FOREWORD

The Department of the Army was assigned responsibility, effective 1 October 1965, for the development and maintenance of a Human Factors Engineering Information Analysis Center in accordance with the provisions of the Department of Defense Scientific and Technical Information program (DoD Instruction 5100.45). At present the Information Analysis Center is located at Tufts University under the technical guidance of the U. S. Army Human Engineering Laboratories.

The Office of Naval Research initiated the Tufts University effort over ten years ago. This volume and the two subsequent volumes, covering the human factors engineering literature from 1940 through 1965, although published by the U. S. Army Human Engineering Laboratories, is a result of the Office of Naval Research support and direction of this program during its formative years. This work was originated under ONR Contract Nonr 494 (13).

Part I	Index to the Human Factors Engineering Literature	I - 1
Part II	Facsimile of Subject Matter File	II - 1
Part III	Citations and Abstracts	III - 1

Introduction

For several years the Human Engineering Information and Analysis Service Project (HEIAS), Tufts University, has been serving the informational needs of the human factors engineering community through the dissemination of information relevant to the field. One way in which information was distributed was via annual annotated bibliographies containing the yearly acquisitions of the project. To date, seven such bibliographies have been published.¹ The citations in these bibliographies were coded to the "Topical Outline of the Literature in Human Engineering", the main indexing scheme employed by HEIAS.

Since the publication of the last bibliography a number of changes have taken place within the project, not the least of which has been the development of a new index. Also many documents which had not been previously processed were added to the system. For these (and other reasons) the decision was made to publish a cumulative bibliography containing all previously listed citations plus any new ones, all coded to the new index. Such a document would provide users in the field with a single reference source. However, the number of accessions to be listed was so great that to contain them all in one volume would be impractical. The publication of several bibliographies, each covering specific time periods, seemed a more reasonable approach. The present bibliography is the first in this series and covers the literature from the period 1940 through 1959. The next bibliography in this series will cover the time period of 1960 through 1964 and the third, the 1965 literature. In addition, a separate bibliography containing foreign accessions will be published.

¹The seven Human Engineering Bibliographies published to date are: ONR Report ACR-24 (1955-56), ONR Report ACR-32 (1956-57), ONR Report ACR-43 (1957-58), ONR Report ACR-55 (1958-59), ONR Report ACR-69 (1959-60), ONR Report ACR-75 (1960-61), and ONR Report ACR-86 (1961-62).

As in the past the project staff was influenced by several considerations in the selection of references for inclusion in the bibliography. First, there was an attempt to select those references which reflected the broad spectrum of revealed interests of human factors personnel. Second, the documents had to be available to the project staff for examination prior to coding and abstracting. If the document was not among the acquisitions of the project, it was not included in the bibliography.

Because of the tremendous volume of literature published during this period, the project staff was not able to acquire every document of relevance. The present volume should, however, provide a useful compilation of references to the human factors engineering literature which reflect the cumulative (through 1959) acquisitions of HEIAS.

This and future volumes will be published in punched loose leaf page format. This will permit addition of new material and modification of old. Additions will be in the form of new acquisitions. Modifications will be primarily in the form of changes to the index and the resulting changes in the coding of the accessions involved. It is suggested that the user place the present volume in a notebook (or notebooks) or whatever form he finds convenient for use, or future modification.

Instruction in the Use of the Present Bibliography

General

The user should examine the index (Part I) thoroughly before attempting to locate references on a specific topic. Familiarization with the terms is essential if effective retrieval is to be realized. After examining its content, the user should be able to enter the index with the terms which are descriptive of, or synonymous with his query. Documents have been coded only to those terms or descriptors which are underlined. Having noted the terms of interest he should then go to Part II (Facsimile of Subject Matter File) and under the appropriate terms find the accession numbers of those documents which have been coded to that term. Noting these numbers he can then go to Part III (Citations and Abstracts) to find the actual references.

The Index and Its Use

The index is basically a combination and refinement of the old "Topical Outline" and "Alphabetical Indexes".² As such, it has some of the features of a hierarchical system and some of an alphabetical system. The accessions are only coded to those terms which are underlined and in cases of subheading, are coded to the lowest subcategory (i.e., to the secondary or tertiary heading, if there is one). For example, if the reader will note the category Aging, Effects of, he will find a number of secondary categories, such as vision, motor performance, etc. No references have been coded to Aging, Effects of, as such, but only to the secondary headings. In the case of Radar and other CRT Displays the reader will note the secondary heading screen and under this, various tertiary headings such as size and shape. Relevant documents, for example those dealing with the shape of radar screens or scope faces, have been coded to the lowest subcategory, in this case size and shape. No references will have been coded to screen alone.

²See previous bibliographies.

The index can, of course, be used as a hierarchical system or a coordinate index. For example, if a user were interested in articles dealing with drugs and their effects, he would examine the references listed in the category Drugs. Similarly, if he were interested in articles dealing with man's tolerance to acceleration, he would go to the category Motion, Effects of/acceleration and deceleration/tolerance. However, if he were interested in the effects of drugs on man's tolerance to acceleration forces, rather than go through all the references in the above mentioned categories, the reader should note only those accession numbers common to both categories. The loose leaf notebook form should facilitate this type of matching.

The reader is advised to look through the various general categories in making a search. These categories contain not only references of a general nature, books, bibliographies, etc., but in some cases miscellaneous articles which could not be readily coded elsewhere. Occasionally, the reader will note a secondary heading "other". These categories contain references to equipment, methods, topics, etc., not specifically listed under the main heading.

An index of this nature develops through use. All relevant terms and descriptors cannot be anticipated in its initial development and are often incorporated only after the index has been in use for some time. Therefore, if the user cannot find terms specifically descriptive of his problem he should attempt to find synonymous terms. As mentioned previously, the user should examine the whole index thoroughly before attempting to locate specific topics.

Facsimile of Subject Matter File

Part II contains those categories to which documents have been coded along with the accession numbers of the documents. In essence, it represents the index stripped to the bare essentials, i.e., minus all

cross headings and notes. The user will note that there are several categories with only a few or no references coded to them. These categories were left in the index because it is known that in the 1960-1965 bibliographies, there will be a number of references coded to them.

Citations and Abstracts

Part III contains the actual citations and abstracts listed in numerical order by accession number. This section was compiled by filming the actual 3x5 citation and abstract cards from the files of HEIAS. In some cases the reference material was on a 5x8 card. This presented layout problems and in an attempt to conserve as much space as possible some cards had to be placed sideways for filming. While we realize this presents somewhat of an inconvenience for the reader, we feel the conservation of space was worth it.

The format of the citations is generally in keeping with the recommendations of the Publication Manual of the American Psychological Association. In some instances, however, variation in the amount and type of information in the original document has introduced some variation in the final citation. The content of the citation tries to maximize the amount of information to assist the user in acquiring a copy of the document.

The abstracts for the most part are descriptive only and do not contain results. However, in the future results will be included. It was simply too great a task to go back and re-abstract documents for this bibliography. The letter codes found at the end of the abstract, the T, I, G, and R designations indicate that the document contains: T-tables, I-illustrations, G-graphs, and R-references (e.g., R-7 means that 7 references were cited). A list of abbreviations used in the abstracts is given on the next page.

The documents cited are not available from Tufts University, but are held in repository at HEIAS and may be examined on the project's premises.

KEY TO ABBREVIATIONS

Gordon, D.A., Zagorski, M.J., Woods, I.A. & Reuder, Mary. A STUDY OF SLOAN ORTHO-RATER PLATES AS MEASURES OF VISUAL ACUITY AT VARIOUS LEVELS OF ILLUMINATION. Proj. 25530100, PHS Rep. 975, Aug. 1952, 8pp. USA Personnel Research Branch, Office of the Adjutant General, Washington, D.C.

1 To make a preliminary assessment of the usefulness of Sloan Ortho-Rater targets (specific combinations of ten letters of the alphabet) as a test of far visual acuity, data obtained from 446 Korean infantrymen by presenting targets in the Baesch and Low Ortho-Rater under three levels of brightness - 10.2, 7.35, and 6.96 log microns-candela were analyzed. Distributions of acuities at different brightness levels, relative difficulties of letters in terms of error scores, and qualitative differences in perception of letters in terms of misidentification are discussed.

2 Clonents, R., Archer, J.M., Nays, Ruth, Schoening, Joyce K., et al. THE EFFECTS OF CHLOROQUINE ON THE SPEED OF VISUAL ACCOMMODATION IN MAN. Contract AF 41(607) 44, Proj. 21 1601 0005, Nov. 1953, 7pp. USAF School of Aviation Medicine, Brooks AFB, Tex. (Medical School, University of Texas, Austin, Tex.).

2 To determine the functionally significant effect of chloroquine on speed of visual accommodation, approximately 70 subjects of a prison population received two tablets of chloroquine (therapeutic doses) or the equivalent in placebo, weekly for 52 weeks. Visual accommodation was tested tachistoscopically and the results are discussed with respect to far-to-near and near-to-far accommodation. Discussion is also presented on the cardiovascular effects observed in animals and side effects of the drug in man.

3 Morris, R.C. DEVELOPMENT OF AN EFFICIENT SET OF DIMENSIONS FOR DESCRIPTION OF AIR-FORCE GROUND-CREW JOBS: PART I. RATING DIMENSIONS. Contract AF 33(218) 13474, AFPRC TM 55 63, June 1956, 57pp. USAF Personnel Research Lab., Lackland AFB, Tex. (Teachers College, Columbia University, New York, N.Y.).

3 The purpose of this study was to determine the appropriate dimensions by which to measure the demands made upon the abilities of the individual in various Air Force ground-crew jobs. Four professional psychologists rated 150 jobs with respect to 170 attributes, on the basis of a written set of job descriptions and attribute definitions. A factor analysis of 130 of these attributes, selected on the basis of their reliability and judged importance, was carried out by Thurstone's diagonal method. The results are interpreted in terms of the number of useful job-ability dimensions that can be identified.

4 Broadbent, D.E. LISTENING TO ONE OF TWO SYNCHRONOUS MESSAGES. AFU 157/51, Oct. 1951, 7pp. Applied Psychology Research Unit, MRC, Cambridge, England.

4 In an investigation of what determines which of two synchronous messages will be listened to, five groups of 8 to 12 subjects were required to attend to a message presented simultaneously with an irrelevant message. Cues to the correct message included the usual auditory call signs, added visual call signs, previous instructions as to which voice to listen to, and the usual auditory call sign repeated twice or inserted late rather than early in the message. The relative effectiveness of each treatment is discussed. The presence of a practice effect is noted.

5 USC Medical Research Lab. A PHOTOMETRIC SURVEY OF THE RED LIGHTING INSTALLATION ON THE USS TRIGGER (SS-564). Proj. NM 002 014-01, Memo. Rep. 52 4, March 1952, 6pp. USC Medical Research Lab., New London Submarine Base, Conn.

5 A photometric survey was made of the low level red illumination in the submarine U.S.S. Trigger, limited to general compartment illumination in the Officers Quarters, the Attack Center and the Crew's Mess Section. Specific recommendations relating to use of plastic covers on fixtures, illumination of instrument dial faces, green radiation emitted by background panels of various instruments, and use of filters at strategic points, are made. Illumination data are included.
T.

6 USC Medical Research Lab. SECOND PHOTOMETRIC SURVEY OF THE RED LIGHTING INSTALLATION ON THE USS TRIGGER (SS-564). Proj. NM 002 014-01, Memo. Rep. 52 5, March 1952, 6pp. USC Medical Research Lab., New London Submarine Base, Conn.

6 A second photometric survey was made one month after the first survey of the low level red illumination in the submarine U.S.S. Trigger (see accession number 5). Approximately 90% of the internally illuminated equipment was tested. Additional discussion and recommendations are made regarding the use of improved filters, design of dials for improved readability, use of red glass lamps, etc. Illumination data are included.

Willson, T.L. & Ritch, T.G. REPORT ON THE GENERAL HEALTH AND MORALE OF THE OFFICERS AND CREW DURING A 30 DAY SIMULATED WAR PATROL ABOARD A SNORKEL SUBMARINE. Proj. NM 002 009, Rep. 3, Nov. 1948, 7pp. *USN Medical Research Lab.*, New London Submarine Base, Groton, Conn.

USS IREX (SS 482), an experimental snorkel submarine with conventional superstructure and battery, conducted a submerged patrol during the period 1-30 March 1948, during which time she was submerged 615 hrs., 390 by snorkel and 225 on battery propulsion. During this patrol, morale and health were good. The increased monotony and emotional stress incident to a largely or totally submerged patrol is considered to make mandatory an even more stringent personnel selection program and efforts directed toward augmented physical and emotional comfort, proper illumination, pleasing interior color and design, and all practical diversifications. The effect on personnel of atmospheric pressure fluctuation due to opening and closing of snorkel head valve presented no problem during this patrol. However, conditions of operations did not afford an evaluation of the problem, in that negligible pressure fluctuations were experienced. A concise appraisal is required of the effect on personnel of prolonged snorkelling during periods of sleep; this most easily accomplished by a proposed dock-side study.

Weybrew, S.B. PSYCHOLOGICAL AND PSYCHOPHYSIOLOGICAL EFFECTS OF LONG PERIODS OF SUBMERGENCE. I. ANALYSIS OF DATA COLLECTED DURING A 265-HOUR, COMPLETELY SUBMERGED, HABITABILITY CRUISE MADE BY THE USS NAUTILUS (SSN571). Proj. NM 23 00 00, Task NM 23 02 20, Subtask 4, MRL Rep. 231, Feb. 1957, 43pp. *USN Medical Research Lab.*, New London Submarine Base, Groton, Conn.

30 enlisted men from the crew of the NAUTILUS were measured daily during an 11-day, completely submerged period to determine when, or if, any debilitating effects resulted from this period of submergence. Critical Flicker Frequency thresholds, Hand Tremor scores, heart and respiratory periods, and daily self-ratings on 28 fatigue-like variables were included in the measurement battery. The data from each test, plotted by day submerged, suggest that optimal adaptation to the submerged conditions occurred during the first 6 days. From the 6th to 8th days, muscular tension increased and the proportion of individuals reporting insomnia, headaches, and lowered motivation also increased, thus suggesting less effective adaptation during this period. The data for the last 2 days indicated more effective adaptation; however, these results were considered spurious due to the "end spurt" previously observed in men living in confined environments for prolonged periods.

Rose, H.W. A BRIGHT-ADAPTATION DEVICE FOR USE WITH DIFFERENT NIGHT-VISION TESTERS. Proj. 21 31 003, Rep. 1, April 1952, 5pp. *USAF School of Aviation Medicine*, Brooks 'B, Tex.

11

To develop and test a bright-adaptation device for use with different night vision testers, a diffusing sphere (painted aluminum) was constructed. Tests employing pre-adaptation by means of the device show the effects of pre-bright-adaptation to five levels of luminance on subsequent dark adaptation. The average threshold measurements for 19 subjects are given for 2 minutes, 5 minutes and then every 5 minutes until the 45th minute. The results are discussed and recommendations made for the use of this device.

Uhlman, J.E. & Bolanovich, D.J. DEVELOPMENT OF ARMY FORCES QUALIFICATION TEST AND PRE-DECESSION ARMY SCREENING TESTS, 1946-1950. Proj. 2651100, PRS Rep. 976, Nov. 1952, 58pp. *USA Personnel Research Branch*, Office of the Adjutant General, Washington, D.C.

The purpose of this program was to develop screening tests for selection of personnel procured by recruitment and induction to fit existing operational requirements and to provide for continuous improvement of these instruments and related procedures. Recruitment tests: R-2, R-3, and R-4 were constructed and used as initial screening tests at local recruiting stations. The Armed Forces Qualification Tests (AFQT), Forms 1 and 2 were developed to meet the need for greater uniformity among the services in mental screening procedures. Each of the 2 forms contains 90 items divided equally among vocabulary, arithmetic reasoning, and spatial relations. Items were matched not only for validity and difficulty but for similarity in content and psychological processes as well. Standardization of the 2 forms was based on samples of the entire military population on duty in all the services as of Dec. 31, 1946. A single conversation table was adopted since the differences in the distribution of the scores on the 2 forms were so slight. AFQT scores were found to be highly correlated with scores on Army aptitude tests such as AGCT. The distribution of scores obtained from operational administration was found to differ significantly from the distribution of scores expected on the basis of the standardization studies. Follow-up studies substantiated the original standardization. To reduce this "operational slippage" steps were taken to control test administration at Armed Forces Examining Stations. (HEIAS)

22 Edwards, W. TWO-AND THREE-DIMENSIONAL AUTOKINETIC MOVEMENT AS A FUNCTION OF SIZE AND BRIGHTNESS OF STIMULI. *J. exp. Psychol.*, Nov. 1954, 48(5), 391-398. (USAF Personnel and Training Research Center, Lackland AFB, Tex.).

22 To investigate the effects of size and brightness of the stimulus on autokinetic movement, special apparatus was built to prevent the stimulus from illuminating surroundings thereby providing a "frame of reference". Fifty-one naive subjects, presented with five stimuli varying in size from .25 to 12 inches and of three brightness levels, .0927, 3.85, and 173.9 foot-lamberts, reported latency, direction and amount of movement. The data for subjects reporting movement are analyzed in terms of movement as a function of size and brightness. The concept of "frame of reference" is examined critically.

30 Conrad, R. PRELIMINARY FACTORY STUDIES OF THE EFFECT OF SPEED AND LOAD ON COTTON WINDING. APU 147/51, April 1951, 11pp. Applied Psychology Research Unit, HRC, Cambridge, England.

Attention is drawn to the fact that the internal factors of industrial skills (the man-machine relationships) have been much less studied by industrial psychologists than have the external factors (working conditions). Drawing on the results of laboratory experiments, it is suggested that what in the textile industry is called "work-load" may confuse two quite separate factors--speed and load--each of which affects performance, but in different ways. Experiments were carried out in the winding rooms of two cotton textile mills in an attempt to examine these factors under the more realistic conditions of normal industrial life. It was found that: a) Increasing the number of spindles far beyond what could possibly be considered to be a reasonable work-load, resulted in a continued increase in operative output per hour. The logarithm of the rate of creeling--i.e., replacing empty supply packages--was found to be directly proportional to the rate at which supply packages emptied; b) creeling time--considered to represent the vast majority of a winder's work--was also proportional to the rate at which supply packages emptied. Thus, under increased work-load conditions, operatives not only pieced-up more ends per unit time, but the relation between an actual operation and the interval between operations, changed. The implications of these results both for current and for future methods of work-load assessment are discussed.

32 Birmingham, H.P., Kahn, A. & Taylor, F.V. A DEMONSTRATION OF THE EFFECTS OF QUICKENING IN MULTIPLE-COORDINATE CONTROL TASKS. Final Report. Proj. NR 554 G20, NRL Prob. Y04 02, NRL Rep. 4380, June 1954, 7pp. USN Engineering Psychology Branch, NRL, Washington, D.C.

32 To determine whether quickening (process of providing operator with instantaneous information of the effects of his own motions) of the control loops will enable the human operator to perform more controller tasks concurrently, a four-coordinate task was performed by six subjects. The task was to manipulate two joystick sticks to keep within view two target dots on a two-gun cathode-ray tube. Each dot was free to move in both x and y coordinates. Performance on this task with quickening was compared with that of tracking on only one or two coordinates without quickening. Implications for training and selection problems are noted.

33 Birmingham, H.P. & Taylor, F.V. A HUMAN ENGINEERING APPROACH TO THE DESIGN OF MAN-OPERATED CONTINUOUS CONTROL SYSTEMS. NRL Prob. Y04 01, Proj. NR 513 G50, NRL Rep. 4333, April 1954, 28pp. USN Engineering Psychology Branch, NRL, Washington, D.C.

Empirical evidence suggests that, at least for short periods of activity, the simpler the tasks imposed upon the human operator of a control system the more precise and less variable become his responses. This leads to the view that optimal man-machine control system performance can be obtained only when the mechanical components of the system are designed so that the human need act only as a simple amplifier. Ways and means are described for achieving such design through "unburdening" (relieving the operator of the task or acting as an integrator) and "quickenning" (providing the operator with immediate knowledge of the effects of his own responses). Aided tracking and other efforts to improve the stability of man-machine systems by modifying the display circuitry are shown to be examples of these two processes. In Part II, a "stimulus-response" analysis is made of the concepts of unburdening and quickening. It is argued that in those man-machine system arrangements which require that the operator behave as nothing more complicated than a simple amplifier, a condition of "stimulus response integrity" may be said to exist. Only under this condition do the responses which the man is called upon to make bear an invariant and proportional relationship to the instantaneous amplitude values of the visual error (stimuli). It is suggested that the choice of a pursuit or compensatory type display is contingent upon the extent to which stimulus-response integrity has been achieved in the system under consideration.

35 Lincoln, R.S. RATE ACCURACY IN HANDWHEEL CRANKING. J. exp. Psychol., June 1954, 47(6), 465-470. (Johns Hopkins University, Baltimore, Md.).

36 Learning a rate of turning a handwheel (radius 7.5 cm) with verbal average error information only, and with a visual error indicator also, was studied with six different types of knowledge of results. Graphs present the accuracy and error data in terms of time during which the proper rate was maintained, in rpm, and in respect to number of oscillations from a standard rate per minute. Results are presented separately for the learning phase, the interim (test) phase, and for relearning.
G. R 3

Examined was the accuracy with which different linear and angular rates of cranking movement can be maintained for clockwise and counter-clockwise directions of turning. The Ss cranked a handwheel at each of 5 different speeds combined with each of 3 different handwheel radii. 15 Ss cranked in a clockwise direction while 15 other Ss cranked in the counter-clockwise direction. The Ss were provided with an instantaneous visual indication of their rate of cranking. In appearance the task resembled a conventional tracking problem but the task was reduced to the maintenance of the required rates. In addition, no changes in handwheel load were introduced by changes in the required speed of turning. With constant angular speed of movement, rate-accuracy increases with increased linear rate in the lower range of handwheel speeds. At the higher handwheel speeds this relationship is reversed, and accuracy decreases as linear rate increases. The differences between handwheel speeds, radii and the interaction of these 2 variables was tested. It was found that for both directions of turning the 2 variables and the interaction were significant at p<0.1. Ss tended to crank at rates slower than the required rate although they were capable of maintaining the required rate. This tendency increased as both linear and angular rate increased. No significant differences in accuracy appeared between the 2 directions of movement, but those Ss who cranked in the counter-clockwise direction showed a significantly greater tendency to lag in rate. 39 Swartz, P., Norris, Eugene B., & Spragg, S.D.S. PERFORMANCE ON A FOLLOWING TRACKING TASK (MODIFIED SAM TWO-HAND COORDINATION TEST) AS A FUNCTION OF RADIUS OF CONTROL CRANKS. *J. Psychol.*, 1954, 37, 163-171. (University of Rochester, Rochester, N.Y.).
Investigated was the adequacy of performance of a 2-hand tracking task as a function of the radius of the control cranks. Each of the 40 Ss was given 2 trials on each of the following control crank radii: 1.0, 2.0, 3.0, 4.0 and 5.5 ins. A latin square design was used to balance the sequence of presentation of the experimental conditions. 2 combinations of control crank positions were employed. In Position I both control cranks rotated in the vertical plane parallel to the frontal body plane. In Position IV the right-hand control crank rotated in the vertical plane perpendicular to the frontal body plane and the left-hand crank rotated in the vertical plane parallel to the frontal body plane, i.e., as in Position I. (The designation of these positions as I and IV is explained.) For both positions clockwise rotation of the right control crank moved the target follower in a direction directly away from the operator; clockwise rotation of the left control crank moved the target follower to the operator's right. 20 of the Ss performed in Position I, the remaining 20 in Position IV. The results were analyzed in terms of mean time on target for each of the control radii within each position and for Position I vs. Position IV. Performance was found superior for the middle values (2.0, 3.0 & 4.0 in. radii) than for the smallest and largest radii used (1.0 & 5.5 in.). A more detailed analysis showed that both for Positions I & IV the 2.0, 3.0, 4.0 & 5.5 in. control cranks all yielded significantly better performances than the 1.0 in. crank. Also, for both positions, the 2.0 & 3.0 in. cranks were significantly superior to the 5.5 in. crank. For Position I performance on the 3.0 in. crank was significantly superior to that on the 4.0 in. crank. For every control radii used performance was somewhat better when the tracking task was performed in Position IV than in Position I.

40 Weiss, B. THE ROLE OF PROPRIOCEPTIVE FEEDBACK IN POSITIONING RESPONSES. *J. exp. Psychol.*, March 1954, 47(3), 215-224. (University of Rochester, Rochester, N.Y.).
The purpose of the present experiment was to determine the accuracy of positioning responses as pressure and distance information was varied using a task where visual feedback was delayed. Eleven different force-displacement conditions were used to provide the variation in information. The S's task was to compensate for the displacement of a spot of light from the center of an oscilloscope screen by moving a stick control the proper distance and in the proper direction. 11 Ss were used, each serving under all 11 conditions. The results showed that relative error and variability decrease with distance moved but that pressure variation has no apparent effect on the measures. Further, the effect of variation in distance was found to be greatest at the smallest displacements within a condition. It was concluded that, in positioning responses made in the absence of visual feedback, displacement is the more crucial dimension of the force-displacement relationship of a control.

41 Conrad, R. & Siddall, G.J. AN EXPERIMENTAL STUDY OF PIRM-WINDING. THE EFFECT OF MIXED SETS ON OPERATIVE EFFICIENCY. *APU 202/53*, June 1953, 11pp. *Applied Psychology Research Unit*, MRC, Cambridge, England.
An experiment was set up in the firm-winding room of a cotton textile mill to examine the effect on operative efficiency of mixed yarn sets. With both work-load and the number of spindles in the sets kept constant a difference of as much as 10 minutes per operative/hour was found between certain sets. Differences in efficiency were associated with differences in the proportion of the total work-load contributed by each group of like spindles on the set. The highest operative efficiencies were obtained when the two different yarns on the same set each provided 50 per cent of the total work-load. The reason for these differences is not known although one possible explanation has been mentioned. The differences between the performance of operatives on any one set were statistically insignificant.

Wendt, C.R. STUDIES OF MOTION SICKNESS, VESTIBULAR FUNCTION AND OF PSYCHOLOGICAL AND PHYSIOLOGICAL EFFECTS OF DRUGS. FINAL REPORT, 1946-1954. Contract NSORI 126, Proj. NR143 060, Task 1, June 1954, 36pp. Psychology Dept. University of Rochester, Rochester, N.Y.

47 This report consists primarily of an annotated list of unpublished experiments and surveys on motion sickness, vestibular functions and the effects of certain drugs on emotional and social behavior, which were carried out during the period 1946 - 1954. It includes a short history of earlier investigations of motion sickness. A factor analysis of behavior changes (as measured by rating scales) induced by seconal, benzedrine, sodium amytal, dramamine, scopolamine and pyrexly compound is discussed in greater detail.

Andreas, B.G., Green, R.F. & Spragg, S.D.S. TRANSFER EFFECTS BETWEEN PERFORMANCE ON A FOLLOWING TRACKING TASK (MODIFIED SAM TWO-HAND COORDINATION TEST) AND A COMPENSATORY TRACKING TEST (MODIFIED SAM TWO-HAND PURSUIT TEST). J. Psychol., 1954, 27, 173-183. (Department of Psychology, University of Rochester, Rochester, N.Y.).

44 To investigate the possibilities of transfer between training in pursuit and in compensatory tracking tasks, 92 military basic trainees were divided into four groups who were trained successively on one type of tracking and then the other. Tests were modifications of the SAM Two-Hand Coordination Test (compensatory) and the SAM Two-Hand Pursuit Test (pursuit). Both "natural" and "unnatural" display-control relationships were included in the experiment. Results in terms of mean time on target are discussed in terms of conditions where transfer occurred.

Nowlis, Helen H., Nowlis, V., Riesen, A.H. & Wendt, C.R. CHEMICAL INFLUENCES ON BEHAVIOR. III. THE EFFECTS OF DRAMAMINE AND SCOPOLAMINE ON EMOTIONAL AND SOCIAL BEHAVIOR WITH COMPARISON DATA ON THE EFFECTS OF OTHER DRUGS. Contract NSORI-126, Proj. NR144-060;54000, Task 1, March 1953, 19pp. Psychology Dept., University of Rochester, Rochester, N.Y.

45 This is a study of the effects of dramamine and scopolamine on emotional and social behavior. Twelve subjects divided into three groups were tested on the Gehl-Kutash grapho-motor test, a code-substitution test, and an adjective check list. Performance of the subjects, under the various medications, in a series of social and motor tasks was also observed and the results are presented in terms of the behavior of the group as a whole and behavior of individual subjects. Comparative data is offered for the effects of placebo, amytal, seconal, and seconal plus benzedrine.

Grether, W.F. (Chm.). THE ROLE OF HUMAN ENGINEERING IN NATIONAL DEFENSE: RECOMMENDATIONS FOR INCREASED EFFECTIVENESS. HPS 107/1, May 1951, 12pp. US Research & Development Board, Department of Defense, Washington, D.C.

This report on the human engineering program of the Department of Defense is based on a discussion by the Panel on Human Engineering and Psychophysiology, Committee on Human Resources, Research and Development Board, at a meeting held at Wright-Patterson Air Force Base in 1951. The meeting evaluated the role of human engineering in the development of military equipment. Recommendations are made for achieving immediate and long-range improvement of the human engineering program of the Department of Defense. (HE145)

Pepler, R.D. THE EFFECT OF CLIMATIC FACTORS ON THE PERFORMANCE OF SKILLED TASKS BY YOUNG EUROPEAN MEN LIVING IN THE TROPICS. 7. A COMPLEX MENTAL TASK WITH VARYING SPEED STRESS AT TWO LEVELS OF INCENTIVE. APU 198/53, Dec. 1953, 25pp. Applied Psychology Research Unit, MRC, Cambridge, England. (Royal Naval Tropical Research Unit, University of Malaya, Singapore, Malaya).

49
This experiment was designed to test the effects of level of motivation upon the loss of efficiency at a high-speed mental task performed in a hot environment. Sixteen young men were tested on a paced mental task while seated in a room at each of four air temperatures: (dry/wet bulb) 85/95, 90/80, 95/75, 100/50 F. In one session at each temperature the subjects were given encouragement and knowledge of results and in a comparison session were given neither. Performance is analyzed with respect to the incentive conditions, room temperature, practice and subjective reports of comfort.

Fitts, P.M., Stevens, S.S., Brogden, W.J. & Inus, H. HUMAN ENGINEERING IN THE NATIONAL DEFENSE. HPS 205/1, June 1953, 12pp. US Research and Development Board, Department of Defense, Washington, D.C.

50
This paper discusses the role of human engineering in the national defense and provides a philosophy for weapon systems development that attempts to maximize the use of human and machine components by recognizing the unique potential contributions and limitations of each. The major topics are: 1) definition of human engineering, 2) military goals of human engineering, 3) military fields of application of human engineering, 4) optimum employment of men as components of future weapons systems, and 5) basic and supporting research.

Pepler, R.D. THE EFFECT OF CLIMATIC FACTORS ON THE PERFORMANCE OF SKILLED TASKS BY YOUNG EUROPEAN MEN LIVING IN THE TROPICS. 5. A COMPLEX MENTAL TASK WITH VARYING SPEED STRESS. APU 196/53, Nov. 1953, 24pp. Applied Psychology Research Unit, MRC, Cambridge, England.

51
This experiment was designed to determine the effects of air temperature upon the performance of a high speed mental task. Twenty-four physically fit young men accustomed to living in the tropics, reported discrepancies between a constant set of figures, visually displayed, and another set which changed every 4, 6, or 8 seconds. They performed this task once at each speed at each of four room temperatures: (dry/wet bulb) 85/95, 90/80, 95/85, and 100/90° F. Performance, measured in terms of errors and omissions, is analyzed with respect to air temperature, working speed, practice and subjective reports of comfort.

Andreas, B.G. BIBLIOGRAPHY OF PERCEPTUAL-MOTOR PERFORMANCE UNDER VARIED DISPLAY-CONTROL RELATIONSHIPS. Contract AF30(602) 200, Rep. 1, June 1953, 17pp. University of Rochester, Rochester, N.Y.

An unannotated bibliography of human engineering studies dealing with perceptual-motor performance under conditions of different display-control relationships is presented. Part of the bibliography cites general articles (32). Part of the bibliography cites experimental studies in which display-control relationships were varied: a) relationships between discrete display elements and discrete control movements (R = 10), b) relationships between the direction and plane of movement of the display and the direction and plane of movement of the controls (R = 61), c) ratio between extent of movement of controls and resulting movement of display (R = 24); d) velocity, rate-aided and acceleration control (R = 9). In general, the bibliography covers material available for examination at the end of 1952. (HEIAS)

Andreas, B.G. & Weiss, B. REVIEW OF RESEARCH ON PERCEPTUAL-MOTOR PERFORMANCE UNDER VARIED DISPLAY-CONTROL RELATIONSHIPS. Contract AF 30(602) 200, Rep. 2, May 1954, 17pp. University of Rochester, Rochester, N.Y.
Experiments dealing with perceptual-motor performance under different display-control relationships are reviewed. The review is divided into 4 parts: a) relationships between discrete display elements and discrete control movements; b) relationships between the direction and plane of movement of the display and the direction and plane of movement of the controls; c) ratio between extent of movement of controls and resulting movement of display; d) velocity, rate-aided, and acceleration control. Each part is introduced by an overview which indicates the problems covered by the studies and some of the more important conclusions which may be drawn from different investigations. Individual abstracts of the reports are presented next, together with comment on each. The abstracts are centered about display-control relationship problem with which the experiments deal; other aspects of the studies are omitted. An attempt is made to indicate the problem investigated, the apparatus employed, the procedure followed and the major results obtained. (HEIAS)

RESPIRATORY RESPONSE TO OXYGEN AND 4.1 AND 6.2 PERCENT CARBON DIOXIDE IN AIR AND OXYGEN AT A CROSSLAND LEVEL OF 5,000 FEET. Contract AF 33(608) 13214, Proj. 21 1402 GOM, Rep. 3, July 1954, 14pp. USAF School of Aviation Medicine, Brooks AFB, Tex. (Department of Respiratory Physiology, Lovelace Foundation for Medical Education and Research, Albuquerque, N.M.).

55
This investigation concerns the differences between the effects of breathing carbon dioxide (CO_2) in air and in oxygen (O_2). Four subjects, acclimated to a ground level of 5000 ft. breathed air for 10 minutes, the experimental mixture for 10 minutes, and the air for 10 minutes. The experimental mixtures were air + 4.1% CO_2 , air + 6.2% CO_2 , O_2 + 4.1% CO_2 , and O_2 + 6.2% CO_2 . The data analyzed are the content of the expired gas, the expiratory minute volume, the tidal volume, and the respiratory rate.

Doranski, T.J. PHYSIOLOGICAL RECOGNITION OF STRAIN IN FLYING PERSONNEL. COSINOPIA IN B-29 COMBAT OPERATIONS. Proj. 21 1208 GOM, Rep. 3, Nov. 1953, 20pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

The occurrence of cosinopia in B-29 aircrew personnel flying combat missions over Korea was investigated. The aircraft commander, navigator, radar observer, bombardier, and engineer of each of five crews were studied with respect to a total of 55 man-missions. Post-flight data were obtained for 45 of the man-missions concerned. One of the missions was a Leaflet and the remainder were bombing missions. The data include findings relative to an aircrew flying its first combat mission. The incidence of cosinopia during the flight phase was circa 20 percent. This value appears to be consistent with the relatively mild stress associated with the air operations described.

Miller, R.B. A STUDY OF THE DEVELOPMENTAL HISTORY OF SELECTED COMPLEX ELECTRONIC SYSTEMS. Contract AF 16 (600) 1339, Proj. 7709, Task 37304, AFTRC TR 56 1, Dec. 1956, 5pp. USAF Maintenance Lab., Lowry AFB, Colo.

58
This is a summary report of a research program designed to determine what kinds of maintenance-related information become available during stages of development of complex electronic systems and to consider the usefulness of this information for the early planning of personnel and training programs for electronic mechanics. Information concerning the developmental history of two systems was obtained and analyzed for developmental products (specifications, diagrams, test equipment, etc.) which would permit anticipation of maintenance requirements. Further analysis of these products led to the preparation of guides for future analyses: position-task description, position structure, characteristics of training and training equipment, and handbook of job instructions. 59
The purpose of this study was to determine the feasibility of developing maintenance proficiency tests for Air Force ground crews in the early stages of procurement of a new weapon system. Two tests were developed for the B-52 aircraft, one for general mechanics and the other for engine mechanics. The test items were written by the test construction staff and experienced mechanics after attending the manufacturer's training school. Trial forms of the tests were administered to Air Force and civilian mechanics; the general mechanic's test to 39 subjects and the engine mechanic's test to 58 subjects. The results are analyzed in terms of the level of difficulty of the items, the independence of the subtests, and internal consistency.

63 Hersh, I.W. & Hunt, W.A. ABBREVIATED PSYCHOLOGICAL MEASURES. Contract N70NR 45011, Proj. NR 154 091, 10pp. Northwestern University, Evanston, Ill.

The history of abbreviated psychological measurement extends back over the past 40 years, beginning with the efforts of medical officers of the U.S. Navy to adapt the Binet scale for measuring intelligence to selection of recruits. Criteria for such brief techniques were formulated at that time which still hold for present-day testing, covering the requirements of "cutting" scores, adequate range, objectivity, economy of time, and simplicity of administration and scoring. These pioneers in brief psychological measurement also were aware of the limitations of the methods. Continuing concern arising from experimental evidence has indicated caution in their use. World War II gave the major impetus to abbreviated tests and the present emergency and manpower mobilization problems again have stimulated interest in the development and validation of rapid, objective methods for neuropsychiatric screening. There now are available in the psychological and psychiatric literature about 300 reports on abbreviated or brief psychological tests. These cover the range of intelligence and other diagnostic measures, personality inventories, and projective techniques and sample populations of normal, neurotic, psychotic, and brain-damaged individuals. These many studies have attempted to meet the demands for brief psychological methods by the military and naval services, hospitals, clinics, schools, and business and industry. Advantages of abbreviated measures lie in their economy of time both in subject and examiner time, in elimination of "deadwood" and "filler" items, in equipment, and in trained personnel. These have been demonstrated in studies of verbal and nonverbal test materials where their diagnostic usefulness has been proven. The limitations of brief measures must be examined in terms of their specific goals, and the significance of set, motivational, and contextual factors which may change as a function of test abbreviation.

62 Roxburgh, M.L. & Ernstling, J. THE PHYSIOLOGY OF PRESSURE SUITS. FPM 293, Nov. 1956, 16pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

Equipment which will maintain an absolute pressure in the lungs of 141 mm Hg. In the event of exposure of aircrew to altitudes above 40,000 ft. will afford short term protection against these altitudes and an emergency descent to be made. A compromise is dictated between the physiological ideal of full body pressurization and the operational ideal of the fully efficient man. The degree of regional counterpressure required is dependent upon the magnitude of the pressure necessary to maintain an intrapulmonary pressure of 141 mm Hg. and the length of time for which it is operative. Thus a trunk counterpressure is required at pressures below 30 mm Hg. At pressures greater than this full trunk counterpressure is essential if the respiratory disturbances induced by high pressure breathing are to be minimized. b) The limit of an aircrew mask is set by the physiological disturbance produced in the unpressurized eyes and head by high breathing pressures. c) Extracorporeal pressurized limbs reduce the effective blood volume in pressure breathing. When this reduction has amounted to a certain value a vasovagal type of collapse will occur, and this sets the limit to the breathing pressure and length of time for which it can be withstood when trunk counterpressure is employed.

67 Chapman, A. THE RECONSTRUCTION OF ABBREVIATED PRINTED MESSAGES. J. exp. Psychol., Sec. 1954, 40(6), 496-510. (Johns Hopkins University, Baltimore, Md.).

67 To explore systematically some of the practical consequences of redundancy in English text, 94 subjects, varying widely in general intelligence and familiarity with grammar, were required to reconstruct English text with various amounts of it deleted. Thirteen prose passages were selected and deletions made in both regular and random patterns in 5% amounts varying from ten to 67 per cent. All subjects also took an intelligence test and an English test. Performance was scored for total amount of material inserted and amount correctly restored. These data were analyzed for effect of percentage of items deleted, regular versus random deletion, type of passage and individual differences.

68 Fuchs, E.F., Harper, Bertha, Brown, Emma & Zeldner, J. THE STABILITY OF APTITUDE AREA STANDARD SCORES AS A BASIS FOR CLASSIFICATION OF ARMY ENLISTED PERSONNEL. Proj. 2933100, PJ 3502 08, Pts A+B, 561, June 1952, 10pp. USA Personnel Research Branch, Office of the Adjutant General, Washington, D.C.

Tests in the AGCT, in different combinations, yield 10 aptitude area scores. Scores in AGCT tests were obtained for 4000 recruits processed during December 1946. 4 methods of summing the aptitude area standard scores from scores on the component tests were tried out. Relationships among the tests were investigated and an analysis made of various distributions of aptitude area scores. The average of the standard scores on the tests comprising an aptitude area gave results similar to more complicated scoring procedures, including equipercentile scales based on AGCT distributions for a 1947 group (N = 1145) and the present group. Numbers of recruits having either highest or second highest score in a given aptitude area were fairly even for the 10 areas. Percentages were consistent for 2 1948 subgroups. Of a group of 200 men, half had 20 or more standard score points difference between their highest and lowest area scores. With the 1948 subgroups the test showed a clear relationship to each other than with the 1947 subgroups. ($r_{15} = .26$ to $.72$ vs. $.03$ to $.04$).

Newman, E.R. & Gerstman, L.J. A NEW METHOD FOR ANALYZING PRINTED ENGLISH. J. exp. Psychol., Aug. 1952, 44(2), 114-125. (Harvard University, Cambridge, Mass. & Watkins Laboratories, New York, N.Y.).

A new measure, the coefficient of constraint, is proposed which provides a limited but extremely useful estimate of the sequential dependencies in sequences of events, such as letters, which cannot be ordered into a metric scale. When the coefficient of constraint was calculated for a passage of printed English, a quite regular behavior of the coefficient was discovered which could be described by the expression $D(n) = 1/n^2$. A possible use of the coefficient of constraint is proposed by which an upper bound is set on the average information per letter in the text examined. This upper bound has both considerable resemblance to, and freedom from, greater constraint. Shannon's estimate of the 'new function'. Neither greater length greater than that of one word.

Bull. 52 27, Aug. 1952, 8pp. USAF Personnel & Motor Skills Research Lab., Lackland AFB, Tex. (Reprinted from: J. exp. Psychol., July 1952, 44(1), 19-26).

84
To test the effect of distribution of practice during acquisition of 3 psychomotor skills, 3 experiments were run, using the Rudder Control Test, the Complex Coordination Test, and the Rotary Pursuit Test. Subjects were basic trainee airmen. Intervals between trials were varied from 0 to 120 seconds. Retention was tested ten weeks after completion of initial training periods. Mean time-on-target or mean time-per-trial are discussed with regard to the effects of practice distribution, both on immediate acquisition and on subsequent retention.

Dwyer, P.G. THE RELATIVE EFFICACY AND ECONOMY OF VARIOUS TEST SELECTION METHODS. Proj. 2552100, RJ 9207 GI, PAS Rep. 937, June 1952, 57pp. USA Personnel Research Branch, Office of the Adjutant General, Washington, D.C.

The present study is an evaluation, in terms of personnel measurement for the Army, of various methods of reducing the number of tests in a battery when the battery is used for predictive purposes, without a significant loss in efficiency. Some 13 different methods were considered for selecting tests out of a larger battery for predictive purposes. Theory was developed for several new procedures and illustrative problems were employed to clarify all the methods. The conditions under which each method might be most efficient were studied. General rules were suggested for the termination of the test selection process at that a) trivial results can be avoided and b) assurance may be had that the tests selected make a significant contribution. Shaw, M.E. SOME EFFECTS OF PROBLEM COMPLEXITY UPON PROBLEM SOLUTION EFFICIENCY IN DIFFERENT COMMUNICATION NETS. J. exp. Psychol., Sept. 1954, 48(3), 211-217. (Johns Hopkins University, Baltimore, Md.).

86
To investigate the effects of problem complexity on problem solving efficiency in different communication nets, six groups of three subjects each were assigned to four conditions. Two types of problem (simple identification of common symbols and complex problems requiring arithmetical computation) and two networks (wheel and circle) were combined to form the four conditions. Time to solve the problems, and errors were studied by analysis of variance techniques for effect of the experimental variables. A rating scale was also administered to gather some information as to effects of the variables on morale.

94 Harris, J.D., Helms, H.L. & Myers, G.K. LOUDNESS PERCEPTION FOR PURE TONES AND FOR SPEECH. *Ann. Arch. Otolaryng.*, Feb. 1952, 55, 107-133. (USN Medical Research Lab., Naval Submarine Base, Conn.).

The technique of alternate binaural loudness was used to explore the growth of loudness in the worse ear of patients with defective and normal ears. Data for pure tones and speech were collected on a variety of types of deafness. It was found that patients can readily induced to make loudness matches for speech in 2 ears of unequal ability and that these matches can be as precise as those for steady pure tones. It was further found that irrespective of the type of deafness recruitment for speech followed a course parallel to that for pure tones and roughly intermediate among the curves of recruitment for pure tones in the speech range. 4 types of recruitment curves were distinguished: asymptotic, straight-line, delayed, and delayed plus asymptotic. No perfect correspondence exists between any type of curve and any type of hearing defect. The data did not unequivocally support the view that recruitment arises from a constant loss of loudness. Rather, it seems that the course of recruitment curves often indicates a constant decrease in the db difference between the normal and the experimental ear. Reasons for the delay feature of some recruitment curves are discussed. Analogues of recruitment in the normal ear and explanations of recruitment curves are discussed. An indication is given that increasing the loudness of speech does not, for some patients with perceptive deafness, cause a proportionate increase in speech intelligibility. (HEIAS)

95 Harris, J.D. & Myers, G.K. THE EMERGENCE OF A TONE'S SENSATION. *J. Gen. Psychol.*, April 1949 35(2), 228-237. (USN Medical Research Lab., Naval Submarine Base, Conn.).

When the absolute threshold of auditory acuity for pure tones is carefully explored with fine intensity steps, a region called the 'zone of detectability' can be noticed by experienced ss. In this zone, pure tones can be detected but cannot be said to have a true pure-tone quality. This zone of detectability is defined as the intensity area between a 5% percent detection threshold and a 50 percent pure-tone threshold. In Exp. I, these two thresholds were simultaneous; determined by a modification of the method of limits at each of six frequencies, 500, 1000, 2000, 4000, 8000, and 16,000. 2 experienced ss were used. The zone of detectability varied from 2.7 to 2.1 db for one ss and from 1.7 to 3.2 for another ss. A slight tendency was found for the zone to be larger at the highest frequencies. In Exp. II, it was shown that particularly for the higher frequencies, an experienced ss can select a certain criterion of tonality and maintain it with considerable precision. In Exp. III, 8 matched a variable frequency of very low sensation level to a standard frequency of 10 db sensation level. The frequency-match was progressively better as the intensity of the variable frequency increased from zero to 10 db sensation level, and the course of this improvement was taken to symbolize the gradual nature of the emergence of a true sensation from an indefinite 'something' to the sharp sensation of a clear pure tone. It was reasoned that the subjective criterion of 'tonality' which ss can select and maintain is indeed one of pitch rather than of loudness; but it was concluded that the phenomenon depends upon the intensity of the stimulus rather than upon a change in its frequency-composition.

96 Remmsley, Anita I. & Harris, J.D. STUDIES IN SHORT-DURATION AUDITORY FATIGUE: II. RECOVERY TIME. *J. Gen. Psychol.*, Feb. 1952, 51(2), 138-142. (USN Medical Research Lab., Naval Submarine Base, Conn.).

The technique of studying auditory fatigue using brief, weak tones has proved very fruitful, since the ear's return to normal is so quick that a great deal of information can be gathered in a short time. This paper studies the course of the recovery from such fatigue as a function of stimulation frequency and intensity, and of recovery interval. To a pure tone of 500, 1000, or 8000 cps up to 70-db sensation level, acting for 14 sec., recovery is complete within little more than a third of a second. For weaker stimuli recovery is proportionately quicker. At about 50-db sensation level, the disappearance of fatigue follows roughly an exponential course; at weaker levels a negative acceleration appears. Experiments with ear-conduction and on a patient with isolated missing rule out the central nervous system and the middle ear respectively as the locus of fatigue. An experiment on the effect of duration of stimulation shows that the ear within at least 100 msec. or less exhibits a residual threshold shift due to stimulation, but that at moderate intensities no greater threshold shifts may be occasioned with fatiguing stimulus durations of at least 10 sec. and probably indefinitely. Whether this continuously adapting mechanism is within the peripheral organ, at the transmission between the sense cells and the first nerve fibers, or is purely neural, is not yet known.

96 Chaparral, A. VISION. *Ann. Rev. Psychol.*, 1951, 11, 45-64. (Johns Hopkins University, Baltimore, Md.).

This report is an annual review of publications in the field of vision. The period covered is primarily 1949-1950. The review is divided into the following areas: 1) basic visual functions--dark adaptation, visual acuity, color adaptation, color-vision defects; 2) visual perception--figural aftereffects, perception of vertical and horizontal; 3) physiological bases of the visual process--electrical studies, single fiber studies, photochemistry of the retina; and 4) applied visual research--dials, radar scopes, reviews of human engineering data, visual requirements in industry, and visual fatigue.

Harris, J.B. PITCH DISCRIMINATION. *J. acoust. Soc. Amer.*, Nov. 1952, 25(6), 750-755. (USN Medical Research Lab., New London Submarine Base, Conn.).

In view of the contradictory nature of the data on the DL for pitch, especially at frequencies below 1000 cps, a new determination was made of the DL at 125, 250, 500, 1000, 2000 and 4000 cps, from 5 to 30 db above threshold, and at 60 cps from 5 to 15 db above threshold. Three well-trained subjects were used, in a forced-judgment variant of the method of constant stimulus differences. Especial care was taken to shape the onset and termination of tones and to choose tone durations so that transient content was minimized. Curves were drawn representing the decrease in sensitivity with loudness. The general relationship between sensitivity and loudness was found to be approximately constant over the frequency range used. It was also found that the absolute DL continues to decrease as frequency decreases, the relationship being more marked at the lower loudness levels. These data differ sharply from the data obtained by approximately sinusoidal frequency modulation (Shower and Biddulph), or it is concluded that at least for frequencies below 1000 cps the two methods explore quite different psychological functions. These results indicate that the traditional method of constant stimulus differences used here is more readily definable as a test of pitch discrimination. The question is raised whether the frequency modulation technique is not rather an experiment in some form of beats or masking.

Zwislocki, J. ACOUSTIC ATTENUATION BETWEEN THE EARS. *J. acoust. Soc. Amer.*, July 1953, 25(4), 752-759. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

In an investigation of the acoustical insulation between the ears, various earphones and obliterating devices were used. Bone conduction was shown to be chiefly responsible for the acoustical leakage between the ears. Conditions were determined under which interaural insulation could be increased considerably. Most of the measurements were performed with a compensation method which appears to give more precise results than methods previously used, and which permits phase measurements.

Harris, J.B. & Ramsley, Anita I. PATTERNS OF COCHLEAR ADAPTATION AT THREE FREQUENCY REGIONS. *J. acoust. Soc. Amer.*, July 1953, 25(4), 760-766. (USN Medical Research Lab., New London Submarine Base, Conn.).

Auditory adaptation was determined in 40s to 100-, 1000-, and 4000-cps tones at 30-, 50-, 70-, and 90-db loudness level. The spread of effect to closely adjacent frequencies was particularly examined. The method of adaptation was used to avoid the intrusion of sea in the simultaneous masking experiment. Loudness patterns were drawn according to the method of Munson and Gardner, confirming and extending the earlier study. Within the range represented by the differential threshold, no especial peaking of the loudness pattern was found. For example, at 1000 cps, there was a broad peak of ± 10 cps. From earlier experiments, adaptation is thought to be confined to the peripheral sense organ. According to this view, the present data would represent a stage in the process of handling frequency information, intermediate between the much broader amplitude patterns and the more precise operations at the command of the nervous system.

Harris, J.B. RECOVERY CURVES AND EQUINOXIOUS EXPOSURES IN REVERSIBLE AUDITORY FATIGUE FOLLOWING STIMULATION UP TO 140 DB PLUS. *The Laryngoscope*, July 1953, 63(7), 660-673. (USN Medical Research Lab., New London Submarine Base, Conn.).

Three fatigue-resistant subjects were given stimulation of 750 cps at 120-140 db sound pressure level, for up to ten minutes. Recovery to normal threshold at 1000 cps was studied with especial care. The shape of the recovery curve depends upon both intensity and duration of stimulation, the best prediction being a combination of both factors. Hearing loss is a linear function of stimulus duration, the function having a different slope for each stimulus intensity. To a less reliable extent, hearing loss is also a linear function of stimulus intensity, when stimulus duration is the parameter. A family of equi-noxious curves appears from these data, showing the combinations of intensity and duration which produce equally deleterious effects on the auditory threshold. These results will predict the hearing losses (at frequencies important in speech communication) which are occasioned by being immersed in a noise band of 600-1200 cps for up to 10 min. at sound pressure levels up to 140 db.

Harris, J.B. DISCRIMINATION OF PITCH: SUGGESTIONS TOWARD METHOD AND PROCEDURE. *Amer. J. Psychol.*, July 1948, 61(3), 309-322. (USN Medical Research Lab., New London Submarine Base, Conn.).

This paper presents a study of certain intra-serial effects tending to vitiate the DL in one variation of the Method of Constant Stimulus Differences. DLs were determined for groups totaling 515 men. Over 12 experimental variants were investigated. The aim was to discover the stimulus-pattern which gives the truest DL, by which is meant the distance between the actual physical magnitude of the standard stimulus and the magnitude of the variable stimulus at the 75% correct point. The final variant evolved was one with the standard stimulus gradually ascending and descending in frequency, and with variables placed quite at random around these values. This variant seemed to provide a true DL. (HEIAS)

Reese, W.A. & Stevens, K.N. ON THE BL FOR FREQUENCY. *J. Acoust. Soc. Amer.*, Sept. 1953, 25(5), 900-905. (Acoustics Lab., Massachusetts Institute of Technology, Cambridge, Mass.).

Difference limens for three frequencies (250, 1000, & 4000 cps) were determined for 2 trained observers by 2 psychophysical methods: the ABX procedure and the method of constant stimulus differences or AX procedure. Though the 2 observers differ considerably in sensitivity, their BL's for the AX procedure are less than $\frac{1}{2}$ of their BL's for the ABX procedure. Comparison of these data with data in the literature on BL's for frequency indicates a wide range of values for different psychophysical procedures and for different subjects. Some observations are reported that illustrate the effect of such factors as practice and ensemble of stimulus conditions upon the size of the BL. The influence of the stimulus ensemble upon judgment time is discussed briefly. In view of all the experimental data, it would be rather imprudent to postulate a "true" BL, or to infer the behavior of the peripheral organ from the size of a BL measured under a given set of conditions. While there is undoubtedly some relation between the size of the BL and the so-called channel capacity, there is little reason to assume that the relation is a particularly simple one, given the different operations by means of which these two quantities are determined.

Morris, J.D. A BRIEF CRITICAL REVIEW OF LOUDNESS RECRUITMENT. *Psychol. Bull.*, May 1953, 50(3), 190-203. (USN Medical Research Lab., New London Submarine Base, Conn.).

The phenomenon of loudness recruitment is critically reviewed. A brief history of the phenomenon is given and previous reviews are indicated. Next, the following psycho-acoustic situations affected by recruitment are reviewed: a) the loudness function; b) isophonic contours; c) restriction of useful intensity range; d) intensity discrimination; e) precision of absolute intensity limits; f) auditory fatigue; g) masking; and h) speech reception. The characteristics of recruitment, viz. inducing conditions, shapes of recruitment curve temporal pattern, and overrecruitment, are surveyed. In the absence of knowledge of just what derangements within the cochlea induce recruitment, and of just how these derangements affect loudness, a number of theories have been offered to account for the facts--a) fiber-loss theory; b) occlusion theory; c) constant loudness-loss theory; d) duplicity theory; e) geometric theory; f) impedance theory; and g) microphonic theory. Finally, analogies of recruitment in the normal ear are reviewed. (MEIAS)

Calvert, J.F., Hartenberg, R.S., Kliphardt, R.A., Shelley, H.P., et al. DEVELOPING PROBLEM-SOLVING SKILLS IN ENGINEERING. Contract N7 ONR 45012, Proj. NR 151 144, 1953, 250pp. Northwestern University, Evanston, Ill.

106

To investigate the effect of degree of patterning (range rings and azimuth markers) on a polar-coordinate grid, five observers made azimuth and range readings of targets on six different grids (a control and five experimental patterns with varying degrees of detail). The display was presented on a horizontal plotting table with five viewing positions. Speed and accuracy scores for the various conditions are used as a functional index for making recommendations concerning the most desirable design and viewing position. T. G. I. R 8

108

A cooperative study was undertaken between engineers and psychologists: 1) to determine how problem-solving ability might be enhanced through undergraduate training, and 2) to assemble suitable educational methods, proposals for their use, and methods for testing their effectiveness. A study of specific abilities and work-methods was augmented by a literature review of problem-solving. Upon this basis, methods were devised for enhancing problem-solving abilities in a course in engineering drawing and descriptive geometry. Four sections of freshmen drawing classes were used in an experiment designed to study the effectiveness of the methods. A manipulative symbolic notation for the description and synthesis of kinematic mechanisms was also developed. T. G. I. R 34

109 Hardy, L.H., Rend, Gertrude, Rittler, M. Catherine, Blenk, A.A., et al. THE GEOMETRY OF BINOCULAR SPACE PERCEPTION. Contract N6ON7115, Proj. NR 14-538, 1953, 68pp. Knapp Memorial Labs., Columbia University, New York, N.Y.

This is a report of progress, theoretical and experimental, in the study of binocular space perception based on the theory of R.K. Luneburg. The experimental evidence definitely supports Luneburg's major conclusion that the dark room visual space has a determinate non-Euclidean metric or psychometric distance function which is a personal characteristic of the observer. In this report the metric has been expressed in terms of coordinates closely related to, but different from those of Luneburg. Now the same methods are used for determining the form of the metric as were suggested by Luneburg. The theory gives an explanation of several well-known perceptual space phenomena such as the frontal geodesics, Blumenfeld arrays, and size constancy. R 18

110 Humphrey, C.E. & Thompson, J.E. AUDITORY DISPLAYS, II. COMPARISON OF AUDITORY TRACKING WITH VISUAL TRACKING IN ONE DIMENSION. C. CONTINUOUS SIGNALS, SIMPLE, INTERMEDIATE AND COMPLEX COURSES. Rep. APL/JHU TG 194, April 1953, 5pp. Johns Hopkins University, Baltimore, Md.

110 With a continuous presentation of auditory or visual error signals in one dimension: 1) Visual tracking performance was far superior to auditory tracking performance; 2) The variability of level of performance of operators indicates a decided need for careful selection of operators who are to perform a tracking task; 3) There was a homogeneous factor operating in auditory tracking trials which did not exist in visual tracking trials; 4) The use of cyclical or repetitive courses of sufficient simplicity to approximate radar displays of aircraft movement permit the operator to learn the rate of motion. When this difficulty is overcome by complex courses, a lack of realism results; hence, random, non-cyclical courses appear to be more desirable. R 5

111 Brown, J.S., Knauff, E.B. & Rosa Baum, G. THE ACCURACY OF POSITIONING REACTIONS AS A FUNCTION OF DIRECTION AND EXTENT. Contract NSORI 57, Proj. 20 M 1, Rep. 1, 1947, 21pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., State University of Iowa, Iowa City, Iowa).

The purpose of this study was to measure the accuracy with which individuals can perform positioning reaction in the absence of visual corrective cues. The precision and variability of positioning reactions as affected by: a) plane of movement; b) direction of movement with respect to the body; and c) distance moved were studied. 6 experimental conditions consisting of 2 directions of movement (toward and away from the body) studied in each of 3 planes or axes were used. Tested were 24 Ss under each of the 6 conditions. The results indicate a tendency to overshoot the intended mark at the shorter distance and to fall short of the intended mark in the longer distances. Movements away from the body exhibit smaller percent errors in positioning than do movements toward the body at comparable distances from their respective starting points. The variability of positioning movements directed away from the body is greater than that of movements toward the body at distances of 10 and 40 cm. The relationship is reversed for distances of 0.6 and 2.5 cm. This effect is attributed to the position of the terminal points with respect to the body, since the larger variabilities were associated with the more remotely located points. (HEIAS) R 8

112 Jenkins, W.L. DESIGN FACTORS IN KNOBS AND LEVERS FOR MAKING SETTINGS ON SCALES AND SCOPES. Contract AF 18(600) 24, RDO 694 17, WADC TR 53-2, Feb. 1953, 5pp. USAL Wright Air Development Center, Wright-Patterson AFB, Ohio. (Lehigh University, Bethlehem, Penn.).

This is a brief summary of five detailed research reports prepared by Lehigh University on the design of knobs and levers. It is intended to provide the design engineer with a convenient integration of the major findings of the research. This research indicates that the time required to make a setting is affected more by the ratio of control movement to indicator movement than by inertia, friction, backlash, setting tolerance, or control size. When a control knob is used to make settings on a linear scale, the optimal ratio is found to be: a) for fine tolerances (.007 to .015"), one or two in. of pointer movement for one complete turn of the knob; b) for coarse tolerances (.016 to .100"), about six in. of pointer movement for one turn of the knob. When a lever is used to make settings on a linear scale to coarse tolerances (.016 to .100"), the optimal ratio is one unit of pointer movement to three units of lever movement. When a joy stick is used to make settings, in two dimensions, on a simulated scope face to coarse tolerances (.10"), the optimal ratio is one unit of indicator movement to two-and-a-half units of stick movement. Malone, Florence L., Sexton, Mary S., & Farnsworth, D. THE DETECTABILITY OF YELLOWS, YELLOW-REDS, AND REDS IN AIR-SEA RESCUE. Proj. No. NM 003 041.35.01, Rep. No. 182. Sept. 1951. pp. 177-185. Medical Research Lab., Submarine Base, New London, Conn.

115

This preliminary study was designed to investigate the effectiveness of the yellow currently in use for life-saving equipment and the usefulness of detection goggles as a means of increasing visibility of colors. Seven subjects made outdoor judgment, with and without goggles, of the distance at which 1/4-inch color circles (a graduated series of yellows, yellow-reds, and reds) mounted on blue-grey boards could be seen. Upon the basis of the resulting data some recommendations are made and further experimentation is indicated.

Chapman, A., & Leysorek, M. ACCURACY OF VISUAL INTERPOLATION BETWEEN SCALE MARKERS AS A FUNCTION OF THE NUMBER ASSIGNED TO THE SCALE INTERVAL. J. exp. Psychol., 1950, 40, 655-667. (Johns Hopkins Univ., Dept. of Psychol.)

125

To obtain information on the relation between accuracy of visual interpolation and the number system assigned to scale markers, eleven naval radar operators estimated the position of a number of short arcs scattered in and concentric with a pattern of four equally spaced concentric circles (scale markers). Eleven numerical scale units were tested--100 to 10,000 yards and 2.5 miles. Relative errors of estimation are analyzed into two components, constant, and variable errors. Differences among scales are discussed in terms of number preferences. T. G. 1. R 8

Whiteside, T.C.D. THE PROBLEMS OF VISION IN FLIGHT AT HIGH ALTITUDE. London: Butterworths Scientific Publications, 1957, 168pp. AGARDOGRAPH 13.

130

This book deals specifically with visual problems of flight in the stratosphere or upper limits of the troposphere. Following an introduction a series of investigations are reported on: 1) effects of changes in intensity and spectral distribution of sunlight at high altitudes; 2) physiological changes affecting visibility of objects inside the cockpit; and 3) physiological factors affecting air-to-air visibility. A discussion of the problems of glare (contrast measurements, discomfort and anoxia) and search (empty field myopia, accommodation, fixation pattern, other problems of empty visual field) presents a comprehensive view of the problem as a whole. Boynton, R.M., & Friedman, M.H. A PSYCHOPHYSICAL AND ELECTROPHYSIOLOGICAL STUDY OF LIGHT ADAPTATION. J. exp. Psychol., 1953, 46, 125-134. Contract N7onr-358, Task Order 2, Proj. NR-140-359. ONR, Brown U.

134

To study the course of light adaptation at scotopic levels, two experiments (two subjects each) were performed using two types of response: 1) Intensity-discrimination threshold, 2) b-wave component of the electroretinogram (ERG). Experimental conditions included: 1) luminance of adapting stimulus about one log unit above absolute threshold, 2) various adapting intervals, including negative (test flash preceding adaptation onset) intervals, 3) 30-minute dark adaptation, 4) from two to six experimental sessions. Sensitivity data are given and discussed in terms of current theory. T. G. 1. R 11

137
To measure (central) sensitivity changes associated with adapting stimuli, intensity discrimination thresholds of a test-flash were determined by two trained subjects before, during, and immediately after the onset of two different adapting stimuli: 1) concentric with and larger than the foveal test-flash, 2) presented at a glare angle of 18°. Luminances of adapting stimuli used were those yielding the same test-flash threshold at "zero" adapting interval. Log luminance of threshold test-flash is shown as a function of the adapting interval. These results are discussed in terms of the stray-light hypothesis.

Kehler, I. AUDITORY GUIDANCE STUDIES. Contract AF 61 (514) 889, AFOSR TR 55 43, 1956, 58pp. USAF Air Research & Development Command, Paris, France. (Institut für experimentelle Psychologie der Universität Innsbruck, Innsbruck, Austria).

141
To investigate factors involved in auditory guidance ("obstacle sense," "facial vision") a series of studies were conducted. A method was developed by which obstacle sense could be measured and 267 persons (four to 85 years of age) were tested with and without a guidance device. Physical and physiological optimum conditions for the "ideal" guidance sound and guiding device were established. A further group of 13 blind and 27 blindfolded persons wearing a guidance device were given intensive training and the results evaluated in terms of the values and limitations of training. And finally the relations between auditory stimuli and facial sensations which occur in connection with detection of obstacles were investigated. A theoretical explanation of the findings is offered.

Hendray, C.M. SIMULTANEOUS VISION AND ADDITION: THE COMPREHENSION OF PROSE PASSAGES WITH VARYING LEVELS OF DIFFICULTY. *J. exp. Psychol.*, Nov. 1953, 44(5), 365-372. (Johns Hopkins University, Baltimore, Md.).

Prose passages selected from fiction sources and having three levels of difficulty as determined by a Flesch count were presented to Ss visually and aurally at the same time. Two groups of Ss were used - one a group of novel enlisted men and the other a group from a university population. The auditory material was recorded on a magnetic tape recorder, whereas visual presentation was accomplished by means of a visual pager that prevented forward and backward glancing. The speed of visual and auditory presentations was identical. Responses were measured by a ten-item questionnaire designed to test for comprehension of the paragraph and for the retention of discrete facts. Scores obtained from simultaneous trials were compared with scores obtained from control groups that performed the same tasks non-simultaneously. The following conclusions can be drawn: a) For simultaneous presentation significantly greater deterioration (from a nonsimultaneous level) occurred with the easy material, thus substantiating earlier findings. b) The scores from all paired presentations were separated on the basis of the lowest score and the highest score regardless of channel involved or level of difficulty of material, it was found that the lowest scores, with only one exception, did not differ significantly from a chance level.

Hendray, C.M. THE PERCEPTION OF SHORT PHRASES PRESENTED SIMULTANEOUSLY FOR VISUAL AND AUDITORY RECEPTION. *Psych. J. exp. Psychol.*, May 1954, 47(2), 86-92. (Psychological Lab., Johns Hopkins University, Baltimore, Md.).

Subjects were provided with outline maps that were incomplete in several details. Brief, simultaneous, visual and auditory instructions were given for completing some of the missing details. Certain items could be completed on the basis of direct information contained in one or other of the sensory modalities. Other, however, could be completed only because of their relation to details capable of location by direct instruction. Information important for the completion of map details was distributed randomly among short passages of unconnected material. All relevant visual and aural clues were presented simultaneously in every case. Opportunities for alterations of attention were curtailed. Thirty-six subjects were randomly assigned to three experimental conditions, and to two groups that were given different instructions. One group was told that relevant information would always appear simultaneously, while the other group was not allowed this information. The number of successfully located simultaneous pairs of items presented for direct location was found to be no greater than could be expected by chance. The total number of correctly located items was less than 50 per cent of the possible items. There was no difference in the number of correctly located simultaneous pairs of items between the "instructed" and the "uninstructed" groups. The "uninstructed" group did not learn in the course of the experiment that all relevant material was presented simultaneously. Significantly more correct completions were made with the visual material than with the auditory. It was concluded that successful division of attention did not occur.

Hendray, C.M. SIMULTANEOUS VISION AND ADDITION: THE DETECTION OF ELEMENTS MISSING FROM OVERLEARNED SEQUENCES. *J. exp. Psychol.*, Oct. 1952, 44(4), 292-300. (Psychological Lab., University of Cambridge, Cambridge, England).

The relative performance of vision and audition under conditions of simultaneous stimulation was investigated for rapid scanning tasks considered to exhibit two levels of difficulty. The Ss were required to detect elements missing from alphabets and numeral sequences when such sequences were presented simultaneously to the two senses in one of four combinations - visual alphabet with auditory alphabet, visual numeral with auditory numeral, visual alphabet with auditory numeral, or visual numeral with auditory alphabet. Performance on the simultaneous trials was compared with nonsimultaneous performance of the same conditions. Analysis of performance was made on the basis of two types of errors. These were errors of omission, or deleted elements which were not reported as missing, and errors of commission which were elements reported as missing which were not in fact missing. The following results were obtained: a) For nonsimultaneous operation more errors of omission were made with the alphabet sequences than with the numeral sequences. More auditory than visual errors of omission were committed with the numeral sequences; b) For nonsimultaneous operation 4 to 5 times as many errors of commission were made with the auditory sequences as with the visual sequences; c) Increase in the number of errors of omission from nonsimultaneous to simultaneous trials because of the conflicting nature of the material was not significantly greater for one modality or the other; d) Increase in the number of errors of commission from nonsimultaneous to simultaneous trials was significantly greater for the visual trials than for the auditory. 165
Edwards, W. THE RELIABILITY OF PROBABILITY-PREFERENCES. Am. J. Psychol., March 1954, 62(1)
68-95. (Johns Hopkins University, Baltimore, Md.)

A previous experiment has shown that choices between bets of equal expected value stated in terms of rolls on a pinball machine are influenced by preferences among the probabilities involved. This and subsequent research raised several methodological questions, which the four experiments here reported were designed to examine. Experiment I showed that a replication of the previous experiment with different Ss and slightly different experimental conditions gave essentially the same results. The pattern of preferences among probabilities reported in the previous experiment was found. The choices involved could not be fitted to a unidimensional subjective scale. The Ss agreed with one another to a very highly significant extent. Experiment II showed that choices between pairs of bets were not substantially influenced by the wording of the bets, the outcome of previous rolls of the pinball machine, or the number of bets being compared. Experiment III showed that the essentials of the pattern of preferences among probabilities could be found in a non-gambling game involving risk, designed to be as different as possible from the pinball situation. Experiment IV showed that the same pattern of preferences among probabilities could be recovered at several different levels of expected value. It was not possible to find any reasonable scale of the subjective value of money which would be consistent with the results of the experiment. This finding was interpreted to mean that the results of experiments like these should be attributed primarily to preferences among probabilities rather than to differences between the subjective and the objective value of money.

167
Edwards, W. PROBABILITY-PREFERENCES IN GAMBLING. Am. J. Psychol., July 1953, 66(3),
349-364. (Johns Hopkins University, Baltimore, Md.)

Ss in gambling experiments do not make choices in such a way as to maximize their expected winnings or minimize their expected losses, although there is reason to assume that these are their goals. An experiment was designed to find out why they do not. Bets of equal expected value, stated in terms of rolls on a pinball machine, were compared with each other by the method of paired comparisons. 12 Ss were run under 3 conditions: Just imagining they were gambling, gambling for worthless chips and gambling for real money. The results showed that there are 2 factors determining choices among bets of equal expected value. The first is a tendency to prefer or avoid "long shots." The second is a set of specific preferences among specific probabilities. Ss made choices in such a fashion that inconsistent triads of choices appeared less than 1/4 the number of times they could. Have appeared, and the number of inconsistent triads decreased as the experiment progressed. Different Ss tended to make the same choices in the same situation to a highly significant extent.

R 9

166
Edwards, W. PROBABILITY-PREFERENCES AMONG BETS WITH DIFFERING EXPECTED VALUES. Am. J. Psychol., March 1954, 62(1), 56-67. (Johns Hopkins University, Baltimore, Md.)

Preferences were found for some probabilities over others in gambling situations in a previous experiment. In that experiment, all choices had to be made between bets of the same expected value. The present experiment was designed to find out what Ss would do when required to choose between bets of different expected values. After preliminary sessions in which the results of the previous experiment were confirmed, Ss were required to make choices between pairs of bets of different expected value according to the method of paired comparisons. The results showed that both preferences for bets with higher expected values, or lower negative expected values, and preferences among probabilities influenced Ss' choices. The former factor was dominant in those bets on which Ss could only win or break even; both were important in those bets on which Ss could either win or lose. These variations in effectiveness of the two major determinants of choices were related to specific properties of the bets involved. It is concluded that probability-preferences are important in determining decisions among bets even when there are objective reasons for preferring one bet to another, although as the difference in expected value increases it seems likely that the importance of probability-preferences will decrease.

Dusek, E.R. MANUAL PERFORMANCE AND FINGER TEMPERATURE AS A FUNCTION OF AMBIENT TEMPERATURE. Proj. 7-83-01-005B, Tech. Rep. EP-68 Oct. 1957, 8pp. USA Quartermaster Research and Engineering Center, Watlck, Mass.

168
To investigate manual performance and finger skin temperatures as related to environmental temperatures, 18 subjects performed on three standardized tests (Minnesota Rate of Manipulation, O'Connor Finger Dexterity, and Purdue Pegboard) under each of four ambient temperature conditions (35, 45, 55, and 75 degrees Fahrenheit). Under each condition, except the control at 75 degrees, the subjects sat for 30 minutes until their hands cooled before completing the tests. Continuous skin temperature recordings were made during the 90-minute exposure period. The performance data (mean for two trials at each temperature) and finger temperatures were analyzed as functions of temperature and for relations among these three. Recommendations are included. T. Fitts, P.M. (Chm.). DESIGN FOR EASE OF MAINTENANCE. Second Symposium on Electronics Maintenance, PPT 202/3, 9-11 May 1956, 201pp. US Research & Development Board, Department of Defense, Washington, D.C.

169
This report presents the papers read and subsequent discussion at a symposium on electronics maintenance. The major theme was that of improved maintenance through initial design so that functions of trouble-shooting, maintenance records, calibration, replacement, and repair are simplified and geared to the military personnel and training subsystem. The general discussion topic was "How can engineers and human engineers together improve the design for equipment maintenance?" Topics included uniform data-collecting systems for criterion failures, maintenance handbooks, a criterion for maintainability, and trade-off curves in the various design areas.

von Békésy, G. NOTE ON THE DEFINITION OF THE TERM: HEARING BY BONE CONDUCTION. J. Acoust. Soc. Amer., Jan. 1954, 26(1), 106-107. (Harvard University, Cambridge, Mass.).

This paper clarifies the meaning of bone conduction in hearing and defines the types of bone conduction. The 3 types are labyrinth bone conduction, skull bone conduction, and clinical bone conduction. Labyrinth bone conduction is independent of both the state of the middle ear and the vibrations of the lower jaw. It would be an ideal tool for the diagnosis of nerve deafness were it not for the fact that it is hard to measure, even in normal ears. Skull bone conduction is concerned with the condition of the middle ear (e.g. presence or absence of ossicles) but is independent of the vibrations of the lower jaw. Clinical bone conduction includes both these types, and in addition it includes hearing produced by the relative movements of the lower jaw.

Mattwick, R.G. DARK ADAPTATION TO INTERMEDIATE LEVELS AND TO COMPLETE DARKNESS. J. Opt. Soc. Amer., March 1954, 44, 223-228. Contract A-0mr-558(CO), Proj. LR 140-036, CEE, (Florida State Univ.)

172

To investigate intermediate dark adaptation (changes in sensitivity of the eye as a result of moving from high luminance to levels between that and complete darkness), threshold measurements (foveal and parafoveal) were made on three subjects during the course of adaptation to four intermediate luminance levels and to darkness. The theoretical and practical implications of the data are discussed.

Bilodeau, E.A. & Morin, R.E. PROFICIENCY ON THE PEDESTAL SIGHT MANIPULATION TEST WITH AND WITHOUT THE TRACKING PIPPER. Proj. 509 020 0007, Res. Bull. 51, 27, Dec. 1951, 7pp. USAF Perceptual and Motor Skills Research Lab., Lackland AFB, Tex.

173

Ninety-six airmen were subjects in an experiment testing ranging and tracking performance with and without the tracking pipper. They practiced for 12 trials per day on five successive days. Time on target scores for ranging, tracking in azimuth, in elevation, and in both, and for triggering are reported. There is a discussion of the results and possible explanations.

Bilodeau, E.A. DECREMENTS AND RECOVERY FROM DECREMENTS IN A SIMPLE WORK TASK WITH VARIATION IN FORCE REQUIREMENTS AT DIFFERENT STAGES OF PRACTICE. Proj. 509 020 0001, Res. Bull. 51 34, Dec. 1951, 6pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

174

As a part of a larger project investigating transfer of training in motor skills, the factor of physical force in the performance of a simple manual skill was investigated. Four groups of basic airmen (total, 160) turned a crank for five minutes of initial practice, and after a 40 sec. rest, three minutes of final practice. Each group had to exert a different amount of force to turn the crank. Data consist of number of crank revolutions per 20 second period. Analysis in terms of horsepower and study of certain extremes of performance are also reported. The results are of interest in connection with the control component of equipment and manual skills.

Bilodeau, E.A. SOME EFFECTS OF MODIFICATION OF INFORMATION ABOUT A PREVIOUS RESPONSE UPON THE ACQUISITION OF TWO LEVER POSITIONING HABITS. Proj. 509 020 0001, Res. Bull. 52 1, Jan. 1952, 7pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

175

These experiments investigated the effects of alternating practice on a visual positioning task with correct knowledge of results, and on the "same" task for which the "knowledge" of results included a constant error. If the subjects compensated for this constant error, their response was reported to them as correct. Two hundred basic airmen were divided into a control group and 4 experimental groups. Each of the 4 experimental groups had reported to them a different constant error. Within-period and between-period trends in scores are reported and there is a discussion of the function in the learning process of the modified and unmodified information presented.

Bilodeau, E.A. A PRELIMINARY STUDY OF THE EFFECTS OF REPORTING GOALS AS A FUNCTION OF DIFFERENT DEGREES OF RESPONSE ACCURACY. Proj. 509 020 0007, Res. Bull. 52 4, Jan. 1952, 5pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

176

This report investigates the belief that in early stages of training it is desirable to provide greater accuracy tolerances than will be required in actual performance. Two hundred eighty-eight basic training airmen moved a green light in one column with a "job stick" to match a red light in another column. The three experimental groups differed in the amount of tolerance allowed in making a "batch". Test trials following immediately after training were the same for all groups, with the true placement being reported. Results are analyzed by groups and by scoring (tolerance) areas of one, two or three lamps.

Bilodeau, E.A. A FURTHER STUDY OF THE EFFECTS OF TARGET SIZE AND GOAL ATTAINMENT UPON THE DEVELOPMENT OF RESPONSE ACCURACY. Proj. 509 020 0007, Res. Bull. 52 7, Feb. 1952, 5pp. USAF Perceptual & Motor Skills Lab., Lackland AFB, Tex.

177

This study is concerned with the factor of target size in acquiring accuracy in a motor positioning habit with visual stimuli--using a lever to position a green light to a corresponding fixed red light. One hundred forty-seven basic training airmen were divided into 3 groups; one group had a one-lamp target, with accurate knowledge of results. The other two groups had a three-lamp target, but through restriction of reports of "correct", one of these received fewer reported lights than the other. Implications for the importance of target size in training are discussed.

184

This investigation was undertaken to determine whether the effects of cold winds upon tactile sensitivity are ameliorated by habitual exposure to cold. The two-point threshold and the vibration threshold of the index fingertip were measured during exposure to air temperature of -16 to -25° C. and wind velocities of 0 and 4 mph. The loss of tactile sensitivity in men who worked outdoors in a very cold climate is compared to that of indoor workers. A similar comparison is made between the results obtained in the course of daily 2-hour exposures to -15° C. of men living in a moderate climate during the winter and during the summer months.

Cocquyt, F. SENSORY ILLUSIONS. *Shell Aviat. Med.*, ca. 1952, (178), 3-8. (SABENA, Brussels, Belgium).

192
This paper discusses and illustrates sensory illusions as a possible reason for certain puzzling aircraft accidents broadly classified as "pilot's error". Primary concern is with the optical illusions of the pilot who does not accurately follow the movement of his aircraft and therefore the "imagined" position differs from the "true" position with resultant error in control. Recommendations concerning proper precautions to take in training pilots are made.

Thorndike, R.L. THE HUMAN FACTOR IN ACCIDENTS WITH SPECIAL REFERENCE TO AIRCRAFT ACCIDENTS. Proj. 21 30 001, Rep. 1, Feb. 1951, 175pp. USAF School of Aviation Medicine, Brooks AFB, Tex. (Teacher's College, Columbia University, New York, N.Y.).

A comprehensive survey of the literature relating to accidents, particularly aircraft accidents, is presented. This appears to justify the following conclusions: a) systematic safety programs have led to reduction in accident rates; b) an accurate and complete system of reporting aircraft accidents and a functional procedure for coding and analyzing the reports is fundamental to research on the causes and prevention of the accidents; c) much of the literature on accident-proneness must be discounted because of inadequacies in the data on procedures of analysis. However, it appears that there are genuine individual differences in tendency to have accidents; d) no test has been found which is clearly outstanding as a predictor of tendency to have accidents; e) evidence from common experience indicates that at the extremes such temporary factors as drinking, fatigue, emotional disturbance make the individual more susceptible to accidents. However, experimental evidence to indicate the critical level of these agents is meager or lacking; f) accident rates have typically been found to be high for the young and for the inexperienced; g) there is little satisfactory evidence as to the effect upon aircraft accident rate of any specific programs of training, retraining, or safety education; h) aircraft accident rates depend upon the task which the pilot faces as well as upon the pilot. In view of these general findings, recommendations are made with respect to future research on aircraft accidents.

195
Conrad, R. THE TEMPORAL ACCURACY OF RESPONSE IN A SENSORI-MOTOR SKILL. APU 186/53, May 1953, 14pp. *Applied Psychology Research Unit, MRC, Cambridge, England.*

An attempt was made to explain the accuracy with which a series of responses could be matched to a series of signals by reference to the continuously changing temporal relationships between these events. Although approximately half of the responses were made too soon and half too late, this distribution was not fortuitous. The temporal position of a response in relation to the signal which started it was influenced both by the position of the previous response, and by the position of the signal for the next response. Not only did these events determine whether a response would be made early or late, but to a large extent they influenced the size of this error. Thus whilst the character of the temporal structure of events around a signal determined the relative accuracy of the response, the mean signal speed in relation to the mean response rate, determined the frequency with which particular temporal structures occurred. The underlying factors that actually determined the character of the response were shown to be masked when the effects of certain experimental variables on response were presented as mean accuracy values.

Lazarus, R.S., Dease, J., & Osler, Sonia F. REVIEW OF RESEARCH ON EFFECTS OF PSYCHOLOGICAL STRESS UPON PERFORMANCE. Contract AF 33(038) 13253, Proj. 509 020 0001, Res. Bull. 51 28, Dec. 1951, 13pp. *USAF Human Resources Research Center, Lackland AFB Tex. (Johns Hopkins University, Baltimore, Md.).*

An understanding of the effect of psychological stress upon skilled performance is of great theoretical and practical importance. People are often faced with the necessity of performing skilled work under conditions which are highly stressful. Such is obviously the case in military combat. The effectiveness of a pilot, gunner, or radar observer must be maintained even when he is threatened by physical injury or harassed by the need to hurry the performance of a complicated task. The obvious fact that human beings are often required to work under stress does not call for further elaboration. The present report represents a systematic review of the literature dealing with the effects of stress on performance. First of all, various experimental procedures which have been used to produce stress are analyzed and evaluated. Various techniques for measuring the effects of stress are next considered. This is followed by a review of experimental studies of performance under stress. Based upon this review, the authors undertake an evaluation of the problem of the effects of stress including a consideration of theoretical constructs which contribute to an understanding of this problem. A bibliography of forty-five references dealing with stress completes the report.

- 196 Day, R.H. REACTION TIMES DURING A DIFFICULT TRACKING TASK. *EPSC 845*, Aug. 1953, 4pp. Flying Personnel Research Committee, London, England. (Psychology Dept., University of Bristol, Bristol, England).
- Studied were variations in performance of the subsidiary task resulting from the various display-conditions of the main task. The task was for the S to extinguish 1 of 2 lights as quickly as possible employing the proper response. The subsidiary task was essentially a complex reaction time situation with which the S dealt during the performance of a difficult tracking task. The time taken by the S to put out the light was recorded by a pen chronograph. 3 experiments were conducted with square displays with areas of the display being 3, 9, 16, 25, and 36 sq. in. in area for Exp. I; square displays with areas of 12, 20, 30, 36, and 38 in Exp. II; and a circular display with areas of 3, 9, 16, 25, and 36 sq. in. in Exp. III. It was found that the response times to the 2 lights varied little with changes in the area of the inner part of the display. None of the differences between the means were statistically significant. No significant changes occurred in the response times of the subsidiary task. No practice effects were observed in the left hand response task during any one trial, and the variation in the time interval separating the signals has not effected the response times.

- 199 McFarland, R.A., Dunlap, J.W., Hall, W.A., & Huseley, A.L. HUMAN FACTORS IN THE DESIGN OF HIGHWAY TRANSPORT EQUIPMENT. June 1953, 41pp. Harvard School of Public Health, Boston, Mass.
- This report has attempted to evaluate the tasks of twelve current models with respect to the size and capabilities of the operator population. Its purpose is to determine the optimum arrangement of controls, displays, seating, and window areas for the most comfortable, efficient, and safe operation of the vehicle. This human engineering approach can be utilized only when the data on human sitting and capabilities are given equal consideration with the structural and mechanical demands of the automotive engineer. Since the operator is the one element in the integration of the man and the machine that can not be redesigned, it becomes necessary to start with the man and design the machine around him. Only with this method can the most satisfactory arrangement be achieved. It is hoped that this study can contribute to these ends: greater integration of the man with the machine, and for the driver, greater comfort, less susceptibility to fatigue, fewer errors, fewer occupational diseases, collisions and injuries, better morale on the job, and a longer productive working life.

Jameson, Dorothea & Hurvich, L.M. SPECTRAL SENSITIVITY OF THE FOVEA. II. DEPENDENCE ON
CHROMATIC ADAPTATION. J. opt. Soc. Amer., July 1953, 43(7), 552-559. (Tufts University,
Medford, Mass.).

Reported are studies undertaken to determine what changes, if any, the spectral sensi-
tivity of the fovea undergoes with change in chromatic adaptation. Five states of adaptation
were compared. The eye was adapted to pure white, blue, green, yellow and red, at the same
time brightness level (10ml). Measurements were obtained for the right eye of each of 2
practical observers, and 10 threshold functions were determined for each condition of adapta-
tion. Measurements for the bright and dark-adapted neutral states were intended as controls
against which to evaluate the effects of chromatic adaptation. The results indicate that a
slight Purkinje shift occurs even for a 1° foveal area with a transition from light to dark-
adaptation. The former was consequently selected as the proper control condition. Alterna-
tive interpretations of the Purkinje shift in the fovea were examined. The spectral sensi-
tivity for the fovea is shown to be dependent on the chromatic state of adaptation. The
changes are small for the single adapting luminance used here, but the dependence is regular
and consistent. The main effect of adaptation to a stimulus of given hue is a relative de-
crement in foveal sensitivity to the range of spectral stimuli which evoke that hue. Spec-
ific shifts in maxima and various inflections in the sensitivity functions are also discussed.

Hurvich, L.M. & Jameson, D. SPECTRAL SENSITIVITY OF THE FOVEA. I. NEUTRAL ADAPTATION. J.
opt. Soc. Amer., 1953, 43, 485-494.
The spectral sensitivity of the 1° fovea of the right eye of two practiced observers was
measured at 10ml intervals from 400 mμ to 700 mμ for the dark-adapted state and for the
bright-adapted (10ml), chromatically neutral state. Ten complete luminosity functions were
obtained for each observer for each of the specified adaptations. The data of these experi-
ments are intended to provide controls against which to evaluate luminosity data for differ-
ent chromatic states. A number of inflections and shoulders are found in the functions for
both states of adaptation. Moreover, the functions for both observers are shown to undergo
a change in form and a displacement from the bright to the dark-adapted state. These changes
in the foveal functions, although small in magnitude, are in the same sense as the familiar
"Purkinje shift". Alternative theoretical explanations of the data are discussed and ana-
lyzed.

Edwards, W. APPARENT SIZE OF AFTERIMAGES UNDER CONDITIONS OF REDUCTION. *Am. J. Psychol.*, July 1953, 66 (3), 449-455. (Johns Hopkins University, Baltimore, Md.).

208

This experiment tested the prediction that the apparent size of the afterimage should remain constant at every distance of the projection-surface under reduction conditions. Ten naive Ss each made 30 judgments of afterimage size; this involved: after-image production by observation through a reduction tube of a 803 ft.-L field for 45 sec., 30 sec. of darkness, and after-image measurement by viewing the original field and the comparison field dimly luminous and adjusting the position of the latter until the two were of equal size. Ss alternated eyes; five afterimage projection distances were used from 42.25 to 90.25 in. (Ss's ability to interpret distance-change as size-change was tested separately). The data were examined by analysis of variance technique and discussed relative to Emmert's law. T. R. 9

Corvey Engineering Company. AIRCRAFT ROCKET GROUND HANDLING METHODS STUDY. Contract AF 33(616) 3117, AFAC TR 56 92, May 1956, 46pp. Corvey Engineering Company, Alexandria, Va.

211

To evaluate present ground handling methods and equipment for folding fin aircraft rockets loaded into aircraft, a program of research was conducted including 1) analyses of reference material; 2) observations of existing facilities, aircraft, rockets and their handling procedures, equipment and tools; and 3) interviews with individuals involved in the ground handling operations. Evaluation and recommendations for improvements are given for rocket packaging and shipment, rocket storage and processing (bulk storage, ready service storage, transport equipment), and aircraft (fighter-bomber and interceptor). Flood, M.M. (Chm.). SECOND ANNUAL CONFERENCE OF HUMAN ENGINEERS, COLUMBIA UNIVERSITY, 9-10 SEPTEMBER 1954. ABSTRACT OF PROGRAM. 17pp. USN Office of Naval Research, Washington, D.C. (Institute for Research in the Management of Industrial Production, Columbia University, New York, N.Y.).

213

This is a collection of abstracts of the second annual "Conference of Human Engineers" sponsored by the Office of Naval Research, (Sept. '54). Papers are summarized which deal with the development of training devices, and applications of human engineering to specific problems, such as open-pit mining drag-line operations, design of airplane indicators, simulators, and systems analysis.

214 Wilson, C.L., Mackie, R.R., & Buckner, D.N. RESEARCH ON THE DEVELOPMENT OF SHIPBOARD PERFORMANCE MEASURES. PART II. THE USE OF A PERFORMANCE RATING SCALE IN THE MEASUREMENT OF SHIPBOARD PERFORMANCE OF ENLISTED NAVAL PERSONNEL. FINAL REPORT. Contract N70NR 70001, Feb. 1954, 81pp. Management and Marketing Research Corporation, Los Angeles, Calif.

A performance rating scale that included 10 traits reflecting various technical and non-technical aspects of Navy shipboard performance was developed and used to evaluate the performance of Electrician's Mates (EM's) and Engineers (EN's) serving aboard submarines in the Atlantic and Pacific Fleets. Analysis of results indicated that officers and petty officers using the scale tended: a) to agree with one another when they evaluated the same man; b) to be consistent in their own evaluations from one time to the next; c) to discriminate reliably among men of the same pay grade; d) to differentiate, to an appreciable degree, the technical from the adjustment aspects of shipboard performance. In addition, a factorial analysis indicated that: e) at least two broad "factors" of shipboard performance--one representing technical skill, and the other, adjustments representing the technical side of performance correlations among traits; f) the traits representing the technical side of performance correlated moderately high with independent measures of technical skill, but the traits representing the adjustment side of performance were not related appreciably to any other measures obtained. As a part of this overall research project practical performance tests and performance check lists for EM's and EN's were also developed (see Parts I & III of this Final Report for details). Relationships between these two measures and the rating scale and reported and discussed in this report. R. 62

Johns Hopkins University. PRESENTED AREAS OF AN AVERAGE PRONE CHINESE INFANTRYMAN. Contract DA 36 034 ORD 375RD, Proj. TB 3 0238A, Proj. THOR TR 6, March 1952, 50pp. Institute for Cooperative Research, Johns Hopkins University, Baltimore, Md.

215

Studies of the effectiveness of weapons for attack of ground troops require knowledge of the target presented area. The average presented area of a typical Chinese infantryman prone on the ground is given as a function of the angle of arrival of fragment or bullet. World War I dimensions of the average United States infantryman were scaled by a relative stature factor to represent those of the average Chinese infantryman. Some applications of the results are suggested. T. U. I. R. 3

Verplanck, W.S. A BRIEF EXPERIMENT ON THE LEGIBILITY OF THE TDC UNDER SEVERAL CONDITIONS OF ILLUMINATION AND ADAPTATION. BuMed & Surgery Proc. X-519 (Av-273-p), Final Rep., March 1946, 8pp. Medical Research Department, U.S. Submarine Base, New London, Conn.

217

To investigate the legibility of the Torpedo Data Computer (TDC) under various conditions of adaptation and illumination of the submarine conning tower, two measures of efficiency (time and errors) were obtained on six subjects. Conditions of pre-adaptation and conning tower illumination were 1) 15 minutes in red illumination and same illumination for trial reading; 2) 15 minutes outdoors and red illumination for trial reading; 3) 15 minutes outdoors and white illumination for reading. The data were analyzed to find the effect of the adaptation and illumination conditions on performance. Recommendations are included. T. R. 1

219

Mard, W.D. SUBJECTIVE MUSICAL PITCH. J. Acoust. Soc. Amer., May 1954, 26(3), 369-380. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

The subjective relation "octave of" is demonstrated to be a valid interval for determining scales of musical pitch for pure tones presented successively. Octave judgments of trained musicians have a standard deviation averaging about 0.6 percent. Inter-observer variability is 2 to 5 times as great, increasing with frequency. Judgments vary significantly from day to day, but as the direction of shift at different frequencies for a single observer is random, the shifts cannot be attributed to changes in the octave criterion. Instead, this variability, and also: a) differences between right- and left-ear judgments of a given observer; b) the change in difference between subjective and physical octaves as a function of frequency; and c) the high inter-observer variability, all confirm the basic instability of pitch-frequency relations implied by the facts of binaural diplacusis. Individual and group scales of musical pitch are deduced. In these scales, the average rate of change of musical pitch with respect to frequency level is less than unity by a small but significant amount. Although this discrepancy is not explained, tests show that it is not an obvious artifact of method. Simultaneous presentation raises variability, but effects means only slightly. The relation between the peculiarities of individual scales and binaural diplacusis is discussed.

Nichotte, A. & de Clerck, J. STRUCTURES PERCEPTIVES CIRCULAIRES CORRESPONDANT A DES FORMES GEOMETRIQUES ANGULAIRES. (CIRCULAR PERCEPTIVE STRUCTURES CORRESPONDING TO ANGULAR GEOMETRIC PATTERNS. L'Année Psychologique, 1951, 50, 305-326. UDC 612.84:535.7, Library Translation 511, Feb. 1953, 14pp. Ministry of Supply, Royal Aircraft Establishment, Farnborough, Hants.

When geometric patterns defined by low intensity points are observed on a screen in total darkness, the constituent points being projected in succession, one at a time, the patterns perceived in a large number of cases are circular or curvilinear. The effects of size and shape of image and of time between the appearance of each individual point are investigated, and the results interpreted by the theory that a circular form is the most easily appreciated shape of a pattern whose size is just small enough to be appreciated as a whole.

226 Carney, C.R., Scheffer, K.E. & Alvis, H.J. STUDIES OF LUNG VOLUMES IN INSTRUCTORS AT THE ESCAPE TRAINING TANK. Proj. NM 002 015.12.01, Rep. 260, Nov. 1954, 13pp. USN Medical Res. Lab., USN Submarine Base, New London, Conn.

Based on a common experience of instructors at the Escape Training Tank, namely, that during their tour of duty, they learn to hold their breath longer and breathe differently, a study of their pulmonary capacities was undertaken. Vital capacity, inspiratory reserve, and total lung capacity of the Tank instructors were found significantly larger than those of laboratory personnel representing average individuals. When measured vital capacities of the two groups were compared with vital capacities predicted on the basis of body surface area, the measured values of the Tank instructors were 14.6% higher than predicted, while those of the laboratory personnel were 0.56% lower. A longitudinal study of the lung volumes of instructors performed over a period of one year following their assignment to the Escape Training Tank demonstrated a significant increase in inspiratory reserve, tidal volume, vital capacity, and total lung capacity while expiratory reserve and residual volume did not change significantly. These findings indicate an adaptation of the lung volume to the stress of skin diving.

227 Draper, J. AN INTRODUCTION TO INFORMATION THEORY, WITH REFERENCE TO THE HUMAN OPERATOR. Repo. from: "The Human Operator in Control Systems, the Royal Military College of Science", Sept. 1954, 19pp. Clothing & Equipment Physiological Research Establishment, Directorate of Physiological & Biological Research, Ministry of Supply.

This paper outlines some of the fundamentals of the theory of selective information. It also describes some of the work that has been done on information transmission by the human S_i, and discusses the estimation of information transmission rates from samples of limited size. Some of the examples of the application of information theory involving human S_i include choice reaction time studies, and a study of the problem of how much information is gained, or how much is learned about spatial location in a single glance. These, as well as several other studies, are described. The correspondence between the measure of the rate of transmission of information and other conventional measures of agreement were indicated. The difficulties and inconvenience of handling the rate of transmission of information algebraically is recognized but the application of this new method to attacking problems and interpreting data appears to be to its credit.

Loeb, M. THE INFLUENCE OF INTENSE NOISE ON PERFORMANCE OF A PRECISE PATTING TASK. Proj. 6-95-20-001, Rep. 268, April 1957, 10pp. AMRL, Port Knox, Ky.

235

To investigate the influence of intense noise on performance of a precise fatiguing task, ten subjects were required to row to certain standards before, during and after three experimental conditions. The conditions were: 1) 115 decibels continuous broad band noise; 2) 115 decibels randomly interrupted noise; and 3) 50 decibels ambient noise (control exposure). A trial consisted of "rowing till exhaustion" at 50 strokes per minute. Performance was recorded by precision potentiometers activated by the rowing movements. The data were studied by analysis of variances for changes attributable to noise. The possible significance of the findings is discussed.

Herbert, M.J. THE SPEED AND ACCURACY WITH WHICH SIX LINEAR ARM MOVEMENTS CAN BE VISUALLY POSITIONED FROM TWO DIFFERENT CONTROL LOCATIONS. Proj. 6-95-20-001, Rep. 260, March 1957, 14pp. AMRL, Port Knox, Ky.

236

To investigate the speed and accuracy of linear arm movements, 18 subjects moved a short rod into and through a metal cylinder until contact was made with a switch at rear of tube, using a right-hand control. Variables studied were: 1) direction of movement (up, down, push, pull, left, right), and 2) location of control (in front of right shoulder, on center line of body). Performance, recorded after four practice days, was measured by time-in error scores (times when rod touched side of cylinder), and total movement times. These data were studied by analysis of variance techniques for differences due to experimental variables. Recommendations for operational equipment design are included.

Loeb, M. THE EFFECTS OF INTENSE STIMULATION ON THE PERCEPTION OF TIME. Proj. 6-95-20-001, Rep. 269, June 1957, 9pp. AMRL, Port Knox, Ky.

237

To determine the influence of intense sound and light upon judgments of time intervals, an exploratory experiment was conducted requiring 27 subjects to make successive estimations (with feedback) of ten- and three-minute periods by throwing a toggle switch. Successive judgments without feedback were then made by 15 subjects in one hour sessions in the presence of 110 decibels noise with normal illumination, 80 decibels noise with intense illumination, and 80 decibels noise with normal illumination. Subjects were engaged in working a jigsaw puzzle. The data (mean estimations) were studied by analysis of variance technique for differential effects due to the experimental conditions.

Davis, R.C. ELECTROMYOGRAPHIC FACTORS IN AIRCRAFT CONTROL: THE RELATION OF MUSCULAR TENSION TO PERFORMANCE. Rep. 55-123, Dec. 1956, 8pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

238

This paper presents the background for and reviews the results of a series of studies dealing with the ways by which muscular tension affects the performance of a task. The studies were organized around the problem of learning how concurrent responses affect each other. Their design was based on the hypothesis that an exact electromyographic description of each of the responses taken singly makes it possible to predict what happens when they are combined. From the experimental data, a further hypothesis was then derived--that there are patterns of response, detectable by electromyographic recording, which will facilitate or inhibit other responses according to their similarity.

Wolf, W.S. OPERATIONAL ANALYSIS OF THE ROUGH-
TERRAIN FORK LIFT TRUCK. Proj. 7-83-01-0045,
Tech. Rep. 27-42, Jan. 1957, 27pp. Environ-
mental Protection Research Division, Quarter-
master Research & Development Center, Watick,
Mass.

239
To determine problems in the use of the rough-terrain
fork lift truck encountered in actual operating condi-
tions, an operational analysis was conducted. The pro-
cedures used include: conferences with development en-
gineers, planning personnel and operating personnel;
field visits to commercial users of equipment; and to Army
exercises; and library research. Factors considered and
analyzed were: job to be performed, personnel and perfor-
mance problems in use of existing equipment, and special
characteristics of operating personnel. Specific problem
areas have been defined and recommendations for further
human engineering and mechanical studies presented for
both immediate improvements and for broader future
changes. T. 1.

Sneider, R. & Smith, K.U. DIMENSIONAL ANALYSIS OF MOTION: VI. THE COMPONENT MOVEMENTS OF AS-
SEMBLY MOTIONS. J. Appl. Psychol., Aug. 1953, 32(4), 300-314. (University of Wisconsin,
Madison, Wisc.).

This study describes electronic techniques which make possible detailed experimental
study of the component movements in assembly motions. By means of the electronic techniques
described, the component movements of travel, grasp, loaded travel, and positioning in a
unimanual assembly task may be isolated and their durations measured in hundredths of sec.
Distributions of the component movement times for 46 Ss were approximately normal. Practice
did not affect uniformly the different types of movement. The efficiency of the 2 manipula-
tive movements, positioning and grasping, changed the most; whereas, the travel movements
in the task, especially the unloaded travel component, showed very little change with prac-
tice. Similar results were found for measures of variability of response during practice.
Practice did not alter significantly the correlations between component movements. Early in
learning the correlations between different component movements of manipulation and practice
are near zero. As practice continues, the values of these correlations do not change sig-
nificantly. At the start of learning, a correlation of about +.007 is found between the 2
travel components in the task. With practice, this correlation increased slightly but not
significantly. These findings, along with similar results found for other motion patterns,
point toward the lack of significance of learning concepts in understanding the details of
movement coordination in skill. However, these results point up the great significance of
component and dimensional analysis in dealing with this problem.

243
Broadbent, D.E. THE ROLE OF AUDITORY LOCALIZATION IN ATTENTION AND MEMORY SPAN. APU 171/53,
March 1953, 16pp. Applied Psychology Research Unit, MRC, Cambridge, England.

3 experiments are reported which were designed to: a) Exp. I--examine the relative effi-
ciency of a number of different types of localization; b) Exp. II--confirm the possibility
that 2 simultaneous auditory stimuli can both be dealt with provided their sources are sepa-
rated in space; c) Exp. III--as a consequence of the results in Exp. II, to examine the li-
mits of immediate memory on 2 channels. The results of these 3 experiments suggest that spa-
tial separation will normally be useful unless alternation between 2 channels is required at
a rate faster than about 1 or 2 secs. This time interval has been found to be important in
other connections, such as this study of "fatigue".

242
Poulton, E.C. LISTENING TO TWO OR MORE CHANNELS. FPRC 843, Aug. 1953, 2pp. Applied Psychol-
ogy Research Unit, MRC, Cambridge, England.

This report gives a brief summary of APU 163: "Multiple Channel Listening" and APU 164:
"Two Channel Listening" and makes the following practical recommendations: a) when messages
over a busy channel have to be logged, a separate monitor should be allocated to it; b) two
busy channels should not be allocated to a single monitor; c) whether one busy channel and
one or more quiet channels, or simply a number of quiet channels, can be allocated to a
single monitor depends upon the frequency of message overlap to be expected, and upon the im-
portance of the messages. Messages will be more likely to be missed or misheard under these
conditions only when they overlap each other; d) if a monitor is allocated a single channel,
but has to sit in a cabin with other monitors, he should use headphones (both in order to
prevent him from hearing messages from other sources, and to prevent other monitors from
hearing his messages); e) if a monitor is allocated two or more channels, he should be in a
separate cabin, with loudspeakers spaced in a horizontal semi-circle in front of him, and
what is known of binaural localization. If he has only two channels to monitor, one earphone
and a speaker opposite the other ear is equally effective--Broadbent, D.E. "The role of audi-
tory localization in attention and memory span." APU 171, 1953.

Barch, A.M. PERMANENT WORK DECREMENTS IN THE PERFORMANCE OF A PURSUIT TASK ARISING FROM SHORT PERIODS OF MASSED PRACTICE. Contract AF 33(038) 13214, Proj. 509 020 0001, Jan. 1952, 5pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

250

To determine the effectiveness of the Tank Hull Trainer 3-T-3 as a training aid in teaching 1) starting and stopping procedures, 2) driver's instruments and controls, and 3) track and suspension system, four companies of basic trainees receiving tank training were used as Ss. A performance test and two paper-and-pencil tests were used to measure the effectiveness of training received by three methods: Army Training Program (utilized M47 tanks for practical work), the trainer, and an inexpensive mock-up of the instrument panel and driver's controls of the M47 tank. Evaluation of training effectiveness was made on the basis of test scores and in terms of man hours, tank hours, and expense of method used.

T. G. I.

247

This experiment was designed to study the role of reactive inhibition and conditioned inhibition in learning an Epicyclic Pursuit Rotor task (keeping a stylus on a moving target). The distributed practice group of subjects (who were college students) had thirty 15 second trials separated by 45 second rests. The massed practice group had no rests between trials, but both groups had five minutes of rest after every six trials. Time-on-target scores are the measures used for the analysis of conditioned inhibition effects, and reminiscence; influence of practice schedule, and of level of initial performance are examined.

Smith, J.F., Flexman, R.E. & Houston, R.C. DEVELOPMENT OF AN OBJECTIVE METHOD OF RECORDING FLIGHT PERFORMANCE. Proj. 508 016 0002, Tech Rep. 52 15, Dec. 1952, 49pp. USAF Human Relations Research Center, Air Training Command, Lackland Air Force Base, San Antonio, Texas.

This project was part of a general research program proposed during an Air Force Planning Conference on Pilot Training Research. The purpose of this project was to develop a method of objectively recording pilot performance in the Primary Flying Training Program. To construct forms for recording student pilot performance satisfactorily, it first was necessary to determine the requirements for completion of the flying phase of Primary Pilot Training. The approach to this task was to examine all maneuvers in the Primary Flying Syllabus in terms of their component items. Each maneuver and its component items was described and listed in an item-by-item format. Following in-flight checks, the maneuver analyses were revised to increase their accuracy and completeness. Upon completion of the maneuver analysis, Performance Record Sheets were designed to record student performance in flight. Items for these record sheets were selected from the maneuver analysis. Experienced flight instructors reviewed, used, and revised the Performance Record Sheets. In addition, observer reliability studies were conducted to determine the agreement between the records of two instructors observing the same pilot performance. Results from these studies were employed to revise the Performance Record Sheets for maximum observer reliability. There are two direct products of this research: first, the maneuver analysis covering all maneuvers in the Primary Pilot Training Program, and second, a method of objectively recording pilot performance. These two products will be of use in pilot training for standardization, for the comparison of group performance, and for the development of objective proficiency measures.

This report pertains to the problem of providing the required specially trained maintenance personnel as soon as new production models are put into the field. The training of these technicians is based on maintenance procedures established for prototype models of the equipment in question. In the present study, the methods for determining maintenance procedures are analyzed and described for both prototype and operational models of the "K-1" radar system. This includes both equipment and activity analysis. A comparison is made between the procedures for the prototype and the operational model, and practical application of the job forecasting techniques are discussed.

Hirsch, R.S. EXPERIMENTAL EVIDENCE FOR IMPROVEMENTS NEEDED IN RIFLE MARKSMANSHIP TRAINING. Contract NONR 494(01), Human Engng. Rep. SDC 494 01 3, June 1953, 36pp. USN Special Devices Center, Port Washington, N.Y.

254
The experiments summarized here are part of research aimed at improving and economizing rifle marksmanship training in the Army. The results have implications for standards of marksmanship measurement, the content of the Army Training Program, and conditions of training. Results with trainee subjects are presented for an experiment in reducing Preliminary Rifle Instructions, a spaced-practice firing experiment, experiments on transfer from sub-caliber training, the use of training films, and a study on the effect of extended training. Recommendations based on the obtained results are given, which pertain to training materials and procedures, and further research.

Meeker, W.F., Carroll, R.M., & Sixhausser, E.D. STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS. Contract DA-36-039-sc-64469, Proj. 132B, Rep. 8, Aug. 1956. RCA, Camden, N.J.

255
This report is one of a series providing research information leading to improved design of Signal Corps voice communication systems used in high-level noise environments of armored vehicles and helicopters. The data reported here concern the construction and testing of ear muffs to provide noise exclusion and the testing of three headset arrangements for suitable transfer characteristics. Attenuation amplitude and phase measurements were made with the subject facing the sound source. The noise reduction achieved by the test of the muffs was compared to that of an electronic noise reducer alone.

Pollack, I. THE IDENTIFICATION AND DISCRIMINATION OF COMPONENTS OF ELEMENTARY AUDITORY DISPLAYS. Proj. 7682, 1956, 10pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C.

Six Ss participated in a series of sound-level discrimination and identification tests which were carried out over a wide range of conditions. In the discrimination tests, Ss attempted to detect differences in sound levels between two members of a pair of tones when the reference signal for discrimination was varied over the range of sound levels examined. In the identification tests, they attempted to assign numerals to the tones. The major findings were: 1) the discrimination threshold increases as the range of sound levels available to the reference signal for discrimination increases; 2) the information transmitted in the identification situation increases as the range of sound levels available for identification increases; 3) the net effect of these two findings is that the information transmission associated with both the discrimination and identification experiments is roughly equivalent over a moderate range of sound levels, at least for medium discrimination criteria.

Edgerton, H.A., Heinemann, R.F.D. & Gray, E.J. CONSTRUCTION OF THE 1953 FORM OF THE EVALUATION PROCEDURE FOR TRAINING AIDS AND DEVICES. Contract N70NR 38302, Human Engng. Rep. SDC 383 2 2, Jan. 1953, 105pp. USN Special Devices Center, Port Washington, N.Y. (Richardson, Bellows, Henry & Company, Inc., New York, N.Y.).

257
This report describes the method used in developing a form for evaluating the effectiveness of training aids and devices. This instrument can be used by any military personnel familiar with the device, and meets other criteria of usefulness. The experimental form (1953), its field testing, and analysis of data and scoring procedure are presented in detail.

258 Wherry, R.J. (Principal Technician). CONTROL OF BIAS IN RATING. SUB. PROJ. L. SURVEY OF THE LITERATURE. FINAL REPORT. Contract DA 49 083 OSA 69, AF Proj. 417, PAS Rep. 890, Sept. 1950, 71pp. USA Adjutant General's Office, Personnel Research & Procedures Branch, Washington, D.C. (Ohio State University, Columbus, Ohio).

This annotated bibliography was prepared primarily from references obtained from the Psychological Abstracts covering a period from 1930-1950. Included is the literature in the fields of rating, judgment and decision, psychophysics, attitude, opinion, interest measurement, and testing. The material is organized into 5 categories: Rating Procedures; Judgment and Decision; Psychophysics; Attitude, Opinion and Preference; Tests. An appendix attempts to summarize the difficulties found or claimed to apply to ratings and means of improvements suggested in the rating literature, and to bring together points concerning related problems from other psychometric fields. A total of 264 references are given. (NEIAS)

263 Hoehn, A.J. A FORMULATION OF THE PROBLEM OF STUDENT MOTIVATION IN AIR FORCE TECHNICAL SCHOOLS. Res. Bull. 51 17, Aug. 1951, 25pp. USAF Technical Training Research Lab., Chanute AFB, Ill.

263 A theoretical formulation of the problem of student motivation in formal learning situations is presented in terms of Lewin's interpretation of field theory. Within this framework motivation principles are reviewed and an analysis is made of motivational problems in Air Force technical schools, utilizing responses of 157 students at 2 AF schools in "non-directive" interviews. Several research studies are proposed.

264 Croeger, J.A. & Detter H.M. THE RELATION BETWEEN SEAT LOCATION AND PERFORMANCE ON TWO RADIO CODE TESTS USING LOUDSPEAKER ADMINISTRATION. Proj. 7700, Task 77G14, AFTRC TR 54 64, Nov. 1954, 6pp. USAF Personnel and Training Research Center, Lackland AFB, Tex.

264 This study tested the effect of seat location on the performance of two radio code tests: Signal Corps Code Aptitude Test (SCCAT) and Army Radio Code Test (ARC-1). The SCCAT was administered to 2,507 airmen and the ARC-1 to 2,314, using two loudspeakers in a 107-seat room. The scores from these tests were analyzed in two ways: variance of the mean scores for each seat and variance of the mean scores for seats grouped in terms of horizontal and longitudinal displacement; also the interaction variance from these two methods was tested. Seat-location differences were examined in terms of test validity.

260 Siegel, A.I., & Stirner, F.W. AN EXPERIMENTAL FLIGHT EVALUATION OF PROTOTYPE SEAT CUSHION ASSEMBLIES. Contract W156a-33411, Oct. 1956, 26pp. Air Crew Equipment Laboratory, Naval Air Experimental Station, NAMC, Philadelphia, Penn.

260 To determine the in-flight usefulness of eight prototype seat cushion assemblies for reducing specific discomforts and debilitations on prolonged flights, comparison data were collected under actual operational, long-range flight conditions. The designs included 1) variations of the present "standard" seat, 2) seat pulsation of mechanical vibration characteristics, 3) use of new porous plastic (Trilok) and 4) inflatable rubber ring. Each pilot (56) completed a structured questionnaire after his evaluative flight and was interviewed to obtain further preference data. Comfort characteristics (fatigue, numbness, pressure, perspiration, efficiency) were analyzed for each seat and comparisons made. Design recommendations are included.

262 Kinsey, J.L. & Weybrew, B.B. ETIOLOGICAL FACTORS IN THE DISQUALIFICATION OF SUBMARINE PERSONNEL. BuMed Proj. NM 003 041.13.03, Rep. 226, June 1953, 40pp. USN Medical Research Lab., New London Submarine Base, Conn.

This report is the first of a series concerned with answering the question, "Why--because of what personality factors, or adjustment processes--does a person become disqualified from the submarine force?" The data consist of a heterogeneous grouping of background factors, test battery scores, evidence of neurotic symptoms, and onboard ratings and observations. Much of the data are used to describe the disqualified sample as completely as possible. On the variables for which an adequate control group of qualified submariners are available, several hypotheses are studied investigating the usefulness of the variable in question for predicting the qualify-disqualify criterion. The results indicate that over half of the disqualifications are the result of inappropriate motivation for the submarine service. There are several predictors of this inadequate motivation suggested by the data; for example, attitude toward authority, ability to verbalize, and the possession of definite goals. There is some evidence that some neurotic-like process may be involved in about 25% of the disqualified group; another 10% may have had such sociological variables as instability of home life associated with their disqualification; while the data from the remaining portion of the group suggest social withdrawal as a major contributing variable.

Dickens, D.D., Stone, G.R. & Highland, R.W. A STUDY OF THE RETENTION OF ELECTRONICS FUNDAMENTALS DURING BASIC RADAR MECHANIC TRAINING. Contract AF 33(038) 13611, Proj. 507 008 0002, Res. Bull. 52 36, Dec. 1952, 31pp. USAF Technical Training Research Lab., Chanute AFB, Ill. (Ohio State University, Columbus, Ohio).

266

The overall purpose of this research is to assess the usefulness of generalized technical training courses which teach principles, later applied in specialized training courses. Airmen in training took a 22 weeks' course in electronic fundamentals for radar mechanics. During two months following this course, while the airmen were still in academic, specialized training, retention of the fundamentals was measured by written examination. Retention scores, in relation to interval elapsed since learning, are given; appendices include details of the examination, with statistical treatment of results.

Ericksen, S.C. DEVELOPMENT OF A LIGHT PLANE PROFICIENCY CHECK TO PREDICT MILITARY FLYING SUCCESS. Proj. 508 016 0003, Tech. Rep. 52 6, Nov. 1952, 45pp. USAF Human Resources Research Center, Air Training Command, Goodfellow AFB, Tex.

This Technical Report describes background research directed toward the development of a light plane flight-check. A flight-check of this type was required in research directed toward assessing the utility of a "pre-primary" light plane training course. This research, currently in progress, will be reported in other Technical Reports. On the basis of the research described in this report a light plane flight-check for field research use has been developed by in-service personnel. In the development described in this report, advantage has been taken of past experience in developing flight-checks and consideration has been given to operational realities and requirements in the administration and use of flight-checks. Since such flight-checks tend to determine the nature of training maneuvers, the maneuvers used in the flight-check for the light plane have been tailored in terms of requirements for performance in flying the T-6 aircraft. This has been done in order to maximize the possibility of transfer of skills learned in flying light planes to the job of flying the T-6 aircraft and in order to maximize the possibility of predicting proficiency in flying the T-6 from flight-check measures of proficiency in light plane flying.

Howard, J.K. & Pickrel, E.W. VALIDATION OF THE AIRMAN CLASSIFICATION BATTERY FOR WOMEN IN THE AIR FORCE. Tech. Rep. 52 5, Nov. 1952, 31pp. USAF Human Resources Research Center, Air Training Command, Personnel Research Lab., Lackland AFB, Tex.

The Airman Classification Battery has been shown to have marked utility in the classification of male personnel. Although the battery was developed specifically for use in classifying male personnel, it also has been used in the classification of the increasing number of WAF's who have been inducted recently. This use of the ACB has been necessary since no other adequate procedure for the classification of female personnel was available. This study, carried out as soon as sufficient data on WAF's became available, was directed toward assessing the effectiveness of the Airman Classification Battery in classifying female personnel. The results of the study indicate that, in general, adequate classification of Women in the Air Force can be made on the basis of tests, weights, and conversion tables designed for the classification of males. On the other hand, the analyses indicate specific areas in which the Airman Classification Battery tests and scoring procedures should be improved to render the battery more effective in the classification of females. For example the Biographical Inventory, as presently constituted, is generally not effective in the classification of female recruits. Moreover, in classifying with respect to jobs involving a mechanical factor the present battery is considerably more effective for males than for females.

Rupe, J.C. RESEARCH INTO BASIC METHODS AND TECHNIQUES OF AIR FORCE JOB ANALYSIS-I. Proj. 507 015 0002, Tech. Rep. 52 16, Dec. 1952, 68pp. USAF Human Resources Research Center, Lackland AFB, Tex.

The relative value of 5 methods of job analysis: questionnaire-survey, group interview, individual interview, observation interview, and technical conference, was investigated. 12 jobs were selected and noncommissioned officers were selected and trained as analysts. Teams of job analysts carried out analyses of jobs at 16 Air Force bases utilizing the five methods. The relative adequacy of the five methods was evaluated through determination of the coverage of job elements which each provided. Determination of the elements associated with any given job was based on the judgments of a large group of experts who reviewed the elements yielded by each of the five methods with respect to whether they actually were or were not associated with the job in question. Evaluation of the five methods of job analysis against this criterion indicated that the questionnaire-survey methods and the group interview method, in general, provided less information on job elements than did the other three procedures. In terms of amount of pertinent job information provided, there was little to choose between the individual interview, the observation interview, and the technical conference methods. However, the data from these four jobs suggest that of the three most effective procedures, the individual interview has important advantages with respect to man hours (particularly of high level personnel) required to obtain the job analysis information.

Besnard, G.G. DEVELOPMENT OF A CHECK LIST TO STUDY JOB TASKS PERFORMED BY B-29 AIRPLANE AND ENGINE MECHANICS. Proj. 507 012 0003, Res. Bull. 52 31, Nov. 1952, 12pp. USAF Human Resources Research Center, Air Training Command, Chanute AFB, Ill.

A check list of job tasks performed by Airplane and Engine Mechanics, AFSC 43131-B, working on B-29 aircraft has been developed. The check list is to be administered to job incumbents and checked by their immediate supervisors. In case of disagreement on level of performance for any task, the supervisor's response will be used. Using results to be obtained from having the check lists completed by mechanics and their supervisors at several Strategic Air Command bases, a factor analysis will be accomplished to identify various clusterings of tasks. The results to be obtained will test the hypothesis that those tasks in the various clusters which will result from factor analysis will resemble closely those tasks which compose the groupings obtained by using expert judges to rate them according to their apparent level of technical complexity employing the method described in this Research Bulletin.

Edwards, W. METHODS FOR COMPUTING UNCERTAINTIES. Amer. J. Psychol., March 1954, 67(1), 164-170. (Johns Hopkins University).

285

This note proposes a simplification in tabulation techniques for computing uncertainties in binary data. In addition, methods for computing uncertainties in certain kinds of non-binary data are discussed. T. R 4

281

To determine whether knowledge of results (KR), provided by means of the Classroom Communicator, would affect the learning of material from tests based on the contents of selected sound films, an experiment was conducted. Learning was defined as retention of specific material. It was measured as a difference between two tests, the first accompanied by KR and the second three weeks later without specific awareness of results. Following the showing of a film, a pencil-and-paper test was given and KR was presented in one of four ways to separate groups of subjects; two control groups had no KR. Differences between the groups on a final post-test and also between immediate and delayed post-test were analyzed. Effectiveness of the various methods for presenting KR are discussed. T. G. 1.

Forbes, T.W., Nowcowitz, K., & Morgan G. A COMPARISON OF LOWER CASE AND CAPITAL LETTERS FOR HIGHWAY SIGNS. Proc. Highway Res. Bd., (30th Annual Meeting), 1950, Dec., 355-373.

286

To compare legibility of lower case and capital letters for highway signs, 75 observers made 1939 individual observations of the distance at which letter targets could be read under daylight and artificial illumination. Other stimulus factors varied were: letter size (5 - 18 inches height), and familiarity of word patterns (from scrambled to a second viewing of familiar place names). The results (recognition distances) are discussed in terms of legibility of the two letter forms as it varies with height, width, sign area, and degree of familiarity. T. G. 1. R 6

Iredell, K.H., Older, H.J., Scipino, J.A. & Hilton, A.C. PERSONNEL STUDIES IN MINE WARFARE. Tech. Rep. & Appendices to Tech. Rep. - Part I, Contract Nonr 902(00), Rep. 53 6, Aug. 1953, 729pp. Psychological Research Associates, Washington, D.C.

This report describes the initial phases of a series of studies of mine warfare personnel administration. This report presents the research methodology used to collect the basic data for further steps of the project. In addition 2 by-products of this research are reported here. One is the development of requirements for personnel to be "qualified in mine warfare". The other is a research memorandum concerning several areas of administrative concern within the mine forces. (NEIAS)

288 Sperling, H.G. & Farnsworth, D. PERISCOPE ACUITY AT NIGHT. CENTRAL AND PARACENTRAL ACUITY AS A FUNCTION OF CONTRAST AND ADAPTATION. Proj. W4 003 041-39.01, NRL Rep. 157, Nov. 1950, 22pp. USN Medical Research Lab., New London Submarine Base, Conn.

Discrimination of a target approximating the visual subtense of a ship at 5,000 yards on low power was measured with the right eye at 9 retinal positions, from central fixation to 15° off central vision. Target to background contrast was varied to sample a range of visibility conditions at sea. It was found that for all target contrasts at light levels at or below twilight (.27 millilamberts) off-center acuity was greater than central acuity. Acuity at 6° from central fixation was found best but little decline was discovered out to 15°. The subsequent effect upon discrimination of the target of viewing 3 common visual indicators was measured. After viewing the S.S. radar P.P.I., a long recovery time was required to detect targets illuminated even as high as full moonlight. The "Christmas Tree" and red illuminated dials produced smaller but appreciable decrement. These laboratory tests indicate that viewing radar indicator lights and dials at normal operating brightness is detrimental to periscope vision at night.

294 Sweeney, E.J. SEX DIFFERENCES IN PROBLEM SOLVING. Contract N6ONR 25125, Proj. NR 153 149, Tech. Rep. 1, Dec. 1953, 79pp. Psychology Dept., Stanford University, Stanford, Calif.

4 studies are reported which were designed to provide data relevant to 1 or more of the following 5 questions concerning differences between men and women in achievement in problem solving: a) can the kinds of sex differences in problem solving previously reported be verified; b) can differences in problem solving be demonstrated for groups of men and women matched with respect to general intelligence; c) can sex differences in problem solving be demonstrated for groups equal in intelligence be accounted for in terms of differences in various special abilities; d) to what extent can sex differences in problem solving not otherwise explained be accounted for in terms of differences in specific knowledge or training; e) what characteristic or characteristics are common to problems on which sex differences are obtained which are not accounted for by differences in intelligence, special abilities, or specific knowledge? The data obtained support the conclusion that there are sex differences in achievement in problem solving which are not accounted for by differences in intelligence in the groups compared or by known sex differences in special abilities or specific knowledge. A loading on the general reasoning factor is characteristic of 1 group of problems on which such differences were obtained. Results obtained with 3 other general kinds of problems confirm the hypothesis that sex differences will occur in problems which involve difficulties in restructuring, but not in problems which lack such difficulties.

296 Smith, R.G. & Westen, R.J. STUDIES OF MORALE METHODOLOGY AND CRITERIA. Proj. 507 009 0063, Res. Bull. 51 29, Dec. 1951, 15pp. USAF Human Resources Research Center, Chantute AFB, Ill.

The research presented in this bulletin represents work directed toward development of methods for use in assessing airman attitudes in the morale area. Data from 13 short scales directed toward measurement of different aspects of Air Force life were factor analyzed. 3 factors were tentatively established. 1 was a general factor designated morale. Another factor reflecting attitudes toward such aspects as standard of living, personal problems, and the Air Force as a way of life and was labeled tentatively a personal-subjective factor. A third factor reflected attitudes toward such issues as barracks and housing, food, and recreation and was tentatively designated the objective-physical need factor. The development of a scale which may yield a general measure of attitudes associated with morale is of methodological interest as is the finding that sentence-completion techniques apparently do not yield as satisfactory measures as do multiple-choice questionnaire techniques. Marked utility of the sentence-completion procedure has been indicated, however, in providing guides for the development of questionnaire items. The implications of this study are primarily methodological and are of principal interest to other workers carrying out research on this important problem. The results may be of some interest, however, to training and operational personnel as background material with respect to research and research problems in this area.

Rockway, M.R., Eckstrand, G.A., & Morgan, R.L. THE EFFECT OF VARIATIONS IN CONTROL-DISPLAY RATIO DURING TRAINING ON TRANSFER TO A LOW RATIO. Proj. 7197-71635, WADC Tech. Rep. 56-10, Oct. 1956, 12pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio.

303

In order to determine the relationship between amount of transfer of a two dimensional tracking skill and degree of physical similarity between the training and test control-display ratios, three groups of subjects (total of 45) were trained on one of three different control-display ratios. Following this they were tested with the lowest of the three ratios. The results are presented and discussed in terms of the relative effect of training with a particular ratio upon subsequent performance with a ratio which for two groups is lower and for the third equal to the training ratio. The degree of positive transfer exhibited by all groups and group differences are also treated.

McCormick, E.J. (Chm.) SYMPOSIUM ON RESEARCH IN OCCUPATIONAL CLASSIFICATION. (PROCEEDINGS OF THE 18TH MEETING OF THE PANEL ON MANPOWER.) 5-6 May, 1952. HMP 201/1, 75pp. Panel on Manpower, Committee on Human Resources, US Research & Development Board, Washington, D.C.

The general subject of the symposium, the problems of research in occupational classification, was presented in 2 main subdivisions--job analysis and job classification. The main emphasis which emerged in the discussion was that, in order to establish and implement an occupational classification system, basic job facts are essential. Within the Armed Services, the job-analysis techniques, methodology and research approaches utilized have taken different forms, but the end results have been accepted by the individual service; and presumably are serving operational needs. In connection with the determination of the best techniques for analyzing the physical demand of jobs, it was reported by Wayne University that their study to develop a usable physical-demands, physical-capacity form for use by both medical personnel and job analysts showed promise. The U.S. Employment Service discussed work on the development of a functional system of occupational classification.

318 Sapon, S.M. & Saul, E.V. FINDINGS ON THE DIFFERENTIAL RESISTANCE TO NOISE OF FRENCH, SPANISH, AND ENGLISH. Georgetown University Monograph Series on Languages and Linguistics, Monograph 6, July 1954, 61-70. (Harvard University, Cambridge, Mass. & Tufts University, Medford, Mass.)

The present study attempted to assess the differential effects of noise on the intelligibility of spoken French, Spanish, and English materials. It was found that: a) for all languages studied, intelligibility is increased in context situations as opposed to isolated words, and in low-noise as opposed to high-noise conditions. This is in accord with previous well verified findings. b) Spanish displays a higher degree of intelligibility than either of the 2 other languages under most conditions. This superiority is generally apparent, and, in the noted instances, statistically significant, but the data do not permit an unqualified statement of the superiority of French to English with regard to noise resistance. c) Several hypotheses relating specific linguistic features as determinants of intelligibility have been assessed, with the finding that no single variable satisfactorily explains all of the obtained data. There is a further implication of practical value pertinent to the notion that some language other than English might be more efficient in communication systems and situations in which resistance to noise is critical.

R 10

Garner, W.R. CONTEXT EFFECTS AND THE VALIDITY OF LOUDNESS SCALES. *J. exp. Psychol.*, Sept. 1954, 48(3), 218-224. (Johns Hopkins University, Baltimore, Md.).

30 Ss were required to make half-loudness judgments with a method of constant stimuli. Each of 3 groups of Ss were given a different nonoverlapping range of variable stimuli to be judged with respect to a standard stimulus. The major results and conclusions are: a) For each group the mean intensity required for half loudness was not significantly different from the mid-point of the range of variable stimuli. Thus, the judgments were made almost completely with respect to the context of presented stimuli; b) Within each group there were large individual differences which were established early in the judgment series and were maintained over the entire series of judgments; c) It is concluded that such judgments are reliable but not valid for purposes of loudness scale construction; d) It is further pointed out that Os in general do not seem able to describe sensory magnitudes with a scale of numbers. Thus, sensory scale construction must depend on the use of converging operations which do not require the assumption of the valid use of number scales by Os.

Attneave, F. PRINCIPLES FOR THE ABSTRACT SIMULATION OF MOVEMENT OVER GROUND. A PRELIMINARY REPORT. Lab. Note SCRL 55-10, Nov. 1955, 6pp. Skill Components Research Lab., APPTRC, ARDC, Lackland AFB, Tex.

This "unpublished draft" of a preliminary investigation discusses principles involved in visual simulation of movement over ground (as in a helicopter). Six dimensions of movement are identified and displays that account for four of them are described briefly. Problems as yet unsolved are indicated.

Garner, W.R. AN INFORMATIONAL ANALYSIS OF ABSOLUTE JUDGMENTS OF LOUDNESS. *J. exp. Psychol.*, Nov. 1953, 46(5), 373-380. (Johns Hopkins University).

To determine the effect of number of stimulus categories on accuracy of judgments of loudness and to examine some of the factors affecting judgmental accuracy, six subjects were required to make absolute judgments of the loudness of tones, using numbers corresponding to the number of stimulus categories. Six stimulus categories varying from three to twenty were used in separate experiments. The data were analyzed in terms of information transmission for judgmental accuracy as affected by number of categories, observer, preceding stimulus, distribution of stimuli and experimental session.

Davis, M., Eldredge, D.H., Glorig, A., Newman, E.B., et al. HIGH-INTENSITY NOISE AND MILITARY OPERATIONS: AN EVALUATION, Contract NMR 1151(01), Proj. NR 140 069, CHABA Rep. 1, Jan. 1954, 9pp. Armed Forces-NRC Committee on Hearing and Bio-Acoustics, Central Institute for the Deaf, St. Louis, Mo.

This report is an operational commentary and evaluation of the BENOX report (An Exploratory Study of the Biological Effects of Noise). A brief background sketch of the formation of the BENOX group is first given. Noise as an operational hazard is considered under the following topics: immediate and cumulative injury, operational importance of injury, specific effects of noise on man, and difficulties of assessing noise hazards. The remainder of the report describes various methods for avoiding and protecting against such noise; some of these deal with noise source, work location, personal protective devices, operational procedures, medical supervision.

322 Garner, W.R. A TECHNIQUE AND A SCALE FOR LOUDNESS MEASUREMENT. *J. acoust. Soc. Amer.*, Jan. 1954, 26(1), 73-88. (Psychological Lab., Johns Hopkins University, Baltimore, Md.).

A method of loudness scaling is presented for obtaining a true ratio scale of loudness. 2 separate loudness functions are required, 1 based on equisection judgments and the other based on fractionation judgments. Interrelation of these 2 scales allows determination of all constants necessary for a ratio scale. The method provides validation of the assumptions underlying its use. Experimental data are also presented which show that a) the method is valid for individual observers; b) differences between loudness scales of different observers are considerably reduced with the method; and c) the loudness function obtained with this method is much flatter than the standard scale now used. It is then shown that this new loudness scale is in better agreement with other data on equal loudness intervals than the standard scale. It is also shown that this scale is in agreement with monaural-binaural loudness data and data on loudness of multicomponent tones.

324 Davis, M., & Eldredge, D.H. FIRST ANNUAL REPORT OF THE ARMED FORCES-NATIONAL RESEARCH COUNCIL COMMITTEE ON HEARING AND BIO-ACOUSTICS. Contract NMR 1151(01), Proj. NR 140 069, CHABA Rep. 2, Feb. 1953-June 1954, 21pp. Armed Forces-National Research Council, Committee on Hearing and Bio-Acoustics, St. Louis, Mo.

The Armed Forces-National Research Council Committee on Hearing and Bio-Acoustics (CHABA) was organized early in 1953 along the lines of the Armed Forces-National Research Council Vision Committee to provide consultation and advice to the Armed Forces in the general areas of a) the effects and control of noise, b) auditory discrimination, c) speech communication, d) the fundamental mechanism of hearing and e) auditory standards. The term "bio-acoustics" includes the direct non-auditory effects of high-intensity sound and vibration on man's body, the relevant problems of noise generation, measurement and control, and the psychological and social reactions of man and of animals to noise. The activities of CHABA are supported equally by the Army, Navy and the Air Force. One meeting of the full CHABA committee and 5 meetings of the CHABA Council have been held to date. 13 working groups have been appointed and 10 of them have accomplished their tasks and have been discharged. The most important single problem dealt with so far has been the possible effects on military personnel and operations of the intense noise caused by jet planes with afterburners on the decks of aircraft carriers and on flight lines. A CHABA working group guided the formation of a short-term study group ("BENOX") which during the summer of 1953 explored the biological effects of high-intensity noise on man and made recommendations for further research. The BENOX report was discussed at the first meeting of CHABA and its operational implications were evaluated by another working group in CHABA Report No. 1. The activities of the other 11 CHABA working groups are also summarized in the body of the present report, which is CHABA Report No. 2.

Forbays, D.G. & Irwin, J.A. MEASURES OF COMBAT CREW PERFORMANCE USED IN B-29 TRAINING. Proj. 511 023 0001, Tech Rep. 52 14, Dec. 1952, 13pp. USAF Combat Crew Training Research Lab., Randolph AFB, Tex.

327

In order to improve training and crew assignment of B-29 combat crews, the reliability of measures of crew effectiveness obtained during training was studied. This report analyzes such available objective measures of crew performance as: measures of radar bombing accuracy, scores on the ultrasonic trainer, measures of optical bombing accuracy, measures of navigation accuracy, and school grades. The interrelationships among these different measures, as well as instructor ratings, are presented. An attempt is made to assess changes in radar bombing scores resulting from training. Recommendations for further research are made.

Balke, B. RATE OF GASEOUS NITROGEN ELIMINATION DURING REST AND WORK IN RELATION TO THE OCCURRENCE OF DECOMPRESSION SICKNESS AT HIGH ALTITUDE. Proj. No. 21-1201-0014, Rep No. 6, Oct. 1954. USAF, School of Aviation Medicine, Randolph Field, Texas.

329

To determine the effects of pre-flight exercise, breathing ambient air or oxygen, on resistance to decompression sickness, 7 subjects performed calisthenics during simulated flights at 38,000 feet, while breathing oxygen. The flights were terminated when severe decompression pains developed. The results are analyzed in terms of the nitrogen elimination rate and the duration of decompression tolerance.

Dept. of Defense. MILITARY STANDARD-COLOR CODE FOR PIPELINES AND FOR COMPRESSED-GAS CYLINDERS. Mil-Std-101A, March, 1954, Superseding Mil-Std-101, July, 1949. Dept. of Defense, U.S. Government Printing Office, Washington, D.C.

335

This report specifies a military standard color and marking code for pipelines and compressed gas cylinders. Requirements met are: 1) unmistakable identification of contents of any system used for operational requirements, 2) distinctive markings to give immediate visual warning of systems that are dangerous, and the type of danger, and 3) markings for compressed gas cylinders compatible with attached piping. A general discussion of coding needs is included.

Harris, J.D. THE ROLES OF SENSATION LEVEL AND OF SOUND PRESSURE IN PRODUCING REVERSIBLE AUDITORY FATIGUE. The Laryngoscope, Feb. 1954, 64(2), 89-97. (USN Medical Research Lab., New London Submarine Base, Conn.). (KRL Rep. 244).

A test for screening fatigue susceptible individuals was investigated. A tone of 2048 cps was sounded for 5 min. at 97 db sound pressure level (80 db on the audiometer). The individual's recovery curve was carefully plotted at 4096 cps., the region most affected by such stimulation. Results were analyzed in terms of sensation level (data of their own threshold) and physical intensity. Sensation level proved the more important parameter. Considerably more rapid recovery was found than reported previously by Wilson, who used, as a criterion of fatigue, inability to hear a tone 10 db over own threshold after 2 min. recovery. The present study shows a better criterion to be, either the time in seconds to return to within 5 db of own threshold, or the residual hearing loss after 1 min. It is of considerable importance to use a pulsing tone rather than a steady tone in determining threshold during recovery from stimulation, in order to minimize the irrelevant masking effects of the high tone tinnitus which very often follows stimulations such as used here.

Glichrist, J.C., Shaw, M.E. & Walker, L.C. SOME EFFECTS OF UNEQUAL DISTRIBUTION OF INFORMATION IN A WHEEL GROUP STRUCTURE. J. abnorm. soc. Psychol., Oct. 1954, 49(4), 554-556. Research Bull. AFPRC TR 54 116. (University of Wisconsin).

338

To test the effects of unequal distribution of problem-related information upon group performance in a four-person wheel group structure, an experiment was performed using 45 groups. Three conditions of information distribution were used: equal, unequal with most information located initially at center of structure, and unequal with a peripheral position initially receiving most information. Time, message units and errors were recorded and sociometric questionnaires on leadership and morale were analyzed. These data were studied by analysis of variance for effects of information distribution and of individual centrality.

Byrne, M.J., Willey, C.L., Weigle, Joyce M. & Luff, Ruth K. THE DEVELOPMENT OF QUALIFICATIONS STANDARDS FOR THE UTILIZATION OF CIVILIAN SKILLS IN THE NAVAL RESERVE. Contract NMR 883(00), June 1953, 27pp. Clifton Corporation, Washington, D.C.

339

The need for the establishment of standards for the enlistment of qualified civilians in the US Naval Reserve in advanced pay grades in various emergency service and exclusive emergency service ratings was the basis for the initiation of this research. An analysis of the enlisted rate and rating structure of the Navy was made to determine the possibility of preparing rating guides in terms of civilian qualifications. Such rating guides were then prepared for about 60 percent of the ratings. The methodology used for rating guide preparation was outlined. Experience and skill requirements, the most appropriate occupational and recruitment sources for ratings, and other relevant data of assistance to field recruits were included.

343 Duncombe, A.B. A REVIEW OF RESEARCH ON MILITARY INSTRUCTOR PROBLEMS. HR 202/3, April 1953, 23pp. Committee on Human Resources, Department of Defense, Research and Development Board, Washington, D.C.

One of the most crucial and difficult aspects of the management of training in the services is the selection of instructor personnel. The efficiency of any training program depends, in the last analysis, on the quality of the instructors who administer it. Until recently, the principal emphasis in selecting and training instructors has been based on subject proficiency, with relatively less weight placed on ability to teach. There has long been, within the services, a strong belief that any man who can perform a specific duty well can also be highly effective in teaching the performance of that duty to others. The ability to teach is now being recognized as a skill in itself, which requires aptitude, study, and practice to develop proficiency. Present research, in addition to continued concern with the development and validation of measurements of instructor proficiency, is increasingly emphasizing the determination of essential instructional and personal characteristics of effective instructors, based upon analysis of data obtained in a field situation. Studies of instructor morale, job satisfactions, and dissatisfactions are receiving increased attention and are particularly pertinent in view of the exceedingly high rate of turnover of instructor personnel. Quality of instruction suffers both from the forced utilization of a high percentage of inexperienced instructors and from the fact that instructors about to terminate service evidence low motivation.

345 McGehee, W. SURVEY OF PSYCHOLOGICAL PROBLEMS AND SERVICES IN NAVAL AVIATION. Contract N70NR 291, Rep. 12, June 1951, 4pp. USN Division of Aviation Medicine, Washington, D.C.

345 This report presents a survey of psychological research and services in naval aviation. Designed to discover which areas of research and service appear most likely to contribute to the improvement of naval aviation, the report offers observations and recommendations concerning such research areas as: the selection and classification of personnel training, equipment design, morale and operations fatigue, leadership, safety, communications, and so forth. Specific problems concerned with training aids, both their application and evaluation are presented.

349 Condit, D.M. A SYSTEM FOR HANDLING DATA ON UNCONVENTIONAL WARFARE (U). - INCLUDING A BIBLIOGRAPHY OF OPEN SOURCES. ORO Stud. 23. 5, TM ORO-T-339, May 1956, 185pp. Logistics Division, ORO, Johns Hopkins University, Chevy Chase, Md.

349 This document outlines a system for treating data on unconventional warfare so as to make such data available for immediate research. Mechanical information-holding systems, the M and addressograph machines, are compared with nonmechanical ones, the card catalogue and key-sort systems. Included is an extensive bibliography of open sources on the topic of unconventional warfare.

360 Karcher, E.K., Jr., Dunn, T.F., Jensen, B.T. & Seeley, L.C. UNIT EFFECTIVENESS TESTS. Proj. DA 29565100, PJ 6502 01, PRS Rep. 923, Jan. 1952, 87pp. USA Personnel Research Branch, Adjutant General's Office, Washington, D.C.

360 The problem studied here is that of evaluating the effectiveness of Army units as teams. This report contains both a manual on building tests for such evaluation and a model test. The manual treats three major problems: 1) general principles of unit evaluation, 2) developing the unit evaluation problems, and 3) planning the unit test administration. The model test for tactical operations (march, defense, and bivouac) of service units embodies the principles, techniques, and instruments discussed in the manual.

361 Havron, M.D., Fay, R.J. & Goodacre, D.M., III. RESEARCH ON THE EFFECTIVENESS OF SMALL MILITARY UNITS. Contract DA 49 063 OSAS1, PRS Rep. 916, April 1951, 92pp. USA Personnel Research Section, Adjutant General's Office, Washington, D.C.

361 This report presents the results of an extensive investigation on the effectiveness of small military units with specific emphasis on the development of small group training procedures and training aids. Utilizing a series of performance, interpersonal relations, and attitudinal scales, groups of rifle and scout squads were tested on two tactical field problems specifically defined for each type of squad. The results are presented and discussed in terms of the relationship among performance, attitudinal, and sociometric variables. Implications for selection and training procedures are presented along with some specific evaluative methods and training instruments.

364 Miller, R.B. ANTICIPATING TANKCROW'S MAINTENANCE JOB. Contract AF 33(033) 12921, Proj. 507 003 0001, Res. Rev. 53 1, March 1953, 21pp. USAF Human Resources Research Center, Lackland AFB, Tex. (American Institute for Research, Pittsburgh, Penn.).

364 This report covers research directed towards the development of a method for anticipating maintenance job requirements prior to the introduction of new equipment into the field. Procedures were developed for making complete concrete statements of the maintenance job. The methods rely on an analysis of what the man must do and are based on construction of the equipment plus data on malfunctions and corrective actions taken from maintenance activities. The technique was applied to Q-24 prototype data and compared with a similar analysis of the Q-24 production models used in the Strategic Air Command. Implications for training were discussed.

365 Quartermaster Food and Container Institute for the Armed Forces. FRI PREFERENCE RATINGS AS PREDICTORS OF FOOD CONSUMPTION. Proj. 7-64-15-007, Interim Rep. 1, Oct. 1956, 19pp. Quartermaster Food and Container Institute for the Armed Forces, Chicago, Ill.

365 To determine the relation between food preference ratings and two measures of food behavior (consumption and acceptance on the serving line), 91 subjects rated 54 foods on a nine-point hedonic scale at the beginning and end of a four-week study. The 'A' ration was served cafeteria style and the subjects were at liberty to select type and amount of food. The amount of each food taken and eaten was recorded by individuals. Correlation coefficients were computed between mean preference ratings and average proportion of a normal serving consumed and also the proportion of subjects who accepted the items on the serving table. The two administrations were correlated. The results are discussed in relation to use of preference ratings in food acceptance work.

Glinos, A.D. BASIC CONCEPTS AND METHODS OF MEDICAL RESEARCH. Contract Nonr 401(2), 1954, 43pp. QMG. (Johns Hopkins University, Baltimore, Md.).

Scientific research methods are methods of isolating certain elements or aspects of physical reality. The methods in essence are conceived and designed to perform a specific kind of isolation. Medical research methods fall roughly into 3 categories according to the degree of complexity of the elements isolated: a) physical-chemical methods; b) biological methods; and c) clinical methods. The basic concepts of each of these methods are reviewed and their use described by examples. A final chapter uses case histories to illustrate the correct handling and proper integration of medical research methods.

Noble, C.E. SOME PHYSICAL SOURCES OF DIFFICULTY IN THE COMPLEX COORDINATION TEST CM701E. Proj. 509 020 0003, Res. Bull. 53 7, April 1953, 29pp. USAF Air Research and Development Command, Lackland AFB, Tex.

370^A

The research reported here was part of a large project directed towards improving tests of motor skills. This particular study represented a follow-up of previous research which established the difficulty of various parts of the Complex Coordination Test CM701E. In this test, the S was required to match the red light in a top row of lights with a green light in the bottom row by appropriate movements of stick and rudder controls. Certain physical sources of difficulty in performance were identified by investigating three apparatus variables: amplitude of response in ft., mechanical work in ft.-lbs., and degree of crossing of the aileron and rudder controls. A graphic technique was used to weight the importance of aileron, elevator, and rudder movements in each match.

374 Lyman, J. & Taylor, C.L. ELEMENTARY BIOTECHNOLOGY. Sept. 1953, 117pp. Engineering Dept., University of California, Los Angeles, Calif.

This report is a syllabus (circa 1953) on elementary biotechnology. It is designed to serve 2 aims: a) to familiarize the engineering student with some of the principles of human bio-science; and b) to lay a foundation for understanding of the problems arising out of the interaction between man and engineering systems. Background in chemistry, physics, engineering, and mathematics, as required in lower division engineering curricula, is prerequisite to the course. Topics covered include: a) the human body as a structure; b) biometry and measurement; c) basic principles of body function (biomechanics, circulation, and homeostatic processes); d) the mechanisms of physical actions (muscle structure and function, muscular-skeletal mechanisms, biomechanics of muscular activity, and physical labor); and e) the integration of human behavior (nervous mechanisms of behavior, learning and motivation, and man-machine stimulus and response systems).

376 Siegel, A., & Courtney, D. DEVELOPMENT OF PRACTICAL PERFORMANCE MEASURES. Contract Nonr 872(00), Institute Rep. No. 4, July 1953, 11. QMG, Psychology, Sciences Div., and Bureau of Naval Personnel, Personnel Analysis Div. (Institute for Research in Human Relations, Philadelphia, Pennsylvania).

The main objective of this study was to develop a manual which can be used as a guide in the construction of performance tests for Navy Personnel. Such a manual was constructed and the tests were administered by Naval personnel with minimal instruction in testing practice. It was found that enlisted men below the rate of Chief Petty Officers were not completely competent as test administrators, however, they did show acceptable inter-examiner reliability. The validity, reliability, and discriminating power of the tests in the Structural Mechanics and Aerial Photographers Batteries were evaluated. The acceptability of the tests was determined by interviews and the consensus of opinion indicated a desire and need for such a device. For the Aviation Structural Mechanic's Battery, it was found that the test-retest reliability was moderately high and that the tests in the Battery were adequately homogeneous and had acceptable discriminating power. For the Aerial Photographer's Battery, it was found that the tests in the Battery were adequately discriminating and seemed to demonstrate acceptable discriminating power.

Morris, Eugenia B. & Spragg, S.D.S. PERFORMANCE ON A FOLLOWING TRACKING TASK (MODIFIED SAM TWO-HAND COORDINATION TEST) AS A FUNCTION OF THE RELATIONS BETWEEN DIRECTION OF MOTION OF CONTROLS AND DIRECTION OF MOVEMENT OF DISPLAY. J. Psychol., 1953, 35, 119-129. (Psychology Dept., University of Rochester, Rochester, N.Y.).

The present study was designed to investigate performance of a 2-hand coordination task as a function of the direction of rotation of the controls in relation to the direction of movement of the display. The SAM Two-Hand Coordination Test was used. 2 groups of 10 Ss each were given 4 trials, one on each of the following experimental conditions: a) clockwise (CW) rotation of the left crank moved the target follower to the left and counter-clockwise (CCW) rotation of the left crank moved the target follower to the right; b) CW rotation of the right crank moved the target follower towards S and CCW rotation of the right crank moved the target follower away from S; c) CW rotation of the left crank moved the target follower away from S and CCW rotation of the left crank moved it toward S; d) the left crank as in (a) and the right, as in (b). For Group I the right crank rotated in a vertical plane parallel to the frontal body plane and for Group II the right crank was placed so that it rotated in a vertical plane perpendicular to the frontal body plane. In terms of mean time on target (t) condition (b) was superior to (a), (c) and (d) both for Group I and Group II. In neither Group I nor II was any of the differences between conditions (a), (c) and (d) statistically significant. Group II was superior to Group I in terms of the overall estimate and in terms of each of the experimental conditions.

Simon, J.R., De Crow, T.M., Lincoln, R.S. & Smith, K.U. EFFECTS OF HANDEDNESS ON TRACKING ACCURACY. *PERCEPT. MOT. SKILLS* 1952, 5, 53-57. (University of Wisconsin, Madison, Wisc.).

391

This paper deals with two aspects of motion--hand usage and handedness--in relation to tracking accuracy. Forty subjects, half of whom performed a direct tracking task and half an aided tracking task, were used. Of each group of 20 subjects, ten were right-handed and ten were left-handed. Five of each of the groups were assigned at random to track with the right hand, while the other five used the left hand. The results were summarized in terms of the relative tracking accuracy obtained with preferred and non-preferred hands and of right- and left-handed individuals on both types of tracking tasks.

392

This is a progress report of the development of a small, compact cathode ray indicator package for use in aircraft under conditions of high ambient lighting. The general characteristics of the projected package are listed. Progress in development is noted and future work outlined.

393 Harris, S. & Smith, K.U. DIMENSIONAL ANALYSIS OF MOTION: V. AN ANALYTIC TEST OF PSYCHOMOTOR ABILITY. *J. Appl. Psychol.*, April 1953, 37(2), 136-141. (University of Wisconsin, Madison, Wisc.).

A special psychomotor test for separate measurement of the travel and manipulation components of motion has been described. The test, called the Analytic Reactionmeter, permits controlled variation and measurement of different bodily and space dimensions of motion which are involved in various types of motion patterns. Preliminary investigation employing the instrument have yielded the following general results: a) critical sources of variation in performance in various motion patterns of the type studied are related to the manipulation and travel components of motion; b) performances in different space dimensions of both manipulation and travel movements correlate highly with one another; c) the reliability of specific tests related to hands, planes, direction of travel, direction of manipulation and complexity of the manipulation pattern in the general test situation described typically exceeds + .80 for manipulation and + .75 for travel movements; d) the present test, and the principles behind it, provide one means of securing precise and analytical data for exact quantitative specification of motions and motion functions. Application of analytical methods described to studies of growth, aging, neurological deficiency, and to industrial selection may advance considerably the scientific validity of data concerning human motion.

von Trebs, Patricia & Smith, K.U. THE DIMENSIONAL ANALYSIS OF MOTIONS: IV. TRANSFER EFFECTS AND DIRECTION OF MOVEMENT. *J. Appl. Psychol.*, Oct. 1952, 36(5), 348-353. (University of Wisconsin, Madison, Wisc.).

394

This is a study in a series on training, and the components of certain complex motor activities. College students sat in front of a control panel, and turned switches according to prescribed patterns of movement. The apparatus allowed experimenter control of direction of motion, pattern, plane, distance of travel, etc. Each subject was trained for 8 days (32 trials) in one of four movement patterns, varying in direction, and was then tested for transfer on the others. Data were analyzed according to travel and manipulative components of motion. Results are reported for the various patterns.

Feiler, G. & Smith, K.U. LEARNING AND INTEGRATION OF COMPONENT MOVEMENTS IN A PATTERN OF MOTION. *J. Exp. Psychol.*, Nov. 1952, 44(5), 301-305. (University of Wisconsin, Madison, Wisc.).

395

The problem of the extent practice plays in the integration or correlation of component movements involved in a single motion pattern is investigated. The task consisted of turning switches--involving 5 manipulative and 4 travel movements which were measured by the "Universal Motion Analyzer"--arranged in 4 patterns of directional complexity. Four trials on each pattern were run on 4 successive days with female college students. Results are in terms of the intercorrelations between levels of complexity of the pattern and the days of practice with the movement components.

McKelvey, R.K. THE BEHAVIOR OF INDIVIDUALS AND PERSONNEL SYSTEMS IN THE SURVEILLANCE FUNCTIONS OF AN AIR DEFENSE DIRECTION CENTER: II. DISTRIBUTION OF VOICE COMMUNICATIONS AT FOUR CRITICAL CREW POSITIONS. Proj. 7712, Task 77207, AFTRC TR 54 99, Dec. 1954, 5pp. USAF Personnel & Training Research Center, Lackland AFB, Tex.

399

This report describes the frequency distribution of voice communications about certain critical points in the air surveillance section of an Air Defense Direction Center operating under standard system-maintenance conditions. The data (both direct and telephone communications) are analyzed and discussed with respect to directional characteristics, levels of activity as distributed among possible participants, relative utilization of available types of voice communication media, implications of limited manning and equipment utilization, and possible points of stress if present conditions should change.

USAF Office of the Inspector General. OPERATIONAL EXPERIENCE WITH EJECTION ESCAPE SYSTEMS FROM 1 JANUARY 1949 THROUGH 31 DECEMBER 1954. Publ. 23 55, AFR 190 16, Aug. 1955, 74pp. USAF Office of the Inspector General, Norton AFB, Calif.

400

This report presents an analysis of all (518) ejection seat bailouts from United States Air Force jet fighter and bomber aircraft since the beginning of ejection seat use (1 January 1949) through 31 December 1954. The efforts upon personnel as related to aircraft model, airspeed, altitude, crew training and other factors are presented; specific and general areas of difficulty in the operation of ejection seat and canopy systems are determined; and recommendations are presented for reducing the incidence of unsuccessful and/or accidental ejection. Some typical ejection briefs are included.

 Spiehl, M. AN EXPLORATORY STUDY OF OPERATOR AND APPARATUS CHARACTERISTICS OF A FLEXIBLE GUNNERY RESEARCH DEVICE. Contract AF 33(038) 22936, Proj. 309 020 0007, Tech. Rep. 32 2, Oct. 1952, 13pp. USAF Perceptual & Motor Skills Research Lab. Lackland AFB, Tex. (State University of Iowa, Iowa City, Iowa).

401
 The need for economical research on perceptual and motor components of aerial gunnery has stimulated the use of simulators. Many such devices, however, contain inherent defects and are of questionable value for the improvement of performance through training. This report describes a redesigned Pedestal Sight Manipulation Test. The apparatus is evaluated on the basis of data obtained from 22 undergraduates (Ss), during seven days of four blocks of practice per day with 16 attack patterns of various speeds. Scores for azimuth, elevation, framing, triggering, and combinations are analyzed by days and calibration tests are reported. Modifications being made are detailed.

 Madner, L., Zeeman, D. C. Pickett, J.H. PROPRIOCEPTIVE CONTROL OF A HAND. Contract Monr 631(00), Tech. Rep. 7, Aug. 1953, 9pp. Office of Naval Research. (University of Connecticut, Storrs, Conn.).
 An eyelid conditioning procedure was applied to three groups of subjects. Of the three groups, one (pre-tap) had organized a movement cycle in previous training, a second (tap) made identical repetitive movements during training but had no previous practice, and the third (no-tap) made no consistent overt movements. Conditioning was obtained in all three groups but learning was more stable when consistent proprioceptive feedback was present. The CR's of the pre-tap and tap group became highly synchronized with the beat-stroke of the movement cycle. The results are interpreted as indicative of a habit under proprioceptive control. Variation of the time relationship between internal and external cues is described. Current research in which overt and covert speech movements are used as the source of proprioception is discussed.

 Willis, M.P. & Farnsworth, D. COMPARATIVE EVALUATION OF ANOMALOSCOPES. Proj. NM 003 041.26.01, Rep. No. 190. Aug., 1954. 89pp. U.S. Naval Submarine Base, Medical Research Laboratory, Bureau of Medicine and Surgery, Navy Department, New London.

40
 To investigate the soundness of current ideas of anomalous color vision and the use of the anomaloscope as a color vision test, a selected sample of 14 individuals were examined on six types of anomaloscopes and a battery of color vision tests of progressive stringency. Conclusions were derived from the data concerning the relative diagnostic value of the various instruments, the theoretical significance of scores, distribution of anomalous trichromatism, and relations among types of anomalies. A scoring method is proposed that can be applied to all anomaloscopes to give comparable scores.

409 Spragg, S.D.S. & Rock, M.L. DIAL READING PERFORMANCE AS A FUNCTION OF BRIGHTNESS. J. Appl. Psychol., April 1952, 15(2), 128-137. (University of Rochester, Rochester, N.Y.)

Experiments are reported on the speed and accuracy with which subjects can read photographic reproductions of instrument dials as a function of the brightness of the dial markings. Young adult males, previously screened so that they constituted groups with excellent visual abilities, served as subjects in dial reading tasks. A brightness range of 0.005 to 6.0 foot-lamberts was used. Both for time and for error frequency scores a critical brightness level was found at approximately 0.02 foot-lamberts. At brightnesses below this level performance was increasingly impaired; above this level increases in brightness produced little or no improvement in visual performance. These findings suggest that for the nighttime operation of equipment where dial-reading and comparable visual tasks are involved brightness values should be kept safely above the critical 0.02 foot-lambert level. As long as this is done visual performance will be as rapid and as accurate as at higher levels (i.e., brightness ceases to be a significant variable.).

410 Blackwell, H. R. STUDIES OF THE FORM OF VISUAL THRESHOLD DATA. J. opt. Soc. Amer., Vol. 43, No. 6, June 1953, 456-463. Contract No. N5ori-116, Proj. NR-142-104, T.O. V. Office of Naval Research. (University of Michigan)

410 To study the form of visual threshold data so that the most appropriate procedure for analyzing the data can be selected, three alternative assumptions are compared and examined critically. The assumptions are that the data will conform to (1) Poisson sums, (2) normal ogives, or (3) log normal ogives. Experimental data (27,482 threshold measurements for four subjects under constant physical conditions) are reported and curves fitted to them by the three procedures. Both theoretical and practical implications of the comparisons are discussed.

411 Lincoln, R.S. & Smith, K.U. SYSTEMATIC ANALYSIS OF FACTORS DETERMINING ACCURACY IN VISUAL TRACKING. Science, Vol. 116, No. 3008, Aug. 1952, 183-187. (Dept. Psychology, University of Wisconsin, Madison.)

411 In this study of factors determining accuracy in visual tracking, systematic analyses were made of the following aspects of tracking precision: a) the instrumental relations of the tracking motions; b) the ratios of motion between hand controls and visual cursors; c) learning in relation to different component movements in the tracking response; and d) target characteristics. The results of a series of experiments designed to investigate these factors are presented and discussed in terms of the particular effect of each factor upon tracking accuracy and also in terms of the general aspects of the process of motion.

414 Lincoln, R.S. & Smith, K.U. **VISUAL TRACKING: II. EFFECTS OF BRIGHTNESS AND WIDTH OF TARGET.** *J. Appl. Psychol.*, Dec. 1952, 36(6), 417-421. (University of Wisconsin, Madison, Wisc.).

The present study comprises 3 experiments concerned with the psychophysical determination of error in direct tracking of a target. It has been found that the pattern relations of target and cursor are related to accuracy of visual tracking. A vernier relation of target and cursor generally produces more accurate performance than an overlapping pattern of target and cursor when the chief of the two elements of the visual presentation is the same. Illumination level of target and cursor affects accuracy in tracking. At low illuminations, accuracy drops off decisively for a cursor pattern which overlaps the target. Generally, the effects of change in illumination in relation to variations in the pattern of target and cursor, as well as alterations in the width of the target, are marked by complex interactions which make it difficult to formulate simple rules regarding these relations. By far the most significant result of this study is the observation that an increase in the width of the target produces no marked change in the level of tracking accuracy. Targets some thirty times the width of the controlled cursor are tracked with almost the same accuracy as targets equal to the width of the cursor. In fact, under some conditions, maximum levels of accuracy are found with targets of a width greater than the width of the cursor. These results are secured under conditions in which the criterion of error remains fixed for all target widths. The target-width effect, as observed here, suggests that the psychophysical laws of tracking behavior deal mainly with phenomena of organization of visual pattern rather than tolerances of alignment and misalignment of visual contours. The tracker's accuracy is determined by precision in scaling or bisection of the visual pattern rather than in terms of the optical resolution of limiting contours that define the visual presentation.

418 Stuntz, S.E. **CURRENT PROGRAM OF RESEARCH IN SELECTION OF SUBMARINE SONAR OPERATORS.** Proj. NM 003 041.07.02, Rep. 201, Dec. 1952, 25pp. USN Medical Research Laboratory, Bureau of Medicine & Surgery, Navy Department, USN Submarine Base, New London, Conn.

With the advent of new sonar gear and new sonar doctrines, present methods of selecting pre-submarine sonarman are found to be outdated. This paper is a prospectus for further research together with an account of the initial steps recently taken by the Naval Medical Research Laboratory. The problem is considered to have two phases: a) thorough analysis of the job to be performed; and b) evolution of selection tests which will predict success in that job. Each of these two areas has several aspects. In attacking the problem, eight specific research procedures have been devised and are being actively pursued. It is urged that anyone who has a positive contribution to offer in the guidance of such a program or in the interpretation of results communicate with the Officer-in-Charge, Medical Research Laboratory.

415 Lincoln, R.S. & Smith, K.U. **TRANSFER OF TRAINING IN TRACKING PERFORMANCE AT DIFFERENT TARGET SPEEDS.** *J. Appl. Psychol.*, Oct. 1951, 35(5), 358-362. (University of Wisconsin, Madison, Wisc.).

415 This study investigated the effect of training in tracking at one target speed upon later performance at different target speeds. The task was to maintain (by turning a crank) an indicator in alignment with a target traveling an erratic path, driven by a constant-speed motor. The sequence of training at three different motor speeds (23, 30, and 37 rpm) was varied among 36 Ss. Mean time on target is analyzed and discussed with regard to the transfer of training at one speed to performance at different speeds.

417 Williams, R.L. **STATISTICAL SYMBOLS FOR MAPS: THEIR DESIGN AND RELATIVE VALUES.** Contract NR 088-006, Nonr 609(G3), March 1956, 115pp. ONR, Yale University Map Laboratory.

417 This study is concerned with the manner in which value symbols used in maps are interpreted by the average map user. In particular, the author is concerned with establishing a table of values presenting necessary information to the cartographer with regard to the visual experience of spot and tone (or overall pattern) symbols. Having selected a series of appropriate symbols experiments were conducted to determine how the shapes of spot symbols are visually related, to ascertain the variation in size of any one symbol necessary for representation of a scale of values visually, and finally, with regard to tone symbols, to develop tables indicative of optimal area relations. More definitive aspects of the above questions were assessed and are discussed in detail.

419 Hartman, B.O. **THE EFFECT OF TARGET FREQUENCY ON PURSUIT TRACKING.** Proj. 6 95 20 001, Rep. 263, March 1957, 14pp. USA Medical Research Labs., Psychology Dept., Fort Knox, Ky.

To determine the effect of target frequency upon two manual pursuit tracking of simple one-dimensional sine input, eight subjects were trained and then tested on six target frequencies (from ten to sixty cycles per minute). The target was a single vertical line moving on horizontal axis (maximum amplitude, 14 inches); the "following" cursor was a similar vertical line below the target and was controlled by a simple, springless joystick. Time-on-target and number of hits were obtained for 144 scoring periods of 75 seconds and were analyzed as functions of target frequency. In addition, a graphic record was taken for one trial period at each frequency and studied for characteristics describing tracking responses. The results are discussed in relation to man's basic motor performance.

Ramsley, Anita I. & Morris, J.D. COMPARATIVE ANALYSIS OF NORMAL SPEECH AND SPEECH WITH DELAYED SIDE-TONE BY MEANS OF SOUND SPECTROGRAMS. Proj. RM 003 041 .56 .03, Rep. No. 248. April 1954. 7pp. U.S. Naval Submarine Base, Medical Research Laboratory, Bureau of Medicine and Surgery, Navy Department, New London.

A delayed side-tone is defined as the sound of his own speech reaching a speaker's ear after a controlled delay interval. The effect of this echo of his own voice was investigated by having subjects read a simple story which included all the words in a phonetically balanced list. The story was first read and tape-recorded in the presence of a side-tone with a delay of .18 sec., and then repeated without a side-tone. The intensity of the side-tone was sufficient to mask the subject's voice at the moment of speaking. Analysis of recordings was undertaken with only those subjects whose speech was affected by the side-tone, i.e. showed stammering, stuttering, hesitation, or blocking. Recordings of a stuttered phrase and the same phrase spoken normally by the subject were analyzed spectrographically. In nearly every case, a phrase spoken in the presence of a side-tone was longer and more emphasized than it was in the absence of a side-tone. The frequency pattern of the word was very often dependent on what immediately followed. If a word was repeated, it resembled, in its first appearance, the word in isolation, but its repetition was more similar spectrographically to the word spoken in the same phrase without the side-tone. This shows the change which the word undergoes in anticipation of its connection with a following word: a) speech, analysis by sound spectrogram; b) sound spectrograms for speech analysis; c) delayed side-tones, effect of, on speech; d) stuttering, as caused by delayed side-tones.

Edwards, W. THE THEORY OF DECISION MAKING. Psychol. Bull., July 1954, 51(4), 380-417. (Johns Hopkins University, Baltimore, Md.). (DNR Rep. 166 1 182).

Economists and others have been developing mathematical theories about how people make choices among desirable alternatives. These theories center on the notion of the subjective value, or utility, of the alternatives among which the decider must choose. They assume that people behave rationally, that is, that they have transitive preferences and that they choose in such a way as to maximize utility or expected utility. The traditional theory of riskless choices, a straightforward theory of utility maximization, was challenged by the demonstration that the mathematical tool of indifference curves made it possible to account for riskless choices without assuming that utility could be measured on an interval scale. The theory of riskless choices predicted from indifference curves has been worked out in detail. Experimental determination of indifference curves is possible, and has been attempted. But utility measured on an interval scale is necessary (though not sufficient) for welfare economics. Attention was turned to risky choices by von Neumann and Morgenstern's demonstration that complete weak ordering of risky choices implies the existence of utility measurable on an interval scale. Mosteller and Nogee experimentally determined utility curves for money from gambling decisions, and used them to predict other gambling decisions. Edwards demonstrated the existence of preferences among probabilities in gambling situations, which complicates the experimental measurement of utility. Coombs developed a model for utility and subjective probability measured on an ordered metric scale, and did some experiments to test implications of the model. The theory of games presents an elaborate mathematical analysis of the problem of choosing from among alternative strategies in games of strategy. This paper summarizes the main concepts of this analysis. The theory of games has stimulated interest in experimental games, and a few bargaining experiments which can be thought of in game-theoretical terms have been performed. R 209

Whiteside, T.C.D. VISION IN AN EMPTY VISUAL FIELD: RATE OF RELAXATION OF ACCOMMODATION. FPRC 897, Sept. 1954, 11pp. Flying Personnel Research Committee, RAF Institute of Aviation Medicine, Farnborough, Hants, England.

When a stimulus at a far point is suddenly removed, accommodation increases involuntarily until it reaches the resting level about 0.5 to 0.1 dioptre. It is possible to increase accommodation voluntarily by causing the eyes to converge, but it is not possible to remain focussed at the far point if the stimulus there has disappeared. This experiment measures the rate at which accommodation assumes its resting level after loss of a stimulus at the far point, and after looking at a near stimulus. It is not possible to give rigid values, since the "resting level of accommodation" fluctuates between 0.5 to 2 dioptres, but in general, the results show that after losing sight of a near and a distant stimulus, accommodation takes about 60 sec. to reach its resting value. After loss of the near stimulus, 60 sec. are required before relaxation can take place to the resting level, and after loss of a distant stimulus, although the S with normal eyesight tries to remain focussed at infinity, his eyes inevitably focus at the resting level about 1/2-2 meters away within 60 sec.

Robson, R.A.H. & Chapin, F.S. RESEARCH ON THE RELATION OF COMMUNICATION AND MORALE. FINAL REPORT ON PROJECT D. Contract NSCGR 66216, April 1953, 12pp. University of Minnesota, Minneapolis, Minn.

428

To ascertain the effects of various types of progress reports on the "morale" of a group, 240 subjects were assigned to nine different groups on the basis of high or low valence values held by the individual subject. The degree of valence was ascertained by observations made before the experimental session began. Six high valent and three low valent groups performed coding operations in a simulated Civil Defense Headquarters Communications Center. Six types of progress reports (continued failure or success, success followed by failure or the reverse, fluctuating success followed by failure, and success followed by no information) were given for 35 minutes, following which they could keep on working or could stop. Group performance and cohesiveness were then compared for the various valence groups. T. I.

Havron, M.D., Greer, F.L. & Galanter, E.H. AN INTERVIEW STUDY OF HUMAN RELATIONSHIPS IN EFFECTIVE INFANTRY RIFLE SQUADS. Contract DA 49 083 OSA 520, Proj. 295 35100, Subtask 81, Personnel Res. Section PR 35E1, PRS Rep. 983, Dec. 1952, 117pp. USA Personnel Research Section, Department of the Army, Institute for Research in Human Relations, Philadelphia, Penn.

The object of the study was to find out some of the factors present in individual squad members and their interpersonal relationships which contribute to small-unit effectiveness in combat. Rifle squads of an infantry division were graded on a 4-phase field problem. Members of the 13 highest-scoring and 13 lowest-scoring squads were interviewed and tested. From a comparison of results, it was found that the members of the more effective squads were better acquainted with each other, took more pride in their squad, and were more aware of each other's feelings and attitudes. The leaders of the better squads were more willing to act on their own initiative, paid more attention to the feelings of their squad members, were more level-headed in a tense situation, and were more often regarded as acting as squad leaders should act. These personal factors affecting squad performance can be grouped under 2 headings: a) those factors which make members of a squad willing to work toward a common purpose, b) those which hinder or help squad members in accomplishing their assignments.

Gordon, D.A., Campbell, J.T., Johnson, C.D., Woods, I. A. & Yaukey, D. VALIDATION OF PERSONNEL MEASURES AGAINST COMBAT PERFORMANCE OF ENLISTED MEN IN KOREA. IIIB. VISION TESTS. Army Proj. No. 29535100, PJ 3512-11, PRS Rep. 942, Apr. 1952, 5pp. Dept. of the Army, Personnel Research Section, Adjutant General's Office, Personnel and Procedures Branch.

438

To determine the effectiveness of visual acuity tests for use in assigning men to combat duty, the Armed Forces Far Visual Acuity Test at high brightness and the Ortho Rater at three decreasing levels of illumination were administered to 467 enlisted men of the 35th Infantry in Korea. Combat ratings were obtained through individual interviews with from one to four noncommissioned officers who knew the men rated. Pearsonian correlation coefficients between test scores and the criterion ratings were calculated and are discussed in terms of the validity of acuity tests for predicting combat performance.

Richardson, Bellows, Henry & Co., Inc., New York, N.Y. EVALUATION PROCEDURE FOR TRAINING AIDS AND DEVICES. 1953 FORM. NAVEXOS P 1090, 1953, 46pp. USN Special Devices Center, Port Washington, N.Y.

439

This document contains several copies of a form designed for use in evaluating training aids and devices. The procedure has three parts: I. Method of Use; II. Educational and Training Characteristics; III. Device Limitations. The document includes instructions for using and scoring the form, a percentile table for interpreting scores, and a recommended form for reporting results of evaluation.

Richardson, Bellows, Henry & Company, Inc. MANUAL FOR USING SOC-CAR EVALUATION PROCEDURE FOR TRAINING AIDS AND DEVICES. 1950, 33pp. Richardson, Bellows, Henry & Company, Inc., New York, N.Y.

440

This is a questionnaire for obtaining from instructors information to be used in the evaluation of training aids. It covers the purpose of the training, a description of the training device, rating of the device, and the use of the device. Included are manuals for use and for scoring of the questionnaire.

441

Mock, R.O. FEEDING ON A LONG-RANGE FIGHTER MISSION (OPERATION FOX PAT). Tech. Note 56-5, Proj. 7156, Jan. 1956, 6pp. Aero Medical Laboratory, WADC, Wright-Patterson, AFB, Ohio.

441

This study was designed to evaluate the utilization of liquid foods as solution to the problem of feeding pilots on long range fighter missions. Pilots were asked to demonstrate preference for eight liquid foods (consisting of juices and flavored milk) and then permitted to select four cans of liquid foods for use on a long over-water flight. In-flight ratings were obtained for initial and return flights (pilots also permitted choice prior to return flight). Mean number of hedonic ratings and number of units consumed during flight were computed. Conclusions are drawn concerning the general suitability of liquid foods and the popularity of juices vs. flavored milk drinks.

443

Klemmer, E.T. TIME SHARING BETWEEN AUDITORY AND VISUAL CHANNELS. Proj. 7682, ca. 1956, 5pp. USAF Operational Applications Lab., Bolling AFB, Washington, D.C.

Three Ss were given tests in which they attempted to follow flashing lights and brief tones by pressing appropriate keys. Only one channel was activated at a time and the rate of alternation between channels was varied systematically between tests. The rate of stimulus presentation in the active channel was 2 per sec. and 3 per sec. in separate tests. The results indicated that forcing S to alternate regularly between tasks more rapidly than once every 2 sec. lowers his over-all performance sharply. It also appeared that forced time sharing between tasks of different difficulties leads to a greater decrement in performance on the easier task. The average reaction time during alternation was close to that for the more difficult channel alone.

Grings, W.W. (Principal investigator) SHIPBOARD OBSERVATION OF ELECTRONICS PERSONNEL: IMPLICATIONS FOR CERTAIN OPERATIONAL AND ADMINISTRATIVE PROBLEMS. Contract Nonr 228(02), Proj. NR 153 093, Tech. Rep. No. 6, June 1953, 61pp. ONR, University of Southern California, Dept. of Psychology, Los Angeles, Calif.

This report is one of a series based upon descriptions of electronics maintenance as observed on twenty ships of the destroyer class within the Pacific Fleet. The descriptions themselves were objective in nature and they attempted to produce an accurate non-evaluative "picture" of the current electronics situation. The present report presents those elements of the situation which are relevant to problems of shipboard organization and matters of higher policy. The organization of various electronics technician's groups is described along with the effects of the various forms of organization. The electronics material officer's relation to the maintenance situation is discussed. Effects of certain shipboard administrative arrangements are described in the section concerned with the role of the bridge in the electronics situation. Formal and informal methods for relaying requests for repair are described, and the effects of each type are discussed. The feasibility of combining certain of the electronics ratings is considered, and some material problems affecting maintenance are pointed out.

450
Grings, W.W. & Bryan, G.L. SHIPBOARD OBSERVATION OF ELECTRONICS PERSONNEL: BRIEF DESCRIPTIONS OF RELATED ELECTRONICS JOBS. Contract N0NR 228(02), Proj. Des. NR 153 093, Tech. Rep. 5, April 1953, 99pp. Department of Psychology, University of Southern California.

450
This report is one of a series based on shipboard observation of electronics personnel aboard ships of the destroyer class. Job descriptions of five major job classifications (electronics technician, sonarman, radarman, radioman, and fire controlman) are presented in terms of duties and activities, time estimates for each activity during various shipboard conditions, and the materials and tools used. A discussion of the relationships among the ratings in terms of the above items is presented.
T. G.

451
Grings, W.W. SHIPBOARD OBSERVATION OF ELECTRONICS PERSONNEL: SHIPBOARD ACTIVITIES OF ELECTRONICS TECHNICIANS. Contract N0NR 228(02), Proj. NR 153 093, Tech. Rep. 4, March 1953, 95pp. Department of Psychology, University of Southern California.

451
This report contains a detailed and objective account of the electronics technician at work aboard ships of the destroyer class. A general description of the technician's job is given and the general maintenance situation is considered - types of repairs performed and activities associated with electronics repair. Material, as well as behavioral, factors influencing repair are discussed. Conditions that limit maintenance are considered in detail. An evaluation is made of the critical requirements of the electronics technician in terms of general abilities, job knowledge and skills.

Grings, W.W. (Princ. Investigator). SHIPBOARD OBSERVATION OF ELECTRONICS PERSONNEL: IMPLICATIONS FOR THE TRAINING OF ELECTRONICS PERSONNEL. Contract N0NR 228(02), Proj. NR 153 093, Tech. Rep. 3, Feb. 1953, 65pp. Dept. of Psychology, University of Southern California, Los Angeles, Calif.

452
The data obtained in the course of an extensive series of observations aboard ships of the destroyer class are examined from the standpoint of the technical training of electronics personnel within the Navy. Descriptions of the kinds and amounts of training in electronics maintenance are presented with discussion of attendant problems. Judgments of the electronics technicians regarding the relevance of their training are presented and discussed. Evidences of specialization and its effects are treated. Attitudinal and other nontechnical aspects of training are discussed. Electronic training levels of the enlisted men who start electronics maintenance training are indicated along with attendant problems.

Williams, S.B., Bare, J.K., Canestrari, R.E., Jr. & Zuidema, Doris. OPERATOR EFFICIENCY AS A FUNCTION OF SCOPE SIZE. FINAL REPORT. Contract AF 33(635) 2882, Task 75005, 1956, 31pp. College of William and Mary, Williamsburg, Va.

456
To investigate the relationship between signal size and display size as it affects operator efficiency, detectability thresholds (signal at any one of 72 positions) and visibility thresholds (signal position known) were determined for two practiced subjects on a simulated radar scope. Signal sizes varied from 2 to 16 millimeters in diameter; scope sizes from 7 to 28 inches in diameter; scope brightness, approximately 0.5 foot lamberts; signal brightness, average 5.57. Detectability thresholds are analyzed as functions of scope size and signal size and their interactions. The effect of area of search on detectability and visibility thresholds is demonstrated.

Abelson, R.P. SPECTRAL ANALYSIS AND THE STUDY OF INDIVIDUAL DIFFERENCES IN THE PERFORMANCE OF ROUTINE, REPETITIVE TASKS. Contract N6ONR 27020, Proj. NR 150 008, March 1953, 108pp. Educational Testing Service, Princeton, N.J.

458
Several methods of analyzing time-ordered data were considered for studying individual differences in the performance of routine, repetitive tasks; spectral analysis was selected and its suitability for analyzing such data was then confirmed by applying it to available psychological data from a study of 'mental blocking' and from one on serial patterns of response in auditory threshold. The experimental task of the present study was jabbing a stylus at a target; five variations of target area were presented to the 33 Ss; 15 Ss were retested a month later. Spectral densities, variance of the responses about the mean, and speeded response were computed. Reliabilities and validities of these measures were determined. The measures were related to general personality characteristics. T. G. I. R 44

McGuigan, F.J. THE RELATIONSHIP BETWEEN 1000" RANGE AND KNOWN-DISTANCE RANGE RIFLE SCORES. HUMPRO Res. Memo. 3, Dec. 1953, 5pp. Human Resources Research Office, George Washington University, Washington, D.C.

460
This study compared marksmanship with the M1 rifle using miniature targets at 1000" range with subsequent marksmanship at known ranges (100-500 yds). Approximately 550 Army basic trainees each fired 51 rounds at 1000" range and "... the usual practice and record courses at known-distance range." Scores at 1000" range are correlated with known-distance scores for slow, sustained, practice, and record firing. The results are discussed in terms of using 1000" range scores for predicting known-distance marksmanship, for matching Ss in training experiments, and for measuring proficiency.

Rock, R.T., Jr., Duva, J.S. & Murray, J.E. TRAINING BY TELEVISION. THE COMPARATIVE EFFECTIVENESS OF INSTRUCTION BY TELEVISION, TELEVISION RECORDINGS, AND CONVENTIONAL CLASSROOM PROCEDURES. Contract N7ONR 47602, Proj. 20 E 5A, Rep. SDC 476 02 2, 24pp. USN Special Devices Center, Port Washington, N.Y.

462
The relative effectiveness of training by live television, by sound moving pictures, and by lectures was investigated in three Naval Air Reserve groups, including officer pilots and enlisted personnel. Comparisons of results of types of training are presented by pairs of types, and differences statistically analyzed. There is a discussion of the different lessons included in the television presentations.

Rock, R.T., Jr., Duva, J.S. & Murray, J.E. TRAINING BY TELEVISION. A STUDY IN LEARNING AND RETENTION. Contract N7ONR 47602, Proj. 20 E 5A, Rep. SDC 476 02 3, 24pp. USN Special Devices Center, Port Washington, N.Y.

463
This is a nontechnical report on a study of the effectiveness of television for rapid mass training. Approximately 3000 Army reservists (all ranks) viewed eight telecasts on infantry activities. Written multiple-choice tests on the contents of each presentation were administered before and after viewing. Use was also made of retention testing, an attitude questionnaire, comments, and ratings. Test-score gains and percent responses are interpreted regarding effectiveness of television in such training. Expert opinion is cited, and the content of the programs are analyzed in terms of good and poor teaching.

Katchmar, L.T. PHYSICAL FORCE PROBLEMS: I. HAND CRANK PERFORMANCE FOR VARIOUS CRANK RADII AND TORQUE LOAD COMBINATIONS. Tech. Memo. 357, March 1957, 15pp. Human Engineering Laboratory, Aberdeen Proving Ground, Md.

475
To investigate hand crank performance in terms of normal work output, 75 subjects were instructed to turn a crank at a "rapid" rate until they could not continue or were told to stop (ten minutes). Three hand crank radii (four, five, seven inches) and five torque loads (10, 30, 50, 70, 90 inch pounds) were tested. Each subject had an initial ten-minute trial with no resisting load and two hours later had a second trial under one of the hand crank-torque conditions. The data consisted of time (seconds) horse-power and foot-pounds per minute. Cumulative work output is shown graphically for each hand crank-torque load combination.

Poulton, E.C. MEMORIZATION DURING RECALL. *Brit. J. Psychol.* (General Section), May 1953, XLIV(2), 173-176. (Applied Psychology Research Unit, 180c, Cambridge, England). (APU 164/53).

476
To study the effect of retention of earlier items on the memorization of later items, 16 members of the Royal Navy were Ss in an experiment. The Ss were required to make a manual choice response to a visual signal, but on certain trials they had to respond first to previously memorized signals while memorizing the signals being presented. Accuracy of responses is studied and discussed with regard to "... the detrimental effect of active retention upon the memorization of new items."

Miller, R.B. & Folley, J.D. THE VALIDITY OF MAINTENANCE JOB ANALYSIS FROM THE PROTOTYPE OF AN ELECTRONIC EQUIPMENT. PART I: AN/APQ 24 RADAR SET. Contract AF 33(038) 12921, Proj. 507 008 0001, June 1952, 127pp. American Institute for Research, Pittsburgh, Penn.

480
The effectiveness of early determination of maintenance job requirements for newly developed radar equipment by analyzing a prototype of the equipment was tested on the AN/APQ-24 radar set. Prototype data were gathered from the manufacturer's records and analyzed according to the maintenance behavioral activities required. A similar analysis was made for production models of the same equipment. The two analyses are compared, and the results are discussed with regard to their implications for predicting maintenance requirements from prototype equipment in order to start early training of maintenance personnel. Special attention is given to the problems of trouble shooting.

Winder, C.L. DECISION MAKING. Contract MONR 225(01), Proj. NR 150 087, Tech. Rep. 1, March 1953, 36pp. Department of Psychology, Stanford University, Stanford, Calif.

484
This report described and summarized studies undertaken for an exploratory project which had as an over-all goal the fuller understanding of decision-making. The studies were concerned with the development of measures of decision-making and the clarification and development of pertinent personality measures. The basic measures of decision-making used in the studies were from the psychophysical type situations involving matching of graded series of stimuli to a standard stimulus of a different modality. Individual differences for decisions of this type were studied. Various personality measures were investigated for their relations to the various decision-making characteristics.

Jones, Margaret M., Hulbert, S.F. & Heise, R.H. A SURVEY OF THE LITERATURE ON JOB ANALYSIS OF TECHNICAL POSITIONS. Person. Psychol., Summer 1953, 6(1), 173-194. (University of California, Los Angeles, Calif.).

485
"This paper presents a survey of the literature on job analysis of technical positions. A technical position is defined as one which is not of professional level, but which requires considerable background of knowledge in a rather narrow area, and some knowledge of general principles. Very little work has been published dealing with these positions, but there is some indication that they are more difficult to rate than are standard factory and office jobs. It is concluded that rather thorough study of technical positions is in order and that considerable emphasis must be placed on skills and knowledge rather than on supervisory factors."

Flanagan, J.C. (Dir.) THE DEVELOPMENT OF TESTS OF APTITUDE AND PROFICIENCY. Res. Note 5, June 1951, 4pp. American Institute for Research, Pittsburgh, Penn.

The method used in developing aptitude and proficiency tests for research personnel is described and illustrated. The method is considered applicable to other test development projects. It is believed that certain techniques used should contribute to the development of valid tests. These are: a) definition of what is to be measured in terms of the critical requirements for the job; b) the use of rationales containing explicit definitions and analyses of the critical behaviors, and item-specification; and c) preparation and editing of items by specialists in the subject matter field and review of each item by several critics.

Siegel, A. & Courtney, D. DEVELOPMENT OF PRACTICAL PERFORMANCE MEASURES, VOLUME I. Contract NMM 872(00). Series 1953. Institute Rep. 4, July 1953, 225pp. Institute for Research in Human Relations, Philadelphia, Penn.

488

This study was concerned with the development of a manual for both the construction and use of performance tests in the Naval situation. Two performance tests were constructed in accordance with manual procedures--Aviation Structural Mechanics' Battery and Aerial Photographer's Battery--and subjected to field tests. The development and testing of these batteries were described in detail. Data on interexaminer reliability, intraexaminer reliability, test-retest reliability, examiner errors, face validity, etc. were obtained and evaluated.

Fleishman, E. A. THE PERCEPTION OF BODY POSITION -- EFFECT OF SPEED, MAGNITUDE, AND DIRECTION OF DISPLACEMENT ON ACCURACY OF ADJUSTMENT TO AN UPRIGHT POSITION. Proj. 509-020-0003, Res. Bull. 53-1, Jan. 1953, 17pp. USAF, HARC, Air Training Command, Lackland AFB, San Antonio, Texas.

494

This experiment was designed to determine the relation between the accuracy of perception of the upright position and the speed and magnitude of prior displacement away from the upright. The blindfolded subject was tilted 15, 20, or 25° to the right or left at a rate of 4, 5, or 6° per second, and attempted to restore the chair to the upright position. One hundred and eighty airmen served as subjects in groups randomly assigned to each experimental condition. The average error in leveling the chair is analyzed with respect to the speed, direction and magnitude of the initial tilt and the subject's previous practice.

Miller, R.B., Folley, J.D., Jr. & Smith, P.R. SYSTEMATIC TROUBLE SHOOTING AND THE HALF-SPLIT TECHNIQUE. Contract AF 33(038) 12921, Proj. 507 008 0001, Tech. Rep. 53 21, July 1953, 16pp. USAF Technical Training Research Lab., Chanute AFB, Ill. (American Institute for Research, Pittsburgh, Penn.).

498

A description of procedures for trouble shooting of electronics equipment which are based upon rational and logical considerations is presented. Two alternative methods are compared: trouble shooting from probability data and trouble shooting by logical elimination of malfunction sources. The latter method is the one developed in this report as being the most feasible. Two phases of the procedure for line trouble shooting are discussed step by step. The half-split technique (a specified check sequence based on mathematical considerations of efficiency) is of special relevance. A mathematical proof of the technique is presented in the Appendix. (See 3389).

Spieth, W. AN INVESTIGATION OF INDIVIDUAL SUSCEPTIBILITY TO INTERFERENCE IN THE PERFORMANCE OF THREE PSYCHOMOTOR TASKS. Contract AF 33(038) 13214, Proj. 509 020 0001, Res. Bull. 53 8, April 1953, 29pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex. (State University of Iowa, Iowa City, Iowa).

499

The focus of this study is the possibility of consistent individual susceptibility to interference as a result of practice on alternating standard and reversed forms of certain psychomotor tasks. The Two-Hand Coordination Test, the Complex Coordination Test, and the Pursuit Apparatus were used by 53 basic trainee airmen in the standard form only, and by 54 with short periods of practice on the standard form, alternated with short periods on the reversed form. Data include: individual performance variables; between-task correlations; and comparisons between pairs of such correlations from the two groups, as well as within-task measures.

Fleishman, E.A. AN EVALUATION OF TWO PSYCHOMOTOR TESTS FOR THE PREDICTION OF SUCCESS IN PRIMARY FLYING TRAINING. Proj. 509 020 0003, Res. Bull. 53 9, May 1953, 20pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

501

The Six-Target Rudder Control Test is a modification of the Rudder Control Test, which differentiates among pilot cadets even after considerable training. The Dynamic Balance Test requires balancing on a board and keeping shifting green and red lights matched. These are evaluated here with respect to their usefulness for the prediction of pilot success in Primary flying training. They were administered along with the Aircrew Classification Battery to 1000 unclassified pilot cadets before training. Extensive analysis of the reliability and validity (in predicting graduation), as well as factorial content of these tests is reported.

Tucker, J.A., Jr. RELATIVE PREDICTIVE EFFICIENCY OF MULTIPLE REGRESSION AND UNIQUE PATTERN TECHNIQUES. Proj. 503 001 0015, Res. Bull. 53 2, Feb. 1953, 25pp. USAF Personnel Research Lab., Lackland AFB, Tex.

502

This is an empirical investigation of the feasibility of using the unique pattern technique in personnel selection and classification. The chief emphasis is on methodology with major attention given to the relative effectiveness of multiple regression versus unique pattern techniques. Two types of Ss, pilot trainees and clerk-typists, are studied; the criteria are pass/fail in pilot training and final grade in technical training school. Using carefully selected predictor variables the two methods are compared for their success in predicting the criterion.

503

French, R.S. THE ACCURACY OF DISCRIMINATION OF DOT PATTERNS AS A FUNCTION OF ANGULAR ORIENTATION OF THE STIMULI. Proj. 509 019 0001, Res. Bull. 53 3, March 1953, 17pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

503

The accuracy of pattern discrimination was studied as a function of the relative angular orientation of the patterns compared. A total of 120 patterns from each of a two-, three-, and five-dot series was employed. The Ss' task was to indicate whether two patterns presented successively were either identical or different in terms of distance relations and spatial positions of the dots. Judgments were made on this basis while at the same time the second pattern of the pair was at any of ten angular orientations relative to the first. Error data were studied by analysis of variance for differences attributable to angular orientation, number of dots, and their interactions. Implications for radar scope interpretation were discussed.

Lewis, D., Adams, J.A. & Spieth, W. AN ANALYSIS OF PERFORMANCE ON THE IOWA PURSUIT APPARATUS. Contract AF 33(038) 13214, Proj. 509 020 0006, Res. Bull. 53 5, March 1953, 30pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

505

An attempt was made to find a short-cut method of measuring individual susceptibility to interference in the performance of motor tasks. A total of 132 airmen at Lackland Air Force Base were given four phases of practice on the pursuit apparatus: preliminary phase followed by original learning, interpolated learning, and relearning phases. Stanline scores for eight different aptitude indexes and preliminary trial scores were correlated with performance scores at the outset of the relearning phase when interference was at a maximum. Prediction of interference based on these two scores was discussed.

 Vasilas, J.M., Fitzpatrick, R., Dubois, P.H. & Youtz, R.P. HUMAN FACTORS IN NEAR ACCIDENTS. Contract AF 33 (038) 21662, Proj. 21 1207 0001, Rep. 1, June 1953, 65pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

507
 The objectives of this project were "to develop procedures for obtaining Hazardous Incident Reports; to try out various methods for obtaining these reports from groups of AF personnel; to collect a number of Hazardous Incident Reports, analyze the behaviors involved, and illustrate how such incidents might be used in a flight safety program; to devise a tentative system for classifying and utilizing near-accident incidents." Some 1,700 reports were collected via the Group Orientation Method and a classification system developed based on aircraft type, aircrew job, and flight phase involved. The effectiveness or ineffectiveness of the behavior evoked was analyzed and categories of corrective and unsafe actions derived.

 Haley, J.A. "PILOT'S ABILITY TO ACTUATE F9F-6 EJECTION SEAT CONTROLS UNDER FLUCTUATING G CONDITIONS"; LETTER CONCERNING. TED ADC AE 6303.1, BUAER LTR AER AE 631/56 of 19 Apr 1954, NAIC LTR MA 4 Serial 10467 of 3 Nov 1953, Ref. MA 4 9393, Sept. 1954, 5pp. USN Air Development Center, Johnsville, Penn.

508
 To determine the time a pilot requires to actuate the ejection seat controls of an F9F-6 under emergency conditions, the ejection system was installed in the gondola of a centrifuge. Navy pilots were tested while being subjected to fluctuating accelerations (from 1.5 to 7.0 positive g at rate of 8.0 g per second) for the time required to eject when dressed in full flight gear and in minimal flight clothing. In addition, motion picture coverage of subjects was made. The data were analyzed and recommendations for ways to decrease time requirements are made.

 Ullett, G.A. & Gleser, G. PSYCHIATRIC SCREENING OF FLYING PERSONNEL: THE DEVELOPMENT OF EMPIRICAL SCALES FOR THE PREDICTION OF ANXIETY-PRONENESS FROM THE EEG AND REACTION TO INTERMITTENT PHOTIC STIMULATION. Proj. 21 0202 0007, Rep. 4, June 1953, 10pp. USAF School of Aviation Medicine, Randolph Field, Tex. (School of Medicine, Washington University, St. Louis, Mo.)

This is a supplement to a previous report which developed an experimental procedure for predicting anxiety-proneness by means of measures based on EEG responses to photic stimulation (flicker). The previous report was based on comparison of criterion groups with reference to specific measures based on the EEG response. The present report develops 3 empirical scales, based on the same data, for quantitative scoring of individual performance. The 3 scales are based on a) the basic EEG record taken with eyes closed and subject relaxed; b) the EEG response to photic stimulation over flicker frequencies ranging from 2 to 30 flashes per sec; and c) subjective sensations induced by the flickering lights. For the first scale (basic EEG) a cutting score of 2 or greater results in selection of 13.7% of non-anxiety-prone and 51.1% of anxiety-prone normal subjects and 48.3% of anxious patients. The second scale (EEG response to flicker), with a cutting score of 1 or greater, selects 35.6% of non-anxiety-prone and 63.3% of anxiety-prone normal Ss and 72.4% of anxious patients. The third (subjective sensation) scale, with a cutting score of 2 or greater, selects 16.4% of non-anxiety-prone and 40.6% of anxiety-prone normal Ss and 48.3% of the anxious patients. When used in combination, with a cutting score of 4 or greater on the combined scale, this procedure selects only 11% of non-anxiety-prone and 59.4% of anxiety-prone normal Ss and 65.5% of anxious patients. Cross-validation of these scales on a new population is in progress and will be reported in a later project report of this series.

Kurke, R.L., & Stephens, J.A. SYSTEMS EVALUATION OF THE TANK. 76mm GUN. NIAI. Tech. Memo. 157, Jan. 1957, 57pp. Human Engineering Laboratory, Aberdeen Proving Ground, Md.

To perform a human factors evaluation of the 76 millimeter Gun Tank, NIAI and to develop a methodology and technique for evaluating Ordnance equipment from a human engineering point of view, the present study was performed. A frequency index of operational use derived from service school data was used in performing a job segment analysis. This was used in conjunction with a detailed study of user crews operating a combat loaded tank. Observations (and recommendations for some items) are reported on: size of crew; visual field and optical aids; working areas--access and egress; seating; hatches and hatchlocks; fire control, displays, and equipment; driver controls and displays; communications; noise levels; clothing; crew interactions. Optimum specifications are provided where possible.

Banan, A., & McFarland, R.A. THE PHYSIQUE OF BUS AND TRUCK DRIVERS: WITH A REVIEW OF OCCUPATIONAL ANTHROPOLOGY. AMER. J. PHYS. ANTHROP. 1955, 13 (4), 711-742.

518

This report presents a review of the literature on occupational anthropometry and the results of an anthropometric study of 375 professional drivers of heavy vehicles. The drivers included 103 bus and 104 truck drivers from New England and New York, 65 Texas truckmen and 103 champion truckmen representing every state. Average age was 36.8 years with ten years of professional experience. Classical anthropometry (including grip strength and endurance tests) and somatotyping were employed. The data were compared with measurements taken on various populations representing the "general population." The significance of the findings and their implications for the fields of medicine, engineering, psychology and vocational placement are discussed. T. R 98

Wilson, C.L., Salstrom, V.K., Mackie, R.R., & Bushner, D.W. THE RELATIONSHIP BETWEEN AIRCRAFT MAINTENANCE AND FLYING SAFETY: I. A CRITERION OF MAINTENANCE ADEQUACY. REPORT Memo. Rep. 32, Feb. 1953, 63pp. Human Factors Operations Research Laboratory, ARDC, Bolling AFB, Washington, D.C.

520

The use of measures such as accident, abort and in-commission rate to evaluate the quality of aircraft maintenance was investigated. A systematic method for randomly sampling aircraft parts to be inspected according to a pre-set check list is described and experience in its use is related. Deficiencies and possible sources of error in the system are pointed out and steps toward their elimination considered.

Spieth, W. ANNOYANCE THRESHOLD JUDGMENTS OF BANDS OF NOISE. J. acoust. Soc. Amer., 1956, 28 (5), 872-877. AFRC TR 55-6. Operational Applications Laboratory, AFRC, Bolling AFB, Washington, D.C.

521

The annoyance thresholds for 13 bands of noise from 50-13,000 cps were determined on 21 listeners. The subject was exposed to the noise over a loudspeaker in an anechoic chamber for a period of 3 minutes, while he set the noise to a level which, if any higher, would annoy him if it were present while he was working. A further group of 162 subjects made only one annoyance judgment each. The relation of the annoyance threshold to the center frequency of the noise and to the attitude and previous work experience of the subject is described.

Groth, Hilde, & Lyman, J. AN EXPERIMENTAL ASSESSMENT OF AMPUTEE PERFORMANCE WITH VOLUNTARY OPENING AND VOLUNTARY CLOSING TERMINAL DEVICES. Rep. 57-12, Special Tech. Rep. 23, Feb. 1957, 25pp. Department of Engineering, University of California, Los Angeles.

522

It evaluates the mode of control of prosthetic devices (Voluntary Opening, VO, and Voluntary Closing, VC), 17 amputees familiar with both types of control were tested. Simple performance tests requiring grasping and moving light objects were employed with performance time as the criterion measure in one series and prehension force in a second series. These data were analyzed for significance of differences among the various treatment conditions with non-parametric Signed Rank Test for Paired Observations. Supplementary information was obtained by means of a questionnaire or tape-recorded interview. The results are related to design improvement of such terminal devices.

Pollack, I. IDENTIFICATION AND DISCRIMINATION OF COMPONENTS OF ELEMENTARY AUDITORY DISPLAYS. J. acoust. Soc. Amer., 1956, 28 (5), 906-909. AFRC-14-55-5. Operational Applications Laboratory, AFRC, Bolling AFB, Washington, D.C.

528

The ability of a listener to identify the loudness of a single 1000 cps tone taken from an ensemble of ten loudnesses is compared to his ability to discriminate between a standard and a variable loudness when the loudness of the standard varies over the same range as the single tone. The range of loudness in a single ensemble was divided into ten equal parts of 0.8 db, summing to a total range of 0-72 db. Six subjects identified the loudness of each of a series of 100 signals, or discriminated the difference between 100 standard and variable signals, or both identified the standard and discriminated the difference of the variable. The accuracy of identification is compared to the accuracy of discrimination in terms of the information transmitted as a function of the size of the scale interval. T. G.

Long, E.R. & Reid, S.L. FACTORS DETERMINING THE LEGIBILITY OF LETTERS AND WORDS PRINTED IN "DOT" PATTERNS WITH PURE BLACK AND WHITE WHEN THE PATTERNS ARE DEGRADED IN VARYING AMOUNTS. THE FIRST OF A SERIES OF REPORTS ON THE "INFOMAX" PRINCIPLE. Contract W33 (038) AC 21269, USAF TR 5922, April 1952, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Virginia, Charlottesville, Va.).

544

To explore some of the factors determining legibility of letter and word patterns formed by elements of "dots" such as would appear when transmitted by a pulse-activated elemental printer, 4 subjects made recognition judgments of stimulus patterns (single letters of alphabet, black on white). Other variables were: number and size of elements in letter, types and degrees of degradation, and viewing brightnesses. The data are evaluated by analysis of variance with attention given to the manner and degree of legibility as affected by all variables. (See also accession numbers 545 and 197)
T. G. I. R. 1

545

Long, E.R. & Reid, L.S. FACTORS DETERMINING THE LEGIBILITY OF LETTERS AND WORDS PRINTED IN "DOT" PATTERNS WITH DIFFERENTIAL BRIGHTNESS OF THE PATTERNS PROPORTIONAL TO THE AMOUNT OF DEGRADATION. THE SECOND OF A SERIES OF REPORTS ON THE "INFOMAX" PRINCIPLE. Contract W 33(038) AC 21269, RD 694 37, AF TR 5923, April 1952, 25pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Virginia, Charlottesville, Va.).

545

To explore some factors determining legibility of letters and words formed by elements of "dots" (see accession numbers 544 and 197), stimulus patterns of single letters of the alphabet were prepared in a "gray scale" (signal and noise elements of brightnesses proportional to their respective intensities). Four subjects made recognition judgments. Other variables included number of elements in letter, type and degree of degradation. Data are evaluated by analysis of variance with attention given to the manner and degree of legibility as affected by all variables.

Northrop, D.S. EFFECTS ON LEARNING OF THE PROMINENCE OF ORGANIZATIONAL OUTLINES IN INSTRUCTIONAL FILMS. Contract NSGMR 269, Human Engng. Rep. SDC 269 7 33, Oct. 1952, 24pp. USN Special Devices Center, Port Washington, N.Y.

546

To investigate the effects on learning of adding organizational titles and commentary at appropriate points in existing instructional films, three types of films were selected: "discrete items" (relatively unorganized); "logically developed" (content dictates the organization); and "chronologically developed" (dramatic or story organization). Three versions of each film were developed with different amounts of added titles and commentary and each version was viewed by two companies of Naval recruits. Informational tests were then administered to these recruits plus control groups who did not view the films. An analysis of covariance was made for each film type. The differential effects of intelligence were also studied since intelligence test scores were available. I.

547

Mercer, J. THE RELATIONSHIP OF OPTICAL EFFECTS AND FILM LITERACY TO LEARNING FROM INSTRUCTIONAL FILMS. Contract NSGMR 269, Rep. SDC 269 7 34, Nov. 1952, 19pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

547

As part of a study on learning from films, the use of optical effects (fades, wipes and dissolves), and of "film literacy" (the recognition of these effects) were investigated. Air Force recruits in training saw "Hunting Animals in the Past" with or without a preliminary 20-minute lecture on the optical effects. Naval trainees saw "Oxygen Breathing Apparatus" with and without the lecture. Multiple-choice tests on the material of the film literacy lectures and the films were measures of learning. Discussion included recommendations related to economical production of training films. I.

Brown, R.H. THE VISUAL DISCRIMINATION OF VELOCITY AS A FUNCTION OF THE RATE OF MOVEMENT AND OTHER FACTORS. NRL Prob. Y04 01, RDB Proj. NR 513 050, NRL Rep. 4299, Jan. 1954, 10pp. Naval Research Lab., (Psychol. Branch, Radio Div. III), Washington, D.C.

As part of a program of basic research on tracking, experiments to determine systematically how man discriminates velocity and acceleration were conducted. The method used involves the simplest discrimination man can make to visual movement. The observer, presented with a spot traveling at a controlled speed, reports its direction. The present report describes the results of an experiment in which eight observers made 120 discriminations when the spot was moving at each of ten speeds. Analysis of the results yields the following conclusions: a) within limits, as the speed with which an object travels increases, the frequency with which man discriminates its direction also increases. This frequency-of-discrimination function may be described as a logarithmic normal probability integral of the rate of movement, and the mean and standard deviation may be taken as representative of the function for a given observer. b) secondary and essentially irrelevant factors in the experimental situation do not affect the discrimination. c) man's sensitivity to differences in velocity improves with velocity at slow speeds. d) the results of this experiment provide for a fuller understanding of man's behavior in tracking. Pickett, J.M. EFFECTS OF VOCAL FORCE ON THE INTELLIGIBILITY OF SPEECH SOUNDS. J. acoust. Soc. Amer., 1956, 28 (5), 902-905. AFRC-TH-56-1. Operational Applications Laboratory, AFRC, Bolling AFB, Washington, D.C.

554

The effects of varying the amount of vocal force on the intelligibility of speech in noise was determined on 6 listeners. Five talkers read lists of phonetically balanced words at loudness levels which produced SPLs of 36 to 90 db one meter from their lips. The speech was electronically mixed with white noise and played to the listeners at signal-to-noise ratios of -6, 0, and +6db. The relation of the level of vocal force to the intelligibility of the speech is described to evaluate the effects of shouting to overcome a noisy environment. T. G. R. 8

555 French, R.S., Crowder, M.A., & Tucker, J.A., Jr. THE K-SYSTEM MAC-1 TROUBLE-SHOOTING TRAINER: II. EFFECTIVENESS IN AN EXPERIMENTAL TRAINING COURSE. Proj. 7709, Tasks 77152 & 37301, Development Rep. AFTRC TN 56 120, Oct. 1956, 41pp. Maintenance Lab., AFTRC, Lowry AFB, Colo.

This report describes an experimental training program which was conducted to evaluate the K-System MAC-1 Trainer and to investigate the feasibility of teaching systematic trouble shooting to apprentice mechanics of average aptitude. The evaluation of the Trainer and the investigation into the feasibility of trouble-shooting training were both accomplished in an experimental arrangement comparing the effectiveness of trouble-shooting training conducted on the Trainer as against the equipment itself. Proficiency measures were taken before, during, and at the end of the training to assess the effect of the special training and to determine the strengths and limitations of the MAC-1 Trainer. The long-range effects of the special training were assessed through proficiency measures obtained on the trainees six months after their assignment to either of two Strategic Air Command bases. Since the Trainer or in question was not designed as an alternative to some other device or method, the conventional interpretation of the results where Method A is compared with Method B is not appropriate. The approach taken here was to "stack the cards" against the Trainer, i.e., to use it at the limits of its capability so that its limitations were made obvious. It was reasoned that if the Trainer proved effective when used as a substitute for the equipment, it almost certainly could be recommended as a supplement for classroom training. The results of the study support the conclusion that the MAC-1 Trainer, possibly with some modifications, could be used effectively in the classroom as a supplement to the equipment either in formal training courses or for GUT. The study further demonstrates that appropriate mechanics can learn systematic trouble-shooting procedures based on a logical analysis of the data flow of the system. R. 8

556

Murtz, A.K., Walter, Jeanette S. & Brenner, H. THE EFFECTS OF INSERTED QUESTIONS AND STATEMENTS ON FILM LEARNING. (RAPID MASS LEARNING). Contract N60NR 269, Proj. Nr 781 005, SDC TR 2697 16, Sept. 1950, 15pp. USN Special Devices Center, Fort Washington, N.Y.

556

Three different ways of enhancing learning from actual films are tested in this experiment. Audience participation in the form of answering multiple choice questions inserted into the film (with answers following), and repetition of the film immediately, or of main points by special titles were methods used with tenth grade students as Ss. The films were on the care and use of hand tools, and on snakes. The analysis of results on tests of content of the films was made by sex and intelligence, as well as experimental group. T.

Stewart, J.L. BASE-CLIPPED SPEECH COMMUNICATIONS. Contract DA-36-039 ac-63803, Proj. 2282, Tech. Rep. 87, Dec. 1955, 20pp. Engineering Research Institute, University of Michigan.

560
The concepts of pre-emphasized and infinitely clipped speech are extended to suggest certain pulse communication systems. Methods of reducing the pulse rate to be transmitted are discussed. Speculations of scientific interest are made of the possibility of further reducing pulse rate and for increasing the fidelity of clipped speech at the receiving end of the system. Practical base-clipping circuits are described with particular attention given to a system utilizing a triggered free-running multi-vibrator. The construction of a microphone that directly realizes pulsed speech is discussed.

Lundervold, A. ELECTRO-MYOGRAPHY AS A TEST FOR PILOT ASPIRANTS. *J. Aviat. Med.*, 1950, 21, 147-150. (Institute of Aviation Med., Oslo, Norway.)

To determine the usefulness of the electro-myogram as a screening device for Pilot Aspirants, 31 normals and 15 neurasthenics were examined with electro-myography. In 6 of the normal persons and in 10 of the others, it was possible to register insertion activity in some of the muscles, when the persons were sitting. These were classified as Group A, the remainder as Group B. Persons from Group A used on the average more muscles, and each muscle was used in a more uneconomical way, as the contractions were longer and more violent. This was found during a tapping operation, and on the average, an even greater difference between the 2 groups was registered when outside conditions were changed, i.e. lowered temperature, increased noise, poor lighting, and also after fatigue experiments. The timing of the reaction muscles shows the same grouping. On the average, members of Group A had a shorter reaction time than those of Group B. It was concluded that the members of each group were fitted for different types of work.

568

Lundervold, A. OCCUPATION MYALGIA. ELECTROMYOGRAPHIC INVESTIGATIONS. *Acta psychiat. neurol. Scand.*, 1951, 26, 359-369. (Neurological Clinic, University of Oslo, Oslo, Norway).

568

Persons suffering from occupation myalgia (46 female, 17 male) and 47 healthy Ss were examined electromyographically during typewriting. The muscle reaction to needle-electrode insertion was recorded prior to the experiment. Muscle action potential records were obtained during task activity, at rest, under nonoptimal environmental conditions, e.g., temperature, noise, and under various psychic influences. These were compared for healthy and diseased Ss. The susceptibility of persons to this disease was discussed in terms of constitutional factors. Some means of effective treatment for muscular hyperfunction were examined.

Lundervold, A. ELECTROMYOGRAPHIC INVESTIGATIONS DURING SEDENTARY WORK, ESPECIALLY TYPEWRITING. *Brit. J. Phys. Med.*, Feb. 1951, 1-5. (Neurological Clinic, University of Oslo, Oslo, Norway).

569

To investigate the effect of sitting position and manner of work upon muscle activity during typewriting, action potentials were recorded from the dorsal muscles of 47 Ss. The time at which continuous muscle activity began and stopped was recorded with relation to the form and location of the back-support, the height of the table, and the position and nature of the typewriter. Recommendations, designed to minimize expenditure of energy during typewriting, were made concerning the construction and placement of office furniture and the proper use of equipment.

Lundervold, A. AN ELECTROMYOGRAPHIC INVESTIGATION OF TENSE AND RELAXED SUBJECTS. *J. nerv. ment. Dis.*, June 1952, 115 (6), 512-525. (Neurological Clinic, University of Oslo, Oslo, Norway).

571

To investigate muscular activity during typewriting, EMG were taken over a three-year period from 110 Ss classified as "tense" or "relaxed" on the basis of their muscular activity under resting conditions. Action potentials were recorded from the muscles of the upper extremities, shoulders, back and thorax during typewriting with one or more fingers. The effect of noises and the influence of cold on action potentials during typewriting was examined. The significance of psychic factors was discussed.

Imus, H. A., & Bell, M. E. THE CHARACTERISTICS OF TRITANOPIA. Tech. Rep. ONRL-1-52, Jan. 1952, 1p. ONR, American Embassy, London.

574

This note concerns the discovery and testing of 24 subjects having a rare form of partial color blindness, tritanopia. A color confusion test chart accompanied by a short explanatory article on color blindness was published in an illustrated English weekly paper of wide circulation and from the many correspondents writing in, these cases were found. Results of the examinations will be given at a later date.

Imus, H.A., & Aspinall, S.R. THE STATE OF ACCOMMODATION OF THE HUMAN EYE IN DARKNESS. Tech. Rep. ONRL-9-52, Jan. 1952, 1p. ONR, American Embassy, London.

577

To determine the state of accommodation of the human eye to darkness, photographs were taken of optoptric images reflected from the anterior surfaces of the human lens while the subject was exercising zero to six diopters of accommodation. Photographs were then taken during the course of dark adaptation and also after administration of homotropine. The size of the image per diopter of accommodation is the measure for the accommodation in force. Discussion is in terms of accommodation and night myopia.

578

Imus, H.A. DIALS AND INDICATORS. Tech. Rep. ONRL 36 52, April 1952, 4pp. Office of Naval Research, American Embassy, London, England.

578

This report gives brief summaries of a series of studies on the human engineering factors in the design and use of dials and gauges. Factors affecting the speed and accuracy of check reading instrument panels investigated were: 1) dial shape; 2) pointer alignment position; 3) dial size and reading distance; and 4) expected movement relation between the indicator and its control. A handbook on design of dials and indicators has been written based on these and related research studies.

 Lewis, H.A. THE INFLUENCE OF "ADAPTINGOL" AND VITAMIN A ON NIGHT VISION. Tech. Rep. ONRL-73-52. ONR, American Embassy, London. July 1952, 3pp.

582
 This report summarizes a study of the influence of "Adaptingol" (trade name for a solution in oil of the dipalmitin acid ester of xanthophyll) and Vitamin A on night vision. Adaptonometer measurements of night vision capacity of three groups of 25 men (19-22 years of age), given respectively "Adaptingol", Vitamin A, and salad oil, were made over a period of several weeks. Determinations of Vitamin A and carotene concentrations in the blood before and for three weeks following the period of dosage are compared with Adaptonometer results and discussed in terms of the effect on night vision.

 Headquarters, Continental Army Command. SERVICE TEST OF HOT WEATHER UNIFORMS. Proj. Nr 2645, DA Proj. Nr 7-79-07-001, Dec. 1955, 43pp. COMARC, Fort Benning, Ga.

583
 To determine and compare the suitability of four hot-weather uniforms (Army), service tests were conducted at several stations. The tests covered: physical characteristics, sitting, laundering, durability, cold night protection, compatibility with load-carrying equipment, camouflage, airborne use, hot-dry use, summer-temperature use, hot-wet use, military characteristics, and general use. A further test of the chemical protective characteristics of the test items was made. Test results were summarized and observed deficiencies listed as either major or minor. Suggested modifications are described.

584
 This manual brings together the knowledge which has been gained through studies of operational emergencies and tests on escape of personnel from aircraft following simulated landing emergencies. Principal supporting data were developed through a time and motion analysis of film records of the escape trials on the C-124 and C-54 military aircraft. Additional data were obtained from tests on civil air carrier aircraft. The several sections of the manual contain material on crew training for this type of emergency, recommended procedures, evacuation devices and equipment, evaluation of emergency exit provisions (for ground escape) and supporting data.

 Bullock, D.H., Meyer, Susan R., & Braley, L.S. ASPECTS OF SIMULTANEOUS AUDIO-VISUAL MONITORING. Contract AF 30(602)-574, Scientific Rep. 3, Nov. 1954, 62pp. Department of Psychology, University of Buffalo.

599
 To investigate some aspects of simultaneous audio-visual monitoring of channels containing independent information, a series of experiments were conducted. Messages were presented in the form of pairs of equal-unit sequences (dot-dash or single dot within a matrix) and subjects were required to (1) discriminate message sequences as same or different by pressing the appropriate button, or (2) locate the position of the "different" response. Proficiency was measured as percent correct discriminations, percent errors, and losses (non-simultaneous minus simultaneous proficiency). The various experiments dealt with interactions arising under simultaneous monitoring, effects of audio message complexity and rate upon visual monitoring, and effect of visual monitoring on audio monitoring.

601 Graham, C.H. ACCIDENT SUSCEPTIBILITY AMONG COAL MINERS AND ITS PSYCHOLOGICAL CORRELATES. Tech. Rep. ONRL 130 52, Nov. 1952, 6pp. ONR, American Embassy, London.

A study of accident susceptibility was made by J.W. Whitfield, (now of University College, London) at a colliery employing about 2000 men. The accident classification used by Whitfield has been modified to become a current Non-Fatal Accident Return Under Coal Mines Act (Ministry of Fuel and Power M.D., Return 39). Indices of accident risk were established to provide an average expectation of accident for an individual. A given individual's actual accident history could be compared with this figure. Statistical analysis of the data indicates that more multi-accident individuals exist than would be expected on the assumption of equal liability. Neither age nor family relationship seems to provide a simple correlation with accident susceptibility. A detailed analysis of some psychological correlates of accident susceptibility indicate that young accident prone men probably tend to show defective performance on tests of a perceptual and cognitive nature. Older accident prone men, on the other hand, may tend to show defective performance in tests of motor coordination. R.2

Freedman, A., Huntington, E.C., Davis, G.C., Magee, R.B., et. al. FOOT DIMENSIONS OF SOLDIERS. Proj. T 13, 500 Proj. 611, Third Partial Rep., March 1946, 146pp. USA Medical Research Lab., Fort Knox, Ky.

605

This study measured the shape and dimension characteristics of men's feet and provided base line factual information for the design of footgear in terms of age, height, weight; anatomical description of foot; dimension and shape characteristics--length, toe region, metatarsal region, instep region, heel and ankle region; and differences between right and left feet. The data from 5,575 white and 1,200 Negro Ss were shown to be readily applicable to the alteration of the flare characteristics, toe curve, toe and ball height, and heel curve of present lasts. Comparisons between Negro and white measurements were noted. Further examination of the data was indicated for more complete recommendations in last pattern. T. G. I.

French, J.W. THE USE OF PERFORMANCE TEST IN CLASS "A" NAVAL TRAINING SCHOOLS (RADIO). NAVPERS 18078, Jan. 1948, 24pp. USN Training Research Div., Bureau of Naval Personnel, Washington, D.C. & College Entrance Examination Board, Educational Testing Service, Princeton, N.J.

This report is concerned with the development and use of performance measures for radio schools in the USN. 2 types of final tests for radionan trainees were developed: a) radio code receiving tests, and b) tests of performance on the use of radio equipment. Four forms of a message test in code were developed. Each form of the test contained a total of 432 characters divided into two messages. One message in each form was made up of ten complete alphabets distributed at random in five-letter groups, with a heading in standard form. The other message was made up of eight sets of digits distributed at random in five-digit numbers, and a similar heading. Each of the headings contained one complete alphabet and two sets of digits. 4 plain language tests were developed; each consisting of 100 words of an average length of 5 letters per word. These tests are of approximately equal difficulty and satisfactory reliability. These 4 plus 4 similar forms of plain language tests were used as the final forms. Studies of relationship between six classification and selection tests of the Navy Basic Test Battery and six measures of achievement in radio school were made. These studies indicate that the Radio Aptitude Test of the Basic Test Battery is the best predictor of the receiving tests, but the relationship is low. The Arithmetical Reasoning Test and the General Classification Test were found to be the best predictors for achievement as measured by the Final Achievement Examination. Examinations prepared by the Bureau of Naval Personnel.

Weitz, J. & Fair, K.L. A SURVEY OF STUDIES OF RHYTHM. Contract No. AF 33(038) 10413, Proj. No. 21 09 004, Res. Bull. 51 4, March 1951, 33pp. HRAC, Air Training Command, Lackland AFB, San Antonio, Tex. (Carnegie Institute of Technology, Pittsburgh, Penn.).

The present report is one part of an investigation of rhythmic performance carried out under Contract AF 33(038) 10413. It represents an attempt to bring up to date information about studies on rhythm and rhythmic ability and to fit these into a reasonable framework. Research studies are summarized under the following headings: Perceptual Studies of Rhythm; Studies of Accenting and Grouping; Rhythm Preferences, Time Estimation, Studies of Rhythm Involving Motor Performance, and Basis of Rhythm. Investigations falling in each of these categories are described briefly and cross-referenced to a bibliography of 339 titles. This work serves as background for a number of types of investigations of rhythm. Particularly, it will be of service in designing studies on the influence of rhythm on various kinds of motor performance, and on the identification and measurement of one or more rhythmic abilities. It is planned to explore these latter questions, and the relation to military problems of personnel classification and the training of motor skills.

619 Zechert, Virginia. JOINT CONVERSION TABLES FOR AIR FORCE APTITUDE INDICES AND ARMY APTITUDE AREAS. Proj. 21 02 34, Res. Bull. 51 5, March 1951, 32pp. USAF Human Resources Research Command, Lackland AFB, San Antonio, Tex.

The purpose of this study was to compare the standard scores of the Army aptitude areas and the related Air Force aptitude indices. Based on a stratified sample of 117 basic airman, tested at Lackland Air Force Base January-April 1950, two sets of equi-percentile conversion tables were prepared: a) Comparison of Air Force aptitude indices with the following related Army aptitude areas: Mechanical Aptitude Index with Aptitude Areas II, VI, VII, VIII, IX, and X; Clerical Aptitude Index with Aptitude Area IV; Equipment Operator Aptitude Index with Aptitude Areas VII and VIII; Radio Operator Aptitude Index with Aptitude Areas IV, V, and IX; Technician Specialty Aptitude Index with Aptitude Areas I, II, III, and IV; Services Aptitude Index with Aptitude Areas I, III, and VII; Craftsman Aptitude Index with Aptitude Areas II, III, VI, and VII; Electronics Technician Aptitude Index with the following related Air Force aptitude areas: Aptitude Area I with Technician Specialty and Services Aptitude Indices; Aptitude Area II with Mechanical, Technician Specialty, Craftsman, and Electronics Technician Aptitude Indices; Aptitude Area III with Technician Specialty, Services and Craftsman Aptitude Indices; Aptitude Area IV with Clerical, Radio Operator, and Technician Specialty Aptitude Indices; Aptitude Area V with Radio Operator Aptitude Index; Aptitude Area VI with Mechanical and Craftsman Aptitude Indices; Aptitude Area VII with Mechanical, Equipment Operator, Services, and Craftsman Aptitude Indices; Aptitude Area VIII with Mechanical and Equipment Operator Aptitude Indices; Aptitude Area IX with Mechanical, Radio Operator, and Electronics Technician Aptitude Indices; Aptitude Area X with Mechanical and Electronics Technician Aptitude Indices.

622 McClure, G. E., Tupes, E.C., & Dalley, J.T. RESEARCH ON CRITERIA OF OFFICER EFFECTIVENESS. Proj. No. 21 03 027, Res. Bull. 51 8, May 1951, 38pp. HRAC, Air Training Command, Lackland AFB, San Antonio, Texas.

The research on measurement of officer qualities reported in this bulletin represents logical expansion of work begun earlier and reported in Air Training Command Human Resources Research Center Research Bulletin 47 1(2). When the USAF decided to retain graduates of Officer Candidate School in the indoctrination division for a six-month on-the-job training tour immediately after commissioning, it became operationally possible to administer motivation and personality measures experimentally to samples that could not only be followed through Officer Candidate School but could also be evaluated for actual on-the-job officer proficiency. This report is a resume of criterion research within the Officer Candidate School structure, and the development of an on-the-job measure of officer performance for use as a criterion of officer quality. This study indicates that: a) officer quality can be rated with sufficient reliability to warrant use of such ratings as a criterion for evaluation of predictive devices; b) the reliability of on-the-job ratings of officers varies directly with the amount of prior briefing of raters as to what qualities to observe and with the amount of guidance each rater receives at the time of the rating; c) the three most important proficiency traits of newly commissioned lieutenants seem to be executive ability, conscientiousness, and cooperativeness; and d) ratings by peers (Buddy Ratings) during Officer Candidate School training have a higher positive relationship with later on-the-job performance ratings than do academic and military grades.

620 Swanson, R.A. A SURVEY OF RESEARCH PROBLEMS IN THE UTILIZATION OF MOBILE TRAINING UNITS. Proj. 21 07 026, Res. Bull. 51 6, April 1951, 10pp. USAF Technical Training Research Lab., Chanute AFB, Ill.

This summary report deals with the functioning of mobile training units in Air Force transitional aircraft mechanic training. The major purpose of these units is to go to wherever bases need special training for the maintenance of new aircraft models. To improve effectiveness of these units, two investigators, working independently, held interviews with a great variety of people who have a connection with the units' training at nine Air Force bases. Results of the survey pertaining to administrative problems affecting the use of the units are given, and detailed proposals for research into the specific training methods utilized are made.

621 Hagin, W.V. THE INFLUENCE OF TYPE OF INSTRUCTIONS ON THE PERFORMANCE OF A PERCEPTUAL-MOTOR TASK. Proj. 21 09 004, Res. Bull. 51 7, May 1951, 29pp. USAF Perceptual and Motor Skills Research Lab., Lackland AFB, Tex.

621 To investigate the influence of the media through which set is established by instructions upon a complex motor task, the SAM Complex Coordination Test was administered with standard time limits, under three different conditions of instruction to three groups of basic airmen. Group I (236 subjects) read the instructions from a typed card and were shown a demonstration with no oral explanation. Group II (194 subjects) were given oral instructions accompanied by demonstration. Group III (261 subjects) were given the standard instructions. Additional tests were given: 13 paper-and-pencil tests and five psychomotor tests. Inter-correlations were obtained between scores on these measures and scores on the coordination test. The data were analyzed for differences that could be attributed to instructions. T. R 4

624 Bilodeau, E.A. & Morin, R.E. RATE AND EXTENT OF IMPROVEMENT IN PERFORMANCE ON THE PEDESTAL SIGHT MANIPULATION TEST. Proj. 21 09 009, Res. Bull. 51 10, May 1951, 21pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

624 The main purpose of this experiment was to determine the rate and extent of improvement of performance on the Pedestal Sight Manipulation Test with practice. Twelve airmen practiced for about 40 min. a day including rests for 19 days. As a secondary experiment, on the next to last day, triggering was omitted, and on the last, the pipper was removed from the sighting reticle. Scoring included time in target area in azimuth, elevation, range, and combinations of these. Relations among scores, effects of practice by days and blocks of trials, and effects of secondary changes are reported.

Bilodeau, E.A. MODIFICATIONS OF DIRECTION OF MOVEMENT PREFERENCE WITH INDEPENDENT VARIATION OF TWO STIMULUS DIMENSIONS. Proj. No. 21 03 004, Res. Bull. 5: 12, June 1951, 7pp. NRRC, Air Training Command, Lackland AFB, San Antonio, Texas.

The present study was designed to yield information concerning the relative influence of two different stimulus dimensions upon verbally expressed preferences for directions of indicator movement. In a relatively simple situation, the attempt was made to measure the effects of systematic variations in these stimulus dimensions on the movement preferences of a sample of basic airmen. The equipment employed included a vertical bank of 41 lamps, which represented the indicator element, and a control lever limiting movement to the forward-backward directions. The influence on preferences for "up" and "down" movements of the indicator lights was measured for the variables: a) locus of a single lighted lamp, including the condition of no lamp lighted, and b) spatial orientation of the control lever within the forward-backward dimensions. The results indicate pronounced effects of each of these variables upon the expressed preferences for indicator movement. These results appear to have implications for at least two important problems. First, in the area of equipment construction, they indicate the necessity for basing design principles upon preference measurements which are taken throughout a wide range of variation in display and control characteristics. For example, the results show that preferences obtained from a given control position are completely reversed when the indicator light is at the lower end of the scale from what they are when the indicator is at the upper end of the scale. Second, with respect to individual differences, the results indicate that the relationship between preferences and a) susceptibility to interference, b) acquisition, and c) extinction might be profitably investigated.

Brown, C.W. & Ghiselli, F.E. INVESTIGATION OF BOMBING GROUND TRAINER (A-6) UTILIZATION IN THE USAF BOMBARDMENT SCHOOL: AN EVALUATION OF THE EFFECTIVENESS OF UTILIZATION OF THE A-6 GROUND TRAINER. Contract AF 33(038) 12776, Proj. 21 06 006, July 1951, 45pp. USAF Aircraft Observer Training Research Lab., Mather AFB, Calif. (Ames Institute of Research, Moffett Field, Calif.).

627

The over-all purpose of this investigation is to evaluate the effectiveness of the A-6 trainer in the USAF Bombardment School program, to make recommendations for increasing its effectiveness, and to suggest research on relevant factors. This report includes data from school records, experiments, suggestions from instructors and students, and professional judgment of research people pertinent to: reliability of scores used both in the trainer and in the air, effect of practice on level and variability of student performance in trainer, retention of skill in trainer over varying periods of time, and relation of performance on trainer to performance in visual bombing.

T.

630 Murray, N.L. ANALYSIS OF THE NAVIGATOR-BOMBARDIER JOB AND IDENTIFICATION OF FACTORS CONTRIBUTING TO SUCCESSFUL PERFORMANCE. Proj. 506 005 0001, Res. Bull. 51 20, Oct. 1951, 94pp. NRRC, Air Training Command, Lackland AFB, San Antonio, Texas.

This study was designed to analyze the job of navigator-bombardier and to identify factors that contribute to successful performance. The unique and complex character of the job make it impossible to employ the standard and sometimes rigid techniques used in job analysis. Thus, aside from the job description that has resulted, it is believed that the techniques evolved are important in the analysis of aircrew positions. A job description embodying a job summary, the work performed, worker characteristics, job characteristics, and factors contributing to successful performance are given. It is concluded that: a) the requirements for the job vary from aircraft to aircraft and that analyses of the job for each type aircraft will have to be undertaken in an attempt to discover the basic or common elements of the job; and b) training, based on these findings, must be instituted to impart the basic knowledge and skills, and special training must be given for the different types of cockpits. It is recommended that: a) the results of this project be extended to include a) methods not included in the final report and any new methods as they become standardized; b) the results be further verified with emphasis on a more representative sample; c) analyses of the job as performed in the various type aircraft be undertaken; d) differences in requirements for different type cockpits be studied to determine whether the differences are significant; e) the feasibility of designing a basic course based on the analyses in (c) should be investigated; and f) some measure of maintenance of proficiency be developed to: a) determine whether trialed observers on VLR type aircraft can be efficiently utilized, and b) determine whether present utilization of 1037's on VLR type aircraft is efficient in view of the logistic problems involved.

Hovgaard, P.E. BIOMECHANICS - A NEW APPROACH TO AIRPLANE SAFETY. Mech. Engrg., Sept. 1944, 613-614. (Curtis Wright Corporation, Buffalo, N.Y.).

633

This note presents a brief summary of a paper concerned with the approach to aircraft safety that is concerned with the human factors and their limitations in relation to the design and construction of the airplane. Features that will compensate for the conditions rather than attempting to avoid them are recommended. Specific examples from crash injury research are cited.

Barch, A.M. WARM UP IN EPICYCLIC PURSUIT PERFORMANCE UNDER MASSED AND DISTRIBUTED PRACTICE CONDITIONS AS A FUNCTION OF THE NUMBER OF PRACTICE SESSIONS. Contract AF 33(038) 13214, Proj. 509 020 001, Feb. 1952, 7pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

636

To investigate the "warming-up" period in the practice of manual skills, the decrement in performance occurring on the Epicyclic Pursuit Rotor (keeping a stylus on a moving target) was studied. There were two different practice schedules both having rest periods at rather short intervals: massed practice (rests only between blocks of trials), and distributed practice (rests between each trial). There is a theoretical discussion of warm-up decrement in the light of these and other results.

Bilodeau, E.A. MASSING AND SPACING PHENOMENA AS A FUNCTION OF PROLONGED AND EXTENDED PRACTICE. Proj. 509 020 0002, Res. Bull. 52 9, Feb. 1952, 6pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

637

As part of a larger project on maintenance of proficiency in motor skills, the effects on performance of practicing a simple motor activity over periods of several days was studied. Fifty-two airmen turned a crank manually as fast as possible, either without rest for eight minutes, or for two four minute periods separated by a rest of four minutes. The results related rate of turning (the performance measure) to trial number within practice sessions, and to days, with respect to massing or spacing of practice.

Beverly, R.F. & Kausler, D.H. THE EFFECT OF PRACTICE ON CIRCULAR ERROR AND ITS COMPONENTS IN VISUAL BOMBING. Proj. 505 006 0005, Res. Bull. 52 10, Feb. 1952, 4pp. USAF Aircraft Observer Training Research Lab., Mather AFB, Calif.

638

This study evaluates the effect of bombing practice on the two independent components of circular error—range and deflection. The scores of three bombardier classes on their last 12 training missions were grouped into three four-mission sequences, and the mean range and deflection errors were computed as well as the mean circular errors. These results are presented for each class and are discussed regarding their implications for the effects of practice on visual bombing efficiency. Implications for training and for future research are also discussed.

Bahrack, H.F., Rankin, R.E. & Fitts, P.M. THE EFFECT OF MOTIVATION UPON PERIPHERAL PERCEPTION DURING THE PERFORMANCE OF A CENTRAL PSYCHOMOTOR TASK. Contract AF 33(038) 10528, Proj. 509 020 0004, Res. Bull. 52 14, April 1952, 7pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex. (Ohio State University, Columbus, Ohio).

639

The hypothesis that "...a condition of high motivation facilitates performance of a central task but...interferes with...peripheral tasks," was tested. One hundred college students performed a "central" manual tracking task concurrently with "peripheral" visual and manual tasks. They performed under conditions of high motivation (cash bonus) and low motivation (thinking they were merely practicing). Results included: time on target, time to perform peripheral tasks, and frequency of looking at peripheral stimuli. They were discussed regarding the effect of motivation on selectiveness of attention.

640

The effect of knowledge of results on tracking and ranging performance was studied using the SAM Pedestal Sight Manipulation Test (a tracking and ranging task). Sixty airmen were divided into five groups with varying degrees of knowledge of results during five days of testing. Time on target was recorded for various combinations of azimuth, elevation, and range. Discussion concerns the effects of knowledge of results during training.

Deese, J. & Lazarus, R.S. THE EFFECTS OF PSYCHOLOGICAL STRESS UPON PERCEPTUAL-MOTOR PERFORMANCE. Contract AF 33(038) 13253, Proj. 509 020 0003, Res. Bull. 52 19, June 1952, 14pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex. (Johns Hopkins University, Baltimore, Md.).

643

To investigate the effects of psychological stress on perceptual-motor performance, personality measurements were obtained on 280 USAF personnel who were tested on a rotary pursuit task. The control group was tested under ordinary nonthreatening instructions; the experimental groups were given ego-involving instructions and then placed under failure-stress at various points in the learning sequence. Results were analyzed to determine 1) the effect of stress induced by the testing procedure itself, 2) the effects of failure-stress introduced either early or late in learning, 3) the effect of failure-stress upon within-subject variability, and 4) the relationship between personality variables and performance under stress

645 Warren, C.E., Fontaine, A.B. & Clark, J.R. A TWO-DIMENSIONAL ELECTRONIC PURSUIT APPARATUS. Contract AF 33(038) 10528, Proj. 509 020 0004, Res. Bull. 52 16, Aug. 1952, 10pp. USAF Air Training Command, Lackland AFB, San Antonio, Texas. (Ohio State University, Columbus, Ohio).

The apparatus described represents a device whereby tracking performance in 2 dimensions can be assessed. An important feature in this development is that the apparatus can be altered to provide for presentation of both a following pursuit (as in flexible gunnery) or a compensatory pursuit (as in the use of the artificial horizon) task, and to provide variety in the type of motor responses required of the persons taking the test. Therefore, the apparatus makes possible a wider variety of experimentation than do pursuit tests previously for only a single type of presentation or response.

Leiman, J.M. & Hill, F.L., Jr. THE CORRECTION OF ERRORS OF PLOTTING IN A ROTATED FACTOR MATRIX. Proj. 503 001 0003, Res. Bull. 52 28, Aug. 1952, 13pp. USAF Personnel Research Lab., Lackland AFB, Tex.

646

This paper presents "a mathematical solution to the problem of corrected error introduced by the graphical rotations of factor matrices when these rotations do not amount to an orthogonal rotation in the aggregate and when an orthogonal solution to the rotation problem is sought." The method can be used whenever a series of rotations results in too great a departure from an aggregate orthogonal transformation. A relatively simple procedure for finding a single transformation matrix is presented.

Reynolds, B. THE EFFECT OF LEARNING ON THE PREDICTABILITY OF PSYCHOMOTOR PERFORMANCE. J. exp. Psychol., Sept. 1952, 44(3), 189-198. (USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.).

647

To study the effects of learning on the predictability of psychomotor performance, about 150 basic trainee airmen were trained for 6 one-hour periods on the Complex Coordination test, a psychomotor task. The mean scores for each period were inter-correlated and were also correlated with scores on 20 written tests selected from the Airman Classification Test Battery. In analysis, primary attention is given to the variations in the correlations as a function of amount of practice on the psychomotor task. There is also some discussion of the acquisition curve for the task.

Tolson, J. COMPARATIVE PHYSIOLOGICAL TOL-
ERANCE OF BRITISH AND U.S. FORT WEATHER CLOTHING.
Rep. 31, 1955, 15pp. Clothing and Equipment
Physiological Research Establishment, Direc-
torate of Physiological and Biological Research,
Ministry of Supply, London, England.

648

To compare the physiological effects and subjective
sensations produced by British and American fort weather
clothing, eight men wore the two types of outfit for work
in the sun and in the day. The work consisted of walking
and carrying a 65 pound weight for 30 minutes, running
and carrying on eight days. The heat stress measured
was assessed by measuring oral and rectal temperatures,
heart rate, and pulse rate. Subjective opinion and
work performance were obtained by a "structured" inter-
view. The objective data were related by analysis of
variance for differences due to, working in day or sun
and type of outfit. Performance data were studied for
specific comfort and design features.

649 Price, Helen G. ANXIETY AND FAILURE AS FACTORS IN THE PERFORMANCE OF MOTOR TASKS. Proj.
509 020 006, Res. Bull. 52 34, Dec. 1952, 16pp. USAF Human Resources Research Command, Air
Training Command, Lackland AFB, San Antonio, Tex. (State University of Iowa, Iowa City,
Iowa).

The effect of anxiety and failure on performance of a psychomotor test was examined. 30
Ss were used. Half of them scored in the highest 20% of the normative distribution on the
Taylor Anxiety scale and half scored in the lowest 20%. The high anxiety (HA) and low anx-
iety (LA) groups were each divided into 3 equal subgroups. Each subgroup was given 20 trials
on the Turret Pursuit Apparatus (TPA). 2 subgroups from the HA and LA used the TPA in its
standard setting and upon completion of the 20 trials were given either "neutral" or "failure"
instructions. The remaining subgroup used the TPA in its reversed setting, followed by neu-
tral instructions. The TPA task was followed by 20 trials using the Epileptic Pursuit Motor
(EPM). Results were analyzed in terms of time-on-target scores both for the TPA and the EPM,
and in terms of the number of contacts and time-on-target-percentage for the EPM. No sig-
nificant differences on any of these measures were found between groups or subgroups.

Jones, E.J. & Bilodeau, E.A. DIFFERENTIAL TRANSFER OF
TRAINING BETWEEN MOTOR TASKS OF DIFFERENT DIFFICULTY.
Proj. 509 020 0001, Res. Bull. 52 35, Dec. 1952, 23pp.
USAF Personnel & Motor Skills Research Lab., Lackland
AFB, Tex.

650

To investigate transfer of training as a function
of the relative complexity of two tasks, 164 basic 12-
men trained successively on two modifications of the SAM
10-Hand Coordination Test. A metal pin had to be moved
in a metal groove on either a circular (simple) or clover-
leaf (complex) path. Time per trial, time of contact
of pin with side of groove, and number of contacts were
discussed in terms of transfer as a function of relative
complexity of task. A hypothesis for predicting transfer
was proposed, and the implications of the results for
training were considered.

Bilodeau, E.A. TRANSFER OF TRAINING BETWEEN TASKS DIFFER-
ING IN DEGREE OF PHYSICAL RESTRAINT OF IMPERATIVE RESPON-
SES. Proj. 509 020 0002, Res. Bull. 52 40, Dec. 1952,
11pp. USAF Personnel & Motor Skills Research Lab., Lack-
land AFB, Tex.

651

To study the relative effectiveness of guided and
unguided practice, 384 basic airmen practiced success-
fully on two modifications of the SAM 10-Hand Coordina-
tion Test. A metal pin had to follow a cloverleaf path, either
in a metal groove (guided) or flesh with a horizontal
surface (unguided). Performance was scored in terms of
contacts per one-minute interval with equally-spaced
inserts along the path. Mean contacts and standard
deviations were discussed with regard to transfer be-
tween guided and unguided tasks, reasons for the results
obtained, and implications for guided and unguided
training.

COMPLEX COORDINATION TEST (COW TEST). Proj. 509 020
0005, Res. Bull. 52 41, Dec. 1952, 11pp. USAF Personnel
& Motor Skills Research Lab., Lackland AFB, Tex.

652

To determine a representative scale of absolute
difficulty in the Complex Coordination Test, 156 basic
airmen made matches for 39 selected combinations of
aileron, rudder, and elevator control positions.
Median time per match was used as a measure of diffi-
culty and was compared with difficulty ratings made by
Ss on a five-point scale. The characteristics of the
derived scale were discussed, together with effects of
sequence, serial position, performance variability,
and massed and distributed presentation.

French, E.S. NUMBER OF CLONED ELEMENTS AND CONSISTENCY
OF REINFORCEMENT IN A DISCRIMINATION LEARNING TASK.
Proj. 509 020 0001, Res. Bull. 53 12, June 1953, 10pp.
USAF Personnel & Motor Skills Research Lab., Lackland
AFB, Tex. (Reprinted from *J. Gen. Psychol.*, Jan. 1953,
45(1), 25-34).

654

To study the interaction of similarity of stimuli
and consistency of reinforcement in discrimination
learning, 384 basic airmen viewed 96 pairs of abstract
forms, choosing one form each trial. "Correctness" of
choice was indicated to Ss after each trial, consistency
in such reinforcement varying from 0 to 100 percent.
Similarity of forms varied from 0 to 3 common segments.
Choice errors and time to make choice are analyzed as
functions of reinforcement consistency and similarity,
and the implications of the interaction of these vari-
ables for theories of discrimination learning and
transfer learning are discussed.

Fleishman, E.A. A FACTOR ANALYSIS OF INTRATASK PERFORM-
ANCE ON TWO PSYCHOMOTOR TESTS. *Psychometrika*, March
1953, 18(1), 45-55. (Yale University, New Haven, Conn.).

655

This paper described an application of factorial
methods to the trial scores of two forms of the Rudder
Control Test--Standard and Experimental Six-Target--to
determine if and when fluctuations occur in the abilities
sampled. These scores were obtained from 698 pilot-
cadets; the Standard was given first for 356, the Experi-
mental for 342. Correlation among all trial scores of
both tests were computed and 12 matrices obtained
for each administration order. I.e., intertrial correla-
tion matrix was factor analyzed by Thurstone's Centroid
Method, and the axes rotated to simple structure. Im-
plications for future psychomotor test development were
indicated.

656 Krumm, R.L. CRITICAL REQUIREMENTS OF PILOT INSTRUCTORS. Proj. 508 016 000. Tech. Rep. 52-1, Sept. 1952, 18pp. HRRC, Air Training Command, Goodfellow AFB, Texas.

The present report describes the procedures which were carried out to define the flight instructor's task, in arriving at a description of the job in terms of critical instructor behaviors, individual and group interviews were conducted with cadets and student officers, student instructors, instructors and supervisors at seven representative air fields in the Air Training Command. Approximately 4600 separate reports of effective and ineffective behaviors of flight instructors were obtained. In classifying the reported behaviors, identical behaviors were grouped together under a single statement summarizing the reported incident. These statements were then combined by grouping similar behaviors and a single phrase was developed which encompassed the various behaviors in the group. This procedure resulted in a reduction of the total number of behaviors reported to 13 independent "components" of behaviors under three general "areas." The complete classification was submitted to a number of experienced pilots and educators for their comments and suggested alterations. In addition, a small scale evaluation of the relative importance of the various behavioral statements was arrived at by administering the classification as a rating scale to a number of experienced pilot instructors. The general comments of the consultants and the results of the instructors' ratings indicated that the classification was a usable and useful device. The pilot instructor's job and, since it dealt completely with observable behaviors which are considered "critical," it would serve as a suitable basis for the development of an instructor proficiency evaluation device.

661 Sells, E. & Moore, J.T. A PRELIMINARY INVESTIGATION OF TROUBLE SHOOTING. Proj. 507 001 000. Tech. Rep. 53-2, Feb. 1953, 10pp. HRRC Human Resources Research Center, Lackland AFB, Tex.

661 This report describes a preliminary exploration directed towards determining characteristics of good and poor trouble-shooters. Malfunctions were inserted into each of three equipments: radar, reciprocating engines, and remote control turners; and observations were made of maintenance men who attempted to locate the malfunctions. Ten men worked on each equipment, the five best and the five poorest trouble-shooters as rated by their supervisors. Other tests given the men included a "symptoms-causes" test, biographical inventory, intelligence test, and concept formation test. Interviews were also conducted. On the basis of the results a number of hypotheses for further research were suggested.

662 Lewis, D., McAllister, Dorothy E., & Bechtoldt, H.P. CORRELATIONAL ANALYSIS OF THE LEARNING AND RETAINING OF FOUR DIFFERENT TASKS ON THE MODIFIED WASHBURN APPARATUS. J. Psychol., 1953, 36, 63-109. Contract AF 33(033)-13214, Res. Bull. 53-35. HRRC, ARDC, Lackland AFB, San Antonio, Tex.

662 To isolate interference effects in changing a psychomotor task, 37 college students matched stimulus-light patterns by manipulating simulated aircraft controls (modified Washburn test). Four tasks were learned in sequence, then relearned, over a 13-day period. Different tasks consisted of different display-control relationships. Performance trends are analyzed in terms of number of matches and number of errors. "Matches" scores for 100 selected trials are inter-correlated and correlation patterns are subjected to detailed analysis, including factor analysis. Discussion covers effects of shifting task, interference measurement, and factors in proficiency loss.

663 Lewis, D., McAllister, Dorothy E., & Bechtoldt, H.P. CORRELATIONAL STUDY OF PERFORMANCE DURING SUCCESSIVE PHASES OF PRACTICE ON THE STANDARD AND REVERSED TASKS ON THE SWI COMPLEX COORDINATOR. Res. Bull. 53-47, Dec. 1953, 14pp. HRRC Human Resources Research Center, Lackland AFB, Tex. (Reprinted from J. Psychol., 1953, 36, 111-122).

663 To study factors affecting performance in shifting complex coordination tasks, 43 college students matched stimulus-light patterns by manipulating simulated aircraft controls (SWI Complex Coordinator). Two tasks (standard and reversed display-control relationships) were learned in succession and then alternately relearned three times over a two-day period. Number of matches per trial was computed for selected trials, and these scores were intercorrelated. Correlational patterns were analyzed and some intercorrelations were factor-analyzed for information on coordination and interference as determinants of performance level. Performance curves were also plotted and discussed.

665 HOIT, D. AN INVESTIGATION OF THE PROFICIENCY OF GROUND CONTROLLED APPROACH FINAL CONTROLLERS. HRRL Rep. 2, April 1949, 13pp. HRRL, Hqs. Command & Operational Commands, Bolling AFB, Washington, D.C.

This is the first report on a series of attempts to measure the proficiency of GCA Final Controllers. A Rank-Order Scale wherein the GCA Final Controllers under test were ranked with regard to their proficiency on a particular task by other GCA personnel was considered the criterion of proficiency. A battery consisting of tests and experience scores was used to measure the criterion. The multiple correlation coefficient between the criterion and the measurement battery was found to be .65. After reworking the personal inventory in the manner most predictive of the criterion, as determined by an item analysis of this test, the multiple correlation was raised to .71. Although by usual standards this might be considered a satisfactory battery for measuring proficiency, it is felt that further research on this particular problem is advisable.

Kistler, G.A. FACTORS INFLUENCING THE EFFECTIVENESS OF AUDIO-VISUAL TRAINING MATERIALS. NO. 3. THE EFFECT OF "RESPONSE GUIDANCE" ON THE VALUE OF AUDIENCE PARTICIPATION IN TRAINING FILM INSTRUCTION. Contract AF 33(616) 1378, NR2 Rep. 26, Nov. 1951, 25pp. USAF Human Resources Research Lab., Bolling AFB, Washington, D.C.

667
This is a preliminary pre-publication draft of a report on the effect of response guidance on the value of audience participation in the training film instruction (see Acc. No. 3445). Seven hundred subjects were shown two slide films designed to elicit frequent audience participation. Half of the subjects were presented with a film in which guided participation was incorporated while the others received the traditional type of film. Both films dealt with learning to read slide rule scales. The results are presented and discussed in terms of the relative amount of learning evidenced by each group of subjects as a function of the type of training film used.

668
Kistler, G.A. FACTORS INFLUENCING THE EFFECTIVENESS OF AUDIO-VISUAL TRAINING MATERIALS. NO. 1. THE INFLUENCE OF SIMPLE ANIMATION TECHNIQUES ON THE VALUE OF A TRAINING FILM. NR2 Rep. 24, April 1951, 24pp. USAF Human Resources Research Lab., Bolling AFB, Washington, D.C.

668
This is a nontechnical report (with an appendix of technical information) of a study of the effectiveness of simple animation techniques in training films. A training film on reading a micrometer was shown to 1300 Air Force trainees; half saw the basic film, half the identical film with simple animation devices added. Pre- and post-tests of ability to read micrometers consisted of pictures of settings to be read. Results (percent correct readings in tests) are discussed regarding implications for use of animation techniques to improve effectiveness of training films. Specific recommendations are made.

Alvis, H.J. BREATHHOLDING BREAKPOINT AT VARIOUS INCREASED PRESSURES. BuMed NM 002 015 01. HRL Rep. 177, Aug. 1951, 110-120. USN Medical Research Lab., USN Submarine Base, New London, Conn.
This study confirms earlier findings that the duration of breathholding varies with the partial pressure of oxygen. Further, it indicates that the influence of oxygen partial pressure was not eliminated at the breathholding breakpoint even at pressure equivalent to four atmospheres absolute. It is shown that in the alveolar air at the breathholding breakpoint there is a linear relationship between pO_2 and $\log(pO_2)$ with 2 parameters which vary between individuals. It does not appear to be acceptable to apply the formula expressing the pO_2 - pO_2 relationship for normal respirations to the situation of breathholding.

680
USN Medical Research Lab. ANALYSIS OF COLORS USED IN DIVERINE COLOR PERCEPTION TESTING CHARTS. Proj. NM 003 041.10, Memo. Rep. 52 9, Aug. 1952, 6pp. USN Medical Research Lab., New London Submarine Base, Conn.

680
This memorandum reports an analysis of the colors used in the Diverine Color Perception Testing Charts. The colors were visually compared with Munsell standards, and values were assigned which were then plotted on ICI Chromaticity Diagrams especially prepared for plotting Munsell values. The x,y coordinates thus obtained were plotted on MNL Mixture Diagrams. Analysis was directed toward the confusion zones of the various plates and the expected diagnostic value as compared with existing tests.

USN Medical Research Lab. "OPTILITE" DARK ADAPTATION GOGGLES. MEMORANDUM REPORT. Proj. NM 003 041.51, Memo. Rep. 52 7, April 1952, 3pp. USN Medical Research Lab., New London Submarine Base, Conn.

681
To evaluate "Optilite" dark adaptation goggles, two samples each of three different types (spectacle, rigid one-piece cover type, cover goggle with soft frame and replaceable lens) were tested. Results include spectral transmission of the lens measured with the Beckman D.U. Spectrophotometer, a comparison with standard normal specifications, and a subjective evaluation by 12 members of the laboratory concerning coverage, comfort, and suitability for wear over prescription glasses.

Schwartz, I., Lee, G. & Farnsworth, D. REPORT OF TWO PHOTOMETRIC SURVEYS OF RED LIGHTING ON THE SUBMARINE SSKI. Proj. NM 002 014.01, Memo. Rep. 52 13, Dec. 1952, 8pp. USN Medical Research Lab., New London Submarine Base, Conn.

682
This reports a photometric survey and evaluation of the low level red illumination on the Submarine SSKI. Discussion and recommendations from the standpoint of acceptability of the lighting under anticipated operating conditions include: spectral quality of illumination, dial brightness on some of the instruments, light leakage from various sources, need for shielding red-lighted rooms from adjacent white-lighted rooms, and the color of fluorescence on the computers.

Neer, E.N., & Dreher, J.J. OPERATIONAL TESTS OF MINIATURE MICROPHONES AND RECEIVERS. Contract AF 19(604)-1577, Proj. 668, Tech. Rep. 34, AFRC TR 54-57, Oct. 1954, 10pp. Operational Applications Laboratory, AFRC, Bolling AFB, Washington, D.C. (Ohio State University Research Foundation).

686

This article presents the results of operational evaluations of the X-33 microphone with selected ear insert and bone transducer (and used with the AIC-10 communication system). Utilizing two types of aircraft, the EC-97 and C-124, a list of 200 Harvard TB words were transmitted by pilots using the ear and bone microphones. A panel of ten listeners were used to evaluate the intelligibility and general characteristics of the transmissions. The results are presented in the form of percent correct word identification scores for each of the microphones. Additional experimentation on reception equipment provides a basis for conclusions concerning the efficiency of headset-microphone combinations. T. R. 9

684

USN Medical Research Lab. REQUIREMENTS FOR GENERAL PURPOSE SINGLES FOR OVER-THE-COUNTER SALE. Proj. NM 003 041-51, Med. Rep. 32 6, April 1952, 3pp. USN Medical Research Lab., New London Submarine Base, Conn.

686

This memorandum report summarizes requirements for general purpose singlasses for over-the-counter sale. Standards are given for light and non-visible radiation transmission, color, size, base curvature, refractive power, optical quality, and frames. I.

682

Brown, W.B. THE VESSEL LENGTH CALCULATOR. NRL Rep. 78, Oct. 1946, 5pp. Medical Research Lab., U.S.N. Submarine Base, New London, Conn.

672

This report describes the design and use of a Vessel Length Calculator intended for use in computing lengths of vessels sighted at sea. Other problems of navigation and surveying with common factors (range, angle formed by lines of sight to the extremities of object, angle of divergence from the perpendicular of the line connecting the extremities) can be solved within the limits of the Calculator - width of harbor entrance, dimensions of small island or reef, are examples. A model Calculator is included. I.

Cook, E.B. VISUAL ACUITY MEASUREMENTS WITH THREE COMMERCIAL SCREENING DEVICES. Bull. Res. Proj. X-493 (Av-263-p), Progress Rep. 2, A revision of report by Sulzman, Cook and Bartlett, Feb. 1946, Apr. 1946. Medical Res. Lab., U.S.N. Submarine Base, New London, Conn.

693

To evaluate the reliability and validity of visual acuity measurements obtained with three commercial screening devices (Bausch and Lomb Company Ortho-Rater, American Optical Company Sight Screener, Keystone View Company Telebinocular), 128 observers were examined twice in a test-retest situation. A standard letter reading test (New London Chart) was the criterion. Consistency of measurements for test-retest given and comparisons are made with the criterion. The devices are discussed in terms of their use in practical situations. T.G.I.R.I.

694

Cook, E.B. A FACTOR ANALYSIS OF ACUITY AND PHORIA MEASUREMENTS OBTAINED WITH COMMERCIAL SCREENING DEVICES AND BY STANDARD CLINICAL METHODS. Bull. Res. Proj. NM 003 011 (X-493), Progress Rep. 4, Aug. 1946. Medical Res. Lab., U.S.N. Submarine Base, New London, Conn.

694

To investigate sources of test score variance found in measuring visual functions (acuity and phoria) with commercial screening devices and by means of standard clinical procedures (see accession number 695), a factor analysis was made of visual measurements obtained on a reasonably heterogeneous population of 123 persons in a test-retest situation. Factors are identified and discussed in terms of the various measuring devices and their implications for establishing visual standards for military and industrial purposes. T.G.I.R.I.

695

Cook, E.B. COMPARATIVE PERFORMANCE OF COMMERCIAL SCREENING DEVICES AND FAR AND NEAR WALL CHARTS UTILIZING THE SAME TEST TARGETS. Bull. Res. Proj. NM 003 011 (X-493), Progress Rep. 5, Aug. 1946. Medical Res. Lab., U.S.N. Submarine Base, New London, Conn.

699

To investigate the causes of differences in visual acuity scores yielded by commercial screening devices (Ortho-Rater, Sight Screener, Telebinocular) and clinical methods of testing (New London Letter Chart), scores from 126 relatively heterogeneous observers were obtained under two conditions: using the devices in standard manner, and using their test targets, photographically enlarged, in a visual alley. The data are analyzed in an effort to determine the factors causing differences. T.G.I.R.I.

696
Cook, E.B. & Wherry, R.J. A STUDY OF THE INTERRELATIONSHIPS OF PSYCHOLOGICAL AND PHYSIOLOGICAL MEASURES ON SUMMARY ENLISTED CANDIDATES: I. HISTORY, EXPERIMENTAL DESIGN, AND STATISTICAL TREATMENT OF DATA. Bull. Res. Proj. NM 003 017, Rep. 1, March 1949, 45pp. USN Medical Research Lab., USN Submarine Base, New London, Conn.

This report introduces a series of papers to be presented on the interrelationships of some 330 physiological and psychological measures obtained on a population of 120 submarine enlisted candidates. For convenience in handling the mass of data, the 330 measurements were subdivided into logical subject matter fields and factor analyzed. Individual papers are in preparation on the main areas covered: physical fitness tests, urinary 17-ketosteroid and androgen output and stress tolerance, psychiatric interview, Rorschach, physical characteristics, anthropometric and somatotyping data, blood data and psychological tests. Significant factors which emerged from the area studies will be combined in final relational study. A detailed discussion of the nature of the correlation coefficient and the technique of factor analysis is included. It is hoped that a small battery of relatively independent tests will be established from the total study, for validation on a subsequent group of subjects prior to suggesting revisions of the submarine selection program. Inasmuch as the variables studied are not peculiar to the submarine service alone, findings should be of interest to the general selection problems of other military organizations and to industry as well. Area studies have suggested worthwhile leads for further investigations in the individual fields covered. It is anticipated that valuable indications of area interrelationships will be forthcoming from the final relational study.

698
Dinnick, F.L., & Rudolph, L.M. CHECKERBOARD VISUAL ACUITY TARGETS: AN EXPERIMENTAL VALIDATION. BuMed Proj. NM 003 008(X-423), Rep. 1, Dec. 1948, 14pp. Medical Research Lab., U.S.N. Submarine Base, New London, Conn.

699
To validate checkerboard targets for use as a test of visual acuity, three observers (vision 20/20) made 20 position judgments under constant illumination for each of 111 targets (individual checkerboard extending one minute visual angle) at five distances (7.05 to 67.40 feet). Distribution curves of correct judgments against distance are compared to the normal curve; those targets giving abnormal curves are rejected. This study also throws light on the relation of visual angle to testing distance.

Farnsworth, D., Sperling, H.G., & Kiable, P.F. A BATTERY OF PASS-FAIL TESTS DETECTING DEGREE OF COLOR DEFICIENCY. BuMed Proj. NM 003 018, Rep. No. 147, Aug. 1949, 8. 39 68 Medical Research Lab., USN Submarine Base, New London, Conn.

711
To determine a suitable combination of tests for classifying color vision deficiency, an unselected population of 1440 young males (17 - 38 years) were screened with 14 American Optical Company Plates and the Binick Anomaloscope; deviants were then examined on the Anomalight, Navy Lantern, Farnsworth Dichotomus 6-20, and F-20 Dichotomus tests. Standardized conditions prevailed for all testing. Data are analyzed to show population incidence for different classes of deficiency. Tests are evaluated for validity and reliability, and a battery of five tests is recommended.

Farnsworth, D., & Foreman, P. A BRIEF HISTORY OF LANTERNS FOR TESTING COLOR SENSATION AND DESCRIPTION OF THE ESSENTIAL PRINCIPLES. BuMed X-497 (Av-041-k), Rep. 104. Apr. 1946. 11pp. Medical Research Lab., U.S.N. Submarine Base, New London, Conn.

709
This report examines critically various features of lanterns used for color vision testing. Included are: (1) a brief description of lanterns which have received official acceptance for color vision testing from 1891 to 1945; (2) an analysis of the diagnostic principles which have made lantern testing efficient (size of aperture, brightness contrast of paired colors, number of colors, etc.); (3) a summary of mechanical features found necessary to promote efficiency and standardization of usage. A proposal to build a prototype lantern to incorporate all the desirable features is set forth.

Farnsworth, D. CONFUSIONS OF COLORED LIGHTS AT SMALL SUBTENSE BY PROTANS AND DEUTANS. BuMed X 263 (Av 151 c), Rep. 108. Sept. 1946. 19pp. Medical Research Dept., USN Submarine Base, New London, Conn.

710
This preliminary report investigates recognition of colored signal lights by partially color-defective subjects (six each of deuterans, protans, normals). Standard signal glass and certain special filters were identified verbally and by matching: yellowish to bluish-green series, red, and metameric pairs of orangish-red and purplish-blue. Results are analyzed with emphasis on color confusion areas, and for practical implications in the selection of signal lights and for lantern tests for color vision.

Cloonan, T. & Thackray, R. ANALYSES OF ACUSTICAL AND INTELLIGIBILITY RELATIONSHIPS OF MILITARY RESPIRATORS. Contract Da 18 1808 (CHL 403), Rep. 15. Dec. 1955. 70pp. Voice Communication Laboratory, Purdue University, Lafayette, Ind.

A study was conducted to determine the relationships between intelligibility and the frequency, intensity and duration characteristics of 4 respirator mask-talker combinations. Intelligibility was found to be significantly related to both fundamental frequency and duration. Contradictory to previous findings, no relationship was found between intensity and intelligibility. Inconsistent relationships were found between acoustical properties of the respirators and intelligibility. Although different respirators contributed differential acoustic impedance to different talkers, this did not appear to have any relationship to intelligibility. In general, the conclusion is warranted that acoustical measurements involving talkers, electronic signal sources and respirators may reveal between-mask differences related to intelligibility. However, the results clearly demonstrate that large samples of talkers are required if generalizations drawn from the data are to be broadly applicable. Suggestions for further research are made.

Harris, J.D. COMPREHENSIVE VALIDATION OF SUBMARINE SONAR SELECTION TESTS. BuMed & Surg Proj. X 327, X 330, X 331, X 632, Sept. 1946. 32pp. USN Medical Research Dept., USN Submarine Base, New London, Conn.

4 classes in the West Coast Sound School were given a battery of 37 selection tests. These men were followed through 5 weeks of training and 30 measures of proficiency recorded at various stages. All men of this study were already so highly pre-selected for psychomotor coordination that no test of coordination, or of motor learning, was effective. The same state of affairs holds for mental and emotional stability. The success of present selection methods is reflected in the fact that none of the 120 men of this study failed for mental, psychomotor, or auditory reasons, but all passed the course successfully. The prediction of ability at written examinations and of a final total mark was as good as usual in studies of this sort. Use of the Navy Basic Battery, and of scores from previous Navy Schools, yielded coefficients ranging up to .41. The best way to predict a man's final standing in sound school is to use his Navy score in Basic Submarine School. The next best predictor is the General Classification Test, and this study recommends that sound school candidates have as good a GCT score as the manpower situation permits. Some success was achieved in relating selection tests to the SRTG records; one test with a propeller noise injector correlated .47 with the SRTG turn-count record. Suggestions for further research are made.

Harris, J.D. THE DECLINE OF PITCH DISCRIMINATION WITH TIME. Proj. NM 003 041.22.03. NRL Rep. 186, Jan. 1952. 13pp. USN Medical Research Lab., New London Submarine Base, Conn.

715
To investigate pitch discrimination as a function of the interval between two tones. 213 Ss judged a test tone with reference to both a fixed and a roving standard tone. Intertone intervals of .1, .3, .5, 1, 2, 3, 3.5, 7, 15, and 25 sec. were used. Differential thresholds were measured and discussed with reference to the interaction of interval and type of standard on pitch discrimination.

Harris, J.D. FUNCTIONS OF LOUDNESS DISCRIMINATION IN SUBMARINE SONAR OPERATIONS. Proj. X 53, April 1945. 23pp. USN Medical Research Lab., New London Submarine Base, Conn.

716
This paper describes the experience of the Submarine Laboratory with Auditory Test No. 7 of the Harvard Psycho-Acoustic Laboratory, "Loudness Discrimination for Bands of Noise." This test consists of four 12-inch record sides containing 110 items, each item being a complex tone (500 to 2,000 cps) which increases or decreases in intensity. S judges the change as louder or softer and records this or an answer blank. Day-to-day score variations and reliability coefficients for some 1,000 Ss given a routine administration are presented. Results of a short-form administration are compared to the full test for 277 Ss. Item analysis data, time-error considerations, and differential loudness thresholds are discussed. Finally, preliminary tests relating test score to sonar performance are reported. T. G.

717
Harris, J.D. FUNCTIONS OF PITCH IN SUBMARINE SONAR OPERATION. Proj. X 330, Jan. 1945, 16pp. USN Medical Research Lab., New London Submarine Base, Conn.

717
This paper presents a brief history of the Submarine Base's study of pure-tone pitch discrimination as it relates to submarine sonar operation. The remainder is devoted to describing the laboratory's experience with the University of California Division of War Research Pitch-Memory Test. Included are equipment and administration information, reliability, validity data, and item analysis of some 590 scores for each of three groups--upper, middle, and lowest 50. These latter data are used to evaluate the reliability and validity of a short-form administration. The pitch function for the group is shown and described.

Harris, J.D. INTERPRETATIONS OF MEASUREMENTS OF AUDITORY THRESHOLDS. Proj. NM 003 021, Prog. Rep. 1, Feb. 1948, 7pp. USN Medical Research Lab., New London Submarine Base, Conn.

719
This report interprets the results of auditory threshold measurement in terms of occupation requirements. Three hearing tests are described: pure tone audiometer, voice tests, and monitored voice tests or phonograph voice tests. A conversion table for speech intelligibility scores is given; it includes classification of test results in everyday terms, conversion of scores into percentage hearing loss for speech, average loss in db for speech range (512-2,048 cps), db loss below normal level of speech, and spoken voice and whispered voice distance-fractions. Auditory functioning (e.g., pitch and loudness discrimination) as it relates to the requirements of various categories of occupation is discussed, and the augmentation of residual hearing considered. Harris, J.D. PITCH DISCRIMINATION AND ABSOLUTE PITCH. Proj. NM 003 026, Prog. Rep. 1, Jan. 1948, 4pp. USN Medical Research Lab., New London Submarine Base, Conn.

720
The relation between pitch discrimination and absolute pitch was examined. The method of Constant Stimuli was used, S judged whether the variable was higher or lower than the standard; equal numbers of higher and lower items were given at 20, 15, 10, 8, 6, 4, 2, and 1 cycles difference. The effect of time interval between Standard and Variable on discrimination judgments was tested using a range of 0.3 to 25 sec. The establishment and stability of a psychological midpoint for such judgments was investigated by eliminating the presentation of the standard. Finally, a technique was devised and tested to compare the effect of the psychological midpoint with that of the actual Standard.

Harris, J.D. PRELIMINARY REPORT ON PROPELLER NOISE DISCRIMINATION. Proj. X 53, Rep. 50, Dec. 1944, 14pp. USN Medical Research Lab., USN Submarine Base, New London, Conn.

The present in-progress report introduces the Propeller Noise Injecture (PNI) which injects simulated propeller noise into a continuous noise and analyzes some preliminary data on 249 Ss. The PNI is intended for pre-selection of sonar operators. From preliminary studies it was concluded: a) an efficient group test has been constructed; b) there is enough range of ability at propeller noise discrimination that the test can be related to other tests. The distribution of this ability approximates the so-called "normal" curve; c) the effect of changing the frequency-composition of the two noises is described; d) intelligence and learning are ruled out as major factors; e) the effects of changing the overall loudness level, and of changing the propeller speed, are described; f) the test is not highly related to any of 9 other auditory tests; g) the direction future research will take is indicated.

723
Harris, J.D. THE RELATION BETWEEN THE AUDIOGRAM AT HIGH FREQUENCIES AND PROFICIENCY IN SONAR PERFORMANCE. BuMed Proj. X 329 (Sub. 58), Interim Rep. 1, June 1945. 9pp. USN Medical Research Dept., USN Submarine Base, New London, Conn.

37 Ss with normal auditory acuity at 4096 and 8192 cy. per sec. were compared on a sonar job sample with a group of 36 Ss whose acuity at these frequencies was lower than 30 db. Ss were required to report bearings of a motor launch performing a standard evolution in a river. The lowest volume setting at which this could be done, and the accuracy of reported bearings were recorded. The JP sonic sonar gear was used, with the frequency filter set at the 6000 cy. position. The volume control settings were reliably in favor of the normal group; the normal group was likewise superior in accuracy of reported bearings by approximately 2/3 of a degree. It is concluded that this experiment furnishes further confirmation of the standards already in use for the disqualification of candidates for underwater sonar training.

Harris, J.D. SOME SUGGESTIONS FOR SPEECH RECEPTION TESTING. BuMed Proj. NM 003 021, Progress Rep. 2, July 1948, 23pp. USN Medical Research Lab., USN Submarine Base, Conn.

Electronic helps to supersede the traditional free voice test are described. Use of the sound-level meter is recommended as the minimum aid. The reporting of hearing deficit in terms of decibels below normal is urged to replace the relatively meaningless distance-fraction. Use of a high-fidelity communication system, costing no more than a good radio, is described briefly, and recommended wherever possible, either with a microphone or a phonograph pickup at the input, or both. The microphone input (the so-called monitored live-voice test) and the phonograph input each have advantages; the former is more flexible in the clinic, the latter somewhat more precise. Especially, by a re-recording technique, the phonograph input is able to take any desirable sample of speech sounds and render them more nearly equal in intelligibility, thus contributing greatly to the validity and efficiency of speech reception testing.

Harris, J.D. STUDIES ON THE COMPARATIVE EFFICIENCY OF THE FREE VOICE AND THE PURE TONE AUDIOMETER FOR ROUTINE TESTING OF AUDITORY ACUITY. Proj. X 487 (Sub. No. 103), Rep. 78, Oct. 1945, 27pp. USN Medical Research Dept., USN Submarine Base, New London, Conn.

This paper is designed to help the beginning worker reach a decision as to which test or tests of auditory acuity he should use and to provide a body of data against which the experienced worker may check his procedures. Data is summarized from this and other laboratories bearing on the relative usability of the free voice and the pure tone audiometer as tests of auditory acuity. A novel method of measuring sound decay as a function of distance is presented. Data are analyzed to show that for a deafened population it is necessary to vary the voice from an average whisper to a loud shout. It is concluded that such control is beyond what can be expected from routine testers. A summary is given of relative testing times for several modifications of acuity test. A statement is given of the relative applicability of voice and pure tone testing for a variety of specific situations.

Harris, J.D. STUDIES IN GROUP AUDIOMETRY ON SUBMARINE PERSONNEL. Proj. X 328 (Sub. 57), Rep. 49, Nov. 1944, 39pp. USN Medical Research Dept., USN Submarine Base, New London, Conn.

In order to handle more efficiently our taking pure-tone audiograms of men undergoing selection for submarine sonar operator, and in response to the needs of other groups in the Navy and elsewhere, we attempted the standardization of a group audiometer test which could truly substitute for the laborious and time-consuming individual examination. This paper presents data on one such group test which we have found satisfactory as a replacement for an individual test. Individual and group tests are of comparable reliability, and label a population in essentially the same manner. In terms of deviation from an individual test, it makes little difference whether the second test is an individual or group examination. The equipment necessary is commonly available. Scoring may be adapted to machine procedure. The number of subjects tested simultaneously is limited only by the amount of sound-treated space and equipment available. We reason that these statements establish the principle of group audiometry as valid, and that the actual performance of the group test is such that it should replace the individual test for many purposes.

Harris, J.D. STUDIES IN SHORT DURATION AUDITORY FATIGUE: II. THE EFFECT OF THE DURATION OF THE STIMULATING TONE: III. THE EFFECT OF THE INTERVAL BETWEEN STIMULI. BuMed Proj. NM 003 041.34.02, Rep. 168, Dec. 1950, 2, 291-300. USN Medical Research Lab., USN Submarine Base, New London, Conn.

This series of 2 experiments investigated the auditory fatigue caused by pure tones up to 70 db sensation level and .1 to 10 sec. in duration, and charted the very quick recovery from these relatively mild stimuli. No cumulative fatigue effects were found up to 5 sec. of stimulation, and only a slight cumulative effect between 5 and 10 sec. at the louder levels. The fatigue occasioned by such tones is transitory, disappearing within a half-second or less. The course of its disappearance is exponential or nearly so for all stimuli used.

Harris, J.D. STUDIES OF PITCH DISCRIMINATION IN MASKING. II. THE EFFECT OF SIGNAL/NOISE DIFFERENTIAL. BuMed Proj. NM 003 022 (X 747) (Sub. 154). Rep. 3, Jan. 1948, 7pp. USN Medical Research Lab., US Submarine Base, New London, Conn.

36 Ss were given tests of pitch discrimination at signal/noise differentials of 5, 7, 10, and 15 db at random. All Ss followed a general trend, in that discrimination became poorer as the signal/noise differential decreased, becoming asymptotic at something less than 5 db. However, there was usable discrimination at 5 db. The hypothesis tentatively proposed is that, within limits, pitch discrimination for a certain tone depends upon the loudness of that tone.

733 Harris, J.D. & Charney, D. A REVISION OF THE NAVY PITCH-MEMORY TEST. BuMed Proj. NM 003 041.07.01, Rep. 152, April 1950, 10pp. USN Medical Research Lab., USN Submarine Base, New London, Conn.

The desirability of revision of Dr. Adelbert Ford's 1944 edition of the Navy Pitch-Memory Test is indicated. The revision reported in this paper is particularly suited to the task of eliminating men of below-average ability in frequency discrimination. Major changes were in the masking of items at various levels of difficulty and in shifting the standard stimulus gradually rather than in jumps of 25 or 50 cps. per sec. The revision was assessed with 92 men. The 1944 edition and the present revision are equal in reliability, and equivalent in meaning; prediction from the newer to the older was as precise as test-retest prediction on the older test alone. On this basis, a raw score conversion table is presented so that the 2 editions may be used interchangeably. The present revision represents an improvement in group test construction in 2 directions: a) the form of the psychophysical function (percent items correct versus level of difficulty) was very much smoother, so that thresholds are determined with greater precision, and b) the 1944 edition yielded a group threshold of 10-12 cps. per sec., while the revision yielded one of 5.0 cps; the latter figure being much closer to the threshold of 4.9 cps obtained on an earlier group of 225 men in which frequency discrimination had been assessed with laboratory precision. We conclude that when it is desired to reject men with poor frequency discrimination, the present revision offers advantages over the 1944 edition, and can immediately be substituted.

Harris, J.D., Helms, H.L., & Myers, C.K. A HELMET-HELD BONE CONDUCTOR VIBRATOR. Laryngoscope, Oct. 1953, 63(10), 998-1007. (USN Submarine Base, New London, Conn.). (Rep. 238).

A Sonotone Model 21-308 bone conduction vibrator was mounted in a helmet, making it possible to adjust and standardize the position of the vibrator tip on the mastoid process of either side, the angle of thrust, and the applied force. It was hoped by this means to improve the interpretability of bone conduction audiometry, an extremely valuable clinical tool where it can be trusted. Test-retest thresholds with the helmet and with the hand-held vibrator were collected on experienced and inexperienced subjects, at 6 octaves from 256 through 8,192 cycles per sec. 10 repetitions were performed for each experienced subject, deliberately extended over several weeks or months. The difference between successive thresholds was somewhat less with the helmet than without; furthermore, the helmet significantly reduced variance among thresholds repeated over extended periods. Evidently, the increased precision of a single threshold (the usual clinical situation) makes worthwhile some such standardization as used here. It was recommended that applied force be standardized anywhere between 200 to 400 grams.

Harris, J.D. & Myers, C.K. INTENSITY DISCRIMINATION FOR WHITE NOISE. Proj. NM 003 020, Prog. Rep. 3, Aug. 1948. 25pp. USN Medical Research Lab., New London Submarine Base, Conn.

736

To determine differential intensity thresholds for white noise and to explore the effect of interstimulus interval (ISI) on time error, 19 Ss judged the loudness of noise by the method of constant stimulus differences. Twelve levels of difficulty for intensity differences were presented at each ISI (0, .1, .2, .35, .5, and 1 sec.). Differential thresholds (DT) for loudness as a function of ISI and the relation of time error to ISI were analyzed and discussed in relation to individual differences, the definition of DT, comparison with previous data, the relation of DT to masking, and the course of the time error with increasing ISI.

Harris, J.D., Myers, C.K., Stover, A.D. & Stuntz, S. E. THE EFFECT OF SENSATION LEVEL ON INTENSITY DISCRIMINATION FOR WHITE NOISE. Proj. NM 003 020, Rep. 4, Medical Research Lab., Rep. 145, Aug. 1949, 26pp. USN Medical Research Lab., New London, Conn.

The just noticeable difference in the intensity of random noise was measured by three different psychophysical procedures, at each of several sensation levels ranging from very weak to moderately loud. The JND ranged from .41 to .65 db at its best. With weak sensation levels these values rose to about 1.6 db. From this and other lines of evidence it was concluded that the limits for discrimination range from about .5 to 1.5 db. The psychophysical method wherein the subjects were forced to guess the direction of a change in intensity produced consistently smaller differential thresholds, and was affected least by sensation level. We conclude that such a method offers the best insight into the ultimate potentialities of the peripheral organ.

Harris, J.D., Ramsley, A.I. & Kelsey, P.A. STUDIES IN SHORT-DURATION AUDITORY FATIGUE: I. FREQUENCY DIFFERENCES AS A FUNCTION OF INTENSITY. BuMed Proj. NM 003 041.34.01, Rep. 167, Dec. 1950, 9, 278-290. USN Medical Research Lab., USN Submarine Base, New London, Conn.

The method of short-duration auditory fatigue allows for rapid accumulation of data since all effects of stimulation with brief tones disappear in usually less than a second. In this experiment, Tone A of 300 ms was followed after 80 ms by Tone B of 30 ms. Both A and B were the same frequency, either 256, 512, 1024, 2048, 4096, 5747, or 8192 cps. Tone A was set at intensities ranging from 20 through 70 db sensation level. Fatigue was calculated as the difference in threshold of Tone B preceded and not preceded by Tone A. A comparison among frequencies was made when they were equated as to intensity, loudness, and sensation level. Equating as to intensity led to curves which bear similarities to isophonic contours, and lends some support to Lüscher and Zwillock's view that the frequency characteristic depends upon intensity rather than loudness. A family of fatigue curves equated for loudness shows that, especially at equal-loudness levels of 40 phons and above, fatigue is a decided function of frequency. At the 70 phon level, 8192 suffers 27 db more fatigue than 256 cps. This differential effect is considerably less evident when frequencies are of equal sensation level.

741

A study was made of the extent to which stimulus intensity and stimulus duration were interchangeable in producing subsequent shifts in auditory threshold. In the first part of the experiment, two successive 1000 cps tones were used; durations of the first tone were varied from 10 to 100 msec.; intensities were 30, 50, 70, or 90 db sensation level. Threshold shifts were calculated by subtracting threshold of the second tone alone from its threshold when preceded by the first. The second part dealt with longer duration auditory fatigue up to five minutes. Recovery thresholds were obtained. The intensity-time relationship was analyzed for these conditions.

743

Study of radar detection-trial data has indicated the possible existence of interscan correlation in the statistical representation of such data. The probability theory of Markov processes is here applied to characterize the statistics of sequences of correlated binary data consisting of detections and nondetections upon individual radar scans. Simple and higher-order Markov processes are discussed with particular emphasis upon the theory of stationary discrete-parameter and non-stationary continuous-parameter, first order processes. Likelihood ratio tests and maximum-likelihood parameter estimators are presented for the stationary discrete-parameter representations.

Myers, C.K. & Harris, J.D. DETECTION THRESHOLDS AND PURE TONE THRESHOLDS IN AUDITORY ACUITY. Proj. NM 003 022 (X 74) (Sub. No. 154), Prog. Rep. 2, Jan. 1948. 5pp. USN Medical Research Lab., New London Submarine Base, Conn.

751

To determine whether Ss could set up and maintain some criterion of minimum tonal quality, tones of five frequencies between 500 and 14,000 cps were presented to Ss who were asked to report two thresholds simultaneously—a threshold of detectability and a pure-tone threshold. For each tone the S stated whether he heard nothing, something, or a tone. Percent response as a function of stimulus intensity was plotted for both the detection and pure-tone thresholds. The relative characteristics of the two thresholds as a function of frequency and masking were analyzed and discussed in relation to pitch detectability and discrimination.

Myers, C.K. & Harris, J.D. THE EMERGENCE OF A TONAL SENSATION. BuMed Proj. NM 003 022, Progress Rep. 4, March 1948. 10pp. USN Medical Research Dept., USN Submarine Base, New London, Conn.

When the absolute threshold of auditory acuity for pure tones is carefully explored with fine intensity steps, a region called the "zone of detectability" can be noticed by experienced subjects. In this zone, pure tones can be detected but cannot be said to have a true pure-tone quality. This zone of detectability is defined as the intensity area between a 50% detection threshold and a 50% pure-tone threshold. In Part I, these two thresholds were simultaneously determined at each of 6 frequencies, 500, 1000, 2000, 4000, 8000, and 14,000 cps. Two experienced subjects were used. The zone of detectability varied at random from 2-4 db independent of frequency. In Part II, it was shown that particularly for the higher frequencies, an experienced subject can select a certain criterion of tonality and maintain it with considerable precision. In Part III, subject matched a variable frequency of very low sensation level to a standard frequency of 10 db sensation level. The frequency-matching was progressively better as the intensity increased from 0 to 10 db sensation level, and the course of this improvement was taken to symbolize the gradual nature of the emergence of a tonal sensation from an indefinite "something" to the sharp sensation of a clear pure tone. It was reasoned that the subjective criterion of "tonality" which a subject can select and maintain is indeed one of pitch rather than of loudness; but it was concluded that the phenomenon depends upon the intensity of the stimulus rather than upon a change in its frequency-composition.

Myers, C.R., Harris, J.B. & Fowler, E.P. THE FEASIBILITY OF GROUP AUDIOMETRY. BuMed Proj. NM 006 007, X 761, (Sub. 163), Terminal Rep., Feb. 1948, 40pp. USN Medical Research Lab., USN Submarine Base, New London, Conn.
In this survey, complete 6-octave audiograms for both ears of 1440 Veteran students. A group audiometry technique was the primary method. The number of answer sheets which could not be scored due to unexplained irregularities (headphone trouble, inattention) was 1.8%. All other individuals were handled at or nearly at its peak efficiency by the group procedure. Satisfactory audiograms were provided for 86.5% of all ears. The rest were given individual testing because one frequency (4000), two frequencies (2000), or more than two frequencies exhibited hearing impairment greater than that which the group equipment was designed to test. The average acuity of this population compares within a few decibels of that of earlier surveys on similar age and sex groups by the U.S. Public Health Service and by Bell Telephone at the 1939 World's Fair. Between 2 and 3% had hearing impairment at least sufficient to begin to impair social communication. On the basis of this survey it would appear that about 1% of our college group had hearing loss, directly war-incurred, sufficient to impair social communication. (This is in addition to the 2% of the same group suffering like impairment but not war-incurred.) But many hundreds of men of the total group had been exposed to as much noise and blast as the 1% impaired group, and it would appear that for the most part our Veterans were amazingly resilient in recovering from the effects of the tremendous noises to which they were subjected.

Hoff, V.B. MEMORANDUM OF THE SELECTION AND TRAINING OF SOUND OPERATORS. Rep. 4, July 1942, 33pp. USN Medical Research Lab., USN Submarine Base, New London, Conn.

Records of the grades made by 210 men during and upon completion of their training at the Sound School at the Submarine Base, New London, or the Sound School for the Inshore Patrol on the USS Sylph were obtained. With these records as a criterion, an analysis of the predictive value of 8 "selective" tests were made. It was found that by use of the selective tests a large number of "poor" sound operators may be eliminated before they entered the school, while most of the "good" ones are retained. It was concluded that use of the selective tests appears to be a valuable means of securing men capable of becoming good sound operators and of saving time and effort which would otherwise be wasted upon those lacking the necessary abilities.

Rose, G.L. & Harris, J.D. SUGGESTIONS FOR CONSTRUCTING TESTS OF PITCH DISCRIMINATION. BuMed Proj. NM 003 026, Progress Rep. 2, Feb. 1948, 20pp. USN Medical Research Dept., USN Submarine Base, New London, Conn.

This paper presents a study of certain intra-series effects in the Method of Constant Stimuli, and some suggestions as to how they may be controlled. Each of 515 men was given one or more tests of pitch discrimination. Over 12 different patterns of Constant and Variable Stimuli were investigated. The objective was to discover the pattern which gave the truest differential threshold. It was found that by arranging the Variable Stimuli symmetrically around the Standard, and making them progressively more and more difficult (as in the traditional test) tended to provide Ss with an extraneous clue; they could use the distance from High-Variable-to-Low-Variable as a basis for judgment rather than the distance from Standard-to-Variable. When the possibility of comparing juxtaposed Low and High Variables was lessened by completely randomizing all items, both as to level of difficulty and as to Highs and Lows, Ss were, nevertheless, able to use some average of all the foregoing Variables as a judgmental anchor against which to relate any succeeding Variable. This averaging tendency was reduced to an insignificant level by placing the standard at random within a relatively short range around the desirable frequency, or by gradually changing it throughout the range. A random pattern was discarded on the basis of the heterogeneity of difficulty within any level of difficulty. The final test-form evolved was one with a Standard gradually ascending and descending in frequency, with the Variables placed quite at random around these values; it was found that S was using the true magnitude of the Standard stimulus as a reference point for judgment. Schaefer, E.E. STUDIES OF CARBON DIOXIDE TOXICITY. (1) CHRONIC CO₂ TOXICITY IN SUBMARINE MEDICINE. Naval Proj. NM 003 015, OS, OS, Rep. 181. Aug. 1951, 10, 156-176. Medical Research Lab., U.S.N. Submarine Base, New London, Conn.

763

The effects on submarine crews of long term exposure to high concentrations of carbon dioxide (CO₂) combined with low oxygen (O₂) ambient air as found in German submarines during World War II are contrasted with the results of short term experimental studies under simulated conditions. Changes in circulation, respiration, body temperature regulation, and behavioral observations are reported. T. G. R 26

Macdonald, D.E., & Watson, J.T. DETECTION AND RECOGNITION OF PHOTOGRAPHIC DETAIL: I. EMPIRICAL DATA APPLIED TO THE PREDICTION OF PERFORMANCE OF DIFFRACTION LIMITED SYSTEMS. Tech. Note 127, June 1966, 25pp. Optical Research Laboratory, Boston University.

764

This article presents the results of studies concerned with the visual detection and recognition of photographic detail as recorded on the photographic negative. A system (i.e., the Laboratory Camera System) is described which permits controlled and independent variation of such experimental parameters as scale, object contrast, image quality, etc. Techniques for analyzing pertinent data are presented along with the predicted performance of diffraction-limited systems with six emulsions. Schaefer, K.E., Alvin, H.J., Webster, A.P. & Willmer, T.L. STUDIES OF OXYGEN TOXICITY. I. PRELIMINARY REPORT ON UNDERWATER SWIMMING WHILE BREATHING OXYGEN. BuMed Proj. NM 002 015.03. 01. Rep. 149, Oct. 1949, 8, 84-93. USN Medical Research Lab., USN Submarine Base, New London, Conn.

Twelve trained underwater swimmers swam in the 100-foot lock of the Submarine Escape Training Tank, wearing either the Liberator or the Brown Underwater Swimming Unit. These swimmers were observed while swimming at various depths to determine the main physiological hazards in using oxygen breathing equipment. Of particular concern was the development of oxygen toxicity. Gas analysis was made by the Van Slyke method and the majority of the carbon dioxide determinations were checked by the Haldane method. The swimmers for different lengths of time ranging from 15 to 93 minutes duration. The data obtained included the time to symptoms and the concentration of oxygen and carbon dioxide in the unit at the end of the swim. The data was examined to determine the relation between the average exposure time and the partial pressure of oxygen (depth) for a constant criterion of oxygen toxicity. Only 1 point was obtained on the curve representing this relationship. The average exposure time to produce symptoms was 61.7 ± 21.5 min. The Liberator Unit was considered to be superior to the Brown Unit.

Holding, D.H., & Dennis, J.P. LOCALIZATION IN THE COMBAT CAP, JANUARY 1954-NOVEMBER 1954. Rep. 47, Feb. 1955, 14pp. Clothing and Equipment Physiological Research Establishment, Directorate of Physiological and Biological Research, Ministry of Supply, London, England.

766
To investigate the effect of wearing a combat hat with flap down on the ability to localize a source of sound, sixteen subjects were tested. Localization in eight directions, with and without the combat hat, and at two sound intensities (25 and 70 decibels above 0.0002 dynes per centimeter squared) were measured. The criteria used were correctness of response and time taken to respond. The data were studied by analysis of variance for differences due to wearing of the cap, direction of stimulus, and intensity of the stimulus. The discussion relates the findings to classical experimentation in localization.

von Schelling, H. & Farnsworth, D. TRICHROMATIC SPECIFICATIONS OF THE MUNSELL 100 HUES AT 5/5 FOR ILLUMINANT A. Proj. NM 011 119, Rep. 144, Color Vision Rep. 20, April 1949, 3pp. USN Medical Research Lab., New London Submarine Base, Conn.

767
The series of painted papers known as the Munsell 100 Hues at 5/5 have been used so extensively in research that trichromatic specifications were calculated for Illuminant A to supplement those previously published for Illuminant C. The positions of the hues are plotted (both A and C) in diagrams to the same scale as the 1931 ICI Standard Observer and Coordinate System. A conversion table is given between production numbers of the series and the numbers of the F-M 100-Hue Test for Color Vision.

Von Schelling, H. SOME STATISTICAL REMARKS ON THE METHOD OF CONSTANT STIMULUS DIFFERENCES. BuMed Proj. NM 003 020, Progress Rep. 1, Feb. 1949, 7pp. Medical Research Lab., US Sub Base, New London, Conn.

The probit method for fitting an ogive can be used for data obtained by the method of constant stimulus differences. This method is seen to have several refinements over the usual method. However, the real value of the probit method as against the usual method is that, for any point P in a psychometric function, a confidence interval can be fixed in which with a given probability the proportion P is situated. Using some loudness discrimination data the probit method is compared with Miller-Urban weights. The Miller-Urban weights overestimated the reliability of the observation around the PSE and underestimated the reliability on the extremes. (NRAS)

774 Shilling, C.W. THE DEVELOPMENT OF METHODS FOR THE SELECTION OF SOUND LISTENING PERSONNEL. USN Medical Research Lab., USN Submarine Base, New London, Conn. 1. March 1943. 70pp.

This report gives an account of the procedures and steps taken to arrive at a method for selecting personnel for sound operating duty in submarines. The report includes the preliminary stages of the project and the final products of the search for the measuring devices. The tests being used include the Otis Self-Administering Test of Mental Ability, the 30-second Test of Musical Talent, Series A; a complete audiogram; a test for pitch discrimination under conditions similar to those of actual ringing. A brief questionnaire is administered to each. It is felt that tests of visual-motor and auditory-motor coordination may be of value. An adjustment inventory is also considered relevant but an appropriate one remains to be found. The validity of the present selection method remains to be tested. Thus, some of the above procedures may have to be eliminated and replaced by others.

775 Shilling, C.W. A REPORT ON SIMPLE BINOCULAR SERIAL #6268, MARK I, MODEL 2. USN Medical Research Lab., U.S.S. Submarine Base, New London, Conn. July 1943. 15pp.

775 To evaluate a simple binocular with the focus and interpupillary distance (IPD) fixed, experimental field testing of visual acuities of 97 men using four comparison binoculars (two standard adjustable with focus and IPD set, two standard adjustable) was conducted. A supplementary statistical check was made of the accuracy with which an individual is able to make his own focus and IPD settings. Performance scores are analyzed for the various binoculars and recommendations are made for modification of the design of the standard type. An interpupillary distance gauge was also evaluated.

776 Shilling, C.W., Everly, I.A. & Harris, J.D. HEARING TESTS: AN EVALUATION. USN Med. Bull., 1945, 44, 100-116. USN Medical Research Dept., US Submarine Base, New London, Conn.

The present study was undertaken in an effort to determine the true significance and value of the common clinical tests of hearing. Data was collected from 1000 ears relating the 6-octave audiogram to the Spoken Voice, Whispered Voice, Coin Click, and Watch tick tests. The Spoken Voice test was found to be practically worthless as an index of acuity. The Whispered Voice test was found to be very effective in screening out that type of ear seriously defective for high tones and concomitantly more or less defective for low tones; the correlation between extent of low tone audiometric loss and whispered voice score was significant, but not high ($r=+.30$). The Coin Click, as used here, produced results very similar to those of the Whispered Voice Test, but for several reasons the latter is to be preferred. The Watch Tick Test differs from the preceding tests in that low tones are involved only slightly. However, the Watch Tick Test is as satisfactory as a differential test of high tone hearing. None of the clinical tests used showed any tendency to measure low tone hearing independently from high tone hearing.

777 Smith, John, & Blumick, J.L. THE PARAMETERS OF SCOTOPIC SENSITIVITY: (1) THE EFFECTS OF SIZE. Unpub. Proj. NM 003 041.09.03, Rep. 174, June 1951, 10, 56-75. Medical Research Laboratory, USN Submarine Base, New London, Conn.

777 To explore the scotopic (night) sensitivity of the dark adapted eye, four trained observers made position judgments for circular stimuli of variable size (8 to 26 min. visual angle) and of constant brightness presented at nine distances from fixation point (from 1" to 27") along four radii (up, down, right, left). Results are given as 50% lines in terms of the angular subtense (size) of the stimuli and the sensitivity gradients of the eye are mapped for the entire visual field.

Periscope acuity at night. (Control and para-central acuity as a function of contrast and adaptation.)

USN, Med. Res. Lab., Unpub. Project NM 003 041.39.01, 28 Nov 1950, Vol. 9

779 To determine the need of dark adaptation for submarine periscope operators for night observation, discrimination of a target, approximating the visual subtense of a ship at 5000 yards, was measured with the right eye (one observer) at nine retinal positions (0° to 15°); contrast of target and background were varied to simulate atmospheric conditions. After viewing three visual indicators commonly located near the periscope, the subsequent effect on discrimination was measured as before. Threshold measurements are presented for both conditions and discussed for their operational applications.

Stevens, S.F. THE EFFECTS OF SOUND INTENSITY LEVEL ON JUDGMENTS OF "TONE RANGE" AND "VOLUME LEVEL" AND INTERPRETATION OF THE LOUDNESS FUNCTION. BuMed Proj. NM 003 041.20.5, Rep. 163, Dec. 1950, 2, 104-194. USN Medical Research Lab., USN Submarine Base, New London, Conn.

The intensity-level-versus loudness-level data of Fletcher and Munson, when interpreted according to the loudness function, provides a basis for measuring the ear's effective frequency response. It can be shown that there is a striking relationship between pure-tone intensity and relative sensitivity for the average ear. For example, increasing signal intensity-level from 70 db to 75 db re: 10-16 watt per square centimeter extends the subjective frequency range (at 1 sec loudness) downward more than three octaves below 400 cycles. This concept is applied to an evaluation of the listener preference tests conducted by Olson and by Eisenberg and Chinn. The conclusion is offered that the disagreement between their conclusions is more apparent than real.

Verplanck, W.S. THE EFFECTS OF PARETHINE ON NIGHT VISION TEST PERFORMANCE. Proj. X-226 (Av-123-W), Rep. 40, May 1944, 11pp. Medical Research Lab., U.S.N. Submarine Base, New London, Conn.

782

Two experiments are presented on the effect of parethine on night vision performance. The first utilizes 17 sophisticated subjects who were tested under controlled conditions on three types of adaptometers. Results are presented in terms of effect of drug on performance on each adaptometer and the possible effects of subjective motivational factors. The second experiment utilizes 124 subjects tested on the Navy Radium Plaque adaptometer. Results are discussed in terms of the sophistication and morale of the subjects as well as the effects of the drug on performance.

Henneman, R.H., & Outcalt, M.R. THE INFLUENCE OF SETTING CUES ON MANUAL RESPONSES MADE TO FOLLOWING-INSTRUCTIONS MESSAGES. Contract # 33(G39)-ac-21269, Proj. 7192, WADC-TR-54-365, April 1955, 14pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio.

805

To discover the effectiveness of setting cues in facilitating manual responses made to following-instructions messages, subjects (64) were required to locate and manipulate in a definite sequence designated switches on a panel matrix of 64 switches. "Messages" conveyed the instructions indicating the specific switches to be thrown on each trial. Setting cues were of two types (area and pattern) each having four degrees of restriction, thus providing different degrees of information to location or sequence of switches to be thrown. Response efficiency was measured in total response time and was studied by analysis of variance techniques for the effect of the experimental variables. The findings are discussed in relation to "set" as a determinant of perceptual responses.

Churchman, C.W. PROBLEM APPROACH TO OPERATIONS RESEARCH. Sept. 1952, 21pp. Cite Institute of Technology.

812

This paper discusses operations research in terms of the questions it raises and the problems it faces. The practice of operations research in military and non-military situations is compared and the fundamental question of all such research stated as "What assistance can the scientist offer a particular policy maker or decision maker at the present time with respect to operation?" In answer, other problems are raised and discussed. Who is the decision maker? What are the possible decisions that can be made? What are the objectives? What is the best decision in terms of the objectives? How do we get the decision maker to adopt the best course of action? K 7

813 King, B.G. (Chm.). **AIRCRAFT EMERGENCY EVACUATION. OPERATING EXPERIENCE AND INDUSTRIAL TRIALS.** Rep. 2. May 1952, 29pp. CAA, Office of Aviation Safety, US Department of Commerce, Washington, D.C. (CAA-CAB Subcommittee Working Group, Washington, D.C.).

This report reviews the aviation industry's experience with the problem of emergency evacuation. The review is presented in 4 major parts, with section I dealing with Field Experience With Emergency Evacuation Procedures and Devices. 122 reports of accidents to tri-cycle gear transport aircraft in 1948, 1949, 1950 and 1951 were analyzed and it was found that partial gear failure and fire caused reduction in emergency evacuation. Section II, Aircraft Manufacturers' and Airline Operators' Emergency Evacuation Tests, reported tests simulating "wheels-up landing" conditions and the times for evacuating through doors and emergency exits. Section III, Airline Operations' Tests of Evacuation Slides, reports test conducted by 2 major commercial airlines to determine time required for escape by jumping into the slide as compared to sitting and scooting onto it. Slides constructed of 3 different fabrics were also tested. No definitive conclusions based on the results could be made. Section IV, Airline Operators' Provisions for Air Carrier Personnel Training in Emergency Evacuation of Passengers, reviews a survey of the operations manuals of 27 airlines. It was indicated that the information provided in these manuals was stated in general terms. Additional or revised instructions on emergency evacuation and supplementary course material were recommended in a number of cases.

817 Bartlett, F. **WHY HUMAN-FACTORS RESEARCH WILL CONTRIBUTE MOST TO SYSTEMS DESIGN.** HPS 206/1, March 1953, 7pp. Committee on Human Resources, Office of the Assistant Secretary of Defense, London, England. (University of Cambridge, Cambridge, England).

817 Systems design research is defined in terms of a multiplicity of items, individual or group, and that the efficiency of performance of any one item depends not alone on its own immediate conditions but also its relation to other items, some of which may be simultaneously present, and others may precede or succeed it in sequence. Key problems for research in such systematic performance are seen to be concerned with temporal structure, performance under stress, process of decision making and development of a new statistic. Problems of organization in systems design and research are discussed briefly.

818 Bartlett, F. & Mackworth, N.H. **PLANNED SEEING. SOME PSYCHOLOGICAL EXPERIMENTS. I. VISIBILITY IN THE CONTROL ROOMS OF FIGHTER COMMAND. II. THE SYNTHETIC TRAINING OF PATHFINDER AIR BOMBERS IN VISUAL CENTERING ON TARGET INDICATORS.** Air. Publ. 3139B, 1950, 76pp. Air Ministry, London, England.

818 This is a detailed review of some World War II research in Great Britain. Under "Visibility in the Control Rooms of Fighter Command" are several studies of the visibility of grids, arrows, letters, and numbers of various designs as a function of viewing angle and distance. Under "The Synthetic Training of Pathfinder Air Bombers in Visual Centering on Target Indicators" is reported a systematic experimental investigation of visual factors in the visual bombing problem followed by experiments on the design of a synthetic training device and the development of training procedures.

821 Davis, D.R. **PILOT ERROR: SOME LABORATORY EXPERIMENTS.** AP 2139A, 1948, 40pp. HM Stationery Office, York House, London, England. (Applied Psychology Research Unit, NEC, Cambridge, England).

821 This article presents the results of a series of experiments concerned with determining the nature and causation of pilot error. Utilizing the Cambridge Cockpit, pilot error was investigated as a function of such variables as noise, drugs, fatigue, and the type of instructions given to the subject. The results are discussed in terms of the types of errors induced by the various conditions of performance with specific emphasis upon the implications for the selection and training of pilots. Also included is a discussion of the individual differences manifested in these laboratory tests of pilot performance.

823 Edelman, H.R., Jr. **POLICY-WHERE WANTED FACTS.** *Ergonomics*, April 1953, 11(4), 13-16. (Neyl & Patterson, Inc., Pittsburgh, Penn.).

823 This paper presents a brief summary of the methods used by a management-research team in studying the problems of efficiency in a particular industrial organization from the point of view of the management itself. Both immediate and long-term values to management are discussed.

824 Edwards, T.M. **DEVELOPMENT OF AN INSTRUMENT FOR MEASURING AIRCRAFT COCKPIT VISIBILITY LIMITS.** Tech. Development Rep. 155, Jan. 1952, 8pp. Civil Aeronautics Administration, Tech. Development and Evaluation Center, Indianapolis, Ind.

824 A binocular-strip film camera for measuring and recording cockpit visibility is described. A photographic record of the outlines of windows in aircraft cockpits as seen by the pilot when he turns his head from extreme left to extreme right can be obtained. A grid of horizontal and vertical lines of 5° is automatically superimposed on the picture giving a reading of the angles of vision. Other practical uses for the device are suggested.

825 Edwards, T.M. & Howell, W.D. **A STUDY OF PILOTS' EYE MOVEMENTS DURING VISUAL FLIGHT CONDITIONS.** Tech. Development Rep. 179, June 1952, 23pp. US Technical Development and Evaluation Center, CAA, Indianapolis, Ind.

825 This study was conducted "to obtain further substantial information for establishing minimum angles of vision from the cockpit of airplanes." Motion pictures records were obtained using three cameras simultaneously: two recorded pilot's eye movements through a system of mirrors; one photographed the horizon out ahead of the airplane. The 11 pilots flew Boeing 377 Stratocruisers during daytime visual flight conditions. The film was analyzed frame-by-frame to determine windshield and window usage during each of ten defined flight phases ranging from taxi before takeoff to taxi after landing. Results were presented in terms of percentage of frames showing use of each windshield section which was five degrees high and ten degrees wide.

Flexman, R.E., Matheny, W.G., & Brown, E.L.
EVALUATION OF THE SCHOOL LINK AND SPECIAL
METHODS OF INSTRUCTION IN A TEN-HOUR PRIVATE
PILOT FLIGHT-TRAINING PROGRAM. Aeronautics
Bull. 9, April 1950, 44pp. University of
Illinois, Institute of Aviation, Urbana.

826
To evaluate proposed changes in training for the
Private Pilot Flight Test, 42 college students were
trained under a revised training syllabus. Half also
practiced in a synthetic trainer (the School Link);
half did not. All were given the CAA Flight Test,
both by CAA Examiners and by Private Pilot Examiners,
after ten hours of flight time. Test scores and in-
structors' grades are compared and are analyzed with
respect to the effectiveness of the Link. Suggestions
for improving training and for additional research are
discussed. The report has 12 appendices.

Fleming, J.C. IMPROVE POWER-PLANT INSTRUMENTATION BY
APPLYING HUMAN-ENGINEERING DATA. Power, Jan. 1954, 86-
89, 206, 208, 210. (The Bristol Co., Waterbury Conn.).

827
This article discusses the application of human engi-
neering data to instrument design with particular empha-
sis on power plant instruments and controls. Several ex-
amples of improved scale readability are described and
illustrated, and an experimental evaluation of two dials
is presented in brief. The need and value of increased
communication of techniques and knowledge between the
psychologist and engineer is indicated.

Giles, J.M. THE DISTRIBUTION OF VISUAL DE-
FECTS IN THE POPULATION. May 18, 1950. 23
pp. Owen Aves Memorial Lecture delivered to
the members of the Yorkshire Optical Society
at Leeds, England.

828
This paper considers the distribution of visual
defects in the population of Great Britain. The ana-
lysis of distribution, incidence of pathology, dia-
tribution of heterophoria and congenital color defici-
encies are based on existing data from many sources.
An assessment of the relative necessity for correction
of refractive errors in the population is made based
on the analysis.

Goldman, D.E. A REVIEW OF SUBJECTIVE RE-
SPONSES TO VIBRATORY MOTION OF THE HUMAN
BODY IN THE FREQUENCY RANGE 1 TO 70 CYCLES
PER SECOND. Proj. NM 004 001, Rep. No. 1.
Mar. 1948. 7pp. Naval Medical Research
Institute, National Naval Medical Center,
Bethesda, Md.

829
This study presents an analysis of the data of
seven investigations on subjective responses to mech-
anical vibration in the range of 1 - 70 cps. The fol-
lowing three reference levels are employed: the thresh-
old of perception; the threshold of discomfort; the thresh-
old of tolerance. A set of reference curves of
amplitude as a function of frequency are presented,
subject to an estimated uncertainty of about one-half
a log unit.

Gowdy, C.W., & Pearce, J.W. A SELECTED BIBLIOGRAPHY OF
THE OPEN LITERATURE ON AVIATION MEDICINE 1945-1955. DR
97, July 1955, 55pp. Reference Research Board, Department
of National Defence, Canada.

830
This is a selected bibliography of the open litera-
ture on topics in or related to Aviation Medicine (1945-
1955). Emphasis is placed on basic rather than applied
research in order to serve as a guide to more important
problems and recent experimental findings in the field.
Coverage is restricted to those journals which are likely
to be available in a medical library of average size with
no references to technical or project reports. These
topics receive special emphasis: air sickness, altitude
effects, anoxia and hypoxia, blood gases and respiratory
physiology, decompression aerobolism, explosive decom-
pression, hyperventilation, negative and positive G,
oxygen toxicity, pressure breathing, stress and fatigue,
and vestibular apparatus. R 724

Hoban, C.F., Jr. & van Ormer, E.B. PRACTICAL PRINCIPLES
GOVERNING THE PRODUCTION AND UTILIZATION OF SOUND MOTION
PICTURES. Spec. Rep. 1, Aug. 1950, 16pp. Instructional
Film Research Program, Pennsylvania State College, State
College, Penn.

832
This report is an abstract of the concluding chap-
ter of "Critical evaluation and summary of experimen-
tal literature on instructional films." It summarizes
results simply and with recommendations for the guidance
of film sponsors, producers, distributors, and users.
Material is included on values of films in instruction
and principles governing film influence such as pre-
vious knowledge, motivation, content of film and in-
structional techniques.

833
Hooton, E.A. (Dir.). A SURVEY IN SEATING. 1945, 101pp.
Haywood-Wakefield Company, Gardner, Mass. (Anthropology
Dept., Harvard University, Cambridge, Mass.).

833
This project consisted of three phases: "1. taking
eight measurements on each individual of a group consti-
tuting a reasonably representative sample of the popula-
tion of the U.S.; 2. reducing these measurements statis-
tically so that the mass of data can be easily compre-
hended and used for manufacturing specifications; 3. mak-
ing certain recommendations, on the basis of the statis-
tics thus obtained, pertaining to the design of seats." A
special measuring chair, accurate to 1/8 in., and a
weighing scale with measuring rod were used. Some 3,800
persons representing a satisfactory distribution of age
and economic level were measured. The data were evalu-
ated in terms of percentiles and correlations, the sexes
being treated both separately and combined.

Schutz, H.G., & Paull, D.M. MODIFICATION OF
FOOD INTAKE BY THE USE OF DRUGS. Proj. 7-84-
15-007, Interim Rep. 1, March 1956, 30pp.
Food Acceptance Branch, Food Laboratories,
Quartermaster Food and Container Institute
for the Armed Forces, Chicago, Ill.

834
To study the nature of the mechanisms regulating
food intake, the effects of specific drugs and combina-
tions of drugs (either known to influence intake or
seemed likely to have such an effect) were measured on
adult male albino rats. Two groups of studies were
reported: (1) those related to neuro-hypothalamic
theories (a. reserpine; b. Benodaine and Urecholine; and
c. insulin-Desocyn, trained eating versus normal eating);
and (2) those related to glucostatic hypothalamic
theories (a. insulin-Desocyn, blood sugar; b. insulin-
glucose; and c. self-selection). In all studies food
intake was measured and in some blood sugar values were
obtained. The results were analyzed and discussed in
relation to the two theories of hunger regulation.

Kleeser, R.W. SECOND ANNUAL REPORT OF THE DIRECTOR OF THE MOOSEHAVEN RESEARCH LABORATORY TO THE NATIONAL ADVISORY COUNCIL FOR RESEARCH. March 1951. 92pp. Moosehaven Research Lab., Moosehaven, Fla.

835

This is a report of the Moosehaven Research Laboratory prepared by R.W. Kleeser in March, 1951. Seven studies which deal primarily with change as a function of age cover the following: 1) the comparative reaction times of 124 subjects, 65-86 yrs of age to an auditory stimulus; 2) the comparative strength of grip of 122 subjects, divided into four groups with mean ages of 67.9, 72.9, 77.7, and 82.5 yrs, on a dynamometer; 3) the comparative performance of 140 subjects, 65-85 yrs of age in an audiometer examination; 4) the comparative visual performance of 24 subjects, 65-70 yrs of age; 5) a study of attitudes in an aged population; 6) intelligence changes in old age; and 7) a series of psychophysiological studies on an old age population. Seaman, E.A., & Lutz, H.B. A PORTABLE HEART BEAT RECORDER. Tech. Memo. 1/56, March 1956, 7pp. Defence Research Northern Laboratory, Defence Research Board, Canada.

840

A portable self-contained unit for recording the heart beat of test subjects in the field is described. A recorder with spring driven chart together with photoelectric heart beat pick-up and associated amplifier are discussed. I. R 2

841

McFarland, R.A., Holway, A.H., & Hurvich, L.M. STUDIES OF VISUAL FATIGUE. Apr. 1942. 255pp. Harvard Univ., Graduate School of Business Administration.

841

To establish valid and reliable criteria for the detection and measurement of visual fatigue, a series of experiments were performed based on a functional analysis of the factors of clear seeing: reading and the visual near point; reading and size of pupillary aperture; blinking and visual fatigue; reading, eye-movements and exercise; perceptual factors (differential brightness sensitivity, color contrast, critical flicker); and physiological factors (respiration, anxiety, bodily posture). Results are discussed with a view to a better understanding of factors affecting visual fatigue. T.O.I.R-26.

842

McLaughlin, S.C. THE BLUE-WEAKNESS OF THE I.C.I. STANDARD OBSERVER. 1952. 2pp. Tufts College, Medford, Mass.

842

This short note presents evidence from the literature and from direct observation in explanation of certain anomalies in the colorimetry of samples having a color depending heavily on energy below 450 millimicrons. This is called the "blue-weakness" of the ICI Standard Observer. T.R.11.

843

Mottley, C.H. OPERATIONAL RESEARCH: IN GOVERNMENT ADMINISTRATION. Working Paper No. 7. Oct. 1950, 15pp. USAF Assistant for Operations Analysis, Operations Headquarters, Washington, D.C.

843

Operational research is defined as the application of the scientific method to operating problems for the purpose of providing executives with a sound basis for decisions regarding the administration of affairs that are under their control. The use of statistical methods is cited as an important part of the research operation. Examples of the application of operational research to various types of governmental problems are presented. The characteristic features of the method are described and a model developed. I. R 12

844

Murrell, M. NOTES ON THE DESIGN OF EQUIPMENT FOR EASE AND ACCURACY OF OPERATION. Naval Motion Study Unit Rep. 36, April 1950, 6pp. Department of Operational Research, Admiralty, London, England.

844

This report contains a data summary on the layout and design of equipment for easier and more accurate operation. Principles are set down in four major categories: equipment location--operator position, working area, display position; control design--cranks, hand-wheels, knobs, joysticks and levers, foot pedals and pushes, control coding; control-indicator relationship--cranks and knobs, levers, left-handed controls; indicator design--choice and arrangement of indicators, scale pointers. The data thus included are intended to assist equipment designers. I.

Small, A. (Dir.). STUDIES OF THE RECOGNITION OF SHAPING EDGES. FINAL REPORT. Contract NME 2894, Sept. 1946, 10pp. Nav Electronics Lab., San Diego, Calif. (Navar Data Div., Univ. of California, San Diego, Calif.)

The audibility of submarine echoes when masked by reverberation, with and without doppler, and by noise was studied. The 24 Mc echoes and reverberations were heterodyned to a frequency of about 800 cps. Recognition differentials, (20 log echo amplitude/reverberation, or noise amplitude for 50% recognition of the echo) were determined, together with the effect of a number of physical and psychological factors upon them. This is a brief paper presenting opinions held by some authorities in the field of vision and highway safety on the use of colored glasses for night driving as a means to eliminate headlight glare.

854

Roos, S.W. FLIGHT BY PERISCOPE. I. PERFORMING AN INHERENT FLIGHT PATTERN: THE INFLUENCE OF SCREEN SIZE AND IMAGE MAGNIFICATION. Univ. of Ill. Bull., Mar. 1951, 49, 46pp. Univ. of Ill. Institute of Aviation,

854

To evaluate a realistic pictorial attitude display, eleven pilots flew a standard instrument flight pattern using a periscope display which presented an image of what lay ahead of the aircraft. Factors varied were size of screen (3, 4, and 2 fathoms) and magnification of image (2.0X, 1.25X, and 0.5X). Two control conditions consisted of flight with unrestricted direct visibility and flight with no outside visibility, one attitude display. Error scores of altitude and direction are analyzed and discussed in terms of the conditions which affect the usefulness of this type display.

Schafer, T.M. DETECTION OF A SIGNAL BY SEVERAL OBSERVERS. FINAL REPORT. Problem MEL-181, NE 121304, USNEL Rep. 101, Jan. 1949, 9pp. Nav Electronics Lab., San Diego, Calif.

856

To determine whether an improvement in the detection of sonar signals may be made by the use of more than one observer on the same piece of equipment, sets of data from previous laboratory studies were re-examined. The tests used three-second pure-tone signals with random noise background or echoes from short pings with sea reverberation background, presented through headphones or on a cathode-ray oscilloscope with linear sweep. A wide range of signals and backgrounds was represented. The records of three observers from each set of data were studied for agreement with predictions from theory developed to cover the use of several observers.

857

This report summarizes a series of investigations conducted to develop a general methodology for the study of consumer preferences and behavior. Application of techniques from the field of psychometrics and psychophysics is made to predict choice and purchases of consumers on the basis of previously expressed preferences. The studies are divided into two areas: (1) methods of obtaining and quantifying preference ratings; (2) the use of quantified ratings in connection with models for predicting consumer behavior. Plans for future research are included.

R 5

860 Steinman, Albert A. REACTION TIME TO CHANGE COMPARED WITH OTHER PSYCHOPHYSICAL METHODS. Arch. Psychol., May 1944, 22, 60pp. (Columbia University, New York, N.Y.).

The purpose of the study was to examine the adequacy of simple reaction time (RT) to change as a psychophysical method. In the first of 4 experiments the relation of RT to changes of brightness and stimulus intensity was investigated. It was found to decrease as the magnitude of the change increased, for the mean RT the decrease showed a hyperbolic function. RT was found to decrease as intensity increased up to a medium level, there after RT increased with increasing intensities. In the second experiment the stimulus ratio required for the liminal brightness increment was shown to decrease as a function of intensity in the manner described by the data of Feig and Brudun. In the last 2 experiments, it was found that over a portion of the stimulus range, the speed of response was related in a regular manner to apparent magnitude as judged by the method of single stimuli. For equal decrements and increments of brightness, RT was found faster for decrements. Similarly, decrements were shown to be judged greater than objectively equal increments. It may be concluded that simple RT to change is an adequate psychophysical method. (MGIA) R 25

861 Tinker, M.A. INTERPRETATION OF ILLUMINATION DATA. Amer. J. Opt. and Arch. Amer. Opt., 1952, 29, 293-300. U. of Minnesota.

862 The focus of this paper is an examination of the validity of the practice of recommending illumination levels for specific visual tasks derived from basic laboratory data obtained in studies on visual acuity, speed of vision, and visibility as affected by brightness levels, nervous muscular tension and performance while working under different brightness levels. The data, as plotted on a logarithmic scale, is compared with the same data on a linear scale and the question of statistically significant increases in any of these functions at higher levels of brightness is examined.

862 Ohwaki, Y., & Onizawa, T. THE FUNCTION OF THE GROUND AS "FRAME-WORK" IN THE PERCEPTION OF SIZE. Tohoku Psychologica Folia, 1951, Tomus XII, Fasciculus 3-4, 53-66. (Tohoku Univ., Sendai, Japan.)

863 To study the effect of framework on perception of size, four subjects observed a geometric figure drawn on a card and later watched it for size from ten comparable figures of varied sizes, distributed at random on a table top, either with a frame (drawn on a card) or without a frame (cutouts on large gray background). Errors are analyzed for quantitative and directional effects of the framework on perception of size. Practice effects of the four testing periods are noted. T.G.I.R.

Hilgard, E.R. REPORT OF HIGHWAY SAFETY RESEARCH CORRELATION CONFERENCE, WASHINGTON, D.C. June 5 and 6, 1952, 67pp. Committee on Highway Safety Research, National Academy of Sciences-National Research Council, Washington, D.C.

A group of sixty scientists and engineers selected from various specialties met for two days of intensive consideration of a nationwide research program on human factors in relation to physical factors of the vehicle and the highway as causes of traffic accidents. An introductory briefing session was followed by a panel discussion designed to present to the research scientists the problems as seen by practical traffic people. Then followed an afternoon, evening and morning of group discussions on ten different topics to draw up recommendations as to areas of most needed information. Lists of specific projects were purposely avoided, since good research people like to formulate their own detailed problems and methods. Finally the chairmen of these sub-groups reported the recommendations to the group as a whole.

Bromer, J.A. A COMPARISON OF ULTRA-VIOLET AND INDIRECT RED SYSTEMS OF ILLUMINATION FOR AIRPLANE INSTRUMENT PANELS. Rep. TED No. NAM 4422. July 1945. 11pp. Naval Air Experimental Station, Naval Air Material Center, Aero Medical Dept., U.S. Naval Base Station, Philadelphia, Pa.

7-0
To compare relative efficiencies of two systems for instrument panel lighting of aircraft (indirect red illumination and floodlighting ultra-violet), six subjects were required to look at the illuminated panel then locate a faint target projected against a simulated night sky background. Other subjects flew a given course in the Link Trainer under both lighting systems. Time to locate the target and deviations of flight performance from the "perfect" performance are analyzed and discussed in terms of the two lighting systems.

Brown, F.R., & Lowery, E.A. A STUDY OF THE REQUIREMENTS FOR LETTERS, NUMBERS AND MARKINGS TO BE USED ON TRANS-ILLUMINATED AIRCRAFT CONTROL PANELS. PART I. THE EFFECT OF STROKE WIDTH UPON THE LEGIBILITY OF CAPITAL LETTERS. Rep. TED No. NAM EL 606. Sept. 1949. 19pp. Naval Air Experimental Station, Naval Air Material Center, U.S. Naval Base Station, Aeronautical Medical Equipment Lab., Philadelphia, Penna.

879

To determine the effect of varying stroke width on legibility of capital letters of fixed height and width, 23 subjects identified test letters (light on dark, five stroke width-height ratios from 1:5 to 1:15) viewed under simulated daylight and varying brightnesses of red trans-illumination for 1/25 and 1/5 seconds. Mean error scores are analyzed for differences due to the varying conditions. An optimal stroke width-height ratio is recommended for use on trans-illuminated aircraft control panels for combined day and night use.

Brown, F.R. SURVEY OF LIGHTING PREFERENCES OF A GROUP OF NAVAL AVIATORS IN THE XAM-2 COCKPIT MOCKUP. Rep. TED No. NAM EL 600. Oct. 1948. 24pp. Naval Air Experimental Station, Naval Air Material Center, U.S. Naval Base Station, Aeronautical Medical Equipment Lab., Philadelphia, Penna.

880

To determine preferences for lighting plans for console and instrument panel in the XAM-2 cockpit mockup, twelve experienced aviators were asked to examine these areas under conditions of (1) no lighting, (2) indirect lighting only, (3) flood-lighting only, and (4) a combination of both. They rated the lighting in order of preference for both console and instrument panel. The results are discussed in terms of illumination for aircraft cockpits; recommendations are included.

Bromer, J.A. INSTRUMENT LIGHTING- INVESTIGATION OF ULTRA-VIOLET REFLECTIONS. Rep. TED NAM 31334. Naval Air Experimental Station, Naval Air Material Center, Aero Medical Dept., Navy Yard, Philadelphia 12, Penna.

881

To study some problems of ultra-violet floodlighting of instruments and cockpit, measurements were made in 13 aircraft of the reflected light from all sources (1) with lights at all brightness settings, and (2) with only auxiliary lights. The amount of brightness at the level of the pilot's eyes was also measured. Subjective evaluation was made of other aspects of the lighting. Results are discussed in terms of glare at the pilot's eyes and recommendations are made for improving the lighting installation for increased visibility and maintenance of dark adaptation.

Wilcoxon, H.C., Johnson, M. & Golan, D.L. THE DEVELOPMENT AND TRYOUT OF OBJECTIVE CHECK FLIGHTS IN PRE-SOLO AND BASIC INSTRUMENT STAGES OF NAVAL AIR TRAINING. Joint Proj. Rep. NM OGI 058.24.01, July 1952, 152pp. USN School of Aviation Medicine, Pensacola Air Station, Fla. & The Psychological Corporation, New York, N.Y.

886

This report summarizes the development and testing of objective check flights in pre-solo and basic instrument stages of Naval Air Training. First approximately 100 students in each stage had two successive check flights with different instructors, graded on the current Navy form. Then approximately 100 students in each stage had two successive check flights with different instructors, graded on two objective rating forms developed for the project as well as on the standard form. Reliabilities of the standard and experimental grading procedures are compared and implications for training flight evaluation discussed. Samples of all forms are presented.

Black, J.W. SOME EFFECTS UPON VOICE OF HEARING TONES OF VARYING INTENSITY AND FREQUENCY UPON READING. Speech Monographs, 1950, 17, 3-6. Research Proj. NA 142 592, BuMed Proj. NM 001 064.01.01, Joint Proj. Rep. 1, Jan. 1950, 6pp. USN School of Aviation Medicine, NAS, Pensacola, Fla. (Ohio State University, Columbus, Ohio).

The present study was designed to find in what manner the reading voice was influenced in pitch (frequency of the fundamental) and over-all intensity by the speakers hearing pure tones as he read. 15 Ss individually read from a list of nonsense words as they listened to tones over earphones. Tones of 90, 121, 161, 216 and 287 cps, and 40, 55, 65, 75, 90 and 98 db were used. The data gave no indication that vocal pitch (frequency of the fundamental) was affected by the frequency of a stimulus tone that sounded in a speaker's ear during reading. Clearly, however, both the intensity and pitch of voice were affected by the level of the tone that was heard. These effects, however, appeared not to be a function of the intensity of the tone but rather of its loudness. Moreover, they were differential. As the tones were increased from loudness level 10 to 65 through 11 points of measurement vocal intensity and frequency increased linearly. Responses to tones of higher loudness levels were not in keeping with these patterns. Both vocal pitch and intensity increased with greater rate per unit change of the loudness level of the stimulus tone at higher levels, and the acceleration rate was greater for vocal intensity than for frequency. The possibility is suggested that in the production of vocal intensity there is more 'control' in the lower portion of the continuum from soft to loud than in the upper part of this range.

Walker, C. & Black, J.W. THE INTRINSIC INTENSITY OF ORAL PHRASES. Contract N60NR 22525, BuMed Proj. NM 001 064.02, Joint Rep. 2, May 1950, 40pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla. (Ohio State University, Columbus, Ohio).

The primary objective of this study was to establish lists of phrases, equated in natural intensity and duration, that might serve as test materials in studies involving comparisons of either rate or intensity of reading. Each of 24 readers repeated 450 phrases of five-syllable length. The three highest root-mean square values of intensity throughout the duration of each reading of a phrase were measured and reduced to a single value. The mean intensity and standard deviation of each phrase as read by 24 speakers were computed. Two sets of lists were constructed: Set A with 29 equated lists of eight phrases each; and Set B with 50 equated lists of five phrases each. There was high consistency in the intensity pattern of a phrase as read by 24 speakers. However, the intensity pattern of one phrase was not indicative of the pattern of another phrase of similar length.

Atkinson, C.J. A STUDY OF VOCAL RESPONSES DURING CONTROLLED AURAL STIMULATION. Contract N60NR 22525, BuMed Proj. NM 001 064.01.05, Joint Proj. Rep. 5, Dec. 1950, 15pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

Some aspects of the involuntary control of the voice by means of the acoustic environment were investigated. Pure tones of 80, 100, 150, 250, 500, 1000, 2000 and 4000 cps, and up to 100 db in one earphone provided the acoustic environment for 24 speakers. The intensity of the tones was found to have differential effects upon both the mean fundamental frequency and the mean intensity with which the speaker said monosyllables. The frequency of the tones had no effect upon either the mean fundamental frequency or the mean intensity of the responses. This ignores what were apparently significant effects when the level of the stimulus was very high.

Black, J.W. THE EFFECT OF DELAYED SIDE-TONE UPON VOCAL RATE AND INTENSITY. Contract N60NR 22525, BuMed Proj. NM 001 064.01.06, Joint Proj. Rep. 6, Jan. 1951, 7pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

Twenty-two subjects read 11 series of short phrases. With each series the subject heard his side-tone in a different time relationship with his speaking. These relationships were .00, .03, .06,30 sec. delay of the side-tone. A relatively constant intensity of side-tone was maintained. The effects of delayed side-tone were: a) reduced rate of reading; and b) increased vocal intensity. The maximum single decrement in rate occurred with the change from .03 to .06 sec. delay; the maximum over-all reduction in rate occurred with .18 sec. delay; and maximum vocal intensity, with .27 sec. delay (not significantly different from .09 sec. or any longer delay).

Black, J.W. THE EFFECT OF NOISE-INDUCED TEMPORARY DEAFNESS UPON VOCAL INTENSITY. Contract N60NR 22525, BuMed Proj. NM 001 064.01.07, Joint Proj. Rep. 7, Jan. 1951, 7pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

24 groups of males, 6 members per group, read phrases before and after 120 mins. exposure to simulated cockpit noise. At the time of the reading a threshold measurement was secured of the readers' auditory acuity at 512 cps. The exposure to noise reduced the mean hearing values 9 db and increased the vocal intensity half of this amount. The recovery in either instance was complete after 15 mins. of silence. The trends of recovery, in so far as they progressed, were linear in both sets of measures. Vocal intensity is apparently not solely a function of the intensity of the airborne side-tone.

Marple, H.B. & Merrill, S.H. A DEVICE FOR THE PRODUCTION OF DELAYED SIDE-TONE. Contract N60MR 22525, BuMed Proj. NM 001 064.01.08, Joint Proj. Rep. 8, Aug. 1951, 24pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

Part I of this report describes the Audio Signal Delaying Unit, a machine that was constructed to provide a time delayed side tone for use in experiments in acoustics, speech, and psychology. By the use of a magnetic tape recorder with a fixed playback and a movable record head, and the use of a high tape speed (60-65 in. per sec.), continuously adjustable time delays were obtained from a minimum of 0.02 sec. to a maximum of 0.35 sec. The signal-to-noise ratio of the machine was about 40 db, with essentially uniform frequency response from 90 to 8000 cps. A simple method for measuring the time delay introduced by the machine, requiring only an a.c. voltmeter and calibrated audio oscillator as additional equipment is also described. Part II of this report is a description of a portable model with improved frequency response. Notes on construction and operation are included.

Black, J.W. ACCOMPANIMENTS OF WORD INTELLIGIBILITY. Contract N60MR 22525, BuMed Proj. NM 001 064.01.09, Joint Proj. Rep. 9, Feb. 1952, 15pp. USN School of Aviation Medicine, Naval Air Station, Fla.

This study was concerned with the relationships between word intelligibility and aspects of the syllabic pattern, word familiarity, phonetic characteristics of words and the relative intelligibility of words based on a sample of 3657 words of medium (20-80%) intelligibility. 10,000 words were screened from Thorndike's 1a-10 categories to give the final experimental list. 80 panels of listeners, 3-12 subjects per panel, listened to the words in classroom "quiet" (65 db of white noise), each panel heard some 450 words. Another 80 panels listened to the words in noise (110-118 db aircraft type) at approximately 2 db signal-to-noise ratio. The analyses indicate that the more familiar words are more accurately identified. Structural characteristics also contribute to recognition; words with many sounds are more intelligible than words with fewer sounds. Thus, three influences, two of them contrary, operate in the auditory recognition of a word. Word familiarity and word complexity operate against each other while phonetic elements add a third dimension that differs from each of the preceding factors, but may not necessarily operate against either of them. 18 sounds tend to enhance the recognition of words; 7, to detract. An intelligible word would seem to be a familiar one, with more than one syllable, the accent on the second syllable and composed of combinations of the 18 more intelligible sounds. Either alternately to the criterion of familiarity, or imposed upon it, the word to be intelligible should contain more instead of less sounds.

Tulhurst, G.C. AUDIBILITY-RECOGNITION SOUR. PRESSURE FUNCTIONS OF THE VOICED COGNATE CONSONANTS. Joint Proj. NM 001 064.01.11, Rep. 11, May 1952, 14pp. USN School of Aviation Medicine, Naval Air Station, Fla.

The present study was concerned with the audibility and recognition sound pressure level functions of the voiced cognate consonant sounds (g, b, v, d, z, z^h , and dz). From these functions the psychophysical thresholds in each syllabic position in relation to the constant vowel (U) were derived. The eight consonant sounds and the single vowel were combined in a random manner into nonsense syllables of the CV, VC and CVC type. These recorded combinations were presented by a high-fidelity magnetic-tape recorder to 288 listeners in groups of 12 who listened binaurally over earphones in a soundproofed room. Some of these subjects listened for audibility and others for recognition. A correlation (r) of .86 was found between initial and final audibility series. A distance "aphonemic interval" between the recognition and audibility thresholds was found. Significant differences were found between the 2 recognition thresholds at each syllabic position. The sounds that were heard as substitutions for the stimulus sounds by the listeners were tabulated and percentages of the total number of substitutions for each sound were calculated. The only consistent patterning of the substitutions was for the final (z), substitutions (the three most frequent) all continuant in character. The calculated sound pressure levels, while they must be considered as rough approximations, indicate that the syllables, hence the vowel, were detected at very low levels in comparison to the arbitrary acoustic reference of .000205 dynes/cm². These calculations give a value of threshold of the vowel (U) as 25 db above the acoustic zero reference point.

Atkinson, C.J. ADAPTATION TO DELAYED SIDE-TONE I. Joint proj. NM 001 064.01.12, Rep. 12, May 1952, 5pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

The side-tone of speakers was delayed while 60 phrases were read. These 60 phrases were read slower and louder than phrases read without delayed side-tone. There was no trend demonstrated in the course of reading the 60 phrases to indicate that speakers adapt to a delayed side-tone; that is, there was no trend in either the duration or sound pressure level toward the duration or sound pressure level of like phrases spoken with normal side-tone. While no adaptation was shown in either the duration or the sound pressure level of speech, there was some evidence that, perhaps, more reading periods might show significance in these aspects. Further, these results do not rule out adaptation in quantities not measured, such as perspiring palms, breath control, quality of speech, or repetitions and mispronunciations of words.

Atkinson, C.J. SOME INFLUENCES OF DELAYED SIDE-TONE UPON INTELLIGIBILITY. Joint Proj. NM 001 064.01, Rep. 13, July 1952, 6pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

Groups of listeners heard intelligibility tests in noise and in quiet. The speakers read with delays of .02 to .09 sec. introduced into their side-tone. The listener heard either the original saying or the original plus the delayed saying of speech material. Speech was received less accurately in every condition, except when the speakers read with a .05, .08 or .09 sec. delay in their side-tones. It was concluded that: a) Listeners hear words more accurately if words are received only as an original message; superimposing an original and a delayed rendition of a word renders the word less intelligible under the delay times studied; b) The delay of .05 sec. in the side-tone of the speaker appeared to affect the reception of his speech beneficially; the intelligibility scores for this condition were significantly higher than at other delay times; c) An intelligibility increment similar to but less than that observed for the .05 sec. delay was present for the .08 and .09 sec. delay of side-tone; d) The effects of the delayed side-tone upon the intelligibility of a speaker became evident in a period of less than 2 min.

Atkinson, C.J. INTELLIGIBILITY OF SPEECH HEARD AT HIGH ALTITUDE AND SEA LEVEL. Joint Rep. NM 001 064.01, Rep. 14, Oct. 1952, 7pp. USN School of Aviation Medicine, Pensacola, Fla.

This investigation was conducted to determine how well speakers were able to make themselves understood over an aircraft intercommunication set while at 43,000 ft. and breathing pure oxygen at 10 in. of water pressure. 4 groups of speakers in units 10 per group took part in speech intelligibility testing conducted during altitude runs in a low-pressure chamber taken to 43,000 ft. Approximately one-half of each panel served as speakers-listeners at altitude and the other half functioned at sea level only as listeners. The speech materials were 4 forms of multiple-choice intelligibility tests. Each group made some 15 altitude runs of one-half hour at altitude. Speaker scores at altitude, listener scores at altitude, and listener scores at sea level were obtained. Listening was done monaurally, one ear open to ambient sounds. The tests were scored in percentage of correct responses. The scores from the listeners at altitude were compared with the scores from the listeners at sea level. All groups start low at Day 1 and rise in percentage of correct responses up to Day 15. The variance due to days was significant in all 4 groups tested but the difference in variance between sea level and altitude was small and not significant. It was observed that speaking at altitude tended to restore O_2-CO_2 balance in the blood.

Tolhurst, G.C. LOCALIZATION ACCURACY RESULTING FROM ISOLATED BINAURAL STIMULATION. Joint Rep. NM 001 164.01, Rep. 15, Jan. 1953, 8pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

Judgments of apparent azimuth of the source of 5 different types of sound stimuli were made by 250 young adults, 30 judgments each. The subjects, in groups, listened over an isolated dual-channel system using split headsets to a single sound source. In effect this eliminated visual, muscle tonus and proprioceptive muscle cues. Subjects were unable to localize the 5 sound types better than chance within a quadrant of $\pm 45^\circ$, except music. There were significant differences between localization frequency when the "correct" criterion was $\pm 90^\circ$. The subjects made judgments, at a highly significant level better than chance, that the sound source was exactly 180° from the stimulus.

Black, J.W. MULTIPLE-CHOICE INTELLIGIBILITY TESTS. Joint Rep. NM 001 064.01, Rep. 17, Nov. 1953, 20pp. USN School of Aviation Medicine, Naval Air Station, Fla. (Acoustic Lab., Ohio State University, Columbus, Ohio).

24 equivalent multiple-choice intelligibility tests were constructed. Each test is comprised of 27 single-word items that are read by speakers in sequences of 3 words. Panels of 11 listeners respond by individually selecting the "heard" word from a group of 4 possible responses. The error items on the listeners' answer form were derived from the errors that were made by the listeners who heard the test items in a "write-down" testing situation. The 24 tests are not dissimilar in the mean values of the items, nor in the variance of the item-values from list to list. The scores assigned by the tests: a) Have split-half reliability or r_{ss} .70-.80; b) Correlate with earlier multiple-choice tests and PB tests r_{ss} .72 and .60 respectively; and c) Vary with noise level in the testing room, approximately 1.5% per db. The tests appear also to be useful in an environment of "classroom noise", or "free-room" testing. The circumstance for which the tests were designed would allow for testing groups of 12 members, and require a new group with either: a) each testing situation, or b) each pair of such situations. The administration time of the test to a panel of 12 persons is approximately 20 minutes.

Black, J.W., Atkinson, C.J., Bragg, V., Merrill, S.W., et al. A MEASUREMENT OF THE TEMPORARY EFFECT OF NOISE UPON HEARING. Proj. NM 001 064.01.18 & Contract NCOM 22525, Proj. NR 145 573, Rep. 18, Nov. 1953, 18pp. USM School of Aviation Medicine, Pensacola Air Station, Fla. (Ohio State University Research Foundation, Columbus, Ohio).

903

A pulse-type hearing test was constructed for assessing the temporary hearing loss of personnel exposed to controlled levels and spectra of noise for specified times. Pulses of 'white' noise and 500-cycle tone were employed in a series of 2 db decremental steps. 1. The two types of pulses measure different aspects of the hearing function. 2. Five administrations of equivalent forms of the test are required for indoctrination. 3. A deviation up to 0.7 db., seems to be 'expected' in the preparation and administration of the tape-recorded test. The test was adapted and coupled with a multiple-choice word-reception test and...compared with more conventional pulse-type tests."

Black, J.W., Tolhurst, G.C. & Merrill, S.W. APPLICATIONS OF MULTIPLE-CHOICE SPEECH INTELLIGIBILITY TESTS IN THE EVALUATION AND USE OF VOICE COMMUNICATION EQUIPMENT. Joint Rep. NM 001 064.01, Rep. No. 19, Nov. 1953, 22pp. US Naval School of Aviation Medicine. (Acoustic Laboratory, The Ohio State Univ.).

Multiple-choice intelligibility tests were developed during World War II for measuring the results of training in voice communication. The tests have been applied only in situations in which only an occasional measurement was required that employed the same personnel, as before and after classroom instruction. This restriction arose because of the inflexibility of the multiple-choice tests and the restrictions imposed by a single formal printed answer form. More recently, additional forms have been devised and the tests have been used extensively in evaluating equipment and the performance of operators. Summaries of approximately 20 such applications comprise this report. The topics of typical uses include evaluations of visual monitoring of voice level, temporal regularity of voice signals, the relative intelligibility of recorded speech, a relationship between side-tone and "free-room" intelligibility, the components of the tower-to-aircraft radio system, comparisons of alternative headsets and microphones, and bone-conduction masking. A singular utilization of the multiple-choice tests is through controlling the separation time of the test items and determining the rapidity with which the test items can be identified through comparison systems.

Lightfoot, C. EFFICIENCY OF IMPAIRED EARS IN NOISE: D. RELATIONSHIP BETWEEN TYPE OF IMPAIRMENT AND AUDITORY MASKING. Rep. 55-121, June 1956, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

905

To investigate the relation between type of impairment (auditory and auditory masking, pure-tone and spondee thresholds were obtained for 31 normally hearing subjects and 59 with impaired hearing (17 with conductive impairment; 42 with perceptive). Measurements were made in quiet and two levels of white noise (group 1: 60 and 80 decibels; group 2: 80 and 95 decibels). The amount of masking (m) of thresholds was studied as a function of effective level (Z) of masking noise for various types of subjects. Discrepancies between obtained data and that estimated from previously established M-2 functions were analyzed. Discussion relates the findings to the concept of "critical band" in studies on masking.

Fishman, S. DEVELOPMENT OF A SHORT BATTERY OF TESTS TO PREDICT PHYSICAL EFFICIENCY GRADES OF WEST POINT CADETS. PJ 4086 03, R and A RCS, PHS Rep. 735, Feb. 1947, 12pp. USA Personnel Research Section, Adjutant General's Office, Washington, D.C.

915

To develop a short battery of physical proficiency tests from a preliminary battery of 19 tests which could be used to predict several criteria of cadet performance at West Point during the first year, data were gathered on cadets in the graduating class of 1949. At time of entrance (1945) 598 cadets had been given ten tests and 110 had been given nine additional tests. Scores on the tests were analyzed for their relationship to 1) total physical education grade at end of first year, 2) MPP-1 IV/IV, a "buddy rating" on physical competence, and 3) discharges and resignations during the first year.

917 Brogden, H.E., Burke, L. & Lubin, A. A FACTOR ANALYSIS OF MEASURES OF PHYSICAL PROFICIENCY. Proj. 29534100, PHS Rep. 937, April 1952, 16pp. US Department of War, TAGO, Personnel Research Section, PR & PBR-Pers Bur, Washington, D.C.

The purpose of this study was to identify basic physical abilities underlying 31 physical proficiency test scores. The physical proficiency test scores, height, weight, and grades were obtained for 217 cadets of the U.S. Military Academy. This data was analyzed by: a) Determining product-moment correlations of all variables; b) Factoring the matrix of inter-correlations employing Thurstone's Group Centroid Method; c) Performing orthogonal rotations of the centroid factors to achieve as close an approximation to simple structure as possible; d) Where the factor plots indicated correlation between 2 clusters of tests, a rotational technique was used employing an additional orthogonal axis. No one factor was found in all the tests. 6 factors were narrow and specific in content and believed to be of no value outside the areas in which these specific activities were involved. These 6 factors were identified as size, course grades (gym, wrestling, boxing, and swimming), throw, jump, run, and broken run. 6 general factors were found. These 6 factors were: a) General (factor of) leg movement, e.g., broad jump; b) Arm extension, e.g., floor push-ups; c) Arm flexion, e.g., rope climb; d) General (factor of) arm movement, e.g., chin; e) Endurance, e.g., chin; f) Ability to mobilize quickly a maximum of force or speed, e.g., soft ball throw.

Navron, M.D., Fay, R.J. & McGrath, J.E. THE EFFECTIVENESS OF SMALL MILITARY UNITS. FINAL REPORT. Contract DA 49 083 OSA 365, Proj. 29565100, Subtask 79, PRS Rep. 980, Sept. 1952, 135pp. USA Personnel Research Office, Office of the Adjutant General, Washington, D.C. (Institute for Research in Human Relations, Philadelphia, Penn.).

922

The purpose of this study was to develop useful measures of rifle squad performance and of the individual and group characteristics contributing to effective teamwork. These measures included tests of four basic combat tasks: attack, defense, point of an advance guard, and reconnaissance patrol; job knowledge; attitudes and interpersonal relationships within the team; and rating forms for evaluating squads and squad leaders. Comprehensive directions for use of these tests by Army units were developed; also a handbook of directions for the construction and use of similar small-unit tactical tests was presented. Predictors of group performance were hypothesized and field trials of some were summarized.

Sharp, L.H., Gordon, D. & Reuder, Mary. REVIEW OF STUDIES ON THE EFFECTS OF TRAINING ON NIGHT VISION ABILITY. DA Proj. 29530100, PRS Rep. 974, Aug. 1952, 10pp. USA Personnel Research Section, Adjutant General's Office, Washington, D.C.

929

To study the question of whether testing, training, or both are required to obtain a group of individuals for key assignments in night operations, a survey was made of evidence in the technical literature concerned with night vision testing and training. A critical analysis of the data presented in these studies is made and suggestions for further research are given. T.R.10.

930

Wherry, R.J. & Corbin, H.M. STUDIES IN VISUAL ACUITY. PRS Rep. 742, 1948, 161pp. USA Personnel Research Branch, Adjutant General's Office, Washington, D.C.

930

is a first move to improve wall chart tests as measuring instruments. 14 tests of visual acuity (far) were administered to 792 enlisted men at Fort Dix, New Jersey. Data collected from the administration of vision tests in 7 commercial devices and other tests at the U.S. Submarine Base, New London, Connecticut, were also studied. Factors in far and near acuity, depth, and phoria tests are identified and discussed. Test-retest reliabilities of 7 methods of scoring the wall charts, a frequency distribution of test scores, and an analysis of test difficulty are included. T.G.I.

931

Uhlauer, J.E., Gordon, D., Woods, I., & Zeldner, J. A PILOT STUDY OF THE RELATIONSHIP BETWEEN SCOTOPIC VISUAL ACUITY AND ACUITY AT PHOTOPIC AND MESOPIC BRIGHTNESS LEVELS. Army Proj. No. 29530100, PRS Rep. No. 963, July, 1952. Dept. of the Army, TAGO, Personnel Research Section, PR & PR-Pers Bur, Washington, D.C.

931

To investigate the relationship between scotopic (starlight), mesopic (partial moonlight), and photopic (daylight) visual acuities, nineteen subjects, tested previously on the Army Night Vision Tester, were retested on four types of alley charts and three Ortho-Rater plates at varied levels of brightness (0.0.1 to 13.5 foot-lamberts). Correlations of acuity scores were obtained and are discussed in terms of the feasibility of developing a test of mesopic acuity for practical use in assessing night vision ability of military personnel. Keats, J.A. FORMAL AND CONCRETE THOUGHT PROCESSES. Contract N6ONR 270 20, Proj. NR 150 088, Aug. 1955, 93pp. Princeton University & Educational Testing Service, Princeton, N.J.

932

This project was an empirical investigation of predictions derived from a theory by Piaget concerning the development of intelligence. In particular, three content areas were studied (arithmetic, probability, and inequalities) making use of group testing procedures and special statistical techniques for analysis. A test, consisting of 74 specially prepared items dealing with the three areas, was administered to children from grades four through ten (approximately 200 in the first two grades and 300 in the others). The results were compared with predictions derived from theory. T. G. I. R 24

Biel, W. C., Eckstrand, G. A., Swain, A. D., & Chambers, A. N. TACTUAL DISCRIMINABILITY OF TWO KNOB SHAPES AS A FUNCTION OF THEIR SIZE. Contract No. AF 33(038)-15474, RDO No. 694-1", WADC Tech. Rep. 52-7, Jan. 1952, 14pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

934

To determine the tactual discriminability of two knob shapes as a function of their size, five groups of twenty subjects each discriminated tactually between wheel (round) and flap (square) airplane control knobs. Five knob sizes varying in one-fourth inch steps between one and two inches were used and each of the five groups were tested with a different knob size. Discrimination errors and response time for each discrimination were recorded. T.T.R.2.

Duncan, C.P. & Underwood, E.J. RETENTION OF TRANSFER IN MOTOR LEARNING AFTER 24 HOURS AND AFTER 14 MONTHS AS A FUNCTION OF DEGREE OF FIRST-TASK LEARNING AND INTER-TASK LEARNING. Contract AF 33(038) 11396, RDO 694 44, WADC TR 52 224, Oct. 1952, 22pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Northwestern University, Evanston, Ill.).
- 936
This is an investigation of retention of positive transfer after 14 months without practice. Undergraduate subjects positioned levers to colored light stimuli, with differing amounts of practice on the first task, and differing similarity of second task to first. The second task was learned immediately after the first, and relearned after twenty-four; fourteen months later it was again relearned. Error and time scores are reported, and effects of degree of learning, similarity of tasks, and individual differences within groups are assessed. Implications with respect to optimum degree of simulation in training equipment are discussed.

Gilinsky, A.S. & Brown, J.L. EYE DOMINANCE AND TRACKING PERFORMANCE. Contract AF 33(038) 22616, Proj. RDO 694 45, WADC TR 52 15, April 1952, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Columbia University, New York, N.Y.).
- 936
This experiment compared the efficiency of compensatory tracking performance with the dominant eye and with the nondominant eye. The task required S to keep an irregularly moving stimulus within a circumscribed area by means of a joystick. Two groups of eight male Ss with marked eye dominance were used; one received training with the dominant eye followed by successive practice with the nondominant; the other had these conditions reversed. Each S tracked 80 two-min trials, 40 with one eye followed by 40 with the other. Performance was measured in terms of time on target and number of errors. Differences in these were evaluated statistically by t.

Krendel, E.S. THE SPECTRAL DENSITY STUDY OF TRACKING PERFORMANCE. PART 2. THE EFFECTS OF INPUT AMPLITUDE AND PRACTICE. Contract AF 33(038) 10420, RDO 694 39, WADC TR 52 11, Jan. 1952, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Franklin Institute Laboratories, Philadelphia, Penn.).
- 937
The application of spectral density analysis to the study of performance in a perceptual-motor task was illustrated. Using two Ss in a simple tracking task, the amplitude part of the frequency response was computed for statistical inputs of two different motion amplitudes and for two different stages of practice. It was hoped that this analysis would indicate whether a rough linear time invariant approximation could be used to describe the tracker's behavior. The results indicated need for further research.

Milton, J.L., & Wolfe, P.J. THE EIGHTH OF A SERIES OF REPORTS ON EYE FIXATIONS OF AIRCRAFT PILOTS: FIXATIONS DURING ZERO-READER APPROACHES IN A JET AIRCRAFT. RDO No. 694-37, WADC Tech. Rep. 52-17, Feb., 1952, 15 pp. WADC, Air Research and Development Command, Wright-Patterson AFB, Dayton, Ohio.
- 940
To obtain a record of pilot eye movements during Zero Reader approaches in a jet aircraft, photographic recordings were made during the period of approach and letdown. (The Zero Reader is an instrument which, when proper adjustments are made, shows aircraft control movements necessary for flight along an established path). Frequency, duration, and sequence of eye fixations are presented with comparisons between results from other instrument approaches using a somewhat similar panel. Discussion is in terms of instrument panel arrangement.

Montgomery, V.E., Duncan, C.P. & Underwood, B.J. TRANSFER OF TRAINING IN MOTOR LEARNING AS A FUNCTION OF DISTRIBUTION OF PRACTICE. Contract AF 33(038) 11396, RDO 694 44, WADC TR 52 115, Oct. 1952, 24pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Northwestern University, Evanston, Ill.).
- 941
This study deals with the effects of distribution of practice on transfer to a very similar task. The subjects (undergraduates) had to hold one lever steady with the left hand, while positioning a right-hand lever to the appropriate slot for one of six possible colored lights. The only difference between original and final trials was the pairing of lights and slots. Some groups had continuous practice (no intertrial rests) with the first task on one day, the second on either one or two days. Others had 10 sec. intertrial rests, and completed their practice in 1, 2, or 3 days. Correct responses and shallow errors (incomplete positioning) are reported.

Spragg, S.D.S. & Kewisher, Joan. THE EFFECTS OF BRIGHTNESS AND COLOR OF ILLUMINATION ON PERFORMANCE OF A COMPLEX PERCEPTUAL-MOTOR TASK. (FLYING A LINK TRAINER). Contract W33 038AC 18317, RDO 694 41, WADC TR 52 203, July 1952, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Rochester, Rochester, N.Y.).

943

To determine the effects of brightness and color of illumination on performance of a complex perceptual motor task, subjects (9,12,4 in different experiments) flew modified "Charley" courses (an almost purely visual task) in a Link Instrument Trainer. Conditions varied were: brightness--0.01 to 1.0 foot-lamberts; color--white, red, orange-red, orange-yellow; and length of task--one to four hours. Performance data in deviations from a calculated perfect course are interpreted in relation to aircraft instrument lighting for satisfactory visual performance at low photopic brightness.

Wickens, D.D. AN INTERPRETATION OF THE DEVELOPMENT OF A PERCEPTUAL SET IN S-R TERMS. Contract AF 18(600) 78, RDO 694 44, WADC TR 52-305, Sept. 1952, 17pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University Research Foundation, Columbus, Ohio).

944

This article is a theoretical study in which an attempt is made to "interpret in S-R terms the development of perceptual biases of the sort wherein the subject acquires tendencies to respond to certain classes or dimensions of stimuli as opposed to others." A hypothetical experiment is presented, in which a perceptual bias is developed, to respond to the dimension of color (as opposed to, e.g., shape) in a transfer situation. A number of experimentally testable predictions are made.

Houston, R.C. & Walker, R.V. THE EVALUATION OF AUDITORY WARNING SIGNALS FOR AIRCRAFT. Contract W33 038 AC 14701, Proj. RDO 694 16, Tech. Rep. 5762, June 1949, 41pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Maryland, College Park, Mo.).

949

The effectiveness of klaxon horns, ditching bells, and several pure tones as warning signals was determined by tests conducted in specified levels of simulated cockpit noise. Ss made equal loudness judgments for 1,050, 2,500, and 3,000 cps paired to the horn and bell signals; made detection judgments of these signals in both steady and intermittent form against four noise spectra of varying intensity; made detection judgments of these signals presented through a loudspeaker or earphones at several db levels against six db levels of each noise spectra either with or without crash helmets. The results were evaluated statistically by variance and chi-square techniques.

Christensen, J.M. IN-FLIGHT ACTIVITIES OF NAVIGATORS IN THE ATLANTIC AND PACIFIC AREAS. AF Tech Rep 5771, May 1949, 17pp. USAF Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio.

The activities of navigators of the Military Air Transport Service engaged in mid-latitude flying in the Atlantic and Pacific areas are reported. Similarities between the two areas are noted. It is concluded that an inordinate amount of time is devoted to paper work in both areas, and that effort aimed at reducing this amount by development of computers, elimination of unnecessary recordings, and streamlining of work forms would be well rewarded. It is suggested that pilots of the Military Air Transport Service be trained in elementary dead reckoning navigation and Loran so that one of them may relieve the navigator on extended missions. It is believed that the development of more efficient celestial devices and of simplified Loran will enhance the efficiency of the navigator in mid-latitude operations of the Military Air Transport Service.

Marrick, M.J. EFFECTS OF MOTION RELATIONSHIPS ON SPEED OF POSITIONING VISUAL INDICATORS BY ROTARY CONTROL KNOBS. Contract W33 032 AC 16011, Proj. RDO 694 24, Tech. Rep. 5812, July 1949, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

952

"Four experiments are described in which Ss alternately adjusted two semicircular indicators by means of rotary control knobs. The position of each indicator in respect to its control and the relationship between the direction of movement of the controls and the direction of movement of the corresponding indicator were varied." Ss made 18 adjustments of each indicator for a given control-indicator arrangement or motion-relationship combination. Performance was measured in terms of response time. Means, standard deviations, significance of differences between means, and correlations between the right and left indicator data are presented.

953

Ellson, D.G., & Wheeler, L. Jr. THE RANGE EFFECT. AF Tech. Rep. 5813, May 1949, 8pp. Air Materiel Command, Wright-Patterson AFB, Ohio. (Indiana University).

953

This study was designed to determine whether the range effect observed in tracking is attributable to the range of stimuli presented or to the absolute magnitude of the individual stimuli. Two groups composing a total of 50 subjects were required to track a stimulus of 1, 0.5, and 0.25 inches for the first group, and 1, 1.5, and 2 inches for the second group with the total tracking time consisting of 12 minutes per subject. Response amplitude was measured and input compared with output amplitude. The results are presented and discussed in terms of group differences as indicative of the relative role of range vs. magnitude of stimuli as determiners of range effect (i.e., the non-linearity of operator responses in tracking).

Fitts, P.M. PSYCHOLOGICAL ASPECTS OF EQUIPMENT DESIGN. USAF Tech. Rep. 5829, Aug. 1949, 99pp. USAF Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (Psychology Branch, Aero Medical Lab.)

Human Engineering concerns the design of equipment and man-machine systems in relation to the abilities of human operators. It is a new field of applied science. Its data are drawn from psychology, anthropology, bio-physics, engineering, and many other sources. The present report is a systematic review of psychological facts and experimental results of significance for human engineering. Systems research is considered first. It contributes to the discovery of critical human "links" and sources of human error in man-machine systems. The design of visual, auditory, and tactual displays are considered next. Here many problems of transmitting and presenting information are considered. The design of controls is treated next. This last section is organized around the concept of man as a link in a control system. Dynamic aspects of human controller processes are considered in relation to servo engineering. Optimum location and mode of actuation of control are among the problems treated.

Blockley, W.V., & Taylor, C.L. STUDIES IN TOLERANCE FOR EXTREME HEAT. SECOND SUMMARY REPORT. AF Tech. Rep. No. 5831, July 1949, 84pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (U. of Calif.)

958
This report summarizes several experiments on tolerance for extreme heat. Twenty-six male college students were exposed for 30 minutes to air at each of two temperatures (130 and 180°F with 20mm Hg. vapor pressure) while rectal and skin temperature, electrocardiogram, respiratory rate and volume, oxygen consumption and weight loss were measured. In a further series of experiments, two subjects were exposed, for as long as they could tolerate, to temperatures of 160, 180, 200, 212, and 240°F at vapor pressures of 7-10, 19-21, and 32-37mm Hg. The physiological measures are analyzed as a function of exposure and recovery time, and their use in the prediction of tolerance time is discussed.

959
Fitts, P.M. & Simon, C.D. THE ARRANGEMENT OF INSTRUMENTS, THE DISTANCE BETWEEN INSTRUMENTS, AND THE POSITION OF INSTRUMENT POINTERS AS DETERMINANTS OF PERFORMANCE IN AN EYE-HAND COORDINATION TASK. Contract W33 038 AC 19816, Proj. RAO 694 31, Tech. Rep. 5832, Feb. 1952, 26pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

959
In experiment I, the relative efficiency of ten different pointer-position patterns was studied using S's performance in a continuous dual-pursuit task as the criterion of effectiveness. The on-target scores were evaluated mainly by analysis of variance technique. In II, the 9 and 12 o'clock pointer positions for both vertical and horizontal separations were studied more extensively. Differences between mean scores for the three successive five-day periods were examined statistically by t. In III, the effect on performance of the distance between instruments was studied. Mean performance scores as a function of the experimental variables were evaluated statistically by t and correlation techniques.

Elison, D.G. & Wheeler, L., Jr. RESONANCE IN THE HUMAN OPERATOR. Contract W33 038 AC 13968, Proj. RAO 649 39, Tech. Rep. 5834, April 1951, 30pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Indiana University, Bloomington, Ind.).

960
To determine whether the human operator in a sine wave transmission situation is subject to resonance effects as input frequencies increase, 22 Ss were presented a sinusoidal tracking task in which the linear components of sine wave trains of varying frequencies occurred as horizontal pointer movements. S tracked the input pointer (0.5 to 5.0 cps) with a second pointer using only vertical movements of the lower right arm. Continuous records of S's tracking movements and of action potentials from the forearm were obtained. Data were used only for the range of frequencies within which S maintained synchronism with the frequency of the input signal - 360 degrees. Mean differences between input and output amplitudes, mean action potentials, and mean phase shifts were evaluated. T. G. I. R 8

Long, G.E. SPEED AND ACCURACY OF READINGS AS A FUNCTION OF DESIGN IN THE SENSITIVE AIRSPEED INDICATOR. USAF Tech. Rep. No. 5836, Aug., 1949, 13 pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (Aero Med. Lab., Psychology Branch)

961
To explore some ways of displaying airspeed information, 10 experimental indicator designs were studied. Each used the same non-rotative printer making a complete rotation for ranges from 50 - 760 miles per hour but with a different type of sensitive indicator for precision readings (counters, printer, rotating card, rotating drum). One hundred college students were subjects. Speed and accuracy scores are analyzed and interpreted in terms of the design of the sensitive airspeed indicator. Recommendations are included.

Milton, J.L., Jones, R.E. & Fitts, P.M. EYE FIXATIONS OF AIRCRAFT PILOTS. II. FREQUENCY, DURATION, AND SEQUENCE OF FIXATIONS WHEN FLYING THE USAF INSTRUMENT LOW APPROACH SYSTEM (ILAS). Projs. RAO 694 28 & 694 31, Tech. Rep. 5839, Oct. 1949, 20pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

963
Frequency, duration, and sequence data were obtained from analysis of the photographic records of eye fixations of 40 USAF pilots each making two landing approaches using standard ILAS procedure under simulated instrument conditions. Means and SDs were computed for the number of fixations per min. and length of fixation on each of the basic flight instruments. Also, differences between means, correlations, and t ratios for length of fixation on the four major instruments and for number of fixations for all instruments for the four recording periods were computed. The relation between frequency and duration of use and between flying experience and these two factors were obtained.

Elison, D.G., Hill, H. & Craig, D.R. THE INTERACTION OF RESPONSES TO STEP FUNCTION STIMULI: II. EQUAL OPPOSED STEPS OF VARYING AMPLITUDE. Contract W33 038 AC 13968, Tech. Rep. 5911, Aug. 1949, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Indiana University, Bloomington, Ind.).

964
"Research reported here was designed to provide information on the linearity of operator performance in a direct tracking situation by determining the extent to which the responses of the operator-apparatus combination to superimposed inputs conform to the responses of a linear system to such inputs. S tracked a spot which made step-function movements away from and back to a center position. Four different amplitudes of displacement were used. The time interval between members of each pair of opposed steps was varied so that both uncomplicated responses to single steps and overlapped responses were obtained. Mean predicted and obtained response times and amplitudes for each displacement at each interval were evaluated by t.

Craig, D.R. EFFECT OF AMPLITUDE RANGE ON DURATION OF RESPONSES TO STEP FUNCTION DISPLACEMENTS. Contract W33 038 AC 13968, Tech. Rep. 5913, Sept. 1949, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Indiana University, Bloomington, Ind.).

965
This paper presents an analysis of the response duration data obtained from two groups of 25 Ss tracking a point which moved with step function displacements of varying amplitudes: 1, 1/2, 1/4 in. and 1, 1 1/2, 2 in. Response duration (expressed as Peak Time) was measured from the stimulus displacement to the initial peak of the response movement. Means and standard deviations were compared by t for the two groups. An hypothesis concerned with the non-linear relationship between displacement and response time is outlined and discussed. T. G. I. R 4

966
Kappauf, W.E., & Smith, W.A. DESIGN OF INSTRUMENT DIALS FOR MAXIMUM LEGIBILITY: III. SOME DATA ON THE DIFFICULTY OF QUANTITATIVE READING IN DIFFERENT PARTS OF A DIAL. Contract W33-038-ac-14480, AF Tech. Rep. 5914, Part 3, May, 1950, 14 pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (Princeton Univ.)

966
To explore the relative difficulty of quantitative scale reading on different portions or sectors of a dial, error data was gathered from two experiments involving 28 subjects and 15 types of dials, varied as to scale range and scale units. Errors are classified as to local or large and systematic and are examined for each portion of the dial where they occur. The relation of errors to scale range and units is also discussed. T.G.I.R15.

967
Kappauf, W.E., & Smith, W.M. DESIGN OF INSTRUMENT DIALS FOR MAXIMUM LEGIBILITY: PART 4. DIAL GRADUATION, SCALE RANGE AND DIAL SIZE AS FACTORS AFFECTING THE SPEED AND ACCURACY OF SCALE READING. Tech. Rep. No. 5914, Part 4, Feb., 1950, 22 pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio.

967
To investigate the effect of some dial design factors on reading performance, twenty subjects read at 28 inches fifty dials (white on black) which varied in size (2.8 and 1.4 inches), scale values (from 0 to 50, 100, 200, 400, or 600 units), and spacing of graduation marks (10's, 5's, 2's and units). Reading errors are classified as local or large and systematic and are presented with reading times. Discussion focuses attention on the direction of these data in terms of the design factors; magnitudes of errors are also analyzed. T.G.I.R17.

968
Werrick, M.J. EFFECT OF TRANSMISSION-TYPE CONTROL LAGS ON TRACKING ACCURACY. Proj. RDO 694 39, Tech. Rep. 5916, Sept. 1949, 18pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

968
This study investigated the relationship between tracking accuracy and temporal lag between control and resultant indicator motion for a simple compensatory pursuit tracking task. Ss were 25 males; the task was "to maintain an indicator pointer on center in such a manner as to compensate for what otherwise would be a complex oscillatory motion of the pointer"; the delay intervals were 0, 40, 80, 160, and 320 msec. Each S performed the task under each time lag for a 30-sec. period. Time-on-target was the measure of performance. Means, standard deviations, and standard error of the means of these scores were presented tabularly and graphically. An hypothesis is examined to describe the relationship between lag time-on-target and control lag. T. G. I. R 1

969
Curvey, V.D. & Hennehan, R.H. PRACTICAL LIMITS OF SPEEDED SPEECH. AF Tech. Rep. 5197, May 1950, 22pp. USAF Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (University of Virginia, Charlottesville, Va.).

As part of a program of research comparing the relative efficiency of auditory and visual communication, an experiment was designed to determine the limits of speeding up recorded speech without undue sacrifice of intelligibility. A new technique was evolved based on chopping segments from a speech record on a plastic base recording tape, then splicing together the unremoved segments of the tape. The resulting abbreviated tapes were found to provide an increased rate of speech without an attendant frequency increase or other indication of translation of the auditory pattern. Using discrete spondaic words from the Harvard Psycho-Acoustic Laboratory Auditory Test No. 14, 11 experimental tapes were prepared with different chop ratios, yielding speed-up rates varying from 1.5 to 4.00 times that of the original speech. Intelligibility scores (number of words correctly heard) remained higher than 90% for speeds up to 2.5 times that of the original test. The implication of the above findings for aviation communication depends upon whether or not they also apply to continuous messages, e.g., questions and sentences. Further experiments are planned to answer this question. Also planned is a visual analysis of the chopped words to determine the word elements essential to the understanding of rapid work. R 18

Cheatham, P.G. A COMPARISON OF THE VISUAL AND AUDITORY SENSES AS POSSIBLE CHANNELS FOR COMMUNICATION. AF Tech. Rep. No. 5919, May, 1950, 28 pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (Univ. of Va.)

970
This report presents a review of the literature relevant to a research program comparing the relative efficiency of the visual and auditory senses for communication purposes. The 139 references are distributed as follows: vision, 84; audition, 45; comparison of the two senses, 4; sensory interaction, 3; additional, 3. R 139

972
Brown, C.W., Ghiselli, E.E., Jarrett, R.F., Minium, E.W., et al. MAGNITUDE OF FORCES WHICH MAY BE APPLIED BY THE PRONE PILOT TO AIRCRAFT CONTROL DEVICES. 3. FOOT CONTROLS. Tech. Rep. 5955, Feb. 1950, 10pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of California, Berkeley, Calif.).

972
This study determined the forces which may be applied by extension of the foot from each of five initial positions: when the foot is placed at right angles to the axis of the lower leg, and when it is placed at angles of 10 and 20 degrees on either side of the right angle position. Leg extension was constrained by requiring the Ss to kneel with the sole of the foot against a pressure plate and the knee touching a vertical block. Ss were 27 male students (25 with pilot experience); right and left foot determinations were counterbalanced. Means, standard deviations, reliability coefficients, and coefficients of variation for all positions, and correlations between height, weight, and ankle-strength were computed.

973
Brown, C.W., Ghiselli, E.E., Jarrett, R.F., Minium, E.W., et al. COMPARISON OF AIRCRAFT CONTROLS FOR PRONE AND SEATED POSITION IN THREE-DIMENSIONAL PURSUIT TASK. Contract W33 038 AC 15098, Proj. RDO 694 17, Tech. Rep. 5956, March 1950, 18pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of California, Berkeley, Calif.).

973
This study evaluated pursuit task performance as a function of three kinds of controls operated from the seated or prone positions. Ss were 111 students divided into four groups: conventional stick and rudder controls seated, California three-dimensional hand controls seated and prone, and Amptmann three-dimensional hand controls prone. Each S made 35 four-minute runs of placing the plane "on target" (within scoring tolerance in all three dimensions). Performance was measured in terms of time on target (percent of total time) for each dimension of control. Performance differences were examined as a function of both the controls and the physical characteristics of the Ss.

974
Loucks, R.B. AN ANALYSIS OF THE TYPES OF ERRORS MADE BY NOVICES IN INTERPRETING AZIMUTH INDICATORS WHEN THE BEARINGS ARE ADMINISTERED VERBALLY. Contract W33 038 AC 15230, Proj. RDO 694 19, Tech. Rep. 5958, Oct. 1949, 19pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Psychology Dept., University of Washington, Seattle, Wash.).

974
This study analyzed the types of errors made when two types of verbal heading instructions were given to novices as they utilized certain kinds of direction indicators in maneuvering an azimuth ground trainer. A total of 256 Ss were tested; instructions were of the form "turn right(left)--degrees" or "turn to--degrees"; indicators were stationary dial (two kinds of scales) or moving dial with fixed lubber lines; heading commands were short turns (5 or 10 degrees) or long turns (55 to 165 degrees). Performance measures include: corrected, direction, heading, and reversal errors; reaction time; pedal movements; and pursuit-meter score. T-values were computed for performance scores as a function of type of instruction and heading command.

975
Loucks, R.B. AN EXPERIMENTAL STUDY OF THE EFFECTIVENESS WITH WHICH NOVICES CAN INTERPRET A LOCALIZER-GLIDEPATH APPROACH INDICATOR. Contract W33 038 AC 15230, USAF TR 5959, Oct. 1949, 14pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Department of Psychology, University of Washington, Seattle, Wash.).

975
To study movement compatibility of display and control relations on a specific aircraft instrument (Localizer-Glidepath Approach Indicator), two groups of novices (58,69) were given a series of test periods on one of two forms of the indicator: 1) movement of needle opposite to that of control stick, and 2) movement of needle same as that of control stick. Performance scores are given as number of seconds the needles were not centered. Learning curves are compared for the two groups for the most favorable movement relation. A proposed design for an indicator is included.

976
Horton, G.P. AN ANALYSIS OF ERRORS MADE ON A SCHEMATIC PPI DISPLAY. Contract No. W33-038-ac-15230, E.O. No. 694-19, AF Tech. Rep. 5960, Oct. 1949, 14pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (University of Washington)

976
To study the relation between various factors of a polar-coordinate display design and accuracy of performance, analysis is made of error data from a previous study (see 977) wherein subjects were presented by projection technique with schematic abstraction of a PPI display and required to read azimuth and range location of single targets. Two types of errors are defined and interpreted as functions of display size and target location.
T. G. I. R 1

977
Horton, G.P. ACCURACY OF READING TARGET LOCATION AND SIZE OF SCHEMATIC PPI DISPLAY. Contract No. W33 038 AC 15230, E.O. No. 694 19, AF Tech. Rep. 5961, Oct. 1949, 44pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (University of Washington).

977
To study some factors influencing the reading of radar-type information, 180 schematic polar-coordinate displays (PPI), each containing a single target, were presented by projection technique to 240 subjects who estimated target location to the nearest mile and degree. Factors varied were: size (3 to 7 inches), number of radii (10°, 20°), exposure time (3, 5, or 15 seconds), and order of reading (miles first or degrees first). The number of correct responses are presented and the relative effects of the variables on reading accuracy are discussed. Design recommendations are included.
T. G. I. R 7

978
Horton, G.P. TARGET SHAPE AND ACCURACY ON A SCHEMATIC PPI DISPLAY. Contract W33-038-ac-15230, E.O. 694-19, AF Tech. Rep. 5962, Oct. 1949, 9pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (Univ. of Washington).

978
To investigate factors influencing accuracy of estimating target information from a polar coordinate system, 108 schematic PPI displays, each containing a single target (either a circle, ellipse, or an arc) were observed by 30 subjects; range and azimuth locations were read to the nearest mile and degree. The number of correct responses are analyzed and interpreted as a function of shape of target and method of reading, e.g., range first or azimuth first.
T. I. R 5

979
Loucks, R.B. AN EXPERIMENTAL COMPARISON OF THE RELATIVE EFFECTIVENESS WITH WHICH TWO TYPES OF MAP READING PROCEDURES CAN BE UTILIZED BY NOVICES. Contract No. W33-038-ac-15230, E.O. 694-19, AF Tech. Rep. 5963, Oct. 1949, 9pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (Univ. of Washington)

979
To investigate the relative effectiveness of two map-reading procedures as used by novices flying a trainer on instruments, one group (14) read a flight course map in a fixed position, and a second (11) rotated the map so that flight stations were successively oriented with nose of trainer as it assumed the corresponding bearing. Errors in heading, direction, reversals, and time are analyzed for differences between the methods.

980
Louchs, R.B. HIGH-SPEED GRAPHIC SWEEP RECORDERS DERIVED FROM THE KEINATH SCANNING TECHNIQUE. Contract W33-038 ac 15230, E.O. 694-19, AF Tech. Rep. 5964, Oct. 1949, 5pp. WADC, Aero Medical Laboratory, Dayton, Ohio

Several types of 'inertialless' graphic sweep records have been developed by utilizing the scanning principle previously described by Keinath. The present models of these sweep recorders have a frequency ceiling of 60 sparks per second, but methods are described for constructing units which would register 400 or more sparks per sec. The techniques which have been developed are particularly designed for inertialless recording of isotonic muscle contractions or for making continuous multi-trace records of autonomic responses. The recorders which are described are relatively inexpensive vs. and obviate the time and labor involved in photographic techniques.

Pitts, P. M., Jones, R. E., & Milton, J. L. EYE FIXATIONS OF AIRCRAFT PILOTS. III: FREQUENCY, DURATION, AND SEQUENCE OF FIXATIONS WHEN FLYING AIR FORCE GROUND-CONTROLLED APPROACH SYSTEM (GCA). E.O. Nos. 694-28 & 694-31, AF Tech. Rep. 5967, Feb. 1950, 19pp. WADC, Aero Medical Laboratory, Dayton, Ohio

981
To investigate a pilot's eye movements during instrument flight, 40 USAF pilots of varying amounts of flying experience made two approaches for a landing using Ground Control Approach (GCA) procedures under simulated instrument conditions. Eye movements were recorded photographically. Frequency, duration, and sequence of eye fixations are analyzed and eye movement link values are determined. The discussion relates these values to optimum instrument panel arrangement. T,I,R5.

982
Jenkins, W.L., Haas, L.O. & Rigler, D. INFLUENCE OF FRICTION IN MAKING SETTINGS ON LINEAR SCALE. Contract W33-038 AC 22561, Proj. 200 694-30, Tech. Rep. 5968, Sept. 1949, 11pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Lehigh University, Bethlehem, Penn.).

982
This study investigated the effect on linear scale setting performance of artificially equalizing the friction at all pointer-movement knob-turn ratios and of varying the friction at the previously found optimal ratio. Four Ss matched the position of a lighted insert in a black bakelite scale with a pointer controlled by a rotary knob, 2 3/4 in. diameter. The equalized friction condition required a pull of 300 grams; for the optimal ratio, pulls of 100, 400, 700, 1,000, and 1,300 grams were tested. Mean total time (travel plus final adjustment) and mean total potential (forearm action potential for total time) were the basis for comparison of the several conditions. T. G. R 1

983
Ford, A., Rigler, D., & Dugan, G. E. PANTOGRAPH FADAR TRACKING: POINT CENTERING EXPERIMENTS. Contract W33-038-ac-22561, E.O. 694-30, AF Tech. Rep. 5969, Sept. 1949, 31pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

983
To study the accuracy of tracking a spot signal as a function of the method of controlling the cursor, 5 operators centered the signal with a single point cursor controlled by a pantograph system of levers for some runs, and by finger centering technique for others. Other variables were: lever reduction ratios (2/1, 4/1, 6/1), hand-rest versus no hand-rest, time limitations (2, 4, 6 seconds). Accuracy scores (mean and standard deviation in decimal fractions of an inch) are analyzed and interpreted in terms of a desirable hand control for accurate centering. Types of errors are discussed. T,G,R5.

Wilson, D.G., & Coppock, H. FURTHER ANALYSIS OF THE PSYCHOLOGICAL RANGE EFFECT. Contract W33-038-ac-13968, E.O. 694-30, AF Tech. Rep. 6012, Aug. 1951, 5pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio. (Indiana University).

985
In this study of the range effect occurring in tracking, an attempt is made to assess a predicted proportionality between response and input amplitudes hypothesized to occur as a function of stimulus amplitude being held constant. Three groups totalling 60 subjects were required to track step inputs of 0.5, 1.0, and 1.5 in. amplitude with each subject tracking only one input amplitude. Mean response times were recorded and analyzed. The degree of variation occurring in early and late trials is evaluated in terms of its implication for predicted response-input proportionality and the consequent magnitude of range effect. E. I. R 5

986
Rock, M.L. VISUAL PERFORMANCE AS A FUNCTION OF LOW PHOTOPIC BRIGHTNESS LEVELS. Contract W33-038-ac-18317, E.O. 694-41, AF Tech. Rep. 6013, Nov. 1950, 31pp. USAF, Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio. (University of Rochester)

986
To investigate performance under low photopic brightness levels, four visual tasks (Judgment of the Muller-Lyer figure, absolute threshold for movement, depth perception, simple addition) were studied under five brightness levels ranging from 0.005 to 1.0 foot-lamberts. Performance scores (speed and errors) are analyzed and interpreted as a function of illumination and task difficulty. Recommendations are made for levels of illumination permitting maximum performance while maintaining dark adaptation. T,G,R75.

987

White, W.J. THE EFFECT OF POINTER DESIGN AND POINTER ALIGNMENT POSITION ON THE SPEED AND ACCURACY OF READING GROUPS OF SIMULATED ENGINE INSTRUMENTS. Contract W33 038 AC 15927, Proj. RDO 694 27, Tech. Rep. 6014, July 1951, 17pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

987

Three experiments were conducted: I determined the effect of pointer design on speed and accuracy of check reading a group of 16 simulated engine instruments with horizontal pointer alignment. Ss check read the panel and indicated alignment or misalignment by a hand-held toggle switch. Five pointer modifications were examined in relation to response time and errors. II determined the effect of pointer alignment position on qualitative reading in terms of comparative speed and accuracy of reading and responding. S corrected the appropriate switch. The 9, 12, 3, and 6 o'clock positions were evaluated in terms of exposure time and as in I. III required S to check read the panel of instruments aligned as in II and indicate same by a hand-held toggle switch; evaluation was as in I. T. G. I. R 6

988

Simon, C.W. INSTRUMENT-CONTROL CONFIGURATIONS AFFECTING PERFORMANCE IN A COMPENSATORY PURSUIT TASK. Contract W33 038 AC 19816, Proj. RDO 694 31, Tech. Rep. 6015, Feb. 1952, 40pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College, Yellow Springs, Ohio).

988

The first two studies of the five reported were designed to discover the effect on task performance when the zero position for a moving pointer is located in each of the four cardinal positions with the control located below the dial. In the first, a knob control 2 1/2 in. diameter was used; in the second, a 12-in. lever was used in the conventional upright position. In the third and fourth, the position and location of the lever control was shifted to determine whether a corresponding shift occurred in performance on each of the pointer positions. The fifth combined all of the variations of the first four. S's task was to keep a constantly moving pointer on a designated spot by a continuous adjustment of a control; mean time-on-target scores and subjective preferences were given. T. G. I. R 15

989

Gardner, J.F. DIRECTION OF POINTER MOTION IN RELATION TO MOVEMENT OF FLIGHT CONTROLS. CROSS-POINTER TYPE INSTRUMENT. Proj. RDO 694 19, Tech. Rep. 6016, June 1950, 20pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

989

To determine the optimal relationship between pointer movement and control movement for a cross-pointer type instrument with a vertical and horizontal needle, 48 pre-flight cadets were given a two-dimensional pursuit task executed with a single stick in a closed cockpit. Four combinations of movement relationships were tested: vertical and horizontal pointers having direct relationships to aircraft motions, having indirect relationships, vertical direct and horizontal indirect, vice versa. Performance was measured in terms of time-on-center scores: vertical, horizontal, and both pointer times. Differences in mean performance scores under the motion relationships were examined for the series of trials: 1-12 (one of above relationships), 13-24 (reversal of 1-12), 25-28 (unannounced return to 1-12 condition). Eckstrand, G.A. RESPONSE PRACTICE AS A FACTOR IN TRANSFER OF TRAINING. Contract W33 038 AC 15927, AF TR 6017, July 1950, 17pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Miami University, Oxford, Ohio).

990

This investigation is relevant to the problem of simulation in training, and particularly to what extent the training of specific motor responses to "training" stimuli will be an adequate substitute for training, of such responses to "operational" stimuli. The training task consisted of pressing the proper key when a particular one of four letters appeared in an aperture. Number of training trials for three experimental groups and a control group (students) ranged from 0 to 64. The test for transfer was learning key-depression to color stimuli. Results include times required to perform the training trials, and the test trials, and errors (striking a wrong key). T.G. R 7

991

Milton, J.L., Jones, R.E., & Pitts, P.M. EYE FIXATIONS OF AIRCRAFT PILOTS. V. FREQUENCY, DURATION, AND SEQUENCE OF FIXATIONS WHEN FLYING SELECTED MANEUVERS DURING INSTRUMENT AND VISUAL FLIGHT CONDITIONS. AF Tech. Rep. No. 6018, Aug., 1950, 33 pp. USAF, Air Materiel Command, Aero Medical Laboratory, Engineering Div., Wright-Patterson AFB, Dayton, Ohio.

991

To investigate a pilot's eye movements during instrument flight, 10 USAF pilots with varied hours of flying experience made one flight during which eye movements were photographed for straight and level flight and standard rate turns performed under simulated instrument conditions, and take-offs and landings performed under contact conditions. Frequency, duration, and sequence of eye fixations are summarized and eye movement link values determined for each of the maneuvers. Discussion relates these data to optimum arrangement of instruments on a panel. T. I. R 5

992

Chalmers, E.L., Goldstein, M., & Kappauf, W.E. THE EFFECT OF ILLUMINATION ON DIAL READING. Contract No. W33-038-ac-14480, E.O. No. 694-15, AF Tech. Rep. No. 602, Aug. 1950, 25pp. USAF, Air Materiel Command, Aero Med. Lab., Engineering Div., Wright-Patterson AFB, Dayton, Ohio. (Princeton U.)

992

To explore various aspects of dial reading performance under low level illumination, eight subjects read dials (varied in difficulty and size) and Landolt ring stimuli (varied in size and contrast direction) under brightness levels ranging from 0.00 to 2.7 foot-lamberts. Two subjects determined subjectively the minimum brightness under which they could work. Errors of interpolation, cross errors, and reading times are interpreted as a function of illumination and task difficulty. Various methods for determining a minimum satisfactory level of illumination in practical situations are discussed. T.G.R 2

993

Blockley, W.V., & Lyman, J. STUDIES OF HUMAN TOLERANCE FOR EXTREME HEAT. III. MENTAL PERFORMANCE UNDER HEAT STRESS AS INDICATED BY ADDITION AND NUMBER CHECKING TESTS. Contract No. W33-038-ac-14504, AF Tech. Rep. No. 6022, Oct. 1950, 54pp. USAF, Air Materiel Command, Aero Med. Lab., Engineering Div., Wright-Patterson AFB, Dayton, Ohio. (U. of Calif.)

993

To investigate the effects of extremely hot environments on the performance of paper and pencil mental tasks, 8 young men were exposed to air at temperatures of 160, 200, and 250°F and a vapour pressure of 20±2 mm Hg. The duration of exposure depended on the heat tolerance of the subject. The rectal temperature, weighted average skin temperature, heart rate, and mental test scores are compared as functions of time and air temperature. The physiological measures are correlated with the mental test scores and the tolerance limit. T.G.R 9

994 McCutchen, J.W. & Taylor, C.L. RESPIRATORY HEAT EXCHANGE WITH VARYING TEMPERATURE AND HUMIDITY OF INSPIRED AIR. Contract W33 038 ac 14504, AF Tech. Rep. 6023, Oct. 1950, 38pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright-Patterson AFB, Dayton, Ohio.

Respiratory heat exchange has been measured by determinations of temperature, humidity and mass flow of inspired and expired air. The ranges of inspired temperatures and humidities were 80 to 180°F and 0.2 to 1.2 in. Hg vapor pressure resp. Five normal young men served as Ss in 61 experiments. Specific enthalpy difference between inspired and expired air proved to be the most fundamental heat quantity; a) as judged by satisfactory predictive relationships which are independent of rate and volume of respiration; b) as established by satisfactory theoretical accountings for the heat and mass transfer process. By setting specific enthalpy difference equal to zero it was found that inspired and expired wet bulb temperatures agreed very closely. This permits the interpretation that adiabatic sensible and latent heat exchanges, between inspired and expired air, take place at constant total heat. The temperature, humidity and enthalpy properties of expired air are described mathematically and graphically. Discussion of these results with other investigations in the literature, where comparison is justified, reveals satisfactory agreement when states of unsaturation of the expired air are considered.

Jenkins, W.L., Meas, L.O. & Olson, M.W. THE INFLUENCE OF INERTIA IN MAKING SETTINGS ON A LINEAR SCALE. Contract W33 038 AC 22561, Proj. RDO 694 31, Tech. Rep. 6038, Nov. 1950, 17pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Lehigh University, Bethlehem, Penn.).

999

The effects on making linear scale settings of inertia alone and in interaction with backlash, friction, friction and pointer-movement knob-turn ratio, friction and knob diameter under normal tolerance, and friction and knob diameter under severe tolerance were investigated. Eight Ss were used; their task was to match the position of a lighted insert in a black bakelite scale with a pointer controlled by a rotary knob. Mean total time (travel plus final adjustment) and mean action potential (active forearm potential during travel and adjustment) were obtained and compared for the several conditions.

Spragg, S.D.S. & Rock, M.L. DIAL READING PERFORMANCE AS RELATED TO ILLUMINATION VARIABLES. III. RESULTS WITH SMALL DIALS. Contract W33-038-ac-18317, E.O. 694-41, AF Tech. Rep. 6040, Nov., 1950, 8pp. WADC, Aero Medical Laboratory, Dayton, Ohio. (University of Rochester)

100

To study the effect of size upon dial reading performance under low photopic illumination, ten subjects read fifty dials (1.4 inch, scale, 100 x 1) at five brightness levels ranging from 0.05 to 1.0 foot-lamberts. Performance scores (speed and error) are discussed as a function of illumination and are compared with results from a study having identical conditions but using a dial size of 2.3 inches with a 10 x 10 scale.

T.G.R.

1001

Crook, M.W., Harber, G.S., Hoffman, A.C., & Kennedy, J.L. EFFECT OF AMPLITUDE OF APPARENT VIBRATION, BRIGHTNESS, AND TYPE SIZE ON NUMERICAL READING. Contract W33-038-ac-14559, E.O. 694-15-PO-12, AF Tech. Rep. 6246, Sept., 1950, 54 pp. WADC, Aero Medical Laboratory, Dayton, Ohio. (Tufts College)

1001

To explore various factors influencing the legibility of numerals, performance on a simple addition task of printed numerals at 14 inches from eye position was studied under varied conditions of brightness (0.01 to 15.0 foot-lamberts), type size (6, 7, 8, and 10 point) and amplitude of apparent vibration (0 to 0.03 inches). Vibration was introduced by a pair of rotating prisms at a frequency of 1050 cycles per minute. Time and error scores are presented; interactions and quantitative relationships among the variables are analyzed and discussed.

Kappauf, W.E. DESIGN OF INSTRUMENT DIALS FOR MAXIMUM LEGIBILITY: PART V. ORIGIN LOCATION, SCALE BREAK, NUMBER LOCATION, AND CONTRAST DIRECTION. Contract W33-038-ac-14460, E.O. 694-15, Tech. Rep. 6366, May, 1951, 26 pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

1002

To investigate the effect of some dial design factors on reading performance, 45 subjects made 40,400 readings of 15 different dial designs varied as to origin location, scale break, number location, and contrast direction (black on white or the reverse). Reading times and errors are presented; specific errors of reversal and of plus one numbered scale division are examined in relation to the design variables. Specific design recommendations are included which will minimize these errors.

Crook, M.W., & Baxter, Frances S. RECOGNITION TIME FOR DIAL-TYPE NUMERALS AS A FUNCTION OF SIZE AND BRIGHTNESS. Contract No. W33-038-ac-14559, E.O. No. 6694-15, AF Tech. Rep. No. 6465, March 1951. 26pp. USAF, Aero Medical Laboratory, Wright Air Development Center, Wright-Patterson AFB, Dayton, Ohio.

1003

To study the effect of brightness and size on recognition time for white dial-type digits on dark background, a series of experiments (brightness from 0.03 to 0.1 foot lambert, and numeral size from 0.12 to 0.90 inches) required subjects (16, 4, 6) to identify digits when presented singly or in groups. The mean and median recognition times (seconds) are presented and analyzed as affected by the primary variables. Attention is given to secondary factors of individual differences and grouping of digits. Recommendations are made for operational conditions.

Kappauf, W.E. SOME DATA ON THE INFLUENCE OF ATTEMPTED INTERPOLATION ON THE SPEED AND ERRORS OF SCALE READING. Contract W33-038-ac-14480, E.O. 694-15, AF Tech. Rep. 6530, May, 1951, 14 pp. WADC, Aero Medical Laboratory, Dayton, Ohio. (Princeton University)

1005

To study the influence of attempted interpolation on scale reading performance, twenty subjects read a series of simply designed straight scales (graduated every unit and numbered every ten) under two types of instructions: (1) read to the nearest scale mark, and (2) read to the nearest tenth of a scale division. Reading times and errors are compared for the "rounding off" and "interpolation" procedures. The discussion is concerned with the most accurate method for scale reading.

T.I.R.5.

1006

Jenkins, W.L. & Olson, M.W. THE USE OF LEVERS IN MAKING SETTINGS ON A LINEAR SCALE. Contract W33 038 AC 22561, Proj. ADO 694 17, Tech. Rep. 6563, Aug. 1951, 12pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Lehigh University, Bethlehem, Penn.).

1006

This study compared the use of right-left-moving levers of various lengths with that of rotary knobs for making settings on a linear scale. Ss. matched the position of a lighted insert in a black bakelite scale with a pointer controlled by the knob or lever turning in a plane parallel to the movement of the pointer. Performance was measured in terms of travel plus final adjustment time. The six experiments examined this datum for: knobs versus 6 and 12 in. levers with a tolerance of .016 in., same with tolerances of .016 and .100 in., same with .016 in. tolerance with narrow and wide inserts, knob versus lever with both tolerances at turn ratios above 4.08 and up to 16.3, levers up to 30 in. in length and levers with added friction (400 grams).

Rulon, P.J., Sampson, P.B., & Schohan, B. THE EFFECTS OF "G" FORCES ON THE PERFORMANCE OF TELETYPE OPERATORS. Contract AF 33(038)-13233, RDO 102-22-SA-9, AF Tech. Rep. 6568, Oct., 1951, 45 pp. WADC, Aero Medical Laboratory, Dayton, Ohio. (Educational Research Corporation)

1007

To determine the effects of violent maneuvers on the performance of airborne teletype operators, 12 teletype operators (6 skilled and 6 unskilled) typed set messages while seated in one of three positions--facing forward, rearward and laterally. The aircraft followed a straight and level course for a part of the 18 minute test period, and performed various more-or-less violent maneuvers during the remaining time. Speed and accuracy of typing is analyzed with respect to the maneuver being performed, the nature of the errors, typing skill and the amount of previous practice under the experimental conditions.

Kappauf, W.E. A DISCUSSION OF SCALE-READING HABITS. Contract W33-038-ac-14490, E.O. 694-15, AF Tech. Rep. 6563, July, 1951, 50 pp. WADC, Aero Medical Laboratory, Dayton, Ohio. (Princeton University)

1008

This report summarizes data on scale-reading habits which have been collected as by-products of a series of studies on the design and use of instrument scales. Error scores are classified as to type and the conditions under which they occur are explored. Explanations for the errors are attributed to either the habits and classes of the reader or to the nature of the task. Influence on the range of individual differences in scale reading situations is presented. Recommendations are made for designing scales to minimize particular types of errors.

Krendel, E.S. A PRELIMINARY STUDY OF THE POWER-SPECTRUM APPROACH TO THE ANALYSIS OF PERCEPTUAL-MOTOR PERFORMANCE. Contract AF 33(038) 10420, E.O. 694 39, AF TR 6723, Oct. 1951, 39pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (The Franklin Institute, Philadelphia, Penn.).

1010

Quantitative information about human frequency response functions in the control of a piloted aircraft would provide a rational basis for stability and control criteria. The amplitude part of the transfer function for a linear time invariant system over a particular bandwidth is the square root of the ratio of the power spectrum of the output to the power spectrum of the input. The applicability of this method for determining the transfer function was explored using one subject and a tracking task having some similarity to an aircraft control problem. Power spectra and several amplitude ratios were determined and discussed.

Knauff, E.B. & Buxton, C.E. AN EXPERIMENTAL STUDY OF THE EFFECTIVENESS OF VARIOUS TRAINING PROCEDURES USED WITH THE AERIAL GUNNERY TRAINING DEVICE 3-A-35 AND 3-A-2. Contract NSORI 57, Proj. 20 B 1, Rep. 2, July 1946, 15pp. Department of Psychology, State University of Iowa, Iowa City, Iowa.

1014

Five groups of Ss (college students) were trained in an experiment on the 3-A-35 and 3-A-2 aerial gunnery training devices to determine effectiveness of various training programs. Variations included the use of "on-target" lights (signifying correct point of aim) and greater or less azimuth movement of target. A post-test provided data on the relative efficiency of the training methods, especially the percent hits scores; time-on-target and "total rounds fired" data are also given. Qualitative reports and data and recommendations concerning the apparatus were included.

Knauff, E.B. MEMORANDUM ON PROGRESS OF LEARNING STUDY ON AERIAL GUNNERY TRAINING DEVICE 3-A-2. Contract NSORI 57, Proj. 20 B 1, Rep. 3, Oct. 1946, 3pp. USN Special Devices Center Library, Port Washington, N.Y. (Department of Psychology, State University of Iowa, Iowa City, Iowa).

1015

This is a progress memorandum reporting a preliminary experiment with 12 Ss using the 3-A-2 aerial gunnery training device. They practiced for 17 days for 20 minutes a day. Each session included three practice blocks of eight attacks using the "familiarize" condition (correct point of aim visible to gunner when trigger is depressed) and one block with the "test" condition (no point of aim visible to gunner). Scoring included the rounds fired, number of hits, total time on target, and percent of hits. Time on target scores were not reported here.

Rhoads, C.S. EFFECTIVENESS OF EJECTION SEAT TRAINING WITH SPECIAL REFERENCE TO SDC DEVICE NO. 6EQ-2. Contract N70nr-38305, Tech Rep. SDC 383-5-1, Nov. 1950, 19pp. ONR, Special Devices Center, Richardson, Bellows, Henry, & Co., Inc.

1016

This is a report of a comparison of SDC Device No. 6EQ-2, a mobile ejection seat trainer with the Research Tower used in England as aids in indoctrination of pilots in the use of ejection seats. Attitudes of Navy and Marine pilots towards the ejection seat were tested before and after the training program, by a questionnaire. This training program included an actual practice ejection on either the SDC device or the Research Tower, a preliminary lecture and a training film. Questionnaire results are analyzed in detail, and suggestions for training are made. A sample of the questionnaire is included.

Knauff, E.B., Hamilton, C.E. & Spence, K.W. AN EXPERIMENTAL STUDY OF LEARNING ON THE AERIAL GUNNERY TRAINING DEVICE 3-A-2. Contract NSCRI 57, Proj. 20 B 1, Rep. 3, April 1947, 16pp. State University of Iowa, Iowa City, Iowa.

1019

This is a report of an experiment carried out with 12 college student subjects on aerial gunnery training device 3-A-2. It was designed to provide information on the limit of skill attainable on this device, the amount of practice required to reach this limit, and the nature of the learning curve. Daily practice sessions of 22 min. were held on 18 days, successive except for two breaks. On the eighteenth day new attacks were presented, for a test of transfer of training. Eight of the subjects practiced for a further 17 sessions, several months later. Results are in terms of percent hits.

Travis, R.C. & Kennedy, J.L. REVIEW OF LITERATURE AND SOME PRELIMINARY RESULTS IN THE DEVELOPMENT OF AN ALERTNESS INDICATOR. Contract NSORI 58, Proj. 20 C 2, Rep. 1, June 1946, 16pp. Navy Dept., Office of Research & Inventions, Special Devices Division. (Lab. of Sensory Psychol. & Physiol., Tufts College, Medford, Mass.).

Reported was an effort to develop an alertness indicator which will offer information concerning the wakeful state of an individual by monitoring brain wave, eye-movements, muscular-activity and other psycho-physical behaviors during wakefulness. Also reported was a survey of the literature and technical investigation which appeared to be relevant to the problem and which afforded information concerning the possibilities for such a device. Some preliminary results of investigations on muscle action potential were reported as well as the description of some future problems for investigation.

R 44

1028

Travis, R.C. & Kennedy, J.L. INTERIM PROGRESS REPORT-ALERTNESS INDICATOR LABORATORY OF SENSORY PSYCHOLOGY AND PHYSIOLOGY, TUFTS COLLEGE. Contract, NSORI 58, Proj. 20 C 2, Rep. 2, Jan. 1947, 19pp. ONR, Special Devices Center, Port Washington, New York. (Tufts College, Medford, Mass.).

The major steps in the development and refinement of the Tufts College electronic-amplification and recording techniques for brain-waves and muscle action potential were reported. The findings of the work conducted show that brain-wave change fails to exhibit significant correlations with changes in alertness. Some conclusions arrived at from the work on muscle action potentials and alertness are reported as are some experimental results from several pilot studies.

Pressey, S.L. BRIEF PRELIMINARY MEMORANDUM REGARDING THE "CLASSROOM COMMUNICATOR." A DEVICE INTENDED TO INFORM AN INSTRUCTOR IMMEDIATELY, DURING LECTURE OR DISCUSSION, OF EXTENT TO WHICH ALL MEMBERS OF CLASS UNDERSTAND WHAT IS BEING PRESENTED. Contract NSORI 17, Proj. 20 E 1, Rep. 1, Feb. 1947, 10pp. Department of Psychology, Ohio State University, Columbus, Ohio.

1033

This is a brief memorandum on the Classroom Communicator, a device designed to permit an instructor to know the extent to which his lecture or discussion is being understood by the members of his class. Details of construction of the device are presented along with the results of preliminary trials with small groups. The results are discussed in terms of the relative advantages of such a device over the traditional methods of ascertaining student comprehension. Suggested applications of the device are also presented.

1030

Kennedy, J.L. & Travis, R.C. INTERIM PROGRESS REPORT-ALERTNESS INDICATOR. Contract NSORI 58, Proj. 20 C 2, T.O.2, Rep. 3, July 1947, 7pp. ONR, Special Devices Center, Port Washington, New York. (Tufts College, Medford, Mass.).

Reported here is the progress made toward the goal of a simple, automatic electronic device for signalling when a person is becoming dangerously inalert. Experiments using total electrical energy from a frequency band above 40 cps., obtained from electrodes placed on the forehead above the eyes have been conducted. This represents a change from the technique previously used by the investigators to count frequency of spike emission. The total electrical energy function (frequency and amplitude) is a more precise measure of the alertness status of the subject than is frequency alone. Total electrical energy is measured by storing muscle spikes in an RC circuit, the rate of leaking of which may be controlled. These experiments were carried out with a time-constant of approximately one second, i.e. the function measured was total electrical energy placed on the condenser during the previous second. Experimentation on shorter time constants will be started shortly. The data of this report suggest the presence of a critical level of muscle activity, rather uniform from subject to subject, below which performance to peripheral stimuli reaches dangerous levels. Further experiments on exhausted subjects and subjects under the influence of drugs are in process to determine how this critical level is affected by extreme fatigue and drugs. Cursory analysis of the results obtained so far suggest that extreme fatigue and sodium pentobarbital raise the critical level.

1035
This is a review of the literature on the use of music with motion picture films. It includes discussion of: general literature, functions of music in motion pictures, techniques of music in motion pictures, functions of the film music composer, and applications to learning from films.
R 45

1036
Ash, P. THE RELATIVE EFFECTIVENESS OF MASSED VERSUS SPACED FILM PRESENTATION. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 0005, SDC Proj. 20 E 4, SDC TR 269 7 3, June 1949, 79pp. USN Special Devices Center, Port Washington, N.Y.

1036
Two experiments were conducted to explore the relative effectiveness of massed and spaced presentation in training films. Subjects were 11 classes of undergraduate psychology students and 10 companies of Navy recruits. In each experiment, groups saw 2 film series; distribution of presentation varied from 1 to 4 sessions. Immediately after seeing film, subjects rated it for interest; after 1-2 weeks, they took a written test on film content. Test scores and film ratings are discussed regarding the influence of massed vs. spaced presentation on interest and learning and general implications for film length.

Roshal, S.M. EFFECTS OF LEARNER REPRESENTATION IN FILM-MEDIATED PERCEPTUAL-MOTOR LEARNING. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 5, Dec. 1949, 40pp. USN Special Devices Center, Port Washington, N.Y.

1039
To study the effects of degree of realism in training films, eight experimental versions were made of a film showing how to tie knots. Variables studied were: camera angle (whether from point of view of observer or participant), motion (continuous motion vs. series of static pictures), portrayal of hands (hands showing or not showing in static shots), and participation (tying knots during presentation, or not). Ss (about 3500 Naval recruits) saw one of the films and then were tested on ability to tie the knots. Results (success in tying knots) are analyzed for implications for the preparation of training films.

Smith, K.R. & vanOrmer, E.B. LEARNING THEORIES AND INSTRUCTIONAL FILM RESEARCH. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 6, June 1949, 12pp. USN Special Devices Center, Port Washington, N.Y.

1039
This document is an outline of five potential areas for research on instructional films. The areas are: psychological learning principles, film characteristics, development of equipment and testing procedures, film utilization, and literature review. The importance of each area is discussed briefly, and, where available, current principles, potential problems, or useful variables are listed. The purpose of the outline is to provide a conceptual framework to indicate areas where research may be profitable.

1040
Vincent, W.S., Ash, P. & Greenhill, L.P. RELATIONSHIP OF LENGTH AND FACT FREQUENCY TO EFFECTIVENESS OF INSTRUCTIONAL MOTION PICTURES. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 7, Nov. 1949, 14pp. USN Special Devices Center, Port Washington, N.Y.

1040
To test the effect of information concentration in a training film, four versions of an informational film on weather were prepared. Two films ran 29 minutes; one contained 224 facts, the other 112. The other two films ran 14 minutes, with 112 facts and 56. All films were shown to different groups from each of three populations: high school students, Air Force basic trainees, and college students. All Ss were immediately tested on film content; some groups were retested after four or seven weeks. Test results are interpreted regarding implications for the preparation of training films.

1041
Lathrop, C.W., Jr. & Norford, C.A. CONTRIBUTIONS OF FILM INTRODUCTIONS AND FILM SUMMARIES TO LEARNING FROM INSTRUCTIONAL FILMS. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 8, Nov. 1949, 23pp. USN Special Devices Center, Port Washington, N.Y.

1041
To study the contributions of introductions and summaries in training films to learning, 261 training films were studied and three were selected as having good introductions, three with good summaries. An alternate version of each film was prepared omitting the introduction (or summary). Each version of each film was shown to a different group of high school students, followed by a test on film content; control groups took tests without seeing films. Test scores are analyzed for differences due to summaries or introductions. Results are discussed with regard to implications for film preparation and need for further research.

Neu, D.M. THE EFFECT OF ATTENTION GAINING DEVICES ON FILM-MEDIATED LEARNING. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 9, March 1950, 21pp. USN Special Devices Center, Port Washington, N.Y.

1042
To investigate factors influencing the effectiveness of attention-gaining devices in training films, 5 versions were prepared of a film on use of shop instruments. Variables were: redundancy of device to film objective and medium of device (visual or auditory). Subjects (Army and Navy recruits) saw one of the films (control groups saw no film) and were then given tests on learning of factual information and on recall of attention-gaining devices. Test scores are analyzed regarding relative effectiveness of relevant and irrelevant devices and of visual and auditory devices, and relation between memory of device and its effectiveness.

Kishler, J.P. THE EFFECTS OF PRESTIGE AND IDENTIFICATION FACTORS ON ATTITUDE RESTRUCTURING AND LEARNING FROM SOUND FILMS. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 10, March 1950, 11pp. USN Special Devices Center, Port Washington, N.Y.

1043

To investigate the influence of established attitudes on the effectiveness of a film for teaching and for restructuring attitudes, 815 college students were shown a film about a Catholic priest. Subjects were grouped by church affiliation and attitude toward the occupation of Catholic priest. Attitudes about occupations and religion were tested before and after the film showing; informational content of film was tested after showing. Mean test scores for the various groups are compared and interpreted regarding the importance of consideration of audience identification in producing training films.

1044

Jaspen, N. EFFECTS ON TRAINING OF EXPERIMENTAL FILM VARIABLES. STUDY II. VERBALIZATION, "HOW-IT-WORKS", NOMENCLATURE, AUDIENCE PARTICIPATION, AND SUCCINCT TREATMENT. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 11, March 1950, 13pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1044

To study the influence of several variables on the effectiveness of film training, 14 different versions were prepared of a film describing a manual assembly task. The variables included number of words per minute (45-142), use of an explanation of function of the unit to be assembled, audience participation (assembly during showing), succinctness of treatment in the film, and learning nomenclature as incidental result of viewing. Time to perform the assembly was tested after showing. Subjects were 1818 Naval trainees. Results are discussed regarding the importance of the various variables in training with films.

1045

McTavish, C.L. EFFECT OF REPETITIVE FILM SHOWINGS ON LEARNING. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 12, Nov. 1949, 7pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1045

To study the effects of repetitive showings of training films, 319 college students were shown 4 general science films. Each of the subjects saw one of the films once, one twice, one 3 times, and one 4 times. There was a pre-test over all 4 films and an individual post-test over each film. Test-score gains are evaluated as a function of number of repetitions, and the effectiveness of repetition is discussed.

1046

VanderMeer, A.W. RELATIVE EFFECTIVENESS OF INSTRUCTION BY: FILMS EXCLUSIVELY, FILMS PLUS STUDY GUIDES, AND STANDARD LECTURE METHODS. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 13, July 1950, 51pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1046

One of a series of studies on the use of films for training, this article reports an experiment with ninth grade high school students in general science. For a full semester, one group saw 44 films only, one group saw the films and also worked on special short study guides before and after each film, while the third group used a standard textbook with a teacher using the customary classroom methods. Results are reported as factual information test scores, before and after film showings, after each of the academic quarters, and after three months following the end of the course.

1048

Carpenter, C. ., Eggleton, R.C., John, F.T. & Cannon, J.B., Jr. THE FILM ANALYZER. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 15, Oct. 1950, 17pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1048

The functions and construction of the Film Analyzer are described in detail in this report. This apparatus is useful in research on training or other films when knowledge of audience reaction synchronized with the film is desired. The device allows responses of up to 40 viewers to be made on a five point scale, and recorded on a chart having reference marks related to the film footage and elapsed time. Operational requirements are outlined, possible uses suggested, and questions raised with respect to the participants' performance on the analyzer.

Walsh, R.K. CAMOUFLAGE SCHEMES FOR HELICOPTERS FOR CONCEALMENT AGAINST TERRAIN BACKGROUNDS FINAL REPORT. Proj. T 973, March 1956, 32pp. USMC Development Center, Quantico, Va.

1049

To develop suitable camouflage for Marine Corps helicopters operating in combat areas, tests were conducted in three phases: 1) laboratory investigations were initiated to formulate paints; 2) panel tests were made to ascertain, on a small scale, the adequacy of the paints; and 3) a full scale field test was carried out utilizing these paints applied to a helicopter. Various seasonal schemes were tested by visual inspection including color photographic coverage for recording purposes and visual inspection with infrared viewing devices including infrared coverage.

1050

Jaspen, N. EFFECTS ON TRAINING OF EXPERIMENTAL FILM VARIABLES. STUDY I. VERBALIZATION, RATE OF DEVELOPMENT, NOMENCLATURE, ERRORS, "HOW IT WORKS", REPETITION. (RAPID MASS LEARNING). Contract N6ONR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 17, Oct. 1950, 25pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1050

This is one of a series of experiments dealing with variables in instructional films possibly affecting training outcomes. The task here was assembly of the breech block of the 40mm antiaircraft gun. Seventeen different film versions were made, differing with respect to the following six variables: high or low number of words per minute (verbalization), slow or fast rate of pictorial development, use of technical nomenclature, showing of common errors to be avoided, "how-it-works" sequence ("logic" of breech-block), and repetition of the demonstration of assembly. Results of a post-test (actual assembly) with apprentice seamen Ss are reported and analyzed.

1051
Welson, H.E., Will, E.R. & Jaspert, N. COMPARISON OF THE AUDIO AND VISUAL ELEMENTS OF INSTRUCTIONAL FILMS. (RAPID MASS LEARNING). Contract NSCNR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 18, Nov. 1950, 15pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1051
Three instructional films were used in an experiment to determine the effectiveness of auditory commentary, visual elements, and the two combined, for learning of factual information. Two films on aerodynamics and one called "Land and Live in the Desert" were used with and without commentary, and in the dark with commentary. Eight test groups of 400 ROTC trainees viewed the aerodynamics films, and college students saw the other. Paper and pencil tests were administered at the end of the viewing. Results are given, and implications for training by film and television discussed.

1052
McBar, C.F., Jr. & van Ormer, E. INSTRUCTIONAL FILM RESEARCH 1918-1950. (RAPID MASS LEARNING). Contract NSCNR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 19, Dec. 1950, 179pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1052
This is a summary of research pertaining to the instructional use of films, 1918-1950. The authors' aim is to analyze, interpret, and synthesize the knowledge resulting from their survey. The data are discussed with respect to objectives of production or use of film, characteristics of the audience affecting reaction to the picture, content and structure of the film, and context in which the film is presented. Major subdivisions of the presentation include description of major film research programs, imparting knowledge, teaching perceptual-motor skills, influencing motivation, attitudes and opinion, comparison of films and other media and methods, audience characteristics, and variables of film production and use.

1053
Ash, P. & Carlton, B.J. THE VALUE OF NOTE-TAKING DURING FILM LEARNING. (RAPID MASS LEARNING). Contract NSCNR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 21, Nov. 1951, 10pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1053
This experiment tests the value of college students' taking notes during the viewing of instructional films--"High Altitude Flying" and "Ocean Survival and Safety." One group saw the film and then took the paper and pencil test. A second took notes on the film, then had the test and a third had a chance to review their notes for 10 minutes before the test. Results of this study are given with a discussion of the present as well as other experimental findings on this subject.

1054
Twyford, Loran. FILM PROFILES. (RAPID MASS LEARNING). Contract NSCNR 269, Proj. NR 781 005, SDC Proj. 20 E 4, SDC TR 269 7 23, Nov. 1951, 16pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1054
This experiment concerns the usefulness of a "rating profile" (which describes the audience's opinion as to whether they are learning during an instructional film) as a predictor for actual learning from the film. The audience--high school and college students--pressed buttons to indicate their reactions as the film proceeded. The graphic profile was derived by summing responses every 10 seconds. Three different types of reactions were tested: "I am learning", "I predict that my classmates are learning", and "I like (dislike) this film." Results are presented relating film information learned and audience reactions during learning.

1055
Allison, Sarah G. & Ash, P. RELATIONSHIP OF ANXIETY TO LEARNING FROM FILMS. Contract NSCNR 269, SDC TR 269 7 24, April 1951, 15pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1055
This report presents an investigation of the effects of "mildly motivational" instructions on what is learned from instructional films. During a course in introductory psychology, three groups of college students took a paper-and-pencil test measure of "chronic anxiety." Weeks later, they viewed either "Your Voice" or "Functions of the Nervous System." The introduction of the films for the three groups were designed either to lower anxiety about subsequent testing, to be neutral, or to heighten anxiety. Learning was tested by objective questions. Results are given on the relationships between these introductions and learning, and the scores on the Taylor anxiety scale and learning.

Mumlin, J.A., Mayer, M. & Harby, S.F. DAYLIGHT PROJECTION OF FILM LOOPS AS THE TEACHING MEDIUM IN PERCEPTUAL-MOTOR SKILL TRAINING. Contract NSCNR 269, SDC TR 269 7 26, May 1952, 8pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1056
This is an investigation of the use of film demonstrations in teaching a skill (tumbling), as compared with live instructor's demonstrations. Physical education college students were taught eight tumbling skills either by the eight two minute films, which were film loops projected by daylight, with a minimum of practice and no help from the instructor, or else by an experienced instructor, with no films. At the end of training, judges rated the students' performance of these skills. Results are given, with recommendations concerning the use of the training films, and daylight projection equipment.

Rohal, S.M., VanderWeer, A.W., Zuckerman, J.V., Brenner, H.R., et al. INSTRUCTIONAL FILM RESEARCH PROGRAM. PROGRESS REPORT. PERIOD 1 JANUARY TO 28 FEBRUARY 1949. Contract NSCNR 269, SDC Proj. 20 E 4, Prog. Rep. 10, Feb. 1949, 24pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1057
Although this is a progress report, it contains data from four research projects on factors influencing the effectiveness of training films. The projects concern 1) degree of realism in representing the learner in a film on knot-tying in terms of camera angle, continuous motion vs. static pictures, showing learner's hands in film, and audience participation; 2) comparing typical instructional methods with film alone and film plus guide for different kinds of subject matter; 3) relative effectiveness of different kinds of commentary, varying level of verbalization, personal reference, and commentary-picture phasing, and 4) effects of inserted questions and statements.

Carpenter, C.R. (Dir.). INSTRUCTIONAL FILM RESEARCH PROGRAM. PROGRESS REPORT. PERIOD: 1 MARCH TO 30 JUNE 1949. Contract NSCNR 269, SDC Proj. 20 E 4, Prog. Rep. 11 12, June 1949, 51pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1058
This progress report covers a four-month period of research on training films. A structured outline classifying areas for research is presented, and the current status of each project is described within the framework of the outline. Major headings of the outline are: Learning Principles, Film Characteristics, Development of New Research Equipment and Procedures, Utilization of Films in Instruction, and Reviews of Pertinent Literature.

1059

Carpenter, C.R. (Dir.). INSTRUCTIONAL FILM RESEARCH PROGRAM. PROGRESS REPORT. PERIOD: 1 JULY TO 31 NOVEMBER 1949. Contract N7CNR 269, Proj. NR 781 005, SDC Proj. 20 E 4, Prog. Rep. 13, Nov. 1949, 53pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1059

In addition to the customary status information this progress report contains preliminary reports on 4 research projects on the effectiveness of training films, including data. The projects concern: 1) the length of the film and the number of facts it contains; 2) effectiveness of film introductions; 3) effectiveness of repetitive film presentations; and 4) comparison of relative effectiveness of video and audio elements in films.

T. R 13

1060

Carpenter, C.R. (Dir.). INSTRUCTIONAL FILM RESEARCH PROGRAM. PROGRESS REPORT. PERIOD: 1 DECEMBER 1949 TO 31 MARCH 1950. Contract N7CNR 269, Proj. NR 781 005, SDC Proj. 20 E 4, Prog. Rep. 14 15 16, 47pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

1060

In addition to the customary status information, this progress report contains preliminary reports on 3 research projects on the effectiveness of training films, including data. The projects concern: 1) effects of varying number of words in narration, amount of "how-it-works" information, audience participation, and succinctness of treatment; 2) effectiveness of visual and auditory attention-gaining devices; and 3) effects of prestige and identification factors on attitude restructuring and learning from films. All the various experimental films produced for the program are listed and described.

Harris, J.D., Haines, H.L., & Myers, C.K. RECRUITMENT, PITCH TESTS, AND SPEECH-TONE HEARING DISCREPANCIES. A.M.A. Arch. Otolaryng., July 1955, 62: 66-70. (USN Medical Research Lab., New London, Conn.)

The problem of why some ears can hear pure tones at certain intensity but are relatively poor at hearing speech was investigated. There is a real discrepancy between hearing for speech and for pure tones for some persons. A group of 26 ears from 22 men and women, all partially deafened, were tested. Articulation curves were drawn for each patient, audiograms were taken and the experimental ear was examined as to presence of recruitment, pitch discrimination and complete background history on all factors likely to have affected the ears were also taken. On the basis of the above, the ear was labelled discrepant. All ears were defined as discrepant for speech and pure tones. The interrelations of loudness perception, pitch discrimination, and speech-tone discrepancies in hearing were examined. It was found that there is no evidence that pitch deafness itself contributes much to speech blurring. All the data point to the conclusion that, although there is no necessity for every case of recruitment to be accompanied by pitch blurring, some of recruitments unfortunately effects on speech reception are alleviated by concomitant pitch deterioration. (HEIAS)

1068

This report describes the preparation of the Manual for Syllabus Construction, aimed at assisting in the improvement of syllabi, texts, and lesson plans in the ground schools of the Naval Air Training Command. The manual itself is appended with an enclosure entitled: Principles of Educational Psychology.

1069

Fryer, D.H. (Dir.). THE TRAINING SURVEY - A METHOD OF EVALUATING TRAINING WITH THE 1948 ANNUAL SURVEY AS AN EXAMPLE. INTERIM REPORT ON EDUCATIONAL RESEARCH PROJECT. Contract N7CNR 383, Proj. NR 782 002, SDC Proj. 20 E 6, SDC TR 383 18, RBH Proj. 128, Aug. 1948, 146pp. USN Special Devices Center, Port Washington, N.Y. (Richardson, Bellows, Henry & Co., Inc., New York, N.Y.).

1069

This report describes in detail a technique for surveying training, involving the following steps: preparation of background material, orientation of survey personnel, collecting evidence, analysis of data, preparation of report, and recommending solutions for training problems. The technique is illustrated with a full report of its use in the 1948 survey of training in the Naval Air Training Command. Included are the reports of 6 survey teams on such subjects as classroom instruction, course technique, student evaluation, training development and research, instructor training and evaluation, and others.

Garnor, W.R., & Hamburger, F. DETECTABILITY AND DISCRIMINABILITY OF TARGETS OF A REMOTE PROJECTION PLAN-POSITION INDICATOR. Proceedings of the Institute of Radio Engineers, Nov., 1947, 35, 1220-1225. Contract N5ori-166, T.O. 1, SDC, ONR, Port Washington, N.Y. (Johns Hopkins University)

1076

To determine the optimum operating conditions for the projection plan-position indication screen of the radar system, threshold measurements for six observers were obtained (minimum detectable signals and minimum separation between two signals) as the following factors were varied: video gain, CRT bias (screen brightness), signal-clipping, light source intensity, and type of diffraction screen. The data are analyzed in terms of target detection as a function of the different variables. Results from a standard PPI are compared with these data.

Harriman, K.W., & Williams, S.B. VISIBILITY ON CATHODE-RAY TUBE SCREENS: POSITIVE VS. NEGATIVE SIGNALS ON AN INTENSITY MODULATED SCOPE. J. opt. Soc. Amer., Feb. 1950, 40, 102-104. Contract N5ori-166, T.O.1, Proj. Desig. No. NR-784-001, ONR, (Johns Hopkins U.)

1077

To compare two methods of presenting signals on cathode-ray tube screens, three trained observers adjusted intensity of the signal (small, intermediate, and large sizes) until signal was just barely visible for (1) grid targets (positive signals) which appeared brighter than background, and (2) cathode targets (negative signals) which appeared darker than background. Threshold data (decibels of attenuation below initial 8-volt reference) are analyzed as a function of scope brightness (bias) for the two types of target.

Woollen, C.E. & Hamburger, F., Jr. A PROJECTION TIMER FOR VISUAL RESEARCH. Contract N5 ORI 166, Task Order I, 166 I 4, Nov. 1946, 11pp. Electrical Engineering Lab., Johns Hopkins University.

1078

A device is described which provides visual images for research dealing with visual display methods. Specifically, the equipment was designed for basic study of visual images to determine an observer's ability to make optimum use of information presented as a series of light spots appearing on a coordinate system of concentric circles. The equipment which is described and diagrammed in detail will produce images variable from three inches to five feet in diameter which can be produced with any duration from 0.143 to 0.800 seconds.

Garner, W.R. AUDITORY THRESHOLDS OF SHORT TONES AS A FUNCTION OF REPETITION RATES. *J. Acoust. Soc. Amer.*, July 1947, 19(5), 600-608. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1079

This research determined for short tones (sine-wave) the extent of threshold change with change in the repetition rate and the conditions under which the change is maximal or minimal. The change was studied as a function of type of threshold--absolute or masked, frequency of tone--250, 1,000, 4,000 cps. and duration of tone--1 to 50 msec. Six trained Ss were used; from each a minimum of five observations were obtained per condition. Repetition rates between 1/4 and 100 per sec. were tested. The threshold changes are considered in terms of total energy changes as afforded by change in repetition rate compared to change in duration. The conditions necessary for temporal integration of acoustic energy by the ear are discussed. G. I. R 4

1080

Witkin, H.A. & Asch, S.E. STUDIES IN SPACE ORIENTATION. IV. FURTHER EXPERIMENTS ON PERCEPTION OF THE UPRIGHT WITH DISPLACED VISUAL FIELDS. *J. exp. Psychol.*, Dec. 1948, 38(6), 762-762. (Brooklyn College & Swarthmore College).

1080

To determine how perception of the upright is affected by position of a simple luminous visual frame (28 degrees right, 28 degrees left, erect) and body position. (28 degrees left, erect), 53 adult subjects in a completely darkened room adjusted a luminous rod (set within the frame) to the horizontal and vertical for all above combinations. In supplementary experiments judgments were made for: 1) additional frame positions, 2) frame within a frame situations, 3) rod with and without a frame situations. All results are discussed in terms of amount and direction of errors as a function of articulation of the visual field. T. G. I. R 3

1081

Garner, W.R. ACCURACY OF BINAURAL LOUDNESS MATCHING WITH REPEATED SHORT TONES. *J. exp. Psychol.*, Aug. 1947, 32(4), 337-350. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1081

These experiments were aimed at showing how the duration and repetition rate of tones affect the binaural intensity-disparity threshold; also the effects of frequency and intensity on differential sensitivity were examined. Six well-trained males observed; the task was to match the tones in the two ears in loudness when these tones differed only in intensity; each S made five loudness matches per condition. Conditions tested included tones of 40 to 100 db, 250 to 4,000 cps, 1 to 200 msec., and 1 to 100 times per sec. The standard deviation of these matched values was used as the measure of differential sensitivity. This technique provided data on loudness relations of the two ears and the magnitude of differences between Ss as compared with differences within Ss. T. G. I. R 7

1082

Garner, W.R. THE EFFECT OF FREQUENCY SPECTRUM ON TEMPORAL INTEGRATION OF ENERGY IN THE EAR. *J. Acoust. Soc. Amer.*, Sept. 1947, 19(5), 808-815. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1082

The following hypothesis was tested: "The rate of temporal integration of energy in the ear is dependent on the width of the frequency band of the energy to be integrated. Duration is exactly equivalent to intensity only when all the energy to be integrated is in a narrow band of frequencies. When the energy is in a wider band of frequencies, integration will occur, but the change in threshold will be less than the change in duration." This change in threshold for very short durations of tone--1 to 100 msec.--was measured for a noise stimulus (50 to 5,000 cps) and sine-wave stimuli--250, 1,000, 4,000 cps--for six male observers using a modified method of limits, threshold being the hearing of two tones in succession. Ten observations were made per binaural condition, 25 per monaural condition. G. I. R 5

1083
Rough, R.G. & Neuharber, F., Jr. AN ELECTRONIC CHRONOGRAPH FOR MEASUREMENT OF VOICE REACTION TIME. *Am. J. Psychol.*, Oct. 1947, 60, 624-638. Contract NSORI-166, T.O.I. Rep. 166-I-27. ONR, SPECIAL DEVICES CENTER, Port Washington, L.I., New York. (Johns Hopkins University, Baltimore, Md.).

This report describes an electronic chronograph which permits a high-speed synchronous clock to be turned on by the video target voltage and turned off by the initiation of a verbal report. Variable errors associated with the circuit are the result of changes in line frequency and the type of initial syllable of verbal response. However, for a normal line frequency excursion of 1/4 cycle the clock error does not exceed 0.4%. Variable errors dependent upon the type of initial syllable of the verbal response are less than 2 msec. Initial experiments employing the chronograph have indicated that for the simplest voice reaction-time measurements, the shortest times involved are in the neighborhood of 200 msec. Compensation for the constant clock error will therefore permit the chronograph to be used in this application with an error not exceeding 1%. In addition to measurement of voice reaction-time, the system may be modified to fit the requirements of many other reaction-time experiments. R O

Saltzman, I.J. & Garner, W.R. REACTION TIME AS A MEASURE OF SPAN OF ATTENTION. *J. Psychol.*, 1948, 25, 227-241. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1084

To evaluate the concept of "span of attention" and to compare the effects of two different methods of studying span, five Ss were presented with concentric circle stimuli under two procedures--tachistoscopic presentation (TP) and reaction time method (RTM). With TP exposure duration was 0.5 sec. and Ss recorded the number of circles appearing on a data sheet. With RTM the stimuli remained in view until Ss made a verbal report. Percent of correct identifications and RTs were analyzed in terms of 1) the effect of exposure time, practice and knowledge of range of stimuli upon the size and immediacy of the span of attention; and 2) the relative efficiency of TP and RTM. 1085

Hanes, R.M. & Williams, S.B. VISIBILITY ON CATHODE-RAY TUBE SCREENS: THE EFFECTS OF LIGHT ADAPTATION. *J. opt. Soc. Amer.*, April, 1948, 38, 363-377. Contract NSORI-166, T.O.I. Rep. No. 166-I-32, ONR, Special Devices Center, Port Washington, L.I., New York. (Johns Hopkins Univ.)

1085

To determine the effect of light- and dark-adaptation on contrast thresholds and time for detecting a supra-threshold signal appearing on a cathode-ray tube screen (P-7), a series of observations were made as these conditions were varied: pre-exposure brightness (0 to 2000 millilamberts), screen intensities (0.0001 to 0.22 millilamberts), length of exposure (1/4 to 5 minutes), contrast ratios of signal to background (0.13 to 2.50). Contrast thresholds and detection times are analyzed statistically and discussed in terms of optimal conditions for radar operation. T.G.I.R.9.

1086
Sleight, R.D. THE EFFECT OF INSTRUMENT DIAL SHAPE ON LEGIBILITY. *J. appl. Psychol.*, April, 1948, 32, 170-88. Cf. NS-ori-166, T.O.I., Rep. No 166-I-35, ONR, Special Devices Center, Fort Washington, L.I., N.Y. (Purdue Research Foundation and Johns Hopkins Univ.)

1086
To study the effect of instrument dial shape on accuracy of reading off information, 60 subjects viewed briefly each of five dial shapes (vertical, horizontal, round, semi-circular, open-window), equated for size and style of numerals, marks and pointers, contrast, size and brightness of background, and positioning of pointer, and reported the settings. Errors of extent and direction are analyzed for significant differences in legibility yielded by the five shapes. Implications for instrument design are discussed.

Sweet, A.L., & Bartlett, M.R. VISIBILITY ON CATHODE-RAY TUBE SCREENS: SIGNALS ON A P7 SCREEN SEEN AT DIFFERENT INTERVALS AFTER EXCITATION. *J. Opt. Soc. Amer.*, April 1948, 38, 329-337. Contract NS-ori-166, T.O.I., Rep. 166-I-35, ONR, Special Devices Center, Fort Washington, L.I., N.Y. (Johns Hopkins Univ.)

1087
To measure visibility changes in signal images on the cathode-ray tube screen (P-7), visual thresholds for each of 5 observers were measured at varied intervals (fluorescence to 60 seconds delay), signal strengths (0 to 105 decibels from reference voltage), scope brightness or CRT bias (11,14,17,20 volts). Visibility data are given as attenuation of signal strength (in decibels) and are analyzed as functions of the three variables to determine conditions favoring optimum signal detection.

Jeffries, R.J. & Hamburger, F., Jr. A LINEAR MOTION CHARACTERISTICS RECORDER. Contract NS-ori 166, Task Order 1, Rep. 166-I-36, Sept. 1947. ONR, Special Devices Center, Fort Washington, L.I., New York. (Johns Hopkins Univ., Electrical Engineering Lab., Baltimore, Md.)

The Linear Motion Characteristics Recorder described in this paper was designed to produce records of the parameters of motion encountered in the study of basic psychological motor problems. The equipment provides a free-moving stylus which may be directed by the S over a predetermined traverse. Simultaneous time-history records are produced of instantaneous displacement, velocity, and angular deviations of the stylus from the traverse. This paper reviews the design of the signal pick-ups and associated equipment. Engineering analyses and performance data are also included.

1092
Williams, S.B., Bartlett, M.R., & King, E. VISIBILITY ON CATHODE-RAY TUBE SCREENS: SCREEN BRIGHTNESS. *J. of Psychol.*, 1948, 22, 455-466. Contract NS-ori-166, T.O. I, Proj. 20-F-1, Rep. 166-I-42, ONR, Special Devices Center, Fort Washington, L.I. New York, (Johns Hopkins Univ.)

1092
To study the effect of screen brightness (grid bias) on the visibility of signals on the plan position indication screen of the cathode-ray tube (7EP7), discrimination thresholds were obtained for four observers at 12 bias (brightness) levels, with a noise-free screen and with noise (screen clutter). Threshold and grid bias measurements are given in voltage units and transformed into brightness units for comparison with classical data on sensitivity of the eye. Practical implications for research in radar displays and for the operating engineer are discussed.

1093
Garner, W.R. THE LOUDNESS OF REPEATED SHORT TONES. *J. Acoust. Soc. Amer.*, July 1948, 20(4), 513-527. (Psychology Dept., Johns Hopkins University, Baltimore, Md.)

1093
These experiments were aimed primarily at determining the relation between loudness and the repetition rate of tones and the effect of duration, frequency, and intensity on this relation. Six experienced males made ten observations per condition: for loudness, duration, and repetition effects the standard was 1,000 cps at 80 db for durations of 1 to 50 msec. and the comparison was repeated at rates of 5 to 100 per sec.; for frequency tones ranging from 125 to 8,000 cps, of 40 or 80 db, and of 20 msec. duration repeated 25 times per sec. were each compared to the same steady tone; for intensity a series of measurements similar to those for frequency were made using intensities ranging from 20 to 120 db. Five basic relations between loudness and the repetition rate of short tones are identified and discussed. T. G. I. R. 14

1094

Bartlett, M.R., Reed, J.D., & Davis, G. ESTIMATIONS OF DISTANCE ON POLAR COORDINATE PLOTS AS A FUNCTION OF THE SCALE USED. *J. gen. Psychol.*, 1949, 41, 47-65. Contract NS-ori-166, Proj. 20-F-1, Rep. 166-I-44, SDC, ONR, Fort Washington, E.Y. (Johns Hopkins University)

1094

To determine the accuracy of reading target range on polar coordinate plots, 48 subjects estimated the relative distances of targets from center in a series of ten displays having identical number of subdivisions but differing in number of units (five, ten, and twenty, respectively). Accuracy of reading is analyzed for different distances in terms of the constant error in judgments and variability of the judgments, and is interpreted as a function of scale numbering. Various number-effects are discussed. T.G.R.

1095

Boughty, J.M. & Garner, W.R. PITCH CHARACTERISTICS OF SHORT TONES. II. PITCH AS A FUNCTION OF TONAL DURATION. *J. exp. Psychol.*, Aug. 1948, 32(4), 478-484. (Psychology Dept., Johns Hopkins University, Baltimore, Md.)

1095

To determine the direction and magnitude of pitch changes as a function of duration over a wide range of durations, frequencies, and intensities, two psychophysical methods were employed--constant stimuli and average error; for both the standard was 250, 1,000, or 4,000 cps at 90 or 70 db and the comparison was 6, 12, 25, 50, 100, or 200 msec. Six Ss were used. In the first procedure one standard was paired with each comparison ten times; for each set of conditions the combined data of all Ss were fitted by a straight line using the method of least squares. In the second, S altered the frequency of the comparison over the entire audible range until it matched the standard in pitch; S made from two to five judgments per condition; variability for the combined data was expressed graphically by sigma. Chapanis, A. THEORY AND METHODS FOR ANALYZING ERRORS IN MAN-MACHINE SYSTEMS. *Ann. N.Y. Acad. Sci.*, Jan., 1951, 51, 1179-1203. Contract NS-ori-166, T.O.I., Rep. No. 166-I-49, ONR, Special Devices Center, Fort Washington, L.I., New York. (Johns Hopkins Univ.)

1096

This paper develops systematically several important concepts and formulae for analyzing errors in complex man-machine systems (specifically, radar problems) and demonstrates by practical examples the applications of these equations to the analysis of errors in such systems. T.G.I.R.11.

1097

Hanes, R.M. A SCALE OF SUBJECTIVE BRIGHTNESS. *J. exp. Psychol.*, Aug., 1949, 39, 438-452. Contract NS-ori-166, T.O.I., Rep. No. 166-I-51, ONR, Special Devices Center, Fort Washington, L.I., New York. (Johns Hopkins Univ.)

1097

To determine how reliably individuals can make fractional estimates of the relation of subjective brightness (brilliance) to physical brightness, four trained subjects adjusted a variable flash to 1/2 and 3/4 the brightness of a standard (0.201 to 100 millilamberts). Other variables were: hue (white, red, green, blue) and duration (1300, 20, 970 milliseconds). The results are analyzed statistically. A subjective brightness or brilliance scale is constructed, the unit of which is called a "bril", and compared with a curve obtained by interstimulus difference limens. T.G.R.

Leysorek, M. ACCURACY OF VISUAL INTERPOLATION BETWEEN CIRCULAR SCALE MARKERS AS A FUNCTION OF THE SEPARATION BETWEEN MARKERS. *J. exp. Psychol.*, Apr., 1949, 39, 270-279. Contract NS-ori-166, T.O.I., Rep. No. 166-I-52, ONR, Special Devices Center, Fort Washington, L.I., New York. (Johns Hopkins Univ.)

1096

To investigate the relation between accuracy of visual interpolation between scale markers and size of scale intervals, 7 subjects estimated the position of targets displayed on 10- or 20-inch polar coordinate plots, with sizes of intervals varied from 1/8 to 10 inches. Errors of interpolation (proportion of the intervals in which estimations were safe) and absolute errors of estimation are analyzed as a function of interval size. A critical value is suggested which will yield maximum accuracy of interpolation. Individual differences in performance are noted. T.G.I.R.

1099

Sleight, R.B. THE RELATIVE DISCRIMINABILITY OF SEVERAL GEOMETRIC FORMS. *J. exp. Psychol.*, Apr., 1952, 45, 324-328. Contract NS-ori-166, T.O. I., Rep. 166-I-55, SDC, ONR, Fort Washington, N.Y. (Johns Hopkins University)

1099

To study the relative discriminability of forms in a complex visual display, 21 subjects sorted a number of geometric forms (21, six of a kind) on the basis of (1) their attention-getting value, and (2) a predetermined order. Mean sorting times for both methods are studied for significant differences among forms. Rank orders for selection and speed of sorting are given. Suggestions are made as to the most discriminable forms to be selected for visual displays. T.I.R.11.

Williams, S.B., & Hanes, R.M. VISIBILITY ON CATHODE-RAY TUBE SCREENS: INTENSITY AND COLOR OF AMBIENT ILLUMINATION. *J. Psychol.*, 1949, 27, 231-244. Contract NS-ori-166, T.O. I., Proj. NR-784-001, Rep. 166-I-56, ONR, Special Devices Center, Johns Hopkins U.

1100

To study visibility on cathode-ray tube screens as affected by ambient illumination, 2 observers made threshold judgments on the appearance of a small signal pip on a typical radar scope of modulated intensity. Room illumination was varied from 0.02 to 1 footcandle for 6 colors: blue, green, magenta, amber, red, and "daylight". Threshold data are analyzed as a function of intensity and hue of illumination and recommendations are made for illumination levels in the radar operating room. These results are compared with those in the visual literature. T.G.R.19.

1101

Kaufman, E.L., Reese, T.W., Volkman, J., & Rogers, S. ACCURACY, VARIABILITY AND SPEED OF ADJUSTING AN INDICATOR TO A REQUIRED BEARING. Contract NS-ori-166, T.O. I., Rep. 166-I-MHC 4. Sept. 1947. 37pp. ONR, Special Devices Center, Johns Hopkins U., Systems Research. (Mt. Holyoke College)

1101

To investigate some factors in the discrimination of angular orientation, 6 subjects observed a large circular display on which was a line of light and adjusted this line to a required bearing. In a second series, a single bearing marker at 300 was fixed on the display as a reference of "anchor". Errors of adjustment and times for adjustment are analyzed statistically to determine the accuracy, variability, and speed of performance with and without an "anchor". Individual differences are discussed. T.G.I.R.

1102

Kuffman, E.L., Lord, H.W., Reese, T.W., & Vollmann, J. THE DISCRIMINATION OF VISUAL NUMBER. *AMER. J. Psychol.*, 1949, 62, 400-405. Contract NS-ori-166, Rep. 166-I-MNC 8. Oct. 1949. ONR, Special Devices Center, Johns Hopkins Univ. (Mt. Holyoke College)

1102

To investigate factors in estimating visual number, 9 subjects received brief (1/5 second) visual presentations of randomly arranged fields of dots (from 1 to 210) and reported the number perceived; some subjects were instructed to report accurately and some for speed. Results are given as percentage error and variability of reported number, time for and confidence of reporting. Analysis and discussion is in terms of the effect of number and instructions on speed and accuracy, and the techniques used for estimating ("subitizing" versus "estimating"). Implications for application to practical problems are drawn.

T. G. I. R 9

1103

Jensen, E.H., Reese, E.P., & Reese, T.W. THE SUBITIZING AND COUNTING OF VISUALLY PRESENTED FIELDS OF DOTS. *AMER. J. Psychol.*, 1950, 50, 383-392. Contract NS-ori-166, Rep. 166-I-MNC 6. Oct. 1950. ONR, Special Devices Center, Mt. Holyoke College, Dept. of Psychol. and Educ.

1103

To investigate the manner in which visual number is discriminated, five subjects received visual presentation of fields of dots (from one to thirty) and reported the number observed. Time for observation was not limited. The data are analyzed statistically in terms of accuracy of report and time between stimulus presentation and reports. The shape of the function is discussed and explained in terms of discrimination techniques used. A discussion of the statistic of analysis by rectification is included.

Humphrey, C.E. & Thompson, J.E. AUDITORY DISPLAYS. II. COMPARISON OF AUDITORY AND VISUAL TRACKING IN ONE DIMENSION. A. DISCONTINUOUS SIGNALS, SIMPLE COURSE. Rep. APL/JHU TG 146, Sept. 1952, 7pp. Applied Physics Lab., Johns Hopkins University, Baltimore, Md.

1106

Four inexperienced Ss performed a simple compensatory tracking task (sine-wave course) under both auditory and visual presentation conditions. Each S was given 50 auditory and 50 visual trials. Tracking was done by joystick movement in the reverse direction from signal motion. Performance was measured by integrator scores obtained electronically from the area under the error curves. Auditory and visual performance data were compared statistically by t-test technique. Tracking efficiency was also determined for both signal conditions. The influence of discontinuous stimulus presentation and reaction time on performance was discussed briefly.

Chapanis, A. STUDIES OF MANUAL ROTARY POSITIONING MOVEMENTS: I. THE PRECISION OF SETTING AN INDICATOR KNOB TO VARIOUS ANGULAR POSITIONS. *J. Psychol.*, 1951, 31, 51-64. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1108

This study tested the accuracy with which Ss could rotate an indicator knob to any angular position in the absence of visual cues. Four male and four female Ss each made 800 settings at each of 20 angular positions which ranged from 0 to 170 degrees. Half of these were made without a visual guide and half with (though S at no time could see his hands or the knob); both right and left hands were used. The main results, given as means and standard deviations, were evaluated by variance analyses; practice effects, differences between hands, sequence of hands, and sex differences also were examined by compounding the standard deviations of all of the settings.

Saltzman, I.J., & Gerner, W.R. THE EFFECTS OF SIZE AND BRIGHTNESS ON THE SPEED OF IDENTIFYING NUMBER OF RANGE RINGS. Contract NS-ori-166, T.O. 1, SEC Human Eng. Proj. 20-P-1, Tech. Rep. SDC 166-I-79. Jan. 1949. 15pp. Special Devices Center, Johns Hopkins Univ., Institute for Cooperative Research.

1110

To investigate the effect of size and brightness on speed of identifying the number of range rings of a polar coordinate display, five subjects viewed a screen presentation of rings (from two to ten) at various visual angles (one degree-ten minutes to ninety degrees) and at varied brightnesses (0.005 to 55 apparent foot candles) and reported the number observed. Total time for identification for the various conditions are analyzed. Discussion is concerned with optimum size and brightness for range readings; number effects and individual differences are noted.

Bartlett, M.R., & Sweet, A.L. VISIBILITY ON CATHODE-RAY TUBE SCREENS: SIGNALS ON A P-7 SCREEN EXPOSED FOR DIFFERENT INTERVALS. J. opt. Soc. Amer., 1949, 39, 470-473. Contract NS-ori-166, T.O. 1, Rep. No. 166-I-83. ONR, Special Devices Center, Johns Hopkins Univ., Psychol. Lab.

1111

To investigate some factors affecting signal detection on cathode-ray tube screens, the minimum detectable signal voltage rendering the target visible was determined (5 subjects) with varied exposure times (0.02 to 4.16 seconds), brightness levels of scope (dim and bright), turning rates of sweep (32 and 6 rotations per minute). Threshold data are analyzed in terms of the relations between target visibility and exposure time. Optimal conditions for grid bias (brightness) and sweep are discussed.

Chapanis, A. THE STABILITY OF "IMPROVEMENT" IN COLOR VISION DUE TO TRAINING-A REPORT OF THREE CASES. Amer. J. Optom. and Arch. Amer. Acad. Optom., June 1949, 26(6), 251-259. (Johns Hopkins University, Baltimore, Md.).

1112

To add some data on the effects of training in color vision, three cases are presented. All were men who had been rejected for military service because of color deficiency, had then received training on color vision tests which enabled them to pass the tests. Several years later they were tested on a battery of color vision tests, two of which were new and two were familiar. Test scores are compared with those for 573 individuals and discussed in terms of the stability of "improvement" in color vision.

Gerner, W.R. THE LOUDNESS AND LOUDNESS MATCHING OF SHORT TONES. J. Acoust. Soc. Amer., July 1949, 21(4), 398-403. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1115

The relation between zonal duration and differential sensitivity to intensity was investigated using a monaural loudness matching technique. Two basic conditions were employed: 1) the standard tone of 500-msec. duration was followed by the comparison tone of variable duration, 10 to 500 msec., the interval between them being either 50, 100, or 500 msec.; 2) everything was identical except the standard and comparison always had the same duration. A 1,000-cps tone was employed throughout. Six experienced Ss each made ten loudness matches for each condition. The probable error of the loudness matches was used as the measure of the difference limen, mean score in db was the loudness measure. The effects of the variables on these measures were considered in some detail.

Williams, S.B. VISIBILITY ON CATHODE-RAY TUBE SCREENS: VIEWING ANGLE. J. opt. Soc. Amer., 1949, 39, 782-785. Contract NS-ori-166, T.O. 1, Rep. 166-I-92. ONR, Special Devices Center, Johns Hopkins Univ., Psychol. Lab.

1116

To determine the limits within which chance eccentricity of view can be a factor in radar detection, two trained observers made threshold (appearance) judgments of a signal on a modified TBP7 cathode-ray tube screen (four scope brightnesses, three signal sizes, viewing angle from zero to twenty degrees of eccentricity). Threshold measurements (units of signal voltage) are analyzed as a function of viewing angle, scope brightness, and signal size. Voltage data is translated to light values and discussed in terms of the approximate size of the differential threshold in brightness units.

Steller, E. HUMAN FACTORS IN PANEL DESIGN. Report from: "Human Factors in Undersea Warfare." 1949, 153-175. US National Research Council, Washington, D.C. (Johns Hopkins University, Baltimore, Md.).

1117

The purpose of this chapter is to summarize and evaluate the results of investigations on the human perceptual and motor capacities directly relevant to panel layout problems, and to describe what the study of human factors in equipment design has to offer in the solution of such problems. The data and general principles derived therefrom are discussed for six major aspects of panel layout: practical limits of the working area, optimal location of controls and displays, importance and frequency of use of controls and displays, patterning of controls and displays, distribution of work over body parts, and confusion of controls and of displays. Problems of the practical application of this research knowledge also are considered.

Doughty, J.M. THE EFFECT OF PSYCHOPHYSICAL METHOD AND CONTEXT ON PITCH AND LOUDNESS FUNCTIONS. *J. exp. Psychol.*, Oct. 1949, 32(5), 729-745. (Franklin and Marshall College, Lancaster, Penn.).

1118
This experiment tested the prediction that the experimenter can predetermine the Constant Errors (CE) for pitch and loudness by the selection of the comparison stimuli in the Method of Constant Stimuli; the same context effects were determined for the Average Error (AE) method. The specific experimental variables included: degree of asymmetry in the stimulus context, stimulus duration (50, 1,000 msec), and degree of spread of comparison stimuli. Three trained Ss made 50 judgments per point. For AE data, CE's were computed from the mean of the distribution of judgments; difference limens (DL) as the probable error of the distribution. The least squares solution for the phi-gamma function with unweighted values, was used to determine the CE's and DL's. Results from the two methods are compared. T. G. I. R 11

1119
To compare current attrition rates for three different types of flight trainees, a study was made of 327 aviation officer candidates, 749 naval aviation cadets, and 459 officers under instruction. These three groups parallel each other in terms of entry and progress through the program with pre-flight school training complete. Attrition rates by type (flight failure, voluntary withdrawal, ground school failure, not physically qualified, not officer material, and other) were calculated and compared. The findings are discussed in relation to recruitment policies. T.

Chapanis, A. STUDIES OF MANUAL ROTARY POSITIONING MOVEMENTS: II. THE ACCURACY OF ESTIMATING THE POSITION OF AN INDICATOR KNOB. *J. Psychol.*, 1951, 31, 65-71. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1123
This second study measured the precision with which Ss could estimate the setting of an indicator knob which they were not allowed to move. Ten Ss each made 180 estimates of the settings at each degree from 0 (the horizontal) through 90 degrees (the vertical). The statistical summary of the data include the mean, standard deviation, median, probabilities (10 and 90), and lowest and highest estimates made for each class of angular positions. The mean and standard deviation data were compared to those obtained in the first study when the settings were made by S. Number frequencies for the final digit of the estimates also were presented. Doughty, J.M. THE ROLE OF REPETITION RATE AND INTER-STIMULUS INTERVAL IN CONTEXT EFFECTS. *J. exp. Psychol.*, Feb. 1952, 43(2), 156-161. (Franklin and Marshall College, Lancaster, Penn.).

1127

The role of the temporal separation of stimuli on context effects was explored by varying repetition rate and interstimulus interval in the methods of constant stimuli and average error. Constant errors (CEs) and difference limens (DLs) for pitch were determined in a balanced and unbalanced context as well as by the method of single stimuli. Two comparison stimulus durations and prior or no knowledge of distribution of comparison stimuli also were tested. The standard tone was always 1,000 cps for 1,000 msec. Two trained Ss were used. For average error data CEs were computed from the mean of the distribution of judgments, DLs the probable error of the distribution. Constant stimuli data were determined by least squares. The effects of these variables on the CE and DL were compared and discussed. G, R 4

1128

Alexander, L.T., & Bricker, P.D. FIGURE-GROUND CONTRAST AND BINOCULAR RIVALRY. *J. exp. Psychol.*, 1952, 44, 452-454. Contract NS-ori-166, T.O. I, Rep. 166-I-158. ONR, Naval Research Lab., Systems Coordination Div., Johns Hopkins Univ.

1128

To investigate the rate of alternation in binocular rivalry as a function of degree of figure-ground contrast of stereoscopic fields, five stereograms, differing in degree of figure-ground contrast, were presented to five subjects. Rate of alternation for individuals and for combined scores is studied in terms of contrast, practice, and individual differences.

Eriksen, C.W. LOCATION OF OBJECTS IN A VISUAL DISPLAY AS A FUNCTION OF THE NUMBER OF DIMENSIONS ON WHICH THE OBJECTS DIFFER. *J. exp. Psychol.*, 1952, 44, 56-60. (Johns Hopkins University, Baltimore, Md.). (ONR Rep. 166 I 149).

1129

To determine the manner in which the number of visual dimensions identifying a given object influences the speed of locating the object in a complex field, a total of sixty subjects viewed large visual displays (49 objects varied in form, hue, size, and brightness) and located the six forms exactly like a given sample. Two conditions were used: (1) the various classes of sample objects differed from one another on only one dimension, and (2) the classes differed on two or three dimensions. Location times are analyzed as a function of a single or compound dimensions used for discrimination.

Garner, W.R. AN EQUAL DISCRIMINABILITY SCALE FOR LOUDNESS JUDGMENTS. *J. exp. Psychol.*, March 1952, 43(3), 232-238. (Psychology Dept., Johns Hopkins University, Baltimore, Md.).

1130

Three hypotheses were tested: the equal discriminability scale for loudness is linearly related to a scale of cumulative difference limens for intensity, the fact that a series has definite limits produces anchoring effects which make discriminability better near the limits, particular spacing of stimulus intensities has no effect on the discriminability scale per se. Accordingly four sets of experimental conditions were used: three spaced the presented stimuli five db apart—one used a range of 5 to 100 db, another 55 to 100 db, the third 5 to 50 db; the fourth used a 5 to 100 db range but spaced the stimuli according to loudness rather than log intensity. Each of ten Ss made 100 judgments of each intensity for each condition. Each S's data were handled separately to construct the equal discriminability scales. R 6

1131 Gebhard, J.W. THRESHOLDS OF THE HUMAN EYE FOR ELECTRIC STIMULATION BY DIFFERENT WAVE FORMS. *J. exp. Psychol.*, 1952, 44, 132-140. ONR, Special Devices Center, Johns Hopkins University, Institute for Cooperative Research, Baltimore, Md.

This study deals with a problem in electro-stimulation which resulted in some controversy due to discrepant findings. The problem is: Does the stimulus strength-frequency relation have one or several minima? Four Ss were tested under 4 wave forms in determining the flicker thresholds: a) a sine wave; b) a positive pulse with a duty cycle of .5; c) a negative pulse with a duty cycle of .5; and d) a "symmetrical" square wave made up of alternating positive and negative pulses of equal duration. Thresholds were obtained at 12 frequencies for each wave form except for the sine wave. These were at 5, 7.5, 10, 12.5, 15, 17.5, 20, 22.5, 25, 35, 45, and 60 cycles/sec. The cycles of 5 and 7.5 cycles/sec. gave lower thresholds than sine waves by an amount predictable from the total AC power; c) Rectangular pulses were most effective when the duty cycle was .5. These results indicate that the effective intermittent electric stimulation for the eye is alternating current and that the efficiency of any wave form is dependent upon the total power of the AC component; d) Thresholds for all wave forms were lowest at a frequency of about 20 cycles/sec. This frequency was the only one at which an unequivocal minimum was observed. The results of the study support some of the work in this area and contribute to the disagreement with other findings.

Hake, M.W., & Hyman, R. PERCEPTION OF THE STATISTICAL STRUCTURE OF A RANDOM SERIES OF BINARY SYMBOLS. J. exp. Psychol., 1953, 45, 64-74. Contract NS-ori-166, Rep. 166-I-160. ONR, Naval Research Lab., Systems Coordination Div., Johns Hopkins Univ., Baltimore, Md.

This study was designed to determine how human Ss perceive the statistical structure imposed on apparently random series of binary symbols. The Ss (40 male and female) were required to predict on each of 240 trials which symbol of 2 possible symbols, H or V, would appear on that trial. Each of 4 groups of Ss predicted a different series of symbols. The 4 symbol series differed from each other in terms of the proportion of trials on which a particular symbol appeared and in the degree of sequential dependency existing between successive symbols. The results indicated that: a) The Ss in all groups began predicting the 2 symbols about equally often and gradually adjusted their predictions to conform to the actual probability of occurrence of the symbols in the symbol series. The Ss tended to predict a symbol following a previous prediction of that symbol about as often as the symbol succeeded itself in the symbol series; b) The predictions of Ss were sequentially analyzed and it was found that the specific stimuli to which Ss responded on each trial were the sequences of events including the previous prediction of Ss and the correctness of these predictions, which had occurred in the previous 2 trials; c) The apparent ability of Ss to perceive and reproduce a sequential statistical structure was explained in terms of response to specific sequences of events occurring prior to each trial. The relevance of these results to the formulation of information transfer was discussed.

Irby, T.S., Ely, J.H. & Chinnell, R.C. COMPARISON OF PHYSICAL DIMENSIONS OF SUBMARINERS AND AVIATION CADETS. Contract NS ONR 641, T.O. 11, SDC Human Engng. Proj. 20 F 2, Memo 2, June 1952, 5pp. ONR, Special Devices Center, Dunlap & Associates, Inc.

The purpose of the present study was to determine whether anthropometric data of aviation cadets (specifically those reported in AAF Technical Report 5501) are comparable to those of submariners. Height and weight measurements were obtained for 350 candidates admitted to the submarine school at New London. Height measurements were obtained from 573 fleet submariners. These measurements were compared statistically with similar measurements on 2,901 aviation cadets. The 2 distributions of heights and weights were not significantly different. Therefore, when designing equipment for submariners in which such measurements are needed, it is safe to use the measurements obtained for aviation cadets. Correlations of other anthropometric data, which might be required in work-place design (ex., sitting height), with height are presented. Since in work-place design the concern is with the distribution of measurements, correlations as high as the ones presented (from .65 to .85) are useful. One limitation of this analysis is that most of the measurements involve vertical dimensions of a man standing upright. Little consideration has been given to horizontal dimensions, such as the width of a seat.

Kelly, J.C. AN EXPERIMENTAL COMPARISON OF 5 CONDITIONS FOR VOICE COMMUNICATION TRAINING. Contract NSORI 104, Proj. 20 K 1, Rep. 3, July 1947, 16pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

1145
Five groups of subjects underwent training in voice communication, under different conditions of type or amount of interference: 1) standard training with Device 8-I; 2) noise output and speech channel gain attenuated 10 VU; 3) same as 2), but with garbled speech substituted for the noise; 4) light ambient noise, transmission through air rather than head phones; 5) same as 4), but with ear-muffs being worn. Pre- and post-training scores obtained by the groups on word-intelligibility tests and tests of connected speech are compared with each other and with those obtained by control (untrained) subjects.

1146
Kelly, J.C. & Mason, H.M. AN EXPERIMENTAL COMPARISON OF 5 CONDITIONS FOR VOICE COMMUNICATION TRAINING. Contract NSORI 104, Proj. 20 K 1, Rep. 4, Aug. 1947, 53pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

1146
Five conditions for voice communication training with Device 8-I (Portable Interphone Trainer) are compared: 1) the usual high noise level; 2) lower noise level, less effective amplification of signal; 3) garbled speech background weaker than noise in (2), instead of airplane-type noise, and weak signal; 4) some "manufactured" noise, plus noise resulting from the simultaneous drilling of several trainees; 5) noise from drilling of trainees only. 55 were 259 male college students; effects of two hours of training were evaluated by word intelligibility tests and judgments of connected speech and high level noise.

Hanley, T.D. & Draegert, G.L. VOICE COMMUNICATION: INTELLIGIBILITY TRAINING WITH PURDUE SPEECH INTENSITY DEMONSTRATOR. Contract N6ORI 104, Proj. 20 K 1, Rep. 8, SOC TR 104 2 8, April 1948, 19pp. NSN Special Services Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

1147

To test retention of improvement in speech intelligibility, 175 male college students who were studying speech (five experimental groups and a control group) were trained in intelligibility, each experimental group under one of five different types or amounts of noise. Intelligibility tests were administered before, immediately after, 65 days after, and 100 days after training. Gains in test scores are analyzed as a function of elapsed time after training and of noise conditions during training. The training effect of intelligibility testing alone is noted and discussed.

Jordyke, H.W., & Draegert, G.L. PURDUE SPEECH INTENSITY DEMONSTRATOR: (TECHNICAL REPORT). Contract N6ORI 104, T.O. 2, Proj. 20-K-1, Rep. 104-2-5, Apr. 1948, 16pp. NSN, Special Services Center, Purdue Univ., Lafayette, Ind.

1150

To evaluate the Purdue Speech Intensity Demonstrator (a device giving the trainee a visual indication of his voice level and of signal-to-noise ratio), 170 male college students were tested. Fifty Ss were assigned to three experimental groups, each group being trained for one hour to speak loudly under one of three experimental conditions (achieving as high a degree of loudness as possible, or maintaining a constant degree). The 120 control subjects took no training. All subjects had pre- and post-tests of intelligibility. Test gains are discussed regarding the effectiveness of the trainer and of the one-hour training period.

Hanley, T.D., Draegert, G.L., Harris, J.S. & Kelly, J.C. VOICE COMMUNICATION: RETENTION OF IMPROVED INTELLIGIBILITY II. Contract N6ORI 104, Proj. 20 K 1, Rep. 104 2 9, Aug. 1948, 15pp. Purdue University, Lafayette, Ind.

1151

This study reports an experiment on retention of improvement in speech intelligibility. Sixty-two male college students (not studying speech) were divided into two groups (28 experimental, 34 control). The experimental group received training in speech intelligibility at a fixed noise level; controls received no training. All Ss were tested for speech intelligibility at a higher noise level both before and after the experimental training, and were retested after 12 weeks. Gains in test scores are discussed regarding the effectiveness of training. Results are compared with another study to evaluate the influence of concurrent enrollment in a speech course.

Harris, J.S., Draegert, G.L., Hanley, T.D. & Kelly, J.C. VOICE COMMUNICATION: EFFECT OF STRESS CONDITIONS ON SPEAKER INTELLIGIBILITY. Contract N6ORI 104, Proj. 20 K 1, Rep. 10, 104 2 10, Sept. 1948, 18pp. Voice Science Lab., Purdue University, Lafayette, Ind.

1152

To investigate the effect of stress conditions on the intelligibility of voice communicators, fourteen subjects were given an intelligibility test following one hour of training on techniques for increasing loudness and one hour in precision of articulation under conditions of noise. The subjects were retested three weeks later under stress conditions. Both tests were recorded and analyzed by a group of listeners. The results are presented and discussed in terms of the differences in intelligibility under normal and stress conditions for the group as a whole and for particular subjects.

Tyler, H.J. & Draegert, G.L. PURDUE SPEECH SOUND TIMER (TECHNICAL REPORT). Contract N6ORI 104, Proj. 20 K 1, Rep. 104 2 7, April 1948, 10pp. NSN, Special Services Center, Purdue University, Lafayette, Ind.

The purpose of the Purdue Speech Timer is to measure the accumulation of transient signals with respect to time. With regard to speech, this timer measures directly the amount of time during which a speaker expands more than a previously determined minimum amount of speech energy. This amount of time, grossly labeled phonation time, can then be compared to silent time within, or to the total time consumed by, a given speech sample, or it may be computed in terms of average phonation time per word or syllable through simple measurement and computation. A signal for operating the timer may be provided either through microphone or phonograph. The instrument has a flat response (2 db) from 80 to 4000 cps. A drop-off of 15 db per octave begins at 4000 cps. For a reliability test, 10 different messages were analyzed 10 times each. No measure deviated more than 2 standard deviations (SD) average 50%, 104 sec., from the mean time for the message involved.

Harris, J.S. VOICE COMMUNICATION: EFFECT OF STRESS ON TALKERS - A PERSONALITY STUDY. Contract N6001 104, Proj. 20 K 1, Sep. 104 2 11, Oct. 1948, 9pp. USN Special Devices Center, Purdue Univ., Lafayette, Ind.

The purpose of the present study was to discover any aspects of personality as measured by the Rorschach Test and the Minnesota Multiphasic Personality Inventory (MMPI) which tend to be related to loss of intelligibility under stress conditions. The 14 Ss. trained in voice communication, were tested under standard conditions and under threat conditions consisting of threat of electric shock and the addition of an unrelated manual task. Individual Rorschach and MMPI tests were administered to each S within a few weeks after the measurement of intelligibility under stress. The following results were obtained: a) Rorschach form-quality was significantly related to increase in variability of intensity and loss in syllable duration from standard to stress conditions of testing; b) The 5 Ss showing a significant loss in intelligibility from standard to stress conditions had significantly lower mean "psychosis" score (MMPI) than Ss showing no significant change; c) Inter-correlations between the Rorschach and MMPI factors were low and not significant. The results obtained in this study indicate that further research in this area would be worthwhile in the hope of obtaining more conclusive results.

Hanley, T.J. & Draegert, G.L. EFFECT OF LEVEL OF DISTRACTING NOISE UPON SPEECH RATE, DURATION, AND INTENSITY. (PSYCHOLOGICAL STUDIES OF TRAINING TECHNIQUES). Contract N6001 104, Proj. NR 782 003, SDC Proj. 20 K 1, SDC TR 104 2 14, June 1949, 16pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

The purpose of the present experiment was to investigate the effect of 4 levels of distracting noise upon the following speech variables: a) words per minute; b) relation of speech time to total time; c) mean syllable duration; d) mean speech intensity level above an arbitrary reference level. 48 Ss read a 73-word standard passage 4 times; once under each level of distracting noise. The noise was fed into earphones worn by Ss. The following measures were obtained: a) total reading time; b) speech time; c) graphic speech intensity trace; d) S's rating of the loudness of the distracting noise. It was found that as distracting noise in the headphones became more intense: a) words per minute became fewer; b) percent speech time increased; c) mean syllable duration increased; d) mean speech intensity level increased; e) Ss judged distracting noise to be louder. When plotted graphically, the data for all variables showed curves of the same general shape. Further, logarithmic curves of the type $y = a \log x + b$ fit all the functions within the range of observations. It was concluded that, within the limits of this experiment, when Ss not trained in communication techniques nor instructed in specific adaptations are confronted with a communication problem in the presence of noise, they tend to recognize and correctly identify increasing amounts of distracting noise and to react in what has been assumed to be a desirable manner.

Kelly, J.C. & Steer, M.D. INTELLIGIBILITY TESTING IN THREE CONDITIONS INVOLVING MASKING NOISE. J. Speech Hearing Disorders, 1949, 14, 369-372. Contract N6ori 104, T.O. 11, Proj. 20 K 1, Tech. Rep. SDC 104 2 17, Dec. 1949. ONR, Special Devices Center, Purdue University, Lafayette, Ind.

The experiment was designed to test the hypothesis that if signal-to-noise ratio is held essentially constant, scores of intelligibility tests obtained under 3 different sound levels will not be significantly different. 40 Ss were given 3 forms of the VCL 24-Word Multiple-Choice Intelligibility Test under: a) The standard setting of Device B-1 (a portable interphone trainer) with 107 db masking noise level; b) speech and noise attenuated 10 db; and c) speech and noise attenuated 20 db. An ANOVA based upon intelligibility scores found no significant differences among conditions. No loss in test reliability (test-retest corrected for attenuation) was found with the reduction in noise level and speech channel gain. Coefficients of correlation ranging from .61 to .77 for arrays of data obtained under similar signal-to-noise ratios but progressively attenuated sound levels provide further evidence that reduced noise and speech level intelligibility testing may produce substantially the same results as testing in high level noise.

Depsey, M.E., Draegert, G.L., Siskind, R.P. & Steer, M.D. THE PURDUE PITCH METER--A DIRECT READING FUNDAMENTAL FREQUENCY ANALYZER. J. Speech Hearing Disorders, June 1950, 135-141. Contract N6ori 104, Proj. 20 K 1, Tech. Rep. SDC 104 2 18, ONR, Special Devices Center, Purdue University, Lafayette, Ind.

The Purdue Pitch Meter is an instrument designed and built to indicate in cycles per sec. the fundamental frequency of speech sounds between 50 and 1000 cps. This operation is accomplished by equalizer circuits designed to amplify the lowest frequency component present and attenuate the higher harmonics. Cycles of the amplified fundamental component are counted and indicated on a meter calibrated in cycles per sec. The applied signal may be from either a microphone or a phonograph. Indicated fundamental frequency in cycles per sec may be read from the built-in meter or recorded on a suitable re-ordering millimeter. Fundamental frequency may also be demonstrated as an audible tone without intelligibility.

Hanley, T.D. ITEM ANALYSIS, VCL INTELLIGIBILITY SERIES. Contract N6ori 104, Proj. 20 K 1, Rep. SDC 104 2 19, April 1950, 29pp. ONR, Special Devices Center, Purdue University, Lafayette, Ind.

The Voice Communication Laboratory (VCL) Twenty-Four Word Multiple Choice Intelligibility Tests were administered to Ss under 2 controlled conditions. Form A was given to naive S and Form B was given to control Ss who had previously undergone intelligibility training in addition to having been tested with Form A. The test results of the two groups were subjected to item analysis to determine the intelligibility of these words and the central tendency and variability of listener scores of Ss who have identified the words in an intelligibility test. It was found that: a) VCL test items range in intelligibility from 13% to 83% on a scale where 100% = no failures and 00% = no passes; b) 92% of the VCL test items fall within the 25%-75% intelligibility range; c) success in passing a given item is almost always unrelated to total listening score. It is believed that, by judicious selection of items, it will be possible to construct intelligibility tests of predictable levels of difficulty, with predictable ranges of dispersion. This hypothesis requires support in practical testing situations before the VCL test series can be used with confidence for selection of personnel for intelligibility training or communication billets, or as a diagnostic tool to define the intelligibility level of a given population. Wilson, D.K. THE MANUAL-VERBAL RESPONSE TACHISTOSCOPE: DISTRACTING DEVICE FOR INTELLIGIBILITY TESTING. Contract N6ori 104, Proj. 20 K 1, Tech. Rep. SDC 104 2 20, June 1950, 17pp. Special Devices Center, ONR, Purdue University, Lafayette, Ind.

This report describes the Purdue Manual-Verbal Response Tachistoscope, which is an instrument designed to measure intelligibility under conditions of distracting psychomotor activity. The intelligibility testing involves the use of a standardized intelligibility test and the psychomotor tasks consist of eye-hand coordination manipulations. The Purdue Manual-Verbal Response Tachistoscope has been designed primarily for research and training in intelligibility under conditions involving high-level noise. Use of the instrument in combination with Navy Device B-1, Portable Interphone Trainer makes possible the determination of the effect on voice communication of psychomotor tasks more or less complex in nature requiring greater or less precision and rapidity of voluntary hand movements. Research involving these communication and manipulation variables have been instituted at the Purdue Voice Science Laboratory and will be reported in the near future.

Doyle, M.P. & Steer, M.D. STUDIES IN SPEECH RECEPTION TESTING. J. Speech Hearing Disorders, 1951, 16, 132-139. Contract N6ori 104, Proj. NR 782 003, Tech. Rep. SDC 104 2 23. ONR, Special Devices Center, Voice Lab., Purdue Univ., Lafayette, Ind.

The purpose of these studies was to investigate the application of the Voice Communications Laboratory (VCL) 24-word Test as a speech reception test of hearing ability, and to compare the results with those obtained under the same conditions for two established intelligibility tests, Auditory Test No. Nine (Spondaic Words) and the PB-50 (Phonetically Balanced) lists. Twenty-five normal hearing subjects and 22 hard of hearing subjects were administered modified forms of the three tests, recorded by the experimenters at Purdue University, and the PB test recorded at Central Institute for the Deaf. The tests were administered in five db steps, through the Purdue Speech Reception Test Equipment. The reliability coefficients for the four tests, computed by the odd-even method, all were above .93. The mean percentage scores and standard deviations of the normal-hearing subjects were computed for the tests at each intensity level. Results of the tests for both the normal hearing and hard of hearing groups were subjected to statistical analysis. Within the limits of this investigation--the samples, tests, apparatus, and procedures used--the following conclusions may be drawn: a) The mean threshold for the VCL test lies at approximately 26 db above reference, with a mean score of 0% at 10 db and 90% at 50 db; b) A high inter-relationship exists among the VCL, No. Nine and PB tests; c) Differences among the test means are statistically significant; d) Although the VCL data (intensity level vs. percentage of correct responses) closely resemble those obtained for the No. Nine test, the VCL is considerably more difficult than the No. Nine, but not as difficult as the PB tests; e) The VCL test appears to differentiate between persons of normal hearing and defective hearing.

Black, J.W. NATURAL FREQUENCY, DURATION, AND INTENSITY OF VOWELS IN READING. J. Speech Hearing Disorders, 1949, 14, 3-8. Contract N7onr 411, Proj. 20 K 2, Rep. 411 1 11. ONR, Special Devices Center, Kenyon College, Ohio.

The present study attempts to determine intensity duration and frequency of a sample of vowels. 42 male Ss read 11 words into a microphone. Each S: a) practiced the words under direction; b) spoke from a standing position in a sound-treated room with a constant distance between his lips and the microphone; c) read the words at 5 sec intervals; and d) inhaled between each pair of words. Measurements of peak intensity, duration and frequency were made from a tape of Ss' speeches. 3 independent ANOVAs and t-tests of the difference between means were used to analyze the data. Significant differences were found among some vowels in their natural frequency, duration and intensity. Frequency appeared to vary with the openness of the vowel, and the more open, the lower the frequency. In general, duration varied directly with the openness of the vowel. Significant differences were found among the overall intensity values of the vowels.

Black, J.W. INFLECTION OF REPEATED MESSAGES. Speech Monogr., 1949, XVI(2), 3-5. Contract N7onr 411, Proj. Designation 782 004, Rep. 411 1 12. ONR, Special Devices Center, Kenyon College, Ohio.

The purpose of this study was to determine whether pitch of voice is copied when repeating messages. Of special interest was whether the final pitch inflection of a phrase is carried over when the phrase is repeated. Two recordings of 60 short phrases were made in which each phrase was spoken with an upward or downward final inflection in one recording and with the opposite inflects in the second recording. The recordings were played to 24 listener-speakers individually who repeated each phrase as soon as he heard it. The phonographic recordings obtained were then played back to panels of 24 judges who had to determine whether each phrase ended with an upward or downward inflection. A chi-square technique was used to detect significant variations from chance performance. The hypothesis that the inflection of the repetition was unaffected by the inflection of the stimulus could be rejected for 2/3 of the phrases at 10 percent level of confidence, and for 1/2 the phrases at the 2 percent level. Thus, the tendency among speakers was to copy the direction of the final inflection of the phrase that was heard. (HEIAS)

Black, J.W. THE RELATION BETWEEN MESSAGE TYPE AND VOCAL RATE AND INTENSITY. Speech Monogr., 1949, 16(2), 3-6. Contract N7onr 411, Proj. Des. 782 004, Rep. 411 1 13. ONR, Special Devices Center, Kenyon College, Ohio.

The purpose of this study was to determine whether vocal rate and intensity varied among 6 types of speaking assignments: a) reading actual phrases; b) repeating factual phrases; c) continuing a familiar statement; d) locating a familiar site; e) reading responsively; and f) describing a picture. 48 male Ss were tested individually and were required to speak into a microphone which recorded his speech under the above 6 conditions. The measures used were the mean duration of the syllables and the relative intensity of the phrases in each type of speaking. One or both of these varied from task to task. This data was submitted on analyses of variance. Each pair of speaking tasks was significantly dissimilar in mean syllabic rate or intensity or both. The differences in responses, duration, and intensity are apparently attributable to differences among tasks, and in a manner that emphasizes the specific nature of the task. (HEIAS)

Black, J.W. THE PRECISION OF ARTICULATION IN REPEATED PHRASES. Central States Speech J., Nov. 1949, App. Contract N7onr 411, Proj. Designation 782 004, Proj. 20 K 2, Rep. 411 1 14. ONR, Special Devices Center, Kenyon College, Ohio.

This paper reports a study of the relationships between the precision of articulation of the stimulus phrase and the repetition--this is a circumstance in which attention of the listener-speaker was focused upon the right message, not an aesthetic characteristic of speech. 5 Ss read lists of 12 5-syllable phrases, the phrases spaced 5 sec. apart. 24 Ss individually heard and repeated the 60 phrases, 3 speech students then selected with unanimous agreement 2 phrases from each list of 12, representing respectively good and poor articulation. The responses to these 10 selected phrases (from the 24 Ss) were re-recorded in pairs with the order of responses to good and poor phrases randomized. These recordings were then played twice to 53 judges. It was found using a binomial test of proportions that Ss tended to repeat the phrases in keeping with the degree of articulation that they heard. Also, when he was judged to be articulating 'better' he was speaking more slowly. However, it could not be established that greater duration and better articulation were necessary concomitants. It was concluded that the speakers changed their articulatory pattern--presumably unconsciously--with the span of successive short speaking performances; and their momentary patterns of articulation were set in part by the ones they heard.

1168

Black, J.W. LOUDNESS OF SPEAKING: THE EFFECT OF HEARD STIMULI ON SPOKEN RESPONSES. Contract N7onr 411, Proj. 20 K 2, Designation NR 782 004, Rep. 411 1 2, June 1948, 39pp. Acoustic Lab., School of Aviation Medicine & Research, ONR, Special Devices Center, NAS, Pensacola, Fla. (Kenyon College, Gambier, Ohio).

A series of experiments is in process to determine characteristics of voice that affect the vocal patterns of responding listener-speakers. Summaries of 5 experiments are given in this report. They treat factors that alter intensity of voice. The data show that in repeating messages that are heard over headsets--except in the instance of very weak signals--the listener responds with greater intensity as he hears more intense signals. It was also found that vocal loudness is similarly affected when the speaker is answering questions instead of repeating words. Moreover, Ss in the experiments were unable to maintain a constant intensity when "saying back" words that were heard at different levels of amplification. 2 amounts of noise background introduced into the headsets of the listeners did not significantly differentiate 2 levels of vocal response. Messages spoken by males and females elicited different intensities, the female being responded to the louder. This observation may be misleading and arise from non-identical intensity levels in the stimulus materials. Room illumination did not affect the intensity with which the listeners repeated words.

Lightfoot, C. & Black, J.W. RATE OF SPEAKING: REPORTS II-III. (RESPONSES TO HEARD STIMULI). Contract N7onr 411, Proj. 20 K 2, Designation NR 782 004, Rep. 411 1 3, June 1948, 15pp. Acoustic Lab., School of Aviation Medicine & Research, ONR, Special Devices Center, NAS Pensacola, Fla. (Kenyon College, Gambier, Ohio).

2 experiments, part of a series, concerned with speech rate are reported. Exp. I evaluated the effect of interrupted phrases on the rate at which those phrases are repeated. Measurements were made of the duration of repeated, 5-syllable phrases the originals of which included equal numbers of: a) phrases containing 1-sec pauses which did not seem to disturb the meaning; b) phrases containing 1-sec pauses which seemed to interrupt the flow of thought; c) phrases containing no pauses. Analysis of the obtained data indicated that: a) the mean duration of repetitions of phrases which had originally been uttered with pauses was significantly greater than that of repetitions of phrases which had originally been uninterrupted; b) the mean duration of phrases originally uttered with seemingly logical pauses was significantly greater than that elicited by phrases containing a distracting interruption. Exp. II evaluated the effect of normal speech rate on the relationship between the rate of repeated phrases and the rate of the original phrases. 25 Ss were divided into 5 equal groups on the basis of time taken to read a list of meaningful phrases and sentences. 5 lists of phrases, comparable in all respects save rate, were presented to each S who was instructed to repeat each phrase in a natural manner. Analysis of the durations of the repeated phrases indicated that: a) original phrase rate influenced the response rates of Ss in the 3 faster speaking groups in a more uniform way than it influenced the less fluent Ss; b) there was a definite relationship between rates of original and repeated phrases for the fast-speaking groups and for the slow-speaking groups.

Lightfoot, C. & Morrill, S.N. LOUDNESS OF SPEAKING: THE EFFECT OF THE INTENSITY OF SIDETONE UPON THE INTENSITY OF THE SPEAKER. Contract N7onr 411, Proj. 20 K 2, Designation NR 782 004, Rep. 411 1 4, June 1948, 12pp. Acoustic Lab., School of Aviation Medicine & Research, ONR, Special Devices Center, NAS, Pensacola, Fla. (Kenyon College, Gambier, Ohio).

This study investigated whether the level of amplification or intensity of the side-tone of an aircraft radio or interphone affect the intensity with which the speaker talks and his intelligibility. 16 naval officers served as Ss and were required to read 4 lists from 2 forms of the Voice Communication Laboratory Multiple-Choice Intelligibility Test while wearing headphones. Each list was accompanied by one of 4 conditions of side-tone in circuit noise. The recordings of the readings were played back to panels of 12 listeners who were composed of the original 16 Ss. The different combinations of Ss formed 4 panels. The listeners heard the recording through earphones at one level of amplification with simulated airplane noise (110-114 db) filling the room. An analysis of variance indicated that intelligibility scores were affected differentially by side-tone level. The speakers were progressively both more intense and more intelligible as their side-tone was diminished in intensity.

Black, J.W. EVALUATION OF THE PRIMARY FLIGHT HELMET, DEVICE 12-EM - 6 (IMPACT - AUDIBLE SIGNAL SYSTEM FOR FLIGHT TRAINING). Contract N70R 411, Proj. NR 001 058.03.01, SDC TR 411 1 18, Dec. 1949, 22pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

1171
This study evaluated the Primary Flight Helmet (PFH) Device 12-EM-6 (Impact-Audible signal system for flight training). The following factors and conditions were investigated: natural responses to the four spatially different PFH signals; recognizability of PFH signals; effect of pre-occupation on reaction accuracy; auditory masking characteristics; comparison of voice and PFH for communication speed, student preference, reliability, and response to false cues; reduction of voice communication in Link trainer flights; and construction and maintenance. Four hundred midshipmen (NR07C) and 64 cadets served as subjects. Data for each test is presented, and tests of significance performed where applicable. Implications for auditory tactile communication are mentioned. R

Lightfoot, C. SOME EFFECTS OF THE COMMON COLD UPON SPEECH. Contract N70R 411, Proj. 20 K 2, Proj. Designation NR 782 004, Tech. Rep. SDC 411 1 8, Aug. 1949, 27pp. Acoustic Lab., School of Aviation Medicine & Research, ONR, Special Devices Center, NAS, Pensacola, Fla. (Kenyon College, Gambier, Ohio).

A study is presented which evaluated the effects of the common cold on a speaker's intelligibility or vocal quality. It was found that whether their words were transmitted to listeners through earphones in a very noisy room or through a loudspeaker in a quieter place, a group of men with coryza will vary considerably with respect to direction and amount of change that administration of a vasoconstricting spray will produce in the intelligibility of their speech. Their average intelligibility, however, after such treatment, will probably be lower than a comparable average representing their normal speech, provided that no more than a third of their words contain sounds ordinarily requiring nasal emission. Also, coryzal utterances of most men can be distinguished from their normal utterances by a majority of untrained listeners; however, the coryzal speech of some men is rather misleading. Although a man's coryzal utterances might be recognized by a large proportion of listeners comparing it with his normal speech, it might be recognized by relatively few listeners comparing it with something he said shortly after his nose had been sprayed. Thus, there might be some relationship between distinctiveness of coryzal vocal quality and extent of nasopharyngeal inflammation. R 3

Lightfoot, C. EFFECTS OF THE MODE AND RATE OF TRANSMITTING MESSAGES UPON THE RELATIONSHIPS BETWEEN THEIR INTENSITY AND THE INTENSITY OF REPETITIONS OF THEM. (PSYCHOLOGICAL STUDIES OF TRAINING TECHNIQUES). Contract N70R 411, T.O. 1, Proj. NR 782 004, SDC Human Engng. Proj. 20 K 2, Tech. Rep. SDC 411 1 10, Aug. 1949, 13pp. USN Special Devices Center, Port Washington, N.Y.

1173
To determine the extent to which the relationship between intensities of original and repeated messages might be affected by (1) the mode of transmitting the originals and (2) syllabic rate of their transmission, equally readable phrases at three speed rates were given to each of 54 subjects. The task was to repeat each message in a normal tone. Messages were transmitted through loudspeaker, through headphones, or directly. Intensity levels were low, but distinctly audible, moderate (ten decibels above the first), and loud (another ten-decibel increase). Average syllabic intensities of the repetitions of messages were determined and studied for differences due to experimental variables. T. G. R 7

1174
Lightfoot, C. RATE OF SPEAKING: IV. EFFECTS OF THE MODE AND LEVEL OF TRANSMITTING MESSAGES UPON THE RELATIONSHIP BETWEEN THEIR DURATION AND THE DURATION OF THEIR REPETITION. Contract N70R 411, Proj. 20 K 2, Proj. Designation NR 782 004, Tech. Rep. 411 1 9, Aug. 1949, 16pp. ONR, Special Devices Center, School of Aviation Medicine & Research, NAS Pensacola, Fla.

This study was concerned with the effect that the duration and intensity level of a spoken utterance has on the spoken response. 18 commands or 5-syllable phrases were recorded phonographically at several rates (rapidly, intermediate rate, and slowly). These were presented to 54 Ss who were instructed to repeat each message in his usual manner of speaking; messages were recorded, and the recorded versions were played through a loudspeaker or through headphones; some emanated directly from the lips of the reader. The intensity level of the messages was low for some Ss, moderate for others, and high for others. The duration of the average of the repetitions of messages presented at one rate and over one transmission system was determined for each S. From these individual measures group means were computed and the differences among the experimental conditions they represented were evaluated. The main findings of the study are: a) Increases in the time taken by the original utterances--whether presented through a loudspeaker, through headphones, or by the reader directly--were accompanied by significant increases in the time devoted to the average repetition; b) such increases in repetition--duration were found whether the original messages were presented at a low, moderate, or high level of intensity; c) for any one of the 3 intensity conditions, the trend of such increases did not vary significantly from one transmission system to another; d) but for any one of the three original rates, average syllabic rates of the repetitions of low- and moderate-level messages were significantly different for the 3 transmission systems; such a difference was not found in the case of high messages; e) differences in mean repetition rate which accompanied changes in transmission system did not appear to be related to the intensity of the repetitions. R 5

1175
Lightfoot, C. RELATIONSHIP BETWEEN ORIGINAL AND REPEATED PHRASES. Contract N70R 411, Proj. 20 K 2, Rep. 411 1 1, May 1948, 23pp. ONR, Special Devices Center, School of Aviation Medicine & Research, Acoustic Lab., NAS, Pensacola, Fla. (Kenyon College, Gambier, Ohio).

3 experiments were conducted to determine the relationship between the rate of saying and phrase and rate of repeating that phrase under 3 conditions: a) When several groups of phrases are originated by a single speaker uses a different rate for each group; b) When a number of phrases are originated by a single speaker who varied his rate from phrase to phrase; c) When each of several groups of phrases is originated by a different speaker who speaks at his usual rate. 25 student pilots served as Ss in all 3 experiments in which they listened to 5 lists of phrases through headphones and repeated the phrases back into a microphone. The repetitions were carried to a graphic power level recorder which furnished an accurate means of measuring the duration of each response. Mean response duration for each stimulus rate and for each condition was determined. On the basis of the analysis it was concluded that: a) There is a positive relationship between duration of original and repeated phrases under all 3 conditions; b) The relationship is not rectilinear when stimuli include phrases presented at a very slow rate; c) The same sort of relationship does not prevail for all 3 conditions whether stimulus rates are within the range commonly found among speakers or whether extremely slow rates are used; d) Response rate is also influenced by factors other than stimulus rate. R 4

1176
Black, J.W. TIMED PHRASES. (PSYCHOLOGICAL STUDIES OF TRAINING TECHNIQUES). Contract N70R 411, Proj. NR 782 004, SDC Proj. 20 K 2, SDC TR 411 15, no date, 9pp. USN Special Devices Center, Port Washington, N.Y. (Kenyon College, Gambier, Ohio).

1175
This report studies the duration of five syllable phrases with the purpose of standardizing phrase duration for work where this factor is important. Eighteen males about to start pilot training read 490 five-syllable phrases selected from Navy Flight Pattern. Duration value of each phrase was determined by a graphic level recorder. The mean duration and standard deviation of the mean duration for each phrase is listed. Also, the differences in duration of phrases in isolation and continuous reading are compared and tested for significance.

Reed, J.B. THE SPEED AND ACCURACY OF DISCRIMINATING DIFFERENCES IN HUE, BRILLIANCE, AREA, AND SHAPE. Contract N0R 131(01), Proj. NR 784 001, SDC Proj. 20 L 2, Tech. Rep. 131 1 2, Sept. 1951, 28pp. USN Special Devices Center, Port Washington, N.Y. (Mount Holyoke College, South Hadley, Mass.).

1177
To determine the relative discriminative value of four common aspects of vision (hue, shape, area, and brilliance), 100 subjects sorted cards carrying symbols varying in each of these aspects on the basis of a given variable. In addition, the size of the stimulus difference for hue and area were varied and sorted. Speed and accuracy of performance (average sorting time, percentage error) are analyzed and interpreted in practical terms for use in coding practices.

1178
Williams, A. ANALYSIS OF INFORMATION REQUIRED FOR INSTRUMENT FLIGHT. Contract N6CRI 199, Proj. 20 L 1, 15pp. USN Special Devices Center, ORR, Port Washington, N.Y. (University of Illinois).

1178
This paper presents a descriptive analysis of the information required by a pilot in order to fly. Definitions of goals and related action sequences are given; the necessary discriminations and manipulations are detailed and reduced to four sub-goals which represent action for the pilot to follow (directional, attitude, temporal, and mechanical). The manner of presentation of these sub-goals, instrumentation, is then explored.

1179
Williams, A.C. EVALUATION AND DEVELOPMENT OF AIRCRAFT INSTRUMENT DESIGNS. Contract N6CRI 71, Proj. 20 L 1, Prog. Rep. 3, May 1947, 8pp. Institute of Aeronautics, University of Illinois, Urbana, Ill.

1179
This paper contains an informal report of tests of perception of motion in a rotating chair in which the axis of rotation may be situated behind the subject, in front of him, or to either side. It is argued that the results of these tests cannot be accounted for in terms of contemporary inertia - momentum theories of vestibular function. A hypothesis of vestibular function in terms of the gyroscopic properties of a vibrating cupola is outlined.

1180
Williams, A.C. EVALUATION AND DEVELOPMENT OF AIRCRAFT INSTRUMENT DESIGNS. Contract N6CRI-71, Proj. 20-L-1, T.O. Prog. Rep. 6, March 1948, 9pp. University of Illinois.

1180
This report on aircraft instrument design is primarily concerned with problems of altitude and direction control manipulation. Various types of controls are analyzed with a general reference to pertinent experimental findings. Requirements for optimal control-indicator relationships are specified and two general design requirements for conventional controls are formulated. A number of aircraft controls are evaluated in terms of the degree to which they meet each design requirement.

1181
Williams, A.C., Jr. PRELIMINARY ANALYSIS OF INFORMATION REQUIRED BY PILOTS FOR INSTRUMENT FLIGHT. Contract N6CRI 71, Proj. NR 784 003, SDC Proj. 20 L 1, Task 16, SDC TR 71 16 1, ca. 1949, 13pp. USN Special Devices Center, GNR, Port Washington, N.Y. (Psychology Dept., University of Illinois, Urbana, Ill.).

1181
This paper employs the following scheme for the analysis of information required for successful instrument flight behavior: "(first) in order to achieve a goal the behaving person (the pilot) must make a series of discriminations between courses of action which are open to him, selecting those which will lead him to the goal, and (second) he must translate these courses of action into a motor performance." Given the goal and necessary subgoals, a summary of the information thus required includes: earth-topography, geography; air-movement, weather; plane-flight characteristics; pilot-limitations; traffic. This information is reduced such that four courses of action: directional, altitude, temporal, and mechanical are represented.

1182
Johnson, B.E., & Williams, A.C. OBEDIENCE TO ROTATION-INDICATING VISUAL DISPLAYS AS A FUNCTION OF CONFIDENCE IN THE DISPLAYS. Contract N6CRI-71, T.O. 16, Proj. 20-L-1, Proj. Designation NR-784-003, Tech. Rep. SDC 71-16-2. June 1949. 18pp. ONR, Special Devices Center, Univ. of Ill., Dept. of Psychol.

1182
To determine the effects of confidence in visually presented information upon response to rotation cues of the display, twenty subjects were placed in a cubicle (on a rotation table) from which could be seen a direct view of the room, its mirror image, a positive panoramic display, and its negative; the task was to move a stick in the direction of acceleration or deceleration during rotation. After inspection of the equipment, further trials were made in which response was to direction of movement. Data from the two confidence levels and the positive and negative cues are compared for their relative effects on accuracy of response.

1183
Williams, A.C., & Roscoe, S.W. PILOT PERFORMANCE IN INSTRUMENT FLIGHT AS A FUNCTION OF THE EXTENT AND DISTRIBUTION OF VISIBLE HORIZON. Contract N6CRI-71, T.O. 16, Proj. 20-L-1, Tech. Rep. SDC 71-16-3. June 1949. 21pp. ONR, Special Devices Center, Univ. of Ill., Dept. of Psychol.

1183
To determine the effect of extent and distribution of visible horizon upon instrument flight performance, nine experienced pilots flew a standardized pattern in a plane modified so that variations in extent (subtending visual angles of 16 degrees, ten degrees forty minutes, and five degrees twenty minutes) and position (on longitudinal axis, and forty degrees to left and right, singly and in combinations) could be made. Nine experimental conditions were given in counter-balanced order. Average error scores for direction and altitude are analyzed for effects of the experimental variables. Further experimentation is outlined.

Williams, A.C. & Fleymann, R.E. AN EVALUATION OF THE LINK SNJ OPERATIONAL TRAINER AS AN AID IN CONTACT FLIGHT TRAINING. Contract N6CRI 71, SDC Proj. 20 L 1, SDC TR 71 16 5, July 1949, 8pp. USN Special Devices Center, Port Washington, N.Y. (Dept. of Psychology, University of Illinois, Urbana, Ill.).

1184
To evaluate the Link SNJ Operational Trainer as an aid in contact flight training, an experiment was performed with 2 groups of 6 college students each. One group learned a series of maneuvers in the Trainer, then rehearsed in an aircraft; the control group learned the same maneuvers directly in the aircraft. Results (number of hours required for criterion performance) are discussed regarding potential savings in flight training time through preflight training in the Link Trainer.

Payne, T.A. A STUDY OF THE MOVING FIGURE AND ORIENTATION OF SYMBOLS ON PICTORIAL AIR-CRAFT INSTRUMENT DISPLAYS FOR NAVIGATION. Contract NSORI-71, T.O. 16, Proj. 20-L-1, Proj. Designation NK-784-003, Tech. Rep. 71-16-8. July 1950. 25pp. ONR, Special Devices Center, Univ. of Ill., Dept. of Psychol.

1185

To investigate some features of a pictorial display of air navigation information (azimuth position in relation to radio station, VOR) two groups of private pilots (18 each) drew solutions to navigation problems using printed drawings in which (1) the moving figure represented the station or the aircraft with the other in a fixed position, and (2) the moving figure represented the aircraft with station location and orientation of compass rose varied. Performance (time and error scores) is analyzed in terms of what the moving part of the display should represent and what position and orientation of symbols should be used. T.I.R.7.

1186

Bell, J.M. A LANDING DISPLAY FOR USE WITH A CONTACT FLIGHT SIMULATOR. Contract NSORI 71, Proj. NR 784 003, SDC Proj. 20 L 1, SDC TR 71 16 8, March 1951. USN Special Devices Center, Port Washington, N.Y. (University of Illinois, Urbana, Ill.).

1186

To determine the geometry of a visual display which might be used in teaching contact landings in a synthetic flight trainer, a mathematical analysis of the visual perspective cues that occur during an approach to landing is made. Application of the equations developed by this procedure is made to the actual design of such a training device. Diagrams are included. I.R.I.

1187

Kaufman, E.L. THE EFFECT OF A SIMPLE TRAINING PROCEDURE ON THE JUDGMENT OF VISUAL NUMBER. Contract NSOR 131(01), Proj. NR 784 001, SDC Proj. 20 L 2, SDC TR 131 1 1, Sept. 1951, 12pp. USN Special Devices Center, Port Washington, N.Y. (Mount Holyoke College, South Hadley, Mass.).

1187

To determine the effectiveness of training on estimation of number, ten subjects viewed fields of black dots (from one to 210) and made rapid estimates (within 1/5 second) of the number perceived; procedure repeated with the correct number of dots given after each report was made; eight months later the first procedure was repeated. Errors are analyzed for group and for individual accuracy as a function of the training (knowledge of results). Discussion concerns trends toward overestimation and underestimation and the lasting effects of training. T.G.

1188

Slater-Hammel, A.T. & Brown, J.S. DISCRETE MOVEMENTS IN THE HORIZONTAL PLANE AS A FUNCTION OF THEIR LENGTH AND DIRECTION. Contract NSORI 57, SDC Proj. 20 M 1, Rep. 2, Oct. 1947. 24pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., State University of Iowa, Iowa City, Iowa).

1188

The speed and accuracy with which individuals can execute simple discrete movements of the hand and arm were investigated. Twelve right-handed males were required to move the limb as rapidly and accurately as possible from one fixed position in space to another, the movements confined to the horizontal plane parallel to the frontal plane of the body. Two directions of movement: right-to-left and left-to-right, and three lengths of movement: 2.5, 10, and 40 cm were studied. From detailed graphic records several aspects of movement were obtained and analyzed: RT (variance analyses); primary-movement time, total-movement time, secondary-movement times, and speed of movement (t and F analyses); and correlations between movement times for the three distances. Lewis, D. & Shephard, A.H. DEVICES FOR STUDYING ASSOCIATIVE INTERFERENCE IN PSYCHOMOTOR PERFORMANCE. IV. THE TURRET PURSUIT APPARATUS. J. Psychol., 1950, 23, 173-182. (Dept. of Psychology, State University of Iowa, Iowa City, Iowa).

1189

This is a report on the development of a new apparatus for research on associative interference in a tracking task--the Turret Pursuit Apparatus. The apparatus is described in detail, and results given for a sample experiment. Forty students had 10 trials a day for 7 days, with the first 3 days' practice on standard (normal) control-display arrangement, next 3 days on reversed arrangement, and final day on re-learning the standard task. The photocell target moved through the same path each day. Results of practice with respect to both interference by reversed task, and individual differences in interference are reported. T. I. R 2

1190

Adams, J.A. THE EVALUATION OF DIFFICULTY OF TASK UNDER SEVERAL DIFFERENT CONDITIONS OF PERFORMANCE ON THE MODIFIED MASHBURN APPARATUS. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract NSORI 57, Proj. NR 783 002, SDC Proj. 20 M 1, SDC TR 57 2 8, 1949. 27pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1190

This is a methodological study to develop a reliable index of the relative difficulty of 6 different tasks on the Modified Mashburn Apparatus. Six groups of 15-18 male college students each practiced for 20 trials on 1 of 6 combinations of display movement to control movement. Number of matches and errors are plotted; ratios of errors to matches are plotted, and 6 possible indices of difficulty (ranging from mean matches and errors to slopes of performance curves) are computed and compared. A combination of certain of these indices is recommended as a general index of difficulty. T. G.

1191

Adams, J.A. THE PROBLEM OF CONTROLLING LEVEL OF LEARNING IN STUDIES OF ASSOCIATIVE INTERFERENCE IN PSYCHOMOTOR PERFORMANCE. Contract NSORI 57, Proj. NR 783 002, SDC Proj. 20 M 1, SDC TR 57 2 9, April 1949. 8pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1191

This is a discussion of the relatively greater difficulty in controlling level of learning in experiments on psychomotor learning than in experiments on verbal learning. The problems are illustrated with learning curves obtained on three Ss with the Mashburn Apparatus. A possible satisfactory solution is proposed and plans for using this method in a forthcoming program of research are discussed. G. R 5

1193

Lewis, D., Shephard, A.H. & Adams, J.A. EVIDENCES OF ASSOCIATIVE INTERFERENCE IN PSYCHOMOTOR PERFORMANCE. Science, Sept. 1949, 110(2855), 271-273. (Department of Psychology, State University of Iowa, Iowa City, Iowa). (SDC TR 57 2 11).

1193

This is a general presentation of some results from a number of studies of associative interference utilizing the Modified Mashburn Apparatus. The apparatus and procedure (original learning, interpolated learning with reversed controls, and relearning) are discussed, and samples are presented of plotted results giving evidence of associative interference. G. R 7

1194

Lewis, D. DEVICES FOR STUDYING INTERFERENCE IN PSYCHO-MOTOR PERFORMANCE. III. THE DOUBLE-DISK PURSUIT APPARATUS. *J. Gen. Psychol.*, 1951, 45, 123-132. (Department of Psychology, State University of Iowa, Iowa City, Iowa). (SDC TR 57 2 13).

1194

This is a report of some unsuccessful attempts to develop a simple pursuit apparatus as a source of interfering reversible tasks. The development of the Double Disk Pursuit Apparatus (2 Koerth-type rotors mounted side by side, almost touching, with which the subject is required to alternate his pursuit action between the 2 disks) is described in some detail, and learning curves are given for pilot experiments using mirror vision with the simple Koerth rotor, and using 2 prototypes of the Double Disk apparatus.

Gagne, R.M., Baker, Katherine E. & Foster, Harriet. TRANSFER OF DISCRIMINATION TO A MOTOR TASK. (MOTOR SKILLS AND JOB EFFICIENCY). Contract N7ONR 316, Proj. NR 783 003, SDC Proj. 20 M 1A, SDC TR 316 1 6, July 1949, 30pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn.).

1195

In an investigation of transfer of training in stimulus discrimination, 140 Navy enlisted men had 60 learning trials on a task requiring discrimination of both color (red or green) and position (top or bottom) of signal lights as stimuli for the selection of one of 4 switches to press. Two groups (56 each) had 30 trials of preliminary practice on color discrimination only or on position discrimination only, and a control group (28) had no preliminary practice. Response times and errors are analyzed and interpreted regarding relative difficulty of color and position discrimination, transfer effects, and implications for choice of components for training.

T. G. R 3

1196

Gagne, R.M. & Baker, Katherine E. STIMULUS PRE-DIFFERENTIATION AS A FACTOR IN TRANSFER OF TRAINING. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract N7ONR 316, Proj. NR 783 003, SDC Proj. 20 M 1A, SDC TR 316 1 7, Aug. 1949, 20pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn.).

1196

To study the effects of practice on differentiating stimuli prior to learning motor reactions to the stimuli, 4 matched groups of 32 college men each had 0, 8, 16 or 32 trials of learning a response letter for each of 4 signal lights. Then all subjects had 60 trials of learning to select one of 4 switches in response to each signal light. Response times and errors are analyzed to evaluate the effectiveness of stimulus pre-differentiation in transfer of training, and implications for training methods are discussed.

T. G. R 8

1197

Gagne, R.M. & Baker, Katherine E. TRANSFER OF TRAINING TO A MOTOR TASK IN RELATION TO STIMULUS SIMILARITY. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract N7ONR 316, Proj. NR 783 003, SDC Proj. 20 M 1A, SDC TR 316 1 8, Aug. 1949, 33pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn.).

1197

To study transfer of training as a function of stimulus similarity, 5 matched experimental groups of 25 Navy men learned to press one switch in response to one color, a second switch to any of 6 other colors. All transferred to final tasks, differing from the training task in that a different color was the stimulus for the one-color switch, and differing among groups in the similarity of the second one-color stimulus to the first. Response time and errors are discussed regarding the relative amount of transfer and interference as a function of stimulus similarity.

T. G. R 7

1198

Gagne, R.M., Baker, Katherine E. & Wylie, Ruth C. THE EFFECTS OF AN INTERFERING TASK ON THE LEARNING OF A COMPLEX MOTOR SKILL. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract N7ONR 316, Proj. NR 783 003, SDC Proj. 20 M 1A, SDC TR 316 1 9, Aug. 1949, 25pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn.).

1198

To study the effects of performing an interfering task at different stages of learning a complex motor skill, 6 matched groups of 22 college men each practiced for 6 stages (26 trials each) making matches with the Complex Coordination Test. An interfering task, involving lever settings in response to light stimuli, was introduced at a different stage for each of the 6 groups. Results (mean time at each stage) are analyzed for the effects of the interfering task, and implications for training on components of tasks are discussed.

T. G. R 3

1199

Gagne, R.M., Baker, Katherine E. & Wylie, Ruth C. TRANSFER OF TRAINING TO A MOTOR SKILL AS A FUNCTION OF VARIATION IN RATE OF RESPONSE. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract N7ONR 316, Proj. NR 783 003, SDC Proj. 20 M 1A, SDC TR 316 1 10, Aug. 1949, 23pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn.).

1199

To study transfer of training as a function of response rate, 5 groups of 31 male college students practiced a tracking task requiring maintenance of a null setting of a moving pointer by turning a crank at an appropriate rate. After 8 trials at one rate, each group transferred to a task requiring a different rate, combinations of 4 different rates being varied among the 5 groups. Results (time on the null setting) are discussed regarding the effects of relative rates on transfer between tasks, and the implications for training methods and devices are pointed out.

Gagne, R.M., Foster, Harriet, & Crowley, Miriam E. THE MEASUREMENT OF TRANSFER OF TRAINING. Contract N7ONR-316, Rep. 316-1-1, Sept. 1947, 59pp. CNR, SDC, U.S. Naval Medical Research Laboratory, New London, Conn. (Connecticut College)

1200

To assess training devices and training, in for instance, the gaining of proficiency in a motor skill, it is necessary to employ transfer of training measures, in the operational situation. This article is a review of such measures of transfer, a discussion of the variations in such measures (as dependent upon experimental conditions), and a statement of the requirements for good measures. The six different types of measures found in the literature are evaluated with respect to these criteria.

1201

Gagne, R.M. & Foster, Harriet. TRANSFER OF TRAINING FROM PRACTICE ON COMPONENTS IN A MOTOR SKILL. Contract N7ONR 316, Proj. 20 M 1A, Rep. 2, Dec. 1947, 60pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn.).

1201

This report concerns the value of varying amounts of practice on a component of a psychomotor skill, in the learning of the task itself. Navy enlisted men learned differential manual responses to four lights. Part training, on discrimination of reactions to the position of the lights, was given 3 groups, for 10, 30 or 50 trials; part training, in discrimination of responses to the color of the lights, was given one group, for 30 trials. These groups, and a control, practiced for 60 trials the total skill, up-down and red-green discriminations. Time for each correct reaction and errors are reported.

Schulman, J., Barmack, J.E., & Coakley, J.D. HUMAN PROBLEMS IN THE OPERATION OF HIGH SPEED AIRCRAFT: I. ATMOSPHERIC OZONE. Contract N6ONR-151, T.O. 1, Proj. 20-M-1b, Memorandum No. 1, Aug. 1947, 13pp. ONR, Special Devices Center, (Division of Bio-Mechanics, The Psychological Corporation, New York)

1204

This paper reviews the available information on ozone (O_3) concentration in the atmosphere as a function of altitude in relation to its effects on man and animals, to evaluate the hazard of ozone toxicity from breathing air compressed at very high altitudes. The symptoms produced by breathing air containing ozone are summarized as a function of concentration and duration of exposure. Since nitrous oxide (NO_2) is a common contaminant in prepared ozone and also occurs in free atmosphere, its toxic effects, alone and in mixture with ozone, are also reviewed.

Barmack, J.E. & Coakley, J.D. A METHOD OF INCREASING THE MANEUVERABILITY OF HIGH SPEED AIRCRAFT WITHIN THE LIMITS OF HUMAN TOLERANCE TO G FORCES. Contract N6-onr-151, T.O. I, Desig. NR-783-004, Proj. No. 20-M-1b, Rep. 151-1-11, Feb. 1948, 67pp. ONR, Special Devices Center. (Division of Bio-Mechanics, The Psychological Corporation, New York)

1205

Theoretical calculations of the magnitude and direction of the g forces acting on the pilot of an aircraft during a high speed turn are presented. Comparisons are made among comparable turns on a constant radius at a constant speed, turns preceded by deceleration and succeeded by equal acceleration, and turns with deceleration going into the turn and equal acceleration coming out. The efficiency of these classes of turns with respect to lapsed time and distance traversed is also compared.

Coakley, J.D. (Dir.). THE EFFECT OF AMBIENT AND BODY TEMPERATURES UPON REACTION TIME. Contract N6ONR 151, Proj. NR 783 004, SDC Proj. 20 M 1b, Task 1, SDC TR 151 1 13, March 1948, 34pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Bio-Mechanics Div., Psychological Corporation, New York, N.Y.).

1206

This review of the literature on the effect of ambient and body temperatures upon RT is organized in terms of three topics: 1) effects of low ambient temperatures on RT, 2) effects of high ambient temperatures on RT, and 3) relationship between body temperature and RT. A critical survey and evaluation of the literature is followed by a brief summary of conclusions applicable to the performance of the pilot in high-speed aircraft.

Vestinger, L., Kelley, H., Orlansky, J. & Coakley, J.D. ESTIMATES OF VISIBILITY FROM HIGH ALTITUDE AIRCRAFT. Contract No. N6-onr-151, T.O. 1, Desig. NR-783-004, Proj. 20-M-1b, Rep. No. 151-1-14, April 1948, 59pp. ONR, Special Devices Center. (Division of Bio-Mechanics, The Psychological Corporation, New York)

1207

To present estimates of visibility (detection of the presence of an object) at high altitudes, data from specific laboratory research is combined with relevant data from the literature. Section I presents data about vision (brightness contrast, visual angle, adaptation level) and the properties of the atmosphere which influence vision; Section II shows how the distance at which an object becomes visible may be computed by taking into account the influence of atmospheric attenuation; and Section III presents estimates of visibility for a specific target at altitudes up to 300,000 feet when the observer is at various altitudes up to 200,000 feet.

Orlansky, J. & Dunlap, J.W. THE HUMAN FACTOR IN THE DESIGN OF STICK AND RUDDER CONTROLS FOR AIRCRAFT. Contract N6ONR 151, SDC Proj. 20 M 1b, Task 1, Feb. 1948, 77pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Bio-Mechanics Div., Psychological Corporation, New York, N.Y.).

1208

"This study is an attempt to determine how airplane control systems may be designed to provide the pilot with optimal sensory information by means of pressure cues obtained from operating the stick and rudder. The present approach to the problem consists of an examination and evaluation of literature pertaining to a) the maximum forces that may be exerted by a human pilot; b) human reaction time insofar as it may be expected to cause delays in the pilot's response; c) the optimal design, placement, and manner of movement of controls, and d) the optimal gradients of control forces. Current specifications for stability and control characteristics of military and civil airplanes are examined."

Spragg, S.D.S., Devoe, D.B. & Davidson, A.L. STUDIES IN THE ACCURACY OF MOVEMENT. I: THE BISECTION AND DUPLICATION OF LINEAR EXTENTS IN THE HORIZONTAL SAGITTAL PLANE. Contract N6ONR 241, Proj. NR 783 006, SDC Proj. 20 M 1b, Task 6, SDC TR 241 6 1, Oct. 1949, 20pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., University of Rochester, Rochester, N.Y.).

1209

This study attempts to determine the accuracy with which Ss 1) can duplicate and 2) can bisect a sampled extent of linear movement in the horizontal plane parallel to the sagittal plane. Each of several Ss made 32 judgments for both the duplicating and bisecting instructions at each of four linear extents which varied from 4 to 24 cm, by moving a rider back and forth on a track. The basic results have been expressed as Mean Average Error, Mean Constant Error, and standard deviation; differences have been analyzed by t tests.

T. G. I. R 2

1210

Spragg, S.D.S., Devoe, D.B. & Davidson, A.L. STUDIES IN THE ACCURACY OF MOVEMENT. II. THE BISECTION AND DUPLICATION OF LINEAR EXTENTS AT VARIOUS ANGLES IN THE HORIZONTAL PLANE, AND AT INCLINATIONS ABOVE THE HORIZONTAL. Contract N6ONR 241, Proj. NR 783 006, SDC Proj. 20 M 10, Task 6, SDC TR 241 6 2, Oct. 1949, 21pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., University of Rochester, Rochester, N.Y.).

1210

As in accession no. 1209, Ss were instructed to duplicate and to bisect a sampled extent of linear movement; however, here the movement was at -90, -45, +45, +90 degrees in the horizontal plane and at inclinations of 0, 45, 90 degrees above the horizontal. The distances to be judged again ranged from 4 to 24 cm; Ss made 16 forward and 16 backward judgments at each angle at each distance. (The gravitational component for the above horizontal inclinations were counterbalanced by a weight). The results were expressed both as average error and constant error, and differences were examined by t-test analyses. Recommendations for control setting situations were made.

1211

Norris, Eugenia B. & Spragg, S.D.S. STUDIES IN COMPLEX COORDINATION. I. PERFORMANCE ON THE TWO-HAND COORDINATOR AS A FUNCTION OF THE PLANES OF OPERATION OF THE CONTROLS. Contract N6ONR 241, Proj. NR 783 006, & SDC Human Engng. Proj. 20 M 10, SDC TR 241 6 3, Aug. 1950, 16pp. USN Special Devices Center, Port Washington, N.Y. (Dept. of Psychology, University of Rochester, Rochester, N.Y.).

1211

To investigate performance of a two-hand coordination task as a function of the planes of rotation of the controls, the SAM Two-Hand Coordinator was modified so that each crank control could be placed in any one of a variety of planes. Three planes were investigated: horizontal, vertical and parallel to the frontal body plane, and vertical and perpendicular to the frontal body plane. Each of ten groups of subjects was given preliminary trials on one plane of rotation; each of nine groups was then assigned to one of a combination of planes; the tenth group continued practice on the preliminary combination. The results were analyzed in terms of mean time on target and for differences between groups which could be attributed to plane of rotation.
T. G. I. R 12

1212

Spragg, S.D.S. & Devoe, D.B. STUDIES IN THE ACCURACY OF MOVEMENT. III: THE BISECTION AND DUPLICATION OF ANGULAR EXTENTS AS A FUNCTION OF SIZE OF ANGLE AND OF TYPE OF ENDPOINT CUE. Contract N6ONR 241, Proj. NR 783 006, SDC Proj. 20 M 10, Task 6, SDC TR 241 6 4, Oct. 1950, 26pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., University of Rochester, Rochester, N.Y.).

1212

This study tested the accuracy of making knob settings as a function of the size of angle to be duplicated or bisected, and of the type of end-point cue provided. The angular extent of knob movement ranged from 20 to 160 degrees and the cues were tactual-kinesthetic, visual, and auditory. Ss (12) were given considerable practice in the knob turning procedures; each S made 20 bisection and duplication judgments with each type of cue for each of four angles. Again the results have been expressed by means of average error, constant error, and standard deviations. Differences were examined by variance analyses and t-tests.
T. G. I. R 4

1213

Morris, E.B. & Spragg, S.D.S. STUDIES IN COMPLEX COORDINATION. II: PERFORMANCE OF THE TWO-HAND COORDINATOR AS A FUNCTION OF THE RELATIONS BETWEEN DIRECTION OF ROTATION OF CONTROLS AND DIRECTION OF MOVEMENT OF DISPLAY. Contract N6ONR 241, Proj. NR 783 006, SDC Proj. 20 M 10, Task 6, SDC TR 241 6 5, Nov. 1950, 17pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., University of Rochester, Rochester, N.Y.).

1213

The accuracy of performance of a complex two-hand coordination task was examined as a function of the direction of rotation of the controls relative to the movement of the display, and the effect of the plane of rotation on the direction of rotation. A modified SAM Two-Hand Coordinator was employed. Two groups of 48 Ss each were used: for one the two cranks were in the vertical plane parallel to the frontal body plane, for the other the left crank was the same and the right was vertical but perpendicular. Four combinations of direction of rotation and two combinations of planes of rotation were tested. Results were analyzed in terms of mean time on target per condition; differences were examined by variance and t-test analyses.

1214

Brown, J.S. & Slater-Hammel, A.T. THE EFFECT OF SPEED-UP INSTRUCTIONS UPON THE PERFORMANCE OF DISCRETE MOVEMENTS IN THE HORIZONTAL PLANE. Contract N5ONR 57, SDC Proj. 20 M 1. Rep. 3, Jan. 1948, 19pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., State University of Iowa, Iowa City, Iowa).

1214

The ability to move the right arm and hand along a horizontal line parallel to the frontal plane of the body as quickly and accurately as possible was investigated using special speed-up instructions. The specific task required S to move a pointer in a left-to-right or right-to-left direction from one fixed reference line to another located 2.5, 10, or 40 cm. away. The 12 Ss each made 20 movements over each length. Performance was measured in terms of: reaction time, primary-movement, secondary-movement, and total-movement time, and accuracy. Means and standard deviations of these data were compared by t and F-ratios respectively, to those obtained in a previous study under normal instructions. The functional relation between speed and distance is described.
T. G. R 5

1215

Brown, J.S. & Knauff, E.B. POSITIONING REACTIONS OF UNIFORM LENGTH EXECUTED AT VARIOUS DISTANCES FROM THE BODY. Contract N5ONR 57, SDC Proj. 20 M 1, Rep. 4, July 1948, 9pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., State University of Iowa, Iowa City, Iowa).

1215

This study investigated the ability to perform positioning reactions involving movements of a constant length (ten cm), executed at various distances from the front of the body. Movements were confined to a line lying in the horizontal plane and perpendicular to the frontal plane of the body; starting positions were 10, 20, 30, 40 cm from the body, direction of movement was toward or away from the body. The 24 Ss each made ten responses at each position using a lightweight sliding pointer; all responses were made in the dark. Mean constant errors for the various positions and two directions of movement were compared statistically by a t-analysis.
T. G. R 1

1216

Brown, J.S., Slater-Hammel, A.T. & Bilodeau, E.A. CHARACTERISTICS OF DISCRETE MOVEMENTS IN THE HORIZONTAL PLANE WHEN EXECUTED WITH ONE AND WITH TWO HANDS. Contract NS ORI 57, SDC Proj. 20 M 1, 4ep. 5. Aug. 1948, 14pp. USN Special Devices Center, ONR, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1216

The ability to move both right and left arms in unison along a horizontal line parallel to the frontal plane of the body was studied for two directions of movement, left to right and right to left, and three lengths, 2.5, 10, 40 cm. Movements were made using a sliding pointer which could be grasped by both hands. The 12 Ss each made 20 responses over each length. Performance measures included: reaction, primary-movement, secondary-movement, and total-movement times, average and maximum speeds; and accuracy. All of these data were compared to those obtained with the same Ss using one-hand. The movement-time differences were evaluated by analyses of variance; speeds by t-tests, and accuracy by a statistical analysis, also.

T. G. R 4

1217

Brown, J.S., Wieben, E.W. & Morris, Eugenia B. DISCRETE MOVEMENTS TOWARD AND AWAY FROM THE BODY IN THE HORIZONTAL PLANE. Contract NSORI 57, SDC Proj. 20 M 1, Rep. 6, Sept. 1948, 13pp. USN Special Devices Center, ONR, Port Washington, N.Y. (Psychology Dept., State University of Iowa, Iowa City, Iowa).

1217

The ability to move the right hand along a line lying in the horizontal plane perpendicular to the frontal plane of the body was studied for two directions of movement, inward and outward, and three lengths, 2.5, 10, 40 cm. The 24 Ss each made 20 responses at each of the lengths with the lightweight sliding pointer. As in the previous studies, the following performance measures were obtained: reaction, primary-movement, secondary-movement, total-movement time; average and maximum speed; and mean constant error. Means of the movement-time scores were compared for the various lengths by t-tests. Relationships among the three basic movement-time measures were examined by correlations. Other comparisons were made with earlier left-right direction data.

Barch, A.M. A DEMONSTRATION OF RETROACTIVE INTERFERENCE IN PURSUIT ROTOR LEARNING. Contract NSOR 166(00), Proj. NR 783 002, SDC Proj. 20 M 1E, SDC TR 166 00 1, Dec. 1951, 16pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1219

This experiment is an attempt to demonstrate interference effects of learning a similar (not reversed) task upon the relearning of the original task, with a rotary pursuit tracking skill. The Epicyclic Pursuit Rotor was used by 43 college students. The conditions provided well-distributed practice, opportunities to warm-up, and medium to high levels of original and interpolated learning, with a short interval before relearning. Results are analyzed with respect to occurrence of interference, and the possibility of warm-up decrement in the relearning.

1219

Lewis, D., Smith, P.N. & McAllister, Dorothy E. RETROACTIVE FACILITATION AND INTERFERENCE IN PERFORMANCE ON THE MODIFIED TWO-HAND COORDINATOR. J. exp. Psychol., July 1952, 44(1), 44-50. (State University of Iowa, Iowa City, Iowa).

1219

In the training of psychomotor skills, the possible interference effects of learning similar or opposite tasks to those already learned are of interest. This report concerns an experiment on the Two-Hand Coordinator, keeping a button on top of a moving target, with a standard control arrangement ("normal"), and a reversed arrangement for second-task learning. The primary aim was to investigate the effects of different levels of learning the second, interpolated task, on the relearning of the standard task. Results (with college student subjects) are in terms of time-on-target scores, principally, and errors.

1220

Morgan, G.T. THEORY AND PROBLEMS OF RADAR VISIBILITY: INTENSITY-MODULATED SCOPES. Contract NSOR 16601, NRL Rep. 3046, JRU Rep. 166-I-148, Apr. 1952, 20pp. Naval Research Lab., Johns Hopkins Univ.

1220

To provide a general framework in which to consider problems of radar visibility, an analysis is made of the major phenomena of target detectability, as observed on the 7MF intensity-modulated radar screen, in terms of the capacity of the eye to make brightness discriminations and of the voltage regulation of light-emission from the screen. Topics covered: visual factors, brightness and size, fluorescence and phosphorescence, positive versus negative pipe, optimum CRT bias, pulse-repetition and antenna-rotation rate, beam width and pulse length, range, time of detection, search time, light adaptation and ambient illumination, color and noise.

1221

Lewis, D., McAllister, Dorothy E. & Adams, J.A. FACILITATION AND INTERFERENCE IN PERFORMANCE ON THE MODIFIED MASHBURN APPARATUS: I. THE EFFECTS OF VARYING THE AMOUNT OF ORIGINAL LEARNING. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract NSOR 93801, Proj. NR 783 007, SDC Proj. 20 M 1E, SDC TR 938 1 1, ca. 1947, 23pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1221

This report concerns the effects of different amounts of training on a psychomotor task (positioning levers in response to lights) on subsequent reversed learning, and relearning. The original task consisted of a standard (normal) control-display relationship, with the nine experimental groups receiving 10 to 50 trials, (1-5 days) followed by 10 to 50 trials of an interpolated, reversed task. Relearning occupied two days (20 trials). Three control groups had no interpolated training. Results are reported for correct matches, and errors. Discussion includes the reciprocal influences of original and second learning, especially with respect to the varying amounts of original learning.

T. G. R 10

1222

Lewis, D. & McAllister, Dorothy E. FACILITATION AND INTERFERENCE IN PERFORMANCE ON THE MODIFIED MASHBURN APPARATUS: II. THE EFFECTS OF VARYING THE AMOUNT OF INTERPOLATED LEARNING. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract NSOR 93801, Proj. NR 783 007, SDC Proj. 20 M 1E, SDC TR 938 1 2, ca. 1950, 14pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1222

Part of a study of training on the Modified Mashburn Apparatus, this experiment was concerned with the effects of varied amounts of second-task learning on the relearning of an original task. Twelve experimental groups of undergraduates had different amounts of practice on the original task (which was lever-positioning in response to lights), and for each level of original learning, different amounts of training on a reversed task. Correct matches and errors on relearning trials constitute the results, the implications of which are discussed.

1223

Hedlund, J.L. & Lewis, D. FURTHER ATTEMPTS TO DEMONSTRATE INTERFERENCE IN THE PERFORMANCE OF ROTARY PURSUIT TASKS. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract NSOR 93801, Proj. NR 783 007, SDC Proj. 20 M 1E, SDC TR 938 1 3, July 1950, 11pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1223

This report concerns the problem of interference between reversed-task learning, and original learning, which seems to occur with certain psychomotor tasks, and not others. Here experiments are reported on more complex types of pursuit rotor--the Double-Disk Pursuit Apparatus, and the Epicyclic Pursuit Rotor--developed in an attempt to demonstrate interference on a rotary pursuit task similar to what is found with positioning tasks. Students practiced an original task, a second one with control action reversed, and then relearned the first. Scores are reported for time-on-target, in beat, and in synchronization.

1224
Shepherd, A.R. & Lewis, D. PIECE LEARNING AS A FACTOR IN SHAPING PERFORMANCE CURVES. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, July 1950, 8pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1224
This is a study on the importance of "mutual" control-display relationships, in the Turret Pursuit Apparatus tracking task. There were two groups of subjects—students—one of which practiced first the standard version of the task (keeping a spot of light on a moving target with hand controls) and second, the reversed task. The other group practiced the reversed, less natural task first, then the standard. Time-on-target scores are plotted for results of these periods, and the relearning of the original task by both groups. G. I. R 2

1225
Adams, J.A. A STUDY OF WORK DEFICIENCY IN PURSUIT TRACKING PERFORMANCE. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, SDC TR 938 1 5, July 1950, 17pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1225
This study begins with a statement of the problem of work-up decrement in psychomotor tasks, and a discussion of various explanations of it—in terms of set, interference, or inhibition. To test these explanations, an experiment was run with two conditions of practice. In-decrements in one group had massed practice on the Epicyclic Pursuit Motor for six minutes a day, for 11 days. The distributed practice group worked for 30 min. a day, with thirty-six trials of ten sec. each separated by 40 sec. rests. Scores were always recorded after 10 sec. practice. Time-on-target scores are reported, and their meaning for the problem discussed. T. G. R 15

1226
Spleth, M. & Lewis, D. THE EFFECTS OF ALTERNATING PRACTICE ON THE PERFORMANCE OF TWO ANTAGONISTIC MOTOR TASKS. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, SDC TR 938 1 6, July 1950, 8pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1226
In connection with research on mutual interference in learning standard and reversed-control-tracking tasks, this experiment was performed with the Turret Pursuit Apparatus. The purpose was to find out whether the task—keeping a spot of light on a moving target—could be learned, if practice were alternated between the standard and expected control-display relationships, and the reversed. In the main experiment three reverse trials to one standard were run, with undergraduate Ss, who practiced an hour a day for five days. Trials were 30 sec. separated by 30-sec. rests. Results are reported for groups and for individual differences. T. G. R 2

1227
McAllister, Dorothy E. & Lewis, D. SINGLE-TRIAL PER TASK VERSUS MULTIPLE TRIALS PER TASK IN THE ACQUISITION OF SKILL IN PERFORMING SEVERAL SIMILAR TASKS. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, SDC TR 938 1 7, Aug. 1950, 18pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1227
To investigate the effects of frequently shifting from task to task while learning, 2 experiments (22 and 24 subjects) were run, one with the Washburn complex coordination apparatus, one with the Epicyclic Pursuit Motor. In each, 2 matched groups practiced 8 different tasks over a period of 8 days, one concentrating on 1 task each day, the other on all tasks every day. Then all practiced for 2 days on 2 test tasks. Learning curves and performance on test tasks are analyzed and discussed regarding single-trial and multiple-trial spacing of practice and implications for theories of transfer and interference. G. I. R 11

1228
McAllister, Dorothy E. THE EFFECTS OF LEVEL OF LEARNING AND OF OVERLEARNING ON PROACTIVE AND RETROACTIVE FACILITATION AND INTERFERENCE. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, Aug. 1950, 24pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1228
To investigate facilitation and interference in motor learning as a function of amount of original learning, an experiment was run using a Two-Hand Coordinator modified to permit reversal of display-control movement relationships. Four experimental groups practiced with standard controls 1, 4 different performance criteria (including overlearning). Interpolated practice with reversed controls was followed by a fixed amount of relearning. For each group there was a control group, a 2nd control group practiced the reversed task only. Time on target, number of errors, and persistence of errors are discussed regarding proactive and retroactive facilitation and interference. T. G. R 5

1229
Shepherd, A.R. LOSSES OF SKILL IN PERFORMING THE STANDARD WASHBURN TASK ARISING FROM DIFFERENT LEVELS OF LEARNING ON THE REVERSED TASK. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, SDC TR 938 1 9, Aug. 1950, 24pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1229
This study concerns the effects of different degrees of interpolated learning. After reaching a criterion of 25 matches per trial on the Modified Washburn Apparatus, five groups of 9-11 male college students practiced to different criteria (25-39 matches) with reversed controls. Relearning was tested immediately and after 24 and 48 hours (two control groups did not have immediate relearning). Number of matches, number of errors, and error-match ratios are discussed regarding implications for theories of retroactive inhibition. T. G. R 15

1230
Lewis, D., McAllister, Dorothy E., Adams, J.A., Shepherd, A.R. et al. AN INVESTIGATION OF INDIVIDUAL SUSCEPTIBILITY TO INTERFERENCE. (HUMAN ENGINEERING SYNTHESIS OF BASIC INFORMATION). FINAL REPORT. Contract W392 93801, Proj. NR 783 007, SDC Proj. 20 X 15, SDC TR 938 1 10, Aug. 1950, 8pp. USN Special Design Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

1230
This is a review of studies investigating the possible existence of a general trait "susceptibility to interference." Thirty-six to 109 college students took part in studies involving learning a motor or verbal task, interpolated learning of a reversed task, then relearning the original task. Performance is studied in detail, and intertask correlations are examined for evidence of consistent susceptibility to interference. Details of a preliminary study and of apparatus construction (modifications of Washburn and Two-Hand Coordinator, the Turret Pursuit Test, rotor tests, and a paired-associates verbal test) are included. T. G. I. R 33

1231
Mackie, M.R. GENERAL TREATMENTS OF INTER-GROUP DIFFERENCES AND THEIR EFFECT ON THE RELIABILITY AND PREDICTABILITY OF PERFORMANCE RATINGS. Contract W392 1113 (00), Proj. NR 151-141, Balladburg, Proj. 002-013, Tech. Rep. 3, ca. 1954, 17pp. Management and Marketing Research Corporation, Los Angeles, Calif.

1231
The question of how rating scores obtained from different small subgroups of personnel can be combined to obtain the most reliable and predictable criterion was investigated. The men comprising the sample were scattered in small groups among 16 submarines in the Pacific Fleet and represented a wide variety of rates and pay grades. Each were rated by a different rater on a rating scale of 20 traits using a 10-to-man format. Several treatments of the scores were investigated from the standpoint of their effect on 1) inter-rater agreement and 2) predictability of the ratings by several logically related variables. T. P 7

Donlap, J.W. & Chancell, R.C. ANALYSIS OF PILOT'S PERFORMANCES IN MULTI-ENGINE AIRCRAFT (R58). Contract NSORI 151, Bureau Proj. X 651. April 1947. 45pp. ONR, Special Devices Center, Psychological Corp., Division of Bio-Mechanics.

In this study the principles of job analysis and of time and motion study are applied to the task of flying a multi-engine aircraft, the R5D. The cockpit of the R5D is divided into 7 general work areas as a basis for analyzing action pathways. Each control is described, with detailed consideration given to its location and to the extent of pilots' arm and body movement required for operation. Photographic records were subjected to frame by frame study and process charts are presented for the pilots' and co-pilots' performance, with the time required for each operation indicated. An analysis was made of the voice recordings and charts are presented showing the frequency of use of controls by pilot and co-pilot during take-off, cruise, and landing. The investigations were not designed to accumulate any considerable amount of quantitative data, but rather to test the applicability of this method of study. However, some conclusions are drawn from the data. Recommendations are made for extending the investigation, and improvement of the recording equipment are suggested. The implications of such an extended investigation for design of cockpits and training of pilots are discussed.

Reese, E.P., Reese, T.W., Volkman, J., & Corbin, E.H. PSYCHOPHYSICAL RESEARCH SUMMARY REPORT 1946-1952. Contract NS-ori-166 and NSOR-151-(01), NAVJCS F-1104, Tech. Rep. SDC-151-1-5. Jan. 1953. 194pp. ONR, Special Devices Center, Mt. Holyoke College, Psychophysical Research Unit.

1234

This is a compilation of over seventy psychophysical experiments concerned with visual discrimination (1946-1952). Main categories are: discrimination of visual inclination, length, area, and number; discriminable aspects for coding; subjective geometry; general problems in judgment; and subjective statistics. All the experiments are summarized and main results presented; apparatus common to several experiments is described in an appendix. Some findings have immediate military application, some are general, and others have basic research application.

1235

Stevens Institute of Technology, Hoboken, N.J. PHOTOGRAPHIC TRIANGULATION FOR ASSESSING ANTI-AIRCRAFT GUNNERY. Contract NSORI 54, July 1947, 6pp. ONR, Special Devices Center, Fort Washington, N.Y.

1235

A method for assessing anti-aircraft gunnery by means of photographic triangulation is described. The apparatus is also described and includes the various devices designed to eliminate tedious computations and measurements which enable one unskilled man to do the equivalent of three technicians in assessing anti-aircraft gunnery problems.

Hoffman, A.C. & Gray, Florence E. RESEARCH & DEVELOPMENT OF READING ASSESSOR. INTERIM PROGRESS REPORT. Contract NSORI 58, SDC TR 58 C 1, ca. 1947, 11pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

1236

To test the relation between comprehension level and reading eye-movements, 37 Ss were given standardized reading materials and comprehension checks. Eye-movements were recorded by the electroculogram technique. Comprehension scores are analyzed in relation to total reading time, number of eye-movements, and number of saccadic movements in left-right and right-left directions. The measures best predicting comprehension under the conditions of this experiment are discussed.

1237

Castro, G. A MECHANICAL TARGET GENERATOR. Contract NSORI 80, Rep. 39 (NS 16), June 1948, 27pp. General Precision Laboratory, Incorporated, Birmingham, N.Y.

1237

This report describes the design and performance testing of a model of a mechanical device for simulating a single moving radar target. Several can be combined to simulate a group of targets for the purpose of training radar operators. Solution of design problems and the construction and testing of the model are described in detail.

Hayek, A. PLOTTING DEVICE FOR AUTOMATIC MECHANICAL PLOTTER. Contract NS-ORI-80, Rep. 51 (NS-14), June 1948. 8pp. ONR, Special Devices Center, General Precision Lab., Inc.

1238

This report describes a plotting device which, when placed on either a map or oscilloscope tube, enables an operator to select points from either source to be plotted on the plotting board (see 1239). The principle of operation, mechanical construction, and operating instructions are included with the necessary working diagram for the device.

I.

1239

Hayek, A., & Gilbert, C.W. AUTOMATIC PROJECTION PLOTTING BOARD. Contract NS-ORI-80, Rep. 50 (NS-13), June 1948. 39pp. ONR, Special Devices Center, General Precision Lab., Inc.

1239

An automatic projection plotting board is described by which the plotted area is projected onto a screen for presentation to a large audience. The report gives the principle of operation of the board and instructions for operation and maintenance. Working diagrams are included.

1240

Beche-Comer, J.G. & Mead, L.C. APPARATUS FOR THE OUTDOOR MEASUREMENT OF DEPTH PERCEPTION. Rep. 1, no date, 14pp. Tufts University, Medford, Mass.

1240

This report describes an outdoor apparatus for the study of depth-discrimination under field conditions. A cockpit mock-up is so devised that observations may be made under conditions of natural illumination (both day and night) or of simulated night conditions with the use of proper filters and goggles. The observer in the cockpit is able to set a mobile stimulus to be equal in apparent distance to a stationary stimulus for varying testing distances. Photographs are included.

Beebe-Center, J.G., & Mead, L.C. CHARGE OF ILLUMINATION FROM DAYLIGHT TO DARKNESS. Tufts Biblio. 24, Commonwealth Fund Rep. 2. 1942. pp. 18-22. ONR, Special Devices Center, Tufts College, Medford, Mass.

1242
This report gives quantitative measurements of the daytime and night time brightness of a white test patch oriented toward the sun, taken at intervals (1 hour to 3 minutes) throughout the day and twilight on different days (July to October, latitude, 42.50) under many atmospheric conditions. The records for clear days are plotted as a function of time of day and also of angular elevation of sun above and below horizon. The latter relationship is discussed as a viable measure for various latitudes and seasons.
G.

1242
Beebe-Center, J.G. & Mead, L.C. THE REPRODUCTION OF NIGHT VISION DURING THE DAY. PROGRESS REPORT. Rep. 3, 1942, pp. Tufts University, Medford, Mass.

1242
To study the relation between depth perception and illumination, two subjects made twenty settings of a mobile stimulus to apparent equality in depth with a fixed stimulus at 100 feet under conditions of (1) full daylight, (2) dusk (one and one-half hours before darkness until full night), and (3) with red and green filters during full daylight (simulated night). Standard deviations and constant errors are analyzed to determine the variability and accuracy of judgments as affected by illumination. The effectiveness of the filter combination for simulating night conditions is discussed.

1243
Beebe-Center, J.G., & Mead, L.C. THE RELATION OF VISUAL ACUITY TO ILLUMINATION. Tufts Biblio. 26, Commonwealth Fund Rep. 4. 1942. pp. 28-30. ONR, Special Devices Center, Tufts College, Medford, Mass.

1243
To examine the relation of illumination to depth perception and to visual acuity, the classical data relating visual acuity to brightness (Koenig) was plotted as the minimum visible angular separation against the logarithm of the illumination in micro-footcandles. This curve permits a comparison of acuity data with the depth perception data (see accession 1242) obtained experimentally.

1244
Beebe-Center, J.G., & Mead, L.C. RELATION OF DECREASE OF BRIGHTNESS AT NIGHTFALL TO DECREASE OF THRESHOLD BRIGHTNESS DUE TO ADAPTATION. Tufts Biblio. 27, Commonwealth Fund Rep. 5. 1942. pp. 31-33. ONR, Special Devices Center, Tufts College, Medford, Mass.

1244
To determine whether the human eye dark adapts fast enough to keep up with the fall of natural environmental illumination, a standard curve for dark adaptation (laboratory data) was compared with a curve of brightness as a function of time of day (see accession number 1241). The relative rates of the course of dark adaptation and the fall of darkness are discussed.
G, P2.

1245
Beebe-Center, J.G., & Mead, L.C. DEPTH PERCEPTION UNDER NATURAL CONDITIONS OF OBSERVATION DURING THE TRANSITION FROM DAYLIGHT TO DARKNESS. Tufts Biblio. 28, Rep. 6. 1942. pp. 34-39. ONR, Special Devices Center, Tufts College, Medford, Mass.

1245
To investigate the effect of transition from daylight to darkness on the consistency of depth perception judgments, data were gathered for 3 subjects for both full daylight and twilight to darkness. Distance of observation was 100 feet. The standard deviations of judgments are related to levels of illumination and to the angular elevation of the sun. (see accession number 1241). The practical implications for pilots are discussed.

1246
Beebe-Center, J.G., & Mead, L.C. THE EFFECT OF THE RED-GREEN FILTER COMBINATION ON DEPTH PERCEPTION AT 100 FEET OBSERVATION DISTANCE. Tufts Biblio. 29, Commonwealth Fund Rep. 7. 1942. pp. 40-44. ONR, Special Devices Center, Tufts College, Medford, Mass.

1246
To determine the effect of a red-green filter combination on depth perception, 6 observers made depth settings at 100 feet under full daylight (see accession number 1245), with and without filter combinations, and full night light, without the filter. The standard deviations of the scores are compared for the 3 conditions and evaluated in terms of the usefulness of the filter combination for simulating night conditions for seeing.

Beebe-Center, J.G., & Mead, L.C. DEPTH PERCEPTION AT 200 FEET OBSERVATION DISTANCE UNDER TWILIGHT CONDITIONS AND WITH A RED-GREEN FILTER COMBINATION. Tufts Biblio. 30, Commonwealth Fund Rep. 7a. 1942. pp. 45-48. ONR, Special Devices Center, Tufts College, Medford, Mass.

1247
To determine the effect of increased distance upon depth perception judgments (see accession number 1246) under twilight conditions and with a red-green filter combination, 4 observers made depth settings at 200 feet. Consistency (standard deviations) of the settings is plotted as a function of brightness and compared with results from the preceding study to evaluate distance effects.

Beebe-Center, J.G., & Mead, L.C. DARK ADAPTATION WITH A COMBINATION OF KR-12 RED AND GREEN ACETATE FILTERS. Tufts Biblio. 31, Commonwealth Fund Rep. 8. 1942. pp. 49-54. ONR, Special Devices Center, Tufts College, Medford, Mass.

1248
To observe the course of dark adaptation when outdoor vision is obscured by the combination of red and green acetate filters, four observers were required to give the orientation of the open end of capital Z (a series of 34, graduated in size from 3.75 to .25 inches) at a distance of 40 feet. Judgments began as soon as the subject donned a pair of goggles fitted with both red and green filters and continued until all sizes had been correctly judged. The time of correct response was recorded for each stimulus size and plotted against the size of the stimulus.

Beebe-Center, J.G., & Nead, L.C. VARIATION OF TRANSMISSION IN A COMBINATION OF RED AND GREEN ACETATE FILTERS. Tufts Biblio. 32, Commonwealth Fund Rep. 9. 1942. pp. 56-67. ONR, Special Devices Center, Tufts College, Medford, Mass.

1249
To evaluate the transmission qualities in red and green acetate filters being used to simulate night vision, visual acuity judgments were made by two subjects wearing successively twenty pairs of goggles fitted with the combination filters. In addition, a photometric determination was made of the overall transmission of each goggle. A comparison is made of the results for both tests by the correlational technique. The range of transmission is presented and discussed.
T.C.R.

1250
Beebe-Center, J.G., & Nead, L.C. A FURTHER REPORT ON VARIATION IN TRANSMISSION WITH A COMBINATION OF RED AND GREEN ACETATE FILTERS. Tufts Biblio. 33, Commonwealth Fund Rep. 9a. 1942. pp. 68-72. ONR, Special Devices Center, Tufts College, Medford, Mass.

1259
To evaluate the transmission qualities of red and green acetate filters being used to simulate night vision, spectrophotometric curves were taken of the acetate for both new and old samples. Further tests were made by exposing photographic film through both filters and then noting variations in density.
G.

1251
Beebe-Center, J.G., & Nead, L.C. INDIVIDUAL DIFFERENCES IN VISION WITH A COMBINATION OF RED AND GREEN ACETATE FILTERS. Tufts Biblio. 34, Commonwealth Fund Rep. 10, 1942, pp. 73-91. SDC, ONR, Fort Washington, N.Y. (Tufts College)

1251
To study individual differences in acuity of vision with a combination of red and green acetate filters, determinations were made for 32 subjects. Test stimuli were 9 rows (varied in size from .65 to .25 inch) of four white E's presented on a black background at a distance of forty feet; the task was to identify the orientation of the open end of the E's in each row. A retest was given to 22 of the subjects and the two sets of scores correlated to check reliability of judgments. The scores are analyzed for variability due to individual differences; these are compared to variability due to filters. Recommendations are made for procedures in selecting the acetates.

Beebe-Center, J.G., & Nead, L.C. PROPOSAL FOR A GROUP TEST OF VISUAL ACUITY AFTER DARK ADAPTATION. Tufts Biblio. 35, Commonwealth Fund Rep. 11. c1942, pp. 92-106. ONR, Special Devices Center, Tufts College, Medford, Mass.

1252
To study the relative importance of variations in acuity due to different filters and variation due to different individuals, two groups of ten and twelve subjects were tested for acuity at forty feet (see 1251) wearing successively eleven or twelve different goggles. The variables are evaluated by an analysis of variance technique. The group procedure is described fully.

Carmichael, L., Beebe-Center, J.G., Nead, L.C., Wellman, S., et al. SUMMARY REPORT TO THE COMING HEALTH BOD. Dec. 1942. 12pp. Psychology Dept., Tufts University, Medford, Mass.

1253
This summary presents Reports One through Eleven of an investigation of discriminative vision under various conditions of day and night. The major problem was the reproduction of night conditions so that aviation pilots might be safely trained during daylight hours to make night landings. The studies include determination of changes in outdoor illumination from daylight to darkness, establishment of norms of visual performance in "real night" which were to be simulated in "artificial night", construction of apparatus for outdoor testing, and testing the filter combinations for simulating night conditions.

Beebe-Center, J.G., & Nead, L.C. DESCRIPTION OF DENSITOMETER DEVELOPED BY MR. BENTLEY WELLMAN. Tufts Biblio. 39, Commonwealth Fund Rep. 13. Mar. 1943. 4pp. ONR, Special Devices Center, Tufts College Research Lab. of Sensory Psychology and Physiology, Medford, Mass.

1254
This report describes an instrument for the measurement of low photometric transmissions of high density filters. Extensive use indicates that speedy and reliable measurements are obtained. Some data on validity are included. Details of the construction of the densitometer are given and a photograph is included.
I.B.I.

1255
Beebe-Center, J.G., & Nead, L.C. TRANSMISSION OF NAVY RED LENSES. Tufts Biblio. 40, Commonwealth Fund Rep. 14. Mar. 1943. 2pp. ONR, Special Devices Center, Tufts College Research Lab. of Sensory Psychology and Physiology, Medford, Mass.

1255
This report presents the results of an examination of 66 red lenses - 25 Polaroid All Purpose Goggles and 40 Polaroid All Purpose Navy Red Lenses. Transmissions for both sides of each filter were measured by passing light through the lens and a green acetate filter. Readings taken by the Wellman Densitometer. Results are examined in terms of acceptability for use with the green acetate in simulating night vision.

1256
Beebe-Center, J.G., & Nead, L.C. FURTHER OBSERVATIONS ON THE CHANGE OF ILLUMINATION FROM DAYLIGHT TO DARKNESS. Tufts Biblio. 41, Commonwealth Fund Rep. 16. Apr. 1943. 3pp. ONR, Special Devices Center, Tufts College Research Lab. of Sensory Psychology and Physiology, Medford, Mass.

1256
To determine whether the relation between brightness of a white patch oriented toward the sun and angular elevation of the sun (daylight and twilight) found to hold during summer months (see 1241) also obtains at other seasons, observations were made on March 12 at various intervals throughout the day and twilight to darkness. Measurements are related to calculations of the sun's elevation above and below horizon, and compared with the data obtained previously for summer months. The practical implications are discussed.

1265
Beebe-Center, J.G. & Mead, L.C. COMPARISON OF NEW MONSANTO BLUE WITH PREVIOUS MONSANTO BLUES. Rep. No. 26. May 1945. 5pp. Special Devices Center, Commonwealth Fund, Tufts College. (Laboratory of Sensory Psychology and Physiology)

1265
This report presents a laboratory comparison with respect to suitability for training pilots for blind flying, of a new Monsanto blue filter with the standard Monsanto blue. The major difference was in thickness. A determination was made of optical density, visual acuity, and eye strain of the new blue in combination with the standard amber.
T.

1266

Beebe-Center, J.G. & Mead, L.C. **RECOMMENDATIONS CONCERNING THE MONSANTO BLUE AND GENERAL USE OF THE BLUE-AMBER COMBINATION.** Rep. No. 27. July 1945. 3pp. Special Devices Center, Commonwealth Fund, Tufts College. (Laboratory of Sensory Psychology and Physiology.)

1267

This report reviews a laboratory comparison (see 1266) of two blue Monsanto filters for use in training pilots in blind flying. Recommendations are presented with accompanying data. The need for supplementary lighting in the cockpit is examined and further recommendations are incorporated.

1267

Beebe-Center, J.G. & Mead, L.C. **COMMENT ON SPECIFICATIONS OF SIMULATED BLIND FLYING SHEETS.** Rep. No. 29. July 1945. 3pp. Special Devices Center, Commonwealth Fund, Tufts College. (Laboratory of Sensory Psychology and Physiology.)

1267

This report is a brief comment on specifications for amber-blue filters for training pilots in blind flying. Of particular concern here is the joint optical density of the two sheets. An auxiliary source of white light for illuminating instruments in the cockpit is discussed.

1268

Beebe-Center, J.G. & Mead, L.C. **COMPARISON OF NEW SAMPLES OF MONSANTO BLUE 23027 WITH PREVIOUS MONSANTO BLUE.** Rep. No. 28. July 1945. 3pp. Special Devices Center, Commonwealth Fund, Tufts College. (Laboratory of Sensory Psychology and Physiology.)

1268

This report presents a laboratory comparison, with respect to suitability for training pilots in blind flying, of Monsanto Blue 2 727 TWA with the approved standard Monsanto Blue A9183. Measurements included spectrophotometric transmittance, optical density, and effects on visual acuity. Recommendations are included.

1269

Duerfeldt, C.H. **ATTITUDE INDICATORS FOR HELICOPTERS, EVALUATION OF, REPORT #1, FINAL REPORT.** Proj. PTR AE-7362.8, 5733-62, Feb. 1956, 4pp. Service Test Division, Naval Air Test Center, Patuxent River, Md.

1269

To evaluate, in a helicopter, the Lear type MM-1 remote horizon indicator with roll and pitch adjustments, 61 flights were made (34.8 hours under simulated instrument conditions). Comparisons were made with the standard type gyro horizon for accuracy and reliability and also checked for accuracy against the visual horizon. The results are discussed with particular reference to hovering operations. Recommendations are included.

1270

USN Special Devices Center. **CHECK-LIST OF GOOD TRAINING PRACTICES.** Contract 16CR1 195, Jan. 1949, 7pp. USN Special Devices Center, Port Washington, N.Y.

1270

This document is a check list of good training practices to be used by designers of training programs and training aids in evaluating their products. It consists of five to ten self-examining questions in each of the following categories: the student, the instructor, the method of instruction, and the trainer.

1271

Seals, L.S., Jr. **THE HUMAN IN CLOSED LOOP CONTROL CIRCUITS.** Dec. 1951, 17pp. USN Special Devices Center, ONR, Port Washington, N.Y.

1271

This paper points out that "engineering is now making greater demands on the biosciences for human design criteria--particularly in control systems--than can possibly be met as long as research clings to a molecular methodology. In order to determine: 1) how man structures his discriminations, and 2) what his response capacities and limitations are, a molar approach such as has been proposed must be generally adopted in the study of biological control elements." This approach considers the problem of control of machines as a regulator process in which man forms part of the regulation cycle.

1272

This report describes the contents and the use of the SDC-NSR Evaluation Procedure for Training Aids and Devices. This procedure, embodied in a form (included in the report), is a series of questions about the device under evaluation, to be answered by the evaluator. It is composed of the following parts: I. Description of the Training Purpose and Situation. II. Description of the Training Devices. III. The Use of the Training Device. IV. Summary Evaluation of Training Device.

1273

USN Special Devices Center. **THE PRINCIPLES OF LEARNING.** Contract 16CR1 199, Feb. 1949, 7pp. USN Special Devices Center, Port Washington, N.Y.

1273

This article discusses the learning process, its measurement and evaluation, aids and hindrances to the process, and some phenomena associated with learning. Illustrations of learning curves and types of learning such as trial and error, associations, and insight are included. The factors of motivation, knowledge of results, part and spaced learning, meaningfulness, and individual differences, transfer of training, use of time, overlearning, verbalization, role of instructor, and instructing procedures are discussed in terms of facilitating learning.

1281

Miller, G.A., Heise, G.A. & Lichten, W. **THE INTELLIGIBILITY OF SPEECH AS A FUNCTION OF THE CONTEXT OF THE TEST MATERIALS.** J. exp. Psychol., May 1951, 41(5), 329-335. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.)

1281

This study examined the effects of limiting the number of alternative test items on the threshold of intelligibility for speech in noise; these limits were achieved by providing three kinds of context: restricting the size of the test vocabulary (2, 4, 8, 16, 32, 256 monosyllables); using the words in sentences (which contained five key words); repeating the test words (monosyllables and words in sentences). The tests were carried out at several signal-to-noise ratios over the range from -21 to +18. Two Ss participated. The intelligibility differences are related to the amount of information present.

Votaw, D.F., Jr. REVIEW AND SUMMARY OF RE-SEARCH ON PERSONNEL CLASSIFICATION PROBLEMS. Contract AF 18(603)-369, Proj. 7702, Task 77037, AFTRC-TN-56-106, Aug. 1956, 12pp. Personnel Research Laboratory, AFTRC, Lackland AFB, Tex.

1282

Methods of making the most efficient assignment of men to jobs are reviewed in this report. In the first section two main problems are defined: (1) given a number of job categories with personnel quotas, and given a group of persons for each of whom an amount of production in each job is known, the problem is to allocate persons to jobs so that production per person is a maximum; (2) given a number of job categories with quotas and a group of persons, where each person is regarded as qualified or not in each job category, the problem is to find some allocation that will place each person in a job for which he is qualified. Ten methods of solution are listed, with references, and discussed briefly in section 2. Section 3 summarizes present knowledge and suggests further research. T. R 19

1283

Galer, E.L., McQuitty, L.L., & Cherry, C.W. A PROCEDURE FOR DEVELOPING JOB-KNOWLEDGE TESTS. Contract AF 33(038)-25726, Task A, Proj. 7700, Task 77015, AFTRC-TN-56-113, Sept. 1956, 20pp. Personnel Research Laboratory, AFTRC, Lackland AFB, Tex.

1283

To develop and illustrate a procedure for building job-knowledge tests, particularly for the situation where nearly all personnel possess prerequisite job knowledge and consequently little relation exists to job proficiency, three 100-item job knowledge tests were prepared from a pool of 12,668 mechanical test items. Tests I and II were the result of random sampling; Test III was stratified so that each of 13 phases of a basic aircraft and engine course was proportionally represented. All tests were administered to 645 Air Force Aircraft and Engine Mechanics at different levels of formal training and experience. Item responses were studied with respect to the power of the items to differentiate between levels of training and experience. T. R 8

1284

Andreas, B.G., Gerall, A.A., Green, R.P., Murphy, D.P., & Spragg, S.D.S. PERFORMANCE ON A TRACKING TASK SIMULATING FIXED GUNFIRE AS A FUNCTION OF INSTRUCTIONS AND DIFFICULTY LEVEL OF INITIAL TRAINING. Contract Monr-668(09), NavTraDevCen-Proj. 20-F-11, Tech. Rep. 668-9-2, Sept. 1956, 11pp. Training Device Center, University of Rochester.

1284

To determine the proficiency level attained in a tracking task simulating fixed gunnery after varying verbal instructions and varying difficulty levels of initial practice, four groups of subjects (ten each) were given performance trials on the Rochester Generalized Tracking Apparatus. Two groups performed after minimum verbal instructions and two after extensive instructions on how to perform the task. Within each group, one half was given an easy task before a final more difficult task; the other half was given initial training equivalent in difficulty to the final task. Time on target scores (milliseconds) were analyzed as functions of instruction and task difficulty. Implications for use of tracking trainers are discussed. G. R 1

1285

Thomas, G.J. VOLUME AND LOUDNESS OF NOISE. *Acad. J. Psychol.*, Oct. 1952, 65(4), 588-593. (University of Illinois, Urbana, Ill.).

1285

This study determined whether S could equate various bandwidths of white noise with respect to volume and whether such equations would be different from those of loudness. Two Ss determined equal-volume and equal-loudness contours with the standard band of noise (250 mels between 1,900 and 2,450 cps) at 22, 42, 62, and 82 db; S made five equal-volume matches and five equal-loudness settings for each of five bandwidths for any one contour; S also made five loudness and five volume judgments at each intensity of the standard. The differences between the equal-volume and equal-loudness judgments of the same noise stimuli were described. The results of equal-volume and equal-loudness matches between a 1,000-cps tone and the standard band of noise were compared. T. G. I. 2 5

Webster, F.A. THE INFLUENCE OF INTERAURAL PHASE ON MASKED THRESHOLDS. I. THE ROLE OF INTERAURAL TIME-DEVIATION. *J. Acoust. Soc. Amer.*, July 1951, 23(4), 452-462. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

1286

This investigation was concerned with "an analysis of the action produced by a given frequency-component of the signal on a corresponding component of the masker." Three experiments were conducted: I--the masking of tones by wide band noise; II--the masking of narrow bands of noise by wide band noise; and III--the masking of narrow bands of noise by narrow bands of noise. The signal level was 60 db SPL in all cases. In I and II an automatic attenuator was used and in III a manual one. Three Ss had to stop following as soon as the masker stopped increasing or the pattern became inaudible; three or four such thresholds were obtained. From the results, the relation of "masking level difference" to frequency was defined. An hypothesis to explain these findings was examined. G. I. R 9

Heise, G.A. & Miller, G.A. AN EXPERIMENTAL STUDY OF AUDITORY PATTERNS. *Acad. J. Psychol.*, Jan. 1951, 62, 63-77. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

1287

"The threshold frequency for the perceptual integration of a variable tone into a temporal sequence of tones was measured as a function of the shape of the sequence and the ratio of the frequencies of successive tones. Six different frequency ratios between successive tones in the sequence were investigated for each of four pattern types: inverted V, upright V, ascending straight line, and descending straight line. For each combination of pattern and frequency ratio between successive tones, four Ss made 'upper' settings of the variable tone, for which increasing the frequency of the variable tone caused it to separate from the remainder of the sequence, and 'lower' settings... of the same type. The results are related to the principles of visual perceptual organization. T. G. R 4

Heise, G.A. & Miller, G.A. PROBLEM SOLVING BY SMALL GROUPS USING VARIOUS COMMUNICATION NETS. *J. Abnorm. & Exp. Psychol.*, July 1951, 45(3), 327-335. (Harvard University).

1288

Problem solving performance of a three-man group was studied for five different communication nets, three signal-to-noise ratios and three kinds of tasks. The tasks were (1) the reassembling of a list of standard words with each member having only part of the information, (2) constructing a sentence, the words of which had been distributed among group members, and (3) forming anagrams by the group. Group efficiency was measured in terms of time or number of words spoken to complete the task and analyzed for effects of communication net, type of task, and stress, provided in this case by noise. Problems of control in small group research are discussed. T. G. I. R 7

Rosenberg, S., & Roby, T.B. EXPERIMENTAL ASSEMBLY OF B-29 CREWS BY SELF-SELECTION PROCEDURES: A DESCRIPTION AND VALIDATION OF THE METHOD. Proj. 7713, Task 77231, AFTRC-TN-56-104, Aug. 1956, 38pp. Crew Research Laboratory, AFTRC, Randolph AFB, Tex.

1290

To assess an assembly technique whereby potential team members "select" each other on the basis of behavior samples from other potential team members, three successive classes of nine B-29 crews were assembled by this procedure. Choices of crew members for each other were based on 1) individual self-descriptions of background information and general attitudes, and 2) specific attitudes toward problems of crew functioning. About half the crews were assembled by using the choices and the other half assembled randomly. Sociometric ratings were obtained in both early and late phases of training together with instructor ratings of crew coordination to serve as validation criteria. Two sets of analyses were performed: 1) to ascertain suitability of choice scores for assembly and 2) to determine the validity of selection scores. T. R 11

1292

Miller, G.A. LANGUAGE ENGINEERING. J. Acoust. Soc. Amer., Nov. 1950, 22(6), 720-725. (Harvard University).

1292

Although such a field of study as "language engineering" does not exist, this paper points the way by which different disciplines might cooperate in the problems of this field. Some problems for the language engineer are posed, with a specific one - development of air international language of the air - discussed in detail. Six steps in such a development are outlined and the contributions needed from various fields of knowledge are pointed out. In still more detail, some contributions that psychology can make toward solving this problem are discussed under: (1) reception of information, (2) information storage, and (3) group problem solving.

Bowen, J.M., & Woodhead, Muriel W. THE RELATIVE ACCURACY OF TRACK PREDICTION ON FOUR RADAR DISPLAYS. FPRC 699, Memo 39, Oct. 1954, 11pp. Applied Psychology Research Unit, NRC, Cambridge, England.

1294

To determine how accurately the future course of tracks on four types of radar displays (Cartesian and polar coordinate with linear and exponential range scales) could be predicted, 12 subjects observed a display with a complete track for five seconds then estimate termination of the track on a second display which showed only 1/3 of the original. Three types of tracks were used in all four quadrants of all four displays. Errors (difference in "miles" between actual and estimated termination) and their deviations in inches were analyzed for type of coordinate and type of range scale used. The effect of track length was studied.

1295

Vince, M.A. DIRECTION OF MOVEMENT OF MACHINE CONTROLS. FPRC 637, Aug. 1944, 9pp. Cambridge Psychological Lab., FPRC, Cambridge, England.

1295

To study relationship between directional movements of the control and the display, preliminary experiments were conducted with simple directional controls involving upward and downward movements with corresponding upward and downward effects. In the first test, a pointer was moved by upward or downward movements of a knob in response to stimuli (short lines) which appeared above or below a horizontal line. An "expected" connection between knob and pointer (both upward or downward) and the reverse or "unexpected" were studied. A second test of the same relationships involved a continuous tracking with a positional control. Errors were analyzed for differences due to the "expected" and "unexpected" directional movements.

Gibbs, C.B. THE ADVANTAGES OF A PRESSURE OPERATED CONTROL LEVER IN A VELOCITY CONTROL SYSTEM. J.E.S. 208, A.P.U. 161/51, Jan. 1952, 24pp. Applied Psychology Research Unit, Royal Naval Personnel Research Committee, NRC, Cambridge, England.

1296

To find optimal relationships between the operator and a servo-mechanism which moves a display element in two directions, two types of joysticks were used to control the output of a velocity control servo-mechanism - a free moving and a pressure control. A range of sensitivities (gear ratios) were tested to determine optimum conditions for each control and performance (errors and graphic records) compared under these conditions. Further comparisons involved finger vs. arm operation and time to correct a given amount of error. The general problems of control sensitivity, control lever loading and control/display relations are discussed along with the problem of the functions of the proprioceptors in such skills.

Pavlik, W.B. MOTIVATIONAL FACTORS IN INDIVIDUAL AND GROUP PRODUCTIVITY: IV. THE EFFECTS OF PERSONAL AND SITUATIONAL MOTIVATION UPON INDIVIDUAL PERFORMANCE IN A SMALL-GROUP SETTING. Contract M601-17, T.O. III NR 171-123, 1956, 75pp. ONR, Ohio State University Research Foundation.

1297

To investigate the role of motivation upon individual performance in a small group setting, sixty subjects were divided into three classes (high, moderate, and low) of inferred individual drive level on the basis of scores on the Taylor Scale of Manifest Anxiety. Three subjects, one from each class, were assigned to each of twenty groups and performed a simple assembly task in a situation designed to control effects of face-to-face interaction. Motivating conditions were: (1) special incentives (reward, group competition) and frequent time signals, and (2) no special incentives and one time signal (control). Performance scores (number of operations completed during each of two twenty-minute work periods) were studied by analysis of variance techniques for differences due to both personal and situational motivation.

O'Neill, R.R. AN ENGINEERING ANALYSIS OF CARGO HANDLING: V. SIMULATION OF CARGO HANDLING SYSTEMS. Rep. 56-37, Sept. 1956, 153pp. Department of Engineering, University of California, Los Angeles.

1298

This investigation treats a method for the prediction of average rate of flow of discrete entities which are moved by a sequence of independently controlled movements and handlings. The technique is applied to present day cargo-handling system, between place of rest of pre-assembled cargo on dock and secured position in hold. The system is idealized as a set of links (round trip path of transporting agents) and nodes (region where the particle is transferred from one agent to the next). Productivity, a measure of the time rate of transport, is studied as it is affected by number and arrangement of links, number of transporting agents, number of storage units at node, size of unit of commodity, and distributions of element working times.

Newman, E.S. THE PATTERN OF VOWELS AND CONSONANTS IN VARIOUS LANGUAGES. *Amer. J. Psychol.* 1951, 64, 365-379. (Rep. PNR 109, Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

Reported is a study of vowel-consonant sequences in a number of languages including Basic-English, English, French, German, Hebrew, Icelandic, Italian, Latin, Lifu, Polish, and Samoan. Comparisons of comparable material in each language were made by taking passages from the New and Old Testaments in each of the above languages. Autocorrelations, certainty measures, and the proportions of vowels and consonants were determined. The autocorrelation shows that there is a strong alternation of vowels and consonants. There is a systematic difference represented by the difference between Latin and Italian on the one hand and German on the other, in terms of syllable length. Latin and Italian consist largely of open syllables, i.e., C-V or V-C combinations, while German has closed syllables generally of C-V-C form. The measures used suggest that there is little structure to be found beyond the fifth or sixth letter, so long as we restrict ourselves to vowels and consonants. It is probably not just a matter of chance that the most primitive languages studied showed the greatest restrictions in terms of patterning, while English showed the least. From the statistical point of view, English is "noisy", i.e., unpredictable.

Creelman, J.A., & Miller, E.E. EVALUATION OF A "MOVING AIRPLANE" ATTITUDE INDICATOR. Res. Proj. NX 001 109 107, Rep. 3, Sept. 1956, 9pp. US Naval School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

1305

To evaluate the "moving airplane" attitude indicator under controlled field conditions, the rates of student learning on the standard gyro (moving horizon) and the Flight Attitude Indicator (moving airplane) were compared. Eight students, four experimental and four control, were selected and paired on the basis of previous flight grades. Each pair was assigned the same instructor but received initial instrument training using different attitude indicators. After completion of the D12 check, students switched instruments and received instruction until successful completion of another D12 check. Criteria were regular flight grades, time to complete instrument stage, and control reversals. The data were analyzed for differences due to type of attitude indicator used. The findings are discussed in relation to laboratory results. T. R 2

Flottorp, G. EFFECT OF DIFFERENT TYPES OF ELECTRODES IN ELECTROPHONIC HEARING. *J. acoust. Soc. Amer.*, March 1952, 25(2), 236-245. (Psycho-Acoustic Lab., Harvard University, Cambridge Mass.).

Depending upon the kind of electrode system employed, a sinusoidal electric current gives rise to at least 5 phenomena. a) With a moving electrode on the skin or on the roof of the mouth (fricative effect), the S receives the strongest sensation of hearing. He may hear either the first harmonic or the first and second harmonics, or the second harmonic alone, depending upon the applied voltage and upon the placement and properties of the electrode. b) With a large-area electrode any place on the skin of the head, if the skin is dry the S hears the second harmonic; if it is wet, he hears nothing. c) When the electrode is immersed in salt solution in the ear (the most common method), the S hears a complex tone containing mostly second harmonic, suggesting the action of a square-law transducer. d) When the electrode is on the mucous tissue inside the middle ear (with eardrum removed), the S hears the first harmonic and/or a noise. e) When the electrode is in contact with the epidermis of the ear, the S hears the first harmonic, and at low frequencies he may also hear a noise. The experimental results seem to indicate that the hearing of a tone under any of these 5 conditions is probably due to vibrations set up outside the cochlea, although there appear to be at least 4 different transducing mechanisms. Contrary to earlier hypotheses, the tympanic membrane is apparently not involved in the conversion of the electrical energy into mechanical vibration.

Newman, E.B. COMPUTATIONAL METHODS USEFUL IN ANALYZING SERIES OF BINARY DATA. *Amer. J. Psychol.*, 1951, 64, 252-262. Contract N5ori 76, Proj. Nr 142 201, Rep. PNR 94. (CNR, Harvard University, Psycho-Acoustic Lab., Cambridge, Mass.).

This paper presents certain mechanical and computational aids that materially reduce the time and effort involved in applying the mathematical theory of time-dependent random processes. The particular procedures developed here have one important limitation: they are applicable only to sequences of binary data, i.e. to data that may be expressed in terms of 2-valued series. Further, it is assumed that such data occur in discrete steps with respect to time. Described are: a) computation of the uncertainty function; b) construction of a relay-operated tabulator; and c) construction of an autocorrelator.

Payne, R.B., & Hauty, G.T. SKILL FATIGUE AS A FUNCTION OF WORK-REST DISTRIBUTION. Proj. 57-14C, July 1957, 5pp. USAF School of Aviation Medicine, Randolph AFB, TX.

1321

To test the explanatory relevance of certain aspects of Hull's reactive inhibition theory to skill fatigue, three groups of subjects (48 in all) were trained to substantial levels of skill on a multichannel tracking task. Groups A, B, and C then performed the task following work-rest distribution ratios of four to one, 0.67 to one, and 0.25 to one, respectively, for four hours of elapsed time. The analysis of data involved comparisons of proficiency among the groups with (1) work (number of trials) held constant, and (2) task confinement held constant. Proficiency changes were analyzed as functions of work and rest variables. The practical and theoretic implications of the results for tracking and watchkeeping tasks are discussed.

Bryan, G.L., Wilson, R.C., Willmorth, N.E., Svenson, D.W., Green, G.A., & Warren, N.D. THE EFFECTS OF INCREASED POSITIVE RADIAL ACCELERATION ON REACHING AND MANIPULATING TOGGLE SWITCHES. PSYCHOLOGICAL RESEARCH ON THE HUMAN CENTRIFUGE. Contract N6ori 77, T.O. 3, No. V. June 1951, 20pp. ONR, U. Southern Calif., Psychol. Lab.

1323

To evaluate the effects of g forces on the ability to reach and manipulate switches near the body, 30 male college students were subjected to positive accelerations of 1.0, 2.5 and 4.0 g in a human centrifuge. The subjects reached for and manipulated one of several toggle switches located around them as rapidly as possible when the signal light coupled with that switch appeared. The reaction time (lapsed time from the appearance of the signal to the initiation of the movement) and the time to complete the movement were measured as a function of switch position, direction of switch manipulation, hand used and the magnitude of the g force acting on the subject.

Johnson, R.E., & Mark, R.M. RESEARCH REPORTS - FEEDING PROBLEMS IN MAN AS RELATED TO ENVIRONMENT. AN ANALYSIS OF UNITED STATES AND CANADIAN ARMY RATION TRIALS AND SURVEYS, 1941-1946. Apr. 1947. 94pp. Office of the Quartermaster General, Research & Development Branch, Quartermaster Food & Container Institute for the Armed Forces. (Harvard Fatigue Lab.)

1341
The results of a number of United States and Canadian Army ration trials and surveys are analyzed. The nature and quantity of diet is considered in relation to the activities performed by the troops and the thermal environment. Tests and surveys conducted in temperate, subarctic, arctic, mountain, desert and jungle areas are reported. Clinical, biochemical, physiological and behavioral observations are summarized. An attempt is made to draw general conclusions concerning the principles of adequate nutrition in relation to the soldier's activities and environment. T, G, R 22.

1343
Mann, C.W. & Zacharias, V.B. APPLICATION OF FOOT MEASUREMENTS IN THE DEVELOPMENT OF LAST SYSTEMS. RESEARCH AND DEVELOPMENT REPORT. FOOTWEAR AND LEATHER SERIES. Rep. 7. 1952. 45pp. USA Office of the Quartermaster General, Research and Development Div., Washington, D.C.

The present report describes a study of the foot dimensions of soldiers, obtained in 2 large scale anthropometric surveys, and their application in the improvement of the Munson last system, used for the manufacture of Army service shoes. The basic dimensions of the feet are compared with the corresponding model last dimensions and the foot gradients for size and width are compared with corresponding last gradients. The results show that many of the standard last grades differ from the corresponding foot grades by more than 30%. The deviations are discussed in detail and their importance is demonstrated. An example is presented which shows that the deviations lead to combinations of shoe dimensions that cannot afford optimum fit for the average foot in certain sizes. The report presents some of the basic principles that are essential in the development of a last system from scientific foot measurements. The evaluation of the fitting qualities of shoes and last systems is also discussed and a new method based upon the analysis of dimensions is described which overcomes many of the disadvantages of conventional methods. The application of the methods described above to research and development problems is demonstrated in the analysis of the Munson last system and in defining some of the important characteristics of a last system. Randall, F.E. & Munroe, Ella H. ANTHROPOMETRIC MONOGRAPH OF ARMY WOMEN. Rep. 148, Feb. 1949, 13pp. Office of the Quartermaster General, Military Planning Div., Research and Development Branch, Lawrence, Mass.

The objective of this project was to provide a simple source of reference of anthropometric data for use by designers of women's clothing and other personal equipment for Army women. An analysis of an Army (female) population, 18-29 years of age, has been made in order to present the interrelationships which exist between 8 bodily dimensions and 2 independent bodily dimensions, Cervical Height and Hip Circumference. Resulting from this analysis is a nomograph from which can be easily read the average values of the 8 dependent dimensions which will be associated with any selected pair of Cervical Height and Hip Circumference values. This nomograph will be of aid to the designers and developers of clothing, personal equipment, and other equipment used by Army women.

1346
Randall, F.E., Munroe, Ella H. & White, R.M. ANTHROPOMETRY OF THE FOOT (U.S. ARMY WHITE MALE). Rep. 172, Jan. 1951, 23pp. Office of the Quartermaster General, Climatic Research Lab., Lawrence, Mass.
Data obtained during an anthropometric survey of the feet of 5575 Army white men are available in a report published in 1946 by the Armed Medical Research Laboratory, Fort Knox, Kentucky. Although the original report contains many useful data, the interpretations thereof do not permit direct application by designers of lasts and shoes for the Army. In order to provide greater detail and also more directly applicable information, an intensive analysis of the original Fort Knox data has been carried out. The general conclusion reached is that the dimensions of the foot which are closely related to the 2 basic dimensions, Ball Length and Ball Girth, are easily accommodated, whereas those poorly related cannot be accommodated by adjustment and, therefore, must be provided for in the design of the shoe. Dimensions which probably are critical in the proper fit of shoes, and which show low correlations with Ball Length and Ball Girth, namely, the Dorsal and Plantar Arch Heights, Foot Flare, and Angular Orientation of the Heads of Metatarsals, may be expected to occur with almost as much variation for any one size as they occur in all feet. Thus, in order to obtain shoes which will fit properly, it will be necessary to construct them in such a manner as to provide for a considerable amount of independent variation in most of the dimensions studied.

Saul, E.V., & Jaffe, J. THE MEASUREMENT OF DECREMENTES IN GROSS MOTOR PERFORMANCE DUE TO CLOTHING. Contract DA44-109-qm-1124. Sept. 1953. 63pp. Office of the Quartermaster General, Tufts College, Institute for Applied Experimental Psychology.

1348
This pre-publication draft describes a study which was designed to investigate the effect of clothing on the efficiency of motor performance. College men performed 28 motor tasks involving gross motor coordination, steadiness, and/or flexibility, under 3 (minimum, medium, and maximum) clothing conditions. The results relate performance scores to each clothing condition.

Prast, J.W., & Noell, W.K. ANOXIA WARNING DEVICE: THE SLOW-WAVE ACTIVITY OF THE BRAIN DURING EARLY STAGES OF OXYGEN LACK. Proj. 21-02-050, Rep. 1. Mar. 1949. 8pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1351
To evaluate the efficacy of an automatic anoxia warning device based upon the incidence of electroencephalographic waves of 4 to 7 cps, 109 subjects aged between 17 and 37 years breathed nitrogen-oxygen mixtures of 6.4 to 8.8 percent oxygen while writing numbers in reverse sequence starting with 1000. The results are presented in terms of the lapsed time from beginning to breathe low oxygen, to warning signal, to first mistake in writing.

1352
Campbell, P.A. AIRCRAFT OBSCURATION BY SUN GLARE. Proj. 34, Rep. 1. June 1942. 4pp. AAF School of Aviation Medicine, 27th AAF Base Unit, Randolph Field, Texas.

1352
To determine certain of the characteristics of sun glare in relation to aircraft obscuration, experimental measurements were made of (1) the area in which objects are obscured by sun glare, and (2) of sun brightness for different atmospheric conditions and times of day. From these data estimates of the area of obscuration at different altitudes are made and a principle for a sight mechanism is developed whereby this glare area might be utilized by a pilot to fly in the sun's path.

Rowland, Louise S. INTENSITY AS A FACTOR IN RECOGNITION OF COLORED LIGHT SIGNALS. Proj. 37, Rep. 1. Aug. 1942. 4pp. School of Aviation Medicine, AAF, Randolph Field, Texas.

1353
To explore the possibilities of constructing a quantitative test for color signal identification based on measurements of chromatic intensity thresholds, 24 color normal and 11 color deficient subjects made judgments of the minimum intensity at which blue, green, and red test lights could be named. In addition, identification tests were made at higher intensities (range of five log units above threshold). The results are analyzed and discussed in terms of consistency of measurements and differentiation between groups. Further study is recommended.

Rowland, W.M. COMPARISON OF HOWARD-DOLMAN DEPTH PERCEPTION TEST, WULFECK GROUP TEST OF STEREO ACUITY, AND KEYSTONE DEPTH PERCEPTION APPARATUS. Proj. 59, Rep. 1. July 1942. 4pp. The School of Aviation Medicine, Randolph Field, Texas.

1354
To determine the value of the Wulfeck Group Test of Stereo Acuity as a method of testing binocular depth perception, 539 aviation cadets were given three tests of depth perception (Howard-Dolman, Keystone, and Wulfeck). The scores are compared and analyzed by means of scatter diagrams. Observed relationships are discussed. Recommendations are made concerning the modification of the Wulfeck test.

1365
Rowland, Louise S. AN INVESTIGATION OF THE PERFORMANCE OF POLAROID WIND-FOIL, GLASS-FOIL, AND DARK ADAPTION COCKPITS. Proj. 63, Rep. 1, July 1942. 3pp. The School of Aviation Medicine, Randolph Field, Texas.

1366
To study the efficacy of three types of Polaroid goggles (Wind-Foil, Glass-Foil, Dark Adapter) in providing eye protection for air crew personnel, service tests were made of the Wind-Foil and Glass-Foil types for protection provided from wind, dust, flash-burn, and glare; for fit with oxygen masks, radio headsets, and for comfort. The field of binocular vision and the light transmitting qualities of the goggles were measured. The Dark-Adapter goggle was tested under laboratory conditions for efficiency in pre-conditioning the eyes for seeing in the dark. Recommendations are included.

1367
Bell, P.C. THE EFFECT OF AIRCRAFT COCKPIT FLUORESCENT LIGHTING ON VISUAL ACUITY AND DARK ADAPTATION. Proj. 64, Rep. 1, July 1942. 3pp. School of Aviation Medicine, Randolph Field, Texas.

1368
To determine the effect of ultraviolet fluorescent lighting on visual acuity and dark adaptation, determinations were made of (1) the threshold for the dark adapted eye prior to, and after five minutes exposure to ultraviolet light (distance of 15 inches), and (2) the minimum intensity required to detect a plane silhouette with white light, and with ultraviolet light directed to the eye (distance of 15 inches). Both measures are analyzed for changes due to type of light. The implications of the findings for use of ultraviolet fluorescent in aircraft cockpits are discussed; recommendations are made.

1369
Bell, P.C. SULFA DRUGS AND DARK ADAPTATION. Proj. 91, Rep. 1, Nov. 1942. 2pp. School of Aviation Medicine, Randolph Field, Texas.

1370
To study effects of sulfathiazole and sulfadiazine on dark adaptation, the Wecht adaptometer was used to obtain dark adaptation curves on four subjects, before and four hours after oral administration of either of the drugs. Six additional subjects receiving sulfathiazole in treatment of gonorrheal urethritis were tested. Variations in blood level analyses are presented and the results of administration of either drug are discussed in terms of effect on dark adaptation.

1371
Rowland, Louise S. SULFA DRUGS AND DARK ADAPTATION. Proj. 91, Rep. 2, Dec. 1942. 3pp. School of Aviation Medicine, Randolph Field, Texas.

1372
To study the effect of sulfathiazole and/or sulfadiazine on night visual efficiency as reflected in light thresholds and the ability to locate the position and distinguish the form of an object, two groups of seven subjects each were tested under controlled pre- and post-medication conditions. Results are presented and conclusions drawn as to the effects of sulfa drugs on dark adaptation.

1373
Bell, P.C. A RETRACTABLE SUN GLASS SHIELD. Proj. 107, Rep. 1, Jan. 1943. School of Aviation Medicine, Randolph Field, Texas.

1374
This report describes a sun glass shield which may be snapped on or off type B-7 aviator goggles to provide a means for detecting an aircraft in the sun or glare area of the sun. The device does not restrict the field of vision when not in use and when in use still permits unobstructed vision over the entire visual field by movement of the head. Instructions for use, photographs and diagrams illustrating the device are included.

1375
Rowland, Louise S. "CHES" FOR COLOR BLINDNESS. Proj. 122, Rep. 1, Feb. 1943. 3pp. School of Aviation Medicine, Randolph Field, Texas.

1376
To investigate reported improvement in color vision following treatment with red and green light, seven color deficient men who had received such treatment and had shown day-to-day improvement in reading the American Optical Company charts were examined. Tests used were (1) a measurement of the Rayleigh equation, (2) Berlin-Polydromatic Plates, (3) Dethmers, 7th edition, (4) Dilling, 2nd edition, and (5) American Optical Company Plates, complete and abridged forms. The results are analyzed for valid evidence that improvement in color perception had occurred.

1377
Rowland, Louise S. DAYLIGHT FLUORESCENT LAMPS AS A SOURCE OF ILLUMINATION IN TERMS OF COLOR PERCEPTION WITH PSEUDO-ISOTHERMATIC PLATES. Proj. 130, Rep. 1, Apr., 1943. 3 pp. USAP School of Aviation Medicine, Randolph Field, Tex.

1378
To determine the effect of "Daylight" fluorescent lighting on results of color perception tests, two groups (30, 25) of color deficient subjects were examined with an abridged form of the American Optical Company Test in natural daylight (twenty footcandles or more) and in fluorescent light (sixty to seventy footcandles). Tests were given in reverse order to the two groups. The number of errors for each subject are compared for the two types of illumination. Recommendations are made.

1379
Rowland, W.Z., & Rowland, Louise S. A COMPARISON OF THREE TESTS OF DEPTH PERCEPTION. Proj. 238, Rep. 1, Feb. 1944. 8pp. School of Aviation Medicine, Randolph Field, Texas.

1380
This report presents an experimental comparison of three depth perception tests: Howard-Dolan, Verhoeff, and Dustran (modified Wulfeck test) -- the latter two are small and more portable than the first. One hundred and sixty-four individuals were tested (156 aviation cadets, 8 men disqualified on the basis of previous visual tests). Individual scores are compared by categories for superior, average, and failing for each test. Retests were given and correlations are given to show test reliabilities. Recommendations are included.

1363

Rowland, W.M., & Rowland, Lucine S. STUDIES OF A NUMBER OF MEN REPORTING DIFFICULTY IN NIGHT OPERATIONS. Proj. 251, Rep. 1. May 1944. 6pp. School of Aviation Medicine, AAF, Randolph Field, Texas.

1363

This is a report of a research study which utilized vitamin therapy with a group of nine military men complaining of difficulty in night vision. To determine the cause of the difficulty each individual was evaluated on various visual tests and a course of vitamin therapy was employed where indicated. Results are discussed in terms of each individual and his case history. Results of visual testing of other night blind men's referrals are presented as well as the effects of night blindness and possible non-vitamin factors producing the condition. Various vitamins, such as A, B, C, etc., were used. T, 21

1364

Rowland, Lucine S. NIGHT VISUAL EFFICIENCY IN ILLUMINATIONS ABOVE THE LEVEL OF THE COKE FURNACE. Proj. 248, Rep. 1. May 1944. 12pp. School of Aviation Medicine, Randolph Field, Texas.

1364

To investigate the need for tests of foveal acuity at low intensities as a part of testing for night visual efficiency, measurements were made of the minimum illumination required to read test letters of varied sizes; further measurements of acuity at three brightness levels (100, 0.04, and 0.003 millilamberts) were made. The results are analyzed for procedures to use in measuring foveal acuity at low illumination, and for the relationship between acuity at low illumination and at ordinary levels. Recommendations are included. T.G.E.

1365

Scobee, R.C. TESTS OF THE GRADED DENSITY SUN GLASS, TYPE "A" AND "B" IN CONNECTION WITH AAF BOARD PROJECT J-4035. Proj. 356, Rep. 1. Jan. 1945. 5pp. AAF School of Aviation Medicine, 27th AAF Base Unit, Randolph Field, Texas.

1365

To evaluate the Graded Density Sun Glass, Type "A" (lenses coated at top with a thin, absorbing layer of chrome nickel alloy) and Type "B" (coated lens at both top and bottom), spectrophotometric measurements of the graded density portion were made and field test given by three flying officers. On the basis of the transmission data and the opinions of the subject, favorable and unfavorable points are listed and recommendations are made for use and for modifications. 1.

1366

Rowland, W.M. NIGHT VISION: A REVIEW OF INVESTIGATIONS AT THE AAF SCHOOL OF AVIATION MEDICINE. Proj. 399, Rep. 1, July 1945; 6pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

1366

This report summarized investigations of night vision made at the AAF School of Aviation Medicine between January 1942 and June 1943. Topics of concern are: 1) development of tests for rating night visual efficiency, 2) training in the use of eyes at night, and 3) miscellaneous studies including pupillary size, effect of carbon monoxide and drugs, mapping of visual fields, and acuity at various low levels of illumination. The need for further investigation is indicated. R 17.

1367

Frade, G.E., Green, E.L., & Hoagson, F.V. COMPARISON OF RESULTS OF SIGHT-SCREENER AND CLINICAL TESTS. Proj. 480, Rep. 1. Sept. 1943. 16pp. AAF School of Aviation Medicine, 27th AAF Base Unit, Randolph Field, Texas.

1367

To compare clinical tests routinely used by ophthalmologists with the A-3 Sight-Screener Test for visual acuity, presence of binocular single vision, depth perception, and muscle balance, 31 subjects were examined. Clinical tests used were: A-3 Projector Chart, Clincon Visual Acuity meter, Waller test with the photometer, the Screen and Familiar test, Howard-Dolman test, phoria and red line test. The results are presented in tabular form with a brief statement concerning the reception of a statistical analysis of the data. T.G.E.

1368

Jennings, A.L., Haber, E., & Gerathwohl, S. A STUDY OF SUMMAY MARKINGS. Proj. 512, Rep. 1. Nov. 1947. 14pp. School of Aviation Medicine, Randolph Field, Texas.

1368

To determine the aircraft runway markings which are most effective as aids to landing under conditions of poor visibility, 10 subjects judged the visibility of nine test patterns of equal area black on white arranged in a moving cell, as viewed through a ground glass that simulated fog. Visibility scores are expressed in terms of visual acuity required to recognize the different markings; also as "detected recognition distances" through fog. Recommendations are made and illustrated with a discussion of advantages and disadvantages of each. T.G.E.

1369

Kell, P.C. IMPROVED AVIATION GOGGLES. Proj. 145, Rep. 1. May 1943. 2pp. School of Aviation Medicine, Randolph Field, Texas.

1369

An aviation goggle is described which was designed to increase the available visual field beyond that provided by the B-7 and Polaroid goggles and to fit with the A-14 oxygen mask. A non-shatterable plexiglass lens and sponge rubber frame are provided for increased comfort and wearability. A photograph of the prototype is included. 1.

1372

Gibbs, P.A. RETINAL ADAPTATION IN NIGHT FLYING. Proj. 21-31-014. May 1952. 6pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1372

To study some possible causes for temporary loss of ability to see the horizon during night flying, nine dark-adapted subjects, under simulated night flying conditions, scanned the horizon and reported time and duration of any loss of vision. Variables were: amount of oxygen, body posture, method of scanning, and intermittent light. Time factors in loss of vision are discussed as a function of retinal adaptation and oxygen deficiency. Comments are made concerning restoration of vision by inverting body position and suggestions are made as to best method of scanning. T.G.I.R.

1373
Cibis, P.A., Gerathwohl, S.J., & Rubinstein, D. **DEPTH PERCEPTION IN MONOCULAR AND BINOCULAR VISION.** Special Report. Jan. 1953. 12pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1373
To study the effectiveness of various cues in depth perception, 21 subjects viewed white squares (plate, with vertical black stripes, with horizontal black stripes) displayed at 15- and 70-degree angles, either in motion or in various fixed positions. Judgments were made of the degree of apparent slant. The same proportion of errors for all conditions are analyzed and discussed in terms of perspective cues, stereoscopic cues, motion cues and their combined effects on accuracy of depth perception. A tabular summary of potential factors in space perception is included. T.I.R.

1374
Gerathwohl, S.J. **PERCEPTIBILITY OF FLASHING AND STEADY LIGHT SIGNALS. II. HIGH-CONTRASTS.** Proj. 21-24-014, Rep. 2. Feb. 1952. 8pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1374
To study the relative visibility of steady and intermittent light signals at contrast ratios higher than 1.00, a multiple complex reaction experiment was conducted with contrast ratios of 1031.5, 133.4, 19.1, 13.3, and 6.6 for both steady and flashing light signals. Subjects were used in groups of 25, 21, and 22. Total response time, response time for first presentation of each light, and correct responses are analyzed for the two signal lights as affected by the contrast ratio, complexity of the task, and practice. T.I.R.

1375
Gerathwohl, S.J., & Rubinstein, D. **INVESTIGATION OF PERCEPTUAL FACTORS INVOLVED IN THE INTERPRETATION OF PFI-SCOPE PRESENTATIONS. II. A PILOT STUDY ON POOR DISCRIMINATION.** Proj. 21-24-009, Rep. 2. Aug. 1952. 12pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1375
To investigate the relative discriminability of simple planimetric figures, 12 targets (pairs of triangles, circles, ellipses, squares, rectangles, and trapezoids arranged in a circle around a center) were presented on a radar scope at three ranges (ten, twenty, and fifty miles) and a simulated altitude of 26,000 feet. Targets were identified by 24 untrained observers. The number of correct identifications is given as an index of relative discriminability and analyzed for significant differences among shapes, positions, sizes, and observers. T.G.I.R.10.

1376
Soley, P.J. **A SUMMARY OF EXPERIMENTS TO DATE ON THE APPLICATION OF NON-LINEAR SCALES OF THE LOGARITHMIC TYPE TO ALTIMETER DESIGN.** DAME 160 1/0 164, POC D77 94 20 27, March 1954. 14pp. Reference Research Medical Labs., Toronto, Ontario, Canada.

1376
As a result of experiments carried out on the interpretation of non-linear scales of the logarithmic type, a single pointer, single revolution altimeter display was designed. A range from ten feet to 60,000 feet was used. This display was evaluated, in terms of interpretation error with controlled exposure time and with uncontrolled exposure time. T. G. I. R. 2

1377
Burt, G.E. **PSYCHOLOGICAL ADAPTABILITY. STANDARDIZATION OF A PSYCHOLOGICAL TEST AND CONSIDERATION OF TRANSFER EFFECTS.** Proj. 21 0222 0003, Rep. 2, Jan. 1953. 14pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1377
To evaluate the procedure for further study and to obtain preliminary data on transfer effects, an experiment was conducted with 118 basic trainees involving learning the task in succession. Tasks were various combinations of response patterns on the SIX Self-Testing Discrimination Reaction Time Test. The second task involved a reversal or a change of axis in the interpretation of the direction signalled on the display. Amount of information to the task varied. Correct and incorrect responses are interpreted in terms of transfer as a function of directed attention and task similarity. T. G. I. R. 3

1379
Holzman, W.H., & Bitterman, M.E. **PSYCHIATRIC SCREENING OF FLYING PERSONNEL. VI. ANXIETY AND REACTIONS TO STRESS.** Contract AF 33(036) 13807, Proj. 21 37 002, Rep. 6, Dec. 1953. 24pp. USAF School of Aviation Medicine, Randolph Field, Texas.

The survey of the literature was summarized under the following major topics: anxiety reactions in military personnel; psychometric studies, stress tests, physiological correlates of emotional disturbances, and anxiety and learning. The bibliography of 263 references was selected from several thousand reviewed. Published reports indicate that while nearly all flyers experience some anxiety before and during combat, the intensity of this experience varies greatly. Furthermore, under strong emotional tension some individuals are capable of more effective control of behavior than are others who soon become badly incapacitated. These observations point to the importance of 2 fundamental factors in anxiety-proneness: a) lability of susceptibility to emotional arousal, and b) control or ability to function adequately in the face of emotional arousal. Both factors are in all likelihood intimately related to a motivational variable which may be called ego-involvement. An individual who is highly motivated to meet certain standards of performance will be more quickly and strongly aroused by the threat of failure and will, at the same time, try harder to maintain control. Unfortunately, there is at the present time little in the way of well-designed prognostic research directly applicable to the practical problems of psychiatric screening. The diffuse literature surveyed does, however, suggest a number of promising approaches which require considerable development and preliminary field work before their validity in screening situations can be assessed. k.263

1380
Barter, J.T., & Alexander, M. **A SIZING SYSTEM FOR HIGH ALTITUDE GLOVES.** Contract AF 18(600)-30, Proj. 7214, WADC-TR-56-599, Dec. 1956. 21pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio.

1380
This report presents the rationale for and procedures followed in the development of a sizing program for high altitude gloves. A selected sample of 100 hands was measured in 31 dimensions. Both x-ray and caliper measurements were used. Summary statistics, regression equations, design dimensions, and a procurement tariff are presented for twelve sizes (chosen arbitrarily to conform with the number of suit sizes issued). The results of a fit-test of two differing styles of gloves sized according to this program are discussed. Detailed instructions for determining the indicated size of gloves are included. T. I. R. 3

1381

Farley, F.M. INDIVIDUAL DIFFERENCES IN CRITICAL AIRCRAFT ELEMENTS. I. THE REGENERATION OF CRITICAL PROFICIENCY REQUIREMENTS FOR B-29 (BOMB CREW). Contract AF 33(616) 10476, Proj. 21 23 014, Rep. 1, April 1952, 17pp. USAF School of Aviation Medicine, Randolph Field, Tex.

Data on aircraft performance were obtained by analysis of already existing evaluation forms, from study of technical aircraft literature, through individual and group interviews with flying personnel, by analysis of bombardment wing gross error board reports, and through reference to critical incidents obtained in a previous study. These data were integrated and utilized to develop tentative lists of proficiency evaluation items for each of B-29 aircraft positions. Subsequently arrangements were made to obtain, through judgments by qualified experts, information regarding the relative importance of the various items. The evidence indicates that the procedures discussed in this report have provided the basis necessary for the development of fully adequate proficiency evaluation techniques of the type required.

Schmidt, Ingeborg. COMPARATIVE EVALUATION OF THE HARDY-BARD-RITTNER POLYCHROMATIC PLATES FOR TESTING COLOR VISION. Proj. 21-31-013, June 1952, 10pp. USAF School of Aviation Medicine, Randolph Field, Texas.

1383

To evaluate the Hardy-Bard-Rittner polychromatic plates (simple geometric forms used in place of numbers) for screening and classifying personnel with respect to color vision, 319 subjects (mean visual acuity 20/30 or better) were examined with the H-B-R charts, American Optical Company 19-plate Test, SAM Color Threshold Test and the Nagel anomaloscope. A comparative analysis of test results was made in terms of their screening, quantitative and qualitative classification abilities. Recommendations for development and suggestions for changes in the H-B-R test are made.

Gochman, N. A STUDY OF METHODS OF EVALUATING INFORMATION PROCESSING SYSTEMS OF WEAPONS SYSTEMS. Contract DA-36-039 ac-63143, Rep. WE-56-U-M-3, Proj. 1380, July 1956, 38pp. Institute for Cooperative Research, University of Pennsylvania.

1384

This report deals with methods of operational analysis and evaluation of communications (or information-processing) systems. It is concerned with examining how in principle and practice one can proceed from raw data of system performance to both an over-all and analytic evaluation that will explain and pinpoint reasons for the over-all result. Basic general theoretical questions such as nature of the standards to be applied and the major factors involved are discussed. Specific and detailed forms which have been developed for actual practical application in the analytic evaluation of weapons systems are presented and discussed in detail.

Ulett, G.A., Gleser, G., Starr, P., Haddock, J., et al. PSYCHIATRIC SCREENING OF FLYING PERSONNEL: FURTHER STUDIES TOWARD THE DEVELOPMENT OF AN ELECTROENCEPHALOGRAPHIC SCREENING TECHNIQUE. Proj. 21 0202 0007, Rep. 5, Aug. 1953, 25pp. USAF School of Aviation Medicine, Randolph Field, Tex. (School of Medicine, Washington University, St. Louis, Mo.).

This report describes the validation of previously developed scales for the detection of anxiety-prone individuals based upon the basic EEG and the EEG changes and subjective responses induced by intermittent photic stimulation. A sample of 110 Ss was used. The individual's proneness to develop anxiety under stress was rated by means of psychological tests and 2 psychiatric interviews. 2 provisional scales for scoring the basic EEG and the scale for subjective response to intermittent photic stimulation were found valid for the prediction of the criterion of anxiety-proneness in the new sample.

Ulett, G.A., Gleser, G., Lwiner, Ann & Vinokur, U. PSYCHIATRIC SCREENING OF FLYING PERSONNEL. IV. AN EXPERIMENTAL INVESTIGATION OF DEVELOPMENT OF AN EEG INDEX OF ANXIETY-TOLERANCE BY MEANS OF PHOTIC STIMULATION--ITS VALIDATION BY PSYCHOLOGICAL AND PSYCHIATRIC CRITERIA. Contract AF 33(616) 1380, Proj. 21 37 003, Rep. 4, Aug. 1952, 39pp. USAF School of Aviation Medicine, Randolph Field, Tex.

221 Ss were utilized in an attempt to devise an EEG measure for selecting anxiety-prone individuals. These Ss were studied under conditions of intermittent photic stimulation both with and without the added feature of an environmental stress-producing situation. Ss were carefully screened by psychological tests and psychiatric interviews and rated for anxiety-proneness on an 8-point scale. There was a significant correlation between the criteria of anxiety-proneness and the following: a) the amount of subjective dysphoria produced by intermittent photic stimulation; b) the amount of abnormal EEG response in the 20-30 cps range to stimulation with flicker frequencies one-half or one-fourth this rate; c) the displacement of the centroid of driving from the normal range; and d) the percentage of abnormal and low alpha records as detected by the electronic analyzer and by clinical inspection of the electroencephalogram. There was no relationship found between the criteria for anxiety-proneness and the amount of change in response to photic stimulation at 14 cps during the experimental stress situation. A check list of anxiety-indicators derived from the basic and photically driven EEG and including evaluation of induced subjective sensations correlated 0.48 with the validating criterion on anxiety-proneness. For an independent sample the check list was again shown to have predictive value. The ability of photic stimulation to produce a disturbance of consciousness in certain susceptible individuals may indicate another possible value of this procedure as a screening device. It is felt that the results of this investigation are sufficiently promising to warrant further refinement and simplification with the ultimate goal of developing an EEG measure useful for the screening of applicants for military service.

Bowen, H.M. SIGNAL VISIBILITY ON A B-SCAN RADAR DISPLAY: A STUDY OF NOISE BRIGHTNESS AND NOISE PATTERN. FTRC 782, Feb., 1952; 4 pp. FTRC, RAF Radar Research Unit, Psychological Laboratory, Cambridge, England.

1387

To investigate the effect of video noise on signal detection on radar displays, three factors which control brightness and distribution of noise were varied: cathode-ray tube bias (from -34 to -44 volts), video limiter values (from just visible to non-limited display); I.F. Gain (to cover operating range on B-scan radar set). Signal detection thresholds (in decibels) for one trained observer were obtained for each viewing condition and analyzed as function of video noise and screen brightness. Theoretical interpretations are given.

Graham, Mervin E. NATURAL TRACKING ON A HORIZONTAL SCALE AND IN THE FOUR QUADRANTS OF A CIRCULAR SCALE. Brit. J. Psychol., 1952, 43, 70-77. Pp. 783. Flying Personnel Research Committee, Univ. of Durham, Staffs. Dept. of Industrial Health.

1388

To determine the effect of target location on manual tracking, a comparison, is made of a horizontal scale with target at midpoint and a circular scale with target in the upper and lower quadrants. Twenty subjects kept a moving pointer on target by a control knob, directly below the displays. A further comparison was made with targets in all four quadrants of the circular display. Tracking errors and frequencies of touching the control the wrong way are analyzed. The best display-control relation for this particular situation is discussed.

Mockworth, N.E. SOME HUMAN-LEGIBILITY TESTS IN A MOCK-UP CONTROL ROOM. Pp. 785. Mar. 1952. 2pp. Flying Personnel Research Committee, Medical Research Council, Applied Psychology Research Unit, Univ. of Cambridge, England.

1389

To test suggested arrangements for a proposed Control Room, tests were made of the legibility of two raid block displays (three-figure index number and an identification letter) on the plotting table. Readings were made by six tellers from five different parts of the room. Error scores are analyzed as a function of the telling position (viewing distance and viewing angle). Recommendations for placement of tellers in the Control Room are made.

Betts, E.A. DATA ON VISUAL SENSATION AND PERCEPTION TESTS. PART II. VISUAL EFFICIENCY. Meadville, Pa.:Keystone View Co., 1940. 66pp. (Penn. State College, Director of Reading Clinic.)

1391

This report presents data on the reliability and validity of readings taken on the three visual efficiency slides (visual acuity) of the Visual Sensation and Perception Tests of the Betts Ready to Read Inventory for screening or detecting cases of questionable visual acuity. The Snellen Letter Test Chart is used as the criterion. Data are 42,329 readings taken on 13,213 cases from kindergarten age to adult level. Correlations are analyzed and tables of expected distribution for adult and school age populations are given.

1392

Betts, E.A., & Ayers, A.W. DATA ON VISUAL SENSATION AND PERCEPTION TESTS. PART III. STEREOPSIS. Meadville, Pa.:Keystone View Co., 1940. 37pp. (Penn. State College, Reading Clinic.)

1392

To establish the reliability of readings taken on the eye coordination (stereopsis) slides of the Visual Sensation and Perception Tests of the Betts Ready to Read Battery, 14,490 readings were taken on 1,650 cases covering an age range from kindergarten through adult levels, with three distance settings: equivalent of 16 inches, 40 inches, and 20 feet. The data are analyzed for relationships among the three slides of the test, reliability of readings taken by different examiners of varying background of experience, and for effect of distance settings. Tables of expected distributions through the various age populations are presented.

1393

Betts, E.A., & Ayers, A.W. DATA ON VISUAL SENSATION AND PERCEPTION TESTS. PART IV. ANISOTROPIA. Meadville, Pa.:Keystone View Co., 1940. 69pp. (Penn. State College, Reading Clinic.)

1393

To establish reliability of the anisotropy slides of the Visual Sensation and Perception Tests of the Betts Ready to Read Battery for detecting cases needing referral, 19,235 readings were obtained on 10,231 cases. The data are analyzed for consistency of test results and of readings taken by different examiners. The interrelationships of the three slides used are studied. Tables of expected distribution for various age populations are given. There is an extensive discussion of anisotropy and of its mechanical functional explanation.

Hick, W.E. & Bates, J.A.V. THE HUMAN OPERATOR OF CONTROL MECHANISMS. Monogr. 17 204, AFU/79, May 1950. 64pp. Ministry of Supply, Permanent Records of Research & Development, Strand, London, England.

This report considers the physiological and psychological attributes of man in tracking behavior and tasks. The tracking task and the physiological characteristics of the operator are discussed in the introduction along with the types of manual control system and the performance and stability criteria involved. The report is broken down into 4 chapters covering: general features of the human operator in action; performance of the operator in a control system; practical considerations in control design; and learning and the acquisition of skill in tracking. This report appears to be the product of an extensive examination of the man-machine relationship in control mechanisms. (HEIAS)

King, B.G., Vollmer, E.P., Henson, Margaret, Margolis, S.I., et al. MEASUREMENTS OF AIRCREWMEN AND AIRCREW SPACES IN NAVAL AIRCRAFT. Proj. X-651, Rep. 1, Dec. 1945, 12pp. USN Medical Research Institute, Bethesda, Md.; & USN Air Test Center, Patuxent River Air Station, Md.

1395

This study was conducted to determine the adequacy of entranceways and intra-aircraft spaces in relation to heights and weights of aircrewmembers, the clothing worn, and activities performed. Results are presented in terms of time required for entrance and exit and also in terms of "theoretical exclusion" limits for various aircraft.

Birren, J.E. & Fisher, M.B. STANDARDIZATION OF TWO TESTS OF HAND-EYE COORDINATION: A TWO-HAND COMPLEX TAPPING TEST AND A ROTARY PURSUIT TEST. Res. Proj. X 233, Rep. 6, Sept. 1945, 11pp. USN Naval Medical Research Institute, Bethesda, Md.

A 2-hand tapping test was devised which required dissimilar simultaneous movements of the 2 hands and which produced frequent "blocking" or interruption of smooth performance. The split-half reliability coefficient (r) for the first practice session (8 1-min. trials) was 0.98 (N=52), retest coefficients were 0.86 (N=46) between sessions 1 & 2, and 0.91 (N=40) between sessions 11 & 12. Ss appeared to improve regularly with practice and most Ss were approaching their maximum performance by the 14th test session. Improvement from trial session 1 to 14 was about 200% of the initial score, that is, the mean rose from 55 to 165 taps per min. The Koehn Pursuit-Rotor test of hand-eye coordination was standardized. The procedure employed 5 30-sec. trials per practice session, and 30-sec. rests between trials. Session 1 had a split-half reliability of 0.96 (N=81). The correlation between sessions 1 and session 2 was 0.74 (N=81), and between session 17 and 18, 0.87 (N=46). Improvement in performance on the pursuit rotor was rapid, the greater part of the improvement occurring in the first 12 practice sessions. Performance on the 2 tests was not significantly correlated. Both mechanical and test performance criteria indicate that these tests are satisfactory in evaluating motor skills. Their long and rather smooth learning curves suggest their usefulness in assaying the influence of prolonged exposure to physiological stress.

King, S.G., Morrow, Dorothy J. & Vollmer, F.P. COCKPIT STUDIES--THE BOUNDARIES OF THE MAXIMUM AREA FOR THE OPERATION OF MANUAL CONTROLS. Proj. X 651, Rep. 3, July 1947, 13pp. USN Medical Research Institute, National Naval Medical Center, Bethesda, Md.

The boundaries of the maximum working area for operation of manual controls may be represented by a segment of the shell of an ellipse; the shell is about 5 in. thick. The maximum dimension to the periphery of this shell is found at approximately shoulder height at 105° to the right or left; dimension diminishes as the arm is brought to the zero position and as the arm is raised or lowered. Average reaches for 139 Ss varied between 36.8 in. and 13.1 at various points on the elliptical segments; dimensions within 0° and 75° satisfactory for 93% of the sample varied from 11.6 to 11.0 in. when seat back was 13° from vertical. Anthropometric measurements are given for a large number of Ss. The problem of representative samples of the military population is discussed. A simple rapid method for further testing of dimensions, selection of pilots, and studying placement of controls is described.

Blackwell, H.R. PSYCHOPHYSICAL THRESHOLDS EXPERIMENTAL STUDIES OF METHODS OF MEASUREMENT. Contract NSORI 116, T.O.-5, Proj. NR 142 106, Engineering Res. Bull. 36, Jan. 1953, 227pp. Office of Naval Research, Washington, D.C. (University of Michigan, Ann Arbor, Mich.)

4. Trials of experiments are reported which are concerned primarily with establishing optimum experimental conditions to be used in psychophysical measurement of sensory thresholds. In all cases, measurements were made by methods of constant stimuli. Primary criteria were the reliability and inferred validity of the measurements made with various procedures. By inferred validity is meant the extent to which threshold data are influenced by variables which are generally agreed to be irrelevant to purely sensory functions. A secondary criterion was the absolute magnitude of the thresholds obtained, the smallest thresholds being preferred as most sensory-determinant. In the first series, 4 Ss made more than 60,000 observations under constant stimulus conditions. Psychophysical procedures were varied systematically. In the second series, 4 subjects made more than 34,000 observations under 8 stimulus conditions, employing each of 2 psychophysical procedures. In the third and fourth series, 10 groups of Ss employed selected psychophysical procedures. 77 subjects made more than 193,000 observations. It was concluded that optimum psychophysical procedures include the following: a) the use of forced choice rather than phenomenal report to indicate discrimination; b) stimulus variation in time rather than in space to provide the basis for a forced choice; c) stimulus magnitudes to be blocked rather than randomized in forced choice; d) the use of Ss with reasonably extensive experience; and e) provision for immediate knowledge of the correctness of responses to be given the Ss. Other topics considered are: a) systematic differences in threshold data related to data collection procedures; b) the neural quantum theory of sensory discrimination and other theories which predict the form of threshold data; and c) the time order of threshold variability.

Duntley, S.O. (Res. Dir.). THE VISIBILITY OF SUBMERGED OBJECTS. FINAL REPORT. Contracts NSORI 07831, NSGNI 07864 & NOBS 50378, Projs. DIC 6621, DIC 6757 & DIC 6918, Aug. 1952, 74pp. Visibility Lab., Massachusetts Institute of Technology, Cambridge, Mass.

1410

The primary concern of this Handbook is with the physical and visual factors which limit the visual detectability of objects submerged in the ocean. The following major problems have been studied experimentally and solutions are offered in form of mathematical equations, nomographs, and measuring devices: (1) apparent contrast of submerged objects; (2) principles of hydrological optics; (3) inherent contrast of submerged objects; (4) visibility from aircraft; and (5) contrast reduction by the atmosphere.

USAF Operational Test Center. OPERATIONAL SATISFACTION TEST OF APPRENTICE AIRCRAFT PROPELLER REPAIRMAN. DETAILED TEST OF TIAF COURSE NUMBER AM2131. FINAL REPORT. Proj. AGC/CSC/1005-A, June 1946, 47pp. USAF Operational Test Center, Eglin AFB, Fla.

1400

To determine the ability of the apprentice aircraft propeller repairman to perform the duties of his Air Force specialty, four apprentices, who represented a cross-section of a graduating class of the Aircraft Propeller Repairman Course, were tested in a 90-day on-the-job situation. The work performed each day was rated by the immediate supervisor. The nature and extent of any additional instruction needed to complete any job was recorded. These data were analyzed and recommendations for improvement of the training course were made.

Meyer, G.L. EXPERIMENTAL TEST OF A GENERAL MODEL OF DECISION BEHAVIOR. Contract DA 36 039 SC 63143, Proj. WESCOM, DA Proj. 3-99 12 023 & SC Proj. 132C, Serial 46, WE 56 U M 4, Aug. 1956, 16pp. The Institute for Cooperative Research, University of Pennsylvania.

1414
This paper is concerned with an experimental determination of the question "Can the models of decision which incorporate the concept of expectation be used to describe adequately how decisions are made?" A game was devised which involved three square arrays of numbers; the numbers in each row represented the amount of money in cents that could be won or lost by the selection of that row. The result that would apply was determined by a random device manipulated by the experimenter. Thirty-four subjects were given 48 trials each. Analysis consisted in counting the number of behaviors that could be considered as consistent with the model of expectation in question.

Hohn, F.E. & Cronbach, L.J. SOME METHODS OF COMPARING SOCIOMETRIC MATRICES. Contract N6001 07135, Tech. Rep. 5, Jan. 1953, 24pp. Bureau of Research and Service, University of Illinois.

1416
This paper develops two measures, the hierarchy index (h) and coefficient of agreement (a), for comparing sociometric matrices. The hierarchy index is a function of ranks, ranging from the value zero, when members of a group are "equal" with respect to the characteristic in question, to the value one for extreme inequality. Differences between bi-values obtained from two sets of observations may be tested for significance. The coefficient of agreement (ranging from minus to plus one) also compares group structures. The assumptions and definitions of each measure are presented. A discussion of the usefulness of h and a sociometric research is presented.

Low, F.M. PERIPHERAL VISUAL ACUITY: A REVIEW. Contract W5000-243, T.O. III, Proj. NR 141-262, June, 1950, 24 pp. ONR. (Johns Hopkins Univ., School of Medicine, Dept. of Anatomy)

1424
This report reviews pertinent literature on peripheral visual acuity. A brief historical sketch is followed by graphical comparison of quantitative results of different investigations. The many factors known to affect peripheral acuity (angular eccentricity, meridional differences, test object differences, brightness of test object, adaptive processes, refractive conditions, color, viewing time, movement, individual differences, spontaneous fluctuation, practice, psychological and others) are discussed with reference to published data and probable reasons for prior agreement among investigators. Theories explaining decreased acuity in the periphery are evaluated.

Courtney, D., Greer, F.L., Masling, J.M. & Orlans, H. NAVAL, NEIGHBORHOOD, AND NATIONAL LEADERSHIP (THREE REPORTS). ANNUAL TECHNICAL REPORT. Contract N6001 694C1, Series 1953 - Inst. Rep. 1, Feb. 1953, 68pp. Institute for Research in Human Relations, Philadelphia, Penn.

1425
The work in the field of leadership that is being carried on by the Institute for Research in Human Relations emphasizes 1) real life situations, 2) the follower in the leader-follower relations, 3) relationships between personality syndromes in both leader and followers and their social behavior, and 4) group or social memberships of followers and social roles of leaders as they interact in social behavior. Three facets of this work are presented here: 1) a study of leadership in a real military situation at the U.S. Naval Training Center, Bainbridge, Maryland, by Joseph Masling; 2) a study of neighborhood leaders in certain areas of Philadelphia, by F. Loyal Greer; and 3) leadership attitudes and ideology as reflected in national polls, by Harold Orlans.

1428 Davis, H. REPORT OF THE CONFERENCE ON HEARING AND VOICE COMMUNICATION. NATIONAL ACADEMY OF SCIENCES, WASHINGTON, D.C., 28 OCTOBER 1950. 24pp. USN Physiological Psychology Branch, ONR, Washington, D.C.

The Conference on Hearing and Voice Communication of which this report constitutes a summary, was one of a series of technical symposia sponsored during 1950 by the Naval Research Advisory Panel for Psychophysiology. The purpose of the conference was to review the research in this area currently being conducted under cognizance of the Psychophysiology Branch, Office of Naval Research, and the formulation of plans for future research activities. Many of the projects to be reported fall clearly in the biophysical or anatomical and physiological classification. These projects include part of the work at the Psycho-Acoustic Laboratory, Laboratory under Meyer, the biophysical and neurophysiological studies of the Princeton for the deaf, the neurophysiological studies of Kemp, Thurlow, et al. at the Central Institute of Rochester, and those of Tunturi at the University of Oregon. Hearing studies, at the University of Chicago, relating conditions reflexes to particular parts of the nervous system also lie in this area. In the area of psychophysics lie many of the projects of the Psycho-Acoustic Laboratory, the work by Harris at the U.S. Naval Submarine Base, New London, on psychophysical functions, and similar work at the U.S. Naval Electronics Laboratory and several other institutions not directly represented at the conference.

1429 Wendt, G.R. & Berry, M. REPORT OF CONFERENCE ON MOTION SICKNESS. NATIONAL ACADEMY OF SCIENCES, WASHINGTON, D.C. 9 SEPTEMBER 1950. 15pp. USN Physiological Psychology Branch, ONR, Washington, D.C.

1429 The presentations and discussion at a symposium on motion sickness sponsored by the Office of Naval Research in 1950 are summarized. Current research is reviewed, covering the use of drugs, effects of forces on orientation, neurophysiological mechanisms, importance of head movements and practical incidence of motion sickness in military operations. The present status of preventative and therapeutic techniques is discussed together with the areas in which the participants considered further research most necessary. R4.

1430 Voss, H.A. SPECIFICATIONS FOR CONTROLS AND DISPLAYS. May 1946; 4pp. ONR, Special Devices Center, Port Washington, L.I., New York.

1430 This paper is a preliminary draft of specifications for controls and displays. General specifications, panel arrangements, knob and handle design, and displays are included.

1431 Meyer, G.L., & Hoban, C.P. INQUIRY INTO THE DECISION PROCESS. Contract DA-36-039 ac-63143, Rep. WE-56-U-M-5, Proj. 132C, Aug. 1956, 15pp. Institute for Cooperative Research, University of Pennsylvania.

1431 This non-technical report is concerned with the nature of the decision process. The problem of information required for decision and the criteria for decision, given the required information, is discussed. A distinction is made between prescriptive and descriptive models of decision and the concept of expectation is identified as common to available prescriptive models. The results of an experimental test of prescriptive models of decision behavior are described. Finally, some areas of research are indicated which might lead to increased understanding and control of decision-making in communications systems. I. R 7

1432 Sloan, Louise L., & Altmann, Adelaide. EVALUATION OF H.R.R. PLATES FOR MEASURING DEGREE OF RED-GREEN COLOR DEFICIENCY. Tech. Rep.--Proj. N6onr 243-07, 3 pp. ONR. (Wilmer Ophthalmological Inst.)

1432 To evaluate the Harri-Rand-Rittler (HRR) Plates for measuring degree of red-green color deficiency, 65 subjects, with such deficiencies, were tested by (1) HRR plates, (2) Color Threshold Test, (3) Nagel Anomaloscope, (4) a filter anomaloscope, and (5) the Navy Lantern Test (given to a selected few); 17 subjects were tested twice on the HRR plates to check on test reliability. The data are analyzed as to relative difficulty of each HRR plate for testing red-green deficiency, the accuracy of the test for classifying degree of deficiency, and for relationships among all tests. Comments are made on the usefulness of the HRR plates. T,G,R5.

1433 Sloan, Louise L., & Rowland, W.M. COMPARISON OF ORTHO-RATER AND SIGHT-SCREENER TESTS OF HETEROPHORIA WITH STANDARD CLINICAL TESTS. Amer. J. Ophthal., Oct., 1951, 34, 1363-1375. Contract N6onr 243-7, Proj. NR141-526, ONR (Johns Hopkins Univ., Wilmer Ophthalmological Inst.)

1433 To determine the degree of agreement between measures of heterophoria by machine tests (Ortho-Rater, Sight-Screener) and clinical tests (Maddox rod and scale, Maddox rod and phorometer, Grid and polaroid tests), subjects were given the five tests (half took the Ortho-Rater first, half the Sight-Screener, with clinical tests following). Some modifications were made in the machine tests. All scores were converted to prism diopters; correlations among the test scores are given. Further analysis is made on the basis of selected pass-fail criteria. The usefulness of the machine tests for screening purposes is discussed. T,G,R7.

1434 Stauffer, A.J. & Thordike, R.L. RESEARCH AND DEVELOPMENT OF NEW ELECTRONIC TECHNICIAN SELECTION TESTS. FINAL REPORT. Contract N6onr 326(00), Aug. 1952; 27pp. USN Classification Survey Research Branch, Bureau of Naval Personnel, Washington, D.C. (Teachers College, Columbia University; New York, N.Y.).

1434 This is a final report of research and development of new Electronic Technician Selection Tests (ETST). The first phase consisted of the preparation of two new forms of the test, built to the same content specifications as the current form but somewhat easier. Approved techniques of item preparation, editing, and analysis were used, and norms developed for the resulting tests. Some data were obtained on the validity of the ETST for the first ten weeks of the electronics course. In the second phase, two electronic technician schools were visited, examinations analyzed, and evaluation procedures discussed with school officials. Operational and research recommendations are included. T. R 3

Canfield, A.A., Conrey, A.L., Wilson, R.C. & Zimmerman, W.S. THE EFFECT OF INCREASED POSITIVE RADIAL ACCELERATION UPON DISCRIMINATION REACTION TIME. *J. exp. Psychol.*, Dec. 1950, 40(6), 733-737. (University of Southern California, Los Angeles, Calif.).

1436
This experiment was designed to evaluate the effects of acceleration (g) forces, such as act on the pilot of an aircraft during high speed turns, on the speed of discriminatory responses. Twenty-three college students performed a reaction time test requiring them to throw a toggle switch in the direction in which a signal light appeared, while subjected to 1, 3, and 5 g's in a human centrifuge. The effects of the g forces and of test practice on the reaction time are analyzed separately and with respect to their interaction.

Kryter, K.D. THE EFFECTS OF NOISE ON MAN. *J. of Speech and Hearing Disorders*, 1950, Monograph Suppl. 1, 95pp. Contract N6onr-272, ONR. (Central Inst. for the Deaf, St. Louis, Mo.).

A review, summary, synthesis, evaluation, and interpretation of the experimental literature on noise as an aspect of man's environment is presented. The first section is concerned with effects upon behavior, particularly in regard to work output and efficiency. The record part brings together material on auditory damage as the result of noise, and defenses against such damage. The third part considers noise as a disruptive factor in speech communication. An attempt was made to dig as deeply as necessary into basic psychological and physiological experiments to support and elucidate the results of the 'applied' and technical research. Each part of the report is followed by its own bibliography, and, in addition, there is attached a bibliography concerned with 'Measurement and Reduction of Noise'.

USAF Operational Test Center. OPERATIONAL SUITABILITY TEST OF THE B-52B FLIGHT SIMULATOR, TYPE S-9. FINAL REPORT. Proj. AFG/SAS/165 A 2, June 1956, 36pp. USAF Operational Test Center, Eglin AFB, Fla.

1444
An operational suitability test of the type S-9 B-52B Flight Simulator (a device to provide realistic transition, instrument, and emergency training for B-52 pilots) was conducted. The following specific areas were investigated: 1) installation and initial checkout including configuration for problem-free installation, facility requirements, and man-hour requirements; 2) sustained daily operation including training requirements, man-hour requirements, logistics, and maintenance requirements; and 3) suitability as a training device, including physical and performance similarity and ability to produce an acceptable training environment. The evaluation was based on an eight-month use period.

1445
USAF Operational Test Center. EMPLOYMENT AND SUITABILITY TEST OF APPRENTICE AIRCRAFT MECHANIC (JET, OVER TWO ENGINES) GRADUATES OF ITAF COURSE NUMBER AB43131E-1. FINAL REPORT. Proj. AFG/CSC/1030-A, Aug. 1956, 23pp. USAF Operational Test Center, Eglin AFB, Fla.

1445
To determine the ability of the apprentice aircraft mechanic to perform the duties of his Air Force specialty, eight apprentices, representing a cross-section of a graduating class of the 14-week Mechanic Course were tested in a 90-day, on-the-job situation. They worked in the flight line organizational maintenance section and were rated each day by supervisory personnel. Additional instruction required to accomplish the work was recorded. Analysis of the data was made and recommendations offered for improvement of training.

1447
Hudson, B.B., & Searle, L.V. THE EFFECTS OF SOUND ON ACCURACY OF AZIMUTH TRACKING. Contract OEM sr 581, Rep. 1, Sept. 1942, 19pp. National Defense Research Committee, (Tufts College Laboratory, Medford, Mass.)

This experiment was undertaken to determine the effect of sounds of high amplitude upon accuracy of performance in azimuth tracking on a Naval trainer. These sounds were introduced at intervals during tests of 4 hours duration. It was concluded that: a) decrement in performance over a period of 4 hours of continuous tracking is rapid; b) sound, introduced at intensities of either 120 or 130 db. produces marked improvement in performance for the duration of the sound. Return to the presound level of performance is rapid; c) marked individual differences exist in ability or willingness to maintain a high level of good performance of 4 hour tests. Marked differences are also apparent for a given S from trial to trial; the performance level variations are not primarily a function of the S's ability; d) learning is rapid. There is only a slight improvement from Test I to Test III; e) average stereo performance was better after the 4 hour test than before the test on all trials. The interpretation may be made that performance decrement was due to arm and hand fatigue, and to boredom or lack of motivation.

1448
Hudson, B.B., & Searle, L.V. CONTINUOUS 13 1/2 HOURS TRACKING FATIGUE TEST. Contract OEM sr 581, Rep. 2, Sept. 1942, 5pp. National Defense Research Committee, (Tufts University, Medford, Mass.)

The nature of tracking performance decrement during continuous work over a long period of time (13 1/2 hrs.) was examined. The task was to continuously track in azimuth an airplane target as it moved in an irregular pattern across the field. In the preliminary 4 hr. test, the observer, not informed about the duration of the experiment, was instructed to keep the reticle as close as possible to the centre of the target. In test number II, a schedule for the introduction of motivation was drawn up and applied during the test. The accuracy of tracking was recorded continuously. It was found that: a) marked performance decrement in azimuth tracking is produced by local muscular fatigue; b) this decrement may be reduced by adequate motivation, but not to initial performance levels; and c) the effect of motivation is short-lived under these conditions of local muscular fatigue.

1449
Hudson, B.B., & Searle, L.V. THREE DAY TEST OF FATIGUE EFFECTS UNDER CONDITIONS OF LONG HOURS ON DUTY, LIMITED SLEEP. Contract OEM sr 581, Rep. 3, Oct. 1942, 11pp. NDRC, (Tufts College Laboratory, Medford, Mass.)

An experiment lasting 74 hours was conducted on a group of 4 observers. Of this time 42 hours were spent on duty, 8 hours eating, 16 hours sleeping, 8 hours at liberty. Hours on duty, times for sleeping and eating, were irregularly scheduled. During the period on duty, Ss were on the alert and were required to spot and report signal lights appearing in the area allotted to them for observation. At intervals Ss reported for duty on a stereoscopic training instrument. Measurements were made of tracking and stereo performance. During the 3 day period, no decrement in this performance was found. During the night periods on the alert, Ss maintained a high standard of performance in spotting and recording signals. During the day periods on the alert, S differences appeared which were relatively constant throughout the test. These differences may be due to variation among Ss in sensitivity to slight changes in contrast (all Ss had at least 20/20 visual acuity). It is evident that in order to produce performance decrement on short stereo or tracking tests due to general physiological fatigue, a schedule similar to the one reported here would have to be maintained over a longer period of time. Ss can muster, for a brief test, sufficient energy to maintain a standard of performance. A by-product of this protracted test was the temporary development of friction between members of the groups of Ss.

1450
Beebe-Center, J.G. MOTIVATION IN THE PERFORMANCE OF ROUTINE MILITARY TASKS. Contract OEM sr 581, Rep. 5, Dec. 1942, 18pp. NDRC, (Tufts College Laboratory, Medford, Mass.)

The effect of motivation on routine tasks is reviewed and 3 principles concerning the role of motivation are given: a) potential output of the organism at any given moment is largely distinct from actual output at that moment; b) potential output of the organism is remarkably constant especially for tasks not involving great physical effort; c) actual output is remarkably variable in contrast with the relative constancy of potential output. These 3 principles lead to an important consequence; namely output can, to a large extent, be controlled by psychological means -- by means of situations, attitudes, training. The 12 principal means of control are presented in the form of rules for the maximization of performance in routine tasks.

Radwin, R.B., & Scerbo, L.V. THE EFFECT OF
SOUND-FIELD DIMENSION ON STEREO-RANGING.
Contract OCMR-572, Rep. 7, Feb. 1943, Typ.
ROM, (Tufts College Laboratory, Medford,
Mass.)

1451
To determine the effect of strenuous physical activity upon stereo ranging accuracy, nine trained subjects were given two preliminary tests of stereo ranging on the Mark II Navy Trainer. Following a period of rapid cardiovascular work with a heavy load, the stereo test was given again. Statistical analysis of the scores in terms of consistency and precision of performance before and after exercise is made. The practical implications for stereo ranging during field conditions are discussed.

Egan, J.P., & Clarke, P.M. SOURCE AND
RECEIVER BEHAVIOR IN THE USE OF A CRITERION.
J. Acoust. Soc. Amer., Nov. 1956, 28, 1257-
1260. (Indiana University).

1452
In an articulation test the listener is sure of some responses and dubious of others. In order to extract some information about this behavior six listeners heard, at a signal-to-noise ratio of -12 db, a list of 200 spondee words from a set of 50 previously memorized. In one experiment the listeners wrote down their responses and then judged them correct or incorrect. In another experiment they marked a given set of spondee words, half of which were actually correct. The listeners were asked to adopt different criteria of certainty in repetitions of the experiment. The results are analyzed in terms of a pair of derived parameters describing the probability of a correct transmission and confirmation--the source operating characteristic and the receiver operating characteristic. C.M.

Hoffman, A.C. & Reed, L.C. THE PERFORMANCE OF TRAINED
SUBJECTS ON A COMPLEX TASK OF FOUR HOURS DURATION.
Contract OCMR 581, Prof. Memo. 1, OSD Rep. 1701,
July 1943, 11pp. Tufts University, Medford, Mass.

1453
To test the hypothesis that individuals would show signs of fatigue (decrement in efficiency of performance) when continuously engaged for relatively long periods of time in a task of psychological complexity, five subjects worked four hours at a complex task that required the continuous matching of dials as well as periodic adjustment of peripheral apparatus. Performance scores were analyzed as a function of time.

1454
Tufts University. THE EFFECT OF DIOPTRIC SETTINGS ON
STEREO PERFORMANCE. Contract OCMR 581, Rep. 8, 19pp.
Department of Psychology, Tufts University, Medford,
Mass.

1454
To explore the effect of diopter settings (assumed to be related to visual acuity) of the eye-pieces to stereo ranging in the Mark II Navy Trainer, 19 men were measured for accuracy of stereo settings on a stationary target under two conditions of diopter settings: zero (no adjustment), and variable (adjustment by each subject). Mean scores and sigma scores are analyzed and interpreted with relation to the use of diopter settings as a means for predicting stereo ranging performance.

1455
Tufts University. EFFECT OF A TWENTY-MILE WALK ON
STEREO-RANGING, TRACKING, AND OTHER TASKS. Contract
OCMR 581, Rep. 6, Feb. 1943, 11pp. Department of
Psychology, Tufts University, Medford, Mass.

1455
To measure the effect of prolonged physical exercise and accompanying loss of sleep upon performance, 13 subjects were tested before, after, and twice during a 30-mile hike. The functions measured were stereoscopic acuity, tracking accuracy, brightness discrimination, reaction time, and persistence. Special memory instructions were used to keep effort at a high level. The overall scores are analyzed and discussed in terms of fatigue effects upon stereo-ranging and tracking in particular. Individual differences and motivation effects are noted.
C.

1456
Tufts University. REPORT ON MOTIVATION IN RELATION TO FATIGUE. Contract OCMR 581, Rep. 9,
April 1943, 19pp. Department of Psychology, Tufts University, Medford, Mass.

The purpose of the present report is to point out various instances in which motivational factors served to influence the results in studies of efficiency during relatively long periods of work. The primary task studied included stereoscopic range findings, aiming in tracking and protracted alertness. Specifically, the following situations where motivational influences were found are considered: a) effect of knowledge results; b) effect of intermittent sittings vs. continuous ones; c) effect of long-continued performance of sleep; d) effect of long-continued alertness; e) effect of fatigue; f) effect of deprivation of sleep; g) effect of prolonged strenuous exercise; h) effect of short period exercise.

1458
Hoffman, A.C. THE RELATIONSHIP BETWEEN
EYEPICCE DIOPTRIC SETTINGS AND STEREO
RANGE SETTINGS. Contract No. OCMR-581,
Rep. No. 10, OSD Rep. No. 1729, Aug.,
1943, 11 pp. OSD, National Defense Res.,
Committee, Washington, D.C. (Tufts College,
Medford, Mass.)

1458
To determine the relationship of diopter settings of the eye-pieces to subsequent scores of stereo ranging on a stationary target in the Mark II Navy Trainer, 19 men in a preliminary, and 12 men in a major experiment were measured for accuracy of stereo settings under conditions of (1) zero diopter setting (no adjustment), and (2) variable diopter setting (each subject adjusted his own eye-piece). Mean scores and sigma scores are evaluated by analysis of variance technique; relevant correlations are given. The use of diopter settings as a means for predicting stereo ranging performance is discussed.

1465
 Ward, L.C. RESEARCH ON FACTORS IN SERVICE JARS. SUMMARY
 REPORT OF RESEARCH AND DEVELOPMENT WORK FROM AUGUST 1,
 1942 TO JULY 1, 1943. Contract ODSR 543, OSD Rep.
 1392, June 1943, 15pp. Psychology Department, Tufts
 University, Medford, Mass.

1469
 This report presents a summary of the research on
 fatigue in service jobs conducted by the Tufts College
 Project during the period August 1942 to July 1943.
 The experiments primarily evaluate the effect of such
 factors as the following upon the performance of visual
 tasks such as tracking, depth perception, etc.: moti-
 vation, sleep deprivation, fatigue, and so forth. In-
 cluded are details of the equipment used in the experi-
 ments (e.g. Tufts Director Tracking Trainer, Mark II
 Ray Stereoscopic Trainer, etc.)

1471
 Dudley, H.W. FUNDAMENTALS OF SPEECH SYNTHESIS. J. Audio, Engng. Soc., Oct. 1955, 3, 170-
 185. (Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.) (Monogr. 2646; Bell
 Telephone System).
 From the communications engineer's point of view, there are 2 fundamental principles of
 human speech synthesis. The first is that speech is a message, which, in its initial
 expression from the body, is represented by a group of muscular vibrations - a multiplicity
 of telegraph signals functionally similar to the muscular vibrations of the finger in holding
 the simplest type of telegraph on-off signals. The second principle is that these multiple
 telegraph signals are made audible to the ear by modulating a set of carrier-frequency
 components in the audible part of the spectrum. Such components range from an inflected,
 buzz-like tone for voiced sounds to a hiss-like noise for unvoiced sounds, including whispers.
 The Vocoder was an early development of apparatus exploiting both of these basic character-
 istics of speech - the telegraph nature in the analyzer and the carrier nature in the
 synthesizer. If advantage is taken of the telegraph nature of speech, a large reduction
 can be effected in the frequency band required for transmission. Where long expensive
 lines are concerned, economic benefit to the telephone user may accrue from such a reduction
 in bandwidth. The ultimate in this telegraphizing speech for transmission would be obtained
 in a system able to recognize phonetic elements and then transmit them by narrow-band tele-
 graph methods. Rudimentary experiments along these lines have been performed, using "Vudrey",
 the automatic digit recognizer, to recognize the individual phonetic units at the sending
 end, and using a Vocoder at the receiving end for the purpose of synthesizing somewhat
 standardized speech from the telegraph-like currents transmitted from the sending end.
 On a basic speech analyzer-synthesizer devices experimented with at the Bell Telephone
 Laboratories over the years are briefly reviewed; these devices include the Voder, the sound
 spectrograph, the visible-speech translator and synthesizer, the electrical vocal tract, and
 the improved Vocoder. R. 18

Vaccaro, J., Jr. & Hudson, E.M. REPORT ON FABRICATION OF INTEGRAL LIGHTING BEZELS. Proj. TED ADC AE 7051 1, Rep. NADC AL 5644, Aug. 1956, 22pp. USN Aeronautical Instruments Lab., Naval Base Station, Penn.

1483

To improve on instruments prepared under a previous project, and to provide two sets of integrally lighted instruments suitable for flight testing, six instruments comprising the flight-instrument group for the TV-2 and F3H-2M airplanes were equipped with a composite wedge and light guide and light values measured across the face of the instrument. These values were compared with requirements as set forth in Bureau of Aeronautics Specification XAE508; these comparisons are stated in the results. Figures are given illustrating lighting with wedge and with standard Bezel. Certain specific recommendations are made for further experimentation and development.

Mirsh, Shirley K. A BIBLIOGRAPHY IN AUDITION. VOL. I, A-M, VOL. II, N-Z. Contract NSORI 76, Proj. NRI42 201, Rep. PNR 88, 1950, 408pp. Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.

This is a 2 volume unannotated bibliography of about 5000 references on audition. The aim was completeness for the period 1938-1948, and reasonably complete coverage for the pre-1938 literature. A supplement tries mainly to improve the coverage for 1948, but references to important (or readily available) entries published during 1949 are included. The articles are listed alphabetically by the author's surname. Co-authors are cross-referenced. A subject index is given in which the articles are classified by the name of the senior author.

USAF Operational Test Center. OPERATIONAL SUITABILITY TEST OF APPRENTICE INSTRUMENT REPAIRMAN GRADUATES OF TIAF COURSE NUMBER AB42230. FINAL REPORT. Proj. APG/CSC/884 A, Jan. 1956, 44pp. USAF Operational Test Center, Eglin AFB, Fla.

1511
To determine the ability of the apprentice instrument repairman graduate of Technical Training Air Force Course Number AB42230 to perform the duties of his Air Force specialty, four representative graduates were studied in a 90-day on-the-job situation. Daily ratings were made by supervisors (immediately responsible for the performance of the job) on performance, time to complete the job, and initiative or effort. The results were analyzed in terms of the capabilities and limitations as observed compared to job description and job training standards. Changes in both these areas are recommended.

1517
USAF Operational Test Center. OPERATIONAL SUITABILITY TEST OF APPRENTICE AIRFRAME REPAIRMAN GRADUATES OF TIAF COURSE NUMBER AB53430. FINAL REPORT. Proj. APG/CSC/895 A, Feb. 1956, 19pp. USAF Operational Test Center, Eglin AFB, Fla.

1517
To determine the ability of apprentice airframe repairman graduates of Technical Training Air Force Course Number AB53430 to perform the duties of their Air Force specialty, six representative graduates were studied during a 90-day on-the-job situation. Rating procedures included assignment to regular work of section without explanation or demonstration, close observation of job performance, and daily ratings on jobs performed. Ratings were made by supervisors immediately responsible for proper performance of the job. The capabilities and limitations of the apprentice were summarized and a critique given in terms of job description, job training standard and the training program. Recommendations are included.

1518
USAF Operational Test Center. EMPLOYMENT AND SUITABILITY TEST OF APPRENTICE ORGANIZATIONAL SUPPLY SPECIALIST GRADUATES OF TIAF COURSE NUMBER AB64131. FINAL REPORT. Proj. APG/CSC/1113 A, July 1956, 13pp. USAF Operational Test Center, Eglin AFB, Fla.

1518
To determine the ability of apprentice organizational supply specialist graduates of Technical Training Air Force Course Number AB64131 to perform the duties of their Air Force specialty, ten representative graduates were studied during a 90-day on-the-job situation. Assignments were made to regular work of the section without explanation or demonstration of specific tasks until capability to perform was established. Supervisors observed and made daily ratings of job performance. The results were analyzed in terms of the capabilities and limitations of the apprentices as compared to the job training standard, and a critique of the training was given. Recommendations are included.

Reed, J.D. SPEED AND ACCURACY OF TARGET DESIGNATION WITH SMALL JOYSTICK CONTROLS. Contract AF 30(602)-373, Final Rep., 22pp. Human Factors Office, RADC, Griffiss AFB, Rome, N.Y.

1523

To investigate the speed and accuracy of target designation with very small joystick controls, a series of experiments were performed by ten highly trained subjects. Measurements were taken of the time required to position a tiny beam of light over simulated targets of 1/8, 1/4, and 1/2 inch diameter under various ratios of hand-to-pointer movement: one to five, 11, 23 and 33. The indicator beam was controlled by a joystick lever of pencil size (two cases). In some experiments force was provided for hand or arm; in others, a locking device provided frictional forces (two to four cases). Mean designation time and number of errors were related to accuracy for the various movement ratios and equipment variables. Implications for equipment design are discussed. T. G. I. R 7.

1523

Reed, B.N., Gaier, E.L., & Paresse, P.J. METACOSMETRY: THE STUDY OF CHANGING BEHAVIOR IN GROUPS. Contract N7 ONR 35609, Tech. Rep. 6, Feb. 1956, 47pp. ONR, Navy Dept., Washington, D.C.

1523

This report describes a method of "metacosmetry" -- the study of changing behavior in groups. Each member of a group makes a set of items in private and then participates in group discussion to arrive at a joint ranking. Each member of the group then ranks the items again in private. Three specific techniques are described for gathering such data: paper and pencil, mark-sense cards, and direct input to an analog computer. The results are analyzed by obtaining rank order correlations among the rankings made by individuals, and between the rankings of the group and each individual. T. G. I. R 22

Macworth, F.E. SOME RECENT STUDIES OF HUMAN STRESS FROM A MARINE AND NAVAL VIEW-POINT. Inst. of Marine Engineering Transactions, 1948, Vol. 64, No. 6. Medical Research Council, Appl. Psychology Research Unit, The Psychological Laboratory, Downing Place, Cambridge, England.

1529

This paper reviews some laboratory research on the working ability of human subjects as affected by (1) general surroundings--temperature extremes and noise, (2) various local arrangements of the working task--visual display (cycloster compared with dial on jig and bore) and manual controls (loading on joystick in tracking task), and (3) stress of time and/or load of information on decision taking. Gaps in our knowledge in each of these areas is pointed out. T.G.I.R.23.

1530

Hick, W.E. REACTION TIME FOR THE AMENDMENT OF A RESPONSE. A.P.U. 93/49, Jan. 1949, 5pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1530

This is a repetition of an earlier experiment on kinesthetic reaction time in slightly modified form to test the findings which seemed to be an exception to usual findings on refractory phase. Three subjects were required to move a recording pen as quickly as possible to a marked position on receipt of an auditory stimulus. Three different methods of operating the control were used. The load, ordinarily light, was occasionally unexpectedly heavy. Results under the various conditions are compared, and discussed in terms of other data concerning refractory phase. T. I. R 6

1531

Nixon, S.R. SOME EXPERIMENTS ON IMMEDIATE MEMORY. I. FOR SPATIAL POSITIONS. II. FOR SERIAL MATERIAL. APU 39, April 1946, 31pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1531

To explore some factors affecting immediate memory for position, a series of experiments were performed: (1) recall of spatial positions in various arrangements of black dots within a circle (from one to five) after intervals of from three to ten minutes; recall in reverse order of playing cards which had been dealt out singly, or recognition of repetitions of sets of numbers. The results are analyzed in terms of the effects of spatial position and serial order position on recall. T.G.I.R.3.

1533

Carpenter, A. SOME EFFECTS OF LIFE IN SINGAPORE. A.P.U. 103/49, June, 1949, 14pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

1533

To determine areas in which experimental studies of the cumulative effects of residence in the tropics might profitably be undertaken, sixty civilian and military residents of Singapore completed a questionnaire covering commonly asserted deleterious effects of the climate. The answers and comments are analyzed and discussed with respect to climatological, sociological and economic factors, and their effects on physical and mental health. T.

Kays, H. S. Poulton, E.C. ANTICIPATION IN MEMORIZING. *British Journal of Psychology*, March-May 1962, 21:112(2), 34-41. (Psychological Lab., University of Cambridge, Cambridge, England). (APJ 1962/49).

1536

To study the effect of anticipation of how and when material must be recalled on the accuracy of recall, 32 X-ray fittings were tested. Subjects were required to learn series of compass directions from a projected display. Recall was tested by having the Ss move controls through the memorized series of directions. Learning-recall sequence and Ss' knowledge of the forthcoming recall sequence were varied. Results (percent recalled correctly) are discussed regarding effects of anticipation, the nature of the retention process, and factors underlying the loss of primary and fidelity in learning.

Poulton, E.C. PERCEPTUAL ANTICIPATION IN TRACKING. A.P.U. 119/50, Aug. 1950, 21pp. Psychological Lab., MRC, Cambridge, England.

1537

To investigate the part played by perceptual anticipation in tracking under different conditions, two experimental arrangements were used. In one the subject had to trace regular or irregular courses under conditions of restricted vision, with or without a preview. In the other, the subject either had to keep a pointer in line with a second pointer moving in a harmonic course by using a positional control (following or pursuit tracking) or had to keep a single pointer moving in this way stationary on a fixed line (compensatory tracking). A detailed analysis of errors in performance under the various experimental conditions was made and related to the perceptual anticipation component.

Poulton, E.C. PERCEPTUAL ANTICIPATION AND REACTION TIME. A.P.U. 199/50, May 1950, 14pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

To determine the effect of perceptual anticipation upon reaction time (RT), 2 experiments were done. In the first, a skilled response (S) had occasionally to be altered at a given point after a variable warning period. In the second, S had to react to 2 auditory signals separated by a short time interval which was systematically varied, the second signal being expected or unexpected. It was found that lack of readiness to respond to a signal, as revealed by a lengthened RT, may be due to S not having prepared himself, as he was not expecting the signal; or to S not being able to prepare himself in time. Preparation for reacting to the second of 2 signals, when both are expected and have to be reacted to, never appears to take more than between 0.2 and 0.4 sec. as judged by Ss. On the majority of occasions it appears to be complete in 0.2 sec. These times are shorter than those usually given, because the extra delay due to incorrect anticipation has been excluded. With intervals of 0.1 sec. or less, delay in the second reaction may be due to the mechanical difficulty of responding quickly enough, especially when the 2 reactions have to be made in opposite directions. These results suggest that so-called psychological refractoriness is due to lack of foreperiod in which to prepare for the R, rather than to "psychological refractory phase" comparable to the refractory phase of nerves. These results also lead to the conclusion that a skilled performance is not merely a series of discrete Rs. It is a single whole, in that performance throughout is dominated by S's anticipatory mental set or aim.

Mitchell, M.J.H. DIRECTION OF MOVEMENT OF MACHINE CONTROLS. V. A TWO-HANDED PERFORMANCE IN A CONTINUOUS TASK. A.P.U. 110/49, May 1949, 23pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

This investigation was designed to examine the problem of 2-handed continuous tasks. In the 2 experiments conducted, the effect on the right-hand performance of introducing a similar task for the left hand was observed under 6 different control-display conditions. The control-display relationship for the left-hand task remained the same, while that for the right-hand task varied to include each of the 6 control display relationships. Each pair of Ss carried out the task with the condition for the right hand task, in a different order, with each condition appearing in a different position in that order and occupying each possible place in that order. Exp. 2 repeated the above procedure but with a different fixed control-display for the left-hand task. The results indicated that when a continuous task is performed with both hands simultaneously, the relation between the direction of movement of the control and the display does on some instances significantly affect the accuracy with which the right hand performs the task. Whereas, in a continuous task performed by the right hand alone, accuracy is unaffected by changes in the direction of movement relationships. The most consistently accurate condition is the natural or "expected" one, i.e., where an upward movement of the control produces an upward movement in the display and vice versa.

Conrad, R. THE EFFECTS OF VERY FAST SPEEDS ON MULTIPLE DIAL WATCHING. APU Rep. 115, Oct. 1949, 12pp. Psychology Lab., Applied Psychology Research Unit, MRC, Cambridge, England.

An experiment was carried out to examine the effect on performance of speed increases on a very fast skilled task. The task required S to respond to a continuously changing display consisting of 4 independent elements. Increasing the speed of the task had no effect on the number of correct responses (R), Ss apparently being fully extended at the slowest speed. An average time of 1.5 sec. was required to make Rs. The total R-rate, however, continued to rise with speed increases, though it lagged behind that necessary for perfect adaptation. At the fastest speed, an average time of 0.72 sec. was taken to make Rs of any kind. The majority of errors fell into 2 classes. Errors of timing (an R at the wrong time) were common, but became less important as the speed increased. Errors of omission (failure to respond to a signal) increased steeply out of all proportion to the number of signals presented. Though the fastest speed was less than twice the slowest, the errors of omission increased fivefold. Evidence for the hypothesis that speed stress would affect the distribution of Rs among the 4 elements of the display was inconclusive. The distribution of correct Rs was unchanged, but errors both of timing and omission increased least on the part of the display that presented most signals. A number of observations were made on the way Ss organized both the perceptual and R side of the task.

Vince, M.A. SOME EXCEPTIONS TO THE PSYCHOLOGICAL REFRACTORY PERIOD IN UNSKILLED MANUAL RESPONSES. APU 124/50, Feb. 1950, 14pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

The present paper presents 3 experiments concerned with the psychological refractory period. The main findings were: a) if the interval between 2 responses (R) requiring discrete Rs is 0.5 sec. or less the RT to the second stimulus is likely to be lengthened; b) where the inter-stimulus interval is less than 0.5 sec., second Rs with a slightly lengthened RT do occur in a minority of cases; c) in some Rs at intervals of 0.2 and 0.3 sec. this implies a complete overlap between the execution of the first R and the formulation of the second R; d) a few Rs also occur where the course of the first R appears to be shortened by the second R beginning in the opposite direction; e) the RT for such first Rs tends to be shorter than that of normal completed Rs; f) when a second stimulus occurs after an inter-stimulus interval of 0.5 or 0.1 sec., it can be made to inhibit the first response in about 1/3 of the cases; g) the RT for such an R is slightly longer than for simple Rs; h) the RT for a double R is only slightly longer than for a single one, the difference being statistically significant only when the double R consists of 2 dissimilar movements. The conclusion drawn from these results is that the psychological refractory phase is not absolute.

Poulton, E.C. SPEED ANTICIPATION AND COURSE ANTICIPATION IN TRACKING. A.P.U. 123/50, Sept. 1950, 12pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

In order to study separately the two kinds of perceptual anticipation in tracking, speed anticipation and course anticipation, two different experimental arrangements were used. In one the subject had to predict the position of a pointer moving in harmonic motion, at a given time ahead. In the other the subject had to keep a pointer in line with a second pointer moving in harmonic motion, when he only received intermittent glimpses of the display. It was found that it was not the length of time ahead, but what happened during that time, which determined the accuracy of perceptual anticipation at different distances in the future. The importance of speed anticipation in "blackout" tracking was demonstrated experimentally by reducing the length of the glimpses of the display, so that the subject could see only the successive positions of the "stimulus" pointer at fixed intervals of time, not its speed in these positions. His performance deteriorated accordingly.

Vince, M.A. LEARNING AND RETENTION OF AN "UNEXPECTED" CONTROL-DISPLAY RELATIONSHIP UNDER STRESS CONDITIONS. APU 125/50, Aug. 1950, 17pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1542
This experiment compares the relative rates of learning for expected and reversed directions of control movement, and also the relative ability to retain the habits under stress conditions. Two matched groups of ten subjects consisting of pilots, seamen, and mechanics performed a simple control-display task with the control movement reversed for one group. After training sessions of 70 stimuli presentations, ten test series were given. The task was repeated with introduction of distractions. The results compare the expected and reversed control groups in terms of: learning curves, correlation of errors and intelligence scores, response time, and effect of distractions.

Gibbs, C.B. TRANSFER OF TRAINING AND SKILL ASSUMPTIONS IN TRACKING TASKS. APU 127/50, Sept. 1950, 18pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1543
Two series of experiments on transfer of training in tracking tasks are reported. One task involved turning a handwheel at a constant rate to keep a pointer steady on a fixed mark. Seventy Naval ratings participated in five experiments, transferring from one to another combination of handwheel diameter, pointer size, handwheel direction, and display-control movement relationships. The second task was pursuit tracking with a handwheel on two tracks of different difficulty, the order of transfer being counterbalanced among Ss (10 business women and 10 Naval ratings). Results are discussed regarding their implications for transfer as a function of task difficulty.

Broadbent, D.E. THE TWENTY DIALS TEST UNDER QUIET CONDITIONS. APU 130/50, Aug. 1950, 22pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1544
To determine whether a task involving vigilance gives a reliable measure of performance, a test was devised consisting of twenty dials, each provided with marked danger point above which the pointer should not be allowed to rise. Forty Ss watched the dials, arranged in rows on three sides of the room, for two 1-1/2 hour periods and made adjustments when necessary. Time between responses and signals and number of signals observed moving are analyzed in terms of the consistency of the task in measuring differences between individuals. Practice effects and dial position as it affects speed of detection are noted.

1547 Mitchell, M.J.H., & Vince, M.A. THE DIRECTION OF MOVEMENT OF MACHINE CONTROLS. A.P.U. 137/50, Feb. 1951, 13pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

Experiments are described in which the relation between the direction of movement of a control and display was varied in order to determine what relationships are likely to cause least confusion to the operator of a machine. Two different types of task were used: a task consisting of intermittent stimuli whose rate of presentation could be varied, and a continuous pursuit task. It is found that accuracy of performance varies with the degree of remoteness of the directional relationship from those met in everyday life, with the complexity of the task, with the ability of the subject, and there is some indication that under certain conditions it may vary with the breadth of his attention. Awareness of the response aspect of the situation in these simple sensori-motor tasks, it is suggested, although necessary in the early stages of learning, may be associated in the later stages with confusion and error.

1546 Conrad, R. SPEED AND LOAD STRESS IN A SENSORI-MOTOR SKILL. A.P.U. 134/50, Autumn 1950, 12pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

In this paper, previous work on the distribution and division of attention is critically reviewed from the point of view of its relevance to the study of skill. It is felt that fundamental methodological weaknesses minimize its value to this field of research. In particular, the presence of time as an environmental factor in skilled behaviour has been consistently underrated. Time is effective in skill in the form of speed. This in the simplest terms can be described as the rate of which critical display changes occur. Speed, however, needs to be qualified by another factor--load--which describes the number of independent streams of signals which comprise the changing display. An experiment was carried out to study the effects on skilled performance of increases of speed and load beyond the point at which deterioration occurs. Twenty subjects did the same task, which demanded adaptation to a continuously changing situation, under three different conditions of load, and at five different speeds for each load. The results can be summarized as follows: a) The number of signals not responded to at all bears a logarithmic relationship to the rate at which they are presented; b) At any one speed, the incidence of this type of error depends markedly on the load content of the display; c) Statistical interaction between speed and load effects is demonstrated; d) Of the responses made, the size of errors of timing is not affected by the speed of the task, but doubling the load approximately doubles the timing error.

1549 Poulton, E.C. TWO POINTER AND ONE POINTER DISPLAYS IN TRACKING. APU 142/50, Dec. 1950, 19pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1549.

These experiments concern the effects of practice and of nature of displayed information on tracking performance. Tracking involved moving a control handle so that a moving pointer was kept on a fixed reference line (one pointer display) or in alignment with a moving stimulus pointer (two pointer display). Learning curves were obtained on 12 Naval ratings for one and two pointer displays. In another experiment, a third pointer (error information) was added; 12 Naval ratings performed with variations in display-control relationships; 12 with or without error information. Results are analyzed for implications for training in tracking.

1550 Bartlett, F.C. PRINCIPLES OF SYNTHETIC EQUIPMENT AND TRAINING. APU 143/50, Dec. 1950, 5pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1550

This paper discusses the principles of synthetic training equipment that have evolved from past research at the Cambridge Psychological Laboratory. It covers general requirements and technical requirements (based on physiological and psychological research), and lists 16 principles of synthetic training, with special emphasis on principles of transfer of training.

1548 Poulton, E.C. ANTICIPATION IN OPEN AND CLOSED SENSORI-MOTOR SKILLS. APU 138/50, Sept. 1950, 15pp. Psychology Lab., Applied Psychology Research Unit, MRC, Cambridge, England.

Two characteristics of compensating voluntarily for an error in responding appear to be of importance in sensori-motor skills. Firstly there is the relatively long latency of voluntary compensation, which allows the initial response deviation to increase before it can be corrected. And secondly in a performance requiring voluntary compensation, maximal accuracy and smoothness are not both possible. The two kinds of anticipation shown in sensori-motor skills, receptor anticipation and perceptual anticipation, are discussed in relation to their function of compensating for reaction time delays. By anticipating the nature and time of occurrence of a signal, the subject can make the appropriate response synchronously with the signal. A further consequence of perceptual anticipation is that smooth yet complex sensori-motor skills are possible. A classification of sensori-motor skills into open and closed types is suggested, the position of any particular skill on this continuum depending upon the degree of predictability of the environmental signals. One advantage of closed skills is the reduced attention which environmental signals require. A second advantage, shared by open skills allowing receptor anticipation, is that voluntary compensation is seldom required. Two experiments are described. One is an example of a closed skill in the early stages of learning. The second demonstrates the relatively small importance of voluntary compensation in a two pointer tracking task with slow harmonic courses, once the subject becomes fairly practiced.

Broadbent, D.E. SPEAKING AND LISTENING SIMULTANEOUSLY. A.P.U. 146/51. Jan. 1951. Epp. Medical Research Council, Applied Psychology Research Unit, The Psychological Lab., Cambridge, Eng.

1553

This investigation of performance in a distraction situation required 27 subjects to give verbal answers to simple questions coming from a loud speaker. Intervals between questions were varied so that at times a question was presented while the subject was still answering a previous one. There were two message sources; S had to make his replies only to the correct one. Performance was analyzed in terms of impairment with overlap of speaking and listening and as a function of rate of presentation of questions.

Hick, W.E. ON THE RATE OF GAIN OF INFORMATION. A.P.U. 162/51, Oct. 1951, 18pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1555

To test the hypothesis that the rate of gain of information is, on the average, constant with respect to time within the duration of one perception, the analytical methods of information theory were applied to data obtained in choice-reaction-time experiments. Two types of experiments were performed: (1) a conventional one with various numbers of alternatives up to ten and with negligible proportion of errors, and (2) a ten-choice experiment in which subjects reduced their reaction-times by allowing various proportions of errors. Some possible conceptual models of the process are considered.

Broadbent, D.E. NOISE, PACED PERFORMANCE AND VIGILANCE TASKS. APU 165/51, Dec. 1951, 8pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

2 vigilance experiments using a 5-choice reaction task are reported. In the first, one group of 9 Ss was "unpaced"--a fresh stimulus was presented each time a reaction was made--and a second group of 6 Ss was "paced"--a fresh stimulus was presented automatically every sec. The 2 rates were about equal. In the paced condition the output of correct responses fell off after 10 min. work, while in the unpaced condition there was no decrement until nearly an hour had gone by. The unpaced Ss, however, showed a marked decrease in the number of short pauses in responding, "short", being here 2 sec. or more. In the second (main) experiment, 18 Ss worked at the task unpaced, for 1/2 hr. on each of 2 successive days. One day the room was quiet, while on the other it contained a steady noise of high intensity. The previous results were confirmed for the first day under either condition but pauses ceased to show a decrement in performance with time on the second day: wrong reactions, however, continued to show one. Such errors were far more frequent in noise than in quiet, the average increase being more than 1/2 of the number occurring in quiet. A further group of 14 Ss showed a similar effect of noise despite a preceding suggestion that contrary results were to be expected. It is suggested that these results allow us to give an adequate interpretation of the peculiarities of vigilance tasks, of differences found between them in the effects of noise and continued exercise, and of the reasons for the apparent failure of other laboratory tasks to show such effects. Broodent, D.E. FAILURES OF ATTENTION IN SELECTIVE LISTENING. APJ 168/51, Feb. 1952, 7pp. Applied Psychology Research Unit, MRC, Cambridge, England.

This present paper contains a series of experiments on the selection out of a mass of speech of parts which are relevant. It is shown, firstly, that a group of 20 Ss found it easier to listen steadily to 1 voice in a mixture rather than change from voice to voice in obedience to a visual cue. This applied only when the voices were familiar, so that one may suspect that an unfamiliar voice has to be reidentified every time it speaks. Secondly, a group of 14 Ss were required to listen to 2 questions and then answer them both before the cycle was repeated. In one case the questions followed one another in time, while in another alternate words were heard from each voice. The latter condition was far harder, showing that the difficulty of listening to 2 messages at once is not purely a matter of difficulty in hearing (masking). A third group of Ss was required to answer only 1 of the 2 questions. The alternate word condition was still the harder, so that neglect even of irrelevant information is not perfect in this case. 2 groups of 10 and 12 Ss respectively underwent the conditions of the third group with variations in the vocal cues available for discarding the irrelevant information. It appeared that if the same voice read relevant and irrelevant words it was harder to answer the relevant ones than if different voices read the 2 types of information. On the other hand, when the voice using the call-sign to be answered varied randomly from question to question, performance was as good as when the same voice used the call-sign throughout the session. This also seems to indicate that reidentification occurs in every message with an unfamiliar voice. (MEIAS)

Conrad, R. MISSED SIGNALS IN A SENSORI-MOTOR SKILL. A.P.U. 187/53, Feb. 1953, 15pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

To explain why speed increases in the demanded rate of work in a sensori-motor skill, led to a disproportionate deterioration in performance, specific association was sought between signals omitted and definable temporal relationships occurring as a result of continuous display changes. The distribution of the time intervals between the signals presented was such that some relationships occurred many times more often than others, the frequency being determined by the mean signal speed. A detailed examination of performance in these terms revealed that omissions occurred close to the nearest response more often than would be expected by chance, and they were as likely to occur just before the response as just after. Furthermore, the probability that a signal would be omitted when it occurred a constant time interval from a response increased linearly with mean speed. The effect of increasing the signal speed was twofold. Firstly, it increased the chances that a signal would occur close to a response, thus subjecting it to a hazardous temporal situation. Secondly, if a signal did occur close to a response it increased the chances that it would be omitted. This latter effect was not due to the crowding in of other specific events as the speed increased, but to the general effect of a shortage of time in the situation as a whole. R 11

1563 Poulton, E.C. & Gregory, A.L. BLINKING DURING VISUAL TRACKING. A.P.O. 152/51, June 1951, 15pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

In order to determine the incidence of blinks during visual tracking, their effect, and the nature of this effect, 2 experimental arrangements were used. In the first the subject had to keep a pen upon a moving line, his blinks being recorded without his explicit knowledge both electronically and by 2 observers. In the second he had to keep 2 pointers in line using a positional control, the display being occluded intermittently in 1 part by a wheel tachistoscope. In another by his own voluntary blinks. It was found that the blink rate was raised when the S expected the tracking to start, and again after tracking. During tracking it was reduced, particularly initially. The blinks that did occur tended to be concentrated in the easy periods of the course. It was not possible to predict the individual's blink rate while tracking from a knowledge of his "resting" blink rate. Blinks were most detrimental when the course was difficult, especially when anticipation was not possible. This effect was due at least partly to interference with vision. But temporary inattention had to be postulated to account for the delayed deterioration following blinking. It was suggested that the blink rate might serve as an index of attention. Blinking cannot be excluded as a cause of accidents. Inattention, of which blinking may be the earliest sign, is probably far more important in this respect.

1565 Moore, R.C., & Tate, G.F. ENGINE INSTRUMENT SIMPLIFICATION PROGRAM "SINGLE" VS "DUAL" INSTRUMENTS. TSEAA 655 1478. Nov. 1946, 47pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

1565 This report reviews progress and objectives of the Engine Simplification Program and discusses the relative merits of "single" versus "dual" instrument methods for presenting engine instrument data. A study to determine the best possible instrument design and arrangement with respect to pilot readability, panel space saving, and ease of maintenance with the subsequent development project is reported. The establishment of an entirely new instrument standard is discussed with plans for an interim program suggested. Specific recommendations are included for continuance of this research.

1566 Reither, H., & Meiator, F.J. THE SENSITIVENESS OF THE HUMAN BODY TO VIBRATIONS. F-TS-616-RE. Sept. 1946. WADC, Aero Medical Laboratory, Dayton, Ohio.

1566 Human responses to sinusoidal vibrations was investigated for the frequency range of 3 to 70 cps. Ten subjects were tested in the standing and lying position with vertical and horizontal vibrations of amplitudes from 0.0001 to 1 cm. applied both along the body axis and transverse to it. After 5 minutes of exposure, the subject classified his reaction in one of the following categories: not perceptible; weakly perceptible; easily perceptible; strongly perceptible; unpleasant, believed dangerous for long periods; very unpleasant, believed dangerous for short periods.

1567 Hollifield, R. G. FINAL DEVELOPMENT STATUS OF KIT CONTAINER, FIGHTER PILOT, SEAT TYPE, SURVIVAL. NCREXD-670-208. July 1948, 9pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

1567 This is a report on the Survival Kit container, Fighter Pilot, Seat Type. One bail-out test was conducted and reported. The kit's size and design, method of donning, compatibility or fit with other equipment are described.

1568 Hollifield, R. G. FINAL DEVELOPMENT STATUS OF KIT CONTAINER, FIGHTER PILOT, BACK TYPE, SURVIVAL. NCREXD-670-208. July 1948, 13pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

1568 This is a report on the Survival Kit Container, Fighter Pilot, Back Type. The design, method of donning, contents, etc. of the kit are described. The results of a single bail-out test are also reported.

1570 Carter, L.F. THE RELATIVE EFFECTIVENESS OF PRESENTING NUMERICAL DATA BY THE USE OF TABLES AND GRAPHS. TSEAA 694 1. Apr. 1946, 9pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

1570 To determine the relative merits of tables and graphs for presenting numerical data, 27 subjects solved a large number of problems using four tables and four graphs presenting linear and curvilinear data, one set of data, and a family of data, under a time limit the same for all problems. Two types of solutions were required: (1) no interpolation, and (2) interpolation. Speed (number of problems completed) and accuracy (frequency and magnitude of errors) are analyzed as functions of the type of solution required. Recommendations are included.

1571 Young, Katherine, D. LEGIBILITY OF PRINTED MATERIALS. Memo. TSEAA 8 694 1A, June 1946, 28pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

1571 This report is a summary of selected experimental studies concerned with the legibility of printed materials (1946). Of particular concern are the conditions under which printed material is best suited to the capacities and habit patterns of the average person: type faces, type sizes, length of line, leading, capital versus lower case, italics versus lower case, white on black or the reverse, color, spatial factors, illumination, modern versus old style numerals. Recommendations are included.

1572 Carter, L.F. A STUDY OF THE BEST DESIGN OF TABLES AND GRAPHS USED FOR PRESENTING NUMERICAL DATA. TSEAA 694 1C. Sept. 1946, 16pp. WADC, Aero Medical Laboratory, Dayton, Ohio.

1572 To study some design factors in tables and graphs used for presenting numerical data, tables were constructed and varied in completeness (number of pages and number of points tabulated); graphs were constructed and varied in frequency of coordinate rulings and the axis on which entered. Seventy subjects solved problems using both types of presentation. Speed and accuracy scores are analyzed for the efficiency of type of presentation. Recommendations are included.

Crocker, Mary L. & Kennedy, J.L. STUDY OF PREFERENCES FOR ABBREVIATIONS OF COMMON WORDS USED IN AVIATION. Contract W33 038 AC 14559, Rep. 3, July 1947, 78pp. Tufts University, Medford, Mass.

1574

To determine the manner in which speed and accuracy of dial reading vary with dial size and spacing of scale divisions, eighty subjects read off settings on simulated instrument dials with fluorescent markings, four sizes (one to four inch diameters), four graduation intervals (five to forty degrees of angular separation) under simulated daylight and night conditions (ultraviolet illumination). Reading time and errors are analyzed as functions of the variables used. The usefulness of the data in estimating reading precision possible with common types of aircraft dials is discussed. T.G.I.B.I.

1578

To investigate optimal abbreviations for common words used in aviation, 175 college students (25 AAF veterans, 150 unselected) indicated their preferences for one of several abbreviations listed for each of 451 words taken from the AMA Bulletin No. 261, under forced speed conditions. Three abbreviations for each word that was chosen most frequently are presented in rank order with their frequencies. A list of 60 abbreviations which were selected very infrequently is given together with the more frequently chosen ones. Some suggestions are made as to the applicability of these data for use.

Kappauf, W.E. THE USE OF THE ANGULAR TRANSFORMATION IN THE STATISTICAL TREATMENT OF ERROR FREQUENCIES. Contract W33 038 AC 14480, Memo, Rep. TSEAA 694 1J, Rep. 2, July 1947, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Princeton University, Princeton, N.J.).

1575

To explore the effects of vibration, illumination, and type size upon the speed and accuracy with which numerals can be differentiated, a series of experiments are described which used a reading task calling for a two digit same-different judgment. Conditions varied: linear vibration, from 0.079 to 0.0079 double inches of amplitude; brightness, 12.4 to 0.96 foot lamberts; type size, six to eleven point (inverted for some trials). Twelve subjects were used. The effects of the experimental values are statistically evaluated by analysis of variance. Discussion treats effect of type inversion in terms of task complexity and familiarity.

T.

1579

This report contains a discussion of the application of the angular transformation in handling error data in certain kinds of psychological experiments where performance on unit tasks is scored on a right or wrong basis (reading of dials, tables, graphs, or printed materials) and in which frequency of error is low and where the likelihood of error from trial to trial remains about the same for tasks which fall in a single category. The angular transformation puts such error data in a form which permits profitable use of analysis of variance. Examples are included. G.B.10.

Smith, W.M. & Kappauf, W.E. STUDIES PERTAINING TO THE DESIGN AND USE OF VISUAL DISPLAYS FOR AIRCRAFT INSTRUMENTS, COMPUTERS, MAPS, CHARTS, AND TABLES: A BIBLIOGRAPHY. Contract W33 038 AC 14480, Memo, Rep. TSEAA 694 1G, June 1947, 25pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Princeton University, Princeton, N.J.).

1576

This report presents a bibliography of scientific reports concerned with the design of aircraft instruments, tables and charts, computers, maps, or to the particular conditions under which these devices were used. A list of sources used in preparing the bibliography is given. R264.

1577

Fitts, P.M. STUDIES OF VISUAL DISCRIMINATION TIME: THE TIME REQUIRED TO RECOGNIZE SIMPLE PATTERNS AT EQUAL DISTANCES FROM THE EYE, AND PATTERNS AT ALTERNATELY FAR AND NEAR DISTANCES. Serial TSEAA 694 1H, TSEAA 8/PMF/jc, July 1947, 2pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

1577

The purpose of the present studies was to determine the time required for successive fixation and recognition of test objects located at equal distances from the eyes and the time required for changing from far to near fixation. 50 college students, serving as Ss, judged the positions of Landolt Rings at distances of 1.) 22 in., 2.) 43 ft., 3.) alternating near and far distances. The author notes that these data are useful in connection with studies of instrument interpretation time.

1580

To explore the effects of vibration on legibility of numerals, three experiments were conducted: (1) vibration frequencies varied (480, 930, 1930 per minute) with favorable and unfavorable conditions of amplitude, brightness, and numeral size, (2) vibration pattern varied (linear, rotary, elliptical) with two conditions of amplitude, and other factors held constant, and (3) stimulus contrast varied (black on white or the reverse) with an unfavorable and with a mixed condition of other factors. The data were evaluated statistically by analysis of variance. Problems for further research are outlined. (See accession number 1575.) T.

Kappas, M.E. DESIGN OF INSTRUMENT DIALS FOR MAXIMUM LEGIBILITY: I. DEVELOPMENT OF METHODOLOGY AND SOME PRELIMINARY RESULTS. MEMORANDUM REPORT. Contract #33 CSM AC 14480, Serial TSEAA 694 11, Oct. 1947, 2pp. Aero Medical Lab., Wright-Patterson AFB, Ohio. (Princeton University, Princeton, N.J.).

1582

This report describes a procedure for the study of precision of dial reading. It consists of presenting 12 dials simultaneously to a single subject and scoring his performance in reading: dials in terms of errors and average time. In a preliminary study, dial size (three), dial design (differing in number of subdivisions), and reading attitude (accuracy or speed), subject differences, and practice effects were explored using the procedure. Analysis of the data is presented and some considerations concerning the methodology are discussed.

Connell, Shirley C. THE RELATIVE EFFECTIVENESS OF PRESENTING NUMERICAL DATA BY THE USE OF SCALES AND GRAPHS. TSEAA-694-1M. Dec. 1947. 17pp. Aero Medical Lab., Headquarters, Air Materiel Command, Engineering Div., Wright Field, Dayton, Ohio.

1584

To determine the relative merits of scales and graphs for presenting numerical data, 32 subjects solved a large number of problems with the aid of four scales and graphs (one each representing linear data, one each representing curvilinear data) with a time limit the same for both. Problems were of three types requiring (1) no interpolation, (2) single interpolation, and (3) double interpolation. Frequency and magnitude of errors were analyzed with respect to the efficiency of scales and graphs for such problem solving.

Christensen, J.M. THE EFFECT OF THE STAIRCASE SCALE ON DIAL READING ACCURACY. MEMO-694-1-P. Oct. 1948. 17pp. Aero Medical Lab., Headquarters, Air Materiel Command, Engineering Div., Wright Field, Dayton, Ohio.

1586

To evaluate the effectiveness of a staircase dial in reducing reversal errors in dial reading, 55 subjects read dials varied as follows: staircase and conventional scales, clockwise and counter-clockwise increase, zero at top and at bottom of scale. Identical problems were presented on each dial and administered by the "card rotation method". Reading times and errors are analyzed for each dial. Special note is taken of the differences yielded by each reversal error. Practice effects are shown.

Hill, H. A REVIEW OF MUSCLE ACTIVITY AND ACTION POTENTIALS AS THEY ARE RELATED TO MOVEMENT. Contract W33 032 ac 13968, TSEAA 694 2E, Rep. 5; May 1947, 14pp. USAF Aero Medical Lab., Engineering Div., Air Materiel Command, Wright Field. (Indiana University; Bloomington, Ind.).

In the interest of studying movements, their initiation, maintenance, and modification, the nature of the contractile properties and processes of skeletal muscle are briefly surveyed. Differentiation of muscle action and forms of contraction, including reciprocity and co-contraction are considered and evidence presented for and against the occurrence of ballistic movements. Recording apparatus and techniques for the study of muscle action are then shortly reviewed. Stetson's classification, used to order the experimental work on movement and muscle action during loading, is briefly reviewed. The electrical occurrences connected with muscle contraction are discussed from the points of potential origin, and speed, form, frequency, and amplitude of propagated waves under various conditions. Evidence on the origin of muscle rhythms is presented, and recording techniques, together with possible interpretations of recorded electrical activities are briefly discussed. Action potentials during movement under various conditions are reviewed. While no attempt is made to trace the development of any specific coordinated movement in a particular individual's lifetime, biologically similar bases of reflex movement (between individuals) are pointed out. The contention is then put forth that structure-function activities (the inheritable reactions, e.g., reflexes) gradually, or in some instances suddenly, come under the control of other than the originally adequate stimulus through the operation of conditioning.

Crook, R. K., Harker, G. S., Hoffman, A. C., Wolfek, J. M., & Kennedy, J. L. PLITUDE THRESHOLDS FOR VISUAL PERCEPTION OF VIBRATION. Contract W33-038 ac-14553, Memo Rep. MEMO-694-1R, Rep. 6, Dec. 1948. 17pp. WADD, Aero Medical Laboratory, Dayton, Ohio. (Tufts University)

1591

To determine the least amplitude of vibration just visually perceptible at reading distance (14 inches) under adequately good lighting conditions (13.0 and 23.5 foot lambert), threshold judgments were made using a page of printed digits (6, 8, 10 point type) with vibration frequencies of 1160, 1450, and 1800 per minute. Threshold measurements (inches of double amplitude) are analyzed as functions of vibration frequency, brightness level, and type size. The results are discussed in relation to legibility at further distances, to bodily sensitivity, and to visual acuity.

Krueger, G. K., Podell, J. E., & Ronco, P. G. EFFECT OF NUMBER OF ALTERNATIVES AND SET ON THE VISUAL DISCRIMINATION OF NUMERALS. J. exp. Psychol., 1954, 48, 75-90. (Tufts University)

1593

To investigate some relationships between amount of information presented and accuracy of discrimination, subjects discriminated accurately a number displayed under conditions of from two to 1000 alternative categories; procedure repeated with an "expectancy" established for a large number of categories when there were only four; a further repetition after subjects had been informed of the actual number of categories to expect. The maximum distance at which discriminations could be made accurately was defined as a threshold. The data are analyzed and interpreted as a function of amount of information presented and of perceptual set.

Happoport, M. THE ROLE OF REDUNDANCY IN THE DISCRIMINATION OF VISUAL FORMS. J. GEN. Psychol., 1957, 53 (1), 3-10. Contract Nonr-495(02), OHS, Ohio State University.

1591

To investigate the role of redundancy in visual perception, stimulus material (constructed metric figures) were prepared of two types (congruent and incongruent) and five amounts (71, 81, 86, 91, 97 percent) of visual redundancy. Subjects were required to sort out a specified pattern from among eight similar patterns (six discriminations for each of eight patterns) under noise-free and 17 percent background noise (perturbation of the stimulus pattern). Average recognition times were analyzed (analysis of variance) in terms of type and amount of redundancy with and without visual noise. Implications of this experimental approach for an interpretation of Gestalt figure concepts are mentioned. T. G. I. R 11

Reedy, J.D. & Saiger, G.L. EVALUATION OF THE HARVARD STEP TEST WITH RESPECT TO FACTORS OF HEIGHT AND WEIGHT. Proj. 6 95 20 001, Rep. 140, Feb. 1954, 6pp. USA Medical Research Lab., Fort Knox, Ky.

This report is concerned with the relationship between height and weight factors and scoring on the Harvard Step Test. Results of studies on Army trainees would seem to indicate that test scores are not appreciably affected by a combined height weight factor or the height factor alone, but may be affected by the weight factor. Low scores in relatively heavy men may be due in part to the weight factor. R 3

Godwin, A.C. & Wallis, D. SOME HUMAN FACTORS IN THE DESIGN OF CONTROLS: AN EVALUATION OF THE LITERATURE. Rep. 51, Oct. 1954, 37pp. Office of Naval Research, American Embassy, USN Mission Study Unit, London, England.

Many summaries have been prepared of the vast accumulation of literature on human factors which should influence control design. Many of them are unutilized to the needs of service designers and those that are useful are frequently inaccessible. This report attempts first to bring up-to-date and expand the summary issued in 1948 by K.F.H. Murrell (N.M.S.U. Report 36). It also tries to evaluate some of the research data and recommendations which appear in the literature, pointing out also where some of the gaps in our knowledge lie. No attempt is made to discuss the intricacies of control mechanisms themselves. The object has been to give an account of the more relevant human factors which have been shown to influence performance through the design of controls, joysticks and other control handles commonly found in association with "closed" or "open" loop systems. Fairbanks, D.H., & Moore, B. DOUGLAS A4D SEAT-EJECTION TESTS. NOTS 1068, TPR-119, Feb. 1956, 25pp. Naval Ordnance Test Station, China Lake, Calif.

1590

To make a functional checkout of the seat ejection system of the Douglas A4D airplane, a series of tests was conducted under dynamic conditions closely simulating flight. Runs were made using an A40 cockpit section, complete with ejection seat and dummy, mounted on a rocket-propelled sled riding on a track. Sled-borne and ground-placed metric and documentary cameras were used to gather data. Analysis of data was made to determine whether the canopy jettisoned cleanly without danger of striking pilot and whether the pilot was released properly from the seat. Recommendations were included. Gerall, A.A., Sampson, P.B. & Spragg, S.B.S. METHOD FOR STUDYING PERFORMANCE ON A SIMPLE TRACKING TASK AS A FUNCTION OF RADIUS AND LOADING OF CONTROL CRANKS. Proj. 6 95 20 001, Rep. 144, April 1954, 18pp. USA Medical Research Lab., Fort Knox, Ky.

4 trained Ss. were tested on a simple tracking task in which the operator was required, by using 2 hand cranks, to align a follower on a stationary target suddenly appearing on the face of a cathode ray oscilloscope. 3 crank radii (2, 4 and 6 in.), and 5 frictional forces (3, 6, 9, 12, and 15 lbs.) were used. The results of this preliminary experiment showed that reactions varied with friction but not with crank radius; that travel times and total times were significantly related to crank radius and friction. Adjustment times were not analyzed.

Loeb, M., Barron, T., & Burde, E. A PRELIMINARY INVESTIGATION OF THE EFFECTS OF WHOLE-BODY VIBRATION AND NOISE. Proj. 6 95-20 001, Rep. 145, Apr. 1954, 17pp. Army Medical Research Lab., Fort Knox, Ky.

1595

To investigate the effects of noise and vibration on psychomotor efficiency, 16 young men performed a variety of tasks while seated on a platform vibrating at 20 cps with a peak to peak amplitude of 0.012 or 0.034 inches, and making a noise of 94 or 102 decibels. Measures of mirror tracing, simple and complex reaction time, manual steadiness, tapping speed, strength of grip, visual acuity, blood pressure, pulse rate, and urinary sodium, potassium, and albumin were made before, during and after exposure to each level of vibration and noise. The results are analyzed for statistically significant differences among the experimental conditions.

Gogel, W. C., Tammaro, J. P., & Inaba, Kay. THE TENDENCY TO SEE OBJECTS AS EQUIDISTANT AND ITS INVERSE RELATION TO LATERAL SEPARATION. Proj. 6-95-20-001, Rep. 146, Apr. 1954, 22pp. Army Medical Research Laboratory, Fort Knox, Ky.

1596

To study monocular and binocular factors determining judgments of distance, a series of experiments were devised wherein monocular and binocular objects were viewed simultaneously (stereopsis was assumed to be effectively absent between objects) under conditions providing no depth cues and conditions where depth aspects of parts of the field were fairly well determined (number of objects, lateral displacement, size). The data are analyzed as a function of lateral line-of-sight separation of objects.

Hartmar, B.O. THE ACCURACY OF THROWING HAND GRENADES AS A FUNCTION OF THEIR WEIGHT, SHAPE, AND DISTANCE. Proj. 6 95 20 001, Subtask AMRL S 1, MEDA, Rep. 153, Aug. 1954, 19pp. USA Medical Research Lab., Fort Knox, Ky.

1598

To determine the influence of shape, weight and distance on the accuracy with which grenades are thrown, 12 subjects were required to throw at a horizontal, bull's eye type of target. Four shapes (sphere, standard, tear drop, and cylinder), five steps of weight (12, 15, 18, 21, and 24 ounces), and four distances (20, 25, 30, and 35 yards) were the variables. Both accuracy, radial distance from center of target, and consistency, dispersion of throws, of performance were analyzed for effects of these variables. An effort curve was plotted using error scores for each combination of weight and distance. Recommendations concerning grenade design are made.

Crook, M.H., Marker, G.S., Hoffman, A.C. & Kennedy, J.L. THE EFFECT OF VIBRATION ON LEGIBILITY OF TABULAR NUMERICAL MATERIAL: EXPERIMENTS 8 & 9. Contract W33-038-ac-14569, WCHRD-694-1Q, Dec. 1948, 18pp. Wright-Patterson AFB, Aero Medical Lab., Eng. Div. (Tufts College)

1603

To study the relations between vibration amplitude and both spacing and page density (number of digits per unit area), two tasks (1. same-different judgment of two digits, 2. recognition of correct answer to a three-digit addition problem) were performed under a variety of conditions of type size, brightness, and vibration frequencies. Spacing between digits were varied from .005 to .061 inches; double amplitudes from .005 to .030 inches; densities from one to 2.2 units. Legibility data are analyzed and interpreted in terms of spacing of numerals in actual situations where vibration is present.

Johnson, A.P. EXPERIMENTAL COMPARISON OF SIGHTING AND TRIGGERING PERFORMANCE WITH HAND GRIPS AS COMPARED TO HAND WHEELS CONTROLS ON THE B-29 PEDESTAL SIGHT. Memo. Rep. TSEAA 8-694-2, May 1946, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

1604

To determine the principle of control action best adapted to the capacities of the user, a study was made of the accuracy of sighting and triggering when using a new type handgrip control as compared to a handwheel control on the B-29 Pedestal Sight. Each subject was required to operate both types of controls for similar time periods but on different days. For each series a time score was obtained for tracking and ranging correctly and for triggering while tracking and ranging correctly. Recommendations for design changes in controls are made on the basis of the results.

1605
Milton, J.L. AN EXPERIMENTAL COMPARISON OF THE ACCURACY OF TRACKING, RANGING AND TRIGGERING WITH TWO NEW TYPE GUN-SIGHT HAND CONTROLS. TSEAA 694-2, Oct. 1946, 12pp. USAF Air Materiel Command, Aero Medical Lab., Wright-Patterson AFB, Dayton, Ohio.

This experiment was designed to determine the accuracy with which gunners could use the B-29 Pedestal Sight when equipped with 2 new type hand controls. The 2 new hand controls, designated B and C, were designed to eliminate most of the faults of the original hand controls on the B-29 Pedestal Sight. Hand control B is a squeeze grip type control utilizing a spring-loaded extension of the right hand control for ranging and a trigger which is incorporated in the left-hand control. Hand control C is a knoblike ranging control used with the right hand in this experiment. The same left hand control was used in both cases. The S.A.M. Pedestal Sight Manipulation Test was used. In order to simulate as closely as possible the complete task of the gunner, the test was arranged to provide data on tracking, ranging and triggering. Hand control B was found to be superior to hand control C in all respects. The ranging score with control B was superior at the 2% level of statistical confidence. Combined tracking and ranging scores, and combined tracking, ranging, and triggering scores were approximately 8% higher. There is less than 1 chance in 100 that this superiority of control B could have occurred by chance. It was concluded that variations in the shapes and modes of action of gun-sight controls make marked differences in tracking, ranging and triggering performance.

Gray, Florence E., Livingston, W.A. & Ellison, D.G. MODIFICATIONS OF THE IAAF S.A.M. PEDESTAL SIGHT MANIPULATION TEST. Contract W33-038-ac-13968, TSEAA 694-2, Nov. 1946, 9pp. WADC, Aero Medical Laboratory, Dayton, Ohio. (Indiana University, Bloomington, Ind.)

This report describes modifications of the Pedestal Sight Manipulation Test (PSMT) which were made to provide: a) simultaneous and independent measures of tracking error in 2 or 3 dimensions, and b) flexibility of sight controls permitting variation of position, form, and mode of action of controls. The modifications which were made include: a) Provision for 1 and 2 dimensional tracking in addition to the 3-dimensional task incorporated in the original PSMT; b) Provision for independent scoring of each tracking dimension and triggering in addition to combination scores; c) Provision for increased sensitivity of the scoring system; d) Provision for increased accuracy of scoring.

Hill, H., Gray, Florence & Ellison, D.G. WAVE LENGTH AND AMPLITUDE CHARACTERISTICS OF TRACKING ERROR CURVES. Contract W33 038 ac 13968, TSEAA 694 20, Rep. 4, April 1947, 23pp. USAF Air Materiel Command, Wright Field, Dayton, Ohio. (Indiana University, Psychology Dept., Bloomington, Ind.).

Tracking error curves were obtained for 10 subjects on the 15th and 16th days of practice in a single dimension tracking situation using constant target rates from 5° to 25° per sec. 2 types of tracking were identified: a) "rate tracking," which produced error curve waves with low initial error, zero or very small wave amplitude, and extremely variable wave length and b) "position correction tracking," which produced waves of high and variable initial error, high and variable wave amplitude, and a relatively small range of wave lengths. Waves of the second type were isolated for separate analysis by segregating waves with amplitudes of 0.5° or more. Changes in mean tracking error and mean wave amplitude are approximately proportional to target speed. For low amplitude waves, including all examples of rate tracking, wave length decreases as target speed increases, but for the high amplitude waves produced in position correction tracking, wave length does not change significantly with target speed. This is especially important since it is the high amplitude waves which account for a major part of the tracking error and the variability in tracking error curves. Wave length is also relatively stable at different amplitudes, increasing approximately 50% with a 10 to 1 increase in amplitude.

Gray, Florence E. & Ellison, D.G. EFFECTS OF FRICTION AND MODE OF OPERATION UPON ACCURACY OF TRACKING WITH THE G.E. PEDESTAL SIGHT. TSEAA 694 21, Rep. 2, March 1947, 10pp. USAF Air Materiel Command, Wright-Patterson AFB, Ohio. (Dept. of Psychology, Indiana University, Bloomington, Ind.).

1608

This study is concerned with the effects of friction and mode of operation upon accuracy of tracking with the G.E. Pedestal Sight. Twenty-four subjects were required to track under two different conditions of operation (i.e., the normal manner vs. looking over or around the sight) and with various degrees of azimuth and elevation friction settings. The results are presented and discussed in terms of the relative effect of the friction settings and mode of operation upon tracking accuracy. The implications for tracking training are also discussed.

1610

Ellison, D.G. & Hill, H. ACTION POTENTIALS DURING TRACKING. Contract W33 038 AC 13968, TSEAA 694 21, Rep. 9, Dec. 1947, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dept. of Psychology, Indiana University, Bloomington, Ind.).

1610

To determine the relationship between type of tracking (position or rate) and the type of muscular movement involved, action potentials from the biceps and triceps muscles were recorded during performance of a tracking task that involved primarily the activity of these two muscles. Tracking error and the two sets of action potential figures were compared graphically and by correlational methods in an effort to identify the type of movement--ballistic or moving fixation.

Gray, Florence E. & Ellison, D.G. THE VALIDITY OF TIME-ON-TARGET (CLOCK) SCORES AS AN ESTIMATE OF TRACKING ERROR-MAGNITUDE. TSEAA 694 2F, Rep. 6, June 1947, 14pp. USAF Aero Medical Laboratory, Dayton, Ohio. (Indiana University, Bloomington, Ind.).

Reported is an investigation comparing 2 methods of scoring based on tracking data obtained in an experiment in which both types of scores were obtained simultaneously. 10 Ss tracked a pointer moving horizontally at constant rates of about 5°, 10°, 15°, 20°, and 25° per sec. Separation of the target pointer and the pointer controlled by the S was recorded graphically. The 2 scores used were time-in-target and mean error scores. The data analyzed included all the data obtained on the 16th day of practice, for each S, a mean error score and 6 time-on-target scores were obtained for 2 right and 2 left runs at each of 5 target speeds. The mean error was correlated separately with each of the 6 time-on-target scores. It was found that the 2 scores are acceptably equivalent under certain conditions. However, the 2 scores varied with target speed and sensitivity of the time-on-target system. Changing the limits of the time-on-target scoring produces marked changes in the degree to which the highest correlation becomes progressively greater as these limits (the size producing the highest correlation) increase. No single sensitivity setting can provide optimal representation of error magnitude for all parts of a variable rate target course.

Ellison, D.G. THE INDEPENDENCE OF TRACKING IN TWO AND THREE DIMENSIONS WITH THE B-29 PEDESTAL SIGHT. Contract W33 038 ac 13968, TSEAA 694 2G, Aug. 1947, 16pp. USAF Aero Medical Laboratory, Dayton, Ohio. (Indiana University, Bloomington, Ind.).

It is desirable that servo-mechanism systems be devised which will compensate for human error in the operating of air-borne gun sights. This report is based on data from experiments designed to find out whether or not human operators tend to make error corrections simultaneously or independently in 2 or 3 tracking dimensions (azimuth, elevation, range). It was concluded that: a) For both trained and untrained operators using the G.E. Pedestal Sight, tracking errors in azimuth and elevation are essentially independent as to time of occurrence. b) For untrained operators, using the G.E. Pedestal Sight, tracking errors (azimuth and elevation combined) and ranging errors are essentially independent as to time of occurrence. These findings point to the conclusion that tracking in azimuth and tracking in elevation may not be integrated by the human operator and that the "tracking problem" might be more correctly considered as the "tracking problems". Experimental comparisons of the accuracy of independent azimuth-tracking and independent elevation-tracking with the accuracy of tracking of each of these dimensions in a combined tracking situation seems to be indicated.

Ellson, D.G. & Hill, H. WAVE LENGTH AND AMPLITUDE CHARACTERISTICS OF TRACKING ERROR CURVES. II. INDIVIDUAL DIFFERENCES AND LEARNING EFFECTS. Contract W33-038 AC 13968, TSEAA 694 2H, Rep. 8, Oct. 1947, 21pp. Department of Psychology, Indiana University, Bloomington, Ind.

1612
This study investigated the effects of practice and individual differences on tracking error. Ten Ss tracked a horizontally moving pointer with a tracking pointer controlled by extension and flexion of the forearm. Practice continued for 16 days. Pointer difference (error) was recorded graphically. Mean error and wave length of error curve were analyzed for practice effects. Errors and wave lengths for selected days are intercorrelated to check stability of performance.

Spragg, S.D.S. & Rock, M.L. DIAL READING PERFORMANCE AS RELATED TO ILLUMINATION VARIABLES: I. INTENSITY. MCRED-694-21, Rep. 1, Oct. 1948, 32pp. USAF Air Materiel Command, Aero Medical Lab., Wright-Patterson AFB, Dayton, Ohio. (Univ. of Rochester, Dept. of Psychol., Rochester, N.Y.)

1613
To investigate the relation between level of illumination and dial reading performance under night viewing conditions, twenty subjects read dial settings (photographic reproductions of a 2.8-inch dial, graduated from 0 to 100 in ten unit steps) under five illumination levels (.005, .018, .022, .296, and 6.0 foot-lamberts). Performance scores (errors and speed) are analyzed as a function of illumination level and compared with the usual relation between visual acuity and brightness. Suggestions for further studies are made.

Ellson, D.G. THE APPLICATION OF OPERATIONAL ANALYSIS TO HUMAN MOTOR BEHAVIOR. Psych. Rev., Jan., 1949, 55(1), 9-17. (Mathematics Dept., Indiana University, Bloomington, Ind.)

Recent development in military, aviation, and industrial equipment design has produced a need for specific information concerning characteristics of the motor behavior of the human operators of these machines. A considerable amount of research has been performed recently on the form of motor responses as a function of those characteristics of the task which are determined by design of machines. To date, no conceptual scheme has been presented which integrates the many isolated facts which permits the prediction of the response to complex inputs on the basis of a limited number of determinations of the response to simple input components is potentially applicable to certain aspects of human motor behavior. From a psychological point of view, the operational analysis method provides a ready-made, limited psychological theory which may be verified experimentally. The method is a direct parallel of the stimulus-response approach in psychology, which is concerned with the relationships between stimuli and responses rather than with intervening physiological mechanisms. Essentially it assumes that the motor response to complex changes in a stimulus input may be predicted from the addition or integration of responses of simpler components of this input. If this assumption is verified, aside from its value in application, it will provide a means for examining the nature of learning and individual differences in motor behavior.

Craig, D.R. & Ellson, D.G. A COMPARISON OF VARIOUS MANIPULATIVE TECHNIQUES IN A TRACKING TASK: A COMPARISON OF A TWO-HANDED AND SEVERAL ONE-HANDED CONTROL TECHNIQUES IN A TRACKING TASK. Contract W33-038 AC 13968, MCRED 694-21, Rep. 11, July 1948, 25pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Psychology Dept., Indiana University, Bloomington, Ind.)

The purpose of this report is to present the results of an experiment concerning various manipulative techniques in tracking with the pedestal Sight Manipulative Test (PSMT). The sight of the PSMT was fitted with a set of 3 extended handgrips. Operators tracked 3 trials daily for 8 days: a) both hands on the offset grip; b) the preferred hand on the centered handgrip; c) the preferred hand on the corresponding offset handgrip; d) the non-preferred hand on the corresponding offset handgrip; e) the non-preferred hand on the centered handgrip. No ranging and triggering were used in this experiment. Use of the preferred hand resulted in significantly superior performance to that achieved with the non-preferred hand. Use of the offset handgrip, whether with the preferred or non-preferred hand, was significantly superior in azimuth and in combined azimuth and elevation, but not in elevation alone. Comparisons of techniques in which both hand and handgrip differ showed that these two variables interacted to influence the tracking performance in a predictable manner. Comparisons of the performance with 1- and 2-hands equivalent. An operator's relative proficiency with 1 technique was highly predictive of his relative proficiency with other techniques. Initial performance was highly predictive of final performance for each of the manipulative techniques.

USAF Aero Medical Lab. SYNOPSIS OF THE AERO MEDICAL ASPECTS OF JET PROPELLED AIRCRAFT. Jan. 1949, 46pp.
USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

1620

The aeromedical and human engineering problems introduced by the use of jet-propelled aircraft are discussed. High altitude flight makes the requirements for oxygen supply, cabin pressurization and protection against decompression sickness more critical. Long term acceleration (g) force toleration, cockpit design, flight instruments, and cockpit temperatures are reviewed in relation to higher flight speeds. Problems of emergency escape at high altitude and velocity are also treated.

Hammond, P.H. A DESCRIPTION OF APPARATUS FOR TRANSIENT RESPONSE OBSERVATIONS ON HUMAN MUSCULAR CONTROL. R.R.E. Tech. Note 576, Jan. 1956, 8pp. Radar Research Establishment, Ministry of Supply, London, England.

1621

Apparatus developed for the study of muscular control in man is described. Mechanisms have been devised to elicit and to measure involuntary activity in the nervous system. The experiments are made automatic by a four-channel "programmer" improvised from a four pen recorder. Limb velocity and acceleration, tension in the tape connecting the subject to the machine, and electrical activity of the muscle groups involved in a movement are the quantities measured. Response variables are photographed from the screen of a cathode ray tube.

Camp, R.T., Jr. THE EFFECT OF A NOISE ENVIRONMENT UPON SPEAKER INTELLIGIBILITY. Contract N6ONR 22525, Proj. NR 145-993, BuMed. & Surgery Proj. NM 601 104 500, Rep. 63, June 1956, 9pp. USN School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

1639

To compare the intelligibility of a voice speaking in a quiet environment with the same voice speaking in the presence of noise, a trained speaker recorded speech intelligibility tests under both conditions. In the quiet condition the speaker received a normal airborne side-tone from mouth to ear; in the noise condition he received the side-tone, mixed with noise (108 decibels) over head phones. The recordings from both sessions were presented to 4 groups of listeners (87) at equated speech levels and speech-to-noise ratios in the presence of noise (114 decibels). Intelligibility scores were analyzed for differences due to conditions of speaking.

Hartman, B.O., Burke, J.T. & Walker, R.Y. THE ACCURACY OF THROWING HAND GRENADES AS A FUNCTION OF THEIR WEIGHT, SHAPE AND SIZE. Proj. 6 95 20 001, Subtask AMRL S 3, MEDEA, Rep. 117, June 1953, 23pp.
USA Medical Research Lab., Fort Knox, Ky.

1647

To investigate the influence of shape, weight and size on accuracy and consistency with which hand grenades are thrown, 25 subjects threw at a target 30 yards away. Four shapes (potato masher, tear drop, sphere, and standard), three weights (12, 18, and 24 ounces) and three sizes (2.0, 2.1, and 2.2 inches diameter) were used. Performance data (radial distance from bull's eye and direction) were studied by analysis of variance for effects of the variables. Recommendations concerning design of the hand grenade are offered.

Alluisi, E.A., Barker, J.S., Inaba, K., Mungesser, F.L., Jr., Tansaro, J.P., & Brune, R.L. LINEAR PERSPECTIVE AS A SOURCE OF PSYCHOLOGICAL ERROR IN BINOCULAR STEREO-SCOPIC RANGE FINDING. Proj. 6-95-20-001, Subtask AMRL S-2, Rep. 97, Oct. 1952, 47pp. DA, Office of Surgeon General, Army Medical Research Laboratory, Fort Knox, Ky.

1648

To investigate linear perspective as a source of psychological error in binocular stereoscopic range-finding on terrestrial targets, subjects ranged targets of three sizes on a stereoptometer (description given in appendix) under two conditions: (1) true stereoscopic acuity requiring judgment of depth or alignment in the median plane, and (2) interocular-vernier acuity requiring judgment of position or alignment in the frontal plane. Errors in ranged distance of targets of different sizes are analyzed as a function of assumed differences in sizes. Implications of the results for perception theories are discussed.

1650

Broussard, I.G., Walker, R.Y., & Roberts, E.E., Jr. THE INFLUENCE OF NOISE ON THE VISUAL CONTRAST THRESHOLD. Subtask under Human Engineering Studies, AMRL Proj. No. 6-95-20-001, Subtask, Hearing and Vibration Problems with Mechanized Equipment, Rep. No. 101, Nov., 1952, 17pp. Army Medical Research Lab., Fort Knox, Kentucky.

1650

To test the effect of noise on perception of small light differences, two groups of subjects (28 each) made judgments of target location (a brightness increment varied from .0173 to .2625 foot lamberts) exposed for ninety seconds on a field of constant brightness (2.275 foot lamberts) under two noise conditions: high level (ninety decibels) for two hours preceding and during testing and moderate (45 decibels). Contrast thresholds were determined from correct response frequencies and subjected to analysis to determine the relative effects of the two noise levels. Further analysis is made of the time factor.

Gogel, W.C., Harker, G.S., Tammaro, J.P.,
Inaba, K., & Brune, R.L. THE EFFECTIVE-
NESS OF SIZE CUES TO RELATIVE DEPTH AS A
FUNCTION OF THE LATERAL SEPARATION OF OBJECTS
Proj. No. 6-95-20-001, Rep. No. 125, Oct.,
1953, 17pp. Army Medical Research Lab.,
Fort Knox, Kentucky.

1652
To investigate size cues in depth discrimination
judgments, eight subjects viewed two sizes of playing
cards (half and double size) located at the same dis-
tance and adjusted a disc of light to apparent equal-
ity with one or the other of the two, for two lateral
separations of the cards (3.8 and 22.9 centimeters).
Additional judgments were made by 10 subjects with a
change in size (normal and double size) and with one
card viewed monocularly and the other card and the
disc viewed binocularly. Equality settings are anal-
yzed for the effectiveness of size cues under these
conditions.

Reedy, J.D. THE RELATION OF POWER AND ENDURANCE TRAIN-
ING TO PHYSICAL EFFICIENCY. Proj. 6-95-20-001, Subtask
AMRL S 4, Rep. 118, June 1953, 49pp. USA Medical Re-
search Lab., Fort Knox, Ky.

1653
This study attempted to determine what changes in
physical condition result from training for power (by
lifting weights), training for endurance (by performing
calisthenics), or training for both power and endurance.
The Ss; 116 enlisted men divided into four groups, un-
derwent appropriate training for 10 weeks. The data
consist of pre- and post-training scores on a variety
of tests that included the Army Physical Fitness Test,
the Harvard Step Test, five muscle-power tests, deter-
mination of lactic acid and hemoglobin levels in the
blood, and anthropometric measurements.

Gogel, W.C., Tammaro, J.P., Nordling, D.A.,
& Nungesser, F.L., Jr. THE PERCEPTION OF
THE RELATIVE DEPTH POSITION OF OBJECTS AS
A FUNCTION OF OTHER OBJECTS IN THE FIELD
OF VIEW. Proj. No. 6-95-20-001, Rep. No.
107, Jan., 1953, 17 pp. Army Medical
Research Lab., Fort Knox, Kentucky.

1654
To investigate perception of the relative depth
positions of objects as a function of other objects
in the field, a difference between apparent and phys-
ical depth positions of laterally separated objects
was produced through use of a series of similar objects
of graduated sizes. Subjects adjusted a test object
(small disc of light) to depth equality with any
given part of the display or with a reference object
for various degrees of lateral displacement from refer-
ence object. Differences in equality settings for the
various conditions are analyzed. A hypothesis is
formulated concerning cues most essential in overcoming
binocular depth illusion.

Corso, J.F. & Harker, G.S. THE USE OF VARIABILITY SCORES
FOR DETERMINING THE PROBABILITY OF FIRST-SHOT HITS OF
STEREOSCOPIC RANGE FINDER OPERATORS. Proj. 6-64-11-05,
Sub-Proj. 11-05 (1), MECEA, Rep. 48, Sept. 1950, 7pp.
USA Medical Research Lab., Fort Knox, Ky.

1655
This study derives from Gaussian statistics a mathe-
matical formula which can be used to calculate the prob-
ability of a first-shot hit for any given range finder
operator variability score. The choice, from the tables
given, of a particular variability score as a criterion
in the selection of stereoscopic range finder operators
needs to be validated by the study of a large number of
operators over a reasonable period of time.

Harker, G.S., & Wickersham, R.A. BINOCULAR
SUMMATION OF GEOMETRICAL PATTERNS AS A
RANGE INDICATOR. Proj. No. 6-95-20-001,
Rep. No. 96, Oct., 1952, 17 pp. Army Medical
Research Lab., Fort Knox, Kentucky.

1656
To evaluate the sensitivity of binocularly sum-
mated reticle patterns in stereoscopic range finding,
the relative sensitivities of various patterns were
determined by comparing them with stereoscopic ret-
icles in a modified telescopic scope and in the ster-
eoptometer under laboratory conditions. Performance
scores are analyzed statistically for differences due
to patterns and type of reticle used. The approach
used in constructing the summated reticle patterns
is discussed together with the feasibility of using
them in practical situations.

THE INFLUENCE OF FORCE AND AMPLITUDE CUES ON
LEARNING AND PERFORMANCE IN A COMPLEX TRACK-
ING TASK. Contract AF 18(600)-1201, Proj.
7716, Tasks 77292, 57050, AFPTRC-TN-57-33,
March 1957, 12pp. Operator Laboratory,
AFPTRC, Randolph AFB, Tex.

1658
To determine the relative effectiveness of force and
amplitude cues on learning and performance of a complex,
two-dimensional tracking task, four groups of subjects
were trained in an F-80 interceptor simulator with a
control column in which the force and/or amplitude cues
could be varied. Group 1 trained with normal cues for a
given airspeed and altitude; the other groups trained
when one or both cues were reduced by a factor of four.
After sixty training trials, all groups practiced for
thirty trials on control column of Group 1. Tracking
proficiency was scored as time-on-target during final
three seconds of each 40-second run. Both training and
transfer performance were studied for differential ef-
fects of varied cues. Implications for utilization of
training devices are indicated.

Buskirk, E.R., Lampietro, P.P., Welch, B.E., & Marcinek, J.G. CALORIC INTAKE AND ENERGY EXPENDITURE OF EIGHT MEN IN A TEMPERATE ENVIRONMENT. Proj. 7-83-01-004C, Tech. Rep. EP-52, March 1957, 11pp. Quartermaster Research & Development Center, Natick, Mass.

1662
To study caloric intake and expenditure in a temperate climate, measurements were made on eight men during a twelve day period at Natick, Massachusetts. Outdoor activity consisted in marching over a marked course at 3.4 miles per hour for four hours. Daily measurements of weight and skinfold thickness (body density and body fat estimates) were made. Caloric consumption and caloric expenditure were calculated from food weighings and energy cost times time spent in each activity of the day. Weather records of temperature, humidity and wind speed were kept. The data were analyzed and discussed in terms of relationships between climate, caloric requirements, and energy expenditure.

Lewis, D.H. THE G-PROTECTION PROVIDED BY THE FULL PRESSURE HALF SUIT. Proj. NM-001 100 310, NADC MA-5511, Rep. 1, Sept. 1955, 23pp. Aviation Medical Acceleration Lab., NADC, Johnsville, Penn.

1665
To assess the protection against accelerative forces (g) provided by the lower half of the Navy's full pressure altitude suit, four subjects were tested on the human centrifuge. A base line of tolerance (criterion was loss of peripheral vision) was established for each subject in a relaxed and unprotected condition. Tests were then made while wearing the full pressure half suit, while exerting muscular straining, for the Z-2 suit (currently in use), and for the Z-2 suit plus straining. The amount of protection was expressed in units of g above base line and compared for the four conditions. Recommendations for further improvement of the half suit in terms of comfort and protection are made.

Adam, J.M., Ellis, F.P. & Lee, T.S. DAILY VARIATIONS IN PHYSIOLOGICAL VALUES FOR EUROPEAN AND ASIAN MEN WORKING AT HIGH TEMPERATURES IN THE TROPICS. R.N.P. 53/749, July 1953, 8pp. Medical Research Council, Royal Naval Personnel Research Committee, University of Malaya, Singapore.

6 British naval ratings who were acclimatized to the tropics and 3 Asians (2 Malays and 1 Indian) were observed while they carried out similar daily work in a similar climatic environment for a period of 14 days at Singapore. The uniformity trials were carried out at dry- and wet-bulb temperatures and air movements of 90/86° F, 50 ft./min; and 120/83° F, 500 ft./min. When allowances are made for differences in the respective levels of motivation, nutrition, and understanding of the purpose of the experiment, there was not a great deal of difference between these 2 groups of young men in the way they responded to work at high temperatures. The most important difference was that the British group sweated more than the Asian group and lost more chloride in their sweat.

Mowry, H.W., Webb, W.B., & Garvin, E.A. READABILITY OF INSTRUCTIONAL MATERIALS AND METHODS FOR ANALYZING. Contract Nonr 816(02), June 1955, 53pp. ONR, Washington University.

1674
To compare the reading difficulty level of study material in Naval Air Technical Training courses with the reading ability of trainees, typical reading materials were collected from three aviation schools: Machinist Mate, Structural Mechanics, and Electronics Technician. These materials were analyzed according to a modified Flesch reading ease formula. Samples with a grade level of 10-12 were also measured by the Dale-Chall formula. The formal education level of the trainees was computed from a sample of those trainees who were graduated or dropped from the school during spring, 1954. Grade level difficulty was compared with percentage of trainees who could be expected to read at that level. Recommendations relating to preparation of training materials are included. T. R 11

1675
This is an interim report (after a three-month period) on tests conducted to investigate the functional compatibility of protective clothing (gloves, boots, hood and one-piece suit) and the mask (Scott Air Pak or Chemox) provided for use with the CORPORAL system. Tests conducted: ability of wearer to hear normal tones, to use telephone, to run, to sit in vehicles, to pick up articles from ground; operational tests during eight fueling operations; questionnaires on suitability submitted to wearers; storage; exposure to sun, wind and dust; and operational tests during defueling. The results were reported in terms of adequacy of protection provided, design efficiency, ease of movement, quality of workmanship, and durability. Recommendations are included.

Broadbent, D.E., & Ford, H.K. TWO-CHANNEL LISTENING IN THE AIRCRAFT SITUATION. PPRC945, Nov. 1955, 6pp. Applied Psychology Research Unit, Medical Research Council, Cambridge, England.

1676
To assess the practical value of multiple channel listening for aircraft, a field trial was conducted. An aircraft was equipped with two radio sets fitted with special connections to pilot's headphones over which was transmitted conversation with call signals to the plane at intervals. Standard conditions involved presentation to both ears; experimental condition presented two conversations, one to each ear, with aircraft calls presented to both. The pilot's task was to fly a designated flight pattern and acknowledge any calls heard on headphones. Photographic records were made of flight performance and acknowledgments were recorded by co-pilot. Analysis of data was made in terms of accuracy of flight and listening performance. Comparisons with laboratory results are made. R 10

1677
Dunlap and Associates, Inc. PILOT PERFORMANCE WITH TWO DIFFERENT ATTITUDE DISPLAYS. Contract Nonr 1076(00), July 1955, 21pp. ONR, Dunlap and Associates, Inc., Stamford, Conn.

1677
To obtain further information with regard to flight performance with attitude displays which incorporate either a moving horizon (standard) or a moving airplane, eight ex-pilots were used to determine whether they could adapt more quickly to the new display than the one they had used previously. In the C-118 jet simulator each subject flew test maneuvers designed to sample realistic aspects of instrument flight control using both attitude displays in counter-balanced order. Performance measures (reversals; time to recover from unusual attitude; time sample readings of airspeed, altitude, and heading; aileron control effort) were analyzed for differences due to type of display used. Preferences and opinions were obtained from questionnaires. T. G. R 3

1679
Radio Corporation of America. STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS. Contract DA-36-033-sc-64469, Rep. 4, 1 May-31 July 1955, 9pp. RCA, Camden, N.J.

1679

This progress report on Signal Corps voice communication systems used in high-level noise environments presents an articulation evaluation of the communication efficiency of standard Signal Corps equipment when installed in two representative vehicles: a Tank, M4, and a Vehicle, Armored, Infantry, Tracked, T-39. A crew of five male subjects was trained in the laboratory on test material and techniques. Articulation tests were then conducted comparing the VNC-7 with the AN/AIC-10 equipment under known noise conditions in the laboratory and then with the VNC-7 equipment installed in the two vehicles. Tests were made with noise-to-noise, quiet-to-noise, and noise-to-quiet talker/listener conditions and word articulation scores computed. Subjective criticisms of the equipment are reported. T. C.

Beitscher, H.R., & Webster, J.C. INTELLIGIBILITY OF UHF AND VHF TRANSMISSIONS AT FIFTEEN REPRESENTATIVE AIR TRAFFIC CONTROL TOWERS. J. acoust. Soc. Amer., 1956, 28(4), 561-564. (U.S. Navy Electronics Laboratory, San Diego, Calif.).

1680

The intelligibility of air traffic control communications carried out over ultra-high frequency and very-high frequency channels is compared. A multiple choice word list was read in the air traffic control tower and recorded in an aircraft flying around it at a radius of 20 miles, while another talker in the aircraft read the same list to be recorded in the tower. This test was made at 15 control towers. The recorded word lists were played to five listeners in the laboratory interspersed with dummy lists containing alternate words. The results are factor analyzed for the effects of the frequency channel, the tower and the direction of communication (tower to plane or plane to tower). T. G. R. 3

1681

Bertsch, W.F., Webster, J.C., Klump, R.G. & Thompson, P.O. EFFECTS OF TWO MESSAGE-STORAGE SCHEMES UPON COMMUNICATIONS WITHIN A SMALL PROBLEM-SOLVING GROUP. I. acoust. Soc. Amer., 1956, 28(4), 550-553. (Human Factors Div., USN Electronics Lab., San Diego, Calif.).

1681

This study was made to determine the usefulness of a two message-storage system to an operator receiving messages from four sources which sometime transmit simultaneously. The messages consisted of an address, a station identification, and three pieces of information to be acknowledged and recorded on a plotting board. The message density was preprogrammed to give time when there was a pause of up to 20 seconds between messages and time when three messages were competing simultaneously. The experiment was run under three conditions: (1) no message-storage; (2) a fixed nine second message-storage used at the option of the operator; (3) a variable time message-storage under the control of the operator. The results are described in terms of the number of errors made on the plotting board and the number of messages that the operator requested repeated. T. R. 4

1683

Lloyd, V.V. THE INTERACTION OF STIMULUS AREA AND INTENSITY-AS CUES IN THE PERCEPTION OF DISTANCE. J. gen. Psychol., 1953, 49, 167-183. (Department of Psychology, Princeton University, Princeton, N.J.).

1683

To determine the degree to which variations in area and intensity influence distance judgments, four subjects viewed seven illuminated squares of varied sizes and rated them in order of their apparent distance. Two series of from 1.0 to 7.3 and 17.6 and 55.0 square degrees of visual angle in area were studied at five intensity levels from .001252 to 12.52 millilamberts. The data are analyzed and plotted to show depth perception as a function of area and intensity; the interactions of both are studied. T.G.R. 4

Billger, R.C., & Hirsh, I.J. MASKING OF TONES BY BANDS OF NOISE. J. acoust. Soc. Amer., 1956, 28(4), 623-630. (Central Institute for the Deaf, St. Louis, Mo.).

1685

The masking of pure tones by seven different bands of noise each 250 mels in width and having known cut-off characteristics was measured on five listeners at levels from 40 to 100 db (steps of 20 db) and frequencies from 100 to 10,000 cps. In a follow-up experiment masking was examined as a function of level in 10 db steps from 70 to 120 db for one band of noise (1000 - 1420). Masking in, above, and below the band of noise is reported, and the implications of these results for the generality of the critical band concept is discussed. G. R. 11

Chang, S.H. TWO SCHEMES OF SPEECH COMPRESSION SYSTEM. J. acoust. Soc. Amer., 1956, 28(4), 565-572. (Northeastern University).

1687

Two methods are described for reducing the bandwidth necessary for the transmission of intelligible speech. The first scheme involves extracting two discrete parameters--voicing and turbulence--and one continuous parameter--fundamental frequency. The second scheme, treated in less detail, outlines the requirements for identifying acoustic elements with phoneme-like properties. G. R. 24

1689

David, E.E. Jr. NATURALNESS AND DISTORTION IN SPEECH PROCESSING DEVICES. J. acoust. Soc. Amer., 1956, 28(4), 586-589. (Bell Telephone Laboratories, Murray Hill, N.J.).

1689

The important parameters for evaluating a speech processing device are the criteria of fidelity, the signal to noise ratio, and the bandwidth necessary to transmit the reduced signal. From these parameters an efficiency rating can be specified. An important constraint in comparing two speech processing devices is that they have equal fidelity according to the criterion being employed. T. R. 8

Sanders, T., & Morris, H. INVESTIGATION OF THE USE OF THE PERISCOPE SEXTANT DURING TWILIGHT. BuAer Proj. TFD NAX AE-9149, Rep. NAES-INSTR-1-53, Jan. 1953, 4pp. Aeronautical Instruments Lab., NAMC, Philadelphia, Penn.

1690

To investigate the usefulness of the periscope sextant during twilight, two observers located celestial bodies with the unaided eye and with the periscope sextant. Observations were made (1) from the roof of a building only in clear weather and when there was a minimum of haze and smoke in the atmosphere, and (2) from an S-1B aircraft in flight. The times at which the bodies were first observed and the corresponding altitude of the sun were compared for the various conditions of observation. Discussion is in terms of the effectiveness of the periscope in reducing the twilight band width for celestial observations.

Jerger, J.F., & Carhart, R. TEMPORARY THRESHOLD SHIFT AS AN INDEX OF NOISE SUSCEPTIBILITY. J. acoust. Soc. Amer., 1956, 28(4), 611-613. (Audiological Laboratory, Northwestern University).

1693

The purpose of this study was to evaluate the duration of the temporary shift in the threshold for a 4500 cps tone, after exposure to a 3000 cps tone at 100 db for one minute, as an index of susceptibility to noise-induced hearing loss. Audiograms were obtained on 178 subjects at 500, 1000, 2000, 3000, 4000, 6000, and 8000 cps. No subject had a hearing loss of more than 15 db at any of these frequencies. The duration of the temporary threshold shift was measured before the subjects were exposed to jet engine noise in test cells for an average of 12 hours over a period of three days. Audiograms were obtained again eight weeks later. The relation between the duration of the threshold shift and the size of the noise-induced hearing loss is presented.

Martin, D.W., Murphy, R.L., & Meyer, A. ARTICULATION REDUCTION BY COMBINED DISTORTIONS OF SPEECH WAVES. J. acoust. Soc. Amer., 1956, 28(4), 597-601. (The Baldwin Piano Company, Cincinnati, Ohio).

1695

Speech intelligibility was measured under different types of distortion--gross high-frequency attenuation, gross frequency response irregularity, multiple echoes, and random amplitude modulation--single and in combination. At least two talkers read four lists of phonetically balanced words to four to six listeners with each type or combination of types of distortion introduced into the channel. The results are expressed in terms of the reduction in word articulation.

Alexander, I.E. & Githler, F.J. CHRONIC EFFECTS OF JET ENGINE NOISE ON THE STRUCTURE AND FUNCTION OF THE COCHLEAR APPARATUS. J. comp. physiol. Psychol., Aug. 1952, 45(4), 381-391. (Princeton University, Princeton, N.J.).

Electrical and histological changes in guinea pig ears were measured 6 to 8 weeks after a 15 min. exposure to jet engine noise. The ambient sound level at cage distance from the engine was in excess of 140 db. for the total measurable frequency band 25 to 7,500 cps. The group audiogram loss was 34db. This figure indicates that the recovery trend which had been observed in groups measured at shorter time intervals has been reversed. Chronic ears were poorer in sensitivity than those tested at more acute stages. Long-term effects were confined to the cochlea. No middle-ear damage was observed. The primary area of damage to the cochlea was found between 6 to 12 mm. from the basal end. However, more destruction was seen at the base than in the apex. It appeared that degeneration spreads from the middle of the cochlea basally. Electrical sensitivity was found to be depressed in accordance with the distribution of damage in the cochlea. These results support the position of total cochlear involvement in response to sound. That is, localization exists only in a gross fashion. It is concluded that jet engine noise represents a serious occupational hazard and suitable protective measures are necessary.

Neely, K.K. STUDY OF MAYDAY AND SOS AS
RADIO-TELEPHONE DISTRESS SIGNALS. J. acoust.
Soc. Amer., 1956, 28 (4), 554-555. (Defence
Research Medical Laboratory, Toronto, Canada).

1698
The detectability thresholds of the words SOS and
MAYDAY as heard against a background of white noise and
speech were determined in order to evaluate them as sig-
nals of distress for use in radiotelephone communications.
The test words were recorded as spoken by each of 12 per-
sons of varying national accents. The recordings were
mixed with words read from a Multiple Choice Intelligi-
bility test and played over earphones to each of ten lis-
teners of varying national backgrounds in an environment
of white noise at a level of 103 db. The thresholds of
detectability of the two words are compared in relation
to the nationality of the speaker and listener.

Pietrasanta, A.C. JET NOISE PROBLEM IN AIR-
CRAFT CARRIER ISLANDS. J. acoust. Soc. Amer.,
1956, 28(3), 427-433. (Bolt Beranek &
Newman Inc., Cambridge, Mass.).

1699
The interference with speech communication in the
control islands of aircraft carriers resulting from the
high noise levels generated by aircraft operations, espe-
cially the rumble of jet aircraft, is discussed in rela-
tion to criteria for effective speech communication as a
function of the distance between the talker and the
listener. Octave band analyses of the noise levels at
various points in the control islands are reported. The
probable noise levels involved in future jet operations
are estimated and the amount of noise reduction required
to meet the criteria is calculated.

Sherwin, C.W., Kodman, P. Jr., Kovaly, J.J.,
Protha, W.C., & Melrose, J. DETECTION OF
SIGNALS IN NOISE: A COMPARISON BETWEEN THE
HUMAN DETECTOR AND AN ELECTRONIC DETECTOR.
J. acoust. Soc. Amer., 1956, 28 (4), 617-622.
(Control Systems Laboratory, University of
Illinois).

1701
The human listener as a detector is compared to an
electronic detector consisting of an RLC band pass filter,
a square law detector, and an exponential integrator. A
preliminary experiment served to determine the signal-to-
noise ratio at which the subjects, four adult males,
could detect a 1000 cps tone 60% of the time. This mix-
ture of signal and noise was tape recorded with signal
durations of from 0.03 to 1.0 sec. and played to both
the subjects and the electronic detector. The parameter
values for which the electronic detector most resembled
the human listener are given, and the residual discrepan-
cies between their behaviors are described.

Tollhurst, G.C. SPEECH RECEPTION AND TEMPORARY
HEARING LOSS AS A FUNCTION OF EXPOSURE TO
HIGH-LEVEL NOISE. J. acoust. Soc. Amer.,
1956, 28 (4), 567-580. (Ohio State Research
Foundation and U.S.N. School of Aviation Med-
icine, Pensacola, Fla.).

1703
To determine the masking of speech and the temporary
loss of hearing produced by intense noise as a function
of its level, spectrum, and duration, a total of 1402
listeners were exposed to noise for two hours. Six
broad band noises at sound pressure levels of 100 db and
over were used varying in the slope of the spectrum level
between 1000 and 10,000 cps from -6 to +3 db per octave.
A tape recorded multiple choice intelligibility test was
administered at 105 db sound pressure level during the
exposure, and thresh- 's were determined for pulses of
5000 cps tone and wh noise during periodic quiet in-
tervals 60 secs. in duration. Articulation scores and
hearing thresholds are reported as functions of the
noise level, spectrum, and time of measurement. G. R 10

1704
Tollhurst, G.C., & Peters, R.W. EFFECT OF
ATTENUATING ONE CHANNEL OF A DICHOTIC CIRCUIT
UPON THE WORD RECEPTION OF DUAL MESSAGES.
J. acoust. Soc. Amer., 1956, 28 (4), 602-605.
(U.S. Naval School of Aviation Medicine, Naval
Air Station, Pensacola, Fla.).

1704
To determine the effects of the loudness level of a
message arriving in one ear upon its intelligibility, and
upon the intelligibility of another message arriving
simultaneously in the other ear, 12 panels of 17 to 30
subjects listened to messages consisting of groups of
words from a multiple choice intelligibility test. The
average sound pressure level in one ear was fixed at
95 db, and the average sound pressure level in the other
ear was varied from 80 to 95 db by 3 db steps. The
intelligibility of the messages arriving in each ear is
described as a function of the varying loudness level.

Weiss, B. BUILDING "FEEL" INTO CONTROLS: II. PRESSURE FEEDBACK, SHORT MOVEMENTS, AND THE INFLUENCE OF MIXED VERSUS CONSTANT SERIES OF DISPLACEMENTS. Contract N6onr-241, T.O. 6, Proj. 20-M-1d, Tech. Rep. 241-6-25, Aug. 1955, 6pp. SDC, University of Rochester.

1708
This study was designed to evaluate the effect of varying pressure cues on control displacements of small magnitudes (less than 7.5 degrees). Utilizing four pressure ranges: 0, 0-7.5, 0-15, and 0-30 lbs., and four displacements (maximum displacement of 6°), eight subjects were evaluated for range effect as they attempted to compensate for the vertical displacement of a spot of light from the center of an oscilloscope screen. The data were analyzed in terms of mean percentage constant errors as a function of pressure and displacement. Conclusions are drawn concerning the effects of lag in visual feedback and of a mixed sequence of displacements on relative error in positioning with stick type controls.

Powers, K.H. A UNIFIED THEORY OF INFORMATION. Tech. Rep. 311, Feb. 1956, 105pp. Research Laboratory of Electronics, MIT.

1710
"The probabilistic theory of information is extended to processes involving the most general probability distributions. A change of probability measure on an abstract space serves as the appropriate mathematical model for the fundamental information process. A unified definition for the amount of concomitant information, which takes the form of a functional of the a priori and a posteriori measures, is introduced. This definition is sufficiently general to be applied to a theory that includes both the discrete and continuous theories as special cases. The definition is applied in a study of the information associated with the realizations of a stochastic process. A brief investigation is made of the problems of communication in the presence of noise and through linear networks." R 28

1712
This study was designed to evaluate the effects on listener accuracy of simultaneously performing a psychomotor task. A total of 29 subjects were presented with a recorded list of words under four conditions of simultaneous activity: (1) marking words heard (no psychomotor task to perform); (2) extinguish lights with hand switches; (3) extinguish lights with foot pedals; and (4) a combination of the second and third conditions. Listening accuracy was defined as the number of correctly identified words. The results are presented and discussed in terms of mean accuracy scores as a function of psychomotor task complexity.

Moser, H.M., Dreher, J.J., & Oyer, H.J. THE RELATIVE INTELLIGIBILITY OF SPEECH RECORDED SIMULTANEOUSLY AT EAR AND MOUTH. Contract AF 19(604)-1577, Tech. Rep. 28, Supplementary Rep. 2, AFPCRC TN 55-64, May 1956, 8pp. Operational Applications Laboratory, AFPCRC, Bolling AFB, Washington 25, D.C. (Ohio State University Research Foundation).

1713
To study the relative intelligibility of speech recorded simultaneously at ear and mouth, a noise cancelling lip microphone (M33/AIC) and an ear microphone with clay covered plastic shield for noise exclusion were used. Six male speakers read three randomizations of a list of monosyllabic air traffic control words, recorded in ambient white noise fields of 25, 95, and 105 decibels. Twelve trained listeners made intelligibility judgments of the three lists under signal-to-noise ratio of -6 decibels (additional white noise superimposed on speech). Scores (percent intelligibility) were compared for speech recorded at mouth and ear. Advantages and disadvantages of the two positions are discussed.

Tolson, J. COMPARATIVE PHYSIOLOGICAL TRIAL
 OF FOUR TYPES OF JERKIN. Rep. 46, Feb. 1955,
 18pp. Clothing and Equipment Physiological
 Research Establishment, Directorate of Physio-
 logical and Biological Research, Ministry of
 Supply, London, England.

1715

This is a report of a comparative study of four
 types of jerkin: (1) the standard Jerkin (leather lined
 with serge); (2) a Jerkin of PVC proofed material lined
 with serge; (3) PVC proofed material lined with shirting,
 angora; and (4) a Jerkin of Cambr cloth. A total of
 24 subjects wore the various jerkins under conditions
 simulating cold weather. Skin temperatures taken at
 appropriate sites were recorded along with the sub-
 jects' own evaluation of the jerkins. The results are
 presented and discussed in terms of the relative ther-
 mal protection afforded by each of the jerkins.

Torrey, Jane W. EVALUATION OF COLOR VISION
 TESTS: ANNUAL SUMMARY REPORT OF PROGRESS.
 Contract Nonr 996(03), Nov. 1956, 5pp. ONR,
 Connecticut College.

1717

This is an annual summary report of research on the
 general problem of color vision and color vision tests.
 Two studies in progress are outlined. The first en-
 tails a survey of color defect in women to arrive at an
 accurate estimate of the incidence of this defect among
 females. The results of this survey for 390 subjects
 are presented. The second study is concerned with de-
 termining the hue, saturation, and brightness discrim-
 ination thresholds among normal and color defective
 individuals. A description of the apparatus (a pro-
 jection device) being built especially for this study
 is presented along with a statement concerning its
 potential completion.

Sevier, R.D. EVALUATION OF SCOTT NOISE LEVEL
 ANALYZERS DEVELOPED UNDER CONTRACT 55-527-F.
 Proj. TED TPR AE 6534, Rep. 1, Final Rep.,
 Dec. 1956, 22pp. Naval Air Test Center,
 U.S. Naval Air Station, Patuxent River, Md.

1718

This article presents a description and evaluation
 of the Scott noise level analyzer, an instrument designed
 to analyze aircraft noise within the range of 40 to 140
 decibels. The extension of this range to 200 decibels
 by means of a high intensity adapter unit is also dis-
 cussed. The evaluation included the following: accuracy
 of calibrated attenuator, frequency response of indi-
 vidual pass-bands, overall sound level accuracy, micro-
 phone noise and hum, flight evaluation, and many other
 aspects. The results are presented and discussed in
 terms of the specific performance of the analyzer under
 the individual tests and its general suitability with
 respect to particular types of aircraft and noise eval-
 uation situations.

Beldam, F.E.M. A COMPARISON OF EXPERIMENTAL
 ALTITUDE PRESENTATIONS. Rep. 57/1, Jan.
 1957, 17pp. Institute of Aviation Medicine,
 Royal Canadian Air Force, Toronto, Canada.

1719

Designed to determine an optimum altimeter presen-
 tation, this study compares the interim fix (Type M-I
 Modified Three-Pointer) with two instrument presen-
 tations, i.e., a five digit counter and a white on black
 logarithmic scale, and with a Kollsman counter-pointer.
 24 flight cadets made a series of readings with each of
 the instruments under varied conditions of lighting and
 exposure. The mean errors occurring with each type of
 altimeter were recorded. The results are discussed in
 terms of the instrument, lighting conditions, and ex-
 posure time which leads to the least number of errors
 in reading.

Pascals, L.R., Grossman, M.I., & Sloane, H.S.
 CORRELATION BETWEEN THICKNESS OF SKINFOLDS
 AND BODY DENSITY IN 88 SOLDIERS. Proj. 6-60-
 11-019, Rep. 162, April 1955, 24pp. Medical
 Nutrition Laboratory, Fitzsimons Army Hospital,
 Denver 8, Colo.

1720

This study was designed to evaluate the relations
 between thickness of skinfold (at various sites) and
 body density with the ultimate goal of deriving equa-
 tions which would permit estimation of body density from
 measurements of skinfold thickness. Skinfold measure-
 ments were made at various sites with 88 subjects (18
 to 25 yrs. of age) and correlated to body density mea-
 surements. On the basis of the relation among certain
 skinfold thicknesses, sites and body density a multiple
 regression equation was derived. This equation is re-
 commended for use in estimating body density from skin-
 fold thickness measurements.

Davis, H., & Weinstock, J.K. AN ENGINEERING
 ANALYSIS OF CARGO HANDLING: III. ANALYSIS
 OF STOCHASTIC MODEL OF CARGO HANDLING. Con-
 tract Nonr 333(07), Rep. 56-34, July 1956,
 33pp. ONR, Department of Engineering,
 University of California.

1721

This article presents an analysis of a stochastic
 model of cargo-handling systems. The primary factor
 investigated is the effect of cycle-to-cycle performance
 variability upon productivity in the link-node model.
 Mathematical and simulation techniques were used to
 evaluate two- and three-link systems with zero storage
 capacity at the nodes. The results are presented and
 discussed in terms of the effect of cargo-handling time
 upon retardation of commodity flow and the general de-
 gree of retardation present in cargo-handling systems.

Grim, H.L. DESIGN AND CONSTRUCTION OF A
 COMMUNICATION SIMULATOR SYSTEM. Proj. 4651,
 WADC Tech. Note 56-94, July 1956, 29pp.
 Directorate of Flight and All Weather Testing,
 WADC, Wright-Patterson AFB, Ohio.

1723

The Communication Simulator System described in this
 report was designed to provide a communication link be-
 tween Radar Approach Control Center (RAPCON) controllers
 and radar target simulator operators. The system will
 provide up to thirty simulator operators with a thirty
 channel talk and receive circuit to the RAPCON control-
 lers. The system was integrated into standard RAPCON
 communication equipment (AN/FSA-4 Control Monitor Group)
 without affecting its normal operation. This enables
 the controller to communicate with "live" aircraft and
 simulator operators simultaneously. The combination of
 radar target simulator and communication simulator pro-
 vides a means for the development of new procedures and
 techniques for air traffic control research. 1.

Alcott, W.S. AIRFIELD APPROACH LIGHTS. Contract AP 33(600)-29600, Proj. 6061, Task 60427, WADC Tech. Note 55-778, Dec. 1955, 178pp. Equipment Laboratory, WADC, Wright-Patterson AFB, Ohio. (United Engineers Inc.).

1729

This report presents an analysis of the various visual problems encountered in the design and usage of high altitude suit visors. These are (1) restrictions to field of view; (2) optical distortions produced by shape of visor; (3) loss of visual field through optical sights caused by excessive distance that the eye is placed from the sights from the visor; and (4) visual impairment due to fogging of visor and to methods used to eliminate the fogging. Design criteria for helmet visors are outlined.

Fulton, J.F., Hoff, Marie M., & Perkins, Henrietta T. (Ed.) A BIBLIOGRAPHY OF VISUAL LITERATURE 1939-1944. Publication 11, Historical Library, Yale Medical Library, 1945, 201pp. Committee on Aviation Medicine, Division of Medical Sciences, National Research Council, Washington, D.C.

1730

To discover maximum noise levels that office personnel find acceptable, and their reactions to noisy offices, a survey was conducted at Hill Air Force Base. A questionnaire composed of 15 rating scales was administered to 190 people scattered over 17 different offices. The rating scales yielded workers' estimates of the "noisiness" of their environment and of the effect of noise on various aspects of their work. Noise measurements were made in the office at time subjects were replying to questionnaire and, over a full day each, at three selected locations. The results of the rating scales were compared with speech interference levels and loudness levels. A criterion for maximum noise acceptable to office personnel was derived. Intermittent and steady noises are discussed. T. G. I. R 11

1734

This book presents a bibliography of the literature on vision that has relevance to military operations. The period covered is 1939 through 1944. Areas covered are: anatomy and ophthalmology, physiology and psychology, visual examination and testing (including methods and instruments), correction of ocular defects in military personnel, training for military specialties (including optimal conditions and procedures, job analyses), ocular trauma (in military services), goggles and ocular protection, illumination, and visibility. Author and subject index are given and a brief description of the more active agencies in Great Britain, the United States, and Canada which have conducted research on visual problems.

Graybiel, A., Niven, J.I., & MacCorquodale, K. THE EFFECT OF LINEAR ACCELERATION ON THE OCULOGYRAL ILLUSION. Res. Proj. NM 001 110-100, Rep. 42, July 1956, 16pp. U.S. Naval School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

1731

This study was designed to evaluate experimental runway distance markers. The markers, each being four-foot square with nonreflective white numerals against a background of international orange, were placed in appropriate positions on a runway and externally lighted by two different methods (to control brightness). Questionnaires were completed by 52 pilots (of various types of aircraft) following use of the runway for normal day and night takeoffs and landings. The relative adequacy of these markers under daytime and night conditions is discussed on the basis of the pilots' answers concerning visibility, information provision, preferred marker design, etc.

1735

To study the influence of linear acceleration on the response to stimulation of the semicircular canal, experiments were performed on five healthy persons on the human centrifuge. Angular acceleration was kept constant and linear acceleration was varied by having the subject seated near the center of rotation or 17 feet from center. The oculogyral illusion was used as an indicator of stimulation of the semicircular canals and was measured by having the subject fixate a collimated star in the dark and signal the onset and cessation of apparent rotations which occurred. The data (durations of illusion) were studied by analysis of variance for effect of linear acceleration.

Skilling, D.C., McCutchan, J.W., & Taylor, C.L. A QUANTITATIVE INVESTIGATION OF THE MA-1 VENTILATING GARMENT WHEN USED WITH A MODIFIED MK-IV ANTI-EXPOSURE SUIT. Contract AF 33 616-32, Proj. 7155, WADC Tech. Rep. 56 209, Dec. 1956, 21pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio. (University of California)

1736
To determine the fall time, terminal velocity and drag coefficient of a man falling freely from a high altitude in a delayed-opening parachute jump, 3 dummies weighing 180, 220, and 280 pounds and one man weighing 240 pounds wearing field equipment were dropped from altitudes up to 50,000 feet. Their fall was followed by automatically tracking radar. The variability of drag coefficient and fall time is discussed in relation to operational conditions and the use of automatic parachute-opening devices operating on a simple time delay.

1739
To provide information concerning the physiological state of human subjects wearing the MA-1 ventilating garment, an MK-IV exposure suit, and other garments comprising 2.15 clo of thermal resistance in thermal environments ranging from 160°-240° F, measurements were made on two subjects. The ventilating garment was given air inputs ranging from 6-14 ft. 3 per minute in volume and 50°-90° F in temperature. The thermal responses were analyzed in terms of heat storage, body temperatures, heart rates, sweat rates, and composite indices of these variables. Predictive equations were developed for estimating the protective limit of the air-ventilated assembly. Studies of the mode of protection of the suit are reported. T. G. I. R 11

Henschke, U.K. & Mauch, H.A. A STUDY OF THE DESIGN FOR A THREE-DIMENSIONAL HAND CONTROL FOR AIRCRAFT. TSEA 696 110, GS AAF Wright Field 42, May 1947, 12pp. USAF Aero Medical Lab., Air Materiel Command, Wright Field, Ohio.
This paper discusses the possibilities for the design of a three-dimensional hand control for aircraft based on former studies. The different possible arrangements can be evaluated in the following way: a) starting from the 3 linear and the 3 rotary movements (which can be derived from the 6 degrees of freedom of a point in space) it is found that 11 movements are logical for elevator control, 9 for rudder control, and 9 for aileron control; b) there are 31 different combinations for these logical movements; c) only 2 of these combinations are acceptable. The 2 suitable combinations of control movements for a three-dimensional hand control are: a) turning a wheel about the longitudinal axis for aileron and for rudder, lateral movement for rudder and aileron; and longitudinal (fore and aft) movement for elevator. For the first flight tests of a three-dimensional hand control, the attachment of a wheel (turning about the longitudinal axis) for rudder control to a normal two-dimensional control stick offers the simplest technical solution.

Graybiel, A., & Niven, J.I. PERSISTENCE OF THE AUTOKINETIC ILLUSION IN PERSONS WITH BILATERAL INJURY OR DESTRUCTION OF THE LABYRINTH OF THE INNER EAR. Res. Proj. WM 001-110 100, Rep. 41, July 1956, 4pp. USN School of Aviation Medicine, US Naval Air Station, Pensacola, Fla.

1740
To explore the possibility that in the absence of angular acceleration, the sensory elements in the cupulae might be stimulated in random fashion by weak currents in the endolymph, seven deaf persons with bilateral labyrinthine injury were used as subjects. In each trial the subject sat in darkness for one minute fixating a spot of light 16 feet away. In half the trials the light was stationary and in half it was moving. The task was to trace the direction of movement on a paper pad and then estimate distances of movement. The frequency and magnitude of actual and autokinetic movements were compared.

Clark, D.M. MEDIASTINAL EMPHYSEMA (PNEUMOMEDIASTINUM) FOLLOWING EXPLOSIVE DECOMPRESSION OF HUMANS: REPORT OF TWO CASES. TSEA 3 695 291, Jan. 1945, 10pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

2 cases of mediastinal emphysema following explosive decompression of humans from a simulated cabin altitude of 8,000 ft. to a simulated flight altitude of 31,000 ft. in 0.5 sec. are reported, with a review of pertinent information concerning pathogenesis and diagnosis. Apparently the findings in these cases represent the first reported objective evidence of pathological changes following explosive decompression of humans. In experimental animals and in clinical material, it has been demonstrated conclusively that pneumomediastinum may be produced by increased intraalveolar pressure and overdistention of pulmonary alveoli. After observation of 5s during explosive decompression there can be no doubt that increased intraalveolar pressure and alveolar distention result from the procedure. In the cases reported here, even if no factor producing increased intraalveolar pressure and alveolar distention were present, it would be extremely difficult to explain as "spontaneous" the appearance, at exactly the same time and place, of 2 cases of pneumomediastinum, considering the fact that the total number of reported cases of spontaneous pneumomediastinum to date is thought to be no greater than 75 or 100.

Gagge, A.P. EXPLOSIVE DECOMPRESSION-A SUMMARY AND EVALUATION FOR AIRCRAFT PILOTS. TSEAL 3 695 291, July 1945, 11pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

Analytical methods are developed in this report which allow the aircraft designer to analyze and evaluate any danger of explosive decompression that may result from the use of cabin pressurization at altitudes. These methods are applied to a typical medium and heavy bombardment aircraft, and fighter-type aircraft; and practical criteria are proposed by which aircraft designers and engineers may evaluate the danger of decompression that may result from enemy gunfire or from structural failure of pressure cabin aircraft in flight. A series (3) of experiments are summarized in tabular and graphic form. These experiments contain the only experimental data available to date (1945) that are of significance to aircraft designers in evaluating the danger of explosive decompression and in the design of cabin pressure controls.

Randa, I. F.E. THE CENTER OF GRAVITY OF THE SEATED FIGHTER PILOT. TSEAL 3 695 321W, Dec. 1944, 5pp. USAF Aero Medical Lab., Hq., Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

The center of gravity of 10 Ss, when seated according to requirements in the Handbook of Instruction for Aircraft Designers, was determined. S was balanced, as seated in the mock-up, on a 1/4" "knife" edge and photographed with a vertical line passing through the fulcrum point. S was then balanced at another fulcrum point, also with the vertical line shown. The 2 photographic negatives of these positions were superimposed and a positive print made of the 2 together. The point of intersection of the 2 vertical lines is then the center of gravity of the seat and man. A correction formula is then applied to eliminate the factor of the seat itself. The average location of the 10 Ss wearing light clothing, and seated according to requirements in the Handbook of Instruction for Aircraft Designers, is 19.46" from the seat and 11.60" from the back; distances being recorded perpendicular to the respective surfaces. In general, the center of gravity tended to lower with shorter statures and rise with taller statures.

Damon, A. GUNNERS' PROVISIONS IN PROPOSED MARTIN "STREAMLINED" TURRETS FOR THE B-32. TSEAL 3-695-32LL, Jan. 1945, 5pp. USAF Aero Medical Lab., Hq., Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

The purpose of this report was to analyze gunners' provisions including comfort, efficiency, vision, and safety in blueprint drawings of 2 streamlined turrets for the B-32 plane. No final comment on the 2 turrets could be made until mockups of the turrets were available. However, some comments on specific features were made. It was felt that of the 2 turrets, the upper is much better from the gunners' standpoint. The range of gunner size is 5'10" and 120 lbs. to 5'10" and 170 lbs. Comfort, efficiency, vision, and safety are all seriously impaired chiefly in the lower turret. Numerous improvements were recommended to improve conditions for the gunner.

Patt, D.I. OPTIMUM SHAPE AND MINIMUM SIZE OF CATWALKS IN PARACHUTE AIRCRAFT. TSEAL 3 695 3235, April 1945, 10pp. USAF Aero Medical Lab., Hqs., Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

The subjects used in the experiments described below ranged in height from 5'11" to 6'3" and in weight from 155 to 200 lbs., representing the top 5% size range of 3,000 flying personnel analyzed in an earlier survey by the Materiel Command. Each subject wore the following personal equipment: flying boots, Type A-6; intermediate flying suit (B-15 jacket, A-11 trousers); intermediate flying helmet, Type A-11; equipped with an A-14 oxygen mask; walk-around bottle, Type A-6; and each of two types of parachutes. Each subject, wearing first the back type (B-8) parachute and then the chest-type (QC) parachute harness (with and without parachute) was caused to walk through a catwalk mock-up of varying dimensions until the minimum dimensions for safe progress were determined. Photographs illustrating the subject mock-up and its use are presented. Telephone communications with the Structures Unit, Aircraft Laboratory, revealed that for purposes of stress, weight and bomb clearance, a trapezoid is the most desirable cross-sectional shape for a catwalk. Hence the mock-up was constructed as a trapezoid of variable dimensions. Results of tests show that the cross-sectional inside dimensions of a catwalk should form a trapezoid not less than sixty-three (63) in. in height, not less than twenty-two (22) in. across the top and not less than twelve (12) in. at the base.

1752
Cover, R.A. A COURSE IN HUMAN ENGINEERING. Amer. Psychologist, 1956, 11(5), 241-243. (St. Lawrence University, Canton, N.Y.).

Reported is the basic outline of a course in "Experimental Industrial Psychology" offered at the St. Lawrence University. The formal aspect of the course including the text (Applied Experimental Psychology by Chapman, Morgan and Garner), as well as several collateral readings were discussed. Besides this aspect of the course, the Ss were required to conduct an individual research project. This project was done in 3 parts. The over-all plan was to identify some practical human engineering problem and to apply psychological data and techniques, plus ingenuity and realistic solutions. In Part I, the students selected a problem and a complete job analysis was conducted. In Part II, recommendations emerging from the job analysis were made. This allowed the students to become familiar with the literature and techniques available. Part III required the students to discuss how the recommendations had, or had not, remedied the problem as analyzed. The value of this type of program was discussed as well as the alternative to this type of program. (MEIAS)

1750
Patt, D.I. COCKPIT DIMENSIONS IN RELATION TO HUMAN BODY SIZE. TSEAL 3 695 3227, April 1945, 5pp. USAF Aero Medical Lab., Hqs., Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

A series of measurements was made on a selected group of 52 Ss (ranging in size from 5'3" and 125 lbs. to 6'3" and 205 lbs.) to determine minimum fighter cockpit widths at shoulder and elbow level, optimum seat-to-rudder pedal distance and the range of seat-to-eye height in each of 3 positions. Results obtained indicate that the absolute minimum fighter cockpit widths at shoulder and elbow level are 24 and 26" respectively. The distance from the seat reference joint to rudder pedal bar ranged from 35.5 to 41.5 with a mean of 39.1". The range of seat-to-eye heights was 28.1 to 35.1", with a mean of 31.8", when sitting erect with back forming a 90° angle with the seat. When Ss were tilted back 13.5° from the vertical, making an angled 103.5° with the seat, an average of 1.3" in seat-to-eye height was lost, giving a range of 26.9 to 34.0", with a mean of 30.5". An additional 1.2" average (range 0.3 to 2.6") is lost in the latter position due to natural slump. The results of experiments on seating indicate that a properly designed seat will reduce natural slump to a minimum, so these last figures are subject to change with the advent of new seats.

Gagge, A.P. HUMAN FACTORS IN AIRCRAFT DESIGN. TSEAL 3 695 53, May 1945, 11pp. Aero Medical Lab., Headquarters, Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

An overview of human factors in aircraft design is provided. It is not intended as a detailed analysis, but to present in a general way the considerations that must be made in aircraft design for the human factor. The topics covered are: a) space and weight requirements; b) altitude tolerance; c) heat and cold tolerance; d) sound; e) vision; f) acceleration. It is noted that in the long run the surest way to improve pilot and aircrew efficiency is to reduce his concern for personal equipment by the proper design of the aircraft itself. (MEIAS)

1756
Taylor, C.L. THERMAL REQUIREMENTS FOR AIRCRAFT CABINS. TSEAL-3-695-56, Aug. 1945. 53pp. Aero Medical Lab., Headquarters, Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

1756
The tolerance of man to extreme thermal environments is reviewed as it bears upon the design of aircraft cabins. The theoretical variables involved in heat exchange between man and his environment are analyzed, equations developed, and related to the results of experiments on human exposure to hot and cold conditions. The influence of factors peculiar to aircraft cabins are included.

Jhapanis, A., & Schachter, S. VISUAL EFFECTIVENESS OF LOW REFLECTANCE COATINGS APPLIED TO TRANSPARENT AREAS OF AIRCRAFT. TSEAL-3-695-62, Oct. 1945. 24pp. Aero Medical Lab., Air Technical Service Command, Engineering Div., Wright Field, Dayton, Ohio.

1759
To determine effect on night vision of low reflectance coatings applied to the transparent areas of aircraft, thirteen such coatings (applied to plate glass, laminated glass, or plastic) were evaluated for (1) effects of haze (Johnson Night Vision Tester and Luckiesh-Hess Low-Contrast Test Chart used with conditions of no glass, uncoated glass, and several coated samples); (2) effects of specular reflectance (JNL Night Vision Tester; under conditions where reflected light from instrument panel was thrown on the intervening glass). The results are analyzed and discussed in terms of the value of such coatings in improving the night vision of pilots.

Patt, D.L., Damon, A. C. RANDALL, F.E. PRINCIPLES OF SEATING IN FIGHTER TYPE AIRCRAFT. Serial TSEAL 3 695 58, Sept. 1945, 43pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

This study was conducted to determine the fundamental requirements of seating in fighter type aircraft for uses in design of future aircraft and where possible, in modifying present aircraft in such a way that the operating efficiency of the pilot may be extended over a period of time commensurate with the airplane's range. Three separate studies were conducted. In these experiments, 25 pilots were given free choice of cockpit dimensions and seat adjustments which were adjusted so that the distances from the point of heel rest to the horizontal line of vision was 39 1/4 in. Comfort was maintained for an average of 5 hours and 55 min. Using the same horizontal line of vision distance, 24 pilots made check runs on the average dimensions, angles, and contours which were held the longest in the initial phase. Seating comfort was held for an average of 7 hrs. and 19 min. Four horizontal lines of vision-to-the-floor distances on cockpit and seat dimensions were studied (35", 37", 41", and 43"). It was determined that the fundamental requirements of seating in fighter type aircraft are dependent upon seat angulation, differential support of the individual's weight over the seat contour, and upon the control arrangement.

Damon, A. ANTHROPOMETRIC DATA ON ARMY AIR FORCES FLYING PERSONNEL. EXP 149 695 4C, Oct. 1942, 58pp. USAF Materiel Center, Experimental Engineering, Wright Field, Dayton, Ohio.

Reported here is an anthropometric survey conducted on 2961 aviation cadets and 584 gunnery students who were measured at Southeast and Gulf Coast Air Forces Training Centers. Included in the report are the data, techniques of measurement, percentile distributions and a description of how to use the distributions. 28 bodily measurements were taken. Correlations of stature, weight, and sitting height with other body segments were made. It was found that for purposes of selecting men for specific turret size, most of the important measures can be predicted from stature and weight.

Randell, R.E. ARTICULATED PLASTIC MANIKIN STANDARDS. MEMORANDUM REPORT. Serial ENG 49 695
28, June 1943, 26pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

The anthropometric data obtained from 2961 aviation cadets were analyzed on the basis of total stature range and were divided into equal thirds. From these 3 divisions in stature, the corresponding populations were taken and the total set of data on each sub-series was averaged. These averages were then used to establish the dimension required for 3 arbitrary manikin standards. One represented an average for the entire series, one for the short third of the stature range, and one for the long third of the stature range. The average stature range was 156-198 cm (61.5 to 78 in.). The average of the short 1/3 of the stature range (17.3% of the population) was 156-169 cm (61.5 to 66.5 in.). The average of the long third of the stature range equalled 184-198 cm (72.5 to 78 in.). Three plastic manikins were constructed on the basis of these dimensions for the purpose of serving as basic size reference: in any way required by aircraft accessory designers and manufacturers, as well as any further needs brought out on clothing and other related subjects.

Cochran, L.B., Gard, F.W., & Kersworthy, Mary E. G x TIME FLIGHT PATTERNS IN THE NAVAL TRAINING COMMAND. PHASE VI: AEROBATIC AND GUNNERY MANEUVERS AS FLOWN IN ADVANCED TRAINING UNIT 201. Res. Proj. NM-001-100 103, Rep. 4, June 1956, 18pp. U.S. Naval School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

1762

To determine the radial acceleration stresses encountered by student aviators in advanced training, G x time flight patterns were recorded by personnel of the Advanced Training Unit 201 in F9F-2 aircraft. Syllabus maneuvers recorded were: Immelman, gunnery, loop, barrel roll, 40° dive, and wing over. The records were analyzed to determine the magnitudes and durations of acceleration stresses for each maneuver. The findings are discussed in relation to the indoctrination program for flight personnel. Recommendations are included.

Ellison, D.G. & Gray, Florence E. FREQUENCY RESPONSES OF HUMAN OPERATORS FOLLOWING A SINE WAVE INPUT. Contract W33 038 AC 13968, Memo. Rep. MCRD 694 2H, Rep. 14, Sept. 1948, 41pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dept. of Psychology, Indiana University, Bloomington, Ind.).

1764

To test the linearity of the human operator, four subjects were required to track a sine wave input by operating double handgrips which rotated on a vertical axis. An "input" pointer moved in a horizontal slot; a second pointer directly below the input pointer is controlled by the handgrips. Experimental variables were 1) input frequency (one-half to four cycles/second), 2) input amplitude, and 3) ratio between handgrip rotation and output pointer movement. The records were analyzed to determine 1) amplitude of movement of output pointer as a percentage of input pointer amplitude and 2) phase shift of the output in degrees (displacement in time of input-output waves).

Craig, D.R. & Ellison, D.G. A COMPARISON OF ONE-HANDED AND TWO-HANDED TRACKING. MCRD 694 2H, July 1948, 29pp. USAF Aero Medical Lab., Hqs., Air Materiel Command, Engineering Div., Wright-Patterson AFB, Dayton, Ohio. (Indiana University, Bloomington, Ind.).

An experiment is reported which compared the accuracy of 1- and 2-handed tracking using extended handgrips and compared the accuracy of tracking with squeeze-grip range control handles and with extended handgrips. 2 groups of Ss tracked the Pedestal Sight Manipulation Test (PSMT) 2 trials per day for 11 days using a sight fitted with extended handgrips. One of these groups (21 Ss) used 2-hands on the offset handgrips when tracking. The other group (22 Ss) used the preferred hand on the corresponding offset handgrip. A third group (26 Ss) used the sight fitted with squeeze-grip range control handles. Ranging and control operations were not used. 2-handed tracking was significantly superior ($p < .05$) to 1-handed tracking in terms of time on target on all trials. Use of the extended handgrips with both hands resulted in superior tracking in elevation to that obtained with squeeze-grip controls. No significant differences were obtained in the case of azimuth or combined azimuth and elevation. These differences in performance might be increased or decreased by changes in the mass and inertia of the sight, by changes in the manipulative techniques used in operating the sight, or by changes in the operating characteristics of the control mechanisms of the sight.

Ellison, D.G. & Hill, H. THE INTERACTION OF RESPONSES TO STEP FUNCTION STIMULI: 1. OPPOSED STEPS OF CONSTANT AMPLITUDE. MCRD 694 2P, Nov. 1948, 37pp. USAF Aero Medical Lab., Hqs., Air Materiel Command, Engineering Div., Wright-Patterson AFB, Dayton, Ohio. (Indiana University, Bloomington, Ind.).

This study was designed to study reaction time, movement time, and amplitude of responses made in tracking 2 successive opposed step function stimuli movements of constant amplitude and varying temporal separation. The experiment was conducted in part to check the results of a study by Vince (1951). The task was basically the same as that in the Vince study with the exception that the direction of the movements in this task was horizontal as opposed to vertical. Also, 2 paper drives, 1 for the stimulus presentation and 1 for recording, were used. The task of the 30 Ss was to follow any changes in position of a vertical black line which was viewed through a narrow horizontal slot with a pencil-type stylus. The stimuli were sudden movements (step functions), 1 inch to the right or left in randomized order, with a return movement to the base line after intervals varying from 0.05 to 1.6 secs. It was found that as the interval between 2 successive stimuli of a pattern was reduced below 0.5 secs., the amplitude and movement time of the first movement were reduced. Also, as the interval was reduced below 0.3 secs., the reversal of the stylus movement following the second stimulus was delayed. The data was not in complete disagreement with the original study but the interpretations were not the same.

Jenkins, W.O. THE ACCURACY OF PILOTS AND NON-PILOTS IN APPLYING PRESSURES ON A CONTROL STICK. TSEAA 694 3, Aug. 1946, 20pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright Field, Dayton, Ohio.

A semi-rigid control stick was mounted on a stand in front of a cockpit seat. 20 AAF pilots and 13 non-pilot Ss were blindfolded and given practice trials in producing specific pressures. Ss attempted to apply pressures of 1, 5, 10, 20, and 40 lbs. for fore and aft action, and of 1, 5, 10, 20, and 30 for lateral operation. 20 successive attempts were recorded for each S in each direction at each pressure. Consistency of performance was determined by computing the variability of each S's performance about his average. Relative consistency was determined by dividing the measure of variability by the standard value at each of the 5 points in the 4 directions. Variability of pressure reproduction increased directly as a function of the standard pressure for both the pilot and non-pilot groups. Relative consistency improved rapidly from 1 to 10 lbs. and was asymptotic near 20 lbs.; beyond 20 lbs. relative consistency was approximately constant. There were no differences between the 4 directions. Ss tended to apply too much pressure when trying for low pressures and too little when trying for high values. Pilots were more accurate than non-pilots. However, number of flying hours was not related to accuracy. It was concluded that a basic factor in flight control design is the pressure cue. In any control design the availability of this cue should be maximized to increase the ability of pilots to fly with precision.

Jenkins, W.O. THE ACCURACY OF PILOTS IN APPLYING PRESSURES ON A WHEEL-TYPE CONTROL. TSEAA-694-3A, Sept. 1946, 11pp. Engineering Div., Air Materiel Command, Wright Field, Ohio.

1767

In order to determine the accuracy with which pilots are capable of applying pressures on a wheel-type control, 20 Air Force pilots were given 15 successive trials (following practice trials) on an aircraft which was mounted to a shaft in such a manner as to permit aileron action. Six conditions of pressure were utilized: 1, 5, 10, 20, 30, and 40 pounds. Variability of pressure reproduction was assessed as a function of the magnitude of standard pressure. The results are discussed in terms of accuracy of performance and individual variation under each of the conditions of standard pressure. Recommendations are offered concerning optimal pressure ranges for control systems employing pressure as a primary cue.

Jenkins, W.O. THE ACCURACY OF PILOTS IN APPLYING PRESSURES ON RUDDER PEDALS. TSEAA 694-3B, Sept. 1946, 12pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright Field, Dayton, Ohio.

Studied was the accuracy with which pilots reproduced pressures on a pair of semi-rigid rudder pedals as a function of the absolute magnitude of pressure being applied to the control. In order to gather information concerning pressures providing the best "feel of controls", a pair of semi-rigid pedals were mounted in front of a cockpit seat. The pressures used were 5, 10, 20, 40, and 60 lbs. The data obtained on the 20 Ss indicates that variability increased as a function of the standard pressure from 5 to 60 lbs. Relative variability improved as the standard pressure increased from 5 to 20 lbs. and beyond the latter values was approximately constant. Merely resting the foot against the pedal resulted in an average pressure of 7 lbs. When reproducing low pressures, pilots applied too much pressure, and when reproducing high pressures, they tended to apply too little force.

Jenkins, W.O. INVESTIGATION OF SHAPES FOR USE IN CODING AIRCRAFT CONTROL KNOBS. TSEAA 694 4, Aug. 1946, 14pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright Field, Dayton, Ohio.

The study was conducted to select a set of control knobs of different shapes which could be recognized immediately by pilots through the sense of touch alone. A series of 25 knob shapes, including shapes now in use and some experimental shapes, were constructed. A group of 40 blindfolded Ss compared each knob shape with every other shape while wearing an A-11-A, medium weight flying glove and with the bare hand. On the average, 12% errors were made in distinguishing between the 25 different shapes with the bare hand and 20% while wearing the flying glove. Hesitation-type errors in which the pilots hesitated over an incorrect shape, but finally recognized that it was not the correct shape, occurred with 30% frequency with the bare hand and 40% with the glove. Practically all pilots made some errors of both types. The knob shapes tend to fall into families on the basis of error pattern. One family includes knobs having edges, corners, and flat surfaces. Another is characterized by rounder surfaces. Knob shapes belonging to the same family tend to be confused with one another, but not with shapes of another family. (HEIAS)

Jenkins, W.O. A FOLLOW-UP INVESTIGATION OF SHAPES FOR USE IN CODING AIRCRAFT CONTROL KNOBS. TSEAA 694 4A, Aug. 1946, 6pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright Field, Dayton, Ohio.

Eight knobs which had been found to yield the fewest errors in an earlier study were employed along with 3 new shapes employed in the "Ideal cockpit" developed by the US Navy Department. 30 Army Air Force pilots were blindfolded and required to judge whether the knobs, presented in pairs, were the same or different. The knob shapes were tested with bare hands and with an A-11-A flying glove. Out of a total of 1,980 comparisons only 9 errors were made. 6 out of 9 errors were made while the flying glove was worn. 8 of 9 errors involved 1 of the Navy knobs. It was concluded that these knobs are readily distinguishable to touch.

Jenkins, W.O. A FURTHER INVESTIGATION OF SHAPES FOR USE IN CODING AIRCRAFT CONTROL KNOBS. TSEAA 694 48, Sept. 1946, 11pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright Field, Dayton, Ohio.

This study was undertaken as a basis for selecting a set of control knobs of different shapes which could be recognized immediately through the sense of touch for use on radar, radio, bombing, and cockpit equipment. A series of 22 knob shapes constructed and a group of 40 blindfolded Ss compared each knob shape with every other shape. Comparisons were made with the bare hand and while wearing an A-11-A flying glove. A set of 8 knobs was selected by means of an examination of the error pattern among the 22 shapes. There were no errors or hesitations made by an individual in distinguishing between these 8 knobs.

Narrick, M.J. DIRECTION OF MOVEMENT IN THE USE OF CONTROL KNOBS TO POSITION VISUAL INDICATORS. AND APPENDIX I. Serial TSEAA 694 4C, April 1947, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

1772

This study was designed to determine human preferences in the arrangements of and motion relationships between indicators and controls. Ninety-two Army pilots were used as subjects in two experiments in which each subject manipulated a control knob to move an indicator light from an off-center to center position. In the initial experiment both clockwise and counterclockwise motion produced the required result. In the second experiment the motion relationship was fixed for each particular run but reversed from one run to another. Control-indicator arrangements were varied. Results are discussed in terms of optimal control-indicator arrangements, preferred movement ratios, and the effects of variation in these dimensions upon speed and accuracy of performance.

Jones, R.E. A SURVEY OF PILOT PREFERENCE REGARDING KNOB SHAPES TO BE USED IN CODING AIRCRAFT CONTROLS. Serial TSEAA 694 4E, Feb. 1947, 7pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

This study was designed to determine pilot preferences as to which aircraft controls should be coded and which of 11 knobs should be used on different controls. Models of the 11 knob shapes were presented to 60 pilots who rated on a questionnaire: a) the shapes which they considered impractical; b) which controls they would prefer to have coded and which knob shapes should be used on these controls. It was found that 6 controls were considered to be in need of coded knobs. Of the 11 knobs, 2 were considered distinctly inferior to the other 9 by the pilots. Characteristics of these knobs were that they had sharp edges which made an uncomfortable grip and which presented danger for snagging on gloves and flying clothing. There was a fair amount of agreement among pilots as to the controls that need coding and as to the knob shapes to be assigned to several of these controls.

Grether, W. DIRECTION OF CONTROL IN RELATION TO INDICATOR MOVEMENT IN ONE-DIMENSIONAL TRACKING. TSEAA 694 4G, Oct. 1947, 9pp. USAF WADC, Aero Medical Laboratory, Wright-Patterson AFB, Dayton, Ohio.

Tested were a group of 36 Army Air Force pilots and a group of 40 college students to determine whether direction of control in relation to indicator movement is a significant factor in determining human efficiency in performing a one-dimensional tracking test. A simplified cockpit mockup which included an instrument panel, a seat, rudder pedals, and a stick was used. Two types of controls were studied: a) reciprocating rudder pedal movement; b) lateral (ailerons) stick movement. For both control movements the upper reference mark on the indicator was used, and the task of the S was to keep the pointer centered over this mark. The 4 experimental conditions were: a) rudder pedal direct; b) rudder pedal reversed; c) stick lateral reversed. The results indicate that in the case of the pilot carrying out the one-dimensional tracking task by means of rudder pedal, the direction of control in relation to indicator movement had a significant effect upon performance. It is assumed that the findings of this study are valid only for one-dimensional tracking.

1778 Brown, C.V., Chiselli, E.E., Jarrett, R.F., Minium, E.W., et al. **MAGNITUDE OF FORCES WHICH MAY BE APPLIED BY THE PRONE PILOT TO AIRCRAFT CONTROL DEVICES. I. THREE-DIMENSIONAL HAND CONTROLS.** Contract W-33 038 ac 15098, MCNED-694-4J, March 1949, 68pp. USAF Aero Medical Laboratory, Wright-Patterson AFB, Dayton, Ohio.

Investigated were the forces which pilots could be expected to apply to aircraft controls from the prone position. Three dimensions of hand movement suitable for operation of elevator, rudder, and alleron controls. The dimensions were described as "push-pull", "push-right-pull-left", and "rotation" about the longitudinal axis. For purposes of comparison, measurements were also made of the forces which could be applied to the identical hand grips from the seated position. Tested were 65 S1, all except 2 being pilots. In terms of forces which can be applied to hand operated controls, the prone position compares favorably with the seated position for aircraft pilots. The "push-right-pull-left" movement dimension, suitable for operation of rudder controls, is unfavorable for application of high control forces. The prone position is inferior to the seated position for the "rotation" movement normally used for alleron control. The prone is superior to the seated position for application of "pull" forces on elevator controls. (MEIAS)

1780 Grether, W.F. **DESIGN OF CLOCK DIALS FOR GREATEST SPEED AND ACCURACY OF READING IN MILITARY (2400) HOUR TIME SYSTEM.** TSEAA-694-8, Oct., 1946, 16 pp. AAF, Air Materiel Command, Aero Medical Laboratory, Engineering Div., Wright Field, Dayton, Ohio.

1780 To study design factors which influence the speed and accuracy of reading clocks in the military or 2400-hour time system, 162 subjects read time from eleven different designs of clock dials--five variations of the 12-hour and six of the 24-hour dials. Other design factors studied were: minute scale--use of numerals, minute graduations, placement at top or bottom of dial; hour scale--use of numerals, 24-hour position. Both accuracy and speed scores were obtained and analyzed in terms of the effects of different design factors. Recommendations are included for a design for further experimentation.

1783 To gain information on research and development (during 1948) pertinent to problems of cockpit and instrument lighting systems, visits were made to one university laboratory and several aircraft manufacturers. A summary report is presented of the salient features of the lighting systems observed, of conferences with company representatives, and comments of the observers. The systems studied included indirect lighting, flood lighting, and lucite edge lighting. Suggestions for needed research are included.

1784 Grether, W.F. **A STUDY OF SEVERAL DESIGN FACTORS INFLUENCING PILOT EFFICIENCY IN THE OPERATION OF CONTROLS.** Memo. Rep. TSEAA 594 9, Nov. 1946, 20pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

1784 To investigate the effect upon human efficiency in operating aircraft type controls of several variations in the type of control movement used, tests were carried out in a simplified cockpit mockup. The task was to keep an oscillating pointer centered on a reference mark by a control. Five possible control movements were available: rudder pedal, and two planes of movement (as for alleron and elevator control) of either stick or wheel. Several variations of leg and arm angle were investigated as well as type of control movement. Efficiency was measured by time-on-target and analyzed for differences due to type of control, direction of movement of hands and arms, leg angle and arm angle.

 Milton, J. L., Jones, R. C., Morris, J. B., 2 FltS, P.M., PILOT REACTION TIME: THE TIME REQUIRED TO COMPREHEND AND REACT TO CONTACT AND INSTRUMENT RECOVERY PROBLEMS. TSCA 69-12a, May 1967. 13pp. USAF Air Materiel Command, Aero Medical Lab., Wright-Patterson AFB, Ohio.

Reported is an investigation of the time required by pilots to comprehend and interpret aircraft instrument readings and make the necessary adjustments in the attitude of the plane under both contact and instrument conditions. The 20 pilots tested wore a pair of sandpapered plexiglass goggles which permitted passage of light but restricted the 3° view of the instruments during the pretest period. The plane was out of initial of 4 standardized maneuvers, the goggles were opened and the 3° determined the attitude of the aircraft and attentioned to recover to straight and level flight as rapidly as possible. Instrument comprehension time was 0.20 or 15% longer than contact comprehension time. Comprehension time here defined as the time for accommodating and focusing the eyes, for comprehending what is seen, and for initiating a control movement. The results indicate that significant improvements in flight instruments are possible, since the present flight panel is more difficult to comprehend than the real horizon. (HMAS)

 1. Refs. P.H. & Jones, R.E. ANALYSIS OF FACTORS CONTRIBUTING TO 460 "PILOT-ERROR" EXPERIENCES IN OPERATING AIRCRAFT CONTROLS. TSEA 694.12; July 1947, 32pp.
 2. Ref. USAF Air Materiel Command, Aircraft Medical Lab., Engineering Div., WRIGHT Field, Dayton, Ohio.

Accounts of errors in using aircraft controls were obtained through recorded interviews and written reports. Pilots in the Air Materiel Command, the Air Training Command, and the AAF Institute of Technology, and former pilots in civilian universities contributed error accounts. In order to minimize personal opinion only detailed factual information furnished by an eye-witness or by the pilot who made the error was accepted. It was found that all errors could be classified under 6 major categories: a) substitution error (50%); b) adjustment errors (18%); c) forgetting errors (18%); d) reversal errors; e) unintentional activation; and f) unable to reach (10%). Practically all pilots of present day AAF aircraft, regardless of experience or skill, report that they sometimes make errors in using cockpit controls. The most likely cause of each type of error are discussed and design changes for eliminating or reducing these errors are suggested. (HEIAS)

Warrick, M.J., & Grother, W.F. THE EFFECT OF POINTER ALIGNMENT ON CHECK READING OF ENGINE INSTRUMENT PANELS. NCRXD-694-17, June, 1948, 33pp. USAF, Air Materiel Command, Aero Medical Lab., Engineering Div., Wright-Patterson AFB, Dayton, Ohio.

1791

To determine the effect of pointer alignment positions on check reading performance, a four by four arrangement of 16 simulated engine instruments (1-3/4 inch diameter) is used in which subjects check read the panel and took appropriate action by positioning one or more toggle switches. Six pointer alignment positions (9, 12, and 3 o'clock, and mixed alignment about each) and two test situations (identification of any deviation and of direction of deviation) were investigated. Response times and errors are analyzed and interpreted with regard to optimum alignment positions. Practical implications for design are discussed; recommendations are included.

Grother, W.F. & Connell, Shirley C. PSYCHOLOGICAL FACTORS IN CHECK READING OF SINGLE IN STRUMENTS. NCRXD 694-17A, Sept. 1948, 21pp. USAF, Air Materiel Command, Aero Medical Lab., Engineering Div., Wright Field, Dayton, Ohio.

The suitability of 5 different principles of instrument indication for check reading purposes was studied. Two types of reading evaluation were made: a) simple check reading, or the mere detection of a deviation, and b) qualitative reading, or judgment of the direction of a deviation. In each of the 3 experiments conducted, the task of the 5 was to respond to appropriate movement of a toggle switch to random presentations of the 5 simulated instruments in an exposure apparatus. The standard airspeed indicator and 4 other simulated instruments were compared for ease of check reading. In one of the experiments the 5 was required to judge whether or not the instrument reading had changed from a desired reading (check reading). The other 2 experiments required the additional judgment of the direction of deviating readings. The results of these experiments showed that the time for simple check reading and making of an appropriate switch movement ranged from 0.51 sec. for a rotating pointer to 0.64 sec. for a rotating dial indicator. For the more complex qualitative reading the response times ranged from 0.59 to 1.09 sec. with considerable variation depending upon the type of indicator and direction of switch movement. In general the moving pointer indicators were superior to those with moving scales. For both types of reading which were measured the direct reading counter with three digits gave results comparable to the best indicators.

Spragg, S.P.S., & Rock, M.L. DIAL READING PERFORMANCE AS RELATED TO ILLUMINATION VARIABLES. II. SPECTRAL DISTRIBUTION. Memo. Rep. NCRXD-694-21A, Dec. 1948, 8pp. USAF, WADC, Aero Medical Laboratory, Wright-Patterson AFB, Dayton, Ohio. (University of Rochester)

1794

To investigate the relation between dial reading performance and color (spectral distribution) of the illumination at low brightness levels, twenty subjects read dial settings on photographic reproductions of dials (2.5 inch diameter, graduated from 0 to 100 in ten unit steps) at distance of 28 inches. Four illumination colors were used: yellow-green, yellow-orange, orange-red, and deep red, each at two brightness levels of 0.01 and 0.10 foot lamberts. Error and time scores are analyzed statistically and interpreted in terms of color and brightness functions.

Damon, A. CLOTHING COMMENTS AND FLAK HELMETS IN THE EUROPEAN THEATER OF OPERATIONS, JULY-SEPTEMBER 1944. Memo Rep. TSEAL-3-695-3200, Nov., 1944, 6 pp. AAP, Air Materiel Command, Aero Medical Lab., Wright-Patterson AFB, Dayton, Ohio.

1797

This report is a verbal summary of flyers' (8th and 9th Air Forces - 1944) comments in regard to flying clothing in general and to felt boots and the M-4 flak helmet in particular. Discussion and conclusions pertain to clothing allotments, clothing requirements relevant to the work space, comfort, and needs for future development of clothing for flyers.

1793

Warrick, M.J. DIRECTION OF MOTION STEREOTYPES IN POSITIONING A VISUAL INDICATOR BY USE OF A CONTROL KNOB. II. RESULTS FROM A PRINTED TEST. NCRXD 694-19A, Oct. 1948, 21pp. USAF, WADC, Aero Medical Laboratory, Wright-Patterson AFB, Dayton, Ohio.

This investigation tested the "clockwise-clockwise hypothesis" that states that human operators expect a clockwise control motion to result in a clockwise motion of the corresponding indicator and a counter clockwise motion to result in a counter clockwise motion to result in a counter clockwise motion of the indicator. Fifty male college students were asked to indicate on a printed test which direction they would rotate a control knob to move a semi-circular indicator to a reference position. The responses of these subjects indicated that they tended to associate a clockwise (counter clockwise) control motion with a clockwise (counter clockwise) indicator motion irrespective of the positions or orientation of the indicator in respect to the control. It appears reasonable to propose that this tendency be considered when designing equipment in which a semi-circular indicator is to be controlled by use of a rotatable knob. A detailed analysis of the results of the printed test showed that the number of subjects whose responses indicated that they associated a clockwise (counter clockwise) control motion with a clockwise (counter clockwise) indicator motion was greater in certain arrangements of indicator and control. It is proposed that, other things being equal, these arrangements of indicator and control be used on equipment in which a rotatable knob positions a semi-circular indicator if it is imperative that the operator not move the control in the wrong direction.

1798 Parreck, H.O., Eldridge, R.H., & Koster, H.F. PHYSIOLOGICAL EFFECTS OF INTENSE SOUND. Final Rep. NCRD 895 718, May 1948, 15pp. USAF Air Materiel Command, Aero Medical Lab., Engineering Div., Wright-Patterson AFB, Dayton, Ohio.

Reported are the results obtained from a preliminary study on the physiological effects of intense noise on man and animals. The sound sources used were: a turbo-jet engine, J-33-g mounted in an outside test stand; and a siren mounted in an anechoic chamber. Laboratory personnel, guinea pigs and rats were subjected to these intense sounds. Severe but temporary losses of hearing were found to occur to the human as along with marked heating of the skin, strong vibration in various parts of the body, sensations of muscular weakness, and excessive fatigue. Guinea pigs and rats have been killed when exposed to the intense sound field of the siren for periods as short as 8 minutes. The death is caused by an excessive elevation of the body temperature.

1800 Mahler, M.R., Bennett, G.K., Doppelt, J.E., Golan, D.G., et al. PSYCHOLOGICAL STUDIES OF ADVANCED NAVAL AIR TRAINING: EVALUATION OF OPERATIONAL FLIGHT TRAINERS. Contract NSCNR 99901, Proj. NR 780 011, SDC Proj. 20 A 8, SDC TR 999 1 1, Sept. 1950, 151pp. USN Special Devices Center, Port Washington, N.Y. (The Psychological Corporation, New York, N.Y.).

1800 This study is concerned with the evaluation of Operational Flight Trainers in the program of the Naval Air Advanced Training Command. A series of experiments was run using 23-24 matched pairs of students in evaluating each of two trainers. Besides training conditions, variables were: students, instructors, syllabus, standards, and flight conditions. Results (differences in proficiency between groups trained with and without trainers) are interpreted with regard to savings in flight time, student proficiency, effective use of trainers, and trainer design.

1801 Legg, J.C. OPERATIONAL EVALUATION OF THE AN/SPA-23 HORIZONTAL INDICATOR. Task 431-L 4651-64541, WADC TN-56-522, Jan. 1957, 13pp. Directorate of Flight & All Weather Testing, WADC, ARDC, Wright-Patterson AFB, Ohio.

1801 To determine if the AN/SPA-23 Horizontal Indicator would be more suitable for air traffic control purposes than the vertical indicators presently used in Air Force RAPOON Centers, the equipment was installed in a Center and used to control aircraft on a variety of flight test missions. Operators were instructed to take note of ease and/or deficiencies of operation while controlling the flights. Air traffic was not heavy enough to define the limits of the capability of the indicator; however, deficiencies and advantages of operation are listed. Recommendations are included.

1802 USA Arctic Test Branch. SERVICE TEST OF COLD-WET UNIFORM. REPORT OF TEST - PROJECT NR 2699 (ARCTIC). DA Proj. NR 7 79-01-002, RDB Tech. Obj. PO 8, July 1956, 59pp. USA Arctic Test Branch, Big Delta, Alaska.

1802 To determine the comparative suitability of two vapor-barrier suits, Coldbar T53-25 and T53-26, as replacements for standard cold-wet uniforms and as special purpose uniform for Army use under cold-wet conditions, a service test was conducted. Selected soldiers wore the uniforms for periods of 14 to 158 days during performance of field and garrison duties. Ambient temperatures ranged from 30 to -62 degrees Fahrenheit and winds varied from calm to 65 miles per hour. The degree of acceptability and adequacy for body warmth was based on troop reaction. Observed deficiencies and suggested modifications were tabulated. Recommendations are included.

1806 Olson, H.C. & Willard, N., Jr. A SIMPLIFIED METHOD FOR RATING THE PERFORMANCE OF STEREOSCOPIC RANGE FINDER OPERATORS. Tech. Rep. 34, Dec. 1956, 21pp. USA Human Research Unit No. 1, Fort Knox, Ky.

1806 The purpose of this study was to develop a simple technique for rating the performance of stereoscopic range finder operators. Data were collected during the training of 179 subjects on the relative efficiency of the standard method of performance evaluation i.e., computation of Units of Error, and a new method (the Range Finder Scoring Graph) which utilizes a scoring graph and simple computation. The relative difficulty of computation and accuracy of each of the measurement techniques provides a basis for recommendation for adoption of the new technique.

1807 General Electric Co. TURBOJET ENGINE CONTROL SYSTEM STUDY. Prepared under Contract Nonr-1737(00), Proj. RSAER-S1 (9-U-94), Dec. 1956, 216pp. Special Devices Center, Port Washington, N.Y. (General Electric Co., Johnson City, N.Y.).

1807 This report presents the results of Phases I and II of a study of the turbojet engine, its controls, and their relation to over-all aircraft performance. A turbojet engine was simulated on an analog computer, the optimum values of the principle variables determined, and control systems were devised to obtain the optimum performance. Emphasis was placed on the consideration of the engine as a part of a larger system composed of an airframe and its flight controls, an engine and its controls, and a human pilot and his capabilities. Recommendations for further phases of the study are included.

1809 Edwards, W. VARIANCE PREFERENCES IN GAMBLING. Amer. J. Psychol., Sept. 1954, 62(3), 441-452. (Johns Hopkins University, Baltimore, Md.)

Previous experiments suggest a mathematical model for predicting decisions among bets. This model asserts that people choose among bets as to maximize subjectively expected utility. The possibility exists, however, that people also prefer some bets to others on the basis of their variance; in addition to the utilities and subjective probabilities involved. This, if so, would be damaging to the model. 2 preliminary experiments failed to demonstrate the existence of variance preferences. In the main experiment, 55 were required to choose between bets with high and low variances. The most significant variable determining choice was the probabilities involved, and the probability preferences found were essentially the same as those found in other experiments. When probabilities were held constant, however, the choices did reveal the existence of variance preferences. The introduction of conditions making high variance desirable produced more bets of high variance, but the introduction of conditions making low variance desirable did not produce more bets of low variance. This is due to the fact that Ss tend to change their habits when they lose money, but not when they win. It is concluded that variance preferences exist, but they are secondary in importance as compared with probability preferences.

1820 Black, J.W. THE EFFECT OF ROOM CHARACTERISTICS UPON VOCAL INTENSITY AND RATE. J. acoust. Soc. Amer., March 1950, 22(2), 174-176. (Department of Speech, Ohio State University, Columbus, Ohio).

1820 To determine the effect of room characteristics upon a speaker's rate and intensity of reading, groups of 23 males read 12 test phrases in each of eight rooms. The rooms represented two shapes (circular and rectangular), two sizes (150 and 1600 cu. ft.), and two reverberation times (0.8 to 1.0 and 0.2 to 0.3 sec.). Microphones led to two meters that registered vocal intensity and, in one instance, duration of the phrases. Each set of measurements was treated by analysis of variance.

1821 USN Motion Study Unit. NAVAL MOTION STUDY UNIT: AIR TRAFFIC CONTROL AT R.N.A.S. FORD. Memo 14, Sept. 1952, 8pp. USN Motion Study Unit, OR, London, England.

1821 To obtain information that would help identify problems of organization and procedures in Air Traffic Control, a preliminary survey of a specific airfield was selected for observation. Questions of layout and physical relations between sections were raised, and several suggestions for improvement were put forward for consideration. Problems that should be investigated before precise recommendations for standard layout of sections and arrangement of personnel included: (1) space and operational requirements of equipment, and (2) capacities and limitations of personnel.

1823 Smith, W.M. PAST EXPERIENCE AND THE PERCEPTION OF VISUAL SIZE. Amer. J. Psychol., July, 1952, 65, 389-403. (Princeton Univ.)

1823 To determine the effect of controlled experience on the apparent size and distance of geometrical forms, 52 subjects were tested initially by judging when triangles and circles, as viewed monocularly, were the same apparent distance as a reference object, viewed binocularly. Four groups, formed on the basis of mean settings of size for triangle, were given varied experiences in size estimation before retesting. Analysis of the test-retest size measures with respect to the effect of experience is made. Discussion relates the results to perception of size in the ordinary environment.

1824 Spencer, J. COMPARISON OF TWO VISUAL WARNING SYSTEMS IN AIRCRAFT. PRAC. 790, June, 1952, 2 pp. RAF Inst. of Aviation Medicine, Flying Personnel Res. Committee, Farnborough.

1824 To study systems for presenting visual warnings of certain types of failure likely to occur in aircraft, two arrangements were compared under flight conditions: (1) warning lights dispersed around instrument panel as close to the appropriate controls as possible, and (2) warning lights centralized on one panel, with two flashing, attention getting signals on cockpit coaming. Ten pilots completed low level cross-country flights while responding to artificially produced warnings. Response times for each system were analyzed and compared. Pilot preferences are discussed.

Smith, W.H. GILINSKY'S THEORY OF VISUAL SIZE AND DISTANCE. *Psychol. Rev.*, May 1952, 52, 239-243. (Princeton University, Princeton, N.J.).

An attempt has been made to evaluate certain aspects of Gilinsky's theory of perceived size and distance. The evaluation has concerned itself principally with size-constancy relationships: a) The restriction of theory to the cases where perceived size is proportional to physical distance requires that a number of data be ignored or explained away. The formulation specifically denies that perceived size may increase with distance, a denial which is contrary to fact; b) The use of the concept of "normal viewing distance" in the formulation raises some serious questions about the generality of the theory; c) Certain inconsistencies are apparent in the derivation of the theory on the basis of size-constancy principles; d) Both the derivation and meaning of the A parameter in the theory are questionable; e) Even allowing the restriction noted in (a) above, the theory is not confirmed by experimental evidence.

Johnson, E.E. A SURVEY OF TANK CREW PROBLEMS. Proj. 6 95 20 001, NEDEA, Rep. 93, Aug. 1952, 8pp. USA Medical Research Lab., Fort Knox, Ky.

1830

Bricker, P.D. & Chaponis, A. DO INCORRECTLY PERCEIVED TACHISTOSCOPIC STIMULI CONVEY SOME INFORMATION? *Psychol. Rev.*, May 1953, 60(3), 181-188. (Johns Hopkins University, Baltimore, Md.).

1830

To investigate the possibility that incorrectly perceived stimuli convey some useful information, 10 Ss were shown nonsense syllables under conditions such that they could recognize half or less on the first trial; incorrectly identified stimuli were shown again and Ss required to keep guessing until correct identification was made. The mean number of additional guesses were compared with the mean of a distribution of random guesses following presentation of stimuli which were not available to the Ss as responses. Discussion is in terms of "cues" which carry information of a useful nature, of word preferences, and word sequence preference.

T. G. R 9

1838

To point up problems of the tank crew which may be alleviated by human engineering research, 894 tank crewmen attending the Armored School, Fort Knox, Kentucky, were oriented as to kinds of problems the human engineer is interested in and then asked to relate some relevant incident that they had either observed or participated in. A total of 623 incidents were found: to concern general problems of human engineering and 521 of these concerned the tank crew. These incidents were categorized as they applied to the commander, gunner, loader, driver and crew in general. Recommendations are made for improved survey techniques.

1833

Lifton, K.A. ERRORS IN TIME-STUDY JUDGMENTS OF INDUSTRIAL WORK PACE. *Psychol. Monogr.*, 355, 1953, 67(5), 1-14. (Occupational Research Center, Purdue University, Lafayette, Ind.).

In a study designed to determine the nature of the errors involved in time-study ratings of work pace, 6 expert time-study men made ratings of the filmed performances of 5 workers doing each of 4 jobs at each of 5 previously established paces. It was found that: a) pace ratings involved considerable error-standard error of pace ratings from different raters on different jobs, workers, and paces was .16%; b) some raters rate higher than others; c) some raters are more consistent than others; d) some raters are rated higher than others, even when all perform the same job at the same paces; e) some raters are rated more reliably than others; f) raters tend to overrate low paces and underrate high paces; g) normal pace is rated most reliable; h) some jobs are rated more reliably than others; i) interactions are important--some raters rated some jobs higher than others; some raters rated some workers higher than others; some workers were rated higher on some jobs than on others and not all raters follow the same pattern; j) worker's judgment on equating the jobs differ from the pace ratings of time-study men; k) individual differences among the worker's judgments are large; l) some workers can judge more reliably than time-study men can rate; m) a correlation of +.46 exists between the workers judgments and the pace ratings of the time-study men.

Minsky, M.L. DISCRETE SELECTION PROCESSES. Contract N0MR 494 (03), Proj. NR 145 038, Rep. 1954 494 03 21, July 1954, 21pp. Dept. of Systems Analysis, Tufts University.

1840

The behavior of those processes by which a system progresses toward an assigned goal through a sequence of discrete trials and evaluations is considered. Each activity cycle of the system requires the selection of one from a set of possible alternate actions. Considered here are a number of schemes for selection and certain "universal" decision procedures discussed. The effect of introducing a random element into the system is examined and some attention is devoted to an examination of the relation between discrete selective processes and the processes underlying performance of servo-mechanisms.

Sloan, Louise L., & Altman, Adelaide. **FACTORS INVOLVED IN SEVERAL TESTS OF BINOCULAR DEPTH PERCEPTION.** A.M.A. Arch. Ophthalmol., Oct. 1954, 52, 824-844. Contract 248(24). ONR, Johns Hopkins University.

1843
To determine what aspects of depth perception are measured by representative tests, a theoretical analysis of factors involved is made and related to three tests: Ewald-Jolman, Yehouff Stereopter, and Vision Tester. Data are obtained under experimental conditions which eliminate, as far as possible, differences not essential elements of the test. A comparative analysis of the test results is made with further study of the relation of acuity and phoria scores to depth scores (Vision Tester). Interpretation is based on the significance of unocular cues and the effect of specific ocular defects on binocular depth perception. T.G.R.34.

1845
Shackel, B. **SOME DESIGN REQUIREMENTS FOR OPTIMUM HUMAN TRACKING PERFORMANCE.** 1955, 10pp. Applied Psychology Research Unit, MRC, Cambridge, England.

1845
To determine the optimum relations between linear control and linear display movements, a one-dimensional compensatory tracking task was used with a positional joystick control lever and an instrumental display. With a control-display movement ratio of 3:1 the following conditions were tested: (1) with and without an elbow rest, (2) length of training session (30 and 150 minutes), (3) length of continuous run (10, 5, and 3 minutes), and (4) length and spacing of rest periods. A further study was made of control-display movement ratios to test the effect of distance of the instrumental display from the operator's eyes on performance. Error scores were analyzed to find conditions yielding optimum performance. G.

Christie, L.S. & Luce, R.D. **SUGGESTIONS FOR THE ANALYSIS OF REACTION TIMES AND SIMPLE CHOICE BEHAVIOR.** Contract DA 36 039 SC 56695, DA Proj. 3.99.10.101 & Proj. 8 1034, Rep. R 53, April 1954, 39pp. Control Systems Lab., University of Illinois, Urbana, Ill.

1857
A model is proposed for the way human beings organize the decisions required by simple choice situations into a series of component decisions. The thesis of the authors is that such an organization of decisions must be reflected in the distribution of reaction times and that, therefore, it may be possible to infer the organization from empirical studies. The model is not firmly based on empirical studies, however, and thus the proposal is described as speculative. Two experiments are suggested that may help determine the value of the model. G. R 15

1858
Fleming, J.G. **HUMAN ENGINEERING IN POWER PLANT INSTRUMENTATION.** Presented at the Instrument Society of America Eighth National Instrument Conference and Exhibit held in Chicago, Illinois, Sept., 1953.

1858
This paper is oriented toward the engineer in dealing with practical efforts to apply the findings of industrial or human engineering psychologists to engine instrumentation. The task of the human engineer is defined and related to the engineer's task. Specific examples of improved scale design and panel arrangements are offered in illustration of this field of technology. T.R.10.

1859
Fleming, J.G. MAN RUNS A POWER PLANT. Symposium on Instrument Design, Feb. 1952, 7pp. Pennsylvania Electric Assoc., Philadelphia, Penn. (The Bristol Co., Waterbury, Conn.).

1859
The design of mechanical instruments as dependent upon the man-machine system they serve is examined in terms of the needs of a power plant. Recent growth in production and complexity of installations have given rise to new problems of non-scheduled interruptions attributable to the human element. The various ways in which mechanical instruments for indicating information, for recording information and for controlling the system are discussed.

Saul, E.V. & Jaffe, J. GRAPHICS GUIDE. (A PROTOTYPE GUIDE ON THE DESIGN AND USE OF GRAPHIC TRAINING AIDS). Contract MONR 494(08), SDC TR 494 08 2, Oct. 1954, 103pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

1861
This report was prepared to aid Army personnel who design, prepare, and use graphic training aids. The contents are based on data obtained through an extensive search of pertinent psychological literature and are presented here in a simplified direct form. Chapters cover: general comments to the designer; the use of pictures, words, layout, lettering, color; preparation of projected aids (television, slides, film strips, transparencies); and the role of the instructor. Practical guides for the designer are a part of each chapter. A glossary of terms and index are included.

1862
Clark, B., & Graybiel, A. VERTIGO AS A CAUSE OF PILOT ERROR IN JET AIRCRAFT. Res. Proj. NM 001 110 100, Rep. 44, Aug. 1956, 20pp. U.S. Naval School of Aviation Medicine, Naval Air Station, Pensacola, Fla.

1862
To obtain information on vertigo as experienced by jet pilots, 137 Navy and Marine Corps aviators assigned to jet aircraft were studied. Individual interviews and a check list of vertigo experiences were used. The data were classified as to type: (1) vertigo of attitude and motion; (2) visual vertigo; and (3) vertigo involving geographical disorientation. Individual descriptions, number and percent in each classification, number of checked items showing a relationship to emotional responses, flight conditions, and pilot's method of coping with vertigo were analyzed. A comparison of experiences with vertigo in jet and propeller aircraft was drawn and preventive procedures discussed.

DuBois, E.F. THE ANATOMY AND PHYSIOLOGY OF THE AIRPLANE COCKPIT. Aeronautical Engineering Rev., April 1945, 4, 1-3. (Cornell University Medical College, Ithaca, N.Y.).

This paper points out the development of aviation physiology and the slow recognition of the engineer to take into consideration the anatomical characteristics and physiological and psychological capacities of the human operator. Since 1942 there has been a wider recognition and application of principle of physiology to the practical needs of aviation. There are certain military requirements, especially maneuverability, gunnery and safety factors which the anatomist, physiologist, and psychologist could bear in mind and establish certain general principles of cockpit design. Some of the problems and elements of the airplane cockpit are considered along with possible improvements in terms of anatomy and physiology of the pilot.

Bartlett, H.R., Williams, S.B., & Hanes, R.M. VISIBILITY ON CATHODE-RAY TUBE SCREENS: THE EFFECT OF SIZE AND SHAPE OF PIP. J. opt. Soc. Amer., June 1940, 30, 463-470. Contract NS-ori-186. ONR, SDC. (Johns Hopkins University)

1864
To determine the effect upon visibility on cathode-ray tube screens (7EP7) of changes in size and shape of signal, two trained subjects made threshold judgments of the appearance of a pip on the PPI screen. A wide range of beam widths (angular dimension) and pulse lengths (radial dimensions) were investigated at each of three field brightnesses (about 0.0001, 0.1, 2.0 footlamberts). Tables, graphs, and empirical equations summarize the data and relationships to more general visual problems are discussed.

Bartlett, H.R., & Williams, S.B. SIGNAL MARK SIZE AND VISIBILITY OF RADAR SIGNALS ON A PLAN POSITION INDICATOR. Contract NS-ori-166, T.O. I, Sept., 1947, 16 pp. ONR, Special Devices Center, Port Washington, L.I., N.Y. (Johns Hopkins Univ.)

1865
To evaluate the effect of signal size in radar visibility, preliminary experiments were made on a 7EP7 radar screen and signal size varied by 1) regarding the screen from different distances, 2) changing the length of signal by widening the azimuth gate, 3) changing the thickness of signal by switching to different presentation range scales, and 4) moving signal from center to periphery of screen. The data are presented as tentative findings; further research on this problem is indicated.

Adams, J.A. WARM-UP DECREMENT IN PERFORMANCE ON THE PURSUIT-ROTOR. *Amer. J. Psychol.*, July 1952, 65(3), 404-414. (State University of Iowa, Iowa City, Iowa).

1868

The Epicyclic Pursuit Rotor modified to approximate the Koerth Pursuit Rotor was used to investigate amount of warm-up decrement with massed and distributed practice. Each group of Ss spent six minutes a day for five days in the paced pursuit task. One group had 36 trials of ten seconds with 40-second rest intervals; the other practiced continually for six minutes with scores recorded every ten seconds. Scores were for time on target and warm-up decrement. T. G.

1869

Atkinson, C.J. VOWEL MATCHING EXPERIMENT. Supplementary Rep. 2, Aug. 1955, 20pp. State University of Iowa.

1869

The ability of a talker to match the loudness levels of heard vowels was measured on 21 subjects. Each subject made nine matches with each of five English vowels, three at each of three levels. One such set of matches was made by the subject by adjusting the level of his own speech in successive trials, and another by adjusting the level of a recorded vowel played to him over a loud-speaker. The sound pressure levels of the recorded and spoken vowels, measured with a microphone at distance of three inches from the ear of the subject, are factor-analyzed for the significance of differences between vowels, levels and talkers. The effect of restricting the frequency range of vowel reproduction was measured in a similar experiment. T. I. R 3

1870

Altman, Adelaide, & Rowland, W.M. MEASURES OF ACUITY WITH OPTICAL SIMULATION OF DISTANCE. *Quart. Rev. Ophthalmol.*, March, 1952, 8, 3pp. Contract N6onr-24307, ONR. (Johns Hopkins Univ., Wilmer Ophthalm. Inst.)

1870

To compare the results of tests of visual acuity in which distance is simulated optically with tests at true distances, the acuities of 157 eyes were measured with letter test targets in an Ortho-Rater and at true distances under experimental conditions which were otherwise similar. Subjects had no ocular defects or diseases other than uncorrected errors of refraction. The data are analyzed statistically and discussed in terms of a simplified procedure for rapid mass testing of visual acuity.

Morse, P.M. FUNDAMENTAL INVESTIGATIONS IN METHODS OF OPERATIONS RESEARCH. Contract DA-19-020-ORD-2684, Proj. 599-01-004, TB-0001, 968, Tech. Rep. 3, Aug. 1955, 34pp. Massachusetts Institute of Technology.

1871

This technical report summarizes accomplishments of the project on fundamental investigations in methods of operations research from December 1954 through August 1955. Active projects reported are: waiting-line handbook, probability models in standard cost items, use of the science library by Massachusetts Institute of Technology personnel, controlling book circulation in a university library, waiting-line theory applied to purchasing of library books, and traffic light scheduling. Precise of two completed projects are presented: waiting-line models applied to manufacturing problems and stock valuation study. Included are lists of project personnel seminar topics and current publications. G. R 3

1872

Armington, J.C. AN ELECTRONIC PSYCHO GALVANOMETER FOR STUDENT USE. *J. Psychol.*, Feb. 1949, 28, 3-7. (Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.).

1872

The construction of a psychogalvanometer suitable for demonstration, lie detection, and student use is described. The meter proper may be used with an extension cord at a point remote from the chassis, making possible projection of the meter dial upon a screen. Because of its non-linear characteristics the instrument may be used from subject to subject without any balancing or adjustment of resistance networks; only the voltage of a single flashlight cell is applied to the subject. It is compact, portable and cannot be damaged by improper operation. I. R 4

1874

Asch, S.E., Witkin, H.A. STUDIES IN SPACE ORIENTATION: I. PERCEPTION OF THE UPRIGHT WITH DISPLACED VISUAL FIELDS. *J. exp. Psychol.*, June, 1948, 38, 325-337.

1874

To determine the relative importance of visual and postural factors in the perception of the upright, 49 subjects observed a tilted mirror scene (room at 30 degree tilt) and adjusted a rod to vertical position in alignment with own body position. Two viewing conditions were used: (1) through a tube which excluded the mirror edge, and (2) without the tube and with full knowledge of the mirror. Scores are presented as mean deviations in degrees from the true vertical; introspective comments are included. The implications for theory of space orientation are discussed. G.R3.

1875

Asch, S.E., & Witkin, H.A. STUDIES IN SPACE ORIENTATION: II. PERCEPTION OF THE UPRIGHT WITH DISPLACED VISUAL FIELDS AND WITH BODY TILTED. *J. exp. Psychol.*, Aug., 1948, 38, 455-477.

1875

To study the relative importance of visual and postural factors in spatial orientation, subjects viewed a small tilted room (22 degrees), on the back wall of which was an adjustable rod. Judgments of the true upright were made by adjusting the rod: (1) with the subject upright and viewing the room through a tube, then with tube removed, (2) with subjects tilted in the same and opposite directions to room tilt, and (3) over an extended period of time. Measurements of deviations of rod settings in degrees from the true upright are analyzed and discussed in terms of the way in which the upright is normally established. T.G.R2.

1877

Matthews, J.L. (Chm.). TINTED OPTICAL MEDIA. *National Safety News*, 1952, 2pp. Safety Reprint General 31.

1877

This report on tinted optical media, primarily sunglasses and tinted glasses for constant wear, is based on the best scientific information available. Basic principles involved are clarified by definition and specific questions answered concerning the effect of such media on visual acuity, ocular comfort, perception of color, and cataract; the valid claims which advertising can make; and the minimum requirements to be met. General comments with respect to usage are included.

1878
Watson, G.T. WINTER ENVIRONMENTAL TESTS, 1957, FT. CHURCHILL, MONTANA, CANADA, OF WEAPON SYSTEM OF RIFLE, MULTIPLE, 106MM, S.P., M50-THREE HUNDRED SEVENTY-FIFTH REPORT ON TBS - 1401 PART II TWENTY FOURTH REPORT - CROSS REFERENCE TS4 4020. DATES OF TEST: 30 JANUARY 1957 - 7 FEBRUARY 1957. March 1957, 81pp. USA Development and Proof Services, Aberdeen Proving Ground, Md.

1878
To determine the accuracy, mechanical reliability, and durability of the weapon control system under winter climatic conditions, the weapon system was given detailed examination prior to the tests; throughout tests observations were made for part breakages; turret raceway brinelling checked; ease of tracking a moving target determined; adequacy of tube traveling lock and turret lock were observed, and accuracy firings were conducted. Results are in terms of detailed inspection of weapon parts and of tests of their working condition. Recommendations are made concerning acceptance inspection procedure. Appendices include detailed firing records, accuracy chart, ammunition data card and so forth.

Barber, J.L., & Garner, W.R. THE EFFECT OF SCALE NUMBERING ON SCALE-READING ACCURACY AND SPEED. *J. exp. Psychol.*, Apr., 1951, 41, 298-309. Contract NS-ori-166, T.O. I, Rep. 166-I-115, Proj. Design. NR-784-001, ONR, Special Devices Center, Port Washington, L.I., N.Y. (Johns Hopkins Univ.)

1879
To determine the influence of scale numbering on scale-reading proficiency, twelve subjects estimated the position of targets on a rectangular grid. The grid had three numerical scales: progression by 5's, 10's, and 20's; there were two task instructions, for speed and for accuracy. Reading times and errors in interpolation between scale markings are analyzed and interpreted in terms of speed and accuracy and type of instruction. Other habits and preferences are discussed.

Bryer, D.H., & Gebhard, J.W. AN ELECTRONIC STIMULATOR FOR USE ON THE HUMAN EYE. *Amer. J. Psychol.*, July 1952, 65, 450-457. (Johns Hopkins University, Baltimore, Md.)

This report describes a stimulator developed as a research instrument for safe use on the eye although there is no reason why it cannot be used on other tissues as well. It has given stable, trouble-free service in the laboratory. It has a versatile wave form output - positive and negative rectangular pulses, square waves, trains of pulses alternating in polarity and a means of introducing sine waves and clipped sine waves into the output. Precise control over amplitude, rate of repetition, and duty cycle are possible with this instrument. (NEIAS)

Beebe-Center, J.G., Carmichael, L. & Mead, L.C. DAYLIGHT TRAINING OF PILOTS FOR NIGHT FLYING. *Aeronautical Engineering Rev.*, Nov. 1944, 3, 10pp.

1883
This paper reports a series of studies dealing with the psychophysical aspects of a technique for simulating night conditions for training pilots in night flying (use of green filter on windows of plane and red goggles on trainees). Five main problems were studied: (1) the extent to which the technique impairs depth perception, (2) individual differences in acuity with the combined filters, (3) nature of the adaptation curve for vision through the combined filters; (4) safety factors, and (5) specifications for both filters. A series of measurements of the change in illumination from noon to nightfall is included.

Beebe-Center, J.G., Mead, L.C., Wagoner, K.S., & Hoffman, A.C. VISUAL ACUITY AND DISTANCE OF OBSERVATION. *J. exp. Psychol.*, Dec., 1945, 35, 473-484. (Tufts College, Medford, Mass.)

1884
To determine the effect of large observation distances on visual acuity, 23 subjects judged the orientation of a stimulus object (white E on black background) at distances varying from thirty to 300 feet and at two miles; measurements were also made at a standard distance by varying the stimulus sizes. Acuity data (reciprocal of the visual angle, in minutes, subtended by a limb of the stimulus object when the orientation of E could just be discriminated) are analyzed as a function of distance; both theoretical and practical implications are discussed.
T.G.R10.

1885 Halsey, Rita M., Curtis, C.E., & Farnsworth, D. FIELD STUDY OF DETECTABILITY OF COLORED TARGETS AT SEA. Proj. NM 002 014-09-03, Color Vision Rep. 31, Rep. 265, XIV(5), May 1955, 1-37. USN Medical Research Lab., New London Submarine Base, Conn.

Air-to-sea sightings of various colored targets were made in fair weather. Observers were stationed in an aircraft flying at 700 feet altitude in an established search pattern. Targets were aluminum spheres painted with different test colors as follows: 16 ordinary paints of varying brightness and saturations in the yellow through red range, including certain Army-Navy standard colors; black and white; and four fluorescent paints. Targets were presented singly, and the distance at which each was detected was recorded. Colors which were detected at the greatest distances were the yellow-red and orange-red fluorescent; next in detectability were ordinary paints of high brightness and of saturation. The effects of certain operational and observational variables are discussed. The data may be used as guides in selecting colors for survival gear and in establishing rescue search patterns.

1886 Schubert, E.D. SOME PRELIMINARY EXPERIMENTS ON BINAURAL TIME INTERVAL AND INTELLIGIBILITY. Contract DA 36-039-sc-63144, Supplementary Rep. 1, Sept. 1955, 26pp. State University of Iowa.

1886 To investigate the effect on intelligibility in noise of having a speech signal arrive at one ear earlier than another, a series of preliminary experiments were conducted. The intervals employed ranged from 200 microseconds to seven milliseconds; materials were individual monosyllabic words and single continuous material. For each kind of material a listening condition was included with one headphone 180 degrees out of phase with the other to afford a comparison with other time intervals tested. Percentage of the monosyllabic words correctly understood and of words correctly reported from continuous material were analyzed as functions of the difference in arrival time at the two ears. The need for further experimentation is stressed.

1888 Berens, C., & Sells, S.B. EXPERIMENTAL STUDIES ON FATIGUE OF ACCOMMODATION. Arch. Ophthalmol., Feb., 1944, 31, 148-159. (N.Y. Univ., Dept. of Ophthalmol.)

1888

To study fatigue of accommodation, effect of prolonged visual exercise on 57 clinic patients with complaints of ocular fatigue or other symptoms of asthenopia was determined. Measurements were made of the initial and final near points of accommodation for each eye, separately and together, on ergographic tasks (astigmatic cross and a line of letters from the Behren's accommodation card at five footcandle illumination). The data are examined for evidences of fatigue of accommodation (change in near points) and for differential effects in the "working eye" and the occluded eye. Further analyses will be made of other effects at a later date.

1889 Berry, R.N. QUANTITATIVE RELATIONS AMONG VERNIER, REAL DEPTH, AND STEREOSCOPIC DEPTH ACUITIES. J. exp. Psychol., Dec., 1948, 38, 708-721. (Brown University)

1889

To study the relations among vernier, real depth, and stereoscopic depth acuities, three tasks were presented under as nearly identical conditions as possible to three subjects. In each case the vertical separation of two black rods, placed vertically one above the other with the lower rod movable in both medial and frontal planes, was judged; brightness, color of visual field, distance, size and shape of test rods were identical. Six vertical separations were used: from 3.6 to 891 seconds of visual arc. The threshold data are analyzed statistically for interrelations and theoretical implications are discussed.

1890 Berry, R.N., Riggs, L.A., & Duncan, C.P. THE RELATION OF VERNIER AND DEPTH DISCRIMINATIONS TO FIELD BRIGHTNESS. J. exp. Psychol., June, 1950, 40, 349-354. (Brown Univ., Psychol. Lab.)

1890

The relation of vernier and depth discriminations to field brightness was investigated by having each of three Ss view two steel rods, the lower one of which could be displaced laterally (vernier) or in the median plane (real depth). Using the method of constant stimuli, determinations of threshold were made for six brightnesses (192, 0.16, 4.8, 0.04, 0.90, and 0.07 ml) of vernier and real depth. Thresholds for each of the Ss for each of the brightnesses in the vernier and real depth situations are presented in the form of tables and figures. The data are also replotted to show the mean thresholds in terms of the angle measured at the individual eye.

1891

Berry, R.N., Riggs, L.A., & Richards, W. THE RELATION OF VERNIER AND DEPTH DISCRIMINATION TO WIDTH OF TEST ROD. J. exp. Psychol., Aug., 1950, 40, 520-522. (Brown Univ., Psychol. Lab.)

1891

To test the effect of angular width of test object on vernier and depth discrimination, three subjects viewed two vertical black rods against a homogeneous white background. The lower rod, movable either in frontal or medial plane, was judged in reference to the upper rod as either: front, back, right, or left. Five widths of test rod were used: 26.8, 53.5, 107, 214, and 424 seconds of visual arc, with a total angular height of one degree, thirty minutes. The threshold data are studied for differences due to width. Other factors influencing judgments are discussed.

Hilger, J.A. OPERATIONAL SUITABILITY TEST OF FIREMAN'S COAT COVER, TYPE MA-1, TROUSER COVER, TYPE MB-1, AND COMPATIBILITY WITH FIREMAN'S COTTON DUCK COAT AND TROUSERS. FINAL REPORT. Proj. APG/CSC/495 AB, Sept. 1955, 29pp. USAF Operational Test Center, Eglin AFB, Fla.

1892

To determine the operational suitability of the MA-1 coat and MB-1 trouser covers while fighting high temperature fires and their compatibility with the fireman's cotton duck coat and trousers, the following tests were conducted: covers were issued to a regular crash crew for a 45-day period during which ten crash fires and rescue operations were simulated; exposure of dummies to high temperatures and recording of "skin" temperatures using thermocouples attached to them; subjecting test personnel wearing the covers to applications of various extinguishing agents; recording the time to don the covers over various clothing combinations and in cold temperatures; and checking for damage to covers during all tests. The capabilities and limitations of the covers are discussed with recommendations. G. I.

1894

Bitterman, M.E. LIGHTING AND VISUAL EFFICIENCY: THE PRESENT STATUS OF RESEARCH. Illuminating Engineering, Sept., 1948, 43, 906-922. (Cornell Univ., Dept. of Psychol.)

1894

This paper examines some of the important theoretical concepts and experimental findings which bear on the problem of illumination standards. The discussion is largely in terms of intensity levels. Performance measures of efficiency, performance under conditions of "maximum effort" and cost of visual work in physiological terms are treated. The need for fundamental research on which to base standards is stressed. R52.

1895

Bitterman, M.E., Ryan, T.A., & Cottrell, C.L. MUSCULAR TENSION AS AN INDEX OF VISUAL EFFICIENCY: A PROGRESS REPORT. Illuminating Engineering, Nov., 1948, 43, 1074-1081.

1895

This is a brief progress report on a study of muscular tension as an index of visual efficiency. The apparatus employed is a four-channel Grass electroencephalographic amplifier which is led into a rectifying and integrating circuit. Various visual tasks have thus far been studied in preliminary experiments; analysis of the findings has led to a new approach to the problem--that of using controlled rates of work. Plans for further work are discussed. G, I, R6.

1896

Black, J.W. A COMPENSATORY EFFECT IN VOCAL RESPONSES TO STIMULI OF LOW INTENSITY. J. exp. Psychol., June 1950, 40, 396-397. (Kenyon College, Gambier, Ohio). (ONR, SDC)

This study was conducted to investigate the possibility that the responses to just-perceptible stimuli are more intense than to ones heard slightly more clearly. This would be an exception to the generalization that messages are said back with an intensity that increases with higher levels of stimuli. 25 male Ss listened to 5 lists of 8 words each and repeated each word as soon as it was heard. Under some conditions the Ss were instructed to say the opposite word. 5 intensity levels were used with the lowest level being 5 db above threshold and increments of 6 db from the first level for the 4 other conditions. An analysis of variance indicates no difference between the repeat and opposite conditions. Variability among Ss in their responses to the experimental conditions of intensity was found to be significant. The 3 lowest levels of stimuli elicited mean responses that were significantly more intense than the mean responses to level 4.

1897

Black, J.W. SOME EFFECTS OF AUDITORY STIMULI UPON VOICE. J. aviat. Med., June 1950, 21(3), 251-255. (Ohio State University, Columbus, Ohio).

A series of studies designed to find some of the determinants of momentary vocal patterns are summarized. Momentary or transient aspects of voice are considered in opposition to any generalization that associates a single or limited vocal complex with an individual talker. 2 generalizations are suggested by the summaries of these studies: a) momentary vocal patterns are in part determined by the second or "other" party in 2-way communication. This places a responsibility upon the interrogator for shaping in some measure the intelligibility of the reply that he anticipates; b) the level of the side-tone is gauged by experience and adjusted to accommodate the "normal". For efficient communication within an aircraft, the necessity is indicated for establishing through training an experience of optimum side-tone.

Blackwell, H.R. STUDIES OF PSYCHOPHYSICAL METHODS FOR MEASURING VISUAL THRESHOLDS. J. opt. Soc. Amer., Sept. 1952, 42(9), 606-616. (Vision Research Lab., University of Michigan, Ann Arbor, Mich.).

1899

To search for a psychophysical procedure for measuring the visual threshold which would show maximum reliability and independence of variables irrelevant to visual functions, a series of experiments were made covering such variables as: response used to indicate discrimination; the number, spacing, and order of light intensities presented in the measurement series; general attitude adopted by S; and extent to which S is given knowledge of the correctness of his response. Analysis of the findings leads to a listing of recommended procedures for determining visual thresholds.

Blackwell, H.R. THE INFLUENCE OF DATA COLLECTION PROCEDURES UPON PSYCHOPHYSICAL MEASUREMENT OF TWO SENSORY FUNCTIONS. J. exp. Psychol., Nov. 1952, 44(5), 306-315. (Vision Research Lab., University of Michigan, Ann Arbor, Mich.).

This study investigated to what extent differences between thresholds obtained with 2 psychophysical procedures depend upon each of 2 stimulus variables. The Ss were required to discriminate brightness differences with the stimulus size and the brightness of the background field varied among experimental sessions. The only difference between the 2 procedures studied was the response used to indicate the presence of discrimination. In one case, phenomenal report was employed; in the other, forced choice was employed. The stimuli were ordered into groups of 20 in succession having the same magnitude. It was shown that Ss exhibited an invalid mode of response, termed positive channelization, when phenomenal report was used. This response tendency consists of spuriously increasing the frequency of "yes" responses toward the end of a group of 20 stimuli of the same magnitude, providing the stimuli elicit more than 50% "yes" responses. It is concluded that the procedure employed to measure thresholds can distort functional relations studied by psychophysical methods. It is concluded further that the use of phenomenal report with grouped stimuli can lead to invalid data. This combination of psychophysical procedures has been specifically advocated by the proponents of the neural quantum theory. The question arises to what extent invalid modes of response arising from the use of this psychophysical procedure have led to spurious evidence for the neural quantum theory.

1901
Blockley, W.V. & Taylor, C.L. HUMAN TOLERANCE LIMITS FOR EXTREME HEAT. ASHVE J. Section, Heating, Piping & Air Conditioning, May 1949, 111-116. (University of California).

Reported are the results of 21 human exposures to air temperatures ranging from 140 to 240°F. To investigate man's ability to tolerate extreme heat, Ss were subjected to these heat ranges in an experimental heat chamber. Clothing was standardized and consisted of close-fitting wool and cotton one-piece union suit, 0.080 in. thick, with loose-fitting felt duffel socks on the feet. The environments have been specified in terms of air and wall temperatures, air movement, and vapor pressure. Physiological measurements included skin, rectal and expired air temperatures, heart rate and body weight losses. Skin temperature rises during exposure and heart rate increases. Blood pressure changes show individual difference with systolic pressure rising during exposure in all cases. Exhaled air temperature responds rapidly to the heat load. An index of physiological strain was derived and the relationships between air temperature, exposure and this index of strain were displayed graphically. (HEIAS)

1902
Polzano, J.H., Alvis, E.J., & Daffner, G.J. SUBMARINE ESCAPE TRAINING EXPERIENCE. Naval & Surgery Proj. NM-002 015.08.03, Rep. 264, May 1955, 28pp. U.S.N. Medical Research Laboratory, Naval Submarine Base, New London, Conn.

1902
This report presents the results of an extensive study of submarine escape training directed towards evaluating the relation between method of escape and incidence of personnel casualties. A total of 185,000 simulated escapes were made during the period of study. Two methods of escape were utilized: (1) escape using the Submarine Escape Appliance (Mann Lung) and (2) escape without any respiratory device (free escape). An analysis of the number and types of escapes and the associated casualties is presented along with a discussion of the role of phase of training, type of casualty (e.g., decompression sickness, aerotitis, emphysema, etc.), and other factors. Conclusions are drawn concerning the fatality rate in free escape vs. that in using the Submarine Escape Appliance. T. R 3

Electronics Research Laboratories, Columbia University. PROJECT LION: SIMULATION STUDY. Contract AF 30(635)-2815, Proj. 4506, Progress Rep. P-1/128, Task IV, 45360, Feb. 1955, 39pp. RADC, Griffiss AFB, Rome, N.Y. (Columbia University Engineering Center).

1903
This report is primarily concerned with the system design of the multi-target radar simulator and specification of the problems associated with its implementation. A detailed description of the system is presented and discussed in terms of the design operation, and problems associated with such components of the system as controlled search, coincidence inversion, and a 2.5 mc dynamic binary counter.

1904
Pike, B.W. ELEMENTARY PRINCIPLES OF ELECTRICITY AS APPLIED TO ACCIDENT PREVENTION. NTS-1868, Jan. 1957, 16pp. USN Ordnance Test Station, China Lake, Calif.

1904
To explain electricity in easily understood terms for personnel who operate electrical equipment and who must therefore be aware of electrical hazards, simple definitions and explanations are given of such terms as conductors, free electron, potential-difference. Electrical shock, heat, arc or spark, and electro-mechanical force hazards are discussed. Safety precautions and methods are included in two appendices.

1905
Bowers, W.H. AN APPRAISAL OF WORKER CHARACTERISTICS AS RELATED TO AGE. J. appl. Psychol., Oct., 1952, 36, 296-300. (The Ohio State Univ. Development Fund.)

1905
This study attempts an appraisal of the comparative performance of industrial workers of different age groups fulfilling a variety of functions in a large organization, and an analysis of the factors involved. Utilizing personnel records and appraisals from a variety of sources on 3,162 workers of both sexes and ranging in age from 18-76 yrs, the data was reduced to meaningful evaluatory categories such as efficiency, accuracy, cooperativeness, etc., and treated according to age groups. The results are discussed in terms of differentiation between age groups, individual differences within such groups, and the relationship between change of traits and increasing age.

Sage, L.C. & Knapp, S.S. AIRPORT LIGHTING SYSTEMS TESTING KIT. Contract AF 33(400) 29099. Proj. 6061. WDC 70 55 326. June 1955. 43pp. WPA Engineering Lab., Wright-Patterson AFB, Ohio.

1911

Carr, W.J., & Gerner, W.R. THE MAXIMUM PRECISION OF READING FINE SCALES. *J. Psychol.*, 1932, 34, 85-94. Contract NS-ori-164, T.O. 1, Rep. 164-1-130, Proj. Design, WH 784-008, ONR, Naval Eng. Lab., Systems Coordination Div. (Johns Hopkins Univ.)

1906

To develop kits containing instruments for acceptance and preventive maintenance testing and trouble shooting for airport lighting systems, visits were made to over thirty special equipment laboratories, Air Force bases, commercial airports, manufacturers of equipment, and specialists in the field. An analysis was made of airport lighting systems - the components, causes of failures, testing required, and the characteristics of effective testing kits. Recommendations were made for a kit of instruments and a procedure for conducting tests on new installations for acceptance, periodic preventive maintenance testing, and trouble shooting when failures occur. The kit contains commercially available instruments and equipment.

1911

To study some factors affecting the accuracy of reading fine scales, 15 subjects estimated to the nearest 1/200 the position of a pointer set between two unnumbered markers of a linear scale. Experimental variables were size of interval (0.5 to 2.0 millimeters in 15 steps), marker and pointer widths (0.1, 0.2, 0.4 millimeters). The discrepancies between estimated and true positions were converted to relative and absolute errors for analysis. Maximum accuracy as related to size of interval, width of pointer, and width of markers and the manner in which these factors influence interpolation habits is discussed.

Carnett, R. INDIVIDUAL DIFFERENCES IN HEARING FOR SPEECH. *Ann. Otol., Rhin., Laryng.*, June 1946, 55, 233-267.

Individual differences in relative acuity for speech reception stimuli and for pure tones were investigated from several points of view. The purpose was to clarify the incidence and significance of these individual differences as they were observed among hard of hearing patients reaching a military program for Aural Rehabilitation. To this end statistical studies were made and analysis of individual case studies employed. A number of statistical studies were made to assess the influence of: a) pattern of pure tone loss; b) duration of hearing loss; c) type of hearing loss; and d) acoustic trauma on difference scores. As a general conclusion, several variables produce systematic shifts in difference scores. A specific conclusion concerning each variable is given. The latter half of the paper is devoted to an analysis of case histories and to clinical interpretation of discrepancies between acuity for speech and for pure tones.

1912

Chapman, A. A COMPARATIVE STUDY OF FIVE TESTS OF COLOR VISION. *J. opt. Soc. Amer.*, July, 1945, 30, 626-649. (Johns Hopkins Univ., Dept. of Psychol., Baltimore, Md.)

1912

To evaluate five pseudo-isochromatic tests of color vision (American Optical Company, Ithaca, New York; Boston, and Easton-Kodak) in terms of their efficiency for detecting color vision deficiencies, 120 men were given these tests and compared with the Royal Canadian Navy Color Test (coloration). Each pseudo-isochromatic test was evaluated by comparing the results with the known classification: 66 normal and 34 color deficient. A plate by plate analysis was made and a further study of the legibility of the numbers used in the plates was made. The effects of visual acuity and age on test performance are evaluated.

1913

Chapman, A. THE DARK ADAPTATION OF THE COLOR ANOMALOUS REARED WITH LIGHTS OF DIFFERENT WAYS. *J. gen. Physiol.*, May, 1947, 30, 423-437. (Johns Hopkins Univ., Dept. of Psychol.)

1913

To study the course of dark adaptation of the color anomalous, determinations of minimum light thresholds were made over a period of 45 minutes following a pre-adaptation period. Four color normal, three deuteranopic (centeranomalous), and four protanopic (protanomalous) subjects were studied. Measurements were made with red, reddish orange, yellow, green, violet, and white test lights. Dark adaptation curves are analyzed and a theoretical explanation advanced to account for the findings in terms of the known sensitivity characteristics of the normal and color-anomalous eye.

Carpenter, C.R. REQUIREMENTS OF RESEARCH ON INSTRUCTIONAL FILMS. *Hollywood Quart.*, Spring 1948, III(3), 262-266. (Pennsylvania State College, State College, Penn.)

1910

This article discusses the following seven requirements for research to improve the effectiveness of instructional films: applying what is already known, dealing with definable variables, making simple and precise experimental designs, developing measurement techniques to evaluate learning, acquiring adequate resources, obtaining cooperation between research and production personnel, and providing for field testing of instructional films.

1914

Chapman, A. DIAGNOSING TYPES OF COLOR DEFICIENCY BY MEANS OF PSEUDO-ISOTHERMATIC TESTS. *J. opt. Soc. Amer.*, March, 1949, 39, 240-249. (Johns Hopkins Univ., Dept. of Psychol.)

1914

To evaluate several pseudo-isochromatic tests for their usefulness in classifying types of color deficiencies, 34 color deficient men (selected by previous testing) were tested on the diagnostic plates of the Ishihara, Heyworth, and Boston color test. Each of the men was examined further with a Konica and Lomb visual spectrophotometer to determine his limit of visibility in the long wave-length (red) end of the spectrum. Test results and the spectrophotometric measurements were evaluated for their ability to differentiate two kinds of color deficient individuals (protano or deuterano).

Chapman, S. RELATIONSHIPS BETWEEN AGE, VISUAL ACUITY AND COLOR VISION. *Human Biol.*, 1950, 22, 30 pp. Contract NS-405-166, T.O. 1, Ser. 166-1-103, GPO, Special Devices Center, Systems Res. Proj., Fort Washington, Pa., U.S. (Johns Hopkins Univ.)

1916

To study relationships among age, visual acuity and color vision, 574 visitors to the Baltimore Occupational Exhibition were tested with a new visual acuity test chart and five pseudo-isochromatic tests of color vision (Danzon and Dillingham, 1948; Dillingham, American Optical Company, author's own test). The distance for all testing was 32 inches and the illumination thirty foot candles. The visitors ranged from seven to 77 years of age. The results are analyzed by correlational procedures and discussed in terms of the effect of age on visual acuity and color vision. 7,511,890.

1916

Chapman, S. VISION. *Ann. Rev. Physiol.*, 1949, 10, 133-152. (Johns Hopkins Univ., Dept. of Psychol.)

1916

This review of literature on vision covers the period from September, 1944 through June, 1947. The topics covered are: reviews and bibliographies, physiology of vision—photoreception and electro-physiology of the retina, color vision, color blindness, luminosity functions of the eye, and effects of smoking, visual accommodation and testing—general tests, color vision and color blindness, dark adaptation, night vision, and stereoscopic vision. R275.

Chapman, S., Rouse, R.O., & Schachter, S. THE EFFECT OF INTER-SENSORY STIMULATION ON DARK ADAPTATION AND NIGHT VISION. *J. exp. Psychol.*, Aug., 1949, 22, 425-437. (Johns Hopkins Univ.)

Reported are 3 experiments conducted to test Russian claims that inter-sensory stimulation and light muscular exercise significantly improved light adaptation.

In the first experiment, six Ss were tested with a Hecht-Shlaer adaptometer on 11 consecutive days. Experimental treatments consisted of swilling oil of wintergreen, listening to a 1000-cycle tone, and performing light muscular exercise on a bicycle ergometer. Control and experimental dark-adaptation sessions were varied systematically from day to day. In the second experiment, five Ss were tested on five consecutive days with the Luckiesh-Hess Low-Contrast Test-chart. The stimuli used here were a loud and soft tone and a heavy and light pressure applied to the back of the hand. The third experiment measured the effects of similar stimuli on form discrimination at very low illumination levels. The results of all experiments are completely negative. None of the stimuli used in this experiment either facilitated or inhibited dark adaptation, contrast sensitivity, or form discrimination at low illuminations. R 21

1918

Crouch, C.L. THE RELATION BETWEEN ILLUMINATION AND VISION. *Illuminating Engineering*, Nov., 1945, 42, 747-764.

1919

To answer the question "How much light is enough for reading?", basic studies on the relation between illumination and vision (particularly visual acuity) are reviewed in terms of the factors into which the engineer has divided the visual task—size, contrast, time, and brightness. Further effects of age, sub-normal vision, and glare are discussed. Specifications for illumination levels for some tasks are given. 7,511,890.

Elfred, K.X., & Kyrasie, D.T. NOISE CHARACTERISTICS OF AIR FORCE TURBOJET AIRCRAFT. Proj. 7210, Task 71705, NADC Tech. Note 56-280, Dec. 1956, 31pp. Aero Medical Lab., NADC, 1200, Wright-Patterson AFB, Dayton, Ohio.

1920

This report presents a summary of the noise characteristics of all operational Air Force turbojet aircraft to be used in establishing zones within which maintenance and other personnel must wear personal protective devices to avoid the risk of permanent hearing damage. The noise characteristics for each aircraft include: (1) a plot of over-all sound pressure level along the angle of maximum noise radiation versus distance from the aircraft engine exhaust; (2) contours of equal sound pressure level; and (3) over-all levels at maintenance positions. Directions are included for using the data. Generalized noise characteristics are included to simplify evaluation of maintenance operations which involve more than one type of aircraft. T. O. R 5

1921

Crook, M.M. PRINTED MATERIALS, MAPS, AND CHARTS. From Human Factors in Undersea Warfare, 1949, 61-76. National Research Council, Washington, D.C. (Tufts University, Medford, Mass.)

1921

This report is a reprint of Chapter Two from Human Factors in Undersea Warfare. A review of representative research on the following topics is presented: general factors of typography; illumination and fatigue in normal reading, with reference to methodological problems; perception of type at a distance; legibility of numerals; tables and graphs; and problems of the use of maps and charts. Possible areas of further research are suggested. R 60

1922

Craik, K.J.M. INSTRUMENT LIGHTING FOR NIGHT USE. EPRC 342, July 1941, 11pp. Flying Personnel Research Committee, London, England.

1922

To evaluate instrument panel lighting system for night use by pilots, the time to read a 3-3/4 inch dial to a mean accuracy of two percent was measured under varying illumination levels; the time to pick up a stationary silhouette in an unknown position at five feet after reading the instruments is also taken as a measure of effect on dark adaptation. Variables investigated were: style and size of lettering, graduations, methods of illumination (white or colored floodlighting, concealed indirect or ring lighting, fluorescent, and radio-active joint). Specifications of a proposed lighting system are given. G. 1

Crawford, S.H. VISUAL ADAPTATION IN RELATION TO BRIEF CONDITONING STIMULI. *Proc. Roy. Soc., Ser. B*, 1947, 134, 283-303.

1923

This paper reports a number of experiments, carried out during wartime, investigating factors influencing dark adaptation. Threshold measurements were made of changes in adaptation before and after a conditioning stimulus was applied. After removal of a relatively brief conditioning stimulus other measurements were made to study the effects of removal of test field contrast, superimposed steady background, area of test field, use of equivalent background transformation, individual differences, color and intensity of conditioning stimulus, spatial and temporal patterning of conditioning stimulus, and the use of natural objects for test stimulus.

Davy, E. SOME RECENT ENGINEERING ASPECTS OF THE PORTABLE FLAME THROWER GUN (U). Proj. 4-08-02-019-01, Chemical Warfare Lab. Rep. 2104, April 1957, 20pp. USA Chemical Warfare Lab., Chemical Corps Research and Development Command, Army Chemical Center, MD.

1924

To study positioning of hand controls on the portable flame thrower gun, two handgrip dynamometers were used to represent controls. Amount of pressure that could be exerted on each was used as an index of optimal positioning. Factors studied were: (1) displacement positions (four horizontal, two vertical, and three lateral); (2) hand position in operation of trigger (grip) control (horizontal with palm up or down and vertical); (3) separation of handgrip components (5.5, 6.5, and 7.5 centimeters); and (4) dynamogenic effect of left hand pressures (0 to 40 kilograms) on maximum right hand pressure. Findings are discussed in relation to equipment design.

Davis, R.C. MOTOR EFFECTS OF STRONG AUDITORY STIMULI. *Amer. Psychol.*, June 1948, 48(1), 257-275. (Indiana University, Bloomington, Ind.).

To study possible motor responses to sensory stimuli 2 experiments were conducted in which muscular action potential, under both forearm, under loud stimulation was recorded. The 50 being instructed to do nothing in response to the stimuli. An increment in action potential over the immediate pre-stimulus level was considered to be a response. The following results were obtained: a) The stimuli produced 2 responses, called a and b, since 2 parts of the overall response curve have different functional relations; b) Both a and b responses are closely related to the state of tension existing just before the delivery of the stimulus; c) Latency, relative to stimulus intensity, and course of adaptation differed for a and b responses. These responses are probably related to some previously studied by other methods, but a complete theory must await more information. (JH145)

1939
 Kennedy, J.L., & Travis, R.C. PREDICTION OF SPEED OF PERFORMANCE BY MUSCLE ACTION POTENTIALS. Contract NSori 58, ONR, Special Devices Center, Tufts College, Medford, Mass.

Described is an electronic counting technique in recording data on frequency of muscle action potential. The task described was to respond to an occasionally presented stimulus (simultaneous flash of light and sound of a buzzer) by pressing a key as quickly as possible. The presentation of the stimulus, occurrence of response frequency of action potentials from surface electrodes placed over the supraspinal muscles, low-frequency potentials from the same suborbital electrodes, and muscle action potential rate from electrodes on the hand were all recorded on a Grass ink-writing oscillograph. At a point in the task, the subject knocked on the door of the experimental room. The stimulus before the knock elicited no response but the knock produced a "startle" reaction with the immediate resumption of muscle spike activity, low-frequency activity, and a pressing of the response key in the absence of a stimuli. It was felt that this arrangement would permit versatility in studying a variety of muscle contraction problems under a variety of conditions of effort and work. It is also felt that these techniques may make it possible automatically to warn personnel engaged in monotonous tasks, such as truck driving, before dangerous conditions of inattentiveness and approaching sleep occur.

1961
Fitts, P.M. PSYCHOLOGY AND AIRCRAFT DESIGN: A STUDY OF FACTORS PERTAINING TO SAFETY. Mechanical Engineering, Feb., 1967, 135-141. NAC, Aero Medical Laboratory.

This first part of this report is on a study conducted to determine some of the difficulties experienced by pilots in using existing equipment. Pilots were asked a series of standard questions that required the Ss only to give an accurate description of their past experiences in flying. These questions dealt with experiences in taking off, flying in instrument weather, landing, mistakes in interpreting instruments, mistakes in using controls, description of experiences or procedures which required the S to be "most on the ball." Each pilot was asked for any "pet peeves" about the cockpit. The reports indicated that many of the incidence of accidents and near-accidents could be reduced by designing new equipment in relation to the psychological capacities and human limitations of the user. The second part of the paper reports a selected group of experiments in the field of psychological engineering. These experiments were conducted on Army Air Force pilots and investigated display problems including: a) the design of clock dials for reading in the military time system; b) design characteristics that would reduce errors in the use of air-navigation plotters; c) factors affecting the legibility of aircraft instrument dials; d) a comparison of 4 types of artificial-horizon indicators. Several studies were concerned with control problems. One of these studies examined human motor abilities related to control design and another dealt with the accuracy and consistency with which pilots can apply specified pressures to stick, wheel, and rudder controls. These represent only a small contribution to the improvement of aviation equipment and more research is strongly recommended.

Ford, A., Rigler, D., & Dugan, Genevieve, E. POINT CENTERING OF SIGNALS ON AN AREA. J. appl Psychol., 1950, 35, 429-433. (Lehigh University, Bethlehem, Penn.).

Of concern here is the precision with which signals, consisting of white spots or patches can be located or "checked" on a dark field, such as that of a radar scope. Signals can be located by a superimposed cursor which actuates a remotely controlled indicator. Reported is an investigation designed to handle the human error problem of how accurately the operator sets the cursor on the signal on "pip." It was found that Ss tended to wobble around the near center on both the artificial signals and the reproduction of the natural signal. The best reduction rates for hand movements in relation to cursor movement was close to 2:1. It was also found that centering signals on an area by means of a pantograph-controlled cursor is about 3 times as accurate as the location of such signals by scale reading methods. The use of a palm rest resulted in slightly superior scores in center and was preferred by the Ss. The limits of visual perception account for less than 1/2 of the range of errors. Skill and precision attitude may account for the remainder. It was found that a cursor surrounded by rings like a "bull's eye" reduced the tendency to drift around actual center.

Garner, W.R. THE ACCURACY OF COUNTING REPEATED SHORT TONES. *J. exp. Psychol.*, 1951, 41, 319-326. Contract NSori 166, Proj. NR 704 001, Rep. 166 I 122. ONR, Special Devices Center, Johns Hopkins University, Baltimore, Md.

This experiment was designed to determine the accuracy with which Ss can count the number of short tones in a temporal series as a function of the repetition rate of the tones and the total number of tones in a series. The Ss were presented a series of short 1000 cps tones and was required to count the total number of short tones. Rates of 4, 6, 8, 10 and 12 per sec. were used, with numbers from 1 to 20. Tone durations of 5 and 40 msec., and intensities of 55 and 95 db SPL were also used. The results indicate that there are no differences in counting accuracy due to either duration or intensity of each tone. The accuracy of counting is a function of both number of tones and repetition rates. The data show, that as the number of tones and repetition rate increased and accuracy decreased, the Ss underestimate the number of tones in a series. It is also shown that individuals differ markedly in their ability to count tones. Randomizing the repetition has a statistically significant but practically unimportant effect on counting accuracy.

Garner, W.R., & Merthensamer, M. SOME EFFECTS OF INTERAURAL PHASE DIFFERENCES ON THE PERCEPTION OF PURE TONES. *J. acoust. soc. Amer.*, 1951, 23, 664-667. Contract NSori 166, Proj. NR 704 001, Rep. 166 I 131. ONR, Special Devices Center, Johns Hopkins Univ., Psychol. Lab.

Fifty-four naive observers were asked to report whether they could hear a difference between two successive tones which differed only in respect to which ear was leading in phase angle. They were not given specific suggestions to listen for a particular effect, but were later asked what they had heard. Two intensities, eight frequencies, and seven phase leads were used. The major conclusions from the results are: a) all observers heard differences due to phase and identified the differences as localization, although for most the localization was in terms of which ear was stimulated rather than in terms of apparent localization of a sound source; b) pitch and loudness differences also occurred, but cannot be explained on the assumption that only one ear was effectively stimulated; c) measures of phase-difference thresholds, upper frequency limits, and time-difference thresholds show approximately the same results as are obtained with other methods.

Garner, W.R. & Hake, H.W. THE AMOUNT OF INFORMATION IN ABSOLUTE JUDGMENTS. *JHU Rep.* 166 I 137, 1951. Reprint 22 52, Nov. 1951, 14pp. *Ind Research Lab.*, Washington, D.C. (Johns Hopkins University).

1952
This paper demonstrates that a measure of the amount of information is useful for the analysis of data obtained by absolute judgments. Equations for calculating this measure are derived and possible interpretations discussed. The contingency coefficient is shown to have some of the same properties as the amount of information. The problem of selection of the stimuli for maximum information transmission is discussed and a technique for constructing the needed scale of equal discriminability is described.

Garner, W.R., & Gebhard, J.W. MACHINE DIALS AND SCALES. *Machine Design*, 1949, Aug. 999. Contract NS-ori-166, Rep. 166-I-8-6. ONR, Special Devices Center, Johns Hopkins Univ., Psychol. Lab.

1954
This paper presents guides to the design of machine dials and scales for quick and accurate reading based on findings of experimental research in the area. The various ways dials and scales are used, e.g., direct reading, directional reading, and quantitative reading, are discussed. The spacing and numbering system of dial markers is discussed and a nomograph permitting reading percentages of correct readings to an interval is given. Other topics include kinds of scales and dials, use of counters and combination instruments, arrangement of dials, and miscellaneous design problems.

1953
Garner, W.R. SOME STATISTICAL ASPECTS OF HALF-LOUDNESS JUDGMENTS. *J. acoust. soc. Amer.*, 1952, 24, 153-157. Contract NS ori 166, Proj. NR 704 001, Rep. 166 I 139. ONR, Special Devices Center, Johns Hopkins Univ., Psychol. Lab.

Half-loudness adjustments have been obtained from 18 observers at 10 intensity levels from 10 to 100 db. Adjustments were made with two methods. An analysis of variance of the attenuation scores necessary for half-loudness showed: a) Intensity accounted for a quarter of the variance. This variance indicates the extent to which the attenuation necessary for half-loudness varies with different intensities. b) Consistent differences between observers accounted for 35 percent of the variance, indicating that some observers consistently require much greater or less attenuation for half-loudness than others. c) One-tenth of the variance was a result of the fact that the shape of the half-loudness function with respect to intensity was different for different observers. d) The error variance, caused by repeated adjustments by the same observer at the same intensity and with the same method, was 22 percent of the total. e) Other variances were practically insignificant. The average half-loudness function differs markedly from previously reported results. It is suggested that this discrepancy, as well as the large differences between individuals, is largely a result of the fact that observers have difficulty establishing the correct fractional value, and thus are extremely susceptible to indirect suggestion. A means of avoiding this problem of a nonvital fraction is suggested.

Gurner, W.A., C. Miller, G.A. THE MASKED THRESHOLD OF PURE TONES AS A FUNCTION OF DURATION.
J. acoust. Soc. Am., 1947, 17, 291-303. Contract OMAr 624. Mass. Psycho-Acoustic Lab.

The relation between auditory sensitivity and the duration of a pure tone was measured using 4 St. 4. different frequencies (500, 570, 1000, and 1500 cps) and 8 different levels of intensity (2.5, 25, 50, 100, 500, 1000, and 2000 msec.) were used. Because of the difficulties involved in measuring the threshold of hearing in the quiet, with any degree of precision and reliability, the masked threshold was determined with a white-noise masking spectrum. The following results were obtained: a) The ear integrates acoustic energy linearly up to 200 msec., for when the duration is decreased by a factor of 10, sensitivity is decreased by 10 db; b) For durations longer than 200 msec., the change in sensitivity is slight, and acoustic integration may be considered complete at approximately 1-sec. The hypothesis that the auditory system integrates acoustic energy linearly, if the zero intensity is reported as that intensity which is effectively zero for the ear, was tested. The data substantiate the hypothesis fairly well. Crofters' statistical hypothesis was also tested, and the data fit that hypothesis as well as they fit the previous hypothesis. Mathematical relationships between the 2 hypotheses are shown such that if the data fit on hypothesis, they must of necessity fit the other.

1957
Graham, C.E., Riggs, L.A., Mueller, C.G., & Solomon, R.L. PRECISION OF STEREOSCOPIC SETTINGS AS INFLUENCED BY DISTANCE OF TARGET FROM A FIDUCIAL LINE. J. Psychol., 1949, 27, 203-207. Contract OMAr-1039. OSRD, Brown Univ.; and Contract NSom-271, Proj. NRI42-404. OSR, Columbia Univ.

1957
To study the way in which stereoscopic threshold settings are influenced by the nearness of the target to a reference fiducial line, five subjects made settings on two types of reticle patterns (single vertical line at different distances to the left of center, and vertical line along the diameter with a "break"). The target (stationary airplane silhouette, slightly below center) was adjusted to the same apparent distance as the reticle lines. The geometric mean average deviation of the settings is plotted as a function of distance of target from reticle line. Comparison is made between the two types of reticle patterns used.

Graham, C.E. SOME FACTORS THAT LIMIT VISION. Monthly Research Report of the Office of Naval Research, 1961, Sept., 16-25. OSR, Washington, D.C.

1959
This paper discusses five visual functions (threshold sensitivity, differential sensitivity, acuity, depth discrimination, and monocular movement parallax) and the parameters which influence them, such as stimulus area, duration, wavelength, retinal position, and the degree of dark and light adaptation. Generalizations concerning the limiting conditions of vision are presented.

1960
To explore factors influencing thresholds for monocular movement parallax (subjects stationary, while objects in space move), 10 practiced subjects made distance settings of two needles, one above the other, moving at constant and equal speeds back and forth across an illuminated field. Variables were: (1) differences in size of moving objects, (2) intensity of illumination, (3) rate of movement, and (4) axis of movement. The data consist of variability measures of threshold settings and are analyzed as functions of the variables tested. A theoretical discussion is given of the geometry of the situation and of the results in relation to space perception cues.

Whitcher, H. RESPIRATORY PATTERNS AT DIFFERENT WORK RATES: THEIR CORRELATION WITH BREATH HOLDING TIMES AND MASKING TIMES. Porton Tech. Paper 499, Aug. 1955, 13pp. Chemical Defence Experimental Establishment, Directorate of Chemical Defence Research and Development, Ministry of Supply, London, England.

1962
This experiment was undertaken to provide an empirical basis for evaluating the procedures used at the beginning of a gas alert. The respiratory patterns of 18 men and 9 women were determined when they were required to stop breathing for as long as possible. They each wore an oro-nasal mask connected to spirometer. The subjects stepped up and down a 20 inch step at a rate of 7.5, 15 or 30 times per minute. The initial tidal air and minute volume, the volume of air inhaled immediately following the signal to stop breathing, the maximum breath holding time, the volume of involuntary respiration during breath holding, the volume and duration of the minimal intervening gasps, and the terminal tidal air and minute volume were recorded.

Valentine, G. DYNAMIC ANALYSIS-EMERGENCY
ESCAPE SYSTEMS. Rep. 451, June 1956, approx.
200pp. Stanley Aviation Corp., 2506 Dallas
Street, Denver, Colo.

1963

To appraise several configurations of emergency escape devices (ejected seat or seat capsule), the following characteristics for each were determined for ejection at 500 knots EAS at sea level and 4000 feet altitude: trajectory to fall; spiral and cross-body acceleration; velocity and altitude versus time. Also determined were thrust requirements for upward ejection at maximum g and minimum altitudes and low altitude escape limitations for critical configurations. The devices evaluated included upward seat, downward seat and seat capsule in three variations each: forward facing, aft facing, and with added mass.

Gulbert, A. & Taylor, G.L. RADIATION AREA OF THE HUMAN BODY. J. Anal. Psychol., July, 1952,
2, 24-37. (Engineering Dept., University of California, Los Angeles, Calif.).

A method for determining directly the area of that part of the body surface which takes part in radiation exchange with the surround is described, together with results obtained for three subjects of divergent body shape and for four different body postures. The analytical basis of the method is developed from the concept of the local shape factor integrated over all space, permitting, by use of the reciprocity theorem, an evaluation of the equivalent total projected area, defined as the radiation area. The experimental procedure involves the photographing of the human subject at a fixed distance in excess of 15 ft., from 32 viewing angles chosen to sample effectively the surface of a hemisphere described about the sagittal plane as equator. The planimetered areas from each photograph, representing projections of the body, are plotted as functions of two angles which define the viewing position, and by a graphical integration procedure the total area "seen" by the whole of the surround is obtained. Data were obtained by this method for the nude radiation area of an "average" young man, whose body dimensions closely approximate those of the Air Force median cadet. In four distinct postures described as erect, semi-erect, seated and crouched. For the erect and seated postures, data were also obtained for a heavy and a light individual. The influence of clothing was evaluated for the average man in the erect posture, with limited additional observations in the other three postures. While the radiation area is a function of posture, as expected, no evidence for a relationship with body type was found. The results are best expressed in the form of a factor expressing radiation area as a proportion of the total body surface area as given by the Dubois formula. The average values of this radiation area factor for nude subjects in the four postures from erect to crouched are 0.77, 0.72, 0.70 and 0.65, respectively.

Kelley, Rita M., & Chaponis, A. ON THE NUMBER OF ABSOLUTELY IDENTIFIABLE SPECTRAL HUES.
J. opt. soc. Amer., 1951, 41, 1057-1058.
Contract NSG-1-101, Proj. NR-784-001, Rep.
106-1-134. ONR, Special Devices Center,
Johns Hopkins Univ.

1965

To investigate the number of absolutely identifiable spectral hues, subjects (normal color vision) observed a test spot and identified the color by number. Familiarization and practice procedures of number identification preceded the judgment test. A 17-hue series, primarily selected from wavelengths separated from each other by an equal number of just noticeable differences, was judged first then reduced to a 15-hue, 12-hue, and 10-hue series. The percent total judgments of correct identifications are presented and related to findings from other similar studies.

Harris, J.D. AUDITORY ACUITY IN SEVERE AERO-OTITIS MEDIA. J. Acoust. Soc. Amer., Oct. 1945,
17(2), 139-143. (USN Submarine Base, New London, Conn.).
39 No. 4 ears and 40 No. 0 ears, measured on a 5-point otoscopy scale, were given a 6-octave audiogram before and after a 50 lb. dry pressure test. Comparing the No. 4 ears with their pre-pressure state or with a control group, it was clear that sound transmission was not greatly affected. In view of the data reported and in the absence of evidence to the contrary, the hypothesis is put forth that the pathological condition of the structures of the ear in acute aero-otitis media does not of itself bring about greatly lowered acuity. Differences between the acuity data in barotrauma presented here and that reported by the Air Forces are discussed. (HEAS)

Harris, J.D. GROUP AUDIOMETRY. J. acoust. soc. Amer., 1945, 17, 73-76. (Medical Research Lab., New London, Conn.)

Described is a group test of auditory acuity which makes use of commonly available apparatus. Two sources of sound were used: a beat-frequency oscillator with provision for intensity control and a Western Electric 68 audiometer. These were coupled through potentiometers respectively to 12 Baldwin magnetic resonant phones and to 12 Permoflux ANB-H-1A dynamic non-resonant phones. In the testing procedure, each S is provided with a headphone, pencil and answer blank. A tone of the desired frequency at an intensity of 30 db above threshold is presented in either 1, 2 or 3 short spurts of about 1/2 sec duration and separated by about 1/4 sec interval. The S is required to indicate presence, absence, or number of spurts heard. A descending and ascending series in steps of 5 db is given. Reliability is only slightly less than that of a careful individual examination. The techniques which produce highest reliability are described and validity is satisfactory in terms of duration from results of an individual test. The test is simple to take and several checks on malinger are provided which make group audiometry practical with population not highly selected for age or intelligence.

Dahn, T.M. MEASUREMENT OF WINDSHIELD DEVIATION AND DISTORTION. Rep. 10342, 31pp. Lockheed Aircraft Corp., Burbank, Calif.

1979

To develop a method of measuring optical distortion in windshields (aircraft) that is simple in operation, does not require much inspection time, can be used by an inspector with limited training, and provides a numerical result without computation on part of the inspector, double exposure photographs were analyzed for evidence of defects. An adequate method was developed for measuring distortion, as well as deviation, through use of a distortion gauge. The validity of the method was established by analysis and demonstrated in actual operation. The gauge and method of using it are described.

Nelson, H. ADAPTATION-LEVEL AS A BASIS FOR A QUANTITATIVE THEORY OF FRAMES OF REFERENCE. Psychol. Rev., 1948, 55, 297-313. (Bryn Mawr College)

1950

To develop a concrete, quantitative approach to "frames of reference", "norms", and related phenomena, the concept of adaptation-level (originating in visual studies of constancy, contrast, adaptation, and color conversion) is defined in terms of the position of the "neutral point" and its determination of the structure of the behavioral field. The mathematical formulation of the theory is developed and agreement between calculated and observed values for various functions are studied. Specific implications of the theory in the field of social behavior are discussed.

Hirsh, I.J. BINAURAL HEARING AIDS: A REVIEW OF SOME EXPERIMENTS. *J. Speech Hearing Disorders*, 1950, **15**, 114-123. Contract N5ori 76, Proj. NR 142 201, Rep. PNR 84, ONR, Harvard Univ., Psycho-Acoustic Lab., Cambridge, Mass.

This paper considers available data that is pertinent and has implications for the advisability, design, and use of binaural hearing aids. Aspects of the problems involve the question of whether or not 2 ears are really better than one, and if there are advantages which are desirable for hard-of-hearing listeners, how can they be preserved or enhanced in the hearing aid? Topics considered in relation to these questions are: absolute threshold, differential thresholds, masking, loudness, and localization and intelligibility. The usual monaural hearing aid does not permit the listener to hear separately acoustic sources that may be separated in space. What is needed is a device that will permit him to localize. It is suggested that a stereophonic hearing aid which will have to separate microphones and simulate 2 ears will be far more beneficial. Although there are some problems from the engineering and cosmetic aspect, these could be overcome. Studies to validate this preliminary outline are required before making further conclusions or generalizations. (HEIAS) R 21

1967
This paper attempts to show that there is a general psychophysical law relating subjective magnitude to stimulus magnitude and the form of this law is a power function. Two general classes of perceptual continua are distinguished: Class I or "quantitative", and Class II or "qualitative" continua. Four kinds of direct methods for constructing ratio scales are described and experimental data from Class I continua are presented to show that equal stimulus ratios tend to produce equal subjective ratios. It is pointed out that Fechner's logarithmic law is not found in experiment because the resolving power (just noticeable difference) is not constant in psychological units but is roughly proportional to psychological magnitude. Hirsh, I.J., Davis, H., Silverman, S.R., Reynolds, E.L., et al. DEVELOPMENT OF MATERIALS FOR SPEECH AUDIOMETRY. *J. Speech and Hearing Disorders*, Sept. 1962, **12**(3), 321-337. (Central Institute for the Deaf, St. Louis, Mo.)

3 new recorded tests for the hearing of speech have been described. Tests W-1, W-2 and W-22 have been constructed to take the place of recorded versions of PAT Auditory Tests 14 and 9 and the PB-lists published by Egan respectively. 2 novel techniques have been introduced: a) The use of magnetic tape recording has permitted the construction of several versions of word orders of a given test list in which all occurrences of a test item in the several versions are physically identical; b) The criterion of phonetic balance in W-22 and the criterion of familiarity of test items in both tests have been more rigidly followed, resulting in easier, more homogeneous lists, but with a more limited vocabulary. Preliminary results have been presented in which the intelligibility for these new tests is shown as a function of intensity. Furthermore, a relation between intelligibility for these new tests and their analogous predecessors has been established. The authors' recommendation for the clinical adoption of these tests is tentative, pending the accumulation of results on larger groups of listeners in both clinical and laboratory situations. R 15

- 1989
Hirsh, I.J., Rosenblith, W.A., & Ward, W.D. THE MASKING OF CLICKS BY PURE TONES AND BANDS OF NOISE. *J. Acoust. Soc. Amer.*, 1950, 22, 631-637. Contract NSR-176, Proj. Nr 142 201. Rep. PNR 95, ONR, Harvard Univ., Psycho-Acoustic Lab., Cambridge, Mass.
- Pure tones and various bands of noise were used to mask impulsive acoustic stimuli (clicks) that were produced by electrical square pulses through a moving-coil type earphone. Results indicate that it is difficult to generalize about the masking of clicks by pure tones from observations on only a few observers because of sizeable individual differences. The masking of clicks by noise, however, is related unambiguously to the intensity and the spectral distribution of the noise. Both pure tones and narrow bands of noise provide maximum masking in the region between 1000 and 3000 cps. Generally speaking, noise is a more efficient masker of clicks than are single pure tones. Although the present measurements were made with masking frequencies below 6500 cps, there is some preliminary evidence to suggest that the audibility of certain clicks in noise is markedly dependent on frequencies above 6500 cps. The linear (slope) relation between the masking of speech or pure tones by noise and the intensity of the noise does not apply here. Rather a trimodal function indicates that the masking of unfiltered clicks by "pinkish-white" noise does not change over a 30-db range of moderate intensities. Below and above this range masking increases with the intensity of noise, sometimes at a slope greater than one.

Hirsh, I.J. & Ward, W.D. RECOVERY OF THE AUDITORY THRESHOLD AFTER STRONG ACOUSTIC STIMULATION. *J. Acoust. Soc. Amer.*, 1952, 24, 131-141. Contract NSR-176, Proj. Nr 142 201. Rep. PNR 121. (Psycho-Acoustic Lab., ONR, Harvard University, Cambridge, Mass.).
- After an ear is exposed to an intense sound, the absolute threshold for many sounds is raised, usually temporarily. The subject of these experiments is the manner in which the absolute threshold recovers to its normal value after such stimulation. These experiments involve exposure for several minutes to intensities of 100-200 db sound pressure level (SPL) with a consequent fatigue that recovers about 10 min. after the cessation of the exposure. The first problem investigated was the recovery of absolute threshold for brief acoustic clicks after stimulation by different pure tones at SPL of 120 db for 3 min. Also investigated was the effect on the click threshold of a broad-spectrum noise at a level of 120 db. Next, the recovery of the threshold for pure tones and band noises was investigated as was the threshold for white noise (160 to 6600 cps). It was found that recovery from such auditory fatigue is not a simple monotonic process. Rather, these experiments show that under certain conditions the threshold first recovers to an approximately normal value about 1 min. after the cessation of the exposure but then rises again to a higher value that reaches a maximum at about 2 min. after exposure. This biphasic recovery curve, with its characteristic "bounce" is found when the exposure involves sound pressure levels between 100 and 120 db and durations of the order of several minutes.

Oliver, H.C. LIGHT TRANSMISSION AND HAZE REQUIREMENTS FOR TRANSPARENT ENCLOSURES. Proj. 7157, WADC TR-55-55, April 1955, 4pp. Aero Medical Lab., WADC, ARDC, Wright-Patterson AFB, Ohio.
- To establish limits of light transmission and haze values for aircraft transparencies and visors based upon visibility requirements for aircraft pilotage, transparency samples varying in both these qualities were tested under a range of illumination corresponding to the range from daylight to darkest night conditions. Visual contrast thresholds were compared with values obtained from unobstructed vision. Ranges of light transmission and haze values were then established to define (1) limits which are highly desirable, (2) values acceptable if other factors take precedence, and (3) minimum values that can be tolerated. Further reduction of light transmission induced by the angle of incidence of sloping windshields and its effect upon night visibility are evaluated. T. R. 1

Crossman, E.R.F.W. PERCEPTION STUDY: A COMPLEMENT TO MOTION STUDY. April 1955, 7pp. Dept. of Engineering Production, University of Birmingham, Medical Research Council, Cambridge, England.
- This paper outlines a method of work study analysis whereby intangible control factors (sensory and mental) may be detected, classified, recorded, and, in some cases, measured. A new chart form is presented with a set of five symbols representing these perceptual factors (plan, initiate, control, end, and check), columns for recording sensory activity, and columns for recording the motor activity (therbligs). The use of this Sensor-factor Process Chart is illustrated with a card sorting task. Data obtained from observations of a process in a shoe factory are given and discussed. Present techniques in work study, laboratory studies of skilled performance, and the application of information theory to this problem are discussed.

Mills, G.J. NOISE LEVEL MEASUREMENTS IN VISCOUNT AIRCRAFT 601. Engng. Rep. 6-3-18, Dec. 1954, 22pp. Trans-Canada Air Lines, Winnipeg, Canada.
- To determine acceptability of noise levels in the cabin of the Trans-Canada Airlines Viscount, over-all and octave band noise levels were measured at eight positions in the cabin during flight. With the microphone at the head level of a seated passenger an over-all reading and eight octave level readings at each of three cruising conditions (13,600, 13,300, and 12,000 rotations per minute) were taken. These data were compared with recommended levels. Measurements were also made of the intensity of external noise radiated from the aircraft when on the ground to determine the quietest method of approaching a passenger terminal.

Hurvich, L.M., & Jameson, Dorothea. A PSYCHOPHYSICAL STUDY OF WHITE. III. ADAPTATION AS VARIANT. *J. Opt. Soc. Amer.*, 1951, 41, 787-801. (Eastman Kodak Co., Color Control Div.)
- To provide a psychophysical definition of white (see accessions 1995, 2000), the threshold luminance required to evoke an absolute sensation of white was measured for three practiced observers with the eye in controlled states of adaptation (various color temperatures of adapting stimulus from 2842 to 10,000 degrees Kelvin; two different luminances of adapting stimulus, five and fifteen millilamberts) with stimulus range of color temperatures from 2842 to 10,000 degrees Kelvin. Threshold data are analyzed as a function of adaptive states. Results are discussed and analyzed in relation to classical concepts of visual color theory. T.G.R38.

Harvish, L.M., & Jameson, Dorothea. A PSYCHOPHYSICAL STUDY OF WHITE. I. NEUTRAL ADAPTATION. J. opt. soc. Amer., 1951, 41, 521-527. (Eastman Kodak Co., Color Control Div.)

1995

To provide a psychophysical definition of white (see also accessions 2000, 1994), the threshold luminance required to evoke an absolute white sensation was measured with the eye in a neutral state (ten minutes in the dark) on three practiced observers for various color temperatures of test stimulus from 2842 to 10,000 degrees Kelvin, dark surround, 11.7 degree test field, and one-second stimulus duration. Data are shown as white threshold contours relating color temperature and luminance. The concept of white as used to describe properties of light, of objects, and of sensations is analyzed. Practical and theoretical implications of the findings are discussed.

Ireland, P.H. A COMPARISON OF CRITICAL FLICKER FREQUENCIES UNDER CONDITIONS OF MONOCULAR AND BINOCULAR STIMULATION. J. exp. Psychol., 1950, 40, 282-286. (Fordham U.)

1996

To compare critical flicker frequencies for monocular and binocular stimulation, Wherrington's 1906 experiment was repeated with a high precision electronic flicker apparatus (see 1997). Threshold measurements were made on 24 subjects under four conditions of stimulation, (1) monocular flicker dominant eye, (2) for non-dominant eye, (3) binocular flicker out-of-phase, and (4) binocular flicker in-phase. Threshold data (frequencies) are analyzed statistically for differences among the conditions of stimulation. Implications of the results for visual theory are discussed.

Ireland, P.H. AN ELECTRONIC FLICKER APPARATUS FOR MONOCULAR AND BINOCULAR STIMULATION. J. Psychol., 1950, 29, 183-193. (Fordham Univ., Dept. Psychol.)

1997

This report describes a high precision electronic flicker apparatus constructed in a manner that would permit stimulation of conjugate areas of the retina. It is described as noiseless in operation; its frequency variable over a range of twenty to sixty cycles per second; and with two light sources flashing either in synchrony or 180 degrees out-of-phase with one another. Calibration procedures are described, tolerances given, and construction details diagrammed.

Jeffress, L.A. Blodgett, H.C., & Beathelme, G.N. THE MARKING OF TONES BY WHITE NOISE AS A FUNCTION OF THE INTERVALAL PHASES OF BOTH COMPONENTS. I, 500 CYCLES. J. ACoust. Soc. AMER. 1941; 24: 823-827. On ships has. devel. Control No. 3287. (U. Texas, Marine Research Lab. and Dept. of Psychology, Austin, Texas)

Work by Hawkins, Hirsh, Licklider, Stevens, Webster and others has shown the so-called "detectable reduction" in masking which occurs when the interaural phase of either the signal or the noise is reversed, or when the interaural phase of the signal is shifted by various amounts. The present paper extends this work by shifting the interaural phases of the masking component of the noise and of the tone by various amounts between $+180^\circ$ and -180° , and also by shifting the noise timing by amounts up to 4.0 milliseconds. The interaural phases of both the noise and the 500-mc. tone signal are therefore parameters of this study. The results are in agreement with those already published, but there is additional large reduction in threshold even when the noise and the tone differ in their interaural phase position by amounts less than 180° . They also show a periodic fall and rise of the masked threshold as the interaural phase difference for the noise is varied. Finally, they show the importance of interaural correlation in determining the extent to which the binocular threshold will be less than the monaural.

CATEGORY ("7"). RESPONSE: RELIABILITY AND RELATIONSHIP
TO PERSONALITY AND INTELLIGENCE VARIABLES. ONE Proj.
NR 154 FROTH, Proj. Rep. NR 001 077 01 01, June 1953,
19pp. USN School of Aviation Medicine, Naval Air
Station, Fla.

To investigate the middle-category ("7") response on personality test items with respect to its reliability and relationship to personality and intelligence, three Guilford-Martin inventories were administered to 344 Naval Aviation cadets. Bernreuter tests were also available for 277 of the subjects. Personality trait scores on the Guilford-Martin tests, intelligence test scores, and years of schooling were used as independent variables. The number of "7" answers for each personality test provided four scores which were then correlated with each other and with each of the other variables. The findings are discussed in relation to possible scoring adjustments on personality tests.

The report describes the contents of a scoring system for a series of performance tests for measuring the proficiency of mechanics on the 2nd Fire Control System. Data from two experiments which employed the scoring system were analyzed by correlational and analysis of variance techniques to determine the inter-reliability and reliability of this type of performance testing and scoring procedure.

2008 Johnson, D.M. A SYSTEMATIC TREATMENT OF JUDGMENT. *Psychol. Bull.*, 1945, 42, 193-224. (University of Illinois, Urbana, Ill.).

This paper considers the topic of judgment in terms of its meaning in psychology. The orientation of the paper is to organize the literature in judgment describing some of the methods in present use, the assumptions commonly made, and summarizing, in general terms, some of the achievements already at hand. The first section discusses the independent variable of judgment which includes simple judgments which can be classified on the basis of a) characteristics of the stimulus objects which are to be judged; b) perceptual judgments; c) affective judgments; d) abstract judgments. Complex judgments, judgments which are made in respect to some general criterion, fall into this category. The second section of the paper considers dependent variables of judgment. These judgments are relative and they are expressed in relation to alternative categories of response or in relation to response alternatives. Included in this category are the response scale and time of judgment. Also discussed are individual differences in judgment in terms of cultural background, personality, etc.

Kelly, J.C., & Steer, H.D. REVISED CONCEPT OF RATE. *J. Speech Hearing Disorders*, 1949, 14,
222-226. Contract 2200-27511, Proj. 2200-27511, Tech. Rep. 130-100-2-16. *Calif. Univ. Coll.*

This study attempted to ascertain whether the traditional method of measuring speech
rate was useful for most speech study purposes. An analysis of sentence rates of the
extempore speech of college students enrolled in a public speaking course was made. The
speech of each of 24 Ss was recorded while the members of the class judged the rate of the
speaker on a 5-point scale ranging from slow to very fast. The measurements made were:
a) The audience judgment of the rate; b) Speech syllable duration which was the total
phonated time of the sentence divided by the number of syllables in the sentence; c) Percent
of the sentence; d) Over-all rate, the number of words spoken in the total elapsed time of
the speech converted into words per minute; and e) Sentence rate which was the same estimate
as over-all rate except that the measurement was made of the sentence. It was concluded
that extempore speech is extremely variable in rate, ranging from 125 to 328 words per
min. on the average. Over-all rate fails to reveal this variability. Over-all rate
fails to reveal the true talking rate. It appears that the sentence-by-sentence analysis
method would come closer to revealing the true speaking rate as well as the true variability
of rate. It is probable that the sentence rate method of describing extempore speech
is more highly related to audience judgment than is over-all rate of speaking.

2016 Kennedy, J.L., & Travis, R.C. PREDICTION AND CONTROL OF ALERTNESS. II. CONTINUOUS TRACKING. *J. Gen. Psychol.*, 1949, 51, 203-210. Contract NS-1-56. ONR, Naval Aviation Center, Tufts College, Medford, Mass.

This study was designed to gather data on a new electronic accumulator which is a physiological indicator which may accurately predict the alertness status of a S. The S was required to operate continuously a hand control in a unidimensional tracking task. A warning light was placed 25 degrees peripherally from the main visuomotor task and reaction time was measured to the onset of the red warning light along with a continuous record of adequacy of tracking performance. The light was turned on automatically at various levels of muscle potential level by varying the gain of the accumulator. Thus, a large number of reaction times at various tension levels could be obtained in a 2 hr. experimental session. It was found that different levels of electroencephalographic activity were significantly related to muscle potential output. The lower the muscle spike emission, in general, the slower the reaction time and the poorer the tracking score. Reaction time and tracking score were significantly related as measures of performance. Great variability in the range and average tension level between individuals throughout the experimental period was found.

2017 Hophart, H.C., & Mason, J.M. ACUITY DIFFERENCES BETWEEN THE TWO EYES AND JOB PERFORMANCE. *J. Appl. Psychol.*, 1950, 34, 423-428. (Purdue U., Occup. Research Center)

2018 To investigate the relation between certain visual skills and job performance, Ortho-Rotor visual acuity scores of 5600 employees on 92 different industrial jobs were obtained. High and low criterion groups were formed on the basis of various measures of job performance. Better eye acuity, near and far, and acuity differences between the two eyes, near and far, were analyzed statistically in terms of their relations to the probability of satisfactory job performance. The applicability of the findings for selection practices is discussed.

2019 Kimble, G.A. EVIDENCE FOR THE ROLE OF MOTIVATION IN DETERMINING THE AMOUNT OF REMINISCENCE IN PURSUIT ROTOR LEARNING. *J. exp. Psychol.*, 1950, 40, 248-253. (Brown University).

2020 To investigate the effects of massed vs. spaced practice on motor learning, 36 Ss. were given 25 practice trials of 50 sec. each on a pursuit rotor. Half had cycles of five trials (with ten-sec. pauses between trials) and a six-min. rest period; half had a 60-sec. rest period after every trial. Subjects worked in pairs and had knowledge of both their results and their partner's. Results (mean time on target per trial) are plotted as learning curves and are analyzed for implications for characteristics of reactive and conditioned inhibition and effects of motivation on reminiscence.

T. G. R. 4

2021 Kimble, G.A. A FURTHER ANALYSIS OF THE VARIABLES IN CYCLICAL MOTOR LEARNING. *J. Gen. Psychol.*, June 1949, 25(3), 332-337. (Brown University, Providence, R.I.).

2022 In this paper, the author reviews the data from earlier studies on cyclical motor learning. The data from separate studies are here tabulated and plotted together and are analyzed for the light they shed on the relative importance and the interrelationships of such and rest variables in motor learning.

T. G. R. 3

2023 Kimble, G.A. PERFORMANCE AND REMINISCENCE IN MOTOR LEARNING AS A FUNCTION OF THE DEGREE OF DISTRIBUTION OF PRACTICE. *J. Gen. Psychol.*, Aug. 1949, 25(4), 500-510. (Brown University, Providence, R.I.).

2024 This study investigates the effects of distributing practice in motor learning. The task (printing the alphabet upside down from right to left) was practiced for 21 30-second trials by five groups of 15 to 45 Ss. Intertrial rest periods varied from 0 to 30 seconds. All but the 30-second group had a two-minute rest period between trials 20 and 21. Mean scores (scoring method unspecified) for each trial are studied as a function of rest interval and trial number. Reminiscence (gain between trials 20 and 21) is calculated. Results are discussed regarding theory of reactive and conditioned inhibition.

T. G. R. 8

2025 Kimble, G.A. & Horenstein, Betty E. REMINISCENCE IN MOTOR LEARNING AS A FUNCTION OF LENGTH OF INTERPOLATED REST. *J. Gen. Psychol.*, June 1949, 25(3), 239-244. (Brown University, Providence, R.I.).

2026 This study investigated reminiscence in motor learning as a function of the duration of interpolated rests. Sixty-three male college students performed 12 50-second practice trials on a pursuit rotor with ten-second intertrial intervals, except that between trials 10 and 11 the interval was varied from 10 to 1200 seconds for different groups. The gain in mean scores for trials 11 and 12 over scores for trial 10 are analyzed as a function of length of rest (period between trials 10 and 11) and are related to Hull's theory of the time-decay of inhibition.

G. R. 2

2027 Kimble, G.A. & Bilodeau, E.N. WORK AND REST AS VARIABLES IN CYCLICAL MOTOR LEARNING. *J. Gen. Psychol.*, April 1949, 22(2), 150-157. (Brown University, Providence, R.I.).

2028 In this study of the effects of rest and work on motor learning, 96 college students were given 30-sec. practice on the Minnesota Rate of Manipulation Test (turning over blocks and refitting them in a form board). Each of four groups had a different combination of 10- or 30-sec. work periods and 10- or 30-sec. rest periods. Results (number of blocks turned per trial) are analyzed as a function of work and practice distribution, and the relative importance of these two variables in motor learning is discussed.

2032
Licklider, J.C.R., Webster, J.C., & Madson, J.M. ON THE FREQUENCY LIMITS OF BINAURAL BEATS. *J. Acoust. Soc. Amer.*, 1950, 22, 468-473. Contract NSC-176, Proj. NR 142 201, Rep. PNR 87. (Harvard Univ., Psycho-Acoustic Lab., and U.S. Navy Electronics Lab., San Diego, Calif.).

The report describes measurements of the frequency limits of binaural beats and outlines a theory of binaural beats based on synchronous discharges in the two auditory nerves. Two sine waves of frequencies f_1 (fixed) and f_2 (variable) were fed separately to the two ears; and the difference $\Delta f = |f_1 - f_2|$ that merited the disappearance of the fluctuating loudness or roughness that is characteristic of binaural beats was determined. Δf was maximal (approximately 35 cps) for frequencies in the neighborhood of 400 cps. Binaural beats were heard above 1000 cps, but careful attention was required and Δf was small. The shape of the curve relating Δf to f_1 provides an explanation for the fact that determinations of the upper frequency limit of binaural beats have not been in agreement: the upper frequency limit depends markedly on Δf . The theory, given to account for the fact that Δf is smaller both at low and at high frequencies than it is near 400 cps combines elements of the Hill-Nashvsky theory of the excitation of neurons with elements of Mavor's volley theory. At low frequencies neurons can discharge in some degree of synchrony with the stimulus wave form, yet fail to coincide within the time interval necessary for synaptic summation. At high frequencies the neurons must take turns discharging, and relatively few can participate in any given volley. At intermediate frequencies, however, each neuron participates in many volleys and the neurons participating in each volley fire almost simultaneously. The result is that at intermediate frequencies synchrony is relatively precise in each afferent pathway and, when the two afferent streams join in a common neural center, beats appear.

Mallister, Dorothy E. FACILITATION AND INTERFERENCE AS A FUNCTION OF RATE OF LEARNING. *Ann. N.Y. Acad. Sci.*, April 1950, 25, 220-232. (State University of Iowa, Iowa City, Iowa).

2036
To study facilitation and interference in motor learning, the Ten-Hand Coordinator was modified to allow reversal of controls and of number and direction of errors. Male college students (64) were trained to a standard performance criterion; half then had interpolated practice with reversed controls; then all rehearsed for 40 trials. One experimental and one control group (10-11 Ss each) had 30 additional trials before interpolated practice. Time-on-target, number of trials, number of errors, and persistence of errors are analyzed regarding effects of level of learning and overlearning on retroactive facilitation and interference.

Mallister, Dorothy E. & Lewis, D. FACILITATION AND INTERFERENCE IN PERFORMANCE ON THE MODIFIED MASHBURN APPARATUS: II. THE EFFECTS OF VARYING THE AMOUNT OF INTERPOLATED LEARNING. *J. Gen. Psychol.*, May 1951, 41(5), 356-363. (State University of Iowa, Iowa City, Iowa).

2038
To study facilitation and interference in motor learning, 12 groups of 8-11 Ss practiced on the Mashburn Apparatus (requiring matching of signal lights by manipulation of simulated altimeter, rubber, and elevator controls), modified to permit reversal of controls. Original learning varied from 10-50 trials; rehearsing on the same task was for 10 trials, and between these sessions there was a period varying from 10 to 50 trials of interpolated learning with reversed controls. Mean number of matches and of errors are examined and discussed regarding effects of varying amounts of original and interpolated learning on the initial stages of rehearsing.

2040 Head, L.C. APPLICATION OF HUMAN ENGINEERING TO FLIGHT PROBLEMS. J. AVIAT. Med., 1946, 19, 45-51.

Reviewed are some of the principles of human engineering which are available for application to flight problems. Also presented is an outline of the research program being conducted by the Human Engineering Section of the Special Devices Center of the Office of Naval Research. Some general principles of human engineering which can be applied to the pilot's relationship to the machine which he directs, can be broken down into 3 categories: a) the display; b) the layout and controls. Some of the principles concern the necessity of certain display elements and whether the information offered is complete and direct. Another principle is whether the information can be provided by auditory or visual warning systems. In the case of conventional signals, standardization of the equipment layout among different aircraft would be beneficial. Equipment controls should be placed so that the pilot may retain as much comfort as possible. The controls should also be easily distinguished. Thus, proper coding would reduce the possibility of error. Some projects in human engineering currently being conducted include the measurement of the effectiveness and ease of interpolation of aircraft instrument and panel arrangement, a job analysis and time and motion survey of pilot performance in multi-engine aircraft, and a handbook of applied psychophysiological functions which will aid in designing equipment in terms of the man who use it. 2038 NEPARIAND, R.A.; EVANS, J.W.; & HAJERLIN, M.M. OPHTHALMIC ASPECTS OF ACUTE OXYGEN DEFICIENCY. Arch. Ophthalmol., 1941, 25, 888-915. (Harvard University, Cambridge, Mass.; & Long Island College of Medicine, Brooklyn, N.Y.).

Reviewed are the physiological effects of oxygen deprivation and the psychological changes associated with anoxia. Specific attention is given to the alterations in visual function due to anoxia specifically in relation to visual sensitivity including light sense and dark adaptation; differential sensitivity; visual acuity; visual fields; peripheral and central color vision; after-images; flicker fusion frequency; intraocular tension; extraocular muscles; accommodation and convergence; and coordinated ocular movements. Several conclusions are arrived at including the need to repeat a number of the studies with a standard apparatus designed to record more accurately. Some of these studies should be conducted on both normal subjects and patients suffering from various ocular anomalies. Many of the studies discussed suggest that the basis for theories should be broader in regard to the nature of certain visual functions. (HFIAS)

2041 Head, L.C.; & WOLF, C.K. J.W. HUMAN ENGINEERING: THE STUDY OF THE HUMAN FACTOR IN MACHINE DESIGN. Sci. Eng. Med., 1952, 25, 372-379. (Institute for Applied Experimental Psychology, Tufts College, Medford, Mass.).

This paper attempts to summarize some recent efforts aimed at solving the problem of the human factor in machine design. A historical account of work conducted in this vein was presented and indicated the role of time and motion studies, management engineering, and study of individual differences. During World War II it became evident that the human being could be the factor that prevented an engineering device from performing to its full specifications, and it was realized that complete equipment must be designed with built-in human factor considerations. One approach to the error of human engineering is that we are studying man as he is, or as part of, a servomechanism. In considering a single man-machine system, it is found that the design problems encountered can be categorized as either display problem or control problems. A great deal of research has been directed toward displays and the design and layout of the work place. A considerable amount of work has been directed towards human motor and perceptual skills. This has been done to attain a better understanding of how the operator does in fact operate.

Miller, G.A. & Heise, G.A. THE TRILL THRESHOLD. *J. Acoust. Soc. Amer.*, 1950, 22, 537-538. Contract W5ori 76, Proj. NR 142 201, Rep. PMR 51. *Ann.*, Harvard University, Psycho-Acoustic Lab., Cambridge, Mass.

If 2 tones of different frequencies are alternated successively 5 times per sec., when the difference in frequency is small the alternation sounds like a continuous up-and-down movement of the pitch; when the difference in frequency is large the alternation sounds like 2 isolated interrupted tones. The transition point between these 2 perceptual organizations is called the trill threshold. The trill threshold was measured as a function of frequency for 14 Ss. S was presented with 2 tones in the following sequence: tone A for 30 sec., then tone A decayed 60 db and tone B built up during the next 20 sec., tone B for 30 sec., then B decayed 60 db and A grew for 20 sec., etc. S heard the sound binaurally at approximately 70 db. One frequency remained fixed while S varied the frequency of the second above or below the trill threshold. Each S made 2 judgments with the variable tone above the fixed tone and 2 with the variable tone below the fixed tone. The trill threshold is given for a frequency range of 100 to 7000 cps. It was noted that the trill threshold does not follow the same function as the differential threshold.

Miller, H.K. AN EXPLORATORY STUDY OF LINEAR INTERPOLATION. *J. Appl. Psychol.*, 1940, 24, 367-370. (Lahigh, U.)

2046

To explore individual differences in ability to make linear interpolations, 21 subjects of differing ages and occupations visually interpolated five interval sizes (one to ten millimeters) each size having 324 problems. Problems were randomly arranged in six different patterns, each pattern with an equal number of interpolated positions, one through nine. Subjects varied under instructions for accuracy with no time limit. Analysis is made of the number of errors with respect to size interval and interpolated pattern. Note is taken of age and occupational influence on performance.

DeGough, R.A., Skandera, D., & Keller, J.R. EJECTION SEAT TRAINING IN THE STRATEGIC AIR COMMAND. Tech. Memo. OL-TM-57-16, Oct. 1957, 50pp. *Operator Lab.*, AFPMRC, ARDC, Randolph AFB, Tex.

2047

To investigate ejection seat training in the Strategic Air Command (SAC), a survey was conducted on four SAC bases. Performance tests by aircrew members on their ejection seat procedures (on an ejection seat trainer) were conducted; questionnaires pertaining to the pilot's previous experience in jet aircraft, quantity and quality of training for ejection, and opinions as to what should be included in training were obtained; and interviews with individuals responsible for training, reviews of their programs, and inspections of their equipment were made. The results were analyzed in terms of (1) requirements for ejection seat training, (2) current status of training, and (3) desirable modifications in equipment and procedures.

Horgan, C.T., Garner, V.R. & Galambos, R. PITCH AND INTENSITY. *J. Acoust. Soc. Amer.*, 1951, 23, 658-663. Contract W5ori 166, Proj. NR 784 001, Rep. 166-1112. *Special Devices Center*, ONR, Johns Hopkins University, Baltimore, Md.

This paper presents data for changes of pitch with intensity for 18 ears, for frequencies from 125 cps to 8000 cps, and for intensities up to a loudness level of approximately 100 db. 2 methods were used to measure pitch-intensity changes. In the first method, the intensity of the standard tone was constant at 40 db (intensity level). In the second method, the standard tone was always 10 db in intensity below the comparison tone. No significant differences were found between data from the 2 methods and the data was pooled. The data made it clear that there is no one function relating pitch to intensity at a particular frequency. Different ears have different functions and they are not entirely consistent with each other either in magnitude or the directions of pitch changes with intensity. What rules there are seem to be purely statistical. That is, the relations of pitch to intensity must be stated in terms of statistical parameters of a population of ears. However, it can be concluded that most observers show very small changes (less than 2%) of pitch with intensity. In general, as intensity is increased, pitch falls at low frequencies and rises at high frequencies.

Moskowitz, S.H., & Gellhard, J.W. THE POKKING AFTER-IMAGE ON SCREENS OF CATHODE-RAY TUBES. *Amer. J. Psychol.*, 1951, 64, 308-330. Contract No. 61-158, Proj. NE-704-001, Rep. 100-1-116. ONR, Special Devices Center, Johns Hopkins Univ.

2052

To investigate the Pokking after-image involved by the sweep moving across cathode-ray tubes, two observers made threshold determinations for the disappearance of the image at low and at high intensities of retinal illumination. Two types of tube screens were used: P-11 phosphor. Threshold measures of Pokking after-image were translated into values of retinal illumination; these data are analyzed as a function of retinal illumination. Discussion relates the findings to earlier studies of the phenomenon and to the practical problem of radar. T.G.I.110.

Christ, W.D. SIMPLE AUDITORY REACTION TIME IN AGED ADULTS. *J. Psychol.*, 1953, 35, 236-244. (Moosehaven Research Lab., Grange Park, Fla.).

2060

To investigate the relation of age to simple auditory reaction time and reaction time variability, 141 subjects at three different age levels (15-39, 40-59, 60-79 years) were presented with the finger reaction time test under conditions attempting to control fatigue, motivation, mental set, etc. Results are presented and discussed with regard to differences between groups and intrasubject variations as a function of physiological decrements attributable to aging. T.G.105.

2061

This paper attempted to determine how airplane control systems may be designed to provide the pilot with optimal sensory information by means of pressure cues obtained from operating the stick and rudder. 4 questions which are applicable to all airplanes, regardless of speed, were examined: a) what are the maximum forces that may be exerted by a human pilot? b) what delays may be expected as a consequence of the pilot's reaction time? c) where should controls be placed and how should they move for most efficient manipulation by the pilot? d) what gradient of stick forces will provide the pilot with optimum pressure cues? The published information relevant to these questions was examined and jet-plane pilots were interviewed. Human capacities for aircraft control were evaluated as were the psychological aspects of handling qualities of the control stick and rudder. Discussed are some recommendations for aircraft control systems. (HEIAS) R 30

Pinson, E. A. & Chapen, A. VISUAL FACTORS IN THE DESIGN OF MILITARY AIRCRAFT. *J. AVAL.* *Med.*, April 1946, 17(2), 115-122. (USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio).

The job of flying is more dependent on vision than on any other of man's senses. The AAF has established elaborate procedures to select aircrew personnel with excellent vision. However, these advantages are lost if the aircraft is not so designed as to enable the aircrew members to make effective use of their eyes. A number of studies have been undertaken by the AAF to provide a set of recommendations to aircraft designers regarding the ways in which these standards of high visibility may be maintained. 2 groups of studies on a) fields of view from fighter aircraft and b) design (optical quality) of transparent panels are summarized. With respect to fields of view, the most important problem is poor forward and downward visibility. With respect to the optical quality of transparent panels, the problem is refraction. Refraction is highly dependent not only on the optical quality of a transparent panel, but also on the angle of incidence at which it is used. The problem is exemplified by the fact that in some aircraft deviation errors contributed more to the error in line-sighting of guns than all other factors combined.

Fried, W. R. DOPPLER NAVIGATION SYSTEMS - PRINCIPLES AND PRACTICE. Proj. 4430, Task 44142, WADC TN-57 175, Dec. 1957, 90pp. (USAF Weapons Guidance Lab., Wright-Patterson AFB, Ohio).

2062
This paper discusses basic principles and technical characteristics of a doppler navigation system and its three major components: doppler radar (principles of operation and major components), computer (present position, and course and distance computers), and heading reference (Gyro-Magnetic compass, Astro compass, Earth Rate Directional Reference). It seeks to sort out, organize, and report the most meaningful facts published about the system and its performance. Three of the appendices provide a compilation of the operational and physical characteristics of typical doppler navigation systems, doppler radars (used as a velocity measure, as such, and as the Velocity sensor in a self-contained navigation system), dead reckoning computers and heading references. T. G. I. R 59

2064
Pollack, I. ON THE MEASUREMENT OF THE LOUDNESS OF SPEECH. *J. Acoust. Soc. Amer.*, 1952, 24, 323-324. Contract NS01 76. (Psycho-Acoustic Lab., ONR, Harvard University, Cambridge, Mass.).

Reported are the results of 3 experimental procedures for setting up loudness scales for speech signals. The procedures used were: a) monaural-binaural equal-loudness matchings in which listeners adjusted a speech signal heard in both ears until it was equal in loudness to a speech signal heard in one ear alone; b) fractionation and multiplication in which listeners adjusted a speech signal to a sound "half as loud" or "twice as loud" as a standard speech signal; c) equal-loudness match against a 1000-cycle tone in which listeners adjusted a speech signal until its loudness was equal to that of a 1000-cycle tone (or which a loudness scale is available). The results indicate that the data of the half-loudness and the twice loudness judgments are in close agreement but they differ greatly from the monaural-binaural data. This contrasts with the relatively good agreement obtained when either a pure tone or a white noise is used. The large change in intensity needed to reduce speech to a level that sounds half as loud to the listener may be the result of a constancy effect analogous to the well-known effect of "size-constancy" in vision. A loudness scale for speech based on available data was also presented. (NEIAS)

2063
Pollack, I. THE LOUDNESS OF BANDS OF NOISE. *J. Acoust. Soc. Amer.*, 1952, 24, 531-538. Contract NS01 76, Proj. NR142 201, Rep. PMR 126. (Psycho-Acoustic Lab., ONR, Harvard University, Cambridge, Mass.).

Studied was the contribution to the loudness of noise made by various frequency bands covering a wide range of noise level. Two basic operations were performed: a) a wide band of white noise (60 to 5800 cps) of uniform spectrum level was divided into narrower bands by passing the electrical signal through a series of sharp cut-off filters; and b) the loudness of the filtered noise band was determined by having listeners adjust the sound level of the band so that it sounded equal in loudness to a white noise at a reference level. 4 filtering operations were performed on the white noise. In series A, the narrower bands were obtained at about the same width (250 mHz), but with different center frequencies; series B the high frequencies of white noise were eliminated and in series C the low frequencies were eliminated. Series D the lower and upper frequencies were removed so that the noise was divided into bands of different widths but with about the same center frequency. The following relations emerged: a) at threshold, it is slightly more effective to concentrate the noise spectrum over a narrow frequency range for which the ear is maximally sensitive than to spread the noise frequencies over a wide range; b) over a wide extent of intermediate loudness levels, it is more effective to spread the noise frequencies over a wide range than to concentrate the noise frequencies into a narrow range; c) at extremely high loudness levels, as compared with intermediate levels, there is relatively less advantage in spreading the noise over a wide frequency range.
R 10

2065 Pollock, I. ON THE MEASUREMENT OF THE LOUDNESS OF WHITE NOISE. Acoust. Soc. Amer., 1951, 21, 654-657. Contract NSORI 76, Proj. N142 201, Rep. PMR 120. (Psycho-Acoustic Lab., GM, Harvard University, Cambridge, Mass.)

Scales of loudness for complex sounds have usually been obtained by determining the equal-loudness relation between the complex under investigation and a sound for which a scale of loudness is already available, e.g., a pure tone of 1000 cps. It is possible, however, to determine scales of loudness for complex sounds without appeal to pure tones or without extrapolation from pure-tone data. This was done in the present experiment. Loudness measurements were carried out by several independent procedures for 1000 cps tone and white noise. The procedures used were: a) loudness-ratio determinations; b) one-ear vs. two-ear loudness matches; c) equal loudness matches between heterophonic signals. Agreement among the different procedures was high, indicating a high degree of internal consistency among the several methods of determining loudness scales. A suggested scale of loudness for white noise, based upon data from the present experiment and from previous work, is presented.

2069 Foster, R.B., & Hooper, F.P. COST-EFFECTIVENESS ANALYSIS FOR STRATEGIC DECISIONS. General 131, 526, AMEL, Nov. 1955, 3, 482-493. Report from "Symposium on Problems and Methods in Military Operations Research at the meeting of the Society in Los Angeles, Calif., Aug. 1955". (Stanford Research Institute & Johns Hopkins University, Baltimore, Md.)

The concept of "feasibility" and the development of a measure of the feasibility constraint are discussed. A model which adapts methods of cost-effectiveness analysis, within this constraint, is developed for making strategic decisions. The basic form of the model is: a) everything is presented in a framework of time; b) all solutions are constrained at the outset by determinations of what is feasible over time; and this constraint is expressed in terms of schedules of availabilities; c) effectiveness at successive points of time is estimated as well as the rates of expenditure needed to achieve this effectiveness; and both functions of time are presented simultaneously, over the specified range. Thus, the decision-maker can evaluate the payoff or the effectiveness that he can achieve at all points in the time period, and the costs that he must incur therefore. This is a brute-force method. We move in a circle of requirements, availabilities, effectiveness, and cost, in which the interaction is taken into account by the method of successive approximation. The past, static cost-effectiveness analysis affords data for a quick first approximation of total requirements; these are scheduled on the basis of the feasibility study and yield most precise cost and effectiveness estimates on the basis of which successive refinements in the requirements and availabilities data are made. Also, familiar difficulties of dynamic analysis are present--systems do not stand still while they are being studied.

2066 Chang, S.H., & Wilen, J. SPEECH ANALYSIS. FINAL SCIENTIFIC REPORT. Contract AF 19(604) 2198, AFRC TR 58 107, Feb. 1958, 36pp. Electronics Research Lab., Northeastern University, Boston, Mass.

This report summarizes the studies performed under a research contract directed toward the specification of important parameters in speech-band compression systems. In Chapter I the present status of the Formoder (Formant-Moment Recorder) is described. The Formoder is an experimental speech-band compression system which makes use of from five to seven narrow-band parametric channels to convey the information of speech. The principle assumptions, the instrumentation and some results of this approach are discussed. In Chapter II a study of the automatic identification of turbulent sounds is described. Experimental results which lead to the possible separation of unvoiced stops and fricatives are reported.

2070 Gaughran, G.R.L., & Dempster, W.T. FORCE ANALYSIS OF HORIZONTAL TWO-HANDED PUSHES AND PULLS IN THE SAGITTAL PLANE. Eng. Biol., Feb. 1956, 28, 67-92. (University of Michigan)

In an investigation of the mechanical factors operant in the exertion by the body of pushes and pulls with the hand, a nude subject exerted a push or pull in the midsagittal plane while placed symmetrically in a seat (without foot or back rest). The testing apparatus was so constructed as to permit recording the subject's posture at maximum force exertion; the maximum horizontal reaction forces at seat and hand grip; and the vertical forces upon the seat. In a subsequent test a foot rest and back rest were utilized. The results of three subjects performing ten repetitions of 6 push and 6 pull postures are discussed in terms of the relative distribution, magnitude, and variability of forces evidenced under each experimental condition. 2068 Reed, J.D. FACTORS INFLUENCING ROTARY PERFORMANCE. J. Psychol., 1949, 28, 65-92. Contract N5 ori 166, Rep. 166 1 5.0. Special Devices Center, ONR, Johns Hopkins University, Baltimore, Md.

A light crank equipped with a counter was used to measure the maximal rate of turning under various conditions. The measure of rotation rate was taken by recording the number of turns in 5 sec. 4 Ss. were used and each spent more than 1200.5-sec. periods of rotary work under a variety of conditions. Frequent rest periods and alternation of hands were both used to prevent fatigue. The apparatus allowed variation in radius, braking force, position and orientation of crank. Of these, the first two are by far the most important. They are interrelated in that increasing the braking force not only results in slower turning but also that the smaller radii are more greatly affected than the larger. The radius which gives maximal angular velocity under conditions of no load is shorter than that which gives maximal velocity when a braking force is applied. Thus, the maximum radius may shift from 2 to 3 cm as the braking force which must be overcome is increased from 0 to 1000 gms. Not only is the performance related intimately to the physical properties of the crank, radius, and torque, but also to certain properties of the subjects. The preferred hand is almost uniformly superior to the non-preferred hand. It shows this superiority in a higher rate at all radii and also by the fact that the maximal performance is obtained at shorter radii. The performances of the two hands of a subject are correlated at each radius, but the shorter radii are less highly correlated than the longer radii. With respect to fatigue, the two hands show comparable effects in the rapid decline of performance as fatigue progresses; they differ in the degree of this decline with the preferred hand showing the greater loss. For both hands the effects of fatigue are more immediate at the shorter radii and less rapid at the longer radii.

Riggs, L.A., Mueller, C.G., Graham, C.H., & Note, P.A. PHOTOGRAPHIC MEASUREMENTS OF ATMOSPHERIC BOIL. J. opt. soc. Amer., 1947, 37, 415-420. (OSMP, Brown Univ.)

2071
To study the effects of optical shimmer or boil upon the quality of telescopic images, instantaneous photographs were taken of a black-and-white target located outdoors at a distance of several hundred meters from a camera under various conditions of atmosphere. In each experiment, 30 or more successive exposures were made and the amount of image distortion which could be attributed to shimmer or boil was measured. The implications of the findings for users of telescopes and rangefinders are discussed.

Gogel, W.C., Hartman, B.O., & Harker, G.S. THE RETINAL SIZE OF A FAMILIAR OBJECT AS A DETERMINER OF APPARENT DISTANCE. Proj. 6-95-20-001, Rep. 235, May 1956, 25pp. AHRL, Fort Knox, Ky.

2072
To determine whether the retinal size of a familiar object can act as a determiner of its apparent absolute distance, four retinal sizes of a playing card were presented one at a time in an otherwise dark field of view. The subjects (80) threw darts, in a parallel alley, to the apparent distance of the card. In a following similar series, several cues to distance were available to the subjects. Results from this full-cue situation were used to convert throw distance to apparent distance. Scores for the first presentation in the reduced-cue situation were analyzed for evidence that absolute distance perception is a function of retinal size. Subsequent scores were studied as relative distance judgments.

Riggs, L. A., Berry, R. N., & Wagner, M. A COMPARISON OF ELECTRICAL AND PSYCHOPHYSICAL DETERMINATIONS OF THE SPECTRAL SENSITIVITY OF THE HUMAN EYE. J. opt. soc. Amer., 1949, 39, 427-436. Contract N7onr-358, Proj. NR-141-359, ONR, Brown University.

2073
To compare electrical and psychophysical determinations of the spectral sensitivity of the human eye, data were obtained (for the light-adapted and for the dark-adapted eye) on five observers, using the same set of filtered light stimuli of various dominant wave lengths. Electrical thresholds were measured by use of an electrode mounted on contact lens; intensity of stimulation necessary at each wavelength to arouse a response of a given magnitude was calculated. Psychophysical thresholds were obtained by conventional low-brightness matching and flicker photometry at high levels. Resultant photopic and scotopic sensitivity curves are compared for agreement with standard curves for this function.

Riggs, L.A., Note, P.A., Mueller, C.G., & Graham, C.H. TWO DEVICES FOR EVALUATING STEREOSCOPIC RETICULE-PATTERNS. Amer. J. Psychol., 1948, 4, 545-552.

2074
This report describes two devices (developed during the period from 1941 to 1945) for simulating the optical and mechanical features of stereoscopic range-finders. Each is designed to present the operator with a moving target and a stationary reticle and with the necessary controls to bring the target into coincidence or equality of stereoscopic depth with the reticle. One device employs black-line or opaque reticles and the other has bright-line or illuminated reticles. The optical and mechanical systems of both are described with illustrative diagrams.

Russell, R.V. THE EFFECTS OF MILD ANOXIA ON SIMPLE PSYCHOMOTOR AND MENTAL SKILLS. Psychol., 1948, 38, 178-187. (University of Pittsburgh, Psychology Dept., Pittsburgh, Penn.)

A study on the effects of mild anoxia on 3 simple psychomotor and mental skills is reported. The skills studied were: finger dexterity, arm-hand coordination and simple addition. A total of 244 Ss were used, 67 in the finger dexterity group (43 experimental, 24 control), 81 in the arm-hand coordination group (50 experimental, 31 control), 96 in the simple addition group (48 experimental, 48 control). Sub-groups were equated for initial level of performance on the skill in question. The experimental sub-group in each case was subjected to mild anoxia, while the control sub-group was tested always under normal oxygen conditions. The mild anoxia was induced by reducing the barometric pressure in a high-altitude chamber. Time under anoxia was held constant at 35 min., since the study was concerned with the short-duration effects of the anoxic conditions. It was found that: a) a decrement in level of performance appeared immediately after the introduction of mild anoxia; b) following an initial decrement in level of performance rapid adjustment occurred as the time under mild anoxia increased; c) in addition to the adjustment process there occurred improvement with continued practice under the anoxic conditions.

Rosenblith, W.A., Galambos, A. & Hirsch, I.J. THE EFFECT OF EXPOSURE TO LOUD TONES UPON ANIMAL AND HUMAN RESPONSES TO ACOUSTIC CLICKS. Science, 1950, 51, 569-571. Contract NSC-176, Proj. NR 142 201, Rep. PMR 83, ONR, (Harvard University, Cambridge, Mass.)

This study was designed to investigate what happens to the human threshold for clicks after exposure to loud tones. Observers were exposed to pure tones of different frequencies, intensities, and duration, and then were presented to a group of 4 clicks every 3 sec. The 4 clicks within each group were at different intensities separated by steps of 4 db. The number of clicks the observer reported provided an estimate of his threshold. It was found that the threshold for clicks is raised by about 10 db after exposure to certain tones (e.g., 250 and 500 c for 2 or 3 min at 130 db sound pressure level). The ear recovers rapidly and is normal after about 40 sec., a time not unlike that required for the ear's neural response to return to normal. After this recovery, however, the threshold goes up again by slightly less than 10 db, and there follows a long recovery period whose duration depends upon the frequency and duration of the exposure tone.

Hartman, R.A. & Mathewson, J.L. "HEAT" A SPECIAL PURPOSE COMPUTER FOR STUDIES IN THE HUMAN CONTROL OF CHURCH EQUIPMENT. Proj. 6 95 20 000, Subcontract NADA S 1, NADA, Rep. 236, April 1956, 21pp. NSA Medical Research Lab., Fort Monmouth, N.J. (Battelle Memorial Institute, Columbus, Ohio).

2080
This report describes a special-purpose computer that is designed to study human performance in controlling complex equipment and systems. The instrument is a research tool featuring a considerable amount of automation. It generates target courses, displays them, receives and displays response signals, computes "error", and feeds the error signal to clocks, counters and graphic recorders, all on a predetermined schedule. Circuit diagrams and functional descriptions of the computer comprise the bulk of the report.

Schlossberg H. A NOTE ON DEPTH PERCEPTION, SIZE CONSTANCY, AND RELATED TOPICS.
Psychol. Rev., 1950, 57, 314-317. (Brown U.)

2079
This note uses a simple geometric equation as a basis for accounting upon the results of various experiments in visual perception of size and distance, including the Ames demonstrations (that direct physiological cues such as disparity and accommodation are relatively less important in determining depth perception than are factors of knowledge, true or assumed, of size of stimulus object, etc.). More traditional experiments are also related to the equation developed. The "unconscious inferences" concept of Helmholtz is discussed in this relation.

Schlossberg H. A PROBABILITY FORMULATION OF THE HUNTER-SIGLER EFFECT. J. exp. Psychol., 1946, 30, 155-167. (Brown U.)

2080
The "Hunter and Sigler Effect" described here is that excessively larger amounts of light are necessary to yield fifty percent correct reports as the number of stimuli is increased from one to six. A formula for predicting this function is developed, based on the assumption that the perception of each stimulus (dot) is an individual event, so that the probability of seeing two dots is less than the probability of seeing either alone. Predicted values are compared with observed values and the theoretical implications discussed.

Peececk, L.J., Harper, R.A. & Pitt, C.H. A FIELD STUDY OF RIFLE AIMING STEADINESS AND SERIAL REACTION PERFORMANCE AS AFFECTED BY THERMAL STRESS AND ACTIVITY. Proj. 6 95 20 601, Sep. 23, April 1956, 2pp. MA, ANNA, Fort Monmouth, N.J.

Rifle aiming steadiness and serial reaction performance were investigated under conditions of heat and cold stress. It was found that short duration activity under cold stress resulted in an increase in horizontal tremor, and that a 2-hour forced march in low ambient temperature resulted in increased tremor in both horizontal and vertical dimensions. Heat stress appeared to cause no changes in rifle aiming steadiness. The serial reaction test was not sensitive to heat or cold stress.

Watson-Matt, R. (Ed.). **OPERATIONAL ASPECTS OF MARINE RADAR. A SUMMARY OF PAPERS.** *J. Inst. Marit.*, April 1949, 2(7), 9-198. (Institute of Navigation, London, England)

Listed are aspects that determine the effectiveness of marine radar and the benefits obtainable for marine radar. Included in the first category are: the operational features of the set itself, the accuracy and clarity of the operating instructions, the position of the set in the ship, operating policy, maintenance policy, aspects of the observer and of the calculated charts, radar reflectors and buoys, and the international collision regulations. The operational yields or benefits include: the heavy saved, the casualties saved, and time saved.

Sedgwick, R.G., & Green, R.L. **FURTHER STUDIES IN THE RELATIONSHIP BETWEEN HETEROPHORIA AND PRISM VERGENCE.** *Am. J. Ophthalmol.*, 1961, 51, 688-694. Proj. No. 784-001, Rep. 144-1-144. ONR, Special Devices Center, Johns Hopkins Univ., B.I.

2087

To study the relations between heterophoria and prism vergence, measurements were made of refractive errors of both eyes for 15 males and 21 females (mean point convergence, heterophoria at twenty feet and 13 inches, prism convergence and divergence at both distances). Apparent prism vergence measurements were converted to true vergence measures by using the heterophoria readings at the same testing distances as a correction factor. The data is studied by correlational procedures and application is made to clinical practice. T, 34.

Sleight, R.B., & Austin, T.R. **THE HORIZONTAL-VERTICAL ILLUSION IN PLANE GEOMETRIC FIGURES.** *J. Psychol.*, 1952, 33, 279-287. Contract NS-ORI-166, Proj. NR-784-001, Rep. 144-1-144. ONR, Special Devices Center, Johns Hopkins Univ.

2090

To determine whether the classical statement of the horizontal-vertical illusion (that the vertical is perceptually longer than the horizontal) is descriptive of judgments of plane geometric figures, two series of figures (one-inch square and five rectangles with major dimension graduated by 1/32 inch steps; a circle and ellipses with same specifications) were presented to eight subjects who determined whether the major dimension was vertically or horizontally oriented. Two exposure times (1/10 and one second) were used. The error data are analyzed for both group and individual performance and discussed in relation to earlier literature. T, G, R6.

2091

Sloan, Louise L. **MEASUREMENT OF VISUAL ACUITY.** *Arch. Ophthalmol.*, 1961, 65, 704-723. Contract NS-ORI-166. ONR, Johns Hopkins Univ.

2091

To investigate the relative merits of different test objects and procedures used to measure visual acuity, a critical review of pertinent literature was made with emphasis upon selection and screening needs of industry and military services. The following points are considered: (1) selection of test object, (2) specification of range and graduation of sizes of test objects, (3) standardization of illumination and brightness contrast between object and background, and (4) effects of distance on test results. Areas for further experimental investigations are indicated. T, G, I, R4, 3.

2092

Sloan, Louise L. **THE THRESHOLD GRADIENTS OF THE RODS AND THE CONES: IN THE DARK-ADAPTED AND IN THE PARTIALLY LIGHT-ADAPTED EYE.** *Am. J. Ophthalmol.*, 1960, 50, 1077-1086. Contract NS-ORI-166. ONR, Johns Hopkins Univ.

2092

To study the variation in retinal sensitivity to light (horizontal meridian), threshold measurements were made on one subject during adaptation to darkness and to a low brightness level (0.7 millilamberts) after previous high brightness adaptation, at a series of 20 locations (20 degrees from fovea, nasal field; 90 degrees, temporal field). The decrease in effective diameter of pupil from center to periphery was determined by photography and used as a correction factor.

2093

Sloan, Louise L., & Altman, Adelaide. **ANISEIKONIA AND THE HOWARD-DOLMAN TEST.** *J. Opt. Soc. Amer.*, 1955, 45, 475-478. (Johns Hopkins Hospital and Univ.)

2093

To study the effects of aniseikonic errors on the moving-rod type of depth perception test, two subjects wore lenses which produced artificial aniseikonia and made settings on a Howard-Dolman apparatus (modified to eliminate monocular depth cues) immediately and after seven days of wearing the lenses. Direct measurement of errors on a space ellinometer was also made. An analysis of the errors on the rod test, on the ellinometer, and predicted by theory is made and the suitability of the moving-rod test for measuring depth perception is discussed. T, G, I, R12.

2094

Smith, M.W. **OLDER WORKERS' EFFICIENCY IN JOBS OF VARIOUS TYPES.** *Personnel J.*, 1953, 32, 19-23. (Ohio State Univ.)

2094

To study the relation of age to industrial efficiency (e.g., job knowledge, accuracy, ability to learn, etc.) and personality variables (e.g., cooperativeness, dependability, attendance, etc.), 903 men, ranging from 18 to 76 years, and divided into three work groups--skilled, unskilled, and clerical--were rated on each variable on the basis of supervisors' evaluations. Results are discussed in terms of change of traits as a function of aging with emphasis upon evaluation of the older worker. A brief summary of the records of those aged 70 or more is presented, as well as suggestions for compensatory means of dealing with functional loss due to age. T, R6.

Klein, Lucius L., Rutland, W.M., & Altman,
Adelaide. COMPARISON OF THREE TYPES OF TEST
TABLES FOR THE MEASUREMENT OF VISUAL ACUITY.
Quart. J. Psychol., 1955, 8, 4-10. Com-
pact size 31097. 220, Johns Hopkins Univ.

2097
As part of an extended study in the development
of a simple, reliable, visual acuity test suitable for
use in industry or by military services for selection
and classification of personnel, three test objects
(standard Orthe-Rater checkerboard, Landolt ring,
selected group of ten letters) were compared by mea-
suring the acuity of 215 eyes having varying degrees
and types of astigmatism. Additional data for two sub-
jects with various degrees of artificial astigmatism
were obtained and photographic studies of the effect
of blurring the image of the test objects were made.
Analyses of these data are made in terms of the most
useful test object.

Egan, J.P. & Wiener, F.M. ON THE INTELLIGIBILITY OF
BANDS OF SPEECH IN NOISE. J. acoust. Soc. Amer.,
Oct. 1946, 18(2), 435-441. (Harvard University).

2097
To determine some of the relations between intelli-
gibility provided by a voice communication system used
in the presence of noise and the frequency band of
speech passed by the system, articulation tests (six
listeners, two trained talkers and lists of nonsense
syllables) were conducted on thirteen systems having
bandwidths ranging from one-half octave to the entire
range of speech frequencies. Two spectra of masking
noise and a wide range of speech-to-noise ratios were
used. For each band-pass system a relation between
syllable articulation and level of received speech was
obtained. From these gain functions, families of equal
articulation contours were derived.

Steggerda, M., & Petty, Christine E. AN ANTHROMETRIC STUDY OF NEGRO AND WHITE COLLEGE WOMEN.
Res. Quart., 1940, 11, 110-118.

Presented are figures indicating similarities and differences in the physical features
of Negro and White females. Sampled were 100 girls from the physical education classes
at Tuskegee Institute. These girls, averaging 20.05 ± .13 years in age, were compared to
an equivalent sample of white girls enrolled at Smith College. The data indicates that these
two samples were alike in vocalization, eye, height, weight, and chest measurement. In all
other body proportions measured there was some significant difference between the races.
The most obvious differences were: a) all linear appendages of the Negroes are larger than
in the Whites; b) the span in Negroes is nearly 10% percent of the stature; in Whites, it
is only 9.4 percent; c) Negroes have a longer lower arm in relation to the upper arm than
do the Whites; d) trunk length in Whites is greater than in Negroes; e) Negroes have longer
faces than Whites, their heads are more dolichcephalic, their noses broader, and their
ears more circular; f) the incidence of caries among these Negroes is 1/2 that of the Whites.

2099
Steggerda, M., & Petty, Christine, E. BODY MEASUREMENTS ON 100 NEGRO MALES FROM TUSKEGEE
INSTITUTE. Res. Quart., 1942, 13, No. 3.

Reported are body measurements of 100 Negro males ranging from 16 to 23 years. The
sample, obtained from members of the physical education classes at Tuskegee College, was
felt to be a random sample of college males. The data obtained was compared to
data obtained by Herskovits on Howard University students and those by Metheny on Negro
students at the University of Iowa. The data shows that these Negro men are slightly taller
than the average of Negro men described in the earlier studies. The men have relatively
long arms and legs and a short trunk. Their heads are large and dolichcephalic.

2102 Steggerda, M. STATURE OF SOUTH AMERICAN INDIANS. *Amer. J. Phys. Anthropol.* 1943, 1, 5-20. (Carnegie Institution of Washington).

The material presented in this paper concerns the names, locations, and stature of 82 South American Indian tribes. The data are presented in tables, according to regional areas, and also by height classes. It can be stated that the smallest Indians (below 160 cm) are located in the northwest and toward the central portion of South America. The next group (160 to 165 cm) live practically in the same area, but continue farther south along the western territory of the continent, which is now Chile. The third group (165 to 170 cm) is found along a narrow strip from northern Brazil and continues as far as the southernmost part of Argentina and the Archipelago. The only tribe of this tall group found in central Brazil is the Bororo, an isolated group of Indians.

2104 Egan, J.P. THE EFFECT OF NOISE IN ONE EAR UPON THE LOUDNESS OF SPEECH IN THE OTHER EAR. *J. Acoust. Soc. Amer.*, Jan. 1948, 20(1), 58-62. (Harvard University).

2104 This paper is concerned with the effect of loudness enhancement with binaural stimulation. One earphone was used to introduce speech at a constant intensity into one ear, and a second earphone was used to introduce a white noise into the other ear. The subject adjusted the intensity of one sample of speech to match the loudness with another sample of fixed intensity as they were presented alternately. Noise was introduced at various intensities into the opposite ear when one of the speech samples was present. The relation between loudness level of speech and sensation level of noise was determined. The effects of temporal order and repetition of stimuli were explored.

Scorle, L.V. & Taylor, F.V. STUDIES OF TRACKING BEHAVIOR. I. RATE AND TIME CHARACTERISTICS OF SIMPLE CORRECTIVE MOVEMENTS. *J. exp. Psychol.*, 1948, 39, 615-631. (USN Research Lab., ONR, Washington, D.C.).

Using a simple test apparatus, Ss were required to make arm-hand corrective movements of 5 to 80 mm in extent. Measures of reaction time, response duration, maximum rate, and accuracy were analyzed as a function of direction and extent of movement, sensitivity of the control knob, friction, and inertia. The maximum and average rates of a movement increased approximately in linear fashion with increasing extent of movement. Reaction times were relatively independent of the distance to be moved. Rates were highest for movements from left to right. Operators tended to compensate for changes in sensitivity to produce nearly the same perceived result with respect to both rate and accuracy. Addition of inertia to the control knob caused the rates to decrease and precision to improve slightly, but additional friction resulted in higher speed and lower precision. (MEIAS)

Underwood, B.J. STUDIES OF DISTRIBUTED PRACTICE. VII. THE INFLUENCE OF REST-INTERVAL ACTIVITY IN SERIAL LEARNING. *J. exp. Psychol.*, May 1952, 43(5), 329-340. (Northwestern University, Evanston, Ill.).

2110

The effect of color naming during rest intervals in distributed practice was investigated. Two groups of 36 college students each learned three lists of 14 nonsense syllables by naming the next word as each word was presented. Intertrial intervals were 2, 30, and 60 seconds. The 30- and 60-second intervals were occupied by color naming by one group, symbol cancellation by the other. Recall was tested 24 hours after original learning. Mean number of errors per trial were examined for influences of intertrial activity. Results were discussed in terms of a "response set" induced by color naming.

Underwood, B.J. STUDIES OF DISTRIBUTED PRACTICE. VII. LEARNING AND RETENTION OF SERIAL NONSENSE LISTS AS A FUNCTION OF INTRALIST SIMILARITY. *J. exp. Psychol.*, Aug. 1952, 44(2), 80-87. (Northwestern University, Evanston, Ill.).

2111

This report describes three experiments on the effects of similarity of words within a list on learning the list. In each, 36 Ss learned three lists of 14 nonsense syllables until able to name each syllable upon seeing the preceding one. Intertrial rest periods were 2, 30, and 60 sec. for the three lists. Recall was tested after 24 hours. The lists used were of a different degree of intralist similarity in each experiment. Mean number of trials to learn, and percent recalled, are interpreted in terms of the Gibson theory of verbal learning.

Alluisi, E.A., Muller, P.F., Jr. & Fitt, P.H. RATE OF HANDLING INFORMATION AND THE RATE OF INFORMATION PRESENTATION. Contract AF 33(616) 43, Proj. 5 (7-7192), WADC Tech. Note 55-745, Dec. 1955, 13pp. USAF Wright Air Development Center, ARDC, Wright-Patterson AFB, Ohio. (Ohio State University Research Foundation, Columbus, Ohio).

This experiment was designed to determine whether the rate of handling information in a forced-paced serial task is a function of: a) the rate of stimulus presentation; b) the uncertainty per stimulus; or c) the joint effect of these factors expressed as the rate of information presentation per se. The experiment involved 10 practiced Ss responding to Arabic numerals with motor (key-pressing) responses and with verbal responses. The independent variables were the rate at which the numerals were presented (1 to 3 per sec.) and the number of possible alternative numerals employed (2, 4, or 8). The results were as follows: For a given constant rate of information presentation, an increased rate of information transmission was obtained by increasing the number of possible alternative stimuli and decreasing the rate of stimulus presentation. There were significant decrements in the relative information transmission rate with increases in the rate of stimulus presentation, but no significant changes with increases in the number of possible alternative stimuli. The percentage omitted responses was relatively unaffected by increases in stimulus complexity at the lower rates of stimulus presentation, but was markedly increased by increases in stimulus complexity at the higher rates of stimulus presentation. In general, the results suggest that information is handled more efficiently the larger the set of alternative stimuli and responses. This finding may represent an interesting difference between animate and inanimate information-handling systems.

Bradley, J.V. & Stump, M.E. MINIMUM ALLOWABLE DIMENSIONS FOR CONTROLS MOUNTED ON CONCENTRIC SHIFTS. Proj. 7182-71514, WADC Tech. Rep. 55-355, Dec. 1955, 41pp. USAF Wright Air Development Center, Wright-Patterson AFB, Ohio.

A series of experiments was performed to determine the minimum allowable dimensions of circular, nondentent knobs mounted upon concentric shafts when frequent inadvertent operation of adjacent coaxial knobs cannot be tolerated. Both unshielded knobs and knobs whose front faces were shielded against inadvertent operation were investigated. A standard setting was used, and measures were taken of reach time, turning time and inadvertent touching of adjacent coaxial knobs. Manipulated variables were thickness, diameter and difference in diameter between the operated knob and the adjacent knobs. The conclusion was reached that if three knobs are to be concentrically ganged, and if the middle knob is about 2 in. in diameter, the diameter of the front knob should be at least 1 in. smaller, and that of the back knob 1 1/4 in. greater than that of the middle knob; b) the front and middle knobs should both be 3/4 in. thick but the back knob may be as thin as 1/4 in. These statements apply to both unshielded and shielded knobs. Statistically significant decrements in performance between adjacent experimental conditions were found when dimensions smaller than these were used. Comparisons between the panel space consumed by nonganged knobs and by concentrically ganged knobs indicated that panel space will seldom be saved by concentrically ganging knobs when the following conditions obtain: a) the knobs can be operated by application of moderate torque, b) the difference in diameter between concentrically mounted knobs is large enough to insure that their inadvertent operation will be infrequent, c) the diameter (1/2 in. to 1 in.) nonganged knobs are acceptable substitutes for the larger diameter concentrically ganged knobs.

Caldwell, L.S. THE ACCURACY OF CONSTANT ANGULAR DISPLACEMENT OF THE ARM IN THE HORIZONTAL PLANE AS INFLUENCED BY THE DIRECTION AND LOCUS OF THE PRIMARY ADJUSTIVE MOVEMENT. Proj. 6 95 20 001. Rep. No. 233. April 1954. 16pp. NSA Medical Research Lab., Fort Monmouth, N.J.

The accuracy of 10° angular displacements of the arm was found to be a function of both the direction and locus of movement. Movements toward the side were most accurate in the side (50° - 90°) region, and movements toward the front were most accurate in the front (0° - 40°) region. (0° represents the intersection of the horizontal and medial planes passing through the shoulder joint and 90° represents the intersection of the horizontal and lateral planes.) Adjustments toward the side were more accurate than those toward the front.

Tinker, M.A. THE EFFECT OF INTENSITY OF ILLUMINATION UPON SPEED OF READING SIX-POINT ITALIC PRINT. AMER. J. Psychol., Oct. 1952, 65(4), 600-602. (University of Minnesota, Minneapolis, Minn.)

2119

To investigate the relation between level of illumination and speed of reading 6-point italic print, two equivalent forms of Tinker's "Speed of Reading Test" were prepared in 10-point Roman and 6-point italic types. Five groups (N=285) were tested on Form I (intensity of illumination—25 ft.-c.); one group was retested on Form II, same type and illumination, while the others were given Form II, 6-point italic, under levels of illumination of 1, 10, 25, or 100 ft.-c., respectively. Performance was measured in number of items completed in ten-minute period with the control group data used as correction in evaluating effects of illumination.

Visual errors in the 2 horizontal directions and of 3 different sizes were produced instantaneously and presented in random order to 10 SS. the errors were corrected through the movement of a joy stick. The joy stick responses were analyzed electrically into time plots of position, rate, acceleration and the third derivative of acceleration (Δ acceleration). Since the control mechanism was nearly frictionless, it was possible to interpret the findings in regard to acceleration and Δ acceleration in terms of force applied by S to the joy stick. When interpreted in this way the following generalization emerged: a) As the visual error increases; (i) the S applies more force in the direction of motion and also more braking force; (ii) he applies and removes these forces at a greater rate; and (iii) he applies these forces over a slightly greater period of time; b) Throughout the course of any one motion, force varies continuously; c) The time relations of these corrective motions are such that it appears that once started, the motions run off without visual or kinesthetic guidance; d) The latter finding suggests that control in target tracking is an intermittent rather a continuous process.

Taylor, H.L. & Brozek, J. EVALUATION OF FITNESS. Fed. Proc., 1944, 2, 216-222. (University of Minnesota, Minneapolis, Minn.)

The term "fitness" is generally used to cover 2 distinct fields. One deals with estimation of occupational work capacity, the other has for its goal the assessment of the ability to withstand physical and biological stresses. These fields overlap and are frequently confused. Tests of cardiovascular, respiratory and metabolic processes, motor performance, sensory and intellectual functions, and emotional state are reviewed to give a rounded picture of fitness of general character which is not closely related to a specific occupation. Particular emphasis is laid on the limitations of these procedures and on valid experimental design.

2118

To investigate the effects of binaural interaction upon pitch perception, a series of studies were made: (1) determination of the number of cycles by which a monaural tone had to be changed to sound the same in pitch as a binaural tone (loudness level 95 decibels, frequencies 200 and 400 cycles); (2) similar determinations for tones varying in frequencies from 120 to 4000 cycles (standard tone introduced in one ear and comparison tone in other ear, loudness level 95 decibels). Changes in frequency are analyzed and discussed in relation to the principle of maximal stimulation and the pitch-intensity function.

Travis, R.C. MEASUREMENT OF ACCOMMODATION AND CONVERGENCE TIME AS PART OF A COMPLEX VISUAL ADJUSTMENT. J. exp. Psychol., 1948, 38, 398-403. (Tufts College)

2120

The speed of monocular and binocular accommodation and convergence was measured as part of a complex visual performance by use of a specially designed tachistoscope. Broken circles served as discriminating stimuli (both near and far distances) in alternating rectangular apertures in the tachistoscope. Fifty college students provided mean times, standard deviations, ranges and reliability coefficients for both eyes, each eye alone, near stimuli only, and far stimuli only. Four subjects were given intense training with the same procedure to study the effect of practice. Visual acuity, perceptual speed, and motor speed data were obtained to evaluate their contribution to the total performance. Results of these later phases of the study are analyzed.

Cohen, J. BINOCULAR DISPARITY AS A CODING
 DIMENSION FOR PICTORIAL INSTRUMENT AND RADAR
 DISPLAYS. Contract AF 18(600)-50, Proj. 7186,
 Tech. Rep. 55-393, Dec. 1956, 22pp. Aero
 Medical Laboratory, WADC, Wright-Patterson AFB,
 Ohio. (Antioch College).

2122

To determine the increments of binocular disparity
 angle which would result in equal discriminability of
 absolute depth judgments, 2 experiments were performed.
 The first experiment employed 19 subjects who recorded
 depth judgments on a continuous scale, whereas in the
 second 20 subjects recorded judgments in 11 discrete cate-
 gories. Twenty-two pairs of test slides with 4 disparate
 targets on each slide were presented in a stereoscope in
 both studies. The responses were coded by the method of
 a scale transformation which required normalizing the
 data and separating the response categories by equal
 standard deviation distances. The findings are discussed
 in terms of usefulness for a coding dimension in present
 three dimensional pictorial instrument and radar displays.

 Turnbull, W.M. PITCH DISCRIMINATION AS A FUNCTION OF TONAL DURATION. J. exp. Psychol., 1944,
 34, 302-316. (Princeton Univ., Princeton, N.J.)

Investigated was the relationship between pitch discrimination and stimulus duration. It
 was found that as the duration of tonal stimuli decreases, accuracy of pitch discrimination
 also decreases. For a tone of 1024 cycles at 60 db above threshold, the effect of stimulus
 duration on pitch discrimination is slight until the duration is reduced to 0.1 sec. There-
 after, accuracy of discrimination declines rapidly until it is reduced essentially to zero
 around 0.01 sec. For a tone of 8192 cycles at 60 db above threshold, pitch discrimination is
 noticeably blunted when one of the tones to be compared has a duration of less than 0.25 sec.
 and accuracy reaches a virtual zero when duration is reduced to approximately 0.02 sec. For
 a tone of 128 cycles presented at 60 db above threshold, accuracy of pitch discrimination
 decreases if the duration of one of the stimuli is reduced to less than 0.5 sec. The curve
 representing decrease in accuracy is thereafter less steep, as duration is reduced, then is
 true at 1024 or 8192 cycles; but the virtual zero point of discrimination accuracy is reached
 sooner, at about 0.03 sec. A decrease in stimulus intensity likewise produces a reduction
 in accuracy of pitch discrimination. This reduction is greater at relatively short durations.
 The data do not support the hypothesis that discriminability varies as the product of inten-
 sity in decibels and duration in seconds.

 Vince, Margaret A. RAPID RESPONSE SEQUENCES AND THE PSYCHOLOGICAL REFRACTORY PERIOD. Brit.
 J. Psychol., 1949, 40, 23-40. A.P.U. 99. Medical Research Council, Unit of Applied Psychol-
 ogy, Univ. of Cambridge, England.

7 experiments investigating the psychological refractory period are presented. In the
 experimental task, where the average maximum free tapping rate was approximately 7 responses/
 sec., it was found when Ss were tapping in response to a clearly visible series of stimuli
 or groups of stimuli, that: a) when the stimuli were exposed singly and separately the maxi-
 mum rate of correct responses was approximately 2 per sec.; b) the response rate could be in-
 creased by grouping the stimuli; c) when the stimuli were presented as symbols requiring
 occasional responses, and the stimulus rate was higher than the maximum possible response rate,
 occasional breakdowns of response, or "blocks" occurred; d) Even when sets of stimulus
 symbols were exposed under conditions where Ss were not still occupied with responding to
 previous stimuli, and an extra stimulus symbol was interspersed during the response time to
 the group, similar breakdowns of response, or blocks occurred; e) These results also indicat-
 ed that inhibition caused by the appearance of further stimuli during the time Ss was still
 occupied with responding to the previous ones could either act on the succeeding stimuli or
 responses or could disrupt the response to the first set of stimuli; f) Evidence was also
 found that the breakdowns which occurred at high rates represented "blocks" in the sensory-
 motor system, rather than a simple limitation imposed by the maximum rate at which a limb
 could move; g) The response rate for single and grouped stimuli in these artificial, experi-
 mental tasks was found to be similar to the rate attained by some Ss in typing and telegraphy.

Mullis, G.L. FACTORS IN HUMAN VISUAL RESOLUTION. *J. opt. soc. Amer.*, 1943, 33, 487-505. (Bausch & Lomb Optical Co., Rochester, N.Y.).

The general topic of this paper is visual resolution in humans. More specifically, factors relating to visual resolution and types of visual resolution are dealt with. The paper includes a discussion of the visibility of lines and points under conditions wherein a bright figure is viewed on a dark background, and a dark figure is viewed on a bright background. Attention is rendered to both primary and secondary considerations which influence visual acuity. Short discussions of resolution of color on color, vernier and stereo-acuity, and the relationship of vernier and stereo-acuties, and explanations of the aforementioned processes are also included. Conway, A.L., High, W.S. & Wilson, R.C. FACTORS INFLUENCING ORGANIZATIONAL EFFECTIVENESS: VII. A SURVEY OF AIRCRAFT SUPERVISORS. Contract N60MR 23815, Tech. Rep. 10, 1954, 14pp. University of Southern California, Los Angeles, Calif.

2133

This study investigates characteristics of aircraft supervisors related to organizational effectiveness. Questionnaires consisting of 24 item-groups on topics such as communication, human relations, and responsibility were completed by supervisors of 24 departments. Organizational effectiveness of each department was determined by four criteria: number of produced items passing inspection, time spent reworking rejects, hours to complete work, and executive staff ratings. The questionnaire responses were numerically weighted and an overall department score obtained. The data were analyzed in terms of the epsilon coefficients between each item-group and the four criteria. The relationship between rating criteria, production rate, and human relationships is discussed. T. R 7

Within, H.A., & Wapner, S. VISUAL FACTORS IN THE MAINTENANCE OF UPRIGHT POSTURE. *Amer. J. Psychol.*, 1950, 43, 31-50.

2138

To investigate some visual factors in maintenance of upright posture, the visual field was varied from a full view of a lighted room, limited to luminous cube in dark room, no view (blindfolded), and a rocking luminous cube in dark room. Body steadiness was measured for 36 men and 37 women under these conditions. The data, body sway in millimeters, are analyzed statistically and interpreted with respect to the progressive weakening structure of the visual field. Individual differences and sex differences are noted. T.G.I.R7.

2139 Wickin, H.A., Wepner, S., & Leventhal, T. SOUND LOCALIZATION WITH CONFLICTING VISUAL AND AUDITORY CUES. *J. Exp. Psychol.*, 1952, 41, 58-67. (Brooklyn College, N.Y.)

Investigated were the roles of visual and auditory cues in sound localization as well as individual differences in manner of integrating these cues. Each of the 37 Ss was required to locate the direction of a sound under conditions of conflicting visual and auditory cues. The visual indication of the source of sound remained fixed at a central position while the auditory indication was shifted to left and right by changing the relative lengths of the 2 tubes which carried the sound to S's ears. All Ss also received control trials in which the eyes were closed. Mean scores for the eyes-open trials were significantly higher than those for the eyes-closed trials indicating a naked difference in the perception of the direction of sound depending upon whether or not the origin of the source is seen. There was marked individual difference in performance particularly in the eyes-open trials and there was evidence that Ss remained stable in their perception. There were some differences between the sexes but these were not significant.

A sex ratio (female/male index) was computed for the most important body measurements and body indices on trunk, appendages, and head dimensions on a sample of Negroes and Dutch Whites. The Negro data were gathered at Tuskegee Institute, Alabama. The Ss (100 male and 100 female) were taken at random from the physical education classes and were of approximately the same age (average of 21.15 for males and 20.05 for females). They are not full-blood Negroes, but represent a hybrid population of Negro, Indian, and White with perhaps a predominance of Negro blood. They are, however, classified as typical American Negroes. The Dutch-White data used for comparison was from middle-aged parents, living in Holland, Michigan. The various index figures are presented for the purpose of better describing the finer differences in body build of the sexes. This was done by comparing the anthropometric findings with respect to sexual dimorphism for each item.

2146 Attneave, F. THE RELATIVE IMPORTANCE OF PARTS OF A CONTOUR. Proj. 509-019-0001, Res. Note PMHS-518, Nov. 1951, 15pp. USAF Human Resources Research Center, Lackland, AFB, San Antonio, Texas.

This study explores the possibility that the various parts of a contour do not have equal importance in determining its appearance. The technique used was to determine which points Ss would abstract from a closed line representing a contour when requested to arrange a number of dots into a pattern looking as much as possible like the outline figure. Each of the 8 Ss were given a booklet containing 16 different figures consisting of a closed, irregularly curved line. The Ss were instructed to draw a pattern of 10 dots which would resemble the figure and to place each dot of the pattern in its appropriate place on the contour itself. The results from 3 of the 16 figures were tabulated for each S. Ss showed a great deal of agreement in the points abstracted. It is difficult to state a physical variable for the principle of abstraction. An appropriate generalization might be that arithmetical maxima of curvature constitute the salient points of a contour; in other words, the most important segments of contour are those most different from a straight curve.

Fitts, P.M., Marlowe, E., & Noble, M.E. THE INTERRELATIONS OF TASK VARIABLES IN CONTINUOUS PURSUIT TASKS: I. VISUAL-DISPLAY SCALE, ARM-CONTROL SCALE, AND TARGET FREQUENCY IN PURSUIT TRACKING. Contract AF 33(038) 10528, Proj. 509 020 0004, Res. Bull. 53 34, Sept. 1953, 66pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, San Antonio, Texas.

The interrelations of visual-display scale, arm-control scale, and frequency of target motion in a continuous pursuit task were studied using a simple harmonic target motion presented in 1-dimension on a cathode-ray tube. A factorial design was used which consisted of 3 variations of each of the above variables. 3 male Ss were assigned at random to each of the resulting 27 experimental conditions. The quantitative measures obtained were: a) root mean square (RMS) error by 1-min. trials; b) time on target scores at ± 5 , ± 15 , and ± 30 tolerance. Graphic records were obtained of the problem, position of the control, acceleration of the control, and the error for selected blocks of trials. Both quantitative and qualitative data were characterized by large individual differences among Ss. Improvement in performance during the 18 1-min. trials was small as measured by the RMS error and the ± 5 , ± 30 time on target scores, but probably for very different reasons. Estimates of reliability based on the odd-even trials for all 81 Ss using adjusted scores that eliminated intercondition variance yielded coefficients ranging from .95 to .99 for each of the 4 quantitative measures. ANOVA utilizing all 4 criterion measures indicated that each of the 3 variables studied had significant effects and that frequency of target oscillation was the most important of the 3 variables studied.

Slice, G.F., & Knoll, Dorothy M. A SIMPLE MEAN-DIFFERENCE TECHNIQUE FOR OBTAINING SCALES. Proj. 511 023 0002, Res. Bull. 53 36, Sept. 1953, 4pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, San Antonio, Texas.

A simple technique has been proposed for obtaining scales from a pool of items which contains a number of a priori scales. The technique is based on an item-test, correlation approach to item selection, but it substitutes a mean-difference criterion for the customary correlation coefficient. It is further suggested that a good approximation to the biserial coefficient is obtained by dividing the obtained mean difference by the maximum possible mean difference for a particular item split. The technique appears to be especially useful when the number of items in the hypothesized scales is small and a quick check on the assignment of items to scales is desired.

Clark, J.R., Fontaine, A.B., & Warren, C.E. THE GENERATION OF A CONTINUOUS RANDOM SIGNAL FOR USE IN HUMAN TRACKING STUDIES. Contract AF 33(038) 10528, Proj. 509 020 0004, Res. Bull. 53 40, Oct. 1953, 23pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, San Antonio, Texas

Described is the construction and the characteristics of a device for producing a random signal for use in the study of human tracking. The signal output of the random function generator is a square wave with a maximum amplitude variation in the range of plus or minus 5 volts and containing frequencies in the approximate range of 0 to 10 cycles per sec. The function generator was designed specifically for use with the Two-Dimensional Electronic Pursuit Apparatus. A classification of target courses based on the qualitative and quantitative characteristics common to all courses is proposed. Also included in the report are the mathematical specifications of a signal generator of one of the classifications, the circuits required for the construction, the generator, and the experimental verification for its characteristics.

2155 Clark, J.R. & Warren, C.E. A PHOTOMETRIC CORRELATOR. Contract AF 33(038) 10628, Proj. 509 020 0004, Res. Bull. 53 42, Nov. 1953, 8pp. USAF Human Resources Research Center, Lackland AFB, Texas.

A Photometric Correlator is described which is capable of performing its prescribed computations with such precision that little, if any, error can be found in the graphic recordings of the correlations of certain known periodic test signals. There is, of course, an upper frequency limit which is estimated at 10 cps. This correlator has an integrating interval of 40 sec. (or less at the option of the operator) and is capable of computing correct correlations of signals which are made up entirely of frequency components which are harmonically related to the interval of integration. Other frequency components of the signals being correlated will contribute to the computed correlation, but these contributions are subject to errors which are generally quite small if the signal frequencies are high and quite large if the signal frequencies are low. Rather arbitrarily, a frequency of 6 cycles per min. might be chosen as a dividing line. The presence of frequencies in the computed correlation below this value is a definite indication that these same frequencies were present in the original signals, but the complete correlation cannot be considered accurate.

2157 Klare, G.R., Gustafson, L.M. & Mabry, J.E. THE READING INTERESTS OF AIRMEN DURING BASIC TRAINING. Contract AF 33(038) 25726, Proj. 507 011 0001, Res. Bull. 53 44, Nov. 1953, 10pp. USAF Human Resources Research Center, Lackland AFB, Texas. (University of Illinois, Urbana, Ill.).

2157 The results of an administration of a reading interest-check list to 398 Sampson Air Force Base basic airmen are presented in rank order from most to least interesting. The checklist contains 117 statements designed to cover the range of nonfiction reading interests. Limitations of the findings and ways in which they might be useful in training situations are pointed out. T. R 15

2158 Gibson, Eleanor J. A SURVEY OF RESEARCH ON IMPROVEMENT IN PERCEPTUAL JUDGMENTS AS A FUNCTION OF CONTROLLED PRACTICE AND TRAINING. Contract AF 33(038) 22373, Proj. 509 019 0003, Res. Bull. 53 45, Nov. 1953, 66pp. USAF Perceptual and Motor Skills Research Lab., Lackland AFB, Texas.

2158 This review brings together experimental data dealing with the effects of training in improving all forms of perceptual judgments. The experiments cited cut across several sense modalities, but are largely confined to those employing human subjects. They are grouped according to the effects of practice on a) acuity, b) upper and lower thresholds, c) color discrimination, d) perception under conditions of impoverished stimulation, e) relative discrimination, and f) absolute judgment. 2159 Brockaw, L.D. & Christal, R.E. AN ITERATIVE METHOD FOR ADJUSTMENT OF ERRONEOUS FACTOR LOADINGS. Proj. 503 001 0016, Res. Bull. 53 46, Dec. 1953, 31pp. USAF Human Resources Research Center, Lackland AFB, Texas.

2159 The development of a procedural modification of Wherry's technique for adjusting erroneous factor loadings is presented in this report. Application of this process to the rotated factors derived from a centroid solution adjusts the rotated loadings by maximizing the variance properly attributable to each factor for each test. It tends to eliminate errors originating in misestimation of communalities or occasioned by mechanical errors of graphic rotation. The type of study that would demand this procedure is discussed. T. R 1

2160 Arnoult, M.D. TRANSFER OF PREDIFFERENTIATION TRAINING IN SIMPLE AND MULTIPLE SHAPE DISCRIMINATION. Res. Bull. 53 48, Dec. 1953, 9pp. USAF Human Resources Research Center, Lackland AFB, Texas. (Reprinted from: J. exp. Psychol., June 1953, 45(6), 401-409).

2160 To investigate the effects of preliminary practice in differentiating stimuli on subsequent reaction to the stimuli, two experiments (250 and 190 basic airmen) were run. Each experiment involved pre-training of two subject groups, consisting of associating letters with five 2-dimensional nonsense shapes, with a control group having no pre-training. Final testing of all groups was discrimination between the learned shapes and a standard in one experiment, recognition of the learned shapes in the other. Response time and accuracy were discussed regarding implications for Gibson's pre-differentiation hypothesis. T. G. I. R 18

2161 Adams, J.A. THE PREDICTION OF PERFORMANCE AT ADVANCED STAGES OF TRAINING ON A COMPLEX PSYCHOMOTOR TASK. Proj. 509 020 0003, Res. Bull. 53 49, Dec. 1953, 44pp. USAF Human Resources Research Center, Lackland AFB, Texas.

2161 This study is an analysis of complex motor performance, done to investigate the prediction of performance at advanced stages of learning. One hundred ninety-seven basic airmen practiced for 64 trials (two days) on the Complex Coordination Test as a criterion measure. During a three-day period they also took six other complex coordination tests, 11 simple coordination, and 34 printed classification tests. The scores on all these tests and scores at selected stages of learning the criterion task were intercorrelated, and regression equations were established for predicting criterion performance at various stages of learning. 2162 Adelson, M. A METHOD FOR STUDYING HUMAN TRACKING BEHAVIOR. Contract AF 33(038) 25726, Proj. 508 017 0001, Res. Bull. 53 50, Dec. 1953, 7pp. USAF Human Resources Research Center, Lackland AFB, Texas.

2162 This report describes a proposed apparatus and how it might be used in studying tracking. The apparatus would consist of a series of signal lights (lighting alternately and rapidly enough to appear to give continuous stimulus motion) and a parallel set of "tracking" lights to be matched with the stimuli by a stick control. Stimuli, response recording, and data analysis would all be handled by IBM equipment. Discussion includes possible application of device to predicting tracking performance and to the study of learning and transfer. R 1

Deese, J., Lazarus, R.S. & Keenan, J. ANXIETY, ANXIETY REDUCTION, AND STRESS IN LEARNING. *J. exp. Psychol.*, July 1953, 46(1), 55-60. (Johns Hopkins University, Baltimore, Md.).

2164

To assess the notion of reliability (time-lapse stability) relevant to the use of the Semantic Differential in applied and experimental settings, and to provide data on effect of sampling variability, 30 subjects rated a single set of 20 concepts chosen at random from the original Atlas study (12,988: a semantic differential Atlas) once, then again after an interval of four weeks. Scale consistency, concept consistency, person consistency and factor-score consistency indices are presented in tables. Implications of the findings for use of the techniques with groups (for group averages) and for use with individuals are discussed.

T. G. I. R 9

2168

In a study of learning under stress, three groups of 30 college students learned a list of 12 nonsense syllables. One group (avoidance) received electric shocks for wrong or omitted responses, one (nonavoidance) received shocks at random for both right and wrong answers, the third (control) received no shock. Each group consisted of 15 high and 15 low scores on the Minne "neuroticism inventory." Learning curves were compared and discussed regarding theoretical implications for anxiety in learning. Incidental data were given for the intercorrelations of the Minne inventory, the Taylor anxiety scale, and the psychasthenia and hysteria scales of the MMPI.

Fleishman, E.A. A MODIFIED ADMINISTRATION PROCEDURE FOR THE O'CONNOR FINGER DEXTERITY TEST. *J. appl. Psychol.*, 1953, 27, 191-194, Proj. 509 020 0003, Res. Bull. 53 53. USAF Human Resources Research Center, Lackland AFB, San Antonio, Texas.

The O'Connor Finger Dexterity Test was administered under time limit conditions to 3 groups of 100 Ss each. One group received the test for a 4-min. time limit condition, another for a 5-min. period, and a third for a 6-min. period. In another sample, 100 Ss were tested and retested 1 1/2 hrs. later under the standard work limit conditions. In an additional sample, 100 Ss were given the test under work limit conditions and retested 1 1/2 hrs. later under the 5-min. time limit condition. Means, standard deviations and test-retest reliabilities were computed for the various administrative procedures. Correlations between the time limit procedure (5-min.) and the full board and 1/2 load work limit procedures were .96 and .89 respectively. Reliabilities between .71 (time limit, 4-min.) and .86 (work limit full board) were obtained. These results indicate that although there is some loss in reliability under the time limit conditions, the reliabilities are probably adequate for group prediction, especially if the test is to be included in a larger battery. Preliminary norms for the modified administration conditions are presented.

Fleishman, E.A. TESTING FOR PSYCHOMOTOR ABILITIES BY MEANS OF APPARATUS TESTS. *Psychol. Bull.*, 1953, 50, 241-262, Proj. 509 020 0003, Res. Bull. 53 54. USAF Human Resources Research Center, Perceptual & Motor Skills Research Lab., Lackland AFB, Texas.

The area of psychomotor (PM) skills research is examined from the viewpoint of aptitude test development. The historical background of PM test development is presented, problems attending their use are discussed and previous factor analyses in the area are summarized. It is concluded that a basic need is for extensive dimensional analyses of motor abilities which would reveal a more basic classification of factors than exists at present. Research of this nature has been fragmentary and limited to a small range of PM tasks. However, there is extensive agreement between studies on factors isolated and this research offers some starting points for more extensive dimensional analyses. Other sources of hypotheses concerning motor skill dimensions are job surveys and transfer studies. Methodological issues are reviewed in the second half of the paper. The value of job-sample tests vs. tests of basic abilities is questioned. Also questioned is the assumption that the abilities involved in complex PM tasks are qualitatively different from the abilities involved in factorially more simple tasks. The possibilities of paper-and-pencil tests and the role of motion picture presentation are discussed. Possible research on the quantification and measurement of "work methods" is pointed out. Finally, studies relative to the problem of selection vs. training with respect to motor skills are suggested.

Noble, M.E., Fitts, P.M., & Marlowe, E. THE INTERRELATIONS OF TASK VARIABLES IN CONTINUOUS PURSUIT TASKS: II. VISUAL-DISPLAY SCALE, AIM-CONTROL SCALE, AND TARGET-FREQUENCY IN COMPENSATORY TRACKING. Contract AF 33(038) 10528, Proj. 509 020 0009, Res. Bull. 53 55, Dec. 1953, 29pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, San Antonio, Texas.

The present investigation is the second of a series concerned with the interrelations of a) the sensitivity or amplitude characteristics of movements made in a target tracking task, b) the corresponding aspects of visually displayed information about various aspects of the task and c) the frequency and coherence of the target motion. The variables can be specified in terms of a control-scale factor (Sc), a visual-display-scale factor (Sd), and the target frequency (F). The problem motion was in the form of a simple harmonic pattern, a highly coherent stimulus sequence, and the information was displayed visually as a compensatory pursuit task on a cathode-ray tube. Each of the 7 Ss were given training until he reached a high and reasonably stable level of performance on each of the 8 conditions that result from the combination of 2 categories each of F, Sc, and Sd. 4 quantitative scores were obtained at the end of each 1-min. trial: a) error root-mean-square score, b) time on target score for a ± 5 , ± 15 , and $\pm 30\%$ error tolerance. Analyses of the quantitative scores indicate that tracking performance was significantly better for the lower (15 cpm) than for the higher (60 cpm) frequency of problem motion. Relative performance was also significantly better for the larger amplitude of control movement (Sc = 40") than for the smaller amplitude (Sc = 10"). For none of the measures of relative performance was the effect of display-scale factor significant.

Ballance, E.L. ACQUISITION OF TWO LEVER-POSITIONING RESPONSES PRACTICED OVER PERIODS OF ALTERNATION. *J. exp. Psychol.*, July 1953, 46(1), 43-49. (USAF Perceptual and Motor Skills Research Lab., Lackland AFB, Tex.).

2170

Six groups of 48 basic trainees practiced for 48 trials making a match on a display panel by positioning an unseen lever. Unknown to the Ss, on alternate blocks of trials the correct lever position varied for five experimental groups. They had conditions that differed only in the number of trials per block (1, 2, 4, 6, or 8); the control group had the same task throughout. Results (positioning for each trial) were analyzed and discussed with regard to the characteristics of learning the alternating tasks.

2172

To investigate the relation of psychological probabilities to their environmental counterparts, direct comparisons were made using letters of the alphabet. Numerical judgments of the relative frequency with which each letter of the alphabet occurs in English text were obtained from 90 subjects. Three additional groups (30 subjects each) attempted to guess fictitious letters in a pack of 100 cards with: (1) no bias given as to frequency, (2) bias for a uniform frequency, and (3) bias for English-text frequency. The data were analyzed by correlational procedures for degree of relationship and influence of environmental biases.

French, R.S. THE DISCRIMINATION OF DOT PATTERNS AS A FUNCTION OF NUMBER AND AVERAGE SEPARATION OF DOTS. *J. exp. Psychol.*, 1953, 46, 1-9. (USAF Human Resources Research Center, Lackland AFB, Tex.) (SMC Res. Bull. 53 64).

2176

To study pattern discrimination as a function of number of items and their separation, a series of 120 different patterns for each number of dots from two to seven were presented to 384 Ss. Each pattern appeared twice, pairs of presentations being either identical or differing only in slight displacement of one dot, and were judged as "same" or "different." Half of the subject groups were given reinforcement through knowledge of the correctness of their answer. Errors and latency data are analyzed and interpreted in terms of the variables. The learning data are discussed.

Nystrom, C.O., Marin, R.E. & Grant, D.A. TRANSFER EFFECTS BETWEEN AUTOMATICALLY PACED AND SELF-PACED TRAINING SCHEDULES IN A PERCEPTUAL-MOTOR TASK. Contract AF 33(308) 23294, Proj. 512 024 0001, Res. Bull. 53 66, Dec. 1953, 18pp. *USAF Human Resources Research Center, Lackland AFB, Tex. (University of Wisconsin, Madison, Wisc.)*

2176

To investigate the relative value of self-paced versus automatically paced training in a perceptual-motor task, transfer effects between the two types of training schedules were studied. Subjects were given four 25-trial blocks of automatically paced or self-paced training on a task that called for a rapid succession of responses to temporally discrete visual stimulus patterns; then they were transferred to the opposite kind of pacing and given four more blocks of trials. Two control groups were used which continued for eight blocks of trials on one type of pacing. Transfer data were analyzed both graphically and by analysis of variance.

Felton, W.W., Fritz, E. & Grier, G.W., Jr. COMMUNICATION MEASUREMENTS AT THE LANGLEY AIR FORCE BASE DURING NOVEMBER AND DECEMBER, 1951. Contract AF 18(600) 26, HRL Rep. 31, Nov. 1952, 85pp. *USAF Human Resources Research Lab., Bolling AFB, Washington, D.C. (The Franklin Institute, Philadelphia, Penn.)*

2181

A field study of the use of communication channels for terminal air traffic control at Langley Air Force Base is described. Measurements were made in a mobile laboratory equipped with communication receivers, magnetic tape recorders, and various time and number recorders on each of 20 days over a five-week period. Samples for analysis were drawn from periods representing both instrument and visual flight conditions. The messages were studied from the following points of view: factors that might limit maximum possible utilization of a channel; time characteristics and content of messages; and estimated amount and rate of transfer of information in landing operations.

Thompson, M.E., Thompson, Jean P., & Busch, E.R. TESTS OF MOTOR ABILITY OR GROSS MUSCULAR COORDINATION. Contract AF 33(038) 22948, Proj. 509 020 0005, Res. Bull. 53 25, July 1953, 35pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, Texas. (University of Arkansas, Fayetteville, Ark.).

The present review is primarily concerned with those tests which are currently being used with males of military age and which appear to measure, primarily, some aspect of gross muscular coordination. In terms of the conventional categories set up by the physical education writers, this has meant, in general, the inclusion of tests of motor educability, motor capacity, motor fitness, motor ability, and strength (where measured by some activity rather than by dynamometers); and the exclusion of endurance tests, specific skill or achievement tests, and cardiovascular tests of fitness. Evaluation is restricted to 9 tests proposed after 1925. However, in the interest of completeness, a number of early tests are briefly described and the early testing movement is outlined. Certain tests which have been developed and standardized primarily for use with high school boys, but which have been used to a limited extent with college men are included in an appendix. Other tests, less pertinent to the inquiry are indicated only in the bibliography.

Bilodeau, E.A. THE EFFECTS OF FORCE VARIATIONS BEFORE REST ON RATE OF RESPONDING AFTER REST. Proj. 509 020 0002, Res. Bull. 53 26, Aug. 1953, 13pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, Texas.

This study was designed to test the hypothesis that the force used in forepractice is irrelevant in later practice where force is held constant. Two levels of rest were used. However, these levels did not allow for full recovery from decremental effects of prior practice. Tested were 320 men on the manual crank. These Ss were divided into 8 groups which differed in load used for initial practice, duration of the single rest interval, and load used for final practice. The results indicated that at the force levels used: a) the particular force used before rest was of no consequence for rate of responding after a rest of brief duration, i.e., 30 sec.; b) the particular force used before a rest of relatively long duration (4 min.) contributed substantially to rate of responding after rest; c) after the long rest interval, the groups with the greater pre-rest load responded more slowly than the groups with a lesser pre-rest load when tested at two force levels. One possible account of the differential rest effect was presented.

Zachert, Virginia, & Friedman, G. JOINT CONVERSION TABLES FOR AIR FORCE CLASSIFICATION TESTS AND ARMY CLASSIFICATION TESTS. Proj. 503 002 0002, Res. Bull. 53 29, Aug. 1953, 31pp. USAF Human Resources Research Center, Air Research & Development Command, Lackland AFB, Texas.

The purpose of this study was to derive conversion tables covering Army Classification Tests and related Air Force Classification Tests. These conversion tables can serve in 2 possible ways: a) Comparison and evaluation of the tests and test scores of one battery against the other; b) The development of a common classification battery, or core battery for all the armed services. The Air Force obtained data from approximately 1800 unselected basic airmen. The Army obtained data from 300 permanent party enlisted men. From the combined sample of approximately 2100, a stratified sample of 500, comprising 426 basic airmen and 74 soldiers, was selected in terms of Army Aptitude Area 1 scores. Equipercentile conversion tables are provided for 11 Air Force Classification Tests and 9 Army Classification Tests.

Attneave, F. TRANSFER AND INTERCORRELATION AMONG THREE PERCEPTUAL TASKS. Proj. 509 019 0001, Res. Note 51 9, Nov. 1951, 4pp. USAF Perceptual & Motor Skills Research Lab., Lackland AFB, Tex.

2201

To determine the degree to which practice on a perceptual task transfers to similar tasks, six groups (20 each) of subjects performed three tasks in one of six possible orders in immediate succession. Task A, matching a projected shape to one of thirty shapes appearing on answer sheet; Task B, matching shapes on a paper and pencil test (time limit); Task C, matching contours in jigsaw puzzle fashion (time limit). Mean scores are examined for evidence of transfer from task to task. The degree to which the tasks actually measured the same ability is studied by correlational technique.

2209 Simon, G.B. THE DEVELOPMENT AND TRYOUT OF A CHECK LIST OF OBSERVABLE BEHAVIORS IN PRE-FLIGHTING THE B-25. Proj. 507 012 0003, Tech. Rep. 53 7, Apr. 1953, 42pp. USAF Human Resources Research Center, Air Training & Development Command, Lackland AFB, Texas.

The research described in this Technical Report is part of a larger project directed towards development of procedures for assessing the efficiency of airplane and engine mechanics. Development of sound procedures of assessment is essential to the improvement of selection and classification devices and training procedures. Moreover, the development has operational implications through providing a prototype on which development of procedures for periodic check of maintenance activities may be based. Part I of this report describes the development of a check-list device designed for use in recording observations of B-25 maintenance activities. The steps followed in the development and revision of the form are described. Part II of the report describes results obtained during tryout of the revised version of this check list. During this tryout, B-25 mechanics at seven Air Force bases were observed during the pre-flighting maintenance check, and the observable maintenance activities which were carried out were noted by the observer on the check list. Although the primary purpose of this tryout was to determine whether field use of the check list was practicable, the data obtained provide interesting information regarding maintenance activities. For example, on the average these mechanics were observed to carry out about 70 per cent of the specific maintenance activities included on the check list and were clearly observed, on the average, to fail to carry out only about 4 per cent of these specific activities. There were, however, marked differences with respect to the completeness with which all maintenance activities on the check list actually were carried out. For example, in general less than 50 per cent of the items pertaining to "outside inspection" and "inspection for leaks" were checked. Marked differences among bases were evident.

2203 Kneill, Dorothy, & Forays, D.G. INTERRELATIONSHIPS OF CRITERIA OF COMBAT CREW PERFORMANCE IN THE B-29. Proj. 511-023 0001, Res. Note OCT 52 1, Dec. 1952, 19pp. USAF Human Resources Research Center, Air Training & Development Command, Lackland AFB, Texas.

Intercorrelations of 35 criteria of B-29 combat crew performance and 3 predictor variables were computed and factor-analyzed employing a modified multiple-group factor technique. Criterion measures used in the analysis include bombing and navigational accuracy scores, ground school grades, and instructor ratings of over-all effectiveness of crew members on training missions, as well as ratings of the flight coordination of various combinations of crew members. 8 factors were extracted and were related to simple structure. 5 of the factors appear to represent measures of over-all crew, sub-team, or individual in-flight effectiveness and/or coordination; 2 represent the ground school performance of 2 of the crew specialties, pilot and gunner; 1 factor includes crew means on 3 altitude scales. It is interesting to note that these last predictor variables form a factor independent of the criterion variables which they were designed to predict. The main impact of this analysis lies in its suggestion for reducing the number of criterion variables which need to be considered in future research on factors related to B-29 crew performances.

2210 Hahn, C.P. A SURVEY OF PERSONNEL AND TRAINING RESEARCH IN GOVERNMENT, BUSINESS, AND INDUSTRY. Contract AF 33 (038) 24602, Proj. 507 011 0001, Tech. Rep. 53 22, July 1953, 13pp. USAF Technical Training Research Lab., Chantrelle AFB, Ill. (American Institute for Research, Pittsburgh, Penn.).

2210 This report summarizes the findings of a survey of personnel and training research programs of government, business, and industry. The literature of professional psychological journals, house organs, trade journals, and management journals was searched and personnel directors of 60 selected organizations were interviewed. Discussion covers the following topics: personnel selection and classification, training programs, evaluation of employee performance, job evaluation, safety programs, and morale. The military implications of the results are discussed, and recommendations are made for further research.

2211 Parks, R.B., Wood, E.D. & Perkins, D.R. DEVELOPMENT OF THE FLEXIBLE GUNNERY PROFICIENCY EVALUATOR. Proj. 512 024 0001, Tech. Rep. 5323, July 1953, 14pp. USAF Armament Systems Training Research Lab., Lowry AFB, Colo.

2211 This report describes in detail the development for research purposes of the Flexible Gunner Proficiency Evaluator, a device controlling the track of a model target aircraft and recording the performance of Ss tracking and ranging on the target with the General Electric Pedestal Sight. Details are given on the various components and their calibration, and the performance of 30 Ss naive to the task is reported.

2219 Bakan, P., Kappauf, W.E., & Payne, M.C. REVIEW OF PSYCHOLOGICAL RESEARCH BEARING ON RADAR-SCOPE INTERPRETATION IN ADC OPERATIONS. Contract AF 33(038)-25726, Proj. 506-061 0001, Tech. Rep. 53-26, Aug. 1953, 15pp. HRL, Air Research and Development Command, Aircraft Observer Training Research Lab., Mather AFB, Calif. (U. Ill.).

2219 This report reviews the findings of psychological research directed toward determining the most efficient utilization of existing equipment and personnel in radar-scope detection. Orientation is toward the Air Defense Command's need for target pickups at long range, speed in target reporting, and good "gross" accuracy on first reports. Recommendations are made for operations officer and scope operator with above assumptions in mind on factors in signal detection, signal search, target location reporting, prolonged scope operation, obtaining knowledge of site proficiency. Research needs are included.

2220 Matheny, W.G., Williams, A.C., Jr., Dougherty, Dora & Hasler, S.G. THE EFFECT OF VARYING CONTROL FORCES IN THE P-1 TRAINER UPON TRANSFER OF TRAINING TO THE T-6 AIRCRAFT. Contract AF 33(038) 25726, Proj. 508 017 0001, Task D, Tech. Rep. 53 31, Sept. 1953, 8pp. USAF Human Resources Research Center, Lackland AFB, Tex. (University of Illinois, Urbana, Ill.).

2220 To test the hypothesis that the amount of transfer of training from trainer to aircraft is affected by the fidelity with which control pressures are simulated, two groups of Ss were trained to criterion in the P-1 Link trainer and transferred to the T-6 aircraft. One group learned the maneuver of climbing and gliding in the trainer with the elevator control stick pressure close to that of the aircraft; the second group learned the same maneuver with pressures near zero. A third or control group practiced the maneuver only in the aircraft. The number of trials in the T-6 to achieve a specified standard of performance was analyzed for differences among the groups. Implications for flight trainers were indicated.

2222
Boyle, D.J. & Hagin, W.V. THE LIGHT PLANE AS A PRE-PRIMARY SELECTION AND TRAINING DEVICE: I. ANALYSIS OF OPERATIONAL DATA. Proj. 508 016 0004, Tech. Rep. 53 33, Oct. 1953, 61pp. USAF Pilot Training Research Lab., Goodfellow AFB, Tex.

2222
To evaluate the use of the light plane as a selection and training device, an experiment was run on flight training. Two groups (120 Air Force cadets in each) were trained to fly the T-6 aircraft. The experimental group was given 25 hours of flight training in a light (Aerona "Champion") aircraft before flight training in the T-6; the control group did not receive light plane training. The two groups are compared with regard to student attrition, achievement of solo flight, and number of accidents. Results are discussed regarding use of light planes in early phases of flight training.

Swanson, R.A. THE RELATIVE EFFECTIVENESS OF TRAINING AIDS DESIGNED FOR USE IN MOTOR TASK DETACHMENTS. Proj. 7714, Task 77241, AFPTC TR 54 1, Feb. 1954, 14pp. USAF Personnel and Training Research Center, Lackland AFB, Tex.

2225
To investigate the relative effectiveness of several types of training devices when used in conjunction with a lecture presentation in the transitional training of skilled mechanics, six devices were selected for study: three types of mock-ups (operating, nonoperating, and cutaway), animated panels, charts, and symbolic diagrams. Different groups of skilled mechanics were given instruction on maintenance of three different systems of the B-47 aircraft. Each group was further divided into six subgroups, one for each type of training aid; the subgroups all heard the same lecture. The effectiveness of the training aids was evaluated on the basis of results from a test given immediately after instruction.

Herman, I.L. & Church, S.A. ANALYSIS OF RADAR AIMING POINT IDENTIFICATION MOTION PICTURE GROUP TESTS. Proj. 7711, Task 77194, AFPTC TR 54 2, April 1954, 21pp. USAF Personnel and Training Research Center, Lackland AFB, Tex.

2226
A description and evaluation of motion picture radar aiming point tests are presented. Radar aiming point identification is an important component of the task of the aircraft observer bombardment. The present study is primarily concerned with 1) test reliability, item difficulty, and item discriminating power; 2) identification of test variance in terms of selected printed test variables in the Airman Classification Battery; 3) technical aspects of the test such as scoring and administration; and 4) discrimination between experienced and naive observers. The practical uses of the test are discussed.

Gagne, R.M. & Bilodeau, E.A. THE EFFECT OF TARGET SIZE VARIATION ON SKILL ACQUISITION. Proj. 7707, Task 77130, AFPTC TR 54 5, April 1954, 16pp. USAF Personnel and Training Research Center, Lackland AFB, Tex.

2228
Two studies concerned with the effect of varying the limits of accuracy required in learning a motor skill were described. The device used was a modified standard rudder control test whose operation resembles that of certain airplane rudders. A signal light informed the S when he was "on target." Critical comparisons were made of performance scores accompanying shifts in both directions between the limits defined as wide and narrow targets.

Gourley, N.V. PROTOTYPES OF PERSONAL BODY ARMOR FOR FLIGHT PERSONNEL. Proj. T-1181, Nov. 1956, 27pp. Marine Corps Equipment Board, Marine Corps Development Center, Quantico, Va.

2229
To evaluate in the field prototype personal body armor for flight personnel, the physical characteristics (particularly weight) were determined. The test items, accompanied by a user questionnaire, were assigned to aircrews of fighter, attack, helicopter, liaison and transport type aircraft. A static test using a subject, equipped with the test items and a parachute harness, suspended in the air from a frame was conducted to determine parachute bail-out compatibility and a buoyancy determination was made to determine the effects of the armor in water. Further testing was done on modified garments. Recommendations are included.

Bilodeau, Ina McD. PERFORMANCE OF AN EFFORTFUL TASK WITH VARIATION IN DURATION OF PRIOR PRACTICE AND ANTICIPATED DURATION OF PRESENT PRACTICE. J. exp. Psychol., Sept. 1953, 46(3), 146-153. (USAF Perceptual and Motor Skills Research Lab., Lackland AFB, Tex.).

2230
This is a report of a study on the effects of duration of past work and expected duration of present work on hand-cranking performance. Twelve groups, of 40 basic airmen each, had 0 sec., 30 sec., or 3 min. practice in turning a crank as fast as possible. Following a one-hour rest interval, all cranked for two min., but different groups were told that the period would be of different durations (10 sec., 30 sec., 3 min., or 5 min.). Final tracking rates are analyzed as a function of duration of initial practice and expected duration of practice.

Fitts, P.M. & Seeger, C.M. S-R COMPATIBILITY: SPATIAL CHARACTERISTICS OF STIMULUS AND RESPONSE CODES. J. exp. Psychol., Sept. 1953, 46(3), 199-210, AFPTC TR 54 8. (Ohio State University & USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

2231
To investigate the role of stimulus-response (S-R) compatibility in the transfer of information in a perceptual motor task, two experiments were conducted. In the first, nine matched S-R ensembles were studied in an eight-choice situation using groups of matched subjects. The results, analyzed in terms of reaction time, errors, and information lost, were related to the hypothesis that information transfer is a function of the matching of stimuli and response. To test the permanence of S-R compatibility effects, five subjects were trained for 32 days to make particular responses to particular stimuli. Differences in reaction time, movement time and frequency of errors were studied for their persistence over this period.

McAllister, Dorothy E. THE EFFECTS OF VARIOUS KINDS OF RELEVANT VERBAL PRETRAINING ON SUBSEQUENT MOTOR PERFORMANCE. J. exp. Psychol., Nov. 1953, 46(5), 329-336. (State University of Iowa, Iowa City, Iowa).

2232
To investigate the effects of verbal pretraining on learning a motor task, 98 male college students learned six stimulus-response pairs. The stimuli were colors, and the responses were directions, expressed as either degree, clock, or direction analogues (irrelevant responses for control groups). Then Ss had 45 20-sec. trials on the Star Discriminator (a device requiring motion of a control handle from a central point into the proper radial channel in response to a signal color). Correct responses and errors in the early trials on the motor task are analyzed regarding the effects of the relevancy of the verbal pretraining.

Myrop, D.W. (Chm.). A STATISTICAL ANALYSIS OF COMMERCIAL NON-AIR CARRIER ACCIDENTS - 1951. PART III OF IV PARTS. June 1952, 23pp. US Civil Aeronautics Board, Washington, D.C.

2234

A statistical analysis of one category of non-air-carrier accidents (commercial) for the year 1951 is presented. Nonair carrier flying is defined as those operations in which the principal business is other than the carriage of persons or property from one place to another for hire. Commercial flying is that done for direct financial return. Accident statistics on primary causes, operational phase, type, pilot age and experience, emergency conditions, and violations are given for various classes of commercial flying. T.

Fleishman, E.A. & Hempel, W.E., Jr. FACTORIAL ANALYSIS OF COMPLEX PSYCHOMOTOR PERFORMANCE. Proj. 7703, Task 77084, Res. Bull. AFPTC TR 54 12, April 1954, 18pp. USAF Skill Components Research Lab., Lackland AFB, Tex.

2235

This paper describes a factor analysis of data previously published through the School of Aviation Medicine and originally collected in 1947-1948 in a cooperative Air Force-Navy research project. A wide variety of both printed and apparatus tests were given at that time and from these data 16 apparatus and seven printed psychomotor test results were selected for analysis. The criterion of 'pilot success' (graduation or elimination from training school) was also included. The factors isolated are discussed in terms of the organization of abilities in the aptitude area of motor skill. T. R 15

Roby, T.B. PREREQUISITES FOR PAIR-SCORES TO BE USED FOR ASSEMBLING SMALL WORK GROUPS. Proj. 7713, Task-77231, AFPTC TR 54 13, Dec. 1953, 17pp. USAF Crew Research Lab., Randolph AFB, Tex.

2236

It is shown that scores which express predicted compatibility between pairs of persons in small work groups, such as bomber crews, may have general usefulness for rational group assembly. The statistical prerequisites for such scores to be maximally useful for differential assignment to groups are stated. The dimensions along which persons in each of the separate classes should be ordered in order to meet these prerequisites are demonstrated. T. R 6

2240: Harris, J.D. & Rawnsley, Anita I. THE LOCUS OF SHORT DURATION AUDITORY FATIGUE OR 'ADAPTATION'. *J. exp. Psychol.*, Dec. 1953, 46(6), 457-461. (USN Medical Research Lab., New London, Conn.).

Auditory adaptation, defined as a reversible shift in threshold following very mild acoustic stimulation, was distinguished from true auditory fatigue by 4 criteria, one of which was the shape of the curve of recruitment. This experiment sought to throw light upon where in the auditory system, adaptation occurs. By the technique of simultaneous binaural loudness balancing between one normal ear and another ear undergoing a threshold shift as a result of a preceding adapting stimulus, it was possible to demonstrate an accelerated growth of loudness (recruitment) in the adapted ear. The intimate temporal relation between adaptation and recruitment, the latter distinctly allied to the organ of Corti, was thought to point to the peripheral organ, not the nervous system, as the site of the recently discovered phenomenon of auditory adaptation. R 24

Ludvig, E. PERCEPTION OF CONTOUR: I. INTRODUCTION. Contract Nonr-586(00), Proj. NR-142 023, Proj. NM 001 075.01.04, Rep. 4, Aug. 1953, 9pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

2242

To investigate the nature of the retinal stimulus effective in producing perception of edge (contour), two observers positioned a central fiducial dot over any observed edge on the stimulus (irregular white figure on black disc, rotating at rates above flicker fusion, illuminated by rectangular pattern of projected light of varied energy values). A method is described for computing the distal stimulus which, under the conditions of observation, results in desired proximal or retinal stimulus. The data are presented as units of relative retinal energy with respect to retinal distance. Theoretical considerations are discussed. T. G: I. R 18

2243
Ludwig, E. PERCEPTION OF CONTOUR: II. EFFECT OF RATE OF CHANGE OF RETINAL INTENSITY GRADIENT. Contract N70NR 316(00), Proj. NR 142 02, & Proj. NR 001 075.01.05, Sep. 5, Aug. 1953, 9pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

2243
This is one of a series of investigations into the nature of the retinal stimulus effective in producing the perception of an edge under certain simple conditions of photopic vision. A method is briefly described by means of which a distal stimulus is computed which, under the conditions of observation, will result in the desired or retinal stimulus. The observer can project a small fiducial dot of light onto the distal stimulus to indicate where an edge, break, contour, or discontinuity appears. Data from two observers are presented on the effect of rate of change of the retinal intensity gradient on contour perception.

Gagne, R.M. & Foster, Harriet. A STUDY OF TRANSFER IN A MOTOR TASK WITH VARYING DISPLAY-CONTROL RELATIONSHIPS. Contract N70NR 316, Proj. 20 M 1A, Rep. 316 12, April 1948, 29pp. USN Special Devices Center, Port Washington, N.Y. (Connecticut College, New London, Conn. & USN Medical Research Lab., New London Submarine Base, Conn.)

2248
This is a study of transfer of training in a visual-motor task as a function of changes in display-control relationships. About 120 Navy enlisted men were trained to move a lever in accordance with data contained in one quadrant of a circular dial. Then they were required to respond to the display in a different quadrant, with consequent change in the display-control relationship. Ss had knowledge of results. Results in terms of total time to complete correct movement in each trial, are discussed regarding inherent difficulty and transfer.

Deese, J. & Bowen, H.M. THE EFFECT OF TASK-INDUCED STRESS ON CODE LEARNING: PROVISIONAL REPORT. 166-1-121, Dec. 1950, 13pp. Psychological Lab., Johns Hopkins University, Baltimore, Md.

This experiment was designed to study the effects of stress induced by rapid pacing upon the learning of symbols from the International Morse Code by the method of anticipation. The stress was induced during the first test by presenting the symbols to the 72 Ss at a rate of one per 2 secs. A practice session followed, after which all Ss were given a test with the signals delivered at the rate of 1 per 2 secs. The effect of the rapid pacing was to impair performance, as measured in the number of signals guessed correctly. The degree of impairment appears to interact with the level of difficulty of the material. On the final test, however, there is no evidence of impairment due to stress during the first test. Actually there is a slight facilitating effect, significant at about the 5% level. A practice session intervened between these 2 tests, and it is suggested that the practice at the faster rate better prepared the Ss to cope with it on the final test. Thus, despite the impairing effects of the speed-stress, it does not impair and seems to facilitate Ss in subsequent performance at that speed.

Andrews, B.G., Green, R.F. & Spragg, S.D.S. FACILITATION EFFECTS BETWEEN FOLLOWING AND COMPENSATORY TRACKING TASKS. Contract NCOMR 241, SDC TR 241 6 7, Aug. 1952, 8pp. USN Special Devices Center, Port Washington, N.Y. (University of Rochester, Rochester, N.Y.).

2269

To study transfer effects between following and compensatory types of tracking, 92 young men in military service had eight trials of one type of tracking, then changed for eight trials of the other. Tasks were the SAM Two-Hand Coordination Test (following) and the SAM Two-Hand Pursuit Test (compensatory). Starting task was different for each half of the subject group. Display-control relationships were also varied between "natural" and "unnatural." Mean time on target is plotted for each trial for the various conditions. Results are discussed in terms of facilitation relationships between the two types of tracking and effects of display-control relationship.

U.S. Dept. of Commerce. SYMPOSIUM ON ELECTRONICS MAINTENANCE. PPT 202/4, 3-5, Aug. 1955, 214pp. U.S. Department of Commerce, Advisory Panel on Personnel & Training Research, Office of the Assistant Secretary of Defense Research & Development, Washington, D.C.

2276

This book is a collection of papers presented at a symposium on electronics maintenance attended by representatives of each of the Armed Services. Five principal topics are in 18 papers: job analysis, selection and classification of personnel, proficiency measurement, training, and group organization. Most of the papers are reviews of the literature and discussions of current progress; those on proficiency measurement report specific data.

Reed, J.B. THE SPEED AND ACCURACY OF DISCRIMINATING DIFFERENCES IN SINGLE AND COMPOUND ASPECTS OF VISION. Contract NMR 131(01), SDC Human Engng. Rep. 131 1 4, Sept. 1952, 26pp. USN Special Devices Center, Port Washington, N.Y. (Psychophysical Research Unit, Mount Holyoke College, South Hadley, Mass.).

2280

To determine the speed and accuracy of discriminating symbols as a function of single or compound visual aspects, a first experiment required subjects to sort 12 packs of 64 cards (each having a symbol exhibiting one of two areas, hues, shapes, and brightnesses) on the basis of each of the six possible compounds. A second experiment required sorting on the basis of only one compound or of only one aspect. Group average sorting time per card and percentage error were calculated for each condition and analyzed with respect to the visual code used. Practice effects are noted.

Kantz, J.E., & Sleight, R.B. LEGIBILITY OF NUMERALS: THE OPTIMAL RATIO OF HEIGHT TO WIDTH OF STROKE. *Am. J. Psychol.*, 1950, 63, 567-575. Contract NS-ORI-186, Proj. Designation NR 784-001, Rep. 166-1-106. ONR, Special Device Center, Johns Hopkins Univ. and Purdue Univ.

2282

To investigate some factors influencing the legibility of numerals, the maximal distance at which 14 subjects could read a series of numerals was determined. Variables were: midstroke height measurement for height/width ratios (six steps from 3.5/1 to 6.5/1), brightnesses (3, 10, 21 foot candles), contrast direction (black on white or reverse), and the ten digit forms. The data are evaluated by analysis of variance technique for the effect of the different variables. Specific numeral legibility is further analyzed by rank order. Discussion relates these data to findings from previous experiments. T.G.I.R.10.

Carnap, R. & Bar-Hillel, Y. AN OUTLINE OF A THEORY OF SEMANTIC INFORMATION. *Tech. Rep. 247*, Oct. 1952, 49pp. Research Lab. of Electronics, Massachusetts Institute of Technology. (University of Chicago).

2286

In distinction to current Theory of Communication that treats amount of information as a measure of the statistical rarity of a message, a Theory of Semantic Information is outlined, in which the concept of information carried by a sentence within a given language system is treated as synonymous with the content of this sentence, normalized in a certain way. The concept of amount of semantic information is explicated by various measures of this content, all based on logical probability functions ranging over the contents. Various estimate functions of amount of information are investigated leading to generalized semantic correlates of the concepts and theorems of current communication theory. Research applications are suggested. R 5

2291
Henry, F.H. DISCRIMINATION OF THE DURATION OF A SOUND. *J. exp. Psychol.*, Dec. 1948, 38 (6), 734-743. (University of California, Berkeley, Calif.).

Listeners for discrimination of the duration of a sound ranging from 32 to 480 msec. were determined for 11 Ss. Stimulus intensity was varied from 20 to 80 db; pitch was varied from 125 to 2000 cycles. Somewhat more than 20,000 individual judgments were obtained. The average S could discriminate approximately 14% change in the duration of a 500 cycle tone of moderate intensity. Discrimination was only about half this good for the shortest duration studied; it was also poorer for faint sounds and low-pitched sounds. The effects of stimulus alteration were consistent with a theory that presumes an integration of stimulus intensity with respect to duration. Perception of differences in the duration of sound stimuli shorter than a half-second can be considered as fundamentally a discrimination of intensity differences. R 14

Camp, R.T., Jr., Tolhurst, G.C. & Morill, S.M. THE INTELLIGIBILITY CHARACTERISTICS OF EARPHONES AND SMALL LOUSPEAKERS IN THE MARK II, MODEL O FULL PRESSURE SUIT HELMET UNDER VARIOUS ALTITUDE, PRESSURE, AND VENTILATION CONDITIONS. *Spec. Rep. 5614*, June 1958, 15pp. USN School of Aviation Medicine, Naval Air Station, Fla.

2293

To investigate the feasibility of replacing the earphones in a full pressure suit helmet (Mark II, Model O) with a loudspeaker system, intelligibility tests were performed on two types of transducers installed in the helmet. The tests were performed under various altitude, pressure and ventilation conditions on a trained observer wearing the full pressure suit and helmet. Speech levels, at which intelligibility thresholds for spondee words were obtained, were analyzed for both transducers under the various conditions. Other measurements taken were: level at which system starts distorting, sound pressure level of external ambient noise which results in an increase to noise level at ear, and the power rating of the amplifier driving the transducers. Mason, H.M. STUDIES IN SPEECH INTELLIGIBILITY: A PROGRAM OF WAR-TIME RESEARCH. THE EFFECT OF VERY LOUD SPEECH SIGNALS UPON INTELLIGIBILITY. *Speech Monographs*, 1946, XIII (2), 19-23. (Purdue University, Lafayette, Ind.).

To determine the effect of very loud speech signals upon intelligibility, four groups of listeners were presented with phonograph records containing mixtures of speech and noise at various levels of signal strength. The results were presented and discussed in terms of the relative intelligibility at various signal levels. The article also presented summaries of other studies pertinent to this problem. Cf. 2649, 2302, 2303, 2304, 2305.

McKinsey, J.C.C. "BEST" STRATEGIES. *Res. Memo 286*, April 1950, 7pp. USAF, The Rand Corporation, 1700 Main Street, Santa Monica, Calif.

This paper considers special strategies, called "best" strategies, which have the special feature that, in addition to being optimum in the usual sense, they take advantage of the mistakes of one's opponent. It is shown here that in the case of finite games such best strategies always exist. Further, it can be shown that every strategy which is not best is dominated by a best strategy. R 0

Mason, H.M. STUDIES IN SPEECH INTELLIGIBILITY: A PROGRAM OF WAR-TIME RESEARCH. IMPROVEMENT OF LISTENER PERFORMANCE IN NOISE. *Speech Monogr.*, 1946, XIII(2), 41-46. (Purdue University, Lafayette, Ind.).

To determine whether training in Air Force communication courses improves proficiency in speaking or in listening, and to what extent this improvement is due to familiarization with test materials, 155 Air Force cadets underwent three kinds of training in communicating above airplane-type noise: 1) articulation tests with knowledge of results; 2) tests with the same voices as on pre- and post-tests; 3) tests with the same words as on pre- and post-tests. Articulation scores on the post-test are compared with those obtained by a control group that underwent no training. The relative effectiveness of handheld and throat microphones was also compared. Cf. 2649, 2300, 2302, 2304, 2305.

Boynton, R.M., & Bush, W.R. LABORATORY STUDIES PERTAINING TO VISUAL AIR RECONNAISSANCE. Contract AF 33(616)-2565, Proj. 7157, Tech. Rep. 55-304, Part 1, Sept. 1955, 41pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio. (University of Rochester).

2307

This report deals with the first stages of a research program investigating problems of visual air reconnaissance. A preliminary investigation of the recognizability of various shaped figures as a function of brightness contrast and distance yielded 46 figures (rectilinear and curvilinear) for use in a study of factors in target recognition. Rectilinear figures, placed among an array of curvilinear forms (16, 32 or 64), were presented to nine subjects at distances from 20 to 60 feet, for exposure times of 3 to 24 seconds, at 75 millilamberts illumination and 100 percent contrast conditions. Percent correct responses were analyzed as functions of exposure time, number of forms, and distance. The effects of figure density, figure cluster, and learning were evaluated. T. O. I. R 5

2308

Kelly, K.L. & Judd, Deane B. THE ISCC-NBS METHOD OF DESIGNATING COLORS AND A DICTIONARY OF COLOR NAMES. NBS Circular 553, Nov. 1955, 158pp. U.S. Dept. of Commerce, National Bureau of Standards, Washington, D.C.

2308

This dictionary of color terms was compiled to assist the scientist, businessman, and layman to understand the different color vocabularies used in the fields of art, science, and industry. It records over 7500 individual color names in a manner that enables one to translate from one color vocabulary to another. A requirement of the method of designating colors outlined by the Inter-Society Color Council developed at the National Bureau of Standards is used. All notations were determined under conditions of average daylight illumination and normal viewing and are applied to all opaque, clear, cloudy, or fluorescent samples whether viewed by reflected or transmitted light and to microscopic structures.

US National Bureau of Standards. SIZE MEASUREMENTS FOR MEN'S WORK TROUSERS. A RECORDED VOLUNTARY STANDARD OF THE TRADE. Commercial Standard 166-50, May 1950, 10pp. US National Bureau of Standards, Department of Commerce, Washington, D.C.

The purpose of this commercial standard is to provide standard methods of measuring and standard minimum measurements for men's work trousers for the guidance of producers, distributors, and users, in order to eliminate confusion resulting from a diversity of measurements and methods, and to provide a uniform basis for guaranteeing full size. The standard covers size designations, methods of measuring, and standard minimum measurements for men's work trousers. It also includes recommendations concerning shrinkage, and a recommended means of identification through labeling work trousers produced in conformity with this standard. The methods and measurements given herein are applicable to finished garments as delivered by the manufacturer.

Mundel, M.E. & Lazarus, I.P. PREDETERMINED TIME STANDARDS IN THE ARMY ORDNANCE CORPS. J. Indust. Engng., Nov. 1954, 13-20.

2315

This paper describes the development and use of pre-determined time standards as a method for approximating the time required to perform manual jobs or the manual parts of jobs. The system was developed by collecting and analyzing a considerable series of time studies of industrial operations in terms of seven basic therbligs. Values are selected from resultant tables to synthesize the time for a job. Some results from the use of the system are presented and discussed.

Mowbray, G.H., Gebhard, J.W., & Byham, C.L. SENSITIVITY TO CHANGES IN THE INTERRUPTION RATE OF WHITE NOISE. J. acoust. Soc. Amer., Jan. 1956, 28, 106-110. Contract NORD 7386, Rep. 366, April 1956. Bureau of Ordnance, U.S. Navy, & Applied Physics Laboratory, Johns Hopkins University.

2316

Difference limens were determined for the discrimination of changes in the frequency of auditory flutter at interruption rates of 1 to 320 ops. The stimuli were presented through binaural earphones at a sensation level of 50 db. The on-off ratio was .5. The method of adjustment (without bracketing) was used to determine the thresholds of four observers. The results are presented in terms of the absolute (Δf) and relative ($\Delta f/f$) difference limens as a function of the frequency. These findings are compared with those of previous investigators, and their relation to the difference limen for pitch is discussed.

Solomon, L.N. RELIABILITY OF THE CONNOTATIVE ASSOCIATION TO PASSIVE SONAR SOUNDS USING A NEW STATISTICAL TEST OF CONSISTENCY. PO 16401, NE 121303 1 (NEL 181), Rep. 443, Nov. 1953. USN Electronics Lab., San Diego, Calif.

2320

This report studies descriptive terms characteristically used in sonar classification, and experimentally evaluates the consistency with which passive sonar sounds may be quantitatively rated on scales defined by polar-opposite adjectives. Sixteen male Ss rated four passive sonar sounds on 50, seven-point scales in a test-retest situation. The reliability of the scale value assigned by each S for each sound scale pair was evaluated statistically by a new consistency test in rating. Recommendations are made for further use of the rating technique, and improvement of classification and training procedures for sonar sound recognition and classification.

2321 Spilth, W., Curtis, J.F., & Webster, J.C. CUES THAT AID LISTENING TO ONE OF TWO SIMULTANEOUS VOICE MESSAGES. Rep. 446, Jan. 1954. 11pp. Nav. Electronics Laboratory, Bureau of Ships, Human Factors Div., San Diego, Calif.

A study was made of the effects of 4 variable listening aids on an operator's ability to answer one of two simultaneous voice messages. The variables considered were: a) horizontal spatial separation of the voice-message sources; b) visual cues in the form of "calling channels" indicator lights; c) frequency spectrum-shaping filters; and d) pull-down facilities for switching a selected channel to an earphone or loudspeaker near one ear. The study showed that when an operator must listen to a voice message which is overlapped by another, masking effect may be minimized by: a) separating the message sources by more than 10° in the horizontal plane; b) placing filters in the most-used circuits so that the aural frequency spectra passed by the circuits do not overlap more than is necessary to produce intelligible speech; c) employing jewel lights to indicate the channel calling, when channel identification is a major problem; and d) providing pull-down facilities for optional use by the operator.

2322 White, C.T. DESIGN OF A COLOR-MATCHING DOSIMETER. Rep. 451, Nov. 1953. 5pp. Nav. Electronics Lab., Bureau of Ships Lab., Human Factors Div., San Diego, Calif.

2322 To design a step-matching dosimeter for atomic radiation compatible with human visual capabilities, the self-indicating, color-matching dosimeters of the IN-56 (XN3)/PD type were evaluated. Changes in the color-matching procedures were designed to make the dosimeter suitable for tactical screening purposes, but not for accurate quantitative readings. The new design was evaluated by both field and laboratory tests. Recommendations and instructions for use are included.

2325 Harper, W.R. A RECOMMENDED DESIGN FOR A COMMUNICATOR'S DESK AND CHAIR. DRML Proj. 59, Rep. 59-5, H.R. 106, April 1955. 29pp. Defence Medical Research Labs., Defence Research Board, Toronto, Ontario, Canada.

2325 A review of the pertinent literature along with a survey of user's evaluations provided the basis for the author's assessment of an existing communicator's desk and chair. The primary aspects of such equipment, e.g., working areas, storage capacities, comfort, and so forth, are considered and a recommended design proposed to meet the requirements noted by users. Prototypes of the proposed equipment were constructed. Photographs of existing and proposed equipment are presented to illustrate the advantages of the proposed design.

2326 Held, R. SHIFTS IN PINAURAL LOCALIZATION AFTER PROLONGED EXPOSURES TO ATYPICAL COMBINATIONS OF STIMULI. AMST. J. Psychol., Dec. 1955, 58, 528-548. Contract N0001-70, Proj. NR 142-201, Rep. FNR-141. ONR & Harvard University, Psycho-Acoustic Lab. (Brandeis University).

2326 To study the role of experience in the ability to localize sound in space, two experiments were conducted. An electric phonophone, worn by three subjects, displaced the aural axis by 22° around vertical axis of head. Measurements of direction finding were made before and after seven hours of exposure to a normal environment. In the second experiment, the conditions of exposure were controlled to produce atypical combinations of stimuli that would accompany the motion of a listener with displaced aural axis. Six subjects went through eight one-hour sessions; direction finding was measured before, during and after each session. The data, angular difference between pre-exposure and post-exposure tests, were analyzed for directional shifts attributable to conditions of exposure. G. I. R 17

2334 US Occupational Analysis Branch. GUIDE FOR ANALYZING JOBS. ANALYST'S WORKBOOK. April 1950. 40pp. US Occupational Analysis Branch, Department of Labor, Washington, D.C.

This handbook contains, in outline form, the basic concepts of job analysis as conducted by the Employment Service. The first of 3 sections covers the information required for a clear, coherent picture of the work done. The second section deals with the skill involved. The factors discussed are: responsibility, job knowledge, mental application, and dexterity and accuracy. The third section is devoted to worker, physical, and training requirements of primary interest in placement work. Included are considerations selected to guide the analyst in the type of information which should be obtained in the course of the analysis. (HEIAS)

2335 Bartlett, F. RADAR DISPLAY RESEARCH AT THE RAF RADAR RESEARCH UNIT. FFRC 801. Aug. 1952. 4pp. Psychological Lab., Flying Personnel Research Committee, Cambridge, England.

2335 This report presents an analytical discussion (from the vantage point of several years research on radar displays) of the merits of approaching the problem of ascertaining the psychological factors involved in radar reading performance by two methods: 1) the use of a prototype or actual complex display, and 2) the use of a "reduced" or controlled display situation which can be advanced to a more fully realistic display step by step. Experimental results from both methods are used to illustrate the analysis.

2337 Poulton, E.C. TWO CHANNEL LISTENING. A.P.U. 166/53, 48. Aug. 1953. 7pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

3 experiments were conducted using 16 different is in each. Selecting information from 2 simultaneous sources of speech was evaluated in terms of omissions, in which 3 was generally unware) and mishearings, which were distributed independently. When relevant information was surrounded by irrelevant on the same channel, omissions exceeded mishearings. When it was surrounded by simultaneous irrelevant information on the other channel, mishearings predominated. Instructions to listen to both sources (distributed attention) gave more omissions than instructions to listen to one of them (restricted attention). This in turn gave more than instructions as to when and to what to listen (directed attention). Mishearings were independent of these instructions. Placing the speakers together increased both omissions and mishearings. Similarity of relevant material to irrelevant increased omissions; it also increased false selections, especially with the speakers together. When only one or neither source presented information continuously, omissions and mishearings were reduced, and none of these differences was significant. The results were discussed in terms of inattention and physical interference.

2341 USA Department of the Army. A GUIDE TO THE COMPILATION AND REVISION OF MAPS. Tech. Memo. 5 240, Sept. 1955, 167pp. USA Department of the Army, Washington, D.C.

2341 This manual provides a text on the techniques of map compilation and drafting for army personnel engaged in such activities. Topics covered include map projections and grids; the compilation and revision of maps from aerial photographs or map manuscripts; the preparation of mosaics, annotated photographs, hasty maps, and other map substitutes. A glossary of terms and definitions is included.

T. I. R 79

2343 Iock, R.N. THE PERCEPTION OF ELABORATION OF STEREO-SCOPIC PRESENTATIONS. Contract N6 ONR 27014, April 1955, 22pp. Princeton University.

2343 This study was designed to explore the perceptual processing of presentations consisting of exposures rapidly succeeding each other in time. Two viewing units allowed for the presentation of figures up to 18 squares of light and provided facilities for the introduction of figural content into the squares. Eight subjects were used; observation was free; observers were instructed to report what they saw and were questioned about unreported configurational aspects. The conditions were classified broadly as 1) basic three-square presentations, 2) figure-ground, and 3) sequence formation. The results are discussed under these headings.

T. R 36

2345 Flanagan, J.C., Lange, C., O'Hagan, Anne & Weisiegel, Mary. CRITICAL REQUIREMENTS FOR RESEARCH PERSONNEL A STUDY OF OBSERVED BEHAVIORS OF PERSONNEL IN RESEARCH LABORATORIES. March 1949, 66pp. American Institute for Research, Pittsburgh, Penn.

2345 The objective of this study was the identification and definition of the characteristics of effective scientific personnel and the development of a practical procedure for evaluating their success in carrying out their duties. Data were collected by means of the Critical Incident Technique. Descriptions were obtained of actual incidents of behavior that were deemed to be particularly effective or ineffective in performance of the job. A large and representative sample of 500 research workers supplied more than 2500 such incidents. A list of critical requirements was prepared from the incidents, using an inductive process. Giving a minimum of inference and judgment on the part of the investigators. An analytical study was made to check its applicability to workers in several fields.

2350 Biel, W.C. & Brown, G.E., Jr. ESTIMATION OF AIRPLANE SPEED AND ANGLE OF APPROACH. FINAL REPORT. Contract N6ORI 189, Proj. NR 143-131, March 1949, 129pp. Denison University, Granville, Ohio. (USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio & Eastern Washington College of Education, Cheney, Wash.).

2350 To determine the accuracy with which observers can estimate airplane speed and angle of approach, twenty commissioned officers recorded their individual estimates for airplanes flown on straight and level courses which varied in speed, direction, altitude, and "minimum slant range" on different approaches. In addition, a series of speed estimations were made with knowledge of actual speeds given immediately after judgments, in an effort to improve such judgments. Statistical analyses of the data are made and the practical implications for gunnery training are discussed.

King, H.G. (Chm.). AIRCRAFT EMERGENCY EVACUATION. A METHOD FOR EVALUATING DEVICES, PROCEDURES, AND EXIT PROVISIONS. CAA Office of Aviation Safety, Department of Commerce, Washington, D.C. (CAA-CAS Subcommittee Working Group, Washington, D.C.).

2353

To develop a standard method of evaluating emergency escape devices, procedures, and exit designs for commercial and military aircraft and to compile descriptive and quantitative data sufficient to provide a basis for acceptance of new devices and procedures, a frame-by-frame analysis of high-speed motion picture records of simulated emergency evacuations was made. Untrained subjects were tested on several escape devices that are carried by civil air transport and military planes. I. I.

2357

Ford, A., & Getz, M.H. THE PERSPECTIVE ILLUSION IN RADAR SCOPE SCOPES. Contract W 28-099-ac-130, Tech. Rep. 1. June 1948. 12pp. USAF, Air Materiel Command, Watson Lab., Red Bank, N.J. (Lehigh U., Dept. of Psychol.).

2357

To investigate methods for overcoming the perspective illusion on GCA radar scopes (tendency to overestimate space at apex of sector scan and underestimate at open end when reading signal deflections above or below glide line), both artificially-drawn scope pictures and simulator presentation of photographic records from real GCA scopes taken at a landing field were used. Methods studied: (1) 100-foot reference lines on each side of glide path, (2) multiple lines every 25 feet with the 100-foot line heavier. Statistical analysis of error and time scores was made in terms of the methods, effects of training, and individual differences of observers. I. I.

2358

Ford, A., & Getz, M.H. TYPES OF ERRORS IN THE READING OF GCA SCALED SCOPES. Contract W 28-099-ac-130, Tech. Rep. 4. Aug. 1948. 18pp. USAF, Air Materiel Command, Watson Lab., Red Bank, N.J. (Lehigh U., Dept. of Psychol.).

2358

To investigate causes of error in reading elevation of GCA (Ground Control Approach) radar scope with reference to a coordinate scaling system (multiple set of horizontal parallel lines on either side of glide path with vertical range lines), 34 subjects made 9501 readings. Problems were artificially drawn scope pictures projected on screen or ultra-violet simulator projection of photographic history of plane approaches. Error data are analyzed and classified according to cause. Discussion relates errors to problems of scope scaling. T.G.I.R.2.

2359

Ford, A. PHOTOGRAPHIC SIMULATION FROM FIELD RADAR SCOPES. Contract W 28-099 AC 130, Tech. Rep. 2, June 1948, 26pp. USAF Air Materiel Command, Red Bank, N.J. (Lehigh University, Bethlehem, Penn.).

2359

This report reviews the development of a simulator for Ground Control Approach (GCA) radar for use in studying visual display problems of the instrument and for training purposes. Characteristics of good simulators are reviewed, with critical examination of various radar simulators. A detailed description of the camera used to make photographic sequences of field runs, and of the ultra-violet projection simulator is given. Optical problems of projection are reviewed. I.

Eckstrand, G.A. CUE ATTENTION HABITS AS A FACTOR IN TRAINING. Contract AF 33(036) 154 74, USAF TR 6944, Aug. 1951, 12pp. USAF Area Medical Lab., Wright-Patterson AFB, Ohio.

2361

To investigate the importance of previously learned cue attention habits on later learning, three groups of 40 Se performed a series of tasks involving associating four response keys with four colored forms. Pretraining involved one of three conditions for each group: color, the relevant cue, form the relevant cue, both cues relevant. Standard training followed with both cues relevant. Each group was then divided into two subgroups, one tested with color only as a cue, the other with form only. Transfer and interference of earlier cue attention habits are deduced from number of trials required to learn test tasks. I. I. R 6

US Air Force-Navy-Civil Aircraft Design Criteria Subcommittee. CLIMATIC AND ENVIRONMENTAL CRITERIA FOR AIRCRAFT DESIGN. AMC 22, June 1952, 65pp. US Air Force-Navy-Civil Aircraft Design Criteria Subcommittee, Munitions Board Aircraft Committee, Washington, D.C.

2367

This document presents a summary of information pertinent to the climatic and environmental factors to be considered in the design of aircraft. The information is presented under four major divisions: material composition of the atmosphere (e.g., snow, fog, frost, etc.), dynamic forces in the atmosphere (e.g., wind, lightning, etc.), solar influences in the atmosphere (e.g., radiation, temperature extremes, etc.), and factors dependent on atmospheric conditions for existence (e.g., biological agents, insects, etc.). Ample references and illustrations are included. T.G. I. R many

2368
Baker, A.W., Hughes, J.P. & Hinds, S., Jr. TRAINING AND REFERENCE MANUAL FOR JOB ANALYSIS. June 1944, 103pp. US Occupational Analysis and Industrial Services Div., Department of Labor, Washington, D.C.

The manual contains the principles and practices of job analysis which have proved their soundness in actual operations. In the first section, the general and specific applications of job analysis are discussed. Methods of analysis are discussed next. While presented through the medium of the job analysis schedule, the methods are sufficiently universal in application to form the basis for any job analysis program. Information supplementing the analysis schedules is discussed in a narrative report, and verification of analyses in the next 2 chapters. Job specifications and their relation to the work of the analyst are discussed. The last chapter provides those who study job analysis for the first time with an organized approach to their study. (NEIAS)

Fryer, D.H. SOURCE BOOK ON THE APPLICATION OF RESEARCH TO GROUND TRAINING IN AVIATION. PSYCHOLOGICAL STUDIES OF TRAINING TECHNIQUES. Contract WTCMR 383, Proj. NR 782 002, SDC Proj. 20 E 6, Tech. Rep. SDC 383-1-11 & RSH Prt., 126, May 1949, 79pp. USN Special Devices Center, Fort Washington, N.Y. (Richardson, Bellows, Henry & Co., Inc., New York, N.Y.).

2370

This is a survey of literature on training research and the application of results to ground aviation training. Topics include study skills, curriculum, proficiency evaluation, validation of training procedures, student attrition, mass training, instructor training, training in perceptual ability (vision and speech-hearing), aircraft recognition training, kinesthetic (actor) training, and audio-visual aids.

Atkinson, C.J. FOUR STUDIES ON SIDETONE. Contract DA 36 039 SC 42562, Suppl. Rep. 5, Oct. 1954, 32pp. State University of Iowa, Iowa City, Iowa.

2373

Four studies on the effects of sidetone are reported. The following topics are included: adaptation to delayed sidetone; effects on intelligibility of changes in sidetone delay and sidetone level; effects of various listening conditions on the sound pressure and duration of speech; effect on intelligibility of changes in the phase, spectrum, and level of the sidetone of the talker. The results from each study are analyzed statistically.

Bellows, R.M. & Smode, A.F. A SURVEY OF ON-THE-JOB TRAINING PROCEDURES IN THE AIR DEFENSE COMMAND. AFRCRL TR 54 2, Jan. 1954, 44pp. USAF Human Factors Operations Research Lab., Bolling AFB, Washington, D.C.

2378

In a study of on-the-job training procedures in the Air Defense Command, 20 Fight-Interceptor and Aircraft Control and Warning units were visited at 13 installations. On the basis of interviews with personnel and administration of OJT check lists, existing inadequacies are determined and various recommendations for the improvement of the training program are made. These recommendations pertain to, e.g., training methods, training materials, proficiency measurement devices; and instructional personnel.

2379

Tufts University, Medford, Mass. APPLICATION OF ELECTROPHYSIOLOGICAL TECHNIQUES TO HUMAN PERFORMANCE. THE READING ASSESSOR - THE ALERTNESS INDICATOR. (PSYCHOLOGICAL STUDIES OF TRAINING TECHNIQUES). Contract NSCRI 58, Proj. NR 782 003, SDC Proj. 20 C 2 & 3, SDC TR 58 2 11, April 1950, 47pp. USN Special Devices Center, Fort Washington, N.Y.

2379

This report presents an historical summary of the research conducted in the development and application of the Reading Assessor and the Alertness Indicator. Previously unreported data on the Reading Assessor and Alertness Indicator projects is presented and includes the following: a study of reading comprehension in which instructions were written and subjects' responses consisted of manipulating dials, levers, etc., (the "baseball game test"); an analysis of responses recorded by the Alertness Indicator and reflecting the occurrence of unalertness; the results of field tests with the portable Alertness Indicator; etc.

Moser, H.M. & Dreher, J.J. N-V ALTERNATE WORD INVESTIGATION. Contract AF18(600)316, Budget Sequence P670 122, AFRCRL TR 54 83 EF Proj. 519, Rep. 13, Sept. 1954, 22pp. Ohio State University Research Foundation.

2384

This report describes an investigation of alphabet words suitable for use for letters N and V. The present words (NECTAR-VICTOR) in the ICAO alphabet are frequently confused, accordingly several proposed alternates were given preliminary tests. Intelligibility testing of NOTAM, VAMPIRE, NECTAR, and VICTOR was conducted using both American and foreign speakers with a panel of trained listeners. Articulation and confusion scores were analyzed for all combinations. Field tests at steadily increasing noise levels were also made. Finally, further tests of N-V alternates were conducted. Recommendations are included.

2385

Moser, H.M., & Dreher, J.J. PHONEMIC CONFUSION VECTORS. Contract AF 18-600-316, Proj. 519, Rep. 14, AFRCRL TR-54-84, Sept. 1954, 18pp. Research Foundation, Ohio State University.

2385

This paper presents some first steps in evaluating the extent and nature of listener phoneme-confusion in dealing with small word ensembles. The standard and modified ICAO alphabet and the digits were evaluated by presenting to trained subjects (both foreign and American) a series of randomly varied three-letter code groups to which they responded by writing the appropriate letter. Analysis of the confusions led to a three-category division based on the vowel triangle. Further analysis between and within phoneme categories was made in an effort to show that confusions of words occur in consistent, predictable ways.

2386

Moser, H.M., Dreher, J.J., Patterson, R.E., & Adler, S. SENTENCE FORM AND INTELLIGIBILITY. (FLIGHT TRAFFIC INSTRUCTIONS). Contract AF 18(600)-316, Proj. 519, Rep. 15, AFRCRL TR-54-85, Sept. 1954, 24pp. Research Foundation, Ohio State University.

2386

To compare the efficiency of flight traffic instructions delivered in complete sentence form and in abbreviated form (telegraphese), two forms of a "typical" script were constructed routing five aircraft through a complete cycle of take-off, traffic and landing. Messages were based on analyses of actual control tower talk. Ten speakers (five nationalities) recorded each form of the "script"; listeners (300 Americans) heard the playback with light white noise masking (-5 decibel signal-to-noise ratio). Each listener was assigned two aircraft call numbers, one for each form of the script, and responded by writing the appropriate information on answer sheets. Intelligibility scores (percent correct) were studied by analysis of variance techniques for differences due to language and to speakers. T. R 3

Crook, H.W., Hanson, J.A. & Weisz, A.
**LEGIBILITY OF TYPE AS A FUNCTION OF STROKE
WIDTH, LETTER WIDTH, AND LETTER SPACING
UNDER LOW ILLUMINATION.** Contracts AF W33-
038-aa-14856 and 33(616)-3018, WADC Tech.
Rep. 33-440, March 1954, 34pp. WADC, AFMPC,
Wright-Patterson AFB, Dayton, Ohio. (Tufts
College).

2389
To investigate factors affecting legibility (recognition of individual letters) of small type, 12 Ss performed on a letter crossout task and an oral reading task under low (red) and high illumination. Experimental type (capital and lower case) approximating six-point Gothic style were used to prepare materials varying in letter width, stroke width, and letter spacing. The data (speed and accuracy scores) are analyzed in terms of illumination and typographical variables. Application of the results to problems in the design of aeronautical charts and checklists is discussed.

Moser, H.M. & Dreher, J.J. **NUMBER TELLING AND DIGIT
PRONUNCIATION.** Contract AF 18(600) 306, RF Proj. 519,
Rep. 7, Feb. 1954, 12pp. Ohio State University Research
Foundation, Columbus, Ohio.

2394
The first part of this study concerns the effectiveness of group and individual number-telling for two-digit numbers. Foreign and American panels were used and speakers comprised many nationalities. Results include comparisons of the methods and panels, effect of masking, and type of mistakes. The second part of the study compares the effectiveness of standard number pronunciation with the recommended variant pronunciation for the digits 3, 5, and 9. Listeners were American; speakers represented several nationalities. Results are expressed in terms of relative errors for each method.

2399
VanderWeer, A.W. **REPORT ON A 16MM MOTION PICTURE PRODUCTION CONFERENCE, 1948. INCIDENTAL REPORT.** Rep. 1, May 1949, 9pp. Instructional Film Research Program, Pennsylvania State College, State College, Penn.

2399
This is a report on the proceedings of the Calvin Company's annual workshop on 16mm. film production. Topics include: trends in the 16mm. industry, production speed, script writing, titles, animation, color films, editing, lighting, television, optical effects, music, sound, and the motion picture laboratory. No experimental data reported.

2403
Radio Corporation of America. **STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS.** Contract DA36-039 SC 64469, Rep. 3, Feb.-April 1955, 11pp. Radio Corporation of America, Camden, N.J.

2403
This is a progress report on a research contract to provide design information leading to significant improvements in Signal Corps voice communication systems used in high-level noise environments encountered in many armored vehicles and helicopters. Included in this report are: 1) a brief description of noise measurements and magnetic recordings of noise made in 15 vehicles with one complete set of data on the M-41 tank. 2) measurements of the characteristics of the interphone amplifier of the AM/VRC-7 and of the response of M-63-U headsets on a six cc coupler (standard Signal Corps equipment). Real-voice measurements are in progress.

2407
Cornell, F.G., Demarin, Dora E., Saupe, J.L. & Crowder, M.A. **PROFICIENCY OF Q-24 RADAR MECHANICS: III. THE TAB TEST-A GROUP TEST OF TROUBLE-SHOOTING PROFICIENCY.** Contract AF 33(038) 13236, Proj. 7709, Task 7715, AFMPC TR 54 52, Nov. 1954, 28pp. USAF Personnel and Training Research Center, Lackland AFB, Tex.

2407
This is one of a series of studies concerned with the evaluation of the proficiency of Q-24 Radar Mechanics (see 2404, 6289, 6290). Specifically it deals with the development of the Tab Test, a device designed to measure trouble-shooting ability by requiring solutions to problems of the sort actually experienced in trouble-shooting electronic equipment. Scoring methods, reliability data, and potential applications of this test are discussed in detail.

Greiner, T. **THE EFFECT OF A VASOCONSTRICTOR, METARAMINOL, ON HUMAN TOLERANCE TO ACCELERATION.** Proj. 7216-71712, WADC Tech. Rep. 56-575, Nov. 1956, 6pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio.

2409
To investigate the effect of drugs in producing tolerance to accelerative forces such as are met in combat flight conditions, positive head-to-foot acceleration was applied to eight trained subjects seated in the Air Force Human Centrifuge sufficient to extinguish central vision (blackout threshold). Two patterns of acceleration (rapid onset and gradual onset), anti-blackout suits (used only on three subjects), and the administration of metaraminol (one milligram per kilogram body weight) or a placebo were the conditions used for two test sessions. Blackout thresholds were plotted to show the degree of protection afforded by the drug, protective suit and gradual onset of acceleration.

Zwislocki, J. DESIGN AND TESTING OF EAR MUFFS. J. Acoust. Soc. Amer., Nov. 1955, 27(6), 1154-1163. (Psycho-Acoustic Lab., ORA, Harvard University, Cambridge, Mass.). (Rep. PMR 177)

Factors controlling the sound attenuation provided by earmuffs are analyzed on an upper limit is estimated of the attenuation that can be expected from simple earmuffs without sacrificing comfort. Further discussion concerns the best dimensions of the earmuff and what can be achieved by adding one or more Helmholtz resonators. The sound attenuation provided by 2 different earmuffs was determined on 8 Ss in 3 sessions with a Bekesy audiometer. The experimental procedure is described in detail and the results are analyzed statistically. Special attention has been paid to the changes in the listener's threshold of audibility with increasing experience.

2412
Stevens, S.S. THE MEASUREMENT OF LOUDNESS. J. Acoust. Soc. Amer., Sept. 1955, 27(5), 815-829. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

This paper reviews the available evidence (published and unpublished) on the relation between loudness and stimulus intensity. The evidence suggests that for the typical listener the loudness L of a 1000-cycle tone can be approximated by a power function of intensity I , of which the exponent is $\log 2$. The equation is: $L = kI^{0.3}$. Intensity here is assumed to be proportional to the square of the sound pressure. In terms of sones, where 1 sone is the loudness produced by a tone at 40 db above the standard reference level, the equation for loudness L as a function of the number of decibels N becomes: $\log L = 0.03N - 1.2$. Otherwise said, a loudness ratio of 2:1 is produced by a pair of stimuli that differ by 10db, and this relation appears to hold over the entire range of audible intensities. At low levels of intensity, the loudness of white noise grows more rapidly than the loudness of a 1000-cycle tone, but above the level of approximately 50 db the 2 loudnesses remain more nearly proportional. The suggestion is made that for all levels greater than 50 db the loudness of continuous noises may be calculated from the equation: $\log L = 0.03N + S$, where S is a spectrum parameter to be determined empirically.

Alexander, S.J., Cotzin, M., Klee, J.B. & Wendt, G.R. STUDIES OF MOTION SICKNESS: XVI. THE EFFECTS UPON SICKNESS RATES OF WAVES OF VARIOUS FREQUENCIES BUT IDENTICAL ACCELERATION. J. exp. Psychol., Oct. 1947, 37(5), 440-447. (University of Rochester, Rochester, N.Y.).

Using the vertical accelerator this study was designed to discover how motion sickness rates were affected by wave frequency when the accelerations in the waves were held fixed. 120 Ss were exposed to frequencies of 13, 16, 22, and 32 cycles per min. acceleration was constant at 0.20 g. The respective amplitudes were 9', 5'4", 2'6", and 1'1". The obtained sickness rates were 37, 37, 10, and 7% going from the large slow wave to the small fast one. Corresponding sickness indices were 53, 47, 10, and 7. It is shown that some waves were 20 times as nauseating as others, per unit of energy. (HEIAS)

2414
Gibson, J.J. THE PERCEPTION OF VISUAL SURFACES. Amer. J. Psychol., July 1950, 63, 367-384. (Cornell University, Ithaca, N.Y.). (QMR)

In this paper, the author attempts a verification of hypothetical stimulus-correlates for texture, slant, and distance. 10 Ss made slant judgments of surfaces of upward and downward increase of texture density. It was found that the gradient of density and the property of optical slant are in psychophysical correspondence. The results suggest that the property of surface slant can be assigned a correlate in retinal stimulation and that perhaps other properties of the phenomenal environment can be similarly accounted for when an appropriate psychophysical method has been applied. A tentative list of phenomenal properties is suggested as composing the essential properties of the experience of a determinate surface. (HEIAS)

2417
Hackman, R.C. & Barr, N.L. THE EFFECT OF IPRAL SODIUM UPON LINK TRAINER PERFORMANCE. Proj. NM 001 056.06.03, Dec. 1954 (Vol. 12), 645-668. USN Medical Research Institute, Bethesda, Md.

The effects of 1.5 gr. and 3.0 gr. oral doses of ipral sodium on the psychomotor performance and circulatory physiology of 4 trained Ss were tested. Measures of performance were obtained while Ss flew a standard Baker pattern and solved a succession of radio range problems in the Link trainer. Measures of pulse rate, blood pressure, and critical flicker frequency were obtained before ingestion of ipral sodium or placebo, 25 minutes later, and after Ss had performed in the trainer. It is concluded that: a) The Link trainer as scored is sufficiently sensitive to reflect differences in performance, provided efficient statistical designs are used. b) Both increments and decrements in performance will occur in some Ss following ingestion of ipral sodium, and these will be consistent for a particular S. c) Both increases and decreases in variability of performance will be observed in some Ss following ingestion of ipral sodium, and these will be consistent for a particular S. d) Few, if any, objective physiological effects ascribable to ipral sodium will occur when single doses of 3.0 gr. or less are employed.

Miller, R.B. A METHOD FOR MAN-MACHINE TASK ANALYSIS. Contract AF 33(038) 226 38, WADC TR 53 137, June 1953, 60pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (American Institute for Research, Pittsburgh, Penn.).

2419
"This report describes a systematic procedure for making a task analysis of the operator's job in any man-machine system...." with special reference to analyses for the design and evaluation of training aids. The procedure is described in detail in outline form, with sample formats and a sample analysis given. I.

2420
Miller, R.B. HANDBOOK ON TRAINING AND TRAINING EQUIPMENT DESIGN. Contract AF 33(038) 22638, WADC TR 53 136, June 1953, 339pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (American Institute for Research, Pittsburgh, Penn.).

2420
This handbook assembles and integrates from the literature those principles of learning that are applicable to the design and use of training equipment. Topics include: an overview of human learning, the role of the instructor, the trainer as a demonstrator of principles, the use of knowledge of results, the problem of simulation, the problem of motivation, and preparing the specifications for a training device. G. R 600 (approx.).

2421
Crook, D.J., Hansen, J.A., McBride, Patricia L., & Wulfeck, J.W. A BIBLIOGRAPHY ON DARK ADAPTATION. July 1953. 27pp. Armed Forces-National Research Council Vision Committee Secretariat, Univ. of Mich., Ann Arbor, Mich. (Turk College)

2421
This is a bibliography of literature on dark adaptation. While the basic concern is with effects of exposure variables with emphasis on duration and intensity, other areas are included: theoretical material on course of dark adaptation which includes experimental data, characteristics of the subject which affect adaptation, and methodological studies. R417.

2423
Draeger, G.L. RELATIONSHIPS BETWEEN VOICE VARIABLES AND SPEECH INTELLIGIBILITY IN HIGH LEVEL NOISE. Speech Monographs, Nov. 1951, XVII(4), 1-7.

2423
This study investigates relationships between speech intelligibility in high level noise and several voice variables, such as syllable duration and speech intensity. Eighty-eight male undergraduates were selected on the basis of high or low speech intelligibility and were recorded reading test material under conditions of high level noise. After measurements of the voice variables, the recorded material was played to panels of listeners. Data analysis included comparison between speakers of inferior and superior intelligibility for each voice variable, correlations between all variables, and contribution of each variable to intelligibility. The results were extended to voice communication training. I. R 28

Woodhouse, M.C. LOUDNESS DISCRIMINATION AND THE RATE OF PRESENTATION OF STIMULI. A.P.U. 238/55, Sept. 1955, 13pp. Applied Psychology Research Unit, Medical Research Council, Cambridge, England.

2430
To investigate the effect of rate of presentation of stimuli on differential loudness discrimination, a practiced subject made judgments as to whether the second of each pair of stimuli was louder than the first. The stimuli were presented in quiet, against a background of random noise (from 53 to 70 decibels), and at varied rates (from 7 to 22 presentations per minute). Threshold measurements were determined for thirty untrained subjects with noise level at 60 decibels and at rates of 10 and 22 presentations per minute. Threshold data were analyzed as function of noise level and rate of presentation. An explanation is sought by reference to the literature of threshold phenomena. T. O. R 12

2431
Broadbent, D.E. THE BASS CUTTING OF FREQUENCY TRANSPOSED SPEECH. A.P.U. 223/56, April 1956, 12pp. Applied Psychology Research Unit, Medical Research Council, Cambridge, England.

2431
To study the effect of bass cutting on the intelligibility of frequency transposed speech, such as might be heard over a single side-band system (S.S.B.) with the receiver mistuned, four experiments were performed. Two types of material (phonetically balanced PB, word lists and spoken digits) were used with five degrees of transposition (-300, -200, 0, +200, +300 cycles) and three levels of bass cut (0, 440, 660 cycles per second). The listeners responded under conditions of (1) noise, (2) faint signal, (3) while carrying out a separate visual task requiring concentrated attention, and (4) listening to a restricted vocabulary (digits) and attending the visual task. Percent words heard correctly under these conditions were analyzed for differences attributable to mistuning and bass cutting. T.R 6

2432
Mellison, R. & Carmichael, L. APPARATUS FOR PRODUCING INTERMITTENT AUDIBLE PULSES. *J. exp. Psychol.*, Jan. 1940, 26(1), 129-131.

The apparatus here described makes it possible to control the onset and cessation of the stimulus, thus avoiding 'clicks' and other secondary stimuli sometimes produced by mechanical devices. It can also be used in timing any psychological performance, i.e. as a metronome with a wide frequency range and great adaptability. (MEIAS)

Cloonan, T. EVALUATION OF THE GRID-MAP INTELLIGIBILITY TEST. Contract DA 18-108-CML-4037, June 1955, 18pp. Voice Communication Laboratory, Purdue University.

2433
Poulton, E.C. SIMULTANEOUS AND ALTERNATE LISTENING AND SPEAKING. *J. Acoust. Soc. Amer.*, Nov. 1955, 27, 1204-1207. (Applied Psychology Research Unit, Medical Research Council, Cambridge, England).

2433
To determine the effect on intelligibility of simultaneous listening and speaking, 12 subjects repeated back a message as soon as they heard it. There were no gaps in the message so speaking was done while listening to more of the message. In an alternate condition, the message was repeated back during a 4.0 second pause between word groups. The materials were taken from Basic English, approximately 168 words in length, and presented at rates of 1.5, 2.0, 2.5 and 3.0 words per second. Subjects were given two training sessions. Percentage of words omitted or repeated incorrectly were analyzed as functions of presentation speed and compared for simultaneous and alternate listening and speaking conditions. G. R. 9

Jorger, J.P., & Carhart, R.T. PRELIMINARY REPORT ON A METHOD FOR THE RAPID MEASUREMENT OF THRESHOLD SHIFT FOLLOWING HIGH-LEVEL ACOUSTIC STIMULATION. Rep. 55-64, Oct. 1955, 6pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Northwestern University).

2434
A test procedure is described which was designed to obtain a rapid measure of the temporary threshold shift following relatively short, high-level acoustic stimulation. Apparatus is described and circuit diagrams given. The test was administered to 68 normal ears and the experimental findings are reported. Implications for the problem of predicting noise susceptibility are discussed. T. O. I. R. 4

Husson, G.S., & Otis, A.B. PHYSIOLOGICAL ADAPTATION TO CHRONIC HYPOXIA: B. RESTING PULMONARY VENTILATION. Rep. 55-76, Oct. 1955, 8pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Johns Hopkins University, Baltimore, Md.).

Resting ventilations were determined on patients with congenital heart disease. Of these 42 were chronically hypoxic, and 45 were noncyanotic. Comparisons were also made with the resting ventilation of normal Ss, altitude-acclimatized individuals, and patients chronically hypoxic from congenital heart disease, as determined by other investigators. The results indicate that, on an average, there is a significant increase in the resting ventilation of the chronically hypoxic patients above that of the nonhypoxic patients, but not as great an increase as shown by acclimatized individuals at altitude. Some of the possible implications and interpretations of these results, as well as those obtained by other investigators, are discussed. R. 12

2435
To evaluate the Grid-Map Intelligibility Test (GMIT, constructed from orthodox Army terminology plus a motor performance test) as a criterion of respiratory intelligibility, a simulated field test was conducted in a large army. Seven speakers wearing one of three Army respirators presented both the GMIT and a standardized Voice Communication Laboratory word test to 27 subjects, without amplification and in the presence of white noise. Intelligibility data were analyzed by analysis of variance for effects of tests, respirators, and speakers. Correlations were computed for the two test scores. The findings are discussed in relation to previous respirator studies. T. O. I. R. 3

2437
Thackray, R. SPEECH INTELLIGIBILITY CHARACTERISTICS OF ARMY RESPIRATORS. Contract DA 18-108-CML-4037, Rep. 13, May 1955, 14pp. Voice Communication Lab., Purdue University, Lafayette, Ind.
A large-scale experiment was conducted to determine the relative intelligibility characteristics of 3 Army respirators. The variables investigated in this design were: a) masks; b) talkers; and c) distance. Statistical analysis led to the following conclusions: a) The relative rankings of the 3 masks remained consistent at varying distances from the talker. b) The relative rankings of the 3 masks were not consistent when worn by different talkers. The factors responsible for this mask-talker interaction are as yet unknown, but are presently being investigated by this laboratory. c) A statistically significant difference was found between talkers. This indicates that individuals differ widely in their ability to communicate effectively through gas masks. d) Significant differences were found between the masks tested. When the masks are ranked from greatest to least intelligibility, the following order is obtained: a) E-13; b) M-9; and c) E-20. R. 2

Naulty, H.W. STUDY OF FIRE-EMERGENCY CONTROL SYSTEM. Contract AF 18(600) 309, WADC Tech. Rep. 54-96, June 1954, 53pp. USAF Wright Air Development Center, Wright-Patterson AFB, Ohio (Cornell Aeronautical Laboratory, Inc., Buffalo, N.Y.).

This report describes the study and development of a fire emergency control system for multi-engine aircraft. Operation of a single control handle in the cockpit sets in motion all the functions necessary for fighting nacelle fires, including rapid engine shutdown and preparation for release of the fire extinguishing agent. An industry-wide survey was made to determine the correct operations for emergency engine shutdown. Based on the results of the survey, 2 typical sequencing control devices were developed, fabricated and mounted on individual demonstration panels. Special attention was given in the design to the simplification of the emergency control handle. One of these demonstration panels simulates a 4-engine piston-powered aircraft installation. The second panel simulates a 4-engine turbo-powered aircraft installation. These systems, along with wiring diagrams, etc., are described and shown by illustrations. The survey report, design evaluation, and a design manual for guidance in designing a fire emergency control system appear at appendices.

USAF Operational Test Center. OPERATIONAL SUITABILITY TEST OF THE ME-2 AIRSPEED MACH NUMBER INDICATOR. FINAL REPORT. Proj. AFG/TAT/149 A, Feb. 1955, 12pp. USAF Operational Test Center, Eglin AFB, Fla.

This investigation determined the operational suitability of the ME-2 airspeed-mach number indicator for use in high-performance fighter aircraft; accordingly, the production model and 4 modified models were tested. 6 pilots made evaluations in F-100A and F-86F type aircraft, and 9 pilots made evaluations in T-33 type aircraft during inclement weather or hooded flight. The results of the pilot questionnaires indicated 3 basic problems: clutter, readability, and mach readability. It was concluded that the production model and 3 of the modifications were not suitable, the fourth modification was suitable only as an interim measure, and the principle of 2 types of airspeed information on one instrument is desirable. Saldanha, E.L. AN INVESTIGATION INTO THE EFFECTS OF PROLONGED AND EXACTING VISUAL WORK. A.P.U. 243/55, Oct. 1955, 19pp. Applied Psychology Research Unit, Medical Research Council, Cambridge, England.

2450

To investigate the kind of changes in performance that take place as a result of prolonged and exacting visual work, a series of experiments were performed. The task, setting a Vernier Calliper Gauge to an accuracy of 0.001 inch, was performed by 33 trained subjects over two-hour periods. One group was given knowledge of accuracy and speed for each setting; another group worked without such knowledge; and a third worked for two periods, first without and then with knowledge of results. Eye-muscle balance and acuity tests were given before and after each work period. Error scores and number of settings were analyzed for effects of each successive 15-minute work period and knowledge of results. Implications for industrial work are discussed. T.G.R 9

Hahn, C.P. THE IDENTIFICATION AND DESCRIPTION OF SOME CRITICAL AIRCREW JOB REQUIREMENTS. Contract AF 33(038) 10476, Proj. 21-29 014, Rep. 2, Feb. 1954, 40pp. USAF School of Aviation Medicine, Randolph Field, Tex.

This is the second step of a long-range research program designed to facilitate the analysis of aircrew specialties and classification of aircrew personnel. Specifically this study refined, by statistical means, the job elements and their component behaviors which were previously developed. 11 job elements involving ability factors were identified, and one additional element tentatively identified. 4 job elements involving non-ability factors concerning motives, temperament, and leadership also were identified. All these elements may be satisfactorily tested by paper and pencil tests. (HEIAS)

2449

Conrad, R. SELF-PACING PERFORMANCE AS A FUNCTION OF PERCEPTUAL LOAD. AFU 239/55, Oct. 1955, 5pp. Applied Psychology Research Unit, MRC, Cambridge, England.

2449

To study self-pacing performance under conditions of varying perceptual loads, 18 subjects performed a sensory-motor task under five load conditions (8, 10, 12, 14 and 16 pointers on the Multi-dial Display). The task required the subjects to judge in advance which channel (pointer) would provide the next signal and to respond accordingly; the interval between signals was near random. The task was self-paced (subjects controlled potentiometer driving the pointers) and knowledge of results (integrated score) was presented. Driving rates (signals per minute) and performance (correct responses, errors per minute, and integrated score) were analyzed as functions of perceptual load. T, R 10

2451 Bello, F. FITTING THE MACHINE TO THE MAN. *Forwards*, Nov. 1954, 134-137.

Men are imperfect operators of machines. Human engineers accept men as they are and try to design the machine so that the operator can function at his best. Application of human engineering to the manufacture of articles of at least intermediate complexity should prove profitable. A comprehensive human engineering study on deficiencies in the design of trucks and cars was well received and enthusiastically accepted by truck drivers. Human engineering gained momentum when 2 streams - 1 out of engineering and 1 from psychology - merged during the second World War. The military need for human engineering is as great today as ever. (HEIAS)

Hillmann, Beverly, Connolly, Katherine & Farnsworth, D. COLOR PERCEPTION OF SMALL STIMULI WITH CONTROL VISION. Proj. NM 002 014.09.02, Rep. 257, Oct. 1954, 21pp. USN Medical Research Lab., New London Submarine Base, Conn.

2454

To study perception of color of small stimuli with central vision, two observers with normal color vision compared small circular stimuli subtending 2, 3, 5, and 7 minutes of visual angle. Colors (63) in each of three areas of the C.I.E. chromaticity diagram for Munsell value were judged at 3.7 ft.-L brightness. The data were plotted on chromaticity diagrams and discussed with respect to confusion zones. Practical applications for situations where small colored detail must be accurately discriminated were noted. G. I. R 19

Bowen, Jane M. THE STEREO WINDOW FOR 3-D VIEWING: A STUDY OF ITS OPTIMUM PATTERN AND POSITION IN SPACE. A.P.U. 244/55; Nov. 1955; 25pp. Applied Psychology Research Unit, Medical Research Council, Cambridge, England.

2456

To compare several patterns for a stereoscopic window which might be printed on a three-dimensional film and to determine its optimum apparent position in space, eleven patterns were examined (eight were black with variations on the inner edge and five were "textured"). The "break range" of fusion (distance between points at which fusion is lost as the two pictures converge and diverge) was the experimental measure determined on 70 subjects wearing polaroid lenses in a series of experiments. The best three designs were tested at varying positions in space between the viewer and the screen for the maximum "break range". The results are discussed in relation to the practical problem of viewing three-dimensional pictures.

2457 Brouha, L. & Bell, M. Virginia. RESEARCH ON INDUSTRIAL FATIGUE. *Rev. Canadiens de Biol.*, Aug. 1948, 7(3), 475-483. (Aluminum Company of Canada Ltd., Institute of Hygiene and Human Biology, Laval University, Quebec, Canada).

By using body temperature changes and heart rate recovery measurements it was shown that without adequate rest periods workers have a statistically highly significant increase of body temperature and heart rate during the later part of an 8 hour shift. When adequate rest periods are introduced, the total amount of work per shift remaining the same, the physiological stress is reduced to such an extent that body temperature and heart reaction remain practically at the same level throughout the entire shift.

2458 Brouha, L. FATIGUE--MEASURING AND REDUCING IT. *Advanced Management*, Jan. 1954, 9-19. Report from: "Society for Advancement of Management: Eighth Annual Time Study and Methods Conference, Spring 1953".

This is an analysis of the problems of fatigue -- what it is, what causes it, how it can be measured, and what can be done to reduce it. Muscular exertion is considered the main factor in fatigue. Pulse rate and body temperature measurements are examined as easy, inexpensive, and valid indices of physiological stress. These also are used to classify jobs according to fatigue stress. Effective methods for reducing fatigue are discussed: work load reduction, heat load reduction, rest period scheduling, worker team organization, and worker selection. (HEIAS)

Gibbs, C.E., Brown, I.D., & Bilney, J.M. REACTION TIMES TO THE "FLASHING LIGHT" SIGNALS OF CARS. THE EFFECTS OF VARYING THE FREQUENCY AND THE DURATION OF THE FLASH. A.P.U. 245/55, March 1955; 9pp. Applied Psychology Research Unit, MRC, Cambridge, England.

2464

This study was designed to assess the effects of varying the frequency and the duration of flash of the "flashing light" signals of cars on human reaction times. Two flashing light systems, a United States commercial system and a trafficator system were compared in daytime and night tests with 12 subjects whose responses were recorded on a specially-designed electric apparatus. Two criteria of efficiency were employed: (1) speed of attraction from a central task and response to the signals; and (2) number of incorrect responses. A Latin Square design was employed and the results are discussed in terms of relative reaction times of each system and the implications for road safety.

Sloan, Louise L., & Habel, Adelaide. TESTS FOR COLOR DEFICIENCY BASED ON THE PSEUDO-ISOCROMATIC PRINCIPLE, A COMPARATIVE STUDY OF SEVERAL NEW TESTS. A.M.A. Arch. Ophthalmol., Feb. 1956, 55, 229-239. (CNR, The Johns Hopkins University).

2467

To make a comparative study of tests for color deficiency based on the pseudo-isochromatic principle, four such tests were chosen: (1) the Dvorine Plates, issued 1953, reprinted 1955; (2) new edition of the Ishihara plates, date not given; (3) the AO-HRR Test, developed by Hardy, Rand and Kittler, 1955; and (4) Twenty-Plate Test, composed of selected plates of high diagnostic efficiency from other tests. A group of 100 normal and 176 color-deficient individuals were given all tests under standard conditions; those with borderline scores were given additional tests of other types. Test scores were analyzed to show the efficiency of each test in classifying the subjects; responses to individual plates in each test were further analyzed. T. G. I. R 15

Bakan, P. EFFECT OF SET AND WORK SPEED ON TIME ESTIMATION. Percept. Motor Skills, 1955, 5, 147-148. (Michigan State University).

2469

To determine whether a time-estimating set has any effect on subsequent estimations of time and to determine the relationship between speed of work and time estimation, two groups of 22 subjects worked at a number-searching task for a period of one hour. Only one group was told in advance that they would have to make an estimate of time spent on the task. Mean time-estimates (in minutes) were compared for differences due to prior knowledge of time-estimate requirement. Work speed data (number of two-digit numbers found during the hour) were combined for both groups and correlated with time estimates. The findings are discussed in relation to tension levels. R 2

2469 Senders, Virginia L. FURTHER ANALYSIS OF RESPONSE SEQUENCES IN THE SETTING OF A PSYCHOPHYSICAL EXPERIMENT. Amer. J. Psychol., April 1953, 66, 215-228. (Antioch College, Yellow Springs, Ohio).

This study investigated the patterning of responses for a large group of Ss (48) and the effects of several experimental conditions on response patterns. The principal findings were: a) the profound effect of instructions on the ratio of yes and no responses, with however, the differences between expected and obtained being statistically significant; b) the oscillation of S's responses throughout the series; c) the occurrence of response patterns; and d) the effect on response-ratios of instructions about stimulus-ratios and possibly the interaction of these with rest-period frequency. Control Instrument Company, Inc. FINAL DEVELOPMENT REPORT. DESIGN OF A FRESNEL LENS SYSTEM FOR AN OPTICAL GLIDE PATH INDICATOR. Contract HDAS 26 484F, DEV 2542, Dec. 1956, 58p. Control Instrument Company, Inc., Brooklyn, N.Y.

2471

To design and evaluate system performance of Fresnel Lens System for use as an optical glide path indicator, a simple model was constructed comprising five Fresnel Lenses each associated with a bank of four lamps. Criteria for optimum performance was attainment of a gradual and smooth transmission of the image on one set of lamps seen through its respective lens to that of the adjacent set. Data were plotted to show ray charts showing 1) effect of "bending" the lens; 2) effects of 180 inch radius lens, and 3) a composite chart showing best lamp setting when lamps are on or off axial position. Causes and remedies of certain distortions in the system are discussed, and recommendations for further studies, including field evaluations, are made. T. G. I.

2472 Brogan, F.A. A SIMPLIFIED TECHNIQUE FOR MEASURING THE AUDITORY INTENSITY DIFFERENCE-LIMEN. Proj. 21 27 001, Rep. 9, Nov. 1952, 9pp. USAF School of Aviation Medicine, Randolph Field, Tex.

An instrument is described which can be calibrated accurately so that error is less than 5%. The error that is present in this instrument is constant in percentage of the result. The operator is simple and direct; values of the difference-limen may be read directly from an attenuator if the dial plate is recalibrated in terms of the table showing difference-limen with associated values. With the exception of the low-frequency oscillator, all material used is normally available in any acoustics laboratory. R 5

Chinn, H.I., Hyde, R.W. & Mitch, L.J. EFFECTIVENESS OF VARIOUS DRUGS IN PREVENTION OF AIR-SICKNESS. TREATMENT BY INTRAMUSCULAR MEDICATION. Rep. 56-6, Nov. 1955, 4pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

Scopolamine was administered to 58 aboard aircraft by nasal instillation (nose drops and spray) 15 to 20 min. after take-off. The incidence of vomiting from airsickness during the subsequent 40 to 45 min. was markedly reduced. Oral and sublingual administration under these conditions was ineffective. Considerable variations in the amount of drug instilled resulted when given by spray. The use of nose drops allowed more accurate medication. The significance of this mode of administration for treating motion sickness is discussed. R 2

Lewis, R.E.P. CONSISTENCY AND CAR DRIVING SKILL. A.P.U. 213/56, Sept. 1955, 11pp. Medical Research Council, Applied Psychology Research Unit, Cambridge, England.

2476
To consider whether consistency in performance between two tests separated by a six-week period is related to skill in driving, cornering trials were performed by three groups of drivers on a roadway without traffic. The comparisons were between 1) skilled police drivers, 2) skilled rally drivers who had been given no standard training, and 3) unskilled drivers. The measure of skill was vehicle acceleration and deceleration recorded photographically every five yards over a distance of 150 yards before and after each of four corners in the test runs. Scores of consistency were calculated for each subject over the six-week period and average scores for the three groups were compared.

Bond, H.J. & Sleight, R.B. HUMAN FACTORS IN THE DESIGN OF DESERT EQUIPMENT. FINAL REPORT. Contract DA 36 034 ORD 1642, Projs. 595 20 001 & TBI 1000, Dec. 1954, 73pp. USA Aberdeen Proving Ground, Md. (Applied Psychology Corp., Washington, D.C.).

The relation of human performance to the operation of equipment under desert conditions has been examined through a survey of the literature. This survey has resulted in a number of conclusions which are of interest to those concerned with the design of military equipment and its use in the specialized environment of the desert. a) Deserts are areas in which severe environmental conditions adversely affect skilled human performance. The most prominent of these conditions are the extremes of heat and light. b) There is a paucity of specific information about the effects of these conditions on visual performance, audition, skilled motor performances and other behavioral responses to the operation of equipment. Data is now insufficient for the appropriate modification of military equipment for desert use. c) Specific studies are needed of the effects of desert conditions upon skilled human performance.

Brown, R.H. & Niven, John I. THE RELATION BETWEEN THE FOVEAL INTENSITY THRESHOLD AND LENGTH OF AN ILLUMINATED SLIT. J. exp. Psychol., Dec. 1944, 34(6), 464-476. (Clark University, Worcester, Mass.).

We have described a method of determining accurately for the human fovea intensity thresholds of narrow illuminated slits for comparison with similarly obtained thresholds of circular areas. The threshold is high for short slits and decreases as the slit increases in length. The rate with which the threshold decreases is markedly less as a function of length of slit than as a function of diameter of illuminated circle. Astigmatic effects which might appear in the experiment actually do not influence the decrease of threshold with increase of slit length. Further decrease in width of the narrow slit apparently operates to increase the threshold uniformly, irrespective of length of slit. The results are interpreted quantitatively in terms of a spatial gradient of visual excitation.

Bradley, J.V., & Argenteanu, J. OPTIMUM KNOB DIAMETER. Proj. 7182-71514, Tech. Rep. 56-96, Nov. 1956, 17pp. Aero Medical Laboratory, WADC, Wright-Fatterson AFB, Ohio.

2485

To determine the relationship between knob diameter and operation time, 48 subjects reached to, grasped, and rotated knobs 125° so that a radial line on its face pointed to a 12 o'clock position within a tolerance of plus or minus one°. Knobs varied in diameter from 1/2 inch to 3 1/4 inches in 1/4 inch increments, were 1/2 inch thick with knurled edges. Two shaft frictions, corresponding to average torques of 81 and 176 inch grams were tested with different subject groups. The data (reach time, turning time for each diameter and friction) were analyzed for main effects and interactions by both parametric and distribution-free statistics. Turning time knob diameter curves are presented. Implications of low-level friction are discussed.

2495. Black, J.W. THE INFORMATION OF SOUNDS AND PHONETIC DIGRAMS OF ONE- AND TWO-SYLLABLE WORDS. Joint Proj. Rep. W-001-064-01-22, May 1954, 11pp. USA School of Aviation Medicine, Pensacola Air Station, Fla. (Ohio State University, Columbus, Ohio).

Approximately 3500 common one- and two-syllable words were transcribed phonetically. The sequences of speech sounds were analyzed in terms of a) the probability of each sound, b) the conditional probability of each pair of sounds, and c) the joint probability of each digram. The maximum information (H) per symbol in an alphabet of 41 symbols (the number treated) would be 5.35 bits (log₂ 41). In the sample studied, the obtained values were 4.15-5.04 bits (E₁) and 3.35-4.21 bits per symbol (E₂). Some transitional probabilities reached 0.33. Among words of a particular length in syllables, the words of few sounds contained the highest information value per symbol. Digrams of greatest conditional and joint probabilities are enumerated in tables.

Saw, M.B. BASIC PRINCIPLES OF STEREOPHONIC SOUND. J. Soc. Roy. Pict. Engrs., Nov. 1953, 51, 567-589.

Stereophonic sound has become of vital importance to industry. The subject has been studied for many years, but the published material is scattered. This paper summarizes the fundamental theory underlying stereophonic sound as far as it has been published, and gives examples of how the theory is employed in representative practical situations. Fundamental differences between ordinary binaural listening and stereophony are pointed out, as well as similarities. It is shown that much qualitative but little quantitative information has been reported. Factors which aid some stereophonic effects are shown to be detrimental to others, and methods of minimizing the undesirable conditions are suggested. Applications to recording are discussed.

Neuer, R.H., & Bruker, J.J. RESEARCH ON THE LANGUAGE OF VOICE PROCEDURES--COMPARISON OF UNITED STATES-UNITED KINGDOM AND INTERNATIONAL CIVIL AVIATION ORGANIZATION PHONETIC ALPHABETS. Contract AF10(600)315, AF Proj. 519, Tech. Rep. 6, June 1953, 12pp. Ohio State University Research Foundation, Columbus, Ohio.

This study investigated 3 hypotheses regarding reception scores for phonetic-alphabet code groups: that there is no difference in these scores between a) standard and letter word methods of transmitting, b) repeat and letter word methods, and c) standard and repeat methods. 6 lists of 26 random 3-letter code groups were made up for both the US-UK and modified ICAO alphabets: 2 were read in standard fashion, 2 with complete repetition, and 2 by the letter-word method. 20 Ss with some listening and transcribing experience were used. Errors were compared by t tests. The repeat method was the most effective transmission technique. All hypotheses were rejected at least at the .05 level of confidence. (NEIAS)

Young, R.W. A BRIEF GUIDE TO NOISE MEASUREMENT AND ANALYSIS. YEL Rep. 606, May 1955, 23pp. U.S. Naval Electronics Laboratory, San Diego, Calif.

2502

This is a brief guide prepared for the particular convenience of Ray users of sound-analyzing equipment. In Part I, elementary principles are reviewed, noise measurement terms defined, notes of a typical noise-analyzer system are described and then were explained, and single methods of plotting graphs for comparison and interpretation of results are given. Part II is concerned with the calibration of sound-measuring equipment and the mathematical background needed for this work. T. O. I. R 13

Coleman, P.D. AUDITORY DISTANCE LOCALIZATION AND STIMULUS FAMILIARITY. Proj. 6 9C 20 001, Task T-1, Rep. 364, April 1959, 6pp. USA Medical Research Lab., Fort Knox, Ky.

2502

To investigate changes in performance in an auditory distance localization situation as a function of opportunity to become familiar with the characteristics of the stimulus, subjects were confronted with a column of 14 loudspeakers extending away in a median plane. The nearest speaker was five feet from subject and the others were at successive two-foot separations. Stimuli were one-second bursts of wide-band random noise with which the subjects were presumably unfamiliar. Subjects received 100 trials in identifying the loudspeaker that served as a sound source. Distance judgments and errors were analyzed for learning effects. T. G. R 6

USA Human Engineering Lab. AN INTRODUCTION TO HUMAN ENGINEERING. Proj. TBI 1000, Tech. Memo 9, April 1954, 41pp. USA Human Engineering Lab., Aberdeen Proving Ground, Md.

This paper has presented, in a very general form, some of the facets which are considered as being important from the standpoint of more adequate consideration of the operator as a component in a man-machine system. It should again be emphasized that the technical information presented does not cover the entire field of human engineering, nor will it answer all the problems or be applicable to all items of material without qualification. It does, however, indicate the broad categories discussed during the conference by Dunlap and Associates, Inc. which should be considered when evaluating the design of many man-machine relationships. Much can be accomplished in terms of further improving the man-machine relationships in Ordnance materiel through the joint efforts of the human engineer and the Ordnance designer. It is not expected that a perfect relationship will be available. However, by receiving human engineering data in practical and useful form, the Ordnance designer can effect necessary compromises to allow for more efficient operation of the man-machine system. Although gaps exist in the present fund of human engineering data, much information is available which can be practically applied to the design of weapon systems. This, and new information, is being disseminated as rapidly as possible. Additional information can be obtained from, or gotten by, the human engineering unit or committee at the responsible design agency. It is suggested that utilization of human engineering personnel be made early in the development or modification of Ordnance materiel.

Vardon, C.J. VISUAL FACTORS IN SIGHTING AT DIN LEVELS OF ILLUMINATION. I. LABORATORY STUDIES. J. Gen. Psychol., 1950, 42, 349-372. (Psychology Dept., Columbia University, New York, N.Y.). This investigation covered an analysis of the visual factors involved in rifle-sighting at din levels of illumination. Both the rear and front sights of the Garand and Springfield rifles were studied. The results indicate that: 1) the aperture type of rear sight is superior to the open or notch type when size is properly adjusted to illumination level; 2) the rear sight size must be increased as illumination decreases; 3) the optimum size of aperture is about 1/2 the pupil size; 4) the lowest illumination at which sighting can occur corresponds to about 30 min. after sunset on a clear day; 5) the sight characteristics for low illumination are: rear-closed 3.5 mm. aperture and front-flat faced post or head sight about 2.9 mm. wide with coating to provide high visibility. In addition some recommendations regarding current practice are included. (NEIAS)

R 8

2505 Ross, S. & Varden, C.J. VISUAL FACTORS IN SIGHTING AT DIM LEVELS OF ILLUMINATION. FIELD TESTS. J. gen. Psychol., 1950, 43 3-16. (Columbia University, New York, N.Y.).

The experiment reported here is a field test of modified (dim-illumination) sights on the regulation (standard) rifle. A group of 10 skilled marksmen who volunteered for the experiment were used as Ss. The tests were carried out at the Air Force Range, Camp Lejeune, North Carolina, on 11 April, 1946. Each S was provided with 2 rifles, identical except for the modified rear sight and the painted front sight. The Ss alternated in the firing of each rifle in a specified pattern, so that when odd-numbered Ss were firing the regulation rifle, even-numbered Ss fired the modified rifle. The Ss fired at 2 distances, 500 yds. and 200 yds. using dim-illumination targets (after Varden). 2 periods of firing were used: a mid-afternoon series (1425-1545) and an evening series (1705-1905). 12 relays of 8 shots were fired by each of the 10 Ss during the former period, and 23 relays of 8 shots during the latter period. An analysis of the data was made in terms of distribution of hits for 5 selected levels of illumination. These levels were: 1,000 millilamberts, above 100 millilamberts, above 10 millilamberts, above one millilambert, and below one millilambert. The results indicate that the "dim-illumination" sights yielded significantly greater accuracy at the level of illumination below one millilambert. At the higher levels of illumination, the regular sights are significantly superior.

2506 Allais, R.A. MEASURED VISUAL ACUITY AS A FUNCTION OF PHENOMENAL SIZE. Proj. 7106, Tech. Rep. 55-384, Oct. 1965, 14pp. NADC, Air Research and Development Command, Dayton Ohio.

2509 To test the notion that visual acuity may be better when the test object is made to appear larger though its objective size on the retina remains constant, 36 observers read a retinally projected visual acuity chart, in a daylight situation favorable to the operation of size constancy, at three convergences. An additional 36 observers read the same retinally projected chart under similar conditions but in a stimulus-reduced night situation so that phenomenal size remained constant. The results are analyzed, using Friedman's Chi-square test and Brandt's sign test for significance of difference between experimental conditions. The practical and clinical implications are discussed in the light of the statistical results.

2506 Connor, D.S. FLIGHT INVESTIGATION OF FLIGHT DIRECTOR SYSTEMS FOR LIGHT AIRCRAFT. R20 X 203 18, Tech. Note NCT 54 30, May 1954, 26pp. USAF Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.

2506 This report concerns an investigation of improved flight information presentation for Army liaison aircraft that are required to engage in instrument flight. An installation of the Collins Integrated Flight System was investigated as representative of flight director systems. Pilots were required to fly a special flight pattern consisting of omnirange homing, radial interception, and low approaches on Instrument Low Approach System. Ground-tracked approaches were also made. Pilot opinion and accuracy of the recorded approaches were analyzed. A comparison was made with a light-weight automatic pilot and approach coupler.

2511 Black, J.W. A RELATIONSHIP BETWEEN SPEAKING AND LISTENING. Contract N7onr 22515, Proj. NR 145 993 & NM 001 104 500.54, Rep. 54, June 1955, 7pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

180 panels of 12 members each responded to Forms C and D of the multiple-choice intelligibility tests in round-robin administrations. Rank order correlations between the listening and speaking scores of members of the 180 panels ranged from .02 to .87. The median value was .21. Low positive correlations of this magnitude are common in applications of these tests and suggest that intelligibility in speaking and listening are not independent skills. However, as more sources of stratification among scores are isolated the likelihood increases that these indications do not reflect a valid relationship.

2507 Goodfellow, L.D. THE HUMAN ELEMENT IN PROBABILITY. J. gen. Psychol., 1940, 23, 201-205. (Northwestern University, Evanston, Ill.).

This paper attempts to show how subjective factors affect statistical techniques, the thesis here being that human judgments are not necessarily distributed according to the mathematical laws of probability. The important differences between physical chance and chance involving a psychological element are discussed and illustrated; the favoring of one of the alternatives offered, the alteration of a response due to a previous response, and the tendency to arrange responses in an asymmetrical order. (HEIAS)

2508 Gault, R.H. & Goodfellow, L.D. SOURCES OF ERROR IN PSYCHO-PHYSICAL MEASUREMENTS. J. gen. Psychol., 1940, 23, 197-200. (Northwestern University, Evanston, Ill.).

5 important sources of error and/or inconsistency in psychophysical measurements are discussed; the method of measurement itself, motivation and instructional set, suggestion, the experimenter, and muscle tension. Some examples are included as illustrations. (HEIAS)

2512

Charnell, R.C., Girden, E., Cuming, M.W. & Chan, G.S. TRAINING AND SUPERVISION OF CONTROLLERMEN. (HUMAN ENGINEERING SYSTEMS STUDIES). Contract N6onr 641, SDC Proj. 20 F-2, SDC TR 641 2-7, April 1950, 17pp. USN Special Devices Center, Port Washington, N.Y. (Dunlap & Associates, New York, N.Y.).

2513

This report presents recommendations, based on previous studies, for the training of controllermen. These recommendations deal with the supervision of controllermen during service at sea and the preparation of a qualifying examination for expert controllermen. Specific recommendations are also made regarding (1) hand allocation to controls; (2) standard times for simple problems; (3) standardization of orders; and (4) preparation of a manual of instructions. A summary and revision of earlier proposals for initial training in the Propulsion Cubicle is included.

Bradley, J.V. & Stump, N.E. MINIMUM ALLOWABLE KNOB CROWDING. Proj. 7182-71514, Tech. Rep. 55-455, Dec. 1955, 21pp. USAF Wright Air Development Center, Aero Medical Lab., Wright-Patterson AFB, Ohio.

Reach time, turning time and inadvertent touching of adjacent controls were measured while a standard setting was made with one of several closely spaced knobs. Variables manipulated were spacing between knobs, knob diameter and knob configuration. Performance improved rapidly with increasing distance between knob edges up to an interperipheral distance of 1 in., after which it continued to improve but at a much slower rate. For equal amounts of panel space consumed by several closely crowded knobs, 1/2 in. diameter knobs were more nearly error free than were the larger diameter knobs tested. For equal distances between knob edges, however, performance improved with increasing knob diameter. These results apply only to knobs capable of being operated by moderate torque. Gloves apparently had little effect upon speed of knob operation. It was found that the frequency with which a crowding knob is inadvertently touched is strongly affected by the angular position which it occupies with respect to the operated knob but is practically independent of the presence of other crowding knobs at the same distance from the operated knob.

Brown, J.S., Melton, A.W. & Buel, J. THE S.A.M. ROTARY PURSUIT TEST, MODEL B WITH AND WITHOUT THE DIVIDED ATTENTION ATTACHMENT. Proj. 350, Rep. 1, Feb. 1946, 22pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

A modified form of the S.A.M. Rotary Pursuit Test is described in which new test units, styluses, and control units were substituted. The essential nature of the test remains unchanged, the S being required to manipulate a stylus so as to keep its point in contact with a round metal target rotating at 60 rpm. A Divided Attention Attachment for use with the S.A.M. also is described. This requires S to make differential manual reactions to a pair of signal lamps with one hand while manipulating the stylus with the other. Representative data on the S.A.M. alone and with the attachment are presented. For both conditions the test was found to have high reliability and moderate validity for selection of pilots. (HEIAS)

Camp, R.T., Jr. THE EFFECT OF A DIVIDING NOISE MASK ON SPEECH RECEPTION. Contract N6onr 22525, Projs. NR 145 993 & NM 001-14 500.52, Rep. 52, May 1955, 13pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

The effect on speech reception of listeners receiving the identical full speech spectrum in both ears (diotic listening) was compared to the effect on speech reception of listeners receiving the high-frequency components above 1650 cps in one ear and the low-frequency components below 1650 cps in the other (dichotic listening) in the presence of 114 db of simulated aircraft noise. A comparison was also made of three headphone arrangements of speech spectra under the dichotic condition. In general, those listeners who listened dichotically earned better reception scores than those who listened diotically. Two of the three speech spectra under the dichotic condition yielded scores significantly different from each other.

Coles, W.D. & Callaghan, E.E. INVESTIGATION OF FAR NOISE FIELD OF JETS. II. COMPARISON OF AIR JETS AND JET ENGINES. Tech. Note 3591, Jan. 1956, 19pp. National Advisory Committee for Aeronautics, Washington, D.C. (Lewis Flight Propulsion Lab., Cleveland, Ohio).

A comparison of the noise generation of air jets and turbojet engines has been made from data obtained under similar free-field conditions. At jet pressure ratios below or only slightly above that for choked flow, the over-all sound power is well represented by the Lighthill parameter, but the results obtained with the afterburning data are somewhat low. Application of a correction to the directional data using nozzle-area ratio and jet velocity ratio to the 8th power gave good correlation between air-jet and engine data. Air-jet and engine spectral data were dissimilar because of a dip in the engine noise spectrum, which was probably caused by a combination of ground-reflection effects and additions to portions of the spectrum by compressor and combustion noise.

Deese, J. COMPLEXITY OF CONTOUR IN THE RECOGNITION OF VISUAL FORM. Contract AF 33 (039)-22642, Tech. Rep. 56-80, Feb. 1956, 22pp. WADC, Aero Medical Lab., Dayton, Ohio.

2521

To investigate the influence of complexity of contour of visually presented forms upon accuracy of recognition, Ss performed under two conditions: 1) simple and complex forms compared under different delays between presentation of sample form and the set from which it was to be identified, 2) the number of sample forms to be identified were 1, 10, or 25. The frequency of use of verbal "coding" as an aid to recognition was indicated. The data were errors of recognition and (for first condition) response times and were analyzed for differences among the forms. Practical implications were discussed.

Skeen, J.R. COMPARISON OF THE OMNI BEARING INDICATOR AND THE RADIO MAGNETIC INDICATOR IN SHORT RANGE NAVIGATION. Contract N60R1 71(16), SPECDEVEN Proj. 20 L 1, Tech. Rep. SPECDEVEN 71-16 13, March 1955, 25pp. USN Special Devices Center, Port Washington, N.Y. (University of Illinois, Urbana, Ill.).

2523

To compare two short-range navigation instrument displays (the Radio Magnetic Indicator and the Omni Bearing Indicator) for accuracy of use by pilots in navigation, 16 experienced pilots were tested. Five navigation problems were flown by the pilots in a 1-Ch-1 Link trainer; one half of the subjects used one display, the other half used the other one. Performance was scored in five different ways and comparisons made between the two groups for each score.

2524 Kennedy, J.L. & Travis, R.C. SURFACE ELECTRODES FOR RECORDING BIOELECTRIC POTENTIALS. Science, Aug. 1948, 108(2799), p183. (Tufts University, Medford, Mass.).

The electrodes described have the desirable characteristics of: maintenance of low-resistance contact for relatively long periods of time; relative freedom from artifacts of body movement, vibration, etc.; comfort in wearing; ease of application and removal; and durability and economy. (HEIAS)

2525

Payne, T.A. A STUDY OF THE MOVING PART, BEARING PRESENTATION, AND MAP DETAIL ON PICTORIAL AIR NAVIGATION DISPLAYS. Contract N60R1-71, Rep. 71-25-10, Nov. 1952, 28pp. ONR, SDC. (University of Illinois).

2525

To investigate some factors in the design of a pictorial instrument display which would provide the pilot with continuous information concerning the relationship in horizontal space of aircraft to ground points, 32 experienced pilots worked navigation problems using functional models of 1) aircraft movement and 2) map movement displays. Other variables tested: heading shown on aircraft symbols or omitted; map detail or no detail; portion of ground track to be flown drawn in or omitted; and aircraft symbol heading up or down on aircraft movement display. Data analyzed include time scores; number of involved problems; and control reversals. Implications for design were discussed.

Gerall, A.A., & Green, R.P. THE EFFECT UPON PERFORMANCE ON A FOLLOWING TRACKING TASK OF INTERCHANGING THE DIRECTION OF DISPLAY MOVEMENT CONTROLLED BY EACH HAND. Contract N60R-241, Proj. 20-M-1d, Tech. Rep. 241-6-24, Aug. 1955, 6pp. SDC, University of Rochester.

2526

To determine the effect upon performance of a following tracking task of interchanging the direction of display movement controlled by each hand, 112 subjects were assigned randomly to one of four groups and practiced for twelve one-minute periods under a specific arrangement of control-display relations. Five additional practice periods were given with reversed relationships. The data (mean time on target scores and error scores) were analyzed for degree of transfer of training as related to continuity relationships existing between controls (planes of rotation of control units parallel with planes of movement of target follower).

T. G. R. 1

2527 Green, R.F., Andreas, B.G., Norris, Eugenia B. & Spragg, S.D.S. THE EFFECTS OF CONTINUITY IN DISPLAY AND CONTROL MOVEMENT RELATIONSHIPS ON TWO-HAND TRACKING PERFORMANCE. Contract N60R-241, Proj. 20 M 1d, Tech. Rep. 241 6 12, Oct. 1953, 7pp. USN Special Devices Center, Port Washington, N.Y. (University of Rochester, Rochester, N.Y.).

This study was designed to discover the general principle to be used in placing controls that will permit the greatest accuracy in tracking. A SAM Two-Hand Coordination Test was used. 4 display-control arrangements were tested; performance was measured by time on target scores. The results indicate that the axes of the control and display should be parallel and their direction of movement the same. Actual location of control is not important, if it is easy to operate. (HEIAS)

2528

Weiss, B. & Green, R.F. THE EFFECTS OF INERTIA ON THE ACCURACY OF KNOB SETTINGS. Contract MONR 241, T.O. 6, Rep. SDC 241 6 9, Jan. 1953, 4pp. USN Special Devices Center, Port Washington, N.Y. (University of Rochester, Rochester, N.Y.).

This study examined the effects of inertia (fly wheel effect) on the accuracy of knob setting. The apparatus allowed for variation of the size of the dead zone and the amount of inertia. S was required to make 5 adjustments at each of 4 different dead zone angles, using 1 inertia value throughout. 7 values of inertia and 4 dead zone angles were tested: 40°, 60°, 120°, 160°. 105 Ss were used. Error was the difference in degrees between S's setting and the desired setting. Inertia values which ranged from approximately 0 to .245 slug. ft. were found to have no significant effect on setting accuracy; relative error decreased as size of dead zone increased. (MEIAS)

2529

Weiss, B. BUILDING "FEEL" INTO CONTROLS: THE EFFECT ON MOTOR PERFORMANCE OF DIFFERENT KINDS AND AMOUNTS OF FEEDBACK. Contract MONR 241, T.O. 6, Proj. 20 M 1d, Tech. Rep. 241 6 11, Oct. 1953, 20pp. USN Special Devices Center, Port Washington, N.Y. (University of Rochester, Rochester, N.Y.).

This study reports the effects of pressure changes and amount of movement on the operator's ability to control a display by means of an aircraft stick control. It was found that performance improves as the range of distance, e.g. control stick range, available to the operator increases. Also, pressure feedback has no apparent effect on performance when the operator is required to predict what a certain setting of the control will do to what is being controlled. (MEIAS)

2531

Bilger, R.C., Hanley, T.D. & Steer, M.D. A FURTHER INVESTIGATION OF THE RELATIONSHIPS BETWEEN VOICE VARIABLES AND SPEECH INTELLIGIBILITY IN HIGH LEVEL NOISE. Contract NCRI 104, Proj. 20 F 8, SDC TR 104 2 26, April 1955, 13pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

2531

The relationship between talker intelligibility in noise and several voice variables such as syllable intensity and syllable duration is investigated by recording speech samples with the introduction of high level noise. Eighty-eight male undergraduates were selected on the basis of their being highly intelligible or highly unintelligible speakers. After specification of the voice variable measures by intensity, pitch, and duration analysis, the criterion intelligibility was determined by listener panels. Multiple correlation techniques were used to determine the contribution of each voice variable to intelligibility. Implications for voice communication were discussed. T. G. R. 16

2532

Matheny, Beatrice J. HUMAN PERFORMANCE IN RADAR VECTORING. THE STUDY OF THE EFFECTS OF VARYING LOADS OF AIRCRAFT PIPS AND PIP SPEEDS UPON VECTORING PERFORMANCE IN AIR TRAFFIC CONTROL. Contract NCRI 7X(16), Proj. 20 L 1, SPECDEVEN TR 71 16 14, March 1955, 39pp. USN Special Devices Center, Port Washington, N.Y. (University of Illinois, Urbana, Ill.).

2532

This study is concerned with determining the effectiveness of air traffic controllers' performance in vectoring aircraft by means of radar. Utilizing a radar vectoring simulator, nine subjects were required to perform under varied conditions of load (i.e., three, six, and eight aircraft) and speed differences. The results are presented and discussed in terms of the effect of load and speed difference on each of the following aspects of performance: (1) vectoring the simulated aircraft; (2) alignment of aircraft on ILS; and (3) avoidance of collisions. Implications for training are specified and discussed.

2533

Silverstein, B., Bilger, R.C., Hanley, T.D. & Steer, M.D. THE RELATIVE INTELLIGIBILITY OF MALE AND FEMALE TALKERS. J. educ. Psychol., 1953, 7, 418-428. (Purdue University, Lafayette, Ind.), (SDC TR 104 2 20).

2533

This investigation determines the relative intelligibility of male and female talkers over the Portable Interphone Trainer in the presence of high level noise. Control and experimental groups were comprised of 138 male and female college students. The VCL 24-Word Multiple Choice Test was administered before and after a training period which stressed loudness and clear pronunciation in communication. The data was evaluated statistically in terms of relative intelligibility of untrained male and female speakers, differential effect of intelligibility training upon male and female speakers, and effect of the sex of the listening panel on speaker intelligibility. White, C.T. POLARIZED LIGHT ILLUMINATION OF RADAR AND SONAR SPACES AND COMPARISON WITH LIMITED SPECTRUM METHODS. Rep. 669, Feb. 1956, 13pp. USN Electronics Lab., Bureau of Ships, San Diego, Calif.

This report has: a) described the cross-polarized lighting control system; b) compared this system with other proposed systems in regard to specific problems; and c) brought into critical focus some of the basic assumptions usually made about the lighting of radar rooms. It is concluded that there is no one lighting system which is best for all installations. Both types of lighting systems, area and localized, represent compromises with the ideal. Each type has advantages and disadvantages which should be taken into consideration before any decision is made as to which system to use in any specific case. It is recommended that full-scale experimental installations of the polarized-light system be evaluated in various types of operational units. R. 5

2540

Ludvig, E. & Miller, J.W. SOME EFFECTS OF TRAINING ON DYNAMIC VISUAL ACUITY. Contract MONR 586(00), Proj. NR 142 023, Proj. NM 001 075.01.06, Rep. 6, Sept. 1954, 12pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

2540

To determine the effect of practice on dynamic visual acuity, 200 unselected naval aviation cadets made 20 successive threshold judgments of movement. Test object (Landolt ring) moved with angular velocities of 20 degrees and 110 degrees per second. Ten subjects continued practice by making approximately 180 threshold judgments over a three-week period. Acuity data (minutes of arc) are analyzed for rate of improvement. Comparisons are made between the high and low group (20 each). A semi-empirical equation is given for the data. T, G, R 6.

2543

Schmidt, I. NEW TESTS FOR THE EXAMINATION AND TRAINING OF COLOR VISION. EVALUATION OF THE COLOR VISION MULTITESTER (SIGNAL LAMP) FOR AVIATION. Proj. 21-29-006, Rep. 4. June 1954. 10pp. USAF School of Aviation Medicine, Air Univ., Randolph Field, Texas.

2543

To evaluate the Color Vision Multitester (Signal Lamp) for use in classifying applicants for aviation training into two groups (pass and fail), 91 persons were given from three to six tests. The data are examined for types of errors committed, for learning and fatigue effects, and in comparison with results on other color vision tests (Ragel Anemoscope and Hardy-Rand-Rittler Charts). Recommendations for the use of this test and instructions for administration are given.

Smith, M.K. A METHODOLOGICAL STUDY OF SIZE-DISTANCE PERCEPTION. J. Psychol., 1953, 35, 143-153. (Dept. of Psychology, Princeton University, Princeton, N.J.).

2544

To investigate some methodological aspects of the problem of "size-constancy" in visual perception, two conditions of observation (binocular in an outdoor environment) were compared: 1) matching nearby comparison object with distant standard object, and 2) reverse of first procedure. The stimulus objects were white cubes (standard, two and four inches) comparison series varying from one-half to six inches, distances (16, 80, 32 feet), and six subjects. The data (size judgments with respect to distance) were analyzed and comparisons made between the two conditions of observation. Discussion was in terms of size-distance perception.

Smith, M.K. SENSITIVITY TO APPARENT MOVEMENT IN DEPTH AS A FUNCTION OF STIMULUS DIMENSIONALITY. J. exp. Psychol., Feb. 1952, 42(2), 149-155. (Princeton University, Princeton, N.J.).

An experiment was carried out to determine whether the sensitivity to apparent movement in depth varied with the apparent tridimensionality of objects viewed monocularly and binocularly. An analysis of the variance of the results, supplemented by statements from the SS, indicated the following conclusions: a) No significant variance in reaction times was found to exist among the test objects used. Apparent tridimensionality of an object had no significant effect on the time it took S to respond to apparent movement in depth. This result was discussed from the standpoint of the effect of object properties on perception and an "entoptic" view of perception; b) Viewing condition (monocular and binocular) introduced significant variation in the data. The reaction times to movement were consistently faster for the binocular condition; c) An attempt was made to interpret the present results in light of other experimental results which indicate an effect on movement perception of such a factor as apparent dimensionality. In addition, an attempt was made to incorporate the results regarding the effect of viewing conditions with other pertinent binocular-monocular data; d) Although no significant interactions existed in the data, marked individual differences in reaction times to this kind of apparent movement were found.

Shaw, W.J. THE EFFECT OF CONTINUED PERFORMANCE IN A TASK OF AIR TRAFFIC CONTROL. FPSC 883, Jan. 1954, 13pp. Flying Personnel Research Committee, London, England. (Applied Psychology Research Unit, MRC, Cambridge, England).

2546

To investigate the effect of the length of work period actually in use at an Air Traffic Control center on the performance of the controllers, three subjects were selected from among the regular controllers and were tested before and after watch spells over an eight-week period. The tests were based on a particular aspect of the controller's task which could be isolated and simulated on a synthetic control board. Performance was scored in terms of errors and time delays in solving the problems (aircraft clearances). The data were studied by analysis of variance for differences due to before- and after-watch tests.

Swire, E.A. (Dir.). PLASTIC MATERIALS FOR VISION DEVICES. FINAL REPORT. Contract DA 20-089 ORD 36437, Proj. C 054, June 1954, 9pp. Armour Research Foundation, Illinois Institute of Technology, Chicago, Ill.

2547

To determine methods for producing a plastic periscope with a resistance to abrasion approaching that of glass, three materials (silicon monoxide applied as a coating by vacuum deposit, an optically clear elastomer such as methyl polyacrylate, and a commercial abrasion-resistant plastic such as allyl diglycol carbonate) were investigated. Two types of periscopes were prepared from these materials, illustrating the feasibility of production.

Devos, D.B. THE USE OF DIRECT READING COUNTERS IN VISUAL DISPLAYS. Spec. Rep. Vol. II, No. 1. Dec. 1954. 10pp. Tufts College, Institute for Appl. Exper. Psychol., Medford 55, Mass.

2548

To formulate guiding principles concerning direct reading counter indicators to serve as an aid in determining whether or not a counter is appropriate for any particular function, the experimental literature was critically surveyed. The advantages and disadvantages of counters as contrasted with dials and scales as indicators are summarized in the form of recommendations.

Head, L.C. HUMAN ENGINEERING. Proceedings, National Meeting, Institute of Radio Engineers, 1954, 29pp. Institute of Radio Engineers, New York, N.Y. (Tufts University, Medford, Mass.)

This paper illustrates and outlines the field of human engineering and attempts to show the relationship of this field to the theme of the symposium which is "engineering based on biological design". Human engineering is defined as engineering for human use, and is thus the applied province of both the engineering and biological sciences. The growth of human engineering is traced from its early beginnings through World War II. In developing equipment for human use various "biological design" characteristics must be considered. These characteristics include such basic factors as body dimensions, physiological processes, and resistance to atypical physical environments, as well as psychological factors such as stimulus detection, bodily mobility, learning, intellectual processes, and sensitivity to stress. Illustrations of each of these characteristics are given. The paper concludes with a comparison of men and machines in terms of their functional capacities.

Peters, R.W. MESSAGE RECEPTION AS A FUNCTION OF THE TIME OF OCCURRENCE OF EXTRANEOUS MESSAGES. Contract N6ONR 22525, Proj. NR 145 993 & BuMed NM 001 064.01.33, Rep. 33, Nov. 1954, 24pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

The effect of extraneous messages upon the reception of voice messages was studied relative to the time of occurrence of the two messages and the content of the extraneous message. Criterion messages were either multiple-choice intelligibility test words or PB words. The extraneous message either immediately preceded or followed the primary message. The results indicated that the presence of a message either immediately preceding or following a primary message significantly interfered with reception. Extranous messages following primary messages were more damaging to reception than were preceding extraneous messages. The amount of interference varied depending upon the type of extraneous message.

Tolhurst, G.C. SPEECH RECEPTION AND TEMPORARY HEARING LOSS AS A FUNCTION OF EXPOSURE TO HIGH-LEVEL NOISE. Contract N6ONR 22525, Proj. NR 145 993, BuMed Proj. NM 001 064.01.32, Rep. 32, Oct. 1954, 41pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

Pulse hearing test scores and multiple-choice word reception scores were obtained from 1402 Naval flight students in groups of approximately 18 per group as they experienced 2 hrs. of high-level noise. Each experimental session was divided into 3 time patterns of noise broken by one-minute periods of quiet. The word reception scores were obtained during the noise intervals and the pulse test scores during the quiet periods. The results indicate that increases in the noise level affected adversely word reception scores; changes in the spectrum of the "shaped" noise also affected scores but octave changes in the octave-band noise did not. Accumulative effects of time-in-noise did not seem to affect word reception; and pre and post-exposure hearing test scores were significantly different.

Black, J.W. & Tolhurst, G.C. INTELLIGIBILITY AS RELATED TO THE PATH OF AIRBORNE SIDE-TONE. Contract N6ONR 22525, Proj. NR 145 993 & BuMed NM 001 064.01.34, Rep. 34, Nov. 1954, 8pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

Panels of 12 speakers read under pairs of experimental conditions that provided criterion intelligibility scores associated with different paths of the speaker's airborne side-tone. Differences between pairs of scores suggest that the speaker's guide in setting his level of normal speech in quiet is carried by the airborne channel.

2556

Tolhurst, G.C. THE EFFECT ON INTELLIGIBILITY SCORES OF SPECIFIC INSTRUCTIONS REGARDING TALKING. Contract N6ONR 225 25, Proj. NR 145 993, Proj. NM 001 064.01.35, Rep. 35, Nov. 1954, 6pp. USN School of Aviation Medicine, Pensacola Air Station, Fla. (Ohio State University Research Foundation, Columbus, Ohio).

2556

This study investigated the effect on speaker intelligibility of the following instructions: talk loudly, articulate precisely, and talk fast. One hundred forty-seven naval flight students served as speaker-listeners. Two forms of a multiple choice intelligibility test were administered. The first was given without special instruction to the speaker; the second test was taken while the speaker utilized one of the special instructions. A simple analysis of variance was performed on the intelligibility scores for the experimental conditions. The effectiveness of the instructions and how they affect intelligibility is considered. Also discussed are implications for the length of voice communication courses.

2559 DUNLAP, J.W. THE HUMAN ENGINEER: NEW ALLY FOR THE ELECTRICAL ENGINEER. Electrical Engineer, Ind., Feb. 1952, 6pp. (Dunlap and Associates, Stamford, Conn.).

This article deals with the interrelation of engineering with considerations of psychological and physiological behavior. The human component is first examined briefly. Some typical problem areas in this field are then discussed: equipment design, inspection, training, or learning, and maintenance. (METAS)

2560

Spence, K.W. PRELIMINARY REPORT ON FIXED GUNNERY SLIDE FILM DEFLECTION TRAINER (3-C-9). Contract NSORI 57, Proj. 20 B 1, Rep. 57 1 2, July 1945, 15pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

2560

This is a report on a preliminary investigation of the Fixed Gunnery Slide Film Deflection Trainer. Ten advanced graduate students in psychology were given preliminary instruction in the principles of fixed aerial gunnery and were then trained on one film and tested on a second. Proficiency, measured in "hits" resulting from squeezing a trigger switch, is analyzed as a function of amount of training and of time interval allowed for "firing." Introspective reports regarding cues employed in learning the task are analyzed. The accuracy of a photoelectric scoring system is evaluated.

Payne, T.A., Dougherty, D.J., Hasler, S.G., Skeen, J.R., et al. IMPROVING LANDING PERFORMANCE USING A CONTACT LANDING TRAINER. Contract NSORI 71(16), Proj. 20 L 1, SDC TR 71 16 11, March 1954, 32pp. USN Special Devices Center, Port Washington, N.Y. (University of Illinois, Urbana, Ill.).

2561

This study evaluated the 1-CA-2 Link trainer as a device for teaching approaches to landing. Two groups of six college students with no previous flying experience underwent basic flying training. The experimental group was given additional instruction in the Link trainer, with a perspective view of a runway projected on a screen in front of the trainer. The groups were compared with respect to number of trials and number of errors prior to achieving a standard level of proficiency on five measures of performance in approach and landing in an SHU aircraft.

Matheny, W.G., Brunner, E.J., Nicklas, D.R. & Wilkerson, L.E. STUDY OF ARMY AVIATION TRAINING. Contract NSORI 07143, Proj. 20 H 3, SDC TR 71 43 1, Oct. 1953, 147pp. USN Special Devices Center, Port Washington, N.Y. (University of Illinois, Urbana, Ill.).

2562

A survey of the Army Aviation Training Program was conducted to determine whether the training curriculum provides adequate preparation for the operational task. The data were obtained through interviews with combat returnees and instructors, photographic records and accident records, and analyses of grades given students on each item in the syllabus. Students and instructors were required to rank items of the syllabus in order of difficulty. Recommendations for various classroom training aids and procedures were made for training in the fixed wing flight and ground school, in the rotary wing flight and ground school, of helicopter mechanics and pilots, and of flight observers.

Rock, R.T., Jr., Duva, J.S. & Murray, J.E. A STUDY OF LEARNING AND RETENTION FROM TELEVISION INSTRUCTION TRANSMITTED TO ARMY FIELD FORCE RESERVEVISTS. FINAL REPORT. Contract NSORI 47502, Proj. JR 781 007, SDC Proj. 20 E 5A, SDC TR 476 02 53, May 1951, 50pp. USN Special Devices Center, Port Washington, N.Y. (Fordham University, New York, N.Y.).

2564

In an evaluation of television as a medium for mass training, approximately 3000 Army Field Force Reservevists were required to view eight one-hour instructional programs on television. Amount of learning was measured by the difference between scores on a test administered immediately before and immediately after each program. Retention was measured also at intervals of 1, 2-4, and 5-6 weeks. Scores were analyzed with respect to the rank of the trainee and to instructional treatment. Results of a questionnaire survey of opinions on the programs were also presented.

Hirsch, R.S. & Saul, E.V. ARMY MARKSMANSHIP AND GUNNERY TRAINING. I. TRAINING REQUIREMENTS FOR INDIVIDUAL WEAPONS. Contract NSORI 494(01), SDC TR 494 01 1, June 1952, 37pp. USN Special Devices Center, Port Washington, N.Y. (Tufts University, Medford, Mass.).

2565

This is a survey of training aids and procedures employed by the Army in tracking gunnery and marksmanship in individual weapons. Observations conducted at seven Army installations are tabulated for 11 weapons and are subsumed under the following headings: instructional topic, training aids actually employed and needed, appraisal of extrinsic motivation, factor of learning, (applications of basic principles), instructor-trainee ratio, differences between training and operational situations. Recommendations involving aids and procedures are made. General training policies (realism of objectives, etc.), human engineering problems (adequacy of design of weapons), and methods for the measurement of proficiency are discussed.

2569 Black, J.W., Lightfoot, C. & Mitchell, J. THE EFFECT ON VOCAL FREQUENCY AND INTENSITY OF HEARING SUSTAINED TONES WHILE READING. Contract N70N 411, T.O. 1, (Proj. NR 782 004, Tech. Rep. 411.0 1 7, ca. 1949, 8pp. USN Special Devices Center, Port Washington, N.Y. (USN School of Aviation Medicine and Research, Pensacola Air Station, Fla.).

Pure tones, similar in frequency to fundamentals of voices, were heard by Ss at a constant intensity. An S read a nonsense syllable after 10-sec. exposure to a tone. The frequency of the tone was then changed and after a 10-sec. exposure the S read another syllable. This continued through 30 syllables. Each of 10 experimental frequencies was heard 3 times. The same vowel appeared in all of the syllables. Measurements of frequency and intensity of the read syllables were analyzed. Both vocal frequency and intensity increased as the frequency of the stimulus tone became higher. The procedure was repeated with the loudness level instead of the intensity of the stimulus tones held constant. The results were inconclusive.

Black, J.W. EXPLORATORY STUDIES: THE RELATION BETWEEN 'UNCERTAINTY' AND VOCAL INTENSITY. (PSYCHOLOGICAL STUDIES OF TRAINING TECHNIQUES). Contract N70N 411, Proj. NR 782 004, SDC Proj. 20 K 2, SDC TR 411.1 6, June 1949, 11pp. USN Special Devices Center, Port Washington, N.Y. (USN School of Aviation Medicine, Pensacola Air Station, Fla.).

2570

Two experiments were presented which dealt with the problem of isolating those physical attributes of voice upon which a listener makes the judgment that a speaker is "uncertain" (in what he is saying). Subjects 1) heard words at different levels of intensity and responded by repeating and saying the opposites of the words, 2) heard digits and letters and repeated the symbols and solved problems, and 3) read symbols on a visual acuity chart. Results discussed the "uncertainty" evidenced in these tasks (auditory and visual) of grossly different levels of difficulty in terms of the relation between stimulus intensity and spoken response intensity.

Bliger, R.C., Hanley, T.D. & Steer, H.D. THE RELATIVE EFFICIENCY OF MONAURAL VERSUS BINAURAL LISTENING IN VARIOUS LEVELS OF NOISE. Contract N0NR 104, Proj. 20 F 8, Tech. Rep. 104 2 40, April 1955, 11pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

To determine the relative effectiveness of monaural and binaural listening in various levels of ambient noise (55, 80, and 105 db), 13 normal hearing Ss were tested in 4 listening conditions: binaural with 2 phones in phase, binaural with 2 phones out of phase, monaural with unused ear covered with a dead phone, and monaural with unused ear exposed to ambient noise. Analysis of the data indicates that binaural conditions were superior to monaural and that differences among noise levels were consistently significant, although, at the highest noise level, the ear-exposed condition was most similar to both binaural conditions. In all 3 noise levels threshold variability remained relatively constant. (MFIAS)

2572 Asher, J.W., Hanley, T.D. & Steer, H.D. AN INVESTIGATION OF LISTENER ACCURACY IN AN ENVIRONMENT OF RELEVANT CONFLICTING VOICE SIGNALS. Contract N0NR 104, Proj. 20 F 8, Tech. Rep. 104 2 39, Dec. 1954, 20pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

The present investigation makes use of the general design of the CIC to test the influence of 4 situational aspects on the information conveying efficiency of the system. The 4 factors tested were the location of loudspeakers and the intensity levels at which the speakers operated, the position of the message source with respect to the bodily orientation of the listener, and the specific codeword which identified for the listener the message to which he was to respond. The major findings of this study can be summarized as follows: a) Spatial separation of loudspeakers resulted in higher listener scores than in the banded speaker position. b) Higher listener scores were obtained with a playback intensity level of 60 db than with a level of 75 or 90 db. c) There were significant differences in listener scores when the codeword identifying the messages differed. d) There were no significant differences in listener scores when the S's left or right shoulder was facing the speaker. However, when the S faces the speaker, listening scores are significantly improved.

2573

Shaffer, G.L., Bilger, R.C., Hanley, T.D. & Steer, M.D. THE RELATION BETWEEN DURATION OF EXPOSURE TO HIGH LEVEL NOISE AND LISTENER ACCURACY. Contract N6ori 104, Proj. 20 F 8, Tech. Rep. 104 2 38, Dec. 1954, 13pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

This study was designed to discover whether noise exposure results in impaired listening ability in a situation in which the individual remains in the noise environment and the listening test stimuli are presented at a constant level with respect to the noise level. 4 listening-in-noise tests were administered; between tests experimental Ss removed their headphones in the presence of the test noise, control Ss in quiet. Test periods were 55 min. and 3 hrs. 25 min. in length. The results, from 198 Ss, indicate that listener performance was not affected by exposure to noise between tests, performances were parallel from test to test and successive scores were significantly different only during the shorter test period. (HEIAS)

2574

Miller, I., Bilger, R.C., Hanley, T.D. & Steer, M.D. COMMUNICATION IN NOISE: SUCCESS RELATED TO THREE DEGREES OF EMPHASIS ON VERBAL CONTEXT. Contract N6ori 104, Proj. 20 F 8, Tech. Rep. 104 2 36, Dec. 1954, 11pp. USN Special Devices Center, Port Washington, N.Y. (Purdue University, Lafayette, Ind.).

The purpose of this experiment was to investigate what effect minimizing or emphasizing attention to an objective verbal context will have upon the intelligibility of spoken words when the amount of information and signal-to-noise ratio are held constant. In this study, the Ss were administered multiple-choice intelligibility tests under noise conditions by the following methods: a) The S checked the words heard from among four alternatives for each test item. b) The S whispered four alternatives before the test word was spoken. c) The S did not see the alternatives before the word was spoken by the experimenter. The data collected in this study indicate that listener scores are improved under the condition in which verbal context of the test items is stressed; on the other hand, listener scores are lessened under the condition in which the verbal context is minimized.

2575

Spilka, B., Hanley, T.D. & Steer, M.D. RELATIONSHIPS BETWEEN CERTAIN ASPECTS OF PERSONALITY AND SOME VOCAL EFFECTS OF DELAYED SPEECH FEEDBACK. Contract N6ori 104, Proj. 20 F 8, Tech. Rep. 104 2 37, Oct. 1954, 25pp. SDC, Purdue University, Lafayette, Ind.

The degree of relationship between certain personality traits: self-percept stability, schizoid tendencies, paranoid tendencies, and rigidity, and several speech variables: syllable duration, % phonation time, mean vocal intensity, and vocal intensity variance, was investigated. Stress upon the vocal process was produced by auditory feedback. 129 Ss were used. The results indicated that the amount of change occurring in vocal intensity variation due to delayed speech feedback appears to be most closely related to personality functioning. Increases in vocal intensity variation appear to be positively related to self-percept stability and paranoid tendencies and negatively related to rigidity. Decreases in vocal intensity variation appear to be positively related to schizoid forms of behavior.

2576

Spilka, B. SOME VOCAL EFFECTS OF DIFFERENT READING PASSAGES AND TIME DELAYS IN SPEECH FEEDBACK. Speech Hearing Disorders, 1954, 19, 37-47. Contract N6ori 104, Proj. 20 K 1, Tech. Rep. 104 2 32. ONR, SDC, (Purdue University, Lafayette, Ind.).

This study determined some vocal rate, duration and intensity correlates of the phenomenon delayed speech or side-tone feedback. Sample size, independence between delay-times, length and content of reading passages, and the duration of the delayed side-tone intervals were rigidly controlled. Each of 2 Ss read a selected passage (8 passages) under a given delay-time (8 delay-times). Results were recorded in terms of syllable duration, % phonation time, mean vocal intensity, and vocal intensity variance. Analysis of variance technique was used on these data. Under the delayed speech feedback conditions syllable duration, % phonation time, and vocal intensity were found to increase and vocal intensity variations to become greater. Another finding was the significant interaction between reading passage and delay-times. (HEIAS)

Spilka, B., Bilger, R.C., Hanley, T.D. & Steer, M.D. THE RELATIONSHIP BETWEEN TALKER INTELLIGIBILITY AND MESSAGE FAMILIARITY. Contract N6ori 104, Proj. 20 F 8, Tech. Rep. 104 2 30, Oct. 1954, 5pp. SDC, Purdue University, Lafayette, Ind.

To determine the extent to which talker intelligibility in noise is related to the talker's familiarity with the message to be transmitted, 2 groups equated with respect to talker intelligibility were tested under different conditions designed to give the talkers differing degrees of familiarity with the message to be transmitted. One group merely heard the words they were to repeat, the second group received additional cues from multiple-choice answer sheets which provided aids in selecting and pronouncing the words. The data, from 92 Ss, indicate that the group given visual cues in addition to auditory cues achieved a significantly higher mean intelligibility score than the group who only heard the words to be transmitted.

Fletcher, R.M. PROFILE ANALYSIS AND ITS EFFECT ON LEARNING WHEN USED TO SHORTEN RECORDED FILM COMMENTARIES. Contract N6ONR 269, Proj. 20 E 4, SPECDEVEN TR 269 7 55, Aug. 1955, 26pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State University, State College, Penn.).

2589

In this study the profile technique (a method for production evaluation of training film scripts) was investigated in terms of its application to shortening instructional material. The commentaries of two films were shortened with and without the use of this technique. These versions along with an intact, complete version of the commentary were used with various groups of Ss. Amount of learning of material was measured by a multiple choice question test. The results are discussed in terms of the differences in degree of learning with each version of the commentaries.

2590

McNiven, M. THE EFFECTS ON LEARNING OF THE PERCEIVED USEFULNESS OF THE MATERIAL TO BE LEARNED. Contract N6ONR 269, SPECDEVEN Proj. 20 E 4, Tech. Rep. SPECDEVEN 269 7 54, Aug. 1955, 33pp. USN Special Devices Center, Port Washington, N.Y.

2590

To discover whether material that was perceived to be useful is learned better than material not so perceived, a rating form and an attitude scale were developed and tested on 473 senior high school subjects. Three instructional films (atomic energy, first aid, knowledge of car parts and construction) were selected as the learning task. Both temporal goal distance (need to use learning) and psychological goal distance (perceived usefulness of learning) were varied by means of varying instructions to the five groups of subjects. Analysis was based on attitude scale, ranking form, pre- and post-test scores, and intelligence test scores. Implications of the results for learning theory and for the construction of training films are discussed.

Grosslight, J.H. & McIntyre, C.J. EXPLORATORY STUDIES IN THE USE OF PICTURES AND SOUND FOR TEACHING FOREIGN LANGUAGE VOCABULARY. Contract N6ONR 269, Proj. 20 E 4, SPECDEVEN TR 269 7 53, Aug. 1955, 57pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State University, State College, Penn.).

2591

To discover the value of still and motion pictures with and without sound for the learning of foreign languages, 409 Ss were shown various film versions of 20 Russian-English words (e.g., words alone with still pictures, with silent motion, etc.). In another aspect of the study, 538 Ss were given all possible variations of sound and film presentations and in addition the order of words was varied. The results are discussed in terms of those aspects of film presentation which appear to aid acquisition of a foreign language.

Carpenter, C.R. (Dir.). EVALUATION OF THE FILM: MILITARY POLICE SUPPORT IN EMERGENCIES (RIOT CONTROL) TF19 1701. Contract N6ONR 269, Proj. 20 E 4, SPECDEVEN TR 269 7 52, Oct. 1954, 37pp. USN Special Devices Center, Port Washington, N.Y. (Instructional Film Research Program, Pennsylvania State University, State College, Penn.).

2592

To discover whether the training objectives of films can be attained through utilization of simpler and less expensive production methods, a comparison was made among three versions of a film: 1) the original motion picture, 2) a filmograph using staged action, and 3) a filmograph with certain scenes replaced by stock shots. The content of the films dealt with regulation of crowds (mobs, riots, etc.) and following presentations of each version to various groups of Army trainees, information and attitude tests were administered. The results are discussed in terms of the relative effect upon learning and attitudes of each type of film.

McIntyre, C.J. TRAINING FILM EVALUATION: FE254 - COLD WEATHER UNIFORMS. Contract N6ONR 269, Proj. 20 E 4, SPECDEVEN TR 269 7 51, Aug. 1954, 14pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State University, State College, Penn.).

2593

To discover whether a humorous approach in a training film has greater teaching value than a film entailing the same instruction but presented in a straight-forward manner, 426 trainees were shown either one or two of three versions of the same film: 1) humorous, 2) humorous portions eliminated and titles substituted, and 3) substitution of blank film for humorous portions. Following the presentation each S was tested for amount of information and Ss presented with two versions rated their preference. The results are discussed in terms of the relative effect of each film upon amount of information learned.

2594

VanderMeer, A.W. TRAINING FILM EVALUATION: COMPARISON BETWEEN TWO FILMS ON PERSONAL HYGIENE: TF8-155 AND TF8-1665. Contract N6ONR 269, Proj. 20 E 4, SPECDEVEN TR 269 7 50, Oct. 1953, 27pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State College, State College, Penn.).

2594

This study was designed to evaluate the teaching effectiveness of two films dealing with personal hygiene: 1) a film using a "singing commercial" approach and 2) a less costly film employing a more straight-forward instructional approach. One hundred and seventy-six recruits were shown either one of the two films and then given an information test. Behavioral measures (hand reaching, foot inspection, etc.) were also made before and after the film. The results are discussed in terms of the relative effect of each film upon acquisition of factual knowledge and change in personal hygiene practice.

Lefkowitz, E.F. THE VALIDITY OF PICTORIAL TESTS AND THEIR INTERACTION WITH AUDIO-VISUAL TEACHING METHODS. Contract N6ONR 269, Proj. 20 E 4, SPECDEVEN TR 269 7 49, Aug. 1955, 18pp. USN Special Devices Center, Port Washington, N.Y. (Pennsylvania State University, State College, Penn.).

2596

This is a study of pictorial tests to discover how accurately they should simulate the actual performance test in order to serve as a valid experimental means of testing the effectiveness of audio-visual teaching methods. The identification of nomenclature and function of the Mark IV 38-caliber projectile hoist was taught to a large group of Ss using two forms of pictorial displays: 1) black and white photographs, and 2) outline drawings. Results are discussed in terms of the conditions under which pictorial tests measure learning best and the relation between pictorial tests and pictorial teaching aids.

Curtis, F.L. THE INFLUENCE OF PRACTICE ON THE DYNAMICS OF MUSCULAR TENSION. *Journal of Physical Education*, June 1949, 25(3), 344-411. (University of Missouri, Columbia, Mo.).

2597
To test the effect of muscular tension on motor performance, six groups of 32 subjects practiced for 30 trials on a modified Koehn pursuit motor while operating a dynamometer with the left hand. Tension to be maintained was different for each group (1/4, 1/2, 3/4 of maximum strength). Control (0) performed the pursuit task with no operating of left hand. Time on target for each trial is analyzed as a function of dynamometer tension, and results are compared with data on maintaining under tension. An hypothetical explanation of the results is discussed.

Casper, C.R. (Ed.). A BIBLIOGRAPHY OF RESEARCH, UTILIZATION AND RESEARCH ON INSTRUCTIONAL FILMS. Contract NCOR 269, Proj. 20 E 4, SDC TR 269 7 40, Nov. 1952, 10pp. *USE Special Services Center*, Port Washington, N.Y. (Pennsylvania State University, State College, Penn.).

2603
This is an extensive bibliography of research studies on the production, use and evaluation of instructional films up to 1952. Some references are included which are indirectly related to instructional films, for example, articles and books deal with radio, music, learning theory, research methods, etc.

2604
Hurst, P.W. Jr. RELATIVE EFFECTIVENESS OF VISUAL DISCLOSURES TO KINESCOPE RECORDINGS AND TRAINING FILMS. Contract NCOR 269, Proj. 20 E 4, SUPPLEMENT TR 269 7 42, May 1952, 2pp. *USE Special Services Center*, Port Washington, N.Y. (Pennsylvania State University, State College, Penn.).

2604
In a replication of a previous study, the investigators attempt to discover the relative effectiveness of the visual disclosures to kinescope recordings and training films. Twelve groups comprising a total of 631 subjects were given one of two instructions: 1) "This is a kinescope recording of a television program" or 2) "This is a training film". Subjects were shown one of five films and pre- and post-tested for amount of knowledge of content of the film. The results are discussed in terms of the degree of learning which occurred under each of the two types of instruction.

Nelson, E.L. & VanderWeer, A.M. THE RELATIVE EFFECTIVENESS OF DIFFERENT COMMENTARIES IN AN ANIMATED FILM ON ELEMENTARY METEOROLOGY. Contract NCOR 269, Proj. 20 E 4, SUPPLEMENT TR 269 7 43, June 1952, 10pp. *USE Special Services Center*, Port Washington, N.Y. (Instructional Film Research Program, Pennsylvania State University, State College, Penn.).

2605
This is an investigation of the relation of the sound track of a training film to the instructional effect of that film. The sound track of a film on meteorology was modified by improving language intelligibility, increasing number of personal pronouns, shortening sentences, and so forth, so that four film versions, each emphasizing a different aspect of improvement, were obtained. Two hundred and ninety-one subjects were shown one of the four versions and pre- and post-tested for amount of training film content. The results are discussed in terms of degree of learning which occurred under each version of the sound track.

Harricks, J.E., Bowler, D. & Krug, R.E. TRAINING 90 MM AA GUN CREW. APPENDIX II - STATISTICAL ANALYSIS. Contract W300 250, Proj. 20 H 12, Tech. Rep. 495 01 4-2, Sept. 1953, 47pp. USN Special Services Center, Fort Washington, N.Y. (Ohio State University Research Foundation, Columbus, Ohio).

2501
This is an appendix which reports the basic data and the statistics of inference concerning the data of Human Engineering Report SpecDevGen 495-01-4 (Training 90 MM AA Gun Crew). (See Accession No. 2579).

2502
Harricks, J.E., Bowler, D. & Krug, R.E. TRAINING 90 MM AA GUN CREW. APPENDIX III - A RECOMMENDED PROGRAM FOR ADVANCED INDIVIDUAL TRAINING IN ANTIAIRCRAFT ARTILLERY. Contract W300 250, Proj. 20 H 12, Tech. Rep. 495 01 4-3, Sept. 1953, 47pp. USN Special Services Center, Fort Washington, N.Y. (Ohio State University Research Foundation, Columbus, Ohio).

2503
This is an appendix to Human Engineering Report SpecDevGen 495-01-4 (see Accession No. 2579), Training 90 MM AA Gun Crew, which presents a discussion and examples of application of some methods and principles which are recommended for consideration in the modification 90 MM AA training program. Some of the concepts dealt with are trainee orientation vs. equipment orientation, the problem of measuring performance, the integration of trainees in a training program, etc., as well as specific recommendations for crew training. 1.

2504
Harricks, J.E., Bowler, D. & Krug, R.E. TRAINING 90MM AA GUN CREW. APPENDIX I - HISTORY OF THE PROJECT. Contract W300 250, Proj. 20 H 12, Tech. Rep. 495 01 4-1, Sept. 1953, 47pp. USN Special Services Center, Fort Washington, N.Y. (Ohio State University Research Foundation, Columbus, Ohio).

2505
This is a technical appendix to Human Engineering Report SpecDevGen 495-01-4 (see Accession No. 2579), Training 90 MM AA Gun Crew, which presents a history of the project. The purposes, techniques, and research designs are presented.

2616
Harricks, J.E., Bowler, D. & Krug, R.E. TRAINING 90MM AA GUN CREW. APPENDIX IV - TRAINING AIDS AND DEVICES. Contract W300 250, Proj. 20 H 12, Tech. Rep. 495 01 4-4, Sept. 1953, 71pp. USN Special Services Center, Fort Washington, N.Y. (Ohio State University Research Foundation, Columbus, Ohio).

2616
This is a technical appendix to Human Engineering Report SpecDevGen 495-01-4 (see 2579) which deals with the training aids and devices utilized in training 90MM antiaircraft gun crews. Some of the aids and devices described are as follows: oval and plastic overlays, plastic mockups (e.g., leveling, indicator regulator, gunner's quadrant mockups), M33 operational control panel mockup, charts, fire and plotting boards, and recording forms. Recommendations concerning the use of additional training devices are presented. 1.

2618
Vossner, Barbara L. INDICATORS OF BEHAVIOR DECREMENT: EFFECTS OF STRESS AND DISPLAY-CONTROL RELATIONSHIPS ON AEROBIC DISCRIMINATION. Proj. DA 19 007 MD 22 (G.I. 19-52). Tech. Rep. 21, Feb. 1954, 74pp. DA Medical Research & Development Division, Office of the Surgeon General, University of Maryland, College Park, Md.).

To determine the effects of task-induced stress on sensorimotor performance, 35 performed a vigilance type task under speed-stress, display-control stress, and monetary conditions. Performance was measured in terms of: percent of display attended relative to stimulation; percent of correct responses; stability of response; and subjective evaluation of stressfulness. The data were analyzed by analysis of variance techniques and correlation. Performance decrement was described relative to amount and kind of stress, attentional emphasis and display position, and type of response in the task situation.

Bradley, J.V. EFFECT OF GLOVES ON CONTROL OPERATION TIME. Proj. 7192-71514, WADC-TR-56-532, Nov. 1956, 11pp. Aero Medical Laboratory, WADC, Wright-Patterson AFB, Ohio.

2619
To investigate differences between bare-handed and gloved performance of instrument control operations, five types of controls (push buttons, toggle switches, knobs, horizontally and vertically operated levers) were operated at room temperature by 30 subjects. The hand was clothed as follows: no glove, wool glove, double glove, i.e., leather over wool. Each subject performed 33 times a sequence of operations in which each of the five controls on each of four panels was operated once (11 sequences for each glove condition). Operation times were measured and analyzed for differences due to wearing gloves, type of glove, and type of control. The findings are discussed in terms of the particular aspects of the apparatus used.

2622
Allison, H.C., Day, E. & Webster, J.C. EVALUATION OF THE USN OPERATIONAL FLIGHT TRAINERS. Contract NOME 99902, Proj. 20 A 9, SPECIFICATION 999 2 1, March 1954, 8pp. USN Special Devices Center, Port Washington, N.Y. (The Psychological Corporation, New York, N.Y.).

2622
This study presents an extensive evaluation of the USN Operational Flight Trainers. Two broad problem areas were investigated: 1) how much transfer of training can be obtained through the use of the trainer and 2) the development of improved utilization techniques. The evaluation was conducted primarily by comparing the trainer with other trainers while performance was measured against a "no-trainer" condition. The results are treated in terms of comparative flight proficiency exhibited by groups of subjects utilizing the various trainers.
T. G. I. R 8

2623
Edgerton, H.A. (Princ. Investigator). A STUDY OF THE UTILIZATION OF FOUR REPRESENTATIVE TRAINING DEVICES. Contract NOME 36307, Proj. 20 A 104, SDC TR-383 7 2, April 1952, 8pp. USN Special Devices Center, Port Washington, N.Y. (Richardson, Bellows, Henry & Co., Inc., New York, N.Y.).

2623
This study was designed to analyze the utilization of four representative training aids in Naval aviation electronics schools. Four methods of evaluation were used: 1) interview with students, 2) interview with instructors, 3) an observer's check list, and 4) a form constructed for the evaluation of training aids and devices. The results are discussed in terms of evaluation of the representative aids' effectiveness and the implications for changes in both design and use of these training devices to increase their effectiveness. Suggestions are made concerning methods by which instructors can improve their own utilization studies of training aids.

Contract NMR 1042(00), Proj. 20 F 72, SPEC DEV TR 1042 00 1, Aug. 1953, 47pp. USN Special Devices Center, Port Washington, N.Y. (Richardson, Bellows, Henry & Co., Inc., New York, N.Y.).

2630

Recommendations are presented for the design of the instructor's station in the Trained Operational Flight Trainer. The topics covered include the general layout of the station and the grouping of the instruments and controls within a panel. Specific recommendations with respect to such features as illumination, switch design, and labeling of instruments are made, also.

Melgand, J.E., Bishop, E.M. & Chantrell, R.C. A STUDY OF THE UTILIZATION AND DESIGN OF THE SPECIAL DEVICES CENTER MARK 18 MODEL 6 GUNSHOT TRAINER (DEVICE 3-A-428 PROTOTYPE). Contract NMR 1043(00), Proj. 20 F 74, SPECDEVEN TR 1043 00 2, Dec. 1953, 54pp. USN Special Devices Center, Port Washington, N.Y. (Rumlap & Associates, Inc., Stamford, Conn.).

2632

To determine the optimal conditions for the use of the Special Devices Center Mark 18 Model 6 Gunshot Trainer (Device 3-A-428), 27 trainees divided into five groups underwent training with the device with one of the following factors varied: amount of coaching, number of trials per session, intertrial interval, target size, and knowledge of results. Differences in time scores and accuracy of tracking and ranging obtained by the groups are assessed. Transfer of training to the operational situation is evaluated in terms of the gunnery proficiency of 24 air crewmen, six of whom had received training on the device.

McClurken, W.D., Benjamin, H., Drummond, H., Harap, H., et al. CBT TRAINING AID REQUIREMENTS, ARMY WIDE. Contract NMR 1257(01), Proj. 20 CC-1, SPECDEVEN TR 1257 1 1, no date, 163pp. USN Special Devices Center, Port Washington, N.Y. (George Peabody College for Teachers, Nashville, Tenn.).

2633

This study was carried out to determine training requirements in Chemical, Biological, and Radiological Warfare. On the basis of interview, conferences, field visits, and reviews of the literature, recommendations are made with respect to the specifications of training objectives, the assessment of the results of training, the self-evaluation of students, and the use of training aids and methods that stress "actual behavior."

2634
Gordon, N.B. STUDY OF CARRIER LANDING TRAINING. Contract NGR 1013(00), SDC IR 20 A 22 1, 12pp. Naval Air Station, Port Washington, N.Y. (Richardson, Bellows, Henry & Co., Inc., New York, N.Y.).

2634
In an analysis of the effectiveness of training in carrier landing, the following procedures were carried out: individual and group interviews with students and instructors, analysis of errors recorded by Landing Signal Officers, tracking and rating of flight problems by instructors and students, study of 35 successful and 38 unsuccessful flight students, and analysis of 1942 accidents in Carrier Qualifications. Recommendations pertain to training practices (e.g., amount of time spent in landing practice) and to training aids (e.g., a classroom demonstration) in carrier landing training are given.

Miller, G.A., & Taylor, W.G. THE PERCEPTION OF REPEATED BURSTS OF NOISE. J. acoust. Soc. Amer., March 1948, 20(2), 171-182. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.). (GPR, Rep. PHR 43)

Noise interrupted at a steady rate has essentially the same spectrum over the range of frequencies transduced by the earphones as does continuous noise. The frequency corresponding to the rate of interruption is not intensified in the spectrum. Consequently, the ability of listeners to respond differentially to the rate of interruption cannot be explained on the basis of a simple resonance theory of hearing. The rate at which an interrupted noise becomes indistinguishable from a continuous noise depends upon the rate of interruption, the sound-time fraction, and the intensity of the noise. For a sound-time fraction of 0.5, the presence of interruptions can be detected at rates well above 1000 per sec. Differential sensitivity to changes in the rate of interruption (with a sound-time fraction of 0.5) is poor above 250 interruptions per sec. Also at these high rates the listener loses his ability to match the frequency of a pure tone to the rate of interruption. Presumably the ability to perceive interruptions in a random noise depends upon the synchronous firing of the fibers in the auditory nerve. This hypothesis is supported by the correspondence between auditory sensitivity to changes in the rate of interruption of a noise and the tactile sensitivity to changes in the frequency of a vibrating pressure applied to the skin.

Goddard, W.L., & Doe, T.E., Jr. TOLERANCE TIMES OF MEN WEARING INSULATED BOOTS. CPB Rep. 189, July 1952, 11pp. USA Office of the Quartermaster General, Climatic Research Lab., Lawrence, Mass.

6 Ss participated in laboratory studies designed to determine foot protection provided by insulated boots and felt boots at +5 F, insulated boots and felt boots at +20 F, and insulated boots and felt boots at -40 F. At +5 F, significantly greater protection was provided by the insulated boots, regardless of whether the socks were wet or dry. At -20 F, it was determined that the insulated boots, with dry socks, were definitely superior to the felt boots. The insulated boots, with wet socks, gave about the same protection as felt boots. The insulated boots, with dry socks, gave about the same protection as felt boots, with dry socks. At -40 F, tolerance times were about the same for men wearing either the insulated boots or felt boots when the socks were dry. Muliuks with dry socks gave better protection than did the insulated boots with wet socks.

 Cheatham, P.G., & White, C.T. TEMPORAL NUMEROSITY: I. PERCEIVED NUMBER AS A FUNCTION OF FLASH NUMBER AND RATE. *J. exp. Psychol.*, 1952, 44, 447-451. (U.S. Navy Electronics Laboratory)

2644
 To investigate perceived number as a function of flash number and rate, four subjects were presented with groups of flashes (one to twenty), at rates from ten to thirty/second of constant duration and intensity (11 milliseconds, 1400 footlamberts) and reported number of flashes perceived. Numerosity reports are analyzed as functions of flash rate and exposure duration and discussed in relation to basic temporal aspects of vision. T, G, R6.

2645
 Cheatham, P.G., & White, C.T. TEMPORAL NUMEROSITY III AUDITORY PERCEPTION OF NUMBER. *J. exp. Psychol.*, 1954, 47, 425-428. (USN Electronics Laboratory, San Diego, Calif.).

The perceived number of auditory pulses as a function of the presented number was obtained for rates of 10/sec., 15/sec., and 30/sec. It was found that the plots of perceived number vs. presentation time for all 3 rates had approximately the same slope, which corresponded to a perceptual rate of about 10/sec. Since this was in basic agreement with visual results, it was concluded that a common temporal process in the central nervous system acts upon both modalities. R 6

 Craig, F.W., Frankel, H., & Bievens, W.V. THE HEAT BALANCE OF MEN WEARING PROTECTIVE CLOTHING. Proj. 4 68 01 002, Rep. 332, Aug. 1952, 23pp. Chemical Corps Medical Laboratories, Md.

To describe the heat balance of men wearing permeable, semipermeable and impermeable clothing while engaged in moderate work temperate, hot-dry, and hot-humid conditions, 2 Ss walked a level treadmill at 2 mph at 100°F and 12% relative humidity (R.H.), 86°F and 75% R.H. and 84°F and 34% R.H., and at 3 mph at 75°F and 56% R.H. Metabolic rate, storage of heat in the body, and heat loss by evaporation were determined. The effect of semipermeable clothing on the heat balance is described by the clothed weight loss. The influence of a complete clothing assembly on heat loss can be described by 2 conductance terms. Heat storage rate was related to voluntary tolerance time and an index of physiological strain. The first approximation equation thus developed permits prediction of performance in terms of environment, grade of work, and clothing characteristics. R 19

 Games, B.R., Lutz, C.C. & Vail, E.G. T-1 ALTITUDE SUIT EVALUATION IN THE F-86D FLIGHT SIMULATOR. WADC TR 54 170, April 1954, 13pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

2647
 This report is concerned with the use of the inflated T-1 altitude suit in the F-86 D Flight Simulator. Pilots wearing the T-1 suit flew a total of 45 hours in the F-86 simulator with the suit being inflated for 15 hours of this time. The results are presented and discussed in terms of the effect of the T-1 suit in both the inflated and uninflated condition upon flight performance, accessibility of controls, performance of a radar intercept problem, and so forth. Also considered are the implications for training in altitude suit operation.

Brown, J.S., Knauft, E.B., & Rosenbaum, G. THE ACCURACY OF POSITIONING REACTIONS AS A FUNCTION OF THEIR DIRECTION AND EXTENT. AMER. J. PSYCHOL., 1948, 61, 167-182, SOC Contract NSR-57, Proj. 2, revision of Rep. 1. (State University of Iowa, Iowa City, Iowa).

24 Ss made positioning reactions of the right hand and arm after a 2.5 sec. visual presentation of 1 or 4 visual extents (0.6, 1.5, 16, or 40 cm.). The direction and plane of movement were varied giving 6 conditions: a) vertical plane; bottom to top; b) horizontal plane; from near to far (perpendicular to the body); c) horizontal plane; from center to right; d) vertical plane; top to bottom; e) horizontal plane; from far to near; f) horizontal plane; from right to center. All Ss were studied under all conditions and extents. The following results were obtained: a) there is a tendency to overshoot at the shorter distances and undershoot the longer distances under conditions e, b, c, and f; b) the percentage error is maximal at short distances and decreases with increasing distance; c) at comparable distance, movements away from the body exhibit smaller percentage errors than movements toward the body; d) the variability of positioning movements increases significantly with distance under all experimental conditions; e) the variability of positioning movements directed away from the body is greater than that of movements toward the body at distances of 16 and 40 cm. The relationship is reversed, however, for distances of 0.6 and 2.5 cm.

Holland, J.D., & Lee, W.A. THE INFLUENCE OF MESSAGE DISTORTION AND MESSAGE FAMILIARITY: THE THIRD OF A SERIES OF REPORTS ON AUDITORY AND VISUAL MESSAGE PRESENTATION UNDER DISTRACTING TASK CONDITIONS. Contract W33(038) ac 21269, Proj. 7192, Tech. Rep. 34 287, April 1955, 20pp. WASA-ARDC, Aero Medical Laboratory, Wright-Patterson AFB, Dayton, Ohio. (University of Virginia, Charlottesville, Va.).

Broader generalization of earlier findings concerning the relative intelligibility of verbal messages presented aurally and visually was sought by investigation of two additional variables. These were: a) message presentation in distorted form, and b) previous familiarization with the message population. Both of these conditions apply widely in practical operations. Two closely related experiments were conducted to discover: a) the influence of a distracting task on the reception of distorted messages as related to sense channel of presentation, and b) the effectiveness of message familiarity in combating the lowered intelligibility of distorted messages, and the possible influence of sense channel in such an effect. The principal findings were the following: a) introduction of the distracting task significantly reduced the intelligibility of the visually presented messages, while leaving the auditory messages essentially unaffected; b) previous familiarization significantly increased the intelligibility of the distorted messages as presented through either sense channel; c) familiarization was significantly more effective when provided through the same sense channel as that through which the distorted form of the message was subsequently presented.

Cookley, J.D., Pucigna, J.T., & Dunlap, J.W., Jr. HUMAN ENGINEERING REVIEW OF THE MANUAL TELEPHONE SWITCHBOARD SB-86/P AND THE CENTRAL OFFICE, TELEPHONE, MANUAL AN/TTC-5. Contract DA-36-039-SC-64647, DA Proj. 3-99-01-022, SC Proj. 2004A, June 1956, 45pp. Dunlap and Associates, Inc., Stamford, Conn.

2656
To evaluate, from a human engineering viewpoint, the design of the Manual Telephone Switchboard SB-86/P and the Central Office, Telephone Manual AN/TTC-5, the equipment and operating procedures were reviewed. A study of the requirements of the SB-86/P from both the operational and operator viewpoint was made with primary emphasis upon detectability of the line and operator signals and secondary emphasis on operator comfort, visibility, and operability of controls and indicators. The equipment was then evaluated against these requirements, and recommendations made for improved design. The second equipment, AN/TTC-5, was developed as a successor to SB-86/P and evaluated in the same manner.

Appely (see Applezweig), M.H. & Moeller, G. THE ROLE OF MOTIVATION IN PSYCHOLOGICAL STRESS. Contract Monr 556(02), Tech. Rep. 3, Proj. NR 172 228, Jan. '57, Spp. ONA, Connecticut College, New London, Conn.

Considered is the role of motivation in psychological stress with a lengthy discussion on the nature and definition of stress. It is proposed that a meaningful approach to an understanding of psychological stress is through an evaluation of individual motivation. Stress is conceived as an environment-person intersection, dependent upon both the situation and the person. Stress research concentrating on the environment alone might produce only deceptive generalities about what situation may be stressful to most people. (HEIAS) R 9

Ames, A., Jr. & Proctor, C.A. ABERRATIONS OF THE EYE. Amer. J. physiol. Optics, 2(1), 3-37. (Dartmouth College, Hanover, N.H.).

Ordinarily the expression "aberrations of the eye" suggests the common defects of the refractive system which are encountered by the ophthalmologist or refractionist. They are myopia and hypermetropia and corneal astigmatism. Properly the expression includes not only the above mentioned defects but all the aberrations of the lens system of the eye, as spherical aberration, chromatic aberration, oblique astigmatism, or astigmatism of incidence, the chromatic error of magnification, coma, and distortion. This paper deals with the explanation and measurement of these latter characteristics of image formation. The apparatus used to measure these characteristics is described. Some preliminary measurements of these characteristics are given. (HEIAS)

Ames, A., Jr. A NEW BASIS FOR CORRECTING REFRACTIVE ERRORS IN THE HUMAN EYE: VISUAL FACTORS AND COMBINATIONS INVOLVED IN THE SENSITIVITY TO BINOCULAR DISPARITY DIFFERENCES. April 1942, 6pp. Dartmouth College, Hanover, N.H.

The position of the image bundle relative to the retina can only be determined accurately by using the waist of a bundle formed by a light source of high intensity, as very slight forward and back movement of such a bundle is apparent. The dioptric condition cannot be as accurately measured with sources of weak contrast because they would appear equally sharp with large forward and back movement relative to the retina. However, determining the position of the waist of the bundle relative to the retina, in itself, does not indicate the nature of the correction necessary to give a subject good vision. In the first place, it is apparent that, if a subject has spherical aberration and a concentrated core back of the waist of the bundle, it would be a mistake to set the waist of the bundle back on the retina. On the other hand, if the subject had an irregular bundle, such as might result from irregular astigmatism, so that there was no concentrated core back of the waist of the bundle, he would have his best vision only if the waist of the bundle were put back on the retina. To properly correct a subject, therefore, it is necessary to know whether he has a regular bundle and a concentrated core back of its waist produced by spherical aberration. This could be ascertained by determining the depth of focus of a subject. A practical and easy way of doing this would be to put a target, consisting of small black letters on a white background, for example a Landolt C on the face of the targets on the refractive arm of the Ophthalmometer and to determine through how much movement the subject could distinguish small letters. By no other method than the above described can proper corrective refraction be given.

Hawley, H.E. STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS. Contract DA 36 sc 54469, Rep. 1, ca. Oct. 1954, 11pp. DA, Radio Corporation of America, Camden, N.J.

The purpose of the present research is to provide design information leading to improvements in Signal Corps voice communication systems used in and between high-level noise environments, such as encountered in armored vehicles and helicopters. Noise spectra in 8 types of armored vehicles and 3 types of helicopters. No noise levels in excess of 128 db were found. Articulation tests were then conducted to evaluate the communication efficiency of present interphone equipment. Word articulation scores of approximately 20% were obtained. Using the noise spectra obtained, calculations were made of the articulation performance of a system composed of elements within the state of the art. These calculations indicated that 80% word articulation was attainable. Further tests determined that 60% intelligibility can be obtained by modifying existing equipment (AN/VRC-7). The noise levels encountered in armored vehicles and the speech levels used produced temporary hearing losses and presumably will produce some permanent hearing loss with continued exposure. (cf. HEIAS 6506 for a bibliography of speech communication in noise.)

Bass, B.M., Gaier, E.L., & Flint, A.W. ATTEMPTED LEADERSHIP AS A FUNCTION OF MOTIVATION INTERACTING WITH AMOUNT OF CONTROL. Contract N7 NR 35609, Tech. Rep. 7, March 1956, 20pp. ONR, Louisiana State University.

2665

To examine the effects of motivation and amount of control in the tendency to attempt leadership in a group situation, 51 groups (5 subjects each) were studied on ten brief trials by means of metagalvanometry, involving individual and group rank order judgments before and after group discussion of items to be ranked. Groups varied in motivation to perform well (high, middle, low) as measured by pre-test questionnaires (validation studies are included in report). Amount of control was varied within the group by giving to some members power to reward or punish other members. Attempted leadership was defined as the total amount of time spent by the subject in talking in the initially leadership situations. The data were studied by analysis of variance techniques.

USN Electronics Lab. LIST OF HUMAN FACTORS DIVISION REPORTS. Jan. 1956, 21pp. JAN
Electronics Lab., San Diego, Calif.

This is a list of the Human Factors' Division technical and scientific reports and memoranda published by the US Navy Electronics Laboratory since its establishment in 1946. Reports published in professional journals are not listed. The list is divided into two main parts--reports and technical memoranda. The latter are written primarily for internal use at the Laboratory with a restricted external distribution. (The earlier designation of the technical memorandum was "internal technical memorandum.")

2667
Alderson Research Laboratories. ANTHROPOMORPHIC TEST DUMMY - MARK III. ca. 1954, 11pp.
Alderson Research Laboratories, Inc., 10 East 38th St., New York 16, N.Y.

The Mark III Anthropomorphic Test Dummy was developed in response to the need for test subjects that would be human enough to give useful information in situations where live human subjects would be endangered. Such conditions are encountered frequently in blast-effect studies, aircraft and automotive safety research, ejection-seat tests, and the like. Mark III is finding wide application in these fields through its ability to respond like a man in test situations. New avenues of research can be explored when the machine shop is substituted for the hospital in the event that tests become too severe. Mark III was designed to reproduce human proportions, weight distribution, articulations, resilience, and other characteristics which determine the forces which would be imposed upon a man in a given system, the motions which he would make, and his terminal condition. It was not intended, however, that Mark III would duplicate the physical damage which would be inflicted upon a man in this process. This point of view was taken after consultation with many noted investigators in the field of high-acceleration and high-impact man-machine systems. It is predicated upon the fact that actual physiological response to test conditions is highly variable and must be treated statistically. Further, physical destruction of the test dummy introduces an artificial endpoint in the observed data and is costly and inconvenient as well. The proper application of Mark III is one in which physical data are recorded by visual observation, high-speed motion pictures, or instrumentation. These data are then reduced and compared with physiological information to give a forecast of the probable consequences to live human subjects.

Hall, A.L. USE OF STANDARD NAVAL AVIATION OXYGEN EQUIPMENT UNDER WATER. Proj. Rep. NM 001 059-29-01, July 1952, 3pp. USN School of Aviation Medicine, Pensacola, Fla.

Various types of Naval Aviation oxygen equipment were taken underwater to a maximum depth of 65 feet by human subjects. All combinations of oxygen equipment operated satisfactorily under water except the H-2 bail-out oxygen cylinder. The 514 cu. in. oxygen cylinder furnished adequate oxygen for an average duration of 31 min. at a depth of 33 ft. Possible implications are made for aircrewmanship making forced landings on the water who are unable to abandon the airplane before it sinks.

Moore, J.V., Saltz, E. & Hoehn, A.J. IMPROVING EQUIPMENT MAINTENANCE BY MEANS OF A PREPLANNING TECHNIQUE. Proj. 7714, Task 67002, AFPTIC TN 55 26, Sept. 1955, 11pp. USAF Training Aids Research Lab., Chanute AFB, Ill.

2680

This study investigates the effectiveness of a preplanning technique designed to improve trouble-shooting effectiveness. One hundred forty-five airman students in an electrical course were given trouble-shooting problems on a generator system mock-up. Half the men utilized the preplanning technique consisting of writing down all possible causes of the malfunction and outlining a checking procedure; half the men were controls. Control and preplanning groups were compared on number of check points, systematic and repetitive errors, correct location of the malfunction, and time required for correct location. A theoretical rationale of trouble-shooting behavior is included.

Bartlett, M.R. THE DISCRIMINATION OF TWO SIMULTANEOUSLY PRESENTED BRIGHTNESSES. *J. exp. Psychol.*, 1942, 31(5), 380-392. (Brown University, Providence, R.I.).

The operations by which brightness discrimination thresholds are measured have been analyzed, and it is shown that brightness discrimination is a mixture of two ideal types of discrimination. The results of a brightness discrimination experiment of the second type are presented. In this experiment the liminal brightness difference for two adjacent areas exposed simultaneously to the dark-adapted fovea was determined as a function of the time of exposure and as a function of the brightness of the two areas. It was found that for any mean brightness, the difference threshold decreases with longer exposure of the areas; and for any given duration of exposure, the ratio $\Delta I/I$ increases as the brightness becomes very great.

Levine, L., Hershkowitz, J. & Conner, F. REPORT OF INVESTIGATION OF CRITERIA FOR SETTING AIRBORNE NOISE LEVEL LIMITS IN SHIPBOARD SPACES. FINAL REPORT. Proj. 5280 4, Feb. 1953, 8pp. USN Material Lab., New York Naval Shipyard, Brooklyn, N.Y.

It has been proposed that good intelligibility should be obtained if the average speech level is higher than the speech interference (SIL) by at least 9 db. In order to test the correctness of the criteria on which this proposal was based, word articulation scores were obtained for various values of D (D=average speech level minus SIL) between 0 and 21 db, for each of 5 noise spectra. The results show a general agreement with the theory underlying the use of SILs. However, a value of D of 9 db did not correspond to a word articulation of 90% as expected. A value of 12 db for D seemed to correspond more closely to a 90% word articulation score. Although the results were insufficient to verify the method of SILs completely, sufficient data were obtained to indicate that the proposed criteria can be used for shipboard compartments where the noise spectra are of the continuous nature. 2688

This is one of a series of studies designed to provide information about the variables related to organizational effectiveness. Questionnaires composed of groups of relatively homogeneous objective items were given to 213 workers, 244 supervisors, and 29 foremen at the California Division of the Lockheed Aircraft Corporation. The items were designed to measure different characteristics of the organization and its personnel. Criterion data (quality control and production measures and ratings by staff executives) were correlated with dimensions derived from the questionnaires. This report presents the analysis for worker level only.

This report represents a summarization of the present state of knowledge of man's response to the stress of hot environments, referred primarily to the aircraft situation. Included are the means to evaluate the net thermal effect of the diverse physical factors comprising the thermal environment of man, so that all combinations of these quantities may be compared on a common scale of reference. Graphical aids to computation are provided, permitting rapid calculation for standardized or typical conditions. The final expression of thermal effect is in terms of a time duration, arrived at by means of a general body parameter, rate of heat storage. Predictive estimates are provided both for safe tolerable duration of stress and for duration of unimpaired psychomotor performance as a function of body heat storage rate; both design limits are based on the minimum times which have been observed in experiments on normal healthy young men. A series of appendices is provided, which outlines the theoretical considerations and experimental data upon which the charts and procedures for tolerance prediction are based.

Atkinson, C.J. SOME EFFECTS ON RATE AND ON RELATIVE SOUND PRESSURE LEVEL OF SPEECH PRODUCED BY ALTERING SIDETONE DELAY AND SIDETONE LEVEL. Contract DA-36-039 sc-42562, Proj. 3 99 12 022, Supplementary Rep. 3, June 1954, 32pp. DA, Laboratory Procurement Office, Fort Monmouth, N.J. (State University of Iowa, Iowa City, Iowa).

Two measures were simultaneously taken of speech produced under several conditions of sidetone. The measures were duration of speech and relative sound pressure of speech. The method of arriving at these measures was described. Averages of each condition of sidetone have been presented in tables. An analysis of the variance of the duration measures and an analysis of the variance of the sound pressure measures were presented. The discussion related the results of the analyses to the averages of the data in the tables. The results of duration (rate) measures may be summarized as follows: a) rate of speech is affected by the amount of sidetone delay, slower rate for longer sidetone delays up to .09 sec; b) rate of speech is affected by the sidetone level, higher sidetone level yields slower speech; c) there is a significant interaction effect for rate among sidetone level x sidetone delay measures. The results of the analysis of the sound pressure measures are: a) sound pressure of speech is affected by sidetone delay; the effect of a sidetone delay up to .09 sec. was to produce louder speech, greater sidetone delays did not change the sound pressure from the .09 sidetone delay overlap; b) sound pressure is highest when sidetone level is highest; c) the sound pressure measures show interaction effects for sidetone level by sidetone delay, sidetone level by talkers, and sidetone delay by talkers.

Di Toro, A.J., Cohen, M. & Schreiner, S.M. DEVELOPMENT OF NOISE SUPPRESSOR FOR SPEECH COMMUNICATION SYSTEMS. Contract AF 33(616) 705, Final Engineering Report, April 1952, 56pp. AGC, Signal Electronics Group, Griffiss AFB, Rome, N.Y.

The problem of improving signal-to-noise for the condition of speech signals in white noise is considered. It is found that an important statistical difference between speech and noise can be used to provide an improvement in signal-to-noise ratio. An experimental noise suppressor using this principle of noise suppression was built in order to determine its usefulness. This unit is described and although the circuitry is quite simple an improvement of approximately 20 db in signal-to-noise may be obtained. Various methods of measuring this improvement are described. Tests with other forms of noise other than stationary white noise showed that the noise suppressor still operated satisfactorily. In order to show that the operations performed on the signal did not decrease articulation, word tests were conducted. The degradation in articulation was found to be very slight. Because of the successful results obtained with this breadboard unit a miniature model was designed and built. Although time did not permit completing modifications to this unit the results indicate that compact units employing this principle can be built for use in speech communication systems.

Fitts, P.M. (Ed.). HUMAN ENGINEERING FOR AN EFFECTIVE AIR-NAVIGATION AND TRAFFIC-CONTROL SYSTEM. March 1951, 84pp. AGC, Committee on Aviation Psychology, Washington, D.C. (Ohio State University, Columbus, Ohio).

This report submits proposals for a long-range program of human engineering research on problems met in planning and designing equipment for an air-navigation and traffic-control system. The report begins with a brief analysis of the essential functions of the air-traffic-control problem. Next, is considered the question: Which of these functions should be performed by human operators and which by machine elements? Next, the status of knowledge concerning: a) the human operator as part of a communication system; b) visual information displays; c) problems of direct vision from aircraft and d) voice communication as related to air traffic control is systematically reviewed. The report ends with a discussion of the application of research findings. (MEIAS)

2719 Ansbacher, H.L. DISTORTION IN THE PERCEPTION OF REAL MOVEMENT. J. exp. psychol., 1944, 31, (1), 1-23. (Brom University, Providence, R.I.).

A phenomenon has been presented which consists in the fact that an illuminated arc of 36°, rotating at less than fusion speed, and observed with fixed eyes, appears to shrink to a fraction of its actual length. This phenomenon is linked to related observations in the literature. Various aspects of the phenomenon were investigated, and it was found: a) the shrinkage is the greater, the greater the speed (within the limits of the present investigation) (Exp. I); b) the shrinkage is due to telescoping rather than to dropping out of the beginning or the end of the stimulus (Exp. II); c) a sine curve shrinks less than an arc (Exp. III); d) an angle side shrinks less than an arc (Exp. III); e) Gestalt laws are operative in the phenomenon (Exp. III). Greater shrinkage of the stimulus does not necessarily mean less shrinkage, a triangle tending to shrink more than one of its sides (Exp. IV). In the discussion, shrinkage was shown to be a function of the degree of overlap of retinal stimulation, provided the existence of visual pulsations is assumed. The assumption of pulsations is supported by the work of Bartley. A theory of visual pulsations would carry the Gestalt theory of motion perception one step further, namely, that stroboscopic motion perception is physiologically more elementary than 'real' motion perception. The duration of one pulsation was calculated from data of Exp. I to be 46-61 ms., and was compared to similar values previously found significant in the field of visual perception. Three additional experiments (V-VII) brought further evidence that shrinkage is actually a function of the degree of overlap of retinal stimulation during the assumed period of visual pulsation.

Ansbacher, H.L. & Mather, K. GROUP DIFFERENCES IN SIZE ESTIMATION. Psychometrika, 1945, 10(1), 37-56. (Brom University, Providence, R.I. & John Innes Horticultural Institution, Merton, London, England).

Fifty-two subjects differing in sex, age, education and domicile (rural or urban) were given the problem of judging the height of an upright board in a natural setting. A preliminary analysis was made on the basis of the simple initial ratio method, both for the original data in the feet and for original data converted to log units. Because the effects of interaction of the several variables made the results of this method inconclusive, the analysis of variance technique as described by Yates (1) for data where the four factors are not equally represented, was applied. This technique showed that, while together the four factors markedly affected judgment, sex had no significant individual effect, age had the largest individual effect but possibly a spurious one, education and domicile had surprisingly large individual effects, and the effect of the four factors may be regarded as simply additive. The relation of the findings to those of previous investigators is discussed. The authors regard as an important result of the analysis the evidence it offers in the design of further experiments, since it demonstrates the value of equal representation for all classes into which data are to be segregated.

Miller, S.A. & Nadar, W.C. ON THE MAXIMUM LIKELIHOOD ESTIMATE OF THE SHANNON-WIENER MEASURE OF INFORMATION. Contract AF-18(600) 322, Rep. AFRC TR 54-75, Aug. 1954, 22pp. AFRC, Air Research & Development Command, Bolling AFB, Washington, D.C.

The limiting form and the first two asymptotic moments of the sampling distribution of the maximum likelihood estimate of the Shannon-Wiener measure of amount of information per observation drawn from a multinomial distribution are determined. Also, approximations to the bias and the mean square error of the estimate are given.

2733

Reid, L.S. & Morse, W.H. THE INFLUENCE OF COMPLEX TASK VARIABLES ON THE RELATIVE EFFICIENCY OF AUDITORY AND VISUAL MESSAGE PRESENTATION. THE FOURTH OF A SERIES OF REPORTS ON AN EXPERIMENTAL ANALYSIS OF COMPLEX TASK PERFORMANCE. Contract W33(028) AC 21269, Proj. 7152, WADC TR 54-283, April 1955, 11pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Virginia, Charlottesville, Va.).

Previous research on complex task performance has been aimed at an increased proficiency through the manipulation of certain task and operator variables. Among other findings, the results indicated that degree of practice on a patterned component and task complexity were significantly and independently related to total task proficiency, the former tending to increase proficiency, the latter to reduce it. The present study was an attempt to relate these results to those of the experiments comparing auditory and visual message presentation in which auditory presentation had been consistently demonstrated to be superior under conditions of a simultaneous distracting task. Basically, the experiment involved the comparison of auditory and visual message reception while the Ss were simultaneously engaged in performing a visual discrimination-motor task. Experimental variables were sense channel, presentation, message length, and amount of previous practice on the visual-motor task component whose stimuli occurred in a patterned sequence. Results were measured in terms of overall proficiency of message reception and task performance combined. Practice on the motor task improved this overall proficiency, having greater differential effect upon the longer messages combined with task than upon the shorter messages plus task. An original superiority of overall performance for the auditory presentation almost disappeared with increasing practice on the motor task. These results completely confirmed the predicted relationships based upon the previous research in both areas noted above.

Pollack, I. EFFECTS OF HIGH PASS AND LOW PASS FILTERING ON THE INTELLIGIBILITY OF SPEECH IN NOISE. J. Acoust. Soc. Amer., May 1948, 20(3), 259-266. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.). (Rep. PNR 48)

The effect on intelligibility of eliminating either the high frequency speech sounds or the low frequency speech sounds was determined by standardized articulation testing procedures under the special circumstance of a background of white masking noise. In general, it was found that intelligibility increased as the frequency range and the intensity level of the speech signal were increased. Contours are presented which describe the interrelations among a) the frequency range of the speech signal, b) the intensity level of the speech signal, and c) articulation efficiency. For each of the experimental conditions, the articulation index -- a measure developed by the Bell Telephone Laboratories -- was computed. It was found that the scatter of the computed indices, when plotted against the scores actually obtained, was of the same order of magnitude as the intrinsic variability of typical articulation scores. It was found that the relative contribution of the various speech frequencies was not constant, but rather was a function of the intensity of the speech signal relative to the constant white noise masking signal. More specifically, as the intensity level of the speech signal was increased, the relative contribution to intelligibility of the higher speech frequencies increased.
