed to cold, young male military subjects were used. They were tested at room temperature (20-23 degrees centigrade) with upper extremities, bared to just above elbows, placed in ice-jacketed boxes (minus four to ten degrees centigrade). In some experiments wool gloves were worn. Temperatures were recorded from the fingers, forearm, and calves. The temperature reactions were studied for changes occurring in digits, muscles, and for correlation between the two during the course of three to four hours of cold exposure.

Miller, R.B. COMMON JOB COMPONENTS AND TRANSFER OF NON-SPECIFIC SKILLS IN ELECTRONIC LINE MAINTENANCE PART II SOME THEORY AND IMPLICATIONS FOR IMPROVING OF TRAINING OF NON-SPECIFIC SKILLS IN L-23 MAINTENANCE JOBS. Contract AF 18(600) 600, Proj. 7709, Jan. 1955, 34pp. American Institute for Research, Pittsburgh, Penn.

12,495
The work described in this report is an outgrowth of previous study of common job requirements for line maintenance of several types of electronic equipment. It was found in these studies that, on the basis of specific external job similarities, not a great deal of transfer of training could be expected from one system to the other. The present study develops a number of hypotheses predicting the kinds of transfer of training to be expected on non-specific job similarities (for example, concepts of "signal flow," methods of trouble shooting, certain overall work methods such as layout of tools), and the psychological grounds on which this transfer can be expected.

Miller, R.B. & Van Cott, N.P. THE DETERMINATION OF KNOWLEDGE CONTENT FOR COMPLEX MAN-MACHINE JOBS. Contract AF 18(600) 1205, Proj. 7714, Dec. 1955, American Institute for Research, Pittsburgh, Penn.

12,496
This report is intended to provide a practical technique for the determination and optimal use of conceptual content in training and job operations. The technique permits the training analyst to induce from concrete job data the essential skills and knowledge which will support his performance and to eliminate irrelevant ones. Four successive steps are delineated: 1) methods for identifying job data, 2) method for deriving operative (or useful) content from particular behaviors, tasks, or job segments, 3) criteria for translating operative content into symbols (verbal descriptions, maps, diagrams) most appropriate for learning and recall, and 4) methods for organizing conceptual supports into training presentations.

Glaizer, M., Glaser, E. & Klaus, D.J. THE TEAM PERFORMANCE RECORD: AN AID FOR TEAM ANALYSIS AND TEAM TRAINING. Contract 17008-37008, NR 154 079, Dec. 1956, 32pp. American Institute for Research, Pittsburgh, Penn.

12,499

To develop a procedure for the evaluation and training of Navy teams, observations of several hundred Navy teams were analyzed to determine the specific behavior critical in producing effective team performance. Thirteen general categories of behavior were used to construct team performance records on which observations can be recorded. Three forms were developed: a general one for Navy teams, one for Gunnery, and one for Combat Information Center teams. The construction and use of the records are discussed and a program for improvement of team functioning is considered.

Gogel, M.C. THE EFFECT OF CONVERGENCE AND ANGULAR SIZE UPON THE COMPUTED VALUE OF A HYPOTHETICAL OBSERVER CONSTANT IN BINOCULAR VISION. USAMRL Proj. 6-95, 20 001, Rep. 372, Dec. 1958, 28pp. USA Medical Research Lab., Fort Knox, Ky.

12,500

The amount of binocular disparity required to duplicate a frontal extent in apparent depth was investigated. In two experiments the angular size of the frontal extent was constant but the convergence distance was varied. The final experiment reversed these conditions. The binocular disparity data were analyzed as a function of the angular size of frontal extent and its convergence distance. Equations for calculating an observer constant from this type of judgment were developed. The consequence of this approach was considered for the perception of the size of a depth interval and the shape of a three-dimensional object.

Fromer, R. & Morowitz, M.W. FLIGHT INFORMATION DISPLAYS FOR INSTRUCTIONAL CONSOLES. CHAPTER I OF THE HANDBOOK OF INSTRUCTOR STATION DESIGN. Contract N61339 74, Tech. Rep. NAVTRADEVEN 20 OS 31 1, Sept. 1958, 83pp. USN Training Devices Center, Fort Washington, N.Y. (Educational Research Corp.).

12,501

To determine the best mode of presenting cockpit information to the flight simulator instructor, two general methods of study were used. The first method included an examination of all relevant literature on instruments currently used, or of similar design to those currently used, in Navy Flight Simulator Instructor Stations. The second method used consultations with informed personnel. The results are given in two parts: (1) A comparative study of 28 instruments with data on general purpose, operating principle, major and secondary functions, type of information presented, and proposed presentation. (2) Analysis of current modes of presentation in five general information categories and recommendations for proposed presentations.

Fritz, E.L. REALISTIC MATHEMATICAL ASPECTS OF AIR TRAFFIC CONTROL. Contract CICA 505, Working Paper 7, Proj. 2384 1, June 1955, 21pp. Laboratories for Research and Development, The Franklin Institute, Philadelphia, Penn.

12,503

This paper summarizes some of the mathematical analogs and models that best describe air traffic control problems. These are the tools with which intensive analysis can be made. The mathematical concepts, coupled with basic descriptions of the operating system, provide the fundamentals necessary for optimum system design. The use of actual data has been kept to a minimum. The general divisions of the system are: 1) departures, 2) the enroute area, and 3) terminal arrival areas. Some general conclusions and recommendations are given.

Grill, R. & Snyder, F.V. PRELIMINARY STUDY OF AIR-CREW TOLERANCE TO LOW-FREQUENCY VERTICAL VIBRATION. Contract AF 34 (601) 2975, Document D3 1189, Model B 47, July 1957, 32pp. Boeing Airplane Company, Wichita, Kan.

5 aircrews were subjected to vertical harmonic motions of frequencies ranging from 3 to 30 cps with input accelerations ranging to a maximum of over 2.5g. The subjective judgments of the effect of the vibrations on the aircrews were reported by them in terms of 5-point scale. The results of the subjective judgment tests indicate that aircrews are able to tolerate unexpectedly high levels of vibratory acceleration for relatively short periods at the frequencies explored. Transmissibility of vibration from supporting structure adjoining the seat to just under the body of the seated airman varied with frequency. Generally, the higher frequencies were transmitted with a greater loss in amplitude of vibration, (or g's) than were the lower frequencies. The same aircrews performed a tracking task while being subjected to vibration of various amplitudes and frequencies. The magnitude and duration of error in tracking was electrically integrated to produce a comparable score for each vibration condition. It was tentatively found that there were statistically significant decrements in performance under vibration conditions which were judged to be nearly "intolerable." In addition, there were some notable individual differences in response to the various vibration conditions.

Rowarth, C.I. & Treisman, M. THE VALIDITY OF MOTOKAWA'S TECHNIQUE FOR INVESTIGATING RETINAL FUNCTION. PPMC 1035, June 1956, 2pp. Flying Personnel Research Committee, London, England. (Institute of Experimental Psychology, Oxford, England).

12,506

This paper describes a series of experiments in which the validity of Motokawa's technique for investigating retinal functions is tested. Motokawa's technique is based on the curve of the change of threshold for electrical stimulation of the eye after various types of light stimulation. Using both naive and trained observers, approaching the threshold from both directions, by equal step changes in stimulus intensity, and by using varied intervals between the warning light flash (of various colors) and the electrical stimulus (from one to nine seconds), phosphene thresholds were obtained and compared with those from Motokawa's studies. Studies from other laboratories are reported.

Anderson, Nancy S. & Leonard, J.A. THE RECOGNITION, NAMING, AND RECONSTRUCTION OF VISUAL FIGURES AS A FUNCTION OF CONTOUR REDUNDANCY. J. exp. Psychol., Sept. 1956, 26(3), 262-270. (Ohio State University).

12,508

This study extends the previously reported finding that one form of redundant metric figure (any one contour restricted to one appearance) was more difficult to identify among a sample of similar figures than were random (nonredundant) metric figures. Two experiments were conducted: 1) two intermediate levels of redundancy (restricting total figure area and restricting the relation of adjacent details) were compared with the earlier more extreme forms; and 2) the perceptual task was varied (classification of a series of figures, paired-associate learning of figure names, and complete reconstruction of figures). The data were analyzed to answer the question of why some particular forms are detrimental to identification performance.

Banks, J.E., Dick, J.L. & William, J.M. A STUDY OF THE EFFECTIVENESS OF GLOVES FOR THE REDUCTION OF THE CONTACT RADIATION HAZARD ASSOCIATED WITH CONTAMINATED AIRCRAFT. Proj. 7801, Task 7801, AFSC TR 57 26, USAF Special Weapons Center, Kirtland AFB, N.M.

12,509

To determine the effectiveness of gloves in reducing the contact radiation hazard to personnel who work on aircraft that have become radioactively contaminated, a number of different types of gloves and glove materials were subjected to test. A representative swatch of the glove was interposed between the source of radiation and dental X-ray film to determine radiation dose. Measurements were made on inside and outside of gloves worn by personnel working on contaminated aircraft and for whole body exposure. The data were analyzed and the gloves rated in order of effectiveness of protection.

Debons, A. & Fried, C. EFFECTS OF RATE AND PROLONGED VIEWING OF RADAR SIGNAL FLICKER. Proj. 4506, RADC TR 58 69, May 1958, 9pp. USAF Rome Air Development Center, Griffiss AFB, N.Y.

12,513

Some radar scopes present lights that flicker at varying rates. To determine whether prolonged viewing would affect observer performance, lights flickering at different rates (zero, four, eight or twelve cycles per second) were presented on a simulated radar scope for periods up to two hours. Twelve subjects were asked to report continuously the number of non-flickering lights (one to four) appearing at random intervals for one flicker rate; three subjects were tested at all four rates. Time to respond correctly to changes in number of non-flickering lights were analyzed for effects of flicker rate and length of observation. Subjective responses as to comfort and alertness to task were elicited.

Dennis, J.P., Siddall, G.J. & Colbourne, P.J. **NOISE LEVELS RECORDED IN 'ANTAR' AND SOME OBSERVATIONS ON THEIR POSSIBLE EFFECTS.** Rep. 64, Oct. 1956, 19pp. Clothing & Stores Experimental Establishment, Ministry of Supply, London, England.

12,524

To investigate noise levels on both diesel and petrol models of the Army's F.V. 4430 34-ton tank towing vehicle (Antar) and to give an account of their possible effect on the operator, noise level measurements were made under various driving conditions. An octave band analyser was used to find the region of highest intensities for the recorded noise levels. Comparisons of these data were made with those reported from other investigations and discussed in relation to the following: damage to hearing both permanent and temporary, effects on communication, health and safety, work efficiency, and subjective effects. Recommendations are included.

Dogan, J.M., Desguin, P.E., Jones, J.S., Hank, S.A., et al. **AUDIO-VISUAL PRESENTATION OF INTELLIGENCE DATA.** RADC TR 57 146A, 1957, 190pp. **Battelle Memorial Institute, USAF Rome Air Development Center, Griffiss AFB, N.Y.**

12,525

This manual describes the essentials of the graphic methods and equipment useful in presenting intelligence data to small audiences. The manual can be used to aid in the selection and use of effective methods and equipment and also as an operating and training guide. Major sections of the manual are: 1) principles of briefing, 2) preparation of pictures and charts, 3) use of still projection in presentation, and 4) techniques and use of motion pictures, stereoscopic presentation, projection of microcopy, and closed circuit television.

Baker, L.E. (Chm.). **THIRD ANNUAL ARMY HUMAN FACTORS ENGINEERING CONFERENCE.** Oct. 2, 3 & 4, 1957, 115pp. **Quartermaster Research & Engineering Command, Natick, Mass.**

12,527

This report is the record of a conference on human factors engineering. Two addresses are given in full. "Man: The Ultimate Weapon", James Edson and "Human Factors in Systems Engineering", Alphonse Chapanis. One section is devoted to presentations by the Army of new organizations and tactics - their influence on material objectives. Another section comprises papers presented by the technical services which deal with human factors research. Reports of working groups are summarized.

Siegel, A.I. & Stirner, F.W. **CAUTION AND WARNING LIGHT INDICATORS FOR NAVAL AIRCRAFT. VII. THE EFFECTS OF COLOR CONTRAST, BRIGHTNESS CONTRAST AND MODE OF LEGEND PRESENTATION ON THE ATTENTION INTRUDING VALUE OF PERIPHERALLY POSITIONED LIGHT INDICATORS.** Contract N1565 33252, NANC ACEL 369, TED NAM EL 52004 Part 19, Feb. 1958, 22pp. **Applied Psychological Services, Wayne, Penn.**

12,528

To investigate the effects of color contrast, brightness contrast, and mode of legend presentation on the attention intruding value of cautionary and warning light signal indicators, fifteen subjects were tested. They were instructed to consider their primary task to be that of keeping three pointers "on target" and secondarily to extinguish any signal light that appeared by pushing the appropriate button. Specific comparisons of performance (response time to signal and number of light signals missed) were made for 1) red and yellow light indicators in a red surround illumination, 2) two levels of surround illumination, and 3) positive and negative modes of legend presentation (legend opaque-background illuminated and the reverse condition).

Barker, P.A. **INVESTIGATION OF TECHNIQUES FOR DISPLAYING INFORMATION IN AN AIR TRAFFIC CONTROL CENTER.** FINAL REPORT. Contract AF 19(604) 2034, AFMCC TR 58 113, May 1958, 133pp. **Electronics Research Directorate, Air Force Cambridge Research Center, Bedford, Mass. (Stavid Engineering, Inc., Plainfield, N.J.).**

12,529

The important features of a variety of dynamic display equipments and techniques pertaining to air traffic control centers are described, broken down into 1) cathode-ray tube techniques, 2) optical techniques, and 3) special techniques. The equipments are analyzed from the standpoint of one or more of the following possible applications: 1) large, bright Plan Position Indicator-type displays, 2) color coded displays, 3) displays imparting altitude information, 4) tabular displays, and 5) miscellaneous. Significant advantages and disadvantages are discussed and those equipments that most nearly meet needs of air traffic control uses are indicated. Topics for human engineering study are suggested.

Baker, L.E., Siegel, A.I. & Stirner, F.W. **CAUTION AND WARNING LIGHT INDICATORS FOR NAVAL AIRCRAFT. VI. AN EXPERIMENTAL COMPARISON OF VISUAL AND AUDITORY "MASTER" SIGNALS UNDER TWO LEVELS OF TASK COMPLEXITY.** Contract N1565 33252, NANC ACEL 366, TED NAM EL 52004 Part 18, Jan. 1958, 24pp. **USN Air Crew Equipment Lab., Naval Air Material Center, Penn. (Applied Psychological Services, Villanova, Penn.).**

12,530

To compare experimentally the attention intruding value of four master cautionary signals (one-tone and two-tone auditory and two visual signals of varying brightness) six subjects performed a simulated flight task. Through instructions they were set to perceive the multiple tracking task and simultaneous attendance to verbal passages as their major tasks and reaction to the cautionary and warning signals as collateral tasks. Time to respond to peripheral light signal indicators and number of signals missed constituted the basis for comparisons. Suggestions for further investigation into task complexity are made.

Rosenbaum, D.A. EXPLOSIVE DECOMPRESSION STUDIES WITH ANIMALS WEARING FULL BLADDER SUIT AND HELMET. Proj. 7160, Task 71814, NADC TR 57 685, Nov. 1957, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,532
This is a preliminary attempt to assess any permanent pulmonary damage resulting from explosive decompression to animals wearing a full bladder type suit and helmet while connected to an automatic oxygen regulator. Studies were made of 17 dogs following explosive decompression (30 milliseconds) through ten and fourteen pounds per square inch (psi). Animals were run in pairs for most of the runs; one was nebulized following the run and autopsied; the other was allowed to live and followed clinically. Case histories, including pathology and physical examination records, of the experimental animals are given. Possible reasons for the findings are discussed.

Kalogeris, J.G. REPORT NO. 9999 PILOT EMERGENCY ESCAPE UPPER TORSO HARNESS SUPPORT DEVELOPMENT TEST OF MODEL F-106A. Test 9999 56 399, Rep. 9999, Aug. 1956, 22pp. Engineering Test Labs., Convair, San Diego, Calif.

12,533
This report describes the development and testing of an Upper Torso Harness that would enable a pilot to sustain ejection seat acceleration forces in excess of 20 G's. Using a Drop Track apparatus, initial seat drop tests were made, using a fully anthropomorphic test dummy to determine the various loads the torso is subjected to under varying G forces. Based upon these results the Torso Harness was developed to relieve the spinal compression load and tested with the dummy. Some human drops were conducted at accelerations up to 11 G's. Various combinations of flight clothes and the Harness were tested.

Laro, J. & Brown, F.R. INSTRUMENT LIGHTING- INVESTIGATIONS OF ULTRA-VIOLET REFLECTIONS. PART 2. MEASUREMENTS OF ULTRA-VIOLET ENERGY IN AIRCRAFT COCKPITS EQUIPPED WITH FLUORESCENT INSTRUMENT LIGHTING. Rep. TED NAM 31334 Part 2, Feb. 1950, 30pp. USN Aeronautical Medical Equipment Lab., Naval Air Materiel Center, Penn.

12,534
The ultra-violet energy in ten naval aircraft, equipped with ultra-violet instrument floodlighting fixtures, was measured at the pilot's eye position. One commercial aircraft equipped with a cold cathode ultra-violet installation was also studied. In addition to measurements of radiant flux density, the related brightnesses of the fluorescent instrument markings on the panels were determined. The data were analyzed and studied with reference to possible ways of reducing the amount of energy reaching the pilot's eye. The measuring assembly, an Ultra-Violet Radiometer, is described.

Loveless, R.E. SIGNAL DETECTION WITH SIMULTANEOUS VISUAL AND AUDITORY PRESENTATION. FPRC 1027, Dec. 1957, 8pp. Flying Personnel Research Committee, London, England. (University of Durham).

12,536
To investigate the possibility of increasing rates of signal detections by use of an additional sensory channel, a comparison was made of the rate of detection of noise masked signals with audio, visual, and audio-visual presentation (earphones, cathode-ray oscilloscope or both). Each of six subjects was given 15 half-hour sessions; each session used only one form of presentation and one signal-to-noise ratio (from -15 to -27 decibels). The task in each case was to indicate the presence of the signal following a ready signal. The proportions of correct detections were analyzed for effect of the three modes of presentation. The strategy used by the various subjects in the bimensory situation is discussed.

McKenzie, R.E. THE EFFECT OF BINAURAL BEATS ON PERFORMANCE. Ph.D. dissertation, 1957, 40pp. University of Michigan.

12,537
To determine the effects of binaural interaction, produced by binaural beat stimulation, upon certain performance measures, forty subjects were tested on the MacQuarrie Test for Mechanical Ability and three subtests from Thurstone Primary Mental Abilities Test. Three matched groups were tested as follows: 1) three times without noise; 2) once without noise, with a pure tone of 250 cycles through both earphones, and with a frequency difference of eight cycles between tones presented to the two ears; and 3) as before except on last test in which a beating tone was used. Differences in performance data were analyzed for effects of types of stimulation. Theoretical explanations of the findings are offered.

Posner, J.F., Jr., Price, H.F., McLaughlin, J.T., Shneider, H.P., et al. **AVIATION MEDICAL SURVEY BOARD. COGNITIVE CHANGES/STIMULI FOR TRAINING HUMAN FLIGHT SURVIVORS.** Sub. Rep. **WRIGHT-PATTERSON AIR FORCE BASE, OHIO.** 11pp. **Wright-Patterson Medical Center, Fort Wright, Ohio.** **Psychological Research Associates, Arlington, Va.**

12,541

The role of the flight surgeon in aviation safety is defined broadly as concerned with problems of the aviator's survival in the hostile environment encountered in aviation. The source content for training flight surgeons is set forth under three major areas of responsibility: 1) accident investigation procedures, 2) accident prevention programs, 3) physiological factors, 4) psychological factors, and 5) physical factors. With respect to each area, key directives are also cited which define the activities of the flight surgeon.

Schub, R., Jaffe, H.S. & Vanderplas, J.H. **SHOPE COORDINATING OF AIRCRAFT INSTRUMENT ZONE MARKINGS.** Proj. 7186, WADC-TR 57 260, March 1953, 11pp. **Wright-Patterson Medical Lab., Wright-Patterson AFB, Ohio.**

12,543

To determine whether aircraft instrument zone markings could be profitably shape-coded rather than color-coded, seven shapes, chosen from a preliminary survey, were selected for further investigation. Simulated instrument dials were shown, with and without numbers; 70 college students and 70 rated Air Force officers were asked to indicate by a forced-choice matching technique their preference for association of each of the shapes with each of seven stated aircraft functional categories. The frequencies with which each marking was associated with each category were analyzed to determine significant trends. Recommendations for further study are made.

Spencer, J. **A COMPARISON OF AN AUDITORY WARNING SYSTEM WITH A CONTROLLED VISUAL WARNING SYSTEM FOR USE IN AIRCRAFT.** FPRC 818, March 1953, 8pp. **Elving Personnel Research Committee, London, England.** (**RAF Institute of Aviation Medicine**).

12,544

To compare two methods for presenting warning information in aircraft, both were installed in an aircraft and tested during a cross-country flight. The two methods were: 1) auditory system of three different warning signals fed into telephone circuit of aircraft intercom set, and 2) visual centralized panel layout (three labeled windows) and attention-getting flashing lights (red flashing for warning with steady red glow behind one window). Ten pilots were tested on their ability to respond to warnings from both systems by flipping the appropriate toggle switch while piloting the plane. Performance data (time to respond to signal) were analyzed for differences due to display.

White, C.S. **THE BIOLOGICAL EFFECTS OF NOISE (SOUND).** Convair Aeronautical Consultant's Report, April 1954, 20pp. **Lamson Foundation for Medical Education and Research, Albuquerque, N.M.**

12,548

This is a summary of the current status of data relevant to the biological effects of noise prepared to give Convair engineers and administrative personnel a fair grasp of existing and future significant problems in the field. A bibliography and supporting documents are presented with a summary of key papers. Working space noise levels specified in the **Handbook of Instructions for Aircraft Designers** is reviewed in light of noise fields of existing and future aircraft. Auditory and extra auditory effects of noise and various protective devices are discussed. Data on hearing thresholds, tolerance levels, changes in threshold due to noise, age and hearing, and allowable levels for various work areas were tabulated. Attention is directed to future problems.

McClure, T.F. & Leary, F.J. TRANQUILIZING DRUGS AND STRESS TOLERANCE. Forj. 7142, WADC TR 56 64, Task 7142, Oct. 1954, 4pp. NSA Climatic Research Unit, Wright-Patterson AFB, Ohio.

12,551
Stress tolerance studies were performed on a group of ten healthy male subjects, ranging in age from 18 to 27, both in their normal state and while on therapeutic doses of the tranquilizers, pentobarbital hydrochloride (Sporine) or amphetamine (Miltan, Equanil). Responses to the tests (Valsalva Overhead, Continuous Positive Pressure Breathing, 30 millimeters Hg Pressure, 100 per cent oxygen at 23,000 feet in altitude chamber; Tilt Table, Harvard Step test; Combined Stress Test) were graded on a one-to-five basis and studied for differences due to the drugs and the degree of stress. Psychological factors were also discussed. The findings are considered in relation to the practice of giving tranquilizers to flying personnel.

12,556
Miller, M.R. THE ORGANIZATION AND FUNCTIONS OF THE CLIMATIC (PHYSIOLOGICAL) RESEARCH UNIT. Engr. Memo. 1 CR, Aug. 1943, 5pp. NSA Climatic Research Unit, Fort Monmouth, N.J.

12,557
The organization and functions of the Climatic Research Unit are set forth in this memorandum. The purpose of the Unit is to provide data on physiological reactions of humans exposed to extreme temperatures while operating Signal Corps equipment. The functions are discussed more specifically in terms of modern warfare and Signal Corps needs. The various groups within the Unit--climatic physiology, sensory and coordinative physiology, chemical physiology and service sub-groups--are discussed.

12,558
Miller, M.R. CHANGES OF COLD SENSITIVITY OF THE HANDS AND FEET BY MEANS OF AIR HEATED BY THE CHEST. Engr. Memo. 7 CR, Sept. 1943, 5pp. NSA Climatic Research Unit, Fort Monmouth, N.J.

12,559
To determine whether cold digits of the hands and feet can be warmed by the delivery to them of a stream of air heated by the chest, an apparatus was developed consisting of 1) specially designed hand-operated centrifugal airblower fitted to 2) a coil of tubing arranged around the chest and 3) extensions of this tubing to hands and feet. The subject, usually dressed, was seated in a -40 degree Centigrade chamber in a turbulent wind velocity. After 30 minutes pumping was started by the subject and continued for one hour; the subject remained in the cold for another 25 minutes. Digit and rectal temperatures were recorded and studied for effectiveness of the method used.

Miller, M.R. SHIVERING OBSERVED IN COOLED SUBJECTS FOLLOWING THE ABRUPT TERMINATION OF THE INSULATION OF CO₂ ENRICHED MIXTURES. Engr. Memo 22 CR, Nov. 1944, 14pp. NSA Climatic Research Unit, Fort Monmouth, N.J.

12,561
This report describes a series of studies investigating the phenomenon of shivering associated with the abrupt cessation of breathing carbon dioxide (CO₂) enriched mixtures. The experiments were conducted with subjects at temperatures of 20 to 23, -10 to 2, and -40 degrees Centigrade. Groups of subjects were changed several times over the nine-month investigation period. After preliminary cooling (hands and feet only at room temperature conditions) various CO₂ enriched mixtures were administered. The effect of abrupt return to room air breathing upon shivering was observed. Similar experiments were conducted upon subjects rendered acidotic by ingestion of ammonium chloride or alkalotic by sodium bicarbonate.

Glaeser, M. & Glaeser, M. A STUDY OF NON-INTELLECTUAL CORRELATES OF TROUBLE-SHOOTING ABILITY: RIGIDITY MEASURES. Contract AF 41(657) 98, Proj. 7719, Task 17011, WADC TR 58 488, Oct. 1958, 30pp. USAF Personnel Lab., Lackland AFB, Tex. (American Institute for Research, Pittsburgh, Penn.).

12,560

To determine the relationship between measures of problem-solving rigidity and performance on both novel and routine trouble-shooting tasks concerned with electronics equipments, 251 electronics trainees were tested on the rigidity tests and of these 152 were tested on the criterion measure. A battery of 13 rigidity tests was constructed in terms of four categories: ability to change performance and perceptual sets, preference for highly structured stimuli, simple stimuli, and general attitudes. Three routine and three novel trouble-shooting problems formed the criterion. Relationship between rigidity and the two types of tasks were analyzed. Rigidity test scores were further analyzed to determine whether they would improve prediction of the Electronics Aptitude Index. T. R 27

12,561

Sells, S.B. HUMAN FLIGHT BEHAVIOR IN GROUPS. Ev. 6 58, July 1958, 21pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

12,561

This paper presents a survey of research on group behavior oriented to problems of aircrew efficiency. A common semantic problem involving the distinction between the terms descriptive of behavior and of group functioning was clarified. The frame of reference used for organizing the review was explained. The following topics were then considered: measurement of group performance—the problems of criteria; research on staffing problems—technical competence, crew assembly; research on utilization problems—structural, group dynamics, and man-machine systems approaches.

Stockbridge, H.C.W. THE EFFECT OF THE ANTICIPATORY STARTLE PATTERN ON AIMING A RIFLE. Rep. 40, Feb. 1956, 16pp. Clothing and Stores Experimental Establishment, Ministry of Supply, London, England.

12,564

To investigate the effect of the anticipatory startle pattern on aiming a rifle, photographic records were taken of nine men firing eight live rounds, eight blank rounds, and eight times with an empty firing chamber. The technique involved three observers who fired 21 shots at seven targets and their mean errors from target center calculated. Also photographic records of 21 rifle aims were made to obtain standard deviations. These data were used in the analysis of subjects data in regard to differences in elevation and traverse errors between live, blank and no rounds.

Sherwin, C.W., Kovaly, J.J., Melrose, J. & Prothe, W.C. AN EXPERIMENTAL STUDY OF THE AUDITORY DETECTION IN NOISE OF SIGNALS OF RANDOMLY VARYING FREQUENCY. Contract DA 36 039 SC 56695, D/A Subtask 3 99 06 111, Rep. R 72, July 1955, 21pp. Control Systems Lab., University of Illinois.

12,566

This investigation related to certain aspects of listening errors in an experimental signal detection situation roughly comparable to one that might be proposed as a test of signal detection apparatus. It was concerned with detection in noise of signals which occur randomly in time and are either of the same frequency (800 cycles per second) or are of varied frequencies (ranging from 300 to 1,200 cycles per second). Detection data from four listeners were analyzed and compared for the two conditions. The results are related to the behavior of a model of the auditory system consisting of a bank of contiguous narrow filters, each as wide as a critical band, and each followed by a low pass filter.

Standize, L.S., Popham, W.J. & Fattu, N.A. A REVIEW OF TROUBLE SHOOTING RESEARCH. Contract N6AR 908(07), Proj. Des. MR 151 167, Res. Rep. 3, Dec. 1956, 126pp. Institute of Educational Research, Indiana University.

12,567

This report presents an annotated bibliography of publications concerned with electronic trouble shooting. Tabular summaries of authors, type of report, tests used, and the variables of electronic trouble shooting performance and personnel are presented in the form of indices to the bibliographic references. The reports include discussions concerning proficiency assessment techniques, training equipment or materials, analyses of job activities, evaluation of maintenance personnel, experimentation, and bibliographies.

Borgatts, E.F. & Bales, R.F. SOCIOMETRIC STATUS PATTERNS AND CHARACTERISTICS OF INTERACTION. J. soc. Psychol., 1956, 43, 289-297. AFPRC TN 56 101. (Russell Sage Foundation & Harvard University).

12,568

To explore the relationship of some sociometric measures of status in three-man groups to overt behavior in group interaction, 125 male Air Force personnel were composed from each subsample of nine persons in such a way that each subject participated with each other subject in four sessions and with two different persons each time. Ratings of leadership, by coparticipants and by self, a popularity score received from coparticipants and a self-rating of social acceptability were obtained. Subjects were then assigned to interaction groups (planning role-playing session) where they were observed. The data were studied for relations between the status categories and interaction rate.

Chiles, W.D. EFFECTS OF HIGH TEMPERATURES ON PERFORMANCE OF A COMPLEX MENTAL TASK. Proj. 7193, Task 71615, WADC TR 58 323, July 1958, 5pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,571

Ten subjects were tested on a complex mental task during one-hour exposures to different dry bulb/wet bulb temperature conditions (85/75, 90/80, 110/90, and 120/105 degrees Fahrenheit). Performance data were analyzed as a function of temperature. The results are discussed in relation to those reported in the experimental literature.

Conover, D.M. & Kraft, C.L. THE USE OF COLOR IN CODING DISPLAYS. Contract AF 33(616) 3612, Proj. 7192, WADC TR 58 471, Oct. 1958, 14pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & OSU Research Foundation).

12,574

The objectives of this study were to (1) determine the maximum number of absolutely identifiable hues, (2) construct an "equally discriminable" scale of hues, and (3) to validate the scale on an independent population sample. Surface colors from the Munsell 51-hue series of colored papers provided the stimulus material. The experimental group consisted of ten color normal subjects, the validating group - 21 color normal subjects. The results were analyzed to find the number of hues that could be used for practical color coding under various conditions. Advantages and disadvantages of color coding are discussed; current engineering practice is reviewed. A color plate and specifications for various code categories are given.

Corso, J.F. SURVEY OF HEARING IN A LOW INDUSTRIAL NOISE-LEVEL POPULATION. Contract AF 33(616) 2626, Proj. 7210, WADC TR 58 442, Task 71700, Oct. 1958, 102pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Pennsylvania State University).

12,575

This report summarizes a series of studies performed in conducting a survey of the hearing characteristics of a population exposed to minimal levels of industrial noise. Each study reported contains a section on purpose, procedures, tests and instructions, results and conclusions. The basic topics relate to threshold of hearing for pure tones measured by different techniques, threshold of hearing for speech, and the discrimination loss of speech. Results are given as normal threshold values in order to provide a basis from which hearing loss due to noise exposure may be evaluated. Recommendations are made relative to the present standards for normal hearing.

Crook, M.N., Alexander, Edith A., Anderson, Edythe M.S., Coules, J. et al. AGE AND FORM PERCEPTION. Rep. 57 124, June 1958, 56pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

12,576

The effect of age on form recognition was experimentally investigated with "Gotteschaldt" forms, incomplete "Street" forms, familiar forms, and irregular forms, under various combinations of exposure time and viewing conditions (varied luminances, contrasts, inversions, and noise overlay). The population sample consisted of 176 males with normal vision, good health, and average educational level above the mean of the general population, distributed in age from the middle teens to the late fifties. The ability of the individual to discriminate, recognize, and identify two-dimensional forms was analyzed as a function of age for the various conditions which ranged from optimum to very unfavorable viewing.

12,576

Kruskal, B.M. STUDY OF WAR-GAME MATHEMATICAL MODELS. FINAL REPORT. Contract AF 18(600) 1243, Supplement 4(96 388), Expired 670 795, WADC TR 96 5, June 1956, 15pp. Engineering Research Institute, University of Michigan.

12,578

This is a final report on a study of war-game mathematical models suitable for use in training Senior Air Force officers. The study included 1) analysis of both simplified mathematical models and complex, realistically detailed models of war games, 2) a two-day conference attended by some 40 military and civilian experts, and 3) frequent consultation with the Weapons Courses staff, Air Command and Staff College, who have recognized a concrete need for a mechanized facility. Recommendations are presented for the introduction of high-speed computing processes coupled with adequate, readable display equipment. A research and development program is outlined.

Burns, H.L. & Stockman, R.E. DESIGN AND DEVELOPMENT OF A PRESSURE AND CYCLE CONTROL FOR DYNAMIC SEAT CUSHIONS. Contract AF 33(600) 31721, Proj. 7222, Task 71747, WADC TR 58 616, Dec. 1958, 9pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Alar Products, Inc., Cleveland, Ohio).

12,579

This report describes the design and development of a control mechanism for a dynamic seat cushion for aircraft use. Requirements to be met included light weight, small size, reliable performance over wide ranges of environmental conditions and long periods of continuous use (up to 60 hours). The cushion consists of an inflatable bladder sandwiched between two layers of foam rubber. In action the cushion alternates between inflation and deflation; the regulating, valving and timing mechanism necessary to accomplish this is described in detail, pictured and diagrammed. The control system was subjected to vibration, temperature, and acceleration tests and modified accordingly.

Aronson, E. & Festinger, L. SOME ATTEMPTS TO MEASURE TOLERANCE FOR DISSONANCE. Contract AF 41(657) 140, Proj. 7739, WADC TR 58 492, Dec. 1958, 15pp. USAF Personnel Lab., Lackland AFB, Tex. (Stanford University).

12,581

This paper reports attempts to develop a measure of tolerance for dissonance. Five tests were developed, four of which were administered to criterion groups which had been selected on the basis of ability to tolerate cognitive dissonance in laboratory experiments. Scores from high tolerance and low tolerance groups were compared to see if the tests discriminated between them. A different approach to a criterion was also used; a group was selected that had demonstrated high tolerance in a real life situation. Personality tests were administered to the group and to a control group and the results analyzed for trends differentiating the two. Further validating studies are suggested.

Dwyer, P.S. DEVELOPMENT OF GENERALIZED MATHEMATICAL PROCEDURES FOR OPTIMAL ASSIGNMENT OF POTENTIALLY EFFECTIVE CREWS. Contract AF 18(600) 1250, Proj. 7712, Task 7722, WADC TR 56 139, Dec. 1956, 60pp. USAF Crew Research Lab., Randolph AFB, Tex.

12,582

The group assembly problem is stated as follows: Given k positions in a group and n candidates for each position with the effectiveness of each group depending on the interrelations of individuals in the group as well as on the qualifications of each individual for his specific task, determine the assignments in such a way that the resulting assembly (in which each individual is assigned to some group) has a maximum sum. The method used to solve this problem makes extensive use of transformations featuring subtraction of constants. The basic method is that of reduced matrices. Approximate solutions with punched cards and machine methods are considered.

Ferguson, A.R. & Dantsig, G.B. NOTES ON LINEAR PROGRAMMING: PART XXXVI. THE ALLOCATION OF AIRCRAFT TO ROUTES - AN EXAMPLE OF LINEAR PROGRAMMING UNDER UNCERTAIN DEMAND. RM 1833, Dec. 1956, 43pp. Rand Corporation, Santa Monica, Calif.

12,585

The purpose of this paper is to illustrate an application of linear programming to the problem of allocation of aircraft to routes in order to maximize expected profits when there is uncertain customer demand. The approach is intuitive; the theoretical basis of the work is found in an earlier study. The allocations are compared with those obtained under the usual procedure of assuming a fixed demand equal to the expected value. The computational procedure is similar to that of the fixed-demand case, with only slightly more computational effort required.

Fioravanti, Adriano, Janni, Michele & d'Francis, G.T. MEASUREMENTS OF DIFFERENTIAL THRESHOLD IN THE PRESENCE OF A SPATIAL ILLUMINATION GRADIENT. Contract AF 61(514) 634 C, ERDC Tech. Note 35 N.3, 1956, 17pp. Istituto Nazionale di Ottica, Arcetri, Firenze, Italy.

12,586

To describe quantitatively the subjective brightness distribution corresponding to a given luminance gradient in a field where luminance varies along a given direction, the photometric differential thresholds of three observers were measured in different points in the field. The luminance varies through three zones from a maximum of 1270 to a minimum of 105 nit. Observations were made with a number of different gradients of illumination by varying the distance between a screen and the field. The results are shown graphically. G. I. R. 10

Gerathewohl, S.J. & Stallings, H.D., Jr. EXPERIMENTS DURING WEIGHTLESSNESS. A STUDY OF THE OCULO-AGRAVIC ILLUSION. Rep. 56.105, July 1956, 22pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

12,587

To investigate visual illusions during flight with particular attention to conditions of sub- and zero-gravity, an F-94C type aircraft was flown through various maneuvers. They included turns, pushovers, pullouts, and aileron rolls producing accelerations of different directions and magnitude, as well as short periods of weightlessness. The observer induced a strong visual after-image and described its apparent motion. There were 15 reliable observers tested. Reports of apparent displacement were analyzed in terms of the condition that produced the illusion. The illusion connected with weightlessness (upward movement) was named the oculo-agravic illusion. I. R. 21

Lybrand, W.A., Hackman, R.C., Kassebaum, R.G., Havron, M.D. et al. INCOMPATIBILITY PROBLEMS OF QUARTERMASTER DESIGNED CLOTHING AND EQUIPMENT, FINAL REPORT, ON CONTRACT DA19 129 QM 258. Contract DA19 129 QM 258, Proj. 7 83 01 004, PRA Rep. 56 21, Dec. 1956, 50pp. Psychological Research Associates, Arlington, Va.

12,590

To determine the nature and extent of functional incompatibilities of Quartermaster issued clothing and personal equipment items with each other and with material and equipment issued by other Army Technical Services (the focus was on general purpose items in common use by front-line troops), interviews were conducted with 87 groups of item users. Approximately 1000 reports of incompatibilities were analyzed and 414 unique problems identified; critical information regarding each problem was specified; and user recommendations for reducing or eliminating the problems were made. Suggestions for further research in this area are specified. T. I.

12,591

Lybrand, W.A., Hackman, R.C., Kassebaum, R.G., Havron, M.D. et al. INCOMPATIBILITY PROBLEMS OF QUARTERMASTER DESIGNED CLOTHING AND EQUIPMENT, FINAL REPORT, ON CONTRACT DA19 129 QM 258, APPENDIX I - LISTING OF INCOMPATIBILITIES. Contract DA19 129 QM 258, Proj. 7 83 01 004, PRA Rep. 56 21, Dec. 1956, 188pp. Psychological Research Associates, Arlington, Va.

12,591

This appendix to a report on incompatibility problems of Quartermaster designed clothing and equipment (see 12,590) presents the 414 problems identified. There are three sections: 1) indices to the problems--alphabetical listing, incompatibility type, and cross-index of type with source, effect, and recommendations categories; 2) summary classification for each problem; and 3) a numerical listing of each problem with definition of the problem, information concerning the items and duty affected, total times reported, recommendations for eliminating the incompatibility, and other classification designations assigned to it. Contract DA19 129 QM 258, Proj. 7 83 01 004, PRA Rep. 56 21, Dec. 1956, 73pp. Psychological Research Associates, Arlington, Va.

12,592

This manual was developed as a part of a research study on incompatibility problems of Quartermaster designed clothing and equipment (see 12,590). It was designed and used as an instrument for standardizing interview procedures to collect user reports on the problems. It is presented as a description of the technique used in the study and as a potentially useful guide for standardizing similar type interviews in further Quartermaster Corps Research and Development Command Research. Procedures, discussions of interviewing and recording principles, and the various aids and forms are included. I.

12,593

Lickey, H.R. MANAGEMENT OF UNITED STATES AIR FORCE BASE LEVEL SUPPLY-SUPPORT FUNCTIONS. M.S.A. Thesis, June 1957, 142pp. George Washington University.

12,593

This study concerns the resources, tools, and techniques employed in the management of a typical United States Air Force consolidated supply organization at airbase level. The problem areas in base level supply-support are discussed under four headings: planning, organization, directing, and controlling. The general thesis underlying the discussion is that the type and form of Air Force supply management which is employed at airbase level is the ultimate measure of effectiveness of the over-all Air Force supply system. Kozhevnikov, V.A. INSTRUMENTS FOR EXAMINATION OF THE GALVANIC SKIN REFLEXES IN THE LABORATORY AND CLINICAL PRACTICE. ATIC 24938, FTS 8866/V, 5pp., ca. 1955, USAF Air Technical Intelligence Center, Wright-Patterson AFB, Ohio.

12,596
This paper describes two instruments developed for the examination of the galvanic skin reflexes in the laboratory and under clinical conditions. They are as follows: 1) a portable instrument for observation of reflexes on a needle galvanometer; and 2) an instrument giving a direct ink record of the galvanic skin reactions. Both instruments are fed from the A.C. electric light system and the reflexes are observed by measurement of skin resistance. The advantages of this method over measurement of skin potentials is discussed. Circuit diagrams and schematic drawings are included. I. R 1

Turner, S.H., Wallace, W.H. & Wessel, A.E. EFFECTS OF REDUNDANT INFORMATION ON SPEED OF INFORMATION-PROCESSING BY HUMAN BEINGS. Contract DA 36 039 SC 63143, Proj. DA 3 99 12 003, SC Proj. 1320, April 1956, 14pp. Institute for Cooperative Research, University of Pennsylvania.

12,598
To investigate the effect of a specific type of redundancy (an alternate input message that can be used to obtain a desired output message as efficiently as some other input messages) on performance, 48 subjects were given 12 tasks consisting of 1) a series of input messages, 2) a single output message, and 3) a set of rules for deriving the latter from the former. Redundant messages were varied from zero to three and task difficulty was graded in three levels. Time to complete the problems, successful and unsuccessful completions, and the use of efficient or non-efficient solution methods were analyzed as a function of redundancy.

12,599
Arzuff, J. & Kay, H. SKILLED PERFORMANCE. Cogn. Psychol., April 1956, 3(2), 112-117.

12,599
In this paper motor skills are considered from the general standpoint of a perceptual skill in the receiving of information. Perceived signals are taken to include signals from either internal or external sources. Skilled performance is treated as a series of events with each event or cue providing information to the operator. The amount of information will vary according to the dependent probabilities. From this viewpoint are considered the general problems of training for two major kinds of tasks (those in which responses of operator do not influence the display and those which directly influence it), part-whole learning, correction of errors, anticipation, and knowledge of results. Nowlis, V. & Nowlis, Helen H. THE DESCRIPTION AND ANALYSIS OF MOOD. Ann. N.Y. Acad. Sci., Nov. 1956, 65(4), 345-355. (Department of Psychology, University of Rochester).

12,602
This monograph describes the use of mood, an old concept newly defined herein as the basis of a possible strategy by means of which research in drugs and research in other areas may fortify each other to increase the understanding and control of human behavior and functioning. A sample of work on drugs with human subjects is considered. The way in which the statistical analyses repeatedly revealed the operation not only of a variety of main effects due to specific factors, but also the overwhelming influence of these factors in complex interaction with each other is discussed. A method for investigating this interaction is described and its basic concept, mood, analyzed. R 14

Carlson, H. & Davis, E. REPORT ON "MAN MADE NOISE". Contract NMR R-56 0020 SC 91, Aug. 1957, 8pp. Federal Communications Commission, Washington, D.C.

12,603

This memorandum gives information concerning the usual location and general characteristics of these types of radio frequency noise generating equipments which are regulated by the Federal Communications Commission. Emphasis is on the interference capabilities of these devices and the need for proper installation and operation.

12,604

Rishbass, C. THE UNIMPORTANCE OF CARBON DIOXIDE AS A CAUSE OF NITROGEN NARCOSIS. RMP-35/554, OPS 153, Oct. 1955, 8pp. Royal Naval Physiological Lab., NRC, Alverstoke, Hants, England.

12,604

To evaluate the responsibility of carbon dioxide (CO_2) for nitrogen narcosis, the effect of voluntary hyperventilation under compression upon alveolar CO_2 and upon performance was studied. The performance task was a series of arithmetic problems and the score was the number of correct answers obtained in two minutes. Alveolar CO_2 samples and performance scores were obtained from eight subjects: 1) under normal pressure, 2) on reaching a pressure equivalent to 250 feet in compression chamber, and 3) after either five minutes of hyperventilating or resting. The data were studied to determine whether hyperventilation reduced alveolar CO_2 under pressure and alleviated the narcosis.

Sellers, E.A., Reichman, S. & Thomas, M. ACCLIMATIZATION TO COLD: NATURAL AND ARTIFICIAL. Amer. J. Psychol., Dec. 1951, 167(3), 644-650. (Department of Physiology, University of Toronto, Toronto, Ontario, Canada).

12,605

To study the nature of the adaptive processes that take place during acclimatization to cold, a series of experiments, using rats for subjects, was undertaken. The first series determined the period of exposure to cold required to produce acclimatization as measured by the survival of clipped animals. Acclimatization periods varied from one day to six weeks, after which the rats' fur was removed by clipping and the rat returned to the cold. The length of time acclimatization persisted after the animals were returned to room temperature was also determined. In a second series an attempt was made to produce a similar metabolic change by the administration of chemical or hormonal substances.

Burke, F.J. FLIGHT EVALUATION OF VISUAL APPROACH ANGLE INDICATORS. Proj. 6061; WADC TN 58 181, July 1958, 32pp. USA Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,606

To provide comparative data in the evaluation of six different types of visual approach angle indicators (WADC Two Bar System; Navy MIRROR Landing system; two types of tri-colored lights; interim mirror system and the British RAE System), six types of aircraft were photographed with a grid camera which, with photo-theodolites was used to obtain touch down and glide path data as the aircraft landed. Pilots were interviewed for their reactions to the systems. Two pilots were assigned to each aircraft; each was required to make 15 day landings and at least five night landings on each system. Spot landings made without the aid of an indicator were made for comparative purposes. Results are discussed in terms of relations between effectiveness of the system and type of aircraft.

Jackson, K.F. AIRCRAFT FATIGUE IN LONG RANGE NIGHT-TIME RECONNAISSANCE. PILOT PERFORMANCE. FPRC 907.2, Aug. 1956, 23pp. Flight Personnel Research Committee, London, England. (Institute of Aviation Medicine, Royal Air Force, Farnborough, England).

12,608

To study changes in pilot performance during long performance flights, ten pilots were studied during a series in which each pilot undertook four 15-hour flights and in which he had control of the aircraft for four two-hour periods. Continuous records of the altitude and heading of the aircraft were made at chosen times during these periods. The records, which concerned straight and level flying only, were examined (a ten-minute section at a time) for both extent and variability of error. Turbulence was recorded in terms of vertical accelerations and certain personal factors were observed. These records were studied for effect of length of control period, effect of successive control periods, and effect of turbulence on performance.

Jennings, D.W. & Walker, F.G. THE DEVELOPMENT OF THE BASIC INPUT DATA IN A LINEAR PROGRAMMING APPLICATION. Paper presented at the Annual Meeting of the Operations Research Society of America, Washington, D.C., May 10 & 11, 1956, 7pp. Operations Research Society of America, Washington, D.C.

12,609

A case history is given of the applications of linear programming as an approximate method of optimally loading paper making machines. With certain adjustments, the machine loading problem took the form of the well-known transportation model. The development of input data for the computational procedure is discussed. Some end results of the programming are presented.

Jensen, B.T. A SURVEY OF LITERATURE ON PERFORMANCE TESTING: SUMMARY MATERIALS FOR FURTHER RESEARCH. PJ 4807 01 Res. Note 52 50, Aug. 1952, 18pp. USA Personnel Research Branch, Adjutant General's Office, Washington, D.C.

12,611

A survey of the literature on performance testing was conducted in order to identify principles of testing applicable to performance test construction and administration. Army materials in this area were also examined. On the basis of suggestions gained from the survey, summary materials were prepared as aids in research and development. These materials are included as appendices: definitions of terms, desirable characteristics for a performance test of basic military proficiency, procedures for test development, criteria for determining amenability for performance testing of an area of military training, format for a test script, and bibliography of materials.

Key, R., Davis, R., Galby, C.M. & Annett, J. CONDITIONS INFLUENCING THE RATE OF LEARNING OF PACED AND UNPACED MOTOR TASKS. FINAL REPORT. Sept. 1956, 51pp. Institute of Experimental Psychology, University of Oxford, Oxford, England.

12,612

This is the final report of a research study investigating some of the conditions which influence the learning of simple skills. The principle focus was on the perceptual side of the performance-how an operator handles the necessary information to carry out a skill. Primary use was made of experimental studies in the laboratory, although some contact with industrial operations was made. The report is divided into three parts: 1) particulars of the project, its personnel and publications; and suggestions for future research, 2) an outline of the theoretical position and the main findings of the experiments, and 3) the individual papers, written by the responsible investigator, which give experimental details.

USA Library. DATA PROCESSING OPERATIONS AND COMPUTERS FOR MANAGEMENT. Special Bibliography 10, Oct. 1956, 72pp. USA Library, Adjutant General's Office, Washington, D.C.

12,613

This bibliography consists of selected items in the area of data processing operations computers for management which were published mostly during the period February to September 1956. The greater part of the listings represent holdings of the Army Library. The major sections are: data processing and modern computer operations; equipment; applications (general; administration and management; banking, insurance, and underwriting; education; industry and technology; transportation; and United States Government Agencies); bibliographies and glossaries; computing and data processing centers, conferences and symposia, and directories of services, personnel, and equipment.

Hartley, E.R. JET AIRCRAFT GROUND RUN-UP NOISE SUPPRESSORS. PLANT ENGINEERING DIVISION REPORT 56-2. 95pp. USAF San Bernardino Air Material Area Directorate, Norton AFB, Calif.

12,614

This report furnishes information concerning the requirement, and the satisfaction of this requirement, for a sound suppressor at Norton Air Force Base, San Bernardino, California. The basic problem is the solution of modern jet fighter run-up noise elimination by means of sound suppressors. The various portions of the project are dealt with in three parts, as follows: 1) a summary of the requirement and historical data; review of commercial equipment, and development of specifications; 2) a resume of fabrication and installation problems encountered; and 3) a resume of the acoustical tests, performed at Noise Suppressors, acoustical data, and conclusions relative to adequacy for Air Force use.

Metcalf, R.D. & Horn, R.E. VISUAL RECOVERY TIMES FROM HIGH-INTENSITY FLASHES OF LIGHT. Proj. 6332, Task 77653, WADC TR 58-232, Oct. 1958, 10pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,615

A high-intensity carbon arc was used as a light source to determine the course of visual recovery after exposure to a level of illumination comparable to that likely to be encountered during nuclear operations. Four subjects were exposed to a source subtending 3 degrees 58 minutes at the eye with a luminance of up to 15×10^6 ft.-ls. Exposure time was constant at 0.1 second. Recovery time was plotted against illumination at the eye and source brightness. Extrapolation was made to the estimated burn threshold and the maximum recovery time to discriminate a brightness contrast comparable to reading red-lighted aircraft instruments was estimated. Recovery times to other levels were indicated.

MacCallin, E.F. & Levy, L. THE EFFECT OF FLINCHING ON RIFLE MARKSMANSHIP. TECHNICAL REPORT, July 1954, 26pp. USA Army Research Hall No. 1, Fort Knox, Ky.

12,616

To study the effects of flinching on rifle marksmanship, two preliminary studies were conducted: (1) to determine whether judgments of experts are reliable measures of flinching, and (2) to determine the extent to which flinching affects marksmanship scores. The trainees fired a series of live rounds interspersed with dummy rounds. The latter were judged for flinching and marksmanship data were obtained from the former. In the second study further marksmanship data were gathered from instructional and known-distance firing. The data were analyzed for reliability of expert judgments of rating and for amount of variation in performance due to flinching. Further research into methods for reducing flinch are suggested.

Kennington, K.W.L. & Stokes, A.W. AN INVESTIGATION OF THE USE OF SYNTHETIC FIBRE SOCKS UNDER HOT/DRY CONDITIONS. C.S.E.E. Rep. 73, March 1958, 32pp. Clothing & Stores Experimental Establishment, Ministry of Supply, London, England.

12,617

To compare the suitability, for use under moderate hot dry conditions, of socks of nylon and Terylene with the standard worsted sock, 30 infantry subjects wore trial socks over a period of six weeks. Assessment was based on comparison of foot skin temperatures, sweat uptakes of footwear, clinical data, and subjective preference data. Climatic conditions ranged from 84 to 98 degrees Fahrenheit shade temperature and 113 to 135 degrees Fahrenheit ground surface temperature. The findings are discussed with reference to the actual socks used and it is pointed out that different fiber forms and fabric construction might affect the conclusions.

Kappauf, W.E. & Strand, A. A BRIGHTNESS DISCRIMINATION APPARATUS FOR THE STUDY OF VIGILANCE. Contract AF 33(038) 25726, Memo. Rep. B 4, Task B, July 1952, 5pp. University of Illinois.

12,618

This note describes a simple brightness discrimination apparatus for use in vigilance studies. The test situation is flexible with regard to 1) the nature of the background or "neutral" stimulus situation (steady or flashing light), 2) number of test areas (one to four), 3) temporal spacing of trials throughout the vigil, and 4) the nature of the trial (single presentation of a given intensity to a series of fixed or increasing flashes). In its present form it can be used for one subject at a time and is operated manually by the experimenter. The possibilities for automatic control and group testing are suggested.

Kalaba, R.E. & Juncosa, M.I. COMMUNICATION NETWORKS. II. INTEROFFICE TRUNKING PROBLEMS. RM 1688, Nov. 1956, 23pp. Rand Corporation, Santa Monica, Calif.

12,619

It is shown that several fundamental interoffice trunking problems for communications networks may be treated in a straightforward, computationally feasible manner by linear programming methods. Two representative problems were devised and tested on a computer. Various aspects of implementation and generalizations are discussed. This is the second in a series of memoranda dealing with communication networks that are characterized by facilities for transmission, switching, relaying, and the like. Various new analytical techniques are introduced in a systems approach for resolving the complex interactions among systems capacities, users' demands, and economic factors.

McGee, J.R., Jr. MILITARY INTELLIGENCE IN WAR GAMING. Paper given at the Washington meeting of the Operations Research Society of America, May 11, 1956. TICSRA 7004, Feb. 1957, 4pp. USA Combat Operations Research Group, Fort Monroe, Va.

12,620
This paper discusses problems encountered in development of the traditional terrestrial war game into an analytical tool for the United States Army. The major problem dealt with here is the search for reliable data on military intelligence (flow of information about the opponents in combat). Two types of military intelligence are distinguished (target and tactical) which affect the war game. The search for the level of intelligence reaching the commander, and thus affecting his decisions, can be approached by mathematical synthesis and historical example. Progress in the use of these two approaches is discussed.

Jones, F.P. & O'Connell, D.N. APPLICATIONS OF MULTIPLE-IMAGE PHOTOGRAPHY IN THE TIME-MOTION ANALYSIS OF HUMAN MOVEMENT WITH A NOTE ON "COLOR CODING". Photographic Science & Technique, Feb. 1956, 3(1), 11-14. (Tufts University).

12,622
A method of time-motion analysis employing multiple-flash photographic techniques is described. The technique was developed as a tool for research in the course of an investigation into the role of head-neck reflexes in human movement. The human subject is dressed in dark clothing and marking patterns cut from reflective tape are attached to the portions of the body of interest for motion analysis. Stroboscopic illumination is used and both single and stroboscopic pictures in black-and-white and color are made. The historical development of multiple-image photography is given.

Hick, W.E. SOME FEATURES OF THE AFTER-CONTRACTION PHENOMENON. Quart. J. exp. Psychol., Nov. 1953, 5(4), 166-170. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,625
To investigate some features of the muscular contraction that appears within a few seconds of the relaxation of the same set of muscles from a sustained voluntary contraction (after-contraction phenomenon), 14 subjects were tested. The task was to apply forces up to eight pounds by pushing or pulling on a handle mounted on a stiff spring. Instructions were used to vary the conditions following the voluntary contraction - relaxation, tension, difficult concurrent task, or graduated return to rest. After-contractions were recorded and analyzed for effects of these conditions. An explanation is suggested based on the interaction of sensory adaptation and some other process apparently related to fatigue.

Hammock, J.C. & Prince, A.I. A STUDY OF THE EFFECTS OF MANIFEST ANXIETY AND SITUATIONAL STRESS ON M-1 RIFLE FIRING. Oct. 1954, 50pp. Human Resources Research Office, George Washington University.

12,628

To determine the relation of anxiety and stress to marksmanship proficiency and the relation of anxiety to the effects of stress on marksmanship, soldiers scoring at the extremes of a scale of manifest anxiety were test fired on the M-1 rifle under "normal" and "stress" conditions. Normal conditions were those obtaining in conventional record fire; stress condition was similar except for a series of explosions going off successively closer to the firer during firing. False instructions stated that a charge would go off directly in front if the firer did not make three bullseyes in the time allotted. Performance was measured in terms of accuracy and rate of firing. Other observational data were collected.

Hammes, J.A., McFann, H.M. & Ward, A.A. A COMPARATIVE TEST OF ACCURACY AND SPEED OF FIRE WITH THE IMPROVED LOOP SLING, WITH THE COMBAT RIFLE SLING AND WITHOUT A SLING. Interim Report. Aug. 1954, 41pp. USA Human Research Unit No. 3, Fort Benning, Ga.

12,629

This report is Part I of a study on the use of a sling in M-1 rifle fire and presents an evaluation of two slings (the Improved Loop Sling and the Combat Rifle Sling) proposed for Army use. Accuracy and speed of fire with each of the two slings and without a sling were measured at ranges of 200 and 300 yards using the prone position. The speed score was based upon time to go from a standing to a prone position, getting into sling, firing, and recovering original standing position. Subjective opinions were gained through questioning. The data were analyzed for differences due to the slings.

Cohen, J., Dearneley, E.J. & Hansel, C.E.M. THE MUTUAL EFFECT OF TWO UNCERTAINTIES. 8pp. University of Manchester, England.

12,630

To investigate the mutual effects of two uncertainties upon subjective estimates of success, two types of tasks were devised: uncertainty related to chance and uncertainty related to skill. In the first task the subjects (30 school children aged 12 to 14 years) were asked to estimate success in throwing darts at a circular target. Some darts were blunt and some targets were aluminum, thus causing failure, the proportion of each being varied separately and together. The second task varied each of two skills, separately and in combinations: throwing darts and obtaining the darts by drawing them over a narrow bridge. Estimates of success under these various conditions were compared.

Colman, K.W., Courtney, D., Freeman, J.B. & Bernstein, Rosa. THE CONTROL OF SPECULAR REFLECTIONS FROM BRIGHT TUBE RADAR DISPLAYS. Technical Report. Contract NMR 2346(00), Rep. 23, Proj. K, Nov. 1958, 20pp. Courtney & Company, Philadelphia, Penn.

12,631

A study of methods for controlling specular reflections from bright tube radar displays (displays not effected by ambient light) was conducted. A search of the literature and an analysis of reflection sources led to an investigation of the use of a circular polarizer (filter) combined with the invisible glass principle (curving glass surface so that light incident to the surface is reflected away from eye of observer into a light absorbing surface or trap). A prototype of the resulting Reflection Attenuator was built and installed in an air tower to be evaluated on the television monitor used to provide remote radar information of local air traffic to tower controllers.

Murder, R.B. VERIFICATION OF AERIAL PHOTOGRAPHIC ANALYSIS OF URBAN RESIDENTIAL STRUCTURES: A STUDY OF ROCHESTER, NEW YORK. Proj. 7732, Task 77321, AFPCRC TR 58.4, Jan. 1958, 15pp. USAF Office for Social Science Programs, Lackland AFB, Tex.

12,633

To test the applicability of a photo-interpretation method developed for identifying residential structures, data from photo interpretations of aerial photographs of Rochester, New York (overlapping stereo-strip) were compared with data assembled from standard sources of information (United States census materials). The data included types of residential structures and descriptions of the structure components of sub-areas. Within the limits of the data, the following methodological considerations were explored: 1) a usable photo-scale; 2) photo-interpretation reliability, and 3) development of structure combinations as predictors of socio-economic status.

Moser, H.M., O'Neill, J.J., Oyer, H.J., Wolfe, Susan M. et al. HAND SIGNALS: FINGER-SPELLING. Contract AF 19(604) 1577, RF Proj. 664, Tech. Rep. 49, AFPCRC TR 58 56, Aug. 1958, 46pp. Ohio State University.

12,634

The possibilities of using the finger-spelling alphabet of the deaf as a supplementary medium of communication in high level noise and/or other situations where voice communications are not desirable or effective are investigated. Twenty-four deaf students were used as subjects for the intelligibility testing of nonmeaningful alphabet triplets under conditions of both artificial and natural lighting. Distances were varied from 20 to 125 feet indoors and from 125 to 400 feet outdoors. Intelligibility scores were analyzed for distance effects and for confusion patterns for each letter. Individual differences in receiving were studied. A history of finger spelling is included.

Boynton, R.M. ON-RESPONSES IN THE HUMAN VISUAL SYSTEM AS INFERRED FROM PSYCHOPHYSICAL STUDIES OF RAPID ADAPTATION. A.M.A. Arch. Ophthalmol., Oct. 1958, 60(2), 800-810. (University of Rochester).

12,637
This paper reviews various experimental psychophysical studies of rapid light adaptation of the human visual system. Of particular interest are the initial changes of decreased threshold before the rise begins. Physiological reasons for the effect are presented and a previously published experiment of the author is described that was intended to identify the conditions under which the lowered threshold can be obtained. The importance of psychophysical methods in visual studies both for theoretical and clinical purposes are discussed.

Brown, R.H. INFLUENCE OF STIMULUS LUMINANCE UPON THE UPPER SPEED THRESHOLD FOR THE VISUAL DISCRIMINATION OF MOVEMENT. J. Opt. Soc. Amer., Feb. 1958, 48(2), 125-128. (USN Research Lab., Washington, D.C.).

12,638
To determine the upper speed threshold for the visual discrimination of movement as a function of luminance, three observers were tested. The observers viewed the center of a circular black area surrounded by a dimly illuminated area. A small moving spot of white light traversed the path (extent 16.8 minutes) of a horizontal line centered in the circle. The direction, speed and luminance of the moving spot were systematically varied; the task of the observer was to indicate direction of movement, an apparently stationary test pattern, or no apparent light. Responses were recorded as correct or incorrect discrimination of motion, response to light but not to motion, and no response. Threshold values are reported.

Brown, I.D., & Gibbs, C.B. FLASHING VERSUS STEADY LIGHTS AS CAR TURNING SIGNALS: THE EFFECTS OF FLASH FREQUENCY AND DURATION OF FLASH. A.P.U. 245/58, April 1958, 21pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,639
To investigate the effects of flash frequency and duration of flash upon attention-getting and discrimination of car turning signals (mounted in close proximity to rear and brake lights), two experiments were conducted. The first was designed to record reaction time to two signals falling within limits of central vision when 1) both were steady and 2) one or the other was flashing. Various frequencies and on-off conditions of flash were tested. The second experiment was designed so that attention-getting values of flash frequency and duration were studied. In addition to responding to a test sequence of light signals displayed at different visual angles, the subject was required to perform a series of addition calculations. Implications of the findings for turning signal design are discussed. T. G. I. R 4

Connelly, R.E. EVALUATION OF WA-1 INTEGRATED ELECTRONIC AND CONTROL SYSTEM INSTRUMENTS. Task 61979(1), WADC TR 58 35, Feb. 1958, 17pp. USAF Directorate of Flight & All-Weather Testing, Wright-Patterson AFB, Ohio.

12,641
This report presents the results of the flight test evaluation of the "WA-1 Integrated Electronic and Control System Instruments" (cockpit "A"). The cockpit "A" instrument panel embodies the "outside-in" display concept where aircraft performance is displayed by moving aircraft symbols against stationary scales or background. Test results were based on pilot opinion obtained in flight by use of wire recorder and after flight debriefings and questionnaires. Four pilots performed a varied series of flight profiles. Analysis was made in terms of (1) specific instruments, (2) the integrated panel, and projected use of Horizontal Situation Indicator.

Corey, E.L. & Webster, A.P. A STUDY OF MARKSMANSHIP EFFICIENCY UNDER CONDITIONS OF LOW ILLUMINATION. KPI36/All(V 1)X 290, M & S Res. Proj. X 290, July 1944, 10pp. USN Medical Field Research Lab., Camp Lejeune, N.C.

12,642
To evaluate marksmanship efficiency under low illumination as affected by 1) use of red goggles for dark adaptation, 2) use of red light in target illumination, and 3) dilation of pupils by means of a mydriatic, 60 expert riflemen were the subjects. Two groups of equal ability performed a series of test firings from dusk until complete darkness; one group wore red goggles except when actually firing, the other group wore no goggles. The second test involved firing upon targets alternately illuminated by red and white light. The third test used matched groups firing with either instillations of homatropine and cocaine or a placebo of water. Test scores were compared for all conditions.

Quirk, R.L. THE EFFECT OF NOISE ON THE PERCEPTION OF PITCH IN AUDIO-VISUAL DISPLAY SYSTEMS. PRESENTED AT THE 10TH ANNUAL MEETING OF THE AMERICAN SOCIETY OF PSYCHOLOGISTS, 1958. Contract NSC 40 000 00 018, Jan. 1958, 30pp. Institute for Applied Experiments, Psychology, Johns Hopkins University.

12,645

This progress report describes briefly five experiments, the results of which are still under analysis. The first experiment investigated the relative importance of reduced contrast and degradation of contour for the impairment of form recognition under visual noise. The remaining experiments were part of an unfinished series concerned with the effect of the degree of familiarization on recognition of irregular forms under noise. Card sorting techniques and direct reproduction of form during brief exposure were tested for the purpose of establishing graduated degrees of familiarity among different sets of forms. Testing under noise has not been completed.

Boris, R.R. THE NUMBER OF SKILL RESPONSES FOR ACCIDENTS. A.P.S. 94/48, Aug. 1948, 6pp. Applied Psychology Research Unit, M.C., Cambridge, England.

12,647

To investigate the nature of the disorder of function called "accident-proneness," 1,200 g. bags of coal miners were tested. Group selection was based on records of 1) no accidents, 2) one accident (median of the large group studied), and 3) more than four accidents. Trials were found consisting of one member from each group of approximately same age and occupations. 32 trials were conducted medically, by interview, and by application of several psychological tests, including the "Skilled Response" test. Performance on the latter test was analyzed (for this report) in relation to accident history. The findings are related to a theory of the nature of accident-proneness.

Doornik, R.F., Johnson, P.M. & Carmichael, L. PSYCHOLOGICAL WRITING, EASY AND HARD FOR ME? Amer. Psychologist, June 1952, 7(6), 195-196. (Tufts University).

12,649

To investigate peak stress (word by sentence receiving maximum emphasis) and "readability," two undergraduate majors in psychology were asked to read 20 sentences in each of five books on psychology and select the one word in each sentence they would stress the most if they were to read it aloud. The results were compared for agreement in markings and corrected for chance agreement. Percentage success between the two subjects was then taken as a "readability" score. These results were compared with a Flesch scoring of the same material. The use of "peak stress" as a measure of "readability" is discussed.

Enfield, F.D. EXPERIENCE WITH PORTAL PRESSURE SUITS AND GLOBAL SURVIVAL KITS. Presented at Sept. 1958 Flight Safety Meeting. Sept. 1958, 7pp. Lockheed Aircraft Corporation, Burbank, Calif.

12,655

This is a summary report of the experiences of Lockheed Aircraft Corporation with the partial pressure suit and its associated equipment as well as with the development of one version of a global survival kit. The objectives in the development of partial pressure suits and helmets are discussed and various problems connected with adequate protection, comfort, speed of donning and the oxygen regulator and supply system are discussed. The effects of wind blast resistance in ejection tests are indicated in terms of needed design changes. The problems in the development of the global survival kit are discussed.

Edwards, T.W. & Howell, M.D. RECOMMENDATIONS ON COCKPIT-VISIBILITY STANDARDS FOR TRANSPORT-TYPE AIRCRAFT. Tech. Dev. Rep. 275, Feb. 1956, 6pp. Technical Development & Evaluation Center, Civil Aeronautics Administration, Indianapolis, Ind.

12,657

The standards that are discussed in this report are recommended minimums for cockpit visual angles. The basis for the recommendations were data obtained in a four part study: 1) an airline-pilot questionnaire in which present day aircraft were evaluated from a visibility standpoint; 2) the development and use of a binocular camera for recording cockpit visual angles; 3) recording and analyzing pilots' eye-movements during visual-flight conditions; and 4) determination of some geometric relationships relative to collision-flight paths. These standards when applied to initial aircraft-cockpit design will improve present safety level by affording the pilots better cockpit visibility.

Design & Associates, Inc. HUMAN ENGINEERING EVALUATION OF THE FARRAND STARTRACKER: SUPPLEMENT NO. 1. Contract NSC 17719, Memo. Rep. 15, Jan. 1958, 7pp. Design & Associates, Inc., Stamford, Conn.

12,659

This memorandum report is based essentially on an earlier report of a human engineering evaluation of the Farrand Startracker. Subsequent to the report, design changes were incorporated into the equipment, and this report presents a study of the redesigned Startracker. The operator's task is described and recommendations for changes in control movement are made. Further recommendations on both control and display aspects are made and discussed.

 Intarsio, R.A. & Lusk, J.J. PRELIMINARY INVESTIGATION OF HYPER ENVIRONMENTS AND METHODS OF SIMULATION. III. PROPOSED HYPER ENVIRONMENTAL TEST FACILITY. Contract AF 33(616) 3913, WADC TR 57 456, Jan. 1956, 43pp. USAF Wright Air Development Center, Wright-Patterson AFB, Ohio. (Radio Corporation of America, Camden, N.J.).

12,453
 This report is concerned with estimating the layout and cost of an over-all test facility for investigating hyper environment, such as high noise, temperature, air cooling, solar radiation, vibration, acoustic excitation, shock acceleration, high-speed particles, explosive decompression, ozone, and ionization. The size, layout, and cost of a building to house the test facilities needed to simulate these environments and the layout, cost, and manpower for each facility are estimated. Included are layout drawings. Simulation facility problems that require future development are listed. One section deals briefly with facilities necessary for environments below 75,000 feet.

 Milinski, C.R. A HUMAN ENGINEERING STUDY OF U.S. NAVY TEST INSTRUMENTS USED ABOARD LARGE SHIPS AND SUBMARINES. FO 05401, NE 091300 819.5 (NEL R1 5), Res. & Dev. Rep. 854, Aug. 1956, 28pp. USN Electronics Lab., San Diego, Calif.

12,453
 A human engineering study was made to determine the capabilities and limitations of the personnel who use test equipment, the field conditions to which such equipment are subjected, and design faults existing in the equipment. Interview-discussions were held with technicians aboard large United States Navy ships and submarines, and design and developmental factors affecting the efficiency of test instruments were analyzed. Details of human engineering difficulties associated with the instruments, with comments and recommendations, are presented as an appendix.

 Bohneke, A.R. & Siri, W.E. THE ESTIMATION OF LEAN BODY WEIGHT FROM ANTHROPOMETRIC AND X-RAY MEASUREMENTS. Res. & Dev. Tech. Rep. USNMDL TR 203 NS 080 001, Dec. 1957, 42pp. USN Radiological Defense Lab., San Francisco, Calif.

12,654
 To determine whether dependable estimates of lean body weight can be made from measurements of "skeletal" size, measurements were made on 31 men by a physical anthropologist following a procedure outlined by the Air Force. In addition to the actual body measurements an x-ray study of the joints and trunk size was made. Estimates of lean body weight from these measurements were compared with those obtainable from density and total body analyses. The usefulness of this technique is discussed.

 Bartlett, F.C. THE AFTER-CONTRACTION OF MUSCLE: A POSSIBLE FRESH APPROACH TO A STUDY OF THE CAUSATION OF TRANSPORT ACCIDENTS. IBC 47/442, A.P.M. 42, 1946, 2pp. Applied Physiology Research Unit, IBC, Cambridge, England.

12,456
 This note suggests that there is evidence indicating that the degree of after-contraction of muscles is related to speed and efficiency of learning new forms of muscular coordination, liability to quick onset of fatigue in skilled work, and the occurrence of particular kinds of accidents. It is proposed that an experimental study of the after-contraction be made on automobile drivers in the hope of finding a diagnostic sign of liability to road transport accidents.

 Anthony, A. & Ackerman, E. BIOLOGICAL EFFECTS OF NOISE IN VERTEBRATE ANIMALS. Contract AF 33(616) 2305, Proj. 7210, WADC TR 57 647, Nov. 1957, 118pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Pennsylvania State University).

12,658
 This report deals with the stress effects of noise on bodily functions other than hearing. It includes physiological, biochemical and behavioral effects of intense acoustic noise at low and high frequencies. The approaches used are as follows: 1) flame spectrophotometric analyses of serum electrolytes, 2) serum ascorbic acid and blood sugar changes, 3) changes in adrenal and plasma cholesterol, 4) behavioral changes, and 5) relationship of seizure-susceptibility to noise stimulation in noise-exposed rats, mice, and guinea pigs. Responses to single noise bursts as well as effects of chronic exposure were studied. The nature of normal physiological defense mechanisms to excessive noise stimulation is discussed.

 Naber, E.H. AN INVESTIGATION OF THE MAGNITUDES OF GALVANIC SKIN RESISTANCE RESPONSES THAT OCCUR WITH DIFFERENT INTENSITY LEVELS OF SHOCK, CONDITIONED TONE AND EXTINCTION TONE. Contract N6ONR22525, Res. Proj. Dec. NR 145 993, Bu Med Surg Proj. NM 18 02 99, Subtask 1, Joint Proj. Rep. 75, Feb. 1958, 34pp. USN School of Aviation Medicine, Naval Aviation Medical Center, Pensacola, Fla.

12,659
 To study the magnitude of the galvanic skin resistance reflex (GSR) during conditioning and extinction to an auditory stimulus as a function of the intensities of the variables, 170 subjects were studied in a series of experiments. There were three variables: 1) intensity of shock, 2) sensation level of the conditioned tone, and 3) sensation level of extinction tone. Each conditioned subject received nine reinforcement and nine extinction trials. Scores were obtained representing strength of conditioning, initial habit strength, resistance to extinction, and gradational habit strength. The data were analyzed as functions of the variables and the response criteria. The findings are related to the use of GSR's in hearing tests.

Petrie, A., Collins, W. & Solomon, P. PAIN SENSITIVITY, SENSORY DEPRIVATION, AND SUSCEPTIBILITY TO SATIATION. Science, Dec. 1958, 128(3336), 1431-1433. (Harvard Medical School, Boston City Hospital, & Boston Sanatorium).

12,661
To investigate the tolerance of pain and of sensory deprivation as related to susceptibility to perceptual satiation, 28 adult male subjects were tested. For one group (19 subjects) pain threshold data were available; the difference between the temperatures at which pricking pain and unendurable pain occurred from exposure to radiant heat was the measure of pain tolerance. For the second group (9 subjects) the measure of tolerance to sensory deprivation was the length of time each remained in a tank-type respirator. The mean amount of satiation measured by loss in apparent size of a "felt" object was related to the other two measures. The findings were discussed in relation to personality and tolerance.

Plutchik, R. AUDITORY PAIN THRESHOLDS FOR INTERMITTENT, "BEAT", AND STEADY TONES. Contract MONR 2252 (01), Dec. 1958, 28pp. Hofstra College.

12,662
To investigate the effect of frequency and intermittency of tones upon the auditory pain threshold, ten subjects were presented with a series of tones at either 1000 or 2500 cycles per second. For each frequency the tones were presented as steady, as interrupted pulses, or as "beats"; the two latter at repetition rates of three, six or fifteen per second. For each condition the intensity of the sound was increased by series of one-decibel steps. The subject indicated the "just noticeably unpleasant" and the "just noticeably painful" points. These thresholds (decibel attenuation from 130 \pm 2 decibels) were studied for effects of type of presentation.

Ramond, C.K., McFann, H.H. & Smith, S. THE EFFECT OF PERSONALIZED STOCKS ON RIFLE MARKSMANSHIP. March 1955, 24pp. USA Human Research Unit No. 3, Fort Benning, Ga.

12,663
To evaluate the effect of personalized stocks on rifle marksmanship, an Infantry School class of 169 advanced non-commissioned officers fired a record course with the standard M1 rifle (initial proficiency). New rifle stocks were then issued according to the lengths of their forearms (short-12 inches, medium-13 inches, long-14 inches) and 40 hours of marksmanship training was given. A second firing of the record course (final proficiency) was then made. The pit scores of both initial and final day's record-firing course were analyzed for differences due to personalized stocks.

Riopelle, A.J., Hines, Marion & Lawrence, Marie. THE EFFECTS OF INTENSE VIBRATION. Contract DA 49 007 MD 535 & DA 49 007 MD 634, USAMRL Proj. 6 95 20 001, Task USAMRL T 3, Rep. 358, Oct. 1956, 57pp. USA Medical Research Lab., Fort Knox, Ky.

12,664
To determine some behavioral, physiological, and pathological consequences of prolonged, intense low-frequency vibration, seven rhesus monkeys were used as subjects. Prior to vibration, the animals were given various behavioral tests and clinical examinations; they were then strapped to a chair in seated position and kept immobilized for eight hours. Following further testing, the animals were vibrated at ten cycles per second with a peak-to-peak excursion of 0.25 or 0.50 inches for eight hours. Survivors were again given the various tests, with post-mortem examination of all subjects.

Saldanha, E.I. ALTERNATING AN EXACTING VISUAL TASK WITH EITHER REST OR SIMILAR WORK. A.P.U. 289 57, Feb. 1957, 15pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,665
To study the differential effects on inspection work of interpolating either rest or another visual task, ten subjects were tested. The main task was setting a Vernier Calliper Gauge to an accuracy of 0.001 inches; the interpolated task was the detection and marking of Landolt rings whose gaps pointed in a given direction. All subjects participated in two sessions of three half-hour periods; the middle period being devoted to rest or Landolt Ring task. A comparable group of subjects worked continuously for two hours on the main task. Speed and accuracy of Vernier settings were compared in the first and third half-hours of work for all conditions. The results are discussed in terms of transfer and dispersion fatigue.

Tillinghast, N.W. & Henderson, B.E. A STUDY OF COCKPIT DISPLAY REQUIREMENTS FOR VTOL AIRPLANES. Contract AF 33(616) 3438, Proj. 6(1 6190), Task 61908, WADC TR 58 58, March 1958, 127pp. USAF Flight Control Lab., Wright-Patterson AFB, Ohio. (Ryan Aeronautical Co., San Diego, Calif.).

12,666
To determine the flight instrument display requirements of VTOL (vertical take-off and landing) aircraft, the flight characteristics of the United States Air Force Model X-13 vertical take-off and landing jet airplane were simulated. A functional rotating cockpit, hydraulic system mock-up and analog computers were utilized. A successive refinement procedure was used in dealing with improvements in instrumentation until display requirements were defined. A display that satisfies the requirements of the VTOL pilot for take-off, transition, low-speed conventional flight, and hovering flight has been built and tested in the simulator.

Veghte, J.H. & Webb, P. EXTENDING HUMAN TOLERANCE TO HEAT BY PRIOR BODY COOLING. Proj. 7164, Task 71830, WADC TR 58 412, Sept. 1958, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,667
To determine the effect of prior body cooling on tolerance to a high level of heat stress, five subjects were exposed to three levels of precooling (30-, 60-, and 90-minutes exposure in a 60 degree Fahrenheit water bath) prior to entering the heat chamber at 160 degrees Fahrenheit. The physiological measurements were continuous rectal temperatures, pulse rates, intermittent metabolic rates, continuous skin temperatures at several body locations, initiation of sweating on four areas of the body as detected by the starch-iodine technique, and nude and clothed weights prior to and after each of the four exposures.

Woodhead, Muriel M. THE EFFECTS OF BURSTS OF LOUD NOISE ON A CONTINUOUS VISUAL TASK. *Brit. J. Indust. Med., 1958, 15, 120-125.* (Applied Psychology Research Unit, MRC, Cambridge, England).

12,670
The effects of short bursts of loud noise on the performance of men doing a matching visual task was investigated. The task ran for four minutes and four bursts of noise were given at irregularly spaced intervals during that time. Each burst lasted four seconds with a peak intensity of 100 decibels. Two groups, 12 subjects each, performed four trials, two with noise bursts, one with a visual signal warning of the coming noise, and one with no noise. In addition, one group received verbal encouragement and knowledge of results. Performance data were analyzed for effects of noise, of prior alerting to noise, and of instructions.

Piomp, R. & Bouman, M.A. THE RELATION BETWEEN HEARING THRESHOLD AND DURATION FOR TONE PULSES. Rep. IZF1958-8, Oct. 1958, 23pp. *Institute for Perception RVO-INO, Soesterberg, The Netherlands.*

12,672
The masking threshold of hearing tone pulses was determined as a function of duration for two subjects. Six frequencies (250, 500, 1000, 2000, 4000, and 8000) were tested; the masking noise was 40 decibels. The data were presented graphically and were compared with results predicted on the basis of a new hypothesis: switching on a tone pulse of intensity (I) results in an effect (S) somewhere in the hearing pathway that approaches its final value asymptotically according to a power function; this final value is proportional to I; perception occurs when S exceeds a critical value (S₀). Experimental data from the literature are examined in light of the above hypothesis.

McGuire, J.C. & Kraft, C.L. A RADIO CHANNEL LOAD DISTRIBUTION ANALYZER FOR USE IN STUDIES OF COMMUNICATION FLOW IN RADAR APPROACH CONTROL CENTERS. Contract AF 33(616) 3612, Proj. 7192, WADC TN 57 424, April 1958, 8pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio & Laboratory of Aviation Psychology, The Ohio State University and The Ocu Research Foundation).

12,678

The Radio Channel Load Distribution Analyzer, described here, was developed in order to obtain measures of frequency of use and time-in-use of radio channels in a radar approach control center. Essentially the device consists of 110 impulse counters arranged in pairs. One of the pair records frequency of use of a channel, the second records cumulative time-in-use of the same channel. Separate instrumentation is required for each control position. Microswitches serve to select the appropriate counting circuits. Other aspects of the equipment and its operation are given. Recommendations for improvements are made.

McCroskey, R.L. Jr. THE EFFECT OF SPECIFIED LEVELS OF WHITE NOISE UPON FLICKER FUSION FREQUENCY. OSU Res. Foundation Contract M6 ONR 22525, Proj. NR 145 993 & USN School of Aviation Medicine, BuMedSurg. Proj. NM 18 02 99, Subtask 1, Rep. 80, Aug. 1958, 10pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,679

The effect of noise upon visual frequency of flicker (FFF) was investigated. White noise (from 85 to 115 decibels) was introduced into a room in which individual subjects determined their threshold of fusion. For half the subjects the noise was continued for 19 minutes with fusion judgments made at regularly spaced intervals. There were 72 subjects. The difference between FFF's obtained in quiet and in noise were analyzed with respect to sound pressure level and duration of exposure to the noise.

McKeworth, M.H. NOTES ON THE CLOCK TEST - A NEW APPROACH TO THE STUDY OF PROLONGED VISUAL PERCEPTION TO FIND THE OPTIMUM LENGTH OF WATCH FOR RADAR OPERATIONS. NRC 46/348, A.P.U. 1, May, 1944, 14pp. Applied Psychology Research Unit, NRC, Cambridge, England.

12,681

To investigate the optimum length of watch for radar operators, more than 170 subjects were tested on the clock test (described in appendix). The task was to report any double movement of a pointer, mounted on a blank clock face, which occurred during a two-hour period. In each half-hour, 12 such movements occurred at irregular intervals. Some groups were interrupted by a telephone call, others were given an additional task to perform. The incidence of missed stimuli and of slow responses were analyzed as a function of time. Effects of the other conditions were considered as were individual differences.

Kimball, O.F. ESTABLISHMENT OF BELOW-ELBOW PREFORM DIMENSIONS FOR EXPANSIBLE SOCKET LAMINATES. Tech. Rep. 5744, Oct. 1957, 8pp. USA Army Prosthodontics Research Lab., Walter Reed Army Medical Center, Washington, D.C.

12,684

To obtain one or more standard below-elbow stump preforms that would eliminate the necessity of taking a plaster impression of each individual stump, measurements from 15 stumps were taken. An estimated root-mean-square (RMS) curve was drawn from the data by determining the average value of stump girths at each two-inch interval. The RMS curve represents the shape of the "average" stump. Three other shapes were determined by estimating different tolerances from the average. The 15 stumps were then studied to determine how many could be fitted by the four shapes. The dimensions of the four preforms are given.

Keegan, H.J. & Schleiter, J.C. AN INDEX TO SPECTROPHOTOMETRIC CURVES OF COLOR RECONNAISSANCE PROJECT. Contract AF 33(616) 52 21, Task 62104, NBS Proj. 0201 20 2325, NBS Rep. 5183, Dec. 1957, 58pp. U.S. Department of Commerce, National Bureau of Standards, Washington, D.C.

12,685

This index pertains to the data on the 250 spectrophotometric curve sheets of the 717 specimens studied during a color reconnaissance studies project. It has been compiled as a guide in the location and use of the curves that are contained in nine of the 13 reports issued. There are spectrophotometric curves of 1) 104 color transparencies of man-made objects, 2) 85 color transparencies of natural objects, 3) 290 man-made objects, and 4) 238 natural objects. Seven German photographic filters are included in this spectrophotometric summary.

Kacemetzky, J., Pilgrim, F.J. & Schutz, H.G. RELATIONSHIP OF CONSUMPTION TO PREFERENCE UNDER DIFFERENT FIELD CONDITIONS. INTERIM REPORT. Proj. Food Acceptance Study, 7-84 15 007, GAFCI Rep. 37 57, Dec. 1957, 21pp. USA Food Labs., Quartermaster Food and Container Institute for the Armed Forces, Chicago, Ill.

12,686

The validity of survey ratings of food preference in forecasting consumption was investigated. Consumption indices from four Army field studies and one civilian survey were compared with soldier's preference as measured by a nine-point hedonic scale. Two indices of consumption - percent of men accepting an item from the serving line and amount of consumption of an item - were analyzed for relationship to each other as well as to preference. Factors that may account for the discrepancies between preference and acceptance, and recommendations for research are presented.

Johnson, E.P. THE CHARACTER OF THE B-WAVE IN THE HUMAN ELECTRORETINOGRAM. *A.M.A. Arch. Ophthalmol.*, Oct. 1958, 60, 585-591. (Waterville, Me.).

12,687

This is a history and summary of investigations leading toward analysis of the human electroretinogram (ERG), with special attention given to work on the scotopic b-wave, the most prominent component of the response. Changes in ERG that result from alternating the spectral composition, the intensity, the area and locus, or the duration of the stimulus are described along with differences correlated with adaptation level of the eye. Four types of the b-wave are distinguished and designations are suggested for each. Those changes in the form of the b-wave of the dark-adapted eye that accompany variations in duration and intensity are analyzed. The unit response technique is discussed.

Craig, J.H., Ditto, M.M., Gross, F.J., Haenschke, D.G., et al. TASK A PART 4. GENERAL AIR-GROUND COMMUNICATION STUDY. TASK D PART 3. EXPERIMENTAL AIR TRAFFIC CONTROL COMMUNICATION SYSTEM. INTERIM REPORT. Contract DA 36 039 SC 64567, May 1957, 132pp. Bell Telephone Laboratories, Inc., Murray Hill, N.J.

12,689

The work completed on a systems engineering research study of communication facilities for the common system of air traffic control during the period 1 July 1956 through 15 May 1957 is reported. An analysis of the present system of air traffic control is presented and discussed. The detailed work is presented in five appendices. Progress in planning and establishing an experimental arrangement enabling the routing of flight plans through an BIDI teletypewriter switching system and the printing of appropriate flight strips is discussed. A further development is in programming a high speed computer for the study of flow of air traffic in the experimental system.

Craik, K.J.M. MEDICAL RESEARCH COUNCIL UNIT FOR APPLIED PSYCHOLOGY. *Nature*, Oct. 1944, 154, 476-478, APU 5. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,692

This brief note describes the general type of work carried out by the Medical Research Council Unit for Applied Psychology, Cambridge, England at the end of 1944. Common principles emerging from the war-time research, which may assist in guiding a fruitful approach to future and peace-time problems, are discussed. These principles are: suiting the job to the man, suiting the man to the job, and improving man's performance.

12,693

Campbell, F.W. THE DEPTH OF FIELD OF THE HUMAN EYE. *FPRC 868*, March 1954, 15pp. *Living Personnel Research Committee*, London, England. (Physiological Laboratory, Cambridge, England).

12,693

To determine the range of the depth of field of the human eye, a series of experimental measurements were made using a simple disc subtending a small visual angle (ten minutes) as the test target. The following variables were investigated: 1) pupil size, 2) color of the visual field, 3) contrast of test target and background, and 4) luminosity of test field. One subject was measured on all tests with a limited number of confirmatory experiments on six other subjects. The data were analyzed for effects of the above variables and for individual differences. The importance of the depth of field of the eye in relation to "day myopia" and range of target recognition is considered in the light of the result.

Derwort, A. THE FORMS OF OUR MOVEMENTS AGAINST VARIOUS RESISTANCES AND THE SIGNIFICANCE OF SUCH MOVEMENTS FOR THE PERCEPTION OF FORCE. TIL/T 4565, July 1957, 25pp. Technical Information and Library Services, Ministry of Supply, London, England.

12,696

To investigate various problems relating to the perception of force and formation of movements, a series of studies were performed in which the subject was required to move the forearm in different ways as the resistance was varied. Records were made of arm movement dimensions (direction, extent, and angular velocity), of force applied by the arm (magnitude and time development), of mechanical resistances used, and the subject's statement in regard to his perceptions. Resistances were produced by internal friction of viscous fluids, by mechanical braking, by gravity and pure inertia. In all the experiments the data were analyzed primarily as to extent to which motor behavior influenced force perception. Related problems are discussed.

Conrad, R. & Hille, Barbara A. THE ADAPTATION OF TELEPHONE OPERATORS TO VARIATIONS IN TRAFFIC LEVELS. A.P.U. 282/56, 1956, 15pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,699

To investigate whether the assumption that telephone operator time per call is independent of traffic-level, a test was carried out over a four-week period at a cordless auto-manual exchange. The traffic load per operator was experimentally varied from 20 to 55 calls per hour by presenting traffic levels and controlling at half-hourly intervals the number of operators on duty. The average time to answer a call was automatically recorded and a snap-reading method of observation was used to determine the proportion of total time during which operators had no work and hence the average time to deal with calls. These data were analyzed as a function of traffic-levels and discussed in relation to the mathematics of telephone exchanges.

Conrad, R. & Hille, Barbara A. THE TIMING OF SIGNALS IN SKILL. A.P.U. 227/54, Dec. 1954, 10pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,700

To explore some aspects of timing as related to skilled performance, a complex sensori-motor task was used in which a multi-dial display presented signals for response at approximately random time intervals. Subjects were tested under two conditions: 1) an operator control for changing the interval between each pair of signals and 2) no control but with signal rate adjusted to performance rate under condition one but with the inherent temporal structure unchanged. The two resulting distributions of the interval between signals were compared for effects of controlled timing. Performance scores were analyzed similarly. Drawing on the results the role of timing in skill is discussed.

Miller, J.W. STUDY OF VISUAL ACUITY DURING THE OCULAR PURSUIT OF MOVING TEST OBJECTS. II. EFFECTS OF DIRECTION OF MOVEMENT, RELATIVE MOVEMENT, AND ILLUMINATION. J. Opt. Soc. Amer., Nov. 1958, 48(11), 803-808. (USN School of Aviation Medicine, Naval Air Station, Fla.).

12,701

To determine whether visual acuity deteriorates when the test object is moved in a vertical plane the visual acuity of nine subjects was tested with the object moving in a vertical, then in a horizontal plane. The apparatus used (Landolt rings in apparent movement produced by an apparatus incorporating a rotating mirror) is fully described in a previous article. Results are plotted in terms of mean dynamic visual acuity obtained for vertical and for horizontal planes. Differences between the two are discussed. The research was extended to investigate the effect of rotating the observer in a modified Link Trainer. A semiempirical equation is presented which describes the three types of movement. The effect of changes in illumination also were investigated and results related to data on effect of angular velocity.

Clarke, N.P., Zuidema, G.D. & Prine, J.R. STUDIES OF THE PROTECTIVE QUALITIES OF CLOTHING AGAINST THERMAL RADIATION. Proj. 631., Task 63352, WADC TR 58 578, Nov. 1958, 19pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,703

To study fabric characteristics that might serve as protection against thermal radiation, twelve fabrics were selected so that the following characteristics could be studied: color, weight, composition, and use of flame retardant agents. Samples of the materials were used to cover the experimental animals as they were exposed to thermal energy from a carbon arc lamp, for three or ten seconds. Both pulse wave and square wave delivery of energy were used. Protection was measured by 1) gross examination and classification of burns and 2) subsequent microscopic examination. Comparisons were made on the basis of all the above variables. A method of mathematical summation of the physical characteristics of fabrics to predict their protective character is proposed.

Chiles, W.D. EFFECTS OF SHOCK-INDUCED STRESS ON VERBAL PERFORMANCE. Proj. 7193, Task 71612, MADC-TR 58 117, June 1958, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio

12,705
To determine the effects of electric shock on the learning of two types of verbal tasks (a high degree of association or no association between stimulus and response) 54 subjects were tested, 30 of them under experimental anxiety (shock) and 24 under a non-shock (buzzer) condition. The shock and buzzer were presented in connection with a reaction time test performed between trials on the learning task; 48 trials were given to each group. After the completion of the basic experiment MAS (Manifest Anxiety Scale) scores were obtained for 18 subjects from each group. The implications of the results for behavior theory as well as their relationship to the experimental use of test-measured anxiety are discussed.

Carterette, E.C. MESSAGE REPETITION AND RECEIVER CONFIRMATION OF MESSAGES IN NOISE. J. acoust. S. Amer. Sept. 1958, 30(9), 846-855. (Department of Psychology, Indiana University).

12,706
A mathematical description is given for the communication situation where messages are sent repeatedly to a receiver who is required to record and confirm them under a criterion. A simple stochastic model assumes that the probability of confirmation is constant over a sequence and a formula is derived for the expected number confirmed after the first n presentations. Experimental tests involved receivers listening under two noise conditions to sets of several hundred messages each. Each message was repeated until confirmed. The data were analyzed for agreement with predictions from the theory.

Carpenter, A. AN EXPERIMENT WITH THE PURSUITMETER TO DETERMINE THE EFFECT OF DIFFERENT WEIGHT LOADS. A.P.U. 40, March 1946, 15pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,707
To determine whether there was a definite weight load beyond which further loading would cause a marked decrease in accuracy of performance on the pursuit-meter, loads from two to forty pounds were investigated. Five inexperienced subjects were given practice sessions at each weight load preceding test periods on five consecutive days. Each subject performed three spells (three minutes each) on each of the load conditions each day. The performance data (total mis-alignment) were analyzed for effect of practice and effect of handle load. The results are interpreted in terms of maximum permissible load and the treatment of practice effects when using the equipment for experimentation on heat stress.

Byford, G.H. THE DISTRIBUTION AND ACCURACY OF 'g' IN A HUMAN CENTRIFUGE. F.P.R.C./Memo 97, Sept. 1958, 54pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

12,709
The errors encountered in the production and measurement of "g" forces in a human centrifuge are examined from the point of view of the definition of the basic unit "g" (the force at a point in terms of the "standard terrestrial unit-g"), and of the spatial distribution of forces within the car. Theoretical equations are developed for this distribution and specific evaluations made for absolute and percent errors in the Royal Air Force Institute of Aviation Medicine centrifuge. The theoretical results are confirmed by measurements, and an analysis made of the centrifuge under normal operating conditions. It is suggested that standardized measurement techniques could be adopted.

Brown, M.K. STRESS SENSATION IN FLIGHT. VII. EFFECT OF THE DEGREE OF FILLING OF THE STOMACH ON TOLERANCE TO ACCELERATION. FPM:1057, Sept. 1958, 5pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

12,712

To investigate the mechanical effects of distension of the stomach on tolerance to accelerative forces, six experienced subjects were tested on the human centrifuge. Tolerance to acceleration was measured by the threshold at which central light loss occurred with the dark adapted eye. Thresholds were determined first with the stomach empty and immediately after drinking as much water as possible within a five minute period. Intra-abdominal pressure was recorded for three of the subjects. The data were analyzed for changes due to distension of stomach. The relationship between increased protection afforded by a full stomach and increased intra-abdominal pressure is discussed.

The case of a pilot who survived ejection at supersonic speed is related. The data obtained from this case were used in a program of ejection tests to obtain force-time history. Four sled ejections, using an anthropometric dummy, were studied with respect to aerodynamic pressure, maximum acceleration forces imposed on the dummy at center of gravity, duration of period of maximal acceleration, and direction of application of peak force. The medical findings of the pilot were related to the force-time history. The findings are discussed in relation to improved design of ejection equipment. T. G. I.

Riggs, L.A. HUMAN RETINAL RESPONSES. *Ann. N.Y. Acad. Sci.*, Nov. 1958, 74(2), 372-376. (Dept. of Psychology, Brown University).

12,721

This paper indicates the difficulties and limitations of obtaining electrical records of human retinal responses and describes progress that has been made in overcoming them. The technique of sealing a metallic electrode to plastic contact lens for recording response is discussed. The form of the response thus obtained is discussed briefly. Methods of obtaining photopic responses through the use of flickering light, red light, and flashes of brief duration are mentioned. R 36

Rahn, W.E., Jr., Strother, W.F., Lucchini, G. & Gulick, W.L. THE EFFECTS OF AIR PRESSURE ON THE EAR. *Ann. Otolaryng. Rhinology and Laryngology*, March 1958, 67(1), 170-177. (Psychological Laboratory, Princeton University).

12,722

To test the hypothesis that altered air pressure in the external meatus or the middle ear cavity affects sound transmission mainly by changing the tension characteristics of the tympanic membrane, pressure changes were introduced simultaneously into both the external meatus and the middle ear. The cochlear response, used as an index of sound transmission, was recorded from each of 15 cats for each of several frequencies (from 100 to 10,000 cycles per second) for both positive and negative pressures (from four to twenty inches of water). The data analyzed graphically and compared to previous findings (12,724) where pressure change was introduced only into the external meatus. G. I. R 3

Rahn, W.E., Jr., Strother, W.F. & Gulick, W.L. THE STABILITY OF THE COCHLEAR RESPONSE THROUGH TIME. *Ann. Otolaryng. Rhinology and Laryngology*, Dec. 1958, 67(4), 972-977. (Psychological Lab., Princeton University).

12,723

To determine the stability of the cochlear response through time, electrophysiological techniques were used on two groups of cats. In one group the procedure for maintaining experimental preparations involved only the regulation of room temperature (84 degrees Fahrenheit), in the other attempts were made to maintain each preparation in as constant a physiological state as possible. The stimulus was a 1000 cycle tone with cochlear potentials picked up from the round window membrane, amplified and measured with a wave analyzer. Recording continued over a period of 85 hours or death. Changes in magnitude of response were analyzed with reference to the initial level established at onset of stimulus. G. R 4

12,724

Rahn, W.E., Jr., Strother, W.F. & Crump, J.F. THE EFFECTS OF PRESSURE IN THE EXTERNAL AUDITORY MEATUS. *Ann. Otolaryng. Rhinology and Laryngology*, Sept. 1956, 65(3), 656-664. (Princeton Psychological Lab., Princeton University).

12,724

In this experiment the effects of pressure in the external auditory meatus was investigated with cats as experimental animals and the cochlear potentials as an index of auditory reaction. Positive pressure was introduced by a rubber bulb (0 to 24 inches of water) and negative pressures produced by a syringe. Tonal stimuli ranged from a frequency of 100 to 10,000 cycles with intensity of each tone adjusted initially to give a response of 50 microvolts for zero value of pressure; some value of positive or negative pressure was then applied, and the altered magnitude of cochlear response observed. The results are shown graphically and are discussed in terms of probable physiological effects of pressure on the tympanic membrane. G. R 11

Harris, C.M. RESIDUAL MASKING AT LOW FREQUENCIES. Contract AF 33(616) 2454, Proj. 7210, Task 71700, WADC TN 58 221, Nov. 1958, 47pp. *USAF Aero Medical Lab.*, Wright-Patterson AFB, Ohio. (Columbia University).

12,725

Short duration auditory fatigue has been termed "residual masking" and is characterized by a shift in threshold of hearing following cessation of a masking noise. Residual masking was determined in the low frequency range (130 to 1000 cycles per second) for three subjects. Masking tones of 250 cycles and sound pressure levels of 90 and 110 decibels were used and thresholds determined at 150 and 200 milliseconds following cessation of noise. Curves of residual masking versus frequency (masking patterns) were constructed. The free-field threshold of hearing (binaural listening) was also measured between 130 and 1000 cycles. Auditory activity patterns were computed and the loudness of the pure tone masking source was evaluated. T. G. I. R 3

Gibbs, C.B. A NEW INDICATOR OF MACHINE TOOL TRAVEL. *APU-177/52*, July 1952, 10pp. *Applied Psychology Research Unit*, MRC, Cambridge, England.

12,726

A new type of quantitative visual indicator was designed to give an accurate and easily read display of a wide range of machine settings. The characteristics of the indicator are those required in a large variety of industrial instruments such as aircraft altimeters, or instruments used to measure travel of machine tools, thickness of rolled metal, and the like. A series of experiments was conducted comparing performance with the use of the new indicator and the conventional dial. Both skilled and unskilled operators using the new indicator were tested for learning effects. I. R 1

Folley, J.D., Jr. & Altman, J.W. GUIDE TO DESIGN OF ELECTRONIC EQUIPMENT FOR MAINTAINABILITY. *RADC Proj. 7502*, WADC Task 71502, WADC-TR 56 218, April 1956, 174pp. *USAF Aero Medical Lab.*, Wright-Patterson AFB, Ohio.

12,727

A major problem faced by the military services is effective maintenance of complex electronic equipments despite shortages of highly skilled maintenance technicians. This guide is intended to alleviate this problem by recommending design practices that will maximize the ease with which electronic equipments can be maintained. Factors to be considered in planning for maintainability are reviewed briefly. A schedule of steps to be taken in designing a maintainable system is presented. Specific characteristics are recommended for equipment and maintenance procedures. G. I. R 11

 Enoch, J.M. & Wild, S. A STUDY OF VISUAL SEARCH ON
 OBLIQUE AERIAL PHOTOGRAPHS. HUMAN ASPECTS OF PHOTO-
 GRAPHIC INTERPRETATION. Contract AF 30(602) 1580,
 OSURF Proj. 696, MCHL T.P. (696) 7 263, Oct. 1957,
 26pp. Mapping and Charting Research Lab., Ohio State
 University Research Foundation.

12,728
 To determine if unique search procedures are em-
 ployed by trained photo-interpreters in examining obli-
 que (graded scale) photographs, visual search patterns
 of three trained subjects were studied by ophthalmogra-
 phic techniques. A series of four oblique aerial photo-
 graphs were searched for specific critical details
 (either existent or non-existent) for a 30-second period.
 Each photograph was graded for variation of scale. Eye
 movement patterns, duration of eye fixations and linear
 extent of eye movements were analyzed and compared with
 earlier data obtained from viewing vertical (ungraded)
 photographs. The effect of scale on interfixation dis-
 tances and duration of fixation were examined. Practical
 implications of the results were discussed.

 Duffus, H.B. (Chm.). AMERICAN STANDARD METHOD OF
 RECORDING AND MEASURING WORK INJURY EXPERIENCE. Rep.
 Z16.1 1954, UDC 313.1, Dec. 1954, 15pp. American
 Standards Association, Incorporated, New York, N.Y.

12,729
 This standard provides a practical and uniform meth-
 od for recording and measuring work injury experience.
 Injury rates compiled in accordance with the standard may
 be used to evaluate 1) the relative need for accident
 prevention activities in different departments of an es-
 tablishment, 2) the seriousness of the accident problem
 in an establishment industry, 3) the effectiveness of
 safety activities in establishment of comparable hazards
 and 4) the progress made in accident prevention within
 an establishment or industry. The various parts are def-
 initions, evaluations of severity, exposure, measures of
 injury experience, and classification of special cases.

 Davis, H. (Chm.). AMERICAN STANDARD SPECIFICATION FOR
 PURE-TONE AUDIOMETERS FOR SCREENING PURPOSES. Rep. Z24.
 12 1952, Aug. 1952, 11pp. American Standards Associa-
 tion, Incorporated, New York, N.Y.

12,730
 This American Standard comprises a part of a group
 of definitions, standards, and specifications for use in
 acoustical work. The audiometer covered here is a device
 designed to assign persons to groups according to their
 auditory sensitivity. It is not intended that medical
 diagnosis should be based on screening procedures. There
 is a section of the report devoted to definitions and one
 to the requirements.

 Davis, D.R. VII. EMOTIONAL DISTURBANCES AND BEHAVIOUR-
 AL REACTIONS. Spec. Rep. Series 275, 1951, 18pp.
 Medical Research Council, London, England.

12,731
 To determine whether some of the common symptoms of
 undernutrition (insomnia, breathlessness, excessive sweat-
 ing, giddiness, exaggeration of tendon reflex, fatigue,
 reduction of sexual activity) exhibited by several groups
 of subjects were primarily the results of physical dietary
 deficiency or part of a behavioral reaction to external
 circumstances, both clinical and statistical data were
 gathered. The subjects were 1) German civilians applying
 for extra rations on account of hunger, oedema, or loss of
 weight, 2) prisoners of war repatriated from Russia, and
 3) a representative sample of factory workers and staff.
 Causes of the symptoms are discussed.

 Carpenter, A. THE EFFECT OF AIR MOVEMENT ON THE PUR-
 SUITMETER TEST AT HIGH ROOM TEMPERATURES. A PRELIMINARY
 EXPERIMENT. MRC 47/397, APU 66, June 1947, 13pp.
 Applied Psychology Research Unit, MRC, Cambridge, England.

12,733
 To investigate the effect of air movement and
 high temperatures on performance of the pursuit meter
 test, nine subjects were studied under nine conditions.
 Three temperature conditions (80/70, 90/80, 100/90;
 on the dry bulb/wet bulb scale) and three degrees of
 air movement (40, 100, and 250 feet per minute) were
 used in all combinations. Each subject performed nine
 three-minute runs with a handle load of 24 pounds per
 condition. Error scores were analyzed for environmen-
 tal effects and for practice effects. Physiological
 measurements of weight loss and rectal temperature
 changes during the 2-3/4 hours stay in the hot room were
 also analyzed. The usefulness of the "effective tempera-
 ture" index is discussed.
 T. G. R 6

 Carpenter, A. REPEATING THE A.H.4 TEST IN THE HOT
 ROOM. MRC 47/396, APU 65, May 1947, 5pp. Applied
 Psychology Research Unit, MRC, Cambridge, England.

12,734
 To investigate the effect of high temperatures on
 performance of a written intelligence test, the A.H.4,
 nine subjects were acclimatized and then tested under
 three temperature conditions (80/70, 90/80, and 100/90
 on the dry bulb/wet bulb scale) and three degrees of air
 movement (40, 100 and 250 feet/minute). Each subject
 performed the test under each of the nine conditions in
 an order that insured all temperature and air movement
 conditions were represented at each stage of practice
 sequence. The test scores were analyzed for effects of
 environmental conditions, and the effects of practice.

12,735
 Carpenter, A. A COMPARISON OF THE EFFECTS OF HANDLE
 LOAD AND OF UNFAVOURABLE ATMOSPHERIC CONDITIONS ON THE
 PERFORMANCE OF THE PURSUITMETER TEST. RNP 47/361,
 HS 182, APU 60, 1947, 12pp. Applied Psychology Research
 Unit, MRC, Cambridge, England.

12,735
 To compare the effects of handle load and high atmos-
 pheric temperatures on pursuitmeter performance, twelve
 subjects were tested on four different days. The exper-
 imental variables were six handle loads (from two to forty
 pounds) and four room temperatures (from 85/75 to
 100/90 - dry bulb/wet bulb, in degrees Fahrenheit, and
 air velocity 100 feet/minute). Each test period consist-
 ed of three test spells of three minutes duration on each
 weight. Tracking errors were analyzed to evaluate the
 significance of each source of variance and their inter-
 actions.

12,736
 Craik, K.J.W. & Macpherson, S.J. THE EFFECT OF CERTAIN OPERATING CONDITIONS ON THE VISIBILITY OF P.P.I. RADAR ECHOES. APU 16/45, March 1945, 10pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,736
 To investigate some factors affecting echo-visibility on a Plan Position Indicator (PPI) display, synthetic electronic equipment in which an artificial "echo" was injected against a background of thermal noise was used. The factors investigated were 1) distance of eyes from screen; 2) intensity of external illumination; 3) use of admiralty pattern illuminated scales with amber filters; 4) amber filters alone and with varying grids; 5) duration of watch period (separately reported, see 12,681); 6) pulse-width; and 7) angular distance of echo from line of sight of operator. Threshold determinations were made on different groups (ten to twelve subjects each) and analyzed for effects of these variables.

 Craik, K.J.W. & Vince, M.A. A NOTE ON THE DESIGN AND MANIPULATION OF INSTRUMENT KNOBS. MRC 45/272, APU 14, Jan. 1945, 9pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,737
 To determine the degree of improvement which can be obtained by "muscular bracketing" of the halving technique in making manual settings, subjects were instructed to turn a knob until a cross-bar on a pointer appeared first above and then below a screen and then to attempt to divide this interval by "feel". Variables investigated were knob size, knob position, method of turning the knob, and size of "dead-zone". Errors in halving the dead-zone were analyzed with a view to defining optimum sizes, gear-ratios, and positions of instrument knobs for such manipulations.

 Craik, K.J.W. & Macpherson, S.J. MEASUREMENT OF PARA-FOVEAL FIXATION AT LOW BRIGHTNESSES. MRC 46/271, APU 11, May 1944, 7pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,738
 A method of measuring the degree to which observers fixate objects parafoveally at low illuminations is described. A bright point-source of light is flashed in the center of the object that the subject is trying to see against a dim background so that a positive after-image is formed on that part of the retina; the subject is then asked to fixate a red dot in the center of the target and to report the position of his after-image on the target. The mean angle of parafoveal fixation was measured for 12 Royal Air Force personnel trained in night vision and for 18 untrained men.

 Craik, K.J.W. THEORY OF THE HUMAN OPERATOR IN CONTROL SYSTEMS. II. MAN AS AN ELEMENT IN A CONTROL SYSTEM. APU 64, 1945, 6pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,739
 As an element in a control system a man may be regarded as a chain consisting of the following items: 1) sensory devices; 2) a computing system; 3) an amplifying system and 4) mechanical linkages. To show the advantages and disadvantages of the human operator as compared with an automatic system, it is necessary to discover in detail the characteristics of this human chain. Some of the techniques available for such study are discussed and an analysis presented of the first two steps in the chain of response--the sense organ and the computing system.

12,740
 Carpenter, A. AUDITORY MASKING BY VERY LOW FREQUENCIES. AFU 253/57, Sept. 1957, 24pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,740
 To investigate auditory masking by stimuli below 100 cycles per second (cps) in frequency, measurements were made on three groups of subjects. In the first, one highly trained subject was used to obtain fairly extensive mapping of the extent of masking produced by four different masking tones (30, 40, 50, and 80 cps). In the second, two groups of untrained subjects were used to confirm the first results. With one group the masking frequency was 40 cps, and with another it was 95 cps. In the third part, untrained subjects were again used with a masking signal of 40 and test signal of 95 cps. There is some discussion of the practical importance of these low frequency sounds for conveying information.

 Creelman, J.A. COCKPIT DESIGN PROBLEMS OF TRAINING COMMAND AIRCRAFT. PART I: T34 AND T28 DIFFERENCES AS REPORTED BY TRANSITIONING STUDENTS. Spec. Rep. 56 34, Dec. 1956, 6pp. USN School of Aviation Medicine, Naval Air Station, F13.

12,741
 To determine sources of difficulty arising from design and layout of cockpit, 121 flight students, who were undergoing transition from the T34 to the T28 aircraft, were given a questionnaire. The questions were designed to elicit comparisons between instrument and control location, accessibility, and legibility on the two types of aircraft. The comments were divided into two general categories: those pertaining to visual presentations and those related to location of controls, handles, and switches. The analyses are presented in tabular form and recommendations based upon the findings are made.

 Confalone, J.L. FINAL ENGINEERING REPORT ON RESEARCH, DEVELOPMENT, AND FABRICATION OF HIGH-FREQUENCY HOMING GROUP AN/ARA-36(XA-1). Contract AF 33(600)26796, Rep. 3202-1, July 1957, 140pp. Airborne Instruments Laboratory, Inc., Mineola, N.Y.

12,742
 This report presents a discussion of the research, development, and flight tests of an engineering model of the AN/ARA-36 (XA-1) homing group and a discussion of the fabrication of four final design models of this equipment. The homing group is an adaptor used with an H-F communications receiver to provide a right-left homing system for use on cargo-type aircraft. It enables the pilot to home on a transmitting station emitting vertically polarized signals. The information is presented to the pilot as an aural keyed signal from which he can determine whether he is flying toward, to the right, or to the left of the transmitting station.

 Bond, G.W., Gale, K.S., Haake, J.W. & Moore, C.J. STUDIES AND INVESTIGATION OF AIR TRAFFIC CONTROL SYSTEMS. FINAL REPORT. JANUARY 10, 1957 TO JANUARY 9, 1959. ANDB Proj. ANDB/ARMY 14.3, SC Contract DA-36 039 SC 73104; Jan. 1958, 31pp. Armour Research Foundation of Illinois Institute of Technology.

12,743
 To improve methods for the analysis and evaluation of air traffic control systems, an enroute air traffic control system was postulated, and analyzed by simulation techniques to determine its response to expected 1965 traffic demand. Graphical simulation was used to evaluate four alternative traffic control procedures. A digital computer program for simulating airway traffic control was developed and the results compared with those obtained by graphical simulation.

Wendelstam, L. & Sjöqvist, A. (Eds.). **GENERAL SYSTEMS. YEARBOOK OF THE SOCIETY FOR THE ADVANCEMENT OF GENERAL SYSTEMS THEORY. VOLUME I. 1954, 162pp.** American Association for the Advancement of Science, Washington, D.C.

12,744

This publication contains a collection of 15 writings, most of which have been published elsewhere, selected for their pertinency to the development of theories of generalized systems and arranged in compact form and orderly sequence. The first section is devoted to introductory papers on general system theory. This second section is concerned with the exploration of mathematical models in the social sciences. The articles in the third part call attention to some unusual "tools of integration" such as cybernetics, qualitative mathematics as applied to biology, and a biological approach to the potentialities of human behavior.
T. G. 1. 2 300

12,745

Wendelstam, L. & Sjöqvist, A. (Eds.). **GENERAL SYSTEMS. YEARBOOK OF THE SOCIETY FOR GENERAL SYSTEMS THEORY. VOLUME II. 1957, 162pp.** American Association for the Advancement of Science, Washington, D.C. (University of Southern California & Mental Health Research Institute, University of Michigan).

12,745

This yearbook consists of 12 papers concerned with some aspect of systems theory. Various forms of reference are represented—mathematical deduction to the more philosophical and speculative. Following an introductory paper that sets forth the philosophy of general systems, the papers are grouped under the following headings: gross principles of system behavior, gross principles of mass behavior, structural units of behavior, and systems approach in psychology.

12,746

Erasmant, D.E. **NOISE AND BEHAVIOR. APU 293/57, 1957, 4pp.** Applied Psychology Research Unit, MCC, Cambridge, England.

12,746

Noise and behaviour are discussed in regard to findings from three types of psychological experiments. First, studies of hearing loss due to noise are treated and their practical importance pointed out. The frequencies and intensities of noise most liable to produce hearing loss and the question of "safe" noise levels are discussed. Secondly, results from studies on the way speech perception is affected by hearing losses in particular frequency bands are reviewed. And last, experiments on efficiency of work in noise are treated.

12,747

Bartlett, F.C. **THE TASK OF THE OPERATOR IN MACHINE WORK. APU 30/43, 1943, 7pp.** Applied Psychology Research Unit, MCC, Cambridge, England.

12,747

The task of the operator is defined in terms of displays that give a signal for action and controls that will give the desired results. Problems in each area are discussed briefly and some fact in each area, which have been experimentally determined, are listed. Under control, the following specific problems are considered: position, direction of movement, resistance to voluntary movement, speed of movement, radius of cranks, motor control and visual display, motor contrast and attenuation, and control and visual alignment. Display problems are: lighting, size of retinal image, brightness contrast, shape of object, general points in visual and auditory perception.

Anderson, R.O. **DESIGN FOR SPACE-VEHICLE CONTROL SYSTEM RELIABILITY. Proj. 1953-1954, AGC 14 58 156, April 1954, 18pp.** JSCF Flight Control Lab., Wright-Patterson AFB, Ohio.

12,749

This paper presents the results of an exploratory study to determine critical flight control system problem areas. The reliability of several manned and unmanned space vehicle attitude control systems was estimated using component reliability data gathered in an Air Force contract. Results show that reliability problems associated with space vehicle control systems are of major concern. Several promising design methods were analyzed to demonstrate the importance of design for space vehicle reliability and the need for more reliability analysis data.

Angvin, J.B.P. **AN EXPERIMENTAL CHART FEATURING SLOPES WITH OTHER AIDS TO AERONAUTICAL RADAR NAVIGATION, "M.C.R.L. XM-7-RAD, NORTHEASTERN RAMSES" ON SCALE 1:1,000,000. Contract AF 33(616) 2378, OSURF Proj. 595, Tech. Paper 205, Jan. 1957, 28pp.** Mapping and Charting Research Lab., Ohio State University Research Foundation.

12,751

This paper describes the salient features of design of a type of chart, to aid navigation by radar, in which all symbols simulate as nearly as possible the forms of return likely to be projected on the radarscope by the features on the ground which they represent. The thinking on the design and content of the chart is outlined. Lithographic prints of an experimental chart to their design are included as Annexes. Criteria for selection of the various elements of topography shown are discussed. A critical commentary gives pointers towards possible improvements and stresses the necessity for in-flight evaluation.

12,752

Agrell, J., Benoit, J., Bellard, A., Barrois, A., et al. BIBLIOGRAPHY OF AVIATION PSYCHOLOGY IN WESTERN EUROPE. 1930 - 1957. 31pp. British Aerospace Association for Aviation Psychology. c/o US Office of Naval Research, London, England.

12,752

This bibliography includes only psychological publications directly connected to aviation. The period covered is from 1930-1957. The items are arranged alphabetically by author according to general topics or sub-topics as follows: general (theory and systems, methods and apparatus, tests, reference works, professional problems); physiological psychology (receptive and perceptual processes (vision, audition, etc.); response processes; complex processes (personality, thinking, etc.); aging); social psychology; personnel psychology (selection, placement); training (systems, criteria); psychiatry, clinical psychology, counseling; and miscellaneous applications (flight safety, environmental factors). 12,753

Barve, J.S. EVALUATION OF DECISION MAKING PERFORMANCE ON THREE PERSONAL NAVIGATION DISPLAYS. Contract AF 33(616) 3743, Proj. 6130 71556, WDC 12 58 49, Nov. 1958, 43pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (The Martin Company, Baltimore, Md.).

12,753

A group of pilots and a group of non-pilots solved two representative types of navigation problems using three map-type navigation displays representing different movement relationships between an aircraft symbol and a ground station symbol. The displays (aircraft movement, earth movement, and mixed movement) were presented by a static projection technique, with verbal explanation of movement relationships. To solve each problem, a directional and a heading decision had to be made. A number of measures reflecting the speed and accuracy of these decisions were obtained and analyzed for differences due to type of subject, kind of display and type of problem. T. I. R 16

Horton, J.M. & Must, F.J. GAMING: A METHOD OF STUDYING SUBMARINE TACTICS. Tech. Rep. 411-HE-15, P58-071, Aug. 1958, 17pp. Electric Boat Div., General Dynamics Corporation, Groton, Conn.

12,754

This report describes a method of studying submarine tactics called operational gaming. A realistic game and the rules for playing were developed which provide for the making of trial-and-error decisions and permitting the players to exercise some skills and judgments similar to those in an actual situation. This type of game makes possible the observation of many elements of real or hypothetical situations not easily investigated by other means. The possibilities of the game as a training device are discussed. The body of the report has been written in the form of instructions given to the participants and umpires in the game which concerns the submarine anti-submarine barrier employing both conventional and nuclear-powered ships. Miller, M., Riley, M.E., Bondurant, S. & Hiatt, E.P. THE DURATION OF TOLERANCE TO POSITIVE ACCELERATION. Proj. 7222, Task 11745, WDC 12 58 635, Nov. 1958, 9pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,756

To investigate man's ability to withstand low magnitude positive accelerations (g) applied over relatively long periods of time, eight young males were studied. Each subject was accelerated at levels of 3.0, 3.5, 4.0, 4.5, and 5.0 g, which were maintained until terminated by 1) fatigue or blackout, 2) appearance of cardiac abnormalities of rate or rhythm upon the continuously recorded electrocardiograms, or 3) the attainment of a previously agreed upon time limit (up to one hour). One series of experiments was made without and one with the standard United States Air Force cutaway anti-g suit. A third series was run on five subjects at 6.0g. The duration of tolerance at each level of acceleration was tabulated and physical symptoms of the subjects discussed. T. R 10

Blackworth, N.H. HIGH INCENTIVES VERSUS HOT AND HUMID ATMOSPHERES IN A PHYSICAL EFFORT TASK. REP 376, MS 108, AFU 13, Aug. 1947, 18pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,757

To determine the extent to which the harassing effect of a given situation (hot and humid atmospheres) can be modified by altering the incentive, physical output was measured for 30 men working to complete exhaustion on an arm ergograph. Both preliminary practice and acclimatization to high room temperatures preceded the testing periods in six different Effective Temperatures (from 61 to 92 degrees Fahrenheit). Two levels of incentive were used on different days: high incentive (knowledge of results, praise and encouragement) and ordinary incentives (neither of the foregoing items). Average amount of work was analyzed for effect of temperatures, incentives and their interactions. The influence of ability levels was also analyzed. T. G. I. R 7

Mitchell, M.J.H. DIRECTION OF MOVEMENT OF MACHINE CONTROLS. IV. RIGHT OR LEFT HANDED PERFORMANCES IN A CONTINUOUS TASK. AFU 85/48, April 1948, 12pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,758

To examine the effect of the relationship between direction of movement of control and display on the accuracy with which either the right or the left hand performs a continuous task, 24 right-handed subjects were studied. Six control-display relationships were used; half the subjects performing each with the right hand and half with the left hand. Amount of error was measured in arbitrary units and actual errors of direction were calculated. The error data were analyzed for each control-display relationship and for each hand used. Previous work in this area is discussed in relation to the results and functional differences between the preferred and non-preferred hands are speculated upon. T. I. R 14

Blackworth, N.H. LOCAL COLD ACCLIMATIZATION IN MAN. Polar Res., Jan. 1956, 2(52), 13-21. APU 25.7/56. (Applied Psychology Research Unit, MRC, Cambridge, England.).

12,759

To determine what impairments of sensation are produced by the cold and whether these changes occur when men become acclimatized, two sensory mechanisms were investigated: the tactile two-point discrimination and the vibration threshold. Field tests were conducted during a winter period at Fort Churchill, Canada, on 30 men who had been stationed there for two winters; half the men were indoor and half outdoor workers. Measurements were made in a warm room and compared with those taken after six minutes in the cold. Follow-up studies were made in England, both in winter and summer months. The results are discussed in terms of acclimatization processes and the practical implications for survival in the cold. G. R 9

Mackworth, N.H. EFFECTS OF HEAT ON WIRELESS TELEGRAPHY OPERATORS HEARING AND RECORDING MORSE MESSAGES. APU 25, ca. 1947, 15pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,760
To determine the effect of hot and moist atmospheres on the accuracy of hearing and writing down morse messages, 11 trained and physically fit wireless operators were tested. Extensive additional practice and acclimatization periods were given in the hot room before testing. Five dry bulb/wet bulb temperatures (85/75, 90/65, 95/65, 100/60 and 105/55) with wind velocity of 100 feet per minute were used; the test period was three hours. The men wrote the morse messages heard on their headphones while seated at a table and dressed in gym shoes and tropical shorts. Rectal temperatures were measured before and after each test period. The test scores were analyzed in relation to both atmospheric and rectal temperature scores.

Mackworth, N.H. & Mackworth, J.F. TEMPORAL IRREGULARITY IN A MULTISOURCE TASK. APU 264/57, Sept. 1957, 16pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,761
In many situations decisions must be based on visual information obtained from a number of different sources. This report is one of a series of laboratory experiments devised to study the environmental variables involved. The experiment attempts to determine the effect of systematically altering the average speed at which decisions were being demanded. A multi-source task (from 4 to 12 channels) was used; the speeds were varied at an average rate of 12, 15, and 18 signals per minute; signal duration was varied; and the presence or absence of fixed comparison signals was manipulated. These variables were examined in a series of experiments. An index of "momentary speed" was devised to combine effects of average speed, density and duration of signals and used to analyze performance data. T. G. I. R 6

Massey, P.M.G. ACCLIMATIZATION TO COLD IN ANTARCTICA. APU 262/56, Oct. 1956, 40pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,762
This paper deals with two aspects of acclimatization to cold, skin sensitivity and increase of subcutaneous fat, which were investigated in 14 months of Antarctic residence. Two hundred finger numbing experiments to cold exposures were performed on twelve men divided into first-year and second-year groups. The finger was exposed to a cold breeze (outdoor temperatures), numbness (two-point discrimination threshold) and skin temperature recovery were measured. Fold thickness and body weight were measured on 30 subjects on 192 occasions. One group of men were at a sledging base, another (control) at static bases. These data were analyzed as a function of time. Some data on frostbite, nail growth, and oral temperatures are also reported.

Pokorovski, Prof. STUDY OF THE VITAL ACTIVITY OF ANIMALS DURING ROCKET FLIGHTS INTO THE UPPER ATMOSPHERE. Trans. 625, Jan. 1957, 6pp. Royal Aircraft Establishment, Farnborough, Hants, England.

12,763
In the first phase of this work, vital activity of the body at high altitudes has been observed in dogs carried in a hermetically sealed compartment in the nose of a rocket. Equipment carried in the compartment allowed observations to be made of the conditions and of the animal's behavior during flight and free fall of the cabin from the rocket. In a second phase, dogs in space suits were placed in an unsealed compartment. Ejection of the dogs and subsequent fall by parachute through the upper atmospheric layers took place. Conclusions are drawn as to the possibility of man flying by rocket to the upper atmospheres.

12,764
Gibbs, C.E. THE WORKER AND HIS TOOLS. APU 304/57, 1957, 6pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,764
The role of the psychologist in improving working tools and technologies is the thesis of this paper. The aims and objectives of this new field of psychology are defined. Some examples of the way in which this new field relates to engineering and industry are given. And, finally, what the approach may mean to psychology as such is considered.

Gray, C.H.G. (Chm.). AMERICAN STANDARD SOUND LEVEL METERS FOR MEASUREMENT OF NOISE AND OTHER SOUNDS. Rep. Z24.3 1944, IUC 601.88, July 1944, 11pp. American Standards Association, New York, N.Y.

12,765
This American Standard for Sound Level Meters comprises a part of a group of definitions, standards, and specifications for use in acoustical work. The standard was prepared to aid in promoting uniformity in meter measurements of various types of sounds. In addition to the definitions a series of appendices give the following: (1) response-frequency characteristics of sound level meters; (2) tests for root mean square addition; (3) calibration adjustment of individual sound level meter; (4) tolerances in response-frequency characteristic; and (5) correction of reading on specific noises.

Hick, W.E. & Clarke, P. A NOTE ON THE POST-CONTRACTION PHENOMENON. APU 39, April 1946, 7pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,766
To examine after-contractions that follow a sustained voluntary muscular contraction in situations which (1) favor their appearance and (2) largely inhibit them, subjects were required to apply forces of 0.0, 2.5, and 8.0 pounds on a handle mounted on a stiff spring and hold it constant for 15 seconds. Four sets of conditions were arranged during which the after-contraction was measured: (1) rest, (2) holding pointer at zero, (3) writing name backwards with left hand, and (4) gradual reduction of force exerted. Frequency of occurrence of after-contractions were examined for each condition. A tentative explanation of the phenomenon and its relation to performance in motor skills is given.

Hodge, M.H. & Reid, L.S. THE INFLUENCE OF IRRELEVANT INFORMATION UPON COMPLEX VISUAL DISCRIMINATION. Contract DA 49 007 MD 537, SGO Tech. Rep. 537 58 2, ISA Research and Development Div., Office of The Surgeon General, Washington, D.C. (Psychological Lab., University of Virginia).

12,767
This report is the first of a series on investigation of the effect of introducing irrelevant information upon performance of a complex visual discrimination task. (The stimuli were complex geometrical patterns which had to be identified on the basis of various stimulus dimensions such as form, size, kind of markings, and so forth). Three variables were manipulated: kind of irrelevant information, amount of practice, and difficulty of the discrimination required. Latency and error analysis were performed on the data with conclusions given relative to the variables studied.

Lybarger, S.F. (Chn.). AMERICAN STANDARD METHOD FOR MEASUREMENT OF CHARACTERISTICS OF HEARING AIDS. Rep. Z24.14 1953, UDC 681.88:534.6, Feb. 1953, 15pp. American Standards Association, Incorporated, New York, N.Y.

12,772

This American Standard comprises a part of a group of definitions, standards, and specifications for use in acoustical work. Practical and reproducible methods of evaluating certain physical performance characteristics of air-conduction vacuum-tube hearing aids are described. The measurement methods which are here standardized give essential information on frequency response, acoustic gain, maximum acoustic output, effect of tone controls, input-output characteristics, harmonic distortion, battery drain, and effect of battery voltages. Drawings, test procedures, and sample plots of test results are included as an aid in setting up the tests and interpreting test procedures.

Packard, J.M., Strutner, L.A., Melton, R.S. & Ackerman, I.F. ELECTROCARDIOGRAPHIC STANDARDS FOR HEALTHY PERSONS: 10 - 19 YEARS OF AGE; HEART SIZE IN ADOLESCENTS. Res. Proj. NM 14 02 11, Subtask 13, Rep. 3, Nov. 1957, 17pp. USN School of Aviation Medicine, Naval Air Station, Fla.

12,775

Measurements of heart size were made from the tele-jerentgenograms of 2,138 healthy school children 12 through 17 years of age. There were 1,072 boys and 1,066 girls studied, none of whom had clinical or electrocardiographic evidence of heart disease. Extensive statistical studies were carried out to determine the relationship of age, sex, body weight, body height and certain chest measurements to heart size (transverse diameter, frontal area, and cardiothoracic ratio). Presently available tables, formulas, and nomograms for predicting heart size were compared with obtained data. Prediction tables were prepared on the basis of the measurement of this study.

Taylor, F.V. HUMAN ENGINEERING AND THE DESIGN OF TASKS. APU 260/56, June 1956, 15pp. Applied Psychology Research Unit, MRC, Cambridge, England. (USN Research Lab., Washington, D.C.).

12,785

The objectives of the human engineer, or engineering psychologist, are defined and various approaches suggested. The approach dealt with in this paper is to consider the man as a data-processing element in the overall system and to seek to reduce the complexity of the processing task. Display-control compatibility is used as an example when man is called upon to make discrete responses. Systems requiring continuous performance by the operator require coding and computing operations. Ways of simplifying both operations are considered. Quickening is given a psychological explanation and shown to reduce both coding and computing operations. G. I. R 18

Torrey, Jane W. EVALUATION OF COLOR-VISION TESTS. A COMPARISON OF DISCRIMINATION THRESHOLDS FOR BRIGHTNESS AND SATURATION IN DEUTERANOPIC, DEUTERANOMALOUS, AND NORMAL OBSERVERS. FINAL PROJECT REPORT. Contract NORR 996(03), Dec. 1958, 21pp. Connecticut College.

12,787

Discrimination thresholds for brightness and chromaticity differences were measured in observers ranging from deuteranopes to normals (two deuteranopes, two moderately and one mildly deuteranomalous, and two normals). Chromaticity discrimination was measured along two dimensions on the I.C.I. Diagram, both passing through the neutral center so that differences on either side were differences of saturation. One line approximated the dimension of maximum confusion for deuterans (bluish red and bluish green), the other of minimum confusion (blue and yellow). The thresholds were compared for differences due to degree of color defect.

Touger, M.L., Meeker, W.F. & Simshauser, E.D. STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS. FINAL REPORT. PHASE II. ELECTRONIC NOISE REDUCTION. Contract DA 36-039 SC 64469, Spec. SCL 1502, SIGEL CMB Projs. 132B, 843D, File 94 PH 91(4307), Feb. 1959, 88pp. Surface Communications Engineering Defense Electronic Products, Radio Corporation of America, Camden, N.J.

12,788

The use of electronic noise reduction to improve signal corps voice communication systems for use in high noise level environments was studied. Three systems were considered: a cavity open-loop system; a cavity feedback system; and a free-field feedback system. The theory of operation of the systems was developed and design procedures established. Each system was tested experimentally and its feasibility for use analyzed. Headsets with improved noise attenuation were also examined. Recommendations are included for means of improving communications in armored vehicle noise.

Turner, S.H., Wallace, W.H. & Wessel, A.E. ERRORS IN INFORMATION-PROCESSING BY HUMAN BEINGS. DA Proj. 3 99.12 023, SC Proj. 132C, WE 56 U M 6, Oct. 1956, 13pp. The Institute for Cooperative Research, University of Pennsylvania.

12,789

This report is third in a series concerning the effects of surplus information on the efficiency of human processing. The data from previous experiments were analyzed to answer the questions: 1) Does the number of mistakes made in information processing vary with general intelligence? and 2) Does the number of mistakes vary with the presence of increasing amounts of surplus information? The experiments involved 48 subjects selected on basis of high Army Classification Test scores (from 115 to 150). Each task contained input messages, rules, and the desired output message to be derived by applying the rules. Either excess or redundant messages were included. The implications of the findings for training, filtering and selection are discussed.

Tear, D.G., Turner, S.H. & Wallace, W.H. PRESENTATION: (II). HOW PREVIOUS EXPERIENCE AFFECTS RESPONSE IN AMBIGUOUS SITUATIONS. DA Proj. 3 99.12 023, SC Proj. 132C, WE 57 U M 1, Feb. 1957, 8pp. The Institute for Cooperative Research, University of Pennsylvania.

12,790

To investigate how past experience based on definite information affects present response to ambiguous information, three experiments were devised in which the task was to conclude which of the conditions (represented by symbols) was true. Three types of input sets of symbols were used; the first two sets were "forcing" in that they always resulted in a decision that a certain condition was true while the third set conveyed ambiguous information from which it was impossible to make a decision. The subjects, however, were required to make a decision in all cases. The experiments varied in the number of forcing sets (four, six, and eight) performed before the ambiguous set. Responses to ambiguous sets were analyzed as similar to or different from those previously made.

Vernon, M.D. THE ASSESSMENT OF 'PERCEPTUAL ABILITY'. MRC 47/151, A.P.U. 29, July 1945, 17pp. Applied Psychology Research Unit, MRC, Cambridge, England.

12,793

To explore the problem as to whether there exists a definite and unitary "perceptual ability" varying with the individual, five series of perceptual material were presented to 22 subjects by the dazzle method (made gradually brighter against a mottled gray background). Errors in recognition (naming the object) and the illumination level at which the object was named were recorded. The data were analyzed by comparing performances of different individuals, and performance with different types of materials. The relationship of the performance on perceptual tests to performance on other tests was also examined.

Woodhead, Mariel M. EFFECTS OF BRIEF LOUD NOISE ON THE PERFORMANCE OF A VISUAL TASK. IV. AN EXPERIMENT WITH SINGLE BURSTS AT THREE INTENSITIES. R.M.P. 58/931, O.E.S. 321, Dec. 1958, 4pp. Operational Efficiency Sub-Committee, RMPRC, London, England. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,794

To determine whether the unfavorable effects of a missile noise on performance vary with the level of intensity of the noise, a decision-making task (Multi-Channel Test) was presented to 18 subjects. They performed the task under four conditions: in silence and with single bursts of missile noise of 80, 95, and 115 decibels. The analysis was concerned with the performance one-half minute or so after each burst. Differences between decisions made on the noise runs were compared to those on the silent run.

12,795

Winick, D.L., Nolan, C.Y. & Bernstein, B.B. A SURVEY OF ORGANIZATIONAL MAINTENANCE OF THE MEDIUM TANK. Contract DA 44 109 QM 650, DA Proj. 095 30 000, Tech. Rep. 45, May 1958, 35pp. Human Resources Research Office, George Washington University, Washington, D.C.

12,795

As one step in improving the maintenance of armor equipment, a study was made of organizational maintenance and of tank maintenance problems and training methods. The M48 tank equipment system, types of maintenance operations, and maintenance activities of organization personnel in four tank battalions were studied. The data were obtained from experienced maintenance personnel, from personnel on the job in the four battalions, and from maintenance records. These data were analyzed to produce an estimate of the maintenance activity reported in the unit records and a description and frequency estimate of actual maintenance activities of first and second echelon personnel. Training methods were also studied. T. G.

Wilkins, E.W.C. OZONE AS A HAZARD IN HIGH ALTITUDE FLYING. Rep. 203, Sept. 1958, 22pp. Advisory Group for Aeronautical Research & Development, NATO, Paris, France.

12,796

The high ozone content of the upper atmosphere is discussed as a hazard to high altitude flying along with possible methods of circumventing the problem. The process of ozone formation and its seriousness as a biological hazard constitute the main part of the report and it is deduced that there is what may be called an "Ozone Barrier" extending from about 50,000 to 150,000 feet above the earth's surface. In this region ozone content is considered a biological hazard to be taken into account in the design of any aircraft depending for cabin pressure on the pressure of outside air. High ozone concentration is discussed as it may affect the functioning of aircraft components. Further research is recommended.

Woodcock, A.H., Thwaites, H.L. & Breckenridge, J.R. AN ELECTRICAL ANALOGUE FOR STUDYING HEAT TRANSFER IN DYNAMIC SITUATIONS. Proj. Ref. 7-83-01 005B, Tech. Rep. EP 86, April 1958, 17pp. USA Environmental Protection Research Div., QM Research & Engineering Center, Natick, Mass.

12,797

An electrical analogue has been constructed to represent the heat transfer system between a clothed man and his environment. The primary purpose of the analogue was to provide a visual indication of the manner in which skin temperature and heat loss through clothing are affected by varying wind, air temperature, activity, and clothing system. The value of this approach in forcing the research worker to synthesize his concepts of heat transfer is discussed. An outline of methods, using the electrical analogue, for investigating the significance of various environmental activity, and clothing factors is presented. Problem examples are given and the possibility of using analogues for planning experiments with human subjects is discussed.

Whitfield, J.W. NOTES ON THE CAUSES OF ACCIDENTS. Brit. Med. Bull., 1950, 7(1-2), 73-75. (Applied Psychology Research Unit, MRC, Cambridge, England).

12,798

The necessity for keeping accident records which describe the accident situation and the resulting injury in systematic form is stressed. The information needed for such records is indicated together with methods of analysis. It is suggested that two major lines of investigation need to be pursued: 1) the study of general conditions which affect the chance of failure and 2) the study of differences between individuals. These two lines of analysis are discussed briefly.

Meyer, E.G., Vernon, J.A., Rahn, W.E. & Strother, W.F. COCHLEAR POTENTIALS IN THE CAT IN RESPONSE TO HIGH-FREQUENCY SOUNDS. Proc. Nat. Acad. Sci., Wash., Oct. 1958, 44(10), 1087-1090. (Department of Psychology, Princeton University).

12,799

Measurements of the cochlear potentials in cats were extended to 100,000 cycles. Both young and old animals were used. The data were analyzed graphically as equal-response curves representing the sound pressure, in decibels relative to one dyne/cm² square centimeter, required to produce a cochlear potential of one microvolt and intensity functions for tones from 1,000 to 80,000 cycles. Consideration is given to the question whether the uppermost frequencies affect the neural elements of the auditory system.

12,800

Wever, E.G., Vernon, J.A. & Lawrence, Merle. THE NATURE OF THE COCHLEAR POTENTIALS IN THE MONKEY. Acta Oto-Laryng., 1957, 42, 87-92. (Psychological Lab., Princeton University and University of Michigan).

12,800

Cochlear potentials were recorded in six rhesus monkeys and one green monkey in response to tones from 100 to 50,000 cycles. A sensitivity function was obtained by determining the sound pressure necessary to produce a standard response of one microvolt. Intensity functions were determined by varying the sound pressure and measuring the resulting potentials. In some animals the distortion arising in the ear was determined by applying a carefully filtered tone of 1000 cycles and measuring the response at this frequency and at harmonic frequencies up to 5000 cycles. The functions were analyzed graphically and discussed in relation to those obtained from other animals.

Watson, C.W. (Princ. Investigator). PHYSIOLOGICAL MECHANISMS DETERMINING IRRADIATION OF STIMULUS IN LIGHT SENSITIVE INDIVIDUALS AND LIGHT SENSITIVE ANIMALS. ANNUAL PROGRESS REPORT. MARCH 31, 1957 TO MAY 1, 1958. Contract DA-49 007 MD 734 01, 5 57, May 1958, 8pp. New England Center Hospital, Boston, Mass. (Tufts University School of Medicine).

12,802

This progress report deals with studies on a research project having, as its principal aim, the provision of an effective method, adaptable to mass application, for the detection in man of excessive sensitivity to light and a susceptibility to epileptic seizures. The subjects tested were 150 individuals with previously demonstrated, consistently reproducible light-evoked cerebral electrical abnormalities. The subject was exposed to a flashing light source during electroencephalographic recording before, during, and after a particular parameter of the stimulus or condition of the subject. Progress on this program is reported.

Waldron, D.L. CENTRAL REPOSITORY FOR HEARING CONSERVATION DATA. AN EXAMINATION OF THE FIRST YEAR'S REPORTING. Rev. 3 59, Oct. 1958, 20pp. USAF Air University, Randolph AFB, Tex.

12,803

This report discusses the problem areas associated with the gathering and reporting of hearing conservation data as required by Air Force Regulation 160-3, "Hazardous Noise Exposure." One part of this regulation requires that a form on hearing conservation data be accomplished and one copy filed in the Central Repository for Hearing Conservation Data. This analysis and discussion of problem areas is based on one year's experience in handling and summarizing the data. The subtitles of the data form are used as paragraph headings: reference audiogram, department or location, job or noise code, time in job, exposure time, previous exposure, age, and loss of hearing.

Zwaan, E.W.J. THE MOON ILLUSION. Rep. IZF 1958-10, Dec. 1958, 16pp. Institute for Perception RVO-TNO, Soesterberg, The Netherlands.

12,805

The main concepts that have been used to explain the moon illusion, size constancy and angle of regard, are discussed. Limitations of these explanations are noted. An attempt is made to unify the two concepts in one theory, using vital spaces as a starting point. Directions and limitations of this vital space are defined by our potential movements; horizontally it is more extensive than it is vertically. Within the space there is size constancy; beyond it size constancy fails. This concept is further developed to explain the various aspects of the phenomenon under consideration.

Coppola, A.F. FINAL REPORT ON TEST OF THE T43 FULL FIELD COINCIDENCE RANGE FINDER TWENTY-FIRST REPORT ON PROJECT TT2-689. DATES OF TEST: 7 SEPTEMBER 1954 - 30 JANUARY 1956. DA Proj. 513-02-052, OOD Proj. TT2 689, Rep. 21, Feb. 1956, 67pp. USA Development and Proof Services, Aberdeen Proving Ground, Md.

12,807

To determine the effectiveness and performance of the coincidence Range Finder, T43, a series of studies have been completed. Three prototype T43 range finders were mounted according to specifications as an integral part of the sighting system in a standard tank, 90 millimeter gun, M47. The analysis of ease of operation, time necessary for obtaining proficiency, and general effects produced by weather conditions, camouflaged targets, light transmission, etc., uses data reported in earlier partial reports and memoranda. To further augment those data, comparisons in ranging were made with a stereoscopic Range Finder, M12. Recommendations for further testing are made.

Duntley, S.Q. THE LIMITING CAPABILITIES OF UNAIDED HUMAN VISION IN AERIAL RECONNAISSANCE. Jan. 1953, 9 pp. Armed Forces-National Research Council Vision Committee Secretariat, University of Michigan. (University of California).

12,818

The ability of the human eye to recognize objects on the ground from moving aircraft was investigated as limited by the observer's speed and altitude, by atmospheric and lighting conditions, by contrast formed by the object and its background, and by the size and shape of the object. Limitations imposed by aircraft structure and by environment were ignored. Established techniques for the prediction of the limiting range at which objects can be visually detected were extended by means of new theory and new data and guided by reconnaissance experiments at model scale. Target recognition was studied and correlations between recognition and detection were found for the circumstances and targets encountered in visual aerial reconnaissance.

 Fiorentini, A. & Radici, T. BRIGHTNESS, WIDTH AND POSITION OF MACH BANDS AS A FUNCTION OF THE RATE OF VARIATION OF THE LUMINANCE GRADIENT. Contract AF 61 (514) 634C, AFOSR TN 58 676, Series II, No. 820, March-April 1958, 12pp. Pubblazioni Dell'Istituto Nazionale Di Ottica, Arcetri, Firenze, Italy.

12,819
 To make a quantitative evaluation of the Mach band (simultaneous contrast effect produced by sharp variation in luminance gradients) characteristics as perceived in a field where the luminance varies in one direction, two observers determined the brightness, width and positions of Mach bands by the method of binocular comparisons. Five fields were tested which varied in the extent of the graded zone of luminance distribution (from eight to 45 minutes of arc). Both the bright and dark bands were measured. The data were analyzed as a function of the width of the zone of varying luminance. An explanation of the results is offered.

 Foitzik, L. THE CONTRAST THRESHOLD OF THE EYE WITH RELATION TO THE PROBLEM OF VISIBILITY. CONTRIBUTIONS TO THE DETERMINATION OF THE DAYLIGHT VISIBILITY RANGE. Meteorological Service German Democratic Republic Publication No. 8, 1951, 78pp, 1958. Armed Forces-National Research Council Committee on Vision, Department of Physics, University of Florida. (Akademie-Verlag, Berlin, Germany).

12,821
 This report presents a series of investigations of the contrast threshold for natural visibility targets out-of-doors. Two methods were used: 1) photometric determination of the apparent brightness of such targets, which are found approximately at the limit of visibility, as well as the luminance of their immediate surroundings and calculations of the contrast and brightness threshold; and 2) visibility ranges for targets of different visual angles were determined with and without magnifying glasses and the contrast threshold calculated. The construction and testing of a large telephotometer are described. Summary tables of measurements are appended.

Coleman, H.S., Coleman, Madeline F., Clark, D.G. & Harding, S.W. OPTICAL QUALITY STUDIES OF INSTRUMENTS OF NAVAL INTEREST. Contract NORD 7958, Task C, NAVORD Rep. 436, April 1948, 100pp. USN Bureau of Ordnance, Washington, D.C. (Pennsylvania State College)

12,831

During and since World War II, a number of new or improved methods have been developed for evaluating the quality of optical systems. These methods, utilizing five different types of apparatus (Kinetic Definition Chart, Diopometer, Interferometer, Contrast Rendition, Light Transmission) were used to study a number of optical systems of interest to the Navy. The study involved 178 specimens of 55 different designs of visual telescopic systems. The summary data were tabulated and compared with data that should have been obtained from fault-free instruments. Such tabulations may be used to evaluate the various designs and form a basis for specifying desired properties of future designs.

Coleman, H.S. LITERATURE SURVEY OF MATERIAL PUBLISHED RELATING TO SPECIFICATIONS OF HAND HELD BINOCULARS. Contract NSCNR 266, Nov. 1953, 59pp. Armed Forces-NRC Vision Committee Secretariat, University of Michigan. (The University of Texas).

12,833

A survey was made of literature pertinent to the design of hand held binoculars intended to be used visually. This survey covered over 5000 open and classified literature items published during the past 116 years (the majority of the more important works were completed during the World War II years). An analysis of the literature was based, for the most part, on the influence of the design properties of the binoculars on detection problems. Recommendations are made for the optical design and procurement agencies of the Armed Forces. A bibliography of references pertinent to binocular specifications is included.

Byrnes, V.A., Scofee, R.G. & Wolpaw, B.J. MANUAL OF INSTRUCTIONS FOR CLINICAL TESTING OF VISUAL ACUITY. Dec. 1951, 19pp. Armed Forces-NRC Vision Committee, University of Michigan.

12,834

This manual presents a revision of the Manual of Instructions for Testing Visual Acuity, Army-Navy-NRC Vision Committee, October 1, 1947. The developments that have made revision necessary are: a machine test for mass testing of visual acuity and new chart tests for clinical testing of far and near visual acuity. This present manual is for use in administering these clinical tests so that standard conditions will prevail. Directions are given for the examination and testing room, equipment and illumination. Test charts are included.

Boudurant, S. & Finney, W.A. THE SPATIAL VECTOR-CARDIOGRAM DURING ACCELERATION. Proj. 7216, Task 71712, WADC TR 59 263, June 1958, 8pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,837

Electrocardiographic and spatial vector-cardiographic effects of several patterns of positive, negative, and transverse acceleration were recorded on healthy young male subjects. The patterns of acceleration included rapid and gradual onset, durations varying from a few seconds to one hour, use of anti-G suit, and number of runs from five to 28. The records were studied for changes that occurred and are discussed in relation to previous studies.

Blackwell, H.R. OPTICS AND VISION. PERIOD 1 FEBRUARY TO 31 JULY 1956. Report of Project Michigan, 2144 159 P, Nov. 1957, 25pp. Vision Research Labs., The University of Michigan.

12,838

The progress of this project, concerned with basic aspects of visual surveillance, is set forth. Three types of studies are described: 1) development and study of tests of illumination, optical, electro-optical and physiological aids, 2) improved visual and photographic surveillance procedures, and battle-area techniques, and 3) background studies leading to the construction of visibility-forecasting charts. These studies involve the following basic aspects of visual surveillance: 1) target and background characteristics, 2) optical properties of the atmosphere, and 3) operating characteristics of the eye.

Berger, C. LEGIBILITY OF LETTERS. Nordisk Medicin, 1951, 45, 789-797. O.N.I. TR. 1186. (Ophthalmological Div., National Hospital, Copenhagen, Denmark).

12,839

The experiments discussed in this paper concern the problem of legibility. The concept of legibility is deduced after an examination of Snellen's original theoretical idea for visual acuity measurements and the physiological-optical functions actually involved in visual acuity measurements with Snellen's letter types. Using the Snellen method of size measurement, modified by varying letter size through changing distance between the eye and the letter, two numerals "5" and "0" and one letter "E" were studied for the influence of height and width on legibility. Some clinical potentialities as well as implications for other research are discussed.

Barr, N.L. IFR FLIGHT WITHOUT ATTITUDE INSTRUMENTS. Res. Rep. NM 15-01 00.01.01, April 1958, 6pp. USM Medical Research Institute, Bethesda, Md.

12,840

To determine how effectively trained instrument pilots can fly without the primary attitude instruments, the performance of 14 pilots using only the gyrocompass, the altimeter, the air-speed indicator and the clock was compared with their performance using a normal instrument panel. Four trial flights were made and the maximum deviation from the prescribed values for heading, altitude, air speed, climb rate, or turn rate recorded for each maneuver. The results are discussed in terms of whether under practical conditions a pilot can perform instrument flight within acceptable limits when direct information on orientation to the earth is not available.

12,842

This is the final report in a series dealing with man as an information transducer. The main interest in the studies has been to define man's capabilities in terms that are usually associated with the description of machines. In this study an attempt has been made to specify some of the properties associated with data processing. Subjects were presented a variety of tasks chosen so that 1) in the majority either a single response or very simple responses were required, 2) the stimuli consisted of simple and familiar symbols or situations, 3) each response could be formulated by making a sequence of simple, unambiguous decisions, 4) each response required many such decisions, and 5) the tasks were self-paced. Response times were analyzed in terms of the stated purpose. R 7

Krumm, R.L. & Newman, P.H. ACCURACY OF INFORMATION ON LINE WORK ORDERS FOR ARMAMENT-ELECTRONICS MAINTENANCE. Contract AF 41(657) 119, Proj. 7950, Task 17077, WADC TR 58 490, Dec. 1958, 34pp. USAF Personnel Lab., Lackland AFB, Tex. (American Institute for Research, Pittsburgh, Penn.).

12,845

To determine the accuracy of mechanics' statements of time required to complete a trouble shooting task for armament-electronics maintenance, ten weeks were spent at two Armament-Electronics squadrons observing representative tasks. Observations were made of time spent by mechanics in performing 76 typical steps of a trouble shooting job. These observations were compared with the mechanics' statements of time required as obtained from Line Work Orders for accuracy of report. Various sources of inconsistency and error are discussed. The feasibility of using the Line Work Orders to obtain work time data for use as a measure of job effectiveness is discussed.

Johnson, E.V. & Ruck, G.E. **LINE VISION IN THE CHROMATIC.** *Psych. Arch. 24, 1943, 254-255, 1943-1944.* T 104.

12,897

This paper describes one experiment in a series on the effect of the extent of visual field on the accuracy of colorimetric measurements. The angular subtense of the visual fields equalled 1.9, 4.1, 5.3, and 10.5 degrees. Measurements were made for gray, pink, green, cyan, blue, and purple at each extent except the largest where only gray could be measured. The experienced observers participated in the measurements. On the basis of 100, 50, and 25 measurements, coefficients for color C_v of each sample and their errors were calculated in the system of the apparatus. The mean relative decrease in the error for a field of 5.3 degrees as compared with one of 1.9 degrees is shown. Graphical representation is included.

McFarland, E.A. **ANEMIA: ITS EFFECT ON THE PHYSIOLOGY AND BIOCHEMISTRY OF THE BRAIN AND ON BEHAVIOR.** *Med. and Biol. Sci., 1932, Chap. 22, 325-326.* (Harvard School of Public Health).

12,899

The way in which anemia may give rise to certain physiological changes in the brain resulting in very direct and striking changes in behavior is discussed. The approach is biological, demonstrating that sensory and mental deterioration and even loss of insight may result from altered metabolism in the nervous tissue. Several studies are reviewed to show how it is possible to relate in a quantitative way alterations in sensory function, such as light sensitivity, to the amount of oxygen in the arterial blood. Effects of anemia on complex mental functions are considered. Experiments at high altitude in the Andes as well as in low-oxygen chambers at sea level are reviewed. The final section deals with the role of anemia in certain mental disorders.

McFarland, E.A., Massey, A.L. & Fisher, H.B. **AGE AND THE PROBLEMS OF PROFESSIONAL TRUCK DRIVERS IN HIGHWAY TRANSPORTATION.** *J. Aeronaut. Sci., July 1934, 23, 330-342.* (Harvard School of Public Health).

12,901

This report presents some data and interpretations concerning the age characteristics of workers in the highway transportation industry with the purpose of pointing out the significance of these considerations for personnel management in the field and also for broader problems of vocational adjustment of workers of all ages. The data show the ages of defined samples of truckdrivers, relation of occupational experience of newly employed drivers to age, ages at employment and separation, and age at which learning to drive automotive vehicles occurred. Known physiologic and psychologic changes associated with age are related to the occupation. Data on truck accidents are analyzed with respect to age. Retirement programs for the industry are discussed.

McFarland, E.A. & Fisher, H.B. **ADAPTATION IN DARK VISION AS A FUNCTION OF AGE.** *J. Aeronaut. Sci., Oct. 1934, 23(4), 424-428.* (Harvard School of Public Health).

12,902

To investigate changes in dark adaptation as a function of age, 204 males between the ages of 20 and 60 years were tested by means of the Night-Shiner adaptation meter. An artificial pupil was used to control the change in pupil size which is known to vary with age. The mean adaptation curves for each age group (five year groupings) were plotted. The final level of dark adaptation and the rate of adaptation were analyzed for their relationship with age. The results are discussed in relation to evidence in the experimental literature and the theoretical implications are pointed out. Practical significance for night driving and flying is considered.

12,903

McFarland, E.A. **SELECTED PROBLEMS IN CIVILIAN JET AIR TRANSPORTATION.** Sept. 1938, App. The Daniel & Florence Guggenheim Aviation Safety Center, Cornell University. (Harvard School of Public Health).

12,903

This paper presents the thesis that flight performance should be considered as a dynamic unit of interacting components including the pilot, his equipment, and the environmental flight conditions. A new approach to the study of this "system," which has been made possible through recent technological developments in the electronic field, is discussed. Important areas in which quantitative information is needed are the 1) relationship between pilot and design of aircraft, 2) influence of changes in skill with age on the safety and efficiency of flying, 3) operational aspects of fatigue, and 4) evaluation of flight proficiency.

T. G. I. R 25

12,904

McFarland, E.A. **HUMAN FACTORS IN INDUSTRIAL SAFETY.** *J. Aeronaut. Sci., Safety Engng., Aug. 1937, 39-48.* (Harvard School of Public Health).

12,904

Control of industrial accidents is discussed in relation to 1) the employee, 2) the worker in relation to his equipment, and 3) the environmental setting. The use of accident analyses in accident prevention and the role of such factors as personal adjustment and age are considered. The design of machines and equipment in terms of human capabilities and limitations is an area considered in the reduction of error and accidents. The interaction of the worker, equipment and environmental variables influencing comfort, efficiency and safety is stressed.

McFarland, R.A., Decon, A. & Stoudt, H.W. Jr. ANTHROPOMETRY IN THE DESIGN OF THE DRIVER'S WORKSPACE. *Amer. J. Phys. Anthropol.*, March 1958, N.S. 16(1), 1-23. (Harvard School of Public Health).

12,856

This paper discusses differences in body size which may have serious implications for the comfort, efficiency, and safety of vehicle drivers. Methods whereby data on human body size may be systematically incorporated into vehicular design are outlined. The value of both "static" and "dynamic" human dimensions to the design engineer are considered. The 5th, 50th, and 95th percentiles of 30 pertinent body dimensions of 360 commercial bus and truck drivers are presented. Specific values are recommended for a sample of cab dimensions closely linked to human dimensions. General aspects and principles of applied anthropometry are discussed.

McFarland, R.A. & Dooley, E.G. EXPERIMENTAL STUDIES OF NIGHT VISION AS A FUNCTION OF AGE AND CHANGES IN ILLUMINATION. *Bull.* 191, 1958, 17-32. *Highway Research Board*, Washington, D.C. (Harvard School of Public Health).

12,860

The importance of a knowledge of night vision or dark adaptation phenomena facts for highway engineers and vehicle designers is discussed. Experimental studies of the effects of the more important variables upon the degree of night vision are reviewed: pre-exposure, light-wave frequency, levels of illumination on visual acuity, changes of illumination on depth perception, glare, light shock, and changes in physiological states such as occur with oxygen deprivation, insulin hypoglycemia, high blood sugar levels, and carbon monoxide anoxia. A series of experiments are reported on dark adaptation, recovery from light shock, visual acuity, depth perception and visibility under glare conditions when targets were seen through a tinted windshield.

Rautian, G.M. & Dekina, V.I. SMALL VISUAL FIELDS IN COLORIMETRY. *Proc. Acad. Sci. USSR*, 1949, 66(5), 859-862. T 1869.

12,866

To establish a relationship between the size of the visual field and the sharpness of the discrimination of colors, the value of error in colorimetric measurements of a number of colored light filters (gray, bluish-green, violet, purple, and pink) were made for fields subtending visual angles of 1.9, 1.12, 0.84, 0.47, 0.33, and 0.12 degrees. One experienced observer made five consecutive determinations for the equality of color in both halves of the visual field of the colorimeter for each light filter. The effect of the decrease in visual field on error of color determinations was analyzed.

12,867

Rautian, G.M. INVESTIGATION OF COLOR VISION OF 995 PERSONS. *Proc. Acad. Sci. USSR*, 1950, 74(6), 1073-1076. T 2302.

12,867

The results of an investigation of color vision of 995 eighteen-year-old males are presented. The examinations were made using a new anomaloscope (see 12,868) based upon the principle that anomalies of color vision result from reduction of sensitivity of each of the three eye receptors. Distributions of the number in each group (red, green, blue) possessing one of the threshold values of the color discrimination in a direction parallel to the corresponding axis of the basic physiological coordinate system were analyzed. The data were also divided into three groups for further analysis: 1) normal--none of thresholds deviated by more than a factor of two, 2) one receptor with poorer sensitivity, and 3) any two receptors with poorer sensitivity.

T. G. R 6

12,868

Rautian, G.M. NEW ANOMALOSCOPE. *Proc. Acad. Sci. USSR*, 1950, 73(1), 99-101.

12,868

A new anomaloscope for investigating defects of color vision is described. The basic feature of the instrument is separate testing of the sensitivity of each of the three receptors of the eye by gradually changing the action on one of the receptors tested while the action of the other two is kept constant. The principle of operation and a sketch of the internal structure of the anomaloscope are presented.

Cogle, K.W. SOME ASPECTS OF THE BASIS OF STEREOSCOPIC VISION. From the Confidential Proceedings of the 33rd Meeting, Armed Forces-WSC Vision Committee, Nov. 1953, Fort Knox, Ky., 6pp. Executive Secretariat, University of Michigan. (Division of Physics & Biophysical Research, Mayo Clinic, Rochester, Minn.).

12,871

The problem of whether stereoscopic vision rests upon a neuro-anatomical and physiological basis or whether it is fundamentally a psycho-physical phenomenon is discussed and the results of an experimental investigation are reported. The subject viewed a bright vertical line as a reference object through a horizontal slit-aperture and a septum and judged whether the test object (line or falling sphere) appeared farther or nearer than the reference line. A screening device of two baffle plates was adjusted in such a way that one eye saw the upper and the other the lower portion of the test line--both eyes could see a central portion of the line. The findings are discussed in terms of a "quantitative" and a "qualitative" concept of stereoscopic depth perception.

Samsonova, V.G. CHANGES IN THE LIGHT-SENSITIVITY RESULTING FROM THE INFLUENCE OF SUCCESSIVELY APPLIED MONOCHROMATIC EXCITATIONS. *Proc. Acad. Sci. (USSR)*, 1949, 64(5), 664-672. T-1737.

12,873

This paper reports experimental data collected during a study of changes in thresholds of light sensitivity of the organ of peripheral vision when stimulations were made successively with monochromatic light of a threshold intensity of the same or complementary color spectral radiation. The wavelengths used were 660, 580, 530, and 479 millimicrons; the field of observation subtended a visual angle of one degree. Three observers made ten successive threshold determinations in seven minutes, with a subsequent pause of five minutes, over a period of one hour. Control measurements were made every hour. The results are discussed in relation to the physiological basis for color vision.

Schaefer, C., Kliefoth, W. & Von Wolff-Breslau, T. INFLUENCE OF COLORED GLASS FILTERS ON VISIBILITY. RESULTING FROM VARIATION OF LUMINANCE CONTRAST, HUE CONTRAST, AND SATURATION CONTRAST. *Zeitschrift Fur Technische Physik*, 1943, 24, 125-140, T 1379.

12,876

The influence of the change of the color contrast by ordinary colored sheets of glass (Neophane and Umbral) on visibility was investigated. On the basis of two older investigations, the effect of colored glass filters on luminance contrast and its effect on visual acuity are discussed. Some new experimental studies were conducted and are reported here. In addition, the influence of the glasses on chromaticity contrast of adjacent and non-adjacent hues and on the saturation of the hues is investigated experimentally. The results from studies on the three components of color sensation (luminance, hue, and saturation) were analyzed to yield the color contrast effects.

Sidorsky, R.C. & Newton, J.M. SHIP CONTROL IV. AN EMPIRICAL EVALUATION OF THE UTILITY OF A PITCH-RATE INDICATOR IN SUBMARINE DEPTH CONTROL. Contract NMR 2512(00), Proj. SUBIC, Electric Boat Tech. Rep. 411 HF 21, P58 217, Dec. 1958, 13pp. Electric Boat Division, General Dynamics Corporation, Groton, Conn.

12,875

To determine whether or not a significant improvement in control of a submarine in depth results from the addition of a pitch-rate indicator to the instrument panel, seven operators performed simulated depth-control maneuvers under two display conditions. One display consisted of conventional depth-control instruments; the second used the same display with the addition of a pitch-rate indicator. Two maneuvers were performed, changing depth 200 feet up or down (depth seeking) and maintaining a constant depth while counteracting a cyclic forcing function (depth keeping). Graphic records of performance were analyzed for effects of the added display.

Sidorsky, R.C. SHIP CONTROL VI. STEERING AND DIVING A SUBMARINE WITH A CONTACT ANALOG DISPLAY. Contract NMR 2512(00), Proj. SUBIC, Electric Boat Tech. Rep. 411 HF 20, P58 212, Dec. 1958, 27pp. Electric Boat Division, General Dynamics Corporation, Groton, Conn.

12,876

This report details the fourth in a series of experiments designed to evaluate a display concept as embodied in the Contact Analog (CA) which displays information (by perspective transformation of a three-dimensional space model) about position, motion in all six degrees of freedom, and the cross-coupling effects between all degrees of freedom. Five men were trained over a five-day period to interpret a dual-surface CA display and to steer and dive a simulated submarine with conventional instruments. After training, the subjects were tested on their ability to perform the maneuvers using only information provided by the CA display. Performance data were compared.

12,878

This study investigated the ability of observers to localize circular targets when these were in the frontal plane of the visual field. Targets consisting of single blackened circles (20 minutes in diameter) were presented tachistoscopically at each of four eccentric locations relative to the fixational center along four meridian lines passing through the center of fixation. The observers were required to indicate the half-meridian on which each target fell. Background luminance was 6.8 foot-lamberts and target exposure was for 0.075 seconds. Mean number of errors was determined for the thirty-two target positions.

Yrakov, S.V. EFFECT OF THE COLOR ADAPTATION OF THE EYE UPON ITS REACTIVITY IN RELATION TO INADEQUATE STIMULATING AGENTS. *Proc. Acad. Sci. USSR*, 1949, 64(2), 203-206. T 1935.

12,879

To determine the effect of color adaptation of the eye upon the character of change in the cone sensitivity of the eye when inadequate stimulating agents are used, thresholds of visibility of monochromatic radiations (green and red) were taken. The inadequate stimuli were electricity and/or sound. The procedure involved 15 minutes adaptation to one of the colors, threshold determinations, ten minutes stimulation with the inadequate stimulus, and further threshold measurements. The resulting changes in sensitivity were analyzed.

Huffaker, C.L. INVESTIGATION OF MAP REVISION TECHNIQUES AND EQUIPMENT. SECOND INTERIM TECHNICAL REPORT. Contract DA-44 009 ENG 3243, Proj. 8 35.03 222, Sept.-March 1958, 38pp. Mark Hurd Aerial Surveys, Inc., Minneapolis, Minn.

12,880

The second phase of an investigation into the field of military map revision is reported. The nature of the maps, aerial photography, and general problems likely to be encountered in map revision were investigated. Instrumentation of existing and possible map revision systems were analyzed. With consideration of certain photographic developments now in progress such as orthophotographs and/or tilt-free photography, an interim instrument is recommended which will permit efficient map revision while awaiting final development of the improved techniques.

Hirsh, E.R. VISUAL RECOGNITION ALONG VARIOUS MERIDIANS OF THE VISUAL FIELD. XIII. LINEAR BINARY PATTERNS AT KNOWN ECCENTRICITIES. Contract DA 36 039 SC 52554, Proj. MICHIGAN, Rep. 2144 316 T, Sept. 1958, 14pp. Willow Run Laboratories, University of Michigan.

12,888

To evaluate the importance of knowledge of target location relative to fixation in the recognition of multiple-element targets, two experiments were conducted using eight- and ten-element targets. The targets, consisting of linear patterns of blackened and open circles, were presented in the frontal plane of the visual field at inclinations of 0, 45, 90, and 135 degrees with respect to the horizontal meridian. The fixation point was varied so that it either bisected or appeared just off either end of vertical and horizontal targets. The observer knew that, regardless of location of fixation point, the target centers always registered with the center of the visual field. Errors in pattern reproduction were analyzed as a function of the eccentricities. I. G. I. R 5

Hirsh, E.R. VISUAL RECOGNITION ALONG VARIOUS MERIDIANS OF THE VISUAL FIELD. X. BINARY PATTERNS OF THE LETTERS "H" AND "O". Contract DA 36 039 SC 52554, Proj. MICHIGAN, Rep. 2144 308 T, Nov. 1958, 12pp. Willow Run Laboratories, University of Michigan.

12,887

To investigate human binary pattern reproduction accuracy for linear target arrays 11 observers were tested. Eight-element patterns of the printed letters "H" and "O" were presented tachistoscopically at inclinations of 0, 45, 90, and 135 degrees to the horizontal of the frontal plane of the visual field. The observer's task was to reproduce the meridian along which the target appeared as well as the pattern of letters. Errors in pattern reproduction were analyzed for effect of inclination and for letter position in relation to point of fixation. The results are discussed in relation to theoretical positions of visual perception. Implications for military surveillance problems are indicated. I. G. I. R 5

Hansen, R.G. & Blackstock, D.T. FACTORS INFLUENCING THE EVALUATION OF EAR PROTECTIVE DEVICES. Proj. 7210, Task 71700, WADC TR 57 772, May 1958, 30pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

Since the number of subjects and the number of measurements necessary to obtain a reliable value for the average attenuation of an earplug under specific, controlled conditions, the method established by the American Standards Association for determining "real-ear" attenuation of ear protectors was employed. Attenuation values for the V-51R earplug were obtained at each of nine frequencies for each of 20 subjects. Testing was repeated on five separate occasions. From the data analysis predictions were made as to how many measurements are needed to obtain attenuation values with given confidence limits. Some of the physical causes of the variability are discussed. I. G. I. R 9

Gray, R.F. & Crosbie, R.J. VARIATION IN DURATION OF OCULOGYRAL ILLUSIONS AS A FUNCTION OF THE RADIUS OF TURN. Proj. NM 10 01 12 2, Rep. 2, NADC-NA-5806, May 1958, 26pp. USF Aviation-Medical Acceleration Lab., NADC, Johnsville, Penn.

12,892

To investigate the effect of varying the radius of turn on visual illusions of rotation (oculogyral illusions), two subjects were exposed on a human centrifuge at radii of 6, 19, 33, and 50 feet to various angular accelerations. They were kept at a maximum velocity for 45 seconds, then decelerated. The oculogyral illusion was recorded as to time of occurrence, direction, and duration. These data were analyzed for effect of radius and repetition. The results are discussed in relation to theories of semicircular canal function. An endnote includes an analysis of effect of rotation on a fluid filled ring at various radii and description of sensations of rotation and tilt which occur on centrifuges.

Girden, E. (Proj. Dir.). SENSING MECHANISMS IN CONTROL OF FINE MOVEMENTS IN PERCEPTUAL MOTOR PRECISION. FINAL REPORT. Contract DA 49 007 MD 625, July 1958, 46pp. Brooklyn College, Brooklyn, N.Y.

12,893

For this project, a series of 11 experiments were completed involving over 700 test sessions. In the final series of studies reported here, precision of performance was measured for a wide range of sensitivities (0.11 to 1.54 foot-pounds torque) using a rotational pressure control in the pursuit tracking of a one-dimensional moving target. Comparison of performance with the pressure control was made to that with a free-moving control. A technique was devised to measure the psychophysics of "pressure-kinesthesia" and preliminary observations were obtained by "fractionation" and "Weber's ratio."

Harcum, E.R. & Blackwell, H.R. VISUAL ACUITY FOR RECTANGULAR AREA LINE GRATINGS WITH VARIOUS INCLINATIONS OF LINES AND RECTANGULAR AREA. Proj. MICHIGAN, Rep. 2144 319 T, Sept. 1958, 10pp. Vision Research Labs., University of Michigan.

12,895

The present study is concerned with the role of dioptric astigmatism in the relative acuity for a line-grating, composed of parallel black and white bars at various inclinations presented along different meridians of the frontal plane of the visual field. The meridian (0, 45, 90, and 135 degrees from horizontal) on which the test object fell was varied independently of the inclination of the lines within the rectangular area line-gratings. Luminance of target and field was about 7.4 foot-candle. Three observers reported the inclination of the lines in the gratings and an analysis of the error was made for the various inclinations and meridians in the visual field.

Sampson, P.B. HUMAN FACTORS IN HELICOPTER INSTRUMENTATION HOVERING DISPLAYS. SIXTH QUARTERLY PROGRESS REPORT. STUDY, DESIGN, AND DEVELOPMENT OF NAVIGATION DISPLAY FOR HELICOPTERS. Contract AF 33(600) 34034, Rep. 484.6, June 1958, 42pp. Laboratory for Electronics, Inc., Boston, Mass. (Institute for Applied Experimental Psychology, Tufts University).

12,916

This progress report comprises a detailed description of a laboratory evaluation of three proposed helicopter hovering displays, which is part of a larger study on the design and development of navigation displays for helicopters. A vector, cross-pointer, and moving-grid type display were compared in terms of human tracking performance in response to these displays on a compensatory tracking task. The results are in terms of integrated error scores and time on target scores. The results are interpreted and suggestions for the design of a helicopter hovering display are incorporated in the report.

Sanderson, J.A. & Tuve, R.L. THE ATTENUATION OF LIGHT BY SMOKE SCREENS. NRL Rep. H 1602, March 1940, 22pp. USN Research Lab., Washington, D.C.

12,918

In this study of attenuation of light by smoke screens, the spectral distribution of light transmitted by smoke screens sufficiently dense to hide completely a 500 watt tungsten lamp (focused) at a distance of 244 meters was determined. The transmission characteristics are analyzed and the problems of signalling and detecting enemy surface craft through smoke are discussed.

Spencer, J. JUDGMENT OF HEIGHT BY THE APPARENT OBLIQUITY OF FAMILIAR GROUND OUTLINES. FPRC 819, March 1953, 15pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

12,919

A series of experiments was performed to assess the accuracy with which people can judge their height when the judgment is based upon an obliquely-regarded familiar shape. Subjects viewed a basic shape produced by four small circular spots, one at each corner of an imaginary square (on the horizontal) and chose a "perspective shape" to match from a graded series of cards (placed perpendicularly to subject's line of sight). The three viewing heights gave angles between the subject's line of sight and the horizontal of 15°, 32°, and 48 degrees. Variations in illumination were achieved with neutral density filters placed over viewing position apertures. Viewing conditions were either monocular or binocular. The results are analyzed and discussed in relation to the problem of aircraft landing.

Paelson, V.J. CONTRACT AF33(616)-3710. PROGRESS REPORT. AUGUST 29, 1957. 125pp. Western Electric-Acoustic Laboratory, Inc., Los Angeles, Calif.

12,921

Progress is reported in the study of four microphone systems: 1) close talking pressure microphone, 2) gradient microphone, 3) pressure pickup in a noise shield, and 4) gradient pickup in a noise shield. These systems have been studied regarding their ability to reduce the effects of external noise, and also their effect on human speech. A noise spectrum and suitable words for articulation testing have been chosen. Several studies on speech levels are also presented. Types of microphones, earphones, and loudspeakers are presented in charts, and progress reports on studies of a high pressure helmet and communication in jet engine noise fields are included.

Pickert, J.M. PERCEPTION OF COMPOUND CONSONANTS. Language and Speech, Oct.-Dec. 1958, 1(4), 288-304. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

12,922

This study examined the perceptual confusions which arise with English compounds of two consonants. One defined class of syllables, made up of 15 initial compound consonants in conjunction with three vowel sounds (i, a, and o), and another class of 15 final compound consonants in conjunction with the same three vowel sounds, were used. Recorded syllables were played back against a white noise background and against a low-frequency noise background. Confusion matrices were derived from the data of six listeners.

Lit, A. THE EFFECT OF FIXATION CONDITIONS ON DEPTH-DISCRIMINATION THRESHOLDS AT SCOTOPIC AND PHOTOPIC ILLUMINANCE LEVELS. Proj. MICHIGAN, Rep. 2144 323 T, Nov. 1958, 12pp. Vision Research Labs., University of Michigan.

12,928

This study measured the precision of depth discrimination with a two-rod test apparatus involving real-depth cues. Effects due to different methods of fixating the rods have been assessed at each of a number of levels of equal illuminance presented to the two eyes. One method of fixation involved steady fixation on the movable comparison rod, while a second method involved steady fixation on the immovable standard rod, and, in a third, the observers fixated either of the rods. The results are discussed in relation to photochemical theories of vision and the current controversy concerning the role of convergence in stereoscopic acuity.

Kristofferson, A.B. MONOCULAR AND BINOCULAR DETECTION THRESHOLDS FOR TARGETS VARYING IN SIZE AND RETINAL POSITION. Proj. MICHIGAN, Rep. 2144 290 T, Nov. 1958, 16pp. Vision Research Labs., University of Michigan.

12,929

This report presents detection probabilities, determined by the temporal forced-choice method, for targets of several diameters between 2 and 64 minutes, for binocular and monocular target presentation. In one series of tests, the target was presented 20 degrees peripherally at zero background luminance, while in a second series of tests the background luminance was approximately ten foot-lamberts and target presentation was foveal. The data are evaluated in terms of three mathematical models of the visual detection system. Some discussion of the relation of these results to the problems of designing optical devices is included.

Kincaid, W.M. & Blackwell, H.R. APPLICATION OF PROBIT ANALYSIS TO PSYCHOLOGICAL DATA. I. TECHNIQUES FOR DESK COMPUTATION. Proj. MICHIGAN, Rep. 2144 283 T, Sept. 1958, 20pp. Vision Research Labs., University of Michigan.

12,932

The present report is the first of a series concerned with the reduction to usable form of data collected in experimental studies of visual detection. The method of data reduction discussed here is probit analysis. The method is described in general terms so that it should be readily applicable for use in the analysis of many classes of psychophysical data obtained in the study of human sensory processes of interest to surveillance systems. When thresholds are evaluated by probit analysis, a cumulative normal distribution function is fitted to the data in accordance with the principle of maximum likelihood. A procedure for solving the set of simultaneous equations with desk calculators is given.

Krendel, E.S. & Modinsky, J. VISUAL SEARCH IN AN UNSTRUCTURED VISUAL FIELD. Contract AF19(604) 1513, Final Rep. AFRC TR 59 51, July 1955 - June 1958. USAF Operational Applications Lab., Bolling AFB, Washington, D.C. (The Franklin Institute Laboratories for Research and Development, Philadelphia, Penn.).

12,933

To determine the time required to detect small visual targets in a broad unstructured visual field, search was conducted in a conventional experimental room with unaided binocular vision under the following conditions: different search areas, contrasts, background luminances, and target sizes of possible significance in field operations. Three thousand, seventy-two trials for each of four practiced observers supplied the data for testing the adequacy of an exponential distribution as a description of visual search phenomena.

12,935

This report presents a technique for electrically recording eye position and eye movements. The associated instrumentation, including a multichannel d-c differential input oscillograph and a special visual angulometer, is described in detail. Examples of several types of eye-movement recordings are presented, and the method of constructing "iso-potential eye-position maps" is outlined. Certain uses of these techniques in studies concerned with variations in the function of the visual system are briefly discussed.

White, W.J. & Riley, M.B. THE EFFECTS OF POSITIVE ACCELERATION ON THE RELATION BETWEEN ILLUMINATION AND INSTRUMENT READING. Proj. 7216, Task 71712, WADC TR 58 332, Nov. 1958, 9pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

12,940

This study is concerned with the manner in which accuracy of quantitative scale reading varies as a function of illumination and acceleration. Six subjects were exposed to accelerative levels ranging from one to four g and reading errors and time were measured for various levels of illumination of the instrument panel. Thus it was possible to determine whether or not a pilot's ability to read aircraft instrument dials at various levels of illumination is impaired by positive g-forces less than that required to produce blackout.

Zechman, F.W. Jr. THE EFFECT OF FORWARD ACCELERATION ON VITAL CAPACITY. Proj. 7222, Task 71746, WADC TN 58 376, Dec. 1958, 6pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Miami University).

12,952

This paper reports the measurement of the effect of forward acceleration on vital capacity for six human subjects. Vital capacities were measured using a Collins Respirometer. Using a rate of onset of 0.1 g per second, subjects were accelerated to maximums of 4, 6, and 8 g, after which subjects delivered two vital capacity volumes. The effect of the various levels of acceleration on vital capacity was determined with the subjects in two positions--trunk inclined 25 degrees and trunk perpendicular to the direction of acceleration. The results are analyzed and discussed.

SUBMERGED SUBJECTS UNDER VARIOUS CONDITIONS OF VISUAL
STIMULI. Proj. 12,943, Task 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100. Contract
DA 36-039 SD 52554, 2144-321 1, Nov. 1958, 12p.
Vision Research Labs., University of Michigan.

12,944
To study the problem of maintaining elevated performance under conditions of extreme fatigue, tests comprising the Army Identification Battery, the 1944 and 1948 combat aptitude area composite, four 10 test series and background information, and some experimental tests were validated against a criterion obtained in field combat situations. The criterion was based on standing by ten minutes on the desirability of having the specific enlisted man along on another similar mission.

DA 36-039 SD 52554, 2144-321 1, Nov. 1958, 12p.
Vision Research Labs., University of Michigan.

12,946
This report describes the capabilities and limitations of vision as a means of identifying and interpreting the many phases of military action. These are chapters and sections describing: on the following topics: nature and measurement of light, anatomy of the eye, optical, refractive errors, the visual field, psychophysical, visual capabilities and problems of visual performance, factors influencing vision outside the aircraft, atmospheric visibility, air-to-ground visibility, take-off, and landing, factors influencing vision within the aircraft, instrument description-approach-landing, and finally, summary, main findings and their use in interpretation and understanding.

Vision Research Labs., University of Michigan.

12,948
To ascertain the anatomical and/or physiological factors involved when experimental "convulsion" was produced, three principal factors were studied: rapid deceleration, total force imparted to the skull, and stretch of the cervical region. Methods were developed for effecting a reproducible "convulsion"; the criterion was abolition of reflex. With a test drop, and suitable instrumentation, the various force vectors were measured in rats. Anatomical studies were made in serial sections of the brain and kind of convulsed animals to establish the site and degree of neural damage.

Hamilton, G.E. THE EFFECTS OF PRACTICE ON THE VISUAL-DETECTION THRESHOLDS OF NAIVE OBSERVERS. Contract DA 36-039 SD 52554, 2144-321 1, Nov. 1958, 12p.
Vision Research Labs., University of Michigan.

12,950
To investigate the effects of practice upon visual-detection thresholds, three groups of naive observers were each given initial practice for nine or ten days on one of three visual-detection tasks. The tasks involved forced-choice detection of a circular target exposed against a uniform background of ten foot-lambert luminance. The target subtended either two or four minutes, and was exposed for either 0.04 or 0.5 seconds. Following initial practice on the condition, either target size or exposure duration was changed and several additional sessions were given to assess transfer effects. The significance of the results for both psychophysical threshold methodology and military observer training are discussed.

Harris, R.R. & Hale, A. VISUAL RECOGNITION UNDER VARIOUS CONDITIONS OF THE VISUAL FIELD: II. LINEAR STIMULI PRESENTED IN DIFFERENT DIRECTIONS. Contract DA 36-039 SD 52554, 2144-321 1, Nov. 1958, 4pp.
Vision Research Labs., University of Michigan.

12,952
To test the recognition capacity of human observers for linear binary targets at various locations in the visual field, linear arrays of eight elements (some open and others blocked) were presented tachistoscopically at four locations: vertical, horizontal, 45 and 135 degrees clockwise from vertical, and at nine eccentric locations relative to fixation. Each target was presented as a 4 element array and was to reproduce the location and choice pattern. Results were analyzed for effect of location in different areas of the visual field, of number fixation, and for sweep of information-identification.

Faulkner, B. ELECTROCARDIOGRAPHIC CHANGES OBSERVED
DURING THE FIRST HOUR OF RESIDENCE AT HIGH ALTITUDE.
Rep. 30 90, Aug. 1958, 4pp. USC School of Aviation
Medicine, Randolph AFB, Tex. (Institute of Avian
Biology, Faculty of Medicine, Lima, Peru).

12,972
To study the early electrocardiographic response to
hypoxia resulting from change in altitude, observations
were made on a group of 13 male subjects from the time of
their arrival at high altitude (10,000 feet) to the end
of one month's residence. The occurrence of the first
electrocardiographic changes was pinpointed, the magni-
tude of the changes was traced, and the evolution of
changes when the subjects returned to sea level was
noted.

McLison, J.L. AIRCRAFT EXTERIOR LIGHTING, TEST FACIL-
ITIES AND PERSONNEL, PROTECTING OF. FINAL REPORT. Proj.
150-72R AF 8226, Sep. 1, Dec. 1958, 2pp. USC Air Test
Center, Naval Air Station, Md.

12,973
This is a brief description of a project on aircraft
exterior lighting. The report describes the installation
of five lighting systems on a T-shaped rotating beam lo-
cated on a roof and an observation platform on the ground at
a distance of two miles. Communications were provided
between the two locations. Six pilot observers were used
as subjects for night observations over a period of one
month. The relative merits of each lighting system are
described in a subsequent report.

Hugh T. O'Neill & Associates. NEW COLOR RECONNAISSANCE
METHODS. FINAL REPORT. Contract AF 33(616) 262, Proj.
5(6 6271), Task 62104, 1956, 424pp. Hugh T. O'Neill
& Associates, Annapolis, Md.

12,974
To explore the possibilities of obtaining new and
better methods of military photo-reconnaissance particu-
larly by means of color photography, the recognition of
various military objects and their background on photo-
graphs was examined. A method of selecting best con-
trast conditions employing spectrophotometric reflectance
curves of objects, backgrounds and color filters is de-
scribed. Two instruments devised for comparing colored
and black and white films as they function in photo-recon-
naissance also are described. Other supplementary meth-
ods are listed. Tentative recommendations for manufac-
ture of film for this purpose are listed and discussed.

Koseley, H.G. & Shannon, R.H. USAF EJECTION ESCAPE
EXPERIENCE, 29 AUGUST 1949 THRU 30 JUNE 1958. M 12 58,
Nov. 1958, 35pp. USAF Directorate of Flight Safety
Research, Norton AFB, Calif.

12,975
This study analyzes 1,462 United States Air Force
ejection seat emergency escapes from the period 29 August
1949 through 30 June 1958. Results to personnel are
studied in relation to altitude, airspeed, attitude,
availability and use of automatic equipment, and other
pertinent factors. Problem areas associated with ejection
escape from high performance aircraft were sought
although few cases of attempted escape at supersonic
speeds were available. Recommendations designed to re-
duce the incidence of unsuccessful (fatal) ejections are
made in the areas of 1) operations and training, and
2) research and development.

Mintz, A. THE INFLUENCE OF ACCIDENT LIABILITY FROM
THE ACCIDENT RECORD. J. Appl. Psychol., 1954, 39(1),
41-48. (City College of New York, New York, N.Y.).

12,977
This paper presents a method for estimating the ac-
cident liability for a given individual in terms of his
known accident record. The solution is based on the as-
sumption that 1) accident liability of people is not
changed by accidents they are in and is not changed with
time, and 2) accident liability varies among people and
is distributed in a known manner Pearson Type-III curve.
Mathematical derivation of the formula is given and il-
lustrative results are presented. An error in the for-
mula as it appears in this article is corrected in a sub-
sequent note (Journal of Applied Psychology 32 (1955)
139.)

Mintz, A. TIME INTERVALS BETWEEN ACCIDENTS. J. Appl.
Psychol., 1954, 39(6), 401-406. (City College of New
York).

12,978
To investigate whether accident proneness is constant
for each individual or, conversely, increases with acci-
dents, accident records of 172 taxi drivers were studied
and time intervals between accidents compared to statisti-
cal expectancies based on the assumption that accidents
are distributed at random over a time period. Drivers
were classified according to number of accidents (1-25),
and mean time intervals between accidents were compared
for the various groups. Results are discussed as they
bear on the alternative hypotheses and findings are re-
lated to those reported by other investigators. Possible
reasons for disagreements are discussed.
T. R 13

12,979
Mintz, A. A METHODOLOGICAL NOTE ON TIME INTERVALS
BETWEEN CONSECUTIVE ACCIDENTS. J. Appl. Psychol.,
1956, 41(3), 189-191. (City College of New York).

12,979
In an earlier paper a suitable method of establishing
whether or not any given individual is accident prone was
based on comparison of the time interval before first ac-
cident, between early accident, and between later acci-
dents for the same individual. A different method, in-
volving comparison of frequency distributions of time in-
tervals between a particular pair of accidents to a the-
oretical distribution of time intervals, is presented in
this paper. Material is given which illustrates applica-
tion of the method to accident records of 67 taxi drivers
This material is compared to material presented by Horn
in his study of airplane pilots.

Margaria, Camillo; C. Spedini. INVESTIGATION OF THE FATIGUE IN MAN. FINAL REPORT. Contract AF 61(514) 637, AFOSR TR 59 117, Oct. 1958. 8pp. Laboratorio di Fisiologia dell'Universita di Milano, Italy.

12,982

This is a micrographed summary of techniques and research on the "Effect of stress on lower neuron activity," published elsewhere. To study some fundamental characteristics of lower neuron activity as a means of investigating fatigue in man, groups of volunteer medical students (number unspecified) were subjected to the activity of a) spinal neurons, motor, sensory and interneurons, b) the neuromuscular system and c) some supraspinal centers were studied under experimentally changed conditions. Results were treated in terms of: 1) fatigue proper, studying a number of stress inducing conditions, and 2) action of neurotropic drugs. There also was a group of experiments performed on animals to reproduce results in particular conditions in man. R 4

Contract N196 33946, SMC ACEL 548, TED SAN E. 52034, Part 15, Tech. Rep. 1, July 1957, 40pp. USN Air Crew Equipment Lab., Naval Air Material Center, Port.

12,993

A detailed examination of the alerting and directing functions of aircraft warning and caution signal system is made in terms of visual, auditory and efference capabilities as input channels. General recommendations are presented which translate to problems for further research. R 25

12,994

Vincent, D.F. ABOVE THE NORMAL CURVE DISTRIBUTIONS. Psychol. at Work, Jan. 1951, 1-8.

12,994

The purpose of this article is to try to clear away some of the superstitions surrounding the content of the normal curve without minimizing its importance. The topic is discussed by employing a variety of illustrations. T. G.

12,995

Vincent, D.F. AGE AND TEST PERFORMANCE. N.I.I.P. Occasional Paper. National Institute of Industrial Psychology, London, England.

12,995

This paper on age and test performance includes, first, a general discussion of the nature of the decline in intelligence test scores with age after twenty and, secondly, a study of the form of the age-score curve on intelligence test scores. T. G. R 9

12,996

USN Training Device Center. BIBLIOGRAPHY OF UNCLASSIFIED HUMAN ENGINEERING REPORTS. NAVEXOS P 1491, Jan. 1958, 18pp. USN Training Device Center, Port Washington, N.Y.

12,996

This bibliography of human engineering reports covers a period from 1946 to 1957 on the following broad subject matter areas: learning, motor skills, perception, voice communications, systems analysis, controls and displays, training devices, research tools, and human engineering. R 350

12,997

Pylo, J.T. A REPORT OF PROGRESS AND DEVELOPMENTS AS OF JULY 1957, PROGRESS REPORT NO. 2. Progress Rep. 2, July 1957, 23pp. U.S. Civil Aeronautics Administration, Washington, D.C.

12,997

This is the second report by the Civil Aeronautics Administration on jet age progress and planning and outlines the progress of the program since July 1956 to the time of publication. There are sections on the following topics: flight operations and airworthiness, civil jet aircraft noise, airports, air traffic control, and communication and navigation aids. T. G.

12,998

Rodger, L. WHAT IS INDUSTRIAL PSYCHOLOGY? Genes, Psychol., July 1947, 1-10.

12,998

This is the third paper in a symposium on the topic, "What is Industrial Psychology?". The author points out that the field is both a science and a technology and disagrees with other opinions stated at the symposium which held that a choice between the two must be made. R 2

12,999

Sealand, G.E., Corney, D.V. & Courtney, D. EXTERIOR LIGHTING FOR NAVAL AIRCRAFT. FINAL REPORT. Contract N1545 32735, Proj. F, Rep. 13, Dec. 1956, 122pp. Courtney & Co., Philadelphia, Penn.

12,999

This is the final report of research on the exterior lighting of naval aircraft, the main objective of which was to delineate the characteristics of an optimal system. The methods of study included observation and participation in all normal naval aviation operations, interviews with Naval aviation personnel, cataloging of existing exterior lighting components, and reviewing applicable literature on human capabilities for coping with exterior lighting. Both an optimal and an interim system are presented and discussed. Other chapters deal with visibility of lights, human capabilities and limitations, and research and development recommendations. T. I. R 219

Garvey, M.D. & Taylor, F.V. INTERACTIONS AMONG OPERATOR VARIABLES, SYSTEM DYNAMICS, AND TASK-INDUCED STRESS. J. Appl. Psychol., April 1959, 43(2), 79-85. (USN Research Lab., Washington, D.C.).

13,000

Three experiments were conducted to determine the effect of stressing the human element in each of three man-machine systems (manual tracking) on the performance of these systems: 1) acceleration control and acceleration-aided control system, 2) same as in 1) but with poor and good subjects, 3) acceleration control and position control system. Forty-eight subjects (16 per experiment) were trained on the respective systems and then required to operate them under a series of task-induced stress conditions (seven). Performance was analyzed by Wilcoxon's comparison of several treatments test. T. G. I. R 8

13,001

Herison, H.J. EFFECTS OF NOISE ON HUMAN PERFORMANCE. J. Appl. Psychol., April 1959, 43(2), 96-101. (Antioch College, Yellow Springs, Ohio).

13,001

The effects of noise level (80 decibels (db)-quiet, 110 db-noise) on a vigilance task (monitoring clocks), a complex mental counting task (counting number of flashes on each of several lights), and a time judgment (estimating passage of a ten-minute interval) were studied. The results were analyzed by analysis of variance technique. These effects are discussed in terms of noise as a source of psychological stress. T. G. I. R 16

13,012

Brandelise, E.P. & Gottadicker, E.W. THE DIFFERENCE THRESHOLD OF THE MAGNITUDE OF VISUAL VELOCITY. *J. exp. Psychol.*, Feb. 1959, 57(2), 83-89. (University of California, Los Angeles, Calif.).

13,012

To make a new assessment of the difference threshold of the magnitude of visual velocity, ten subjects adjusted the rate of one (comparison) of two rotating black discs (velocities of 10, 20, 30, 60, 90 revolutions per minute) so as to equate the velocity of the two white dots located near the edge of each disc. The standard deviation of adjustment was the threshold measure employed; an analysis of variance was performed. These findings were compared with those of other researchers; differences in experimental methods and individual variability were discussed. T. G. I. R 6

13,013

Edwards, M. INFORMATION AND AUTOKINETIC MOVEMENT. *J. exp. Psychol.*, Feb. 1959, 57(2), 86-90. (University of Michigan, Ann Arbor, Mich.).

13,013

To examine the hypothesis that autokinetic movement occurs if the visual world is highly redundant and not if it is full of information, 20 subjects (after 10 minutes dark adaptation) viewed a pattern of 289 lighted holes which were arranged either disorderly (randomly) or orderly and pressed a button when movement of the pattern began. Amounts and latencies of movement were recorded. The findings were examined in light of the above hypothesis. R 2

13,014

Stevens, S.S. & Scope, Geraldine. FINGER SPAN: RATIO SCALE, CATEGORY SCALE, AND JND SCALE. *J. exp. Psychol.*, Feb. 1959, 57(2), 91-95. (Harvard University, Cambridge, Mass.).

13,014

To determine, by method of magnitude estimation, how subjective thickness varies with width of object grasped between thumb and middle forefinger, and to compare this with category and Fechnerian scales constructed from just noticeable differences (jnd), about 33 subjects made these judgments by: 1) assigning numbers to blocks proportional to their apparent thickness (5 to 65 millimeters (mm.) in 5 mm. steps), the standard block being presented before each variable block or only at beginning of series (12 blocks); 2) assigning numbers between one and seven, having been presented with both one and seven for references; 3) assigning "long" or "short" method of single stimuli with two stimuli and two categories. The above three scales were constructed and compared. G. I. R 8

13,015

Vanderplas, J.M. & Garvin, E.A. THE ASSOCIATION VALUE OF RANDOM SHAPES. *J. exp. Psychol.*, March 1959, 57(3), 147-154. (Washington University, St. Louis, Mo.).

13,015

To assess the interaction of association value and stimulus complexity as determinants of recognition, 50 subjects viewed 180 random shapes (30 at each of six complexity levels) and responded with a word, phrase or yes if these reminded them of something and no if they did not. Associative values, content values and heterogeneity indices were thus computed for each shape, and a contingency analysis on associative value as a function of complexity level was conducted. Correlations between pairs of variables, for example complexity and content, were also computed. T. G. I. R 6

13,016

Vanderplas, J.M. & Garvin, E.A. COMPLEXITY, ASSOCIATION VALUE, AND PRACTICE AS FACTORS IN SHAPE RECOGNITION FOLLOWING PAIRED-ASSOCIATES TRAINING. *J. exp. Psychol.*, March 1959, 57(3), 155-163. (Washington University, St. Louis, Mo.).

13,016

To study the effects of four levels of practice in labelling on the recognition of random shapes of three levels of complexity and three levels of association value, 144 subjects (four for each of 36 conditions) first attempted to learn a nonsense label for each of a set of eight random shapes (complexity level one and associative value about same for a given subject). Next the subject attempted to select from a group those shapes for which he had learned labels in part one. For the four levels of practice, means and standard deviations were computed. For the recognition task, mean number and time of responses for: 1) correct recognitions, 2) correct rejections and 3) incorrect rejections were computed; separate analyses of variance were carried out for each of these three classes of response. T. G. I. R 15

13,017

Charles, J.P. & Duncanson, C.P. THE DISTANCE GRADIENT IN KINESIC FINGER AFTEREFFECT. *J. exp. Psychol.*, March 1959, 57(3), 164-170. (Northwestern University, Evanston, Ill.).

13,017

To obtain quantitative measurements of kinesiographic finger after-effect (FAE) and to determine if a distance gradient in FAE similar to that in vision exists in kinesiography, each of nine groups (20 subjects/group) judged one of nine widths of blocks by: 1) making four judgments of test block (constant error data), 2) inspecting different block for one minute by running thumb and forefinger along sides, 3) judging test block with same hand by adjusting scale with other hand, 4) one minute rest; 5) inspecting as in 2, and 6) judging as in 3. A control group without inspection also was run. Trend analyses were used to test FAE and distance gradients. Also, analysis of variance using successive blocks of trials was performed to further check on practice effects. T. G. I. R 13

13,018

Stevens, S.S. CROSS-MODALITY VALIDATION OF SUBJECTIVE SCALES FOR LOUDNESS, VIBRATION, AND ELECTRIC SHOCK. *J. exp. Psychol.*, April 1959, 57(4), 201-209. (Harvard University, Cambridge, Mass.).

13,018

To compare the dynamic characteristics of three different sense modalities, numerical ratio scales of subjective magnitude for loudness, vibration and electric shock were used to predict the form of equal-sensation functions that should result from matching apparent intensity in any two of these modalities. About 30 subjects served in one or another parts of experiment. Cross-modality matches were made between each modality; comparisons between predicted and experimental functions were made. G. I. R 17

13,019

Stevens, S.S. TACTILE VIBRATION: DYNAMICS OF SENSORY INTENSITY. *J. exp. Psychol.*, April 1959, 57(4), 210-218. (Harvard University, Cambridge, Mass.).

13,019

To determine, by the method of magnitude estimation, how subjective intensity of a vibratory stimulus varies with amplitude of vibration applied to finger and to arm and to compare the function obtained on finger with category scale and Fechnerian scale constructed from just noticeable differences (jnd), six experiments were performed using between ten and 12 subjects. The judgments yielded ratio, category and jnd scale for 60 cycles per second vibration applied to the finger and a ratio scale for the arm. These scales are compared and discussed in terms of possible mechanisms involved. G. R 22

13,020

Stewart, E.D. THE GELB EFFECT. *J. exp. Psychol.*, April 1959, 57(4), 235-242. (University of Texas, Austin, Tex.).

13,020

To examine the parameters that affect the Gelb phenomenon, within the framework of Heisen's adaptation level theory - particularly the contrast principle, four subjects made judgments as to the appearance of the Gelb disk (by adjusting a measuring disk from 360 degrees white to 360 degrees black) when three different sizes of white disks were suspended in front of the Gelb disk. (Position of white disk in relation to Gelb disk varied from center to tangent). Equations for the data were determined, and the findings were discussed in terms of the laws of lightness-contrast.
T. G. I. R 16

13,022

Dignan, J.M. GROWTH OF A MOTOR SKILL AS A FUNCTION OF DISTRIBUTION OF PRACTICE. *J. exp. Psychol.*, May 1959, 57(5), 310-312. (University of Hawaii, Honolulu, Hawaii).

13,022

To compare the growth of a pursuit tracking skill under massed versus distributed practice, two groups of subjects had six sessions of eighteen 30-second trials per session. One group (22) had 1.5 minute intervals (distributed) between trials, the other (19) had two seconds (massed); but both groups had 1.5 minute intervals for the sixth session. Then both groups had four test trials. The performance of the two groups on the test trials was compared by the Mann-Whitney signed rank test. An index of skill level and work decrement were computed for each group and curves fitted to these data. The results are interpreted in terms of several relevant views.
G. R 13

13,023

Giles, S. SET TO RESPOND AND THE EFFECT OF INTERRUPTING SIGNALS UPON TRACKING PERFORMANCE. *J. exp. Psychol.*, May 1959, 57(5), 333-337. (University of Bristol, England).

13,023

To compare pursuit tracking performance with and without a simultaneous auditory task (pressing key when auditory signal occurred), 20 subjects performed under five experimental conditions of tracking alone, auditory task alone and the two in combination at different rates. Mean timing and mean amplitude error scores for tracking were compared, as well as auditory reaction times. The results were explained in terms of interference and set to respond. The second part of the study compared tracking with and without instructions to expect the auditory signals, though none were presented, as a further examination of the set to respond explanation.
T. G. R 9

13,024

Rhule, W. & Smith, M.W. EFFECTS OF INVERSION OF THE VISUAL FIELD ON HUMAN MOTIONS. *J. exp. Psychol.*, May 1959, 57(5), 338-343. (University of Wisconsin, Madison, Wisc.).

13,024

To study the effects of four perceptual conditions ranging from normal vision and kinesthetic feedback to inverted vision and kinesthetic feedback on the travel and manipulative movements of handwriting in handwriting tasks of three levels of complexity, four groups of six subjects wrote patterns of three symbols (levels of complexity) in various sequences for ten sessions. Analyses of variance were made of first and last session performance for each symbol and both types of movement. Also, Duncan Range tests were computed for performance differences at three difficulty levels for four perceptual conditions. Results were interpreted in terms of the theory of space-structured motion.
G. I. R 14

13,025

Van Fleet, E. & Gibson, J.J. THE SENSITIVITY OF THE EYE TO TWO KINDS OF CONTINUOUS TRANSFORMATION OF A SHADOW-PATTERN. *J. exp. Psychol.*, May 1959, 57(5), 344-347. (University of Helsinki, Norway & Cornell University, Ithaca, N.Y.).

13,025

To compare the perceptions induced by two kinds of continuous transformation and determine whether corresponding impressions of rigid and non-rigid motion would occur spontaneously, 20 observers viewed the shadow of a net undergoing the two classes of motion and described these movements. For the second and third parts, they used the names developed in part one (spontaneous terms) to identify these movements presented with and without intertrial intervals. The findings were discussed in terms of Fechner's question about the eye's ability to distinguish between change of position and change of state.
I. R 5

13,026

Koriat, R.B. THE VISUAL PERCEPTION OF THE MEDIAN PLANE AS INFLUENCED BY LABYRINTHINE STIMULATION. *J. Psychol.*, Jan. 1959, 57(First Half), 25-35. (Brandeis University, Waltham, Mass.).

13,026

To study the influence of labyrinthine stimulation on visual perception of the median plane, 18 subjects were asked to adjust a luminous gold spot to apparent median plane while sitting in a rotating chair which subjected each to acceleratory or deceleratory rotation around his vertical axis. All testing was done in the dark. Subjects were retested after a lapse of at least one day. Results were evaluated by analysis of variance and *t*-tests. Findings are discussed in terms of a residual displacement theory of space perception and in terms of a sensory tonic theory as these can account for the phenomena.
R 22

13,027

Karvonen, T.M. THE VERTICAL-HORIZONTAL ILLUSION IN ARTIFICIAL VISUAL FIELDS. *J. Psychol.*, Jan. 1959, 57(First Half), 41-45. (University of Stockholm, Sweden).

13,027

To investigate quantitatively how artificial visual fields with different ratios of vertical axis to the horizontal (*y/h*) influence the size of overestimation of the vertical line (*y/v*), and test the hypothesis that the shape of the visual field is one of the factors influencing subjective estimation of vertical direction, spectacles producing artificial visual fields were worn by 16 subjects, each of whom made 96 adjustments (to a point at which length of a vertical line appears subjectively equal to the horizontal line) under each of six conditions. Differences in over or underestimation under the various conditions are tested for significance. Results are discussed as they relate to the general hypothesis.
T. G. I. R 7

13,028

Mayner, H.S. & Tresselt, M.E. SHIFTS IN CONNOTATIVE MEANING OF WORDS AS A FUNCTION OF VARYING AMOUNTS OF PREVIOUS RESTRICTIVE EXPERIENCE. *J. Psychol.*, Jan. 1959, 57(First Half), 107-116. (Bell Telephone Laboratories, Inc., N.J. & New York University, New York, N.Y.).

13,028

To discover the optimum number of discrete stimuli needed to produce the greatest anchoring effect for a series of word-concept scales, 100 subjects were given a list of 600 words and asked to check each as belonging to none, or one of six concepts. Profiles were obtained which showed frequency with which each word was judged as belonging to a given concept. From these data anchoring concepts were selected and word lists prepared in which the number of anchoring stimuli was varied systematically from zero to 30 per conceptual category and administered to 450 new subjects. Analysis of variance was performed for each conceptual category.
T. G. R 5

13,029

Mayzner, M.S. & Tresselt, M.E. ANAGRAM SOLUTION TIMES: A FUNCTION OF TRANSITION PROBABILITIES. *J. Psychol.*, Jan. 1959, 47(First Half), 117-125. (Bell-Telephone Laboratories, Inc., N.Y. & New York University, New York, N.Y.).

13,029

To study the effect of different transition probabilities (digram frequency associated with each letter pair) 40 subjects, randomly assigned to one of two major conditions (the same 20 words presented as anagrams having (1) low transition totals, or (2) high transition totals; hard letter order obtained under both conditions), were asked to solve the 20 anagrams verbally. The Mann-Whitney U test was employed to evaluate effect of the transition probability variable. Results are discussed as they relate to relative loss of the patterned letter groups; hard or easy letter orders; methodological considerations, and so forth.
T. R 19

13,030

Donaldson, J., Magnusch, K., McHugh, L., Nicer, R., et al. PSYCHOLOGICAL ASPECTS OF CONFINEMENT IN FALLOUT SHELTERS. *J. Psychol.*, April 1959, 47(Second Half), 163-170. (Johns Hopkins University, Baltimore, Md.).

13,030

The psychological problems which might arise in large public fallout shelters occupied over an extended period of time by a heterogeneous group are discussed under the headings - traumatic (immediately after the disaster) and post traumatic (after the initial shock waves). Measures (taken before any attack) to help alleviate these problems are suggested.
R 3

13,031

Jones, F.P., Gray, Florence E., Hanson, J.A., & O'Connell, D.M. AN EXPERIMENTAL STUDY OF THE EFFECT OF HEAD BALANCE ON PATTERNS OF POSTURE AND MOVEMENT IN MAN. *J. Psychol.*, April 1959, 47(Second Half), 247-258. (Tufts University, Medford, Mass.).

13,031

To study change in postural pattern following change in distribution of tonus, six normal adults were trained to recognize and inhibit tensional responses that disturb head balance. Single and multiple-image photography was employed to record these patterns, t-tests were performed on the data and the findings were discussed in terms of anti-gravity reflexes and resultant patterns of movement.
T. G. I. R 9

13,032

Comelli, P.E., Jr., Napier, S. & Werner, H. PERCEPTION OF VERTICALITY IN MIDDLE AND OLD AGE. *J. Psychol.*, April 1959, 47(Second Half), 259-266. (Clark University, Worcester, Mass.).

13,032

To study changes in spatial organization - the perception of verticality - in old age and compare it to that in younger ages, 75 men between 20 and 60 years adjusted a luminescent rod to the vertical under each of 12 conditions which included different body positions in combination with different starting positions of the rod. Deviation from vertical in degrees for each condition was analyzed as a function of age by analysis of variance. The findings are discussed in terms of the orthogenetic principle.
T. G. R 4

13,033

Bartley, S.H. & Adair, H.J. COMPARISONS OF PHENOMENAL DISTANCE IN PHOTOGRAPHS OF VARIOUS SIZES. *J. Psychol.*, April 1959, 47(Second Half), 289-295. (Michigan State University, East Lansing, Mich.).

13,033

Actual viewing distance necessary to obtain a judgment of equal distance for different sizes of photographic prints was determined psychophysically for 15 subjects using several print sizes and viewing distances. An analysis of variance was performed on the data and the findings discussed in terms of the laws of visual angle and constancy.
G. I. R 5

13,034

Kunnas, T.M. VISUAL FIELD AND SUBJECTIVE CENTER OF A DIAMOND. *J. Psychol.*, April 1959, 47(Second Half), 305-316. (University of Stockholm, Sweden).

13,034

To investigate whether and to what extent the shape of the monocular visual field influences the interocular differences both for horizontal and vertical diagonal distances, ten subjects bisected these distances by fixing the center point of a diamond under each of four experimental conditions (natural visual field-right eye, left eye; artificially limited visual field-right eye, left eye). Average differences between right and left halves when they appeared equal subjectively were compared graphically and statistically by t tests for the various conditions. The findings are discussed in terms of the four predicted effects.
T. G. I. R 16

13,035

Eckrig, K.C. THE INFLUENCE OF AREA ON THE CRITICAL FLICKER-FUSION THRESHOLD. *J. Psychol.*, April 1959, 47(Second Half), 317-330. (The Psychiatric Institute, N.Y.).

13,035

To investigate effect of area on critical flicker fusion (cff) thresholds using foveally-fixed testpatches (from 3.4 to 49.6 degrees diameter in six steps), three practiced observers judged the point of flicker for each size at seven frequencies (35 to 85 cycles/second). Also to determine maximum cff when area and intensity of test patch were as great as apparatus would permit, five observers made judgments for the 49.6 degree testpatch. The results were discussed in terms of the Granit-Harper law and the Ferry-Porter law and related to previous findings.
T. G.

13,036

Ekman, G. WEBER'S LAW AND RELATED FUNCTIONS. *J. Psychol.*, April 1959, 47(Second Half), 343-352. (University of Stockholm, Sweden).

13,036

This paper investigates in some more detail the relation between subjective magnitude (R) and the subjective correlate (MR) of a just noticeable stimulus difference in four continua, and, on this basis, derives an adequate form for Weber's law and tests it by fitting some experimental data to the function. Also, possible relations between differential and absolute sensitivity are discussed.
