The purposes of two experiments were: (1) to compare the learning of concepts based on a prominent partial in a complex tone with learning based on harmonic structure of a complex tone; and (2) to determine effect of prior experience and stimuli and hierarchical order on concept formation. Both experiments used the method of anticipation. In the first, six stimuli and six responses were presented to 20 subjects. In the second, 28 subjects were given a comparable task but the stimulus included temporal changes along various dimensions. Analysis of variance was performed on results from both experiments, and results from the two are compared.

Meinmann, E.G., Tulving, E. & Kuchlas, J. THE EFFECT OF OCULOMOTOR ADJUSTMENTS ON APPARENT SIZE. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 32-45. (Vassar College, Poughkeepsie, N.Y., University of Toronto, Toronto, Ontario, Canada & Swarthmore College, Swarthmore, Penn.).

13,039
Three related experiments are reported bearing on the problem of whether changes in apparent size are: 1) caused by one of the oculomotor adjustments, 2) caused by several of them, or 3) are the optical consequences of these adjustments. Apparatus used in all experiments consisted of an arrangement for presenting in rapid succession two stimulus objects whose size or distance was to be compared. The first experiment dealt with relative apparent size of objects presented at different distances and relative apparent distance of the same objects. The second experiment tested the effect of eliminating oculomotor adjustments; in the third, all three of the associated oculomotor adjustments occurred together. Results are discussed as they relate to size constancy experiments. T. G. I. R 11

Story, Anne. FIGURAL AFTER-EFFECTS AS A FUNCTION OF THE PERCEIVED CHARACTERISTICS OF THE INSPECTION-FIGURE. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 46-56. (USAF Cambridge Research Center, Bedford, Mass.).

13,039
To test the hypothesis that set operates, and that figural after-effects (FAE's) differ according to the way subject (S) perceives the inspection-figure (I-figure) 360 S's were divided into seven groups, five of which were controls. I-figure was an ambiguous B-13 presented to group one as a "B" and to group two as "13". It was postulated that greater FAE's should result from inspection of the figure presented as "B". FAE's for the two groups are compared and discussed in terms of the hypothesis. A second experiment tested the hypothesis that kinesthetic after-effects would be greater for S's set to perceive inspection object as open instead of closed. T. I. R 3

13,040
Jenkin, N. & Hyman, R. ATTITUDE AND DISTANCE-ESTIMATION AS VARIABLES IN SIZE-MATCHING. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 68-76. (Harvard University, Cambridge, Mass.).

13,040
To obtain evidence on the general question whether subjects (Ss) who overestimate projected size of a standard under the "analytic" attitude (depth cue available, but S instructed to compare areas of space projected at a given distance; b. two stimulus objects) would do likewise under the objective attitude (cue available), 77 subjects were individually tested in a one-hour session and made judgments under both instructions. Differences in size-distance judgments (scores) were intercorrelated and factors extracted by the centroid procedure. Relationships between estimated distance and size matches were tested for significance. Results are discussed as they relate to a general "tendency toward constancy," and compared with those obtained by other investigators. T. R 11

13,041
Grew, S. COMPLEXITY OF RESPONSE AND TIME OF INITIATING RESPONSES IN RELATION TO AGE. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 83-82. (University of Bristol, England).

13,041
To investigate the effect of complexity of response on response time as this related to age, twelve subjects 20-26 years old, and twelve subjects 50-57 years of age were given a simple perceptual-motor task involving the element of choice. Effects of increased complexity of response on performance in both continuous and discontinuous performance were compared for older and younger subjects. Analysis of variance was used and differences tested for significance. Some possible explanations of obtained results are discussed. T. G. I. R 4

13,042
Shankel, B. SKIN-DRILLING: A METHOD OF DIMINISHING GALVANIC SKIN-POTENTIALS. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 114-121. (Psychological Research Lab., Feltham, England).

13,042
Various methods which were tried in order to convert the skin into an inert, "noise-free" conducting medium were described, and results obtained from the method which was deemed best were presented in graphs and tables. The value of this technique to the field of electro-oculography was discussed. T. G. R 7

13,043
Turner, R.H. NEW USES FOR THE OSCILLOSCOPE AS AN INSTRUMENT OF RESEARCH AND DEMONSTRATION. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 122-124. (Cherlin College, Cherlin, Ohio).

13,043
Thirteen phenomena which may be readily demonstrated with the oscilloscope were listed and briefly discussed. It was suggested that this approach might be used by small laboratories to replace more expensive specialized equipment.

13,044
Eason, R.G. & White, Carroll T. A PHOTOELECTRIC METHOD FOR INTEGRATING MUSCLE-ACTION POTENTIALS. *Amer. J. Psychol.*, March 1959, **LXXII**(1), 125-126. (USN Electronics Lab., San Diego, Calif.).

13,044
The principle basic to the method described in this note consisted of passing light through a given segment of the ink-tracing and measuring with a sensitive photometer the amount of blockage caused by the tracing. The procedure was described in detail and some advantages of the method were noted.

13,045
Thurlock, W. & Tabory, L. EFFECTS OF REPEATED PRESENTATIONS OF A TONE UPON ABSOLUTE LOUDNESS JUDGMENTS. *J. gen. Psychol.*, April 1959, **60**(Second Half), 161-166. (University of Wisconsin, Madison, Wisc.).

13,045
To determine: a) whether repeated judgments of a soft tone will change one's frame of reference so this tone will eventually sound louder and b) whether repeated judgments of a loud tone will cause it eventually to sound weaker, 70 subjects rated the loudness of a 1000 cycles per second tone, repeated 100 times, on an "absolute scale." A different sensation level (10, 30, 50, 70 or 90 decibels) of the tone was used for each experimental group. Friedman's rank test was applied to average ratings for blocks of ten trials for each condition. The results are discussed in terms of Helson's Adaptation Level Theory and other relevant concepts. G. R 5

13,046
Tabory, L. & Thurlock, W. JUDGMENTS OF THE LOUDNESS OF A SERIES OF TONES WITH TWO DIFFERENT RANGE EXPECTANCIES. *J. gen. Psychol.*, April 1959, **60**(Second Half), 167-172. (University of Wisconsin, Madison, Wisc.).

13,046
To determine how the end stimuli of a series of tones affect judgments of the loudness of the series, two groups of subjects (12 in each - all had a minimum of two years training in music) rated, on a numerical scale by the method of Single Stimuli, a 1000 cycles/second tone which ranged in six steps either from 30 to 50 decibels (group 1) or from 70 to 90 decibels (group 2). A set of judgments (50 of each stimulus) was made for each of two expectancies: 1) that range of tones would be as they were demonstrated, 2) that range may be as demonstrated, larger or smaller. Mean ratings as a function of intensity for two expectancies and ratings for end stimuli were analyzed by Wilcoxon signed rank test. T. G. R 5

13,047

Kyan, T.A. MULTIPLE COMPARISONS IN PSYCHOLOGICAL RESEARCH. *Psychol. Bull.*, Jan. 1959, 56(1), 26-47. (Cornell University, Ithaca, N.Y.).

13,047

Methods such as the F test only permit rejection of the over-all null-hypothesis, that all the means are equal, but do not provide a procedure for comparing specific means with each other. Several basic issues involved in multiple comparisons are discussed - a priori versus a posteriori comparisons, concept of error-rate, nonindependence of comparisons, and so forth - and five specific methods for multiple comparisons of means are discussed.

Cyano, T. A NEW PSYCHOPHYSICAL METHOD: METHOD OF TRANSPOSITION OR EQUAL-APPEARING RELATIONS. *Psychol. Bull.*, Jan. 1959, 56(1), 74-79. (Hokkaido University, Japan).

13,048

Questioning whether in using the method of adjustment the amount of illusion (as in the Muller-Lyer) can be measured without destroying or altering the stimulus pattern, the author describes a method which leaves the original stimuli intact while the apparent relation between the stimulus parts is measured. Results obtained with both the old and the new method are compared, using the Muller-Lyer illusion, figural after-effects, and the size-constancy experiment. Theoretical considerations, such as proper classification of the new method, are discussed.

Plutchik, R. THE EFFECTS OF HIGH INTENSITY INTERMITTENT SOUND ON PERFORMANCE, FEELING, AND PHYSIOLOGY. *Psychol. Bull.*, March 1959, 56(2), 133-151. (Hofstra University, Hempstead, N.Y.).

13,049

This paper reviews studies published since 1950. Three hypotheses are advanced relating to research on the effect of noise on various kinds of performance. The effects of sound on feeling are discussed in terms of fatigue effects and the characteristic repetitive sounds in terms of subjective reports. Studies of the physiological effects of repetitive sounds and of loud sounds are also reviewed.

Clarke, N.P., Bondurant, S. & Leverett, S.D. HUMAN TOLERANCE TO PROLONGED FORWARD AND BACKWARD ACCELERATION. *J. Aviat. Med.*, Jan. 1959, 30(1), 1-21. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

13,051

This report stresses the need for further study of man's tolerance for acceleration due to the imminence of manned space flight and extends previous observations by defining optimal body positions for both forward and backward acceleration. Using a rate of onset of 0.5 g per second, plateaus between two and 12 g were maintained with subjects optimally-positioned, until subjective loss of a critical faculty occurred. Tolerance limits were defined and spatial vectocardiography, respiratory rate and changes in functional residual capacity and pulmonary compliance were observed.

Bergin, K.G. MEDICAL ASPECTS OF CIVIL JET AIR TRANSPORT OPERATIONS. *J. Aviat. Med.*, Jan. 1959, 30(1), 22-28. (British Overseas Airways Corporation, London Airport, London, England).

13,052

This paper discusses some of the medical aspects of civilian jet air transport operations. The characteristics of the good pilot are mentioned first and then some of the consequences of decompression at altitude. Oxygen requirements in normal flight and in emergency are discussed generally and then related to Comet aircraft equipment. Finally, brief consideration is given to such special matters as glare and radiation hazard.

Hall, F.G. & Salzano, J. MAXIMAL INSPIRATORY AND EXPIRATORY STROKE VOLUMES IN HUMAN SUBJECTS AS RELATED TO BODY POSTURE. *J. Aviat. Med.*, March 1959, 30(3), 167-172. (Duke University, Durham, N.C.).

13,058
In this experiment, timed maximal expiratory and inspiratory stroke volumes were measured as a function of posture. Subjects were 18 normal young men ranging in age from nineteen to thirty years. During the tests, the subjects were placed in four postures: standing, supine, head up, and body axis at 45 degrees from horizontal, and head down and body axis at 45 degrees from horizontal. Percentage of maximal stroke volume was related to posture.

Feld, A. & White, C.T. THE EFFECTIVENESS OF THE EYE AS A SENSORY-CONTROL MECHANISM. Navy Electronics Laboratory Rep. 934, Oct. 1959, 19pp. (Navy Electronics Lab., San Diego, Calif.).
This investigation was undertaken in order to study the characteristics of human bio-electric potentials to determine the utility of these phenomena for human engineering applications; specifically, to determine the feasibility of controlling electromechanical devices directly by means of the potentials elicited by voluntary eye movements. The results were as follows: a) The control of electromechanical devices by means of bioelectric potentials produced by voluntary eye movements appears to be technically feasible with current electronic and servomechanism techniques; b) Operators could become proficient at this type of task with relatively little training; c) This method of control has several possible future applications. Based upon these results it was recommended that it should be determined to what extent other bioelectric phenomena, such as muscle action potentials, might be used as control mechanisms. (HFIAS)

Scharf, B. CRITICAL BANDS AND THE LOUDNESS OF COMPLEX SOUNDS NEAR THRESHOLD. *J. acoust. Soc. Amer.*, March 1959, 31(3), 365-370. (Northeastern University, Boston, Mass.).

13,073
To measure the loudness of faint sounds as a function of band width and level, over 100 different subjects were asked to match in loudness complexes of different band widths to a comparison sound which was either a pure tone of the same frequency as the center of the complex, or a band of white noise. Subjects used a "bracketing" method in approaching the loudness match. Results are discussed in terms of a critical band "which defines limits with which the spreading of energy leaves the loudness of a complex sound unchanged."

Edwards, R. ACCESSIONS IN SET ADJUSTMENT. *J. ACQUIS. Soc. Amer.*, May 1959, 21(5), 547-557. (Western Electric-Aerometric Lab., Inc., Los Angeles, Calif.).

13,007

This paper reviews the relationships between the noise resulting from commercial jet and propeller airplane operations, including takeoff, taxi, and idle, for various projected traffic densities and various airport building functional design criteria. Presently used criteria are evaluated and new criteria are suggested to fill a gap in the over-all evaluation procedure for short time delays. Methods and examples are presented which expedite initial visualization of the major structural factors in an airport design situation, facilitate decisions for preliminary airport building layout, and enable evaluation of possible wall and roof structures. T. G. I. R 21

13,008

Ward, W.R., Glorig, A. & Silar, Hans L. HEARING SENSORY DEVIATION FROM TEMPORARY THRESHOLD SHIFT AND DEVIATION OF EXPOSURE. *J. ACQUIS. Soc. Amer.*, May 1959, 21(5), 600-602. (Research Center, Subcommittee on Noise, Los Angeles, Calif.).

13,009

To determine whether the manner in which a temporary threshold shift (TTS) is produced is irrelevant to the recovery process, i.e., "If two recovery curves coincide at any point in time they will agree at all points," three groups of five listeners each were exposed to (1) 105 decibels (dB) Sound Pressure Level (SPL) for 12 minutes, (2) 98 dB for 27 minutes, or (3) 90 dB for 117 minutes. One week intervened between successive tests, and order of presentation was balanced so each experimental condition was presented first to one group, second to another, and so forth. Apparatus and procedures were described in earlier articles. Results were discussed in terms of hypotheses presented in the literature, and of generalizability of the findings. G. R 8

13,010

Garner, W.R. ON THE GAMMA LOGNESS FUNCTION, MASKING AND THE LOGNESS OF MULTICOMPONENT TONES. *J. ACQUIS. Soc. Amer.*, May 1959, 21(5), 602-607. (Johns Hopkins University, Baltimore, Md.).

13,011

The loudness data of Fletcher and Munson for multi-component tones were predicted, using the lambda loudness function and two basic assumptions: (1) loudness of components add as the sum of their squares, and (2) the effect of masking is to subtract a constant amount of loudness. The usefulness of the lambda function as compared with other loudness functions for integration of auditory data was discussed. G. R 9

13,012

Galliksen, H. MATHEMATICAL SOLUTIONS FOR PSYCHOLOGICAL PROBLEMS. *Amer. Scientist*, June 1959, 47(2), 178-201.

13,013

This paper attempts to show the value of the mathematical-deductive approach to various psychological problems, and in particular to indicate the very general applicability of two techniques: 1) the usefulness of matrix algebra for expressing a large number of psychological theories and for comparing the theory (observation equations) with data, and 2) the generality of multidimensional scaling as an approach to a variety of psychological problems. Astin, K.M. SOME EFFECTS OF NOISE ON HUMAN BEHAVIOR. *J. ACQUIS. Soc. Amer.*, April 1959, 21(2), 183-200. (Anna State Hospital, Anna, Ill.).

13,021

To differentiate the effects of the stimulus, noise, in terms of its use as a discriminative stimulus or as response-contingent stimulus, the effects of noise were studied (1) when the presence or absence of noise had fixed temporal relationships to neither the response or the reinforcement, (2) to reinforcement, and (3) to responses. 80 subjects participated approximately six hours a day for one to three days. The task was to detect deflection of a meter-needle on a face which subject was required to light in order to detect the signal. Subject was in a closed sound-attenuating room. Noise was delivered through two enclosed speaker systems. Results are discussed in terms of modification in performance which accompanied noise under each of the three conditions. G. R 29

Pollock, I. & Johnson, L.B. REPRODUCTION AND IDENTIFICATION OF ELEMENTS OF AUDITORY DISPLAYS. *J. ACQUIS. Soc. Amer.*, Jan. 1959, 21(1), 7-8. (USAF Cambridge Research Center, Bolling AFB, Washington, D.C.).

13,023

The ability to identify the frequency of tones was examined under four training procedures: 1) control (no information provided), 2) information (informed of correct tone), 3) production (produced tone on oscillator and then informed of correct tone), 4) reproduction (duplicated tone by whistling and then informed of correct tone), the aim being to improve such identifications. For each procedure, 16 listeners identified one out of a set of 12 different possible tones (932-1760 cycles/second) by assigning a numeral to it - experimental series. All four groups of listeners then identified tones with no information provided - control series. The results were analyzed by nonparametric statistical tests and their implications for the operational situation are indicated. G. R 5

Stelcock, J., Pridgen, E. & Davis, R. ON SOME POSTSTIMULATORY EFFECTS AT THE THRESHOLD OF ACTIVITY. *J. Acoust. Soc. Amer.*, Jan. 1959, 31(1), 9-14. (Syracuse University, Syracuse, N.Y.).

13,081

To determine the nature of the poststimulatory shift at the threshold of audibility as a function of duration of test stimulus (10-50 milliseconds), duration of prime stimulus (10-1000 milliseconds), sensation level of prime stimulus (15-85 decibels) and interval between prime and test stimulus (20-about 700 milliseconds), listeners responded to the second of a pair of 1000 cycles/second tones by a modification of Dekey's tracking method. Also, the effects of gradual as well as abrupt cutoffs of the prime stimulus were determined. The results are discussed in terms of other relevant findings, with some mention of underlying neural activity. G. R. 15

Fullack, L. & Pickard, J.M. EXPERIMENTAL OF PEAK-CLIPPED SPEECH AT HIGH NOISE LEVELS. *J. Acoust. Soc. Amer.*, Jan. 1959, 31(1), 14-16. (NSA Operational Applications Lab., Bolling AFB, Washington, D.C.).

13,084

To determine whether peak-clipping of speech improves speech intelligibility in high-level noise environments, symmetrical peak-clipped (0, 12 and 24 decibels) power-compensated speech signals mixed electrically with noise (uniform and low frequency, from 250-4000 cycles at both 90 and 125 decibels) for a range of speech-to-noise ratios were presented to five listeners over matched bilateral earphones. The test materials were the Harvard 19 monosyllabic word tests; the check-list method was employed. Intelligibility scores were presented as a function of the aforementioned variables and a statistical analysis of the test variance of these scores was performed. G. R. 8

Starrick, C.E. EFFECT OF BACKGROUND NOISE ON THE ACTIVITY INTENSIVE DIFFERENCE LIMIT. *J. Acoust. Soc. Amer.*, Feb. 1959, 31(2), 239-242. (Washington University, St. Louis, Mo.).

13,085

To study the effect of random background noise (signal-to-noise ratios of -15, -10, 0 and 10 decibels and quiet) on the difference limit (DL) for pure tones which were varied in frequency (250, 1000, and 4000 cycles/second) and sensation level (20, 40 and 60 decibels), three trained listeners judged when the tone was modulated under all combinations (45) of the above conditions at each of three separate sessions. In addition, the DL of a 1000 cycle/second tone at 10, 30, 50 and 70 decibels for signal-to-noise ratios of -10, 0, 10 and 20 decibels was studied using a loudness matching technique (method of average error). All data were treated by analysis of variance technique. The results are discussed in terms of the simple masking hypothesis. T. G. I. R 9

von Békésy, G. STIMULUS-RESPONSE RELATIONS BETWEEN HEARING AND SKIN SENSATIONS. *Psychol. Rev.*, Jan. 1959, 66(1), 1-32. (Harvard University, Cambridge, Mass.).

13,087

A comparison of hearing and the sensation of vibration along the skin, in which neurophysiological observations and differences were pointed out, demonstrates the feasibility of the analogy between these senses for research in hearing, the phenomena of which are not directly observable. The mode of the cochlea constructed from various threshold denervation studies were utilized for experiments comparing the two senses. Problems of inhibition and summation are discussed and the functioning (law of contrast) of the nervous system demonstrated for both hearing and skin sensation. G. I. R 21

Staats, A.M. & Staats, Carolyn K. HEARING AND IN CORRELATED BUT SEPARATE. *Psychol. Rev.*, March 1959, 66(2), 136-144. (Arizona State University, Flagstaff, Ariz.).

13,089

Two approaches to word meaning were summarized and contrasted: 1) verbal responses made to the word and 2) conditioned mediating responses, part of the response elicited by the object denoted by the word. Word meaning is distinguished from a word's verbal associates and the correlation between intensity of meaning and verbal-associate measures were reported. These approaches were discussed also in terms of the manner in which words acquire meaning. Conclusions as to semantic generalization are set forth. T. I. R 17

Sherr, D.J. INTELLIGIBILITY OF REITERATED SPEECH. *J. Acoust. Soc. Amer.*, April 1959, 31(4), 423-427. (G. and C. Merriam Company, Springfield, Mass.).

13,093
To determine the intelligibility of reiterated speech (interrupted speech with repetitions), several trained listeners responded to 18 PB (phonetically balanced) word lists in quiet and in noise with two duty cycles (25 and 50 per cent) with different rates of interruption of the speech signal (0.05 to 3.6 and 24 to 2640 interruptions/second) and with different build-up and delay times (0.1 to 2.5 milliseconds) in the switching operation. Also a few selected conditions were tested with interrupted speech. Analysis of variance was performed on the data for reiterated and interrupted speech for the 25 per cent duty cycle and several switching rates. The data are interpreted in terms of previous findings and intelligibility functions are presented. T. G. I. R 9

Lehiste, Ilse & Peterson, G.E. VOWEL AMPLITUDE AND PHONEMIC STRESS IN AMERICAN ENGLISH. *J. Acoust. Soc. Amer.*, April 1959, 31(4), 428-435. (University of Michigan, Ann Arbor, Mich.).

13,094
This paper is primarily concerned with consideration of the parameters which contribute to the judgment of phonemic stress in American English within a framework of physiological effort in which four acoustical parameters predominate: speech power, fundamental voice frequency, phonetic quality and duration. The main emphasis here is the inter-effects of amplitude and phonetic quality. Volume indicator and instantaneous amplitude observations on sustained vowels produced under various conditions of speech effort, and on vowels produced in CMC words in a carrier phrase with stress held constant are reported. A theory concerning the perception of linguistic stress, based on judgments of physiological effort involved in producing vowels, is proposed. T. G. I. R 17

13,095
Decherage, P.M. & Marsh, J. AUDITORY LOCALIZATION OF CLICKS. *J. Acoust. Soc. Amer.*, April 1959, 31(4), 486-492. (Central Institute for the Deaf, St. Louis, Mo.).

13,095
To determine the relationship between intensity differential and temporal differences of auditory clicks in the situation where sound is localized in the median by intensity increases compensating for time differences, four observers at each of three click intensities (40, 60, and 80 decibels) adjusted (10 trials) the interaural temporal difference to the auditory sound image of the click was in the median plane. In a second experiment, five observers made the same series of judgments in the presence of each of four levels of high-frequency masking noise which interfered with reception in the basal turn of the cochlea. These results plus various physiological observations are the basis for a discussion concerning the underlying peripheral mechanism for auditory localization. T. G. I. R 23

13,096
Solomon, L.K. SEARCH FOR PHYSICAL CORRELATES TO PSYCHOLOGICAL DIMENSIONS OF SOUNDS. *J. Acoust. Soc. Amer.*, April 1959, 31(4), 492-497. (CSN Electronics Lab., San Diego, Calif.).

13,096
This is an attempt to correlate physical measurements of sounds with their rank orders on seven psychological dimensions: magnitude, aesthetic-evaluative, clarity, security, relaxation, familiarity and mood, which were isolated in a previous study by factor analysis. Fifty subjects ranked 20 passive sound recordings, which had been analyzed for average sound pressure level in each of eight octave bands from 37.5 to 9600 cycles/second, in terms of their acoustically perceived characteristics on the seven dimensions. Correlations (rho) between sound pressure level measurements and rank orders on these seven dimensions were calculated. Also, an analysis of the manner in which 20 sounds clustered within the space defined by the seven dimensions was made. T. G. I. R 3

Pollack, I., Rubinstein, H. & Dicker, L. INTELLIGIBILITY OF KNOWN AND UNKNOWN MESSAGE SETS. *J. Acoust. Soc. Amer.*, March 1959, 31(3), 273-279. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

13,097
To examine the effect of the tendency of concurrence of words upon intelligibility, for unknown and known message sets, five listeners responded to an unknown 144-word message (monosyllabic English content words, 13 from each frequency class in the Large Magazine Count) and five listeners responded to known eight-word messages (composed of aforementioned words) all of which were presented against white noise for a range of signal-to-noise (s/n) ratios (-10 to +15 decibels) which corresponded to several fixed levels of intelligibility (10, 25, 50, 75 and 90 per cent). Also the effect of successive presentations of lists of known and unknown sets without and with correction information was determined. The results are discussed in terms of the adequacy of the PB word lists for intelligibility testing. T. G. I. R 13

Kivra, Doreen. THE EFFECT OF LETTER POSITION ON RECOGNITION. *Canad. J. Psychol.*, March 1959, 13(1), 1-10. (McGill University, Ottawa, Canada).

13,098
Three experiments were performed to answer these questions: 1) Is response sequence the same over a wide range of stimuli, e.g. when gaps and non-alphabetical material are introduced? 2) What is the effect of reading experience? 3) Do changes in duration of the stimulus affect the way in which letters are reported? Materials consisting of letters and geometric forms were presented tachistoscopically. Subjects (83) of two different educational levels were used. Differences in accuracy in recognition of letters were compared for each of four positions, for varied arrangements of stimuli and as between the two educational levels. Results are related to other experiments in the area. T. I. R 4

13,099

Baker, C.H. **THEORY OF VIGILANCE.** *Canad. J. Psychol.*, March 1959, 13(1), 30-42. (Defence Research Medical Labs., Toronto, Ontario, Canada).

13,099

This paper discusses and expands the expectancy hypothesis of vigilance proposed by Baker. Illustrations and supporting data are drawn from studies involving (1) rate of signal appearance, (2) inter-signal interval, (3) signal magnitude, (4) knowledge of results, (5) environmental factors and, (6) knowledge of signal location.

McDonnell, P.R. **PERFORMANCE IN A VIGILANCE TASK WITH AND WITHOUT KNOWLEDGE OF RESULTS.** *Canad. J. Psychol.*, June 1959, 13(2), 68-77. (Defence Research Medical Laboratories, Toronto, Ontario, Canada).

13,100

To investigate performance in a vigilance task with and without knowledge of results, two job subjects were required to depress a microswitch each time light was seen through an aperture. Response time was plotted as a function of task duration and length of inter-stimulus interval for both knowledge and no-knowledge conditions. Analysis of variance was performed on the data and results are discussed as they relate to the hypothesis that inhibition is generated at a faster rate under condition of no-knowledge than under knowledge.

Coxon, J.F. **AGE AND SEX DIFFERENCES IN PURE-TONE THRESHOLDS.** *J. Acoust. Soc. Amer.*, April 1959, 31(4), 478-507. (Pennsylvania State University, Philadelphia, Pa.).

13,101

To determine normal thresholds of hearing for pure tone, for an age-stratified sample, 500 subjects exposed to minimal levels of industrial noise were given detailed otological examination, required to complete a life-history questionnaire, and given audiometric examinations. Results are presented in tabular form by sex, age group, and for each ear for the total group, for a screened group, and for a truncated distribution. Age range was 18-69 years. Curves of presbycusis are presented and compared to those of the American Standards Association (ASA). Differences between curves obtained in this study were compared with those reported by ASA, and related to the proposed revision of present standards of normal hearing.

Swets, J.A. **INDICES OF SIGNAL DETECTABILITY OBTAINED WITH VARIOUS PSYCHOPHYSICAL PROCEDURES.** *J. Acoust. Soc. Amer.*, April 1959, 31(4), 511-513. (Massachusetts Institute of Technology, Cambridge, Mass.).

13,103

To test the assumption made by decision theory that a given signal-to-noise ratio should yield a particular value of the index of detectability (d') regardless of the procedure by which the data are collected, two studies were conducted. One, estimates of d' were obtained from the forced-choice method, with different numbers of alternatives; in the other the yes-no method was used. Estimates of d' obtained under the two conditions were compared and theoretical implications of findings discussed.

Swets, J.A., Shipley, Elizabeth F., Hilly, Sally J. & Green, D.M. **MULTIPLE OBSERVATION OF SIGNALS IN NOISE.** *J. Acoust. Soc. Amer.*, April 1959, 31(4), 544-551. (Massachusetts Institute of Technology, Cambridge, Mass.).

13,104

For sets of experiments investigating the relationship between gain in detectability resulting from additional observations, and type of signal and noise employed were reported. The first presented five observations of each signal in noise, the second employed signals whose frequencies were unknown to the observer. Inferences were made about (1) observer's ability to integrate over time, (2) amount of noise generated by the auditory system, (3) nature of the process of frequency analysis, and (4) observer's mode of dealing with uncertainty as to signal frequency.

Ward, M.E., Glorig, A. & Sklar, Hans L. **HYPERBOLIC REDUCTION OF OCTAVE-BAND NOISE: APPLICATIONS TO DAMAGE-RISK CRITERIA.** *J. Acoust. Soc. Amer.*, April 1959, 31(4), 522-534. (Research Center, Los Angeles, Calif.).

13,105

To investigate the effect of specific octave bands of noise on growth and recovery of temporary threshold shifts (TTS) in normal observers average TTS of 26 dB of 13 min were obtained using apparatus described in a prior study. General equations for octave-band noises were derived and compared with that for broad-band noise. Recovery curves for the two types of noise were compared. Results were discussed as they relate to damage-risk criteria for continuous noise and to need for ear protection.

Bransford, R., Milner, B. C., & Goldstein, R. ELECTROPHYSIOLOGIC RESPONSES TO SOUND AS A FUNCTION OF INTENSITY, EEG PATTERNS AND SEX. *J. Speech Res., March 1959, 2(1), 28-39.*

13,110

The aims of this study were: 1) to study the properties of electroencephalogram (EEG) and electroencephalic (EEG) responses as a function of intensity close to threshold of hearing, 2) to learn how the percentage of responses varies with sex and with patterns of the EEG, and 3) to derive a criterion for the estimation of threshold from the percentage of EEG and EEG as a function of intensity. Subjects were 22 men and 14 women (17-40 years) with normal hearing. The aforementioned responses were recorded simultaneously from the subjects while tones of 1000 cps at -6, 0, +5 and +10 db sensation level were presented in random order in either ear. The data were evaluated by analysis of variance and a criterion developed for estimation of threshold.

Yaffee, M. CHAMBER SIMULATES SPACE ENVIRONMENT. *Aviation Week*, April 1959, 20(15), 91-96.

13,120

This article describes the latest project of the Air Force on development of a universal test chamber to simulate all environmental factors from 75,000 feet out through interplanetary space. In a separate project the problem of nuclear environment simulation was studied, and a facility capable of simulating such radiation is under construction. Also the importance of combined environmental testing for various equipments is indicated. Finally the estimated costs of such simulation facilities are presented. Included is a chart which summarizes the characteristics of various simulation facilities.

Westley, S.H. & Thompson, P. A FURTHER STUDY OF HORIZONTAL ASYMMETRY IN THE PERCEPTION OF PICTURES. *Percept. Mot. Skills*, June 1959, 9(2), 125-128. (Michigan State University, Ann Arbor, Mich.).

13,123

To determine whether there are differences in the perception of distances on the left as compared to the right portion of the visual field, 25 observers equated the size of the human figure in a large and a small photographic print (identical except for size) by adjusting the distance of the large print. Five sets of three prints were used for each set the mask had been placed so the human figure occupied a different portion of the print. The data were analyzed by analysis of variance technique, and compared to those of other researchers. A principle is arrived at which accounts for the results obtained.

Bell, A.M. BILATERAL TRANSFER OF WORK DECREMENT EFFECTS AS A FUNCTION OF LENGTH OF REST. *Percept. Mot. Skills*, June 1959, 9(2), p. 181. (Veterans Administration Hospital, Augusta, Ga.).

13,124

This is a brief summary of an experiment designed to investigate whether the bilateral transfer of work decrement effects is the same function of the length of interpolated rest as is "bilateral reminiscence". Twenty-five right-handed male students practiced on a manual crank device under each of five rest conditions. A covariance analysis was employed to adjust post-rest scores in terms of pre-rest scores and to compare scores as a function of the rest condition.

Bell, A.M. EFFECTS OF EXPERIMENTALLY-INDUCED MUSCULAR TENSION AND FREQUENCY OF MOTIVATIONAL INSTRUCTIONS ON PURSUIT ROTOR PERFORMANCE. *Percept. Mot. Skills*, June 1959, 9(2), 111-115. (Louisiana State University, Baton Rouge, La.).

13,125

To investigate the effects of muscular tension and motivational instructions on pursuit rotor performance, 216 male subjects (24 for each of nine experimental conditions) were tested. Tension was varied by the amount of weight subjects were required to hold in their non-preferred hands; motivational instructions by the frequency of introduction of instructions to improve. A Lindquist Type III factorial design was employed and an analysis of variance performed. The results are discussed in terms of their implications for Hull's theory.

13,126

To determine whether the delayed speech feedback task can effectively differentiate persons with mild to moderate hearing losses from those with normal hearing, 60 hard-of-hearing and 48 normal hearing persons read series of five two-digit numbers (flashed singly on a panel) under these conditions: no delayed feedback, 50 dB delayed feedback, 60 dB delayed feedback (delay is .17 second). Error scores for the two groups were compared by chi-square test, and the advantages and disadvantages of predicting hearing loss from this measure of feedback disturbance are discussed.

Macmill, A.C. SINGLE STIMULI JUDGMENTS BASED ON A STANDARD OF FAMILIAR SIZE. *Percept. Mot. Skills*, June 1959, 2(2), 119-126. (University of Glasgow, Glasgow, Scotland).

13,128
To examine the application of the principles of judgment of size when the standard is based on a familiar object, subjects judged a series of different-sized reproductions of an ordinary matchstick by the method of single stimuli when the center of the stimulus series and the norm based on prior experience did not coincide exactly. Also series of large stimuli were presented in order to determine the shift in the standard. Analysis of variance and t tests were employed to compare the judgments.

13,130
To determine whether apparent tactual size of an object varies depending on the degree of tension with which it is held by thumb and forefinger, 24 subjects matched the distance between one pair of rods to that between another pair (the standard) by grasping one pair with each hand. The two main conditions were with and without the application of pressure for an equal number of judgments with each hand.

Draper, M.H., Ladefoged, P. & Whitteridge, D. RESPIRATORY MUSCLES IN SPEECH. *J. Speech Res.*, March 1959, 2(1), 16-27. (University of Edinburgh, Edinburgh, Scotland).

13,131
This study investigated the action of some of the respiratory muscles during speech by electromyography. Simultaneous recordings also were made of oesophageal pressure, volume of air in the lungs and wave-form of utterances. Data were obtained from 18 subjects, five of whom served as principal subjects, for spontaneous conversation, word lists, and short sentences. The recordings indicate the pattern of change-over from the use of one muscle to another as volume and pressure change. These data are reduced to a schematic form from which predictions of muscle involvement can be made.

Jeryer, J.F., Corbett, R., Tillman, T.M. & Peterson, J.L. SOME RELATIONS BETWEEN NORMAL HEARING FOR PURE TONES AND FOR SPEECH. *J. Speech Res.*, June 1959, 2(2), 126-140. (Northwestern University, Evanston, Ill.).

13,133
To determine the physical discrepancy between thresholds for a 1000-cps pure tone and for speech, both thresholds were measured in three groups of normal-hearing subjects. The specific variables examined were: sophistication of listener, effect of practice, method of threshold determination, order of test administration, sex, ear and familiarity with test vocabulary. The preliminary experiment used two groups of ten each to examine the first two variables. The main experiment used 96 (third group) to study the other variables (five-factor design). Analysis of variance was employed to interpret the threshold differences for pure tone and speech words as a function of the above variables.

Tripp, C.A., Fleckiger, F.A. & Weinberg, G.M. EFFECTS OF ALCOHOL ON THE GRAPHOMOTOR PERFORMANCE OF NORMALS AND CHRONIC ALCOHOLICS. Percept. Mot. Skills, Sept. 1959, 2(3), 227-236. (Handwriting Institute, Inc., New York, N.Y.).

13,144

To compare motor functioning in normals and in alcoholics both when sober and when inebriated, a variety of handwriting tasks, e.g., standard sentence, w-shaped loops, were performed by 60 alcoholics and 18 normals (all were males 20-60 years). The following measures were obtained: pressure, variability, stasia, speed. Each task was performed spontaneously and under instructions to write as lightly as possible. The performances of the two groups were compared when sober, when inebriated; also performances were compared within groups for these two conditions. These differences were analyzed by t, and discussed as a function of possible physiological and psychological conditions.

Goldberg, F.M. & Fiss, H. PARTIAL CUES AND THE PHENOMENON OF "DISCRIMINATION WITHOUT AWARENESS". Percept. Mot. Skills, Sept. 1959, 2(3), 243-251. (Research Center for Mental Health, New York University, New York, N.Y.).

13,146

To test the hypothesis that better than chance discrimination can occur only when the stimuli have been at least partially recognized, 28 male students responded to tachistoscopically exposed familiar geometric figures (square, circle, triangle) under three experimental conditions (following a threshold series): exposure time where partial recognition of the figure is possible (32 trials), same exposure time to check on effects of practice (32 trials), briefer exposure time where partial recognition was not possible (32 trials). The results were analyzed as a function of experimental conditions and discussed in terms of the concept of sensory threshold vs. continuous reception of information.

Cook, T.W. CUMULATIVE TRANSFER IN THE REPRODUCTION PATTERNS ON THE TORONTO PEG BOARD. *Percept. Mot. Skills*, Dec. 1959, 9(4), 375-385. (University of Toronto, Toronto, Ontario, Canada.).

13,167

To investigate the cumulative transfer in reproducing patterns on the Toronto Peg Board, five groups of five subjects learned to reproduce each of five patterns of 25 colored pegs after five-second presentations. The presentations and attempts at reproduction continued until an errorless trial occurred. The interval between trials was 30 seconds and between learning periods was five minutes. Performance scores included form, displacement, and color errors. These measures were interpreted in terms of transfer effects.

Conklin, J.E. LINEARITY OF THE TRACKING PERFORMANCE FUNCTION. *Percept. Mot. Skills*, Dec. 1959, 9(4), 387-381. (System Development Corporation, Santa Monica, Calif.).

13,168

To investigate the tracking performance function when control lag is varied between 0.0- and 1.0-second in 0.2-second intervals, one skilled subject performed ten trials each of pursuit and compensatory tracking with the various lag periods randomized over the trials. The displacements and slopes of the obtained curves were compared statistically.

Kemp, R.C. EFFECTS OF VIBRATION ON SPEECH SOUNDING
DURING ON-SCREEN WORK UNDER TWO LEVELS OF ILLUMINATION.
J. Speech Res., Dec. 1959, 2(4), 335-339.
(University of Rochester, Rochester, N.Y.)

13,170
To evaluate the effects of vibration in rifle sighting
scopes on aiming errors under two levels of illumination,
60 SMC scopes were carried in a laboratory ex-
periment with six sighting units—22, 24, 26, 28,
30 inches—on 24 and 30 foot-candle. The variable and
constant aiming errors were measured and analyzed by
analysis of variance.

Fitzpatrick, R.J. THE EFFECTS OF VIBRATION ON
SPEECH SOUNDING. J. Speech Res., Dec. 1959, 2(4), 335-339.
(George Washington University, Washington, D.C.)

13,172
To determine whether a sound (threshold) to pro-
duce a temporary threshold shift (TTS) can satisfy the
necessary threshold to a noise exposure sound, TTS measure-
ments were made following two conditions of exposure
one in which a period of silence followed a broad-band
noise exposure, and one in which the same exposure was
followed by noise at levels which alone do not produce
TTS. The noise, 120 db, SPL (sound pressure level) was
presented for three minutes then three minutes of sil-
ence or of noise of 70 and 90 db. The data were ana-
lyzed by t tests.

Barford, E.R. & Jörger, J.F. EFFECTS OF LOUDNESS IN-
CREASE ON RELATED SPEECH PERCEPTION. J. Speech Res.,
Dec. 1959, 2(4), 341-348. (McGill University,
Montreal, Quebec, Canada & Northwestern University,
Evanston, Ill.)

13,174
Delayed speech feedback behavior was compared in
three groups: ten hearing-impaired subjects with re-
cruitment, ten hearing-impaired subjects without re-
cruitment, ten normal listeners, ten hearing-impaired
with recruitment but without speech discrimination loss,
and ten with artificially obstructed external canals.
Each subject went through pure-tone testing, speech
audiometric testing, and speech feedback testing. The
delayed effect was measured at feedback sensation levels
of 0, 10, 20, 30, 40, and 50 db. Median error scores
were compared. Implications of these data for clinical
predictors of spoorer threshold are discussed.

Feldt, L.S. THE LATIN SQUARE DESIGN IN SPEECH AND
HEARING RESEARCH. J. Speech Res., Sept. 1959, 2(3),
216-226. (University of Iowa, Iowa City, Iowa.)

13,176
This paper describes the nature of the Latin square
design, discusses the assumptions which underlie it, and
outlines some of its advantages and limitations in
speech and hearing research. The origin of the Latin
square design is touched upon briefly and its modifica-
tions are noted, particularly as related to its use in
psychological research. Some factors which can be dealt
with effectively by this design, and which otherwise
would impair the validity of the experiment if allowed
to operate out of control, are examined and discussed.
A major limiting factor and its solution is also pre-
sented. Most of the discussion is based on a comparison
of Latin design with simple factorial analyses.

Chaffin, J.L. THE RELATIONSHIP BETWEEN HEARING
AND SPEECH RECEPTION. J. Speech Res., Sept.
1959, 2(3), 227-231. (Stanford University, Stanford,
Calif.)

13,178
This study investigated, on an experimental basis,
the relationship between speech reception threshold (SRT)
for the hearing, threshold for the loudness (LTL) and
SRT for speech reception, speech reception threshold of
speech (SRT) and threshold of perception for speech
reception (SRT). Eleven male and 14 female subjects, all
with normal hearing, participated. All stimulus materi-
als were tape recorded by the speakers they consisted of
three A, B, and C of the SRT, SRT, and SRT for the
SRT, and a sample of speech for the SRT and SRT. For
statistical analysis of the data, t tests
and correlation coefficients were run. The results are
discussed and compared to previous findings.

Bartlett, C.D. SILENCE PERIOD AND SPEECH RATE, RE-
DUCTION AND PERIOD. J. Speech Res., Sept. 1959,
2(3), 244-250. (Florida State University, Tallahassee,
Fla.)

13,180
This study was aimed at determining the effect of ex-
ternal silence transmission times of approximately
0.005 (shorter-than-normal), 0.010 (normal), and 0.015
seconds (longer-than-normal) on 1) oral reading rate of
normal speakers, 2) precision of articulation, and 3.
pitch variability as measured by number, mean extent, and
mean rate of inflections. Twenty-four college males with
normal hearing participated. Subjects read several kinds
of materials (e.g., five-syllable phrases, 70-word reading
passage) with each of the silence delays. From the tape
recordings of these readings, the aforementioned measures
were obtained. Analysis of variance technique was used
for evaluating the differences in the three measures per
condition.

Goldman, J.C., Nelson, L. & Ashburn, D.D. SPEECH
RECEPTION BY DIRECT MICROPHONE AT HEAD AND NECK POSITIONS.
J. Speech Res., Sept. 1959, 2(3), 277-281. (University
of California, Santa Barbara, Calif.)

13,182
This preliminary study is part of a larger program
aimed at selecting microphones and pickup sites which
give satisfactory intelligibility, quality, and usability
under high ambient noise. Specifically, the present
study investigated the relative power of the vowels and
the relative quality preference for a six-card sample of
continuous speech as picked up by a crystal vibration
microphone at eight different locations on the head and
neck. The vowels and a short speech sample of one talker
were recorded from each position. Twenty-four judges
rated the pleasing quality of the speech samples by
paired comparison technique, and intelligibility on a
five-point scale. The data were evaluated by analysis
of variance and chi square. The implications of the
findings are discussed briefly. T. G. I. R 9

Stromme, C. EXPERIMENTAL BLOCKAGE OF PHONATION BY
DISTURBED SIDETONE. J. Speech Res., Sept. 1959, 2(3),
286-291. (Ohio State University, Columbus, Ohio.)

13,184
To determine the influence of air-conduction side-
tone signal distortion on the phonation of a vowel sus-
tained in falsetto, and to probe the relationship of
phase and distortion of signal to the experimental effect
of phonatory blockage, eight normal-hearing male college
students, after practice, sustained a vowel in falsetto
under two experimental conditions: 1) the signal had no
appreciable nonlinear distortion, and 2) the signal had
62.5 per cent nonlinear distortion. Phonations were
scored by: 1) number of phonatory blockages, and 2)
total time consumed by blockages. Additional groups of
subjects, with no experience and with various kinds of
experience, also participated under either the same con-
ditions or additional ones. Sound spectrograms were ob-
tained and analyzed. I. R 33

Goodson, J.E. & Miller, J.W. DYNAMIC VISUAL ACUITY IN AN APPLIED SETTING. *J. Aerospace Med.*, Oct. 1959, 30(10), 755-763. (USAF School of Aviation Medicine, Naval Air Station, Ft. and Kresge Eye Institute, Detroit, Mich.).

13,210
To determine the relationship between performance in the laboratory and in the air on visual pursuit of moving targets, 15 males were tested using 12 sizes of Landolt "C" presented for 0.4 seconds, at angular velocities of 20, 60, and 90 degrees per second in the air, and at velocities of 20, 50, 75, 95, and 110 degrees per second in the laboratory. Acuity thresholds were compared for threshold method as well as laboratory versus air setting. Correlations and variance analyses were performed.

Willis, H.S.K. & Hoffman, I.L. HEARING LOSS FROM HIGH INTENSITY SOUND OF JET ENGINES. *J. Aerospace Med.*, Oct. 1959, 30(1), 764-772. (USAF Hospital, Westover AFB, Mass.).

13,211
This field study analyzed the audiograms of 1685 persons exposed to high intensity sound from jet engines and a control group of 362 persons, in order to obtain evidence for the theory that repeated exposure to high intensity noise can be a primary cause of hearing loss. All subjects met pre-established criteria to insure that no other compounding pathological condition existed. Some of the relationships examined were years of exposure and hearing loss, and age and exposure. Suggestions for testing such persons are indicated.

Nareff, M.J. PASSENGER PHLEBITIS. *J. Aerospace Med.*, Nov. 1959, 30(11), 791-796. (USAF Hospital, Wiesbaden, Germany).

13,212
Eight cases of venous thromboembolism (Phlebitis) in human passengers who underwent long distance flights are discussed. Ten factors which may contribute to passenger phlebitis are considered and indexed for each of the eight passengers. These factors are: sex, age, usage of tobacco, obesity, past history (of related pathology), flight duration, seat type, onset in hours, pathology, and complications. The relation of leg movement and position, increase of intra-abdominal pressure and other factors which may contribute to phlebitis are considered. A recommendation concerning passenger immobility in flight is included.

San-Jacobsen, C.M. ELECTROENCEPHALOGRAPHIC STUDY OF PILOT STRESSES IN FLIGHT. *J. Aerospace Med.*, Nov. 1959, 30(11), 777-801. (Electroencephalographic Lab., Graceland Hospital, Windsor, Colo., Norway).

13,213
Eight channel EEG tracings were obtained from 30 experienced military jet pilots in order to determine 1) the effect of combat flight stress on pilot consciousness levels; 2) if the brain is stressed under combat flight conditions to such a degree that this stress can be measured by airborne EEGs; and 3) if there is a correlation between the pilot's in-flight EEG, his ability to fly an interceptor, and his accident rate due to pilot error. The flight conditions were a composite of ten maneuvers common to combat interceptor flight. EEG tracings were compared with pilot flight performance. The feasibility of EEG as an in-flight determinant of physiologic response to flight stress is considered.

Clarke, N.P. & Headley, R.N. STUDIES OF PRIMATE TOLERANCE TO COMPLEX ACCELERATIONS. *J. Aerospace Med.*, Nov. 1959, 30(11), 825-831. (University of Washington School of Medicine, Seattle, Wash.).

13,216
Five monkeys were exposed to complex accelerations similar to those of an unstable satellite re-entry. Simulated deceleration in the forward facing position up to 20 g was combined with sine wave pitch oscillations lasting up to 60 seconds through half amplitudes of 20 degrees at three and five cps. Maximum accelerations were recorded backward, forward, and headward. Ability of animals to make coordinated movements after centrifugation was observed. Post mortems on the animals were made to determine the locus of hemorrhages, evidence of brain damage, etc.

Lawrence, S.D. & Clarke, H.P. A TECHNIQUE FOR DETERMINING CHANGES IN FORCE OF CARDIAC CONTRACTION DURING ACCELERATION. *J. Aerospace Med.*, Nov. 1959, 30(11), 830-839. (USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio).

13,217

This article describes a technique for measuring changes in force contraction of the heart during positive acceleration in intact, anesthetized dogs, using modification of the Walton-Bridge strain gage arch. The equipment and surgical techniques are detailed. Three profiles of positive acceleration were studied using 11 animals: 1) rapid acceleration to 3g and centrifuged here for 15 seconds; 2) gradual acceleration with and without dibenylol, 3) positive acceleration of 3g for four to ten minutes. Arterial pressure and force contraction were compared.

Behnke, A.R. THE ESTIMATION OF LEAN BODY WEIGHT FROM "SKELETAL" MEASUREMENTS. *Hum. Biol.*, Dec. 1959, 31(4), 295-315. (USN Radiological Defense Lab., San Francisco, Calif.).

13,219

This study compared lean body weight (LBW) estimated from skeletal anthropometric and x-ray measurements with that estimated from body density and total body water determinations on 31 male subjects. Various combinations of the anthropometric and x-ray measurements were correlated with body density and body water determinations, thus demonstrating the greater role played by some dimensions in estimating LBW. Skeletal measurements and LBW proportionality constants for a Reference Man and Woman were derived.

Kissling, R.J. & Haag, C.M. NITROGEN NARCOSIS AND ITS EFFECTS ON PERFORMANCE. *Naval Research Bulletin*, Dec. 1959, 6-12. (USN Experimental Diving Unit, Naval Gun Factory, Washington, D.C. & USN Physiological Psychology Branch, ONR, Washington, D.C.).

13,222

This report describes an initial experiment in a study directed toward the determination of the extent of behavioral impairment or decrease in performance efficiency and its systematic relation to increasing degrees of nitrogen partial pressure. Five subjects underwent three measures of performance—choice reaction time, modified Purdue Pegboard Test (manual dexterity), and conceptual reasoning—at sea-level pressure, at simulated 100-foot salt-water pressure, and during decompression at ten-foot depths. Performance data were analyzed for differences due to pressure level. The implications of the findings for increasing deep-sea divers' effectiveness and safety during rescue operations is discussed.

Thurlow, W.R. & Elfiner, L.F. PIPE-TONE CROSS-EAR LOCALIZATION EFFECTS. *J. Acoust. Soc. Amer.*, Dec. 1959, 31(12), 1606-1608. (University of Wisconsin, Madison, Wisc.).

13,224

To determine the frequency limits within which a tone in one ear would effect localization of a tone of a different frequency in the other ear, three experiments were performed. In Experiment I (12 subjects) separate tone sources were used for each ear to obtain an estimate of the shape of the function relating localization effect to frequency level of standard used. Experiment II examined three of the frequency ranges (600, 1000, and 4000 cps) used in Experiment I. In Experiment III four subjects examined binaural localization effects for low frequencies, with the frequency in one ear a simple multiple of that in the other. Some theoretical implications of the results are presented.

Wansdrunk, C. ON THE INFLUENCE OF THE DIFFRACTION OF SOUND WAVES AROUND THE HUMAN HEAD ON THE CHARACTERISTICS OF HEARING AIDS. *J. Acoust. Soc. Amer.*, Dec. 1959, 31(12), 1609-1612. (Philips Research Labs., N.V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands).

13,225

To assess the influence of diffraction of sound waves around the human head on the frequency characteristics of hearing aids, three specimens of hearing aids were measured on ten male and ten female subjects. Sound fields for each hearing aid were taped. The subjects, in four different experimental positions, were situated so that the hearing aid was at the same point as it was during the taping of the sound field. The taped sound field was played back and output of the hearing aid was measured. Other methods of measuring the effects of diffraction are discussed, and the possible use of a simulated "standard" head is investigated.

Pickett, J.M. BACKWARD MASKING. *J. Acoust. Soc. Amer.*, Dec. 1959, 31(12), 1613-1615. (USAF Operational Applications Lab., Applications Research Branch, AFRC, Bedford, Mass.).

13,226

To determine the auditory masking effect of a noise burst on a preceding weak stimulus, three subjects were subjected to a short 1000-cycle tone which preceded a burst of white noise by a variable silent interval. Tone durations were 5, 10, 15, 20, 25 and 50 milliseconds; silent intervals were 0, 2, 5, 10, 25 and 100 milliseconds; and noise burst levels ranged from 50 to 130 db above threshold. The threshold-intensity level of the tone was taken as a measure of the masking provided by the noise burst. The relative contributions of the tone-noise interval (as opposed to the tone duration) as variables in backward masking are investigated. Implications for further research are suggested.

Nicks, D.C. PREDICTION OF SEQUENTIAL TWO-CHOICE DECISIONS FROM EVENT RUNS. *J. exp. Psychol.*, Feb. 1959, 57(2), 105-114. (San Fernando Valley State College, San Fernando Valley, Calif.).

13,229

This study was an investigation of trial-by-trial behavior in sequential two-choice decision tasks (probability learning tasks, as a function of event runs). Seventy-two subjects made 380 anticipatory guesses of red or green light under the following conditions of red versus green light occurrences: 50:50, 67:33, 75:25, and 50:50 non-random sequence. Run curves were plotted for each group, showing the proportion of prediction of one event after n successive previous occurrences of that event and after n successive previous occurrences of the other event. Results were discussed in terms of decision-making and decision-making theory.

Ingham, J.G. VARIATIONS IN CROSS-MASKING WITH FREQUENCY. *J. exp. Psychol.*, Sept. 1959, 58(3), 199-205. (Medical Research Council Neuropsychiatric Research Unit, Cardiff, Wales).

13,235

To determine the differential masking effect of one tone upon another in the opposite ear (cross-masking) when frequency separation of the two tones was separated, monaural thresholds were obtained from 30 subjects for six frequencies (600-1400 cps) determined before and during exposure to a continuous masking tone of constant frequency (30 db above threshold) using a modified method of limits. Functions are presented of the average masking effect for test tones of the different frequencies. Results were discussed in terms of three hypotheses: 1) mutual inhibition, 2) overlapping patterns of activity, and 3) a statistical model.

Siegel, S. & Goldstein, D.A. DECISION-MAKING BEHAVIOR IN A TWO-CHOICE UNCERTAIN OUTCOME SITUATION. *J. exp. Psychol.*, Jan. 1959, 57(1), 37-42. (Pennsylvania State University, Philadelphia, Penn.).

13,237

This experiment tested the hypothesis that the asymptotic probability of S's predicting the occurrence of the more frequent event in a two-choice uncertain outcome situation is a function of the level of reinforcement present in the situation, such that the probability of predicting the more frequent event will tend toward unity as the rewards (positive utility) and costs (negative utility) of correct and incorrect predictions are increased. Thirty-six subjects (Ss) made predictions in a two-choice uncertain outcome situation according to one of three conditions: no payoff, reward, and risk. A nonparametric k-sample test against ordered alternatives was used to test the data. T. R. 17

Beck, J. STIMULUS CORRELATES FOR THE JUDGED ILLUMINATION OF A SURFACE. *J. exp. Psychol.*, Oct. 1959, 58(4), 267-274. (University of Pennsylvania, Philadelphia, Penn.).

13,239

This study was aimed at determining for surfaces with clearly perceptible pattern texture composed of two different intensities 1) whether consistent judgments of surface illumination can be made and 2) whether variables can be found in the light array which will specify these judgments. Observers adjusted the illumination on a comparison surface to match a standard surface for four different patterns, each at brightness levels of 1.1 and 3.2 ft-L. Each surface was viewed monocularly, simultaneously in a dark room. The standard had a grey background and white pattern and the comparison a black background and white pattern. Medians, confidence intervals, and ranges of the matches were determined. The possible correlates for such judgments are discussed. T. I. R. 11

13,240

Engen, T. & Pfaffmann, C. ABSOLUTE JUDGMENTS OF ODOR INTENSITY. *J. exp. Psychol.*, July 1959, 58(1), 23-26. (Brown University, Providence, R.I.).

13,240

To determine 1) the greatest number of intensities of an odor that can be identified correctly by rank order, and 2) the effect of a) selection of the odorants, b) the size step between stimuli, c) intensity of stimuli, and d) practice and number of stimulus categories on accuracy of odor intensity identification, 250 absolute judgments of odor intensity for each of five sets of stimuli were made by eight experienced subjects. Four odorants (amyl acetate, n-Heptanal, n-Heptane, and Phenylethyl alcohol) were utilized at five concentrations (100, 50, 25, 12.5 and 6.25 per cent dilution). Data were analyzed by means of the "informational analysis" (Erickson and Hake). T. G. R. 10

13,241

Carlson, V.R. AFTEREFFECT OF A MOVING PATTERN. *J. exp. Psychol.*, July 1959, 58(1), 31-39. (National Institute of Mental Health, Bethesda, Md.).

13,241

To determine the after-effect of a pattern of curved lines when the pattern was moving versus the after-effect of a stationary pattern, ten subjects made adjustments on a variable-curvature test line (to apparent straightness), following inspection of a pattern of alternating light and dark stripes (each ten millimeters and 145 centimeters in radius of curvature). The inspection pattern either moved at rate of 24 millimeters/seconds or was stationary. An additional 15 subjects were utilized in control experiments. Data were analyzed in terms of correlation of curvature between inspection patterns and the lines adjusted by the subjects. Results were discussed in terms of effects of 1) motion, 2) optimum fixation time before eye movement, and 3) the interaction between movement and curvature of the inspection line. T. R. 21

13,242

McGuigan, F.J. THE EFFECT OF PRECISION, DELAY, AND SCHEDULE OF KNOWLEDGE OF RESULTS ON PERFORMANCE. *J. exp. Psychol.*, July 1959, 58(1), 79-84. (Hollins College, Hollins, Va.).

13,242

To determine the effect of 1) precision (specificity), 2) delay, and 3) schedule of knowledge of results (KR), on performance at a line drawing task, 84 female subjects performed on 70 "learning" trials and 70 extinction trials. The task was to draw a six-inch line while blindfolded. Values of precision (specificity) were one-eighth inch, five-eighths inch, and ten-eighths inch (subjects were told within these limits how much their lines deviated from the six-inch standard). Values of length of delay were 0, 15, and 30 seconds, and the values of KR furnished were 10, 55, and 100 percent. Results were analyzed by means of a three-by-three-by-three analysis of variance and discussed in terms of the interaction between the three variables. T. R. 12

13,243

Underwood, B.J. & Scholz, R.W. STUDIES OF DISTRIBUTED PRACTICE: XIX. THE INFLUENCE OF INTRALIST SIMILARITY WITH LISTS OF LOW MEANINGFULNESS. *J. exp. Psychol.*, Aug. 1959, 58(2), 106-113. (Northwestern University, Evanston, Ill.).

13,243

To determine the influence of intralist similarity on the learning of lists of low meaningfulness and to explore the effect of intertrial interval, eight groups of 30 subjects learned one of four ten-nonsense syllable lists with either a two-second or seventeen-second intertrial interval. Each list was presented for 40 trials; the anticipation method was used. Correct responses were analyzed as a function of degree of intralist similarity, massed vs. distributed practice, and serial position in list. These results are compared to those from the previous study and interpreted as compatible with an inhibition (by interference) theory. G. R. 2

Schnore, M.M. INDIVIDUAL PATTERNS OF PHYSIOLOGICAL ACTIVITY AS A FUNCTION OF TASK DIFFERENCES AND DEGREE OF AROUSAL. *J. exp. Psychol.*, Aug. 1959, 58(2), 117-128. (University of Western Ontario, London, Ontario, Canada).

13,244

To determine the effects of 1) task differences and 2) degrees of arousal on individual patterns of physiological activity, nine physiological functions were obtained from subjects while they performed at two tasks (tracking and arithmetic) under two levels of arousal (auditory distraction and electric shock). Results were analyzed by means of analysis of variance, coefficient of concordance, and chi square and discussed in terms of intra-individual variability of physiological functions and the effectiveness of the various measures in differentiating among conditions. T. G. R. 29

13,243

Murphy, R.E. EFFECTS OF THREAT OF SHOCK, DISTRACTION, AND TASK DESIGN ON PERFORMANCE. *J. exp. Psychol.*, Aug. 1959, 58(2), 134-141. (Johns Hopkins University, Baltimore, Md.).

13,245

To investigate the effects of threat of electric shock, aural distraction, and task design on performance, 80 male subjects dealt four decks of 32 cards, each deck consisting of different design patterns. Time taken to deal each deck and errors in identifications of patterns were recorded. Shock was administered through attached electrodes and aural distraction was induced by presenting random series of numbers through earphones. Results were submitted to an analysis of covariance and discussed in terms of the interaction between and effects of distraction, shock threat and task difference on performance.

Stevens, J.C. & Meck, J.D. SCALES OF APPARENT FORCE. *J. exp. Psychol.*, Nov. 1959, 58(5), 405-413. (Harvard University, Cambridge, Mass.).

13,249

This study was designed to explore the functional relations between the subjective magnitude and the physical magnitude of mechanical forces by: 1) obtaining a ratio scale for apparent magnitude of a force exerted by an observer (O) on a hand dynamometer, 2) obtaining a ratio scale for force applied to O's hand, 3) comparing 1 and 2 by having O match the force in 2 on the dynamometer, 4) comparing subjective scale for force and subjective scale for lifted weights. To avoid bias, magnitude estimation, magnitude, ratio, and category production were employed. For each procedure, several Os made a fairly large number of judgments of the kind appropriate to that scale. The scales of apparent force thus constructed were compared and discussed in terms of the generality of the power function. T. G. I. R 7

Jones, A. THE EFFICIENCY OF UTILIZATION OF VISUAL INFORMATION AND THE EFFECTS OF STRESS. *J. exp. Psychol.*, Dec. 1959, 58(6), 428-432. (University of Pittsburgh, Pittsburgh, Penn.).

13,250

To determine the effect of variations in intensity of stress on efficiency of utilization of visual information, 37 male subjects were asked to identify various simple forms, each reproduced in a series of 17 ascending levels of information. Recognition thresholds were determined as a function of varying degrees of subject shock expectation. Results are plotted and the data submitted to analysis of variance. Implications of the findings for further investigation of information processing in visual perception are considered.

Stevens, J.C. & Shickman, G.M. THE PERCEPTION OF REPETITION RATE. *J. exp. Psychol.*, Dec. 1959, 58(6), 433-440. (Harvard University, Cambridge, Mass.).

13,251

To determine the effects of intensity, rate of stimulus and sense modality on perception of repetition, 109 observers made subjective estimates of frequency of: 1) periodic flashes of light, 2) bursts of noise, 3) clicks, 4) tactual pulses on the fingertip, and 5) electric pulses applied across the fingers, by methods of fractionation and magnitude estimation. Curves of repetition estimations for the various sense modalities were compared as a function of rate of stimulus repetition (signals/second). Results were discussed in terms of just-noticeable differences and ratio scale.

13,252

To investigate the perceived number of vibratory stimuli as a function of the number presented for rates of 10 per second and 30 per second, five subjects made 200 judgments each of the number of vibratory stimuli presented (under the thumbnail). Visual perception of number when the eye was adapted to a high light level was also investigated. Results were compared with previous work on vision and audition, and discussed in terms of physiological hypothesis.

Lit, A. THE EFFECT OF FIXATION CONDITIONS ON DEPTH DISCRIMINATION THRESHOLDS AT SCOTOPIC AND PHOTOPIC ILLUMINANCE LEVELS. *J. exp. Psychol.*, Dec. 1959, 58(6), 476-481. (University of Michigan, Ann Arbor, Mich.).

13,253

To determine the effects of different methods of fixation on precision of depth discrimination, as a function of varying levels of equal illumination (to both eyes), two subjects performed at least 60 equality settings (in a two-rod test apparatus involving real-depth cues) for each of 14 levels of illumination which were repeated for the following methods of fixation: 1) steady fixation on the movable comparison rod, 2) steady fixation on the immobile standard rod, and 3) fixation on either of the rods at the subject's discretion. Depth discrimination threshold curves were plotted for all three methods of fixation as a function of illumination level. Results are discussed in terms of chemical postulates and related to other studies.

Lehiste, Ilse & Peterson, G.E. LINGUISTIC CONSIDERATIONS IN THE STUDY OF SPEECH INTELLIGIBILITY. *J. acoust. Soc. Amer.*, March 1959, 31(3), 260-286. (University of Michigan, Ann Arbor, Mich.).

13,254

This is an attempt to define intelligibility as a basic aspect of the communication process by taking account of the linguistic facility of both the speaker and listener. Toward this end the dialect intelligibility ratio was described and defined. Essential considerations for the construction of intelligibility test materials were discussed. The Harvard Phonetically-Balanced word lists were analyzed for phonetic balance vs. phonemic balance. CNC lists of phonemically balanced monosyllables also were constructed.

Wright, H.N. AUDITORY ADAPTATION IN NOISE. *J. acoust. Soc. Amer.*, July 1959, 31(7), 1004-1012. (Northwestern University, Evanston, Ill.).

13,255

To describe the initial rate, extent, and recovery from auditory adaptation to tones of 250, 1000, and 4000 cps measured both in the presence and absence of noise; ten experienced listeners participated in an experimental session consisting of: establishment of the unadapted level of the experimental ear, seven minutes of stimulation, determination of adaptation and recovery. The method of fixed intensities was used; the stimulus to the control ear was presented dichotically in phase with the sustained stimulus to the experimental ear for 15 seconds at one-minute intervals, the subject varied the level in his control earphone until the fused sound appeared in the median plane. Adaptation was determined for two conditions where only the tone was present and five where tone and noise were present. T. G. I. R 7

Miskolczy-Fodor, F. RELATION BETWEEN LOUDNESS AND DURATION OF TONAL PULSES. I. RESPONSE OF NORMAL EARS TO PURE TONES LONGER THAN CLICK-PITCH THRESHOLD. *J. acoust. Soc. Amer.*, Aug. 1959, 31(8), 1126-1134. (New York Eye and Ear Infirmary, New York, N.Y.).

13,256

To examine the relationship between loudness sensation and pulse duration: 1) threshold intensity as a function of selected pulse duration was studied monaurally (40 subjects) for frequencies of 250, 1000, and 4000 cps; and 2) at selected suprathreshold levels, intensity was held constant as pulse duration was gradually increased for 20 subjects (141 measurements). Discussion concerns: 1) the duration-intensity relationship as a function of frequency, 2) the relationship between time threshold and loudness in sones, and 3) a comparison between monaural and binaural time threshold.

13,257

To study the effect of noise level, duration, and filtering on identification of interaural correlations obtained from bursts of wide-band noise, six subjects made a total of at least 5600 identifications under the following conditions: correlated bursts of wide-band noise at 1) 30-90 db, 2) 10-1000 milliseconds, and 3) 0.2-4.0 kilocycles per second (filtered). Also studied was the interaural cross-correlation necessary for correct identification in 75 percent of the trials. Effects of polarity and of the experimental procedure on identification of interaural noise correlations were discussed.

Pickett, J.M. LOW-FREQUENCY NOISE AND METHODS FOR CALCULATING SPEECH INTELLIGIBILITY. *J. acoust. Soc. Amer.*, Sept. 1959, 31(9), 1259-1263. (USAF Operational Applications Lab., Applications Research Branch, AFRC, Bedford, Mass.).

13,259

To explore the effects on speech intelligibility of adding low-frequency bands of a free-field noise, four trained listeners scored for reception, on a checklist, sets of 25 words to which were added low-frequency bands of intensities ranging from 20-600 cps and noise levels ranging from 73-115 db. Direct low-frequency masking was measured as well as any upward spread of masking to higher frequencies. Implications for calculating the effects of noise interference upon intelligibility are discussed.

Woodhead, Amiel M. EFFECT OF BRIEF LOUD NOISE ON DECISION MAKING. *J. acoust. Soc. Amer.*, Oct. 1959, 31(10), 1329-1331. (Applied Psychology Research Unit, MRC, Cambridge, England).

13,260

To determine the effect of brief loud noise on decision-making, two experiments (and one control) were performed utilizing 48 subjects. In experiment I, 18 subjects were administered 10 bursts (lasting 0.95 second) or recorded rocket noise (110 db. pressure) while performing at the Mackworth multi-channel test. In experiment II, 18 subjects were administered three single blasts each (0.95 second in duration) of the rocket noise to determine effects on variations in intensity of the rocket noise on decision-making. Intensities were 85, 95, and 115 db. Results were discussed and a critical threshold for the effect of noise burst intensity on performance is considered.

Thurlow, W.R. & Rawlings, I.L. DISCRIMINATION OF NUMBER OF SIMULTANEOUSLY SOUNDING TONES. *J. Acoust. Soc. Amer.*, Oct. 1959, 31(10), 1332-1336. (University of Wisconsin, Madison, Wisc.).

13,261

The aim of the present experiments was to investigate the accuracy with which the number of simultaneously sounding tones can be perceived. Various 1-, 2-, and 3-tone stimuli were presented to 13 Ss, who had to judge how many tones were present. Results showed that discrimination of number of different tones sounding was far from perfect (even though Ohm's acoustic law would lead us to expect high accuracy). The discrimination of the average person was not improved even when frequency components were widely spaced. Accuracy of perception was poorer for 2- and 3-tone combinations than for 1-tone stimuli. Number of allowable response categories also affected percent correct responses. Individual differences in performance were found to be large.

Pollack, I. MESSAGE UNCERTAINTY AND MESSAGE RECEPTION. *J. Acoust. Soc. Amer.*, Nov. 1959, 31(11), 1500-1508. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

13,264

To determine the effect of message uncertainty vs. response uncertainty on accuracy of reception of masked messages, nine experiments were performed using experienced subjects. Words were wired electrically with white noise (110-6500 cps) at a level of 80 db. above threshold. Investigated were possible contributing factors such as the parameters of message vs. response uncertainty as well as irrelevant alternatives; response uncertainty vs. response diversity; listener strategy; confidence ratings and conceptual operations; categorization vs. representations; relation to signal detectability theory; and measure of response discriminability. Results are related to information theory.

13,265

The improvement in word intelligibility associated with successive presentations of a word in noise was examined with recorded and with independent samples of the speech and/or its background noise. The listener's criterion for termination of a trial was shown to be a crucial determinant of the gain of intelligibility with successive presentations. The improvement in intelligibility was greater for independent samples of speech and noise than for successive presentations of a single recorded sample. The observed improvement, however, was less than predicted for the ideal observer with perfect memory by the theory of signal detectability. Indexes of response discriminability and signal discriminability are briefly discussed.

Harris, C.M. RESIDUAL MASKING AT LOW FREQUENCIES. *J. Acoust. Soc. Amer.*, Aug. 1959, 31(8), 1110-1115. (Columbia University, New York, N.Y.).

13,266

To investigate "residual masking" (the temporary shift in the threshold of hearing following cessation of a masking source) as a function of loudness density vs. frequency, curves of residual masking vs. frequency were obtained for 250 cps. masking tones at sound pressure levels of 90 and 110 db. These masking patterns were obtained 150 and 200 milliseconds after cessation of the masking tone. Also, residual masking was measured as a function of intensity level of a "white noise" masking source. Plots of loudness density versus frequency were obtained from residual masking patterns, and loudness of the pure-tone masking source was evaluated.

Elmer, R.H. MASKING PATTERNS OF TONES. *J. Acoust. Soc. Amer.*, Aug. 1959, 31(8), 1115-1120. (USN Medical Research Lab., New London, Conn.).

13,267

To determine the relative effects of aural harmonics and cochlear spread of masking tone activity on the extension of masking to frequencies above the masking tone, monaural masking patterns were obtained from three listeners for pure tones (spaced by octaves) from 250-8000 cps. (at 20-100 db. above threshold). Results are discussed in terms of 1) the activity pattern of the masking tone in the cochlea, 2) beats between signal and masking tones, 3) aural harmonics, and 4) suppression of cochlear response to the signal.

Solomon, L.N. SEMANTIC REACTIONS TO SYSTEMATICALLY VARIED SOUNDS. *J. Acoust. Soc. Amer.*, July 1959, 31(7), 986-990. (USN Electronics Lab., San Diego, Calif.).

13,268

This is an attempt "to clarify the role of beat rate and accent, as they interact with spectrum, in the phenomenological clustering of passive sonar sounds in terms of psychological similarity." Artificially produced complex sounds were employed. These were varied systematically in spectrum, in amplitude modulation at several beat rates, and in terms of presence or absence of accent within a group of four beats. Every combination of all parameters (21 sounds) was rated by 20 naive subjects on the seven psychological dimensions of sound that had been previously isolated by factor analysis. Analysis of the resultant clusters of sounds indicated the influence of the three variables examined.

Van Duzend, W.A. & Smith, E.E., Jr. IMPROVED HAND-WRITING. *PERCENT. MOT. SKILLS*, Dec. 1959, 2(4), 365-367. (Bell Telephone Laboratories, Inc., Murray Hill, N.J.).

13,281

These two experiments were designed to test one's ability to write words when there is a delay between the act of writing and the appearance of the script. Subjects, after practicing with the system until they felt ready, wrote each of 17 words under the following delays: 0, 4, 8, 12, 16, 20, and 24 milliseconds. Time to complete word was one measure, automatic writing was the other. In the second experiment, the effect of speed-accuracy trade-off was determined (in the first, subjects were instructed simply to do their best), every thing else remained the same. The subjects were used. The same two measures of performance plus error scores were used. (There were no errors in Experiment 1.) The results are discussed briefly as they relate to visual-motor learning. T. G. I. R. 2

Blackman, N. & Proschan, F. OPTIMUM SEARCH FOR OBJECTS HAVING UNKNOWN ARRIVAL TIMES. *OPERAT. RES.*, Sept.-Oct. 1959, 7(5), 625-638. (Sylvania Electric Products, Inc., Mountain View, Calif.).

13,295

In this paper the mathematical solution is developed for a search problem in which the arrival times for objects is in accordance with a Poisson distribution. Thus, the problem is to arrange the optimum pattern of search, taking into account: 1) the a priori probability of arrival in each region, 2) the probability of detection as a function of region, 3) the length of time required to scan each region, 4) the gain (or loss) after detection as a function of arrival time, etc. The range of application of the model thus developed extends from missile detection to checking of rapid-turnover personnel. Several cases are solved. R. 4

Michael, D.X. THE SOCIAL ENVIRONMENT. *Operat. Res.*, July-Aug. 1959, 7(4), 506-523. (Dunlap and Associates, Inc., Stamford, Conn.).

13,293

This paper discusses "the social environment and its implications where the role of humans is important for operations research and the related techniques of systems analysis and human engineering." Those processes and agencies of the social environment which determine what a man does with his abilities and how well or poorly he does it are presented in terms of the individual, the culture in which he lives, the social groups with which he is associated, and the "institutional" world. The manner in which the social environment operates in man-machine systems, traditional and advanced, is examined.

Clark, D.F. & Ackoff, R.L. A REPORT ON SOME ORGANIZATIONAL EXPERIMENTS. *Operat. Res.*, May-June 1959, 7(3), 279-293. (Case Institute of Technology, Cleveland, Ohio).

13,291

The ultimate objective of the research here reported is to develop mathematical theory for explaining the effect of organizational structure on the efficiency of organizational performance. The method developed uses an organizational analogy in the form of an operational game. Several experiments are described in which the following variables are examined: presence or absence of an executive, availability of communication channels, and cooperativeness or competitiveness of pay-offs.

Checks, G.K. AN OPERATIONS-RESEARCH EVALUATION TECHNIQUE OF THE USE OF SALES-RESEARCH INFORMATION. *Operat. Res.*, May-June 1959, 7(3), 313-321. (Royal Metal Manufacturing Company, New York, N.Y.).

13,293

The information requirements of sales organizations are discussed. A working hypothesis about the use of such data in decision-making was found necessary in this problem of the optimum structure of information for a multi-plant, multi-product organization. Limitations in defining such a model are the paths from raw data to research information and from this to decision-making and finally to "change in sales." The benefit from this approach is already being felt at Royal Metal Manufacturing where the research is only in the raw data to research information phase.

Coe, J.C. TRAFFIC ANALYSIS OF SMALL TELEPHONE SWITCHBOARDS. *Operat. Res.*, May-June 1959, 7(3), 347-361. (USA Electronic Proving Ground, Sierra Vista, Ariz.).

13,294

Some fundamental traffic considerations of small telephone switchboards are examined. In particular, those with 12 subscribers or less, and with conversations of one to six minutes' duration were analyzed. A number of results were obtained which indicate: 1) load conditions under which a second operator improves service, 2) conditions under which operator or line is a limiting factor, 3) conditions under which subscribers receive poor service, etc. The determination of some traffic parameters are quantified.

Behnke, A.R., Guttentag, O.E. & Brodsky, C. QUANTIFICATION OF BODY WEIGHT AND CONFIGURATION FROM ANTHROPOMETRIC MEASUREMENTS. *Hum. Biol.*, Sept. 1959, 31(3), 213-234. (USN Radiological Defense Lab., San Francisco, Calif. & University of California Medical Center, San Francisco, Calif.).

13,296

In this study seven anthropometric measurements (bicep diameter, chest, biceps, forearm, buttocks, thigh and calf circumferences) obtained on 31 Navy men were summated for the calculation of body weights. Waist, ankle, wrist and knee circumferences also obtained from the group were used in partitioned anthropometric analyses. In addition body fat was estimated by the helium dilution chamber technique. Constants were then derived for estimating surface area of the body, as well as weight. Similar anthropometric data on women were compared to those of the men, and relationships are indicated. Data from other groups were also compared.

Clippmeyer, D. EFFECT OF DEGREE OF ILLUMINATION ON RATE OF AMBIGUOUS FIGURE REVERSAL. *Canad. J. Psychol.*, Sept. 1959, 13(3), 169-174.

13,297
This study investigated the effect of illumination on the rate of ambiguous figure reversal. Twelve naive subjects viewed a Necker cube for two minutes under dim, medium, and bright illumination conditions. The number of reversals was recorded for each ten-second period of the two-minute observation. Analyses of variance were carried out for the 30-, 60-, 90-, and 120-second performance periods. The findings are discussed in terms of both number and rate of reversals.

Bolles, R.C., Hulicka, Irene M. & Hanly, Barbara. COLOUR JUDGMENT AS A FUNCTION OF STIMULUS CONDITIONS AND MEMORY COLOUR. *Canad. J. Psychol.*, Sept. 1959, 13(3), 175-185. (University of Pennsylvania, Philadelphia, Penn. & University of Oklahoma, Norman, Okla.).

13,298
To demonstrate that an observer will make a color match, if permitted, regardless of possible memory color influences, 20 subjects learned the "color names" of six pairs of nonsense figures; half were the colors indicated and half were actually gray. The subjects then made color matches for each figure by successive presentation method. Variability of color judgments is indicated. In a second experiment, 32 naive subjects made color matches between several pairs of figures which differed in physical dimension and in implied memory color--leaf, square, donkey, nonsense figure--under match-possible and match-impossible conditions. Color-matching errors were subjected to an analysis of variance. The role of associative and sensory factors in perception of color is discussed. R 12

Scott, T.H., Bexton, W.H., Heron, W. & Doane, B.K. COGNITIVE EFFECTS OF PERCEPTUAL ISOLATION. *Canad. J. Psychol.*, Sept. 1959, 13(3), 200-209. (McGill University, Montreal, Canada).

13,299
This is a systematic investigation of the effects of perceptual isolation on cognitive function. Male subjects (29) were placed in isolation for as long as they would stay (three to four days). Before, during, and after isolation they were given two batteries of tests which consisted of arithmetic problems, number series completion, word making and anagrams, Koh's blocks, Wechsler digit-symbol, McGill Picture Anomaly test, etc. They were also subjected to propaganda during the isolation period. Control subjects (27), not isolated, were given the tests and propaganda material. Differences in the error scores between the experimental and control groups were analyzed and p-values determined. The effects of propaganda on the scores on attitude scales were assessed by t-tests. T. G. R 4

Doane, B.K., Mahatoo, W., Heron, W. & Scott, T.H. CHANGES IN PERCEPTUAL FUNCTION AFTER ISOLATION. *Canad. J. Psychol.*, Sept. 1959, 13(3), 210-219. (McGill University, Montreal, Canada).

13,300
This study investigated the changes in visual perception after four days of isolation. In addition, spatial orientation and somesthetic perception were studied. Male subjects (17) composed the experimental group; 13 were confined to a cubicle, 4 underwent only visual isolation. Visual, spatial and somesthetic tests were administered to the control group (20 subjects) at the same time intervals as for the experimental group: before testing, after 48 and 72 hours of isolation, and after the completed period of isolation. Visual perception tests included: critical flicker frequency, figural after-effect, size constancy, etc. Tests of somesthetic function were tactual form-discrimination and two-point limen. Spatial orientation was tested by requiring movements in certain directions without vision. T. R 10

Crawford, B.H. MEASUREMENT OF COLOR RENDERING TOLERANCES. *J. opt. Soc. Amer.*, Dec. 1959, 49(12), 1147-1156. (National Physical Laboratory, Teddington, Middlesex, England).

13,302
To determine the degree of variation which can be tolerated in different bands of the spectrum of an illuminant, color rendering tolerances were measured by direct experiment using several levels of illumination and a variety of test objects. The criterion was a "just noticeable difference from the standard when judged by memory only." The general procedure was the gradual, continuous alteration of the spectral composition of the illuminant until the observer judged the object as looking different than it did initially. Tolerances for six contiguous spectral bands of comparable weight in color rendering were measured for several types of illuminants with such objects as pictures, colored surfaces, etc. A method for the assessment of color-rendering properties is presented and discussed. MacAdam, D.L. SMALL-FIELD CHROMATICITY DISCRIMINATION. *J. opt. Soc. Amer.*, Dec. 1959, 49(12), 1143-1146. (Eastman Kodak Company, Rochester, N.Y.).

13,303
Color discrimination data for 11 chromaticities were determined by a single observer using a matching method which consisted of adjusting the luminance and chromaticity (amount of red, green, and blue) of one stimulus until it matched a standard stimulus of the same size. Two sizes of stimuli were tested: three minutes and 4.4 degrees. Thirty matches were made for each chromaticity at each size. The data (amounts of red, green, and blue) were subjected to an analysis of variance and metric coefficients were determined. The results are presented graphically as discrimination ellipses on CIE diagrams for the luminance values studied for both field sizes. The use of these data for evaluating the large chromaticity differences encountered in color graininess is discussed. T. G. R 11

Armington, J.C. CHROMATIC AND SHORT TERM DARK ADAPTATION OF THE HUMAN ELECTRORETINOGRAM. *J. opt. Soc. Amer.*, Dec. 1959, 49(12), 1169-1175. (USA Walter Reed Army Institute of Research, Washington, D.C.).

13,304
To study the spectral sensitivity of the human ERG as modified by chromatic adaptation, the ERG was elicited by test flashes that followed 2.5 sec. after the termination of a colored adaptation. Three colors of adaptation (red, blue, and purple) and test flashes from 400 to 700 mμ were used. The heights of the various components of the ERG were measured (one S, six repetitions of each flash and adaptation) and averaged; plots relating the amplitude of a component to test flash luminance were made. From these, the relative spectral sensitivities of response components were determined.

Jones, R.C. QUANTUM EFFICIENCY OF HUMAN VISION. *J. opt. Soc. Amer.*, July 1959, 49(7), 645-653. (Polaroid Corporation, Cambridge, Mass.).

The detective quantum efficiency for foveal vision is computed from the flash perception data of Blackwell and McCree. The detective quantum efficiency is identical with the concept of quantum efficiency introduced by Rose in 1946, and is defined as the square of the ratio of the smallest possible threshold to the observed threshold, where the smallest possible threshold is set by the statistical fluctuations in the number of the background photons entering the eye. The computed values of the detective quantum efficiency Q are tabulated in Table V, and depend on the target diameter a , on the light pulse duration T , and on the background luminance B . The maximum values of Q (with the respect to variation of a and T) range from about 0.25% to about 1.0% over the range from 0.1 to 100 ft-L, with the maximum value occurring at about 1.5 ft-L. The computed values of Q are free of the questionable assumptions previously used by Rose and by Jones regarding integration time and threshold signal-to-noise ratio.

Boynton, R.M., Kandel, G. & Olney, Judith W. RAPID CHROMATIC ADAPTATION OF NORMAL AND DICHROMATIC OBSERVERS. *J. opt. Soc. Amer.*, July 1959, 49(7), 654-666. (University of Rochester, Rochester, N.Y.).

13,307

Forty spectral sensitivity curves were obtained on three observers--normal, deuteranope, protanope--for blue, green, red, and yellow adapting stimuli at brightnesses ranging from 0.8 to 80 millilamberts, thresholds being taken at 10 millimicron ($m\mu$) intervals from 400 to 700 $m\mu$. The test stimulus (one-degree diameter) and adapting stimulus (five degrees) appeared in the following manner: adapting stimulus (0.3 sec.)--darkness (0.05 sec.)--test stimulus (0.033 sec.)--darkness (1.7 sec.)--sequence repeated. Both 3- and 4- curve fits were made to the data, which were interpreted in terms of 3- vs. 4- receptor models of the underlying mechanisms in cone vision.

Sweeney, E.J. EFFECT OF THE TEST STIMULUS ON THE MEASUREMENT OF DARK ADAPTATION. *J. opt. Soc. Amer.*, July 1959, 49(7), 667-668. (USN Medical Research Lab., New London, Conn.).

13,308

The effect of intensity of the test stimulus on the course of dark adaptation was systematically explored so as to determine the allowable upper limit. A Hecht-Shlaer Adaptometer was used. The test stimulus, two degrees in diameter, was centered 10 degrees from fixation. A ten-degree flashing stimulus, one-fifth second in duration, concentric to test stimulus, was presented once a second for 90 seconds at a brightness ranging from 3.6 to 10.6 log micromicrolamberts. Forty minutes dark adaptation preceded testing of two observers. Thresholds were obtained for the entire course of dark adaptation, then the flashing stimulus procedure was instituted. Results are discussed in terms of sensitivity tolerance.

DeMott, D.W. DIRECT MEASURES OF THE RETINAL IMAGE. *J. opt. Soc. Amer.*, June 1959, 49(6), 571-579. (University of Rochester, Rochester, N.Y.).

13,310

Several experiments are described in which empirical data on the characteristics of the retinal image were obtained. The main apparatus consists of an eye holder with accessories, a microilluminometer, and acuity targets (3 seconds to 3.35 minutes). Details in the handling of the excised fresh steer eyes and in the experimental procedures are presented. The effects of pupil diameter and of chromatic aberration on the sharpness of the image were determined as well as the effect of acuity target-width. Other experiments studied the effects of: 1) the optical system, 2) the post mortem age of the eyes, and 3) the use of contact lens. The conflict between these and other data and theoretical calculations of the retinal image are discussed in terms of entoptic stray light and minimum resolvable black line. G. I. R 12

Koomen, M.J. VISIBILITY OF STARS AT HIGH ALTITUDE IN DAYLIGHT. *J. opt. Soc. Amer.*, June 1959, 49(6), 626-629. (USN Research Lab., Washington; D.C.).

13,312

The distribution of luminance over the sky at 100,000 feet for solar elevations of 10, 40, and 80 degrees was calculated and the daylight visibility of stars under these conditions was predicted from visual threshold data. The calculations were based on 1) theoretical values obtained using the Raleigh law of light scattering which had been subject to empirically determined corrections and 2) photometric measurements made from a stratosphere balloon plus barometric pressure information. The determinations of star visibility were based on relation between background luminance and threshold intensity when search is not necessary. Further estimates of visibility using a ten-power telescope are included.

Sharp, H.C. EFFECT OF SUBLIMINAL CUES ON TEST RESULTS. *J. appl. Psychol.*, Dec. 1959, 43(6), 369-371. (Utah State University, Salt Lake City, Utah).

13,313

This study is concerned with the effect of subliminal cues on test results. The cues were correct answers or alternate correct and incorrect answers presented for 1/200 second at seven-second intervals such that each answer was superimposed upon its test item three times. The test was constructed from material in their elementary psychology tests. Sixty-two subjects took the test; one group was presented the correct cues, the other the alternate correct and incorrect cues. Mean scores for the two groups were compared. These are discussed in light of other related research and factors are suggested to account for them.

Rando, W.W. THE EFFECTS OF PARTIAL PAIRING ON SCALE VALUES DERIVED FROM THE METHOD OF PAIRED COMPARISONS. *J. appl. Psychol.*, Dec. 1959, 43(6), 379-381. (Oklahoma State University, Norman, Okla.).

13,314
The relationship between scale values computed from complete and partial pairings was determined when the rating task as well as the number of observations was permitted to vary with the reduction in the number of pairs. Sixty subjects were divided into six groups; each group received a different partial pairing schedule. The test materials were 30 nationality group names presented in pairs. The subject selected one of each pair according to a criterion. One complete and five partial pairing schedules were used. Pearson correlation coefficients provided an estimate of the degree of association between scale values for all pairing schedules. These were then compared by t tests.

Champion, J.M. & Turner, W.W. AN EXPERIMENTAL INVESTIGATION OF SUBLIMINAL PERCEPTION. *J. appl. Psychol.*, Dec. 1959, 43(6), 382-384. (Georgia State College of Business, Savannah, Ga. & General Motors Institute, Detroit, Mich.).

13,315
The influence of a subliminal visual stimulus on subsequent recognition of the stimulus and association with its name was studied. A 30-minute film was presented to two groups of subjects; one group was also presented the experimental stimulus (meaningful object with brand name) at .01 second duration at ten-second intervals throughout the experiment. The other group was presented the control stimulus (few nonsense lines on black background) in the same manner. Following the film, a questionnaire to determine the subliminal effects was given to the subjects. Chi-square technique was used to evaluate the difference in the questionnaire scores between the two groups.

Riggs, L.A. & Tulunay, S.U. VISUAL EFFECTS OF VARYING THE EXTENT OF COMPENSATION FOR EYE MOVEMENTS. *J. opt. Soc. Amer.*, Aug. 1959, 49(8), 741-745. (Hunter Laboratory of Psychology, Brown University, Providence, R.I.).

13,321
The relationship between the degree of stabilization of the retinal image and the extent of seeing a test object was studied. The test object, one degree in diameter, was a bipartite field of various luminance ratios 4.16, 2.00, 1.63, and 1.25. Two observers reported the time during which they were able to see the vertical line separating the semicircles of the target. Viewing periods were 39 seconds, rest periods, 21 seconds. The relative error of image stabilization was varied from -0.26 to 1.15 for each luminance ratio. These data provided information on the comparative effects of image motion and contrast on the maintenance of vision. The present data were related to previous work in terms of the physical characteristics of the retinal image and the physiological basis for seeing with image motion. T. G. I. R 10

Battersby, W.S. & Magman, I.H. NEURAL LIMITATIONS OF VISUAL EXCITABILITY. I. THE TIME COURSE OF MONOCULAR LIGHT ADAPTATION. *J. opt. Soc. Amer.*, Aug. 1959, 42(8), 752-759. (Mount Sinai Hospital, New York, N.Y.).

13,322

Investigation of the visual excitability changes during the course of light adaptation was aimed at distinguishing the role of neural activity from that of photochemical. The viewing situation consisted of: 1) 20-degree adapting field, 1 m. constant, 2) three-degree conditioning flash, 1, 10, or 100 m. for 5, 50, or 500 msec., and 3) 40-minute test flash, 5 msec. The conditioning and test stimuli were presented concentrically at seven degrees of arc in the temporal half-field. Intervals between these stimuli ranged from -200 msec. (test stimulus before) to +1500 msec. (test stimulus after). From the obtained thresholds of two trained observers an approximation of the photochemical contribution was made and the neural effect estimated. Some neural mechanisms are postulated. G. I.

Jameson, Dorothy & Hurvich, L.M. PERCEIVED COLOR AND ITS DEPENDENCE ON FOCAL, SURROUNDING, AND PRECEDING STIMULUS VARIABLES. *J. opt. Soc. Amer.*, Sept. 1959, 42(9), 890-898. (New York University, New York, N.Y.).

13,325

Alternative formal definitions of perceived color are presented and discussed in terms of overall predictive value. The importance of induction effects is thus established. An exploratory study is reported in which sensory scaling techniques were used to obtain quantitative estimates of color attribute functions and changes in these functions for the same test stimuli with different adaptation and surround conditions. Test stimuli were narrow spectral bands, two degrees by ten degrees or two degrees by one degree, presented for about one second in a 37 degree circular surround. Hue, saturation and brightness estimates were obtained. The neural and photochemical mechanisms are discussed. C. R. 24

13,326

Ogilvie, J.C. & Taylor, M.M. EFFECT OF LENGTH ON THE VISIBILITY OF A FINE LINE. *J. opt. Soc. Amer.*, Sept. 1959, 42(9), 898-900. (Defence Research Medical Labs., Toronto, Ontario, Canada).

13,326

The threshold visibility of a series of targets which ranged from a fine dark line to a square and which were presented in both a vertical and oblique orientation were determined. The viewing situation consisted of: 1) 1.25 degree circular area with luminance of 250 ft-L, 2) 1.25 degree annulus with luminance of 200 ft-L, 3) remaining visual field with luminance of 180 ft-L. Five subjects participated. Percentage visibility values found or some of the data were transformed to probits. The 50 per cent threshold values are plotted for angular area of test object as a function of angular width. T. G. R. 8

Newhall, S.M., Burnham, R.W. & Evans, R.M. INFLUENCE OF SHADOW QUALITY ON COLOR APPEARANCE. *J. opt. Soc. Amer.*, Sept. 1959, 42(9), 909-917. (Eastman Kodak Company, Rochester, N.Y.).

13,328

The effect of a shadow of zenith skylight quality upon the color appearance of various test samples was determined, and compared to that obtained under a daylight quality shadow. The test sample appeared in the left aperture and the colorimeter in the right. Four lighting conditions of the test sample were tested: 1) illuminated surround of 13.5 ft-L, 2) daylight shadow of 2.5 ft-L, 3) skylight shadow of 2.5 ft-L, and 4) half illuminated and half skylight shadow. Three observers participated. All color appearance matches are presented as Munsell rennotations. T. G. I. R. 4

13,329

Sperling, H.G. & Lewis, M.G. SOME COMPARISONS BETWEEN FOVEAL SPECTRAL SENSITIVITY DATA OBTAINED AT HIGH BRIGHTNESS AND ABSOLUTE THRESHOLD. *J. opt. Soc. Amer.*, Oct. 1959, 42(10), 983-989. (USN Medical Research Lab., New London, Conn.).

13,329

This study provides information on: 1) relationship between high brightness and threshold luminosity functions, 2) description of humps and dips in spectral sensitivity functions which will allow for a theoretical synthesis in terms of underlying functions, and 3) relationship between combined color mixture functions in luminance units and the luminosity function based on different methods of measurement. Foveal spectral sensitivity was measured at 28 wavelengths at ten mu intervals from 410 to 690 by: 1) absolute thresholds using 2-degree and 45-minute stimuli, 2) flicker photometry, and 3) heterochromatic brightness matching. Appropriate adaptation periods preceded testing. T. G. R. 19

13,330

Shurcliff, W.A. NEW VISUAL PHENOMENON: THE GREENISH-YELLOW BLOTCH. *J. opt. Soc. Amer.*, Nov. 1959, 49(11), 1041-1048. (Polaroid Corporation, Cambridge, Mass.).

13,330

This report describes a new phenomenon of color visions: an observer viewing a uniform physical field suddenly sees his perceptual field break up into areas, patterns, and background that are very different in color. The experimental findings presented are qualitative; they are descriptions of the spectral compositions of the fields, and classification of the patterns. The latter category includes findings on the range of sizes, shapes, colors, and durations of the patterns and exploration of time-delay, sequence, and repetition effects. From an analysis of these observations, a simple model of the proposed mechanisms is derived.

Evans, R.M. FLUORESCENCE AND GRAY CONTENT OF SURFACE COLORS. *J. opt. Soc. Amer.*, Nov. 1959, 49(11), 1049-1059. (Eastman Kodak Company, Rochester, N.Y.).

13,331

This is an investigation of the colors in the Munsell SR plane using the ordinary surface colors and colors produced in a small aperture in a large white illuminated surround. With surface colors, four observers made four sets of observations each on white, gray, and black backgrounds by selecting samples according to each of four series: 1) constant chroma, 2) constant saturation, 3) constant contrast with the background, and 4) constant gray content. With aperture colors the observers made observations for four loci: 1) same gray content threshold, 2) zero gray or fluorescence threshold, 3) brightness match threshold, and 4) illuminant mode threshold. The results suggested several hypotheses which were further explored experimentally. T. G. I. R. 11

Hanes, R.M. & Rhoades, M.V. COLOR IDENTIFICATION AS A FUNCTION OF EXTENDED PRACTICE. *J. opt. Soc. Amer.*, Nov. 1959, 49(11), 1060-1064. (Applied Physics Lab., Johns Hopkins University, Silver Spring, Md.).

13,332

To determine whether or not substantial improvement in color identification could be obtained with extended practice, one observer studied color chips in the Munsell 21-Chart Student Set for several hours each day for about five months, and underwent two-hour test sessions once a week during this period. The observer selected the method of study and the initial set of colors. Subsequently, the test session results were the basis for deleting hues as well as adding them. Upon completion of the five-month period, three additional test sessions were administered, one a week later, one a month later, and one about three and one-half months later. Number and kind of errors are presented. The results are discussed and compared to other recent findings on color memory. T. G. I. R. 2

Karenetzky, J. CONTRAST AND CONVERGENCE EFFECTS IN RATINGS OF FOODS. *J. appl. Psychol.*, Feb. 1959, 43(1), 47-52. (USA Quartermaster Food & Container Institute for the Armed Forces, Chicago, Ill.).

13,335

Several assumptions were set forth as to the rating of foods as poor or good and predictions were then made as to how these ratings would be influenced by the order in which the foods were judged. Four groups of 40 subjects rated each of four samples, presented in one of four orders, on a nine-point scale. An analysis of variance of these preference ratings was performed for each of the four sets of data. The results are discussed in terms of convergence and contrast effects.

Graham, Elaine & Landis, C. EFFECTS OF STRIATED FIELDS ON CRITICAL FLICKER FREQUENCY. *J. opt. Soc. Amer.*, June 1959, 49(6), 580-585.

13,337

This is an attempt to study systematically the effect of striated fields upon the critical flicker frequency (cff). The test stimulus, 8.5 degrees on a side, contained gratings which subtended 0.63, 0.21, 0.07 and 0.025 degree. Retinal illuminance was varied over about six log trolands (5.02 to -0.48 log trolands). Two subjects were employed. Two sets of monocular cff thresholds were obtained with each grating for each brightness. The findings are compared to those obtained by other researchers, in terms of patterned versus unpatterned fields.

Campbell, D.T. & Fiske, D.W. CONVERGENT AND DISCRIMINANT VALIDATION BY THE MULTITRAIT-MULTIMETHOD MATRIX. *Psychol. Bull.*, March 1959, 56(2), 81-105. (Northwestern University, Evanston, Ill. & University of Chicago, Chicago, Ill.).

13,344

A validation process is suggested which utilizes a matrix of intercorrelations among tests representing at least two traits, each measured by at least two methods. Those aspects of validity emphasized in the process include: 1) evidence of convergent validity by independent measurement procedures, 2) evidence of discriminant validity or minimum correlations with tests which are supposed to differ, 3) evidence of higher relations between independent measures of the same trait than between measures of different traits, 4) evidence of same pattern of trait interrelationship in all heterotrait triangles of mono- and heteromethod blocks of the matrix. Other multitrait-multimethod matrices are discussed in terms of the four criteria, and the problems in achieving these are considered. T. R 36

Wertheimer, M. ON DISCRIMINATION EXPERIMENTS. I. TWO LOGICAL STRUCTURES. *Psychol. Rev.*, July 1959, 66(4), 252-266. (New School for Social Research, New York, N.Y.).

13,347

Two different logical structures are set forth as a basis for understanding learning to respond correctly in discrimination experiments. The essential factors in the first one are the differences between each of the members of the test pair and each of the training stimuli, i.e. the correct response occurs on the basis of recognition of absolute qualities. The important factors in the second one are the relations within the test and training pair, i.e. the position in relational structures. The factors which favor absolute over relational reactions are discussed in terms of the two structures. Finally, the ability of the relational structure to handle also the absolute is considered.

Rindra, D. STIMULUS CHANGE, REACTION TO NOVELTY, AND RESPONSE DECREMENT. *Psychol. Rev.*, March 1959, 66(2), 96-103. (McGill University, Montreal, Canada).

13,349

This paper suggests how "novelty" in the test situation may determine response decrement and develops a basis for predicting the effects of a stimulus change by specifying the nature and determinants of "novelty" reactions. Essentially an additional proposition is proposed beyond Estes' and Bush and Mosteller's mathematical formulation of Guthrie's common-element model. This is "any change in stimulus elements from the training to the test situation produces response decrement because, and to the extent that, the novelty provided by the altered stimulus elements evokes interfering reactions-to-novelty." Three empirically testable implications of this formulation are worked out in detail.

Foley, P.J. THE FOREPERIOD AND SIMPLE REACTION TIME. *Canad. J. Psychol.*, March 1959, 13(1), 20-22. (Defence Research Medical Labs., Toronto, Ontario, Canada).

13,350

This experiment investigated the relation between the ready signal and the optimum duration of the foreperiod in simple reaction time. Eight subjects responded to the onset of the stimulus light by pressing a key. There were twenty presentations for each of nine conditions. The duration of the ready signal, the time between cessation of ready signal and onset of stimulus and the total time, i.e. the addition of these two intervals, were varied. The combinations of these values made up the nine conditions. Mean reaction times were obtained, and an analysis of variance was carried out.

Churchill, A.V. A COMPARISON OF TACTUAL AND VISUAL INTERPOLATION. *Canad. J. Psychol.*, March 1959, 13(1), 23-27. (Defence Research Medical Labs., Toronto, Ontario, Canada).

13,351

This experiment investigated the effect of the visual vs. tactual sense modality on scale interpolation. The scale consisted of 11 rods ranging from one-half to one and one-eighth inch in diameter, in one-sixteen inch increments. The one-half inch rod was "zero" and the one and one-eighth inch rod "ten"; they were 12 inches apart. Ten subjects estimated the unit position within the interval (nine intervals) represented by each of nine rods, each presented six times in a random series of 54 presentations. These judgments were made by both modalities, the equipment appropriately modified for each. Interpolation errors were scored in terms of magnitude and frequency. Chi square was used for analyzing the under- and overestimation categories.

Thornton, G.B. ENG CHANGES IN A RETROACTION EXPERIMENT USING A PERCEPTUAL MOTOR TASK. *Canad. J. Psychol.*, March 1959, 13(1), 49-58. (University of Toronto, Toronto, Ontario, Canada).

13,352

This investigation was aimed at determining whether muscle tension varies systematically with practice on a two-hand tracking task and with the successive acquisition of competing response tendencies. Fifty males, divided into five groups, performed the Two-Hand Coordinator motor task, each with different intervening activity between the original learning and relearning phase, e.g., rest, reversed task, additional trials on original task. Electromyograph was measured from the forearm during all practice periods, as well as time-on-target. Covariance analysis was performed on the between-groups differences of the time-on-target means, and on the mean electromyograph scores between original and relearning.

Powesland, P.F. THE EFFECT OF PRACTICE UPON THE PERCEPTION OF CAUSALITY. *Canad. J. Psychol.*, Sept. 1959, 13(3), 155-168. (Queen's University, Kingston, Ontario, Canada).

13,353

To study the effects of practice upon the perception of causality 40 subjects in eight groups judged the causality of a bar falling because a post was removed after practice with different intervals of delay between the above two events (0.0 to 1.0 seconds). These judgments were then made during a random series of delays, after each group received different kinds and amounts of interpolated practice, and again during a random series of delays. In a second experiment 43 subjects in five groups judged whether or not one object's movement caused the other's. Similar practice, test, interpolated treatments, and post-test procedures were used. In all cases temporal thresholds of causality were obtained. The Kruskal-Wallis One-Way Analysis of Variance, the Walsh Test, etc. were used to analyze the data. T. R 11

Bousfield, W.A., Berkowitz, H. & Whitmarsh, G.A. ASSOCIATIVE CLUSTERING IN THE RECALL OF MINIMALLY MEANINGFUL GEOMETRIC DESIGNS. *Canad. J. Psychol.*, Dec. 1959, 13(4), 281-287. (University of Connecticut, Storrs, Conn.).

13,354

The development of associative clustering was studied using four categories of minimally meaningful and simple geometric designs, a total of 24 designs. Twenty-five undergraduates participated. The subject drew each stimulus as it was presented; after the final item he began his first recall. There were five successive recall sequences. Seven types of scores were obtained, e.g., number of items correctly recalled, number of irrelevant intrusions. A split-plot design was used. The data were analyzed by analysis of variance technique. The applicability of this technique for studying concept formation was discussed.

Baker, C.H. & Boyes, G.E. INCREASING PROBABILITY OF TARGET DETECTION WITH A MIRROR-IMAGE DISPLAY. *J. appl. Psychol.*, June 1959, 43(3), 195-198. (Defence Research Medical Labs., Toronto, Ontario, Canada).

13,368

This study was concerned with increasing the probability of detection of targets near locations representing maximum range on a radar-like display on which maximum range was presented by the center of the sweep line. Essentially the radar display was the B-scan type arranged as a "mirror-image" display. Two groups of subjects were tested on each of four conditions: conventional, horizontal, horizontal mirror-image, and vertical mirror-image; for one group the mirror-image display was twice the area of the others, for the other it had been equated. Targets were presented for one second at each of 13 locations. Target detections per display were compared by analysis of variance.

Bourassa, G.L. & Guion, R.M. A FACTORIAL STUDY OF DEXTERITY TESTS. *J. appl. Psychol.*, June 1959, 43(3), 199-204. (Allis Chalmers Manufacturing Company, Milwaukee, Wisc.; & Bowling Green State University, Bowling Green, Ohio).

13,369

A battery of dexterity and vision tests was factor analyzed to: 1) identify a "tweezer dexterity" factor and 2) determine the relationship between fine dexterities and visual skills, particularly depth perception. The battery was composed of tests constructed on the assumption of: 1) manual dexterity, 2) finger dexterity, 3) tweezer dexterity, 4) visual acuity, and 5) depth perception. Subjects were 100 female undergraduates. Thurstone's centroid method was used for the analysis, and five factors were extracted, three of these were identified.

Smith, E.E. & Kight, S.S. EFFECTS OF FEEDBACK ON INSIGHT AND PROBLEM SOLVING EFFICIENCY IN TRAINING GROUPS. *J. appl. Psychol.*, June 1959, 43(3), 209-211. (University of Delaware, Newark, N.J.).

13,370

This study was conducted in a field setting to determine whether 1) feedback will increase group productivity and self-insight, and 2) subgroup structure will result in increased group productivity and self-insight. Subjects were 54 male and 49 female foremen who were participating in a five-day management training course. There were subgroups with and without feedback and the control condition with no subgrouping. The task was a problem-solving type. Number of problems solved was compared for the feedback and group conditions by a non-parametric rank test.

Kay, B.R. THE USE OF CRITICAL INCIDENTS IN A FORCED-CHOICE SCALE. *J. appl. Psychol.*, Aug. 1959, 43(4), 259-270. (University of New Hampshire, Durham, N.H.).

13,371

This article illustrates the use of critical incidents in a forced-choice scale through the evaluation and analysis of the performance of foremen. The incidents were obtained through interviews with the personnel. These were then rated in terms of three levels of foremen performance for each foreman. The foremen were also rated independently by supervisors. These ratings were compared by correlation techniques.

Eilbert, L.R. & Glaser, R. DIFFERENCES BETWEEN WELL AND POORLY ADJUSTED GROUPS IN AN ISOLATED ENVIRONMENT. *J. appl. Psychol.*, Aug. 1959, 43(4), 271-274. (American Institute for Research, Pittsburgh, Penn.).

13,372

This study "is concerned with the identification of possible predictors of personal adjustment to conditions of Arctic isolation." Subjects were 648 enlisted personnel. They were first rated by supervisors as to well or poorly adjusted. Then several measures were used to compare the two groups: biographical inventory, self-appraisal blank, incomplete sentences test, anxiety scale, medical symptoms list, etc. Also, aptitude and job proficiency scores were obtained. Mean scores on the various instruments were compared statistically for the two groups. Further study is suggested.

Pouliot, S. & Misiak, H. THE MEASUREMENT OF NEGATIVE AFTER-IMAGES IN FIRST-GRADE BOYS AND GIRLS. *J. genet. Psychol.*, Sept. 1959, 95(First Half), 13-17. (Fordham University, New York, N.Y.).

13,378

In order to develop a procedure for measuring latency, duration, and reappearances of after-images of young children, 40 American-born, white, six-year old children of both sexes made after-image responses to a set of nine stimuli administered in two sessions, nine days apart. All children were tested for color blindness, color naming, and animal and bird identification. The effect of color and sex on latency, duration, and reappearances of after-images was calculated and subjected to t-test. Discussion concerns the effects of the two independent variables.

Botwinick, J., Brinley, J.F. & Robbin, J.S. MODULATION OF SPEED OF RESPONSE WITH AGE. *J. genet. Psychol.*, Sept. 1959, 95(First Half), 137-144.

13,379

To determine the effect of age on "adaptive" slow performance, when instructions required slow performance, 34 "young" subjects (18-32 years) and 29 "old" subjects (65-81 years) were required to write in normal fashion, "New Jersey Chamber of Commerce." Subjects then wrote the same phrase at optimum speed levels (slow-fast-slow). Writing time was measured as a function of age and education. Pearson product moment correlations were performed on results. Discussion is in terms of performance ranges as a function of age and motivational factors.

Zajac, J.L. DEPTH PERCEPTION OF STEREOSCOPIC IMAGES RESULTING FROM FUSION OF CROSSED AND UNCROSSED DOUBLE IMAGES. *Amor. J. Psychol.*, June 1959, LXXII(2), 163-183. (University of Edinburgh, Edinburgh, Scotland).

13,386

Two experiments studied depth perception and relief using a "natural stereoscope". In experiment I, a stationary rod, 6 mm. in diameter, was placed 41.4 cm. in front of the subject in his median plane. A farther rod (same size) was varied, in ten cm. steps, from 70 to 150 cm. A fixated rod was introduced between them at appropriate distances. In experiment II, the farther object was a cardboard strip 1.75 cm. wide moved from 80 to 157 cm. From the results the author develops a theory of stereoscopic vision based on three laws which are discussed.

Pomeroy, J.S., Wallach, H.A. & Coleman, E.L. THE IDENTIFICATION OF INCIDENT REGULARITY. *AMST. J. PSYCHOL.*, June 1959, LXXII(2), 280-289. (Harvard University, Cambridge, Mass. & University of Pennsylvania, Philadelphia, Penn.).

13,387

To examine sources of interference that prevent rapid, efficient identification of recurrent regularities in the environment, 92 subjects (in eight groups) predicted in which window (left or right) a light would appear. Prediction accuracy determined the amount of memory stored. Variations in procedure included: 1) degree of stimulus interference—introduction of the out-of-pattern stimuli; 2) degree of response interference—one group matched the light sequences (according to instructions) for the first three presentations; and 3) cost of error—knowledge of points earned for a correct response and lost for an incorrect. The results are related to problem-solving theory.

James, L.V. SOME INTRINSIC FINDINGS UNDER THE METHOD OF SUCCESSIVE INTERVALS. *AMST. J. PSYCHOL.*, June 1959, LXXII(2), 220-229. (University of North Carolina, Chapel Hill, N.C.).

13,388

This article discusses invariance of different scaling methods under various conditions. Specifically, invariance of the estimates of scale parameters obtained by the method of successive intervals is discussed. The invariance of equal interval scales is demonstrated under a number of conditions: 1) under changes in the number of categories and anchoring phrases used to define categories of a rating form; 2) when the assumptions of normality of subjective distribution is replaced by an assumption of normal error distribution of differences in subjective values obtained from repeated ratings; and 3) when the same scale form was used for rating of different sets of stimuli and was administered to distinct samples of respondents.

Kraushopf, J. & Riggs, L.A. INTEROCULAR TRANSFER IN THE DISAPPEARANCE OF STIMULATED IMAGES. *AMST. J. PSYCHOL.*, June 1959, LXXII(2), 282-283. (Brown University, Providence, R.I.).

13,392

The possibility of interocular transfer of the phenomenon whereby a target imaged such that it remains fixed in position on the retina disappears with prolonged viewing was tested. By means of an optical arrangement utilizing among other things contact lenses with mirrors embedded in them, it was possible to present a target to the same spot on the retina of both eyes. The stimulus target was presented to one eye and the time required for it to disappear was recorded. The target was then presented to the same spot on the retina of the other eye and the time taken for it to disappear recorded. The data were treated by the Wilcoxon paired replicates test.

Bergman, R. & Gibson, J.J. THE NEGATIVE AFTER-EFFECT OF THE PERCEPTION OF A SURFACE SLANTED IN THE THIRD DIMENSION. *AMST. J. PSYCHOL.*, Sept. 1959, LXXII(3), 364-374. (Cornell University, Ithaca, N.Y.).

13,395

Two experiments were performed to investigate negative after-effects and adaptation effects of prolonged viewing of a slanted surface monocularly and binocularly. First, six subjects viewed a slanted board through two tubes for four minutes. Six different degrees of slant were used: 15, 30, and 45 degrees forward and backward, from a plane perpendicular to the subject's line of sight. Adaptation was determined by subjective report. Negative after-effect was determined by having the subject attempt to set the board perpendicular to his line of sight. In the second experiment the subjects performed the same task only monocularly.

13,396

This article describes several cases of monocular polyopia induced by fatigue (ocular work) and presents hypotheses as to the physiological bases of the phenomenon.

13,400

Beecham, G., Dohle, Shirley I. & Cohen, R.D. VISUAL RECOGNITIVE THRESHOLDS FOLLOWING SENSORY DEPRIVATION. *Amer. J. Psychol.*, Sept. 1959, LXXII(3), 429-433. (Wayne State University, Detroit, Mich.).

13,401

Divergent results reported in the literature in the area of sensory deprivation may be due to variations in conditions of deprivation, or to differences in measures of behavioral efficiency employed, or both. This study compares the effects of two different conditions of sensory deprivation on perceptual functioning in vision. Recognition thresholds for five-digit numbers were obtained after periods of 0, 5, 15, and 30 minutes of total and of partial visual deprivation. Thirty-two subjects were divided into two equal groups, one subjected to total and one to partial visual deprivation. Results are discussed as they relate to findings reported in the literature, and to hypotheses regarding the effects of visual deprivation.

Kappas, M.E. & Payne, M.C. PERFORMANCE DECREMENT AT AN OBSERVER-PACED TASK. *Amer. J. Psychol.*, Sept. 1959, LXXII(3), 443-446. (University of Illinois, Urbana, Ill. & Georgia Institute of Technology, Atlanta, Ga.).

13,402

The purpose of this study was to determine whether the rate of finding numbers changed significantly with long periods of observer-paced search. Sixty subjects, working in a group, searched test-booklets, pages of which each contained ninety pairs of two-digit numbers. After two practice periods, subjects worked uninterruptedly for seventy-five minutes on ten different pages. Subjects were instructed when to turn the pages. Performance was scored as the number of numbers found in each fifteen-minute period. The data were subjected to analysis of variance. The performance change over time was also presented in terms of mean number of numbers found in successive fifteen-minute periods.

Green, B.F., Jr., Wolf, Alice K. & White, B.W. THE DETECTION OF STATISTICALLY DEFINED PATTERNS IN A MATRIX OF DOTS. *Amer. J. Psychol.*, Dec. 1959, LXXII(4), 503-520. (Lincoln Labs., Massachusetts Institute of Technology, Bedford, Mass.).

13,406

To investigate the ability of human observers to detect patterns in "noisy" visual displays, seven experiments are reported (utilizing five observers) on the detectability of statistically determined bar-patterns in dot-matrices. Thresholds of detection were determined as a function of: duration of response, average number of dots on display, the subtended visual angle, grain of display, number of bars of dots, random variations in numbers of bars, and multiple exposures. Threshold functions and statistical analysis of performance are provided. The discussion compares the human observer and the "ideal" mechanical detector. The effects of the main variables on signal detection are discussed and the techniques are considered as a tool for future research.

Gebhard, J.W. & Mowbray, G.H. ON DISCRIMINATING THE RATE OF VISUAL FLICKER AND AUDITORY FLUTTER. *Amer. J. Psychol.*, Dec. 1959, LXXII(4), 521-529. (Johns Hopkins University, Baltimore, Md.).

13,409

Four sets of measurements were made of the ability of a subject to match the rates of intermittent white light (flicker) and white noise (flutter). Difference limens (DL) for comparing flicker and flutter were measured (by the method of adjustment) to assess the nature of variables in cross sensory matching; simultaneous matching to fixed standard rates (two subjects made five matches at five frequencies: 5, 10, 20, 30, and 40 cps.); simultaneous matching to standard rates (same two subjects); and successive matching to fixed standard rates (16 matches at each of 13 frequencies). Results are plotted and analyzed. Cross-sensory matching is compared with intersensory matching and discussion includes optimum conditions for intersensory matching.

Holmes, H. & Rohles, F.H., Jr. A QUANTITATIVE STUDY OF REVERSAL OF CLASSICAL LIGHTNESS-CONTRAST. *Amer. J. Psychol.*, Dec. 1959, **LXXII**(4), 530-538. (University of Texas, Austin, Tex.).

13,410

In order to investigate the effects of reversal of "classical" lightness contrast, ten observers made 14 judgments of lighter-darker (on an 11-step scale) for each of four series of 14 gray, 7 by 11 inch cards. On one half of the card vertical white lines, 1 mm. in width; and on the other half, similar black lines were drawn. Distance or separation between the lines was varied (3 to 35 mm. in steps of 4 mm.). Each card was judged, on both halves, as to relative grayness. An analysis of variance of the lightness judgments was made and the significance of the difference between judgments of all separations was determined. Discussion is in terms of physiological correlates of contrast and association.

13,417

Roehrig, W.C. THE INFLUENCE OF THE PORTION OF THE RETINA STIMULATED ON THE CRITICAL FLICKER-FUSION THRESHOLD. *J. Psychol.*, July 1959, **48**(First Half), 57-63. (The Psychiatric Institute, New York, N.Y.).

13,417

To a) demonstrate that the total area of a foveally fixated test patch is not effective for critical flicker fusion threshold (CFF), b) determine how large a central portion of the test patch may be blocked out without affecting the CFF, and c) determine whether the "annulus-effect" is present over a wide range of test-patch diameters and frequencies, data were obtained from three observers. Results were presented graphically, showing mean difference in Log f_c between full-field-test-patcher and annuli.

Noble, C.E., Alcock, W.T. & Frye, R.L., Jr. THE JOINT INFLUENCE OF PRACTICE AND INSTRUCTION ON DISCRIMINATION REACTION TIME. *J. Psychol.*, July 1959, **48**(First Half), 125-130. (Montana State University, Missoula, Mont.).

13,418

To test the hypothesis that specificity of instructions is relevant to the acquisition of perceptual-motor skill, two groups of fifty-two subjects received 160 practice trials under instructions which varied in specificity. Differing instructions were designed to vary the number of competing responses in the task. Acquisition curves for the two groups were presented which showed mean reaction time as a function of practice under the two types of instruction. The learning device consisted of four units of the USAF Discrimination Reaction Time apparatus. The task was to snap the switch corresponding to the relative positions of the red light in any red-green stimulus pair.

Arnhoff, F.N. ADULT AGE DIFFERENCES IN PERFORMANCE ON A VISUAL-SPATIAL TASK OF STIMULUS GENERALIZATION. *J. educ. Psychol.*, Dec. 1959, **50**(6), 259-265. (Mental Health Research Unit, Syracuse, N.Y.).

13,419

To test the hypothesis that older subjects would have consistently fewer errors than younger subjects on a visual-spatial task of stimulus generalization, 60 practicing nurses and 54 members of a club for older persons were tested. Results were presented in terms of a) analysis of errors, b) reaction times, and c) reaction times and zero-error scores.

Cronbach, L.J. & Gleser, G.C. *INTERPRETATION OF RELIABILITY AND VALIDITY COEFFICIENTS: REMARKS ON A PAPER BY LORD. *J. educ. Psychol.*, Oct. 1959, 50(5), 230-237. (University of Illinois, Urbana, Ill.).

13,420
This paper considered a paper contributed by Lord on the usefulness of unreliable difference scores. The present authors "identified three risks which may be taken into account in fixing strategies for test interpretation and for evaluating the usefulness of a test interpreted by a particular strategy." They placed emphasis on the maximum risk of erroneous interpretation of test scores rather than on average risk. Tables are presented showing the utility of tests for classifying persons under two different conditions. Test designers and selectors of tests are cautioned to interpret these, and similar tables, in the light of their particular situations.

Mabb, W.B. & Schwartz, M. MEASUREMENT CHARACTERISTICS OF RECALL IN RELATION TO THE PRESENTATION OF INCREASINGLY LARGE AMOUNTS OF MATERIAL. *J. educ. Psychol.*, April 1959, 50(2), 63-65. (USN School of Aviation Medicine, Naval Air Station, Fla.).

13,421
This brief paper described an experiment to test "the relationship between the consistency of measurement of information obtained by individuals and the number of items of information presented the individuals" at one time. Subjects were 345 naval cadets who read six stories, then were tested by one of four different methods. The data were treated by analysis of variance.

13,427
Stochastic models have been constructed around the phenomenon of "probability matching" and have been primarily used in the investigation of human choice behavior. This paper presents a critical appraisal of appropriateness of stochastic models when the development of "probability matching" is from a "positive recency principle" as compared with "negative recency" behavior. Results from three experiments were presented to illustrate the mechanism determining "probability matching" for human subjects.

Dillon, D. DIFFERENCES BETWEEN ASCENDING AND DESCENDING FLICKER-FUSION THRESHOLDS AMONG GROUPS OF HOSPITALIZED PSYCHIATRIC PATIENTS AND A GROUP OF NORMAL CONTROL PERSONS. *J. Psychol.*, Oct. 1959, 48 (Second Half), 255-262. (Columbia University, New York, N.Y.).

13,435

Flicker Fusion (FF) data obtained while investigating the effects of insulin and coma therapy were reanalyzed in view of findings which cast doubt on the validity of the use of the average of a series of ascending and descending determinations as the measurement of FF threshold. Data were regrouped to account for luminance, direction of stimulus presentation, session (before, during, or after therapy) and a patient-control grouping in terms of outcome of therapy. The data were treated both in terms of actual FF thresholds and in terms of the difference between ascending and descending thresholds. Two analyses of variance were carried out upon these data. Differences between ascending and descending thresholds were discussed as these were able to differentiate among patients and patients from controls. T. R 4

Collins, W.E. THE EFFECTS OF DEUTERANOMALY AND DEUTERANOMALIA UPON THE FOVEAL LUMINOSITY CURVE. *J. Psychol.*, Oct. 1959, 48 (Second Half), 285-297. (Fordham University, New York, N.Y.).

13,436

Three specific hypotheses were tested regarding the relationship among normal, deuteranomalous, and deuteranopic subjects with regard to spectral sensitivity of their dark adapted fovea. Radiometric measurements were made, using three normal, three deuteranomalous, and two deuteranopic subjects. For every session (six) and subject the average of five wedge readings per wavelength were obtained, and converted into a log-micro-watt value. Data were treated by the method of analysis of variance. Subjects within each color type were compared for variability in threshold requirements, and at the short wavelengths. Several possible explanations for causes of these color defects were advanced.

Bartley, S.H. SOME COMPARISONS BETWEEN PRINT SIZE, OBJECT POSITION, AND OBJECT SIZE IN PRODUCING PHENOMENAL DISTANCE. *J. Psychol.*, Oct. 1959, 48 (Second Half), 347-351. (Michigan State University, East Lansing, Mich.).

13,438

To investigate the hypothesis that it is the visual angle subtended by the crucial target item at the eye that determines the apparent distance of the item, six observers each made ten readings for each of two general conditions. In five conditions, the comparison target was moved away and in the other five it was moved in the opposite direction. The size of the crucial item in a photographic print was manipulated either by simple enlargement of the print or by enlargement of the print to enlarge the item, but in connection with print cropping. Results were discussed as they relate to the law of the visual angle.

Riss, E. ARE HALLUCINATIONS ILLUSIONS? AN EXPERIMENTAL STUDY OF NON-VERIDICAL PERCEPTION. *J. Psychol.*, Oct. 1959, 48 (Second Half), 367-373. (Brooklyn College, Brooklyn, N.Y.).

13,439

The purpose of this investigation was to investigate the relationship of auditory hallucinations to sound stimuli. Seven psychotic patients were trained to report the beginnings and ends of auditory hallucinations. Subjects were tested in sound treated rooms; the single sound stimulus being produced by a pure-tone audiometer at 125 cps. Each subject was tested for auditory hallucination under three levels of sound intensity. Results were discussed as they relate to the usually held definition of hallucinations as perceptions in the absence of sensory stimuli.

West, L.J. AN EXPERIMENTAL COMPARISON OF NONSENSE, WORD, AND SENTENCE MATERIALS IN EARLY TYPING TRAINING. AFPTC TR 57-108, Aug. 1957, 9pp. USAF Personnel and Training Research Center, Lackland AFB, Tex. (Reprinted from: J. Educ. Psychol., Dec. 1956, 47(8), 481-489).

14,003

This experiment evaluated four types of early keyboard learning practice materials in typewriting: single-finger nonsense sequences, short words, long words, and sentences. Each of these four types was used by a different group of learners for the first hour of practice. During the second and last hour, all learners used the same code and alphabetic sentence materials. Speed and error scores on the final tests using code and alphabetic sentences were analyzed for differences due to type of material originally used for practice. Factors that might account for the observed differences are discussed.

Willingham, W.W. PERFORMANCE DECREMENT FOLLOWING FAILURE. Special Rep. 58-9, May 1958, 5pp. USN School of Aviation Medicine, Naval Aviation Medical Center, Fla.

14,007

To investigate performance decrement after failure on a check flight as a function of interval between failure and subsequent performance, the flight records of 648 students whose first failure occurred on A-18, A-19, or B-17 during the latter half of 1956 were studied. Two grades were computed: average flight grade up to time of failure, and grade on extra time flight immediately following failure. Grade decrements as a function of days elapsing between failure and subsequent flight were analyzed for each of the three types of flight and for groupings of superior and inferior students. Recommendations are included.

Thompson, M.E. RESPONSE GENERALIZATION AS A FACTOR IN THE ACQUISITION OF MILITARY SKILLS: RIFLE TARGET PRACTICE. (SECOND QUARTERLY REPORT). Contract HMRRO 650 021, 14pp. Institute of Science and Technology, University of Arkansas, Fayetteville, Ark.

14,009

This is a progress report of an investigation of the hypothesis that training for accuracy in rifle firing may be facilitated by application of principles derived from studies on response generalization. The primary variable studied is range of reinforcement—a buzzer is activated by shots of the required degree of accuracy. Subjects are assigned randomly to one of three groups and given 50 shots in blocks of five. Total, constant and variable errors will be analyzed for effect of area of reinforcement. This report presents results for 68 subjects.

Irion, A.L. & Briggs, L.J. LEARNING TASK AND MODE OF OPERATION VARIABLES IN USE OF THE SUBJECT-MATTER TRAINER. Contract AF 41(657) 13, Proj. 7709, Task 37302, AFPTC TR 57-8, Oct. 1957, 19pp. USAF Maintenance Lab., Lowry AFB, Colo.

14,020

Two studies are reported herein that were conducted as part of an experimental evaluation of the Subject-Matter Trainer, a device designed for potential use in Air Force technical training. One study deals with the comparative effectiveness of four modes of operation when each is employed solely throughout a 20-minute practice period for each of three kinds of learning tasks. The second study concerns the relative effectiveness of selected combinations of two or more of these modes of operation when used in sequence during different portions of the practice period. Retention test scores (immediate and after one week) were analyzed for differences due to mode of operation.

Samuel, J.A. & Sell, R.G. SOME DESIGN CHARACTERISTICS OF HAND-OPERATED MASTER CONTROLLERS IN STEELWORKS. PE/N/12/55, Oct. 1955, 19pp. Plant Engineering Div., British Iron and Steel Research Association, London, England.

14,026
To establish optimum design characteristics of a hand-operated master controller, three characteristics were investigated: number of speed steps (6, 4, and 3 in both forward and reverse directions), arc of movement of controller handle (30, 35, and 20 degrees on either side of "off" position), and length of handle (9, 12, and 15 inches). The seat was adjusted to optimum operating conditions for each of three operators who performed settings under each of the 27 possible conditions. Order of settings were such as to eliminate effects of learning and subject differences. Subjects also rated each setting on a four-point scale of difficulty. Time and ease of setting were the criteria against which characteristics were measured.

McGuigan, F.J. A COMPARISON OF THE WHOLE AND PART METHODS OF MARKSMANSHIP TRAINING. July 1953, 17pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,041
To compare M1 marksmanship proficiency under two methods of instruction: 1) the currently used part method, and 2) a whole method in which the firing act is taught as an integrated practice unit, an experiment was carried out using identical procedures at two army installations. A single infantry basic training company was divided into four matched (rifle steadiness, intelligence) platoons and trained as follows: 1) part method, 2) whole-live-fire method, 3) whole dry-fire method, and 4) no training. The criterion of proficiency was the pit scores obtained during four days of firing on the known-distance range. These scores were analyzed for effect of part versus whole method, live versus dry firing, and high versus low intelligence.

Mead, L.C. (Chm.). TRAINING RESEARCH. SCOPE, METHODOLOGY, AND CONTRIBUTIONS. HTD 200/2, April 1951, 36pp. US Department of Defense, Washington, D.C.

14,044

This report presents the papers and discussions of the symposium on Training Research. The central objective of the symposium was to clarify and discuss the purpose, methodology, and contributions which can be made by training research to the efficient utilization of human resources in furthering military objectives and utilizing modern war equipment.

14,047

Miller, E.E. TRANSFER EFFECTS OF SPECIAL TRAINING UPON PRE-SOLO FLIGHT TRAINING. Res. Proj. NM-16 01 11, Subtask 13, Rep. 1, Sept. 1958, 63pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,047

Analysis of the learning situation in naval pre-solo flight training resulted in the development of economical, simple, and administratively feasible training aids for the following areas: procedures, trimming, knowledge of local area, nose attitudes, and landing approaches. The techniques developed were applied to 72 pre-solo students according to a complex (factorial) experimental design, and the effects of the particular techniques were assessed independently. Criterion measures were pre-solo flight grades, flight instruction time, rankings by flight instructor, comments on questionnaires, and some secondary criteria. The findings are related to training theory and problems.

Miller, E.E. EVALUATION OF INSTRUMENT-TRANSITION VERSUS TRANSITION-INSTRUMENT SYLLABUS. Special Rep. 57-23, Sept. 1957, 11pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,048

To evaluate a recommendation that the sequence in flight instruction in the VS/VP Phase 1 syllabus be changed to offer instruction in basic instruments before transition, precision and acrobatics, 100 students from each of the two syllabus orderings were compared. Safety was analyzed by comparing the number of downs and warm-ups as recorded for transition, precision, acrobatics, and instruments; accident data were also studied. Other factors studied were training time, cost, flying skill, grades, attritions, and opinions of both students and instructors.

Miller, R.B. & Slebochnick, E.B. RESEARCH FOR EXPERIMENTAL INVESTIGATIONS OF TRANSFERABLE SKILLS IN ELECTRONIC MAINTENANCE. Contract AF-41(657) 71, Proj. 7729 (7709), Task 37300, AFTRC TR 56 2, Jan. 1958, 21pp. USAF Personnel and Training Research Center, Lackland AFB, Tex.

14,049

To determine the extent to which special training in generalized maintenance skills may lead to positive transfer in excess of that obtained from training in specific maintenance skills, two laboratory experiments were conducted. In the first, 24 high school students (males) performed two types of electronic maintenance, 1) after learning "what to search for" in the job environment, or 2) following study of "principles of trouble shooting." In the second, 36 subjects were scored on performance of specific trouble shooting problems after training in 1) trouble shooting principles, or 2) concepts of data flow only. The findings are discussed in relation to training programs for electronic trouble shooting.

Rulon, P.J. & Brooks, W.D. A COMPARISON OF TWO METHODS OF TEACHING MORSE CODE. Contract N 61339 294, ERC Proj. 49 7, Letter Order 7, Exp. Design Proj. 9 4074, July 1958, 68pp. Educational Research Corporation, Cambridge, Mass.

14,071

This report contains a description of two methods of teaching Morse Code: the current Navy method based upon the Code-Voice technique, and the Robins method based upon development of three skills (audio-perception, interpretation, typewriting). The design and rationale of an experiment for comparing the relative efficiency of these two methods is presented in some detail.

Bulson, P.J., Langmuir, C.R. & Schweitzer, R. F. THE DEVELOPMENT OF A PERFORMANCE TEST OF TROUBLE-SHOOTING PROFICIENCY FOR AM/APQ-24 RADAR MECHANICS. VOLUME I. Contract AF 33(038) 14542, HRC Proj. 507 007 0001, HRC Proj. 25, July 1953, 74pp. Educational Research Corporation, Cambridge, Mass.

14,073

This report describes the development and the details of a performance test of a radar mechanic's ability to "shoot trouble" in an AM/APQ-24 airborne radar system. The test situation is a standardized performance exercise in which observations of performance are restricted to the mechanic's adaptations to a malfunctioning radar system. Evaluation of the test problems and the related equipment, administration and scoring procedures are discussed.

Zeidner, J., Martinek, M. & Anderson, A.A. EVALUATION OF EXPERIMENTAL PREDICTORS FOR SELECTING ARMY HELICOPTER PILOT TRAINEES-I. PRD Tech. Res. Note 99, Oct. 1958, 35pp. USA Personnel Research Branch, Adjutant General's Office, Washington, D.C.

14,093

As part of a long-range research effort to improve selection of helicopter pilot trainees, scores on 41 experimental measures (4 background, 11 reference or control, 11 ability or aptitude type, and 15 personality and/or leadership type) were obtained for 310 trainees undergoing the helicopter pilot training course at Fort Rucker, Alabama. These scores were compared with three types of achievement indexes: flying proficiency, academic achievement, and leadership proficiency. The findings were used in determining the composition of a final experimental battery for the long-range study.

Warren, N.D., Dossett, W.F. & Ford, J.S. A CORRELATIONAL ANALYSIS OF ACHIEVEMENT IN A GENERALIZED ELECTRONIC TROUBLESHOOTING COURSE. Contract AF 41(657) 44, Proj. 7709, Task 37301, AFPTIC TN 57 148, Dec. 1957, 34pp. USAF Maintenance Lab., Lowry AFB, Colo.

14,099

Previous research led to the development of the Generalized Electronic Troubleshooting Trainer (GETS) and a training curriculum. Attention was given in this study to the factorial structure of troubleshooting achievement measures and the estimates of achievement scores from standardized ability tests. Achievement measures were scores on a written test and on the GETS trainer. Sixteen standardized tests of special abilities were also given. Subjects were 90 high school males, 16-19 years old, with mental ages from 156-253 months. A factor analysis was conducted to reveal the underlying factors.

Peters, G.A. & Gardner, S. INDUCING CREATIVE PRODUCTIVITY IN INDUSTRIAL RESEARCH SCIENTISTS. Psychological Research Associates, Inc., Encino, Calif. & University of Southern California, Los Angeles, Calif.

14,108

The thesis of this paper is that there is a real and important crisis in American science - the apparent lack of scientific creativity and inability of the research scientist to function effectively in group research projects. Cognitive factors are discussed together with specific actions that could be taken by industrial management and by those in charge of academic training of scientists. Certain personal characteristics of scientists are pointed to as needing special remedial attention. Special creativity-induction training programs are discussed.

Peibin, Eunice. THE INFLUENCE OF INTERPOLATED RECALL UPON RECOGNITION. APU 136 50, 1950, 7pp. Applied Psychology Research Unit, MRC, Cambridge, England.

14,112

To investigate the effect of interpolated activity (immediate recall) upon the recognition of an original experience, subjects (16) were shown a picture. One-half of the group were asked to recall it and were then given a recognition test; the other half were given only the recognition test after the same interval. A second experiment with a further group of 24 subjects was conducted along similar lines. Number of correct identifications of the picture were compared for the experimental and control groups. The findings are discussed in relation to factors which militate against identification after recall.

Meehan, J.P. & Jacobs, H.I. RELATION OF SEVERAL PHYSIOLOGICAL PARAMETERS TO POSITIVE G TOLERANCE. Contract AF 33(616) 2932, Proj. 7216, Task 71712, WADC TN 58 665, Jan. 1959, 11pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dept. of Physiology, School of Medicine, University of Southern California, Los Angeles, Calif.).

14,115

To study the relationship of several physiologic parameters to positive g-tolerance, a series of experiments were undertaken. Blood pressure, blood volume, and physical condition as measured by both the Harvard Step Test and a modified physical fitness test were the parameters and g-tolerance was measured as that acceleration which caused a loss of peripheral vision. Subjects were studied at the end of one month of enforced rest and again at the end of one month of supervised physical training.

14,122

Broadbent, D.E. CLASSICAL CONDITIONING AND HUMAN WATCH-KEEPING. APU 175, 1953, 9pp. Applied Psychology Research Unit, IRL, Cambridge, England.

14,122

It is the main thesis of this paper that classical conditioning derives its chief interest and importance from the fact that it reduces learning to a much less central position than any other form of animal experiment. Two principles are derived from mathematical and experimental evidences: that only certain aspects of the total stimulus situation can initiate complex responses at one time; and stimuli possessing intensity, biological importance and novelty are most likely to be selected at any time. The Pavlovian situation and certain experiments on human beings, such as watch-keeping and the pacing of factory work, are interpreted in terms of these principles.

14,124

Brooks, W.D. DEVELOPMENT OF PROTOTYPE PROFICIENCY TESTS FOR SAGE OPERATORS: MANUAL DATA INPUTS PERSONNEL. ERC Proj. 46, Contract AF 41(657) 95, Proj. 1975, Task 76892, AFCRC TM 58 66, Sept. 1958, 14pp. Educational Research Corporation, Cambridge, Mass.

14,124

The jobs of SAGE Manual Data Inputs personnel and a test to measure the proficiency of these operators are described. The test was administered to personnel from the Experimental SAGE Sector, the New York Air Defense Sector and to instructors and students of a SAGE training group. The test aimed to simulate actual work conditions and to require the examinee to make realistic decisions. Test results were analyzed with respect to internal consistency, validity and reliability.

T

14,125

Brooks, W.D. RESULTS OF PROFICIENCY TESTING AT ESS: MANUAL DATA INPUTS PERSONNEL. Contract AF 41(657) 95, Proj. 1975, Task 76892, ERC Proj. 46, OAL TM 58-6, Sept. 1958, 14pp. Educational Research Corporation, Cambridge, Mass.

14,125

The test results of 14 persons on prototype proficiency tests for Manual Data Inputs Personnel are summarized. The test, part of a program designed to develop off-the-job performance tests for system evaluation and training, contains five parts: one and two for the supervisor and three, four, and five for both supervisor and technician. Mean scores for each part are reported and grouped according to task. The results of the analysis of this information indicate that further test development should result in useful instruments for measuring proficiency.

Hesse, H. & Silverman, R. THE MANUAL TRACKING PROCESS IN THE PRESENCE OF COUNTERMEASURES. Contract AF 33(616) 3274, IAWR Rep. 58-4, July 1958, 55pp. Institute for Air Weapons Research, University of Chicago, Chicago, Ill.

14,134
The value of radar countermeasures depends upon how the radar operators respond to the degraded information provided them by radar. This report examines the response of the operators as limited by this information and by the time available for reaction. Among the concepts that are quantified is the efficient utilization of surveiller (operator) capability and decision processes for initiating and continuing interesting (penetrating) tracks and rejecting non-interesting (all other vehicles and countermeasures) tracks. A theory is developed for use as an evaluation tool in predicting the success of penetrator countermeasures to the defense radars.

Peters, R.W. MULTIDIMENSIONAL SCALING APPROACH TO THE DETERMINATION OF BASIC PSYCHOLOGICAL PARAMETERS FOR PURE TONES. Contract AF 33(616) 3644, Proj. 7231, Task 71701, WADC TR 59 201, April 1959, 34pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Mississippi Southern College, Hattiesburg, Miss.).

14,135
To evaluate the multidimensional scaling method of successive intervals for use in auditory areas where the dimensions are not well known, an investigation of the dimensionality of auditory perception of pure tones was made. The stimuli were 16 pure tones presented in all possible paired combinations to 39 observers who made judgments of similarity between the stimuli on a nine-point scale. Inter-stimuli distances were determined on the basis of the judgments and were analyzed mathematically to reveal the minimum number of dimensions necessary to account for the distances. The findings are discussed in relation to the validity of the method.

Cyr, C., Thure, L.E. & Erickson, S.C. STUDIES IN TRANSFER LEARNING: EFFECT OF METHODS OF INSTRUCTION ON OPERATOR PROFICIENCY. Contract NAF 2149(01), Tech. Rep. 1, Nov. 1957, 30pp. Department of Psychology, Vanderbilt University, Nashville, Tenn.

14,141
To determine the relative effectiveness of two contrasted methods of instruction on the learning, retention, and transfer of complex operator skills, standard automatic calculators (Friden and Marchant) were used as simulators for complex military equipment which requires technical operation. Four groups of 20 subjects were used as follows: 1) rote training (direct practice), 2) conceptual training (paper and pencil exercises stressing general principles of operation), 3) two control groups. Pre-training familiarization was given on both machines. Scores on proficiency test (immediately after training), retention test (following day) and transfer test (on Marchant) were analyzed for differences between the two methods.

Daniel, R.S., Eason, R.G. & Dick, R.D. RELIABILITY OF THE MAP-MATCH METHOD FOR ASSESSMENT OF NAVIGATOR PERFORMANCE IN RADAR BOMBING. Contract AF 18(600) 1052, Proj. 7711, Task 47003, AFTRC TN 57 121, Oct. 1957, 12pp. USAF Operator Lab., Randolph AFB, Tex.

14,142
The map-match method for assessing navigator performance in radar bombing was examined experimentally for reliability. Scoring of 206 individual scope photographs from 27 bomb runs taken from a Strategic Air Command evaluation mission was completed by an experienced map-match operator. One week later, the same photographs were rematched. Evaluation of the degree of reproducibility was made by 1) correlating the two sets of scores in terms of azimuth and ranging components, and by 2) the method of absolute discrepancies between crosshair positioning between them. The second method was also applied to sets of scores obtained by different operators.

Gordon, Mary A. INTERACTION OF EXPERIENCE AND APTITUDE IN PREDICTING SUCCESS IN TRAINING COURSES FOR AIRPLANE AND ENGINE MECHANICS. Proj. 7719, Task 17009, AFTRC TN 57 133, Nov. 1957, 11pp. USAF Personnel Lab., Lackland AFB, Tex.

14,144
This report presents the results of some studies exploring the effect of background factors on the prediction of success in Air Force training courses for Airplane and Engine Mechanics. Biographical measures of mechanical experience and cultural status of the home were tried out in combination with verbal and mechanical aptitude tests and years of education to predict final grades in mechanical training. Urban and rural groups were treated separately. The effect of background differences in mechanical experience was studied at successive stages in training. Implications of the findings for improved prediction are discussed.

Gardner, H. METHOD OF ALLOCATING MILITARY PERSONNEL BY WILL WITHIN THE AIR FIGHTING GROUP COMMAND. Working Paper 9. May 1957, 13pp. AFM Office of Operations Analysis, Eglin AFB, Fla.

14,149
This report describes a mathematical model for allocating military personnel in shortage skills within the Air Fighting Group Command (AFGC). Basic assumptions and methodology used in computing 1) United States Air Force relationship of precedence category and personnel priority designator (PPD) and 2) relationship between command PPD and average PPD for selected primary mission units in AFGC, are detailed. The technique used is intended to supplement other methods such as careful study, judgment, logic, and intimate familiarity with command functions, and the 12th.

Hanes, R.H. & Goldbeck, R.A. A STUDY OF HUMAN FACTORS IN THE OPERATION OF THE KITE AXON SYSTEM. PART I: TRACKING PROBLEMS AND MEASUREMENTS. PART II: THE "SHOOTING TEAM" RECOMMENDED OPERATING PROCEDURES. Task CLASSIC I, Tech. Rep. 34, Nov. 1956, 7pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,150
A critical need exists for the development of standardized tracking procedures and of proficiency measures for guided missile personnel. This report details the beginning phase of a program designed to meet this need—a survey of training problems and an analysis of Kite Axon team procedures. The survey was conducted through observations and discussions during a series of visits to various installations and defense areas. The analysis of team procedures was accomplished through the summarization and integration of operating procedures employed in Pittsburgh, New York, and Chicago areas. A new set of recommended procedures was developed.

14,151
Kirkade, R.G. & Kild, J.S. THE EFFECT OF PROCEDURAL VARIATIONS IN THE USE OF TARGET IDENTIFICATION AND AEROSCOPE POSITION INFORMATION EQUIPMENT ON THE PERFORMANCE OF A SIMULATED RADAR APPROACH CONTROL SYSTEM. Contract AF 33 (616) 3612, Proj. 7194, Task 71583, WADC TR 58 624, May 1959, 18pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ariston Psychology Lab., Ohio State University & The Ohio State University Research Foundation, Columbus, Ohio).

14,151
To explore the interaction effects of an airborne position information (API) display with the display of target identification, two experimental steps were used with ten laboratory-trained controllers. Several variations in the procedures and system configurations (such as use of ground reference points and fixed approach paths) were also compared and evaluated. A variety of measures of system efficiency (delay time, fuel consumption, go-arounds, etc.) and of safety (separation errors) formed the data for analysis.

Drucker, A.J. ABSTRACTS OF FRB RESEARCH PUBLICATIONS FY 1958. FRB Tech. Res. Note 96, Sept. 1958, 28pp. USA Personnel Research Branch, Adjutant General's Office, Washington 25, D.C.

14,154
This report identifies both by publication serial number and by Research and Development Research Task all research publications prepared and released by the Personnel Research Branch of The Adjutant General's Office in fiscal year 1958. The listing includes four Technical Research Reports, 19 Technical Research Notes, 25 Research Memorandums, and two Research studies. Abstracts are given for the majority of the publications giving principal research findings.

14,155
Moffett, R. & Smith, W. DEVELOPMENT OF GLARE, PROTECTIVE, DIVERGENCE, ETC. Proj. 4 80 ON 013 02, ONL Rep. 2224, Oct. 1957, 54pp. Protective Development Div., USA Chemical Warfare Lab., Army Chemical Center, Md.

14,155
To develop an impermeable glove which would afford protection against toxicological agents and provide greater manual dexterity than the US neoprene glove now in use, a developmental program was carried out. Various commercially available polymers were tested and a method for compression molding the glove from the selected material (butyl rubber) was devised. The method then was tested for commercial feasibility, three pairs of compression molds were built, and factory runs of 1000 gloves were produced from each mold. Acceptability tests were then made.

14,159
Ester, H.D. ADAPTABILITY OF FLYING PERSONNEL. A LONGITUDINAL STUDY OF THE CONDUCTIVE IN MILITARY FLYING. 57 139, Nov. 1957, 33pp. AFM School of Aviation Medicine, Randolph AFB, Tex.

14,159
To investigate the relation of the somatotype to military flying achievement, a group of 1,666 Army Air Force cadets for whom somatotype data were obtained on entering primary pilot training in 1943 was followed up through military personnel record files during 1954. Follow-up data included 1) present military status, discharge information, 2) success or failure in flying training if undertaken, 3) reason for flying training failure, if applicable, 4) accidental death in aircraft and/or combat action, 5) prisoner-of-war status, 6) psychiatric disturbances during military service, and 7) psychiatric or bad conduct discharge. These data were studied in all possible combinations with the somatotype data.

14,160
Hopkisson, R.G. & Bradley, R.C. A STUDY OF GLARE FROM VERY LARGE SOURCES. A17/144/59, Note E 987, March 1959, 20pp. Bullington Research Station, Garston, England.

14,160
In view of the increasing tendency to the use of large sources in lighting practice a detailed study of the effect of very large sources on glare discomfort was undertaken. This report describes experimental conditions and procedures. Some first results are also presented. The source of luminance was such that it could be varied from apparent source size of 10^{-3} steradians up to full visual field and over a wide range of luminances. The experiments used small numbers of experienced subjects and were conducted by means of the Multiple Criterion Method with the subject in control. Equal glare curves are shown for various experimental conditions.

14,161
Fiedler, F.E. LEADER ATTITUDES AND GROUP EFFECTIVENESS. FINAL REPORT. Proj. IR 170 106, 16 ORI 07135, Aug. 1957, 69pp. University of Illinois Press, Urbana, Ill.

14,161
This monograph summarizes the findings of a six-year research program designed to identify psychological factors underlying group effectiveness. Its specific aim was the development of a theory regarding the part which interpersonal perception plays in making groups productive. The study is divided into three fairly distinct parts: 1) mathematical studies examining problems of measuring similarity between persons (both perceived and real), 2) development of interpersonal perception tests for group testing and rapid scoring, and 3) relating interpersonal perception measures to group performance criteria. The study was concerned with "natural" groups such as bomber crews and managements of consumer cooperatives.

14,163

Fleishman, E.A. & Friedman, M.P. THE DEVELOPMENT OF THE AIR FORCE AURAL CODE TEST. Proj. 7776, Task 27000, AFPC TR 57 131, Nov. 1957, 42pp. USAF Contract Lab., Lickland AFB, Tex.

14,163

Improvement of procedures for selecting airmen for radio operator training has been a persistent problem in the Air Force program. This report describes the background, rationale, development, and standardization of the Air Force Aural Code Test which is now operational and is weighted as two-thirds of the Radio Operator Aptitude Index. The test consists of two parts: discrimination of auditory rhythmic patterns, and learning three Morse Code letters. Successive revisions and the unique test construction problems involved are described in detail. Complete instructions to examiners and to examinees, and the conversion tables used operationally are provided.

14,167

Goffard, S.J. DEVELOPMENT OF A MEASURE OF SKILL AT RECEIVING INTERNATIONAL MORSE CODE. May 1957, 30pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,167

To establish a method for measuring skill at receiving International Morse Code which would have more flexibility and generality than is shown by percentage of correct responses at a given speed (the method now in use), a series of progress tests was constructed. A series of tables for use in determining "speed scores" from the raw scores (per cent correct) was constructed. A trial run of the raw progress tests and associated tables for them was made on students in the Army's High Speed Radio Operation (HSR) Course, Southeastern Signal School at Fort Gordon, Georgia. The resultant data were analyzed in terms of learning curves and factors affecting learning. Comparisons between the new and old methods are made.

14,169

Morawitz, M.W. & Wells, C.F. HUMAN FACTORS IN MAINTENANCE. PART I. AN INVESTIGATION OF MAINTENANCE PROBLEMS OF A REPRESENTATIVE TRAINING DEVICE. Contract M61339 74, Proj. 20 OS 23, NAVTRADEVEN-TR 20 OS 23 1, Jan. 1958, 33pp. USN Training Device Center, Fort Washington, N.Y.

14,169

This report presents the results of a two-week situational investigation to ascertain maintenance problems as they affect human factors. A representative training device (1506) was selected for investigation. A visit was made to a Naval Air Station to study the maintenance problems and obtain information pertaining to such factors as: down-time relative to utilization-time; areas and causes of breakdown, problems of maintenance personnel relative to maintenance work; distinctions among part failure, design failure, and human failure; and opinions of personnel on minimizing maintenance problems. Examination of records, questionnaires, observations, and consultations provided the data for analysis.

14,172

Havron, M.D., Gorham, W.A., Nordlie, P.G. & Bradford, R.G. TACTICAL TRAINING OF THE INFANTRY RIFLE SQUAD. Task SQUADTRAIN, AMRO Subcontract 650 017, Tech. Rep. 18, June 1955, 116pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,172

To develop training methods and procedures to increase the effectiveness of infantry rifle squads, four methods of training were developed: 1) Control, 2) Group Participation, 3) Combat Fundamentals, and 4) Team Training. A different group of eight squads was trained by each method by Army instructors. Effectiveness of the different methods was evaluated using scores on performance tests given immediately following training and opinions of trainees, instructors, and research staff. The best elements of all methods were then combined into a Final Training Program and used to train 48 squads, 16 of which were trained by instructors with no previous experience with the project. Comparisons of performance were made with that of squads trained by Army methods. T. G. I. R 0

14,174

Myers, J. STUDY OF A PHOTOSYNTHETIC GAS EXCHANGER AS A METHOD OF PROVIDING FOR THE RESPIRATORY REQUIREMENTS OF THE HUMAN IN A SEALED CABIN. Rep. 98 117, Nov. 1958, 17pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Lab. of Algal Physiology, University of Texas, Austin, Tex.).

14,174

To study some of the basic problems of a photosynthetic gas exchanger as a method of providing the respiratory requirements of human occupants of a closed chamber, a small model gas exchanger utilizing Chlorella pyrenoidosa at 25 degrees Centigrade was developed. A series of experiments was conducted measuring the efficiency of the exchanger in producing oxygen and removing carbon dioxide during continuous operation over a period of seven to 15 days. Technical improvements in design are discussed.

14,176

Hick, W.E. "DISCONTINUITY AND THE HUMAN OPERATOR OF MACHINE CONTROLS". APU 67/67, June 1947, 16pp. Applied Psychology Research Unit, MRC, Cambridge, England.

14,176

This paper presents a tentative discussion of the problem of the continuity (or discontinuity) of human response. The main question is what aspects of the response are continuous and what are discontinuous, with the object being to arrive at an answer that will be of practical use in the design of machines, instruments, or vehicles to be controlled in this manner. The major topics of the paper are continuous time functions, input-output continuity, types of operator discontinuity, refractory phase, and intermittency in tracking.

14,177

Hick, W.E. AN EXPERIMENT ON RIFLE AIMING. APU 51/46, Aug. 1946, 12pp. Applied Psychology Research Unit, MRC, Cambridge, England.

14,177

A simple and economical photographic method of recording the movements of a rifle during aiming and trigger-pulling (without live rounds) is described. Recommendations for use and limitations of the equipment and method are made. Preliminary trials were made on a small number of subjects ranging in skill from complete beginners to experts. Certain tentative conclusions are drawn, and possible lines of further investigation are suggested. Some points of more general interest arising from the work are mentioned, such as the mode of operator functioning.

14,178

Holt, H.O.; (Chm.). REPORT OF CONFERENCE ON RIFLE MARKSMANSHIP TRAINING RESEARCH. 24-25 June 1953, 86pp. USA Office, Chief of Army Field Forces, Fort Monroe, Va.

14,178

In 1950 the Department of the Army established a survey and research project to determine where marksmanship and gunnery training could be improved and the expenditures of training ammunition curtailed through use of existing and new training devices. This document reports a conference of the research personnel and representatives of the agencies that plan, supervise, and execute rifle training. Included in full are reports on 1) comparison of whole and part methods of training, 2) obtaining accurate scores on the known distance range, 3) experimental evidence for improvements in training methods, and evaluation of a special live-firing trigger-squeeze exercise. Recommendations based upon the findings are included.

 Morowitz, M.W. & Wells, C.F. ANALYSIS OF COCKPIT MOTIONS NEEDED FOR OPERATIONAL FLIGHT TRAINERS. Contract N61339 294, Proj. 20 OS 51, ERC Proj. 39 4, Letter Order 4, Dec. 1958, 57pp. Educational Research Corporation, Cambridge, Mass.

14,180
 To evaluate motion platforms in Operational Flight Trainers (OFT) as training aids, the following methods were used: 1) a review of the literature was made on discrimination of motion, acceleration, gust, displacement, tilt, etc.; 2) visits were made to four facilities that were either doing research on or were using a motion platform in training; 3) informal opinion samples were taken of expert personnel at above facilities; and 4) a personal evaluation was made of the "flying characteristics" of two OFT's incorporating motion platforms. A list of relevant training tasks that can be adequately simulated is given; recommendations are included.

 Kugris, Violette A. RESULTS OF PROFICIENCY TESTING AT ESS: INITIATION SUPERVISOR. Contract AF 41(657) 9, Proj. 1975; Task 76892, ERC Proj. 46, OAL TM 58 4, Sept. 1958, 11pp. Educational Research Corporation, Cambridge, Mass.

14,181
 The Initiation Supervisor Test was administered to eight persons at the Experimental SAGE Sector. The test contains three parts: 1) decision-making situations, switch actions and procedures, speed determination, 2) situations requiring priority of decisions and actions, 3) items on knowledge of symbology and selector switches. Scores were obtained and analyzed.

 Kugris, Violette A. DEVELOPMENT OF PROTOTYPE PROFICIENCY TESTS FOR SAGE OPERATORS: INITIATION SUPERVISOR. Contract AF 41(657) 95, Proj. 1975, Task 76892, ERC Proj. 46, AFRC TM 58 65, Aug. 1958, 17pp. Educational Research Corporation, Cambridge, Mass.

14,183
 A proficiency test (for the Initiation Supervisor) was developed "to provide estimates of the operators' ability to solve typical problem situations by applying specific knowledge and procedures." The test was constructed following a detailed job analysis of this position. It was administered to 57 individuals—operators, instructors, and students in the SAGE program. The results are indicative of the potential value of a more refined test.

14,184
 Kugris, Violette A. DEVELOPMENT OF PROTOTYPE PROFICIENCY TESTS FOR SAGE OPERATORS: TRACK MONITOR. Contract AF 41(657) 95, Proj. 1975, Task 76892, AFRC TM 58 64 & ERC Proj. 46, Aug. 1958, 17pp. Educational Research Corporation, Cambridge, Mass.

14,184
 A proficiency test was constructed for the position of Track Monitor at the Experimental SAGE Sector in order to provide estimates of operator's ability to solve typical problem situations by applying specific knowledge and procedures. The test items were of two types: 1) decision-making required by the job, and 2) areas of job knowledge essential to such decision-making. The test was administered to 80 individuals including both experienced operators and graduating students of the SAGE Training Department. An item analysis was made. Recommendations for further development were included.

 Jones, E.R. & DiVall, R.M. FUNCTIONAL SUITABILITY TEST OF THE F-151/F-100A FIXED GUNNERY TRAINER. PHASE VI. AFTRC TN 57 96, July 1957, 113pp. USAF Operator Lab., Randolph AFB, Tex.

14,187
 The F-151 Fixed Aerial Gunnery Trainer is an attachment that provides a visual display for fighter-type flight simulators and is designed to teach pilots air-to-air and air-to-ground attacks. This report (1) describes the device's capabilities and limitations for training, (2) suggests training and proficiency measurement uses, and (3) recommends certain improvements and applications. A demonstration of the usefulness of the device was given by training both experienced and inexperienced F-100A pilots under close supervision. During its operational use, a systematic examination and evaluation of physical characteristics and accuracy of simulation were made.

 Gaito, J., Hanna, T.D., Bowe, R. & Greco, S. ENVIRONMENTAL REQUIREMENTS OF SEALED CABINS FOR SPACE AND ORBITAL FLIGHTS. PART 3. PERFORMANCE AND HABITABILITY ASPECTS OF EXTENDED CONFINEMENT. TED NAM AE 1403, NAMC ACEL 385, Sept. 1958, 52pp. USN Air Crew Equipment Lab., Naval Air Material Center, Philadelphia, Penn.

14,189
 To determine the effects upon performance of seven days of confinement in a small area with an oxygen concentration equivalent to 55 per cent at sea level, six men were studied under the above conditions. Tasks of three types (simple psychomotor, simple judgment, and complex psychological) were performed on schedule throughout the period; intellectual aptitude tests were given before and after the run; and a habitability questionnaire was filled out by each subject after the run. Performance data were analyzed for the effect of time spent in the confined area and the effect of type of function sampled. Recommendations are included.

Kelley, C.R., Bowen, H.M., Ely, J.H. & Chennell, R.C. TRACKING TRAINING II: A CASE HISTORY. NAVTRADVCEN TR 1906 00 2, March 1958, 36pp. USN Training Device Center, Port Washington, N.Y.

14,190

To study the process of learning to track under different conditions, a representative tracking task (submarine depth control) was chosen. An analog computer was adopted to serve as a training device. The authors first trained themselves, observed their own learning processes and developed an actual training program. Three subjects were trained according to the program and three control subjects received equivalent periods of loosely supervised practice. Performance was observed and measured. The results provide general information about the problem of how to train men to track with specific procedures and devices for the task studied.

Kelley, G.J., Jr., Huesle, H.C. & Duston, A.G. ELECTRONICS TRAINING FOR OBSERVERS. Proj. XXII, May 1954, 31pp. USAF Senior Observer Section, Mather AFB, Calif.

14,191

To determine the amount and content of electronics training to be presented in graduate and undergraduate aircraft observer training, factors bearing on the problem (criteria for training, facts of present course content, assumptions basic to training, and definitions) were outlined. Information gathered included the history of electronics instruction in aircraft observer training, training requirements of operational using agencies, student opinions, field-grade aircraft observer opinions, observations at an Air Force base, future needs, and requirements for understanding current in-flight maintenance manuals. This information was analyzed and recommendations made.

Lichtenstein, M. STUDIES IN HUMAN CONTROL DYNAMICS. NRL Rep. 805, Oct. 1957, 36pp. USN Electronics Lab., San Diego, Calif.

14,195

This study was conducted to obtain: 1) general observations on operator control characteristics, 2) a survey of operator performance in simulated control systems, and 3) evaluations of data analysis techniques. These were done in both compensatory and pursuit experimental tracking situations. Situations in which the error of the concept of "the" human operator transfer function is apparent are described. Inverse transfer-function performance, operator time instability, operator phase characteristics and frequency characteristics, operator error tolerance, and so forth are discussed in terms of control-display relationships. Conclusions and recommendations are set forth.

Leonard, J.A., Clark, H.M. & Staats, S. FACTORS CONTRIBUTING TO GENERAL VERSUS SPECIFIC PERCEPTUAL LEARNING. J. exp. Psychol., May 1957, 53(5), 324-329. (Ohio State University, Columbus, Ohio.)

4 groups of 45 Ss each were used in an experiment to examine the effects of transfer between samples of the same class of material. It was shown that: a) The Ss transferring between different samples of the same class of material (Group I) showed transfer effects which increased from 60% to 87% from the first to the third post-transfer trial when compared with a nontransferring control group (Group II). b) Another group (IV) pretrained on the same task but using material of different kind from that of the control group showed improvements in transfer from 34% to 80% from the first to the third post-transfer trial. c) The performance of Groups II and IV differed significantly only on the first post-transfer trial. d) Part of the transfer effect shown by Group II could be accounted for by familiarity with the task rather than the class of material used. e) Pretraining on an identical sample of figures but on a different task (Group III) produced about the same transfer effects as pretraining on the same task but a different sample of figures (Group I).

Koyne, L.L., Padirni, D.T. & Fullington, R.W. RELATIVE HEARING LEVELS AND TYPES OF HEARING LOSS AMONG FOUR SELECTED GROUPS OF AIR FORCE PERSONNEL. Rep. 59 51, April 1959, 11pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (University of Texas, Austin, Tex.).

14,208

To investigate the relative hearing levels of right and left ears in four groups of Air Force personnel: 1) 25 non-noise-exposed Class A, 2) 25 noise-exposed Class A, 3) 50 noise-exposed Class B, 4) 25 noise-exposed Class C, pure tone air-conduction and bone-conduction tests were administered. Air-conduction thresholds were established at: 250, 500, 1000, 1500, 2000, 4000 and 6000 cps; bone-conduction thresholds at: 250, 500, 1000, 2000 and 4000 cps. A comprehensive history was obtained by interview. Data on awareness of a preferred or better ear also were obtained. Median and mean thresholds for right and left ears were calculated. Chi square and t-test were employed to study threshold differences. The data were analyzed also to establish the incidence of different types of hearing loss among Class B and C. T. G. R 9

14,209

Kraus, R.W. AN EVALUATION OF PATIENTS SUSPECTED OF HAVING NOISE-INDUCED HEARING LOSS. Review 4 59, June 1959, 16pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

14,209

This paper reports the evaluation of 77 U.S. Air Force flight-line personnel with defective hearing. For each person the following information was obtained: medical history, occupational history, family history, physical examination, hearing tests, estimate of actual noise exposure, and presbycusis. On the basis of the audiometric tests, these personnel were diagnosed as to type of defect. For that type now suspected of resulting from prolonged exposure to noise, detailed extracts of these audiograms are included. The difficulties in determining whether defective hearing in a specific patient is caused or aggravated by noise exposure are discussed.

Adams, O.S., Levine, R.B. & Chiles, W.D. RESEARCH TO INVESTIGATE FACTORS AFFECTING MULTIPLE-TASK PSYCHOMOTOR PERFORMANCE. Contract AF 33(616) 6050, Proj. 7184, Task 71582, WADC TR 59 120, March 1959, 37pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,210

To study 1) the 24-hour test-retest reliability and intercorrelation of a battery of seven performance tasks (four monitoring, arithmetic computation, tracking, and pattern perception) and of four psychophysiological variables (heart rate, breathing rate, skin resistance, and skin temperature), 2) the effects of performing simultaneously various combinations of physically compatible tasks, and 3) the relation of psychophysiological criterion measures to performance criteria and to conditions of task presentation, fifteen subjects were tested. The data were analyzed by correlational techniques.

Andrews, T.B. & Hackman, R. COMMUNICATIONS AND READABILITY. HBM 200/1 App. 13, June 1951, 11pp. US Research and Development Board, Department of Defense, Washington, D.C. (University of Maryland, College Park, Md.).

14,211

The problem of military communication is analyzed in terms of factors affecting efficient communications: (1) sensory channel used, (2) rate of handling by recipient, (3) training of recipient, (4) method of transmission and presentation, and (5) limiting conditions such as noise or irrelevant information. The critical problem is specification of adequate criteria of communicability. Suggestions for improvement of communication systems, aside from the mechanical characteristics of the system, are discussed. Readability and its relation to communications are discussed.

Anderson, C.D. THE CONSTANT-RATIO RULE AS A PREDICTOR OF CONFUSIONS AMONG VISUAL STIMULI OF BRIEF EXPOSURE DURATION. Contract AF 19(604) 1962, AFOSR TR 58 60, May 1959, 37pp. Hearing and Communication Lab., Indiana University, Bloomington, Ind.

14,212

To explore the generality of the constant-ratio rule (for a given stimulus, the ratios of response proportions are independent of the number of stimuli being discriminated), an experimental examination of the rule as a predictor of confusions among visual stimuli was made. Four highly practiced subjects were tested with two subsets of three monosyllabic five-letter words (master set was made up of all six words) presented under very brief visual exposure. Obtained responses were compared with predicted responses and discussed in relation to findings from applications of the rule to other sense modalities (auditory).

Pondy, L.R. SUMMARY REPORT ON AVAILABLE METHODS FOR EVALUATING MAN-MACHINE SYSTEMS. Sept. 1959, 47pp. Battelle Memorial Institute, Columbus, Ohio.

14,214

This report attempts to present a representative sample of the few existing unclassified quantitative methods applicable to the study of man-machine systems. This area of study is defined and distinguished from human engineering. Its methods of study are indicated--the experimental, procedural and theoretical techniques which permit the description, representation, simulation or investigation and subsequent evaluation of such systems in order that output may be related to the various independent variables. To discuss these methods within the context of problem solution, the main body of the report consists of abstracts of the papers which reported them. Comments and additional notes, in some cases, are appended.

Narisi, S.L. TIME OF FALL IN LOW ALTITUDE ESCAPE. OOO Proj. TS1 15, DA Proj. 502 06 001, FA Subproj. CIO1, Memo. Rep. 664, Dec. 1957, 10pp. Frankford Arsenal, Pitman-Dunn Laboratories Group, Philadelphia, Penn.

14,215

This study is aimed at investigating the time of free fall of a man ejected from a fast-moving airplane as a function of his initial position and initial vector velocity. From the statistics on survival as related to altitude, a theoretical curve showing survival probability as a function of time is presented. The main section is devoted to identifying and specifying the important parameters--air speed, angle of elevation, bank angle, catapult velocity and drag--as a function of time for some representative low altitudes. Each of these is developed mathematically and conclusions are set forth as to best theoretical conditions for survival.

Culbert, S. PHYSICAL CHARACTERISTICS OF LEAFLETS: A SURVEY OF THE LITERATURE. Contract AF 33(038) 27522, HRI "Project Revere," Res. Memo. 21, Jan. 1954, 17pp. USAF Human Resources Research Institute, Maxwell AFB, Ala. (Dept. of Psychology, University of Washington, Seattle, Wash.).

14,223

This study compared closed-loop man-machine control system performance between a zero-order system (no integrators in the loop) and an aided fourth-order system (four integrators in the loop), using complex course inputs over a wide range of frequencies. A compensatory tracking task, consisting of a cathode-ray tube (CRT) display and a handwheel control to move a marker dot along the horizontal coordinate of the CRT face to keep it in coincidence with a vertical reference line at center, was used. Six subjects served as trackers. Mean error scores were analyzed for effects of systems and frequencies. The findings are compared with deductions from servomechanism and human engineering theory.

14,229

To determine the time necessary for detecting spherical targets subtending visual angles of 10.00, 12.34, 17.45, 29.73 and 59.13 minutes of arc in homogeneous and partially structured visual fields, three subjects were required to locate the target, when stationary, or locate and indicate the direction of the target, when moving. The latter procedure was employed in both unstructured and partially structured fields. Size and position of target and structure of visual field were randomized in the experimental sessions. Results are discussed in terms of the position sense of the eye and a method for determining probability of successful search (i.e. detection) is formulated.

Emanuel, I., Alexander, M., Churchill, E. & Truett, B. A HEIGHT-WEIGHT SIZING SYSTEM FOR FLIGHT CLOTHING. Proj. 7214, Task 71739, WADC TR 56 365, April 1959, 109pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College, Yellow Springs, Ohio).

14,232

This report presents a height-weight-sizing system for use by designers and fitters of flight clothing. The observations and recommendations reported here are based on a re-analysis of the body size data of the 1950 Anthropometric Survey of Air Force flying personnel. Pairs of dimensions were correlated with other dimensions important to clothing design to find the pair yielding the highest correlation. Practical and statistical problems in developing a sizing system are discussed and tables of body dimensional data are presented for several basic size programs. The choice and application of the programs are discussed in detail.

Emanuel, I., Alexander, M. & Churchill, E. ANTHROPOMETRIC SIZING AND FIT-TEST OF THE MC-1 ORAL-NASAL OXYGEN MASK. Contract AF 33(616) 3641, Proj. 7214, Task 71728, WADC TR 58 505, March 1959, 23pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College, Yellow Springs, Ohio).

14,233

A sizing program for oral-nasal-oxygen masks, based on total face length and lip length, has been developed through a re-analysis of the 1950 USAF Anthropometric Survey head and face data. Face forms, based on the sizing program, have been constructed for use in preparation of such masks. The MC-1 Oxygen Mask, an oral-nasal, pressure-demand type mask, has been fabricated in accordance with the sizing program and the face forms. Fit-tests on 150 subjects have been conducted. The theoretical and practical aspects of the sizing procedure are discussed in this report. Design limits and suggested procurement tariffs for each of the six proposed sizes are given.

Ernst, A.A. FEASIBILITY STUDY FOR A MAN-MACHINE SYSTEMS RESEARCH FACILITY. Delivery Order AF (33 616) 56 10, Proj. 7184, WADC TR 59 51, March 1959, 245pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,234

This report presents the results of a study of the feasibility, design, and cost of a large-scale laboratory facility for research on man-machine problems. Postulates of the study were 1) need for an optimal division of labor among men and machines in complex weapons systems, 2) orientation toward functional rather than physiological and psychological factors of the human environment, and 3) possibility of employing dynamic simulation of such systems. Feasibility was judged through designing, implementing, and operating a scale model of the desired facility. The characteristics required of the equipment, its cost, and conclusions as to how well the design objectives might be met are presented.

Merenda, P.F. & Macaluso, C.J. A CRITICAL ANALYSIS OF THE FIRE CONTROLMAN - FIRE CONTROL TECHNICIAN MERGER IN THE U.S. NAVY. Tech. Rep. 30, Aug. 1956, 11pp. USN Examining Center, Great Lakes, Ill.

14,235

To investigate differences in basic and inherent qualities between two groups (Fire Controlman and Fire Control Technician ratings in the U.S. Navy) which have been merged into one (FI), random samples were drawn from the Navy-wide population of candidates for advancement in FI rating in the February 1956 series of examinations. The sample was then divided into 1) pure Fire Control Technicians and 2) integrated Fire Control Technicians (former Fire Controlmen). Examination standard scores and Navy standard scores on three tests (General Classification, Arithmetic, and Mechanical) were analyzed by multiple regression techniques for differences between the two groups. The findings are discussed in relation to the merging of these groups.

Kidd, J.S. A COMPARISON OF ONE-, TWO-, AND THREE-MAN CONTROL UNITS UNDER VARIOUS CONDITIONS OF TRAFFIC INPUT RATE. Contract AF 33(616) 3612, Proj. 7184, Task 71583, WADC TR 59 104, June 1959, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (The Ohio State University & The Ohio State University Research Foundation, Columbus, Ohio).

14,242

To determine effect of input load and team size upon performance of the particularly complex task of radar air traffic control, nine laboratory-trained controllers, operating as one-, two-, or three-man control units, guided returning aircraft arriving at intervals of 30, 60 or 90 seconds through the approach phase of flight from entry into the 50-mile radius control zone to Ground Control Approach turnover, ten miles from touchdown. A total of 54 problems were accomplished, six per session, each consisting of the arrival of 24 aircraft. The two measures of performance were system efficiency and safety. The results were analyzed by the Friedman two-way and the Kruskal-Wallis one-way analysis of variance. Predictions of two- and three-man team performance from individual scores were made. T. I. R 20

Wesserman, P. & Silander, F.S. DECISION-MAKING. AN ANNOTATED BIBLIOGRAPHY. 1958. Graduate School of Business and Public Administration, Cornell University, Ithaca, N.Y.

14,247

This volume is designed to provide a carefully selected and annotated list of books, articles, and documents which will serve as a general and broadly conceived introduction to the study of decision-making. The period covered is primarily that from 1947 through September 1957. Only English language publications are included. A complete author and title index is included. The major classifications are: the decision-making process (general and theoretical), values and ethical considerations, leadership as a factor, psychological factors, decision-making in small groups, community decision-making, communications and information handling, mathematics and statistics in decision-making.

Harrison, L.P. FINAL APPROACH VISIBILITY STUDIES. FISCAL YEAR 1952. PROGRESS REPORT. PART III. Proj. 4.14, DDT 21 6/1, Jan. 1954, 92pp. Weather Bureau, US Department of Commerce, Washington, D.C.

14,249

To explore the feasibility of using television for the determination of visibility in the instrument approach and landing zones of airports, a field experiment was conducted. On seven different occasions, each of six hours duration, a television camera was installed at the south end of the instrument landing runway and video signals were transmitted to a receiver in the Weather Bureau Airport Observatory. The visual range (V_R) as judged by an observer of the television picture was compared with V_R judgments of an end-of-runway observer, looking in the direction the nearby camera was oriented. A limited variety of meteorological conditions were experienced; both day and night tests were made.

Webb, P. & Klemm, F.K. DESIGN OF VENTILATED CLOTHING. Proj. 7164, Task 71831, WADC TR 58 608, March 1959, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,250

The purpose of ventilated clothing is reviewed and the functions of convective and evaporative cooling are described. These functions are achieved by applying certain principles that are discussed in detail. Various ventilating garments are described to illustrate the evolution of the principles and an ideal ventilating system is defined for pressure suit assemblies. Tests are detailed which demonstrate the validity of each design principle employed in the ideal system. The general subjects of low energy ventilating systems and of integration of ventilated clothing assemblies are discussed. Recommendations are made for the use and design of ventilating systems for protective clothing.

Hatch, H.G. Jr. EFFECTS OF WATER-LANDING IMPACT ON AN ORBITAL CAPSULE FROM THE STANDPOINT OF OCCUPANT PROTECTION. NASA TR D 39, Sept. 1959, 18pp. National Aeronautics and Space Administration, Washington, D.C. (Langley Research Center, Langley Field, Va.)

14,251

This investigation was aimed at determining the effects of water-landing on an orbital capsule, which has a conical-shaped body with a segment of a sphere as the landing surface, from the standpoint of human tolerance, in order to discuss the problem of protecting an occupant from the landing impact. The instrumented capsule contained five accelerometers, each measuring accelerations at various axes; also different attitudes (representing swaying of parachute) were simulated. Tracings of acceleration and superimposed vibration were made during flight. These findings plus human tolerance data are discussed.

Harcum, E.R. VISUAL DETECTION AND RECOGNITION OF TARGETS OF NON-UNIFORM LUMINANCE VIEWED AGAINST UNIFORM BACKGROUNDS. FINAL REPORT. Contract NOAS 57 623 D, UMRI Proj. 2643, Rep. 2643 2-F, Oct. 1958, 11pp. Research Institute, University of Michigan, Ann Arbor, Mich.

14,252

To determine the effect on target detection and recognition of dependencies among units of luminance microstructure within the targets when the targets are composed of black and white cells presented against uniform black or gray backgrounds, these thresholds were obtained by the ascending method of limits on two experienced and two inexperienced observers for eight target forms each with three degrees of internal dependence. Threshold differences as a function of the aforementioned variables are discussed as well as the importance of these factors as informational cues.

14,253

Williams, J. & Horvath, S.M. PULMONARY BLOOD VOLUME AND CIRCULATORY ALTERATIONS IN DOGS EXPOSED TO COMPENSATED HIGH INTRAPULMONARY PRESSURES. Contract AF 33(616) 5173, Proj. 7160, Task 71814, WADC TR 58 471, April 1959, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (State University of Iowa, Iowa City, Iowa)

14,253

To measure circulatory and pulmonary blood volume alterations that might occur if pressure breathing is compensated by adequate counterpressure, dogs were placed in full pressure suits and helmets and exposed to pressures from four to 230 millimeters mercury for periods ranging from two to 300 minutes. The data were studied for the effectiveness of the pressure suit for protection to the animal exposed to compensated high breathing pressures.

14,254

Wolfe, A.S. & O'Connell, M.H. SOURCES OF VARIABILITY AMONG ARTICULATION TESTS FOR NORMAL EARS WITH PB WORD LISTS. 58 123, March 1959, 6pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

14,254

To determine 1) the effects of sound pressure levels of 90, 100, 110 and 115 decibels on articulation test scores, 2) the effects of order of presentation of test forms on test scores, and 3) the reliability of tests performed at each presentation level, four forms of the Harvard Phonetically Balanced (PB) word test were arranged in an appropriate design. The subjects were 64 Air Force recruits ranging in age from 17 to 25 years and with normal hearing within the frequencies 500, 1000, and 2000 cps. The findings are discussed in relation to the use of the PB test lists as screening tests of speech perception efficiency.

14,255

Mercer, E.R. & Blackwell, H.R. VISUAL RECOGNITION ALONG VARIOUS MERIDIANS OF THE VISUAL FIELD. XI. IDENTIFICATION OF THE NUMBER OF BLACKENED CIRCLES. Proj. MICHIGAN, Rep. 2144 314 T, Dec. 1958, 24pp. Willow Run Labs., University of Michigan, Ann Arbor, Mich.

14,255

This is one of a series of experiments investigating an observer's ability to identify targets composed of multiple elements having one of two possible forms (binary elements). A linear array of open and closed circles were presented tachistoscopically at four inclinations on the frontal plane of the visual field, with each array passing the observer's fixation point. The task was to estimate the number of closed (blackened) elements that appeared on either side of fixation. Error data from 20 observers were analyzed for meridians as a whole and for half-meridians.

14,256

Quedry, F.E. Jr. & Ceran, S.J. DERIVATION OF 'SUBJECTIVE VELOCITY' FROM ANGULAR DISPLACEMENT ESTIMATES MADE DURING PROLONGED ANGULAR ACCELERATIONS: ADAPTATION EFFECTS. Proj. 6 95 20 001, Task USAMRL T 4, NEDRA, Rep. 376, Feb. 1959, 21pp. USA Medical Research Lab., Fort Knox, Ky.

14,256

To describe the change in intensity of subjective reaction (magnitude of subjective velocity) during periods of prolonged constant angular accelerations varied in magnitude from one trial to next and to determine the nature of any response decline during the course of constant-magnitude stimulus, ten subjects made estimates of angular displacement by indicating direction of apparent rotation of a target light (in dark room) and signalling each time they apparently rotated through 45 degrees. Four angular velocities were used: 0.5, 1.5, and 2.0 degrees per second squared for 100, 10, 70, and 50 seconds respectively. The results are discussed in terms of predictability by Van Emmon's "torsion-pendulum" theory, adaptation effects, and so forth.

14,257

Farnsworth, D. PSYCHOLOGICAL STUDIES OF AGING IN ENGLAND. ONRL TR 54-59, June 1959, 9pp. USN Office of Naval Research, London, England.

14,257

This report describes studies which are being conducted in England on the problems of aging. The Nuffield Foundation sponsors exploratory studies on a wide front: the effect of educational facilities available to elderly people; pilot studies on their economic position; the possibilities of employment of older workers unable to carry on their normal work; aging performance in relation to complexity of task; the physiology of age; compensatory processes with age. Some of these studies are summarized briefly.

Glassner, H.F. & Peters, G.A. EFFECTS OF MENTAL TASK DIFFICULTY ON PHYSIOLOGICAL RESPONSE. Engng. Paper 848, Aug. 1959, 24pp. Equipment and Safety Research, Douglas Aircraft Company, Inc., El Segundo, Calif.

14,258

To compare the measurements obtained on each of several physiological variables when level of intellectual difficulty of work tasks is systematically varied, such recordings were made on subjects performing problems drawn from the first, third and fifth difficulty levels of the Army General Classification Test. The physiological indices included respiratory, cardiac and skin resistance changes. A Latin square design was employed and therefore analysis of variance performed. Chi square also was used because of the nature of the assumptions necessary for the former technique. Discussion of these indicants and their potential for monitoring space crews, for determining operator loading factors, and so forth is included.

14,259

Gardner, R.E. & Carl, J.M. THE EFFECTS OF AMBIENT ILLUMINATION, CRT BIAS, AND NOISE UPON TARGET DETECTABILITY WITH A B-DISPLAY. Proj. NA 433 002 & NE 091 600 2, NRL Rep. 5264, Jan. 1959, 8pp. USN Research Lab., Washington, D.C.

14,259

To determine the effects of: a wide range of ambient illumination, receiver gain, and cathode-ray-tube bias on target detectability for a typical airborne-intercept radar B-display, four male subjects detected targets on such a display in a cockpit mock-up for several intensities, receiver noise values and target positions. Optimum values as a function of ambient illumination are indicated, and related to other findings in this area.

Frank, W.E. & Gibson, R.J. A NEW PRESSURE-SENSING INSTRUMENT. J. Franklin Inst., July 1954, 228(1), 21-30. (Bioengineering Section, Franklin Institute Laboratories for Research and Development, Philadelphia, Penn.).

14,260

This report describes work done developing a system for measuring pressure exerted by the individual on his environment. The instrument had to function so accurate pressure contours could be drawn, particularly in the areas of bony prominences. The experiments included testing of different materials particularly for reducing hysteresis and instrumentation. Specific applications for this device are indicated.

14,261

Dzendolet, E. & Rivley, J.F. MAN'S ABILITY TO APPLY CERTAIN TORQUES WHILE WEIGHTLESS. Proj. 7184, Task 71506, WADC TR 59-94, April 1959, 28pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,261

This study first reviews the anthropological literature to determine the torques a man can apply under normal conditions. Three experiments were performed in order to determine these torques under frictionless conditions: 1) maximum torque person can exert while trying to supinate his hand, 2) reaction force to a torque applied to a handhold (pushes and pulls) with handle varied through four positions and 3) qualitative observations on person performing two simple mechanical acts. The values obtained empirically were compared to calculated values and the validity of predictions so based was indicated. Suggestions concerning optimum body positions, use and location of handholds, design of handtools, and so forth are made.

14,262

Fryer, D.I. AIRCRAFT PASSENGER-SEAT DESIGN AND CRASH SURVIVAL. FPRC 1055, Aug. 1958, 17pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

14,262

This review of available information describes the forces likely to be encountered in an aircraft accident and the best means by which to minimize their various effects on passengers. The discussion of protective engineering includes the floor, seat anchorage, and seat orientation. Major attention is given to the arguments advanced for and against the adoption of backward facing seats.
T. R 46

14,263
Dunlap and Associates, Inc. INTEGRATED INSTRUMENTATION FOR AIRCRAFT. HUMAN ENGINEERING PHASE. Dec. 1954, 51pp. Dunlap and Associates, Inc. Stamford, Conn.

14,263
This is a summary of the findings of the first year studies in the program to improve and simplify aircraft instrument presentation. An analysis was made of the visual cues which provide information for flight control during contact flight. These were incorporated in a single display which appears adequate for presenting data related to orientation of the aircraft in space. A series of aircraft tests for evaluating this display and comparing it to a standard and an advanced display system are described. Plans for further development of this display concept are indicated.

14,264
Gervey, W.D., Taylor, F.V. & Newlin, E.P. THE USE OF "ARTIFICIAL SIGNALS" TO ENHANCE MONITORING PERFORMANCE. NRL Prob. R05 19, Proj. NO: OIC 520, NRL Rep. 5269, Feb. 1959, 8pp. Applications Research Division, USN Research Lab., Washington, D.C.

14,264
To explore the behavior of human monitors searching over a two-hour period for signals that appear infrequently, five experiments were run using a multi-dial display. The variables were 1) use of artificial signals indistinguishable from the real signal, 2) use of artificial signals readily distinguished from real signal, 3) informative feedback (red light) and 4) motivational feedback (noise). The response times to the real signals were analyzed for effects of the variables on monitoring efficiency.

Cummings, E.G., Blevins, W.V., Greenland, C.M. & Craig, F.N. THE EFFECT OF PROTECTIVE MASKS ON THE SOLDIER'S ABILITY TO RUN A HALF MILE. Subproj. 4 08 02:023 01, OMLR Rep. 2254, Oct. 1958, 20pp. USA Chemical Warfare Lab., Army Chemical Center, Md.

14,265
To assess the effects of the E13 and M9 gas masks on the soldier's ability to perform intensive work demanded by assault maneuvers, half-mile speed running was performed by nine paratroopers. Each subject ran the half-mile single while wearing the E13 mask (with and without the filter), the M9 mask (with and without the filter), and with no mask. Each run was separated by 24 hours. Running times, per cent increase in running time (as based on the no mask condition), final heart rates, and the statistical analysis of the data are given. The effects of mask weight, distribution, inspiratory resistance, and visual field on running are discussed.

Hale, H.B., Ellis, J.P., Jr. & Kratochvil, C.H. CHANGES IN PLASMA CORTICOSTEROIDS AND BICARBONATE AS A RESULT OF PILOTING SUPERSONIC AIRCRAFT. 59 61, April 1959, 4pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

14,266
The present study is concerned with hyperventilation in F-100 pilots. Plasma bicarbonate determinations provide a means of detecting in-flight hyperventilation, and, in theory, corticosteroid determinations might differentiate the susceptible from the tolerant ones. Such determinations were made immediately before and after relatively short flights. Comparison was made of instructors and students to ascertain whether the difference in flying is reflected by these parameters.

14,267
Hall, F.G. & Salzano, J. EFFECT OF BODY POSTURE ON MAXIMAL INSPIRATORY AND EXPIRATORY STROKE VOLUME. Contract AF 33(616) 3421, Proj. 7164, Task 71632, JADC TR 59 126, March 1959, 12pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Duke University Medical Center, Durham, N.C.).

14,267
To enable a close study of respiratory processes, a method for measurement of both inspiratory and expiratory stroke volumes is described. Tided maximal expiratory and inspiratory stroke volumes were measured, using the method described, in 18 normal young men ranging in age from 19 to 30 years. During these tests, subjects were placed in four postures: standing, supine, head up and body axis at 45 degrees from horizontal, and head down and body axis at 45 degrees from horizontal. The percentage of maximal stroke and flow rates were analyzed in relation to body posture.

Craggall, A.M. & Robinson, H.M. MEASURING AND PREDICTING THE GENERATION OF STATIC ELECTRICITY IN MILITARY CLOTHING. Proj. 7 93 18 019, Rep. 110, Sept. 1959, 67pp. USA Textile Division Laboratory Branch, ON Research & Engineering Center, Hattick, Mass.

14,268
This report contains: 1) a summary of an investigation on the problem of static electricity in clothing assemblies from the standpoint of hazard due to characteristics of the clothing components, 2) an analysis of the generation of static electricity and of specific atmospheric and other conditions under which the problem becomes acute, 3) data from on-the-individual tests of static electricity on men wearing cold-dry uniforms, 4) data from an evaluation of antistatic finishes for effectiveness and durability, 5) instrumental methods for predicting electrostatic propensity are reviewed, and 6) a new Quartermaster device for the aforementioned predictions is described and discussed.

Crockford, G.W., Mellon, R.F., Humphreys, P.W. & Lind, A.R. AIR-VENTILATED SUITS FOR WEAR IN VERY HOT ENVIRONMENTS. RNP 59/944, CES 439, CP 33, Jan. 1959, 18pp. Clothing Panel, Climatic Efficiency Sub-Committee, RNPAC, London, England.

14,269
The object of the research was to provide an air-ventilated suit which would enable a man to carry out light watch-keeping duties for one or two hours in an environmental condition of 180 degrees Fahrenheit dry-bulb temperature and 130 degrees Fahrenheit wet-bulb temperature. Tests, described in this report, were conducted to determine the optimum quantity and temperature of the ventilating area for the suit. Sixteen tests were carried out in an air temperature of 178 degrees Fahrenheit during which volunteer subjects wore the suit ventilated with dry air at given rates between ten and 25 c.f.m. (cubic feet minute) and at given temperatures between 86 and 100 degrees Fahrenheit with a constant humidity. Physiological measurements were made before, during, and after the tests. Recommendations are included. I. G. R 3

Melpar, Incorporated, Falls Church, Va. STUDY OF EVALUATORS FOR AIRCRAFT INSTRUMENTATION DISPLAY. FINAL REPORT. Contract NR DA 36-039 SC 75578, Proj. NR 11 00 0000, Task 11 57 0081, USAEPG SIG 950 41, June 1958, 58pp. USA Electronics Proving Ground, Fort Huachuca, Ariz.

14,270
To determine the feasibility of fabricating a flight simulator for testing developmental aircraft instrumentation; to determine its probable acceptability, value and cost; and to determine, if feasible, concepts and doctrines for employment, studies were made of the evaluation problem, the "pros" and "cons" of "in-flight" versus simulator testing, basic analog computer operations, and how simulator techniques could be used. A computer and associated laboratory facility are described in detail and the experimental techniques to perform instrument display evaluation are discussed. Comparative cost estimates of simulator testing and flight testing are presented.

Burt, C.P. TRACKING PERFORMANCE AS A FUNCTION OF FEEDBACK SPECIFICITY. Proj. 7364, Task 7362, NRC TR 38 544, March 1958, 13pp. NRC Ann. Rept. 13, Wright-Patterson AFB, Ohio.

14,275
To provide knowledge concerning the relationship between human performance and the specificity of feedback information, four degrees of specificity and two levels of task difficulty were studied in terms of their effect on error and on control action in the performance of a one-dimensional compensatory tracking task using an acceleration control. Eight subjects were assigned randomly to each of eight combinations of task difficulty and feedback specificity and performed 30 90-second trials. Tracking error and control action scores were analyzed to find an optimum degree of specificity of feedback information.

Jager, J.F. & Carhart, R.T. SOME RELATIONS BETWEEN NORMAL HEARING FOR PURE TONES AND FOR SPEECH. 59 43, April 1959, 12pp. CASE School of Aviation Medicine, Randolph AFB, Tex. (Northwestern University, Evanston, Ill.).

14,277
To determine the intensity difference between normal hearing for speech words and for a 1000 cycle per second pure tone, a preliminary investigation employed ten sophisticated subjects well acquainted with test materials and ten naive subjects initially not acquainted with tests. Thresholds were obtained by two methods (up-and-down and clinical) and compared for effect of sophistication on the two thresholds. The main experiment, employing 95 young adults with normal hearing, investigated five factors: type test method; order of test administration; sex, ear, and familiarity with test vocabulary. The data were analyzed for differences attributable to these factors and for average differences between the two types of thresholds.

Johansson, G., Backlund, F. & Bergstrom, S.-S. LUMINANCE CHANGES AND VISUAL ACUITY. Rep. 5, March 1959, 22pp. Psychological Lab., University of Umeå, Umeå, Sweden.

14,278
To study the time lag in visual acuity after luminance changes, a series of three experiments was conducted. The luminances ranged from one to 10,000 millilamberts, the visual acuity tests were of the checker-board type, and the subjects numbered five, seven, and five for the several experiments. The luminances were presented 1) serially, 2) in random order, and 3) with inserted glares (duration of three and six seconds). The time lag data were studied as a function of preadaptation luminances for the three conditions of presentation. The implications of the findings for the operator in machine systems are discussed.

Buckley, D.M. THE RELIABILITY OF SUBJECTIVE ESTIMATES OF TARGET DIFFICULTY. Proj. 7713, Task 7713C, CL DE 37 21, Mar. 1959. 20pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,280
As one phase of an investigation into methods of determining the difficulty of radar aiming points (AP), a study was made of the reliability of subjective estimates of target difficulty. Thirty subjects rated photographs of radar target presentations taken at four distances from the AP on radar bank maps. Separate estimates of difficulty on a seven-point scale were obtained for each of three associated areas on each photograph. The data were studied for reliability of estimates using analysis of variance techniques.

14,282
Kidd, J.S. & Hooper, J.J. DIVISION OF RESPONSIBILITY BETWEEN TWO CONTROLLERS AND LOAD BALANCING FLEXIBILITY IN A RADAR APPROACH CONTROL TASK: A STUDY IN HUMAN ENGINEERING ASPECTS OF RADAR AIR TRAFFIC CONTROL. Contract AF 33 (616) 3512, Proj. 7184, Task 71583, WDC TR 58 473, April 1959, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Aviation Psychology Lab., Ohio State University & OSU Research Foundation, Columbus, Ohio).

14,282
The general problem of optimum division of duties between two or more men who are performing essentially the same functions in a complex man-machine system were investigated. In a simulated radar approach control system, six two-man pattern-feeder control teams were evaluated under three methods of assignment (sector, rotation, and destination control) and under two levels of restraint on the option of exchanging responsibility during the approach (partial and no restraint). Measures of performance were system efficiency (mean control time, fuel consumption, go-arounds), safety (separation error), intercontroller communication and job satisfaction (opinion inventory).

Klein, R.G. & Kline, J.S. THE EFFECT OF TEAM SIZE AND INTERPERSONAL COMMUNICATION ON DECISION-MAKING PERFORMANCE. Contract AF 33(616) 3412, Proj. 7184, Task 71584, WDC TR 58 474, April 1959, 12pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Aviation Psychology Lab., Ohio State University & OSU Research Foundation, Columbus, Ohio).

14,283
The performance of single individuals and two-man teams, with and without intercommunications, was compared in a complex decision-making task. The task was an operational "game" derived from radar approach control with 48 subjects participating once in each of the three experimental conditions. Time, output, and error scores were analyzed in a study of work unit productivity and individual efficiency as affected by the conditions. The implications of the findings for increasing productivity are discussed.

Kneaser, G.L. ATTENTION AND PERFORMANCE REQUIREMENTS FOR GUIDED MISSILE GROUND SUPPORT FUNCTIONS. Contract AF 33(616) 170, Proj. 7185, Task 71584, WDC TR 59 340, May 1959, 4pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (General Electric Company, Schenectady, N.Y.).

14,284
This report summarizes an investigation of the high skill level requirements found in missile systems employing automatic electronic test and checkout equipment. The study consisted of interviews, visits to factories, schools, and missile test centers; and studies of documents ranging from service records and class grades through production specifications to the latest versions of operational plans. An outline of the factors that must be considered in the design of a maintenance system is presented and discussed in detail. Further research is recommended in development of techniques for evaluating the design of test logic, maintenance operations, and manual tasks.

Katzick, J.L. QUARTERMASTER HUMAN ENGINEERING HANDBOOK SERIES: VI. SIZE LIMITS OF THE HEAD AND NECK AREA OF THE SOLDIER WEARING QUARTERMASTER HEADGEAR. Proj. Ref. 7 83 01 005, Tech. Rep. EP 127, March 1959, 71pp. USA Environmental Protection Research Div., ON Research & Engineering Center, Watik, Mass.

14,285
This report presents human engineering information on the size range of the head and neck area of the soldier wearing Quartermaster headgear. It should be used as a handbook by engineers and designers for establishing space allowances in the design and sizing of man-operated equipment. The data are concerned with the middle 90 per cent of the ranges of head sizes for the Army population. The information is presented in pictorial form with index scales so that dimensions can be measured on the pictures and referred to the index scale to establish actual size.

Kremer, G.L. ATTENTION VALUE OF AUDIO AND VISUAL WARNING SIGNALS. Contract AF 33(616) 135, Proj. 7184, Task 71580, April 1959, 76pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dept. of Psychology, Washington University, St. Louis, Mo.).

14,286
A summary of a series of investigations on the "attention-demand" value of auditory and visual stimuli is given. Following a survey of the literature, a method was developed which was intended to provide a laboratory analogue of real tasks and which lent itself to measurements of stimulus-effectiveness in attracting the attention of the subject. Threshold and reaction time measures could be obtained. Comparison was made of the attention-demanding values of auditory stimuli differing in frequency, and of visual stimuli differing in wavelength under different conditions of background noise. The implications for designing systems of warning signals are discussed.

Kuempel, E.S. SHORT DURATION PHYSIOLOGICAL ANALYSIS OF EEG DATA. Contract AF 33(616) 5181, Proj. 7215, Task 71713, WDC TR 59 66, Feb. 1959, 12pp. USAF Army Medical Lab., Wright-Patterson AFB, Ohio. (The Franklin Institute, Philadelphia, Pa.).

14,287

To assess the applicability of certain communication engineering techniques to the analysis of electroencephalographic (EEG) data, amplitude spectra were computed from .20-second samples of EEG data obtained from bipolar electrodes positioned at the left parietal and left occipital locations. Differences were obtained between these spectra as a function of the state of consciousness of the subject. The implications of these differences for an electronic discrimination scheme are discussed.

Swadlow, J.A. THE POSITION OF THE FOOT IN A FOOT CONTROL. PE/3/5/54, Sept.-Oct. 1958, 28pp. The British Iron and Steel Research Association, London, England.

14,288

To investigate the position of a foot pedal in relation to the foot, a preliminary experiment was run to define the number of likely positions in which an optimum ankle position might lie. In the major experiment, seven subjects were required to move a pointer through a given distance to align it with a black pointer by operating a foot pedal in three different positions. Time taken to complete the task (a given number of runs) and the number of steps used during the runs were analyzed for differences among positions. Subjective reactions to this type of pedal and preferences for position were further analyzed. Optimum positions are given.

McFar, M.E., Mamm, J.A. & Taylor, J.E. TRAINING IN: EXPERIMENTAL DEVELOPMENT OF TRAINING METHODS AND PROFICIENCY TESTS FOR IMPROVING THE EFFECTIVENESS OF COMBAT REFLEXES. March 1959, 126pp. USAF Army Medical Lab., Wright-Patterson AFB, Ohio.

14,291

To develop a practical basic course in rifle marksmanship instruction which will prepare the soldier to use his rifle effectively in combat and to develop proficiency tests based on combat criteria to measure the adequacy of training, comprehensive analyses of the situations confronting the rifleman in combat were made. The training course and two tests (marksmanship and target discrimination) were developed. Two groups of trainees were given the conventional basic training at different Army posts and a third was given the experimental course. The relative efficiency of the groups were then evaluated. Principles of effective use of the rifle are discussed.

Bradley, J.T. & Morris, R.A. SPACING OF ON-OFF CONTROLS. IIS: ENGINE SWITCHES. Contract AF 33(616) 3404, Proj. 7182, Task 7214, WDC TR 58 475, March 1959, 21pp. USAF Army Medical Lab., Wright-Patterson AFB, Ohio.

14,292

To investigate efficiency in the human operation of toggle switches as a function of the spacing between controls, 36 right-handed subjects performed a standardized control operation in which the center one of three closely spaced switches was operated while avoiding contact with adjacent switches. Variables were type of toggle switch, spacing, orientation of the linear array, and direction of thumb performance measures were reach-and-operation time, inadvertent touching and/or operation of adjacent switches. The data were analyzed and discussed in terms of optimal design of such controls. The findings are compared with data obtained in a previous similar experiment using push buttons.

Blackwell, H.R. & Blackwell, C.M. STUDIES OF DARK ADAPTATION FOR NIGHT VISION. Part. MONITORING, Rep. 2144 3457, Jan. 1959, 13pp. Wright-Patterson AFB, Ohio.

14,296

The dark adaptation process for observers using normal binocular vision was measured in a series of experiments. An automatic recording dark adapter was used with a 0.25 degree test target of white, red, and blue light. Measurements were made following a 500-second exposure to a 1000 foot-lambert preadaptation field. The foveal and two peripheral locations (12 and 15 degrees) were studied. The ρ' were analyzed for differences in the dark adaptation function due to target color and retinal location. The known spectral response curves of rod and cone cells are used to identify the receptors involved in various phases of adaptation.

Baile, B. & Mire, R.M. THE PRESENT STATUS OF PHYSICAL FITNESS IN THE AIR FORCE. Rep. 59 67, May 1959, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

14,298

To collect material for the standardization of physical performance capacity, work capacity (a sensitive and realistic measure of physical fitness) was determined on more than 500 military and civilian Air Force personnel. A treadmill test was devised for screening work capacity which permitted evaluation of results in terms of physical and physiological terms: test duration in minutes, metabolic requirements for the work (based on measurements of gas exchange), cardiovascular response (pulse rate, blood pressure), oxygen consumption, and pulmonary ventilation. Factors such as age, activity, weight, and personal habits were related to the results. An arbitrary rating scale of work capacity is suggested.

Madany, G.M. & Madany, R.V. ON THE REDUCTION OF CHOICE REACTION TIMES WITH PRACTICE. Reprint Series Rep. 476, April 1959, 8pp. Applied Physics Lab., Johns Hopkins University, Silver Spring, Md.

14,299

To investigate the effect of practice upon choice reaction time, the performance of one practiced subject was recorded for two choices and four choices. The stimuli were lights positioned on a display panel in accordance with the arrangement of response buttons. Although there were ten stimulus and response positions, only the index and second finger positions were used. Each trial consisted of 3000 reaction times for the two conditions; there were 15 trials spaced over a period of five months. Mean choice reaction times for the two conditions were analyzed as a function of trials. The findings are discussed in relation to their use in information theory.

Mockler, F.A., Nymard, J.E., O'Reilly, L.J. & Williams, J.C., Jr. PSYCHOLOGICAL DEFICIENCIES IN THE DESIGN OF FLIGHT SIMULATORS FOR TRAINING. Contract AF 33(616) 2723, Proj. 7191, Task 7105, WADC TR 58 369, Jan. 1959, 132pp. Wright-Patterson AFB, Ohio.

14,300

This report surveys the general problems of simulator design (primarily flight and engine systems) with reference to factors of psychological stimulation that influence transfer of training. Present Air Force utilization of simulators is discussed; training research literature on flight trainers and simulators is evaluated; and a number of experimental programs are suggested. Several specific problem areas are examined with particular emphasis on possible empirical solutions. Motivational, instructional, and methodological variables are also considered. Finally, conventional theories of transfer of training are evaluated for predictive efficiency in this area.

Parrish, J.A. **A STUDY OF TWO NON-LINEAR METHODS OF COMBINING PREDICTOR TESTS.** FEB Tech. Res. Note 102, May 1959, 21pp. USA Personnel Research Branch, Adjutant General's Office, Washington, D.C.

14,306

The predictive efficiency of two relatively untried but promising methods of combining test scores were compared with that of the usual (multiple regression) method. Scores on four Army Classification Battery Tests and two experimental tests were obtained on 1000 enlisted infantrymen on their first tours of duty. The basic problem was to combine test scores by taking into account special population characteristics in such a way as to maximize prediction of rated combat efficiency. Both experimental methods used test scores for defining population characteristics: 1) interaction method made use of cross-products in prediction formula, and 2) configural method determined the best prediction for each score pattern.

Rimmer, R.S. **BOUNDARY-LAYER-INDUCED NOISE IN THE INTERIOR OF AIRCRAFT.** NACA Rep. 37, April 1936, 39pp. Institute of Aeronautics, University of Toronto, Ottawa, Canada.

14,307

At high speeds the turbulent boundary layer causing the airplane fuselage excites appreciable skin vibration, producing strong noise in the interior. The fluctuating exciting pressure distribution can be represented as a pattern of moving waves (Fourier integral). A moving ripple in the skin follows underneath each wave, and the noise is ultimately due to these ripples. The acoustical effects of the moving ripples are calculated from an infinite sheet; this is the main result of this investigation. The results are used to provide a tentative estimate of the noise generated at subsonic speeds in a practical fuselage. Some comparisons are made with experiment. Finally, no idea for noise alleviation is presented.

14,312

To obtain information pertaining to the design of index tabs as used on checklists to facilitate handling, an experiment was performed in which subjects were required to pick up a check list from a thighboard, turn to a specified section of the list, then replace the list back on the thighboard. The experimental variables were 1) size of tabs, 2) encumbrance conditions (bare hands and work clothes, gloves, gloves and fully inflated MC-3 partial pressure suits), and 3) tab position (top, center, or side of list). Reaction times in using tabs to locate information were studied by analysis of variance methods for effect of the variables.

Riley, J.A. OCCUPANCY THEORY WITH APPLICATION TO MULTI-CHANNEL COMMUNICATION SYSTEMS. PART 1: THEORY. Contract AF 19(604) 1396, AFMTC IN 57 562, Scientific Rep. 5, June 1957, 49pp. Parks Mathematical Laboratories, Inc., Carlisle, Mass.

14,313

This report presents a generalized occupancy theory (study of problems concerned with the distribution of a given number of objects in a given number of cells or compartments) which includes the classical and restricted theories as special cases. Some of the basic problems in the general theory are formulated and discussed. The principle tool in the development is the Markov method from the theory of random flights. From a mathematical point of view, channels in a multichannel communication system are cells occupied or not by objects of a different color representing different kinds of communications. Thus the occupancy theory can be used to determine the probabilities of various events in the use of multichannel communication systems.

14,314

Riley, J.A. OCCUPANCY THEORY WITH APPLICATION TO MULTI-CHANNEL COMMUNICATION SYSTEMS. PART 2: APPLICATIONS. Contract AF 19(604) 1396, AFMTC IN 57 563, Scientific Rep. 6, Feb. 1958, 31pp. Parks Mathematical Laboratories, Inc., Carlisle, Mass.

14,314

This paper applies the Occupancy Theory (see 14,313) to some problems of multichannel communication systems. Basic assumptions for a model of a communication system are stated and the resultant model is then identified with the basic model of Occupancy Theory. Since an immediate consequence of the communication model is the possibility of self-interference (two or more stations overlap in their choice of transmitting channels), the results of the theory are applied to three self-interference problems. The solutions have not only intrinsic interest, but should serve as examples for other applications.

14,319

To study the relationship between frequency of constant-displacement whole-body vibration and lethal exposure time, 186 rats were studied. Except for control subjects, all were vibrated at some one frequency until death occurred or after 12 hours. The displacement (peak-to-peak or total amplitude) was constant at .25 inches, frequencies tested ranged from 10 to 45 cycles per second and acceleration increased as the square of frequency. Lethal exposure time was analyzed as a function of frequency and acceleration. Pathological effects of vibration were determined.

Conrad, R. PERFORMANCE OF TELEPHONE OPERATORS RELATIVE TO TRAFFIC LEVEL. *Nature, Dec. 1956, 178, 1400-1401. APV 276/56. (Applied Psychology Research Unit, MRC, Cambridge, England).*

14,324

To investigate the performance of telephone operators in relation to traffic level, the traffic load per operator (cordless auto-manual exchange) was varied experimentally over a four-week period. Operator waiting time was measured by a snap-reading method, and from it operator time per call was calculated. The data were analyzed to test the assumption that operator time per call is independent of traffic level.

Altman, I. & McGrath, J.E. A CONCEPTUAL FRAMEWORK FOR THE INTEGRATION OF SMALL GROUP RESEARCH INFORMATION. *Contract AF 49(638) 256, Supplemental Agreement 1(58 446), AFOSR TR 59 252, & HRL TR 59/1 CM, Feb. 1959, 115pp. Human Sciences Research, Inc., Arlington, Va.*

14,325

This is a report of the second phase of a research program designed to integrate existing research knowledge about small groups. The approach used is data-oriented, thus dealing with empirical research results in detail, and the classification system is based on the form or system of empirical data which permits a logically complete framework. The basic approach and resulting integrative framework are described; results of its application to a sample of small group research studies are presented; some major potential applications of the research to basic and operational problem areas are discussed. A reader instruction manual is appended.

Clark, R.R.M. DEVELOPMENT OF TYPE MS-2 AIRBORNE DATA RECORDER. *Contract AF 33(616) 3423, Proj. 7135, Task 71804, Phase IIA, WADC TR 57 603, Feb. 1958, 26pp. HNS Aero Medical Lab., Wright-Patterson AFB, Ohio. (Testing Div., Douglas Aircraft Company, Inc., Santa Monica, Calif.).*

14,326

The development of a small, direct-writing, 20 channel data recorder, designated Type MS-2, especially for airborne use, is described. Means of recording certain aircraft environmental conditions as well as physiological measurements of flight personnel are explained. The development of special transducers for measuring relative humidity and physiological temperatures is described. The influence of environmental changes on the accuracy of the recorder has been determined and is reported here. Operating, calibration, and maintenance instructions are included.

Shelanski, M.V. & Gabriel, K.L. CUTANEOUS TOXICITY EVALUATION OF AIR FORCE DEVELOPMENT MATERIALS-XII. *Contract AF 33(616) 5595, Proj. 7145, Task 71536, WADC TR 59 124, June 1959, 9pp. HNS Aero Medical Lab., Wright-Patterson AFB, Ohio. (Industrial Ecology Research and Testing Lab., Inc., Philadelphia, Penn.).*

14,327

To establish the primary irritant and sensitization characteristics to the skin of Air Force development materials, prophetic testpatch studies were performed on laboratory animals and 300 volunteer human subjects. Three crystalline substituted phenyl ethers, three DOK flame-resistant cotton fabrics, one untreated cotton sateen fabric, and four fungicidal-treated (fluorinated diphenyl sulphide) cotton sateen fabrics were studied. Procedures for field testing are outlined.

Silvestro, A.W., Kelly, J.B. & Courtney, D. HUMAN FACTORS CONSIDERATIONS IN THE DESIGN OF AIRPORT TRAFFIC CONTROL QUARTERS. (SECOND INTERIM REPORT). PRELIMINARY ENGINEERING LAYOUTS. *Contract FAA/RND 04, Proj. P, Rep. 27, June 1959, 39pp. Courtney and Company, Philadelphia, Penn.*

14,328

This is the second interim report on work accomplished in giving human factors consideration to the design of airport traffic control quarters. It includes all the work of the first report plus work accomplished since its issue. Written recommendations and drawings are provided for the over-all space requirements and general layout of air traffic control quarters including the tower cab, Instrument Flight Regulations control room, controller ready room, training space, and visitors observation area. Such information is also supplied for layout of operating consoles, desks, and other furniture or furnishings for these areas.

Slodota, R.F., Forrest, J., Carter, W.K. & Wade, E.A. COMFORT EVALUATION OF THE C-119 PILOT SEAT (AEROSEAT). ONE OF A SERIES OF STUDIES PERTAINING TO THE DESIGN EVALUATION OF PILOT AND CREW STATION EQUIPMENT. Contract AF 33(616) 3040, Proj. 7215, Task 71724, WADC TR 58 312, March 1959, 14pp. Wright-Patterson AFB, Ohio. (Bio-Mechanics Lab., Tufts University, Medford, Mass.).

14,330

To evaluate certain design characteristics of the C-119 Pilot Seat (Aeroseat) in terms of their adequacy for the maintenance of human comfort, subjective and behavioral laboratory tests were administered by means of hourly questionnaires to 17 subjects during a voluntary sitting period of seven hours maximum duration. The subjects were allowed to leave the seat only when discomfort feelings compelled them to do so. On the basis of average voluntary seating time, hourly ratings of overall and of specific body regions comfort, and evaluation of individual seat parts, recommendations for seat design improvement were made.

Colman, K.G. TARGET COLOURATION. ANC Exp. Proj. 55/6 78, Rep. 3041, Oct. 1958, 13pp. RCAF Air Armament Evaluation Detachment, CEPE, Cold Lake, Alberta, Canada.

14,331

To select the best possible color, or color combination for visual and photographic computation, ten color samples were prepared and compared visually, by means of black and white photography, and by means of color photography. A series of tests were made of the colors applied to ground targets under varied lighting conditions. From the results obtained the most obvious color combination was selected and applied to an M-3 Sweep Wing Target. This target was towed and photographed under varied lighting conditions. The results were assessed and compared to visual observations. Recommendations for an optimum color scheme are included.

Sprague, M.E. & Ross, C.W. WORLD GUIDE TO FIELD CLOTHING REQUIREMENTS. Proj. Ref. 7 43 01 005, Tech. Rep. EP 115, July 1959, 40pp. USA Environmental Protection Research Div., ON Research & Engineering Center, Watich, Mass.

14,332

A rapid method for determining the type and amount of clothing required for seasonal wear in a given world area is presented in this guide. The world has been classified into nine types of field clothing requirement areas. It has been determined that four distinct ensembles are required to protect troops adequately against all types of natural environments encountered in these nine areas. Maps and tables are presented to 1) indicate the general amount of clothing required in all areas, 2) prescribe the assortment of field clothing in each place and in each season, and 3) designate camouflage requirements for the issue of hot weather assortments and over whites.

Sperling, M.G. & Lee, G.B. THE AREA-INTENSITY RELATIONSHIP AT THRESHOLD FOR THREE STIMULUS DURATIONS IN THE HUMAN FOVEA. Proj. NN 22 01 20, Subtask I, Rep. 1, USNML Rep. 287, May 1957, 6pp. USN Medical Research Lab., Submarine Base, New London, Conn.

14,333

The relationship of area and intensity functions for three stimulus durations (0.001, 0.040, 0.250 seconds) in the human fovea were re-determined and are reported in this paper. Seven circular stimuli were used ranging in visual substance from about one minute to one degree in diameter. Threshold data from two subjects (right eye monocular observation) obtained by the serial method of limits are reported for each stimulus area and each stimulus duration. The mathematical relationship describing the function was determined and discussed in relation to previous findings.

Conrad, R. & Mille, Barbara A. TELEPHONE OPERATORS' ADAPTATION TO TRAFFIC VARIATIONS. J. Inst. elect. Engrs. Jan. 1958, 4(New Series), 13-14. APU 282/58. (Applied Psychology Research Unit, NEC, Cambridge, England).

14,334

To test the assumption that the rate at which telephone calls enter an exchange does not affect the time taken by operators to deal with them, experiments were carried out at an auto-manual cordless telephone exchange over a period of four weeks. The main experimental variable (rate of work in terms of calls per operator per hour) was controlled by varying the number of operators on duty. A snap-reading method was used to measure the proportion of total time spent operating. The data were analyzed in terms of effect of traffic level on operator performance.

Tillmer, T.M. & Jerger, J.F. SOME FACTORS AFFECTING THE SPONDEE THRESHOLD IN NORMAL-HEARING SUBJECTS. Rep. 59 69, May 1959, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Audiology Lab., Northwestern University, Evanston, Ill.).

14,336

To investigate the effects of 1) knowledge of test vocabulary and 2) practice in responding to words at threshold intensity, three groups of ten normal hearing subjects each were formed. The spondee thresholds were obtained for each subject (List E of Auditory Test W-1) with exactly 18 spondee words. In group I, the initial threshold was obtained with words one through 18, the second with words 19 through 36. In the other two groups, both thresholds were obtained with the first 18 words; in the third group, however, the words were first read aloud to each subject. The data from the three groups were compared for effects of the two variables.

Westheimer, G. ACCOMMODATION LEVELS DURING NEAR CROSSED-CYLINDER TEST. Contract NMR 495(09), RF Proj. 654, Tech. Rep. 4, May 1959, 3pp. Ohio State University Research Foundation, Columbus, Ohio. (Reprinted from Amer. J. Optom. & Arch. Amer. Acad. Optom., Nov. 1958, Mono. 242, 1-6).

14,337

To investigate the validity of the crossed-cylinder test as a measure of near accommodation level, eight young subjects were tested. Accommodation levels were measured in each subject when presented with a visual configuration consisting of a set of three horizontal lines at one optical distance and a set of three vertical lines at a different optical distance. Responses to each set of lines separately and together were analyzed. A modification of the test is suggested.

USN Research Lab. COMPARATIVE EVALUATION OF THREE APPROACHES TO HELICOPTER INSTRUMENTATION FOR HOVERING FLIGHT. Proj. NA 550 010, NRL Prob. Y02.11 & BuAer Prob. TED NRL AE 7047, May 1957, 31pp. USN Research Lab., Washington, D.C.
- 14,340
To compare three helicopter flight display systems (conventional, integrated, and quickened), a simulator was constructed consisting of cockpit system and pilot seating arrangement with an analog computer for solving the dynamics of motion. The operator's task was to minimize translational motion while the vehicle was subject to gust disturbances; in some conditions a secondary task (controlling heading) was added. Each of six subjects accumulated approximately 25 hours of simulator time. The error scores were analyzed for differences among the systems and for the effect of the stress of a secondary task on these differences.

Peters, G.A. & Semnara, J.L. ACADEMIC TRAINING NEEDS IN HUMAN FACTORS ENGINEERING. J. aeron. Educ., May 1959, 42(9), 799-805. (University of Southern California, Los Angeles, Calif. & Dover, N.J.).
- 14,341
This is a discussion of the academic training needs in the field of human factors engineering and represents an initial effort to clarify some of the major problems and offer some proposals for their solution. The problem areas were identified by modified job analyses with non-supervisory personnel in the field followed by interviews with various levels of supervisory personnel to determine what they considered current training deficiencies to be. A suggested core curriculum is presented to illustrate how a one-year graduate level program could be organized to cover the range of problems of greatest importance.

Torrrey, Jane M. EVALUATION OF COLOR VISION TESTS. SUPPLEMENTARY TECHNICAL REPORT. Contract NOMP 996(03), June 1959, 7pp. Connecticut College, New London, Conn.
- 14,345
To test the hypothesis that blue-yellow discrimination requires a longer exposure period than red-green to achieve its minimum threshold, a pilot study was performed measuring the discrimination thresholds between points near a neutral center of the ICI Chromaticity Diagram along the two dimensions, red-green and blue-yellow. Each stimulus consisted of a pair of colors to be judged as to the position of the blue or green and was exposed for two different intervals: 1/5 and two seconds. Six observers were used. Thresholds of discrimination and ratios of blue-yellow to red-green thresholds for both exposure times were calculated from the data as a test of the hypothesis.

Tolhurst, G.C. THE EFFECTS OF SIGNAL-TO-NOISE RATIOS AND PEAK CLIPPING UPON A TIME ACCELERATED MULTIPLE-CHOICE INTELLIGIBILITY TEST. Joint Proj. NM 18 02 99, Subtask 1, Rep. 83, Jan. 1959, 15pp. USN School of Aviation Medicine, Naval Air Station, Fla.
- 14,346
In an attempt to construct an intelligibility test that could be used as a sufficiently sensitive measure for indicating subtle differences among stressor situations, a multiple-choice test in which one-half of the test items had a progressively accelerated presentation was constructed. This test was compared with a comparable test of regularly spaced items, and with the test as recorded by one or by three speakers. Various signal-to-noise ratios (from +4 to +16 decibels) and levels of peak clipping (from 0 to 30 decibels) were also tested. Mean percent reception scores were analyzed for the effect of these various conditions.

Tessendorf, J. BEATS IN COCHLEAR MODELS. *J. Acoust. Soc. Amer.*, May 1959, 31(5), 606-619. (University Hospitals, Iowa City, Iowa).

14,347

This paper describes the hydrodynamic phenomena observed in cochlear models when responding to beat signals. The effect of beats of imperfect unisons and of mistuned consonances upon the cochlear fluid motion and upon the traveling wave pattern were observed. Both continuous and stroboscopic illumination were used for observation and high-speed motion pictures were used for observing the displacement pattern of the membrane. These observations give evidence as to the mode of frequency analyses performed by the model in the case of complex stimulation.

Dardano, J.F. & Mower, I. RELATIONSHIPS OF INTERMITTENT NOISE, INTER-SIGNAL INTERVAL AND SKIN CONDUCTANCE TO VIGILANCE BEHAVIOR. Proj. TBI 1000, Tech. Memo, 7 59, July 1959, 29pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.

14,352

To investigate the relationships of intermittent, low intensity, ambient, white noise, inter-signal interval variability and basal skin conductance to prolonged observation, 36 observers, separately, monitored a cathode ray tube screen for a continuous three-hour period in an isolated environment. The task was to differentiate a total of 180 critical signals that differed from a periodically blinking background signal only by a larger amplitude. Performance was measured by reaction time. Skin resistance was at 15-second intervals throughout the session. Performance data were analyzed for effects of the experimental variables.

O'Connell, M.H. & Baccaro, P.M. MEASUREMENT OF AUDITORY THRESHOLD BY MANUAL AND SAM AUTOMATIC AUDIOMETRY. Rep. 58 131, March 1959, 10pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

14,354

To test the reliability of the test programming (a modified descent) technique used by the SAM automatic audiometer, threshold values obtained by this audiometer were compared with the results of two types of descending stimulus manual audiometry (single and triple descent). Two groups of unskilled listeners were tested: 24 with normal hearing and 24 with subnormal hearing. Each subject received two tests by each method separately for each ear at six frequencies: 500, 1000, 2000, 3000, 4000 and 6000 cycles. Threshold values were analyzed for comparability among methods and for test-retest reliability of each method.

Evvard, E. RESCUE OF AVIATORS BY MEANS OF EJECTION SEATS. AIC 305111 A, F TS 9115/III, 1956, 16pp. USAF Air Technical Intelligence Center, Wright-Patterson AFB, Ohio. (Belgian Air Force Medical Service, Belgium).

14,356
This report reviews 15 cases wherein ejection seats were used in the pursuit plane squadron of the Belgian Air Force during a period of five years (1952-1956). The circumstances surrounding the ejection where the consequences were fatal and those where the conditions under which the ejection took place were abnormal are described. Technical comments and practical suggestions resulting from the analysis of ejections are made under six points: 1) jettisoning the glass enclosure of the cabin, 2) position of feet before ejection, 3) minimum altitude for safe ejection, 4) the jump from high altitude, 5) the equipment of flight carried during ejection, and 6) aeromedical instruction of air personnel.

Finn, B.J. & Gaydos, H.F. THE RELATIONSHIP BETWEEN INDIVIDUAL PERSONALITY VARIABLES AND BODY TEMPERATURE RESPONSE PATTERNS IN THE COLD. Proj. 7-83 01 005, Tech. Rep. EP 106, March 1959, 11pp. USA Environmental Protection Research Div., QM Research & Engineering Center, Natick, Mass.

14,357
To study relationships between certain psychological and physiological responses to stress (cold exposure), 57 male volunteer test subjects were studied. Each completed the Minnesota Multiphasic Personality Inventory, were measured for weight, height, and body fat, and were then exposed to successive climatic conditions of 1) 70 degrees F. (Fahrenheit), 50 per cent R.H. (relative humidity), no wind; 2) 50 degrees F., 50 per cent R.H., five miles per hour wind; and 3) 78 degrees F., 50 per cent R.H., no wind; for periods of 30, 75, and 115 minutes respectively. Skin and rectal temperatures were recorded during all periods; subjective response regarding feelings of warmth were obtained during cold exposure. Analysis was made of relationships between personality variables and body response patterns. T. R 17

Fried, C. & Ivey, Lois F. A HUMAN ENGINEERING EVALUATION OF SPOTTING ROUNDS WITH RESPECT TO FIRE DIRECTION CAPABILITIES. Proj. TBI-1000, Tech. Memo. 4 59, June 1959, 31pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.

14,358
To evaluate spotting rounds with respect to fire direction capabilities, 12 enlisted men of the 82nd Airborne Division, Fort Bragg, North Carolina, made observations of spotting rounds randomly placed around the target. Four distances were used: 500, 1000, 1500, and 2000 yards. The subjects used standard Army M16 field type binoculars (7X magnification) and were required to make corrections in yards for azimuth and range from the position where the spotting round appeared to actual target position. The radial and range errors were analyzed as a function of distance. The feasibility of the technique for military use is discussed.

Nicks, S.A. THE MOTIVATIONAL EFFECTS OF REST PERIODS ON PERFORMANCE. OCO Proj. TBI 1000, Tech. Memo. 8 59, Aug. 1959, 16pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.
- 14,364
To investigate the effects of different rest schedules on the performance of a heavy rotary task, 40 subjects were tested under two schedules: 1) fixed interval-rest after a given amount of time, and 2) fixed ratio-rest after a given number of responses. Rate of response (total number) and work output (in foot-pounds) were analyzed for differential effects of the rest schedules.

Hansen, O.K., Franks, P.E. & Modrick, J.A. NATURE AND USE OF THE MAC-2 (MALFUNCTION AND CIRCUITRY) TRAINER. Proj. 1710 71604, MACC TR 59 140, May 1959, 13pp. USAF Air Medical Lab., Wright-Patterson AFB, Ohio.
- 14,365
This report discusses the MAC-2 trainer, which simulates the data flow of the MA-7A bomb-nav system, and can be used for training and proficiency measurement in the use of data flow information and technical manuals by flight-line mechanics. A brief history, advantages and limitations, suggested modifications, research problems, and empirical basis for uses of the trainer are included.

Jackson, K.F. THE MULTIPLE TRACKING TEST. FPFC 1072, Nov. 1958, 27pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).
- 14,367
The first part of this report deals with a description of the equipment and the methods of performance measurement of the Multiple Tracking Test. This test contains five separate control systems in each of which a pointer, subject to disturbances, can be controlled by turning a knob. The number of control systems in use and type of deviations may be varied at will. Over-all performance accuracy as well as some aspects of the skills involved can be measured. The second part of the report describes some experiments in which the test has been used: effect of hot environments and the effect of task characteristics, such as number of control systems and velocity of pointer disturbance.

Jackson, K.F. PERFORMANCE IN A SIMULATED HIGH-ALTITUDE EMERGENCY. FPFC 1058, Dec. 1958, 7pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).
- 14,368
To assess the chances of pilots, using pressure breathing equipment, to make a successful descent to safe altitudes, a high-altitude emergency situation was simulated in a decompression chamber. Performance was measured by a multiple tracking test which the subject worked at before, during, and after the emergency. The subjects had been trained in using the pressure breathing equipment which each wore throughout the work period. Error scores and number of control movements were analyzed for effects of the "emergency."

Kidd, J.S. RESEARCH ON HUMAN ENGINEERING ASPECTS OF AIR TRAFFIC CONTROL. Contract AF 33(616) 3612, Proj. 7184, R.F. Proj. 690, April 1959, 38pp. Ohio State University Research Foundation, Columbus, Ohio.
- 14,369
This final report of a long term research study of air traffic control in its human engineering aspects consists of brief summaries of 47 studies. These reports consist of major system studies which employed the Electronic Air-Traffic Control Simulator (designed and developed for the project) and technical support studies involving many research tools and equipment. A developmental trend from factors directly related to system equipments to procedural and organizational characteristics of the system appears in the major studies. The technical reports range from investigations of team work to work on lighting systems for radar centers with emphasis on ability of human operators to perceive and interpret input signals from their environment.

Matties, G.B., Weiss, E.C. & Holzen, D.E. AN EVALUATION OF MODE SELECTOR SWITCH ARRANGEMENTS. OCO Proj. TBI 1000, Tech. Memo. 10 59, Aug. 1959, 21pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.
- 14,370
A study was initiated to determine the optimum switching arrangement in terms of operator performance for the selection of the track, acquisition and search modes for a proposed Anti-Aircraft (AA) weapon system. Five switching arrangements were studied. One hundred subjects were trained in the task to error-free performance, then tested under a time stressor (stimulus presentation rate increase) until a breakdown point was reached when he could no longer respond. Errors of commission and of omission, breakdown rate, control handle movement, and subjective statements of preference were analyzed in terms of the different switching arrangements.

Malraven, P.L. & Leebeck, H.J. RECOGNITION OF COLOR CODE BY NORMALS AND COLOR DEFECTIVES AT SEVERAL ILLUMINATION LEVELS. AN EVALUATION STUDY OF THE H.R.R.-PLATES. Rep. 12F 1959-9, June 1959, 18pp. Institute for Perception RVO-TNO, Soesterberg, Netherlands.
- 14,371
To establish the relationship between the ability of normals and color defectives to recognize the color code of resistors and their quantitative classification according to two tests of color deficiency (Hardy-Rand-Pitter and Ishihara plates), 69 resistors each with colored bands were presented to each of 81 subjects who identified the colors, using a list of possible names. The total number and kind of mistakes were compared with quantitative classification of each subject by the two tests. All tests were conducted with illuminant C, 500 lux. Further study of 40 subjects was conducted at lower illumination levels.

Zarricillo, J.J. IDIOPATHIC ORTHOSTATIC HYPOTENSION AND ITS RELATIONSHIP TO POSITIVE G TOLERANCE. Res. Proj. NM 11 01-11, Subtask 1, Rep. 13, May 1959, 10pp. USN School of Aviation Medicine, Naval Air Station, Fla.
- 14,372
This paper presents two cases that demonstrate decreased positive g tolerance as a consequence of orthostatic hypertension. Two student pilots, normal in all respects but demonstrating a definite fall in blood pressure on assuming the upright position, were subjected to human centrifugation. Their respective greyout, blackout, and unconscious threshold levels were determined and compared to 115 normal cases subjected to centrifugation in the same manner. The implications for diagnostic study as well as for the screening of naval air cadets are discussed.

Marshall, J.F. & Marzocchi, R.E. THE COMPARISON OF SCOTCH AND PHOTOPH VISION IN RELATIONSHIP TO BLACKOUT THRESHOLD ON THE HUMAN CIRCULATORY. Proj. No. 11 02 12, Subtask 1, Rep. 2, April 1959, 7pp. USA School of Aviation Medicine, Naval Air Station, Pens.

14,373

To compare the blackout thresholds obtained under scotopic and photopic levels of intensity on the human circulatory, 20 subjects were tested. Each subject was dark adapted, the blackout threshold determined (light intensity 0.625 log units above absolute visual threshold while being centrifuged in a relaxed unprotected state) a second threshold measurement was made wearing an anti-blackout suit. Following ten minutes in full light the procedure was repeated using a target with a light intensity of 3.9 millilamberts. The data were analyzed for relationships between blackout thresholds for the two light conditions, protected and unprotected.

Van Bock, R.J. FLIGHT EXPERIENCES ABOUT HUMAN REACTION TO ACCELERATIONS WHICH ARE FOLLOWED OR PRECEDED BY THE WEIGHTLESS STATE. Proj. No. 11 02 12, Subtask 1, Rep. 2, April 1959, 7pp. USA School of Aviation Medicine, Naval Air Station, Pens.

14,373

Pre-weightlessness and post-weightlessness accelerations were simulated in jet aircraft. Records were made of accelerations, both of the aircraft and those experienced by the subjects; heart action (HR); galvanic skin resistance (GSR); subject's behavior (climatology); and subjective impressions of subject (voice recording). Records from 11 subjects were analyzed for effect of the experimental conditions on acceleration tolerance and efficiency of physiological recovery mechanisms. The implications for manned space flight are discussed.

White, C.T. & Gilliland, D.C. INTER REPORT OF PROJECT NO. CE 2056, "EVALUATION OF TELEPERCEPTORS" (A PROX UNKNOWN, EMB TECH GEN UNKNOWN). Proj. No. CE 2056, ACN CE 2056, May 1957, 18pp. USA Air Force and Electronics Board, Fort Rigg, N.Y.

14,375

To evaluate teleperceptors for use by the individual soldier to determine if they 1) improve his capability for collection of intelligence information in a combat surveillance role and 2) increase his night driving capability under low illumination levels, various tests were performed. The physical characteristics were determined and tested for ruggedness and ease of adjustment and handling under field conditions. The test items were used under conditions of natural night illumination for reconnaissance; as an aid for reading maps, aerial photos, dials, meters, and making notes and sketches; and for night driving. Recommendations are included.

Stokes, A.K. & Hughes, W.P. PHYSIOLOGICAL TRIALS OF HIGH BOOTS (P.V.C. UPPERS) AND ANKLE BOOTS (I.G.S.) WITH ANKLETS AND PUTTEES. (INCLUDING A COMPARISON BETWEEN JUNGLE BOOTS AND HIGH BOOTS WITH TERYLENE UPPERS). Rep. 82, Nov. 1957, 21pp. Clothing and Stores Experimental Establishment, Ministry of Supply, London, England.

14,377

To compare some physiological aspects of five types of army boots (High Boots, Ankle Boots with web anklets, Ankle Boots with puttees, High Boots with Terylene uppers and Jungle Boots), experiments were designed to assess these footwear by the following criteria: thermal insulation as evidenced by foot and lower leg temperatures, water repellancy as indicated by measured water uptake, and sweat retention by weighing the sweat content of socks and boots. Trials were carried out in two phases: 1) dry shod to obtain foot temperatures and sweat retention after marching, and 2) wet shod to provide information on water repellancy.

Barrett, A.A. & Clement, C. THE COMPARISON OF ALTITUDE INDICATORS USING LIMITED FLIGHT SIMULATION. FRC 978, Dec. 1957, 4pp. British Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England & Royal Aircraft Establishment of the Ministry of Supply, London, England).

14,379

To evaluate the relative merits of several altitude indicators, limited though complex flight simulation was used. The experiment was further designed to yield data for developing future display evaluation techniques. Trained pilots, as subjects, were required to "fly" the simulated aircraft from a selection of suddenly displayed attitudes to "straight and level." The performance of this task (time to first response, errors in lateral movement direction, control errors, time to complete response) was recorded and analyzed. The results give some useful indications of both the dynamic characteristics of the displays and of the potentialities of the technique.

Conry, R.A., McFarland, R.A. & Chubbuck, R. THRESHOLD AND RATE OF DARK ADAPTATION AS FUNCTIONS OF AGE AND TIME. A DEPENDENT. ON 17th, 20pp. Harvard School of Public Health, Boston, Mass.

14,380

To present a mathematical derivation of a model for representing dark adaptation as a function of age and time, 30 subjects, drawn from each of eight decades ranging from the teen-age level through 89, were studied. Following pre-exposure (three minutes) of the right eye to a standard 1500 millilambert incandescent light source, a test flash was first presented within 59 seconds and readings were taken at stated intervals over a period of 40 minutes. The data on rate of adaptation were analyzed as a function of age and a mathematical model describing the form was derived.

Shultz, G.L. THE USE OF THE TEN 704 IN THE SIMULATION OF SPEECH RECOGNITION SYSTEMS. FINAL REPORT. 1 JULY 1956 TO 31 DECEMBER 1957. Contract NOB 2101 (00), NO 048 108, Res. Rep. 57, Jan. 1958, 20pp. Research Center, International Business Machines Corporation, Yorktown Heights, N.Y.

14,381

The first step in mechanical speech recognition involves the analysis of a large number of speech sounds to determine the characteristics by which these sounds may best be discriminated. To accomplish this analysis special advantage is taken of techniques made possible by the advent of the large scale digital computer. This paper describes the equipment required to both facilitate editing samples of sounds for analysis and convert these sounds to digital form suitable as computer inputs. A system of programs is presented and the feasibility of the computer as a research tool is illustrated.

Krasling, J. THE TISSUE PRESSURES OF THE EXHIBITS DURING HIGH PRESSURE BREATHING. *SYM 927*, July 1955, *Rep. Phys. Research Institute, London, England*. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

14,385
To investigate the tissue pressures of the extremities during high pressure breathing, the pressure required to introduce small (0.45 cubic millimeter) quantities of fluid through a needle into the tissue under observation was determined for a subject breathing normally and again during high pressure breathing with trunk counterbalance. The subcutaneous of the forearm and thigh, the brachioradialis and triceps muscles of the upper limb and the vastus lateralis, gastrocnemius, soleus and anterior tibial muscles of the lower limb were investigated. The data were analyzed to assess the changes in vascular transmural pressures in these areas which occur with pressure breathing. Effects of digital compression and inflation of anti-g suit were studied.

McFarland, R.A. HUMAN FACTORS IN VEHICULAR DESIGN AND OPERATION, WITH SPECIAL REFERENCE TO ACCIDENTS. Contract DA 49 007 MD 156, Feb. 1958, 4pp. Department of Industrial Hygiene, Harvard School of Public Health, Boston, Mass.

14,387
The application of human engineering principles and data to the design of vehicles in order to increase efficiency and safety has been emphasized in this project. An interdisciplinary team has carried out this series of "host-agent" studies, and also other investigations concerned with the influence of "host" factors and "host-environment" interactions in accidents. The results to date have been published in four monographs, three reports, and 25 articles in technical and professional journals. The work during 1957-58 has included additional literature search, a human factors analysis of the driver's work space in the automobile, development of apparatus and procedures of operator responses while driving, visual perception in relation to tinted windshields, and some accident studies. Tolhurst, G.C. SPEAKER INTELLIGIBILITY: A NOTE ON THE EFFECT OF MONAURALLY DELAYING AIRBORNE SIDE-TONE. Joint Proj. NK 18 02 99, Subtask 1, Rep. 84, Jan. 1959, 8pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,388
To study the effects of monaural air-conducted side-tone delay using speaker intelligibility scores as the criterion measures, 48 speakers experienced such a delay. For one-half of the speakers, the delay occurred in the right ear and for the other half in the left ear. Each speaker experienced ten different time delays during his reading of multiple-choice intelligibility lists. Listening panels (12-15 listeners per panel) responded to the multiple-choice items and the resultant intelligibility scores were tabulated to yield a mean score for each speaker at each of the ten delay times. The data were studied by analysis of variance techniques for differences due to delay period and the ear affected.

Duffett, J.B. EDUCATION OF MEASUREMENT PROCEDURES BY STATISTICAL CONSIDERATIONS. Proving Ground Instrumentation Symposium, June 1955, 30-36. American Ordnance Association, Washington, D.C. (USA White Sands Proving Ground, Las Cruces, N.M.).

14,391
The viewpoint of the user of data - especially the viewpoint that different uses may require different criteria in the choice of an adequate measurement instrument - is emphasized in this paper. Four such uses which can be made are described: estimation of the mean, estimation of the standard deviation, quantitative explanation of each item in terms of the sources contributing to it, and the acceptance or rejection of each item in a lot. The Simon-Grimbs method for evaluating precision of measurement errors associated with the data was discussed.

14,392
Dover, J.J. A CENTRALIZED DATA PROCESSING SYSTEM. Proving Ground Instrumentation Symposium, June 1955, 66-74. American Ordnance Association, Washington, D.C. (USAF Flight Test Center, Edwards AFB, Calif.).

14,392
This paper describes the need for and the different phases in the development of a centralized automatic data processing system at the Air Force Flight Test Center. The system consists of 1) a central ground processing facility, 2) an airborne magnetic tape data recording system for flight test, 3) a magnetic tape data acquisition system for use at the Experimental Rocket Engine Test Facility, 4) a data acquisition system for space time information at the Experimental High Speed Track Facility, and 5) a digital data acquisition system for a radar photodolite used in space positioning.

Bartlett, N.R. & Bartlett, Susan C. SYNCHRONIZATION OF A MOTOR RESPONSE WITH AN ANTICIPATED SENSORY EVENT. *Psychol. Rev.*, July 1959, 66(4), 203-218. (University of Arizona, Tucson, Ariz.).

14,393
To investigate the ability to synchronize a motor response with a sensory event, a series of experiments was conducted. Both unpracticed and highly practiced subjects were studied as they attempted to press a button or throw a toggle switch in unison with one of a series of regularly spaced stimuli. Variables studied were motor mode of response (finger, hand, voice, toe), type of stimuli (auditory, visual, combination of both) and interval between stimuli (from 0.125 to 4.0 seconds). The data were comprised of errors—constant errors and standard deviations. The findings are related to the literature on reaction time. A simple theory is presented and discussed.

Kenna, C.R. & Foreyth, D.M. FOREIGN CONCEPTIONS OF INTERMITTENT PERIODS OF ALTERNATING DIRECTION. Science, Feb. 1959, 129(3246), 390-391. (USAF Operational Applications Lab., Bolling AFB, Washington, D.C. & Department of Psychology, Johns Hopkins University, Baltimore, Md.).

14,397
To study visual flicker as affected by intermittent photic stimuli of unequal periods, observations were made by two subjects. Intermittent electric square waves composed of two alternating periods were used. Either of the two periods could be varied independently of the other. The test area subtended one-half degree of visual angle with a luminance of 1800 millilamberts. One period was set at a fixed value and the observer adjusted the other until a fusion point was obtained. In successive measurements the first period was increased by two millilamberts until no further fusion point was reached. The fusion data were analyzed as a function of the duration of alternate periods of stimulation.

Beebe-Center, J.G. STANDARDS FOR USE OF THE GUST SCALE. J. Psychol., 1949, 28, 411-419. (Harvard University, Cambridge, Mass.).

14,401
A set of standards is described for the practical measurement of taste strength. The standards consist of nine concentrations of aqueous solutions of sucrose, quinine sulfate, tartaric acid, and sodium chloride representing nine levels of sensory intensity extending from one gust (subjective taste intensity of one per cent solution of sucrose) to 100 gusts in steps of one-fourth log gusts. The use of the standards, their reliability, and degree to which they represent the taste characteristics of all foodstuffs are discussed.

Anderson, T.C. & Deane, R. MILITARY UTILIZATION OF PSYCHOLOGISTS DURING WORLD WAR II. Amer. Psychol., Dec. 1948, 3(12), 530-538. (University of Chicago, Chicago, Ill. & George Washington University, Washington, D.C.).

14,405
To investigate the manner in which psychologists' services were utilized during World War II, survey data were gathered from 1541 psychologists who were in military service or government work connected with the military during that period. The questions covered the following general areas: extent of use made of professional training and skills, factors related to utilization of such skills, factors related to entrance into each of the several branches of military service, present work status, and factors related to trends in occupational shifts. Recommendations are offered for better organization and utilization of professional psychologists in the event of another national emergency.

Alexander, I.E. & Githler, R.J. THE EFFECTS OF JET ENGINE NOISE ON THE COCHLEAR RESPONSE OF THE GUINEA PIG. J. Comp. Physiol. Psychol., Dec. 1947, 42(6), 517-525. (Princeton University, Princeton, N.J.).

14,409
To investigate possible auditory hazards involved in the operation and maintenance of jet aircraft engines, guinea pigs were exposed in groups to the noise generated by a jet engine for a period of 15 minutes. The overall noise level at cage distance was in excess of 140 decibels with the spectrum from 80 to 8000 cycles. Cochlear responses of the animals were tested at three time intervals: immediately, one week, and three weeks. Unexposed animals were tested to serve as controls. The data were analyzed for hearing impairment and for amount of recovery at the various periods. An additional test was conducted on the effect of protection. Tentative explanations of the results are offered and the practical implications are discussed.

Brockaw, L.D. SCHOOL AND JOB VALIDATION OF SELECTION MEASURES FOR AIR TRAFFIC CONTROL TRAINING. Proj. 7719, Task 17108, WADC TN 59 39, April 1959, 14pp. USAF Personnel Lab., Lackland AFB, Tex.

14,411
In a program to improve selection procedures for trainees in the CAA Air Traffic Control School, a large battery of tests was administered to all trainees entering in the summer of 1958. Instructor ratings and lecture grades were collected at the end of the course. Approximately one year after the men had graduated they were identified on the job to collect supervisory ratings of their proficiency, as well as data on recommendations for promotion. A battery of tests suitable as a screening device was selected on the basis of the training validation. These tests were further analyzed for validity on the job criteria.

Bee, A. & Sell, R.G. ECONOMIC INVESTIGATIONS INTO THE DESIGN OF MASTER CONTROLLERS. PE/SE/82/58, Aug. 1956, 20pp. The British Iron & Steel Research Association, London, England.

14,406

This paper describes a series of laboratory experiments and work trials investigating the effects of certain design variables of hand- and foot-operated steelworks master controllers upon operating characteristics of the controllers. Basic procedure in each experiment was the use of a group of subjects to perform a series of standard tasks (aligning two pointers on a scale) using the controller. The variables were as follows: 1) foot controller--position of pivot relative to ankle, number of speed-steps, angle between extreme positions, and the operating torque; 2) hand controller--number of speed-steps, arc of movement of handle, length of handle, feel of controller, use of mechanical latch, etc. The findings are related to optimum combinations of design variables for most efficient work performance. Blackwell, H.R. EVALUATION OF THE NEURAL QUANTUM THEORY IN VISION. Amer. J. Psychol., July 1953, LXVI, 397-408. (University of Michigan, Ann Arbor, Mich.).

14,407

The neural quantum theory, which is concerned with the fundamental nature of sensory discrimination, is examined for its relevance in the field of vision. The postulates of the theory are discussed. The experimental task was to evaluate the extent to which actual threshold data conformed to the theoretical quantum curves. The data were gathered from four subjects by the method of constant stimuli. Each of 14-18 values of the luminance increment was presented 20 times. The 20 values of the same increment were presented consecutively. Two groups of 20 catch stimuli were presented in random order. The subject responded "yes" or "no" to each presentation. These conditions conformed to those required by the theory. T. G. R 7

Berliner, R.J., Young, R.P. & Hall, G.F. MAN-MACHINE FACTORS IN THE NUCLEAR REACTOR CONTROL SYSTEM. Proj. NE 401 000, Task 401 001, NRC Proj. Y12 03, NRC Rep. 5270, March 1959, 20pp. NRC Research Lab., Washington, D.C.

14,408

One important problem in the design of a research reactor is the allocation of control responsibility among man and automatic equipment so as to achieve the maximum in safety, flexibility, and continuous operation. This report presents the man-machine considerations which led to defining the operator's task in the control system of the nuclear reactor at the U.S. Naval Research Laboratory and how these considerations were implemented in the original design. Cal, E., Mastrilli, L. & Scavini, G. THE TRAINING OF RAILWAY PERSONNEL IN STEELWORKS. PE/SE/87, Jan./Feb. 1958, 7pp. The British Iron & Steel Research Association, London, England. (Societa Confindustria, Genoa, Italy).

14,409

This paper deals with the training of railway personnel in steelworks under the following points: 1) job analysis and job evaluation in the transport departments; 2) selection of candidates; 3) theoretical and practical trainings; 4) advancement and promotion. Several appendices are included: 1) example of job analysis; 2) example of a psycho-technical examination; 3) training of mobile personnel on Italian state railways and training of personnel for local operations; 4) safety regulations for narrow gauge rail transport; and 5) safety regulations for interval works transport. T. G. I.

Byram, G.M. & Jamison, G.M. SOME PRINCIPLES OF VISIBILITY AND THEIR APPLICATION TO FOREST FIRE DETECTION. Tech. Bull. 954, March 1948, 61pp. US Department of Agriculture, Washington, D.C. (Pacific Northwest Forest and Range Experiment Station, Portland, Ore.).

14,410

To develop ways of determining visual range, a measure useful in the efficient operation of forest fire detection systems, a series of long-range studies was undertaken. This report summarizes the findings of the studies under the following major topics: 1) visibility and the effect of haze upon it, 2) practical measurements of visibility distance (visibility meters, methods for estimating without instruments), and 3) application of findings to other fire detection problems (search methods, eye-test for lookouts, haze-penetrating filter, optical aids). The appendix contains the mathematical theory of visual range as well as additional information on the various devices. T. G. I. R 31

14,411

Brown, W.L. & McDowell, A.A. VISUAL ACUITY PERFORMANCE OF NORMAL AND CHRONIC IRRADIATED MONKEYS. Rep. 56 149, Nov. 1958, 3pp. USAF School of Aviation Medicine, Randolph AFB, Tex. ((University of Texas, Austin, Tex.).

14,411

To determine the persistence of visual acuity deficit following radiation exposure, the performance of monkeys was investigated approximately three years after exposure. Six normal (controls), ten low-dose, nine intermediate-dose, and four high-dose irradiated rhesus monkeys were tested to a criterion of 21 correct responses (24 trials a day) for two successive days on each of eight visual acuity problems presented in order of increasing difficulty. Each problem required a choice between 1) circles and 2) circles with breaks in order to procure a food reward. The mean errors to criterion were analyzed for differences among groups at each problem level. T. G. I. R 2

14,412

Brook, A.M. EVALUATION OF COMBINED ELBOW AND WRIST SIZE, ANTERIOR, LATERAL, STUMP-ADJUSTED (OUTSIDE ELBOW EDGE WITH STUMP-ADJUSTED 12.14. Tech. Rep. 5762, Dec. 1957, 7pp. USAF Human Research Lab., Walter Reed Army Medical Center, Washington, D.C.

14,413

Commercially available adult size external elbow (outside elbow flange) with stump-adjusted locking mechanism (A.S. Hixson Corporation, Santa Clara, California) were evaluated and tested for compliance with Tentative Standards. Functional tests, physical strength tests, design and construction evaluation, and appearance evaluation were made and the results reported.

14,413

Calhoun, L.S. THE EFFECT OF ELBOW ANGLE AND BACK-SUPPORT HEIGHT ON THE STRENGTH OF HORIZONTAL PUSH BY THE HAND. Proj. 6'95 20 001, Task USAMC T 3, NEMO, Rep. 378, March 1959, 21pp. USA Medical Research Lab., Fort Knox, Ky.

14,413

To determine the effect of the elbow angle on the force of the push movement by the hand, nine subjects were tested. The task was to push on the handle of a dynamometer with as much force as possible while in a seated position. The strength of the push movement was measured at five elbow angles (60, 85, 110, 135 and 160 degrees). At each angle measurements were made when there was no back support and with a back rest at 20, 40, 60 and 80 percent of the distance from seat to shoulder joint. The data were analyzed for the effects of angle, backrest, and their interactions. Consideration was given to the possible ways in which the arm might have produced the forces measured.

14,414

Carp, R.T., Jr. A TABLE FOR CONVERTING VOLTAGE TO SOUND PRESSURE LEVEL IN DECIBELS ($0.03 = 0.0002 \text{ VOLT} = 0.0002 \text{ INCH/CM}^2$). Proj. IN 18 02 11, Subtask 2, Rep. 1, Dec. 1958, 26pp. USAF School of Aviation Medicine, Naval Air Station, Fla.

14,414

The measurement of sound pressure level of noise with a microphone system and a voltmeter involves the conversion of the output voltage of a microphone system into sound pressure level. Such conversions are often accomplished by laborious computations or by graphic means. A table was computed to facilitate a direct accurate conversion of output voltage into sound pressure level without the usual computation or interpolation. Directions for use of the table are included in the report.

14,416

McLester, W. TRAINING OF PERSONNEL FOR RAIL TRANSPORT IN IRON AND STEEL WORKS. PE/H/63/57, Feb. 1958, 4pp. Plant Engineering & Energy Div., British Iron and Steel Research Association, London, Eng.

14,416

This paper gives a brief outline of some aspects of training in a steelworks traffic department. The internal and external traffic services needed to maintain production levels in the Corby Works of Stewarts and Lloyds, Ltd. are described and the system employed in this plant to train shunters, drivers and supervisors is discussed.

14,417

McCutchan, J.W. & Isherwood, J.D. PREDICTION OF THERMAL TOLERANCE WHEN USING AN MA-2 VENTILATING GARMENT WITH A MODIFIED MK-IV ANTI-EXPOSURE SUIT. Contract AF 33(616) 5402, Proj. 7164, Task 71830, WADC TR 59 326, June 19 59, 25pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of California, Los Angeles, Calif.).

14,417

To provide a rational basis for the prediction of thermal tolerance when using an MA-2 ventilating garment with a modified MK-IV anti-exposure suit, physiological responses of human subjects were measured while wearing this combination and other garments comprising 2.15 clo of thermal resistance. Responses are shown graphically in terms of heat storage, heart rates, sweat rates, and composite indices of these variables. A nomograph presents the equation embodying the results which predicts the cooling power of the garment. Directions for its use in predicting human tolerances are given.

14,418

McDowell, A.A. & Brown, M.L. PERIPHERAL CUE LEARNING SET IN Rhesus MONKEYS. Rep. 59 4, Feb. 1959, 3pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (University of Texas, Austin, Tex.).

14,418

Four control and nine chronic whole-body irradiated rhesus monkeys were tested on six four-trial peripheral cue learning set problems per day for 39 days. These monkeys had had previous experience on standardized learning set problems and in the utilization of peripheral cues to procure food rewards. The experiment investigated the effects of this prior experience on their present acquisition of peripheral cue learning sets. The data (percent errors) were analyzed for differences between trials, training periods, and subjects (normal versus irradiated monkeys).

14,419

McDowell, A.A. & Brown, M.L. VISUAL ACUITY PERFORMANCE OF NORMAL AND CHRONIC FOCAL-HEAD IRRADIATED MONKEYS. Rep. 59 5, Dec. 1958, 4pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (University of Texas, Austin, Tex.).

14,419

To investigate the visual acuity performance of chronic focal-head monkeys in an effort to determine whether the passive radiation doses to which they had been subjected two years prior had resulted in a visual acuity deficit, six such monkeys and nine control monkeys were tested on each of eight visual acuity problems presented in order of increasing difficulty. Mean errors per day per problem were analyzed for differences between groups. Differences within the experimental group of irradiation of the frontal and the posterior association areas were further analyzed.

14,420

Peters, G.A. & Adams, B.R. DESIGNING CONTROL CONSOLES. Prod. Engng., April 1959, 2pp. (Santa Monica, Calif.).

14,420

Guides that will help arrange instruments and controls for time-saving and error-free operation are presented in tabular form. The advice is based on recent human factors research and provides better conditions for the human operator for both standing and seated operation. Ten basic considerations for the designer to keep in mind when designing consoles are given.

14,421

National Defense Research Council, The Netherlands. THE INFLUENCE OF "ADAPTINOL" AND VITAMIN A ON NIGHT VISION. Tech. Rep. GNL 73 52, July, 1952, 6pp. USN Office of Naval Research, London, England.

14,421

A cooperative project, conducted by the Research Unit for Nutrition and the Research Unit for Observations, of the National Defense Research Council of The Netherlands, on the influence of "Adaptinol" and Vitamin A on night vision has been conducted and prepared for publication in the Dutch language. A summary in English, written by M.A. Bouman and others, is presented. Measurements were made for several weeks of the night vision capacity of three groups of 25 men aged between 19-22. The members of the three groups were given respectively "Adaptinol," cod liver oil containing 5000 I U Vitamin A, and salad oil. Measurements were made before, during, and after dosage.

14,422

George Washington University. BIBLIOGRAPHY OF REPORTS. ADDITIONS TO LIST FROM 30 JUNE 1958 TO 15 MARCH 1959. Human Resources Research Office, George Washington University, Washington, D.C.

14,422

This bibliography presents a list of reports from 30 June 1958 to March 1959. Part I contains annotated technical, special and research reports issued by the Director's Office; Part II lists reports from the various Divisions and Research Units.

14,423
George Washington University. BRIEF ON HUMAN RESEARCH
UNIT NO. 1. Apr. 1955. Typ. Human Resources Research
Office, George Washington University, Washington, D.C.

14,423

This brief report describes the mission, personnel,
research organization, and current program of Human Re-
search Unit No. 1, ONRAC, Fort Knox, Kentucky. The Unit
is concerned with research in Army training, particularly
in armor. The staff is composed of both military and
civilian personnel organized in various task forces pre-
sently concerned with research in effectiveness of tank
crew team, performance in tank gunnery, tank driving
and maintenance, and armor communications.

14,424

Zidema, J.D., Cohen, S.I. & Silverman, A.J. CLINICAL
EVALUATION OF LOW G TOLERANCE. Proj. 7216, Task 71712
& Proj. 7215, Task 71713, NADC TN 57 246, July 1958,
12pp. USAF Aero Medical Lab., Wright-Patterson AFB,
Ohio.

14,424

Twelve student pilots were referred to this labora-
tory for psychophysiological evaluation, following in-
flight blackout episodes. The patients were studied
by a team using cardiovascular, neuro-hormonal, bioelec-
tric, psychologic, and psychiatric techniques. Illustra-
tive case histories are given. The relationship of car-
diovascular and psychophysiological factors in tolerance
g forces is illustrated.

Swanson, A.M. NOTES ON SIMULATION INSTRUMENTATION
FOR MEASUREMENT OF PILOT PROFICIENCY. Proj. 7721,
Task 47025, OL TN 57 3, May 1957, 43pp. USAF
Operator Lab., Randolph AFB, Tex.

14,425

An investigation of the feasibility of obtaining
pilot proficiency measures from oscillograph records of
pilot performance in the B-52 Simulator (Type S-2) has
been initiated. This paper discusses the integration of
the recording equipment (Photron six-channel oscillograph)
with the flight simulator, and the development of a plan
for obtaining appropriate data to evaluate the utility
of the instrumentation for the purpose desired.

14,426

Sitgreaves, Rosedith. PROBABILITY AND STATISTICS IN
ITEM ANALYSIS AND CLASSIFICATION PROBLEMS OPTIMAL TEST
DESIGN IN A SPECIAL TESTING SITUATION. Rep. 57 117,
Sept. 1957, 35pp. USAF School of Aviation Medicine,
Randolph AFB, Tex. (Columbia University, New York,
N.Y.).

14,426

To evaluate the usefulness of various tests of abili-
ties, such as those utilized in reaching decisions as
to personnel assignments, and particularly to aid in
the selection of items for such tests, a probability
model for the testing situation is developed in some
detail. The model examined here is based on an earlier
model.

14,427

Richey, Francis. A NOTE CONCERNING THE RADAR CON-
TRAST OF AIRPORT RUNWAYS. Contract AF 33(616) 1708,
Sci. Rep. 2, AFRC TN 57 198, Feb. 1957, 10pp.
Research Laboratories, Hughes Aircraft Company,
Oulver City, Calif.

14,427

The radar contrast of a perfectly absorbing gap sur-
rounded by reflecting semi-infinite half planes has been
derived as a special example of a theory giving the radar
contrast of any extended target complex. The radar con-
trast is defined in terms of the power received at the
antenna and does not take into account the effects of
noise. By comparing the contrast of an absorbing gap
with that obtained for two point sources of angular sepa-
ration equal to the width of the gap, an explanation is
given of the unexpectedly good results obtained by side-
looking reconnaissance radars in resolving airport run-
ways of angular widths four or five times smaller than a
half-power beamwidth.

14,428

Van Gierke, H.E. & Mettsdorp, A.C. ACQUISITION CRI-
TERIA FOR WORK SPACES, LIVING QUARTERS, AND OTHER
AREAS ON AIR BASES. Contract AF 33(616) 3485, Proj.
7210, NADC TN 57 248, Nov. 1957, 16pp. USAF
Medical Lab., Wright-Patterson AFB, Ohio.

14,428

This report presents a summary of noise control cri-
teria recommended for use in air base planning. The
modifications of earlier criteria were necessitated by
recent research which is reflected in this summary.
Criteria are given for noise environments that allow safe
and a satisfactory performance of human functions in the
following classes of occupied areas: living quarters;
important communication centers; office areas; work and
shop areas; group meeting, study, and rest areas; and
hospitals. The criteria are described for each class.

14,429

Peterson, R.O. & Jones, Edna, M. HUMAN FACTORS
SUPPORT IN THE DESIGN AND USE OF THE REDSTONE
FIRE UNIT PROFICIENCY ANALYZER. Contract D61339 69,
Tech. Rep. DATTACENTEN 69 2, 162pp. USAF Training
Device Center, Fort Washington, D.C. (American
Institute for Research, Pittsburgh, Penn.).

14,429

The Fire Unit Proficiency Analyzer, Device 3G15,
is a training device to be used with operational equip-
ment in training the Redstone missile firing battery.
This study provides human factors recommendations for
1) the design of training equipment, 2) the use of the
training equipment, and 3) a plan to field test the
training system. A brief statement of the methodology
used is also presented. Appendices present full data
and information on the various phases of the study.

USA Aviation School Library. ARMY AVIATION. SPECIAL
BIBLIOGRAPHY NO. 1. (REVISED). April 1959, 16pp.
USA Aviation School, Fort Rucker, Ala.

14,430

This is a special bibliography on Army aviation.
The references are listed under the following general
headings: general, history, aircraft, maintenance,
training, operations, helicopter operations, and future.
Most of the references, with the exception of those in
history, cover the period from 1945 through 1958.

Guiguet, B. & Fieda, D. A PRELIMINARY STUDY OF
MECHANICAL EXCAVATOR CABS. PE/KE/94/57, Sept. 1957,
20pp. Plant Engineering Div., British Iron and Steel
Research Association, London, England.

14,431

A study was made of the cabs of mechanical excavators
in order to determine what design modifications could be
made to make the work less arduous and to increase pro-
ductivity. A brief survey of excavators and their dif-
ferent equipment was made. Accident records were ana-
lyzed to determine what factors were responsible. Impli-
cations for redesign of equipment and for training of
operators are discussed. A further study of training
schemes led to the formulation of two selection tests
based on the key demands of the task, to proposed train-
ing apparatus, and to comments of faulty design of cabs.
Suggestions are made for the consideration of manufac-
turers and an outline of needed research is given.

Canoga Corporation. NIKE INSTRUMENTATION RADAR SYSTEM.
AFAG TECHNICAL NOTE XVII-4. QUARTERLY PROGRESS RE-
PORT JULY, AUGUST, SEPTEMBER, 1956. Contract AF 33(616)
42, Canoga Rep. 7150 16, Oct. 1956, 18pp. Canoga
Corporation, Van Nuys, Calif.

14,432

Progress of work on a contract to perform certain
basic modifications to the NIKE radar system for the Air
Force is reported. This is part of an extended research
and development program in perfecting the most accurate
and complete instrumentation radar system available for
obtaining time-space-position ballistics data on bombs
dropped from very high altitudes. The existing NIKE
radar system is to be modified for this purpose. Specif-
ic details of the contract are given and the degree of
completion of the various tasks is discussed.

14,433

Flight Safety Foundation Inc. INSTRUMENT PANEL CALIBRATION. Human Factors Bull. 59 2H, 1p. Flight Safety Foundation Inc., New York, N.Y.

14,435

This bulletin demonstrates how the sudden deceleration of the skull against a rigid, firmly anchored instrument panel can produce pressures resulting in skull fracture, brain injury and death in an otherwise survivable accident. Methods of protecting the head from damage by suitable design are suggested.

Griffin, D.R., Hubbard, Ruth & Kald, G. THE SENSITIVITY OF THE HUMAN EYE TO INFRARED RADIATION. J. Opt. Soc. Amer., July 1947, 37(7), 545-554. (Harvard University, Cambridge, Mass.).

14,435

To investigate the sensitivity of the eye to infra-red radiations, measurements were made in the near infra-red, in two areas of the dark adapted eye: the central fovea (cones) to 1000 millimicrons, and a peripheral area (primarily rods) to 1050 millimicrons. Determinations of the visual thresholds were made for radiation passing through a series of infra-red filters. Estimates of spectral sensitivity were derived from the data and sensitivity functions were chosen by successive approximation, which were consistent with the observed thresholds. Number of observers varied from 39 to 54.

Green, R.R. & Mickle, F.A. SPEED OF REACHING TO CRITICAL CONTROL AREAS IN A FIGHTER-TYPE COCKPIT. Contract AF 33(616) 54-1, Proj. 7164, WADC TR 58 687, June 1959, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (The Macmillan Company, Baltimore, Md.).

14,436

To investigate basic speed of movement under optimum conditions to stimuli placed in various critical cockpit movement areas, ten subjects performed a positioning task. The subject, seated in a cockpit mock-up, was required to position his hands on the control stick, to extinguish a light by a toggle switch, and then to return his hand to the stick. The lights were located in nine critical control manipulation areas and placed symmetrically on right and left sides of cockpit. Response times in seconds were analyzed for effect of position of light and switch.

Grebe, R.M. (Ed.). HANDBOOK OF TOXICOLOGY. TRANQUILIZERS. VOLUME IV. Proj. 7165, Task 71836, WADC TR 55 16, March 1959, 120pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,437

This report presents data on physical, chemical, biological, and toxicological properties of 66 tranquilizers, compiled from extensive literature references. Wherever possible, data are presented on molecular formula and weight, structure, physical and chemical properties, pharmacology, clinical aspects, toxicity, and mode and site of action for each compound. The material is up-to-date at time of publication and has been carefully reviewed and authenticated by the contributors. Since the report is a survey, the values should be considered as "yardsticks" of activity rather than as absolute and definitive.

Graybiel, A. & Hipp, Dorothy. THE OCULO-GYRAL ILLUSION: A FORM OF APPARENT MOTION WHICH MAY BE OBSERVED FOLLOWING STIMULATION OF THE SEMICIRCULAR CANALS. Proj. X 145 (AF 75 3), Rep. Four, Nov. 1945, 26pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,439

The oculo-gyral illusion refers to a form of apparent motion resulting from the stimulation of the receptors in the semi-circular canals following angular accelerations. This study was undertaken to investigate some aspects of this illusion. Human subjects (four) were rotated in a modified Link Trainer, in a Barany chair, or on a human centrifuge and the illusory perceptions of motion were recorded. The chief variables concerned: 1) the nature or illumination of the fixation object, 2) the direction and strength of the stimulus, and 3) the position of the head of the subject. The importance of the findings for research and for night flying are discussed.

T. G. R 18

14,440

Graybiel, A. DISORIENTATION IN PILOTS. Nov. 1949, 10pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,440

The problem of disorientation in pilots is considered in this paper. A partial outline of possible etiologic factors is presented under three main headings: the aerial environment, the plane, and the pilot. The physiogenesis of aviator's vertigo is reviewed and man's limited ability to cope with this form of disorientation is emphasized. Two forms of visual illusion, autokinesis and the oculo-gyral illusion, are discussed briefly and their significance in aviation is commented upon.

T. R 12

14,441

Graybiel, A. & Clark, B. THE AUTOKINETIC ILLUSION AND ITS SIGNIFICANCE IN NIGHT FLYING. J. Aviat. Med., June 1945, 16(3), 111-151. (USAF School of Aviation Medicine, Randolph AFB, Tex.).

14,441

This report is concerned with the autokinetic illusion (apparent movement of an object in a visual field when other visual references are inadequate) and its significance in aviation. Experiments were carried out both in the laboratory and during formation flights at night. The chief characteristics of the autokinetic movement were determined on approximately 500 subjects. The effect of various factors in reducing the illusion was tested: size, shape, numbers, arrangement in planes and distances, and actual movement of subject and/or target in various combinations.

Gravendeel, D.W. & Plomp, R. MICRO-NOISE-TRAUMA? Rep. ICF 1959 1, 15pp. Institute for Perception RVO-TNO, Soesterberg, Netherlands.

14,442

To investigate the hearing damage that might be caused by the noise of light fire arms, audiograms were compared for three groups of young men: 1) 61 men who had been in shooting noise many times, 2) 48 recruits who had never been in shooting noise but had been exposed to industrial noise, and 3) 139 recruits who had never been exposed to either shooting or industrial noise. Maximal hearing loss and number of dips in the audiogram were analyzed for various frequency regions tested. The size, place, and form of the dips indicating hearing loss were examined carefully and an explanation proposed in terms of "micro-noise-trauma."

Grafstein, A., Clark, R., MacDonqudale, K. & Hay.
Dorothy I. ROLE OF VENTILATOR PATTERNS IN THE
VISUAL PERCEPTION OF A MOVING TARGET IN THE DARK.
Ann. N. Y. Acad. Sci., April 1945, 50(2), 259-266.
(USN School of Aviation Medicine, Naval Air Station,
Ft. Belvoir.)

14,443
This report is concerned with the illusory effects
produced by rotation during the visual perception of a
moving object. Six well-trained subjects reported their
perceptions both during and following rotation while ob-
serving a moving target in the dark and in a lighted
room. Rotation was at varying speeds (from 10 to 15 ro-
tations-per minute) both to the right and the left; the
target path was circular, two meters distant and 15 de-
grees above eye level. The qualitative descriptions of
the subjects are reported.

Masteller, F., et al. PHYSIOLOGICAL PERFORMANCE
FOLLOWING A HYPNOTIC DOSE OF A BARBITURATE. J.
Pharm. & exper. Ther., May 1951, 102(1), 55-61.
(Anesthesia Lab., Massachusetts General Hospital,
Boston, Mass.).

14,444
To investigate the nature and duration of the neuro-
muscular effects of pentobarbital sodium (generally em-
ployed as a hypnotic agent), each of 30 young men was
studied in two test sessions. A battery of ten psycho-
logical tests, covering a range of functions from rela-
tively simple (reaction time, tapping) to higher mental
activities (memory) were employed. The first day of
each test session was used to standardize activities
prior to medication and for practice on the tests; 0.1
gram pentobarbital sodium or a lactose placebo were ad-
ministered; on the second day post-medication testing
started at 6:00 A.M. and continued at intervals until
11:00 P.M. Test data were analyzed for any effects due
to the drug.

14,446
Gordon, D.A. & Lee, G.B. MODEL SIMULATOR STUDIES-
VISIBILITY OF MILITARY TARGETS AS RELATED TO ILLUMI-
NANT POSITION. Prof. MICHIGAN, Rep. 2144 341 T, March
1959, 30pp. Willow Run Labs., University of Michigan;
Ann Arbor, Mich.

14,446
Experimental data are reported on detection and
identification (class and name) for military targets ob-
served in a small-scale model of an outdoor scene. The
effects on visibility of lighting the targets with sources
at various azimuths (elevation constant) and at var-
ious elevations through the median plane were determined.
These source positions are those which might be occupied
by searchlights or flares. Illumination was 0.02 and
2.0 foot-candles in separate experiments. The results
are explained in terms of the underlying contrast situ-
ations and pattern effects of ground and foliage shadows.
Suggestions are offered for applying the findings to
military illumination practices.

Guth, S.K. VISIBILITY. G-E Review, May 1952, 4pp.
(General Electric Co., Nela Park, Ohio.).

14,447
This paper describes a method for evaluating visibil-
ity on a definite numerical basis. The Luckiesh-Moss
visibility meter that relates visibility of any object
of visual task to a standard object is discussed and
its practical uses are illustrated. Visibility and il-
lumination level are discussed in some detail with a
table of foot-candle levels for typical visual tasks in-
cluded.

Hatch, T.F. HUMAN ASPECTS OF ENGINEERING. Engg.
Engg., May 1949, 406-408. (Industrial Systems
Foundation, Mellon Institute, Pittsburgh, Penn.).

14,448
This paper considers criticisms that have been lev-
eled against the lack of social effectiveness and re-
sponsibility of the engineer. It is argued that the
scope and responsibility of the engineer should be
broadened to the extent that the social and human prob-
lems can be defined in quantitative terms and dealt with
in the ways of the engineer. Human engineering as a
legitimate branch of the profession is discussed.

de Ericson, A. & Legrand, P. THE MOTIVATIONS OF FLYING
PERSONNEL. No date, 2pp. Centre d'Etudes Psycholo-
giques de l'Armée de l'Air, Versailles, France.

14,449
An abstract of a study of the motivations of flying
personnel is given. It deals with results obtained from
personal history questionnaires and from inquiries into
hierarchical analyses of behavior of a sample of 500 pil-
ot candidates. Three types of motivation were dis-
tinguished: flight, military, and hunting. A factorial
analysis of quantified data was carried out.

Hamon, Surgeon General. ATTITUDES OF THE MILITARY
AUTHORITIES TOWARDS SCIENTIFIC PSYCHOLOGY. March 1957,
5pp. Medical Research Council, London, England.

14,450
The writer maintains that the military will, of
necessity, pay the greatest attention to whatever the
techniques of scientific psychology can contribute to-
wards the consolidation of the fighting value of the
armies. After discussing the changing social structure
of the military, permanent cadres versus numerous or
changing contingents, the conclusion is reached that
research in morale is greatly needed. Difficulties as
well as opportunities in research of this kind are dis-
cussed.

Karwowski, J.F. & Weyner, M., Jr. STARS IN VISION: IV. THE INTERACTIONS OF REDS AND CONES IN AFTER-SENSATIONS. *J. gen. Psychol.*, 1951, 44, 215-233. (Dept. of Psychology, Dartmouth College, Hanover, N.H.).

14,453

To investigate further a phenomenon in the after-image series (bleaching effect) which is manifested as a whitish dazzle of striking intensity, a moving slit of light (36 centimeters displacement; 76.4 centimeters per second movement rate) was observed in a dark room by five subjects who maintained fixation on a centrally located point of light. Intensity, wave-length and dark adaptation were varied to produce characteristic transformations of the after-effects. These transformations are described and explained in terms of rod-cone participation.

Hodge, D.C. AN INVESTIGATION OF THE EFFECT OF VARIATION IN RIFLE SIGHTING RADIUS ON AIMING ERRORS UNDER TWO LEVELS OF ILLUMINATION. M.A. Thesis, 1959; 9pp. Texas Technological College, Lubbock, Tex.

14,454

To determine the effects of variations in rifle sighting radius (from 12 to 42 inches in six-inch increments) on aiming error at illumination levels of 50 and one foot-candle, 60 subjects were tested. The task was to align the mirror-image of a target with a set of rifle sights and to mark a score sheet when satisfied with the sight-target alignment. The standard M1 rifle sights were used with six different widths of front sight posts to maintain same apparent sizes of front sight and target. Ten trials of ten shots each were given. The variable and constant errors of aiming were analyzed for effect of sighting radius and illumination.

Hochberg, J.E. & Bitterman, M.E. FIGURAL AFTER-EFFECTS AS A FUNCTION OF THE RETINAL SIZE OF THE INSPECTION-FIGURE. *Amer. J. Psychol.*, Jan. 1951, LXIV, 99-102. (Cornell University, Ithaca, N.Y. & University of Texas, Austin, Tex.).

14,455

To demonstrate the relation between figural after-effects and the area of the retinal region that is stimulated, ten subjects were tested in their ability to adjust a variable disk to apparent equality with a standard disk. Four conditions of satiation were used: 1) and 2) the inspection figure was varied only in size (satiation period of three minutes); 2) and 3) inspection figure was varied only in distance so that apparent size was varied; and 4) no inspection figure was used. The mean constant errors for ten determinations under each condition were compared.

Hill, J.M.M. B.I.S.R.A. ACCIDENT RESEARCH. AN ACCOUNT OF WORK IN PROGRESS. PART I: INTRODUCTION AND COMMENTARY. CRS/112, Feb. 1957, 20pp. British Iron & Steel Research Association, London, England.

14,456

This report is an account of work in progress of industrial accidents along operational research lines. This approach considers accidents in their broadest aspects in relation to other personnel problems and with special reference to the human factor. The sample being studied includes all entrants to a certain steelworks in 1947. Their careers have been recorded over a period of four years. The data collected includes biographical records, previous employment records, all employment data from 1947-1951, dates and durations of all absences with reasons, and information on all accidents. The preliminary data is presented in a series of diagrams in Part II of this report (see 14,457).

Hertzman, A.B. & Ferguson, I.D. FAILURE IN TEMPERATURE REGULATION DURING PROGRESSIVE DEHYDRATION. Contract AF 33(616)3357, Proj. 7164, Task 7183D, WADC TR 59 398, July 1959, 27pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dept. of Physiology, St. Louis University School of Medicine, St. Louis, Mo.).

14,458

To observe in detail the sweating responses, changes in body temperature, and changes in the digital and cutaneous circulation during dehydration, measurements were made on 14 young men. The subjects were exposed to an ambient temperature of 43.3 degrees C. (110 degrees F.) without food or water for a period of 12 hours. Pre- and post-exposure weights were taken and, during various periods of the exposure, the following items were recorded: weight losses, skin and oral temperatures, regional sweating rates, electrocardiograms, volume pulses in finger and toe pads, and urine outputs. In some experiments tracheal blood pressures and flicker fusion frequencies were recorded. The data were analyzed as a function of time; theoretical implications are discussed.

Hecht, S., Hendley, C.D., Ross, S. & Richmond, P.H. THE EFFECT OF EXPOSURE TO SUNLIGHT ON NIGHT VISION. *Amer. J. Ophthalmol.*, Dec. 1948, 31(12), 1573-1580. (Columbia University, New York, N.Y. & Ohio State University, Columbus, Ohio).

14,459

To investigate the length of time onset of dark adaptation remains above normal after exposure to sunlight, and whether such effects accumulate when people are exposed day after day, a series of measurements was made. 1) Subjects looked at the sky (3000 to 12,000 millilamberts) for periods of from four minutes to an hour and the course of dark adaptation was measured. 2) Similar measurements were made with sky brightnesses ranging from 3,500 to 16,000 millilamberts. 3) The effect of prolonged exposure was measured on two groups of 51 young men. One group was exposed from four to six hours daily for four weeks while the others were kept indoors; the groups were then reversed for two weeks. Implications for night vision are discussed.

Marcus, E.R. & Rabe, A. VISUAL RECOGNITION ALONG VARIOUS MERIDIANS OF THE VISUAL FIELD. III. PATTERNS OF BLACKENED CIRCLES IN AN EIGHT-CIRCLE TEMPLATE. Proj. MICHIGAN, Rep. 2144 294 I, Nov. 1958, 67pp. Willow Run Labs., University of Michigan, Ann Arbor, Mich.

14,461

This is one of a series of studies investigating an observer's ability to identify targets composed of multiple elements having one of two possible forms (binary elements). Linear arrays of blackened or open circles were presented to the observers tachistoscopically at various locations in the visual field (0, 45, 90, or 135 degrees to the horizontal about the center of fixation in the frontal plane). The target was exposed for approximately 0.075 seconds and the observer attempted to reproduce the target pattern and position. Reproduction accuracy was analyzed for effect of target position along various meridians of the visual field.

Hooton, E.A. BODY BUILD IN A SAMPLE OF THE UNITED STATES ARMY. PART I: BODY BUILD IN RELATION TO MILITARY FUNCTION. PART II: MEASUREMENTS OF BODY BUILD. Contract W44 109 QM 1078 & W44 109 QM 2014, Tech. Rep. FP 102, Feb. 1959, 348pp. USA Environmental Protection Research Div., QM Research & Engineering Center, Natick, Mass. (Harvard University, Cambridge, Mass.).

14,464

This report presents data from two exhaustive investigations into the body shape and size of Army personnel. The sample represents males accepted for military service. Part I covers: 1) the general distribution of body types classified into 18 groups; 2) the military utility of each of the several groups, as indicated by the extent to which the various body types tended to be concentrated in distinct units and specialties; and 3) the correlations of the body build groups with all sociological and other data such as age, months of service, etc. Part II deals with the more important measures gathered on individual soldiers as such measures apply to various body types, previously determined from the photographs.

Jerger, J.F., Shedd, Joyce L. & Harford, E. ON THE DETECTION OF EXTREMELY SMALL CHANGES IN SOUND INTENSITY. Rep. 58 127, Nov. 1958, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (Audiology Lab., Northwestern University, Evanston, Ill.).

14,466

A unique method for the clinical assessment of differential intensity discrimination of sound is described. Short (200 milliseconds) one decibel intensity increments are superimposed, at five-second intervals, on a pure tone of constant amplitude at a sensation level of 20 decibels. The patient responds to the momentary increase in loudness. The procedure is called SISI (short increment sensitivity index) and results are expressed in terms of the percentage of 20 increments to which a response is made. Data on selected cases are reported to illustrate the manner in which the score varies with different kinds of hearing loss.

14,470

Kahn, A. THE USE OF ARTIFICIAL SIGNALS FOR THE DETECTION OF RARELY OCCURRING SIGNALS. Human Factors Data Bull. 17, April 1958, 3pp. Wartime Electric Commission, Baltimore, Md.

14,471

This bulletin presents a brief summary of an experiment on human monitoring performance. To study ways in which such performance could be kept from deteriorating with time, artificial signals were introduced into a display panel of eight dials, the pointers of which all moved in a random fashion. Subjects were required to detect the movement of any one of the dial pointers into a crosshatched area on left of dial (real signal occurring 2-3 times in a two-hour watch) under two conditions: with an additional task of responding to movements of pointer to the right into a black area (artificial signal occurring every 75 seconds) and without this task. Performance was compared for these conditions. G. R. 1

Lauer, S. REASONS FOR EMPLOYEE RESISTANCE TO SAFETY EQUIPMENT. INTERIM REPORT ON PROTECTIVE FOOTWEAR. CE/19/57, Jan./Feb. 1958, 16pp. Operational Research Dept., British Iron & Steel Research Association, London, England.

14,475

This interim report contains the results of the first stage of an investigation concerned with factors which further or hinder the wearing of protective (steel toe-cap) boots and shoes in the steel industry. Details of protective footwear sales and of facilities that exist for selling such footwear on the work premises were obtained from 63 works. Facilities are classified as to size of the works: over 2000 employees and under 2000 employees. These facilities are then related to the sales figures. A selection of unsolicited remarks on some aspects of protective footwear is included in the report. I. G.

14,476

Kirkade, R.G. & Kidd, J.S. THE EFFECT OF DIFFERENT PROPORTIONS OF MONITORED ELEMENTS ON OPERATOR PERFORMANCE IN A SIMULATED RADAR AIR TRAFFIC CONTROL SYSTEM. Contract AF 33(616) 3612, Proj. 7184, Task 71583, 44DC IR 59 169, June 1959, 12pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

14,477

A simulated radar approach control system was used to evaluate the influence of different levels of monitoring on system performance. Monitoring level was varied by manipulating the proportion of aircraft in the system having airborne position information (API) equipment. The API-equipped aircraft did not require active control of their approach path as did those aircraft not so equipped. Four conditions were compared: 100, 63, 37, and zero per cent of aircraft with API equipment. Eight laboratory-trained controllers participated. Measures of system performance were safety (separation between aircraft) and efficiency (missed approaches, average number of planes processed, average delay, and average fuel consumption). Recommendations for the use of API equipment in terminal operations were made. I. G. R. 11

14,480

This paper discusses the contribution made by recent investigations to the knowledge of the manner in which vibrational forces of the air are transferred to the fluids in the normal ear with a minimum of energy sacrifice. The experimental studies described are concerned with the middle ear and revolve around three basic functions: 1) the matching of the properties of air to those of the perilymph, 2) the transmission of periodic vibrations with a minimum of alteration in their form, and 3) the provision of a protective mechanism for the prevention of damage to the inner ear structures. G. R. 6

14,481

Neuer, E.G. RECENT INVESTIGATIONS OF SOUND CONDUCTION. PART II. THE EAR WITH CONDUCTIVE IMPAIRMENT. *Ann. Otor. Rhinol. Laryngol.*, Dec. 1950, 59(4), 18-42. (Princeton University, Princeton, N.J.).

14,481

This paper deals with the reception and transmission of aerial sounds in the ear with conductive impairment. Some of the common changes of the ear's conductive structure that result from accident, disease or deliberate surgical effort are discussed and suggestions are made how the general principles of sound conduction in the normal ear may apply. The following major topics are dealt with: 1) perforation and loss of the drum membrane, 2) interruption of the ossicular chain, 3) fixation of the ossicular chain, 4) the fenestration operation, 5) a physical theory of cochlear immobilization, 6) acoustic routes to the fenestrated ear, and 7) bone conduction in the otosclerotic ear. Leary, R.G. & Williams, J.R. DIRECTIONALITY OF MANUAL MOVEMENTS IN ALIGNING AND IMPACTION LEVER CONTROL ADJUSTMENTS FOR HORIZONTAL AND VERTICAL POSITIONS. *CGO Proj. No. 1300*, Tech. Mem. 3 59, April 1959, 22pp. *US Army Research Office-Durham*, Durham, North Carolina, NC.

14,482

To determine population stereotypes or "natural" movements involved in levers designed to control elevation and azimuth movements and to determine in which plane (horizontal or vertical) levers should be placed to effect better control, US Army selected personnel were tested on two types of control panels (one vertical and one horizontal with an azimuth and elevation control on each). A missile model was moved right, left, up, or down by the controls. The subject was instructed as to the direction the missile was to be pointed. Responses for direction of control movement and speed of response were recorded and analyzed. Recommendations are included. T. L. R. 25

14,483

Lacey, S. THE HUMAN FACTOR. *Safety*, Feb. 1954, 2pp. CE/7/58 (British Iron and Steel Research Association, London, England).

14,483

This paper reviews an investigation of accidents at the Park Gate Iron and Steel Company, England. Only workers who joined the firm in 1947 were studied. The method used was to trace the workers' "lives" with the company from the day of entry onward. The number of accidents sustained over a four-year period was analyzed in terms of such factors as 1) length of employment, 2) six months or less employment versus more than six months, 3) number of "no reason" absences, and 4) contractors versus re-entrants. The significance of the findings for management practices is discussed. G.

14,484

Lacey, S. RECORDING AND PRESENTING ACCIDENT DATA AT COMPANY LEVEL. CE/11/57, Jan./Feb. 1958, 16pp. Operational Research Dept., British Iron & Steel Research Association, London, England.

14,484

This report presents two useful methods of presenting accident rates graphically. One, the monthly accident control chart, makes it possible to compare a department's accident rate month by month with its own record. The other, the yearly interdepartmental comparison chart, shows rates of different departments within the same company. Both charts are adaptations of quality control charting techniques making allowance both for scale effects (different sizes of departments) and for chance fluctuations in rates. Detailed instructions are given for plotting the charts. A type of record useful in determining the relative order of different causes for accidents is also given. T. G. R. 3

Becke-Comer, J.G. & Maddell, D. A GENERAL
PSYCHOLOGICAL SCALE OF TASTE. J. Psychol., 1948,
26, 517-534. (Harvard University, Cambridge, Mass.).

14,487
This investigation deals with the problem of defining
a general psychological scale of taste strength on the
basis of the specific scales published by D.R. Lewis.
The first step established experimentally that cross
qualitative matches with respect to subjective strength
are possible in the field of taste. The next experiment
established that, for solutions of sucrose and sodium
chloride, pairs of hetero-qualitative solutions which
are g times as strong as a pair of empirically matching
solutions likewise match empirically. These results,
based on data from two observers, were used to construct
a general psychological scale of taste strength. The
scale unit is named a gust.

Lutz, C.C. DEVELOPMENT OF AN EMERGENCY PRESSURE SUIT
(COVERALLS, HIGH-ALTITUDE, TYPE CSU-4/P). Contract
AF 33(616) 3329, Proj. 6336, Task 63619, WADC TR 59
148, July 1959, 20pp. USAF Aero Medical Lab.,
Wright-Patterson AFB, Ohio

14,488
This report describes the various features evaluated
during the development of Coveralls, High-Altitude, Type
CSU-4/P. Each progressively improved prototype garment
is described and test results are reported. The final
model of the coverall is considered physiologically ade-
quate to meet the specified requirements. Comfort and
mobility features are compared to those of partial pres-
sure suits. Preliminary flight test results are reported
and an operational evaluation is recommended.

Kugel, R., Jr. STATIC LINE, TYPE T-10 TROOP PERSONNEL
PARACHUTE-GENERAL, DYNAMIC, AND STATIC TESTS. Proj.
6071, WADC TR 59 364, Suppl. 1, Apr. 1957, 24pp.
USAF Aeronautical Laboratories Lab., Wright-Patterson
AFB, Ohio.

14,490
To determine the effects of trooper collision during
landing and the forces involved in the inadvertent open-
ing of the reserve parachute of a towed trooper, a
series of aerial tow tests was conducted. The towed
dummy was first subjected to the forces of the reserve
parachute. The collision forces were determined by
towing one dummy and then launching a second. Forces
were recorded at the static line aircraft attachment
point as well as on the dummy. Test results were sum-
marized and the implications for training procedures
discussed.

FROM SENSORY LOSS. Ann. N.Y. Acad. Sci., Sept. 1958,
24(1), 119-127. (Bioengineering Section, Franklin
Institute Labs., Philadelphia, Penn.).

14,491
This paper discusses the need and value of the ap-
plication of engineering effort to problems resulting
from sensory loss. The work of the engineer on the
guidance and communication problems of the blind is dis-
cussed in particular. Various guidance devices, such
as obstacle detectors of various kinds, are described.
Methods for converting printed material into speech
and improved techniques for producing raised-dot (Braille)
reading are discussed. The need for other devices and
for rehabilitation studies are mentioned.

SUBMARINE ATMOSPHERIC CONDITIONS INCLUDING A METHOD
OF DETERMINING THE METABOLIC REQUIREMENTS OF SUB-
MARINE PERSONNEL. XII(5), NRL Rep. 220, Oct., 1959,
9pp. USN Medical Research Lab., Submarine Base, Conn.

14,492
Three tests were conducted on board the U.S.S. PERCH
(ASSP-313) which give information relative to prolonged
survival in a man-regulated atmosphere. The equipment
on this submarine for maintaining the carbon dioxide and
oxygen concentrations at fairly constant levels made
possible the study of effects in the field of (1) oxygen
lack at normal barometric pressure when the carbon diox-
ide concentration is maintained at a constant but ele-
vated level for varying lengths of time, and (2) carbon
dioxide excess at normal barometric pressures when the
oxygen content is maintained at 18 per cent or above
for varying lengths of time. A method for determining
the average caloric requirements of submarine personnel
is included.

Lewis, D.R. PSYCHOLOGICAL SCALES OF TASTE: I.
Psychol., 1948, 26, 437-446. (Dept. of Psychology,
Harvard University, Cambridge, Mass.).

14,493
To establish psychological scales of taste intensity,
four substances (in solution) were investigated: sodium
chloride, sucrose, quinine sulphate, and tartaric acid.
The procedure in each case was that of fractionation
with observers selecting by taste, from a set of com-
parison concentrations, the one most nearly representing
one-half the subjective strength of a standard concen-
tration. This procedure was repeated at several levels
of concentration for each of the four types of solution.
From these data, scales for each type of solution were
generated, both by algebraic and geometric procedures,
relating psychological intensity in arbitrary units to
physical concentration of the solution.

Elliott, R.T. STATISTICAL ANALYSIS, ACCIDENT PREVENTION TRANSPORT AND WORKS OPERATIONS IN INDUSTRY. Metal Treatment and Data Forming, Nov. 1954, 11(10), 541-544.

14,478
This article discusses the work of the Operational Research section of B.I.S.E.A. (British Iron and Steel Research Association). The primary responsibility is to investigate the organization of operations in industry - the employment of resources and any relevant scientific techniques are applied in order to bring about higher efficiency. Certain aspects of work undertaken in various categories are discussed, with examples: 1) mechanizing research (computers), 2) accident studies, 3) transport and traffic, and 4) works operations.

14,479
Flanagan, J.C. (Dir.). IMPROVING PERFORMANCE IN LOADING OPERATIONS. RESEARCH NOTES No. 15, May 1959, 4pp. American Institute for Research, Pittsburgh, Penn.

14,499
This note described research procedures used to discover why loading of heavy equipment into transport vehicles in a military organization took so much time. The major effort was to compile and analyze systematic records of the activities of each crew member. The measures taken for improvement consisted of: 1) development of working principles as a basis for task reorganization, 2) preparation of an activity chart, and 3) preparation of a supervisory control sheet. The result of field tests were described. The applicability of these methods to other problems of management were discussed.

14,501
In a search for significant life sciences information which will enable crews of high-altitude, high-performance vehicles to function efficiently, an evaluation of a liquid diet was made. A preliminary phase consisted of studies of 15 males who lived five days on a liquid diet, approximately 2600 calories and 115 grams of protein, while performing their usual laboratory duties. Criteria used to evaluate the diet included food consumption records, acceptability data, physiological effects, and psychological changes. The findings are discussed in relation to the utility of such a diet for extended periods of time.

Galanter, E.H. & Milson, V. THE RELATION BETWEEN SCALES OF LOUDNESS AND THE DIFFERENCE LIVEN FOR AMPLITUDE DISCRIMINATION. PART 22. TED MUR EL 52004. HUMAN ENGINEERING INVESTIGATION OF THE INTERIOR LIGHTING OF NAVAL AIRCRAFT. Contract N55 33766, NAC ACN 372, Tech. Rep. 3, Feb. 1959, 25pp. USN Air Material Center, Philadelphia, Penn. (Dept. of Psychology, University of Pennsylvania, Philadelphia, Penn.).

14,507

This report is one of a series concerned with parameters relevant to the intelligibility of auditory stimuli for aircraft signal indicators. The results of three experiments are summarized: 1) a comparison of loudness functions derived from magnitude estimations with those derived from magnitude production, 2) the inter- and intra-individual reliability in producing loudness functions; and 3) the feasibility of predicting the slope parameter of the loudness function from individual difference threshold determinations. The results are used to frame recommendations for auditory warning signal devices in terms of their psychological effect on the operator.

Fregly, H.J. & Iampietro, P.F. DIETARY POTASSIUM SUPPLEMENTATION AND PERFORMANCE IN THE DESERT. Proj. Ref. 7 83-01 005B, Tech. Rep. EP 109, April 1959, 16pp. USA Environmental Protection Research Div., QM Research & Engineering Center, Haverhill, Mass. (College of Medicine, University of Florida, Gainesville, Fla.).

14,509

To investigate the feasibility of enhancing operational capabilities by adding extra potassium to the soldier's diet when he is operating in a hot environment, 15 healthy male volunteers were studied for a period of five weeks. The first week was used for control measurements, following which two groups were formed--one being given a capsule containing supplementary potassium, the other a placebo each day in addition to a diet containing a normal amount of potassium. Performance ability was assessed by measurement of heart rates after a 4.5-mile hike in two hours, scores on the Harvard Step Test, electrocardiograms, and morning rectal temperatures. The sequence of physiological changes in the hot environment is discussed.

Moskowitz, W., Dylla, H. & Schoman, C.M., Jr. SUBMARINE GALLEY IMPROVEMENT BASED UPON INDUSTRIAL ENGINEERING STUDIES AND TECHNIQUES. Proj. NT002047, Subproj. CR 29 (3)F, April 1958, 33pp. USN Supply Research & Development Facility, Bureau of Supplies & Accounts, Bayonne, N.J.

14,510

An industrial engineering study of food preparation in a mock-up submarine galley was made utilizing time, flow, and motion study techniques. The operations of a qualified submarine commissaryman in preparing food during a 16-day menu period were charted. The relationship of items of equipment to each other, distances moved by commissaryman, and the percentage of work time spent at each piece of equipment were analyzed. This analysis provides a guide for a more efficient equipment arrangement. A new galley, occupying the same space, but requiring 30 per cent less movement to operate, was proposed.

Goldsmith, C.T. THE DETERMINATION OF THE DEGREE OF INTERACTION BETWEEN AUDITORY AND VISUAL SENSE. PERCEIVEDS. Contract DA 36 069 ORD 1758, RMO Proj. 1634/427842, June 1958, 48pp. NSA Office of Conference Research, Washington, D.C. (Fordham University, New York, N.Y.).

14,511

To determine the extent of concomitant variability between visual and auditory channels when near-threshold signals are presented simultaneously, separate visual and auditory thresholds of five subjects were obtained ten times. Energy points representing each subject's average performance were selected and entered on a five by five matrix, such that subjects could be stimulated simultaneously with both types of signals with predictable probability of detection. Twenty sessions of the combined stimulus were given and performance compared to that for separately presented signals. These results were analyzed in terms of predictions from a model set up to test the hypothesis of independent variability of the two kinds of thresholds over time.

Uffholz, L.M. THE MOTION PICTURE CAMERA IN INDUSTRY. From the Proceedings of the Sixteenth Annual National Time and Motion Study and Management Clinic, Chicago, Ill., Nov. 5-7, 1952, 3pp. Industrial Management Society, Chicago, Ill. (American Greeting Corporation, Cleveland, Ohio).

14,514

This paper discusses the use of the motion picture camera as a working tool in the field of management. Some of the ways in which the camera has been used in a specific industry are discussed: a control medium for setting standards, new equipment purchase or development, operator training, exchange of knowledge and techniques, public relations, and employee relations. The equipment required for such purposes is discussed.

14,515

Kadler, G. CRITICAL ANALYSIS OF MOTION-TIME SYSTEMS. Proceedings of the Sixteenth Annual National Time and Motion Study and Management Clinic, Chicago, Ill., 1952, Nov. 5-7, 9pp. Industrial Management Society, Chicago, Ill. (Washington University, St. Louis, Mo.).

14,515

This paper presents a critical analysis of all predetermined motion-time systems. The assumption that each qualitative basic unit of work can be assigned a time value for rate-setting is shown to have inherent errors that do not appear to be capable of improvement. Evidence from experimental research, systems studies, and industrial applications are presented in evidence. Procedures for accurate and consistent standards are discussed.

Turney, C. LIMITATIONS AND USES OF JOB EVALUATION. Proceedings of the Sixteenth Annual National Time and Motion Study and Management Clinic, Chicago, Ill., Nov. 5-7, 1952, 6pp. Industrial Management Society, Chicago, Ill. (A.T. Kearney & Company, Chicago, Ill.).

14,516

Job evaluation is defined here as a systematic method for determining the relative value of jobs within an organization. Five aspects of this technique that are considered as limiting factors are discussed: 1) the tool must be applied to jobs, not the individual worker, 2) the tool is systematic, not scientific, 3) jobs need to be rated in relationship to each other, 4) jobs are to be compared within a company or an organization, and 5) it is a long-range and continuing problem.

Middleswart, F.F. THE APPLICATION OF TIME STUDY AND METHODS TO MAINTENANCE. Proceedings of the Sixteenth Annual National Time and Motion Study and Management Clinic, Chicago, Ill., Nov. 5-7, 1952, 5pp. Industrial Management Society, Chicago, Ill. (E.I. du Pont de Nemours & Company, Wilmington, Del.).

14,517

This report describes factors leading to increased cost of maintenance work in recent years. It is argued here that the techniques of time study and methods can be applied to reduce this cost. The following six controls necessary for developing proper methods are discussed with examples from industrial application: 1) planning the job, 2) scheduling the job, 3) control of material, 4) control of tools, 5) preventive maintenance, and 6) maintenance cost analysis. The use of measurement is discussed in the following steps: 1) development of basic data, 2) development of application standards, 3) means of applying measurement, and 4) response of personnel.

Barnes, G.H. DATA REDUCTION EQUIPMENT FOR THE ANALYSIS OF HUMAN TRACKING. Contract AF 33(616) 270, Final Rep. F 2333, May 1953, 35pp. Franklin Institute Laboratories for Research and Development, Philadelphia, Penn.

14,522

In the study of feedback systems a linear component is normally characterized by its transfer function (the ratio of output to input signal as a function of frequency). The characterization for a non-linear component, say the pilot of an airplane, is much more difficult and requires new techniques. Such a new technique is the Data Reduction System described in this report. Spectra and cross-spectra in human tracking experiments can be determined and descriptive functions for human trackers found. The equipment has been subjected to tests of validity and it is to be used in conjunction with a flight simulator for analyzing pilot tracking.

USA Aviation Board. EVALUATION OF THE GRIMES TYPE-COCKPIT LIGHT MODEL D-6810A-2 (AMBER AND RED LENSES). REPORT OF PROJECT MR AVN 2358. Sept. 1958, 5pp. USA Aviation Board, Fort Rucker, Ala.

14,529

To determine the suitability of the Grimes Cockpit Light, Model D-6810A-2, for Army use, the light was installed in the cockpit of an aircraft. Informal evaluations were made during night flights (approximately 40 hours). Four different light beams are provided by the light (flood or spot, red or amber). Recommendations are included.

14,530

Carmichael, L. READING AND VISUAL FATIGUE. *Proc. Amer. Phil. Soc.*, March 1948, 92(1), 41-42. (Smithsonian Institute, Washington, D.C.).

14,530

This is a summary of an experimental study of visual fatigue, in which 20 high school and 20 college subjects read for each of two six-hour periods. Half of each group read from books and the other half from microfilm projections of the same books. Illumination level on the pages of the books was approximately 16 candles. Multiple-choice tests on content were answered at the end of every 25 pages of reading. Continuous records were made of all eye movements. The visual acuity and stereoscopic acuity of each subject were measured before and after each period and subjective comments were recorded. All records were analyzed for work decrements due to the prolonged reading.

Chase, R.A., Sutton, S. & First, Daphne. BIBLIOGRAPHY: DELAYED AUDITORY FEEDBACK. Dec. 1958, 13pp. Communications Lab., Department of Biometrics Research, New York State Department of Mental Hygiene, N.Y.

14,531

This bibliography consists of 101 items on the area of delayed auditory feedback and 46 related papers. The first set of items represents a systematic review of published literature for the period 1950-1958; the second set comprises items felt to be pertinent to questions raised by research in the area, but does not represent a systematic search.

14,532

Chase, R.A. EFFECT OF DELAYED AUDITORY FEEDBACK ON THE REPEITION OF SPEECH SOUNDS. *J. Speech Dis.*, Nov. 1956, 23(5), 583-593. (College of Physicians and Surgeons, Columbia University, New York, N.Y.).

14,532

The idea that the condition of delayed auditory feedback facilitates the circulation and recirculation of speech units in the speech-auditory feedback loop (thus accounting for the observed increase in phonation time) suggested that it is possible to repeat the speech sound (b) more times in a five-second period under delayed feedback than under normal conditions. This hypothesis was tested experimentally with 20 subjects. Possible mechanisms accounting for the observed effects and applications of the research to the study of stuttering are indicated.

14,533

Chase, R.A., Harvey, S., Standfast, Susan, Rapin, Isabelle, et al. A COMPARISON OF THE EFFECTS OF DELAYED AUDITORY FEEDBACK ON SPEECH AND KEY TAPPING. Dec. 1958, 5pp. Communications Lab., Department of Biometrics Research, New York State Department of Mental Hygiene, N.Y.

14,533

To compare the effects of delayed auditory feedback on speech and on non-vocal tasks, each of 14 subjects was asked to repeat the speech sound h as in "hook" in groups of three. Vocal output was first amplified and returned without delay; a delay of 244 milliseconds was then introduced. Vocal performance was recorded and analyzed for effects of the delay. Each subject was then required to tap a key that hit a strip of spring steel with a strain gauge mounted on it; auditory feedback was handled as above. Records of time and pressure characteristics of key-tapping performance were analyzed for effects of delay and compared with results of vocal performance.

Chauncey, H.H. & Shannon, I.L. PAROTID GLAND SECRETION RATE AS A METHOD FOR MEASURING RESPONSE TO GUSTATORY AND MASTICATORY STIMULI IN HUMANS. Rep. 59 66, May 1959, 7pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

14,534

To develop a new approach to the quantitative determination of the effect of gustatory and masticatory stimuli, parotid gland secretion rate was employed to measure response elicited. Four gustatory stimuli (citric acid, sodium chloride, sucrose, and quinine sulphate) and three masticatory stimuli (gum base, paraffin, and rubber bands) were used with 216 male subjects. A plot of secretory response against its corresponding affecter intensity—bolus volume (masticatory), or application rate (gustatory)—was constructed; the relationship was expressed mathematically and the maximal response and reflex equilibrium constant for the different stimuli were calculated.

Christensen, K.K. & Johnson, L.L. STUDY TO DETERMINE METHODS OF SIMULATING G EFFECTS. Contract AF 33(600) 37276, WADC TN 58 314, Oct. 1958, 108pp. USAF Aeronautical Accessories Research Lab., Wright-Patterson AFB Ohio. (Armour Research Foundation, Illinois Institute of Technology, Chicago, Ill.).

14,535

To determine methods of simulating acceleration and deceleration sensations in aircraft flight simulators (without actually producing them), the following steps were taken. A literature survey was made to ascertain the significant sensations and studies were conducted of methods for mechanically inducing heaviness and immobility sensations, chemically inducing physiological effects, psychologically inducing effects of acceleration, and controlling the various simulated effects. Several devices that may indirectly induce acceleration effects were investigated. Recommendations as to the feasibility of simulation are made.

Curran, H.T. Jr. & Gochwind, R.T. EVALUATION OF SIGHTING DEVICES FOR A SMALL HAND-HELD ROCKET LAUNCHER. Tech. Memo. 659, Sept. 1959, 15pp. USA Ordnance Human Engineering Lab., Aberdeen Proving Ground, Md.

14,536

The degree of difference in accuracy due to aiming error among three types of experimental sighting devices was investigated. The sights were: 1) an iron sight with a 20-inch sight radius utilizing a plexiglass plate upon which a reticle was etched for the front post, 2) a unity-power optic using singlet lenses, and 3) a unity-power optic using doublet lenses. Twenty-eight Infantry men were used as subjects. Both qualitative and quantitative disparities among the sights were ascertained. Possible effects of low illumination sighting are discussed.

Dodson, H.L. COCKPIT VISIBILITY, MEASUREMENT OF. FINAL REPORT. Proj. TED PIR SI 5002, ST33 82, Rep. 1, April 1958, 14pp. USN Air Test Center, Naval Air Station, Md.

14,537

Measurements of the cockpit downward visual cut-offs of several late model Naval airplanes were made. For these tests, the airplanes were jacked to pitch angles approximating that of the power approach condition, and measurements were made with the pilot's head both in the design normal eye position and as far to the left as would be safe and comfortable to maintain in flight. The data are presented in tabular form as angles of depression from the horizontal. Pilot responses concerning internal fogging and effect of rain on visibility from cockpit are also reported.

Du Mas, F.M. CATINUA, CATEMENSIONS, CATESCALES. J. clin. Psychol., April 1951, VII(2), 112-117. (University of Texas, Austin, Tex.).

14,538

This paper introduces several new concepts and indicates their utility for science in general and clinical and office psychology in particular. A rational analysis of certain concepts and their associated phenomena is presented. The major objective is to lay out a guide for the construction of information files (case histories, biographical data sheets, interview forms, etc.) that systematize and order these data so that a more coherent picture of the individual is obtained and also quantify sub-domains of information. Definitions and illustrations of the following concepts are given: catinuum, catemension, and catescale.

Elam, J.O. & Greene, D.G. (Princ. Investigators). STUDIES ON RESUSCITATION AND ARTIFICIAL RESPIRATION. Contracts DA 49 007 MD 507 & DA 49 007 MD 209, Prog. Rep. 1, Feb. 1958 - Nov. 1958, 31pp. USA Research & Development Div., Office of the Surgeon General, Washington, D.C.

14,539

Five studies on resuscitation and artificial respiration are reported. 1) Physiological management of ventilation during anesthesia: measurements of arterial pH and expired CO₂ were correlated with intervals of mild hyperventilation alternating with mild hypoventilation produced by a servo ventilator in 48 surgical patients anesthetized with common agents. Clinical advantages of mechanical ventilation were reported. 2) Training requirements in resuscitation: evaluation of several methods in progress. 3) Evaluation of Edgewood Resuscitator: this tidal-volume device was used on 118 patients; results were given. 4) Mask-to-mask resuscitator: two innovations were described. 5) Resuscitation studies: a new tracheal pickup device was constructed, and a documentary film was made. Elkin, E.H. EFFECTS OF SCALE SHAPE, EXPOSURE TIME, AND DISPLAY-RESPONSE COMPLEXITY ON SCALE READING EFFICIENCY. Contract AF 33(616) 3612, Proj. 7184, WADC TR 58 472, Feb. 1959, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

14,540

Three scale-reading variables were examined in both quantitative and qualitative reading tasks. The variables were: three scale shapes (circular, vertical, and open-window); four exposure conditions (120, 360, 1080 milliseconds, and termination by subject's response); two degrees of display complexity (100 and 20 intervals); and three of response complexity (reading to nearest five, to nearest 1, and high, low or OK). The scales were exposed tachistoscopically and the subject's oral response time was measured; error scores were also recorded. The data were analyzed in terms of the relative merits of each variable and how it interacts with the others.

Faulds, B. THE PERCEPTION OF PITCH IN MUSIC. Contract MONR 1858 (15), Proj. NR 150-088, National Science Foundation Grant G 642, May 1959, 87pp. Psychology Department, Princeton University, Princeton, N.J.

14,543

This study examines the sense of pitch in a variety of situations, some musical and others not, with the object of deciding how best to predict success in musical studies. A battery of 14 auditory tests was devised and given to two groups of subjects: 67 freshmen from a college of music and 35 freshmen from a liberal arts college. The scores were studied by factor analysis techniques to identify underlying factors in the tests. Factor scores were then computed for the subjects and used as predictors of the college of any given subject. The main contributions of this study for testing musical aptitudes are discussed.

Frazer, J.W. & Reeves, Elizabeth. ADAPTATION TO POSITIVE ACCELERATION. WADC DA 5918, Proj. DA 11 01 12.3, Rep. 4, Dec. 1958, 16pp. USN Air Development Center, Johnsville, Penn.

14,545

To determine whether or not animals would show increased tolerance to acceleration (as measured by survival time) if conditioned to lower levels of acceleration, 150 rats were subjected to acceleration. One group (50) was preconditioned by exposure to 2 g, a second group to 12 g, and third to cage-stressing one-half hour a day for six weeks. At the end of the conditioning period all animals were subjected to 20 g and their survival time was measured by means of a transistor amplifier (heart rate). Statistical correction was made for rats preconditioned at 12 g before comparing survival times for evidences of adaptation.

Finnie, A.W. & Kenchington, K.W.L. GLOVES FOR AMMUNITION EXAMINERS. CSEE Rep. 89, Dec. 1958, 33pp. Clothing & Stores Experimental Establishment, Ministry of Supply, London, England.

14,547

To investigate the use of gloves for the finer manipulative tasks associated with ammunition examination under moderately cold sheltered conditions, a designed trial, in three parts, involving 36 subjects was conducted. The existing Glove, Leather, Light Duty, was examined against the Glove, Chamois, and an experimental glove. Assessments were made by laboratory dexterity tests at 60 and 28 degrees Fahrenheit. Thermal insulation tests were carried out at 28 degrees Fahrenheit. Small scale user trials took place at two Central Ammunition Depots, in which subjects were timed in actual tasks when wearing each type of glove. Subjective assessments were obtained by questionnaire. Recommendations are included.

Gallup, H.F. RECEPTOR CONTRIBUTION TO THE CRITICAL FLICKER FREQUENCY CURVE. Rep. NANC ACCL 341, Aug. 1957, 29pp. USN Air Crew Equipment Lab., Naval Air Materiel Center, Penn.

14,548

To study receptor contributions to the off (critical flicker frequency) curve, data from previous research were reviewed and their interpretations closely examined. To check certain discrepancies, to fill a gap in the data, to provide an experimental test between predictions from the concept of inhibition of rod effects by cone effects and those from the concept of declining receptor contribution, and to identify the slopes of rod and cone curves with the size of their respective populations, off-log intensity curves were determined for two subjects. Light-time fractions (.50, .80, and .90) were used at each of three retinal locations (0, 5, and 18 degrees temporal from fovea) chosen for their different ratios of rods to cones. Forms of the obtained curves are discussed relative to the stated purposes. T. G. I. R 27

Gaskill, H.S. SURVEY OF PERSONAL AND INTERPERSONAL FACTORS IN DRIVING. Contract DA 49 007 MD 502, Ann. Rep. for period 1 March 1958 to 28 February 1959, 11pp. USA Research & Development Div., Office of the Surgeon General, Washington, D.C.

14,549

This report discusses a research program dealing with the relationship of personal characteristics to motor vehicle accident/violation experiences. During the initial phases (1953-1956), a coordinated series of studies of matched accident-repeater and accident-free airmen (drivers) demonstrated that specific personality, temperament, and attitude characteristics distinguished these groups more reliably than psychophysiological, intellectual, or skill attributes. Subsequently, a large scale study of 6706 teen-age pre-drivers was initiated to determine whether specific personality factors associated with accident/violation driving could be used to identify subsequent safe drivers. A final analysis of the data will be made when these drivers have 36-months driving experience. G. R 3

George, L.S. HEAT RESISTANT CLOTHING TRIALS AT THE PARK GATE IRON AND STEEL CO. LTD. SM/A/79/53, Rep. Ref. 53/35, 1953, 4pp. The British Iron & Steel Research Association, London, England.

14,552

This report summarizes a demonstration of a heat resistant ensemble worn in the blast furnace and open-hearth furnace departments of a steel works. The material of the equipment was composed of aluminum metal adhering to a fire-proofed textile base and consisted of a hood covering the entire head and neck (with glass window), a long-sleeved coat, gauntlets, and leggings with boot top cover. The ensemble was evaluated for degree of protection from heat, fire-proof qualities, durability, and attitude of workers towards wearing it. Recommendations are included.

14,553

Goldman, A. SENSORY INTERACTION AND RESPONSE CAPACITY. Tech. Rep. NAVTRADEVEN 789 11 1, June 1959, 52pp. USN Training Device Center, Port Washington, N.Y.

14,553

To determine whether the operator in a man-machine system with very high rates can perform more efficiently when the sensory inputs are through one sense modality or divided between two sense modalities, four groups (32 subjects) were required to track a target under one of four conditions. 1) Display was presented visually and was tracked with joystick control. 2) With the same display, a linear control was used with one hand tracking horizontal and the other vertical movements. 3) Horizontal movement of target was displayed visually and vertical movement by audio signal with joystick control. 4) Same as preceding with a linear control. Each group performed three similar, but increasingly difficult tasks. Time-off-target scores were analyzed for effect of the four conditions and task difficulty. T. I. R 21

Hickey, A.E., Jr. & Blair, W.C. ENGINEERING CONTROL I. MULTIPLE DISPLAY MONITORING. Contract NMR 2512(00), PS9 004, Electric Boat Tech. Rep. SP059 002, Jan. 1959, 14pp. Electric Boat Division, General Dynamics Corporation, Groton, Conn.

14,559

To determine how operators voluntarily distribute their visual work load while monitoring three displays for signals, two experiments were performed. In one the signals persisted until they were detected and reset by the operator; in the other the signals were transient and were only detected. In each experiment three groups of six subjects were each given one half-hour session per day for eight days. Signals were varied in number for each display but were presented randomly. Subjects had to push one set of buttons to light and observe the displays and another set to report detections and reset signals. Only one display could be observed at a time. Both the frequency and duration of observing were measured and analyzed.

Humphries, M. & Shephard, A.H. AGE AND TRAINING IN THE DEVELOPMENT OF A PERCEPTUAL-MOTOR SKILL. Percept. Mot. Skills, March 1959, 2, 3-11. (University of Toronto, Toronto, Ontario, Canada).

14,560

This paper is one of a series dealing with the general problem of the relationship between chronological age, training, maturation, and performance. In this experiment three groups of children, ages 5-1/2, 7-1/2, and 9-1/2 years, received training on the reversed task of the Toronto Complex Coordinator in three sessions; each session was separated by six months. In each session, training was given in two five-minute periods; each period was separated by a 20-minute rest period. Performance (matches and errors) was analyzed for relationships with age. Brief rest periods and intervals of six months were also examined in relation to age, amount of training, and age at which training started.

Jarl, V.C., Gerhardt, R. & Riis, E. APPROACHES TO THE PROBLEM OF FLYING SAFETY. 5pp. Norwegian Armed Forces, Oslo, Norway.

14,562

This paper discusses various approaches to the improvement of flying safety. Present methods are reviewed critically, especially the analysis of aircraft accidents. It is suggested that what constitutes an accident needs to be redefined. A tentative guide is presented for facilitating the reporting as well as the logical and psychological analysis of predisposing and precipitating factors leading up to the accident. The gathering and use of near-accident data is discussed. It is further suggested that new leads for research may come from the general care-of-the-flyer program. An example is given in the case of lateral dominance as associated with malfunctioning of the pilot.

Jerison, H.J. EXPERIMENTS ON VIGILANCE: THE EMPIRICAL MODEL FOR HUMAN VIGILANCE. FIFTH IN A SERIES. Contract AF 33(616) 6095, Proj. 7184, Task 71581, WADC TR 58 52*, Jan. 1959, 25pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College, Yellow Springs, Ohio).

14,563

A model of human vigilance is presented which is an integrated summary of empirical studies. Vigilance is defined as a probability of detecting rare and near-threshold events (signals). In the model this probability is described as a function of the combined effects of signal frequency, response frequency, signal detectability under ideal observing conditions, time at work, complexity of the monitored display, and various subject variables. A deductive theory of vigilance should have this function as one of its consequences.

G. I. R 34

14,564

Jerison, H.J. EXPERIMENTS ON VIGILANCE: DURATION OF VIGIL AND THE DECREMENT FUNCTION. FOURTH IN A SERIES. Contract AF 33(616) 3404, Proj. 7184, Task 71581, WADC TR 58 369, Dec. 1958, 15pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Antioch College, Yellow Springs, Ohio).

14,564

Results of previous experiments on vigilance were re-analyzed for data on human performance during short (half-hour) and long (two-hour) vigils. The data permitted performance comparisons of different groups of naive subjects on short and long vigils and of naive subjects on short vigils with that of the same subjects on subsequent longer vigils. The analysis was made in terms of initial and final levels of performance and the shape of the decrement function as affected by length of vigil. An explanation of the findings is offered which is consistent with an expectancy theory of vigilance; implications for lengths of monitoring tasks are discussed.

Karpovich, P.V., Keeney, C.E. & Alexander, A.A. PHYSIOLOGICAL AND KINESIOLOGICAL METHODS FOR TESTING FOOTGEAR. Contract DA 19 129 QM 309, Proj. Ref. 7 79-10 001C, Rep. 13, Jan. 1959, 95pp. USA Textile, Clothing & Footwear Div., QM Research & Engineering Center, Natick, Mass. (Dept. of Physiology, Springfield College, Springfield, Mass.).

14,566

To develop physiological and kinesiological methods for the evaluation of the effect of military footwear upon the function of the soldier, several types of American, British, and Canadian footwear were compared. The methods used were 1) measuring energy cost of walking, 2) measuring bone alignment of the foot and lower leg, 3) determining the speed of sprinting 30 yards, the time of running a zig-zag course, and the height of vertical jumping, 4) measuring the pressure exerted on selected areas of the soles of the feet. Several auxiliary devices and techniques were developed.

Kenchington, K.W.L. THE REGIONAL COOLING OF THE GLOVED HAND UNDER SIMULATED MOTORCYCLING CONDITIONS. Rep. 83, Nov. 1957, 11pp. Clothing & Stores Experimental Establishment, Ministry of Supply, London, England.

14,567

To minimize bulk in motorcyclist's handwear by the use of graded insulation in accordance with regional requirements, a study was made of hand skin cooling when wearing the Gauntlet, M.T. under simulated motoring conditions. Chamber experiments were carried out at 32 degrees Fahrenheit, in a constant wind of 38 miles per hour, with top military subjects. Skin temperatures were taken at 12 points on the hand over a period of 30 minutes. Cooling curves were constructed. The results are discussed with reference to hand position when driving and suggestions are made for the design of an improved gauntlet.

14,572
To determine the effects of unequal binocular retinal
illumination on the perception of depth discrimination, equal-
distance (equality) settings were made using a two-end
test apparatus including real depth cues by two trained
observers. Two variables were studied: 1) the level of
equal retinal illumination presented to the two eyes, and
2) the difference in the level of illumination presented
to the two eyes. Illuminance levels ranged from low com-
patible to high photopic levels. The significance of the
results for visual theory is discussed.

THRESHOLD AS A FUNCTION OF TARGET VELOCITY. Percept. Mot.
Sci., Sep. 1959, 9(2), 1-10. Willow Run
Lab., University of Michigan, Ann Arbor, Mich.

14,563
Some of the logical consequences of drawing a dis-
tinction between the following two aspects of problem-
solving behavior are explored: 1) actions directed toward
the acquisition of information to guide future actions
toward valuable goals, and 2) actions directed toward the
utilization of accumulated information to attain a valua-
ble goal. An experimental paradigm accomplishing this
separation is described for the case of an environment
of periodic sequences of binary events. A general way of
describing behavioral strategies is developed. The
structure of the binary environmental sequences and of
the behavioral strategies and their interrelations are
described. Predictions from an experiment are compared
with data from studies of human subjects.

14,573
To investigate a localization error that arises when
a transversely moving target is binocularly observed un-
der conditions of unequal binocular retinal illumination
(Pulfrich stereophenomenon), means of the near and far
displacements of a black vertical rod were made (two
practiced observers) for a wide range of target veloci-
ties under each of several conditions of unequal binocu-
lar retinal illumination. The data were analyzed as func-
tions of target velocity for difference levels of differ-
ence in binocular illumination. An explanatory theory
was offered to account for the results. Implications for
problems of military surveillance are pointed out.

Ludwig, E. & Miller, J.M. STUDY OF VISUAL ACUITY
DURING THE OCULAR PERIOD OF MOVING TEST OBJECTS. I.
INTRODUCTION. Ann. Exp. Psychol., Nov. 1958, 48(1),
199-202. (Kresge Eye Institute, Detroit, Mich. &
USC School of Aviation Medicine, Naval Air Station,
Ft. Belvoir, Ill.).

14,570
A bioelectric phenomenon, designated the ocular rest-
ing potential (ORP), was utilized to measure small eye
movements. The ORP is recorded by placing pairs of elec-
trodes on the skin of the face around the eyeball. This
phenomenon depends upon the existence of a polarity dif-
ference between the front (cornea) and the back (retina)
of the eyeball, the well-known corneal-retinal potential.
The success with which the ORP can measure small move-
ments is discussed. An oscilloscope display of complex
eye movements as recorded from the ORP is described and
its possible uses for research pointed out.
G. I. R 25

14,574
To determine the manner in which visual acuity is af-
fected when observed during the voluntary ocular pursuit
of moving test objects (dynamic visual acuity), apparent
movement was produced by rotating a mirror in the desired
plane of pursuit. The range of angular velocities uti-
lized was 10 to 170 degrees per second at the nodal point
of the tested eye; the test objects were Landolt rings.
Dynamic visual acuity thresholds were determined for en-
listed naval personnel ranging in age from 17 to 33 years
having a static visual acuity of 20/20 or better. The
acuity data were analyzed as a function of velocity.
Possible causes for the findings are discussed.

Marrindale, R.L. & Lowe, M.F. USE OF TELEVISION FOR
REMOTE CONTROL: A PRELIMINARY STUDY. Proj. REPORT,
AFOSR TR 58-12, Aug. 1958, 10pp. USAF Special Weapons
Center, Kirtland AFB, N.M.

14,571
A summary of work accomplished during the year 1958
on a study of the organization of the visual system in
respect to color is reported. A correlation of color re-
sponsiveness with conduction velocity along the nerve
fibers in monkeys was made. Flashes of five different
colors at equal intensity were delivered to the eye and
the response to single cortical cells recorded. The re-
sponse of the same cells to stimulation of the optic
nerve was then sought. Implications of the results on
future work are discussed.

14,575
Closed circuit television is expected to have a vari-
ety of military applications requiring remote control.
This test was performed to determine optimum monitoring
arrangements. Fifteen Air Force officers performed a
simple remote control task under five monitoring condi-
tions and the accuracy of their performance was measured.
The data were analyzed for effects of displacement of the
visual field from normal line of sight and for different
camera positions. Some remedial actions were discussed
such as repositioning the monitor to compensate for
camera angle.

Kucwalski, A.A. & Brown, K.L. THE EFFECTS OF MONITORING RESPONSES ON THE BEHAVIOR OF THE MONITOR. MONITOR, Rep. 55-58, April 1958, 4pp. MONITOR, University of Texas, Austin, Tex.

14,576

To determine the effects of nuclear radiation exposure on the behavior of the monkey, ten male rhesus monkeys were exposed to nuclear radiation. Systematic observations of the free cage behavior of the experimental and nine control (non-exposed) animals were made for ten days preceding and on alternate days for as long as he survived through 28 days following exposure. The four behavioral categories were 1) nondirected visual activity, 2) nondirected locomotor activity, 3) object-directed activity, and 4) self-directed activity. The behavioral syndrome was compared to that known to be produced by laboratory exposure to radiation.

Parker, K.F. ACTIVE EAR DEFENDER SYSTEMS: OCCUPANT INTERRELATIONS AND THEORY. Contract AF 33(616) 3051, Proj. 7210, Task 71700, MOD 12 57 568(Part 1), Sept. 1958, 4pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Radio Corporation of America, Camden, N.J.).

14,577

The potentialities of the noise cancelling principle in ear protectors were investigated. The basic theory, discussed in an appendix, has been applied to 1) a non-feedback cavity ear muff system, wherein noise picked up by a microphone outside the muff and adjusted for phase and amplitude was transmitted through earphones under the muff, 2) a feedback ear muff system, similar to the first, yet employing negative feedback with the pick-up microphone located inside the muff, and 3) a free-field loudspeaker system. Based upon the examples studied and the transducer problems involved, objectives for developmental noise reducing systems are suggested.

Schmitz, M.A. THE EFFECT OF LOW FREQUENCY, HIGH AMPLITUDE VIBRATION ON HUMAN PERFORMANCE. PROGRESS REPORT NO. 2A JANUARY 31, 1958 TO JANUARY 31, 1959. Contract DA 49 007 MD 797, Rep. 128, Jan. 1959, 5pp. Research Laboratories, Milwaukee, Wisc.

14,578

To determine whether relatively low frequency and high amplitude vertical vibration (of the type found in work vehicles) affects human psychomotor performance, 18 subjects were exposed to vibrations of 2.5 and 3.5 cps at two displacements for 90 minute periods. Subjects were seated on a wooden chair on a mechanical shaketable. Pre- and post-control measures were taken before and after each test session. Performance during vibration was compared to a no-vibration condition on the following tests: 1) hand tremor, 2) visual acuity, 3) compensatory tracking, 4) foot pressure constancy, 5) foot reaction time, and 6) body equilibrium. The effects of exposure time and vibration conditions were analyzed.

Smiley, G.L. THE USE OF THE IBM 704 IN THE SIMULATION OF SPEECH RECOGNITION SYSTEMS. Res. Rep. RC 37, Dec. 1957, 20pp. International Business Machines Corporation, Poughkeepsie, N.Y.

14,580

The first step in mechanical speech recognition involves the analysis of a large number of speech sounds to determine the characteristics by which these sounds may best be discriminated. To accomplish this analysis special advantage is taken of techniques made possible by the advent of the large scale digital computer. This paper describes the equipment required to both facilitate editing samples of sounds for analysis and convert these sounds to digital form suitable as computer inputs. A system of programs is presented and the feasibility of the computer as a research tool is illustrated.

Sinalko, H.M. & Cartwright, G.P. CAREFUL: A PILOT STUDY OF THE EFFECTS OF HEAVY TARGET LOAD ON HUMAN AND AUTOMATIC DECISION MAKERS. Contract DA 36 039 SC 56695, D/A Subtask 3 99 01 002, Rep. R 115, Sept. 1959, 43pp. Coordinated Science Lab., University of Illinois, Urbana, Ill.

14,582

A brief experiment was done to test the hypothesis that very heavy target loads would adversely affect a human tactical decision-maker while the same number of targets would not degrade the performance of an automatic system. A series of air defense exercises was used in three modes: 1) fully automatic, 2) CIC officer could override decisions of the automatic system or make his own if he so chose, and 3) the officer made all the decisions and assignment of interceptors. Two scripts differing in numbers of targets (37 and 60) were used. Data (target penetrations, kills, assignments) from 24 runs were analyzed in terms of the effectiveness of the mode under each load condition. Implications of the findings for designers of automatic decision-making machines are discussed.

005, Subtask 5, Test 10, Res. Rep. 558, March 1958.
12pp. USN Experimental Division Unit, Naval Gun Factory,
Washington, D.C.

14,584
To develop a scale for measuring symptoms of decompression sickness which will improve the precision of experimental work in diving, a sample of 60 cases covering a wide range of seriousness in post-dive symptoms was selected. Six judges, medical officers with considerable experience in experimental diving, ranked and scored the cases in terms of seriousness. The responses were examined for agreement of judgments. Ratings and scores were analyzed and, together with descriptive judgments, used as a basis for a zero-ten psychometric scale.

Tanner, W.P., Jr. A RE-EVALUATION OF WEBER'S LAW AS APPLIED TO PURE TONES. Contract DA 36 039 SC 63203, DA Proj. 3 99 04 042, SC Proj. 1943, Rep. 2262 185 I, Tech. Rep. 55, Aug. 1958, 26pp. Dept. of Electrical Engineering, University of Michigan Research Institute, Ann Arbor, Mich.

14,585
The hypothesis that Weber's law as applied to intensity discrimination of pure tones reflects a condition of the environment rather than the hearing mechanism was investigated. An inventory of the various possible noise sources which may exist was made and an equation derived for the way in which these noise sources may be expected to affect the detectability of a signal. Data for three observers over four levels were obtained and analyzed in terms of the equation.

Tanner, W.P. Jr. & Jones, R.C. THE IDEAL SENSOR SYSTEM AS APPROACHED THROUGH STATISTICAL DECISION THEORY AND THE THEORY OF SIGNAL DETECTABILITY. 1959, 19pp. University of Michigan Research Institute, Ann Arbor, Mich. & Polaroid Corporation, Cambridge, Mass.

14,586
An analysis is presented of sensory experiments in which the relevant variables are identified and those conditions in the environment are analyzed which place limits on performance in visual experiments. A general model of an ideal observer, one who performs to the limits of his environment, is described. The model is a purely mathematical concept describing the maximum possible correlation between observable events in very simple detection experiments. The analysis of the limits of environment is based on the statistical properties of photons. Necessary terms are defined, and a theorem for employing the model in descriptive ways is presented and illustrated.

Peckham, R.H. & Hart, W.M. RETINAL SENSITIVITY DURING PHOTOPIC ADAPTATION. Contract NCR 2750(00), Tech. Rep. 1, Oct. 1959, 18pp. The Eye Research Foundation, Bethesda, Md.

14,597

To investigate factors that may affect the response of the eye to sudden changes in luminance, a psychometric method was employed. This entails determining the probability of response of each subject to a series of stimuli in a liminal range, presented in an order that appears random to the subject. The stimuli were repetitive short alternations of equal durations above and below a constant background luminance. The response was called "scintillation." A series of eight experiments was performed on: 1) effect of contrast and range, 2) summation, 3) reliability of data, 4) retinal sensitivity to low luminance, 5) effect of adaptation to excessive brightness and to dimness, and 6) effect of age.

Rockway, M.R. & Franks, P.E. EFFECTS OF VARIATIONS IN CONTROL BACKLASH AND GAIN ON TRACKING PERFORMANCE. Proj. 7197, Task 71635, WADC TR 58 553, Jan. 1959, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,601

This report is one of a series concerned with the effects of discontinuous control system nonlinearities on tracking performance. Six subjects performed a simulated aircraft tracking task using each of 12 control conditions resulting from combining four levels of control backlash (0, 0.2, 0.6, and 1.8 degrees of stick deflection in total extent) and three levels of gain (0.5:1, 1.5:1, and 5.0:1). Integrated error scores and a limited number of graphic records of display error and control position were obtained. The error scores were subjected to analysis of variance for effects of backlash, gain, and their interactions on system performance. The implications for design of manual control systems were discussed briefly. T. G. I. R 7

USN Group Psychology Branch. BIBLIOGRAPHY OF UNCLASSIFIED RESEARCH REPORTS IN GROUP PSYCHOLOGY. Rep. ACR 22, Sept. 1957, 41pp. USN Group Psychology Branch, OIR, Washington, D.C.

14,604

This bibliography lists technical reports submitted to the Office of Naval Research in the field of group psychology as of 1 January 1957. The primary areas covered are: 1) the structure and function of the group as a whole, 2) the behavior of the individual as a group member, 3) and a combination of (1) and (2) with emphasis on motivation. Other reports concern: disturbed psychological states which are of interest to the Navy; psychological warfare; and fatigue and related states. R 700 (approx.)

Chapanis, A. (Dir.). A REPORT OF RESEARCH UNDER CONTRACT WITH THE OFFICE OF NAVAL RESEARCH. PROGRESS REPORT NO. 2, 1 NOVEMBER 1959. Contract (NOR) 248(55), Nov. 1959, 14pp. Institute for Cooperative Research, Johns Hopkins University, Baltimore, Md.

14,605

This report outlines progress on a general research contract concerning psychophysiological aspects of sensory perception and discrimination relating to design characteristics, human utilization and evaluation of man-machine systems. A list of the personnel and their visits and special activities is given; the research reports published since the last report (four) and those awaiting publication (three) are listed; summaries are given for reports completed since the last report (four); and current and proposed research projects (twelve) are described. A bibliography of reports (twelve) published in the last two years is included. R 19

14,606

Jones, M.B. & Goodson, J.E. THE EFFECT OF BOREDOM ON SUGGESTIBILITY. Proj. NM 16 01.11, Subtask 16, Rep. 1, July 1959, 10pp. US School of Aviation Medicine, Naval Air Station, Fla.

14,606

To investigate the relationships between suggestibility and boredom, two groups of naval aviation cadets were deprived of all social contact for a period approximating eight hours. Immediately following isolation the cadets were tested individually for suggestibility, and an equal number of control subjects were also tested. The Hall body-sway technique was used to test for suggestion of postural sway and of arm levitation. Responses of the two groups were compared. T. R 12

14,607

Crook, M.N., Gray, Florence E., Hanson, J.A. & Weisz, A. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: FAMILIAR FORMS VIEWED AGAINST COMPLEX BACKGROUNDS IN FACSIMILE COPY. Contract DA 49 007 MD 536, Interim Rep. 3, May 1955, 9pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,607

To measure the effect of noise degradation on recognizability of form as seen against several types of background, test forms from an earlier experiment were grouped into four difficulty categories. The background arrangements were referred to as 1) plain, 2) ten percent small, 3) 50 percent small, and 4) 20 percent large. Each combination of forms and backgrounds was presented at four signal/noise levels. Subjects wrote on prepared record sheets the names of the forms they thought they could identify. Recognition scores were analyzed for recognition-noise functions for the several types of background. G. I.

14,608

Boardman, L.J. SOME CHARACTERISTICS OF THE EYE AFFECTING PHOTOMETRIC MEASUREMENTS. NRL Rep. 5296, May 1959, 19pp. USN Research Lab., Washington, D.C.

14,608

A series of measurements were made to determine how some of the luminosity characteristics of the eye change in the mesopic and scotopic regions of vision and how these changes affect photometric measurements. Two interdependent studies were made. 1) The variation of achromatic sensitivity over the retina of a fully dark-adapted eye was measured using five observers (for the temporal side), level of illuminance 2.1 effective microlamberts, and angular distances ranging from two to sixty degrees from foveal center. Measurements were extended on one subject for the nasal region, for luminances up to 30 effective microlamberts, and for various colors. 2) The effect of equivalent luminance due to size, shape, and color of the photometric field was measured on five subjects. 14,609

Bryan, G.L., Rigney, J.W., Bond, N.A., Jr., LaPorte, H.R., Jr., et al. THE ROLE OF HUMANS IN COMPLEX COMPUTER SYSTEMS: A DESCRIPTION OF THE STUDY. Contract NOR 228(02), Proj. NR 153-093, Tech. Rep. 24, Jan. 1959, 57pp. Dept. of Psychology, University of Southern California, Los Angeles, Calif.

14,609

The background, rationale, and procedures used to study personnel problems connected with programming and maintaining general purpose digital computers are described. Fifty computer locations were visited, and interview, observational, and questionnaire data were collected. Brief descriptions of the various data-collection techniques are given. This report is the first of a series of four; substantive findings will be presented in following reports. T. I. R 4

14,610

Baker, C.A., Morris, D.F. & Steedman, W.C. TARGET RECOGNITION ON COMPLEX DISPLAYS. Proj. 7184, Task 71580 WADC TR 59 418, Aug. 1959, 21pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

14,610

To determine the speed and accuracy of form recognition in a search task similar to that in air-to-ground radar and infra-red sensing systems, subjects (24) were first shown a reference photograph of a target and instructed to locate that target on a display containing numerous other forms. The stimulus forms were generated by filling in, on a statistical basis, some of the cells of a 90,000-cell matrix. Variables were: 1) four degrees of distortion between reference form and target, 2) four sizes of display with proportional increase in number of irrelevant forms, and 3) the stimulus properties of the forms (single cell or group of interconnected cells). Criterion measures (search time and errors) were analyzed for effect of these variables.

14,611

Baker, C.H. THREE MINOR STUDIES OF VIGILANCE. PCC Proj. D77 94 20 42, DRML Proj. 234, Rep. 234-2, H.R. 178, April 1959, 15pp. Defence Research Medical Labs., Toronto, Ontario, Canada.

14,611

The three experiments reported were undertaken to test inferences made from an expectancy theory of vigilance. The first demonstrates the expectancy concept in a reaction time experiment. The second was undertaken to examine the hypothesis that vigilance decrement is a function of inter-signal regularity. The third investigates the way in which knowledge of results operates in a vigilance setting. An appended note presents data on the ability of human subjects to generate a series of signals characterized by temporal regularity.

14,612

Arens, Beverly E. & David, H.A. OPTIMAL SPACING IN REGRESSION ANALYSIS (PRELIMINARY REPORT). ca. 1958, 31pp. Virginia Polytechnic Institute, Blacksburg, Va.

14,612

Experimenters frequently measure a response (or dependent) variable y for a set of values of an independent variable x . In this analysis, the assumption is made that x can be measured without error but that y possibly differs from its unknown true value $f(x)$ by a random term z which may represent experimental error, individual random departure from the true law or both. Polynomial approximations to $f(x)$ provide a convenient approach to these problems. The situation in which the levels of x are at the choice of the experimenter is dealt with in terms of how the n values of x should be spaced in order to minimize the error of the approximating polynomial. Cases of negligible random error and a straight-line approximating function are considered. (See also 14,615) T. G. R 4

14,613

David Clark Co., Inc., Worcester, Mass. INTEGRATION OF PERSONAL EQUIPMENT. Contract AF 33(616) 3329, Proj. 6325, WADC TR 59 382, Aug. 1959, 28pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,613

This report covers the efforts, methods of approach, and solutions to some of the problems of integrating items of aircrew personal equipment. The major problem of integration is the combining of various individual items that have specific functions with each other without complicating these combinations beyond their effective limits. Practical solutions were achieved in some areas, but additional work is required in others.

Graham, C.H. & Haia, Y. SOME VISUAL FUNCTIONS OF A UNILATERALLY DICHROMATIC SUBJECT. Proceedings of a Symposium held at the National Physical Laboratory on Sept. 22, 24 & 25, 1957, Paper 11, 280-295. National Physical Laboratory, London, England.

14,614

This paper presents a report on the visual functions of a subject giving color blind discriminations with the left eye and normal discriminations with the right eye. Luminosity curves, flicker curves, brightness matches, color-mixture data, hue discrimination data, and binocular color matching data are presented and discussed. The implications of the findings for visual theory are indicated.

Case Institute of Technology. COMMUNICATIONS IN THE PRESENCE OF AN INTELLIGENT NOISE SOURCE. Contract AF 30/602/ 1847, WADC TR 59 68, Tech. Note 3, 1959, 9pp. Operations Research Group, Engng. Administration Dept., Case Institute of Technology, Cleveland, Ohio.

14,616

Strategies for a communicator to use during interference by an enemy jammer have been discussed in previous notes. The objective of these strategies was to enable the communicator to maximize either his average unjammed message time or his average channel capacity. This note discusses a system of coding to be used for keeping errors within reasonable bounds when the receiver and transmitter cannot know at which points in time they are communicating without interference. The suggested system is not considered to be optimal but is an improvement over mere repetition.

Parker, J.F., Jr. A REPORT ON RESEARCH CONCERNING A METHOD FOR OPTIMIZING THE EFFICIENCY OF TRAINING PROGRAMS. ANNUAL REPORT. Contract NONR 2489(00), Dec. 1958, 13pp. Psychological Research Associates, Inc., Arlington, Va.

14,617

This note describes the basic nature of a research plan that aims to determine the extent to which effectiveness of training can be increased by using instructional procedures based on the changing patterns of ability which have been found to underlie each proficiency stage of learning. A tracking task is to be used. The plan of procedure, performance measures, and the training program are outlined and discussed.

Perez, S.H. IMPLICATIONS OF RANGER TRAINING FOR
FIGHTER PREDICTION. Proj. 29560000, Comb Sel b-02,
Tech. Rep. 116, Oct. 1959, 39pp. USA Personnel Re-
search Branch, Adjutant General's Office, Washington,
D.C.

14,618
To continue current research efforts to identify men
with fighter potential, a field situation is needed in
which combat trainees can demonstrate their tactical
competence in the face of combat-like pressures. The
rigorous Ranger Training course of the US Army Infantry
School provides a close approximation to the type of
field situation desired. As a first step in translating
Ranger activities into situations where the individual's
competence might be assessed, a civilian research psy-
chologist enrolled in the eight-week Ranger training
course. On the basis of his records and observations a
preliminary blue-print of patrol-patterned situations
was drawn up and is presented herein.

Neely, K.K. & House, P.M. THE INTELLIGIBILITY OF
VERBAL SYMBOLS: II. TWO-, THREE-, AND FOUR-WORD
PHRASES OF VERBAL COLOUR SYMBOLS. PCC Proj. D77 94
40 07, DRUM Proj. 118, Rep. 118-3, March 1959, 18pp.
Defence Research Medical Labs., Toronto, Ontario,
Canada.

14,619
To evaluate the effects of adverse noise conditions
(-12 decibels signal-to-noise ratio) on the intelligi-
bility of 26 verbal color symbols used in radiotelephony,
test lists were recorded in which each word appeared
twice in each position of a two-, three-, and four-word
phrase. Trained listeners (69) responded to the record-
ed test lists by writing down the word they heard. The
data were analyzed for differences in intelligibility
among the symbols, for differences with respect to po-
sition in the phrase, and for differences due to the use
or omission of a carrier phrase.

Miller, E.F., II. EFFECT OF EXPOSURE TIME UPON THE
ABILITY TO PERCEIVE A MOVING TARGET. Proj. NM 17 01
11, Subtask 2, Rep. 2, Jan. 1959, 11pp. USN School of
Aviation Medicine, Naval Air Station, Fla.

14,620
To determine the effect of duration of observation
upon the ability to perceive a moving target, 66 naval
aviation cadets were tested on a target moving at 110
degrees/second angular velocity. Seven exposure times
were used: 200, 300, 400, 500, 600, 660, and 820 milli-
seconds; the moving targets were Landolt rings. Thresh-
old measurements were made for each exposure time by re-
ducing the size of the ring until a point was reached
when 50 percent correct judgments of the position of the
opening were made after each target excursion. Individ-
ual differences are discussed.

Creen, B.F. Jr. (Leader). PSYCHOLOGY GROUP 58
QUARTERLY PROGRESS REPORT. Contract AF 19(604) 5200,
Rep. 58 B 1, Sept. 1959, 9pp. Lincoln Lab., Massachu-
setts Institute of Technology, Lexington, Mass.

14,621
This is a report of work accomplished or in progress
on a research program in psychology. The major program
is aimed at the development of more effective means for
men to communicate with machines. Five aspects are be-
ing developed: automatic speech recognition, syllable
segmentation, speech synthesis, information processing
language, and information retrieval. Human information
processing such as auditory encoding, visual psycho-
physics, prediction of complex judgments, remembering
and rote learning are also under investigation. Sev-
eral methodological problems are discussed.

Loeb, M. & Riopelle, A.J. THE INFLUENCE OF LOUD
CONTRALATERAL STIMULATION ON THE THRESHOLD FOR
LOWER FREQUENCY TONES. Proj. 6:95 20 001, Task 01,
Rep. 404, Nov. 1959, 11pp. USA Medical Research
Lab., Fort Knox, Ky.

14,622
To measure the attenuation due to the acoustic re-
flex for sounds near threshold, two experiments were
performed using different psychophysical procedures.
In the first, subjects tracked the threshold for 100,
500, and 1000 cps tones continuously by a procedure sim-
ilar to Bekesy audiometry; in the second, thresholds
were determined by the method of limits for brief 125,
500, and 1000 cps test tones. In both experiments a
contralateral tone (100 decibel, 2000 cps or 105 deci-
bel, 2200 cps) was introduced to activate a reflex and
the resultant shift for a test tone was noted. Possible
significance of the results is discussed.

Schutz, H.G., Overbeck, R.C. & Laymon, R.S. RELA-
TIONSHIP BETWEEN FLAVOR AND PHYSICO-CHEMICAL PROPER-
TIES OF COMPOUNDS. FINAL REPORT. Contract DA19
129 QM 1141, Proj. 7 84 15 007, P 1115, Rep. 3, Oct.
1958, 40pp. USA Quartermaster Food and Container
Institute for the Armed Forces, Chicago, Ill. (Bat-
telle Memorial Institute, Columbus, Ohio).

14,623
Work is reported on the following: 1) an experiment
on adaptation and cross-adaptation in which ten subjects
rated the intensity of 30 diverse odorants (on a nine-
point scale) at supra-threshold levels for a ten-minute
period, at which time they rated a second odorant to
yield cross-adaptation information; 2) physico-chemical
data collection on the 30 odorants; 3) computation of
rank-order correlations among the physico-chemical vari-
ables, the nine factors obtained in a factor analysis of
the 30 odorants in a previous study, rate of adaptation;
and intensity; 4) a discussion and interpretation of the
results in light of current olfactory theory and recent
experimental evidence.

Karask, B.S. & Zucker, F.J. (Eds.). THE MCGILL
SYMPOSIUM ON MICROWAVE OPTICS. PART II DIFFRACTION
AND SCATTERING. AFRC TR 59 118(II), April 1959,
369pp. USAF Electronics Research Directorate, AFRC,
Bedford, Mass.

14,624
This volume presents 39 papers dealing with various
problems in diffraction theory. The objective of the
symposium at which they were presented was to make an
appraisal of the status of the field and indicate future
lines of work. Some of the major topics dealt with are:
electromagnetic theory, general techniques, the geomet-
ric optics limit, asymptotic developments, diffraction
by apertures, scattering by specific bodies, radiation
patterns by antennas, and experimental studies.

Kopra, L.L., Pedrini, D.T. & Fullington, R.W.
DAY-TO-DAY STABILITY OF THE AUDITORY THRESHOLD IN
NOISE-EXPOSED AND NON-NOISE-EXPOSED AIR FORCE
PERSONNEL. Rep. 59 83, Aug. 1959, 10pp. USAF
School of Aviation Medicine, Brooks AFB, Tex.

14,625
To investigate short-term cumulative temporary
threshold shift in noise-exposed Air Force personnel,
daily pure-tone audiometric tests were administered on
five consecutive mornings to three groups of men: 1) 27
flight-line men exposed to job noise, 2) 24 flight-line
men not exposed to job noise during the test week, and
3) 52 non-flight men. The audiometric data were ana-
lyzed for day-to-day variability and for changes occur-
ring during the test week.

Kraus, R.H. DISORIENTATION: AN EVALUATION OF THE ETIOLOGIC FACTORS. Rep. 59 90, Aug. 1959, 8pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

14,626

A brief history of the development of instrument flight and a review of the physiologic mechanisms involved in maintaining aerial orientation were presented. To investigate the hypothesis that anything requiring the pilot to divert his vision from his orienting reference could lead to disorientation, each of three pilot subjects flying in F-100F jet aircraft was required to 1) make transition from visual flight reference to instrument flight reference upon sudden lowering of the hood and 2) attempt to maintain straight and level flight with eyes closed. The time to make transition and for the plane to attain a dangerous altitude was measured. The findings are discussed in relation to disorientation accidents.

Klein, S.J., Mendelson, E.S., & Gallagher, T.J. THE EFFECTS OF HYPOXIA ON AUDITORY SENSITIVITY: II. THRESHOLD SHIFTS IN A QUIET ENVIRONMENT. Proj. TED NAM AE-5112, Rep. NAMC-ACEL-411, Nov. 1959, 15pp. USN Air Crew Equipment Lab., Naval Air Material Center, Penn.

14,627

To investigate the effect of hypoxia on auditory threshold shifts, seven male adults with normal hearing inspired a nitrogen-oxygen mixture of 9.6 per cent oxygen by volume for an average of 16 minutes. Auditory threshold shifts from the pre-hypoxic level were recorded during the reduced oxygen intake phase and for 40 minutes (ten-minute intervals) after return to normal breathing. Bone and air thresholds were determined for frequencies ranging from 226 to 4096 cps. in one octave increments in a quiet environment. Threshold shifts were analyzed as a function of frequency.

Kidd, J.S. A COMPARISON OF TWO METHODS OF CONTROLLER TRAINING IN SIMULATED AIR TRAFFIC CONTROL TASK. A STUDY IN HUMAN ENGINEERING ASPECTS OF RADAR AIR TRAFFIC CONTROL. Contract AF 33(616)-3612, Proj. 7184, Task 71583, WADC TR 58 449, Jan. 1959, 21pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Laboratory of Aviation Psychology, Ohio State University, Columbus, Ohio).

14,628

Improvement in performance in a complex task of radar air traffic control was compared for two conditions of training: 1) a constant high input load and 2) a graduated input load. Relative input load was defined as the number of aircraft under the control of a single pattern-feeder. Sixteen novice controllers were divided into two matched groups and were given ten training trials under one condition. Performances on trial ten were compared on several criteria of efficiency and safety for the two training conditions.

Helm, C.E. A MULTIDIMENSIONAL RATIO SCALING ANALYSIS OF COLOR RELATIONS. A TECHNICAL REPORT. Contract NMR-2214(00), Proj. NR 151-174, Ph.D. Dissertation, June 1959, 70pp. Dept. of Psychology, Princeton University, Princeton, N.J.

14,629

This study was designed to provide information relevant to the development of a uniform color scale and also to investigate the relations between two different multidimensional scales. Following an analysis of color models and uniform color scales and the problem of providing suitable data by multidimensional scaling procedures, a multidimensional triads ratio judgment experiment was carried out on a set of color chips using ten normal and four color defective subjects. The data were compared with those from two previous multidimensional successive intervals experiments. The findings are discussed for their relevance to the problem of scaling color relations for a uniform color scale.

Hickson, R.H., Scott, D.M., & Boyes, G.E. DETECTABILITY ON CATHODE RAY TUBE SCREENS: COMPARISON OF PPI, INSIDE-OUT PPI, AND B-SCAN UNDER NOISE AND NOISE-FREE CONDITIONS. PCC Proj. D77 94-20-22, DRML Proj. 163, Rep. 163-15, H.R. 156, June 1959, 16pp. Defence Research Medical Labs., Toronto, Ontario, Canada.

14,630

To compare target detection performance of operators on three types of displays, an experimental radar indicator (developed by the National Research Council of Canada) was used. This equipment will present any of three displays on the same CRT (cathode ray tube): 1) a normal Plan Position Indicator (PPI), 2) an 'Inside-out' PPI, and 3) a B-scan. In one experiment the scope was noise-free; in the other a background of receiver-generated noise was present. Detectability thresholds were obtained for a wide range of target locations and compared for effect of type of display, target range, and noise conditions.

14,631

Hickson, R.H. VISIBILITY ON RADAR SCREENS: THE EFFECT OF SCOPE BRIGHTNESS AND RANGE. PCC Proj. D77-94-20-22, DRML Proj. 163, Rep. 163-17, H.R. 173, June 1959, 6pp. Defence Research Medical Labs., Toronto, Ontario, Canada.

14,631

To investigate visibility thresholds for radar screens as a function of both scope brightness and range, two subjects made threshold judgments of target visibility on a 12-DPA plan position indicator cathode ray tube (CRT) for five screen brightnesses and nine ranges. Range was in tenths of the radius of a five-inch sweep-line and scope brightnesses (expressed as CRT bias voltage) were 45, 46, 47 (optimum), 48, and 49. The task was to report a target as soon as it became visible in a designated half-inch square. Mean threshold values were analyzed for effect of CRT bias, range, and test days.

Hawkes, G.R., & Warm, J.S. COMMUNICATION BY ELECTRICAL STIMULATION OF THE SKIN. I. ABSOLUTE IDENTIFICATION OF STIMULUS INTENSITY LEVEL. Proj. 6 95 20-001, Task USAMRL T-5, MEDEA, Rep. 400, Sept. 1959, 18pp. USA Medical Research Lab., Fort Knox, Ky.

14,632

The usefulness of current intensity level as a cue for signalling purposes was investigated. Four sets of stimuli of two, three, four, and five intensity levels each were selected for absolute identification. The levels selected ranged from 114 to 197 percent of the absolute threshold and were equally spaced in terms of equal subjective increments of sensation. Each of 24 subjects was tested on each stimulus series, with one series per session. The data (percent correct identifications) were analyzed for the amount of information transmitted (in bits) as a function of number of intensity levels. The results are discussed in terms of a communication system using this type of sensory input.

Gibson, Eleanor J., Gibson, J.J., Smith, O.W., & Flock, H. MOTION PARALLAX AS A DETERMINANT OF PERCEIVED DEPTH. J. exp. Psychol., July 1959, 58(1), 40-51. (Cornell University, Ithaca, N.Y.).

14,633

To investigate the common assertion that motion parallax is a cue for depth perception, the optics of differential velocities of the elements in a field of view were examined and two cases were distinguished: that of two velocities in the field and that of a gradient of velocities. Two-velocity experiments were conducted with 1) two spots and 2) two superimposed textures to carry motion; velocity difference was taken to be the essential cue to depth judgments. Reports were obtained for a large and a small velocity difference and for a motionless field. With new groups of subjects the experiment was repeated with verbal instructions about depth. The case of a flow of velocities (or flow-gradient) was also investigated.

Shearer, J.W., Peterson, D.A. & Slebodnick, E.B. TECHNIQUES FOR HUMAN FACTORS EVALUATION OF PROTOTYPE SPECIAL WEAPONS AND ASSOCIATED EQUIPMENT. Contract AF 29(601)-513, Proj. 7800, AIR 259 59 FR-198, AFSC TR 59 14, April 1959, 132pp. USAF Special Weapons Center, Kirtland AFB, N.M. (American Institute for Research, Washington, D.C.).

14,638
A method for systematic evaluation of human factors aspects of prototype special weapons equipment was developed. From available related studies and military specifications a source data, a number of human factors guides were constructed and tried out during standard weapon system evaluations. From these preliminary guides three were developed and further refined during evaluations of both bomb-type and missile warhead special missions. The final techniques include: 1) a guide to evaluation of preliminary manuals or instruction pamphlets, 2) a guide to static evaluation of equipment, and 3) an observational record form used in functional tryouts of equipment for noting operational requirements for personnel, time, and training.
I. R 4

14,639
On the basis of an exploratory study of social isolation, two hypotheses were suggested: 1) the force acting on a person in a barrier situation to reach a goal is an increasing function of the person's need for the goal; 2) the greater the relevance of this person's ideation with respect to goals, and 2) the greater within limits the magnitude of the force, the greater will be the person's estimate of the time spent in the barrier situation. These hypotheses were tested with female subjects in an experiment on "food tasting" in which deprivation of food, thinking about food, and the desire to eat corresponded to the concepts of need, relevance of ideation, and force.

14,640
The literature was surveyed for studies concerning the effects of low-frequency mechanical whole-body vibration. A few of the studies in each of the major areas--pathology and lethality, physiology, behavior, and theory and measurement--are discussed briefly. A number of the publications were selected for inclusion in a representative bibliography.

Tetley, W.H. THE CYBERNETIC THEORY OF LOGISTICS. Rep. M58 74, April 1958, 41pp. Industrial College of the Armed Forces, Washington, D.C.

14,641
The aim of this thesis is to evolve a Generalized Logistics Model and to express its parameters in terms of Information Theory. Part I deals with the basic principles necessary to construct such a model. Part II introduces the concept of an error-prone channel and discusses a Fundamental Theorem that can quite easily form the basis for a mathematical theory of logistics.

Stevens, S.S., Carton, A.S. & Shickman, G.M. A SCALE OF APPARENT INTENSITY OF ELECTRIC SHOCK. J. exp. Psychol., Oct. 1958, 56(4), 328-334. (Harvard University, Cambridge, Mass.).

14,642
By the method of magnitude estimation, subjects having no previous experience in judging electric shock made numerical estimations of the apparent intensity of an electric current applied through salt-water electrodes to the fingers of one hand. A ratio scale of subjective intensity was constructed and compared with a category scale that was determined by having subjects judge various currents on a scale from one to seven.

Sperling, P.I. BIBLIOGRAPHY OF RESEARCH REPORTS IN
PSYCHOPHYSIOLOGICAL STUDIES 1955-1958. Proj. 6 95.
20 001, MEDH MR, Rep. 359, March 1959, 15pp.
USA Medical Research Lab., Fort Knox, Ky.

14,643
The titles of research reports in psychophysiology
that have been sponsored by the U.S. Army Medical Serv-
ice are listed alphabetically by author. The period
covered is from 1955-1958. The various areas under
which the research was performed are: 1) sound and hear-
ing, 2) vision and perception, 3) complex behavioral
processes, 4) coordination and balance, and 5) somatic
influences. A subject-matter grouping of report numbers
is included.

Tolhurst, G.C. SYSTEMS TESTING: FURTHER APPROACHES
TO MICROPHONE EVALUATION. Contract N60NR 25525, ONR
Proj. NR 145 993, BuMedSurg Proj. NM 18 02 99, Subtask
1, Rep. 85, Jan. 1959, 8pp. USN School of Aviation
Medicine, Naval Air Station, Fla.

14,644
To explore procedures that might be used in evalu-
ating microphones and to set standards for evaluating
system components, two questions were investigated: 1)
Does bandwidth beyond that readily attainable contribute
to speech reception? and 2) Does restricting the dynamic
range of a system by various amounts of peak clipping
contribute to message reception? Multiple-choice tests
were recorded in noise by one voice using two different
microphones. One experimental series presented the signals
full-band and low-pass filtered in noise and quiet;
the other presented full-band recorded tests at six lev-
els of peak clipping with a plus six signal-to-ratio
white noise. There were 92 listeners.

Waldron, D.L. A PRELIMINARY STUDY OF THE EFFICIENCY
OF LIMITED FREQUENCY MONITORING AUDIOMETRY IN THE
AIR FORCE HEARING CONSERVATION PROGRAM. Rep. 59 89,
Aug. 1959, 4pp. USAF School of Aviation Medicine,
Brooks AFB, Tex.

14,646
The Rudmose audiograms of 879 aircraft and engine
maintenance men were examined in such a way as to answer
two questions: 1) The poorest threshold level of hearing
would have been identified in what percentage of this
sample if tested only at 4000 cps? and 2) What percentage
of those with a 15 decibel or higher hearing level, at
any of the frequencies from 500 through 4000 cps, would
have been picked up for more extensive testing if they
had been screened at 15 decibels for 4000 cps only? The
efficiency of using limited frequency audiometry that
employs 4000 cps as the test tone is discussed in the
light of the analyses.

Winterberg, R.P. & Channell, R.C. HUMAN FACTORS RE-
VIEW OF RADIO SET AN/GRC-50. Contract DA 36 039 SC
73253, DA Proj. 3 99 00 100, Task Order 18, July
1959, 16pp. Dunlap and Associates, Inc. Stamford,
Conn.

14,647
The AN/GRC Radio Set is reviewed in terms of the hu-
man factors involved in its operation. Possible opera-
tional difficulties are described, many of these being
associated with the present control arrangement and de-
sign. Recommendations are made for design changes that
should minimize operational problems.

Lyman, J., Groth, Hilde, Ziedman, K., Fink, Carolyn J.,
et al. STUDIES OF EFFECTIVENESS OF ELIMINATION OF DIS-
PLAYED INFORMATION WITH OBSERVER PRACTICE INCREASE.
ANNUAL SUMMARY REPORT NOVEMBER 1958- SEPTEMBER 1959.
Contract N6NR 233(49), Rep. 58 62, Oct. 1959, 15pp.
Dept. of Engineering, University of California,
Los Angeles, Calif.

14,649
This report presents a review of research accomplish-
ments during the year 1958-1959. Activities in three
categories are described: 1) Development and check-out of
an electronically controlled display and control panel
with the necessary recording apparatus for the study of
specified display variables in a perceptual-motor task;
2) Development of methodology and actual construction of
a versatile paper-and-pencil test for the evaluation of
redundancy in dial reading tasks; 3) Initial experimental
investigations and subsequent statistical evaluation of
a) probability distribution and performance effects of
additional cues in the task; and b) performance effects
of type and amount of redundancy on a simulated dial
reading task.

Westbrook, C.B. THE PILOT'S ROLE IN SPACE FLIGHT.
Proj. 1365, Task 13554, MADC TN 59 31, Feb. 1959,
16pp. USAF Flight Control Lab., Wright-Patterson
AFB, Ohio.

14,650
Man's basic capabilities as a control element—as an
actuator, sensor, computer, and as part of a complete
control system—are discussed and some conclusions drawn
as to his strong and weak points. Several factors that
contribute to a change in thinking regarding flight con-
trol in space missions are reviewed, e.g., reliability,
changed dynamic characteristics of the vehicles, and the
new control systems required. The phases of a lunar soft
landing mission are then reviewed to determine what func-
tions should or must be done automatically and what
should be done by man. Some conclusions are drawn as to
man's role in a space vehicle.

Berbert, J.H. VISUAL ACUITY AS A FUNCTION OF INTENSITY
FOR DIFFERENT HUES. Proj. NR 442 000, Task NR 442
003, NRL Prob. 503.03, NRL Rep. 5104, May 1953,
21pp. USN Research Lab., Washington, D.C.

14,651
To determine the influence of luminous intensity and
hue on the resolution of fine detail, where the fine de-
tail is two points of light matched in intensity and
chromaticity on a dark background, threshold settings
were made by two subjects. The task was to adjust one
point of light (approach or recede) to an apparent "just-
touching" position; the angular subtense at the eye was
called the threshold angular subtense. Six colors were
used: white and five others having dominant wavelengths
near 400, 500, 550, 600, and 650 millimicrons. For
each color a range of intensities was used. The data
were analyzed to find the optimum hue and intensity range
for such settings.

Bushnell, D. MAJOR ACHIEVEMENTS IN BIODYNAMICS:
ESCAPE PHYSIOLOGY AT THE AIR FORCE MISSILE DEVEL-
OPMENT CENTER HOLLAMAN AIR FORCE BASE, NEW MEXICO
1953 - 1958. 1958, 56pp. USAF Missile Development
Center, Holloman AFB, N.M.

14,652
This monograph documents the contributions of Hol-
loman's Aeromedical Field Laboratory to the understanding
of the punishing effects of windblast and the tremendous
forces of abrupt deceleration encountered during emer-
gency escape from high-mach aircraft. The application
of this experimentation to the effects of the magnitude
and relatively long duration of g-loading experienced
during sustained acceleration of multi-stage space ve-
hicles is also discussed. A final section is devoted
to conflicting views on escape: seats versus capsules.

Chorafas, D.N. OPERATIONS RESEARCH FOR INDUSTRIAL MANAGEMENT. 1958, 303pp. Reinhold Publishing Corporation, N.Y.

14,653
This book presents a detailed explanation of some of the most recently developed analytic techniques used for managerial decision-making. The first chapters include the fundamentals of experimental model making, of game theory, of business simulation methods, and of strategic gaming. The later chapters are devoted primarily to modern allocation methods: linear programming, transportation and flow, matrix analyses for production scheduling and inventory control. A case study in strategic gaming and a mathematical model for simulated industrial competition are included.

Hale, F.C. & O'Hara, J.J. AN ENGINEERING ANALYSIS OF CARGO HANDLING - X-ENERGY EXPENDITURE OF LONGSHOREMEN. Contract N00N 233(07), Rep. 59 20, June 1959, 49pp. Dept. of Engineering, University of California, Los Angeles, Calif.

14,659
To explore the energy cost and physiological cost of the longshoring task, a systems engineering study was carried out in the Los Angeles and Long Beach harbors. Energy cost was assessed by the indirect methods of oxygen consumption, heart rate, and ventilatory response; activity measurements were made by systematic work sampling techniques. The energy expenditure data obtained for a variety of longshoring task was compared with known data from other industrial tasks. The percentage of work-cycle spent working was compared with earlier studies. Correlations between the two types of data were computed. It is suggested that current work-rest relationships be reviewed in light of the findings of this study.

Held, R. & White, B. SENSORY DEPRIVATION AND VISUAL SPEED: AN ANALYSIS. Science, Oct. 1959, 130(3379), 860-861. (Brandeis University, Waltham, Mass.).

14,660
To investigate changes in judgment of visual speed as a consequence of sensory deprivation, a series of experiments was conducted. The task was to observe a black bar sweep, like the second hand of a clock, through 90 degrees from a horizontal to a vertical position at a rate of 60 degrees per second; at the vertical the bar disappeared and a judgment was required as when the hidden bar would reach a fixed marker ten degrees beyond. Performance before and after the following conditions was analyzed: 1) eight hours patternless visual stimulation; 2) one-half hour of the same; 3) randomized visual stimulation (extrinsic noise); 4) hyper-stable stimulation (exposure to a fixed pattern); and 5) dark exposure field.

Hubbard, H.H. & Maglieri, D.J. AN INVESTIGATION OF SOME PHENOMENA RELATING TO AURAL DETECTION OF AIRPLANES. Tech. Note 4337, Sept. 1958, 49pp. National Advisory Committee for Aeronautics, Washington, D.C. (Langley Aeronautical Lab., Langley Field, Va.).

14,661
An investigation was conducted to evaluate the significance of the external noise level of an airplane with regard to its detection by ground observers. Modifications were made in the propulsion system of a single-engine airplane to reduce its external noise. Conventional noise level measurements consisting of broad-band and narrow-band frequency analyses were made in static ground tests. Listening data were obtained with the aid of ground observers for cruise flights as well as take-offs, landings, and power-off glides for the modified and for an unmodified airplane.

Iseley, C.W. & Carl, J.M. CRT TARGET DETECTABILITY WITH TRANSPARENT AND OPAQUE PHOSPHORS. Proj. NA 433 003 & NE 096 600 2, NRL Prob. R05 20, NRL Rep. 5413, Oct. 1959, 7pp. USN Research Lab., Washington, D.C.

14,662
As part of a program of research on visual factors in cathode-ray tube (crt) display systems, problems arising from environmental illumination are being investigated. An investigation was made of the target detectability characteristics of a transparent and an opaque phosphor under moderate illumination conditions. A radar B-scope presentation was simulated; independent variables were crt grid bias, receiver noise, and type of phosphor; nine subjects participated in target detection tests. Detectability thresholds were analyzed for the effects of the independent variables and their interactions.

Jones, G.M. DISORIENTATION IN FLIGHT. FFRC/Memo 96, Sept. 1958, 14pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

14,663

The main sources of information about orientation, normally available to man (visual sensation and those special sensations responding to linear and angular movements) are related to problems of disorientation during flight. Attention is drawn to the unreliability of the sensing mechanisms other than the eyes during flight and evidence is given, drawn from experimental investigations, to show that even the eyes may feed misleading information to the brain. Implications for the aircraft designer are discussed.

Krendel, E.S. THE SPECTRAL DENSITY APPROACH TO A PERCEPTUAL-MOTOR TASK. Albion Electronics, 1952, 2pp. (Franklin Institute Laboratories, Philadelphia, Penn.).

14,666

To study the human operator's frequency response, a method was selected in which the spectral density of the output was compared to the spectral density of the input, using a random signal as the input on a simple compensatory tracking device. The question of linearity of the operator's response was examined by comparing the amplitude frequency response for two subjects when tracking a distribution whose mean absolute amplitude was one centimeter, and another of two centimeters. The effect of practice was examined by comparing the output when the subjects were naive and when highly trained. The effect of instructions to track for accuracy and for speed was also examined. The suitability of the method for further research is discussed.

Lawrence, M. THE EFFECT OF OVERSTIMULATION AND INTERNAL FACTORS ON THE FUNCTION OF THE INNER EAR. Contract DA 49 007 MD 634, Prog. Rep. 9, Jan. 1958, 5pp. University of Michigan, Ann Arbor, Mich. & Kresge Medical Research Building, Ann Arbor, Mich.

14,667

This paper reports progress on a research contract in which some of the phenomena known, through electrical and histological studies, to occur within the cochlea are examined by audiometric means. The ultimate goal is to establish audiometric measures that can serve as a diagnostic tool to pinpoint the cause of altered hearing. Specifically, the dynamic range, as determined by measurements of the threshold of aural harmonics, has been investigated. Also the physiology and morphology of the cochlea in the normal condition as well as under the influence of various agents, particularly loud sounds, are being studied. Six studies concerned with the above topics are reviewed briefly.

Peterson, G.M., Evans, J.L. & Weldon, R.J. ACCURACY IN CALCULATING ARITHMETICAL PROBLEMS OF VARYING COMPLEXITY. Engng. Res. Rep. SC 3896(TR), Oct. 1956, 103pp. Sandia Corporation, Albuquerque, N.M. (University of New Mexico, Albuquerque, N.M.).

14,668

To determine methods of solving arithmetical problems which would reduce the number of errors when human computers perform the work, college students in mathematics were used to test 11 different methods. These methods were of three types: partnership, worksheet, and self-check. The problems, simple to complex, involved the operations of addition, subtraction, multiplication, division, use of logarithms, single and double interpolations, and cross references to data in tables and graphs. Problems were analyzed to find all computational errors and analyzed for effect of method used, for factors contributing significantly to the scores, and for error types.

Schaefer, V.H., Ulmer, R.G., Link, H.J. & Yost, D.H. SOME BEHAVIORAL AND PHYSIOLOGICAL STUDIES IN VIBRATION. Proj. 6 95 20 001, Task USAMRL T-5, MEDEA, Rep. 389, June 1959, 31pp. USA Medical Research Lab., Fort Knox, Ky.

14,670

Four experiments designed to explore basic effects of whole-body vibration were studied. The variables studied were body weight, food intake, fecal output, water intake, urine output, open field activity, and elevated maze and straight-alley behavior. Pathological data were also obtained. Rats were used as subjects. The vibration frequency was at 25 cps; the motion was sinusoidal, and the displacement was 0.25 inch. The various experiments used varied schedules of food deprivation, vibration, and type of behavior test. The results are discussed in terms of behavioral and physiological functioning, evidence of adaptation, vibration as a stressor, and histopathological changes.

Schärf, B. LOUDNESS OF COMPLEX SOUNDS AS A FUNCTION OF THE NUMBER OF COMPONENTS. J. Acoust. Soc. Amer., June 1959, 31(6), 783-785. (Northeastern University, Boston, Mass.).

14,671

To investigate the effect on loudness of complex sounds of varying the number of components within the sound, complexes of two, three, four, and eight tones, and a band of white noise were matched in loudness to a 1500 cycle tone. The overall spacing, ΔF , between the lowest and highest components of the stimuli were held constant at either 175, 1600, or 3400 cps. With the complexes centered around a given frequency, four loudness levels were tested (25, 50, 75, and 90 decibels Sound Pressure Level). The data were analyzed as a function of the number of components. An explanation of the findings is suggested.

Stevens, S.S. ON THE VALIDITY OF THE LUMINOUS SCALE. *J. Acoust. Soc. Amer.*, July 1959, 31(7), 990-1000. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

14,673

This paper tries to answer certain objections relating to the validity of the sone scale (loudness scale). It is argued that the form of the sone scale can be verified by cross-modality matchings. Instead of working with numerical estimates of magnitudes or ratios, these new procedures allow observers to equate apparent intensity of stimuli in two different sense modalities. Results of these experiments are offered as evidence for the validity of the sone scale. An explanation of the subjective intensity function is offered.

Sutro, F.J., Ward, H.O. & Townsend, C.A. HUMAN VISUAL CAPACITIES AS A BASIS FOR THE SAFER DESIGN OF VEHICLES. FINAL REPORT. Contract AF33(616) 61 01 604, June 1958, 28pp. Medical Research Lab., CAA, Columbus, Ohio.

14,676

To complete the description of man's limits of fixation and total behavioral field of vision for a sedentary task (no body motion), final results are presented on the effects of combined movements of both head and eyes on foveal and peripheral visual fields. Both maximum and moderate extents of head and eye movement are treated, with the latter taken as 45 percent of maximum. These results are based on data in the 1958 Annual Report. The results are discussed with regard to applications. Measurements are reported on the visual occlusion due to the obstruction of the subject's own body, with effects on visual field computed. In addition, some field tests on the use of fluorescent paint to make a vehicle more conspicuous are reported.

Isabelle di Francia, G. (Supervisor). BASIC RESEARCH IN THE FIELD OF VISION. FINAL REPORT. Contract AF 33(616) 61 01 604, June 1958, 28pp. Istituto Nazionale di Fisica, Accademia-Firenze, Italy.

14,677

The general object of the research, summarized in this paper, was to investigate some specific effects of contrast and of interaction which arise due to a variation of the light stimulus with time. Three topics were studied: 1) the role of eye movements in vision, 2) the mutual interaction of the two eyes, and 3) the influence of the time variation of the luminance on fusion conditions and on electroretinal response. Practical application to light signals is discussed.

von Békésy, G. NEURAL FUNNELING ALONG THE SKIN AND BETWEEN THE INNER AND OUTER HAIR CELLS OF THE COCHLEA. *J. Acoust. Soc. Amer.*, Sept. 1959, 31(9), 1236-1249. (Harvard University, Cambridge, Mass.).

14,680

This paper attempts to show that 1) the rotating tones in hearing, 2) the rotating vibrations on the skin, 3) the difference limen for the smallest perceptible distance on the skin, and 4) Mach's law of contrast are all a consequence of the same funneling action of the nervous system. A neural funneling unit is proposed that takes into account that a local stimulus produces both an area of activity and, around it, an area of decreased activity. The funneling action between these areas of sensitivity in the cochlea was investigated. The cochlear model (described earlier) was further developed to incorporate the findings.

McIntire, R.J., Yafenc, R. & Peterson, G.W. FACTORS INFLUENCING DIAL OPERATION: II. SPECIAL-PURPOSE DIALS-SINGLE DIALS. Engng. Res. Rep. SO 3839(12), April 1956, 48pp. Smiths Commission, Albuquerque, N.M. (University of New Mexico, Albuquerque, N.M.).

14,681

To determine the relative merits of three special-purpose, double-number dials, 96 subjects were tested. Each subject first took the dial booklet test in which he read and recorded settings from photographs of the dials; then he entered a booth where he was required to set the actual dials or to check settings already made. A total of 14,400 settings and checkings were made and recorded; time to perform each operation was also recorded. Number and magnitude of errors and time scores were analyzed for differences due to dial design. Dial test booklet results were analyzed to determine whether it was an accurate predictor of dial operation. A test of the hypothesis that checking errors are inversely related to frequency with which errors are encountered was made. T. G. I. R 2 B

Anderson, E.S., Stenler, F.W., Kellough, R.F., Jr. & Rogers, E.B. AIR-BLAST STUDIES WITH ANIMALS. Subproj. 4 95 02 002 03, AFOSR 1110, OLCR 2266, July 1959, 22pp. USA Chemical Warfare Lab., Army Chemical Center, MD.

14,683

The damage to be expected in man due to the long duration blasts from bombs is not known at present. As a step in obtaining such information, a study of the extent and nature of injuries to large and small animals exposed to air blast in the large shock tube at the Ballistics Research Laboratory, Aberdeen Proving Ground, is under way. This report is of a pilot study, in which single goats, rabbits, and groups of mice were exposed in the tube under a number of conditions that varied, especially the extent of animal translation and the shock front characteristics. The feasibility of using the tube for such experimentation is discussed. T. G. I. R 6

Burgess, B.F., Jr. THE EFFECT OF TEMPERATURE ON TOLERANCE TO POSITIVE ACCELERATION. NADC WA 5936, Proj. 1M 19 01 12 1, Rep. 16, May 1959, 10pp. US Air Development Center, Johnsville, Penn.

14,684

To extend knowledge of the effect of heat on tolerance to positive acceleration and to explore the effect of environmental temperatures beyond the limit that could be compensated for by the body's normal heat regulatory mechanism, six trained centrifuge subjects received positive acceleration in a temperature range from 75 degrees to 160 degrees F. (Fahrenheit). Impairment in vision was used as the physiological end point, and changes in tolerance to acceleration was used as the criterion for determining the overall efficiency of the various mechanisms of the body in combatting the heat stress. Recordings of skin temperature, respiratory rate, heart rate, reaction time, and light error were made for all centrifuge runs. G. R 3

Birdsall, T.G. DETECTION OF A SIGNAL SPECIFIED EXACTLY WITH A NOISY STORED REFERENCE SIGNAL. Contract AF 49(638) 369, Proj. 9778, Task 37710, AFOSR TN 59 909, TR 93, Sept. 1959, 22pp. Research Institute, University of Michigan, Ann Arbor, Mich.

14,688

This report treats the optimization problem of detecting the presence of a signal in a background of white Gaussian noise under the restriction that the signal is specified exactly but the receiver memory contains only a noisy version of the signal. The optimum receiver is specified. The performances of both the optimum receiver and the cross-correlation receiver with a noisy memory are calculated and compared for a special case. While this study has implications for many fields, it is only the applications to psychophysics that are discussed here. G. I. R 3

Rehke, A.R. MILITARY ASPECTS OF UNDERWEIGHT AND OVERWEIGHT. Res. & Devel. Tech. Rep. USNRL TR 205 MS 060 G01, Dec. 1957, 56pp. USN Radiological Defense Lab., San Francisco, Calif.

14,691

This study analyzes military standards for underweight and overweight individuals. Basic research pertinent to the analysis is summarized. The concept of an organized body pattern (distortion in the healthy individual only by an accumulation of excess fat) such that constants applicable to populations can be derived from measurements on a comparatively few individuals is examined in light of available anthropometric data. Anthropometric data are compiled for both a reference military man and a woman. A weight reduction experiment on one man (age 55) is described.

Clarke, D.G. (Proj. Officer). OPTIMUM INSTRUMENT PRESENTATION AND PANEL ARRANGEMENT FOR ARMY ROTARY-WING AIRCRAFT. REPORT OF PROJECT NR AVN 457.8/59, Proj. NR AVN 457.8/59, Aug. 1959, 9pp. USA Aviation Board, Fort Rucker, Ala.

14,691

To determine the optimum panel arrangement for the "basic six" flight instruments in Army rotary-wing aircraft, aviators with varying amounts of experience flew helicopters under actual and simulated instrument conditions using various panel arrangements. Further testing and study were conducted to determine an optimum presentation for helicopter integrated instrument displays. Instrument flight was attempted from the cockpit's seat, utilizing the pilot's instruments in order to determine whether a copilot's panel is required. Recommendations are included.

Crosbie, R.J. THE REQUIREMENTS FOR MODIFICATION OF THE HUMAN CENTRIFUGE FOR HIGH PERFORMANCE AIRCRAFT AND SPACE VEHICLE SIMULATION RESEARCH. Proj. NM 11 02 12.6, Rep. 3 & Proj. TED ADC AE 1410, Rep. NADC MA 5907, July 1959, 30pp. USN Air Development Center, Johnsville, Penn.

14,692

This paper presents a proposed modification program for the human centrifuge at the Aviation Medical Acceleration Laboratory. Specifications are given concerning centrifuge improvements as a dynamic simulator for space vehicle studies such as the X-15 and Mercury Project and for g-tolerance and performance investigations. A proposed 100 g capability for the centrifuge is discussed, and an interchangeable capsule concept is explained. Also presented are the detailed requirements for the complete program along with criteria for a feasibility study of the proposed modification.

Carhart, R. & Jerger, J.F. A PREFERRED METHOD FOR CLINICAL DETERMINATION OF PURE-TONE THRESHOLDS. Rep. 59 91, Sept. 1959, 14pp. USAF School of Aviation Medicine, Brooks AFB, Tex. (Audiology Lab., Northwestern University, Evanston, Ill.).

14,693

This paper urges that clinical practices in the determination of pure-tone thresholds be standardized by using the basic features of the Hughson-Westlake technique. This technique was accepted in 1944 by the Committee on Conservation of Hearing of the American Academy of Ophthalmology and Otolaryngology. The discussion 1) gives a brief description of an improved version of the Hughson-Westlake technique, 2) reviews those features of auditory behavior that determine the suitability of this method, and 3) reports an experimental comparison between this method and two other methods.

Crook, M.M. EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS. Contract DA 49 007 MD 536, Prog. Rep. 2, Oct. 1954, 11pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,694

This is a progress report of a study of the effect of noise in electro-visual display systems upon the recognizability of certain types of visual forms. Test copy is produced by facsimile printing with controlled amounts of white noise added to the printing signal. A set of 96 silhouettes representing familiar objects has been selected and prepared for testing. Some exploratory studies are discussed and future plans detailed.

Charipper, B.A. SUBMARINE DEPTH CONTROL WITH A COMBINED PITCH-ANGLE AND PITCH-RATE INDICATOR. PS9 036, Electric Boat Tech. Rep. SPD 59 023, March 1959, 11pp. Electric Boat Div., General Dynamics Corporation, Groton, Conn.

14,697

To examine the value of pitch-rate information to submarine controllers, 18 male subjects (six in each of three experimental display conditions) were required to maintain pitch angle (Part I) and subsequently depth (Part II) of a simulated submarine. The three display conditions were: 1) pitch-angle indicator alone, 2) separate pitch-rate indicator added to the left of the pitch-angle indicator, and 3) combined pitch-rate and pitch-angle indicator. Keeping pitch-angle and depth-keeping performance were analyzed for differences due to the displays used.

Endmann, R.L. AN INVESTIGATION WITH NEUTRAL DENSITY FILTERS OF THE RELATIONSHIP BETWEEN CRT SIGNAL DETECTION AND BRIGHTNESS DISCRIMINATION. Proj. 6501, Task 95001, RADC TN 59 318, Nov. 1959, 6pp. USAF Rome Air Development Center, Griffiss AFB, N.Y.

14,700

Signal detectability on cathode ray tubes (CRT) depends primarily upon the brightness discrimination ability of the observer. Typical data on brightness discrimination indicates that this function improves continuously up to intensity values well above the maximum light output of a CRT. Yet, observations relating to voltage required for signal detection on CRT's to grid bias, which regulates light output, show a minimum value well below the bias that produces maximum light output. This report presents two previous explanations of this phenomenon and investigates the implications of one. Some special difficulties encountered when trying to apply brightness discrimination data to intensity modulated scopes are discussed.

Enoch, J.M. THE EFFECT OF THE SIZE OF THE DISPLAY ON VISUAL SEARCH. Contract AF 30(602) 1580; OSURF Proj. 696, Proj. 1763, Task 39855, MCRL Tech. Paper (696) 15 279, RADC TN 59 64, Jan. 1958, 31pp. Mapping and Charting Research Lab., Ohio State University Research Foundation, Columbus, Ohio.

14,701

A part of an over-all program investigating visual search behavior, specifically with regard to photointerpretation, the effect of the size of display on visual search habits of a group of 12 untrained observers was determined. An ordered series of experimental aerial maps of different sizes were searched for a specific critical detail; eye traces were recorded. These records were analyzed for differences in pattern and efficiency (percent of eye fixations falling within the display area) due to size. The implications of the findings for visual search techniques and aids are discussed.

14,703

Enoch, J.M. THE EFFECT OF VISUAL SEARCH OF THE DEGREE OF GENERALITY OF INSTRUCTIONS TO THE PHOTOINTERPRETER. A SUBTASK WHICH IS PART OF THE PROGRAM ON HUMAN ASPECTS OF PHOTOGRAPHIC INTERPRETATION. Contract AF 30(602) 1580, Proj. 1115, OSURF Proj. 696, Task 15001, RADC TN 58 299, MCRL TP (696) 14 270, Jan. 1958, 33pp. Mapping and Charting Research Lab., Ohio State University Research Foundation, Columbus, Ohio.

14,703

Since one of the main factors affecting a search pattern is the nature of the question given the photointerpreter, this study attempted to determine the effect of using general instructions to locate a class of objects. Three trained photointerpreters were presented a series of high quality small scale aerial photographs and given the following instructions with each: 1) Locate all recreational facilities; 2) Locate all railroad facilities; and 3) Locate all public utilities. The time limit was one minute during which eye movements were recorded and after which the subjects reported their findings. In a second part, airport symbols were searched for. The findings were compared to an earlier study having more specific instructions. T. G. I. R 8

Eiband, A.M. HUMAN TOLERANCE TO RAPIDLY APPLIED ACCELERATIONS: A SUMMARY OF THE LITERATURE. NASA Memo. 5 19 57E, June 1959, 93pp. National Aeronautics and Space Administration, Washington, D.C. (Lewis Research Center, Cleveland, Ohio).

14,704

The literature is surveyed to determine human tolerance to rapidly applied accelerations. Pertinent human and animal experiments applicable to space flight and to crash impact forces are analyzed and discussed. These data are compared and presented on the basis of a trapezoidal pulse. The effects of body-restraint and of acceleration direction, onset rate, and plateau duration on the maximum tolerable and survivable rapidly applied accelerations are shown.

Forsyth, D.M. & Brown, C.R. FLICKER CONTOURS FOR INTERMITTENT PHOTIC STIMULI OF ALTERNATING DURATION. J. opt. Soc. Amer., Aug. 1959, 49(8), 760-763. (Dept. of Psychology, Johns Hopkins University, Baltimore, Md. & USAF Operational Applications Lab., Bolling AFB, Washington, D.C.).

14,706

Flicker studies generally employ a train of light pulses consisting of a single period of stimulation repeated serially. When fusion points are measured using trains of pulses in which alternate periods were of different duration, a fusion contour can be obtained which identifies those combinations which, when alternated serially, result in a transition point between flicker and fusion. In this study, data were obtained on three flicker contours each of which identifies those combinations of two periods which, when alternated serially, have the same apparent rate of flicker. The implications of the findings for visual theory are indicated.

Grieve, D.W. & Humphries, W.J.A. A NEW HEART BEAT DETECTOR AND ITS AUXILIARY RECORDING AND TELEMETRY SYSTEMS. Rep. 67, July 1957, 16pp. Clothing & Sports Experimental Establishment, Ministry of Supply, London, England.

14,708

A heartbeat detector that will provide a useful method of detection of heartbeats (and their telemetry if required) when the subject is engaged in exercise is described. The device is electronic and employs two ECG (electrocardiograph) channels whose outputs are compared in a coincidence circuit that enables the heart signal to be discriminated from muscle interference. A new feedback device produces an audio oscillation at each beat of the heart and can be used to operate telemetry and recording systems. The applications of this device are discussed.

Garner, W.R. THE DEVELOPMENT OF CONTEXT EFFECTS IN HALF-LOUDNESS JUDGMENTS. J. exp. Psychol., Sept. 1959, 59(3), 212-219. (Johns Hopkins University, Baltimore, Md.).

14,710

To determine whether differences between subject's half-loudness judgments could be predicted and controlled by deliberate manipulation of stimuli heard in a preliminary series, 135 subjects were required to make half loudness judgments with the method of constant stimuli. Three variables were used: 1) the range of intensities of comparison stimuli in the main series of judgments, 2) the range of intensities in a preliminary series, and 3) the length of the preliminary series. The data were studied by analysis of variance techniques to determine the main sources of variance. The usefulness of this type of judgment is discussed in light of the findings.

Garner, W.R. AN ARGUMENT FOR THE USE OF DISCRIMINABILITY SCALING PROCEDURES IN SCALING SENSORY INTENSITIES. Contract NS ORI 166, Proj. NR 145 08, Task Order I, Rep. 166 I 221, reprinted from the Proceedings of the Fifteenth International Congress of Psychology, Brussels, 1957, 4pp. Johns Hopkins University, Baltimore, Md.

14,711

The thesis of this paper is that those psychological methods using the Fechnerian assumption that psychological units of magnitude or intensity can be equated with units of discriminability are more legitimate, valid, and useful for the scaling of sensory intensities than are those methods using various types of direct response on the part of an observer. To support this thesis, the author uses information derived from research in audition--primarily that of loudness scaling.

Contract DA 49 106 QM 1, DA Proj. 095 50 000, HUMRO TR 57, June 1959, 44pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,725

The effects of wearing the protective mask on individual combat skills were measured during the first hour and after five consecutive hours of masking. Performance test scores of masked soldiers were compared with their scores when tested under comparable conditions without masks. The skills tested were: driving vigilance, radio communication, target detection with unaided vision and with binoculars, firing shoulder weapons, cross-country running, and unaided voice communications. Implications for Army training practices and for combat command decision-making are discussed.

Michel, E.L. & Ewing, C.L. PHYSIOLOGICAL SIGNIFICANCE OF BREATHING PATTERN CHANGES AS A MEANS OF DETECTING HYPOXIA. A REVIEW. Proj. TED NAW AE 5112, Rep. NAWC ACEL 407, Aug. 1959, 9pp. USN Air Crew Equipment Lab., Naval Air Material Center, Penn.

14,726

A review of the pertinent literature on factors influencing breathing pattern changes was made in an effort to determine whether an oxygen-want warning system based on the "normal breathing pattern" could give physiologically significant information concerning the presence of hypoxia. An analysis of reported findings was made. Included also is a discussion of the significance and limitations of the breathing pattern affected by hypoxic stimuli.

Peters, G.A. PSYCHOLOGICAL PROBLEMS OF MAN IN SPACE FLIGHT. AN ANALYSIS OF SOME OF THE PSYCHO-SOCIAL-SEXUAL PROBLEMS WHICH MAY OCCUR IN MANED SPACE FLIGHT. Engng. Paper 916, Nov. 1959, 19pp. Equipment and Safety Research Section, Douglas Aircraft Company, Inc., El Segundo, Calif.

14,727

An analysis is presented of presently available information regarding the psychological hazards of extended space flight. Based upon the results of the analysis, attention is directed to problems of selection, training, and psychological environment of astronautic crew members. The need for research conducted to determine the relative importance of the various psychological factors and to find means to overcome or compensate for such hazards is stressed.

Prichard, A.C. EXPECTANCY EVALUATION AS AN AID TO DECISION MAKING. DA Proj. IR 3 55 GO 200, Signal Corps Task. IR 3 55 OI 201, Tech. Memo. IR M 1929, Nov. 1957, 18pp. USA Signal Engineering Labs., Fort Monmouth, N.J.

14,728

A method is described for deriving a measure of the degree of certainty with which human reactions to a given situation may be anticipated. This method of situation evaluation is intended to supply a logical and quantitative foundation upon which decisions can be based. Techniques are outlined for breaking down a complex situation into simpler aspects. Division of work into sub-tasks enables a changing situation to be analyzed continuously. The range of situations that may be evaluated by this method extends from personal to national.

Richman, M.W., Enoch, J.M. & Fry, G.A. THE EFFECT OF LIMITING THE TIME ALLOWED FOR SEARCH UPON VISUAL SEARCH PATTERNS. Contract AF 30(602) 1590, OSURF Proj. 696, Proj. 1115, Task 13001, MCRL Tech. Paper (696) 12 268, RADC TN 58 234, Jan. 1958, 29pp. Mapping and Charting Research Lab., Ohio State University Research Foundation, Columbus, Ohio.

14,729

To ascertain the effect of limiting the time allowed for search upon visual search patterns of photointerpreters, six experimental aerial maps were used, each of which contained a simulated railroad line and a target, Landolt "C," near a line. Two groups of four subjects were required to locate the target. Group I was allowed 20 seconds search time, although they were not informed of the time limit. Group II was treated identically for the first two maps; then before each of the next four maps a time limit of 12, 9, 6, and 3 seconds was posted. A record of the actual time taken to locate the target and of eye movements was analyzed for effects of these time instructions.

Reid, A.M. A COMPARATIVE TRIAL OF GOGGLES, MULTIPURPOSE, IN THE MIDDLE EAST. Rep. 76, July-Aug. 1955, 54pp. Clothing & Stores Experimental Establishment, Ministry of Supply, London, England.

14,730

To ascertain the adequacy of two different prototypes of multipurpose goggles with particular reference to dual and glare in a comparative trial with current British issue Goggles, M.T. and Eyeshields, A.T.; both objective and subjective measurements were made using 40 soldier subjects for the former and five separate units for the latter. Field trials were carried out in the Canal Zones; meteorological, dust intrusion, and airborne dust concentration data were collected. Adequacy of visual acuity and field of vision were determined, and the effect on acuity of differing transmission values of various colored lenses was assessed. Subjective information was obtained on dust and glare protection, misting, fit and comfort, and compatibility with headgear.

Schwarz, G. ON SOME NON-ORTHOGONAL FACTORIAL DESIGNS. Contract NMR 266(59), Proj. O42 205, Rep. CU 6 59, June 1959, 19pp. Columbia University, New York, N.Y.

14,731

A class of multifactorial designs are defined and analyzed in this paper. The designs considered have each a total number of observations that cannot be divided equally among cells in the design; however, by distributing the observations in a way that is in a certain sense symmetrical, the equations that determine the least squares estimates of the parameters become explicitly solvable. The case of two non-interacting factors with arbitrary numbers of levels is treated. After defining the designs, the estimates and their variances and covariances are computed. A general discussion of the symmetries and algebraic properties involved is given.

Shurrager, P.S. POLYMERIZATION OF VITREOUS HUMOR SUBSTRATE IN LIGHT AND DARK ADAPTATION. FINAL REPORT. Contract AF 19(600) 578, IIT Proj. 6062, AFOSR TR 58 161, Dec. 1958, 140pp. USAF Office of Scientific Research, Washington, D.C. (Illinois Institute of Technology, Chicago, Ill.).

14,732

This report contains data and conclusions from several phases of a six-year research project. Included are new physical and chemical properties of vitreous humor during light and dark adaptation and changes that occur throughout adaptation. Psychophysical studies of human threshold sensitivity are presented and discussed as to their relationships to the processes in the vitreous. Unique methods for obtaining these data and presenting them in terms of known quantal and energy contents are given. Inter-relationships among ERG components are analyzed and new techniques for analysis of cyclic phenomena are described. Practical applications of the findings to aviation and military operations are suggested.

Tolhurst, G.C. LISTENER RECEPTION: THE EFFECTS OF: PART I - DIOTIC AND DICHOTIC PEAK CLIPPING PART II - REINTRODUCING SELECTIVE FILTERING AT VARIOUS INTERRUPTION RATES PART III - SPECIFIED AMOUNTS OF PEAK CLIPPING. Contract N6ONR 22525, ONR Proj. NR 145 993 & Bumsburg. Proj. NM 18 02 99, Subtask 1, Rep. 82, Jan. 1959, 20pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,733

Part I. To determine the effects of various levels of peak clipping upon speech signals presented diotically and dichotically (modified signal to one ear and clear signal to the other), multiple-choice test lists were presented to panels of listeners. Part II. To study effects of modification of the speech signal upon listening, a clear recording of multiple-choice tests was high- and low-pass filtered, then interrupted at six rates. Resultant signals were then recorded upon a clear recording and played to panels of listeners. Part III. Multiple-choice test lists, peak clipped at six different levels, were responded to under conditions of quiet and plus six decibels of white noise.

Townsend, C., Fry, G.A., & Enoch, J.M. THE EFFECT OF IMAGE DEGRADATION ON VISUAL SEARCH: AERIAL HAZE. Contract AF 30(602) 1560, OSURF Proj. 696, Proj. 1155, Task 15001, MRL Tech. Paper (696) 13 269, RADC TM 58 275, Jan. 1958, 35pp. Ohio State University Research Foundation, Columbus Ohio.

14,734

The effect of general contrast reduction of photographic displays (simulating the effect of aerial haze) on visual search was investigated. Five displays (maps) were used, each of which contained similar content and map symbols; on each was a Landolt "C" at a short distance from a railroad symbol. The over-all contrast was different for each map. Four subjects were required to find the Landolt "C" near the railroad and to signal when found. The time to locate the target and a record of eye movements were analyzed for efficiency of search and pattern of search as affected by image degradation.

Wenzel, D.G. & Rutledge, C.O. THE DOSE-EFFECT AND DURATION OF ACTION OF SEVERAL CNS STIMULANTS ON MOTOR AND PSYCHOMOTOR PERFORMANCE. Contract NOKR 583(09), Dec. 1959, 25pp. School of Pharmacy, University of Kansas, Lawrence, Kan.

14,737

To evaluate central stimulants on human performance, four drugs (caffeine, d-amphetamine, methylphenidate, and phermetrazine) were studied for their effects on five relatively standard tests of performance (two types of tapping rate, two types of reaction time, and a motor pursuit task). Fifteen practice subjects were tested; each subject was tested on 13 afternoons, each time receiving a different treatment. The first test was always a control after which the drugs (dosage varied) or a placebo were administered followed by further testing. The test data were analyzed for effect of the drugs, drug dosage, and time elapsed after drug administration.

14,739

Embark, K.H. APPLICATION OF USER GUIDANCE TO EQUIPMENT DESIGN. Report from Fourth Annual Army Human Factors Engineering Conference 9-11 Sept. 1958, USA Chemical Center, Md., 4-7. USA Office of Research & Development, Washington, D.C.

14,739

The application of user guidance to all stages in the design and development of equipment for the Army is discussed. The problem of how such guidance should be given is discussed and some measures proposed for solving this problem.

14,740

Herbert, M.J. DECREMENTS IN DRIVING SKILL AS A FUNCTION OF CUMULATIVE ENVIRONMENTAL STRESSES. Report from Fourth Annual Army Human Factors Engineering Conference 9-11 Sept. 1958, USA Chemical Center, Md., 13-15. USA Office of Research & Development, Washington, D.C. (USA Medical Research Lab., Fort Knox, Ky.).

14,740

This paper describes a research program, underway at Fort Knox, on complex psychomotor functions. The rationale for the program is discussed in terms of the mobility aspects of modern warfare and the corresponding demands upon the soldier. Initial efforts are being directed to the problems of skill-fatigue in vehicle driving and the identification of basic skills underlying the driving task. Test instruments are being designed which will be sensitive to various motor skill patterns and the stressfulness of several environmental factors is being measured.

14,741

Quedry, F.E. VESTIBULAR FUNCTIONS IN ANGULAR ACCELERATION. Report from Fourth Annual Army Human Factors Engineering Conference 9-11 Sept. 1958, USA Chemical Center, Md., 15-26. USA Office of Research & Development, Washington, D.C. (USA Medical Research Lab., Fort Knox, Ky.).

14,741

A program of research in vestibular functions during angular acceleration is described. Part of the current work is devoted specifically to the study of phenomena that occur when a person moves his head with respect to the axis of rotation of a turntable. All variables considered to be relevant--angular velocity, angular acceleration and deceleration, time factors, direction, position of head, visual orientation, etc.--are being investigated. Completed work dealing with the theoretical control of vestibular reactions by the vestibular end-organ are discussed. Some data are presented.

Timberlake, T.G. HUMAN ENGINEERING IN CORPS OF ENGINEERS EQUIPMENT DESIGN. Report from Fourth Annual Army Human Factors Engineering Conference 9-11 Sept. 1958, USA Chemical Center, Md., 47-54. USA Office of Research & Development, Washington, D.C. (USA Engineer Research and Development Lab., Fort Belvoir, Va.).

14,742

This paper discusses informally some of the human engineering aspects of the work done in the Army Engineer Research and Development. Since most of their equipment is commercially available, emphasis has been placed on maintenance studies. One area where the human factors have been stressed is the design of equipment for Arctic operation. A program being conducted to develop a family of air-transportable construction equipment for use in assault-type operations is discussed in terms of the human factors involved.

Withington, V. POSITIONAL AND STEERING ERRORS IN HARBOR NAVIGATION. Contract NMR 609(02), NR 238'001; LMP-640-7, Tech. Memo. 41, June 1957, 7pp. Laboratory of Marine Physics, Yale University, New Haven, Conn.

14,744

This paper examines the requirements for an all-weather navigation system for surface vessels in harbors and harbor-approach areas which would permit the use of the present precise steering potential of such vessels. Present errors of navigation under the most adverse conditions are analyzed in terms of instrumental errors, combined instrumental and dead-reckoning errors, precise track delineation, and steering and the time factor. Some of the essentials for the desired system, as indicated by the analysis, are discussed.

Lefler, J.H. FIXED-WING INSTRUMENT PRESENTATION. FINAL REPORT OF TEST PROJECT NR-AVN 1557. Proj. 1557, Dec. 1958, 47pp. USA Aviation Board, Fort Rucker, Ala.

14,745

To determine the optimum attitude and navigation instrument and/or instrument system presentation for use in Army fixed-wing aircraft, instrument-qualified aviators, with more than average amounts of instrument experience, flew under instrument conditions, using various panel arrangements. Existing attitude and navigation instruments as well as integrated instrument systems (Collins Integrated Flight Systems FD-103C and FD-105, and Sperry Integrated Instrument System) were evaluated. An optimum panel arrangement of flight instruments is recommended for standard Army airplanes.

USAF Air Research & Development Command Headquarters. HUMAN ENGINEERING ARDC TECHNICAL PROGRAM PLANNING DOCUMENT FOR THE FISCAL YEAR 1959 OPERATING PROGRAM. ASTIA AF TFPD 57 780E, Aug. 1957, 61pp. USAF Air Research & Development Command Headquarters, Baltimore, Md.

14,746

This document supersedes the Technical Program Planning Document entitled "Human Engineering" dated August 1956. Section I treats the military problem in this area as one of determining man's capabilities and limitations and to apply this knowledge to the design of weapons systems. Section II attempts to evaluate present capabilities and limitations in accomplishing this aim with the discussion organized around equipments or operations in which the basic tasks of the operator are similar. Section III points to several possibilities for gaining more information of human behavior characteristics. Technical requirements are given in Section IV.

14,747

USAF Air Research & Development Command Headquarters. PERSONNEL AND TRAINING ARDC TECHNICAL PROGRAM PLANNING DOCUMENT FOR THE FISCAL YEAR 1959 OPERATING PROGRAM. ASTIA AF TFPD 57 780G, Aug. 1957, 73pp. USAF Air Research & Development Command Headquarters, Baltimore, Md.

14,747

This document revalidates and brings up to date Technical Program Planning Document on "Air Force Personnel and Air Force Training," dated August 1956. The major sections are 1) the military problem, 2) evaluation of present capability and limitations, 3) technical possibilities, and 4) technical requirements.

Schock, G.J.D. A STUDY OF ANIMAL REFLEXES DURING EXPOSURE TO SUBGRAVITY AND WEIGHTLESSNESS. Proj. 7851, Task 78501, AFMDC TN 59-12, June 1959, 15pp. USAF Aeromedical Field Lab., Holloman AFB, N.M.

14,748

Several experiments were conducted to study the role of the vestibular apparatus during states of sub-gravity and weightlessness. A number of cats were used in which either the vestibular portions of the VIII cranial nerves were sectioned bilaterally or the vestibular cortical area of the brain had been removed surgically two months before testing. A comparison of the labyrinthine and postural reflex behaviors of these animals and unoperated cats during periods of weightlessness were observed during aircraft flights where this condition was achieved.

Runyon, R., Gordon, N.B. & Chajet, G. RELATIVE MOTION TRAINING (A PRELIMINARY ANALYSIS). NAVTRADEVEN Proj. 20R21, Tech. Rep. NAVTRADEVEN 20 RM 1 1M, Sept. 1958, 16pp. USN Training Device Center, Port Washington, N.Y.

14,755

This report examines the performance of a variety of perceptual-motor skills in relative motion situations and evaluates the potential of appropriate training systems. The various types of motion situations studied are those in which vehicles are involved in 1) independent motion, 2) collision courses, 3) pursuit courses, and 4) fixed positional relationships. The types of problems that exist for the operator are clarified; hypotheses concerning the types of skills and/or knowledge involved in responding appropriately are formulated; cues used in the "inside-out" (apparent) orientation are differentiated from those used in the "outside-in" (real) orientations; some of the mathematical relationships are expressed; and some training problems likely to be encountered are discussed. Mann, H. (Proj. Engr.). REQUIREMENTS FOR FORMATION LIGHTS ON HIGH PERFORMANCE CARRIER AIRCRAFT. FINAL REPORT. Proj. TED PTR AE 8025, ET311 248, Rep. 1, June 1959, 12pp. USN Air Test Center, Naval Air Station, Md.

14,757

To establish formation light requirements on high performance carrier-based aircraft, flight evaluation of the existing formation lights on the F11F-1 and F3H-2 airplanes was made. Rheostats were installed in the tail position and in each of the wing position formation light circuits; the pilots of these craft were instructed to vary the rheostat settings in accordance with instructions from various wingmen flying in formation with them. Records were made of the settings that gave good distance and attitude cues without glare. Two settings, one for good visibility and one for poor visibility conditions, were established. Recommendations are made pertaining to the number, locations, dimensions, colors, and intensities of lights. I.

Lawrence, M. THE EFFECT OF OVERSTIMULATION AND INTERNAL FACTORS OF THE FUNCTION OF THE INNER EAR. Contract DA 49 007N MO 634, Prog. Rep. 10, Jan. 1959, 12pp. Physiological Acoustics Lab., University of Michigan, Ann Arbor, Mich.

14,759

This bulletin reports research in progress in the general area of the causes of deafness. During the year 1958 one of the projects was the study of the effects of overstimulation and internal factors on the inner ear. The technique used, recording of the electrical potentials arising from the inner ear when stimulated by sound, has been studied extensively. A series of experiments on functional changes in inner ear deafness is reported. A histological study of the development of sensory-cell innervation in the inner ear and three studies dealing with the relation between the middle and inner ear are among the seven studies described. A list of all reports from 1955 to 1959 is appended.

Crock, M.N. EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS. Contract DA 49 007 MO 536, Prog. Rep. 1 (Quarterly Prog. Rep.), July 1954, 14pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,767

Exploratory work was done to map out conditions for systematic testing of the effect of noise on the recognition of familiar visual forms against an unstructured background. About 80 silhouette forms representing familiar objects were reproduced by facsimile printing with a supplementary noise circuit. Copy were produced by this method under various degrees of random noise, the signal/noise ratio being expressed in decibels. Recognition scores for the noisy test forms were obtained from a small group of subjects. These results are to be analyzed with respect to a number of variables that might be important for further experiments.

Creer, B.V., Stewart, J.D., Merrick, R.B. & Drinkwater, F.J. III. A PILOT OPINION STUDY OF LATERAL CONTROL REQUIREMENTS FOR FIGHTER-TYPE AIRCRAFT. NASA Memo. 1 29 59A, March 1959, 44pp. National Aeronautics and Space Administration, Washington, D.C.

14,769

As part of a program of research on airplane handling qualities, a pilot opinion study was made of the roll performance of fighter-type aircraft flying in their combat speed range. Both a stationary and a moving flight simulator were used, and the results were supplemented by tests in actual flight. The subjects were seasoned test pilots with engineering education and combat air veterans. Each subject was required to rate the roll performance of a given airplane or a given airplane simulation on a numerical rating scale. The data were analyzed in terms of a hypothesis that pilot opinion of lateral controllability would correlate with a roll damping and an aileron power parameter written as roll acceleration.

Goodson, J.E. & Miller, J.W. DYNAMIC VISUAL ACUITY IN AN APPLIED SETTING. Contract NMR 586(00), Proj. NR 142 023 & Bumsburg. Proj. NM-17 01 99, Subtask 2, Rep. 16, May 1959, 13pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,770

To determine the relationships between performance in the laboratory and in the air with regard to the visual pursuit of moving targets, 15 subjects were tested under both conditions. The air trials required the subject to view the ground target (two Landolt "C's") as the plane moved at angular velocities of 20, 69, and 90 degrees per second, and to indicate the position of the opening in each "C". Twelve target sizes were used to obtain threshold values at each velocity. A series of thresholds were then determined in the laboratory for one and for two targets. Threshold data were analyzed for effects of air versus laboratory conditions and for one versus two targets.

Gardner, R.A. PERCEPTION OF RELATIVE FREQUENCY AS A FUNCTION OF THE NUMBER OF RESPONSE CATEGORIES. USAMRIID Proj. 6X95 25 001 02, Rep. 408, Dec. 1959, 10pp. USA Medical Research Lab., Fort Knox, Ky.

14,771

To study decision behavior in an uncertain situation where the only basis for choice was the perceived relative frequency of events in a series, the number of response categories was increased independently of the number of categories of events. The extra choices were dummies in that no hits could be obtained by choosing them. The subject (384 subjects) was instructed to predict the event (letter of alphabet) that he expected (letter was projected on screen after prediction) by inserting his response plug into the jack under the letter of his choice on a response panel. The relative frequency of choices for the most frequent events was analyzed in relation to the number of response categories. Rate of extinction of dummy choices was studied.

Hale, H.B. HUMAN CARDIOACCELERATIVE RESPONSES TO HYPOXIA IN COMBINATION WITH HEAT. Rep. 60 14, Sept. 1959, 13pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

14,772

The effects of high ambient temperature on heart rate responses to moderate reductions in oxygen pressure were determined in healthy male subjects. Four experiments were performed: 1) decompression in a heated chamber (49 degrees C) from ground level to 18,000 foot pressure level with total time at reduced pressure of 15 minutes; 2) hypoxia induced by use of an oxygen-nitrogen mixture to an equivalent pressure of 18,000 feet slightly later than heat; 3) hypoxia (equivalent of 14,000 feet) imposed simultaneously with heat by the preceding method for 15-minute periods; 4) same as (3) but with a 45-minute period. The data (heart rate, skin and rectal temperatures, and ventilation) were analyzed for effects of hypoxia combined with heat.

Department of Civil Aviation. PILOTS NOTES ON THE PRECISION VISUAL GLIDE PATH (P.V.G.). DCA Publ. 37, Aug. 1958, 6pp. Department of Civil Aviation, Melbourne, Australia.

14,773

The Precision Visual Glidepath (PVG) is a visual approach aid, for use in visual meteorological conditions, which gives visual guidance in relation to an approach path defined by two bars of lights. The arrangement of lights recommended for runways is described and a representation of PVG as seen by the pilot on final approaches is presented. Following directions for the method of use by the pilot is a summary of pilot notes.

Brown, W.L., Carr, R.M. & Overall, J.E. THE EFFECT OF WHOLE-BODY RADIATION UPON ASSOCIATION OF PERIPHERAL CUES. Rep. 58 47, March 1958, 4pp. USAF School of Aviation Medicine, Randolph AFB, Tex. (University of Texas, Austin, Tex.).

14,774

To test the hypothesis that chronic irradiated monkeys differ from normal monkeys in the degree of association of peripherally placed cues, object-quality stimuli were presented as discrimination problems to three treatment groups: non-irradiated, low-dose irradiated, and high-dose irradiated. The subjects were assigned randomly to three groups: 1) two successive discrimination problems each day for five days; 2) same except that the positive and negative stimuli of the second pair were presented six inches behind the positive and negative pair of the other during training; and 3) same as (2) except that the significance of the stimuli was reversed. Trials to criterion and each problem were averaged and studied by analysis of variance techniques.

Bishop, E.W., Abbott, W.C. & Bowen, H.W. A METHODOLOGY FOR THE EVALUATION OF GROUND SURVEILLANCE RADARS. FINAL REPORT. SC Contract DA 36 039 SC 73253, Proj. 3 99 00 100, Task Order 02, June 1955, 46pp. Dunlap and Associates, Inc., Stamford, Conn.

14,775

An evaluation program for ground surveillance radars is developed in this report. The general basis for evaluation is discussed. A typical radar system is used to develop an illustrative test program. Special attention is given to human factors.

14,776

Bell Helicopter Corporation. ADVANCES OF HELICOPTER VTOL - STOL PORTION OF AMIP ARMY-NAVY INSTRUMENTATION PROGRAM. Contract NDIR 1670 (00), Bell Doc. D228 100 002, Aug. 1959, 36pp. Electronics Department, Bell Helicopter Corporation, Fort Worth, Tex.

14,776

This brochure discusses in non-technical language the salient advances that have been made in the Helicopter VTOL-STOL portion of the Army-Navy Instrumentation Program (AMIP). A general AMIP organization, philosophy, and information flow chart is presented for general orientation to the program. Advances in the following are then discussed: human engineering; information sensing and processing; sensing objects and air velocity; fundamental sensing, computing, display, amplifying, displaying, and mechanisms amplifying; test and evaluation; simulation and research helicopters; and the future.

14,777

Cumming, R.W., Lane, J.C. & Baxter, J.R. INSTALLATION NOTES ON THE PRECISION VISUAL GLIDE PATH (P.V.G.). ARL Hum. Engng. Note 3, July 1959, 17pp. Aeronautical Research Labs. Australian Defence Scientific Service, Melbourne, Australia.

14,777

The Precision Visual Glidepath is an approach aid for use in moderate to good visibility which gives visual guidance in relation to an approach plane defined by two bars of lights on the ground. This note is mainly concerned with the design features of the aid and its installation, and in particular, shows how it might be set up in "difficult" locations.

Glover, M. & Glover, P. THE VALIDATION OF PRESENTING
CONCEPTS FOR PERSONNEL AND TRAINING REQUIREMENTS: A CASE
STUDY. Contract NMR 2241 (30), Aug. 1959, 37pp.
Armstrong Institute for Research, Pittsburgh, Penn.

14,780
The feasibility of predicting future personnel and
training requirements for new weapons systems was evalu-
ated. Statements concerning requirements that had been
made five years previously on the basis of a prototype
system were checked against a final model of the system
now in operational use. Statements were obtained from
three areas (knowledge of operation, operational main-
tenance, and trouble shooting), and items drawn from
task analysis, proficiency test material, and equipment
casualty analyses were rated with respect to their cur-
rent applicability by a group of ten experts who were
working with the operational missile. The ratings
were analyzed for reliability.

Faulkner, J.P. & Briggs, G.E. DEVELOPMENT OF SYSTEMS
RESEARCH AND DESIGN METHODOLOGY. QUARTERLY REPORT.
Contract AF 33(616) 6166, Proj. 7134 & AF Proj. 894,
Rep. 894 2, Oct. 1959, 13pp. Ohio State University
Research Foundation, Columbus, Ohio.

14,781
This report describes progress made for the period
July through September 1959 on the various systems ex-
periments underway. These experiments deal primarily
with Air Traffic Control with several exploratory exper-
iments on suitable methodology for modeling decision
making in systems environment. Technical support studies
have had two foci: the investigation of factors in visual
perception, and of factors to be considered in studying
information processing and decision making by teams of
individuals. Titles of reports completed are listed.

Fenichel, R.L. & Kydd, G.M. A STUDY OF THE EFFECTS OF
POSITIVE ACCELERATION UPON ERYTHROCYTE HYDRATION IN
HUMAN SUBJECTS. Suedberg, Proj. AM 19 02 12 2, Rep. 1,
& Rep. NAC 5904, May 1959, 11pp. USAF Aviation
Medical Acceleration Lab., Naval Air Development Center,
Penn.

14,782
Human subjects were employed to study the effects of
positive acceleration upon erythrocyte hydration. Ve-
nous blood samples were obtained just before the accel-
eration series was begun, after the third centrifuge
run (2.5 g), and immediately after the last run (5.5 g).
Acceleration exposure began at 1.5 g level and increased
at 1/2 g increments with five minutes between runs, and
was terminated upon the subject's loss of peripheral
lights (about 5.5 g average for the unprotected subject).
Index values of Mean Corpuscular Volume, Mean Corpuscu-
lar Hemoglobin, and Mean Corpuscular Hemoglobin Concen-
tration were determined and analyzed.

Fried, C. A STUDY ON THE EFFECTS OF CONTINUOUS
WAVE JAMMING ON THE DETECTION OF ANTIAIRCRAFT OPERA-
TIONS CENTER SYMBOLS. OCO Proj. TBI 1000, Tech. Memo.
9 59, Sept. 1959, 27pp. USA Ordnance Human Engineering
Lab., Aberdeen Proving Ground, Md.

14,783
To investigate the effect of electronic interference
or jamming on the detectability of four symbols (Circle,
Cross, Half Circle, and Cross-Within-Circle), considered
for adoption as Antiaircraft Operations Center Symbols,
the shapes were shown to the subjects under three condi-
tions of continuous wave jamming. Shape diameters re-
mained constant. The task was to scan all quadrants of
the display scope and report the number of hostile tar-
gets in each quadrant. Scanning time and number of er-
rors were recorded and analyzed for each symbol as a
function of noise level.

Carr, W.J. SELF-DIRECTING DEVICES: A REVIEW OF
CURRENT CONCEPTS. Contract AF 33(616) 6224, Proj.
1775, Task 7715, NAC 59 02, Aug. 1959, 27pp.
NAF Aerospace Medical Lab., Wright-Patterson AFB,
Ohio. (Orlando University, Leesburg, Penn.).

14,784
A selective review of the literature on self-di-
recting devices is presented with emphasis on those
studies that provide for a functional analysis of the
devices. Three major classes of variables that influ-
ence the effectiveness of learning by such devices are
discussed: characteristics of the device, of the pro-
gram, and of the learner. Major attention is devoted to
an analysis of the process of programming. Discussion
is focused on a number of variables that might affect
the effectiveness of the programming. A working model
is presented, based upon the process of conditioning.

CONTROL OF SHIVERING: A SHIVERING SUPPRESSOR MECHANISM
OF THE BRAIN STEM. Contract AF 33(616) 6224, Proj.
22 1301 0009, Rep. 1, June 1954, 25pp. USAF Institute
Aeronautical Lab., Lang AFB, Alaska. (University of
California, Los Angeles, Calif. & Long Beach Veterans
Administration Hospital, Long Beach, Calif.).

14,785
To determine the anatomical localization of a shi-
vering suppressor region in the hypothalamus of cats,
the Horsley-Clarke stereotaxic apparatus was used to
hold the animal. Bipolar electrodes were used for stimu-
lation. Action potentials were recorded to detect
shivering or cessation of shivering along with visual
observation. Fifty to 60 points in the hypothalamus
were stimulated for each experimental animal. The loca-
tion of these points were determined by microscopic exami-
nation of the brain after the animal had been killed.
The data were used to map the anatomical region from
which the suppressor effect can be evoked and to locate
the most sensitive region.

Kahn, A. & Cornog, D.Y. SPACING OF ON-OFF CONTROLS.
Human Factors Data Bull. 39, June 1959, 4p.
Air Arm Division, Westinghouse Electric Corporation,
Baltimore, Md.

14,788
This bulletin presents the results of two studies on
the spacing of various types of ON-OFF switches on con-
trol panels. In the studies, each subject was required
to move his right hand from a centrally located rest
position to a switch and throw it as quickly as possible
without touching or moving adjacent switches. Tables
are included that give the characteristics of each
switch, the mean and standard deviation of ten measure-
ments of the tangential force (ounces) required to oper-
ate the switch, and a comparison of the toggle switches
used here with push-button data. The percentage of
"touching" error as a function of type of switch, dis-
tance between, and direction of throw is shown.

Kahn, A. & Kozmin, A.L. THE EFFECT OF THE NUMBER OF CHARACTERISTICS OF DISPLAYED ERROR ON TRACKING PERFORMANCE. Human Factors Data Bull. 41, Aug. 1959, 3pp. Air Arm Division, Washington Electric Corporation, Baltimore, Md.

14,790

To determine if sufficient control accuracy, which meets systems accuracy, can be achieved when the error signal is presented to the operator in discrete steps (as in a digital computer), subjects were required to track two functions that were combinations of sine waves of varying frequency. Five types of display error were used: 1) direction of error only, 2) error direction plus three indications of magnitude, 3) error direction plus six indications of magnitude, and 4) error direction and continuous magnitude. The results are shown graphically in terms of mean tracking error for the different types of error display. Implications for use of the digital display are discussed.

Johnson, R.W., Barker, G., Hamilton, D., Hankness, Helen, et al. DIFFERENTIAL PREDICTION WITH INCOMPLETE CRITERION DATA. Contract MGR 477(06), Public Health Research Grant M 743(03), Aug. 1959, 91pp. University of Washington, Seattle, Wash.

14,792

This study concerns the prediction of multiple criteria when there are incomplete criterion data. Such circumstances frequently occur in contexts such as the statistical prediction of college grades, where not every student takes one or more courses in each academic area. It is shown that the appropriate criterion is the conditional event, "success given that individual i participates in criterion activity j ," and that a "method of subgroups" can appropriately be used. This method is described and its disadvantages in computational labor discussed. Two short-cut methods are described and an empirical study made to ascertain whether these methods provide acceptable predictions.

Hawkes, G.R. & Warm, J.S. COMMUNICATION BY ELECTRICAL STIMULATION OF THE SKIN: III. MAXIMUM I. FOR ABSOLUTE IDENTIFICATION OF CURRENT INTENSITY LEVEL. USAMRL Proj. 6X95 25 001 05, Rep. 410, Sept. 1959, 13pp. USA Medical Research Lab., Fort Knox, Ky.

14,793

To determine the amount of information transmitted (I_t) by absolute identification of current intensity level under "ideal conditions", ten subjects were stimulated with electric current on the pad of the index finger and required to identify the current intensity level of the stimulus. One group was informed of the accuracy of their judgments; the other was not. Four sets of stimuli at four different intensity levels were selected on the basis of preliminary data. Current values ranged from 113 to 295 percent of the Absolute threshold and were always less than tolerance level. The data were analyzed for effect of extension of physical range of stimulus intensities and knowledge of results.

McNair, D.T. & Krendel, E.S. THE HUMAN OPERATOR AS A SECOND SYSTEM ELEMENT. J. Franklin Inst., May & June 1959, 267(5 & 6), 1-49. (Franklin Institute Laboratories, Philadelphia, Penn.).

14,795

The role of human elements in certain closed loop control systems is considered. The analytic basis for measurements of human dynamics is presented in terms of the use of a quasi-linear mathematical model for the human operator—its describing function and remnant. Steady state describing functions measured by various experimenters in the field are discussed and the adaptive, optimizing behavior of the human operator is demonstrated. The remnants are also discussed and plausible sources for their origin postulated. The use of such knowledge by the systems designer is discussed.

Loeb, M. & Rispelle, A.J. THE INFLUENCE OF INTENSE CONTRALATERAL STIMULATION ON THE LOUDNESS OF A LOW FREQUENCY TONE. USAMRI Proj. 6X95 25 001 01, Rep. 409, Sept. 1959, 11pp. USA Medical Research Lab. Fort Knox, Ky.

14,793

A hypothesis was developed on the basis of previous experiments that the acoustic reflex, once aroused, acts in such a way that it provides considerable attenuation for loud tones and little or none for fainter ones. To test this hypothesis a 2200 cps tone, loud enough to activate the acoustic reflex, was introduced to the left ear just before and overlapping that of a 500 cps test tone in the right ear. A comparison tone was then introduced and subjects asked to evaluate the relative loudness of the test and comparison tones. Subsequently the comparison tone was varied in intensity and adjusted by the subject to apparent equality with the test tone (varied from 70 to 105 decibels). The results are discussed in relation to the hypothesis.

14,803

McFarland, R.A. HUMAN AND ENVIRONMENTAL FACTORS OF AUTOMOBILE SAFETY. SAE Transactions, 1956, 64, 625-654. (Harvard School of Public Health, Boston, Mass.).

14,803

This paper points to the multiple causation in most automobile accidents, thus attempts at control should involve consideration of the interaction among the driver, his equipment, and the environment. Of first importance are the basic physical, physiological, and psychological characteristics of the driver but these facts must be associated with specific aspects of the other two in order to understand, and so prevent, accidents. Studies relating to various aspects of this concept are reviewed and the need for carefully controlled experimental studies, epidemiological surveys, and statistical analysis is stressed.

14,804

McFarland, R.A. HUMAN FACTORS IN HIGHWAY TRANSPORT SAFETY. SAE Transactions, 1956, 64, 731-750. (Harvard School of Public Health, Boston, Mass.).

14,804

This paper is primarily an extensive review of two broad research programs in highway safety and of human factors in vehicular accidents. After showing that highway accidents are a major problem to the nation and that most accidents have multiple causes, it is argued that a successful approach to accident prevention requires consideration of the relationships and interactions between the driver, his equipment, and his environment. The types of research needed are discussed and illustrative findings were cited from various studies, such as driver activity analysis, application of anthropometric data to vehicle design, design of instruments and controls, crash injury research, and environmental factors.

McGrath, J.E. & Nordlie, P.G. RESEARCH METHODOLOGY OF REQUIREMENT-SETTING STUDIES. Contract NOKR 2525 (00), Rep. 3, HSR RM 59/23 SM, Nov. 1959, 33pp. Human Sciences Research, Inc., Arlington, Va.

14,807

This report is one of a series of studies on system research methodology. The results of a review of the methods employed in some 50 system studies aimed at establishing various types of requirements for complex man-machine systems are presented. The review is focused on the applicability of available methods for establishing human performance requirements for complex, future weapon systems. Included are description and discussion of steps for conducting requirements studies, and a bibliography of the system studies covered in the review.

McGrath, J.E., Nordlie, P.G. & Vaughan, W.S., Jr. A SYSTEMATIC FRAMEWORK FOR COMPARISON OF SYSTEM RESEARCH METHODS. Contract NOKR 2525 (00), Rep. 1, HSR TM 59/7 SM, Nov. 1959, 63pp. Human Sciences Research, Inc., Arlington, Va.

14,808

This is the first report of a research program aimed at synthesis of system research methodology. The purposes of the research are discussed. Certain basic methodological concepts are presented which provide a basis for systematic description and analysis of the system research process. These concepts are developed into a framework for classification and comparison of methods used to accomplish different portions of a total system research problem. A selected list of studies and methodological reports that most influenced the concepts presented in this study is included.

Robinson, J.E., Jr. HUMAN ENGINEERING TESTS OF SELECTED AIRCRAFT ANTI-COLLISION LIGHT SYSTEMS. Contract NOAS 57 541 C & NOAS 59 6008, July 1959, 194pp. Applied Psychology Corporation, Arlington, Va.

14,809

This report describes a human engineering investigation and evaluation of aircraft exterior light systems to determine their relative value as warning and direction-indicating devices. Both ground and flight tests were used with procedures designed to yield quantitative data relevant to the human factors involved. Fifteen observers participated in the tests; ground test problems totaled 5184 and flight test problems totaled 925. Conspicuity was quantified from search time measurements, and direction-indicating capabilities from directional response time and accuracy. The findings are discussed in relation to urgent research problems in this area.

Steinkamp, G.R., Hawkins, W.R., Hasty, G.T., Burwell, R.R., et al. HUMAN EXPERIMENTATION IN THE SPACE CABIN SIMULATOR. DEVELOPMENT OF LIFE SUPPORT SYSTEMS AND RESULTS OF INITIAL SEVEN-DAY FLIGHTS. Rep. 59 101, Aug. 1959, 86pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

14,810

The first of a series of reports on seven-day simulated space flights being conducted to determine the biomedical requirements for manned space flights is described. The small space cabin simulator and its involvement is described; the protocol of experimental design is discussed; and pre-testing and post-testing methods are presented. Results of a study of five subjects committed to seven-day periods in this small cabin and on a four to four work-rest schedule are shown and discussed from the standpoint of the physiologic, psychophysiology, and nutritional implications.

Robinson, J.P. LINEAR PROGRAMMING AS A TOOL FOR SYSTEM RESEARCH. Contract NOKR 2525 (00), Rep. 8, HSR RM 59/28 SM, Nov. 1959, 16pp. Human Sciences Research, Inc., Arlington, Va.

14,813

The major features of linear programming, one important class of analysis techniques, are summarized and ways in which these methods can be utilized in systems research are treated. The treatment focuses on the kinds of problems to which linear programming methods can be applied, the conditions necessary for their application, and the kinds of solutions which they can provide. Mathematical basis and computational procedures are treated only when essential to exposition.

Hopkin, V.D. PREFERRED LOAD AND POSITION FOR A HOOD JETTISON HANDLE. FPRC 992, April 1959, 4pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

14,816

To find the preferred position of a firing handle for jettisoning the canopy of an aircraft and to investigate various aspects of the loads for restraining the handle, 15 male subjects were tested. The task was to pull a D-shaped handle through various lengths (zero to nine inches) to activate a firing mechanism. The variables, in addition to length of pull, were load (35 to 105 pounds), position of handle relative to body, and direction of pull. Preferences of the subjects were analyzed and recommendations made. T.

Jackson, R.O., Swanseen, H.W., May, W., Lach, W.J., et al. THE AIR TRAFFIC CONTROL PROBLEM AS IT EXISTS IN THE LAKENHEATH (ENGLAND) MILITARY CONTROL AREA. Contract AF 19(604) 2272, AFRC TR 59 120(II), Air Traffic Series 2, Nov. 1958, 418pp. Tasker Instruments Corporation, North Hollywood, Calif.

14,817

This report was a thorough system analysis of the air traffic control operation at a military control area in order to define the problems, its phases, and related factors. The facilities were described and rules, procedures, patterns and approach/holding fixes were evaluated. The accuracy and reliability of air traffic control data functions and equipment were investigated. T. G. I. R 100

14,818

Jackson, R.O., Swanseen, H.W., May, W., Lach, W.J., et al. THE AIR TRAFFIC CONTROL PROBLEM AS IT EXISTS IN THE OLATHE (KANSAS) CONTROL AREA. Contract AF19(604) 2272, AFRC TR 59 120(III), Air Traffic Series 3, Nov. 1958, 400pp. Tasker Instruments Corporation, North Hollywood, Calif.

14,818

This volume reports a detailed study of the air traffic control problem as it exists in the Olathe Control Area. The Air Traffic Control facilities were described, and procedures, patterns, air route structure and reporting/holding fixes were evaluated. Climatological data were given; standard operating procedures were itemized; performance characteristics of aircraft operating in the area, and nature of the air movements were analyzed. It was intended that the report would aid systems designers and operations analysts in optimizing systems operation. T. G. I. R 92

Guignard, J.C. THE PHYSICAL RESPONSE OF SEATED MEN TO LOW-FREQUENCY VERTICAL VIBRATION: SOME PRELIMINARY STUDIES. FPRC 1062, April 1959, 10pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

14,819

To investigate human response to whole-body vibration within a limited band of vibration frequency, vertical sinusoidal vibration was applied to ten male subjects in a standardized sitting position, at frequencies from seven to 60 cps. and accelerations up to one g. Transmissibility, which was defined in the experiments as the ratio of the peak vibration acceleration recorded at the part of the body concerned to that recorded from the reference accelerometer, was measured at the hip and shoulder. Subjective reactions were also noted. Observations were made on the effect of tensing of the body, of discomfort, speech effects, vision, and maintenance of posture. T. G. I. R 27

Bullard, R.W. THE GASEOUS ENVIRONMENT AND TEMPERATURE REGULATION. JUNE 1, 1958 - FEBRUARY 1, 1959. Contract DA 49 007 MD 947, March 1959, 43pp. Indiana University School of Medicine, Indianapolis, Ind.

14,822

To study the effects of oxygen deficiency and carbon dioxide excess upon responses involved in mammalian temperature regulation, a series of experiments was conducted. Nude men were exposed to five degrees C ambient temperature for 70-minute periods. At selected times the subjects breathed air rich in carbon dioxide or low in oxygen for 10, 20, or 30-minute periods. Shivering responses, metabolism and body temperatures were recorded and analyzed in relation to the change in gaseous environment. Rats and ground squirrels were exposed to a greater degree of oxygen deficiency in an altitude chamber. Characteristics of the cooling curve/are discussed and the physiological mechanisms involved are described. T. G. R 27

Burke, R.O. A PRELIMINARY EVALUATION OF THE LINK VISUAL LANDING SYSTEM MARK IV. M.S. Thesis, Jan. 1959, 141pp. University of Wyoming, Laramie, Wyo.

14,823

To evaluate a jet transition simulator utilizing the Link Visual Landing System Mark IV, the attitudes of a group of pilots undergoing a transition training course in which this device is used and their opinions as to its effectiveness were investigated. Questionnaires, listing those normal and emergency procedures which were possible to present in the simulator, were given to 41 trainees and 22 staff training personnel. The instructions were to indicate the items he thought most beneficial and also those least beneficial. These ratings were analyzed by frequency tabulations as well as a percentage score. Several chapters of the report are devoted to discussions of flight training devices in general, a description of the visual landing system, and development of simulator training programs. T. I. Crook, M.N. & Gray, Florence E. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: FORM COMPLEXITY AND RECOGNITION. Contract DA 49 007 MD 536, Interim Rep. 9, Jan. 1959, 5pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,825

The relation between complexity of irregular geometrical forms and ability to classify the forms as having been seen or not seen in a preliminary familiarization routine was investigated. Complexity was measured in terms of the number of sides (4, 8, 12, 16, 20). Ten subjects were tested individually by being shown 40 forms, singly for ten seconds, and then attempting to identify those 40 forms on a test sheet containing 200 forms. Results were expressed as number (or percent) of judgments correct. G.

Crook, M.N. PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS. Contract DA 49 007 MD 536, Interim Rep. 4, March 1956, 3pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,826

Progress since the Annual Report of October 1955 is summarized, including further analyses of data from two experiments on irregular forms, an experiment in progress designed to provide both time and error scores on the effect of natural versus unnatural brightness relation between figure and ground, work on a technique for producing irregular forms with curved contours, and preparations for subsequent steps in the program.

14,827

Cope, F.W. PROBLEMS IN HUMAN VIBRATION ENGINEERING. Proj. 131 18 01 12.4, Rep. 2, NALC MA 5902, March 1959, 14pp. USN Aviation Medical Acceleration Lab., Naval Air Development Center, Penn.

14,827

The effects of whole body vibration on the human operator of vehicles and methods of prevention are discussed in this paper. The first section is devoted to the ways in which vibration is transmitted from vehicle to man and to methods of preventing such transmission. That portion of the vibration which reaches the man can cause a variety of anatomical, physiological, and performance changes which are discussed in the second section. Finally, an effort is made to relate experimental findings to practical problems. Some practical methods and equipment for vibration protection are described. G. I. R 19

Crook, M.N. & Weisz, A. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS. A PRELIMINARY EXPERIMENT. Contract DA 49 007 MD 536, Interim Rep. 1, Dec. 1954, 8pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,828

A preliminary experiment is described which served the double purpose of testing a technique for producing simulated noise in visual displays and of classifying a group of familiar forms in terms of relative recognizability. The simulated noise technique is described in some detail. G. I.

14,829

Crook, M.N., Bishop, H.P., Gray, Florence E., Hanson, J.A., et al. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: IRREGULAR FORMS VIEWED AGAINST PLAIN AND COMPLEX BACKGROUNDS IN FACSIMILE COPY. Contract DA 49 007 MD 536, Interim Rep. 5, Sept. 1956, 14pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,829

A method for generating unfamiliar forms which are quantitative enough to modify in describable steps was presented in some detail. Two experiments using such forms and their modifications were carried out. The first served mainly to explore several different aspects of the problem of recognition of irregular forms. Form modification, signal/noise ratio, and polygon category were varied. In the second, complex backgrounds were added but the number of items in the other categories was reduced. Results were discussed in terms of the various dimensions. G. I.

14,830

Crook, M.N. & Jaffe, J. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: DIRECTION OF CONTRAST AS A FACTOR IN THE RECOGNITION OF FAMILIAR FORMS. Contract DA 49 007 MD 536, Interim Rep. 5, Oct. 1956, 10pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,830

To investigate the effect of natural versus unnatural brightness contrast directions on the recognizability of familiar forms under noise, 12 male students had to recognize each of 24 such forms (12 light, 12 dark) of three classes of difficulty presented in both contrast directions under each of four or five noise levels. After 12 practice trials on forms not used in the experiment, the subject was shown the eight forms of each difficulty group under each noise level, most severe level first. Recognition time was analyzed as a function of noise level and contrast direction.

Crook, M.N., Gray, Florence E., Hanson, J.A. & Weisz, A. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: A SET OF IRREGULAR FORMS. Contract DA 49 007 MD 536, Interim Rep. 10, Jan. 1959, 15pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,831

This report describes a general method of constructing irregular forms by two different techniques. In addition, necessary subsidiary rules are enumerated. The forms themselves are of two broad types--those bounded by straight lines, those bounded by curved and straight lines. For each type sets were constructed with 4, 8, 12, 16, and 20 sides. Each original form was modified in four progressive steps. All forms in these sets are illustrated.

Geoghegan, E., Sargent, F., II & Sayer, Joyce. NUTRITIONAL OBSERVATIONS IN H.M.S. WAVE. RNP-59/954, CES 443, NP 9, March 1958, 39pp. Climatic Efficiency Sub-Committee, NSC, London, England.

14,832

To assess the effect of a cold environment on nutrition, an investigation was conducted on 55 members of the crew of H.M.S. WAVE. Five weeks were spent in a temperate climate (44 degrees to 49 degrees F) and six weeks in the Arctic (34 degrees to 41 degrees F). For 13 weeks records were maintained of food consumption and body weight. Venous blood and timed specimens of urine were collected before the cruise and after six weeks in the Arctic. The data were analyzed and discussed with reference to 1) caloric intake and exposure to cold, 2) cold exposure and metabolism of ascorbic acid, and 3) nutritional requirements in cold climates.

14,833

Edwards, W. SUBJECTIVE PROBABILITY IN DECISION THEORIES. Rep. 2144 361 T, March 1959, 21pp. Willow Run Labs., University of Michigan, Ann Arbor, Mich.

14,833

This report is concerned with theories which explain choices among risky alternative courses of action by means of the concept of utility, or subjective value, and subjective probability. The mathematical implications of subjective rather than objective probabilities are examined. It is concluded that the traditional form of the theory is more restrictive than has hitherto been supposed and is consequently inconsistent with existing data. A more flexible form of the theory is developed, and an experiment to test its validity is outlined.

DeBois, P.H. & Gold, D. SOME REQUIREMENTS FOR QUANTITATIVE METHODS IN BEHAVIORAL SCIENCE RESEARCH. AFOSR TN 58 1104, ca. 1958, 41pp. Washington University, St. Louis, Mo.

14,834

Some requirements for quantitative methods of analysis in behavioral research are discussed in relation to the order of measurement which characterizes the data. A technique is developed for dealing with three (or more) categorical variables which will provide some of the kinds of answers obtainable when one or more of the variables involve interval measurement. Two primary problems of interest to the behavioral scientist when dealing with interval data are discussed: 1) the development of means of identifying unitary variables manifested in diverse acts of behavior by groups of individuals, and 2) the application of factor analytic techniques in the determination of the basic variables underlying a set of observed variables.

Crook, M.N. & Coules, J. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: FAMILIARITY AND RECOGNITION OF IRREGULAR FORMS. Contract DA 49 007 MD 536, Interim Rep. 8, Jan. 1959, 14pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,835

To investigate the effects of varieties of experience with irregular (unfamiliar) forms on the familiarization process and of degree of familiarity as a factor in the recognition of forms in degraded copy, a series of five experiments were conducted. Irregular geometric test forms constructed by a randomization method were used throughout; three sets were used for familiarization and one for recognition. Several sorting techniques and one reproduction technique were used with different frequencies for familiarization with a final familiarity rating and, in some cases, recognition under noise being obtained.

14,836

Crook, M.N. & Coules, J. THE EFFECT OF NOISE ON THE PERCEPTION OF FORMS IN ELECTRO-VISUAL DISPLAY SYSTEMS: REDUCED CONTRAST AND CONTOUR DEGRADATION AS FACTORS IN IMPAIRMENT OF FORM RECOGNITION. Contract DA 49 007 MD 536, Interim Rep. 7, Jan. 1959, 7pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

14,836

To investigate the differential effect of reduced contrast and contour degradation on form recognition in noisy copy, test sheets of Landolt rings were prepared in three sizes. These sheets were reproduced at various noise levels (contour degradation) and printing current ranges (contrasts). The subject's task was to judge the position of the gap in each ring. Results were expressed as mean percentages of items correct at the several combinations of noise level, printing current range, and ring size. A small-scale check test was made using "familiar" forms (silhouettes of known objects).

Gogel, W.C. THE PERCEPTION OF SPACE WITH BINOCULAR DISPARITY CUES. Proj. 6 95 20 001, Task USAFRL T 2, MEDEA, Rep. 379, April 1959, 24pp. USA Medical Research Lab., Fort Knox, Ky.

14,837

This paper summarizes an approach to the understanding of the perception of space when the depth component is supported only by binocular cues. This theoretical approach emphasizes the perceptual interrelation of frontal and depth extents. Equations expressing the application of this position have been developed for the perception of the depth resulting from a binocular disparity and for perception of three-dimensional shape. Experimental data relating to these equations are reviewed. Implications of this approach are discussed with regard to the perceptual consequences of base and optical magnification.

Gaito, J. HUMAN ENGINEERING INVESTIGATIONS OF AIRCRAFT COCKPIT VISUAL DISPLAYS. PART 20. THE RELATIONSHIP BETWEEN PHYSICAL AND APPARENT BRIGHTNESS FOR THREE DEGREES OF INSTRUMENT BACKGROUND HETEROGENEITY. Proj. TED NAM AE 7047, Rep. NAMC ACEL 388, March 1959, 9pp. USN Air-Crew Equipment Lab., NAMC, Philadelphia, Penn.

14,841

To investigate the relationship between physical and apparent brightness as a function of degree of background heterogeneity, three experiments were conducted using the method of average error. Background heterogeneity was provided by arranging nine airspeed indicators in a three-by-three matrix on a black panel which was angled 25 degrees from vertical so that the center-most dial face was normal to the direct line of vision. In experiments (1) and (2), the subject equated each instrument singly with the center one and voltage was recorded. Then he equated each instrument with every other one when the lights for the nine instruments were on. In the last experiment, brightness readings rather than voltages were made.

Miller, E.F., II. THE ELIMINATION OF HEADACHE, NAUSEA, AND DIZZINESS, REPORTED BY A STUDENT PILOT DURING INSTRUMENT FLIGHT STAGE BY MEANS OF REMEDIAL VISUAL TRAINING. A CASE STUDY. PART I. TRAINING PERIOD. PART II. ONE YEAR LATER. Spec. Rep. 57 29, Nov. 1957, 16pp. USN School of Aviation Medicine, Naval Air Station, Fla.

14,848

This case study describes a remedial visual training program for a student pilot who had frequent occurrences of dizziness, nausea and intense headache while flying on instruments. Three types of training were employed: tachistoscopic viewing of 4-, 5-, 6-, and 7-digit numbers; practice in maintaining fusion under diplopic conditions; and duction tests with Risley prisms. Before this training, measurements of lateral and vertical phorias, muscle balance, and ductions were made. These were compared with the same measurements taken during training.

Mendelson, E.S. A SENSITIVE METHOD FOR REGISTRATION OF HUMAN INTRATYMPANIC MUSCLE REFLEXES. Proj. NM 13 01 13.3, Rep. NAMC-ACEL 368, Feb. 1958, 4pp. USN Air Crew Equipment Lab., Naval Air Material Center, Penn. (Reprinted from J. appl. Physiol., Nov. 1957, 11(3), 499-502).

14,849

By tympanometry, the intratympanic muscle reflexes of 25 subjects were measured for tones of 400-8000 cps at levels of 80-115 db. Each tone was presented several times. Latency, size and direction of pressure were observed. The primary aim of this report was to detail the method of recording.

Reese, W.G. & Dykman, R.A. ORIENTING BEHAVIOR AS A (POSSIBLE) DIAGNOSTIC TEST OF (1) CEREBRAL PATHOLOGY AND (2) EMOTIONAL STABILITY. ARMY PROGRESS REPORT. Contract DA 49 007 MD 746, Jan. 1958, 33pp. Psychiatry Dept., Medical Center, University of Arkansas, Little Rock, Ark.

14,850

The response of a healthy organism to even mild, simple stimuli (lights, tones, breezes, etc.) was called here the orienting response (OR). The preliminary findings from a research study of OR in medical students and in psychiatric and neurological patients were reported. The Ss were presented with a series of auditory signals of conversational intensity and recordings made of heart rate, respiration, skin resistance, and muscle potentials. The student data were used to study 1) adaptation, 2) effect of psychological states such as anxiety and monotony, and 3) various methods of quantifying autonomic data. The patient data will be used to evaluate the diagnostic possibilities of OR.

14,851

Theoretical studies were conducted in the field of reliability and probabilistic networks. The concept of h(p) functions is discussed; the Shannon-Moore expansion theorem is proved and an extension of it given; an additional theorem on necessary conditions for realizability of h(p) functions is presented; some formulae concerning the interrelationships of coefficients of reliability functions for series, parallel and composition of networks have been developed; computation of these coefficients is also included.

14,852

A model is developed which may yield improved analysis and prediction of the effectiveness of man-machine systems. It incorporates considerations of intra- and inter-individual differences, individual stress tolerance, effect of stress upon response time and decision making time. Thus, it reasonably agrees with currently accepted thinking regarding human behavior. The model was applied to the pilot's task of landing an F4D aircraft on a carrier. The predictions are presented and evaluated.

Sparke, J.W. METHODS OF INDICATING A GLIDE PATH BY VISUAL MEANS. U.D.C. 656 713 985 661, Tech. Note EL 160, Dec. 1958, 28pp. Royal Aircraft Establishment, Farnborough, Hants, England.

14,853

The main requirements for an effective visual glide path indicator system are defined. The information which it would be required to transmit is discussed in some detail along with ways of coding the visual signals. Recent developments in such systems are described, e.g. three-colour sector light system, double bar ground aid, and one is proposed as meeting the requirements most satisfactorily.

Stone, P.T. & Corkindale, K.G. SOME FACTORS AFFECTING THE EFFICIENCY OF VISION AT NIGHT. Rep. 88, Oct. 1957, 19pp. Clothing & Stores Experimental Establishment, Ministry of Supply, London, England.

14,855

This summary of dark adaptation phenomena gathered from the literature brings together factors which must be considered for maintaining optimum night vision. The physiological mechanisms of adaptation are first reviewed. The characteristics of the stimulus situation, e.g., intensity and wavelength of previous light, retinal location; and of the individual, e.g., oxygen, age, alcohol, which influence light sensitivity are outlined and briefly discussed. Recommendations allowing for optimum night visual performance are presented.

Stevens, S.S. ADAPTATION LEVEL VS. THE RELATIVITY OF JUDGMENT. *Amer. J. Psychol.*, Dec. 1958, **LXXI**, 633-646. (Harvard University, Cambridge, Mass.).

14,857

This paper distinguishes between the processes, sensory adaptation and judgmental relativity, and suggests that the theory of "adaptation-level" tends not to keep them separate. In particular, certain questionable assumptions in this quantified theory are indicated, and an attempt is made to show that it is not a good model of the judgmental process. In addition, this theory was shown not to fit the results of category-scaling. The author then proposes the theory of judgmental relativity and its two classes of psychological continua.

Zegers, R.T. PHOTSENSITIZATION IN RELATION TO MEAN AND STANDARD DEVIATION VALUES. *Psychol. Monographs*, 1959, **73**(11), 1-25, No. 481. (Fordham University, New York, N.Y.).

14,861

The research described was undertaken to determine whether the human eye undergoes a process of photosensitization when it operates at low levels of illumination. Seven related topics are treated. Part 1 deals with the photopic luminosity curves of four subjects demonstrating the normalcy of their color vision. Part 2 reports the data obtained from the investigation of photosensitization (differential threshold for foveal vision at low background levels). The next five parts treat the investigation of the variability of the standard deviation 1) with wavelength, 2) under fixed conditions of field size and method at a few wavelengths, and 3) with field size. Quantum estimates of the mean values of these data are presented.

Glaser, E.M. & McCance, R.A. COMPARISON OF HYOSCINE HYDROBROMIDE WITH SOME NEWER PREVENTATIVES FOR MOTION SICKNESS. *RMP* 59/551, SS 91, Feb. 1959, 6pp. Survival-at Sea Sub-Committee, RMPRC, London, England.

14,864

A controlled experiment was carried out with Army volunteers, using naval life-rafts and artificial waves, to compare the merits of various motion-sickness remedies (hyoscine hydrobromide, cyclizine hydrochloride, meclizine hydrochloride, and perphenazine). The motion was fairly severe and lasted for one hour. Each subject (72 in all) received each of six treatments (no drug and no-lactose dummy, lactose dummy, and each of the above drugs) at 48-hour intervals. Incidence of vomiting or retching was recorded by observers, and other symptoms were reported by the subjects on questionnaires within ten minutes of the end of each test. The data were analyzed for the treatment producing the fewest symptoms of motion sickness.

14,867

The problem of insuring ready recall of a large body of in-flight job information by Air Force pilots was explored. The effectiveness of a voluntary self-tutoring approach using one type of "game appeal" device was investigated. Two matched groups of pilots were pre-tested on their knowledge of instrument flying information. The device was installed in the crew lounge of one of the groups but not in the other. After a two-month period both groups were tested again. Performance of the two groups was compared. Factors pertinent to the interpretation of the results and implications for further research were discussed.

14,871

To determine whether any deafness of flight deck men had resulted from current flying operations (jet aircraft) on the aircraft carriers, 224 aircraft-carrier personnel were tested by pure tone audiometry after an average of three weeks' rest from aircraft noise. The hearing of 131 shore-based men was tested in establishing a control group. Each ear was examined clinically and a questionnaire completed in preparation for the audiometric tests which were made at eight frequencies (from 0.25 to 8 kilocycles per second). All hearing losses from causes other than aircraft-noise exposure were excluded, and the remaining subjects grouped in three grades of increasing noise exposure. These data were then compared with the control group for assessment of hearing loss due to aircraft-noise exposure. T. G. R 58

14,873

This study was concerned with the investigation of several aspects of statistical decision theory. Five general hypotheses concerning the ability of human subjects to perceive the underlying statistical structure of sequential events were tested. These hypotheses were derived from a pilot study and from the theory of statistical decision functions. The performance of two randomly assigned groups of 25 subjects each was compared on a questionnaire and two specially constructed sequences containing two discrete events. A mathematical criterion of accuracy was utilized for purposes of evaluation of performance. The implications of the findings for theories of decision making are discussed.

14,870

To investigate the problem of narcosis induced in divers breathing compressed air, a series of experiments on human and animal subjects were conducted. Electroencephalograms were recorded on men and on animals at various simulated depths (up to 300 feet of sea water) in a pressure chamber, together with psychological tests (multiplication tests, cross-out tests) to ascertain the degree of narcosis induced. Similar experiments involved the breathing of isonarcotic concentrations of nitrous oxide and of helium. Comparisons of electrical activity, of objective signs of mental impairment, and of subjective impressions of narcosis, were made between records taken at the surface with those at the simulated depths.

Beidler, L.M. THE PHYSIOLOGICAL BASIS OF TASTE PSYCHOPHYSICS. From the Second Symposium on Physiological Psychology, March 19-21, 1958, 1-11. USN Physiological Psychology Branch, ONR, Washington, D.C. (Florida State University, Tallahassee, Fla.).

14,876

A theory of the mechanism of taste receptor stimulation has been previously developed in detail and accounts for much of the quantitative data obtained from electrophysiological investigations of the taste responses of many different species of animals. This theory has now been applied to certain psychophysical properties of human taste sensations. Data concerning consecutive just noticeable differences (j.n.d.'s) of sodium chloride, saccharin, and sucrose have been used in the application of the basic taste equation. The results of the experimental data and predictions from theory are discussed in detail. The relation between this approach and that taken by Fechner and Stevens is discussed.

Geldard, F.A. DEVELOPMENTS IN VIBRATORY COMMUNICATIONS. From the Second Symposium on Physiological Psychology, March 19-21, 1958, 33-39. USN Physiological Psychology Branch, ONR, Washington, D.C. (University of Virginia, Charlottesville, Va.).

14,878

Three lines of recent progress in a vibratory research program are reported: 1) the systematic measurement of frequency discrimination (Δf), over its useful frequency range, for mechanical vibrations; 2) the exploration of an important "derived" dimension of vibration—envelope shape or "attack"; and 3) identification of the crucial stimulus variable determining the shape of the frequency function for alternating current electrical stimulation of the skin. The bearing of all three on the more general problem of cutaneous communication is discussed, as is also the status of several stimulus dimensions which are, as yet, unexplored experimentally.

Stevens, J.C. & Stevens, S.S. THE GROWTH OF SUBJECTIVE MAGNITUDE WITH STIMULUS INTENSITY. Presented at: Second Symposium on Physiological Psychology, USN School of Aviation Medicine, Pensacola, Florida, March 19-21, 1958, 41-49. USN Physiological Psychology Branch, ONR, Washington, D.C. (Harvard University, Cambridge, Mass.).

14,879

For a large class of perceptual continua, subjective magnitude grows as a power function of the physical level of the stimulus. This relation has been demonstrated by two methods: 1) magnitude estimation under which the observer assigns numbers proportional to the apparent magnitude of various stimuli; and 2) ratio production, under which observers set one stimulus to some prescribed apparent fraction or multiple of another stimulus. The continua apparently governed in this manner are discussed with appropriate supporting data and the exponents of the functions are presented. The validity of the methods and functions is further discussed.

Notterman, J.M. SOME PRELIMINARY PSYCHOPHYSICAL DATA CONCERNING TIME-VARIANT STIMULI. From the Second Symposium on Physiological Psychology, March 19-21, 1958, 51-55. USN Physiological Psychology Branch, ONR, Washington, D.C. (Princeton University, Princeton, N.J.).

14,890

The research program, within which the present study was made, is an attempt to effect a closer relationship between behavior theory and servo system theory. The reported study is of interest in a servo system context because the continuous closed-loop model requires knowledge of the detecting characteristics of human organisms for inputs using combinations of initial stimulus magnitude plus the first and second time-derivatives of this magnitude. Whether the organism discriminates the derivatives or the time integral of these derivatives over an interval of time is being investigated. Preliminary data for judgments of loudness increase are presented for the first two subjects run. Details of the experimental conditions are given.

Riggs, L.A. VISUAL EFFECTS OF MINIMAL EYE MOVEMENTS. From the Second Symposium on Physiological Psychology, March 19-21, 1958, 123-135. USN Physiological Psychology Branch, ONR, Washington, D.C. (Brown University, Providence, R.I.).

14,883

The experiments reported are concerned with the eye movements that occur in spite of the attempt of the subject to fixate as steadily as possible on a stationary target. A contact lens that rests firmly on the limbus of the cornea is used to support a plane mirror whose surface is normal to the visual axis. Light reflected from the mirror is used to trace out the motions of the eye on a moving photographic film. The resulting records of eye movement reveal the minimal extent of motions of the retinal image under normal viewing conditions.

Gleason, J.J. RESEARCH ON THE VISUAL PERCEPTION OF MOTION AND CHANGE. From the Second Symposium on Physiological Psychology, March 19-22, 1958, 125-171. *USAF Physiological Psychology Branch*, CMR, Washington, D.C. (Cornell University, Ithaca, N.Y.).

14,886

A series of experiments on visual perception of motion and change over the past five years are discussed. A reformation of the problem of motion sensitivity and a number of tentative conclusions, based on these data, are discussed. Instead of having to do with the perception of "motion" in the abstract, the conclusions apply equally to the perception of objects, and of the rigidity, slant, shape, size, and distance of objects and surfaces. It is suggested that rather than perception of "motion", perception of change-of environmental events as given to the eye by transformations of the optical pattern-is basically that it is also one aspect of the sensory control of behavior by feedback stimulation. 14,891

The master-slave manipulator is now widely used as a general purpose tool for remote handling. Heretofore, common practice has been for the worker engaged in remote handling to stand while working. However, it is probable that under some circumstances in the future (in a space vehicle situation) the operator may be required to work while in a sitting position. A study was conducted to determine the extent of limitations upon the inherent work range of the master-slave manipulator (G1 Model 8) when the operator is seated. Contours of effective performance areas in five horizontal planes were determined. G. I. R 4

Chernikoff, R., Drey, J.W. & Taylor, F.V. TWO-DIMENSIONAL TRACKING WITH IDENTICAL AND DIFFERENT CONTROL DYNAMICS IN EACH COORDINATE. IRL Prob. Y02 11, Proj. DA 550 010, Order AE 7047, IRL Rep. 5424, Nov. 1959, 6pp. *USAF Research Lab.*, Washington, D.C.

14,894

In many complex tracking devices the control dynamics may differ in the various coordinates. This requires the operator to supply a different transfer function in each tracking dimension. The purpose of this investigation was to determine the effect upon tracking produced by using various pairings of position, rate, and acceleration control dynamics in the X and Y coordinates of a two-dimensional tracking system. Performance scores for six subjects, who were given trials under all conditions, were analyzed for the conditions of minimum error. The findings are interpreted in terms of the limitations of the information-handling capacity of human operators. T. G. I. R 2

Duffy, C.W., Brown, W.F., Smith, G.H. & Highmaster, W.J. THE DEVELOPMENT OF JOB DESCRIPTIONS FOR SOME ARMY BATTERY OFFICERS. Tech. Rep. 44, April 1959, 78pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,896

This study is the first stage of a research project designed to determine the level of skill and knowledge required of officers assigned to ICS-ADK (surface to air missiles) batteries so that courses of instruction can be scientifically devised to train officers for their required duties. Information was obtained from experienced officers through checklist responses indicating the importance of and training needs associated with activities drawn from a job description. This report contains final (job descriptions for five officers and training need check lists. The use of this material for establishing training courses is discussed.

Davis, R.C., Carafello, L. & Kohn, K. CHANGING ACTIVITY WITH GASTROINTESTINAL ACTIVITY. J. Comp. Physiol., Aug. 1959, 22(4), 464-473. (Indiana University, Bloomington, Ind.).

14,896

A series of experiments are reported in which the effects of food, rest, visual stimulation, and a gastric balloon on activity recorded from the abdomen by external electrodes were investigated. In some of the experiments simultaneous recordings of electrical activity and recordings from the gastric balloon were made and compared. Subject reports of stomach contractions were also obtained and plotted for correspondence with the other records. The results were compared to studies in the literature on "hunger pangs" and some possible errors in methodology were noted.

Davis, R.C. SOMATIC ACTIVITY UNDER REDUCED STIMULATION. J. Comp. Physiol., June 1959, 22(3), 305-314. (Indiana University, Bloomington, Ind.).

14,897

To determine the condition of somatic variables under low levels of stimulation, two groups of subjects were studied. One group lay on a cot in a dark, soundproofed room for about 40 minutes; the other group was given five minutes of rest followed by continuous moderate light and sound. Recordings were made of muscle potentials from three locations, of circulatory and of respiratory variables. The changes in these records over the period in the two groups were compared. To account for the pattern observed in the reduced stimulus group a hypothesis of increased sensitization or "anticipation" is proposed.

Jay, J.M. & Chastkoff, R. THE USE OF QUICKENING IN ONE COORDINATE OF A TWO-DIMENSIONAL TRACKING SYSTEM. Tech. Rep. 44, April 1959, 78pp. Human Resources Research Office, George Washington University, Washington, D.C.

14,899

In a previous study (14,896) it was found that tracking error in one coordinate of a two-dimensional tracking system was affected by the dynamics used in the other coordinate. This study sought to determine how the introduction of quickening into one coordinate of a second-order, two-coordinate tracking system would affect performance in the unquicken coordinate. Eight subjects performed the tracking task under each of eight conditions: each of the dynamics, acceleration and quickened acceleration, was tracked separately in each coordinate for both one- and two-coordinate conditions. Tracking errors were analyzed for the effect of system dynamics.

Foster, T.M. HUMAN FACTORS IN HIGHWAY DESIGN, OPERATION AND SAFETY PROBLEMS. Aug. 1959, 12pp. Highway Traffic Safety Center, Michigan State University, East Lansing, Mich.

14,901

Human engineering factors in the design and operation of highways are discussed with regard to their contribution to improvement of traffic efficiency and safety. Experimental studies of the way in which driver perception, judgement, and response time can be affected by highway design factors are reviewed. Problems of traffic flow and experimental data relating to the factors involved are presented. The use of mathematical models and simulation in the study of traffic flow are discussed. Examples are given of other human factors data already available or obtainable through specialized studies that suggest ways of obtaining more efficient driver-vehicle-highway-and-environment interrelationships.

Finch, D.M., Charlton, J.M. & Davidson, H.F. THE EFFECT OF SPECULAR REFLECTION ON VISIBILITY. Ca. 1757, 39pp. University of California, Berkeley, Calif.

14,902

The physical characteristics of a task and the distribution of flux from a lighting system as they affect the visibility of an object were evaluated quantitatively in two separate studies. In both studies, samples of handwriting in pencil and of printed ink material were used as tasks. Physical measurements using a micro-photometer were made in one study and a visibility meter was used in a series of field studies. Results of both sets of measurements were expressed in terms of loss of contrast due to specular reflections within the task, and therefore decrease in visibility. The concept of directional reflectance of materials and brightness factors are discussed.

Murphy, K., Chalk, Y. & Goto, Y. MEASUREMENT OF THE FATIGUE OF WORKERS IN A NEURAL CODE. Tokyo Psychologica Bull. 1959, 1-25. (Institute of Psychology, Tokyo University, Sendai, Japan).

14,911

Measurements of fatigue were made on 175 miners of Taro Mine in Iwate Prefecture, Northern Japan. Measurements consisted of critical flicker fusion decrements between pre- and post-work values, body weight decrements between pre- and post-work values and subjective reports of fatigue (reported fully elsewhere). The variables considered were the kind of work (rockdriller, timberman, trapper, chissman, capenter, tippler, and battery locomotive operator), the difference between pits (atmospheric temperature difference), and the day of the week (six-day week). Differences in decrements due to the variables were analyzed and discussed in relation to subjective feelings of fatigue and to accident occurrence rate in the mine. T. G. I. R 4

Slattery, R.C. ABSOLUTE JUDGMENTS OF STATIC PERSPECTIVE TRANSFORMATIONS. Oct. 1958, 9pp. Electric Boat Division, General Dynamics Corporation, Groton, Conn. (Reprinted from J. exp. Psychol., Oct. 1958, 26(4), 340-364).

14,923

To determine the degree to which accurate estimates of the extent of a perspective transformation depend upon motion in the stimulus, static perspective images corresponding to a flat grid-patterned surface viewed at various pitch angles were projected onto a vertical screen. The 21 perspective patterns that would result from rotation of observer in two-degree steps from zero to -40 degrees were displayed to 25 naval officers who were then asked to judge the extent of their apparent rotation in the medial plane. The method of absolute judgments was employed. Mean estimate and variability of judgments for each pitch angle were calculated. Implications for the contact analog display system for flight are noted.

Roach, Lucis & Accarelli, Ester. ON THE INFLUENCE OF THE INCOMPLETE ADAPTATION OF THE PERIPHERAL RETINA ON THE SPEED OF READING. Atti della Fondazione Giorgio Ronchi, Jan. Feb. 1959, 12(1), 33-42.

14,924

Changes in the speed of reading were investigated during the adaptation to light of the peripheral retina. Luminance level of the peripheral field was isopic (either blue or green), while that of the foveal test field was in the photopic range. The first series was completed after the subject had been dark adapted for 25 minutes; the second series was completed after the onset of the peripheral light; and the third series after 25 minutes of dark adaptation followed by 25 minutes of adaptation to the peripheral light. Three subjects were tested. Data from the three conditions were compared for the effect of incomplete adaptation.

Cristofan, D.W., Rables, F.H., Jr. & Grawicke, M.E. A DEVICE FOR MEASURING GROSS MOTOR BEHAVIOR IN PRIMATES. Proj. 7182, Task 71820, NADC IN 59 353, Oct. 1959, 4pp. USN Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

14,925

To meet the need for a method of measuring gross motor behavior as affected by gravitational forces, a jumping device for primates was developed. It consisted of a large box with a stand at each end and a well, carrying a constant electrical charge, in the middle. Shock, preceded by a tone, was used to make the animal jump over the well to the opposite side. Motion pictures of the jump, as viewed through the plexiglass side and top, allowed measurement of the height and distance of the jump. Other possible uses of the device are described.

Michaels, R.M. INTENSITY DISCRIMINATION FOR NARROW BANDWIDTHS OF NOISE AT VARIOUS PULSE LENGTHS. Proj. NR 442 000, Task NR 442 003, NPL Prob. 503 03, NPL Rep. 5186, Oct. 1958, 28pp. USN Research Lab., Washington, D.C.

14,926

Upon the assumption that the auditory system acts as an envelope detector, a series of hypotheses were stated predicting how intensity discrimination would be influenced by the variations in the stimulus envelope. Filtered random noise of four bandwidths and four pulse durations were used to vary the rate and number of fluctuations. Seven listeners heard two pulses of noise in succession, judging the intensity of the second relative to the first. The physical differences were determined by taking the ratio of the total energy in each pulse. A transition curve for the responses to the various stimulus differences was plotted and the difference taken as the probable error of the fitted curve. The results were studied with respect to the envelope detector model of auditory discrimination. T. G. I. R 14

 Freedman, S.J. & Greenblatt, M. STUDIES IN HUMAN
 ISOLATION. Contract AF 33(616) 5663, Proj. 7123,
 Task 71741, NADC TR 59 24, Sept. 1959, 46pp.
 USAF Aerospace Medical Lab., Wright-Patterson AFB,
 Ohio. (Massachusetts Mental Health Center, Boston,
 Mass.).

14,933
 Thirty normal college-age subjects were run in
 eight-hour experimental sessions that involved: 1) non-
 patterned visual and auditory input combined with social
 isolation, 2) visual deprivation (blackout) combined with
 auditory patterning and social isolation, and 3) social
 isolation alone. Perceptual and cognitive distortions
 and disorientations differentially induced by these con-
 ditions are described. Six additional somewhat "deviant"
 subjects were run under the first condition. The rela-
 tionship between visual and cognitive imagery was ana-
 lyzed. A theoretical formulation is proposed to account
 for the perceptual distortions reported.

 Fraizer, J.J. ELECTROLUMINESCENT LIGHTING OF AIRCRAFT
 INSTRUMENTS. Contract AF 33(616) 5273, Proj. 1373,
 Task 13683, NADC TR 58 510, Sept. 1958, 141pp.
 USAF Flight Control Lab., Wright-Patterson AFB, Ohio.
 (The General Electric Company, Ithaca, N.Y.).

14,934
 This report describes the work done in applying
 electroluminescent lamps to a group of aircraft in-
 struments (tachometers, flow meters, voltmeters and two
 vertical tape devices). Specific problems encountered
 are discussed. The results of an investigation of the
 properties of electroluminescent lamps which were sup-
 plied by five manufacturers are presented. The investi-
 gation includes a study of the effects of temperature,
 voltage, frequency, and humidity on the brightness of
 the lamps.

 Davis, L.W. & Basore, B.L. INFORMATION CONTENT OF
 LEARNED MESSAGES. Contract AF 30(602) 1890, Proj.
 4519, Task 45241, OR 3 1004, NADC TR 59 209, May
 1959, 52pp. Diamond Communication, Albuquerque,
 N.M.

14,935
 The primary purpose of this study was to investi-
 gate the application of communication-theory techniques
 to the theory of learning. A search of the existing
 literature was made. Efforts were then made to develop
 a theoretical model based on the principles of communi-
 cation and information theory. Mathematical expressions
 were derived which attempt to describe the results of
 the learning process in terms of probabilities of postu-
 lated events. The expressions were then applied to the
 learning of "binary mosaics" or simple message patterns.

 Brantley, L.R., Dunbar, J.M. & Meyer, H. "SECOND
 SKIN" PROTECTION AGAINST LOW TEMPERATURE EXPOSURE.
 FINAL REPORT TO THE OFFICE OF THE COMTECHMASTER
 GENERAL. Contract DA19 129 GM 795, Proj. DAF 79
 10 0010, Jan. 1958, 90pp. Dept. of Chemistry,
 Confidential College, Los Angeles, Calif.

14,937
 This report presents the results of work undertaken
 toward the development of creams, ointments, etc., which,
 when applied to the hands and part of the face, would of-
 fer protection against injurious effects from exposure
 to low temperatures yet be flexible enough to permit good
 manual dexterity. Vinyl plastisols with good viscosity
 stability have been developed under this program. Accel-
 erators are described with which these plastisols can be
 filmed at temperatures feasible for the skin to form
 either dense or foamed coatings with satisfactory phys-
 ical properties including flexibility at -45 degrees F.
 New silicone rubber coatings were found and a two-layer
 system is described which meets the specifications for
 the "second skin".

 Blair, W.C. & Kaufman, H.M. COMMAND CONTROL I: MUL-
 TIPLE DISPLAY MONITORING II: CONTROL-DISPLAY SPATIAL
 ARRANGEMENT. Contract NADR 2512(00), Proj. SUBIC,
 PS9 100, Electric Boat Tech. Rep. SDC9 062, Nov. 1959,
 17pp. Electric Boat Division, General Dynamics Corpora-
 tion, Groton, Conn.

14,938
 To determine the effect of varying display-control
 spatial arrangement and total signal frequency on moni-
 toring proficiency, three conditions of display and con-
 trol separation ranging from grouped to separated were
 tested, each with three displays and associated controls.
 A separate group of subjects was used for each of the
 three arrangements. For half the sessions, they were
 given signals at a high and for the other half at a low
 frequency rate. The task was to push one set of controls
 to observe and another to report detections and reset
 signals. Only one display could be observed at a time.
 Reset times were recorded as measures of overall pro-
 ficiency, a frequency and duration of observation were
 taken as observation measures.

 Berger, H.M. A NOTE ON THE EFFECT OF SORTIES SCHEDULING
 ON MAINTENANCE WAIT-TIME. Tech. Memo. 7, Feb. 1958,
 14pp. USAF Operations Analysis Headquarters, United
 States Air Forces In Europe, New York, N.Y.

14,939
 The problem discussed in this note is the reduction
 of maintenance wait time (time aircraft has to wait
 before the required service is started) that is achieved
 with a fixed maintenance capacity and a fixed flying
 hours commitment by varying the sortie scheduling. In
 the case of unscheduled maintenance, a knowledge of the
 present state of the system should be used to determine
 the number of sorties on the next flight. In the case
 of periodic inspection, all that is necessary is that
 sorties be controlled by aircraft tail number. If both
 types of scheduling are carried out simultaneously
 maintenance wait time can be reduced without increasing
 maintenance resources or decreasing total amount of
 flying.

Wernitz, M.W. & Fromer, R. A SET OF DISCRIMINABLE SURFACE COLORS AND SYMBOLS FOR CODING IN ANIMATED TRAINING PANELS. Contract N61339 294, Tech. Rep. NAV TRACVCRN 20 OS 52, May 1959, 19pp. USN Training Device Center, Fort Washington, N.Y. (Educational Research Corporation, Cambridge, Mass.).

14,940

To develop a set of discriminable surface colors and symbols to use for animated training panels, a set of seven colors plus white, light gray and dark gray were selected as representative of readily differentiable color sectors of the color wheel. These colors served as backgrounds for intermediate colors displayed as Landolt rings. Six color-normal subjects were tested for their ability to indicate the position of the break of 72 rings on each background panel. The data (average percent error) were analyzed to discover the 15 most discriminable colors. The procedure for symbol coding involved the ranking (for discriminability) of pairs of symbols (selected from various sources) presented in two different spatial orders by the two experimenters. T. I. R 4

Clarke, X.P., Hyde, A.S., Cherniack, M.S. & Lindberg, E.F. A PRELIMINARY REPORT OF HUMAN RESPONSE TO REARWARD-FACING RE-ENTRY ACCELERATIONS. Proj. 7222, Task 71746, WADC TN 59 109, July 1959, 14pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

14,941

Tidal volume, electrocardiographic changes, tracking performance ability, and subjective response were evaluated during an acceleration profile designed to encompass several possible rearward facing reentry patterns. A maximum acceleration of 16.5 g and a total time of 170 sec. were employed. Subjects faced the center of rotation with the trunk and head inclined 12 degrees in the direction of the centrifuge axis; they were supported with a contoured net system. Two of the seven Ss repeated the experiment wearing the MC-2 full pressure suit, both pressurized and unpressurized. T. G. I. R 6

Bryan, G.L., Rigney, J.W., Bond, M.A., Jr., LaPorte, H.R., Jr., et al. THE ROLE OF HUMANS IN COMPLEX COMPUTER SYSTEMS: MAINTENANCE. Contract NGR 228(02), Proj. NR 153 093, Tech. Rep. 26, Jan. 1959, 96pp. Dept. of Psychology, University of Southern California, Los Angeles, Calif.

14,942

This investigation was designed to 1) observe and describe maintenance requirements and practices for digital computer systems now in use, 2) examine methods for screening, training, and evaluating computer technicians, and 3) to obtain up-to-date information on the organization and supervision of computer maintenance work. Visits were made to 50 representative computing centers and on-the-site information was collected by means of observation, questionnaires, and interviews. The results presented provide a state-of-the-art summary regarding human factors problems in maintenance and serve to define computer personnel problems. R 9

Armington, J.C. & Mitnick, L.L. ELECTROENCEPHALGRAM AND SLEEP DEPRIVATION. J. Appl. Physiol., March 1959, 14(2), 247-250. (USA Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington, D.C.).

14,947

The occipital alpha rhythms were recorded for ten subjects before, during, and after a 98-hour period of sleep deprivation. Five experimental conditions, each lasting two minutes, were employed. The instructions for these conditions were 1) to keep the mind blank with eyes open; 2) same with eyes closed; 3) to count aloud to ten repetitively, eyes closed; 4) same with eyes open; and 5) to add silently a number, cumulatively, eyes closed. Recordings were made with the subjects standing. The records of electrical activity were analyzed for the effects of the sleep deprivation alone and in combination with problem solving. G. I. R 12

14,948

Atkinson, R.C. THE OBSERVING RESPONSE IN DISCRIMINATION LEARNING. Contract NMR 235(58), (NR 170 282), Tech. Rep. 4, Sept. 1959, 17pp. Dept. of Psychology, University of California, Los Angeles, Calif.

14,948

To gain information about the orienting or observing response in discrimination learning, the typical discrimination task was modified so that an observing response could be identified and directly measured. The experimental situation consists of a series of discrete trials. The sequence is as follows: 1) ready signal to which the subject responds in one of two possible ways (observing response); 2) one of three stimulus events (cues) are presented; 3) the subject responds (discrimination); 4) a final reinforcing event ends the trial. Trial type, reinforcing event, and stimulus schedules were varied. Six groups of 40 subjects per group were run; performance data were analyzed in terms of a Markov chain model for discrimination learning.

14,949

Bradley, J.V. UTILIZATION OF MULTIPLE CUES IN PAIRED COMPARISONS. Proj. 7182, Task 71514, MACD TR 59 548, Sept. 1959, 41pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

14,949

Subjects were given one, two, or three cues with which to make an either-or decision. Certain hypotheses were formulated to describe the subject's thought processes in utilizing the multiple cues and mathematical models were constructed to simulate them. The models were then used upon data for the single-cue case to predict performance in the multiple-cue case. Predicted performance data were then compared with observed data to test the predictive validity of the model and the tenability of the corresponding hypothesis. The data used for this investigation were discriminations mediated primarily by the tactual sense modality.

Bittini, Marcella & Ronchi, Lucia. ON THE FACTORS WHICH INFLUENCE THE HUMAN SCOTOPIC ELECTRORETINOGRAM AT DIFFERENT LUMINANCE LEVELS. Atti Della Fondazione Giorgio Ronchi, July-Aug. 1958, XIII(4), 318-323. AFOSR TN 59 334.

14,950

How factors such as the total time of variation of the luminance and the behavior of the time derivative of luminance influence the human scotopic electroretinogram are investigated. Blue and green colored stimuli were used at various luminance levels and responses recorded for one subject: 1) to stimuli of equal energy but different time of variation of the luminance, and 2) to stimuli of equal time of variation but different behavior of the time luminance derivative. The results are discussed in terms of the cues for brightness discrimination furnished by the electroretinographic response.

Carterette, E.C. & Cole, M. A COMPARISON OF THE RECEIVER OPERATING CHARACTERISTICS FOR MESSAGES RECEIVED BY EAR AND BY EYE. Contract NMR 235(56), Tech. Rep. 2, June 1959, 14pp. University of California, Los Angeles, Calif.

14,953

The receiver operating characteristics (ROC) curves for auditory and for visual reception were compared experimentally. Spoken messages were received by earphones in a wide band noise at three different speech-to-noise ratios and the visual messages were exposed briefly in a tachistoscope for various durations so as to give intelligibility levels corresponding to those of the auditory case. Four subjects were tested, on the previously learned word lists, for identification and made confidence ratings on the certainty of their responses on a six-point rating scale. Comparisons were made of changes in distributions of rating categories for various speech-to-noise levels; accuracy of reception as function of rating category and the ROC curves.

Delgoffe, R.D. FACTORS AFFECTING SIGNALING BY VISUAL METHODS. Ordinance Task 341 366/43083/12040 & 341 366/63258/01040, MACD Rep. 6034, Dec. 1957, 24pp. USN Ordnance Lab., White Oak, Md.

14,954

A digest of experimental work from various sources is presented as a guide in research and development programs for signaling devices. The factors that affect the effectiveness of the use of visual methods to convey information over relatively large distances are analyzed and discussed in terms of their individual components: physical nature of signal, atmosphere, ambient illumination, and the physiological and psychological response involved in seeing. The following topics are discussed: 1) characteristics of the eye and the seeing process, 2) brightness and visibility thresholds, 3) luminance thresholds for various colors, 4) point sources versus diffuse light, 5) values of background luminance under various conditions, and 6) flashing versus steady lights.

Feallock, J.B. & Briggs, G.E. DEVELOPMENT OF SYSTEMS RESEARCH AND DESIGN METHODOLOGY. Contract AF 33(616) 6156, Proj. 60(8 7164), EF Proj. 894, Rep. 3, Dec. 1955, 13pp. Ohio State University Research Foundation, Columbus, Ohio.

14,955

This is a progress report which gives brief summaries of major tasks accomplished or under study in the following areas: general systems research employing dynamic task simulation, technical studies and supporting basic research, and design and development of research equipment.

14,956

Ercoles, Anna Maria & Fiorentini, Adriana. VISIBILITY OF THE MACH BANDS AS A FUNCTION OF FIELD LUMINANCE. Atti Della Fondazione Giorgio Ronchi, May-June 1959, XIV(3), 230-235. (AFOSR TN 59 781).

14,956

The visibility of a subjective contour (Mach band) was investigated as a function of luminance. It was found that the dark Mach band is visible at levels lower than the luminance threshold for the bright Mach band. At high levels, however, the luminance gradient required for the perception of the dark band is greater than that required for the bright band.

Ersoch, J.M. THE EFFECT OF IMAGE DEGRADATION ON VISUAL SEARCH: BLUR A SUBTASK WHICH IS PART OF THE PROGRAM ON HUMAN ASPECTS OF PHOTOGRAPHIC INTERPRETATION. Contract AF 33(602) 1580, OSURF Proj. 696 & Proj. 1763, Task 39865, NRL Tech. Paper (696) 16 280, RADG TN 59 63, Jan. 1958, 23pp. Mapping and Charting Research Lab., Ohio State University Research Foundation, Columbus, Ohio.

14,957

The effect of blur on visual search was studied with the modified ophthalmograph apparatus. The display material consisted of experimental aerial maps containing only areas of white, black, and five shades of gray with the critical detail (Landolt "C") inserted in approximately equally weighted zones. Various degrees of blur were produced in successive displays. Six subjects viewed the displays in fixed order and searched for the critical detail (target). Analysis of data (duration of fixation, correct identifications) was made for effect of quadrant, zone, direction of eye fixation, and blur gradient. The implications of these findings for actual search situation are discussed.

 Ellick, D.E. JUDGMENTS OF THE RELATIVE FREQUENCY OF SEQUENTIAL BINARY EVENTS: EFFECTS OF FREQUENCY DIFFERENCES. Proj. 6190, Task 71554, WADC TR 59 560, Oct. 1959, 17pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

14,958
 The accuracy of discriminating which of two events occur more frequently when both are presented in a random sequential order, at a constant rate too fast to permit counting, was investigated. Subjects were required to indicate on a ten-centimeter scale the proportion of time occupied by the more frequent event. Each judgment was based on a total of 190 events with overall per cent differences between the occurrence of the two elements being 0, 4, 10, and 16. Ten subjects were tested. Estimated proportions were compared to actual proportions, and mean proportion of correct judgments were analyzed as a function of frequency differences.

 Gaylord, R.H. HUMAN ENGINEERING DESIGN RECOMMENDATIONS FOR MINIATURIZED EQUIPMENT. Contract DA 36 039 SC 75054, DA Proj. 3 89 01 602, Quart. Rep. 2, Nov. 1958, 4pp. American Institute for Research, Pittsburgh, Penn.

14,960
 Partial completion of a draft of the Human Engineering Miniaturization Guide has resulted from analysis and collation of information in the literature. A tentative outline is included. The literature so far examined yields considerable information needed for designing small displays but is generally lacking in information necessary in designing small controls. Results to date of canvassing manufacturers of man-machine linkage means are described.

14,961
 Gerathwohl, S.J. EQUIPMENT FOR MANNED SPACE CAPSULES AND LUNAR BASES. SPECIAL REPORT. Feb. 1959, 28pp. USA Medical Research and Development Command, Headquarters, Office of the Surgeon General, Washington, D.C.

14,961
 Equipment variables which are thought to be significant for man's exploration and survival in space are discussed and sets of research tasks necessary for the accomplishment of manned space missions are proposed. Specific areas so treated are 1) equipment for safety, comfort, and survival; 2) the engineered environments; 3) emergency and survival; 4) pilot support; 5) space communications; 6) human performance in space vehicles; and 7) instrumentation and equipment for operational and environmental research.

 Gatling, F.P., Murrel, E.M. & Brickett, J.H. TRENDS IN NAVAL AVIATION INJURY PATTERNS. Aero Medical Dept. Rep. AM 3 59, June 1959, 12pp. USN Aviation Safety Center, Naval Air Station, Va.

14,962
 Data from the Naval Aviation Safety Center were accumulated from accident reports from the close of World War II (1946) through 1958. The data were examined and tabulated by specific accident type, phase, and damage classifications in current use at the Safety Center. Corresponding tables were constructed for fatal injuries. In addition, bailouts and ejections and their relation/injury patterns were developed from the data. These tabular presentations were analyzed for trends in accident aircraft patterns.

 Jones, Edna M., Gaylord, R.H. & Folley, J.D., Jr. GUIDE TO HUMAN ENGINEERING OF MINIATURIZED EQUIPMENT. FINAL REPORT. Contract DA 36 039 SC 75054, AIR 261 59 FR 202, June 1959, 63pp. American Institute for Research, Pittsburgh, Penn.

14,963
 This guide contains information applicable to the special human engineering problems encountered in the design of miniaturized equipment. It is intended to serve both as a source book of known facts and of suggested principles, and as a means for calling attention to some of the problems created by miniaturization. Section I presents some fundamental concepts and definitions; Section II describes a procedure for human engineering of miniaturized equipment; and Section III presents facts related to each of three proposed solutions to the problem of providing adequate man-machine linkage where space is extremely limited. Actual measured swept areas for different types of controls, tables of data on size recommendations, and related design recommendations are included. T. G. I. R 11

MacCanon, D.M. EFFECTS OF OXYGEN INHALATION ON COLD PRESSOR RESPONSES OF MAN. Contract DA 49 007 MD 1008, Sept. 1959, 6pp. University of South Dakota, Vermillion, S.D.

14,968

To determine whether oxygen inhalation would alter the responses of the cardiovascular system to the external stimulus of the cold pressor test, ten subjects were tested. Blood pressures and pulse rates were determined in 28 experiments, before, during, and after immersion of the right hand in cold (4 degrees C) for one minute. Air or 100 percent oxygen was inspired throughout the test. The blood pressures and pulse rates were compared for oxygen and for air inhalation. Differences between basal values and changes from basal values resulting from cold pressor responses were analyzed.

Kruger, L.V. PITCH EXTRACTION FOR SPEECH SYNTHESIS WITH SPECIAL TECHNIQUES FOR USE IN DIGITIZED BAND-WIDTH COMPRESSION SYSTEMS. Proj. 4602, AFRC TR 59 116, March 1959, 47pp. USAF Communication Sciences Lab., AFRC, Bedford, Mass.

14,973

Pitch channel techniques for voice compression systems are reviewed and comparisons made between time and frequency domain methods for pitch extraction. The problem of extracting pitch from band-limited circuits which have no fundamental is treated. Techniques for improving the rise and fall resolution of the inverted pitch analog signal are shown. Digital transmission of pitch channel information at rates below 150 bits per second is discussed. A hiss-buzz segmenter is described, its uses indicated, and a special reduction technique in digital signal transmission is given. Tracking requirements for a universal pitch extractor are discussed and the channel used in the AFRC Scanvocoder described.

Kreider, M.B., Buskirk, E.R., Iampietro, P.F., & Bass, D.E. EFFECT OF CONTINUOUS COLD EXPOSURE ON NOCTURNAL BODY TEMPERATURE OF MAN. Proj. 7 83 01 006, Tech. Rep. EP 117, July 1959, 6pp. USA Environmental Protection Research Div., QM Research & Engineering Center, Natick, Mass.

14,974

To determine whether nocturnal body temperatures are modified when men live continuously in the cold under controlled laboratory conditions uncomplicated by activity and clothing, five men were studied over a period of 42 days. Cold stress consisted of living at 60 degrees F., wearing only shorts, for 14 days. This cold period was preceded and followed by two weeks at 80 degrees F. Activity and diet were the same throughout; one blanket was used at night. Rectal and skin temperatures were measured periodically during both day and night. The 24-hour patterns of body temperature were studied and comparisons made between those taken the first two and the last two days of the stress period to check on acclimatization effects.

Kurtz, A.K. RECENT DEVELOPMENTS, PRACTICES, AND RESEARCH IN THE FIELD OF CODE LEARNING. Contract NMR 2519(90), Tech. Rep. 1, Sept. 1959, 52pp. The Psychological Corporation, New York, N.Y.

14,975

This review of research in code learning is devoted predominantly to those publications that have appeared in 1950 or later; some exceptions are made for a few classic and comprehensive studies. Special emphasis is given to those few studies concerned with "second-level" or advanced training. Topics covered are transmission speeds for code-reception practice, tone speed, order of signal presentation, rate of introduction and grouping of signals, amount of practice per signal, types of practice materials, code-voice method, learning theory, arrangement of practice time, progress in code learning, errors, accuracy standards, variety and antimonotony procedures, prediction of success, code sending and typing, and criteria of proficiency.

Kristofferson, A.B. & C'Connell, R.H. THE DETECTABILITY OF TARGETS CONTAINING INTERNAL LUMINANCE GRADIENTS. Proj. MICHIGAN, Rep. 2144 297 T, Sept. 1958, 9pp. Willow Run Labs., University of Michigan, Ann Arbor, Mich.

14,976

Detection thresholds were measured for 13 non-uniform targets consisting of a circular area approximately 60 minutes in diameter, on the center of which a circular luminance increment approximately four minutes in diameter was superimposed. The ratio of center to annular luminance ranged between 1.0 and infinity. Predictions of the luminance of the center area required for the entire target to be at detection threshold were made on the basis of several variants of the element contribution hypothesis, using values of threshold luminance of center and of annulus presented singly. The results from three observers were compared with the predictions.

Garner, W.R. CONTEXT EFFECTS AND THE VALIDITY OF LOUDNESS SCALES. Contract NS CRI 166, Proj. NR 145 089, Rep. 166 I 187, June 1954, 20pp. USN Office of Naval Research, Washington, D.C. (Psychological Lab., Johns Hopkins University, Baltimore, Md.).

14,978

To determine to what extent half-loudness judgments made with a method of constant stimuli can be influenced by the context of the stimuli presented to the observer, each of three groups of observers was given a different non-overlapping range of variable stimuli to be judged with respect to a standard stimulus. For each observer an intensity value for half judgment was computed by linear interpolation on the psychophysical function to determine an intensity equivalent to half of the judgments being more than half as intense. Such a value was computed for the first half, the second half, and for the complete series. The means, medians, and standard deviations were compared. Individual differences on judgments were compared.

Carterette, E.C. & Cole, M. REPETITION AND CONFIRMATION OF MESSAGES RECEIVED BY EAR AND BY EYE. Contract NMR 233(58), (NR 170 282), Tech. Rep. 3, June 1959, 18pp. Dept. of Psychology, University of California, Los Angeles, Calif.

14,980

To compare the auditory and visual modes of reception over successive repetitions of a message, a rating method was used to obtain receiver operating characteristics (ROC) for 60 heterogeneous words. A single message was sent under difficult conditions of reception and was repeated until it had been assigned the highest accuracy category on the rating scale or until it had been sent a maximum of six trials. The accuracy of reception for both modes was analyzed as a function of confidence rating and intelligibility level.

Basore, B.L. REDUNDANCY FOR IMPROVING ACCURACY IN COMMUNICATIONS. Contract AF 19(604) 4078, AFRC TR 59 170, June 1959, 41pp. Dikewood Corporation, Albuquerque, N.M.

14,981

A study of the role of redundancy in communication was carried out principally in terms of an n-dimension model of message space. An effort was made to determine an intuitively clear method of comparing the significance of redundancy in reducing error rates in a communication link with the contribution realized through the use of long messages and delay. Conclusions were drawn with respect to cost of communications in relation to channel capacity usage.

Townsend, F.M. THE UTILIZATION OF PATHOLOGY IN AIRCRAFT ACCIDENT INVESTIGATION. Reprint from "Medical Aspects of Flight Safety." AGARD. 30, 1959, 9pp. PERGAMON Press, New York, N.Y. (USAF Institute of Pathology, Washington, D.C.).

14,983

Aircraft accidents continue to be a problem within the United States Air Force. The contribution of the pathologist to the field of flight safety is discussed. It is stressed that an investigation by the pathologist should encompass all the many factors which affect the "man-aircraft" relationship. The approach to this field is characterized as a consideration of 1) environmental factors, 2) traumatic factors, and 3) pre-existing disease. Several case histories are given to illustrate the need for continuing research in the first and last areas. Air Force recommended procedures for the Medical Investigation of Aircraft Accident Fatalities are reviewed in light of the duties of the pathologist.

Slechta, R.F., Forrest, J., Carter, W.K. & Wade, E.A. COMFORT EVALUATION OF THE C-124 CREW SEAT (WEBER). ONE OF A SERIES OF STUDIES PERTAINING TO THE DESIGN EVALUATION OF PILOT AND CREW STATION EQUIPMENT. Contract AF 33(615) 3066, Proj. 7215, Task 71724, WADC TR 58 316, Oct. 1959, 15pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Bio-Mechanics Lab., Tufts University, Medford, Mass.).

14,984

To evaluate certain design characteristics of the C-124 Crew Seat (Weber) in terms of their adequacy for the maintenance of human comfort, 17 subjects were tested during a voluntary sitting period of seven hours' maximum duration. Subjective and behavioral laboratory tests were administered at hourly intervals using a questionnaire type of comfort rating for overall comfort and for comfort of specific body regions. Following termination of the sitting period (termination was at the will of the subject up to the seven hour period), final comfort ratings and individual seat parts ratings were completed by all subjects. On the basis of test data and specific comments made by subjects, recommendations for seat design improvement are made.

Rosenblatt, F. THE PERCEPTON A THEORY OF STATISTICAL SEPARABILITY IN COGNITIVE SYSTEMS. Contract N0R 2381(00), Proj. PARA, Rep. VG 1196 G 1, Jan. 1958, 262pp. Cornell Aeronautical Laboratory, Inc., Buffalo, N.Y.

14,985

The theory of statistical separability and the design of the perceptron (electronic brain model) which are presented in this report originated from a series of studies of memory trace mechanisms in the central nervous system. This report constitutes the basic theoretical exposition of the theory. Following an introductory discussion, the following topics are developed: stimulus sampling and perceptual generalization, basic organization of the perceptron, equations of statistical separability (analysis of the predominant phases; the post-dominant phase for an ideal environment; in differentiated environments), bivalent enforcement systems, temporal pattern recognition, methods of figural analysis, cognitive sets, and selective recall.

Rees, D.W. & Copeland, Mola K. THE EFFECTS OF SERIAL POSITION IN CHECK-LIST DESIGN. Proj. 7184, Task 71586, WADC TR 59 552, Sept. 1959, 17pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

14,986

An experiment was conducted to determine 1) whether serial position effects occur in the use of check-lists, and 2) whether these effects can be modified. Subjects responded to a serial presentation of instructions by actuating switches. Two check-lists of instructions were tested: a high and a low generalization list. The two criterion measures of performance were time spent observing the list (search time) and number of errors made. The data were studied by analysis of variance.

Reza, F.M. BASIC CONCEPTS OF INFORMATION THEORY FINITE SCHEME. Contract AF 19(604) 2452, Scientific Rep. 2, AFRC TN 59 588, SURI Rep. EE 507 5995 2, Sept. 1959, 75pp. Syracuse University Research Institute, Syracuse, N.Y.

14,987

The basic elements of information theory of discrete channels is presented in a manner parallel to the presentation of the elements of discrete probability theory. A measure for information content of a discrete system is developed and used for evaluating the rate of transmission of information in a communication system. The approach is mathematical rather than philosophical with emphasis on logical clarity. The method of presentation should prove of some interest to scientists and engineers who wish to acquire some introductory knowledge of the subject.

Pollack, M. TECHNICAL STUDIES IN CARGO HANDLING - V. THE EFFECT OF COMMUNICATION ON A N-STAGE SHUTTLE PROCESS. Contract N0R 233(07), Rep. 58 43, May 1958, 20pp. Dept. of Engineering, University of California, Los Angeles, Calif.

14,988

In this paper a simple communication model is presented. This model is used for estimates of the effect of communication on an N-stage shuttle process using the data from a previous simulation study of the process. The functional relationship between effectiveness and balance allowance (average delay) is determined. Balance allowance values from the simulation study and from a study of a large amount of actual cargo handling data are compared. For these values of balance allowance, the corresponding values of coefficient of variation used in the simulation study are obtained.

Pollack, M. AN ENGINEERING ANALYSIS OF CARGO HANDLING - VII. SOME STUDIES ON SHUTTLE AND ASSEMBLY LINE PROCESSES. Contract N0R 233(07), Rep. 58 12, Feb. 1958, 41pp. Dept. of Engineering, University of California, Los Angeles, Calif.

14,989

Two types of flow processes are described and formulated—a shuttle and an assembly line process. Variations of each are studied for the general N-stage condition. The shuttle process is considered for multiple shuttles per stage, storage capacity at the nodes, and the combination of multiple shuttles per stage with storage capacity at the nodes. The assembly line process is considered for multiple machines per stage both with and without set-up times included. The mathematical method of recurrence relations is used to formulate these relations for the various significant variables (delay and arrival times of items at various positions) of both processes. A bibliography of recent studies in queueing theory and assembly line analysis is included.

Mori, Gina F. IS IT POSSIBLE TO MEASURE THE CONTRAST ENHANCEMENT OF A FIGURE WITH "QUASI PERCEPTIVE CONTOURS"? Atti Della Fondazione Giorgio Ronchi, March-April 1959, XIV(2), 137-139.

14,990

A figure with quasi-perceptive contours is described as one where a figure is seen as superimposed upon the paper where other figures are drawn (stratification effect). One such figure is illustrated in which an equilateral triangle, whose vertices coincide with the centers of three black circles from which a sector has been removed, is seen as superimposed upon another triangle having its vertices (drawn in black) at points between the three circles. An explanation of this effect is offered in terms of contrast enhancement effect and measurement of this effect was attempted. Differential thresholds were determined at various points near the perceived border or contour, both inside and outside the figure. The data were compared for differences in luminance between figure and background. T. I. R 4

Wolf, E. & Zigler, M.J. SOME RELATIONSHIPS OF GLARE AND
TARGET PERCEPTION. Contract AF 33(616) 3305, Proj.
7186, Task 71551, WADC TR 59-394, Sept. 1959, 29pp.
USAF Aerospace Medical Lab., Wright-Patterson AFB,
Ohio. (Visual Research Lab., Wellesley College,
Wellesley, Mass.).

14,999
This study was carried out to describe quantitatively
the relationship between the luminance of a glare source
and threshold luminance of a test target when both are
varied in angular subtense and distance from each other.
The threshold visibility of the test target was deter-
mined for various sizes and luminances of the glare
source, various angular separations between the two, and
for various exposure times and retinal locations. Thresh-
old luminance for the readability of Landolt rings, let-
ters, and dials were similarly determined.

Staves, J.C. WALKING UNDER ZERO-GRAVITY CONDITIONS.
Proj. 7154, Task 71505, WADC TR 59-327, Oct. 1959, 8pp.
USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

14,996
This is the first report on experiments with perma-
nent magnetic sandals that enable a man to walk with an
approximately normal gait under weightless conditions.
Four subjects were observed as they attempted to initiate
self-rotation while in the weightless condition pro-
duced aboard a C-131B aircraft during the zero-g maneu-
ver. Subjects reported upon their orientation percep-
tions during this period. A basic index was formulated
to define magnetic requirements in terms of the inductive
forces required to hold a subject stationary. A vector
analysis of the 1-g walking gait was made. Further
studies are proposed.

Spano, L.A. & Bailey, T.L. AUXILIARY HEATING SYSTEMS
FOR COMBAT CLOTHING. Proj. 7-93 30 C01, ONR TR 20,
(APO 1), July 1959, 60pp. USA Pacific Division & For-
man Div., ON Research & Engineering Command, Natick,
Mass.

14,997
The results of a re-examination by the Quartermaster
Corps of the environmental protective properties of pre-
sent clothing systems for troops operating in Arctic cli-
mates are given. The examination was conducted with re-
ference to 1) what degree of protection is now provided,
2) what can be anticipated in the immediate future, and
3) what programs must be initiated to answer unsolved
problems. On the basis of the findings, a research pro-
gram is outlined: 1) development and evaluation of aux-
iliary heating systems for warming troops exposed to
deep cold, 2) development of auxiliary heating devices
and systems for the extremities, and 3) design and devel-
opment of a combat clothing ensemble provided with an in-
tegral auxiliary heating system.

Fitts, P.M. (Ed.). NOTES AND SELECTED READINGS ON
HUMAN ENGINEERING CONCEPTS AND THEORY. Aug. 1959,
710pp. College of Engineering Summer Session, Univer-
sity of Michigan, Ann Arbor, Mich.

14,999
There are two major parts in this volume on Human
Engineering. The first part is in outline form and cov-
ers lectures and papers on the following general topics:
human factor engineering—an overview of concepts and
theory; survey and analysis of human factor engineering
problems in selected systems; recent advances in simu-
lation and measurement; special topics; special environ-
mental problems and stress effects; general psychologi-
cal theory relevant to human factor engineering; and lab-
oratory projects. The second part contains 37 selected
original papers and research reports of pertinence to
the above topics. The whole comprises an intensive
course for practicing engineers and scientists.

Black, J.W. PREDICTING THE CONTENT OF SHORT PHRASES. Contract NMR 495(119), NR 140 993/6-16 59, EF Proj. 1002, Rep. 82, Jan. 1959, 5pp. Ohio State University Research Foundation, Columbus, Ohio. (Reprinted from: QUART. J. Speech, Oct. 1959, 111(3)).

15,017

To study the predictability of the content of short phrases under three conditions (type of material, knowledge of source of material, and units of different length and position), approximately 400 new students in the naval flight training program were required to guess successive letters of the text until the correct letter had been found. Two samples of the printed language were selected: phrases from flight instruction and from newspaper. Each phrase contained five syllables and 3, 4, or 5 words. One half of the subjects were told the source of each phrase; the remainder were told that all phrases were "newspaper language". Mean percentage of correct first guesses through all letters and spaces and amounts of information (in bits) per space were analyzed for the effects of the experimental conditions. T. R 6

Griffith, A., Clark, E. & Zentgraf, J.J. OBSERVATIONS ON HUMAN SUBJECTS LIVING IN A "TWIN ROOMING ROOM" FOR PERIODS OF TWO DAYS: CANNED STRESS. Res. Proj. NMR-13 6021, Subtask 1, Rep. 47, Oct. 1959, 36pp. USN School of Aviation Medicine, Naval Air Station, Fla.

15,019

To investigate the consequences of prolonged visual rotation of human subjects living in a "twin rooming room", five healthy subjects and one control (basis of visual-ocular function) were monitored. The nearly identical, windowless room was constructed around the center post of a centrifuge which was rotated at rates varying from 1.5 to 10.0 rotations per minute for periods of two days each. During each period, the subjects were engaged in a series of tasks designed to serve as stimulants and in the same time give time measure of their performance. The results, presented and analyzed in this report, consist primarily of the symptoms reported by the subjects. Some inferences are drawn as to neuropsychological mechanisms involved.

HUMAN RESPONSE TO AUTOMATIC TRAFFIC LIGHT
PATTERNS. June 1959, 11pp. Frank Parsons Engineering
Group, Ann Arbor, Mich., Chicago, Ill.

15,025
To study the effects of providing additional cues
to the automobile driver through the medium of traffic
signal lights on the behavioral responses (decision
time, stopping time), 24 subjects performed on an auto-
mobile simulator. The task was to drive and stop in
response to a standard and three experimental traffic
light patterns. Half of the group received instruction
on the experimental system while the other half
received none. All subjects were given simulation practice.
A detailed analysis was made of the objective
differences in behavioral and response times and the in-
dividual subjective preferences. The optimum signal
light pattern is described.

A CONTROL ON THE STRENGTH OF SIX LINEAR HAND MOVEMENTS.
Proj. 5956/25 001, Task C3, Rep. A11, Dec. 1959. 42pp.
USAF Medical Research Lab., Fort Knox, Ky.

15,027
To determine the effect of control position on the
force with which six linear hand movements could be made
along the X, Y, and Z axes of an essentially isometric
control, five subjects were employed. Measurements were
made of the maximum force applied in a five-second period
to a dynamometer handle by each of six linear hand move-
ments. Maximum strength of each movement was measured at
80 control positions (five handle distances, four angular
elevations, and four lateral positions). The data were
analyzed by the method of orthogonal polynomials (explan-
ation in appendix), and recommendations for optimum control
positions were made.

To determine whether loudness discrimination for
tonal signals in a noise background is stable throughout
a range of intensities, a forced choice variant of the
constant stimulus method was used. A tone was presented
in thermal noise to two experienced subjects. The differ-
ential sensitivity was explored for the tone at six
levels (three to forty decibels) above the 50 percent
recognition threshold in a broad band noise. The Differ-
ence Limit, 75 percent criterion, for a pure tone (1000
or 6000 cps) was established over the range of intensities
used. These data were compared to previous data for
listeners in a quiet situation.

Rulon, P.J. A STUDY OF THE ACCURACY OF RECOGNITION OF
THE INCIPENT STALL IN FAMILIAR AND UNFAMILIAR PLANES.
Rep. 74, Nov. 1947, 136pp. Civil Aeronautics Admini-
stration, Washington, D.C.

15,028
To investigate the accuracy of recognition of the
incipient stall during flight with light aircraft, check
flights were administered to subjects (student pilots,
private pilots, and flight instructors) in aircraft e-
quipped with stall warning indicators that were visible
only to the check-pilot. During the execution of assign-
ed maneuvers, subjects were directed to fly as close as
possible to the edge of the stall without actually stall-
ing the plane. Performance was judged by means of the
warning indicators. On other flights the pilots were
directed to fly normally; the check-pilot measured per-
formance as before but without the subject being aware of
the check. The results are discussed with respect
to regulatory policies.

Douglas Aircraft Company, Inc. STUDY SPEC. - HUMAN
ENGINEERING OF CONTROL SYSTEMS. July 1956, 14pp.
Douglas Aircraft Company, Inc., 51 Segundo, Calif.

15,029
This specification defines the requirements for a
human engineering study to determine the optimal control
linkage between the human operator, the integrated in-
strument display system currently under development by
the Joint Army-Air Instrument Development Program, and
the airplane into which the integrated display system
will be installed. A selected bibliography on control
systems is included.

Schwartz, R.E. RESPIRATORY PATTERN AND RESPIRATORY
RESPONSE TO CARBON DIOXIDE. Proj. 5956/25 001, Task C3,
Rep. 314, July 1959, 14pp. USAF Medical Re-
search Lab., New London, Conn. (Reprinted from
J. Appl. Physiol., July 1959, 12(1), 1-7).

15,031
To determine the cause of the marked individual vari-
ations in the respiratory response to carbon dioxide
(CO₂), 65 subjects were exposed to various CO₂ concentra-
tions (8.5, 9.3, 9.4, and 9.5 percent) for 15 minutes
followed by a recovery period of equal length. Respira-
tory responses to CO₂ and to air were studied for rela-
tionships that might be present. The practical applica-
tions of the findings to the problem of personnel selec-
tion were discussed.

J.C. HUMAN ENGINEERING ASPECTS OF RADAR AIR TRAFFIC
CONTROL. II AND III: EXPERIMENTAL EVALUATIONS OF
TWO IMPROVED IDENTIFICATION SYSTEMS UNDER HIGH DENSITY
TRAFFIC CONDITIONS. Contract AF 33(616) 43, Proj.
7192, WADC TR 56 68, July 1956, 45pp. USAF Aero Medi-
cal Lab., Wright-Patterson AFB, Ohio. (Ohio State
University & Ohio State University Research Foundation,
Columbus, Ohio).

15,033
In two experiments, radar air traffic controller per-
formance was investigated in simulated return-to-base
problems at several traffic densities with two improved
identification systems—the Clock Code omnipresent system
using a symbolic code attached to each blip and the Light
Pencil interrogator system which gave on-demand identifi-
cation. The controller's environment included noise-free
displays with an localized lighting system. The basic
problems were simulated return-to-base missions of jet
and propeller-driven aircraft under instrument flight
rules (IFR). Traffic densities ranged from 25 to 40 air-
craft per hour. Various performance criteria were used
in the analysis of the efficiency of the two identifica-
tion systems.

Stroud, R.C. COMBINED VENTILATION AND HEAT-REMOVAL EFFECTS OF SENSITIVITY TO RESPIRATORY CHANGES. Proj. 7146, Task 7129, WADC TR 59 350, Sep. 1959, 13pp. USAF Medical Research Lab., Dayton, Ohio. (Reprinted from J. Appl. Physiol., May 1959, 14(3), 245-246).

15,035

To develop a method for measuring respiratory sensitivity to changes in oxygen (O_2) tension independent of change in carbon dioxide (CO_2) tension, a combined analysis of breath-holding and ventilatory drive was made. Comparisons were made of experimentally determined responses of three subjects to various combinations of O_2 and CO_2 tensions with values predicted by the analysis.

McGuire, J.E. & Webb, P. EFFECTS OF FLIGHT ON COOLING OF THE BODY BY CONVECTION. Proj. 7146, Task 7129, WADC TR 59 350, Sep. 1959, 13pp. USAF Medical Research Lab., Wright-Patterson AFB, Ohio.

15,037

To determine the feasibility of using a ventilating suit as a vehicle for body cooling prior to heat exposures, a series of experiments was conducted with three experienced subjects. During the cooling phase various ventilating air temperatures (30, 45, and 60 degrees F.), air flow rates (10, 20, and 34 cubic feet per minute), and time durations (30, 60, and 90 minutes) were explored with both light and heavy clothing assemblies. The heat phase consisted of sitting in a chamber held at a constant temperature of 160 degrees F. until tolerance (impending heat stroke) was reached. Results were expressed in several forms: an index of strain, body storage rates, tolerance times, terminal rectal temperatures, etc. Recommendations are made for optimal usage of the suit for extension of heat tolerance. Clarke, L.P. & Headley, R.M. STUDIES OF PRIMATE TOLERANCE TO SOME COMPLEX ACCELERATIONS. Proj. 7222, Task 7146, WADC TR 59 630, Nov. 1959, 8pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

15,039

Satellite vehicles during unstable re-entry into the denser portions of the earth's atmosphere may be subjected to complex accelerations. Five primates were exposed to simulated deceleration in the forward facing position of up to 20 g combined with sine wave pitch oscillations through half amplitudes of 20 degrees at three and five cps. Accelerations (headward-footward and forward-backward) were measured on the seat at head level and directly on the skull of one animal. Types of movement made by the animals after centrifugation were observed. Post-mortem examinations were made and are reported.

Jeantheau, G. THE DIFFERENTIAL EFFECTS OF SPEED AND LOAD STRESS ON TASK PERFORMANCE. Contract AF 33(616) 3612, Proj. 7184, Task 71583, WADC TR 59 7, July 1959, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

15,041

To investigate the effect of various levels of speed and load stress on performance in an information processing task, ten subjects were required to discriminate and report pairs of identical symbols within symbol matrices of various sizes (four rows and two, three, or four columns). Each matrix was referred to as a "message," the rows were "words," and the cells were "symbols." Five levels of presentation were used: 17, 20, 24, 30, and 40 messages per minute. Each subject worked under all conditions, and performance was assessed both in terms of error scores and a derived information measure. The value of information measures in assessing tasks of this type is discussed.

USA Infantry Human Research Unit, Fort Benning, Ga. IMPROVED SELECTION CRITERIA FOR PARACHUTIST TRAINING. RESEARCH MEMORANDUM. Oct. 1958, 8pp. Human Research Research Office, George Washington University, Washington, D.C.

15,043

This note presents a discussion of the problem encountered as a result of the use of silhouette targets for marksmanship training and the manner in which the targets were modified for research purposes. The standard Army silhouette target is constructed of cardboard with the shape of a human target in a prone or kneeling figure. Problems of resistance to weather and durability, under conditions of bullet strikes were encountered. New targets constructed of fibreglass and composite materials were compared for initial cost, durability, repair and repair time.

Miller, D.E. & Crawford, R.M. TASK PERFORMANCE WITH THE NEW MODEL 8 MASTER-SLAVE MANIPULATOR AS A FUNCTION OF VIBRATION, DISTANCE, AND FREQUENCY. Proj. 7184, Task 71583, WADC TR 59 712, Nov. 1959, 16pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

15,045

To investigate the ability of Master-Slave Manipulator (JPL Model 8) operators to identify the slave hands and their movements with corresponding components and functions of the human body (forearm, wrist, and finger movement), a handling task involving rearrangement of blocks was devised. The task was performed under two conditions: 1) with standard slave (two red), and 2) with slave (two modified so that the one corresponding to the thumb of the operator was green). Work time as a function of task distance (9, 24, and 63 inches) was investigated and work ratios, based on mean time ratios for direct versus remote handling, were determined.

Crook, R.M. VISUAL FACTORS AFFECTING EFFICIENCY IN THE TASK OF PHOTOINTERPRETATION. ANNUAL SUMMARY REPORT. Contract W33-494(17), Dec. 1959, 7pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

15,047

Work accomplished on a research study of visual factors affecting efficiency in photointerpretation is summarized. Two phases are described: 1) a general survey of visual factors in photointerpretation, and 2) a preliminary investigation of some specific factors. On the basis of survey results an outline of factors affecting visual performance in photointerpretation is presented. The specific problems which have received attention are general illumination, illuminants for colored transparencies, differential illumination in stereo viewing, binocular viewing of duplicate photographs, and visual fatigue.

Forbes, T.W. HUMAN FACTORS IN HIGHWAY SAFETY. Oct. 1959, 17pp. Highway Traffic Safety Center, Michigan State University, East Lansing, Mich.

15,045

This paper on human factors in highway safety emphasizes that the driving public must be convinced of the importance of specific knowledge of best operating procedures and of maintaining most effective personal condition and driving behavior. Highway officials, designers, traffic engineers and safety experts should likewise be aware of such specific, scientific information. The perceptions, judgments, responses, knowledge, motivation, alertness and personality factors of the driver are analyzed as they relate to the task of driving. The Human Engineering approach to the study of safe driving is discussed and illustrated with specific examples. G. R 11

Morris, J.D., Malins, H.L. & Morris, C.V. BITE TIME AUTOMETRY - TEMPORAL INTEGRATION IN THE HYPACUSIC. Proj. AM 22 01 20 03 03, VIII(5), Sep. 1959, June 1959, 15pp. USAF Medical Research Lab., New London, Conn. (Reprinted from A.M.A. Arch. Otol., June 1956, 67: 699-713).

15,047

To determine whether hearing for very brief duration times can lead to a useful test for the diagnosis of hearing disorders, complete otological notes together with complete audiometry and tests of recruitment and of energy integration were obtained on a group of normal ears and patients with hearing impairment. In these latter cases, at least one normal or near-normal frequency was available to serve as a reference for frequency balancing and for integration data. A selected series of 25 defective ears was presented, using the slope of integration and the T_0 (duration, in milliseconds) above which no further improvement in threshold occurs, which provides information as to the integrative power of the ear. Conclusions as to the usefulness of a temporal integration test are made. T. G. R 11

Howell, W.C. & Kraft, C.L. SIZE, BOLD, AND CONTRAST AS VARIABLES AFFECTING THE LEGIBILITY OF ALPHA-NUMERIC SYMBOLS ON RADAR-TYPE DISPLAYS. Contract AF 33 (616) 3612, Proj. 7184, Task 71583, WDC TR 59 536, Sept. 1959, 36pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

15,048

To determine the functions relating size, blur, and contrast, and their interactions, to legibility of alpha-numeric symbols on a radar-type display, 12 subjects were studied under all 64 conditions obtained by combining factorially four levels of each of the three variables. The stimuli, 36 alpha-numeric symbols (26 letters of alphabet, Mackworth style, and ten Arabic numerals) were projected on a ground-glass screen one at a time at a rate controlled by the subject's verbal responses. Speed and accuracy were both stressed. Performance indices were information transmitted, speed, and accuracy. Confusion data were also reported. Optimum legibility is reported for the combined variables. Implications and possible generality of these data are discussed. T. G. I. R 17

Liverant, S. & Scodel, A. INTERNAL AND EXTERNAL CONTROL AS DETERMINANTS OF DECISION MAKING UNDER CONDITIONS OF RISK. Contract AF 49(638) 317, 1959, 14pp. Ohio State University, Columbus, Ohio.

15,052

A test was made of the hypothesis that individuals approaching a situation that involves decision-making under conditions of risk differ on a dimension of internal-external control (those who believe they can exert some modicum of control versus those who do not). An internal-external control test of 60 forced-choice items was administered to 85 Ss, each of whom engaged in a risk-taking situation in which he was required to bet on the outcome of a pair of dice 30 times. Four amounts of money and seven alternative outcomes with known objective probabilities could be selected. The differences in selection of high, intermediate, and low probabilities, in payoff values, in amounts of money spent were analyzed with relation to internally and externally oriented Ss. T. R 15

Chambers, R.M. & Smith, R.J. (Eds.). "WHAT NEEDS DOING ABOUT MAN-IN-SPACE?"—A DISCUSSION AT THE 1959 AMERICAN PSYCHOLOGICAL ASSOCIATION CONVENTION, 1959, 46pp. General Electric Company, Philadelphia, Penn.

15,055
This report contains eight short presentations on the topic "What Needs Doing About Man in Space?" given by psychologists who represented industry, government, and university activities. The major issues discussed were: 1) the role that man has in space; 2) criteria for determining whether a space vehicle should be manned or unmanned; 3) allocation of man-machine functions; 4) techniques and devices for simulating space flight conditions; 5) need for reliable data about man, machines, and space; 6) man's intellectual capabilities in space environments; 7) kinds of tasks to be used in studying man's capabilities; 8) selection of men for space flight; and 9) the need for new approaches to the problem.

Conover, D.W. THE AMOUNT OF INFORMATION IN THE ABSOLUTE JUDGMENT OF MUNSSELL RUE. Contract AF 33(616) 3612, Proj. 7154, WADC TR 55-267, June 1955, 4pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Coker State University & Ohio State University Research Foundation, Columbus, Ohio).

15,058
Using surface colors provided by the Munsell 50-hue series of colored papers, a preliminary equal-discrimination scale for the absolute recognition of colors was developed. Based on these data 16 colors were selected that represented an equally spaced series. This scale was validated with a second group of subjects. Both the initial and validating data were analyzed to determine the maximum amount of information in absolute judgments of hue which can be transmitted to the average color-normal observer by use of surface colors of maximum saturation. The implications for practical coding purposes are noted.

Alexander, H.S. & Charles, W.D. AN EXPERIMENTAL STUDY OF PROLONGED INTERMITTENT PHOTIC STIMULATION. Proj. 7154, Task 71580, WADC TR 59-715, Nov. 1959, 6pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

15,059
To investigate the resistance of the human operator to effects of intense, flashing lights for prolonged periods of time, four subjects were exposed to very bright intermittent photic stimulation at five, ten, and fifteen cycles per second for a period of two and one-half hours. Bipolar electroencephalograms were recorded from the right and left occipital, parietal, and post-temporal areas of the brain. Continuous recording and monitoring were conducted for the first 30 minutes followed by three to five minute recordings every 20 minutes and, finally, 20 minutes of continuous recording at the end of the period. A simple addition test was given at 15-minute intervals. The data were analyzed for effects of photic stimulation over time.

Carroll, J. PRINCIPLES OF CRASH-INJURY INVESTIGATION. Rep. AF CIR 62-0-107, Sept. 1959, 37pp. Flight Safety Foundation, Phoenix, Ariz.

15,063
This presentation of the principles of crash-injury investigation was given at the sixth annual postgraduate course in aviation medicine. The thesis of the paper is that in survivable aircraft accidents, unnecessary injuries and death are produced primarily through aircraft design deficiencies and that primary corrective considerations lie strictly in the field of crash safety design engineering. In order to develop crash safety design parameters it is necessary to collect and analyze accident-injury data. Instructions are given as to the procedures to follow, the kind of data to collect, and how to conduct the investigation. Report forms, design data sheets, a list of basic equipment, and some bulletin board materials are included.

Bradley, J.V. TACTUAL CODING OF CYLINDRICAL KNOBS. Proj. 7184, Task 71501, WADC TR 59 182, Sept. 1959, 29pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

15,070

Tactual coding of knobs by use of bizarre shapes is frequently achieved at the expense of manipulability and setting precision, which appear, in many cases, to be optimal when knobs are cylindrical. Certain parameters of cylindrical knobs were therefore investigated: rim surface, diameter, and thickness. Each parameter was studied in a separate experiment with the other two held constant. In addition, the effect of wearing gloves and time limitations were investigated. The subject's task was to feel one of two knobs whose pictures were before him and identify the correct picture. The data were analyzed in terms of the cues that would permit efficient tactual coding.

Mengelkoch, R.F., Adams, J.A. & Gainer, C.A. THE FORGETTING OF INSTRUMENT FLYING SKILLS AS A FUNCTION OF THE LEVEL OF INITIAL PROFICIENCY. Contract N61339 126, NAVTRADEVEN 71.16-18, ca. 1958, 124pp. USN Training Device Center, Port Washington, N.Y.

15,076

To determine 1) how instrument flying skills are affected by a four-month interval of non-flying and 2) whether this effect differed as a function of initial level of flying proficiency, two matched groups of ROTC students were given a "high" and "intermediate" amount of flight training and then tested for retention after a four-month period of non-flying. Implications of the results for programs to maintain flight proficiency are discussed, and suggestions are made for needed further research.

Meeker, W.F. ACTIVE EAR DEFENDER SYSTEMS: DEVELOPMENT OF A LABORATORY MODEL. Contract AF 33(616) 3051, Proj. 7231, Task 71786, WADC TR 368(11), Dec. 1959, 41pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Radio Corporation of America, Camden, N.J.).

15,077

A laboratory model active ear defender using negative acoustic feedback to provide noise reduction was constructed. The noise reduction obtained at each ear on one subject in a noise field of approximately 100 decibels was demonstrated. Improved transducer arrangements were then developed and further tests were made with arrangements for insert or semi-insert use as well as for conventional over-the-ear headset. The amount of noise reduction from 100 to 300 cycles per second was determined. Design requirements necessary to extend the range to higher frequencies are discussed. G. I. R 9

McConnell, D. & Shelly, M.W. TRACKING PERFORMANCE ON A SEQUENCE OF STEP FUNCTIONS WHICH APPROXIMATES A CONTINUOUS FUNCTION AS A LIMIT. Contract AF 41(657) R, Proj. 1710, WADC TR 59 43, July 1959, 16pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

15,078

To investigate the relations between continuous tracking error and error in tracking a sequence of step functions which approached the continuous signal as a limit, five paid male subjects each served six times in each of 36 conditions. Response measures were root-mean-square error between target and cursor and between cursor and limiting continuous function. Results were compared to previous findings concerning relations between stimulus amplitude and response amplitude. T. G. R 20

15,079

Pendergrass, E.P. EFFECTS OF X-RAY UPON THE SKIN OF HUMAN VOLUNTEERS. Contract DA 49 007 MD 191, Oct. 1959, 7pp. University of Pennsylvania, Philadelphia, Penn.

15,079

The purpose of this investigation, undertaken during World War II, was to determine the feasibility of using X-ray to depilate the donor site prior to skin grafting. There were 99 human volunteers in the original study. The thigh was the usual site of irradiation; dosage and fractionation were varied. It was determined at an early stage that permanent epilation was always accompanied by other undesirable radiation sequelae. However, follow-up of the volunteers has been maintained and observations on late radiation sequelae are reported herein.

Lowder, R.G. CONSIDERATIONS IN PREDICTION OF MAINTAINABILITY. Proj. 7184, Task 71586, WADC TN 59 375, Nov. 1959, 7pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

15,080

This brief report suggests a method for predicting how much maintenance will be required by a system before it goes into production. It also contains recommendations for construction of such a prediction instrument. R 6

15,081

Gain, P. & Fitts, P.W. A SIMPLIFIED ELECTRONIC TRACKING APPARATUS (SETA). Contract AF 41(657) 70, Proj. 1710, WADC TR 59 44, Nov. 1959, 12pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

15,081

A simplified electronic tracking apparatus which is economical and portable is described. By manipulating a control device the subject keeps a pointer of a zero-center meter at the null point. Voltages generated by the subject are compared with corresponding voltages generated by the meter. Result of the comparison is the sum of the voltages, or error. Error then introduced to the subject's display and to a second amplifier is integrated by a third amplifier and displayed on a voltmeter on the experimenter's console. G. I. R 4

Moser, H.M., Oyer, H.J., Fotheringham, W.C., O'Neill, J.J., et al. THE EFFECT OF AUDITORY STIMULATION ON THE PRONUNCIATION OF ENGLISH WORDS BY NON-NATIVE SPEAKERS. Contract AF 19(604)-4575, RF Proj. 882, AFRC TN-59 56, Tech. Rep. 54, Sept. 1959, 16pp. Ohio State University Research Foundation, Columbus, Ohio.

15,090

To investigate the effects of auditory stimulation on the pronunciation of non-native speakers of English, eight foreign students recorded 50 stimulus words under two conditions: 1) pre-stimulation, in which the subject merely read words printed on a list, and 2) post-stimulation, in which the subject first listened to three pronunciations of a single test word by an American speaker and then attempted to imitate the pronunciation. Intelligibility scores were derived, and mean scores obtained under each of the two conditions were compared. T. R 12

15,091

Shapiro, R. & Consolazio, C.F. REPORT ON ENERGY REQUIREMENTS OF MEN EXPOSED TO SOLAR RADIATION AND HEAT. Proj. 5 60 11 020, Rep. 240, July 1959, 20pp. USA Medical Research and Nutrition Lab., Fitzsimons Army Hospital, Denver, Colo.

15,091

To determine the effect of solar radiation and temperature on energy expenditure and caloric requirements, ten male subjects were exposed for ten days to humidity controlled periods of low (67 degrees F.), intermediate (73.3 degrees F.), and high (100.6 degrees F.) temperatures and to a period of direct sunlight (78.3 degrees F.). Sweat and pulse rates, internal body temperatures and blood pressures were recorded daily. Energy expenditure for controlled levels of activity and basic metabolism rates were measured with the Muller-Franz meter. Food and water were supplied freely and consumption recorded. Foods were analyzed for protein, fat, moisture and ash. Calories were computed using energy equivalents of 4, 9, and 4 for protein, fat, and carbohydrates. A discussion is included. T. R 23

Reig, R.W. NON-LINEAR ADAPTATION IN MANUAL CONTROL SYSTEMS. Contract NOBS 72017, Rep. 7420 R 4 & Contract DA 19 020 ORD 4637, Rep. 7967 R-3, June 1959, 81pp. Massachusetts Institute of Technology, Cambridge, Mass.

15,093

To test the human operator as a feedback control element in a situation where a non-linear type of control characteristic appeared to have a good chance of performing better than an "optimum" linear system, three operators were trained and run using the Sanborn and the oscilloscope as visual displays. "Optimum" was defined as minimizing the mean square value of the difference between system input and system output. The specific objective was to determine if a human operator could adapt to a non-linear characteristic when it was to his advantage to do so. Previous work on human operator behavior is reviewed. T. G. I. R 11

15,094

Goffard, S.J. EFFECTIVENESS OF VARIATIONS IN CODE PRACTICE. Task RADOP II, May 1958, 25pp. Human Resources Research Office, George Washington University, Washington, D.C.

15,094

To relieve the monotony involved in practice required to develop skill in receiving International Morse Code, new practice materials, designed to be more interesting, were devised and evaluated experimentally against old materials. Two hundred sixty men, 138 experimental and 122 control subjects, were used in the research. Speed, progress, and follow-up tests were administered. R 9

Suppes, P. BEHAVIORISTIC FOUNDATIONS OF UTILITY. Contract NMR 225(17), Proj. NR 171 034, Tech. Rep. 23, July 1959, 29pp. Institute for Mathematical Studies in Social Sciences, Stanford University, Stanford, Calif.

15,099

The author uses the behavioristic notions of stimulus, response and reinforcement to derive a theory of subjective probability and utility. After discussing the fundamental assumptions of stimulus sampling learning theory, the author attempts to show how this theory may be used to derive a utility function for various simple choice situations. Results of this discussion then are related to Shannon's concept of entropy and Luce's choice axiom.

Finnie, A.W., Reid, A.M. & Lewis, B.D. STREAMLINING THE SOLDIER IN BATTLE ORDER. A FORM OF LOAD CARRIAGE. Rep. 60, Aug. 1956, 40pp. Clothing and Stores Experimental Establishment, Ministry of Supply, London, England.

15,102

This report describes a form of load carriage which seeks to distribute the present battle order load equally between front and back in such a way that comfort and stability are increased. A small comparative field trial was made of this equipment and the Z2 (modified) equipment, which is generally accepted as the best existing British load carriage equipment for battle order. The main field trial was supported by range firing tests and a test on water uptake and time of drying out of both equipments. Subjective opinions were also obtained.

Hardy, R.H., Edwards, R.G. & Hughes, W.P. SOME MOVEMENTS OF THE FOOT DURING WALKING. FEBRUARY, 1953. Rep. 28, Jan. 1954, 16pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,103

To examine the movements of the foot during walking and to relate the movements observed to probable muscular activity and specific muscular function, foot movements of 150 subjects, walking on a power-driven endless belt, were recorded by means of cinematography, electromyography and photography of specifically placed neon traces. Measurements were made with reference to inversion during the terminal phase of the forward step; abduction of the great toe during the same phase; inversion of the feet during the thrust phase; eversion of the foot during passing phase (free leg passing standing leg); and internal rotation of the leg. Data are treated by means of the Chi Square. A discussion is included.

Hardy, R.H. CRITERIA OF COMPARISON OF DIFFERENT TYPES OF FOOTWEAR (AUGUST-SEPTEMBER 1951). Rep. 16, April 1952, 21pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,104

To determine if simple laboratory observations before and after a forced march of 13 miles could detect any differences in response of a subject to the exercises in General Service Boots compared with Crepe-soled shoes, observations were made of 11 subjects by means of slow motion cinematography, standard radiography, standard photography, plethysmometry, dynamometry, and subjective responses. Data are treated statistically by comparing before and after observations of subjects using both kinds of footwear. Results are discussed in terms of the establishment of criteria for footwear comparison.

Kenchington, K.W.L. & Draper, J. TRIALS AT LOW TEMPERATURES OF GLOVES-COLD/WET (MARCH-APRIL, 1955). Rep. 55, Feb. 1957, 28pp. Clothing and Stores Experimental Establishment, Ministry of Supply, London, England.

15,105

To compare the performance of three different combinations of handwear for use under cold/wet conditions, the following tasks were carried out by 12 1/2 year old subjects in a climatic chamber at 32 degrees F and 10 degrees F: marching, resting, handling wet line, loading and firing a rifle, and dismantling and reassembling a Bren gun. Objective measurements were made of hand temperatures and of manipulative dexterity. Subjective assessments of hand comfort and suitability were also obtained. Recommendations are made concerning relationships between thermal environment, condition of gloves, dexterity and required activities.

Kenchington, K.W.L. & Draper, J. PETROLEUM RESISTANT MITTENS PART II. A SURVEY OF HAND DIMENSIONS. CEPRE Rep. 21, Nov. 1952, 17pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,106

To determine the range and distribution of hand sizes of potential users of petroleum resistant mittens, a simple sizing board was used to obtain hand length and breadth dimensions from a random sample of 100 servicemen. Theoretical distributions are fitted to the data and used in preparing different hand sizing schemes based upon two breadths and three, four, and five different lengths. Proportions of mittens to be manufactured for each hand size are calculated for each of these schemes and the percentages of the population expected to be fitted by the scheme are determined. Recommendations for the future design of petroleum resistant handgear are included.

Proctor, K.A. COMMENTS ON THE LAY-OUT OF THE DRIVER'S SEAT. F.T. 1000. Mem. 2, Dec. 1952. 4pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,107

A drawing of a conventional motor vehicle seat is reviewed. The following features of the layout are discussed and recommendations made: general layout, steering, foot pedals, hand brake, gear lever, seat (angle and firmness), and seat adjustment. T. I. R 8

15,108

Proctor, K.A. & Stockbridge, H.C.M. COMMENTS ON THE SEATING ARRANGEMENTS F.T. 402. Mem. 3, April 1951. 4pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,108

Drawings of general arrangements and seating in the Morris Motors F.V. 302, A.1575 and A.1571 tanks were inspected and commented upon. Comments were focused on, and included, the following aspects of seating: aspects of design such as dimensions, covering, surface inclination, relation of seat to controls, and leg-rest height. T. I. R 4

15,109

Proctor, K.A. & Stockbridge, H.C.M. COMMENTS ON THE COMMANDER'S SEAT F.T. 603. Tech. Mem. 6, Dec. 1952. 5pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,109

An armrest support was designed and built which, while using minimum space, would retain the desirable features of an earlier buttack support: provision of adequate body stabilization while enabling the operator (Commander/Forwarder) to rotate his body and a machine gun easily in one movement. Ten subjects supported themselves in a neck-up for ten minutes in a position approximating that in the turret of the F.V. 503. Subjective opinions of the comfort of the buttack support were obtained. The arm rest support was discussed in terms of suggested modifications and use on vehicles other than the F.V. 503. T.

15,110

Beld, A.M., Reckmann, E.T. & Draper, J. A COMPARATIVE PHYSIOLOGICAL FIELD TRIAL OF FOUR TYPES OF LOAD CARRIAGE EQUIPMENT. Rep. 43, Jan. 1955, 22pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,110

The trial represents an attempt to assess the physiological strains imposed by four types of load carrying equipment. The assessment consisted of 1) a validation field trial in which the value of the measurements was examined, 2) a main field trial in which the four equipments were compared in battle order, and 3) a laboratory trial comparing the equipments. The measurements were 1) physiological—pulse rate, rectal temperature, respiratory ventilation volume, and subjective ratings; 2) performance tests—rifle fire, Bren magazine filling and sand shovelling. Marches of three and six hours and periods of 28 hours continuous duty in the field and half hour walks at three miles per hour (treadmill) in the laboratory were carried out. T. I. R 7

15,111

Reckmann, E.T. & Taylor, P.F. BODY TEMPERATURE STUDIES PART III. RECTAL AND ORAL AS INDICES OF INTERNAL TEMPERATURES. SOME THEORETICAL AND PRACTICAL CONSIDERATIONS. Rep. 53, April 1954, 48pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,111

The interrelationship is considered of temperatures in men taken simultaneously in the mouth and at three points in the rectum under the following conditions: 1) rest, 2) physical change, 3) exercise, 4) heating and cooling, 5) eating and drinking. The results are of some fundamental interest but may also throw light on practical problems concerning the physiology of clothing and equipment. Data from various animals are included. T. I. R 60

15,112

Simmons, G.J., Anderson, D.M. & Draper, J. FUTURE BOMBING PROLONGED PERFORMANCE ON A SIMPLE COMPENSATORY TRACKING TASK. DUNDEE - MARCH 1954. Rep. 45, Jan. 1954, 14pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,112

To test the hypothesis that absence of variability of sensory input relates to fatigue of tracking performance, a preliminary experiment was conducted with 21 subjects. Each subject was tested for an uninterrupted period of two hours on a simple compensatory tracking task that required keeping the target correctly aligned by cranking a handwheel at a constant speed. It was considered that failure to attend the display would result in target deviation. The resulting errors were recorded and analyzed for consecutive half-hour periods. T. I. R 11

15,113

Stokes, A.S., Hughes, W.P. & Draper, J. PRELIMINARY TRIAL OF HEAVY LOAD CARRIAGE. CARRIER, MURRAY, G.S. & U.S. PARACHUTE, TUNNO. Rep. 46, July 1954, 24pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,113

This study compares the Carrier, New-Pack, G.S., Type "T" and U.S. Parachute, Piqued and investigates the ventilation volume and pulse rate when loads greater and less than one-third body weight are carried. Four men carried loads of 40 and 75 lb. on 50-minute marches in summer weather on the above carriers; physiological measures were taken at different intervals throughout. Subjective opinions were also obtained. The physiological data were subjected to variance analysis. T. I. R 11

Tolson, J. & Draper, J. BODY TEMPERATURE STUDIES PART I. SKIN TEMPERATURE SYMMETRY AND MEAN. Rep. 52, July 1956, 19pp. Clothing and Stores Experimental Establishment, Ministry of Supply, London, England.

15,114

To obtain information on skin temperatures at symmetrically placed points on the body and to compare various methods of estimating mean skin temperature, three experiments were performed. 1) Temperature variation over small areas of skin were measured on one subject. Temperatures at points on the circumference and at the center of one-inch diameter circles on various parts of the body were determined. 2) Skin temperatures were measured at a large number of symmetrically placed points on the skin of one subject. 3) Experiment two was repeated on four subjects. Six different methods were used to calculate mean skin temperatures. T. G. I. R 19

15,115

Bodd, A.M., Brager, J., Florida, A.V., Anderson, B.M., et al. A COMPARATIVE PSYCHOLOGICAL TEST OF A PROGRESSIVE COMBAT EQUIPMENT FIGHTING ORDER. (C.E.F.C.) AND THE ENVIRONMENTAL EQUIPMENT 2.2 (M.P.). Rep. 64, Sept. 1957, 44pp. Clothing and Storage Experimental Establishment, Ministry of Supply, London, England.

15,115

The trial was carried out in two phases 1) a conditioning period during which the 16 subjects were habituated up and standardized as far as possible by repeated practice in taking all obstacles under 2) the test period in which equipment was compared during normal soldierly activities such as marching, running, jumping, etc., in performance of such tests as dexterity and finally, in a long exercise of 26 hours continuous duty. Measurements were taken of post exercise pulse rates, time measures where appropriate, subjective opinions, and observational notes with photographs. Comparisons were made on the basis of all these measures.

Brown, G.M., Zayner, M.C., Bernstein, A.J. & Chamber, H.A. DEVELOPMENT AND EVALUATION OF AN IMPROVED FIELD RADIO REPAIR COURSE. NUMBER 18 58, Sept. 1959, 81pp. Human Resources Research Office, George Washington University, Washington, D.C.

15,116

Information obtained in a field study was the basis for devising a course of instruction for Field Radio Repairmen, MOC 286-1. The new course emphasizes recognizing and correcting the most common troubles in the most frequently repaired items of equipment. A systematic trouble-shooting procedure was provided and "functional context training" features (theoretical material presented in a maintenance-oriented context) were incorporated. To evaluate the new course two groups of 100 students each were given the new course and the standard course respectively and were then administered a comprehensive battery of job-related proficiency tests. Performance scores were compared for relative proficiencies.

Selmares, S. & Tappscott, R.J. THE EFFECTS OF VARIOUS COMBINATIONS OF DAMPING AND CONTROL POWER ON HELICOPTER HANDLING QUALITIES DURING BOTH INSTRUMENT AND VISUAL FLIGHT. NASA TN D 58, Oct. 1959, 38pp. National Aeronautics and Space Administration, Washington, D.C. (Langley Research Center, Langley Field, Va.).

15,118

To determine the effects of control power and damping variations on handling qualities, four experienced pilots made 35 visual flight maneuvers and Instrument Landing System approaches conducted under simulated blind-flying conditions in a 5,500 lb. reciprocal-engine helicopter. Control power (moment on helicopter produced for a given control displacement) ranged from one-half original to four times the original power. Damping (moment on helicopter proportional to and opposing angular velocity) ranged from very low to high. Results are evaluated on the basis of pilot opinion and appropriate statistical procedures (t tests) and discussed in terms of applicability to the other aircraft.

Goodill, H.S. SURVEY OF PERSONAL AND ENVIRONMENTAL FACTORS IN DRIVING. FINAL REPORT. Contract DA 49 007 MD 302, Nov. 1959, 41pp. University of Colorado Medical Center, Fort Collins, Colo.

15,120

To determine if specific personality factors associated with accident/violation driving could be used to identify non-safe drivers before they began to drive, a predictive study of 6906 "pro-drivers" (median age 15 years) were administered a battery of personality tests (Guilford-Zimmerman Temperament Survey; Allport, Vernon, and Lindzey Study of Values; Driver Survey; and the CAT). Also, these specific tests on a group of 32 driver education subjects and 104 non-driver education control subjects were gathered and analyzed in terms of 26 measures of personality and value for each subject.

Kemper, R.M. A BREATH-HOLDING TEST: A PRELIMINARY INVESTIGATION OF ITS PSYCHOMETRIC USEFULNESS. Proj. NM 18 09 1 2, Vol. IX, Oct. 1959, 340-348. USN Medical Field Research Lab., Camp Lejeune, N.C.

15,121

To explore the usefulness of a group objective test of breath-holding in contributing to the assessment of temperamental characteristics, a method was presented for administering such a test. The test was administered to a group of 51 Marine Corps officer helicopter pilots on two occasions. Test-retest reliability was computed. Test scores were then related to personality measures obtained from the Guilford-Zimmerman Temperament Survey, the Minnesota Multiphasic Inventory and the Objective-Analytic Personality Test Battery. Significant relationships are interpreted and recommendations for further study are made.

Sanders, J.W. SURVEY OF HUMAN DYNAMICS DATA AND A SAMPLE APPLICATION. Contract AF33(616) 5607, Proj. 7180, Task 71501, WADC TR 59 712, Nov. 1959, 12pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Minneapolis-Honeywell Regulator Company, Minneapolis, Minn.).

15,124

This study concerns the application of the results of research on the human transfer function to compensatory tracking tasks in which the human operator is part of a closed loop tracking system. The form of a quasi-linear (linear for a particular task) human transfer function was laid out on the basis of previous experimental results. Calculations were made of mean square tracking error, and effects of variation of aircraft dynamics on tracking error were examined, assuming human reaction time and neuromuscular lag were constant.

Negan, J.J. TRACKING PERFORMANCE RELATED TO DISPLAY CONTROL CONFIGURATIONS. Proj. 20 F-108, NAVTRACDEVEN TR 322 1 2, Jan. 1959, 22pp. USN Training Device Center, Port Washington, N.Y.

15,125
To determine the relative merit in terms of operator performance, six display-control configurations using a continuous random input, position and rate control, and pursuit and compensatory tracking were tested. Ninety-six male college students served as subjects. Questions such as the following were investigated: Does the operator perform better with linear or rotary display configuration? Are differences in eye-hand coordination performance with various display-control situations magnified or diminished with practice? Implications of the results are discussed for the form in which information is presented to, and in which control is exercised by, operators in instructor's stations and other training equipment.

Molnar, A.P. & Lybrand, W.A. BASIC DEVELOPMENT ACCOMPLISHED ON WIDE-ANGLE, NON-PROGRAMMED, VISUAL PRESENTATIONS. VOLUME II. Contract N61339 404, NAVTRACDEVEN TR 404, April 1959, 195pp. USN Training Device Center, Port Washington, N.Y. (Carmody Corporation, Buffalo, N.Y.).

15,126
Part I of this report contains a discussion and evaluation of equipment and techniques used in visual presentations and a summary of functional design criteria which should be considered in the design of visual equipment for training purposes. There are also recommendations for research and development. Part II contains abstracts of documents pertaining to visual presentations and includes the areas of design approach, training purpose and characteristics, description of useful components, and a brief summary of reports reviewed. Part III consists of a 75-item general bibliography. Part IV presents the state-of-the-art questionnaire sent to manufacturers and organizations.

Molnar, A.P. & Lybrand, W.A. BASIC DEVELOPMENT ACCOMPLISHED ON WIDE-ANGLE, NON-PROGRAMMED, VISUAL PRESENTATIONS. VOLUME I. Contract N61339 404, NAVTRACDEVEN TR 404, April 1959, 142pp. USN Training Device Center, Port Washington, N.Y. (Carmody Corporation, Buffalo, N.Y.).

15,127
This report is a survey of research and basic development on wide-angle, non-programmed, visual presentation. It summarizes available information in a form intended to be useful to design engineers working in this area. The visual presentations discussed are used primarily as training and research tools for the purpose of simulating the "real visual world" to operators of vehicle systems.

Howell, W.C., Christy, R.T. & Kinkade, R.G. SYSTEM PERFORMANCE FOLLOWING RADAR FAILURE IN A SIMULATED AIR TRAFFIC CONTROL SITUATION. Contract AF 33(616) 3612, Proj. 7164, Task 71583, WADC TR 59 573, Sept. 1959, 15pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Laboratory of Aviation Psychology, Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

15,128
The situation in which the operator assumes control in the system after failure of a primary automatic component was studied using the Ohio State University Electronic Air Traffic Control Simulator. Primary variables were: prebreakdown activity of operator and degree of procedural flexibility in the task. Six trained undergraduates participated both as operators and pilots. A factorial design was employed. Performance was measured in two categories: system efficiency and safety. The results are handled in terms of manual takeover of an aircraft after loss of Planned Position Indicator information in an air traffic control system.

Murray, E.J., Schein, E.H., Erikson, K.T., Hill, W.F., et al. THE EFFECTS OF SLEEP DEPRIVATION ON SOCIAL BEHAVIOR. J. soc. Psychol., 1959, 42, 229-236. (USA Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington, D.C.).

15,130
To determine the effect of sleep deprivation on a variety of social activities and on the frequency of change from one activity to another, two experiments were performed in which behavior observations were made for 72 and 98 hours of sleep deprivation. In the first, 10 subjects were observed extensively (every 15 minutes); whereas the second was done to obtain a larger sample of subjects (50) using fewer observations (at beginning, then after 66 to 88 hours) after a longer loss. The percentage of various categories of behavior were statistically compared for the experimental and control groups as well as within the experimental as a function of hours of loss.

Plomp, R. & Bouman, M. RELATION BETWEEN HEARING THRESHOLD AND DURATION FOR TONE PULSES. J. acoust. Soc. Amer., June 1959, 31(6), 749-758. (Institute for Perception RVO-TNO, Soesterberg, The Netherlands).

15,132
The relation between hearing threshold and duration for tone pulses was examined in light of a new hypothesis: "Switching on a tone pulse of intensity results in an effect somewhere in the hearing pathway, that approaches its end value asymptotically according to an exponential function, this end value being proportional to the perception occurs when s exceeds a critical value so." Masked thresholds at a fixed noise level were obtained on two observers at 250, 500, 1000, 2000, 4000, 8000 cps. for durations of ten seconds to one msec., by a descending series of intensities. A formula was derived to correct for short pulse durations because these data deviated from the hypothesis. The data from other relevant studies are also discussed in terms of the present hypothesis. Holt, R.R. & Goldberger, L. PERSONOLOGICAL CORRELATES OF REACTIONS TO PERCEPTUAL ISOLATION. Contract AF 33 (616) 6173; Proj. 7222, Task 71743, NADC TR 59-735, Nov. 1959, 46pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Research Center for Mental Health, New York University, New York, N.Y.).

15,134

To determine the relationship between personality and reactions to sensory deprivation, 14 male students were subjected to eight hours of such deprivation, then retested on a battery of cognitive tests as well as several personality assessors. Fourteen measures of reaction were derived from the behavior and verbalizations in the deprivation situation. From personality data Q-sort ratings were obtained. The results are presented as rank-order correlation coefficients between the dependent variables from the isolation study and independent variables of personality.

Holding, D.H. AN APPROACH TO THE PROBLEM OF EQUIPMENT COMPLEXITY AND MAINTENANCE TIME USING ARMY SELECTION GROUP DATA. Tech. Memo. 18, ca. 1954, 6pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,135

The problem of equipment complexity and its relation to maintenance time was examined in terms of criteria of efficiency and potential manpower using army selection group data. The criteria of efficiency are operating time, operating complexity, and existing operator/maintainer ratio. The potential manpower problem involves army selection procedures, aptitude tests, and educational standards. No specific recommendations are made.

Harris, J.D. AUDITORY FATIGUE FOLLOWING HIGH FREQUENCY PULSE TRAINS. Proj. NM 22 03.20.02.01, XVIII(1), Rep. 306, Jan. 1959, 9pp. USN Medical Research Lab., Naval Submarine Base, Conn.

15,138

Auditory fatigue following trains of high-tone pulses was measured in 156 young men varying: 1) sound pressure level (SPL)—90 to 120 db., 2) duration of exposure—1 to 25 minutes, 3) duty cycle—1.4 to 100 per cent. Stimulation was at 3500 cps. Index of fatigue was the total cumulated loss of threshold occurring in the first ten minutes of recovery. Equi-noxious contours were obtained with the MUX, a new unit derived from the fatigue index employed. From these data protection levels and damage risk criteria were specified.

Halsey, Rita M. IDENTIFICATION OF SIGNAL LIGHTS: I. BLUE, GREEN, WHITE, AND PURPLE. II. ELIMINATION OF THE PURPLE CATEGORY. Proj. NM 22 02 20.03.01, XVIII(5) Rep. 310, May 1959, 14pp. USN Medical Research Lab., Naval Submarine Base, Conn. (Reprinted from: J. opt. Soc. Amer., Jan. 1959, 49(1), 45-55).

15,139

Identification of colored light signals by 100 observers using one of six color names (red, yellow, green, blue, purple, white) was done for two intensity levels of each of 50 stimuli presented singly against a dark background. The test colors were blue, green, white, and purple. Ten observers in four rows were run at a time, thus there were four viewing distances (10 to 17.5 ft.) and four sizes of stimulus (4 ft. 10 ins. to 4 ft. 6 ins.) they recorded their observations on data sheets. The results were represented as chromaticity zones. A second experiment repeated the above one except "purple" was eliminated as a possible response. The data from these two studies are applicable to colored signal specifications.

Gravendeel, D.W. & Plomp, R. THE RELATION BETWEEN PERMANENT AND TEMPORARY NOISE DIPS. AMA Arch. Otolaryng., June 1959, 62, 714-719. (Institute for Perception RVO-TNO, Soesterberg, The Netherlands).

15,141

Permanent and temporary noise dips were measured on 288 soldiers and 36 recruits respectively by continuous audiometry. The relation between these two forms of noise deafness was sought to determine whether the same mechanism is responsible for these losses. Spread of dips across the frequency spectrum and average shape of dips were determined from the audiometric data. Comparison of these characteristics in the two cases provided some evidence about the nature of the mechanism.

Corkindale, K. G. & Siddall, G. J. A SHORT EVALUATION OF NUPRONITE SAFETY NIGHT DRIVING GOGGLES. Tech. Memo. 35, June 1955, 9pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,145
To evaluate the general design of Nupronite safety night-driving goggles and to determine their anti-glare properties, five subjects, under glaring conditions, each made 20 judgments wearing glasses (and 20 judgments while not wearing glasses) of the position of a Landolt broken ring. Results were discussed in terms of acuity vs. anti-glare properties (determined by subjective opinion). Also, a questionnaire was administered to five subjects wearing goggles. The items concerned: reduction of traffic headlight glare, reduction in visual field, misting and windproofing, comfort and adjustment, durability, and reflection from silvered portions of the lenses. Results from both the acuity test and the questionnaire are utilized in presenting the satisfactory as well as unsatisfactory anti-glare and acuity properties. I. R 4

Barlow, R. E. & Hunter, L. C. MATHEMATICAL MODELS FOR SYSTEM RELIABILITY. Contract DA 36 039 SC 78281, Engng. Rep. EDL E35, Aug. 1959, 105pp. Sylvania Electric Products, Inc., Mountain View, Calif.

15,151
This paper presents "a workable method for determining the reliability of large, complex systems. Repair is an integral part of the model proposed and the usual assumption of component independence is not made." Reliability of the system is defined in terms of a stochastic process. There are specific applications of the generalized concept. Two types of preventive maintenance policy are presented. The problem of optimal checking procedures is solved for one class of failure distributions. T. G. R 9

15,152 Alexander, L.F., Ford, J.D., Jr., Jensen, B.T., Jordan, W., et al. PROBLEMS ENCOUNTERED IN DEVELOPING AND MAINTAINING A FIELD SYSTEM TRAINING PROGRAM. SP 107, Sept. 1959, 21pp. System Development Corporation, Santa Monica, Calif.

This volume contains 5 papers presented at the 1959 Annual Meeting of the Human Factors Society at UCLA, Los Angeles, Calif. The first paper deals with the requirements for a field system training program. Among the topics covered are: stimulus inputs, motivation and morale, knowledge of results, utilization of knowledge of results, personnel selection and turnover. The second paper deals with the appropriate contribution of simulation techniques to system training. Among the topics discussed are the reasons for simulation and several general principles regarding simulation. The third paper deals with new machine training techniques, including feedback, and debriefing. Among the topics discussed are reasons for debriefing, information in this area, operational definitions, and pay-off connected with debriefing. The fourth paper deals with problems of conducting system training in a military culture. Major problems cited are those due to: a) introducing new procedures into a culture utilizing military personnel as training personnel, and c) aspects of the military culture antagonistic to new training procedures.

15,153 Hendler, E. THE EFFECTIVE STIMULUS FOR WARMTH SENSATION IN MAN. Proj. NM 17 01 13-2, Rep. NAMC ACCL 460, Aug. 1959, 10pp. USN Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

15,153 To determine threshold warmth sensation, a central, circular area of forehead skin, blackened or unblackened, of an experienced subject was exposed to radiation from an infrared source. A stimulus was presented; the subject indicated whether or not he had experienced a warmth sensation. Skin temperature was recorded after each exposure, and an interval between exposures allowed this to return to a relatively steady level. Exposure duration and source intensity were varied.

15,157 Von Diringshofen, H. OBSERVATIONS ON THE PHYSIOLOGY OF THE SENSES DURING THE TRANSITION FROM ACCELERATIONS TO WEIGHTLESSNESS. From: "Rocket Technology and Space Research, April-June 1959, 3(2), 1-8". Trans. 61, Nov. 1959. USA Feltman Research & Engineering Labs., Picatinny Arsenal, N.J.

15,157 This report describes subjective observations during short periods of weightlessness realized through free fall, parabolic flights, and the sling test (laboratory conditions). The period of weightlessness lasted anywhere from 7 to 14 seconds under these conditions. The discussion is aimed particularly at indications of human tolerance of weightlessness as influenced by the transition stage from acceleration to weightlessness. These observations are made with reference to test flights of the rocket plane X-15.

15,159 Campbell, F.W. & Westheimer, G. FACTORS INFLUENCING ACCOMMODATION RESPONSES OF THE HUMAN EYE. Contract WNR 495(09), RF Proj. 654, Tech. Rep. 5, Sept. 1959, 4pp. Ohio State University Research Foundation, Columbus, Ohio. (Reprinted from: J. opt. Soc. Amer., June 1959, 49(6), 568-571).

15,159 To establish the role of chromatic aberration, spherical aberration, and astigmatism in supplying information to the brain on the direction of error in out-of-focus blurring, four subjects adjusted an out-of-focus high-contrast test object until it was in focus. These adjustments were made in a normal optical situation, i.e., with all clues operating in a monochromatic situation, i.e., without chromatic aberration; in a monochromatic plus pupil annulus situation, i.e., without chromatic and spherical aberration; and in a situation with all three clues missing. All subjects were homotropized; and an artificial pupil was used. Dioptric displacement of the target was recorded.

15,161
This bibliography on space medicine contains summaries of reports and articles compiled from the abstract card indices of the Netherlands Armed Services Technical Documentation and Information Centre. Some of the reports are available on loan from the Centre. The index indicates wide coverage of factors related to space travel; from biological and physiological to psychological variables; design of vehicles and suits; radiological problems of space flight, etc. One hundred eight abstracts are included. A majority are in English, but some are in German or Dutch.

15,162
Payne, R.B. TRACKING PROFICIENCY AS A FUNCTION OF THERMAL BALANCE. Tech. Rep. 58 14, May 1959, 10pp. USAF Arctic Aeromedical Lab., Ladd AFB, Alaska.

15,162
This experiment investigated the relation between body heat loss and performance decrement in monitoring and controlling a complex visual display, and the effect of glycine administration on such decrement. The USAF SAM Multidimensional Pursuit Test was given to 72 airmen. Considerable training in this task preceded testing. Subjects were assigned to one of nine conditions: three temperatures (70, 55, and 40 degrees F.) and three glycine treatments (0, 20, and 40 grams). A test session consisted of 160 one-minute trials, separated by 15-second rest intervals. The performance scores were treated by analysis of variance technique.

Siddall, G.J. & Corkindale, K.G. AN EVALUATION OF LAMAC GLARE GOGGLES. Tech. Memo. 34, June 1955, 12pp. Clothing and Equipment Physiological Research Establishment, Ministry of Supply, London, England.

15,167
This is an evaluation of the Lamac Glare Goggles for general use. Three general techniques were employed: examination for durability, adjustment ease, etc.; testing of glare effects on acuity; and questionnaire for user opinions. For the second method, five subjects indicated the position of Landolt rings with a central and 45-degree glare source both with and without the goggles. Decision time and error measurements were obtained and analyzed by analysis of variance technique. These findings plus the durability factors and user opinions are discussed in terms of the range of usefulness of the goggles.

Sweeney, E.J., Kinney, Jo Ann S. & Ryan, Alma P. STANDARDIZATION OF A SCOTOPIC SENSITIVITY TEST. Proj. NM 23 01 20.04.03, Vol. XVIII, No. 3, Rep. 308, March 1959, 8pp. USN Medical Research Lab., Naval Submarine Base, Conn.

15,169

A scotopic sensitivity test was examined to determine 1) whether it could measure individual differences in night sensitivity in a sample of enlisted men, and 2) the most efficient means of administering and scoring it. Some reliability and validity checks were made. The test consisted of points of light located 5, 10, and 20 degrees from central fixation on each of the four axes of a quadrant. The intensity was constant at 4.986 log μ cd, the size was varied in six equal steps: .10 to .25 degrees. The sample was 108 enlisted men. Number of correct responses for each stimulus size for each radial position were obtained and analyzed. Results were also obtained and compared for two testing procedures, monocular vs. binocular viewing, retest, etc. T. G. R 5

Schwartz, I. & Dimick, F.L. COMPARISON OF HIGH ACUITY SCORES ON SNIFFEN AND ORTHO-RATER TESTS. Proj. NM 23 01 20.04.01, Vol. XVII, No. 11, Rep. 304, Oct. 1958, 5pp. USN Medical Research Lab., Naval Submarine Base, Conn. (Reprinted from: Amer. J. Optom. & Arch. Amer. Acad. Optom., June 1958, 35(5), 309-313).

15,169

High acuity scores on Snellen and Ortho-Rater tests were compared in order to determine their size relationship and to set up a transformation equation of score from one test to the other. A total of 1,071 scores in each of the tests was obtained. The correlation ratio and coefficient of correlation were obtained. Prediction from one score to the other is discussed, and conversion scores are presented. T. G. I. R 2

Rao, U.V.R., Savage, I.R. & Sobel, M. CONTRIBUTIONS TO THE THEORY OF RANK ORDER STATISTICS: THE TWO-SAMPLE CENSORED CASE. Contract NONR 2582(00), Task NR 042 200, Tech. Rep. 8, Sept. 1959, 19pp. University of Minnesota, Minneapolis, Minn.

15,171

In this article rank order theory is developed for the two-sample problem in which not all of the random variables are observed, i.e., the observations have been censored. The approach is similar to the regular two-sample case except in the consideration of likelihood ratios of rank orders. Several censoring rules and terminal procedures are presented and discussed. 15,172

Van Den Brink, G. & Bouman, M.A. VISUAL ACUITY DEPENDENT ON SPHERICAL CORRECTION. Ophthalmologica, Sept. 1959, 138(3), 222-224. (Institute for Perception RVO-TNO, Soesterberg, The Netherlands).

15,172

The results of some experiments on state of accommodation and its relation to dioptric power are briefly discussed. Measurements of visual acuity were made for several values of spherical power at a number of luminances. The relationships among these factors are briefly indicated. G. I.

15,173

Vos, J.J. ABOUT THE DANGER OF OCULAR LESIONS BY INFRARED SEARCHLIGHTS. Rep. 12F 1959 8, ca. 1959, 8pp. Institute for Perception RVO-TNO, Soesterberg, The Netherlands.

15,173

This report discusses the possible danger of ocular injuries from infrared radiation. Using data from other sources, the effective thermal dose upon the iris diaphragm is calculated and compared tabularly with other data. Results from a previous study by the author are used to calculate the temperature rise in the retina. These two indices are evaluated in terms of potential ocular lesions. T. G. R 4

15,174

Vos, J.J. A THEORY OF RETINAL BURNS. Rep. 12F 1959 6, ca. 1959, 26pp. Institute for Perception RVO-TNO, Soesterberg, The Netherlands.

15,174

A quantitative formulation of the generation, conduction, and convection of heat is applied to the occurrence of functional damage of the retina by heat. Experiments by W.T. Ham, et al., on retinal flashburns in rabbit eyes were then analyzed. In general, a satisfactory explanation did not use the critical temperature level concept, which proved too simple, but was in terms of "equal steam production". G. I. R 8

15,175

USN Aviation Safety Center. AIRCRAFT MAINTENANCE ERROR STUDY. 1958, 39pp. USN Aviation Safety Center, Norfolk, Va.

15,175

This report for the calendar year 1957 covers all aircraft accidents in which primary and/or secondary cause was maintenance, service, or supervisory error. The accidents or incidents were broken down by aircraft system involved. The authors state that basic causes for maintenance errors among all model aircraft were fundamentally the same, and point out that pilots and maintenance personnel should read the narrative for all models. Most of the errors fall within the categories of 1) improper and incomplete security of equipment, 2) improper adjustments, and 3) leaving loose objects adrift. I.

Marum, E.R. VISUAL RECOGNITION ALONG VARIOUS MERIDIANS OF THE VISUAL FIELD II NINE-ELEMENT TYPED WRITTEN TARGETS. Proj. MICHIGAN, Rep. 2144 293 T, Dec. 1953, 23pp. Willow Run Labs., University of Michigan, Ann Arbor, Mich.

15,184

To study visual recognition of targets (composed of binary elements) presented along various meridians, 20 observers (ten experienced, ten inexperienced) recorded on a matrix target patterns which were presented on the N-E, NW-SE, W-E, or NE-SW meridian of the visual field. Target exposure was approximately 0.1 seconds; luminance of field approximately 6.8 foot-lamberts. Observers were sometimes informed in advance which meridian would be used. The different experimental and subject conditions were tested by the Friedman two-way analysis of variance.

Dale, H.C.A. A PRIORI PROBABILITIES IN GAMBLING. Nature, March 1959, 183, 842-843. (Applied Psychology Research Unit, MRC, Cambridge, England).

15,189

To examine the question of a priori probabilities directly, subjects were questioned before they began to play at a laboratory gambling task. One hundred thirty-one subjects used in the first experiment had a choice of three bets, of long, short, and medium odds. In the second experiment 142 subjects were given only one pay-off matrix, in which it paid to avoid the bet with long odds. Results are discussed as they relate to previous findings that individuals tend to over-estimate the frequency of occurrence of infrequent events and under-estimate that of comparatively frequent ones.

Broadbent, D.E. INFORMATION THEORY AND OLDER APPROACHES IN PSYCHOLOGY. Reprint from: 'Proceedings of the Fifteenth International Congress of Psychology', 1959, 111-115. North Holland Publishing Co., Amsterdam, Holland. (Applied Psychology Research Unit, MRC, Cambridge, England). (APU 344/58).

15,190

The author holds that information theory, far from having exhausted its usefulness to psychology, does provide an "objective language for discussing events within the nervous system," and... "puts a new emphasis on the process of discriminating the actual sensory event from other possible ones, which older approaches have neglected." Experiments which have raised doubts as to usefulness of the theory are discussed.

Bowen, H.M., Andreassi, J., Truax, S., & Orlovsky, J. OPTIMUM SYMBOLS FOR RADAR DISPLAYS. Contract NONR 2682(00), Sept. 1959, 33pp. Dunlap and Associates, Inc. Stamford, Conn.

15,196

The experiments described in this report were conducted to discover 1) sets of geometric symbols which could be recognized with high accuracy under a variety of display conditions and discriminated from each other, and 2) the size and stroke width to height ratio desirable for symbols to be used on complex displays. Absolute discriminability was established for a set of 20 geometric shapes, and makes possible the selection of a set of geometric shapes which will seldom be confused. The study was specifically oriented towards radar displays. Recommendations were made regarding appropriate dimensions of such symbols.

Bartlett, Susan C., Beinert, R.L. & Graham, J.R. STUDY OF VISUAL FATIGUE AND EFFICIENCY IN RADAR OBSERVATION FINAL REPORT. Contract AF 30(602) 667, RADG TR-55 100, 1955, 70pp. Dept. of Physics, Hobart College, Geneva, N.Y.

15,197

Three experiments are reported in which the effects of luminance of sweeping sector background, speed of rotation of the sweep, and intermittence of appearance of pips on radar observer efficiency and visual fatigue were studied. Luminances were .003, .03, and .3 ml; speeds were 4, 6, 10, and 15 rpm; intermittencies varied. Three naive subjects monitored a radarscope for one or two-hour watches and reported each time a target appeared. Phorias were measured before and after each session. Target detection data were subjected to analysis of variance. Individual variability is discussed.

15,200

Bowen, H.M. THE RADAR SIGNAL AND THE HUMAN OBSERVER. June 1954, 12pp. Applied Psychology Research Unit, NEC, Cambridge, England.

15,200

This paper attempts to define the optimum match between the variable features of the radar display and the visual and mental abilities of the human observer. Brief reviews of relevant findings on signal detection as a function of noise, background brightness, on signal location and tracking as a function of scale, display size, on the effect of ambient illumination, and on the effect of operator alertness are presented.

15,201

Crutchfield, R.S., Woodworth, D.G. & Albrecht, Ruth E. PERCEPTUAL PERFORMANCE AND THE EFFECTIVE PERSON. Contract AF 18(600) 8, Proj. 7730, Task 77353, WADC TN 58 60, April 1958, 85pp. USAF Personnel Lab., Lackland AFB, Tex. (University of California, Berkeley, Calif.).

15,201

To explore the potential contribution of a number of perceptual tests in assessing and understanding the personality of the effective person, ten perceptual-cognitive tests were administered to 100 Air Force captains. Some of the tests were: size-weight illusion, perception of vertical, Gottscheldt figures. The subject was scored on each test according to the measure(s) derived from it. These measures were correlated with all 600 other scores obtained for such areas as intellect, interests, emotional adjustment, etc. They were also compared with certain Air Force criterion measures of military effectiveness.

Clark, W.C. & Blackwell, H.R. RELATIONS BETWEEN VISIBILITY THRESHOLDS FOR SINGLE AND DOUBLE PULSES. Proj. MICHIGAN, Rep. 2144 343 T, April 1959, 31pp. Willow Run Labs., University of Michigan, Ann Arbor, Mich.

15,202

The relation between detectability and certain aspects of the temporal characteristics of targets was systematically investigated. Targets were single continuous pulses which varied in duration and double pulses which varied in temporal separation; background luminance was varied for both. Detection thresholds were obtained by the method of constant stimuli on seven observers. The threshold data were used to evaluate the temporal contribution mathematical model in terms of its predictive value and some of its assumptions.

Andrews, I.G. & Ross, S. INDICATORS OF BEHAVIOR DECREMENT SUMMARY REPORT ON SECOND YEAR OF OPERATION. Proj. DA 49 007 MD 222 (O.I. 19 52), Tech. Rep. 23, No Date, 12pp. University of Maryland, College Park, Md.

15,204

This report summarizes a year of research devoted mainly to the study of higher levels of behavior organization under stress. Some of the variables investigated were: protracted performance of visuo-motor discriminations under monotony, differential ego-involvement in various tasks, differential individual anxiety, administrative pressure. The types of behavior studied include vigilance, reasoning and problem solving, and visual tracking.

15,206

Eddowes, E.D. DETECTION OF STATISTICALLY DEFINED PATTERNS IN A MATRIX OF DOTS. Human Factors Data Bull. 44, Nov. 1959, 3pp. Westinghouse Electric Corporation, Baltimore, Md.

15,206

A series of experiments are reported which investigated problems in the detection of patterns on noisy displays. The displays were based on a square matrix of dot positions which provided vertical or horizontal bar patterns with varying numbers of dots (noise) in alternate bars. Conditions investigated were 1) amount and kind of noise (dot number and separation), 2) number of bars, 3) exposure time, and 4) multiple exposure. Subjects were required to determine if any given test display contained vertical or horizontal patterns. The results were discussed in terms of statistical properties of the stimuli.

Enoch, J.M. EFFECT OF THE SIZE OF A COMPLEX DISPLAY UPON VISUAL SEARCH. J. opt. Soc. Amer., March 1959, 49(3), 280-286.

15,209

To determine the effect of the size of a complex display upon natural visual search tendencies, 12 subjects were presented an ordered series of seven experimental aerial maps of different visible area. Eye traces were recorded on a modified ophthalmograph while they searched for a specific critical detail. Eye traces were analyzed in terms of: 1) average duration of fixation and average interfixation distance, 2) percent of eye fixations falling outside of the display area, and 3) analysis by zones. Distributions of the percentage of eye fixations were submitted to quadrant analysis. Discussion is in terms of optimum display sizes and typical zones of fixation.

15,210

Fraser, D.C. THE STUDY OF FATIGUE. Aug. 1954, 5pp. RAF Institute of Aviation Medicine, Farnborough, Hants, England.

15,210

In order to arrive at an objective definition of fatigue, pertinent research is reviewed and evaluated in terms of established principles and tests for fatigue. The results are discussed which were obtained by studying fatigue as change in control sensitivity occurring during a prolonged visual task. Changes in fatigue are inferred from changes in subject's variance around his own mean. Neither the data or its analysis are presented in this report. An objective, operational definition of fatigue is presented.

Tanner, W.P., Jr. PSYCHOPHYSICAL APPLICATION OF THE THEORY OF SIGNAL DETECTABILITY. Contract DA 039 SC 15358, Proj. M970, DA Proj. 3 99'04 042 & SC Proj. 29 194 B O, Task EDG 6, EDG Tech. Rep. 18 & Rep. 1970 5 S, Feb. 1954, 12pp. Engineering Research Institute, University of Michigan, Ann Arbor, Mich.

15,212

The detection of light signals in a uniform light background was used to demonstrate experimentally the internal consistency of a new theory which defines the form of data expected from such "yes-no" and "forced-choice" psychophysical experiments. This theory assumes: 1) false alarm rate and correct detection vary together, 2) neural activity is a monotone increasing function of light intensity, 3) all stages prior to cortex function only in transmission of information. Hypothetical detection curves are presented and the data are analyzed in terms of these.

Usher, T.H. CONDITIONAL FEEDBACK APPLIED TO HUMAN OPERATOR TESTING. Extramural Res. Grant 9401 15, Res. Rep. 22, Oct. 1959, 72pp. Dept. of Electrical Engineering, University of Toronto, Toronto, Ontario, Canada.

15,223

A method of display called a "conditional feedback" display was defined and compared with pursuit and compensatory systems. An IBM 650 digital computer was used to obtain average system step-responses. The systems were compared on the basis of error growth curves. Choice of optimum display was on the basis of minimum input-output error.

Lee, A. THE EFFECT OF TARGET VELOCITY ON A FRONT-
PARALLEL PLANE ON HORIZONTAL SPATIAL COORDINATION AT
PERIPHERAL VISION LOCUS. *Psych. Monographs*, Sep.
1958 71, April 1958, 10pp. Willow Run Labs.,
University of Michigan, Ann Arbor, Mich.

15,225

To determine the magnitude of localization error for
a black vertical rod which oscillates in a given fronto-
parallel plane as a function of target velocity at each
of three specified photopic levels of binocular retinal
illumination, ten practiced subjects made binocular set-
tings of equivalence in a two-end test apparatus that
provided "real" depth cues. The ten target velocities
ranged from 1.00 degrees/second to 35.00 degrees/second
and the three photopic levels of retinal illumination
were 2.86, 3.15, and 3.64 log trolands. Localization
errors are plotted as a function of target velocity and
level of illumination. The results are discussed in re-
lation to existing experimental data.

Law, J.C. & Conway, R.W. PILOT OPINIONS AND PRACTICES
ON THE APPROACH TO LANDING: A QUESTIONNAIRE SURVEY AMONG
AUSTRALIAN CIVIL AND MILITARY PILOTS. *Jap. J. Psychol.*,
April 1959, 70pp. *Psychological Research Labs.*,
Australian Defence Scientific Service, Melbourne,
Australia.

15,227

In this report replies to two questionnaires on
pilot opinions and practices on the approach to landing
are analyzed question by question. Eight hypotheses con-
cerning pilot opinion and practice in approach to land-
ing are tested. Questionnaire items concern types of
aircraft flown, approach preferences, touch down point,
information used in controlling the descent path, pilot
opinion on risk of undershoots and overshoots, visual
cues to glidepath and numerous other variables. In-
strument questionnaire replies are compared with opera-
tional pilot questionnaire replies. The approacher con-
tains sample questionnaires.

Turner, A.S. APPLICATION AND EXTENSION OF SEQUENTIAL
DECISION THEORY TO THE RADAR SEARCH PROBLEM. *OSN*
Bureau of Ordnance (NED 1402), M.I.T. Lincoln Lab.
(DDC B 157), Tech. Rep. 4, May 1957, 62pp. *Massa-
chusetts Institute of Technology*, Cambridge, Mass.

15,229

Application and extension of sequential decision
theory to two basic search problems (with emphasis on
the optimum nature of sequential detection of signals
in noise): 1) to establish a fixed-reliability minimum-
time search, utilizing a pulsed, early warning search
radar with a single electronically scanned antenna and
fixed guard range gate. Possible time savings as a func-
tion of truncated sequential detection versus fixed-
sample detection are discussed. 2) to establish a fixed-
time maximum reliability search utilizing a pulsed beam-
rider guided-missile seeker with a single scanned gate.
Appendix A contains discussion of a scheme for instru-
menting a sequential detector for pulsed signal in nor-
mal noise.

Simon, B. (Ed.). PSYCHOLOGY IN THE SOVIET UNION.
1957, 300pp. *Stanford University Press*, Stanford,
Calif.

15,231

This book, a collection of papers by Soviet psychol-
ogists, is intended to familiarize English readers with
the general direction of Soviet psychology. The philo-
sophical basis of Soviet psychology and a brief summary
of its present organization serve as introduction. The
topic areas include higher nervous activity and percep-
tion, psychology of understanding, role of language in
formation of temporary connections, spatial discrimina-
tion, theory of memory, child psychology, objective
method in psychology.

Kincaid, W.M. THEORETICAL MODELS FOR THE DISCRIMINATORY
PROCESS IN VISUAL DETECTION. *Psych. Monographs*, Sep.
1958 71, Jan. 1959, 3pp. *Vision Research Labs.*, *University
of Michigan*, Ann Arbor, Mich.

15,233

This paper attempts to clarify thinking about the
nature of the discriminatory process involved in visual
detection. A variety of theoretical models (e.g.,
simple threshold, theories of signal detection in the
presence of noise) are shown to be variations of a more
general model. The more general model is "expressed in
terms of an abstract space corresponding with the set
of possible states of the central nervous system". Dif-
ferent subsets of this space correspond to different
responses. Suggestions for further research are includ-
ed.

Martens, E.R. VISUAL RECOGNITION ALONG VARIOUS MEASURES
OF THE TEST FIELD. VI. 8-ELEMENT AND 10-ELEMENT BINARY
PATTERNS. *Psych. Monographs*, Sep. 1944-1953 T, Nov. 1958,
10pp. *Vision Research Labs.*, *University of Michigan*,
Ann Arbor, Mich.

15,235

To study the recognition capacity of human observers,
17 observers were shown linear binary patterns which were
presented tachistoscopically at facilitations of 0, 45,
90, and 135 degrees in the visual field. Eight-element
and ten-element targets were used. Mean errors per ob-
server per presentation were analyzed for differences
among the various pairs of facilitations. This experiment
was sixth in a series devoted to testing visual responses
to similar targets. A theoretical analysis of factors
which may be involved in tasks such as those used in
these experiments was included.

Kincaid, W.M. & Hamilton, C.E. AN EXPERIMENTAL STUDY OF
THE NATURE OF FORCED-CHOICE RESPONSES IN VISUAL DETEC-
TION. *Psych. Monographs*, Sep. 1944-1953 T, Jan. 1959, 29pp.
Willow Run Labs., *University of Michigan*, Ann Arbor,
Mich.

15,237

By otheses about the nature of forced-choice re-
sponses in visual detection were examined in this paper,
and their predictions were tested. The hypotheses ex-
amined include 1) the psychophysical curve, 2) the
fixed-criterion hypothesis, and 3) the decision-making
hypothesis. Experimental principles are discussed, and
results of experiments given. Theoretical implications
are presented.

Kendler, H.H. LEARNING. *Ann. Rev. Psychol.*, 1959,
10, 43-88. (New York University, New York, N.Y.).

15,239

This review covers the period April, 1957-April, 1958.
The review reflects current preoccupation with the de-
veloping of theoretical formulations. The literature re-
viewed is classified and discussed under the following
topics and sub-topics: 1) neo-behaviorism and stimulus-
response functionalism, motivation and learning, discrim-
ination and generalization, retention and transfer; 2)
Skinner's position, his contributions and those of his
followers; 3) statistical learning theory, experimental
tests of the theory, theoretical articles designed to in-
tegrate available data, and purely theoretical articles
related to mathematical theory; 4) cognitive theory; and
5) intertheoretical differences. The review is summa-
rized in a series of seven general statements.

Jenkins, H.M. PERFORMANCE ON A VISUAL MONITORING TASK AS A FUNCTION OF THE RATE AT WHICH SIGNALS OCCUR. Tech. Rep. 47, Oct. 1953, 25pp. Massachusetts Institute of Technology, Cambridge, Mass.

15,236
To determine the effect of the rate at which signals are presented on performance in extended watches, three experiments were performed utilizing 100 subjects in a visual monitoring task in which the signal was an increase in the amplitude of deflection of an indicator needle. Performance as a function of signal rate (7.5-400 signals per hour) was measured in three ways: percentage of signals detected; incidence of false reports; and time required to respond to an obvious signal provided by onset of a pilot light. Results were submitted to chi square, plotted and discussed in terms of possible performance improvement.

Law, F.M. EFFECT OF SUPRATHRESHOLD CHANGES IN BRISQ-NESS ON FORM PERCEPTION. *Am. J. Physiol.*, Dec. 1958, 123(3), 409-419. (Department of Anatomy, Johns Hopkins University School of Medicine, Baltimore, Md.).

15,236
To determine the effects of sudden supra-threshold stimulation of brightness (from +1.2 to -1.6 log millilamberts) on peripheral form perception, 11 subjects responded as to presence, absence, and position of sets of four combinations of five Landolt circles. In a series of 12 experiments, angle deviation (30 to 45 degrees), test object size, test object contrast (27 to 97 percent), test object brightness (+1.2 to -1.6 millilamberts), and preparation of the subjects were manipulated. Interactions between variables are plotted. Results are discussed in terms of retinal structure and function.

Laboratorio di Fisiologia dell'Università di Milano. INVESTIGATION OF THE FATIGUE IN MAN. FINAL REPORT. Contract AF 61(514) 637, AFOSR TR 58 117, ca. 1958, 5pp. Laboratorio di Fisiologia dell'Università di Milano, Milan, Italy.

15,237
This is a condensed version of a study designed to determine the effects of stress on lower neuron activity. Total reflex times were obtained from spinal sensory and motor neurons as well as from supra-spinal centers, utilizing medical students (age 20-25 years). Results were reproduced utilizing animals. The reflex-time data were attained under the following stress-inducing conditions: hypoglycemia, hypoxia, physical exercise, sleeplessness, and high environmental temperature. The effects of 15 drugs such as acetylcholine, cortisone and ritalin were determined. Results are discussed.

Isaacs, D.B. (Prof. Dir.). BOMBER OPERATOR "FATIGUE": THE EFFECT OF LENGTH AND REPETITION OF OPERATING PERIODS ON EFFICIENCY OF PERFORMANCE. Contract ONR 919, ONR Rep. 3304 & Res. Rep. 6, Jan. 1944, 36pp. Applied Psychology Research Unit, MRC, Camp Murphy, Fla. (Yerkes Laboratories of Primate Biology, Orange Park, Fla.).

15,239
To determine the effect of long and repeated periods of operation of an A-scan oscilloscope on performance efficiency on "fatigue effects", eight highly trained subjects, under simulated field conditions, were tested during four-hour periods of continuous scope operation on successive days for a period of approximately three weeks. Efficiency in detection of signals and accuracy in determining azimuth of target signals were measured as a function of operating periods and submitted to analysis of variance as well as graphic representation. Fatigue as a function of "echo" was also measured. Results are discussed. Three appendices contain additional material.

15,240
Leonard, J.A. THE DISCRIMINABILITY OF SIMULATED VISUAL SIGNALS. ca. 1957, 5pp. Applied Psychology Research Unit, MRC, Cambridge, England.

15,240
To establish some of the factors making for ease or difficulty in discriminating amplitude-modulated signals displayed on a Cathode-Ray tube, subjects performed the following tasks in response to a simulated set of signals found on a probability basis: 1) a standard identification task, 2) sorting, 3) paired identification task, 4) paired-associates learning task, and 5) reconstruction of the stimulus on a physical model. Stimuli are metric histograms which are rendered randomly nonsensical by probability based variations in complexity, redundancy, and noise. Results are discussed in terms of the applicability of easy nonsense symbols generated by probability models, as a tool for provision of visual "nonsense" material which can be graded on an APU basis.

Leonard, J.A. TACTICAL CHOICE REACTIONS: I. *Quart. J. Exp. Psychol.*, May 1959, XI(Part 2), 76-83. (Applied Psychology Research Unit, MRC, Cambridge, England). (APU 339/59).

15,241
To observe the effect of varying the number of alternatives on choice reaction time in a task having an initial high degree of compatibility, vibratory stimuli from relay armatures were presented to 1, 2, 4, or 8 fingers of eight subjects. The response was to depress the armature to the finger(s) stimulated. Reaction time was compared as a function of the amount and identity of the fingers stimulated. Errors in choice of response finger(s) were also recorded. Implications for further research are discussed.

Pepler, R.D. WARMTH AND PERFORMANCE: AN INVESTIGATION IN THE TROPICS. Ergonomics, Nov. 1958, 2(1), 63-88. (Applied Psychology Research Unit, MRC, Cambridge, England). (APU 284/58).

15,247
The effect of unusual levels of environmental warmth on the performance of skilled tasks by young European men living in the tropics was studied. Five experiments were performed: three on manual tracking, one on prolonged visual watchkeeping, one on high speed decision taking. The tracking was done at several temperatures (66-92 degrees F) with several handle loadings (8-32 lb.). The vigilance was done at 67, 82, and 92 degrees F. The decision task was done at 72, 81, 86, and 91 degrees F. These findings were compared to some obtained with artificially acclimatized men.

Roth, E. SOME THEORETIC ASPECTS OF THE USE OF INERT GASES IN SEALED CABIN ENVIRONMENTS. Rep. 58 152, Nov. 1959, 18pp. USAF Aerospace Medical Center, Brooks AFB, Tex.

15,248
The physical analysis of decompression bubbles within the body was reviewed in an attempt to provide a working model for selection of several inert gas combinations in sealed cabins. The maximum bubble size and symptom frequency after decompression appear to be proportional to a gas factor (solubility in oil \times diffusion coefficient in oil/solubility in water). The inert gases--helium, neon, argon, krypton, xenon, and nitrogen--were compared with this relationship in mind.

Marin, R.E., Grant, D.A. & Nystrom, C.O. TEMPORAL PREDICTIONS OF MOTION INFERRED FROM INTERMITTENTLY VIBRATED LIGHT STIMULI. Contract AF 18(600) 54, RDO Proj. 694 49; WADC TR 54 69, Jan. 1954, 14pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (University of Wisconsin, Madison, Wisc.).

15,249
The accuracy of predicting when a moving object would reach a target was studied as a function of: velocity (.10 foot/second, .05 foot/second), interval between onset of successive cue lights (8 or 4 seconds), number of cue lights (2, 4), and distance for target from last cue light (2 or 4 ft.). Twenty-two subjects viewed the successive illumination of cue lights placed at even intervals in a horizontal row, then estimated the time it would take the imaginary object to reach target light by pressing button at predicted arrival time. For each of the 16 experimental conditions, three estimates were made by each subject. Analysis of variance technique was used.

Poulton, E.C. TIME FOR READING AND MEMORY. Brit. J. Psychol., Aug. 1958, 49(3), 230-245. (Applied Psychology Research Unit, MRC, Cambridge, England). (APU 392/58).

15,251
To determine how comprehension was affected by "altering the speed of reading to the greatest feasible extent," 192 subjects were required to study series of statements, presented under various conditions. Tests of memory, recall, and recognition followed immediately; a delayed test of memory was given one week later. Two subsidiary questions were also investigated: Is it possible to learn as much by reading a part of the document carefully, as by reading it all more hurriedly? Is comprehension affected by the degree of rigidity of pacing while reading?

Kidd, J.S. A SUMMARY OF RESEARCH METHODS, OPERATOR CHARACTERISTICS, AND SYSTEM DESIGN SPECIFICATIONS BASED ON THE STUDY OF A SIMULATED RADAR AIR-TRAFFIC CONTROL SYSTEM. Contract AF 33(616) 3612, Proj. 7184, Task 71583, WADC TR 59 236, July 1959, 29pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Ohio State University & Ohio State University Research Foundation, Columbus, Ohio).

15,252
This paper summarizes 14 major systems experiments concerned with relatively complex man-machine system operations, and carried out through the use of dynamic systems simulation. Results of the studies were presented in tabular form. Tentative generalizations are made regarding the following characteristics: 1) distribution of functions, and 2) procedural flexibility. Practical applications are made to problems of traffic load, procedures, and displays. Future trends are predicted.

Jerger, J.F. CUMULATIVE AUDITORY FATIGUE. Rep. 58 46, March 1958, 9pp. USAF School of Aviation Medicine, Randolph AFB, Tex.

15,265
This study explored the cumulative auditory fatigue phenomenon by measuring these effects induced by three successive one-minute fatiguing stimuli of different intensities. Six one-hour sessions were run on each of 26 subjects, using six fatiguing intensities--85, 90, 95, 100, 105, and 110 db.--in random sequence. Cumulative fatigue was defined as the difference between threshold recovery time after the first fatiguing tone and that after the third tone. Rank-order correlation coefficients were computed for the different intensities. Other analyses were also made.

USA Personnel Research Section. REPORT ON COMPARISON OF THREE VISUAL ACUITY TESTS. PMS Rep. 249, Feb. 1942, 3pp. USA Personnel Research Section, Washington, D.C.

15,269
This report compares the scores of about 395 men on the Snellen, Broken Circle #1 and #2, Shortened Circle, and AAA acuity tests. Intercorrelations were obtained mainly between the Snellen and Broken Circle #1 and #2 scores. The results are described in terms of reliability as well as relationship among the tests.

Waters, L.K. & Wherry, R.J., Jr. FACTOR ANALYSIS OF SELECTION TESTS AND PERFORMANCE MEASURES IN U.S. NAVAL SCHOOL PRE-FLIGHT. Proj. MRO05.13 3763, Subtask 10, Rep. 2, Aug. 1959, 11pp. USN School of Aviation Medicine, Naval Air Station, Fla.

15,273
"A 19-variable matrix representing the relations among selection test total and sub-scale scores, course performance in US Naval School, Pre-Flight, and a peer rating of officer potential was factor analyzed." These data were collected from 336 cadets. Six factors were obtained from the matrix based on variables loading .35 or greater. In addition correlations were obtained between selected predictors and pre-flight technical courses, and some recommendations made regarding the use of these scores as predictors.

15,274
On three totally deaf subjects ocular torsion was measured when the subject was tilted or exposed to centripetal force. This procedure was arranged to ensure only otolith stimulation. Counter-rolling was determined by comparative measurements of the position of the eye made from photographs of the face before, during, and after each procedure. Several angles of tilt were tested. These records were compared to those of normal subjects by the F test.

Sydiah, D. ON THE EQUIVALENCE OF CLINICAL AND STATISTICAL METHODS. J. appl. Psychol., 1959, 43(6), 395-401. (University of Saskatchewan, Saskatoon, Canada).

15,276

This paper compares linear statistical and clinical methods of personnel assessment with respect to: a) correlation with interview decisions, b) correlation between models, and c) errors of measurement. Eight interviewers assessed from 14 to 50 Canadian Army applicants using biographical, test, and interview information. The assessment consisted of a 120-item Q-sort check list. These data were quantified into statistical and clinical scores, and the aforementioned correlations computed.

Shaw, W.J. OBJECTIVE MEASUREMENT OF DRIVING SKILL. International Road Safety and Traffic Rev., Autumn, 1957, 10(1), 37-39. (Applied Psychology Research Unit, MRC, Cambridge, England).

15,277

This paper covers specifically the driver variables which make for safe driving or for accidents. The research in this area has used two approaches: the statistical approach in which large numbers of accidents are examined to establish causal relationships, and the experimental approach in which some physiological or psychological attribute of the person is related to some criterion of driving ability. Some accident surveys and experimental techniques are briefly covered.

Briggs, G.E. & Wiener, E.L. FIDELITY OF SIMULATION: I. TIME SHARING REQUIREMENTS AND CONTROL LOADING AS FACTORS IN TRANSFER OF TRAINING. Contract M61339 508, Tech. Rep. NAVTRADEVEN 508 4, Oct. 1959, 12pp. USN Training Device Center, Port Washington, N.Y. (Ohio State University, Columbus, Ohio).

15,294

To determine the effect that fidelity of simulation (degree of control loading) of a training device has on transfer of training as a function of the complexity of the task, 48 undergraduates performed in a two-dimensional control task which simulated an operational interceptor aircraft. Transfer of training was measured as a function of: control loading (spring stiffness present in a control column) and peripheral time-sharing requirements (number of simultaneous dimensions of control required). Each subject received 24 (40-second) training trials followed by eight (40-second) transfer trials. The results are plotted and subjected to analysis of variance. Implications and recommendations are in terms of optimum high fidelity of control loading.

Gottsdanker, R. REACTION TIME: THE TIME TO INITIATE A RESPONSE. MH Aero Doc. U ED 6102, Dec. 1958, 13pp. Minneapolis-Honeywell Regulator Company, Minneapolis, Minn.

15,295

This paper reviews experimental studies of reaction time (RT), especially as they concern categories of uncertainty which prevent the synchronization of response with signal. Categories which have been subjected to experiment and for which there are some "solid conclusions" and categories which at present are only possibilities for investigation were discussed. The uncertainties discussed were: Temporal, Signal-Region, Response, Discriminal, Competitive, Option, Translation, and Encoding-Decoding Uncertainty. Other variables affecting RT were discussed briefly.

Gottsdanker, R. THE INTRINSIC ACCURACY AFFORDED BY THE OPERATOR'S MOVEMENTS. MH Aero Doc. U ED 6122, May 1959, 17pp. Minneapolis-Honeywell Regulator Company, Minneapolis, Minn.

15,296

This report reviews two general kinds of research devoted to investigating the intrinsic accuracy afforded by operator movements with special emphasis on performance at airplane control boards without visual error-feedback. The first type of research involves production of some physical extent (displacement, force, etc.) and the second concerns discrimination through "kinesthetic recognition". Variables are considered, such as direction and unit of response, and others. Indices of performance are discussed with emphasis on statistical analysis of response data. Previous experimental research in both areas is considered and evaluated.

Contract AF 41(657) 64, Proj. 1710, Task 71605, WADC TR 59 255, Dec. 1959, 57pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Psychological Research Associates, Inc., Austin, Tex. & Yale University, New Haven, Conn.).

15,313

To investigate relationships between ability variables and progress in learning a complex perceptual-motor skill, to specify the abilities underlying terminal proficiency on a complex control task, and to investigate the way in which the contribution of these abilities to proficiency change over time, 203 subjects were given a large battery of printed and psychomotor apparatus tests. Five performance measures were obtained for each subject. All test scores and criterion (task) measures were transformed into stanines, and intercorrelations obtained between the measures. The matrix of intercorrelations was factor analyzed, and 15 ability factors identified. The authors pointed out relevance of the findings for learning of complex skills, problems in training, and in test development. T. I. R 23

Gerathwohl, S.S. & Haber, H. A STUDY OF RUNWAY MARKINGS. Proj. 21 02 007, Rep. 2, April 1949, 1-2. USAF School of Aviation Medicine, Randolph AFB, Tex.

15,322

To study the chevron as an aircraft runway marking, two experiments were conducted. Five chevrons differing as to their angle (30, 60, 90, 120, and 150 degrees) were studied by means of a fog simulator to select the most efficient angle. In the second study, the effect of perspective distortion on the appearance of the chevron was studied by means of a changeable angle. The subjects had to form an angle of 60 degrees by free judgment (with a paper model for comparison) while viewing the apparatus both vertically and at a three degree angle. On the basis of this and one previous study a Runway Marking Plan was designed.

Guignard, J.C. & Travers, P.R. EFFECT OF VIBRATION OF THE HEAD AND OF THE WHOLE BODY ON THE ELECTROMYOGRAPHIC ACTIVITY OF POSTURAL MUSCLES IN MAN. SOME QUALITATIVE OBSERVATIONS. EPRC Memo 120, April 1959, 11pp. Living Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

15,328

The influence of whole-body, head, and limb vibration upon the electromyographic activity of resting and active postural muscles was observed in man. Concentric needle electrodes were used with the Royal Air Force type three electromyograph throughout the experiments. Observations of postural muscle activity were made by cathode ray oscilloscope display and appraised clinically. Frequencies of vibration ranged from 2 to 10 cps and vibrational accelerations from 0.6 to 1.0 g. The resulting observations were discussed and suggestions for further quantitative investigations were made.

Pepinsky, H.B., Pepinsky, Pauline N., Minor, F.J. & Robin, S.S. TEAM PRODUCTIVITY AND CONTRADICTION OF MANAGEMENT POLICY COMMITMENTS. Reprint 11, Nov. 1959, 5pp. Engineering Experiment Station, Ohio State University, Columbus, Ohio. (Reprinted from *J. appl. Psychol.*, 1959, 43(4), 264-268).

15,349

In an experiment designed to test the influence of group structure on team productivity in a simulated industrial setting, 20 four-man teams were divided into ten consecutive team pairs. Each member of a pair was subjected to either 1) a condition in which subsequent events contradicted the team's expectations of management, or 2) a condition in which expectations were confirmed. Results were discussed 1) as they related to the hypothesis that confirmation teams would be the more productive, and 2) in terms of alternative rationales. Theoretical implications of the experiment were suggested. T. R 8

15,352

Pollack, I. "LONG-TIME" DIFFERENTIAL INTENSITY SENSITIVITY. *J. acoust. Soc. Amer.*, March 1955, 27(2), 380-381. (USAF Operational Applications Lab., AFRC, Washington, D.C.).

15,352

This note considered the differential intensity threshold for noise bursts made over "long" (one-half, one, three day, and longer periods) time intervals. In a given 30-second sitting a listener was presented three five-second noise bursts. The sound level of the first was judged relative to the last signal heard in the previous session; the second sound level was then judged relative to the first; and the third was the reference signal for the next experimental session. The over-all reference level was 90 db sound pressure level. Long- and short-term judgments were compared graphically. G.

Ramo, S. THE GUIDED MISSILE AS A SYSTEMS ENGINEERING PROBLEM. Canada Aeronaut. J., Jan. & Feb. 1957, 3(1 & 2), 3-9, 37-43. (Ramo-Wooldridge Corp., Los Angeles, Calif.).

15,354
This paper first discusses systems engineering rather broadly, indicating the common characteristics of complex engineering systems and the factors that usually must play a large part in system invention and design. Particulars are then added in the exploration of systems engineering by reference to the guided missile art. Finally, the way to improve our ability to invent and design engineering systems is discussed.

15,361
Baker, C.H. & Lavery, J.J. PERFORMANCE DURING TRAINING AS A CRITERION OF RETENTION OF MOTOR SKILLS. ca. 1952, 28pp. Defense Research Board of Canada, Toronto, Ontario, Canada.

15,361
Two experiments were undertaken: 1) to determine a) the effect of varying amounts of practice with error feedback on subsequent retention, and b) whether the degree of subsequent retention is a function of time; and 2) to study a technique for presenting error feedback in a novel way in order to enhance subsequent retention. In the first experiment, four groups of 12 Ss each were required to draw lines of a stated length while blindfolded. Error feedback was a statement of "right" or "wrong." Experimental conditions varied for each of three groups; the fourth group served as control. Effect of the form of error feedback provided during training on subsequent retention was investigated and implications of results for the design of simulators were discussed.

Haight, F.A. THE GENERALIZED POISSON DISTRIBUTION. Reprint 80, Aug. 1959, 5pp. Institute of Transportation and Traffic Engineering, University of California, Los Angeles, Calif.

15,365
The assumption of random distribution of arrival times of cars in a study of vehicular traffic was found to be unsatisfactory because: 1) very small gaps do not occur as frequently as theory requires, and 2) some interference between vehicles exists which introduces an element of regularity into arrival times. Alternative models were discussed: Feller's model for Type I particle counter and Gerlough's suggestion to translate the negative exponential distribution away from the origin. A Type III distribution was suggested and was developed as a more satisfactory type of solution.

Haight, F.A. TWO QUEUES IN PARALLEL. Reprint 70, 1958, 10pp. Institute of Transportation and Traffic Engineering, University of California, Los Angeles, Calif. (Reprinted from: Biometrika, Dec. 1958, 45, 401-410).

15,366
"The method of differential-difference equations is used to investigate the case in which each arrival to a system of two queues joins the shorter queue, or, if they are of equal length, one particular queue. In case each person must remain in the queue which he originally joins, relations are obtained between the asymptotic state probabilities. If queues are permitted to change queues whenever it seems advantageous to do so, the formulation is simplified, and explicit expressions are obtained."

15,367
Haight, F.A. OVERFLOW AT A TRAFFIC LIGHT. Reprint 78, 1959, 5pp. Institute of Transportation and Traffic Engineering, University of California, Los Angeles, Calif. (Reprinted from: Biometrika, Dec. 1959, 46, 420-424).

15,367
Under the assumption of continued input in every circumstance except zero queue length, the probability is computed of Z cars being in the queue at the beginning of a red phase of fixed cycle lights when there were X cars in the queue at the beginning of the preceding green phase. The case of traffic along a main street into a signalized intersection which is governed by a light possibly actuated by side street traffic is also considered.
R 5

15,368
Haight, F.A. QUEUEING WITH RENEGING. Reprint 74, 1959, 14pp. Institute of Transportation and Traffic Engineering, University of California, Los Angeles, Calif.

15,368
This paper considers a queue in which a person who has joined it may decide to leave if it appears that the time consumed will exceed the time he has available. Three specific problems are treated: 1) How to make a rational decision while waiting in a queue, 2) The probable effect of this decision, and 3) The behavior of a queue in which all persons are employing such a procedure.

15,369
Haight, F.A. TOWARDS A UNIFIED THEORY OF ROAD TRAFFIC. REPRINT 68, April 1958, 14pp. Institute of Transportation and Traffic Engng., University of California, Los Angeles, Calif. (Reprinted from: Operations Res., Nov.-Dec. 1958, 6(6), 813-826.).

15,369
Three types of descriptive theories of vehicular traffic (vehicles treated individually, statistically, or as particles satisfying a certain partial differential equation) are treated briefly. It is indicated how the three methods correspond to different types of traffic situations and how the properties common to each type are dealt with. The operating speed y of a car is a function of desired speed x and traffic density λ , where x and y are random variables and λ a real parameter. Relationships are proposed between the distributions of x and y and quantities which occur in empirical studies of traffic. It is postulated that for large λ queueing theory may be usefully employed, and several necessary modifications are discussed.

Kelly, J., Dennen, W. & Martel, R. RESEARCH REPORT AN EXPERIMENTAL STUDY OF VARIABLES ASSOCIATED WITH THE LEARNING OF MORSE CODE PART I. Oct. 1958, 16pp. Educational Methods & Evaluation Dept., USA Security Agency School, Fort Devens, Mass.

15,371
In an effort to select and utilize the most efficient and practical methods of training Morse Code operators, an investigation was conducted of variables in the learning situation that were judged to be of singular importance to the outcome of training in the job situation: 1) incorporation of actual job features into initial training, 2) diversification of teaching techniques, and 3) overlearning. Three groups of enlisted students in the USA Security School, equated on general ability on General Technical Score (Army General Classification Battery) and code aptitude, were trained to receive International Morse Code by three different instructional techniques designed to test the variables. An evaluation of variable (1) was reported here. (See also 15,372).

15,372
Bally, J., Janner, M. & Martel, R. RESEARCH REPORT
AN EXPERIMENTAL STUDY OF VIBRATIONS ASSOCIATED WITH
THE LANDING OF WHEAT CERE FROM THE
SUBSISTENCE METHODS & Evaluation Dept., USA, Security
Agency School, Fort Devens, Mass.

15,373
This was a continuation of the study reported in
15,371. On variables associated with the landing of Wheat
Cere. The second and third variables—diversification of
training techniques and overloading—were reported here.
Data from the three training groups were used in
evaluating the effects of the first and second variables.
All three groups were administered a series of standard-
ized tests to evaluate the effect of overloading.

Lowless, R.E. ATTENTION TO INDIVIDUAL CHANNELS IN A
BIBRARY EXPERIMENTAL. AFRC Memo 129, Sept. 1959,
App. Elmsford Personnel Research Committee, London,
England. (Sheffield Department of Industrial Health,
University of Durham King's College, Newcastle-on-Tyne,
England).

15,375
An earlier experiment showed that a higher rate of
signal detection was obtained when signals were simulta-
neously presented through vision and audition than
were obtained from either channel alone. Some Ss were
reported to have had initial difficulty in using the
bimodality presentation. This experiment attempted to
determine whether the difficulty lay in attending to
both signal sources at once. The same apparatus was
used as before by which signals in the two channels were
derived from a common source and were of equal signal
level; signals in each channel could be separately con-
trolled. Three groups of Ss served under one of the
following conditions: visual or auditory signals alone
and both single and double signals. Rates of signal de-
tection were compared. T. R. 1

15,376
Levin, M.C., Schoeller, M. & Gerstner, H.B. INITIAL
CLINICAL REACTION TO THERAPEUTIC WHOLE-BODY X-RADI-
TION - SOME CIVIL DEFENSE CONSIDERATIONS. Rep. 60 1,
Nov. 1959, App. USAF School of Aviation Medicine,
Brooks AFB, Tex. (Medical Branch, University of Texas,
Galveston, Tex.).

15,377
This report describes early clinical events displayed
by 11 cancer patients after whole-body x-ray treatment
in a single large dose and compares these events with
published reports of "radiation sickness" with acute se-
quelae observed in nuclear accidents. The potential role
of early radiation-induced response in nuclear disasters
is evaluated.

15,384
Licklider, J.C.R., Christman, R.J. & Guttman, M. ON
JAMMING SPEECH COMMUNICATION WITH COHERENTLY AMPLITUDE-
MODULATED INTERFERENCE. Contract AF 18(600) 1219,
AFRC IN 57 58, Oct. 1957, 22pp. USAF Operational
Applications Lab., Bolling AFB, Washington, D.C.
(Massachusetts Institute of Technology, Cambridge,
Mass.).

15,384
Two ways of achieving the goal of speech intelli-
gibility to friendly and unintelligibility to enemy ears
were investigated. In both techniques an interfering sig-
nal was superimposed upon the speech signal which, when
removed, left the speech intelligible. The two techniques
were based on different strategies for shaping the inter-
ference to impair intelligibility, and each is described
and illustrated.

15,385
McIntosh, J.L., Day, D.J. & Beckner, E.L. INVESTIGATION
DURING THE PROBLEM OF CANOPY OPENING IN ESCAPE FROM
DOWNED AIRCRAFT. Tech. Rep. IN 257, AFRC Paper 1961,
Sept. 1959, 3pp. Royal Aircraft Establishment,
Farnborough, Hants, England. (RAF Institute of Aviation
Medicine, Farnborough, Hants, England).

15,386
This report presented a re-evaluation of the problem
of canopy ejection from a submerged aircraft. When an
aircraft has ditched and submerged with the canopy closed,
the canopy may be forcibly held shut by the water pressure
load. A theoretical analysis of the problem was made and
preliminary trials conducted to evaluate the factors which
prevent ejection of the canopy. The time required for
a subject to eject the canopy manually after the air-
craft had submerged to 35 feet was determined. Recommen-
dations were included.

15,390
Moser, R.M., Decker, J.J., O'Sullivan, J.J. & Adler, S.
A COMPARISON OF SINGLE- AND DOUBLE-BOUNCE TRANSMISSION
UPON THE INTELLIGIBILITY OF OPERATIONAL WORDS. Contract
AF 18(600)1316, AF Proj. 519, Tech. Rep. 30 & AFRC IN
55 66, May 1959, App. Ohio State University Research
Foundation, Columbus, Ohio.

15,391
This study extends previous studies of the effects of
voluntary stuttering upon the transmission of two-digit
numbers and single words. A "double-bounce" type of
transmission was employed to investigate the hypothesis
that no difference would be found in articulation scores
between "single-bounce" and "double-bounce" transmission
of single words. Material recorded by a male speaker
consisted of 50 words randomized into six lists of 50 test
items each. Ten listeners were trained on practice lists
using non-stuttered speech. Intelligibility scores for
the two types of transmission were compared.

Steiner, S.H. STANDARDIZATION OF AN ENDPOINT TO POSI-
TIVE ACCELERATION ON THE HUMAN CENTRIFUGE. Proj. 7222,
Task 71746, WDC IN 59 426, Dec. 1959, 8pp. USAF Aero-
space Medical Lab., Wright-Patterson AFB, Ohio.

15,395
To establish an objective and standardized endpoint
for positive acceleration experiments, a comparison was
made of blackout thresholds to a red filtered light of
760 mμ, raised 0.5 log units above the visual threshold
in dark adapted subjects and to a white light in the
same subjects. Differences among the subjects as well
as differences between the two lights were analyzed.
The variability of results from centrifuge to centrifuge
was discussed together with physiological implications,
advantages, and possible sources of error.

Torgersen, P.E. AN EXAMPLE OF WORK SAMPLING IN A HOS-
PITAL. Reprint 12, Nov. 1959, 4pp. Engineering Experi-
ment Station, Ohio State University, Columbus, Ohio.
(Reprinted from J. Industrial Engng., May-June 1959, 197-
200).

15,399
This article illustrates with a case study two of
the newer applications of work sampling: 1) analysis of
human activities in a setting somewhat alien to the in-
dustrial engineer and 2) measurement of performance in
professional work groups. The example given concerns a
work sampling of the work of the registered nurse in a
hospital. A step-by-step description is given of the
preliminary work and the manner of making the observa-
tions. The data from 1600 observations are presented in
tabular form and used to point up the possibilities of
work sampling in this type of situation.

Walsack, J.W., Crook, Doreen J. & McBride, P.I.
STUDIES ON DARK ADAPTATION EXPERIMENTS I, II, AND III -
THE PRE-EXPOSURE TOLERANCE OF THE HUMAN FOVEA ADAPTED
TO DIFFERENT BRIGHTNESS LEVELS, INCLUDING DARKNESS.
FINAL REPORT PERIOD: 1 SEPTEMBER 1952 - 30 AUGUST 1953.
Contract AF 30(632) 195, DARC TR 54 26, Oct. 1954, 34pp.
WAFB Rome Air Development Center, Griffiss AFB, N.Y.
(Institute for Applied Experimental Psychology, Tufts
University, Medford, Mass.).

15,402
The effect on foveal dark adaptation of pre-exposure
of the eye for brief durations to light of relatively low
brightness was investigated. Monocular measurements
were made of both absolute brightness sensitivity (R)
and difference or contrast sensitivity (DE), using a one-
degree square centrally-fitted test patch. The three
experiments dealt with 1) the pre-exposure tolerance of
the dark-adapted fovea, 2) the pre-exposure tolerance of
the fovea adapted to different brightness levels, and 3)
the pre-exposure tolerance as measured by contrast sensi-
tivity. Pre-exposure brightnesses ranged from 0.10 to
100 fcd/l and duration from 1 to 100 seconds. Adaptation
levels of 0.10, 1.0, and 10 fcd/l were used.

Chase, R.A., Norvey, S., Standfest, Susan, Rapin, I.
J., et al. STUDIES ON SENSORY FEEDBACK: THE
EFFECT OF DELAYED AUDITORY FEEDBACK ON SPEECH AND KEY-
TAPPING. Aug. 1959, 25pp. Communications Lab., De-
partment of Biometrics Research, New York, N.Y. (Colum-
bia University College of Physicians and Surgeons, New
York, N.Y.).

15,403
Assuming that alteration in sensory feedback infor-
mation would result in change in motor performance in
question, the present investigation sought to answer:
1) are changes in time and intensity of speech and key-
tapping under Delayed Auditory Feedback (DAF) qualita-
tively the same for the two motor systems? 2) does the
same DAF result in more change in motor performance for
one system than for the other? 3) does the amount of
change in a subject's performance under DAF in the two
modalities correlate? Fourteen subjects were asked to
repeat the sound "b" in groups of three sounds under
normal and delayed feedback. They were also asked to
tap on a key in groups of three under the same condi-
tions.

15,406
Dempster, W.T., Cabel, W.C. & Felts, W.J.L. THE ANTHRO-
POMETRY OF THE MANUAL WORK SPACE FOR THE SEATED SUBJECT.
Amer. J. phys. Anthropol., Dec. 1959, 11(4), 289-317.
(Department of Anatomy, University of Michigan, Ann
Arbor, Mich.).

15,408
The anthropometry of the manual work area was ap-
proached by an indirect method using photographic records
of time exposures showing the motions of a tiny neon lamp
at the hand grip. The records of 22 seated male subjects
were analyzed for eight sets of motions involving the for-
ward-directed hand and different grip orientations. The
limits of space within reach relative to the mid-sagittal
junction of the seat and chair back were defined. Vari-
ability data were obtained from the graphical records of
the different hand-range spaces. The findings are dis-
cussed in relation to the geometry of the more effective
hand positions and in relation to practical problems of
work space designing.

Gullford, J.P., Berger, R.W. & Christensen, P.R. A
FACTOR-ANALYTIC STUDY OF PLANNING. I. HYPOTHESES AND
DESCRIPTION OF TESTS. Rep. 10, July 1954, 28pp.
Psychological Lab., University of Southern California,
Los Angeles, Calif.

15,412
The first phase of an attempt to isolate and define
abilities that may be important in the domain of plan-
ning was reported. Upon the basis of a review of the
literature, four hypotheses were formulated as to fac-
tors to be expected in terms of the classes of activi-
ties involved in the various stages of planning. These
were 1) orientation, 2) prediction, 3) elaboration, and
4) ordering. Two additional qualitative factors were
posed: 5) ingenuity, and 6) evaluation. Tests were con-
structed, adapted, or selected to test the hypotheses;
31 tests were so chosen. A later report will give the
results of administration and analysis of the tests.

Howland, D. APPLICATION OF OPERATIONS RESEARCH TO
HIGHWAY PROBLEMS. Reprint 8, Jan. 1959, 9pp. Engin-
eering Experiment Station, Ohio State University,
Columbus, Ohio. (Reprinted from Highway Res. Bd.
Proc., 1958, 37, 72-80).

15,420
The basic character of operations research is des-
cribed briefly as an attempt to conceive of specific prob-
lems as problems in the area of decision theory. In terms
of this characterization, a question is raised regarding
the role of operations research in the analysis of high-
way problems. Some examples of the application of this
type of research to highway problems are given. This ap-
proach is compared with the traditional approach to high-
way problems. Some advantages as well as the difficul-
ties associated with the use of operations research in
this manner are pointed out.

Benson, A.J. & Dearnaley, E.J. ESTIMATES OF ABILITY DURING ITERATIVE PERFORMANCE OF A FATIGUING TASK AND MEASURES OF ELECTROMYOGRAPHIC ACTIVITY IN A MUSCLE GROUP NOT DIRECTLY INVOLVED. Rep. 1092, July 1959, 1pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

15,425

To examine the relationship between EMG activity while Ss attempted to maintain a constant tension on a double-handled isometric myograph for as long as possible and estimates made by the Ss of how long they could continue, the integrated EMG was recorded from the left gastrocnemius soleus muscle group during three separate pulls separated by a five-minute rest. Each S was instructed to pull as long as he could and to estimate before and at 15-sec. intervals how long he could maintain the tension; duration of pulls, estimates of duration, and EMG were analyzed for relationships with fatigue, learning, and personal data items.

T. G. R 10

15,426

Benson, A.J. & Dearnaley, E.J. ESTIMATES OF ABILITY DURING A FATIGUING TASK WITH AND WITHOUT COMPETITION AND MEASUREMENT OF ELECTROMYOGRAPHIC ACTIVITY IN MUSCLE GROUPS NOT DIRECTLY INVOLVED. Rep. 1089, Feb. 1959, 13pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

15,426

The experiment reported here was a preliminary inquiry into two possible approaches to the general problem of fatigue and motivation: 1) the measurement of electromyographic activity in muscles not engaged in the primary task, and 2) subjective estimates of performance. In ten subjects the integrated electromyogram was recorded from the left gastrocnemius soleus muscle group while the subject attempted to maintain a tension of ten kilograms on a double handled isometric myograph. Experimental conditions were: 1) the tension achieved was not displayed, 2) the tension developed was displayed, 3) tension was displayed and an award was made for maximum duration and accuracy. Estimates of pull duration were made before (and at 15-minute intervals) each pull.

Dearnaley, E.J. CHANGES IN ESTIMATES OF PERFORMANCE INDUCED BY THE THREAT OF RECEIVING AN ELECTRIC SHOCK IF THE ESTIMATES ARE NOT ACHIEVED. AFRC Memo 12, Oct. 1959, 5pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

15,436

To investigate how estimates of time for which it is possible to continue a difficult task would be affected by some element of danger if estimated performance was not achieved, 18 male subjects each made three attempts, separated by five-minute intervals, to maintain a tension of ten kilograms (± five per cent) on a double handled isometric myograph for as long as they could. Before his second and third attempt, each subject was asked to estimate his performance in time units; the threat of electric shock for failure to achieve the estimate was made for one of the last two trials. Estimates, expressed as percentage of previous performance, were studied for condition of threat of punishment vs. no-threat.

USN Office of Naval Research. NAVAL HUMAN ENGINEERING BULLETIN. No. 39, Oct. 1959, 10pp. USN Office of Naval Research, Washington, D.C.

16,057

This publication includes a brief report of the Human Engineering Conference, with notes from the keynote address on future roles of human factors in electronics. Thirty-one unclassified GNR code 495 reports are listed, covering all reports received since publication of the last bulletin. The reports cover a wide variety of human engineering problems, including surveillance and manned space flight studies.

Bond, G.F. SUMMARIES OF RESEARCH REPORTED ON DURING CALENDAR YEAR 1959. Dec. 1959, 19pp. USN Medical Research Lab., New London Submarine Base, Conn.

16,058

Twenty summaries of research conducted at the Naval Medical Research Laboratory during the calendar year 1959 are presented in this report. Titles of three reports issued as memorandums are also given. Reports of research in the following areas are among those included: audition, vision, submarine and space cabin atmosphere, and patterns of reaction to stress.

Freedman, S.J., Grunebaum, H.U. & Greenblatt, M. PERCEPTUAL AND COGNITIVE CHANGES IN SENSORY DEPRIVATION. Contract AF 33(616) 3663, National Institute of Mental Health Research Grant M 1863, June 1958, 17pp. Dept. of Psychiatry, Harvard Medical School, Boston, Mass. & Brandeis University, Waltham, Mass.

16,064

To compare the effects of visual and auditory "non-patterning" under social isolation conditions with social isolation alone, 26 subjects were subjected to an eight-hour experimental session. Subjects were divided into two groups, one of which received continuous non-patterned visual and auditory stimulation and one which was socially isolated but with vision, audition and touch remaining unimpaired. Differences in performance scores were analyzed for significance of these variables on perceptual distortion, visual input, auditory input, motility, and social interaction. A theoretical formulation was proposed for the understanding of distortion.

US Government Printing Office. SECOND SEMIANNUAL REPORT OF THE NATIONAL AERONAUTICS AND SPACE ADMINISTRATION COVERING THE PERIOD APRIL 1, 1959, THROUGH SEPTEMBER 30, 1959. March 1960, 164pp. US Government Printing Office, Washington, D.C.

16,092

This report covers the period April 1 through September 30, 1959. Activities are listed and described chronologically and include the descriptions of activities in the following areas: 1) the space flight program: operational missions, space vehicle program, manned flight, research, satellite applications, sounding rocket development, international cooperation, and tracking and data systems; 2) advanced aeronautics and space research: propulsion and power generation, control and guidance of craft, materials and structures, fluid mechanics, space and aircraft aerodynamics, and operations and environment; 3) organizations and supporting activities. Publications prepared during this period are listed.

Pollack, I. ASSIMILATION OF SEQUENTIALLY ENCODED INFORMATION. Amer. J. Psychol., July 1953, 66(3), 421-435.

16,093

This paper presents a methodology for use in studying verbal learning which is based on the theory of information. The approach allows an objective quantification, in units not specific to the particular experimental operations considered, of 1) the learning materials used (the informational input), 2) the information lost (the error output), and 3) the information gained (the difference between 1 and 2). It is contended that by using such units comparisons can be made of the results of a diversity of experiments. An illustrative experiment in learning designed to fulfill the methodological requirements is reported and the results considered briefly.

Egan, J.P., Greenberg, G.Z. & Schulman, A.I. OPERATING CHARACTERISTICS. SIGNAL DETECTABILITY, AND THE METHOD OF FREE RESPONSE. Contract AF 19(604) 1962, AFRC TR 59-58, Dec. 1959, 54pp. Hearing and Communication Lab., Indiana University, Bloomington, Ind.

16,094

This paper reports experiments concerned with the detection of signals presented at random times. Using the method of free response, it was assumed that the listener divides time into a succession of subjective temporal intervals and that these implicitly define a trial. The further assumption was made that the listener's criterion is associated with a particular point on a particular operating characteristic. The problem was to establish a relation between measures of the number of responses per signal and the assumed critical probabilities. Data were obtained from seven listeners in one experiment and from four in a second. Limitations in the method of analysis are discussed. An additional analysis was made of the data in which only the first response made after each signal was tabulated.

Egan, J.P. RECOGNITION MEMORY AND THE OPERATING CHARACTERISTIC. Contract AF 19(604) 1962, AFRC TR 58-51, June 1958, 32pp. Hearing and Communication Lab., Indiana University, Bloomington, Ind.

16,095

The problem of locating and defining the role of a criterion in the behavior of the individual is troublesome. Confidence ratings in judgments are related to a posteriori probability of the occurrence of a particular stimulus, given a particular response. The operating characteristic can be used to display the degree to which the subject can partition the stimuli by his ratings. The present study attempts to show how the operating characteristic may be applied in the study of recognition memory. The purpose of the experiments was to determine the form of the operating characteristic for recognition memory. Forty-eight subjects participated in two experiments. The shape of the operating characteristic for recognition was analyzed for individuals and averaged for subjects with similar performance.

Egan, J.P., Schulman, A.I. & Greenberg, G.Z. OPERATING CHARACTERISTICS DETERMINED BY BINARY DECISIONS AND BY RATINGS. *J. Acoust. Soc. Amer.*, June 1959, 31(6), 768-773. (Indiana University, Bloomington, Ind.).

16,096

The theory of signal detectability is discussed as it relates to the study of the detectability of a signal by listeners. A measure of performance is derived which is relatively independent of the procedure employed and which is also unaffected by circumstances which can influence the criterion adopted by the listener. Two psychophysical experiments were performed in which the performance of listeners using multiple criteria was compared with performance in which a single criterion was required. In the second experiment, using the rating method alone, the relation between the measure of performance and the ratio of signal energy to noise power per unit bandwidth was investigated.

Bishop, A.B. A MODEL FOR OPTIMUM CONTROL OF STOCHASTIC SAMPLED-DATA SYSTEMS. Reprint 4, Nov. 1957. Engineering Experiment Station, Ohio State University, Columbus, Ohio. (Reprinted from: *Operat. Res.*, Aug. 1957, 5(4), 546-550).

16,097

This paper reports a model developed for a "sampled-data feedback control system for processes having randomly-distributed outputs or involving measurement techniques that introduce a significant component of variance in the measured values of the controlled variable. ... The method of derivation involves successive operations on the normal probability density function. The effects on system response..., oscillatory tendencies and system variance of various values of the constant... are discussed." Two classes of criterion function are also mentioned from which optimum values of the proportionality constant can be determined.

Howland, D. THE HUMAN AS A MONITOR IN A MAN-MACHINE SYSTEM. Reprint 7, Oct. 1958. Engineering Experiment Station, Ohio State University, Columbus, Ohio. (Reprinted from: *News in Engng.*, Oct. 1958, 23-29).

16,098

This study investigated 1) the gradual decrease in performance as measured by failure to detect signals over long-time intervals and 2) development of a better understanding of the process by which a decision is made as to whether some aspect of a situation has changed or not. Two groups of 12 subjects observed sequences of reading with minimum time-lag for a four-hour period. To investigate the hypothesis that log-keeping would reduce error, one group was required to maintain a written record of readings. The data were discussed within the framework of a feedback control model.

Corbin, H., Carter, J., Reese, E.P. & Volkmann, J. (Eds.). EXPERIMENTS ON VISUAL SEARCH 1956-1957. FINAL REPORT. I. AIDS TO THE IDENTIFICATION OF CONVERGING GROUPS. Contract AF 19(604) 1713, Task I, AFRC TR 57 59, July 1958, 11pp. Psychophysical Research Unit, Mount Holyoke College, South Hadley, Mass.

16,103

This is the third in a series of experiments concerned with the speed and accuracy of identifying converging groups of objects. Ss were shown series of displays of dots; on each successive display, every dot was displaced slightly; certain dots converged on the last display while others moved on random courses. Previous experimentation showed this to be a difficult task; this experiment was designed to test possible aids: 1) markings made by S on plastic overlay, 2) destination points marked in the display, 3) rings drawn around point of convergence, and 4) arrows attached to each dot indicating direction of movement. Applications of the results to practical identification problems were suggested.

Corbin, H., Carter, J., Reese, E.P. & Volkmann, J. (Eds.). EXPERIMENTS ON VISUAL SEARCH 1956-1957. FINAL REPORT. II. SPEED AND ACCURACY OF SEARCH FOR TARGETS IN A HORIZONTAL ARRAY. Contract AF 19(604) 1713, Task II, AFRC TR 57 59, July 1958, 10pp. Psychophysical Research Unit, Mount Holyoke College, South Hadley, Mass.

16,104

Three experiments were accomplished on the ability of observers to spot targets that appear suddenly on the scene. The basic task in all studies was to search for a small dot of light which might appear anywhere on a curved "horizon" line in the visual field. In the first study, Ss searched for targets over five values of stimulus range (5, 40, 80, 120, and 158 degrees) with three levels of target-to-background brightness. The second study varied the time between ready signal and appearance of a moderate, constant brightness target over a 158-degree range. Last, the search performance was studied by controlling the head and eye movements pursuant to search.

Ericksen, S.C. A REVIEW OF THE LITERATURE ON METHODS OF MEASURING PILOT PROFICIENCY. Contract AF 33(038) 23183, Proj. 508 016 0003, Res. Bull. 52 25, Aug. 1952, 24pp. USAF Pilot Training Research Lab., Goodfellow AFB, Tex. (American Institute for Research, Pittsburgh, Penn.).

16,106

A review of literature on methods of measuring pilot proficiency is presented as a general summary of the research contributions that should be recognized when dealing with problems in this area. The studies surveyed include the years through 1951. Following an historical review, these topics are dealt with: 1) selection without criteria, 2) early studies with a psychological orientation, 3) evaluation of subjective measures, 4) studies done in USN aviation, and 5) recent studies involving civilian pilot data. In addition to the major topic there is a discussion of some studies that provide a comparison between subjective and objective grading methods.

Drizin, D.H. THE 'HILO' INDICATOR AN EXPERIMENTAL INVESTIGATION OF HUMAN FACTORS RELEVANT TO THE DESIGN OF A LONG-RANGE CARRIER-BORNE ANGLE OF APPROACH INDICATOR. FPRC Memo 127, Nov. 1959, 16pp. Flying Personnel Research Committee, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

16,107

It is doubtful whether mirror and projector sights now in use will prove adequate for use with carrier-borne aircraft. The split-beam indicator (Hilo) described here would be effective at distances of between 1000 and 4000 yards from the carrier. An experimental investigation into human factors relevant to the detailed design of this indicator was concerned with these questions: Is there any advantage in interposing a band of neutral filter between the red and green segments of the component filter system? What shades of red and green would provide the clearest Hilo indication? Specific recommendations are made for design of the indicator.

Brehner, J. & Burrows, A.A. THE EVALUATION OF AIRCREW INFORMATION SYSTEMS. FPRC Memo 108, Feb. 1959, 9pp. Flying Personnel Research Committee, London, England.

16,112

The purpose of this paper was to examine methods and criteria for evaluations of aircrew information systems and to make recommendations for such evaluations where this was possible. The problems inherent in the evaluation of such systems were raised in historical perspective. Aircrew Information Systems were defined, various approaches to evaluation explored, a list of principles for use in developing checklists was given, an analysis of operations to be performed upon the information presented to the operator was made, performance measures used in the evaluation of aircrew information systems were discussed, and certain recommendations were made.

Eason, R.G. AN ELECTROMYOGRAPHIC STUDY OF IMPAIRMENT AND ESTIMATES OF SUBJECTIVE EFFORT ASSOCIATED WITH VOLUNTARY MUSCULAR CONTRACTION. PO 06401, NE 091300 3 (NEL N4 2), Rep. 898, May 1959, 27pp. USN Electronics Lab., San Diego, Calif.

16,119

To study the feasibility of using the surface electromyogram (EMG) as an index of muscular fatigue and subjective effort, a behavioral task was employed, restricted to voluntary contractions of certain muscles of the arm (hand dynamometer). The measurements were of changes occurring in the EMG as a function of the magnitude and duration of isometric contraction. The first experiment investigated relationships between EMG and degree and duration of voluntarily sustained contractions; the second dealt with rate of acquisition and amount of local and generalized impairment during sustained contractions; and the third tested the hypothesis that surface EMG reflects amount of effort required to maintain a sustained contraction.

Tiffin, J. & Bromer, J. ANALYSIS OF EYE FIXATIONS AND PATTERNS OF EYE-MOVEMENT IN LANDING A PIPER CUB J-3 AIRPLANE. Rep. 10, Feb. 1943, 24pp. Division of Research, US Civil Aeronautics Administration, Washington, D.C. (Purdue University, Lafayette, Ind.).

16,121

To study the different types of eye fixations and eye-movement patterns that occur during the landing of an airplane by pilots with varying degrees of skill, photographs were taken of the pilot's eyes during the last five to ten seconds before landing at the rate of 16 frames per second with a camera specially mounted in a Piper Cub J-3. Pictures of 177 landings made by 33 pilots (ranging from the elementary stage of dual instruction to over 200 hours flying experience) were analyzed frame-by-frame. Graphs of the eye movements show the different visual fields used and are separated into four groups according to flight experience of the pilot. A supplement contains two pertinent reports of progress on a later study of visual depth perception in aviation.

Tinker, M.A. & Carlson, W.S. SENSITIVITY OF PERIPHERAL VISION IN RELATION TO SKILL IN LANDING AN AIRPLANE. Rep. 14, April 1943, 15pp. Division of Research, US Civil Aeronautics Administration, Washington, D.C. (University of Minnesota, Minneapolis, Minn.).

16,122

This document sets forth the same experimental study of response time to peripherally presented stimuli as related to skill in landing an airplane as given in 16,123. However, there is a more adequate presentation of the data and analyses in this document than in 16,123.
T. I. R 9

16,123

Tinker, M.A. TESTS FOR THE SENSITIVITY OF PERIPHERAL VISION. Jan. 1941, 28pp. Division of Anthropology and Psychology, National Research Council, Washington, D.C. (University of Minnesota, Minneapolis, Minn.).

16,123

To test the hypothesis that response time to peripherally presented visual stimuli might be related to skill in landing an airplane, a disjunctive reaction time experiment was performed. The subject was required to indicate, by pressing an appropriate lever, in which quadrant the break in an illuminated ring appeared; the ring surrounded a central fixation spot of light. Three sizes of ring, three sizes of break, and three levels of illumination were used. On the basis of instructor ratings of landing skill, ten pilots were selected from the top and ten from the low ratings. Several comparisons were made in an effort to evaluate the visual reaction time data as related to landing skill.

Kelly, E.L. THE DEVELOPMENT OF "A SCALE FOR RATING PILOT COMPETENCY." Rep. 18, July 1943, 21pp. Division of Research, US Civil Aeronautics Administration, Washington, D.C. (Purdue University, Lafayette, Ind.).

16,124

This study describes the development of a scale for rating pilot efficiency. On the basis of preliminary trials, a 14-item graphic scale was devised and subjected to experimental study. Instructor ratings of the best and the poorest students were secured from 91 flight instructors in the Civilian Pilot Training program connected with various colleges. The 91 pairs of rating scales were scored on a 20-point scale and studied graphically. Additional ratings were secured on a roughly random sampling of students. A factor analysis of the intercorrelations was made and the resultant factors described. An appendix provides weights for the various items which permit more accurate scoring of the scale.

Heinemann, E.G. & Merrill, T. TILT ADAPTATION AND FIGURAL AFTER-EFFECTS. *J. exp. Psychol.*, Dec. 1954, 48(6), 468-472. (Harvard University, Cambridge, Mass. & Massachusetts Institute of Technology, Cambridge, Mass.).

16,130

Three experiments were performed to determine whether changes in apparent tilt of lines after long inspections represent an alignment effect or an adaptation to the norm. Twelve subjects served in one or more of the experiments. Subjects were required to fixate a mark for a period during which only the standard line was exposed, then to judge direction of tilt of a variable line exposed briefly. Measurements were made under four conditions. In some instances the standard line was vertical and the cardboard on which it was presented was tilted; in some, both the standard and the cardboard were tilted. Differences between angular positions of the standard and the variable were tested for significance. Results were compared with those from similar experiments.

Garner, W.R. SYMMETRIC UNCERTAINTY ANALYSIS AND REDUNDANCY OF PRINTED ENGLISH. Reprinted from: "Proceedings of the Fifteenth International Congress of Psychology," Brussels, 1957. Contract NSORI 166, Proj. NR 145 089, Task I, Rep. 166 I 220, 1-7. Johns Hopkins University, Baltimore, Md.

16,131

Information analysis is considered as a technique essentially analogous to analysis of variance. Although the analogy is useful, it may also be restrictive in that variance analysis requires that the criterion must have a metric. In information, or uncertainty analysis, this need not be so, but can use the same property of the criterion variable as of the predictor variables. Equations are developed and are discussed as they apply to sequential data where there are sequential dependencies. Definition of the term "redundancy" is questioned in the light of the above discussion.

McCormack, P.D. PERFORMANCE IN A VIGILANCE TASK AS A FUNCTION OF INTER-STIMULUS INTERVAL AND INTERPOLATED REST. *Canad. J. Psychol.*, 1958, 12(4), 242-246. (Defence Research Medical Labs., Toronto, Ontario, Canada).

16,133

To investigate performance in a vigilance task as a function of task duration, length of inter-stimulus interval, and degree of interpolated rest, 60 subjects were tested. The task lasted 50 minutes with some subjects working the entire period, others resting five minutes or ten minutes before completing the last ten minutes. The task was to depress a switch whenever a light appeared through an aperture (one centimeter in diameter). The light was presented 51 times to each subject, the intervals between stimuli being 30, 45, 60, 75, and 90 seconds. Response times were recorded and analyzed for effects due to the experimental conditions. The results are discussed in relation to the expectancy hypothesis and the hypothesis that inhibition is response-generated.

- 16,151
Previous studies have been reported in which the loss of one night's sleep can seriously impair the performance of a simple, prolonged mental task (Five Choice Test of Serial Reaction). The experiment reported here investigated three aspects of this problem: 1) effect of knowledge of results, 2) influence of familiarity with task, and 3) consistency among subjects in effect of sleep loss. Twelve subjects were given a test of serial reaction time in which repeated simple choices had to be made quickly and accurately over a period of 30 minutes. Four testing conditions were used: with knowledge of results after normal sleep and after no sleep the previous night, with no knowledge of results after normal sleep and after no sleep. Tests were given twice a week for six consecutive weeks. T. G. R 4

- 16,165
This paper describes the application of a general-purpose relay machine of modular construction to some kinds of psychological studies. The hardware described was developed to 1) reduce time required to set up a given experimental apparatus and 2) reduce cost of experimentation. This machine is being applied to two principle kinds of studies: those concerning communications services and devices, and studies of man-machine systems under normal environmental conditions for the subject. Further applications are discussed and advantages and disadvantages of the method are pointed out. I.

Roby, T.B. & Lanzetta, J.T. CONSIDERATIONS IN THE ANALYSIS OF GROUP TASKS. Psychol. Bull., March 1958, 55(2), 88-101. (Tufts University, Medford, Mass. & University of Delaware, Newark, Del.).
- 16,168
This report proposes a paradigm that may be useful in preliminary attempts to isolate and define important group-task characteristics. Based on the paradigm, several classes of relatively molecular differentiating properties of tasks are discussed. Then the concept of "critical demands" task properties at a higher level of abstraction is introduced. Such demands will serve as useful intervening variables between molecular task properties and task performance measures. Finally, an attempt is made to apply both the molecular and critical demand analyses to a widely used task and to show how the usefulness of this task could be further extended. T. I.

Christner, Charlotte A., Schutz, H.G. & Ray, H.W. SOME FACTORS AFFECTING VISUAL SEARCH TIME FOR SYMBOLS ON A LARGE VISUAL DISPLAY. Contract AF 30(602) 1766, 1959, 17pp. Battelle Memorial Institute, Columbus, Ohio.
- 16,170
The present study "grew out of the need for information on some of the factors which had to be considered when placing a large number of symbols on a visual display on both a clear and cluttered background, such as needed for large global display." The variable to be investigated was visual search time. Factors chosen to be studied for effect on visual search time included: 1) symbol density, total number of symbols on display; 2) symbol types, number; and 3) type of surface symbols displayed upon, i.e., clear or a map. Ten Ss were used and the three factors were employed in a factorial design. Data were analyzed by analysis of variance and multiple regression techniques.

Archibald, E.R. & Simons, D.G. SEALED CABIN ATMOSPHERE PROBLEMS. Task 78516, AFMDC TR 59 42, Dec. 1959, 15pp. USAF Missile Development Center, Holloman AFB, N.M. (USAF Aeromedical Field Lab., Holloman AFB, N.M.).
- 16,173
Certain physiological problems encountered in the design and operation of hermetically sealed cabins are discussed. Known parameters that limit human performance are presented along with a discussion of atmospheric environmental factors as to upper and lower limits for a flight of 24 hours duration where conditions of "no performance decrement" are desired. The parameters presented include inspired carbon dioxide partial pressure, alveolar oxygen partial pressure, and total cabin pressure.

Altman, I., Jenkins, J.P. & McGrath, J.E. THE TRANSFORMATION OF SMALL GROUP RESEARCH INFORMATION FOR COMPUTER ANALYSIS. Contract AF 49(698) 256, Supp. Agreement 1(58 446), HSR TN 59/9 GN, Oct. 1959, 61pp. Human Sciences Research, Inc., Arlington, Va.
- 16,174
Relationship coding forms (RCF) developed to classify "information about individual variables and the nature, e.g., significance, directionality, etc., of their relationship with other variables" provided raw data for the present study. To prepare data for key punching for electronic data processing, a data translation form was used to code 1) identifying information concerning the study, 2) information about variables, and 3) information about the relational term. Types of questions to be asked of the data were descriptive or actuarial, and questions involving the integration of knowledge in the small group field. The Data Translation System is described in detail. Rules and procedures for application of the classification systems are contained in an appendix.

Blyth, C.S. INFLUENCE OF PHYSICAL CHARACTERISTICS, PSYCHOLOGICAL FACTORS AND DRUGS ON THE CAPACITY OF MAN TO WORK IN THE HEAT. Contract DA 49 007 MD 949, Nov. 1959, 17pp. USA Research and Development Div., Office of the Surgeon General, Washington, D.C. (Laboratory of Applied Physiology, University of North Carolina, Chapel Hill, N.C.).
- 16,175
To determine the effect of caffeine, dexedrine, dehydration, and superhydration on man's capacity to withstand heat and exercise stress, a total of 90 different experiments was performed on 15 male subjects. Measures used to evaluate the stress were heart gain, heart rate, sweat loss, and mental, psychomotor, strength, and psychological tests. Heat stress was provided in a hot room at 110 degrees F, humidity of 25-30 percent, and air velocity of three to five mph. Exercise stress was provided by a motor-driven treadmill, moving at four mph at zero grade. Three acclimatization and six experimental periods, each of three-hours duration, were utilized. The difference between performance before entering the hot room and after some time in the heat was used to appraise the influence of the various conditions. T. R 5

Walker, P.G., Pool, E.T., Parker, J.F., Kelly, P.J., et al. HUMAN FACTORS SUPPORT PROGRAM FOR OPERATOR PERSONNEL AM/TSQ-13 DATA PROCESSING SUBSYSTEM (SYSTEM 4121). Contract AF 19(604) 5194, AFMDC TR 59 57, FRA Rep. 59 30, Dec. 1959, 15pp. Psychological Research Associates, Inc., Arlington, Va.
- 16,181
Purposes of this program were to 1) provide operator manuals to be used in training operator personnel for manning TSQ-13 equipment, 2) conduct a training program, and 3) develop proficiency measures for evaluation of operator performance after training. The training manuals include both equipment operation and system operation. Proficiency measures were developed for Cartrac operators, Auxiliary Data Panel operators, Weapons Controller positions, MIO, and SIG positions. Proficiency tests were pretested before being used as measures of performance.

Lit, A. THE EFFECT OF FIXATION CONDITIONS ON DEPTH DISCRIMINATION THRESHOLDS AT SCOTOPIC AND PHOTOPIC ILLUMINANCE LEVELS. J. exp. Psychol., Dec. 1959, 58(6), 476-481. (Vision Research Labs., University of Michigan, Ann Arbor, Mich.).
- 16,183
The effects of systematic variations in conditions of fixation on depth discrimination thresholds were investigated. The methods of fixation were: 1) steady fixation on the movable comparison rod, 2) steady fixation on the immovable standard rod, and 3) fixation on either of the rods at will. A two-rod test apparatus involving real-depth cues was used. The rods were viewed under conditions of equal binocular retinal illuminances ranging from a low scotopic to a high photopic level. Threshold data were based on equidistant (equality) settings of the stimulus rods. The results were discussed in reference to photochemical theories of vision and the current controversy on the role of convergence cues in stereoscopic acuity.

Livingstone, R.E. & Weems, B.F. (Proj. Officers). TEST AND EVALUATION OF THE NAVY HELICOPTER RESCUE SEAT. Proj. J28-3/1 17, Sept. 1958, 20pp. USCG Testing and Development Div., Office of Engineering, Washington, D.C. (USCG Air Station, Miami, Fla.).
- 16,184
The grapple-type helicopter rescue seat as developed by the U.S. Navy was tested and evaluated for Coast Guard use. In flight tests, comparisons were made among three types of rescue equipment: the seat, the sling, and the Erickson Rescue Basket. Following the tests, the seat was redesigned to reduce the possibility of its hanging up or fouling in rigging or overlaps of small boats and ships. During redesign, padding of the seat to reduce possible injury to survivors was accomplished. Further evaluation was made of the padded grapple seat and three prototype redesigns. Following further modifications, a wheel-type and grapple-type seat were evaluated.

Jones, L.V. & Jeffrey, T.E. DEVELOPMENT OF SUITABLE RATING SCALES FOR MEASURING THE SUBJECTIVE REACTIONS OF TROOPS USING QM ITEMS UNDER ACTUAL FIELD TEST CONDITIONS. Contract DA-19 129 QM 1291, FEA MRS 5902, MRS 59 71, Tech. Rep. R 5, Nov. 1959, 87pp. USA Quartermaster Field Evaluation Agency, Fort Lee, Va. (Psychometric Lab., University of North Carolina, Chapel Hill, N.C.).
- 16,186
An investigation was conducted to determine those aspects or characteristics of issue clothing and equipment that are primary determiners of soldier acceptance and to develop suitable scales for measuring acceptance. A questionnaire was devised composed of statements representing some feature of the article to be judged and administered to 400 soldiers. Four issue items were judged. The data were analyzed for the features that best predicted acceptance for each item and for common factors running through all four items. Two additional rating scales were then developed and used to judge other articles. An optimal design for such questionnaires was discussed and their generality to a variety of items was suggested.

Vaccaro, J., Jr. DESIGN REPORT ON HORIZONTAL DISPLAY. Proj. TED ADC AE-73002.2, Rep. NADC AI 5950, July 1959, 18pp. USN Air Development Center, Johnsville, Penn.
- 16,196
A design concept evaluation of three prototype horizontal displays of the Army-Navy Instrumentation Program (ANIP) is described. The primary purpose of the horizontal display is to provide a visual display that will orient the position of an aircraft with respect to its destination, or target, in a manner easily assimilated by the pilot. Navigational information in pictorial rho-theta form, relative bearing of a fixed geographically oriented radio transmitter, magnetic heading of the aircraft, readout counters for distance-to-go and time-to-go are presented. Results of functional tests and visual inspection tests made in the laboratory are presented.

Peckham, R.H. & Hart, W.M. NEURAL INTEGRATION AT THE RETINAL LEVEL AS EVIDENCED BY FLICKER FUSION MEASUREMENTS. Am. J. Ophthalmol., Nov. 1959, 48(5) Part II, 594-600. (Bethesda, Md.).
- 16,199
The use of flicker measurements was used in this experiment to assess retinal functions. Flicker stimuli were presented to the right and left eye separately in a constant order which appeared random to the subject. Each change in flicker rate was preceded by a warning signal and the subject responded by sounding or failing to sound a buzzer. Stimuli were presented in two ranges: from 22 to 34 per second and from 30 to 46 per second. Records from 38,000 trials on 334 eyes were obtained. The thresholds of critical fusion frequency for low contrast foveal flicker were established by psychometric methods. The results were described in forms of clearly defined probability functions and used in an analysis of the inferred theoretical behavior of the retina.

Newell, A. & Simon, H.A. THE SIMULATION OF HUMAN THOUGHT. Contract AF 49(368) 700, Proj. RAND, Res. Memo. 2506, Dec. 1959, 41pp. The Rand Corporation, Santa Monica, Calif.
- 16,213
The authors describe a method for studying human problem-solving, give an example of its application, and discuss the theory of problem-solving which emerges. A theory of central processes is constructed in the form of a program. The sufficiency of the theory for predicting problem-solving behavior is demonstrated by realizing it in a computer. The theory is tested against human processes by comparing the trace generated by the program with the protocol of a human subject. The theory which emerged is "mediational" encompassing "Gestalt" processes.

16,232

The aim of this study, Part II of a two-part report, was to investigate whether for a given value of the parameters, duration and total time of variation of illuminance and wavelength, the scotopic b-wave is affected by changes in the derivative of luminance with respect to time. Two stimuli, one characterized by a slow rise of the luminance and the other by a sequence of short flashes, were used. The role of total energy, duration, color, total time of variation of the luminance, and total time derivative of the luminance were discussed in terms of their relation to the height of the scotopic b-wave at high luminance levels.

16,238

The work of the Road Research Laboratory, Department of Scientific and Industrial Research, England, on street lighting is described. Accident data before and after lighting improvements for 64 sites are analyzed. Some data on changes in both speed of driving and accidents are also given. Investigations carried out to discover whether further changes are desirable in various aspects of the recommended street lighting practice are described. These include a study of the effect of changes in road surface on light distribution, lantern arrangements, and siting of street columns supporting the lanterns. Finally, an experimental low-cost lighting system for use on main traffic routes outside built-up areas is considered.

16,241

Christie, A.W. "THE ROAD SURFACE AS A FACTOR IN STREET LIGHTING". Presented at: Road Engineering Division Meeting, 20 May 1954, Road Paper 45, Oct. 1954, 506-531. *Institution of Civil Engineers*, Westminster, London, England.

16,241

The theory of vision in lighted streets is examined in simple terms in order to show that the effectiveness of the lighting is determined to a large extent by the reflecting properties of the road surface. Three main types of lantern light distribution are described and their use is discussed. The results of studies of bright patches on a number of surfaces are shown in relation to estimation of the effectiveness of lighting installations and in improving their design. Some methods used to improve the nonskid properties of roads are related to their effect on lighting. The effect of surface texture on the reflection of light from wet surfaces is also examined.

Cole, J.N., Von Gierke, H.E., Kyrazis, D.T., Eldred, K.M., et al. NOISE RADIATION FROM FOURTEEN TYPES OF ROCKETS IN THE 1,000 TO 130,000 POUNDS THRUST RANGE. Proj. 7210, Task 71705, WADC TR 57-354, Dec. 1957, 54pp. *USAF Aero Medical Lab.*, Wright-Patterson AFB, Ohio.

16,243

Detailed noise characteristics were measured on 14 types of rockets, with both solid and liquid propellants, in the thrust range from 1,000 to 130,000 lbs. Near field and far field levels on static fired and vertical launched rockets were measured under essentially free field conditions. Measurement and data reduction methods were described. Final results were given as near field sound pressure spectra, far field directivities, acoustic power spectra, and pressure-time histories. This noise environment was studied as a function of nozzle configurations and of flame front action in the jet stream. A formula for over-all acoustic power level output of rockets and an approximate generalized power spectrum dependent upon nozzle diameter and jet flow characteristics were given.

Brown, J.L. REVIEW OF THE CONE-TO-ROD EFFICIENCY RATIO AS A SPECIFICATION FOR LIGHTING SYSTEMS. Contract AF-33(616)-22616, Proj. 7186, Task 71544, WADC TR 57-448, Aug. 1957, 21pp. *USAF Aero Medical Lab.*, Wright-Patterson AFB, Ohio. (Columbia University, New York, N.Y.).

16,246

The need for systems of illumination that afford maximum stimulation of the eye at low luminances has led to the widespread use of red light. The theoretical basis for the advantage of red light is reviewed. Several methods for the practical specification of illumination which are based on a cone-to-rod luminous efficiency ratio are analyzed and compared in terms of the actual physical significance of the numerical values which they yield. The general problem of specification is discussed in relation to a number of underlying practical problems, such as the luminance level at which a given system must be used, the nature of visual tasks for which it is provided, and those for which it must be preserved. The use of the cone-to-rod luminous efficiency ratio is recommended for experimental testing.

Brown, L. Jr. & Israel, J.G. ON ADAPTIVE CONTROL SYSTEMS. Contract DA 30 069 ORD 1960, ONR Rep. 1308 10 & Res. Rep. R 720 39, P28 663, April 1959, 84pp. Micro-wave Research Institute, Polytechnic Institute of Brooklyn, Brooklyn, N.Y.

16,248

Methods of realizing control systems that exhibit adaptation are considered. A philosophy is first developed for such systems by considering the behavior of a human being acting as a controller in situations that require adaptation. Two major problems are defined: identification and excitation. Three specific techniques for solving the identification problem are described: 1) the heuristic series expansion of the impulse response, 2) representation of the impulse response as the sum of a set of preselected exponential functions, and 3) the impulse response expansion in a series of orthonormal functions. A solution to the excitation problem appropriate to each technique is described.

Banner, R.H. THE EFFECTS OF STRESS ON UROPEPSIN EXCRETION. Proj. 7229, Task 71742, NRC IN 57 427, Dec. 1957, 11pp. USAF Army Medical Lab., Wright-Patterson AFB, Ohio.

16,249

Uropepsin changes under simulated flight stress were studied using 23 subjects under conditions of 120 hours cabin confinement, elevated temperatures, prolonged positive g forces, and visual and auditory stimuli deprivation. Urine samples were obtained at varying schedules for each of the test conditions. The method for analyzing uropepsin was described at length.

Fluhr, F.R. DIGITALIZED PICKOFF DISPLAY CONVERTER. Proj. NE 051 100 C24.33, BuShips S 1600, NRL Prob. Y01 04, NRL Rep. 5261, March 1959, 7pp. USN Research Lab., Washington, D.C.

16,253

Due to the increasing complexity of the Naval Data Handling System, a more efficient data processing method is required. Thus, the Pickoff Display Converter, a digitalized machine, which allows the operator to generate derived position coordinates and insert them into the computer memory, has been offered. Mode functions provided are the direct and differential modes of operation. The Digitalized Pickoff Display Converter would also be capable of working with a Fast-Scan type of display.

Kestige, W.R. THE EFFECT OF HUMID, CLOTHING AND IMMOBILIZATION ON THE MAINTENANCE OF THE BODY TEMPERATURE IN WATER. NRP 60477, 25 97, Oct. 1959, 8pp. Scientific-Sat-Sat-Commission, NRC, London, England.

16,259

To investigate the effects of immersion in water on the human body, studies were made of 12 healthy young men. Immersions were made in a laboratory tank at water temperatures of 15 and 5 degrees C on every second day and at higher temperatures every day for a period of 20 minutes. During immersions the men either sat still or walked (swimming movement) and were clothed or naked; the water was either undisturbed or stirred for the sitting condition. The rate at which men lost heat was found by measuring body temperatures. Metabolic rates, alveolar air measurements, and ECG records were obtained. From the data, certain recommendations were made to be given to men about immersion in water after shipwreck.

Kraft, J.A. APPROACHES TO THE MEASURE OF FLIGHT CROWN CONFIDENCE SCORES AND FAILURE. Presented at: Annual Meeting of the Aero Medical Association, 24-26 March 1958, 24pp. Military Operations Research Engineering Div., Lockheed Aircraft Corporation, Marietta, Ga.

16,260

Briefly reviewed are recent advances in flight systems and the problems of human factors which accompany long endurance flights. The need to study problems associated with the tolerance of humans to high and sustained g forces, tolerance to sustained cosmic, ultraviolet, and x-ray bombardments, as well as others is mentioned and the need for further simulated environmental studies is stressed. Described is the Lockheed Human Factors Research Laboratory which contains a mock-up simulating a space restricted flight station. The experimental program and performance tasks are described and the physiological and clinical measures are discussed.

Stevens, S.S. INTRODUCTION: A DEFINITION OF COMMUNICATION. J. Acoustic Soc. Amer., Nov. 1959, 22(6), 689-690. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.).

16,266

Because the word communication has so many different meanings, a broad, operational, and behavioristic definition is offered. The definition is discussed in relation to information theory.

16,269

Wilcox, R.H. A MEASURE OF COHERENCE FOR HUMAN INFORMATION FILTERS. Psychometrika, Sept. 1957, 22(3), 269-274. (USN Research Lab., Washington, D.C.).

16,269

Developed here is a coherence measure which is a quantitative measure of the extent to which a man avoids random activity during filtering operations. Due to the great rate of information a processing system receives, man or machine, only a certain amount can be handled. Filtering as performed by a human being can be coherent or at least in part random. The quantitative method presented here measures the extent to which a human filter avoids random activity in the selection of informational items during periods of overload.

Needle, H.M. RADAR BEAM CODING TECHNIQUES. Proj. 4004, Task 40143, RADC TR 57 343, Dec. 1957, 11pp. USAF Air Development Center, Griffiss AFB, N.Y.

16,271

To determine the operational characteristics and capabilities of a breadboard model of the CMA Pictorial Position Indicator (an aircraft instrument that projects a continuous display of an aircraft's position and ground track on a map it receives the data information from the distance and bearing indicators of the Tactical Air Communications and Navigation System and it may be either lap held or rack mounted), to evaluate it as an airborne navigation aid, and to determine the desirability of a user test, exploratory tests were conducted in fixed-wing and in rotary-wing aircraft. In addition, accuracy, wear up time, continuous use capabilities, and installation and maintenance problems were determined. Recommendations were included.

Chang, S.H. SPEECH ANALYSIS FINAL SCIENTIFIC REPORT. Contract AF 19(604) 2198, AFPC TR 58 107, Feb. 1958, 31pp. Electronics Research Lab., Northeastern University, Boston, Mass.

16,277

A summary is presented of studies directed toward the specification of important parameters of speech in speech-band compression systems. In the first chapter, the present status of the Formoder (Formant-Moment Coder) is described. This experimental speech-band compression system makes use of from five to seven narrow-band parametric channels to convey the information of speech. The principal assumptions, the instrumentation, and some results of this approach are discussed. In chapter two a study of the automatic identification of turbulent sounds is described. Experimental results that lead to possible separation of unvoiced stops and fricatives are reported.

T. G. I. R 11

16,278

Discussed here is a radar beam coding technique designed for tracking radar used for landing aircraft. In particular, data transmission using a digital system is considered. The radar coding and transmitter encoding used are explained. The accuracy of the technique is determined by the code which is transmitted. The radar performance determines the number of bits which a system is capable of sending. A bench test using an AR/APG-30 as a radar transmitter was employed to test the beam coding technique.

Gris, H.L. TEST OF RADIO COMMUNICATIONS DURING RADAR GROUND CONTROLLED APPROACH (GCA). Proj. 4651, RADC TR 57 343, Dec. 1957, 14pp. USAF Directorate of Flight and Air-Weather Testing, Wright-Patterson AFB, Ohio.

16,279

The problem of providing the pilot with a means of communicating with the ground communications approach controller (GCA) during final approach was investigated. A method using the standard equipment of the aircraft was devised that allowed the pilot to transmit signals to the GCA controller during the approach. Sixty-six tests were conducted with eight different types of aircraft, jet and reciprocating, on two frequencies, 218.9 and 336.8 MCS, at ranges from 0.2 miles to six miles out on final path approach. Recommendations concerning the use of the system were offered.

Dobson, R.M. CONSECUTIVE AIRDROP DELIVERY OF PERSONNEL AND EQUIPMENT FROM THE C-123B AIRCRAFT AND SUITABILITY OF THE STATIC LINE RETRIEVER SYSTEM. OPERATIONAL TEST REPORT. Proj. 995HF 30, AFPC TR 58 80, June 1958, 16pp. USAF Air Proving Ground Center, Eglin AFB, Fla.

16,280

The results of operational testing of consecutive airdrop delivery of paratroops and A-21 containers with supplies from the C-123B aircraft and of the suitability of the static line retriever system as installed in the aircraft were described. Paratroop jumps and airdrop of personnel dummies were made both preceding and following drop of the A-21 containers. The static line retriever system was found capable of retrieving dummies weighing approximately 400 lbs. Minor modifications to this equipment were suggested.

Mathery, W.G. & Hardt, H.D. THE DISPLAY OF SPATIAL ORIENTATION INFORMATION. Contract WOMB 1670(00), Rep. D228 421 001, Aug. 1959, 41pp. Bell Helicopter Corporation, Fort Worth, Tex.

16,282

These experiments are the first of a series aimed at determining the variables making up an effective display for presenting spatial orientation (attitude) information to the pilot of an aircraft. Variables studied were: 1) method of encoding the ground plane (content), 2) size of display, 3) shape of display, and 4) S enclosed or not enclosed within cockpit type of exposure (internal reference). A static display (stimuli projected on a screen) was used in which the S pressed an appropriate button to indicate his judgment of the relationship between plane and ground as seen in each stimulus projection. Response times and errors were recorded and analyzed for differences among the variables.

Wilkerson, L.E. A STUDY TO DETERMINE HOW WELL RATE CAN BE DISCRIMINATED AND CONTROLLED. Contract NMR 1670(00), Rep. D228 420 004, Dec. 1958, 35pp. Bell Helicopter Corporation, Fort Worth, Tex.

16,283

To determine how well a person can control and discriminate rates of movement, 16 flight-naïve and eight flight-experienced Ss were tested. They were presented with two different symbols, a line and a circle, which could be either expanded or contracted to show rate of change. The task was to control the symbol according to a prescribed pattern of increasing, holding, and decreasing rate of change. Four different control sensitivities were used for each of the symbols. Both position data and rate data were analyzed for accuracy of performance for each condition. The findings were discussed in relation to helicopter pilot performance and ways of encoding rate information in displays.

Wilkerson, L.E., Fox, G.A. & Matheny, M.G. THE EFFECT OF SCALE FORM ON THE SPEED AND ACCURACY OF SCALE READING. Contract NMR 1670(00), Rep. D228 420 003, Oct. 1958, 22pp. Bell Helicopter Corporation, Fort Worth, Tex.

16,284

To evaluate three types of displays—circular-moving pointer, linear-fixed pointer, and linear-moving pointer, 36 Ss were given ten presentations of each display and required to record the reading following a one-half second exposure. The size of numbers, graduation mark separation, interval values, and pointer width were the same for all three scales. Frequency of errors in reading each of the scales as well as for segments of the scales were examined. Magnitude of errors was also analyzed. The results were discussed relative to the number of fixations possible with the exposure time used.

Fox, G.A., Hardt, H.D. & Matheny, M.G. DETECTION OF SMALL CHANGES IN THE SIZE OF THE SQUARES IN A GRID LINE DISPLAY. Contract NMR 1670(00), Rep. D228 420 002, Feb. 1959, 22pp. Bell Helicopter Corporation, Fort Worth, Tex.

16,287

To determine how much changes in the size of the squares in a grid line display would have to be made to be detected by a human observer, three standard grid patterns of different size were presented and each compared with itself and eight variations in size. Comparisons were made by 36 Ss who reported whether the squares in the second display looked larger, smaller, or the same as the previous display. The results were analyzed using the normal graphic method and were discussed with reference to a proposed altitude display for helicopters.

Fedderson, W.E. THE EFFECT OF VARIATIONS IN CONTROL SYSTEM DYNAMICS UPON TRACKING PERFORMANCE. Contract NMR 1670(00), Rep. D228 430 001, Oct. 1958, 28pp. Bell Helicopter Corporation, Fort Worth, Tex.

16,288

Two experiments were performed to illustrate the hypothesis that the "function determining operator performance in a tracking situation is the rate of movement of the display element in response to a control input rather than the value" of the control-display ratio or system lag. Twenty-four Ss served in each of 24 conditions for both studies. Experiment I investigated compensatory tracking of a display along the vertical dimension of a cathode-ray tube (crt); Experiment II studied tracking of angular rotation of the same display (three-inch fluorescent winged-symbol on the face of a 17-inch crt). Voltage difference between Ss' control output and cam output was recorded to measure error amplitude and direction.

Dunlap, J.W. THE ANALYSIS AND PREVENTION OF MOTOR VEHICLE ACCIDENTS AMONG AIRMEN. FINAL REPORT. Contract DA 49 007 MD 876, Dec. 1959, 4pp. Dunlap and Associates, Inc., Stamford, Conn.

16,294

A summary report of a study of accident analysis and prevention was given. The results of an interview study of a representative sample of 138 airmen drivers who became involved in personal injury accidents while driving privately-owned motor vehicles and 100 airmen not so involved were presented. The results of the interview study provided the basis for the development and trial of a specially-designed countermeasure to reduce injury-producing accidents among airmen. The countermeasure was described and the results of a year's trial were summarized.

16,295

Margaria, R., Gualtierotti, T. & Spinelli, D. EFFECT OF STRESS ON LOWER NEURON ACTIVITY. Exp. Med. Surg., June-Sept. 1958, 16(2-3), 166-176. (Contract AF 61(514) 637, AFOSR TN 58 537).

16,295

Monosynaptic reflexes were studied to investigate stress. A mixed nerve in the sciatic area was used, thus conduction speed of both motor and sensory fibers and central delay together with the end-plate delay were calculated. The following conditions of stress were studied: hypoxia; hypoglycemia; muscular fatigue due to prolonged physical effort; action of drugs: caffeine, barbiturates; alcohol; and lack of sleep. The results obtained fell into two categories which involved the central mechanism and the peripheral part of the reflex. The observations were discussed as well as the action of insulin in stress conditions. The problem of distinguishing stress from fatigue and injury is still apparent.

Madson, R.A. HIGH ALTITUDE BALLOON DUMMY DROPS. PART I. THE UNSTABILIZED DUMMY DROPS. Proj. 7218, Task 71719, WADC TR 57 477, Part I, Oct. 1957, 40pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

16,296

As part of a study on high altitude escape problems, the characteristics of instrumented dummies carried aloft to predetermined altitudes were studied during the free fall in unstabilized situations. Altitudes were varied from approximately 90,000 to 30,000 feet. The attitudes assumed by the dummies, type of spin or tumble occurring, and angular velocities recorded on the accelerometers were studied. Further tests to develop a method of stabilizing a man descending from high altitudes were recommended.

Stanley, J.R. LIGHT INTENSITY LEVEL REQUIRED FOR GROUND PHOTOGRAPHY OF AN AIRBORNE FLASHING LIGHT. Contract AFDCM 80-4, Proj. 5080 50580, APGC TN 58 1, Jan. 1958, 9pp. USAF Air Proving Ground Center, Eglin AFB, Fla.

16,302
To determine the minimum light intensity necessary for photographing ballistic trajectories, a variable intensity flashing-light source was photographed using ground-based cameras. The light source used was a GE FI-118 Edgerton lamp (strobe light) operated from capacitors charged by a 450 volt battery. One ground and two airborne missions were conducted. The ground mission, a functional check of the light unit, was conducted in an altitude chamber at 20,000 feet altitude and -18 degrees F temperature. The airborne missions were conducted during clear weather, between darkness and midnight, and at 40,000 feet altitude. Capacitor values tested ranged from 6.2 to 97.0 microfarads.

Reveal, R., Jr. & Ruch, F.L. AN APPLICATION OF THE CRITICAL-INCIDENT TECHNIQUE TO AIR FORCE COMBAT LEADERSHIP. Contract AF 33(038) 23295, Proj. 7731 (505 039 00 01), Res. Rep. AFPTIC TN 58 8, Feb. 1958, 47pp. USAF Office for Social Science Programs, Lackland AFB, Tex.

16,307
This study reports the use of the critical-incident technique to secure descriptions of specific behaviors associated with effective officer combat leadership as observed by fellow officers. From 562 protocols of standardized interviews with 624 Far Eastern Air Force officers on 17 overseas bases in 1951, 1034 statements describing leadership behavior were extracted by two teams of three analysts each. These statements were classified with adequate reliability (estimated above .80) in 32 categories. These categories may be interpreted as one statement of critical requirements for effective leadership of such combat officers.

Sturrock, P.E. & Kitzes, G. AN ESTIMATION OF EXPOSURE TO CARBON MONOXIDE BY BREATH ANALYSIS. Proj. 7159, Task 71803, WADC TR 57 291, March 1958, 13pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio.

16,308
This study was designed to develop a rapid semiquantitative method of screening subjects for possible carbon monoxide (CO) poisoning. A colorimetric indication gel for carbon monoxide developed by the National Bureau of Standards was used as the indicator in this study. Preliminary investigations yielded a method of obtaining a normal "lungful" of air from the subjects. The correlation between breath-CO concentration determined by the colorimetric-indicating method and blood-CO concentration was determined in a series of experiments using 32 smokers and nonsmokers. The blood-CO analysis was performed by the monometric Van Slyke procedure. The advantages and disadvantages of the method were discussed.

Waite, J.V. & Buss, W. MULTI-STAGE PERSONNEL PARACHUTE. Proj. 6068, Task 61496, AFPTIC TN 58 19, Oct. 1958, 13pp. USAF 6511th Test Group (Parachute), El Centro, Calif.

16,316
One of the hazards encountered by a parachutist while free falling following a high altitude bailout is uncontrolled tumbling and spinning which may impair his physical and mental capacities. To avoid this it was proposed to use the parachutist's main canopy as a stabilization device to permit rapid descent at high altitude. Several methods of deploying the main canopy in a streaming condition to provide sufficient drag were developed and tested. Modifications were made to the parachute assembly and a method of anchoring the suspension lines within the pack was devised. Tests were made with an articulated dummy.

von Békésy, G. SIMPLIFIED MODEL TO DEMONSTRATE THE ENERGY FLOW AND FORMATION OF TRAVELING WAVES SIMILAR TO THOSE FOUND IN THE COCHLEA. Proc. Nat. Acad. Sci. Wash., Dec. 1956, 42(12), 930-944. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.). (Rep. PNR 187).

16,323

To investigate what happens to sound waves that travel in a direction in which the mechanical properties of the medium are changing continuously, a model was constructed and is described. The model consists of a series of pendulums in which the length of the pendulum is continuously graduated and in which the pendulums may swing completely free or be coupled in varying degrees of strength; this is a simplified model of the cochlea. Energy flow and formation of traveling waves similar to those in the cochlea are demonstrated and discussed. The use of the model for investigating pathological cases of hearing loss is also indicated.

Howell, W.C. & Briggs, G.E. AN INITIAL EVALUATION OF A VIBROTACTILE DISPLAY IN COMPLEX CONTROL TASKS. Contract AF 33(616) 3524, Proj. 9 (610 6190), Task 50706 & OSURF Proj. 813, Tech. Rep. (813) 5, Oct. 1959, 16pp. Ohio State University Research Foundation, Columbus, Ohio.

16,338

Three experiments were completed which explored the accuracy human operators can achieve in both simple and complex control tasks when input and output information are displayed by way of the tactual sense modality. Tracking performance was first compared on three compensatory displays, two visual and one vibratory. The vibratory display was then studied under two levels of aiding in a second-order control system. In the third study a vibratory display was studied in which apparent movement (phi effect) was used to indicate system error. The use of such vibrotactile displays as a substitute for visual displays under conditions where the visual sense is degraded or in periods of high g stress is discussed.

Fry, E.B., Bryan, G.L. & Rigney, J.W. TEACHING MACHINES: AN ANNOTATED BIBLIOGRAPHY. Contract N0NR 228(02), Proj. NR 153 093, Tech. Rep. 28, Nov. 1959, 106pp. University of Southern California, Los Angeles, Calif.

16,339

This is the first of two reports concerned with a study of the potentialities of teaching machines for technical training in the navy. The report consists of: 1) an introduction which contains summarizing statements about the references in the bibliography, tables which summarize facts about work in this area (e.g., frequency per year of teaching machine studies, frequency of different categories of articles), and a descriptive summary of devices which have been developed; 2) the annotated bibliography; and 3) a catalogue of commercially developed teaching machines. Included in the references are discussions of programming, developmental and descriptive studies, training experiments, field surveys, and theoretical discussions.

Clark, D.L. DETECTION OF SIGNALS IN NON-GAUSSIAN NOISE. Group Rep. 47.36, Dec. 1959, 16pp. Lincoln Laboratory, Massachusetts Institute of Technology, Lexington, Mass.

16,350

This paper considers the problem of detecting signals in highly complicated noise. On the basis of the assumption that the effects of non-Gaussian amplitude densities can be considered separately from the effects of complicated spectral densities, a simple model is introduced that is capable of generating a family of non-Gaussian amplitude density functions with dependence on the spectral density minimized. The model and the parameters by which it is characterized are chosen on an intuitive basis to facilitate calculation of the performance of simple detection schemes and to permit measurement in the laboratory of detectors whose analysis becomes hopelessly involved.

Botha, E. A FURTHER APPLICATION OF BEHAVIORAL THEORY TO EXPERIMENTS ON THE ROLE OF PREFERENCE IN PERCEPTION OF SIZE. *J. Soc. Res.*, 1957, 51-64. (University of Cape Town, Cape Town, Union of South Africa).

16,351

Certain predictions about behavior and perception, based on the postulate that size perception is a function of specific acquired habits, were tested in experiments with school books, representing liked or disliked subjects, as stimuli. Three different situations were used: 1) free choice, 2) homework, and 3) free time preparation. In both first and third conditions, the Ss were shown, in rapid succession, photographs, of the same size, of a book representing a liked and disliked book; the task was to report the larger of the two. In the second test, one photograph showed a book of invariant size and the second one was varied until the S reported them as identical; questions were asked about homework practices. Mothers' and teachers' reports were studied in relation to the findings. T. R 1

Bradley, J.V. STUDIES IN RESEARCH METHODOLOGY: II. CONSEQUENCES OF VIOLATING PARAMETRIC ASSUMPTIONS - FACT AND FALLACY. Proj. 7184, Task 71561, WADC TR 58 574 (II), Sept. 1959, 33pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio.

16,353

"Methods of investigating the effects of assumption-violation are examined. Particular attention is given to methodological and other bias operating in favor of the conclusion that parametric tests are extremely insensitive to violations of theoretical assumptions. Fallacious arguments advanced in support of this conclusion are discussed. Using a new method, the effect of non-normality upon the probability levels and power of the critical ratio test is investigated."

Black, J.W. VOICE COMMUNICATION STUDIES FINAL REPORT. Contract N6ONR 22525, Rep. 398, Sept. 1959, 15pp. Ohio State University Research Foundation, Columbus, Ohio.

16,354

This report brings together the titles of technical reports (listed in chronological order), names of research personnel, and topics of emphasis for research in voice communications conducted by the Ohio State University Research Foundation over a ten-year period, 1949-1959. The reports are related to seven topics as follows: voice intelligibility, dimensions of voice, problems in listening, hearing oneself (sidetone), the language of voice communication, problems in hearing, and the evaluation of equipment.

Annaby, D.H. & Cook, K.G. DESIGN STANDARDS FOR MAN-MACHINE TASKS IN SIGNAL CORPS SYSTEMS. Contract DA 36 039 SC 78326, Proj. 3 99 00 110, Dec. 1959, 51pp. Applied Psychology Corporation, Arlington, Va.

16,356

This study is concerned with the development of a method whereby the human functions (particularly in non-routine tasks) in man-machine systems can be classified and analyzed. Attempts to derive basic processes through classificatory methods and/or models utilizing concepts from a single theoretical framework are discussed in the first portion of the report. A model utilizing concepts from the theories of symbolic functioning and information was constructed and examined in terms of its ability to specify the demands made upon man in any man-machine system. The next steps in this research study are delineated.

Dunlap and Associates, Inc. HUMAN FACTORS REVIEW OF RADIO SET AM/GRC 53 FINAL REPORT. Contract DA 36 039 SC 73253, Proj. 3 99 00 100, Task 17B, Sept. 1959, 6pp. Dunlap and Associates, Inc., Stamford, Conn.

16,357

The Radio Set AM/GRC-53() is reviewed in terms of the human factors involved in the control panels of the Radio Transmitter T-682()/GRC, the Radio Receiver R-880()/GRC, and the Electrical Filter Assembly F-399()/GRC. General comments are made about the design of these items in relation to their operational aspects and suggestions are made for minor modifications of the present design and more radical changes for future models.

16,359

Missler, E.H. THE MATHEMATICAL ANALYSIS OF HEAT TRANSFER AND TEMPERATURE RELATIONS IN THE HUMAN BODY. PROGRESS REPORT NO. 1: 1 MARCH 1959 - 15 DECEMBER 1959. Contract DA 49 007 MD 2003, Rep. 3, Dec. 1959, 7pp. University of Texas, Austin, Tex.

16,359

Two mathematical models having many of the characteristic properties of the human thermal system have been developed. One of the models is used for making steady state calculations, the other for transient state calculations. The models are described briefly in expository form in this report. The equations for both models have been coded for the IBM 650 computer to facilitate calculations. Computed results have been compared with experimental data reported in the literature.

Plant, Jane. A LOOK AT HUMAN ENGINEERING IN THE SOVIET
UNION. Co. 1959, 21pp. Douglas Aircraft Co., Inc.,
El Segundo, Calif.

16,363
The author examined some 13 issues of a Russian
Journal of Military Aviation published in 1957-1958.
Inferences were made concerning Soviet policies and
attitudes toward human engineering. Two tentative con-
clusions were drawn: 1) the Russians seem to place far
greater emphasis on the contribution to air safety of
the role of thorough, disciplined training than to engi-
neering of the aircraft itself; and 2) the Russians prob-
ably are, in fact, directing considerable attention to
the relationships between men and the machines with which
they work.

Kelley, C.R., Bowen, H.M., DeGroot, Sybil G., Frank, P.,
et al. RELATIVE MOTION II: THE NATURE OF RELATIVE MOTION
SITUATIONS. Contract N61339 316, Tech. Rep. NAVTRADEV
CEN 316 1, Nov. 1959, 107pp. USN Training Device
Center, Port Washington, N.Y. (Dunlap and Associates,
Inc., Stamford, Conn.).

16,370
This study was undertaken to broaden our knowledge of
the nature of relative motion situations from physical-
mathematical and psychological standpoints. Relative
motion was defined as the change in the relative position
of two moving objects which can be perceived or under-
stood in terms of more than one frame of reference. The
psycho-perceptual and mathematical aspects of relative
motion were delineated and systematized yielding guide-
lines for selecting a suitable frame of reference for
operator tasks. One experiment was carried out to deter-
mine whether the shape of an aircraft contributes to the
accuracy with which its motion is observed in a relative
motion situation. Recommendations are included.

Furchtgott, E. & Friedman, M.P. EFFECT OF HUNGER AND
SATIETY ON ODOR SENSITIVITY. Contract DA19 129 QM 844,
Proj. 7 84 15 007, Rep. 13 (Final), July 1959, 17pp.
USA Quartermaster Food and Container Institute for the
Armed Forces, Chicago, Ill. (University of Tennessee,
Knoxville, Tenn.).

16,380
To test the effects of hunger on odor and taste sensi-
tivity, a series of experiments was performed in which the
amount of practice in making threshold determinations and
the control of food intake on test days were varied. Odor
and taste thresholds were determined 1) before and after
lunch, 2) after a 1150-calorie lunch on one day and on the
following day after a fast since a standard breakfast, and
3) following seven practice trials on each of four days
after an 1800-calorie lunch and four more days when lunch
was withheld; 20 subjects were used. The effect of the
experimental treatments on threshold sensitivity was stud-
ied by analysis of variance technique.

THE EFFECTS OF SELECTED COUNTERMEASURE AND COUNTER-
COUNTERMEASURE TECHNIQUES ON SYSTEM PERFORMANCE. FINAL
REPORT. Contract AF 33(616) 3739, Dec. 1959, 54pp.
Batelle Memorial Institute, Columbus, Ohio.

16,384
The primary objective of this study was to determine,
by a laboratory method, the effects of two types of elec-
tronic countermeasures (ECM) (noise and sweep-spot jam-
ming) on air-defense-system performance, both with and
without the use of an electronic counter-countermeasure
(Dicke fix). It was also wished to ascertain the degree
of relation among several criteria potentially useful in
ascertaining ECM effectiveness, such as the General Mills
measure of receiver-sensitivity degradation. By the use
of an analog computer, ECM and radar simulation equipment,
human subjects, and a digital-computer intercept model,
one sub-system within the total air-defense environment
was simulated and 15 different experimental conditions
studied and evaluated.

Gerathewohl, S.J. PSYCHOLOGICAL PROBLEMS OF SELECTION,
HOLDING, AND CARE OF SPACE FLIERS. Nov. 1959, 13pp.
USA Medical Services, Washington, D.C.

16,385
This paper presents a discussion of psychological re-
quirements for the selection of space fliers based on an
evaluation of selection methods used for somewhat similar
jobs. For example, the methods used to select combat
pilots were studied for their applicability to the present
problem. Problems involved in training and management of
the holding or waiting period between time of induction
and first flight are discussed. The maintenance of in-
terest and motivation in the astronaut, as well as the
importance of personal characteristics such as ability to
resist social pressures, are also discussed.

Gibbs, C.B. SERVICE PROBLEMS OF SIMULATOR DESIGN. RNP
60/966, OES 342, Sept. 1959, 3pp. Operational Efficiency
Sub-Committee, RNPAC, London, England. (Applied Psy-
chology Research Unit, MRC, Cambridge, England).

16,386
The problem of simulator design for command link
missiles is analyzed. It is argued that the perceptual
and not the motor aspects of control are of critical im-
portance in simulation and current projection techniques
are examined in the light of this assumption. The math-
ematical problems and certain other problems of atmos-
phere and other effects are analyzed. Some recommenda-
tions are presented for the proper use of present
trainers.

Morris, Allene. PATTERN TARGET ANALYSIS. PART I. A THEORY. PART II. A PSYCHOPHYSICAL EXPERIMENT. Contract N00S 72092, Index No. NS-714 100, SIO Ref. 59 62, Nov. 1959, 29pp. Visibility Lab., Scripps Institution of Oceanography, University of California, San Diego, Calif. (USN Electronics Lab., San Diego, Calif.).

16,390

A psychophysical experiment was conducted 1) to determine the visual detection thresholds for targets of various shapes and internal pattern configurations as observed under various luminance conditions, and 2) to define the effective visual stimulus. The data were analyzed with respect to earlier results from the Tiffany study on target visibility and prediction curves for patterned target visibility were obtained. A theory of pattern target analysis was evolved on the basis of the experimental data and is described in detail. G. I. R 3

16,391

Morris, Allene. PREDICTING THE DETECTION RANGE OF A TARGET IN A MOVING FIELD OF VIEW. Contract N00S 72092, Index No. NS 714 100, SIO Ref. 59 69, Dec. 1959, 20pp. Visibility Lab., Scripps Institution of Oceanography, University of California, San Diego, Calif. (USN Electronics Lab., San Diego, Calif.).

16,391

This paper reviews major references that report experimental data on visual thresholds for static and moving targets. The visibility of a stationary target varying with exposure time is compared to that of a target moving at various angular velocities relative to the observing eye in an effort to determine possible equality in terms of effective stimulus energy. The particular concern is with the prediction of the detection range of a target in a moving field of view from existing data. R 76

Savage, L.J. SUBJECTIVE PROBABILITY AND STATISTICAL PRACTICE. Contract AF 49(638) 391, AFOSR TN 59 1161, Oct. 1959, 45pp. USAF Mathematical Sciences Directorate, Office of Scientific Research, Washington, D.C. (University of Chicago, Chicago, Ill.).

16,394

This is a printed version of a lecture given to a meeting of statistics seminars at the University of London. The author argues that the concept of subjective probability is "capable of suggesting and unifying important advances in statistical practice." The author develops his arguments through defining subjective probability in terms of an idealized person; a discussion of Bayes' theorem and the likelihood-ratio principle as these relate to concepts of significance and confidence level and a discussion of the theory of precise measurement are also included. Illustrative examples are given for each of the above topics. The author believes that ultimately every topic in statistics should be reviewed in light of the concept of subjective probability. G. R 116

16,395

Sampson, P.B., Coleman, P.D. & Eikin, E.H. THE FEASIBILITY OF USING THE EYE AS A SOURCE OF CONTROL SIGNALS IN TRACKING. Contract N00R 494(16), NR 144 122, Dec. 1959, 41pp. Institute for Applied Experimental Psychology, Tufts University, Medford, Mass.

16,395

The idea that eye movements could be made to produce signals that could be used for machine control purposes was considered from the point of view of its feasibility. Topics relevant to the problem included 1) suggestions for applications, 2) techniques for obtaining eye movement signals, 3) tracking characteristics of the eye, and 4) human factors considerations in the design and use of an eye movement control device. T. R 43

16,398

Sampson, H. SERIAL ADDITION AS A FUNCTION OF STIMULUS DURATION AND PACING. *Canad. J. Psychol.*, 1958, 12(3), 179-183. (University of Canterbury, Christchurch, New Zealand).

16,398

Results from previous studies raised questions as to whether some source of disturbance in addition to speed of pacing affected performance in paced serial addition tasks. Two experiments were designed to answer whether the value of longer stimulus durations within pacing intervals is lost 1) if changes in stimulus durations are presented unsystematically while pacing rates are increased systematically and 2) if changes in pacing rates and stimulus duration occur systematically. Twenty Ss participated in two experiments in which a serial addition task was presented under five pacing conditions with nine on-off ratios and when pacing and stimulus durations were varied. Results were discussed as they allow for increased adequacy of account of factors influencing performance under these conditions. T. G. R 4

16,399

Sampson, H. STIMULUS DURATION AND PACED PERFORMANCE. *Canad. J. Psychol.*, 1958, 12(1), 7-12. (Canterbury University College, Christchurch, New Zealand).

16,399

To investigate the role of stimulus duration in paced performance, serial addition performance was studied under these conditions: 1) pacing constant, on-off ratios varied; 2) "on" constant, "off" varied and "off" constant, "on" varied; 3) on-off ratio constant, pacing varied. In the first three experiments, 30 Ss were used. Results were presented in terms of analysis of variance of percents correct under the five experimental conditions. In experiments four and five, in which various pacing intervals were presented randomly, 25 Ss participated. Results of the four experiments were discussed as they relate to the problem of stimulus duration in paced performance as well as problems connected with variable pacing. T. G. R 4

Askren, W.B. MAN FUNCTIONS IN SPACE FLIGHT. Paper presented to the Panel on Psychology, of the Armed Forces-NRC Committee on Bio-Astronautics, Washington, D.C., Dec. 1959, 10pp. USAF Wright Air Development Division, Wright-Patterson AFB, Ohio.

16,418

Duties typical of those to be assigned to future space crews are described in the form of an activity analysis for a three-man crew on a hypothetical 72-hour moon trip. Major activities are thus shown to be navigation, flight control, energy management, in-flight maintenance, and the like. The duties are further analyzed to determine the criteria that should be used in selecting personnel for a space flight of this type.

16,422

Allen, Patricia S., Bennett, E.M. & Kealer, Dorothy K. FORCED-CHOICE RANKING AS A METHOD FOR EVALUATING PSYCHO-PHYSIOLOGICAL FEELINGS. ONE OF A SERIES OF REPORTS PERTAINING TO THE EVALUATION OF MAN'S MINIMUM LIFE-SPACE REQUIREMENTS. Contract AF 33(516) 3068, Proj. 7222, Task 71747, WADC TR 58 310, Dec. 1959, 123pp. USAF Aerospace Medical Lab., Wright-Patterson AFB, Ohio. (Bio-Mechanics Lab., Tufts University, Medford, Mass.).

16,422

The importance of adequate seating to personal comfort and hence efficiency of crew members, especially on prolonged flight, led to evaluation of design characteristics. The purpose of the present study was to develop reliable and efficient equipment evaluation techniques. The present investigation was focused on subjective meanings of comfort-discomfort or feeling states as these might relate to such things as boredom, excitement, etc. Multiple forced-choice ranking methods were employed to assess comfort inducing or inhibiting characteristics of aircraft seats. Twenty-four SS assessed six seats.

Wood, W.D. & Bators, B.L. A COMMUNICATION CHANNEL WITH LEARNING. Contract AF 30(602) 1890, Proj. 4519, Task 45541, RADC TR 59 363, Sept. 1959, 17pp. Pikewood Corporation, Albuquerque, N.M.

16,425

This technical note covers initial work on a generalization of information theory to include learning by the receiver. Assuming that the receiver can recognize the elements of the message set but is unfamiliar or inexperienced with their probabilities of occurrence, a modified "entropy" concept can be defined using subjective "probabilities" for measuring the element of surprise to the receiver. The entropy of the message set as seen by the receiver is proved to be greater than or equal to the true entropy of the message set and intuitively satisfactory examples of learning steps are shown to reduce this difference.

Marrs, J.L. A POSSIBLE CRITERION FOR VISUAL RECOGNITION THRESHOLDS. Contract NOBS 72092, Index No. NS 714 100, SIO Ref. 59 65, Nov. 1959, 18pp. Visibility Lab., Scripps Institution of Oceanography, University of California, San Diego, Calif.
- 16,446
A theoretical analysis of the detection and recognition capability of an ideal mosaic detector is described. The relationship between detection and recognition for this idealized mosaic is used to hypothesize a criterion for the threshold of visual recognition. A brief psychophysics experiment was performed as a first test of this hypothesis. The degree of success and the limitations of the test are discussed.

Harvey, O.J. PERSONALITY CORRELATES OF CONCEPTUAL FUNCTIONING AND CHANGE ACROSS SITUATIONS. Contract NONR 1147(07), Tech. Rep. 3, ca. 1958, 30pp. University of Colorado, Boulder, Colo.
- 16,447
Working from the assumption that once a concept is formed the individual is motivated towards its maintenance, the author performed a series of experiments in which the results of various attempts to alter existing opinions or concepts were related to certain personality correlates. Nine experiments were performed using nine personality measures to study: 1) relative effectiveness of gradual and absolute approaches in changing weak and strong concepts, 2) effects of extreme anchor discrepancies, 3) reciprocal effects of the group and three types of leaders, 4) effect of proximal and remote anchors, 5) relationship of certain personality characteristics to concept shift, 6) displacement reactions to nondirectional criticism from source of power, 7) reaction to negative information about self, etc. T. Gulliksen, H. & Messick, S. (Eds.). PSYCHOLOGICAL SCALING: THEORY AND APPLICATIONS. Contract NONR 1856 (15), 1959, 210pp. John Wiley & Sons, Inc., New York, N.Y. (Princeton University, Princeton, N.J. & Educational Testing Service, Princeton, N.J.).
- 16,450
The chapters of this book were originally presented as papers at a conference designed to bring together investigators applying scaling techniques in widely different fields. The conference was organized around the following five general topics: 1) properties of category scales and quantitative estimation scales and their implications for the nature of psychological judgments under varying conditions; 2) problems in psychophysical scaling; 3) discussion of scaling in the context of attitude measurement; 4) choice and the measurement of utility, game theory and decision-making situations; and 5) various aspects of multidimensional scaling.

Colman, K.W., Wallace, W.H., Danaher, J.W., Clark, W.C., et al. HUMAN FACTORS IN AIR TRAFFIC CONTROL SYSTEMS DESIGN. SUMMARY REPORT PART 2. Contract FAA/BRD 27, Proj. N, Rep. 32, Nov. 1959, 30pp. Courtesy and Company Philadelphia, Penn.

16,455

This report summarizes briefly the tasks performed during the period August 1958 through November 1959 on a research program on human factors in air traffic control systems design. Technical memoranda and reports which give complete details of work accomplished are listed. Major human factors assistance given is discussed under three tasks: 1) development and evaluation of air traffic control systems (program planning and information requirements); 2) design of air traffic control data processing and display systems (Data Processing Central and Automatic Ground/Air/Ground Communication System); 3) simulation of air traffic control systems. Abma, J.S., Huffman, Lois L. & Mason, L.J. THE FURTHER DEVELOPMENT AND EVALUATION OF AURAL READING DEVICES FOR THE BLIND. SUMMARY REPORT. Contract V1005 M.1961, June 1959, 75pp. Battelle Memorial Institute, Columbus, Ohio.

16,457

This report gave an account of engineering and evaluation activities on a project undertaking the development of a direct translating aural reader for the blind. Experience in using five prototype devices (optophones) during the years 1957-1958 indicated the desirability of a number of mechanical and electronic modifications which are described in detail. Plans for further developments were discussed. Evaluation activities included the investigation of various training techniques using ten blind subjects. Seven of the subjects were new to the program in September 1958, and three advanced subjects were retained from the previous group. Progress of the two groups was compared. Continuation of the evaluation of the optophone reading devices was recommended. I. G. I. R 2

Bartow, J.E., Krassner, G.H. & Riehs, R.C. DESIGN CONSIDERATIONS FOR SPACE COMMUNICATION. IRE Trans., Dec. 1959, CS-7(4), 232-240. (USA Signal Research and Development Lab., Fort Monmouth, N.J.).

16,460

With the advent of artificial earth satellites, the use of such vehicles for communication purposes has been the subject of considerable study by both military and commercial organizations in the communications field. This paper describes the problems involved in space communication, the assumptions that must be made, and the technical limitations which determine the communication system that should be used for a particular time frame. Some characteristics for an optimum system are stated and some technical characteristics of the first successful satellite communication system are given. G. I. R 4

Bell, C.G., Stevens, K.N., House, A.S., Heinz, J.M., et al. RESEARCH ON SPEECH SYNTHESIS. FINAL REPORT. Contract AF 19(604) 2061, AFRC TR 60 101, Dec. 1959, 15pp. Research Laboratory of Electronics, Massachusetts Institute of Technology, Cambridge, Mass.

16,466

To increase understanding of the speech communication process, the experiments described in this paper sought to discover relations between 1) symbols used to describe language, 2) configurations and acoustic excitations of the vocal tract as functions of time, and 3) properties of the acoustic signals radiated from the vocal tract. The studies reported (largely by citation) were concentrated mostly on experiments with speech synthesizers and on the direct analysis of speech. A large part of the work reported on speech analysis was done with a digital computer. Related research activities were also mentioned. I. R 53

Skinner, I.D. THE EFFECT OF LIMITED RESOURCES ON DECISION BEHAVIOR IN TWO-CHOICE SITUATIONS. M.A. Thesis, Aug. 1959, 39pp. University of Texas, Austin, Tex.

16,467

This study was designed to determine whether a relationship exists between the maximum number of trials allowed for a problem and the number of these trials a subject is willing to use for purposes of sampling. Subjects, 108 students run in groups of four, were given decision-making problems of varying length and were faced with the choice of making an early decision with high probability of error or of spending more available time gathering information having fewer trials left to recoup losses. Results were discussed as they related to other studies of decision-making, especially those related to probability learning. T. G. I. R 16

Gardner, R.A. PERCEPTION OF RELATIVE FREQUENCY AS A FUNCTION OF THE NUMBER OF RESPONSE CATEGORIES. Proj. 6X95 25 001 02, Task 02, Rep. 408, Dec. 1959, 10pp. USA Medical Research Lab., Fort Knox, Ky.

16,480

The purpose of the flight described in this voluminous report was to put man and his balloon capsule into conditions equivalent to space flight to study reactions of both. A chronological report of preflight and inflight proceedings is given; the report is profusely illustrated. A running account of the flight is given including the pilot's comments during flight. A series of individual reports included data on ballasting and valving effects, meteorological aspects, cosmic ray monitoring, radiation effects on the pilot, communication and telemetry, nutritional aspects, hematological experiments, and reports from both the flight surgeon and the tank scientist.

T. G. I. R 51

16,480

Choice behavior in an uncertain situation where the only basis for choice was the perceived relative frequency of events in a series was studied. The number of available response categories, or choices, was varied independently of the number of stimulus-event categories in the series by adding dummy-choices (choices that could not result in hits) on the response panel. The data were analyzed to ascertain whether increasing the number of response categories tended to increase the response bias in favor of the most frequently presented category. An interpretation of the multiple-choice effect in decision-making was offered.

Korbel, H. DEVELOPMENT OF A NEW OPTICAL LANDING GUIDE. FINAL REPORT. Proj. 16, Rep. NS OOC OGI, Dec. 1959, 26pp. USN Material Lab., New York Naval Shipyard, N.Y.

16,481

This report summarized the second stage of a research program of neuropsychological research. In the first stage, two major psychological categories were distinguished through neurobehavioral analysis: discriminative and preferential. In the second stage, tests of the validity of these distinctions were made and problems of "preference" were studied by use of techniques developed in decision theory. Tests of the distinction between discrimination and preference were accomplished in the laboratory. Brain lesions were then made to determine whether differential effects could be obtained. A theoretical discussion of the results was presented.

R 13

16,489

Optical glidepath indicators, consisting of a light source and a large mirror, both located on the landing field, have proved to be effective in guiding pilots of aircraft during landings. The design, construction, and testing of a louver device which would replace the mirror are described. Among its advantages over the mirror are lower size and weight, lower cost, and greater flexibility in design. As an example of the last, the louver guide may be buried in the center of the runways rather than located to one side. Construction drawings of the Louver Landing Guide are included.

Emanuel, A.F. & Mauch, H.A. THE DEVELOPMENT OF A READING MACHINE FOR THE BLIND. SUMMARY REPORT. Contract V 1005 M 1943, June 1959, 6pp. Mauch Laboratories, Inc., Dayton, Ohio.

16,482

This paper discusses some characteristics of complex, man-computer information processing systems and an approach to the design and improvement of such systems. The contents stem directly from experience of a group performing research and development on the SAGE Air Defense System and represent an attempt to abstract from this experience those techniques that have proved useful in answering such questions as 1) does or will a system have problems? 2) what are they? 3) where is the basic source of any problem? and 4) how does one go about solving them? Major sections deal with contingency analysis, specific design techniques, and optimizing man-computer relationships.

16,490

This report described a reading machine development program (for the blind) in which an attempt is being made to improve the output of the direct translation type reading machine in order to reduce reading speed limitations and learning difficulties while retaining features of low cost and portability. A mechanical model of the human speech mechanism was built and evaluated in an effort to produce a speech-like output. A further effort was made in this same regard to develop a collection of speech sounds (word fragments) for the construction of artificial words resembling speech. A word synthesizer is being developed which will compose artificial words from the word fragments. Future plans for the solution of scanning problems were discussed.

16,486

Laboratory for Electronics, Inc. STUDY, DESIGN, AND DEVELOPMENT OF NAVIGATION DISPLAY FOR HELICOPTERS. FINAL REPORT. Contract AF 33(600) 34034, Oct. 1959, 78pp. Laboratory for Electronics, Inc., Boston, Mass.

Connelly, R.E. EVALUATION OF THE AIR FORCE INTEGRATED FLIGHT INSTRUMENT SYSTEM AND ENGINE PARAMETER INDICATOR. Task 61978(3) & (4), WADC TR 59 414, Dec. 1959, 11pp. USAF Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.

16,486

The study, design, and development program summarized in this report had as its prime purpose the over-all improvement in helicopter instrument flight. Three aspects of the program were described: 1) investigation of kind and type of instruments required and wanted by experienced helicopter pilots and of the way in which the instruments should be grouped; 2) investigation of the advantages to be gained by incorporating Doppler radar to improve the guidance displays for the pilot of a manually controlled aircraft; and 3) investigation of a Doppler-controlled automatic-stabilization system using the autopilot.

I. R 14

16,491

Flight tests were conducted to determine: 1) acceptability of changes incorporated in the production integrated flight instruments (consisting of sensing units, air data computer system, coupler, flight director, and flight instruments) as the result of previous tests; 2) acceptability of the miniaturized air speed and altitude indicators as stand-by instruments for use with the integrated flight instruments; and 3) performance and desirability of the engine parameter indicator. In addition to the above evaluations, 17 specific recommendations were made for development of future weapon systems.

Goldbell, J.C. UNDERSTANDING-ESCAPE PROGRAM: DESIGN, DESIGN AND CONCEPT FORCE TESTS FOR-1 AND FOR-1 CONCEPT TESTING AROUND A SHOOTING SUBSTANCE. DESIGN REPORT NO. 8. Proj. NOC ME 6807, Rep. NOC ED 5011, Jan 1958, 13pp. USAF Air Development Center, Johnsville, Penn.

16,493
To determine the waterflow effect tending to close the canopy of a sinking aircraft and to investigate the positions maintained during pilot egress, tests were conducted at Key West, Florida, during November 1958. A single-place fighter aircraft (F4U-1) and a two-place trainer aircraft (T-28) were secured alternately to the aft deck of a submarine which was used as a research platform. Canopy force tests were conducted in full down and nose down positions with canopy removal testing. Human egress tests included both the above positions with canopy open and canopy jettisoned. On the basis of the test results, recommendations were made concerning equipment and escape procedures.

Clark, C.C. & Woodling, C.M. CENTRIFUGE SIMULATION OF THE X-15 RESEARCH AIRCRAFT. Proj. NOC ME 6816, Tech. Rep. NOC ME 6816, Rep. 9 & NOC ME 6816, Dec. 1958, 13pp. USAF Air Development Center, Johnsville, Penn. (USAF Air Development Center, Johnsville, Penn. & National Aeronautics and Space Administration, Washington D.C.).

16,495
Three centrifuge simulation studies were made to determine human tolerance to oscillating accelerations of the amplitude and duration which might be expected under conditions of operation of the X-15. In the third program, 31 recording channels were used to characterize computer aircraft response, including cockpit displays; 13 to characterize pilot control actions and his electrocardiogram; 12 to characterize the centrifuge response; and 8 to characterize switch positions. Pilot performance in terms of tolerance of g-impact, blackout, physiological and bodily reactions, and reactions were reported. The restraint system and cockpit instruments were described in some detail. A fourth program was contemplated.

Miller, G.C., Wagner, R.L., Tansil, R.C., Riley, D.L., et al. INVESTIGATION OF MEDIA AND DESIGN OF A CONSOLE FOR REAL-TIME DATA PRESENTATION: DESIGN I REPORT: DIRECTION OF DATA PRESENTATION AND SELECTION OF PARAMETERS. Contract AF 64(615)604, July 1958, 13pp. Industrial Information Laboratories, Milroy, N.J. (ITT Laboratories, San Francisco, Calif.).

16,500
A group of parameters for real-time monitoring of high performance aircraft, sub-orbital, and orbital vehicles was formulated to provide information for flight safety control. Both aircraft and aircraft functionality were considered. A definition and purpose of real-time monitoring were followed by an outline of the definition and definition of flight operation of high performance aircraft, the potential role of real-time monitoring in the operation of such aircraft, console criterion and its application, and parameter selection in terms of malfunctions that could occur in the measurement of complex conditions. The art of data presentation was considered in terms of methods and of taking full advantage of the sensory system of the human. Viscular and physiological malfunctions were presented. T. R 48

16,501
Bryant, G.L. & Schuster, J.M. AN EXPERIMENTAL COMPARISON OF NOISE SHOCKING TRAINING TECHNIQUES. Contract N00014-59-1-0013, Dec. 1959, 13pp. Dept. of Psychology, University of Southern California, Los Angeles, Calif.

16,502
The purpose of this study was to compare the relative effectiveness of guidance (direction of the students' trouble shooting activities during training) as compared with explanation (justification and clarification of reason for each step). Trainees, each at his own pace, worked on 60 trouble shooting problems under one of the following conditions: 1) no guidance, no explanation; 2) partial guidance, no explanation; 3) complete guidance, no explanation; 4) partial guidance, explanation; or 5) complete guidance, explanation. Ten criterion problems were then administered and performance was compared for students trained under the various conditions. Differences were tested for significance. Implications of results for training of trouble shooters by the U.S. Navy were discussed and a sample problem described. T. I. R 9

16,503
Carlsen, L.D. & Bortner, R.J.K. THERMAL STRESS AND PHYSIOLOGICAL STRAIN. Contract AF 19(604) 1467, Proj. 7952 13, AAL IN 57 13, June 1957, 13pp. USAF Arctic Aeromedical Lab., Fort AFB, Alaska. (Dept. of Physiology and Biophysics, and Meteorology, University of Washington, Seattle, Wash.).

16,504
Major considerations in the evaluation of environmental stress and the resulting physiological strain are discussed. Emphasis is placed upon the fact that these are essential elements common to all investigations of environmental stress, which is defined as the tendency of the environment to cause a change in the individual. Strain is defined as the change in the homeotherm brought about by stress. Items are listed and discussed about which information must be given on environmental stress at various temperatures and for various conditions. The type of data needed for adequate evaluation is considered. Various charts and graphs are included.

Buchanan, D.A. ACCURACY OF SPEED ESTIMATION BY ESS OPERATORS. Contract AF 19(604) 2635, AFRC IN 59 67, SOC FM 282, Nov. 1959, 17pp. System Development Corporation, Santa Monica, Calif.

16,506
This study had three purposes: 1) to determine how accurately experienced operators can estimate the speed of SAGE-displayed radar data tracks, 2) to evaluate the use of a Special Experimental Display Generation Program (SEDD) in obtaining this type of information, and 3) to assess the utility of a specific application of SEDD in the study of effects of other variables in speed estimation. Thirteen Ss (13) were tested on 64 trials. Estimates on speed made by the Ss were subtracted from true speeds and recorded as error scores. Constant and average errors were compared to obtain relative variability of the scores. Individual differences among operators and possible explanations for low reliability of data were discussed in the context of contribution of the present study to methodology and directions of future studies. Kilmer, W.L. SOME METHODS FOR INCREASING THE RELIABILITY OF COMPLEX DIGITAL COMPUTATION SYSTEMS. Contract AF 33(616) 1953, Proj. GPC 102, Task 2, Rep. TA 30 303, Tech. Rep. 1, March 1958, 34pp. Electronics Research Lab., Montana State College, Bozeman, Mont.

16,308
First in a series of studies on methods and devices for making digital communication systems more reliable, this report contains two main sections. The first part generally concerns the logical problem of how to make digital computer transfer of communication systems more reliable and is nothing more than a brief comparison of the most outstanding methods that have been presented in the literature thus far. The second part is an account of a theoretical scheme that has been especially devised to complement the methods referred to in Part I. The principle purpose and value of the scheme are discussed.

Fitchner, S.L. MORE CIRCULAR METHODS FOR ESTIMATING RELIABILITY: AN EXPERIMENTAL APPROACH. Proj. 1450, Res. Mem. 2249, June 1958, 3pp. Rand Corporation, Santa Monica, Calif.

16,310
An exploratory analysis is presented of the problem of a priori reliability estimating by means of the Monte Carlo method. The method permits integrating into one analysis the effects on the system output of environmental and operational stresses, of time-dependent deterministic events, and of randomly occurring catastrophic events. The problem considered here is that of predicting non-catastrophic failures. The utility of the method, the validity of the results, the unbiased nature of derived estimates, and the requirements for input data are demonstrated. To exhibit the use of a general model, the performance of a hypothetical component circuit is examined and an estimate of its reliability obtained.

Gallie, C.F. MATHEMATICAL SOLUTIONS FOR PSYCHOLOGICAL PROBLEMS. A TECHNICAL REPORT. Contract N0R 1206 (15). National Science Foundation Grant G 642, June 1956, 34pp. Princeton University, Princeton, N.J. & Educational Testing Service, Princeton, N.J.

16,543
A review of what is known about the quantitative effects of electric currents on man is presented. Experimental studies on human beings and on animals are reviewed. The discussion begins with the first tingling sensations resulting from barely perceptible currents, proceeds with reactions produced by currents of increasing intensity, and includes various causes of electrocution. The paper concludes with mention of effects caused by high-frequency currents, burns and blisters, and the necessity for prompt application of approved methods of resuscitation for victims of severe electric shock accidents.
T. G. I. R 10

16,545
The value of the mathematics-deductive approach to various psychological problems is discussed with particular emphasis on 1) the usefulness of matrix algebra for expressing a large number of psychological theories and for comparing the theory (observation equations) with data, and 2) the generality of multidimensional scaling as an approach to a variety of psychological problems. The discussion of each illustrative problem stresses the close tie between the mathematical statement and the psychological statement for every variation in psychological assumptions there must be a matching variation in the mathematical equations.

Wright, W.E. & Taylor, L.E. TASK CLASSIFICATION STUDY. Contract AF 33(616) 1996, Proj. 1978, Task 15570, WDC TR 59 234, Dec. 1959, 13pp. Electronics Engineering Department, General Dynamics Corporation, Rochester, N.Y.

16,545
This report outlines the general philosophy and approach to a basic venture in the study of human learning-task classification. It is proposed that a rational classification be developed for the tasks human beings have to learn. Each task category would be set up in such a way that a specified set of common principles of learning referring to basic variables would operate in essentially the same way in all task situations subsumed under it. In this way the actual and hypothesized effects of various basic and task variables and their interactions would be set forth. The characteristics and supporting arguments for this classification, methodological problems involved in its development, and the problem of evaluation are discussed.

16,566
A device is described for conveniently and inexpensively plotting event rates from time-based data records, such as heart rate from ECG and discharge frequency from volleys of nerve impulses. Principles of design, construction of a prototype, and photographic duplication of copies in quantity are discussed. The use of a program for plotting nerve impulse frequencies is illustrated.

16,566
A battery of physiological, psychological, and biochemical tests served as a basis for Project Mercury candidate recommendation. Data were yielded on physiological limitations of high transverse g, anthropometric measures, intelligibility measures, effects of noise and vibration on performance, body responses to heat stress, physical fitness tests, and psychological evaluation tests. The final candidate recommendation meeting was described. Methods used to correlate biomedical data statistically and a list of possibly significant correlations were discussed. Recommendations for future experimentation and evaluation programs were included.

von Beckh, H.J. MULTI-DIRECTIONAL G-PROTECTION DURING EXPERIMENTAL SLED RIDS. Reprint from Proceedings Xth International Astronautical Congress, London, England, 1959, 671-682. USAF Aeronautical Lab., Holloman AFB, N.M.

16,583
This report represents one phase of an effort aimed at the use of airframe-human pilot system studies as the basis for derivation of vehicle dynamic handling qualities, specifically, lateral qualities. Tentative criteria are derived for certain roll/aileron transfer function qualities by applying existing pilot dynamic response data to servo analysis studies of the airframe-pilot system. The criteria are examined in the light of existing pilot opinion data and limited regions of validation are established. For those regions where no data exist, the tentative criteria can provide an interim basis for design and a guide to future testing.

16,600
Described was a device which acts as a multi-directional g-protection. A catapult sled track with the sled propelled by one or two MAI ejection-seat catapults was used. The anti-g platform was in the form of an isosceles triangle which was pivoted on its apex by a vertical axis which was fixed on the structure of the sled and allowed free rotation through 360 degrees. Two accelerometers, placed in positions corresponding to the animal's (rat) spinal and transverse-to-spine direction, were used to obtain acceleration data. The favorability of such a free moving platform was discussed as was the need to extend studies to primates and human subjects.

Stedke, R.F., Forrest, J., Carter, M.V. & Wade, E.A. COMFORT EVALUATION OF THE G-2241 FILM SEAT (WHEEL). ONE OF A SERIES OF STUDIES PREPARING TO THE DESIGN EVALUATION OF FILM AND CHIN SEATING EQUIPMENT. Contract AF 33(616) 3042, Proj. 7212, Task 7224, WDC 72 28 JCA, Nov. 1959, 14pp. (DNR Research Medical Lab., Wright-Patterson AFB, Ohio. (McDonnell Lab., Dept. of Sociology, Tufts University, Medford, Mass.).

16,604
Certain design characteristics of the G-2241 Film Seat (wheel) were evaluated for adequacy in the maintenance of human comfort. Tests were carried out using 18 Ss of variable weight and stature wearing anti-g suits. Each S was required to remain in the seat until his discomfort reached a point where he felt compelled to leave or until a period of seven hours had been completed. Questionnaires were presented hourly during the sitting period to follow the S's comfort and opinion of the seat; a posttest required a rating of the seat's comfort. The data included time of voluntary sitting, comfort ratings (both hourly and final), and subjective comments on the seat. Recommendations for design improvements were made.

Smith, K.U. & Stoen, R. THE ELECTRONIC HANDWRITING ANALYSER AND NOTION STUDY OF WRITING. J. Appl. Psychol., 1956, 4(5), 302-306. (University of Wisconsin, Madison, Wisc.).

16,612
This study applies precise methods of action analysis to the investigation of writing skill. An Electronic Handwriting Analyser is described that permits separate and automatic measurement of the component movements of manipulation and travel in the writing task. Preliminary results obtained from ten Ss on the writing of single numbers and script letters are presented and discussed in terms of differences in duration of the two component movements and the nature of individual differences obtained. The significance of the technique used in the general study of motor coordination in relation to growth, aging, learning, and other psychological factors is discussed.

Rundell, Lucia & Nuss, G.M. F. ON THE FACTORS WHICH AFFECT THE CONTRAST ENHANCEMENT IN A FIGURE WITH "GHOST PERCEPTIVE CONCEPT" AND A PRACTICAL APPLICATION OF SUCH A FIGURE. J. Opt. Soc. Am., 1959, 49(1), 49-50.

16,616
This paper was concerned with a figure with "ghost perceptive contours" and deals with the factors responsible for and the effect of luminance and viewing angle on contrast enhancement. Monocular viewings of the figures were made at varying luminance. To investigate the effect of viewing angle, the figure was uniformly illuminated and surrounded by a field of dim luminance. After-images were examined as well as observations under intermittent illumination. Conclusions were drawn and some practical implications concerning the perception of contrast were noted and discussed.

Adams, R.G. PROBABILITY APPLICATIONS IN MILITARY OPERATIONS RESEARCH: THE PRACTICE IN ONE ORGANIZATION. Rep. AFSC 507, Nov. 1959, 12pp. North American Aviation, Inc., Columbus, Ohio.

16,623
This paper demonstrates the application of probability theory in military operations research. It gives a complete account of the growth of military operations research in industry, the functions performed for management and the biases that arise. Probability techniques are discussed and include the frequency interpretation of probability. A number of probability statements and theorems are presented and important distribution functions are described and illustrated. Case studies are presented and show the probability applications to weapon system requirements. The report is concluded by an evaluation of the accuracy and reliability of probability determinations.

Foley, P.J. THE EXPRESSION OF CERTAINTY. Amer. J. Psychol., Dec. 1959, 64(4), 614-615. (Defence Research Medical Labs., Toronto, Ontario, Canada). (DNR Proj. 76, Rep. 766, POC D77 94 2021, HR 167).

16,628
To evaluate the meanings of expressions of certainty, 38 subjects were asked to give five statements a value from one (X will not occur) to ten (X will occur). The statements rated were: "1) I am sure X will occur; 2) I suppose X will occur; 3) I am certain X will occur; 4) I think X will occur; and 5) I am positive X will occur." A frequency-distribution showing the number of subjects who assigned values to each statement was shown. From the results obtained, conclusions concerning the meaningfulness of these phrases were drawn.

16,629

A final report on the undertakings and activities of the aviation crash injury research program was presented. The objectives and tasks of the program were cited and the accidents investigated were reported. Evaluations of aircraft and aircraft components of the DC-3, the Army L-20 Beaver, Army L-17, and the XM-40 Army utility helicopter were made. A new Helicopter Accident Injury Report Form was developed and made available to the U.S. Army, Federal Aviation Agency, and interested state groups. A crash survival design manual was developed and a training program in crash-injury accident investigation was initiated.

16,640

This paper is concerned with the inversion of a class of matrices with special patterns as well as the numerical inversion of matrices in general. It also provides some special methods for the inversion of matrices for special and general cases. Some of the types of matrices considered are diagonal matrices of type r , type r diagonal inverse matrix, generalization of matrix partitioning in inversion, and non-patterned matrices. These results will be applied to problems in analysis of data where such matrix inversion is applicable.

16,643

To examine consumption and reasons for non-consumption of A rationing, a study, reported in three parts, was conducted. The first report cited was conducted to assess the adequacy of the methods and procedures used in the pilot and final phase of the study. The final phase was conducted at four installations in four separate parts of the country with procedures and materials the same for all parts. Three questionnaire forms were used with five foods studied at each meal. The results were examined in terms of percent of food taken and percent of food eaten. The variability and reliability of consumption in terms of different food classes and other variables were discussed.

16,631

The multiple comparison problem with which this paper is concerned arises often in connection with n random samples drawn from n normal populations with means μ_1, \dots, μ_n and a common variance. The problem is that of making $n(n-1)/2$ simultaneous two-sided symmetric t -tests of the $n(n-1)/2$ hypotheses $H_{ij}: \mu_i = \mu_j$, $i, j = 1, \dots, n$, $i < j$. A comprehensive Bayes analysis leading to a simple solution with well-defined properties that appear to be appropriate to an appreciable class of practical problems has been made. The more mathematical aspects of this analysis and solution are presented herein.

Smith, O.W. DISTANCE CONSTANCY. Contract AF 33(038) 22804 & NOR 401 (24), Sept. 1956, 5pp. Cornell University, Ithaca, N.Y.

16,633

This study was designed to investigate the feasibility of a digital TV. It was desired to develop optimum system standards which would produce an acceptable picture for a variety of military applications using a minimum bit rate. The work was directed towards the application of such a system to intercommunications, briefing, and observing hazardous operations in military operations. New scanning methods and methods of digital modulation were developed. These include the Difference Signal Modulation, and Pulse Code Modulation methods. Recommendations for future projects were presented.

T. I. R 14

16,648

To investigate the distance constancy problem which requires the judgment of a far extent as longer or shorter than a near standard extent, 23 Ss were required to make such judgments. The standard stimulus (a white sheet of oilcloth 54 inches wide and 10 feet long) was viewed at 25 ft. in front of the S; the variable stimulus, at 125 ft., was exposed in lengths which were multiples of three. An approximation method was used to determine the S's mean match of equality. Data from 23 Ss were analyzed to determine whether distance constancy holds under these conditions.

Smith, G.W. THE EFFECTS OF MOVING OF TWO STRIPS ON JUDGMENTS OF OBJECTIVE VELOCITY. Contract NMR 401 (14). Sep. 1956, 13pp. Cornell University, Ithaca, N.Y.

16,649

The effects of windows of two different sizes on judgments of objective velocity were investigated. Two windows, one of which was twice the linear dimension of the other, were used; identical movement patterns were viewed through the windows. The task was to adjust the speed of the variable so that the physical velocity of its surface was judged equal in terms of ft./sec. to the speed of the standard under the following conditions: 1) large window for both variable and standard fields; 2) small window for both fields; 3) small window was standard and the large was variable; and 4) the reverse of (3). Match judgments of 22 Ss were obtained for analysis.

Norton, J.R., Taylor, C.L., Davis, H., Haase, R.H., et al. TECHNICAL STUDIES IN CARGO HANDLING - VII. THE HUMAN OUTPUT FUNCTION, ITS CONCEPT AND MEASUREMENT. Contract NMR 233(07), Rep. 59 75, Dec. 1959, 19pp. Dept. of Engineering, University of California, Los Angeles, Calif.

16,661

It is not yet possible to measure directly on the human muscle involved the total physiological energy cost to a human of the performance of a task. An approximation of direct measure is discussed in this report. Total physiological energy cost is here termed the Human Output Function (HOF); it is differentiated from the mechanical work involved, defined as force times a distance or torque times an angle, which is only a part of total energy cost. An equation is developed for use with Lauru's force plate as an indirect measure of HOF. Preliminary design analyses for a force plate for laboratory analyses of cargo handling tasks are presented.

Swartz, M.F., Obermayer, R.W. & Muckler, F.A. SOME THEORETICAL LIMITS OF MAN-PERISCOPE VISUAL PERFORMANCE IN AN ORBITAL RECONNAISSANCE VEHICLE. Contract AF 33(616) 5472, Fyng. Rep. 10,978, Dec. 1959, 132pp. Martin Company, Baltimore, Md.

16,672

An analytic human engineering evaluation of the man-periscope method of presenting visual information to the orbital reconnaissance operator was given. The objective of the report was to establish theoretical limits of visual performance as a function of 1) minimum-resolvable object-length, 2) area viewed, 3) time-to-view, and 4) display scale-factor. From a review of the literature, 13 parameters were selected and examined as to their interrelationships and their effects on the four dependent variables for five representative orbital altitudes. The derived data were then extrapolated to an orbital altitude range of 113 to 22,289 miles. T. G. I. R 44

Savage, I.P. CONTRIBUTIONS TO THE THEORY OF RANK ORDER STATISTICS: COMPUTATION RULES FOR PROBABILITIES OF RANK ORDERS. Contract W48 2300(03), Task NR 042 200, Tech. Rep. 9, Sept. 1959, 4pp. University of Minnesota, Minneapolis, Minn.

16,679

The problems involved in the computations of the probabilities of rank orders are noted. This paper presents two rules which may be employed to facilitate the computation of probabilities of rank order for one-sample and two-sample cases. An example for the application of the rules is presented for both the one-sample rule and the two-sample rule. R 3

Richter, D.L. TWO-STAGE EXPERIMENTS FOR ESTIMATING A COMMON MEAN. Contract AF 49(638) 251, Tech. Note 59 793, Mimeo. Series 231, June 1959, 15pp. Institute of Statistics, University of North Carolina, Chapel Hill, N.C.

16,681

In this paper the investigator treats the problem of estimating the common mean μ of two populations using a fixed number n of observations. The paper is broken down into three parts with Chapter I setting forth the problem and, in Chapters II and III, the asymptotic minimum value of n is derived. The results are indicated and the reasons for the results are discussed. R 3

Rees, F.M., Speth, A. & Jotila, S. STUDY OF SYSTEM RELIABILITY. Contract AF 19(604) 2432, AFRC IN 58 306, SRI Rep. SE 507 5867 1, Tech. Rep. 1, June 1958, 18pp. Syracuse University Research Institute, Syracuse, N.Y.

16,684

This was a report on the major work done over the first year of this project. The three major areas of study were: 1) study of tolerance in systems, 2) redundant component networks, and 3) equilibrium between disturbance and recoveries. Topological rules for obtaining network functions were outlined and a method for a systematic study of tolerance was devised. A number of redundant component networks were discussed and a method to determine the reliability of one class of redundant component connections was developed. The concept of the equilibrium probability associated with a "self-recovery system" was introduced. A basic linear integral equation was developed and the properties of such processes were investigated.

Kelson, R.T. AN EMPIRICAL STUDY OF ARRIVAL, SERVICE TIME, AND WAITING TIME DISTRIBUTIONS OF A JOB SHOP PRODUCTION PROCESS. Management Sciences Res. Proj. Res. Rep. 60, June 1959, 41pp. University of California, Los Angeles, Calif.

16,685

This paper is concerned with intermittent production systems producing specified job lots to customer orders on essentially general purpose equipment. The three important elements which contribute to the flow time of work of such a job are processing time, transport time, and waiting time. From empirical data the nature of the arrival and service time distributions for the machine centers of a typical job shop during an experimental time period was studied and the correspondence of the assumptions of existing waiting-time theoretical models were examined.

Smith, E.K., Anastasio, F.J., Harar, S., Kalustyan, B.C. et al. STUDY OF POINT LIGHT SOURCE PROJECTION SYSTEM COMPONENTS. Contract NCR 1626(03), NAVTRADECEN TR 1628 1, March 1959, 211pp. USN Training Device Center, Port Washington, N.Y. (deFlores Company, Inc., Englewood Cliffs, N.J.).

16,691

This report is first in a series designed to investigate the usefulness of the point light source in presenting the visual displays required for various training devices. The basic components of the system—the point source of light, the display-object, and the screen—were described. Variations in system parameters were studied intensively to determine their interrelationships and their effects on the qualities of the visual displays obtained. Values of system parameters which achieve optimum visual display qualities were then related to the basic components of the system to establish desirable attributes of these components. Useful technical information was furnished in the appendices.

Sterns, A.A., Frank, M.R., Kent, D.C., Newman, M.M., et al. **MEASUREMENTS OF THE PULMONARY DIFFUSING CAPACITY FOR OXYGEN DURING EXERCISE.** *Ann. Rev. Respiratory Diseases*, Dec. 1959, 50(6), 806-824. (Cardiopulmonary Lab., USN Hospital, St. Albans, N.Y. & Dept. of Physiology, State University of New York, Brooklyn, N.Y.).

16,698

To test the interpretation that pulmonary diffusing capacity reflects the area and permeability of the alveolar-capillary "membrane," measurements were made under circumstances thought to affect primarily area or permeability. Selected patients who had resections of lung tissue, others with interstitial fibrosis and sarcoid disease, and "normal" patients (most were young men) were tested using the method of Lillien-thal, Riley, Proenamel and Franke. Values of pulmonary diffusing capacity were compared for the several groups. Observations on effects of age and severity of exercise were also made.

USA Food Acceptance Branch. **FOOD PREFERENCE SURVEY CONDUCTED IN 1958 INTERIM REPORT 10.** Proj. 7:84 15 007, **OMCRAF Rep. 23 59**, June 1959, 9pp. **USA Food Acceptance Branch, ON Food & Container Institute for the Armed Forces, Chicago, Ill.**

16,705

In continuation of a program of food preference surveys of Army men initiated in 1949, data were obtained on 27 foods for the first time, and also on a number of foods previously surveyed, to determine whether attitudes had changed over several years. From 1000 to 1250 respondents were chosen from each of four posts selected as being representative of the Army. Each respondent filled in a questionnaire about the specific foods, rating each on a nine-point scale, or checking a "not tried" box. Mean preference ratings and percent not tried were given for each food along with the earlier rating when available.

von Békésy, G. **NEURAL VIBRATIONS AND THE SIMILARITY BETWEEN SOME SENSATIONS PRODUCED BY TONES AND BY SKIN VIBRATIONS.** *J. Acoust. Soc. Amer.*, Oct. 1957, 29(10), 1059-1069. (Psycho-Acoustic Lab., Harvard University, Cambridge, Mass.). (Rep. FMR 200).

16,706

Some similarities and differences between skin sensations and hearing were investigated. The volley principle was used to design experiments on how the skin perceives the pitch and locus of a vibrator. The various experiments were concerned with: 1) pitch sensation on the skin, 2) summation of vibratory stimuli with different frequencies, 3) fusion frequency for vibrations of the skin, 4) rotating skin sensations analogous to the rotating tone in hearing, 5) apparent size of the sensation, and 6) modification of sensation according to sensitivity of skin.

Carter, C.V. & Huff, M.W., Jr. **THE PROBLEM OF ESCAPE FROM SATELLITE VEHICLES.** Presented at: Fourteenth Meeting of the Flight Test Techniques and Instrumentation Panel, May 11-15, 1959, Athens, Greece, **AGARD Rep. 242**, May 1959, 15pp. **Advisory Group for Aeronautical Research & Development, NATO, Paris, France.**

16,715

Certain problems associated with the design of escape systems for manned satellite vehicles are presented. An escape system is defined here as an alternate vehicle that can be utilized in the event the primary vehicle becomes uninhabitable. Specific problems considered are escape 1) prior to take-off, 2) during boost at high dynamic pressure, 3) during exit from and entry to the atmosphere, and 4) during orbit. Design procedures are presented that can be employed to determine a satisfactory escape system configuration.

Knapp, R.R. THE EFFECT OF ENVIRONMENTAL FACTORS ON THE PERFORMANCE OF MARINE CORPS PERSONNEL. PILOT STUDY: THE USE OF PERFORMANCE TESTS AND QUESTIONNAIRES TO DIFFERENTIATE BETWEEN TYPES OF BODY ARMOR - A PRELIMINARY INVESTIGATION. Res. Proj. Task NM 41-03 09, II, 267-292, June 1959, USN Medical Field Research Lab., Camp Lejeune, N.C.

16,734

A preliminary investigation was undertaken to determine the feasibility of using performance tests and questionnaires to differentiate between various types of body armor and load-carrying systems in terms of changes in efficiency of performance and of user acceptability. Ten Marine Corps Ss performed a field problem of one hour's duration requiring relatively strenuous exercise under five conditions: one control with no weight carried, over that of rifle, helmet, and field clothing; and four experimental wherein the weight carried was varied from 16 to 36 lbs. Performance tests were given before and after the exercise and the questionnaires after exercise. Difference scores between pre- and post-exercise tests were subjected to analysis of variance for differences among conditions. T. I. R 7

Maddox, R.L. (Proj. Officer). ANGLE-OF-ATTACK INFORMATION FOR INSTRUMENT FLIGHT. FINAL PROJECT REPORT. Proj. TMAD 59 6, Oct. 1959, 13pp. USAF Instrument Pilot Instructor School, James Connally AFB, Tex.

16,741

To investigate the uses that can be made of angle-of-attack information during instrument flight, 26 flights totaling 76 hours were flown by 12 pilots with the Project Officer. A typical simulated instrument flight included instrument take-off, climb to altitude, cruising flight, holding, Instrument Landing System approach, missed approach, and radar approach to a full stop landing. Prior to flight, pilots were briefed on the principles of angle-of-attack, on operation of the indicating system, and on reference indices (previously worked out) to be used. Notations of pilot reaction and control of aircraft were made during flight and a post-flight debriefing was conducted. Findings were discussed under each phase of the flight.

Mooney, C.M. RECOGNITION OF SYMMETRICAL AND NON-SYMMETRICAL INK-BLOTS WITH AND WITHOUT EYE MOVEMENTS. Canad. J. Psychol., 1959, 13(1), 11-19. (Defense Research Medical Labs., Toronto, Ontario, Canada). (Proj. D77 94 35 29 (HR 162), Rep. 142 2).

16,744

The present study was based on the hypothesis that memorability, as measured by subsequent recognizability, of novel visual configurations is enhanced by visual inspection rather than a single brief glance. Twenty-four Ss participated in an experiment of factorial design, permitting six replications. Each S was tested twice; two series of ink-blot were used, 16 symmetrical and 16 non-symmetrical, one test presenting one series at .07 sec. exposure allowing a single brief glance, the other test presenting the other series at a five second exposure allowing visual inspection. There were 32 presentations (16 initial and 16 subsequent appearances) in each test. Two kinds of errors, non-recognitions and false recognitions, were analyzed.

Boardman, L.J. SOME RECENT ADVANCES IN RADIOACTIVE SELF-LUMINOUS AIDS TO NIGHT MILITARY ACTIVITY. Proj. M3 674 100, NRL Prob. M5 01, BuShips S 1825, NRL Rep. 3241, Dec. 1958, 12pp. USN Research Lab., Washington, D.C.

16,792

The characteristics and properties of some recently developed radioactive self-luminous sources of light excited by the radioactive isotope krypton-85 are described. Of particular interest are the railway switch light, the hand lanterns, and flashlights. Also discussed are uses such as deck and personnel markers and exit and emergency signs. The ability of the eye when fully dark adapted to read or work in a dark room with these light sources has been determined as well as the distances that such sources are visible in the dark. Radioactive hazards are discussed.

Anast, J. ADVANCED COCKPIT INSTRUMENTATION. Presented at: Joint Meeting of the Flight Test Panel and Aeromedical Panel, Athens, Greece, 11-15 May 1959, Rep. 235, 21pp. Advisory Group for Aeronautical Research & Development, NATO, Paris, France. (Lear Incorporated, Grand Rapids, Mich.).

16,800

This report described development work by the U.S. Government and Lear, Incorporated on an integrated cockpit instrumentation system to meet the changing requirements of high-altitude, high-speed flight. The primary effort had been in the development of all-attitude instrumentation systems to meet the demands of all-weather flight. The Standard and Phase II GI (Vertical Gyro Indicator) Systems were discussed and their limitations indicated. Other indicators (Three-Axis, Two-Axis Flight-Director, and Three-Axis Flight-Director) were described. Application of the integrated display to helicopters, command and remote standby instrumentation, and verticality errors were discussed.

Hartshorne, F.A. (Supervisor). A PREDICTION OF AN/FPS-3 RELIABILITY. Contract AF 30(602) 1623, Proj. 4526, Task 45155, RADC TN 58 19 & Rep. R 2 57, Oct. 1957, 60pp. Government Service Dept., RCA Service Company, Inc., Camden, N.J.

16,801

To provide a specific example demonstrating the random sampling technique of reliability prediction for complex systems, the AN/FPS-3 Search Radar equipment was analyzed. The random sampling technique is an attempt to advance the art of reliability prediction by reducing time and cost factors. Through this approach the mean life (mean time between random failures) and probability of survival values for the overall AN/FPS-3, tower groups, and building groups equipments are estimated. The concepts, terminology, and premises associated with reliability prediction are presented.

Enoch, J.M., Fry, G.A. & Townsend, C.A. MODIFICATION OF SEARCH BEHAVIOR WITH SPECIAL EMPHASIS ON FEEDBACK ENHANCEMENT TECHNIQUES. Contract AF 30(602) 1560, Proj. 1763, Task 39855, RADC TN 59 368 & CSURF Proj. 696, TP(696) 25, July 1959, 35pp. Mapping and Charting Research Lab., Ohio State University Research Foundation, Columbus, Ohio.

16,804

To determine the degree to which natural visual search tendencies may be modified, eye movement photographs were made for a group of eight subjects as they searched for designated symbols on complex display material (experimental serial maps). Four conditions of search were investigated and compared: 1) free search, 2) forced pace automatic scanning, 3) and 4) a boustrophedonic search pattern with and without the addition of an after-image for enhancement of feedback. Durations of fixations, extents of eye movement, patterns of eye movements, and uniformity of coverage were examined for the effect of these conditions of search with special emphasis on the potential uses of feedback enhancement.

Eichmeier, J. & Rheinstein, J. INVESTIGATION OF THE POSSIBLE INFLUENCE OF ATMOSPHERIC IONS ON HUMAN REACTION TIME FINAL TECHNICAL REPORT 1959. Contract DA 91 591 EUC 1035, Dec. 1959, 51pp. Institut für Technische Elektronik, Technische Hochschule, Munich, Germany.

16,805

A series of experiments investigating the effect of artificially generated atmospheric ions upon push-button reaction time were conducted. Variables studied included the level of ionization and method of exposure (absorption through skin and breathing through the mouth or nose), and locality of experimentation. In addition, some work was done toward establishing the fact that the results were actually due to artificially generated atmospheric ions. The possibilities of the elimination of atmospheric small ions in a sealed room were examined and improvement of the small-ion counter equipment was considered.

Clark, C.C. & Gray, R.F. A DISCUSSION OF RESTRAINT AND PROTECTION OF THE HUMAN EXPERIENCING THE SMOOTH AND OSCILLATING ACCELERATIONS OF PROPOSED SPACE VEHICLES. Proj. TED ADC AE 1412, Task NR 005.12 0005.6, Rep. 3 & Rep. MADC MA 5914, Dec. 1959, 50pp. USN Aviation Medical Acceleration Lab., Johnsville, Penn.

16,807

This paper discusses the need for "packaging" the crew during rocket travel to reduce or prevent the body distortions and involuntary control motions which would otherwise occur in response to acceleration. Simulation of space flight by human centrifuge is described. Acceleration effects of vehicle design with specific reference to the X-15 research aircraft and three proposed orbital vehicles are discussed along with various experimental methods for protection against these effects. Water immersion with lung pressurization as a method to prevent body distortions is discussed. It is pointed out that as protection against short term effects of acceleration is developed, increased study of long term effects will be needed.

Chipman, J.S. STOCHASTIC CHOICE AND SUBJECTIVE PROBABILITY. Contract NMR 2582(00), Task NR 042 200 & Proj. AF 49(638) 33, Tech. Rep. 2, Sept. 1958, 40pp. School of Business Administration, University of Minnesota, Minneapolis, Minn.

16,809

An axiom in the theory of behavior under uncertainty (that a numerical probability can be attached to every uncertain event) is examined in this paper. Two basic concepts are considered: 1) the stochastic nature of choice, and 2) the characterization of events in terms of the nature and amount of information associated with them. A model is presented of the preference structure of choice and evidence from a choice or decision experiment is presented and compared with the model. Further assumptions needed in order to obtain a good theory to describe the behavior observed in the experiment are proposed.

Chang, S.H. & McHugh, P.G. AN EXAMPLE AND EXTENSION OF CAPACITY CALCULATION OF A CERTAIN DISCRETE CHANNEL WITH MEMORY. SCIENTIFIC REPORT 2. Contract AF 19(604) 3053, AFRC TN 59 569, Aug. 1959, 24pp. Electronics Research Project, Northeastern University, Boston, Mass.

16,811

The capacity of a certain binary channel with finite memory has been studied and reported in a previous document. This document illustrates the method of capacity calculation by devising a channel that possesses two types of imperfections: 1) distortion due to memory and 2) contamination due to noise. This example demonstrates the relative effects of noise and memory, the increase of capacity by tolerating a greater interdigital interference and the use of pulse weighting to counteract the effect of memory. The method of calculation is further extended from the binary channel to the m-nary channel.

Chambers, B.M. TRANSFER OF TRAINING AMONG COMPONENTS OF A COMPLEX VELOCITY CONTROL TASK. ADC Proj. 7737, Task 27052 & Task NR 005.15 1003.1, Repts. 3 & MADC MA 5920, Dec. 1959, 20pp. USN Aviation Medical Acceleration Lab., Johnsville, Penn.

16,812

To test the application of the "transfer of training among task components" principle to the learning and performance of complex rate control task, tests were conducted on six experimental groups of airman, who were given specific practice on parts of the task, and three control groups. The portions of the task practiced were the most difficult, the moderately difficult, the easiest, or combinations of these. One control group received whole-task practice and the other two had no practice. Then each subject in all groups received eight test trials on the total task. Deviations between pre-test and post-test performance scores were used to evaluate transfer of training effects.

Charipper, B.A. SHIP CONTROL X TRACKING IN THE HORIZONTAL PLANE WITH A CONTACT ANALOG DISPLAY. Contract NMR 2512(00), Proj. P59 125, Tech. Rep. SPD 59 083, Aug. 1959, 12pp. Electric Boat Div., General Dynamics Corporation, Groton, Conn.

16,813

To determine how well operators of a simulated submarine can follow a prescribed path in the horizontal plane (course dimension only) using a contact analog roadway, five inexperienced Ss were required to perform this task for five sessions. The roadway was approximately 137.4 scale ft. wide and 100 scale ft. below the submarine. The contact analog was mounted in the Electric Boat Submarine Simulator which provided the vestibular/kinesthetic cues of roll and the equations of motion of a SKIPJACK class submarine traveling at 16 knots. On the fifth day, photographic records were taken at one-second intervals of the position relative to the white center line of the roadway.

Herthol, R.P. ERRORS IN VISUAL SIZE-MATCHING IN THE FLEXIBLE GUNNERY TASK. Proj. 512 024 0001, Res. Note FG 52 2, July 1952, 14pp. USAF Human Resources Research Center, Lackland AFB, Tex.

16,814

To examine the possibility that certain size-matching (or equating of visual stimuli) tasks that appear quite simple may have hidden complexities that cause performance to be inadequate, a paper-and-pencil test consisting of 78 representations of aircraft centered in the sights of a gunnery, some correct, some under- and some over-framed, was devised and administered to two groups of gunnery trainees. One group had received 12 weeks of training, the other had not yet started training. The task chosen for investigation was one called "framing" (measuring the apparent wingspan of a target plane with the RETICLE of a sight) in aerial gunnery. Number of errors were analyzed for differences due to training and to banking angle of aircraft factors in perceptual organization that may cause errors were discussed.

Kupferberg, S. STATISTICAL ESTIMATION AND TEST OF HYPOTHESES AS APPLIED TO NON-DETERMINISTIC MODELS. Contract AF 33(616) 3274, IAWR Rep. 58 7, Aug. 1958, 125pp. Institute for Air Weapons Research, University of Chicago, Chicago, Ill.

16,815

The application of the classical statistical theory to problems of estimating and testing which may arise from nondeterministic machine models is discussed. For the case in which the underlying distributions are either normal or exponential, point estimators and confidence intervals for the mean and standard deviation are described along with tests for their equality. Various problems in determining sample size to meet necessary criteria are discussed. A table and some charts not readily available in the literature are included to aid in sample size determination. Various functions that may be evaluated by these techniques are mentioned.

Huber, C.F., Lucier, R.C. & Flood, R. HUMAN FACTORS AFFECTING CONSOLE DESIGN IN THE FIELDAR SYSTEM. FINAL REPORT. Contract DA 36 039 SC 73047, DA Proj. 3 28 01 28, WDC 36 EIC/D 4437, Rep. AD0041, July 1959, 12pp. Institute for Cooperative Research & House School of Electrical Engineering, University of Pennsylvania, Philadelphia, Penn.

16,824

The role of human factors in systems development in general with particular reference to their position and treatment in the Army FIELDAR system is studied. After a general discussion of the need for human factors personnel in all large system development projects, the relative emphasis on human factors by several Army technical services is examined. The console design of the FIELDAR system is considered upon and specific problems are discussed along with recommendations for improvement in design. Finally, some suggestions for the use of immediate and long range studies by human factors personnel are made.

Masley, M.C. & Toogler, M.L. (Leaders). STUDY OF COMMUNICATION IN HIGH-LEVEL AMBIENT NOISE FIELDS. FINAL REPORT. PHASE I NOISE ANALYSIS AND EQUIPMENT PERFORMANCE. Contract DA 36 039 SC 64469, SIGEL CMB Profs. 1323 & 8430, Spec. SOL 1502, File 94 PH 91(4327), May 1955, 146pp. Radio Corporation of America, Camden, N.J.

16,826

This was the first report on Phase I of a research program designed to obtain design information leading to significant improvements in Signal Corps voice communication systems used in the high-level noise environments encountered in many armored vehicles and helicopters. In this first phase, the noise spectra in armored vehicles and helicopters were determined and analyzed; the performance of present Signal Corps equipment in high-level sound fields was evaluated; and a system was synthesized to provide the improved performance required. Interim measures for improvement of present equipment were recommended.

16,828

To evaluate the role of physical fitness in relation to a simulated survival situation, 18 men, divided into four groups, lived outdoors under simulated survival circumstances. The maximum temperature experienced was 10 degrees F and the minimum was -40 degrees F, the weather conditions becoming progressively more severe until the test was terminated at ten days for three groups and six and one-half days for one group. Caloric intake for the ten-day group was 4000, 3000, and 900 respectively; the last group had no food. The "Pack test" of physical fitness was administered to each 5 before and after the test. Weight losses were recorded and observations made on morale.

Wynne, M. HUMAN FLOW THROUGH A COMMUNICATIONS NETWORK. Contract DA 31 022 ORD 1989, Proj. 3999 G1 004, TR 0081 & 1001, Tech. Rep. 13, Feb. 1959, 23pp. Electrical Engineering Research Lab., University of Illinois, Urbana, Ill.

16,831

Memorable having branches which are communication channels of limited capacity but capable of transferring information within this limit in either direction are considered. The first part of the paper shows the calculation of terminal capacities (amount of information which can be transferred from one vertex to another) in the given information network. The second part defines the capacity matrix which represents the terminal capacities between every pair of vertices in a network. Properties of this matrix are given. Finally a synthesis of information networks from a given capacity matrix is shown. Possible extensions of its mathematical properties are outlined.

Rosenblatt, F. PERCEPTION SIMULATION EXPERIMENTS (PROJECT WIDA). Contract AFMTC 2282(59), Rep. VG 1196 G 3, June 1959, 34pp. Cornell Experimental Laboratory, Inc., Buffalo, N.Y.

16,891

The PERCEPTION is a theory of a new brain model. It is a minimally constructed "nerve net" consisting of logically simplified neural elements and has been shown to be capable of learning to discriminate and recognize perceptual patterns. This paper reports a series of digital simulation experiments which were carried out on the perception using the IBM704 computer. Both "forced learning" and "spontaneous learning" performances were investigated and some insight gained into conditions under which different systems break down or deviate from typical biological learning phenomena.

Wolf, E. RECIPROCITY INEQUALITIES, COHERENCE TIME AND BANDWIDTH IN SIGNAL ANALYSIS AND OPTICS. Contract AF 19(604) 1717, AFMTC IN 57 353 & Rep. RM 126, June 1957, 21pp. Division of Electromagnetic Research, Institute of Mathematical Sciences, New York University, New York City, N.Y.

16,898

This paper is concerned with establishing a rigorous reciprocity relation of the Heisenberg type between the coherence time and the bandwidth of polychromatic radiation. Following upon an observation by Gabor that the usual formulation of the reciprocity inequality relating the effective duration of a signal and its effective bandwidth is unsatisfactory for signals that are intrinsically real, a modified version is presented. It is shown that this formulation is restricted to signals with zero mean value and there is no evidence of inequality. A definition of the coherence time of light is proposed and investigated for reciprocity inequality of the required type.

van Oosterom, T. MEASUREMENTS ON THE RELATION BETWEEN MAGNITUDE AND DURATION AND ON THE RATE OF APPLICATION OF THE CONTROL FORCES ACHIEVED BY PILOTS IN SIMULATED MANOEUVRES. Presented at: Fourteenth Meeting of the Flight Test Techniques and Instrumentation Panel, Athens, Greece, 11-15 May 1959, Rep. 241, 26pp. Advisory Group for Aeronautical Research & Development, NATO, Paris, France. (National Aeronautical Research Institute, Amsterdam, Holland).

16,892

To obtain data on desirable control characteristics of aircraft, the following measurements were made on 27 military and civil pilots on: 1) maximum control forces which could be exerted at various positions of the controls with respect to the pilot's seat; 2) forces that could be maintained during various periods of time with the controls in the optimum position; and 3) rate of increase of pedal forces. To gain basic information for establishing structural strength requirements, a second series of measurements were made on 135 Ss. The maximum rate of increase of the control forces, maximum control force that can be achieved, and the shape of the curves giving control force as a function of time in sudden maneuvers were determined.

Smith, J.E.R. & Katz, Isaac. THE RELIABILITY OF STATISTICAL INFERENCE UNDER RESTRICTIONS. Contract AF 19(600) 1000, Group Rep. 50 6, Apr. 1959, 15pp. Lincoln Lab., Massachusetts Institute of Technology, Lexington, Mass.

16,861

To determine for a very simple queueing system how large a sample is required for a given degree of accuracy in measures of system efficiency, an IBM 704 electronic computer was programmed to simulate a one-server queue with random arrivals at an average rate of 60 customers per unit time. Service time was constant at one unit (system load 60) with a first-come-first-served discipline. The measure of efficiency used was the conditional waiting-time distribution. System load was varied over 100 units with 25 sample distributions for each load (from 0.25 to 0.95), each based on 4000 and 1000 non-core units. For each load and sample size the 25 distributions were based on either 100,000 or 25,000 observations.

INTERIM TECHNICAL REPORT 11. Contract DA 19 020 ORD 2684, Projs. DA 599 01 004, ORD TB 0631, OCR 968 (Rev.) 2, CR 7125, OCR Rep. 968:24, Jan. 1959, 83pp. School of Industrial Management, Massachusetts Institute of Technology, Cambridge, Mass.

16,868

A class of linear programming problems is discussed. These problems are very simple extensions of the classical Hitchcock-Koopman transportation problem; the latter is included as an important special case. Only the simplex method of solution of linear programming problems is considered. A number of points that are particular to the classical "transportation problem" are derived from the very simple nature of the matrix of the coefficients in the constraints. This theoretical foundation allows a justification of the well-known "stepping-stone" algorithm. All the results are then extended to the general problem.

Jones, H.B. SIMPLEX THEORY. Mon. Series 3, June 1959, 104pp. School of Aviation Medicine, Pensacola Air Station, Fla.

16,875
This monograph develops and describes an approach to a correlation matrix called "solar correlational analysis" in which the analyst looks for correlation patterns, for structural wholes, and for an empirical theory to integrate his structural solution. One structural pattern, the simplex (a sequence of stages each one of which is studied within the next like sections in a telescope) is developed further. The history of the simplex form in the study of learning is reviewed. The string model as a way of reconstructing the training process or the manner in which stages of training are put together is presented with models taken from naval air training. A final chapter is devoted to the operations involved in simplex analysis.

Jones, L.V., Rock, R.D., Shaffer, E.M. & Johnson, E.S. PREFERENCE FOR FOOD COMBINATIONS. Contract DA 19 129 W 1003, File P 1113, Rep. 5 (Final), Jan. 1959, 31pp. NSA Communication Food & Correlation Institute for the Armed Forces, Chicago, Ill. (University of North Carolina, Chapel Hill, N.C.).

16,876
The power of a model for the prediction of choice of simple menus consisting of three food items was evaluated in a field trial with 307 army enlisted personnel. Predictions based on individual food items and for pairs of constituents were derived. Data for both types of preferences were added to account for the major variance in the preference scale values of the menu. The results are interpreted with regard to the value of preference data for individual foods in predicting acceptability of menu, interactive effects in preference for food combinations, and the predictive value of preference data for food pairs. Use of the model in optimizing institutional menus is suggested.

Harris, J.D. AUDITORY FATIGUE FOLLOWING HIGH FREQUENCY PULSE TRAINS. Proj. NM 22 03 20.02 01, Rep. 306, XVIII (1), Jan. 1959, 1-8. USN Medical Research Lab., New London Submarine Base, Conn.

16,882
To explore temporary threshold shifts and possible auditory damage from brief repetitive high-frequency sound, large groups of young men were exposed to high intensity pulse trains at 2.5 kc and examined continuously for subsequent acuity changes at four kc. Duty cycle varied from 1:4 to 100 percent tone-on, train length from 1 to 25 minutes, and SPL from 90 to 120 db. A new unit, the NOX, representing total cumulative fatigue over a ten-minute interval, was invented to describe the results. These data specified the damage risk criteria and levels of ear protection necessary for such auditory situations.

Hardy, J.D. (Chm.). PANEL ON ACCELERATION (PANEL 5) OF THE ARMED FORCES-NSA COMMITTEE ON BIO-ASSEMBLIES. Minutes of First Meeting, Natick Mass., 14-24 July 1959, 12pp. National Academy of Sciences - National Research Council, Washington, D.C.

16,884
These minutes of the first meeting of a Panel on Acceleration define the mission of the Panel as being "to review and report upon the research and development problems concerned with the biological effects of mechanical forces which may be of interest in the area of bio-astronautics." The principal areas of interest and the problems of concern to the Panel are listed. The discussions in these minutes are primarily concerned with descriptions of present and proposed facilities and uses of human acceleration devices and motion simulators. Recommendations for future work are included.

16,884
Erskine, D.C. & Phillips, M.D. INTEGRATED AIRBORNE CN CONTROL AND DISPLAY EQUIPMENT PROGRAM. Contract AF 33(600) 30475, NSC TR 59 271, June 1959, 81pp. NSA Wright Air Development Center, Wright-Patterson AFB, Ohio. (Radio Radio Div., Radio Aviation Corporation, Ann Arbor, Mich.).

16,884
This is the final report of a research program designed to develop and demonstrate the operational feasibility of an integrated communication-navigation-identification (CNI) control subsystem for present-day high-performance aircraft which would reduce the total amount of critical cockpit area required and relieve the pilot of some of his tasks. The development of the subsystem was described in detail and test results comparing it with present CNI controls were discussed. Possibilities of controlling the subsystem from the ground by data link were studied as a move toward further reducing pilot load. The feasibility of an integrated control subsystem for use in any high-performance aircraft was discussed in relation to the present development.

Clark, M.C., Courtney, D. & Colman, H.M. CAPABILITIES AND LIMITATIONS OF THE PILOT OPERATING IN A TERMINAL AREA WITHOUT TOWER CONTROL. (TECHNICAL REPORT). Contract FAA/MD 27, Proj. M, Rep. 31, Nov. 1959, 95pp. Courtney and Company, Philadelphia, Penn.

16,895
This study examines the factors that contribute to the ability of pilots to maintain separation and establish high landing rates at uncontrolled airfields for possible application to the more complex situation where the air traffic controller has become a necessity. The information in the report is based on an analysis of the relevant psychological literature, air observations at controlled and uncontrolled airfields using a typical light aircraft, and ground observations of typical "fly-ins" by several private pilots at uncontrolled airports. The major analyses are devoted to the pilot's perceptual and psychological capabilities and to additional factors such as regulations, airfield and aircraft characteristics, and the control loop.

Cheatham, T.E., Jr. & Lett, M.H. SIMULATION LANGUAGE SYSTEM TWO (SL-2). Contract AF 33(600) 35190, Tech. Memo. 58 2, Feb. 1958, 16pp. OMCA, Technical Operations, Inc., Washington, D.C.

16,896
This report describes the development of a program system called "Simulation Language System Two" (SL-2) in response to the needs of digital computer programs for simulating certain aspects of real world situations. These needs are discussed in relation to SL-2. An example of the use of this program is given.

Chang, S.S.L., Harris, B., Hauptschein, A., Hoffman, D., et al. EVALUATION AND OPTIMIZATION OF DIGITAL COMMUNICATION SYSTEMS. FINAL SCIENTIFIC REPORT. Contract AF 19(604) 1964, AFRC IN 59 110, Feb. 1959, 23pp. Research Div., College of Engineering, New York University, New York, N.Y.

16,897

Work on a contract calling for evaluation of digital communication systems and their optimization under practical criteria and constraints is summarized. The work accomplished includes: 1) an analysis of the effects of noise in the feedback channel of communication systems; 2) a general theory of digital communication systems with fading, interference, and feedback; 3) the extension of null-time reception to systems employing envelope detection of a pulsed carrier, including frequency shift keying systems; and 4) the performance of an experimental null-time reception system with unidirectional and decision-feedback channels. Suggestions for future research are given. T. G. I. R 24

16,898

Chang, S.S.L., Harris, B., Hauptschein, A., Hoffman, D., et al. EVALUATION AND OPTIMIZATION OF DIGITAL COMMUNICATION SYSTEMS. FOURTH SCIENTIFIC REPORT. Contract AF 19(604) 1964, AFRC IN 57 971, Jan. 1958, 111pp. Research Div., College of Engineering, New York University, N.Y.

16,898

This progress report describes work accomplished on the evaluation and optimization of digital communication systems. Two main classes of systems, unidirectional and bidirectional, are being considered. The first problem considered here is that of transmitting information through a noisy unidirectional channel in finite time with the least error. A large portion of this report pertains to the bidirectional or feedback systems: the effect of truncation of the decision processes of a cumulative decision feedback system is considered; the advantages of cumulative decision feedback are discussed; a coded information-feedback system is devised; and experimental data are obtained from a model of an uncoded, non-feedback, null-reception system. Chang, S.S.L., Harris, B., Hauptschein, A., Morgan, K., et al. EVALUATION AND OPTIMIZATION OF DIGITAL COMMUNICATION SYSTEMS. PART II. THIRD SCIENTIFIC REPORT. Contract AF 19(604) 1964, AFRC IN 57 769(II), Oct. 1957, 124pp. Research Div., College of Engineering, New York University, New York, N.Y.

16,899

A study of n-station communication networks has been initiated, and various techniques for analyzing and rating networks are summarized. Linear programming is shown to be a general method for the synthesis of optimal networks which are subject to linear constraints on demand and capacity, transportation and flow techniques being simply special cases of linear programming. General expressions are developed for the information rate and reliability of n-station networks, and illustrative examples of the method are presented for series and parallel networks. The application of the null-reception and decision feedback concepts to the scatter-multipath problem is considered further. T. G. I. R 22

Burch, G.E. & Gerathewohl, S.J. SOME OBSERVATIONS ON HEART RATE AND CARDIODYNAMICS DURING WEIGHTLESSNESS. Reports Control Symbol CSCRD 16 5, Nov. 1959, 28pp. USA Biocastroautics Research Unit, Redstone Arsenal, Ala.

16,902

A survey was made of the efforts made during the last decade to determine the biomedical effects (cardiovascular functions in particular) of subgravity and zero-g. Animals and men were exposed to short and moderate periods of weightlessness and their behavior, respiration, and cardiovascular functions were recorded during aircraft and rocket trajectories. The obtained records were discussed and a generalized survey of the cardio-dynamic effects was given in tabular form. These findings were discussed in relation to the ability of man to tolerate space flight. T. G. I. R 18

Beckner, D.M. & Harabedian, A. HUMAN PERFORMANCE AS A FUNCTION OF THE JOINT EFFECTS OF DRIVE AND MOTIVATION. Contract NMR 6053(00), Proj. NR 145 120, Dec. 1959, 62pp. Human Factors Research, Incorporated, Los Angeles, Calif.

16,903

To investigate the joint effects of the Hall-Spence motivational construct, D or generalized drive, and incentive motivation, K, on human performance, an effort was made to produce variations in K by giving one-half the Ss (experimental group) an opportunity to obtain a three-try (three) dependent upon their performance on a nine-choice disjunctive reaction time (RT) task and not giving the other half a similar opportunity. Two levels of D were produced by giving one-half of the Ss conditioning trials in which a 1000 cps tone was paired with an electric shock and then the tone was presented to all Ss on all test trials. Thus, there were four experimental groups. Speed and accuracy (information transmission) on the RT tasks were analyzed for differences among the various DK groups. T. G. I. R 18

Seaphart, F.W. (Principal Investigator). BIOLOGICAL FACTORS IN SPACE FLIGHT. Contract AF 18(600) 1792, AFRC IN 58 58, Nov. 1958, 41pp. Division of Educational Research, University of Virginia, Charlottesville, Va.

16,908

This report presents the results of a working group conference concerned with planning biological experiments that would provide data from which the feasibility of a manned space flight could be determined. The major considerations treated were 1) behavioral factors, 2) instrumentation factors, 3) ecological factors, and 4) physiological effects of the space environment. In each area the problems were defined and a suggested research program outlined. T.

Abramson, L. A MODIFICATION OF THE WALD SEQUENTIAL PROBABILITY RATIO TEST AS APPLIED TO RADAR DETECTION. Contract AF 15(604) 1572, AFRC IN 58 395 & Tech. Rep. T 10/133, Aug. 1958, 30pp. Electronics Research Lab., Columbia University, New York, N.Y.

16,913

For a fixed false alarm probability, α , and a fixed miss probability, β , the Wald sequential probability ratio test (SPRT) minimizes the average time, T , to decide between signal-plus-noise and noise alone. Since the SPRT is designed to detect a fixed signal although the true signal may vary over a large range, a modification of the SPRT was investigated which results in a smaller maximum T at the expense of a larger minimum T . The modification consists of performing a preliminary SPRT and, depending on its outcome, then performing one of two more SPRT's, after which a decision is made. The special case of a constant signal with additive independent Gaussian noise is considered. T. R 2

Shaffer, E.M. & Plesner, R.A. BAYES ESTIMATION OF PROPORTIONS: THE EFFECT OF STIMULUS DISTRIBUTION AND EXPOSURE TIME. AFOSR TR 59-1111 & Rep. 23, Dec. 1959, 17pp. Psychometric Lab., University of North Carolina, Chapel Hill, N.C.

16,931

To evaluate predictions from the decision theory model of the behavior of individual Ss in a typical psychophysical experiment, the solution (known as a Bayes strategy) was mathematically derived for the task described below. Twenty-three Ss were required to estimate the percentage of ones in random matrices composed of ones and zeros in varying proportions. The two types of information were experimentally varied by using different stimulus distributions and exposure time. The stimulus distributions were not told to the Ss, who thus had to learn stimulus probabilities during the course of the experiment. Subject estimates were compared with those derived from the model.

Schwartz, L.S. (Dir.). EVALUATION AND OPTIMIZATION OF DIGITAL COMMUNICATION SYSTEMS. FIFTH SCIENTIFIC REPORT. Contract AF 19(604) 1964, AFOSR TR 58 578, Nov. 1964, 65pp. College of Engineering, New York University, New York, N.Y.

16,933

The problem of transmission of information over a bidirectional communication system with noise in the forward and feedback channels is discussed. A system that prevents nonconservation of message length is described and the results of analysis are summarized. A technical description is given of a model of communication decision-feedback system with noise in the forward and feedback channels. This system prevents nonconservation of message length by reserving, for a given block of message units, a fixed correction interval for repetition of ambiguously received messages. Several correction procedures are analyzed and compared. Comparisons are also made with unidirectional and ideal decision-feedback systems.

Michel, E.L. & Langevin, R.W. ENVIRONMENTAL REQUIREMENTS OF SEALED CABINS FOR SPACE AND ORBITAL FLIGHTS PART 2. CONTINUOUS EXPOSURE OF HUMAN SUBJECTS TO INCREASED OXYGEN TENSION FOR SEVEN DAYS. Proj. TED NAM AE 1403 Part 2, Rep. NAM ACEL 384, Sept. 1958, 11pp. USN Air Crew Equipment Lab., NAMC, Philadelphia, Penn.

16,943

In an attempt to define human limitations to higher than normal oxygen percentages for space flight, six volunteers were confined for a seven-day period (168 hours) in an altitude chamber at 10,000 feet (523 mm Mercury) simulated altitude breathing 80 percent oxygen. This is the equivalent of breathing 55 percent oxygen at sea level since the partial pressure in both cases is 418 mm Mercury. Prior to the study, each subject was evaluated by means of medical history and physical examination. During the study, measurements were made of vital capacity, pulse rate, respiratory frequency, and observations were made as to appearance and activity in general. Follow-up medical and physical examinations were made.

Laurent, A.G. ORDER STATISTICS AND STATISTICAL INFERENCE FOR A MODEL WITH RELIABILITY FUNCTION $S(t) = \exp[1-t \cdot \exp(t)]$. Contract N628(00), (NR 042 201), Tech. Rep. 4, Nov. 1959, 71pp. Department of Mathematics, Wayne State University, Detroit, Mich.

16,946

This paper discusses the use of order statistics in problems of statistical inference that arise under the assumption that the phenomena under study are correctly represented by the Reliability Function $S(t) = \exp[1-t \cdot \exp(t)]$, where t is a "reduced" variable. The motivation for the study of the present models arose from a consideration of situations where an aging process takes place and the future performance of the system depends on its age. Expected values, variances and covariances of the order statistics, tables of expected values, and uses of the tables are presented. Minimum variance unbiased estimates of the parameters, confidence limits and tests of hypotheses are described.

Kreider, M.B. & Impletro, P.F. OXYGEN CONSUMPTION AND BODY TEMPERATURE DURING SLEEP IN COLD ENVIRONMENTS. *J. Appl. Physiol.*, Sept. 1959, 14(5), 765-767. (USA Environmental Protection Research Div., ON Research & Engineering Command, Metic, Mass.).

16,979

To investigate the effect of cold on heat exchanges of the body during nighttime sleep, six young soldiers slept at the following ambient temperatures 25.5 to 26 degrees C (78 to 80 degrees F), 15 to 18.5 degrees C (60 to 65 degrees F), and -22 to -34.5 degrees C (-25 to -30 degrees F). Rectal and skin temperatures were recorded and mean weighted skin temperatures were calculated at 10, 20, 30, 40, 50, and 60 minutes intervals every night; oxygen consumption was measured at six-minute intervals on occasional nights. Observations were made as to periods of wakefulness and restlessness during the night. The obtained values were discussed in relation to limits of body cooling compatible with substantially continuous sleep.

16,995

An analytic study and comparison of certain ground-air communication links is presented. Systems employing frequency-shift keyed (FSK) modulation are first examined and an analysis leading to an optimum detector for a two-state FSK system is presented. The performance of carrier (on-off) keyed FSK and phase-shift keyed (PSK) binary systems operating in an environment of additive, white, Gaussian noise are analyzed and compared on the basis of the error probability attained as a function of the received signal-to-noise ratio. Finally, an analysis of modulation methods directed at minimum bandwidth PSK systems is presented. Recommendations for future investigation are presented.

Mortimer, N. DETERMINISTIC THEORIES. Contract AF 49 (630) 33, AFOSR TN 58 1113, Aug. 1958, 64pp. University of California, Los Angeles, Calif.

16,953

An analysis of the notions of a deterministic theory and of a deterministic system and an investigation of some of the properties of these notions are presented. The investigations are conducted within metamathematics in the wider sense, construed as including the apparatus of set theory. Definitions of the concept of deterministic theory, the derivative concept of a deterministic system, and several related concepts are given. An inquiry is then made as to whether two specific theories (classical particle mechanics and Newtonian celestial mechanics), often alleged to be deterministic, actually are so. Theorems relating determinism with various other concepts that have been associated with it in the literature are presented. Finally, explicit definability and determinism are discussed. R 30

Green, D.M. DETECTION OF SIGNALS IN NOISE AND THE CRITICAL BAND CONCEPT. Contract AF 19(604) 2277. AFOSR TR 58 51 & Tech. Rep. 82, April 1958, 78pp. Engineering Research Institute, University of Michigan, Ann Arbor, Mich.

16,996

An attempt was made to use behavioral data as a basis for a mechanistic and mathematical description of the auditory frequency analysis process. The critical band theory is used as an interpretive device in discussing the research. An analytic review of research from the areas of masking, frequency discrimination and loudness is presented and two new experimental studies are reported in detail. The first of these concerns detection of multiple component signals in noise. A model extending the critical band theory is considered in analyzing the results. The second study applies ideas developed in the first to a situation where the signal is a sample of noise. Two parameters of the signal are investigated: bandwidth and duration. A general model of the receiving mechanism is proposed. G. I. R 29

Kurze, A.A., Marks, K.L. & Schermerhorn, J.G. A NEW HORIZON IN COMMUNICATION THEORY - THE POLYPHASE CONCEPT. Proj. 4518, RADC TN 58 6, Jan. 1958, 38pp. USAF Rome Air Development Center, Griffiss AFB, N.Y.

16,999

This report attempts to explain the significance of the polyphase concept and its application to communications engineering which, to date, has been treated from a single-phase concept only. The polyphase concept is shown to be of sufficient scope and power to penetrate into every domain constituting communication theory and to provide new applications to old problems such as information theory, modulation, antennas, detection, and circuitry. Further outlined are the possibilities of the application of the polyphase concept to such areas as multiplexing, high-power generation, and interference suppression. T. G. I. R 24

Bradley, J.V. & Wallis, R.A. SPACING OF PUSH BUTTON ON-OFF CONTROLS. *Engng. Industr. Psychol.*, Winter 1959, 1(4), 107-119. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio & Antioch College, Yellow Springs, Ohio).

17,076

To investigate human factors which limit the degree to which an instrument may profitably be miniaturized, 36 Ss were tested on panels on which controls varied in diameter (three ways), orientation (two ways), and spacing (six ways). Each S was tested for all 36 possible combinations. Performance was compared in terms of time scores and touching errors as functions of spacing. Results were related to previous studies of degradation of performance as this related to crowding of knobs. Recommendations were made for optimal placement of push buttons. T. G. I. R 14

Meranda, P.F., Farrington, A.R. & Clarke, M.V. PREDICTION OF PERFORMANCE OF TEXTILE WORKERS. *Engng. Industr. Psychol.*, Winter 1959, 1(4), 120-127.

17,077

This study was an extension of a study conducted to determine the merits of the Activity Vector Analysis (AVA). The AVA is a self concept personality assessment instrument used to predict success of line workers in the textile industry. The 230 Ss were rated by an interviewer and by an analyst of the AVA. The criteria of success was a job proficiency rating and actual job status. Comparisons between predicted and foreman's ratings and between predicted and actual job outcomes were made. The merits of the AVA as compared to personal interviews were ascertained and discussed. T. R 1

Seminara, J.L. SPEED AND ACCURACY OF MATCHING TACTUALLY CODED RELATED PAIRS OF ITEMS. *Engng. Industr. Psychol.*, Winter 1959, 1(4), 128-133. (Missile Systems Div., Lockheed Aircraft Corp., Van Nuys, Calif.).

17,078

The use of tactual cues to perform a common simple operation was investigated. The speed and accuracy of matching related pairs of simulated plugs and receptacles on six Ss were determined. The same task was conducted with the aid of visual cues. These two types of performance were compared and evaluated. T. G. I. R 8

Buel, W.D. STABILITY OF PREFERENCE INDICES IN FORCED-CHOICE RATING SCALE ITEMS. *Engng. Industr. Psychol.*, Winter 1959, 1(4), 134-137.

17,079

To check the assumption made in forced-choice scale construction that preference indices (PI's) determined from responses to items in checklist form remain stable when those items are matched on similarity of PI and dissimilarity of discrimination index (DI) and are responded to in forced-choice form, 11 Ss evaluated men on 143 items on a five-point scale. For each item PI's and DI's were obtained and a forced-choice scale was constructed. The same Ss rated the same men on the new instrument three months after the initial study. Results were discussed as they provided a test of the assumption stated above. R 3

Mukherjee, B.N. LEARNING EFFICIENCY IN A PSYCHOMOTOR TEST AS A FUNCTION OF INITIAL SKILL. *Engng. Industr. Psychol.*, Winter 1959, 1(4), 138-142. (Bureau of Educational & Vocational Guidance, Patna, Bihar State, India).

17,080

To investigate relations between different measures of learning derived from successive performance on a simple psychomotor task and initial level of ability in the task, 16 subjects were divided into four groups on the basis of scores made on trial tests on a two-hand coordination test. Learning curves based on time scores were correlated with initial performance level. Results of this investigation were compared with findings from similar investigations. T. G. R 8

Glanville, M.H. SAFETY IN TRANSPORT. I. SAFETY ON THE ROAD. *J. Royal Soc. Arts*, May 1954, CII(4926), 496-519. (Road Research Lab., Dept. of Scientific & Industrial Research, Harmondsworth, Middlesex, England).

17,339
This paper treats the road safety problem with particular reference to Great Britain. The magnitude of the problem of road accidents at present and possible future trends in both traffic and accidents are discussed. The broad issue of road safety is then discussed as 1) the equipment used (the road and the vehicle), 2) the human element (the pedestrian and the driver), and 3) properly devised and applied sanctions for both 1) and 2).

Brown, V. SAFETY IN TRANSPORT. II. SAFETY IN THE AIR. *J. Royal Soc. Arts*, May 1954, CII(4926), 520-533. (Ministry of Civil Aviation, London, England).

17,340
Factors in achieving air safety are treated in the following order: airworthiness; crashworthiness; airling operation, maintenance, and inspection; accident investigation; the passing of information among government departments, designers, manufacturers, and operators; statistics; and publicity. A final comment is given on what the government of the United Kingdom is doing to overcome the hazards of flying.

Wilson, G.R.S. SAFETY IN TRANSPORT. III. SAFETY ON THE RAILWAYS. *J. Royal Soc. Arts*, May 1954, CII(4926), 534-549. (Ministry of Transport and Civil Aviation, London, England).

17,341
The working principles and methods which underlie the high standard of safety characteristic of railway travel are discussed with particular reference to Great Britain. Major topics treated are as follows: government regulation; railway safety in 1874; railway signalling (block system--double and single lines, signals and interlocking, modern signalling controls, track circuits, continuous track circuiting and multi-aspect signals); railway brakes (nonautomatic, automatic, modern improvements, vacuum, and air brake systems); observance of signals (automatic train control, warning control, and stop control on urban electric railways); and derailments (breakages and failures, examinations). Future developments are discussed.

Walters, R.H. A NON-PARAMETRIC APPROACH TO THE GRAPHICAL ANALYSIS OF TRENDS. *Canad. J. Psychol.*, June 1959, 13(2), 84-85. (University of Toronto, Toronto, Ontario, Canada).

17,462
When the responses of a group of Ss over a series of trials on a task are examined, and when the data do not meet the requirements of a parametric analysis, a nonparametric analysis should be used. Such an approach is described and the procedure is illustrated with reference to an actual experiment.

Lambert, M.E. & Fillenbaum, S. A PILOT STUDY OF APHASIA AMONG BILINGUALS. *Canad. J. Psychol.*, March 1959, 13(1), 20-34. (McGill University, Montreal, Quebec, Canada & University of North Carolina, Chapel Hill, N.C.).

17,463
Studies on the effects of aphasia among people who use more than one language were reviewed and three generalizations (primacy, habit strength, and affective) about such effects of speech were discussed. Both classical and new cases of polyglot aphasics were analyzed to determine if any relation exists between language learning contexts and the nature of aphasic disorder and to what extent these data fit the general principles. Some tentative conclusions were derived in support of the learning context principle.

Mead, L.C. A PROGRAM OF HUMAN ENGINEERING. *Ann. N.Y. Acad. Sci.*, Jan. 1951, 51(Art. 7), 1125-1134. (Tufts University, Medford, Mass.).

17,516
A review is given of the manner in which the field of human engineering arose and the term itself is defined and discussed in relation to other areas of endeavor. A program of human engineering as it appeared at the time of writing (1951) is outlined in terms of objectives and types of studies undertaken. Some illustrative examples of results obtained from human engineering research are presented.

17,517
The main thesis of this paper is that improvements in safety and efficiency in airline operations center around the design of equipment to comply with the human characteristics of the operators. A number of illustrations relating aircrew duties to design features are given. The value of advance analysis of a system in terms of human factors is stressed.

Reels, L.S., Jr. SOME CONSIDERATIONS OF ARSENICAL
NUTRITION. Ann. N.Y. Acad. Sci., Jan. 1942, 25(Part 7):
1159-1163.

The effect of World War II in producing constructive progress of research among medical personnel, representative of the allied countries, and individual laboratories to solve previously unsolved problems is discussed. The progress emerging from this effort is being hastened, producing a field that, perhaps, may displace in the effect of the relationship between man and machine. The writer feels it is hard to find what about that conflict is unsolved problems at the 24th are to be solved. Some aspects of progress might be given as illustration of such progress.

Ann. N.Y. Acad. Sci., Jan. 1961, 51 (Art. 7), 1207-
1212. (Department of Anatomy, College of Physicians
and Surgeons, Columbia University, New York, N.Y.).

The efficient management of normal motor activities and the substitution of prosthetic devices for the normal mechanisms depend upon an understanding of the fundamental factors which underlie human movement. The locomotor mechanism, its fundamental features, its control, and the methods by which these factors can be studied are discussed.

Blankart, H.M., & Cooper, W.W. AN EVALUATION OF SURGICAL PROCEDURES USED IN A PERMANENT STAGE OF RAT-TOOTH EXOSTOSIS. *Ann. N.Y. Acad. Sci.* Jan. 1966, 21 (Part. 7), 1223-1238. School Engineering Dept., University of California, Berkeley, Calif. & Orthodontic Surgery Sect., University of California, San Francisco, Calif.

A critical review of experimental techniques that have been used for studies of human perception of all significant psychomotor features (1) of three salient kinesthetic features: 2) differentiated types of postural activity, 3) static posture, and 4) dynamic posture, and 5) body motion patterns, and 6) body motion patterns. These features include: 2) static posture, 3) static posture, and 4) static posture, and 5) static posture, and 6) static posture. The information and symbols of data gathered by the use of these methods should contribute to a better understanding and use of these procedures for improvement of cases of psychomotor learning.

The basic functional requirements of lower extremity prostheses are discussed with reference to recent force control research findings. The nature and significance of the many important functional characteristics as related to prostheses are discussed and related to their incorporation in leg design.

Tajiri, Gen. & Electric, A.C. - APPLIED FOR PATENTED
MACHINES OF MIXING OF THE SPINNING, AND AND SAND
CLOTHING, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588,

A method of kinematic analysis of the motions of shovels, arms, and hand is described. The six steps involved are discussed in detail: 1) measurement and calibration of the standard experimental S, 2) fitting of the S with visual landmarks, 3) cinematography of the S performing the activities under study, 4) obtaining the Cartesian earth coordinates of the visual landmarks from selected frames of the developed film and correcting these coordinates for parallax, 5) analysis of the coordinate data to yield the onset and angle of the idealized kinematic system, and 6) obtaining angular velocities and accelerations of the members of the kinematic system from the serial frames.

42. H. G. HUMAN ENGINEERING PROBLEMS IN SERVICE TESTING OF PROSTHETIC DEVICES. Ann. N.Y. Acad. Sci., Jan. 1951, 51 (Art. 7), 1266-1271. (College of Engineering, New York University, New York, N.Y.).

Some of the psychological considerations that enter into the selection of amputee pilot wearers of prosthetic devices which are to be service tested are reviewed. Attention is directed to issues and problems arising in connection with experimental design in a human engineering problem of this kind. Also considered are difficulties that arise with the development and utilization of a research team consisting of professionals from several diverse areas. Values and limitations of such a cross-disciplinary approach are indicated.

O'Brien, E.C. **MECHANISMS OF DUST REMOVAL FROM SURFACES.** *ASBESTOS*, 1959, 2(1), 54-74. (Turner Brothers Asbestos Co. Ltd., Rochdale, Lancs., England).

17,775
The problem of removing the dust from a job surface as to achieve the given factor is considered. Following a discussion of the state of research on this problem is reviewed. While considerable work has been done in the field of "mechanical" dust removal, it is suggested to consider the prospects of such the use of 11, and 12, especially (called here "thermochemical" models) for the estimation of the progress of such job is presented. Considerations based on these models are also discussed. Satisfying as a method for study of this problem is considered for further experimentation.

Morley, E.R. **THE CONTROL OF FINE DUST REMOVAL FROM SURFACES.** *ASBESTOS*, 1959, 2(1), 54-74. (Turner Brothers Asbestos Co. Ltd., Rochdale, Lancs., England).

17,777
This paper first considers the different types of dusts associated with the electroplating industry and then discusses the techniques of collecting and scrubbing them. The substances from which dusts arise are chrome, copper, cadmium, zinc, and tin chloride. These are cleaned by specially designed scrubbers. The steam from the hot water scrubbers is handled by exhaust ducts. Also, the removal of polishing dust is briefly described.

Wiles, G.H. **AIR CONSERVATION IN INDUSTRY.** *ASBESTOS*, 1959, 2(1), 54-74. (Wiles Ltd., Gillingham, Surrey, England).

17,779
This paper is aimed at emphasizing "the attractive feasibility of internal recirculation from dusty processes, providing adequate dust removal means are incorporated." Three types of apparatus for air cleaning are considered: electrostatic precipitator, disintegrator scrubber, and dry filter. Because of economic considerations only the dry filtration technique is considered in detail. Some types described include the "Box Carister" and paper absolute. Average total costs for recirculating air are calculated and presented. Finally, the feasibility of recirculating is considered.

Bastlin, M.P. **DUST CONTROL IN THE ASBESTOS TEXTILE INDUSTRY.** *ASBESTOS*, 1959, 2(1), 54-74. (Turner Brothers Asbestos Co. Ltd., Rochdale, Lancs., England).

17,781
The highlights of the Merewether and Price study, which examined 363 people from various age groups of the asbestos industry (for incidence of fibrosis) and made engineering recommendations regarding equipment, plant, and methods to be used, are presented as background information for evaluating the present conditions in the industry. The remainder of the report describes and discusses the methods of dust suppression now utilized. These include exhaust hoods, damping troughs, and oil emulsion treatments for the weaving operations; mechanical mixing of various grades of fiber; automatic dispensing of the fiber; better enclosure of all machines; and mechanical means for removal of dust from machines.

Kobayashi, T., Kikuchi, J.M., Kikuchi, R.M., & Kikuchi, F.L. **ADAPTATION OF HUMANS TO NOISE AND VIBRATION FROM NOISE CONTROL.** *ASBESTOS*, 1959, 2(1), 54-74. (Turner Brothers Asbestos Co. Ltd., Rochdale, Lancs., England).

18,001
An investigation was made of the effects of noise and vibration on humans. The subjects were exposed to noise and vibration from a machine. The results showed that the subjects were able to adapt to the noise and vibration. The subjects were able to work for a period of one year without any adverse effects. The results showed that the subjects were able to adapt to the noise and vibration. The subjects were able to work for a period of one year without any adverse effects. The results showed that the subjects were able to adapt to the noise and vibration. The subjects were able to work for a period of one year without any adverse effects.

Riecken, H.W. **A PROGRAM FOR RESEARCH ON EXPERIMENTS IN SOCIAL PSYCHOLOGY.** *ASBESTOS*, 1959, 2(1), 54-74. (USAF Research & Development Center, Griffiss AFB, N.Y.).

18,007
Sources of unintended variance in data collection in experimental social psychology are identified and discussed. The particular task undertaken is the examination of the particular features of the social situation in which data are collected and the processes of negotiation between investigator and subject through which they come to understand how to behave in the situation. Some problems for research in this area are proposed.

Bach, J. & McFadden, R.J. NOTES ON A CONSTRUCTIVE
FRAMEWORK FOR A THEORY OF ORGANIZATIONAL DECISION MAKING.
Contract AF 49(638) 33, AFOSR TN 58-1114, Providence, RI:
Interdisciplinary Behavioral Sciences Research Conference,
University of New Mexico, Albuquerque, N.M., Jan-August
1958, 72pp. Michigan State University, East Lansing, Mich

18,005
This is a preliminary statement of the first phase in
a three-phase study: a definitional framework of concepts
held to be pivotal in any rigorous theory of organiza-
tional decision-making. The explicit development of such a
theory and its empirical testing are future projects.
The definitional framework comprises some 91 definitions.
These are grouped into four related categories, with a
section devoted to each category as follows: a pool of
preliminary concepts, decision behavior, conflict and
cooperation, and decision-making in organizations.

Bogert, J.E. THE RELATIVE EFFICIENCY OF PRESENT THE
LONG-DURATION "BURST" AND "CONTINUOUS SCATTER" LONG
DISTANCE COMMUNICATION TECHNIQUES. AFOSR TN 58-156,
June 1958, 27pp. USAF Communications Sciences Lab.,
AFOSR, Bedford, Mass.

18,006
The transmission efficiencies of the "burst" and "con-
tinuous" very high frequency long-distance communication
techniques are compared using available data from the
literature. For the same effective radiated power, an
estimate is made of the teletype capacity which is a-
vailable for 99 percent of a year's hours at an average
character error rate of 1:1000. It is concluded that,
at the present time, the continuous technique yields a
high reliability-capacity product in the lower vhf re-
gion.

Norman, R.D. ORGANIZATION OF AND REACTIONS TO THE INTER-
DISCIPLINARY PROGRAM IN THE BEHAVIORAL SCIENCES SUPPORTED
BY THE AFOSR AT THE UNIVERSITY OF NEW MEXICO. Contract
AF 49(638) 33, AFOSR TN 58-1099, 1958, 66pp. University
of New Mexico, Albuquerque, N.M.

18,007
An organized or systematic approach to interdisciplinary
research in the behavioral sciences is discussed.
The Interdisciplinary Program in the Behavioral Sciences
consisted of two eight-week programs held at the Univer-
sity of New Mexico during the summer of 1957 and 1958.
The present report is organized into three major sec-
tions: 1) a general description of the program--its
purpose and organization, selection of participants,
etc.; 2) reactions to some general aspects of interdisci-
plinary programs; and 3) observations on the functioning
of the New Mexico effort specifically. A list of 43
research studies developed during the two conferences
is appended.

Lichte, W.H., Miller, J.G. & Borresen, C.R. THE INFLU-
ENCE OF CHART SCALE AND AMOUNT OF INFORMATION ON AIMING-
POINT IDENTIFICATION BY EXPERIENCED SUBJECTS. Contract
AF 18(600) 1209, Proj. 7738, Task 27014, AFFTRC TN 58-2,
Jan. 1958, 24pp. USAF Operator Lab., Randolph AFB, Tex.
(University of Missouri, Columbia, Mo.).

18,008
As a first step in determining what kinds of charts
are most helpful to the navigator in preparing for and
carrying out his scope-reading and bombing tasks, an
experimental study was made of the influence of chart
scale and amount of information on aiming-point identi-
fication. A series of charts varying in chart scale and
amount of information was constructed for experimental
use with six groups of Ss; a seventh group used a con-
ventional chart. The Ss were B-47 navigators. After a
period of chart study, the Ss indicated target locations
on O-15 scope photographs. Errors were analyzed for
effect of the chart variables.

Sestini, Marcello. A METHOD FOR INCREASING THE EFFEC-
TIVENESS OF BRIEF SIGNALS BEFORE THE BACKGROUND.
Atti della Fondazione Giorgio Ronchi, Nov.-Dec. 1959,
11(6), 611-618. (Accademia Nazionale di Scienze, Lettere,
Firenze, Italy).

18,011
The threshold illumination from a stimulus target
extending 12 minutes visual angle and lasting 60 msec.
was measured when the stimulus was presented either in
the dark or against an illuminated background. Each
stimulus (blue or green) was seen against a background
of the same color and was brighter than this background.
Comparisons were made between threshold data obtained
with rectangular and triangular targets having equal
energy and duration and different time distribution
luminance. Two observers made many observations. Im-
plications of the findings for radar displays were dis-
cussed.

Young, M.P. & Wall, G.F. MAN-MACHINE FACTORS IN THE NRL
NUCLEAR REACTOR CONTROL SYSTEM. Proj. NR 401 000, Task
NR 401 001, NRL Prob. V02 03, NRL Rep. 5270, March 1959,
20pp. NSN Research Lab., Washington, D.C.

18,013
One important problem in the design of a research re-
actor is the allocation of control responsibility among
men and automatic equipment so as to achieve the maximum
in safety, flexibility, and continuous operation. This re-
port presents the man-machine considerations which led to
the defining of the operator's task in the control system
of the nuclear reactor at the U.S. Naval Research Laborato-
ry and how these considerations were implemented in the
original design. It is felt that the basic operating pro-
cedures described here may be modified to meet require-
ments of future reactor research programs.

Zajonc, R.B. & Swoke, W.H. REDUNDANCY IN TASK ASSIGNMENTS
AND GROUP PERFORMANCE. Psychometrika, Dec. 1959, 24(4),
361-369. (University of Michigan, Ann Arbor, Mich.).

18,014
The problem of combining abilities of group members to
maximize the performance of the group as a whole is exam-
ined in terms of redundancy in task assignments. In par-
ticular, ways of distributing a given number of items of
information among a given number of individuals to ob-
tain the maximum probability of each item being recalled
by at least one individual are studied. It is shown that
there exists an optimal distribution scheme which is in-
dependent of the amount of material originally given, the
size of the group, and individual differences in ability.
The model presented is not restricted to recall and may,
with slight modifications, be applied to other behavior
such as learning, problem solving, or decision-making.

Brierty, W.B. ENVIRONMENTAL CRITERIA FOR EQUIPMENT DESIGN. Presented at: Fourth Annual USA Human Factors Engineering Conference, Army Chemical Center, Md., 9,10, 11 Sept. 1958, 40-41. USA Research Office, Office of the Chief of Staff, Washington, D.C.

18,018

The Department of the Army policy that relates to the attainment of the capability to conduct military operations in any world area is discussed with specific reference to equipment design and testing. The point is made that with increasing complexity of equipment and the great variety of tactical, strategic, and operational environments possible, the present philosophy of testing needs to be examined critically. Present activities in such a review are discussed.

Goldberg, B. INFRARED BINOCULARS AND HUMAN ENGINEERING. Presented at: Fourth Annual USA Human Factors Engineering Conference, Army Chemical Center, Md., 9,10,11 Sept. 1958, 51-60. USA Research Office, Office of the Chief of Staff, Washington, D.C.

18,019

A background of basic information about active infrared radiation and image converter systems is presented and followed by a consideration of infrared binoculars, their use, and the human engineering problems that are still associated with them. Uses include locomotive driving and repair, missile erection and launching, construction operations, vehicle repair and bridge building, and helicopter landing in darkness. Some of the problems discussed are bulk, weight and balance, discomfort due to unequal magnification, limited field-of-view, and limited depth focus.

Hughes Aircraft Company. UHF AIR/GROUND SCATTER COMMUNICATION SYSTEM STUDY. Contract AF 19(604) 2160, Rep. 2160 F, Oct. 1957, 114pp. Communication Systems Lab. & Systems Development Labs., Hughes Aircraft Company, Culver City, Calif.

18,021

This air/ground scatter communication study was undertaken to assess the significance of research findings on scatter propagation in terms of their application to military ultra-high frequency air/ground voice communications. The results stem from contact with qualified people in propagation research, systems engineering, and communications operations as well as from a careful review of the literature. Six background studies (UHF tropospheric scatter propagation, other propagation possibilities, airborne and ground antennas, modulation, equipment and operational considerations) are presented and a specific UHF Transhorizon Communication System is proposed and described.

Hurwitz, H.M.B. THE CHANGING ROLE AND STATUS OF THE SCIENTIST AND ACADEMIC IN AMERICAN SOCIETY: INTERIM REPORT. Contract AF 49(638) 33, AFOSR TN 58 1107, 1957, 38pp. Birkbeck College, University of London, London, England.

18,022

This report is concerned with the broad issue of the changing role and status of the scientist and academic in American society. It involves a longitudinal study of their professions. There are three sections: 1) A discussion is presented of the "sciconad", a neologism which serves to designate a newly emerging socio-economic occupational class. The sciconad is an individual with professional, specialized training in one of the sciences, yet one who functions within an organizational setting. 2) Several suggestions are presented for further study of the problem. 3) A series of appendices reveal the extent to which relevant information has been obtained to date on the problem under study.

Sauer, R.P. FUNDAMENTAL CONCEPTS IN THE THEORY OF SYSTEMS. Contract AF 33(616) 2797, Proj. 7060, WDC TR 57 624, Nov. 1957, 137pp. USAF Aeronautical Research Lab., Wright-Patterson AFB, Ohio. (System Research, University of Chicago, Chicago, Ill.).

18,023

This report presents approaches to various areas embraced by the theory of systems. Section I is an expository discussion of digital processes containing a brief historical account of routine computational procedures in classical mathematics, the Post-Turing theory of algorithms, and the abstract ideas of digital analysis. Sections II "Discrete Linear Mechanisms" and III "Continuous Mechanisms" present a treatment of the basic theory of pulsed and continuous servomechanisms. Section IV contains an extensive development of weighting functions from the point of view of functional analysis. In Section V, a class of mechanisms known as finite automata is analyzed.

Alford, R.W. & O'Clair, F.R. INVESTIGATION OF THE RELIABILITY OF RECOMMENDATIONS RESULTING FROM A FLIGHT TEST EVALUATION. AFIC TN 58 21, May 1958, 38pp. USAF Flight Test Center, Edwards AFB, Calif.

18,024

To investigate the reliability of USAF Flight Test Center (AFIC) test recommendations in detecting and eliminating operational problems, an opinion survey of 45 pilots and 106 maintenance personnel was accomplished. The pilots completed a survey form requiring evaluation of 176 cockpit features. These features were largely based on recommendations which had been made by the AFIC at a previous time. Acceptability levels of items where modification had been accomplished, partially accomplished, and not accomplished were analyzed. Maintenance personnel were asked to evaluate specific training inadequacies and assign rank order maintainability ratings to aircraft in each of several areas. Responses were analyzed in relation to test predictions.

Shambaugh, G.F. & Pratt, J.J., Jr. DEVELOPMENT OF INSECT REPELLENTS FOR PERSONAL USE: I. DIETHYLTOLUAMIDE. Proj. 7.65 01-002, Pesticides Section Rep. 1, May 1959, 15pp. USA Chemicals & Plastics Div., QM Research & Engineering Command, Natick, Mass.

18,029

This summary of the research and development on diethyltoluamide was assembled from several published and unpublished sources. It is intended for use by the Continental Army Command in evaluating this repellent as an acceptable troop use item. A report was made on laboratory and field tests on skin and clothing, stability with packaging, effect on textiles and plastics, cosmetic acceptability, toxicology, commercial availability, and cost.

Slote, L. THE ENGINEERING BIOTECHNOLOGY OF HANDLING WASTES RESULTING FROM A CLOSED ECOLOGICAL SYSTEM THERMAL ENERGY EXCHANGE WITH SPECIFIC APPLICATION TO WASTE HANDLING IN A CLOSED ECOLOGICAL SYSTEM. PROGRESS REPORT. Contract AF 18(603) 71, AFOSR TR 58 268, July 1957, 7pp. College of Engineering, New York University, New York, N.Y.

18,030

The variation in the total surface temperature of a perfect heat conducting or spinning biosatellite for a given orbit and for various conditions of irradiation is analyzed. The results of the analysis are applied to the problem of using thermal energy sources in connection with processes for cracking of human waste and for the purification of urine by freezing in a closed ecological system.

Saith, H., Maffei, M.L. & Mortenson, F.A. PHILOSOPHY AND GUIDELINES FOR RELIABILITY PREDICTION OF GROUND ELECTRONIC EQUIPMENTS (AN INTERIM ENGINEERING REPORT). Contract AF 30(602) 1623, Proj. 4526, Task 45155, RADC TN 58 20, Oct. 1957, 85pp. USAF Reliability Technology Section, RADC, Griffiss AFB, N.Y. (Government Service Dept., Radio Corporation of America, Camden, N.J.).

18,031

The basic concepts of reliability prediction of ground electronics equipments are stated and the methods which have yielded accurate predictions as evidenced by field experience are described. Detailed engineering data developed for the techniques are included along with descriptions of other important aspects of reliability improvement and prediction which require further exploration and development.

Stevens, M.E. A SURVEY OF AUTOMATIC READING TECHNIQUES. NBS Proj. 1205 20 5712, NBS Rep. 5643 & RADC TN 58 21, Aug. 1957, 86pp. US Data Processing Systems Div., National Bureau of Standards, Washington, D.C.

18,033

This report presents the results of a survey and evaluation of current developments in automatic reading techniques. In addition to a study of available literature, inspections of devices in operation or under development and detailed discussions with personnel engaged in studies of character recognition techniques were made. The results are discussed under the following headings: 1) areas of applicability of automatic reading techniques, 2) critical factors in automatic reading problems, 3) controlled solutions to reading problems, 4) automatic reading techniques, and 5) further prospects for development.

Giles, C.G. THE SKIDDING RESISTANCE OF ROADS AND THE REQUIREMENTS OF MODERN TRAFFIC. Road Paper 52, Presented at: Road Engineering Division Meeting, London, England, 23 Oct. 1956, 33pp. Institution of Civil Engineers, Westminster, London, England. (Road Research Lab., Dept. of Scientific & Industrial Research, London, England). (Proc. Instn. Civ. Engrs., Feb. 1957, 6, 216-249).

18,034

The problems to be considered in insuring that in wet weather the skidding resistance of roads is adequate for the demands of modern traffic are examined. Standards for meeting the full performance of vehicles in braking, cornering, and accelerating, and the extent to which requirements are modified by the manner of driving are discussed. Methods of measuring skidding resistances of surfaces are reviewed with an interpretation of test results. Investigations on the relation between skidding resistance and risk of skidding accidents are considered. As a guide to meeting requirements, a table of suggested sideways-force coefficients is presented.

Wever, E.G. THE COCHLEAR POTENTIALS AND THEIR RELATION TO HEARING. Ann. Otol., Rhinol., Laryngology, Dec. 1959, 68(4), 975-989.

18,035

The view that cochlear potentials constitute one of the essential links in the chain of events from the entrance of sounds into the ear to the arousal of auditory sensations is defended in this paper. A comparison of the threshold acuity of animals as determined by behavioral methods with the pattern of cochlear potentials recorded from the same animals is made, using available data from the literature. A number of features that bring out certain systematic relations between the cochlear potentials and auditory acuity are presented and discussed.

Grime, G. THE PERFORMANCE OF HEAD-LAMP BEATING BEAMS. Proc. Instn. Mech. Engrs. Automobile Division, 1954-5, (3), 108-16. (Road Research Laboratory, Department of Scientific & Industrial Research, Harmondsworth, Middlesex, England).

18,037

This paper is largely concerned with work done at the Traffic and Safety Division of the Road Research Laboratory, Great Britain, on the question of improvement of vehicle headlighting, and thus visibility, on the road. The work falls into three parts: 1) surveys to determine the magnitude of the dazzle (glare) problem and the state of aim and maintenance of headlights in use, 2) the development of methods of testing headlights and forecasting their performance from curves of light distribution, and 3) consideration of methods of improving visibility and reducing dazzle.

Grime, G. & Giles, C.G. THE SKID-RESISTING PROPERTIES OF ROADS AND TYRES. 1954, 19pp. Road Research Lab., Dept. of Scientific & Industrial Research, Harmondsworth, Middlesex, England. (Reprinted from Proc. Instn. Mech. Engrs. Automobile Div., 1954-5, (1), 19-30).

18,038

This paper is concerned almost entirely with skidding on wet roads. The main facts are given concerning the importance of wet-weather skidding in relation to accidents, and then methods of measuring the slipperiness of road surfaces are considered. Typical results for British roads are given and considered in relation to such factors as types of surfacing and surface texture. It is then shown that the non-skid properties of tires depend for their effectiveness upon the type of road surface as well as on the tread pattern. The results of experiments with a number of different patterns are discussed.

Smeed, R.J. ACCIDENT RATES. ca. 1953, 11pp. Road Research Lab., Dept. of Scientific & Industrial Research, Harmondsworth, Middlesex, England. (Reprinted from Internat. Road Safety & Traffic Rev.).

18,040

A large amount of vehicular accident information from different countries has been brought together and analyzed in an effort to arrive at an understanding of the way accident frequency varies with the quantities to which it can be related. The variables discussed are: 1) number of vehicles, 2) type of accident, injury, 3) number of vehicles involved, 4) accidents at junctions, 5) rural vs. city areas, 6) traffic flow, and 7) distance traveled.

Smeed, R.J. SOME STATISTICAL ASPECTS OF ROAD SAFETY RESEARCH. J. Royal Statist. Soc., 1949, CXII(1), 1-23. (Road Research Lab., Dept. of Scientific & Industrial Research, Harmondsworth, Middlesex, England).

18,041

This paper surveys some aspects of road-accident statistics and draws attention to some of the matters into which investigation is required. Accident rates in different countries are compared and the trend of accident rates in Great Britain are considered along with the economic cost of road accidents. Some of the available evidence of the success of various accident prevention methods are then discussed.

Glarville, W.H. SPEED ON THE ROAD AND RELATED EFFECTS. *Trans. Roy. Inst.*, 1956, 26(163), 1-17. (Road Research Lab., Department of Scientific & Industrial Research, Harmondsworth, Middlesex, England).

18,042
This paper deals with problems of safety as related to driving speeds. In general, consideration is given to what happens up to speeds of 100 mph. The human operator as a road user and driver, how he reacts to speed, and how accurately he judges speed are considered first. The efficiency of brakes, distances required to stop and how it varies with speed are considered. These considerations are then linked to the question of the car/road combination. The energy stored up in the moving car, the forces required to stop the car, and protective devices for crash injury are discussed.

Charlesworth, G. & Coburn, T.M. THE INFLUENCE OF ROAD LAYOUT ON SPEEDS AND ACCIDENTS IN RURAL AREAS. Presented at Public Works and Municipal Services Congress, Harmondsworth, Middlesex, England, Nov. 1956, 21pp. Road Research Lab., Dept. of Scientific & Industrial Research, Harmondsworth, Middlesex, England.

18,043
This paper presents information on the effect of certain items of road layout on speed and accidents on rural roads. The estimates of the effect of road curvature, gradients, carriageway width, and amount of traffic on mean speeds are presented for use in assessment of the value of road improvements. Formulae relating the speed exceeded by the fastest 15 percent of cars and the fastest five percent of cars to mean speed are derived for use in selecting the speed value to be used for design purposes. A comparison of accident rates per vehicle mile on different roads is made to show benefits obtained from various types of road improvement.

Braunstein, M. & Anderson, N.S. A COMPARISON OF READING DIGITS ALOUD AND KEYPUNCHING. Rep. RC 185, Nov. 1959, 13pp. *IBM Research Center*, Yorktown Heights, N.Y. (University of Michigan, Ann Arbor, Mich. & University of Maryland, College Park, Md.).

18,058
To compare talking to keypunching for relatively untrained operators, five experimental Ss with no prior training in keypunching were studied. After a few practice sessions on the keypunch, the Ss were required to read digits for five minutes into a tape recorder and then to key digits for five minutes on a summary punch. Three series were performed. A preference survey was made by asking the S to either read or keypunch three sheets of 25 digit numbers as they preferred. Errors, reading, and punch rates (calculated from errors and time) were analyzed for relative speed and accuracy of the two methods.

Bellman, R. & Kalaba, R. ON COMMUNICATION PROCESSES INVOLVING LEARNING AND RANDOM DURATION. Reprinted from "1956 IRE National Convention Record, Part 4," 1956, 16-21. *The Institute of Radio Engineers, Inc.*, New York, N.Y. (The Rand Corporation, Santa Monica, Calif.).

18,063
A brief resume is given of previous papers showing that certain aspects of the fundamental problem of determining the utility of a communication channel in conveying information may be viewed as problems within the framework of multi-stage decision processes of the stochastic type, and as such may be treated by the theory of dynamic programming. In this paper, the treatment of communication problems involving the use of a channel whose statistical properties are not completely known is shown. Also those channels involving processes of random duration are discussed. Both are special cases of still more general problems in prediction.

Beckman, E.L., McNutt, D.C. & Rawlins, J.S.P. ESCAPE FROM DITCHED AIRCRAFT. III. AN INVESTIGATION INTO THE FEASIBILITY OF USING THE STANDARD MARTIN-BAKER EJECTION SEAT SYSTEMS FOR UNDER WATER ESCAPE FROM DITCHED AIRCRAFT. FPRC 1093, July 1959, 21pp. *Flying Personnel Research Committee*, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

18,065
The feasibility of using the ejection test as a method of escape from ditched aircraft at sea was investigated. The physical forces which would act upon the pilot when using the ejection seat in water were measured in a test tank. Subsequent to the above measurements an evaluation of the human tolerance to these forces was undertaken in a lake approximately 30 ft. deep. Finally, the hazards involved in ejecting through the canopy underwater were evaluated. Functioning of the auxiliary systems of the ejection seat were also undertaken. Recommendations were made for modifying the present ejection seat systems to improve their performance under water.

Hartline, H.K. RECEPTOR MECHANISMS AND THE INTEGRATION OF SENSORY INFORMATION IN THE EYE. *Rev. mod. Physics*, April 1959, 31(2), 515-523. (The Rockefeller Institute, New York, N.Y.).

18,076
This paper deals with an analysis of the first steps of the visual process. The inherent properties of the receptor are discussed in terms of the type of processing of information from the outside world. The next step in the processing of sensory information concerns the distribution of light over the entire population of visual receptors where neural integration begins. Inhibitory interaction is described and its function ascribed to enhancement of contrast effects. Thus, patterns of afferent nervous activity are greatly modified to accentuate significant features of information about the environment.
G. I. R 29

Hartline, H.K. THE MODIFICATION OF SENSORY INFORMATION BY NEURAL INTERACTION IN THE EYE, AND ITS RELATION TO VISION. IRE Trans., June 1959, RE-6, 84-85. (The Rockefeller Institute, New York, N.Y.).

18,077
The spatial and temporal modifications of sensory information produced by "integrative" neural processes in the retina of the eye are discussed briefly. The modifications produced by neural integration in the eye appear to be distortions, but are more properly to be considered the accentuation of significant features of the stimulus pattern to which the organism must respond appropriately if it is to survive and flourish.

18,084
Greek, D.C. CHECKLIST OF HUMAN ENGINEERING DESIGN PRINCIPLES. Rep. MD 58 334, Jan. 1959, 86pp. Missile Div., North American Aviation, Inc., Columbus, Ohio.

18,084
This checklist presents, in a single, easily referenced document, design principles compatible with human engineering ideals and appropriate to missile systems. The data are, however, applicable to any man-machine system design with information for both the design engineer (recommendations on hardware) and the human engineer (a guide and memory aid to use in evaluating compliance with basic human engineering principles). There are seven major sections: visual displays, controls, aural equipment, panel layout, workspace characteristics, maintainability, and safety. A subject index is included.

Raifsnider, M.H. RADAR AIR TRAFFIC CONTROL DEMONSTRATION FOR AIR TRAINING COMMAND. WADC TN 55 605, Oct. 1955, 10pp. USAF Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.

18,092
A demonstration of the previously developed Radar Controlled Formation Break-Up and Descent Procedure was attempted on 22 July 1955, using F-86D and B-47 aircraft of the Air Training Command. Eight planes of each type participated in the demonstration. Initial radio contact with the two flights was made over Indianapolis, Indiana, and the aircraft were monitored by Flight Test Radar while enroute to Madison, West Virginia. The attempt was made to land the high performance aircraft at the rate of one every 30 sec. Actual landing rates were reported and discussed in terms of ways to improve performance.

Northrop Aircraft, Inc. A METHOD FOR PREDICTING WEAPON AND SUPPORT SYSTEM MAINTAINABILITY. Rep. NAI 57 848, Sept. 1957, 93pp. Operational Plans Development Section & Weapon Systems Analysis Department, Northrop Aircraft, Inc., Hawthorne, Calif.

18,099
This is a progress report of a study of means to develop more maintainable aircraft. An analytical method of determining a suitable "yardstick" in the form of a maintainability index is described. To illustrate its usefulness, it has been applied to the communication and navigation, control surfaces, and landing gear systems of the T-38 aircraft. The collection of data and problems involved are discussed. A methodology is developed for determining aircraft availability considering various operational factors (estimated annual hours to be flown, size of maintenance crew, etc.) with curves presented relating maintainability index to these factors. Problems of indirect maintenance are also discussed.

Dentzig, G.H., DeHaven, J.C., Cooper, I., Johnson, S.M., et al. A MATHEMATICAL MODEL OF THE HUMAN EXTERNAL RESPIRATORY SYSTEM. Contract AF 49(638) 700, Proj. RAMP, Res. Memo. 2519, Sept. 1959, 100pp. The Rand Corporation, Santa Monica, Calif.

18,106
The thesis that a part of the human physiological system can be simulated by a suitably constructed mathematical model was examined. As a test case, the external respiratory function was chosen. Based on the known physiological and chemical aspects of this system, a mathematical model was constructed. The model used derives from a class of mathematical programming methods that were originally developed for representing complex military and industrial activities. The value of some 30 different molecular species as determined by the model were compared with observed values.

Dunning, G.M. BIOLOGICAL EFFECTS OF A NUCLEAR ATTACK. Rep. TID 5563, Sept. 1959, 28pp. US Radiation Effects of Weapons Branch, Division of Biology and Medicine, Atomic Energy Commission, Washington, D.C.

18,109
The biological effects of an assumed nuclear attack of 1453 megatons (total yield) on the United States, 2500 megatons on the Northern Hemisphere outside the continental United States (one-half being fission and one-half fusion and all surface bursts) are considered in this paper. Principal factors discussed are 1) shorter-term hazard (excluding immediate blast, thermal and radiation effects) of external gamma radiations and internal radiation by ingestion of contaminated food and water; and 2) long-term hazards such as leukemia and bone tumor, life shortening, and genetic effects.
R 23

Dunham, C.L. RADIOACTIVE FALLOUT--A TWO-YEAR SUMMARY REPORT. Rep. TID 5550, May 1959, 110pp. US Technical Information Service, Atomic Energy Commission, Washington, D.C.

18,110
This summary report on radioactive fallout presents information gathered through a two-year period, 1957-1959, as a continuation of the congressional hearings of 1957. It covers such topics as 1) public information program; 2) present state of knowledge on biological effects; 3) Atomic Energy Commission's research program on fallout; and 4) a report on progress made on "unresolved questions" from the 1957 hearings on "clean" nuclear weapons, distribution of fallout, "safe" levels of radiation, and the like. Standards for radiation protection are also discussed. There are seven special papers appended which spell out some of these topics in detail.

Connally, M.E. COMPUTERS FOR AIRCRAFT SIMULATION. Contracts NSOR 07895 & N61339 45, Rep. 7591 R 2, Dec. 1959, 112pp. Electronic Systems Lab., Massachusetts Institute of Technology, Cambridge, Mass.

This report is the concluding work on a one-year study of the equations of motion and the computing techniques used in the aerodynamics computer section of Operational Flight Trainers. A review of the characteristics of basic 60 cps, 400 cps, and DC analog computing techniques is presented with emphasis on the relative applicability of these techniques to the unique requirements of the OFT problem. It is concluded that 400 cps techniques would give more than acceptable performance and would offer substantial advantages with respect to cost, size, maintenance and power consumed. In conclusion, several suggestions are made concerning OFT acceptance procedures, the matching of the OFT to the actual aircraft, and standardization.

Ludvig, E. & Miller, J.W. THE EFFECTS ON DYNAMIC VISUAL ACUITY OF PRACTICE AT ONE ANGULAR VELOCITY ON THE SUBSEQUENT PERFORMANCE AT A SECOND ANGULAR VELOCITY. Contract NMR-586(00), Proj. NR 142 023, Proj. NM 001 110 501.09, Rep. 9, June 1955, 10pp. USN School of Aviation Medicine, Pensacola Air Station, Fla.

18,132

It has been previously shown that visual acuity deteriorates as the angular velocity of the test object, relative to the observer's eye, is increased; also substantial improvement has been shown, with practice, at high angular velocities and a lesser amount at low angular velocities. This study was designed to demonstrate whether or not there is transfer of training from low to high (20 degrees/sec. to 110 degrees/sec.) angular velocities of test object and also of the converse situation. The Ss were 200 naval aviation cadets; 20 successive dynamic acuity thresholds were determined for each angular velocity with half the Ss tested first on the low and half on the high velocity condition.

Lockhead, G.R. & Klemmer, E.T. AN EVALUATION OF AN 8-KEY WORD-WRITING TYPEWRITER. Rep. RC 180, Nov. 1959, 26pp. IBM Research Center, Yorktown Heights, N.Y.

18,134

A typewriter was described which utilizes only eight keys and which types entire words with the simultaneous depression of key combinations. Letters of the alphabet and numbers can also be typed in this way. The time required to learn 160 multiple-finger patterns (words) and the speed and accuracy with which they could be typed were investigated. Three Ss performed a sequence of different tasks: initial learning of the words to criterion of three perfect repetitions; speed trials, learning the letter and number code, re-learning the 100 words, and typing textual material. Time required to learn the patterns, error rates, and speed rates were analyzed with some discussion concerning types of error patterns involved in multiple key-press responses.

Lindquist, S.E., Neff, W.D. & Schuknecht, H.F. STIMULATION DEAFNESS: A STUDY OF HEARING LOSSES RESULTING FROM EXPOSURE TO NOISE OR TO BLAST IMPULSES. J. comp. physiol. Psychol., Oct. 1954, 47(5), 406-411. (Laboratories of Physiological Psychology and Otolaryngology, University of Chicago, Chicago, Ill.).

18,137

To investigate temporary hearing losses produced by exposure to noise and permanent losses produced by blast impulses, behavioral tests of hearing were made and intracochlear damage was assessed post-mortem. The Ss were adult cats, one ear of each being surgically destroyed in order to confine testing to one ear. Audiograms at frequencies from 62.5 to 10,000 cps were obtained by a conditioning method. One group of animals was then exposed to intense noise for 15, 30, and 60 minutes, in varying order. The other group was exposed to blasts of noise produced by the firing of a .32 caliber pistol. Hearing tests were then made at intervals until either complete recovery or a deficit level remained over a period of several weeks. The animals were then killed; the cochleas were examined for inner ear damage. G. I. R 13

Lehninger, H.V., Laug, E.P., McConnell, H.J., Chapman, R.D., et al. EFFECT OF FALLOUT CONTAMINATION ON PROCESSED FOODS, CONTAINERS, AND PACKAGING. OPERATION PLUMBBOB. Proj. 38.1 I, Rep. WT 1496, May 1959, 19pp. US Civil Effects Test Group, Food & Drug Administration, Department of Health, Education, and Welfare, Washington, D.C.

18,138

The effect of a comparatively low level of fallout on the protective qualities of 18 packaging materials was examined. The materials were mounted in six-inch squares on plywood board and placed, along with samples of whole-sale or bulk containers holding processed foods, at two-mile intervals along an arc, approximately 25 miles from Ground Zero. Three exposure boards were used at each station: one held clean materials, one slightly soiled with dirt, and one streaked with oil. Samples which received the largest amount of fallout were examined. Readings of radioactivity were made in the field and also in the laboratory. Various decontamination procedures were then tested for efficiency.

Konecki, E.B. PHYSIOLOGICAL FACTORS IN SPACE FLIGHT. Engineering Paper 739, March 1959, 17pp. Missiles and Space Systems Engineering, Douglas Aircraft Company, Inc., Santa Monica, Calif.

18,143

This presentation delves into some of the more fundamental physiological factors involved in life in a closed ecological system for missions lasting months and possibly years. In particular, the possible reduction of vital payload through lowering metabolism is discussed. Following a discussion of vital human needs, a comparison is made between those of the male and the female and the suggestion is made that "women in space" is preferable to man. Other means of reducing metabolism discussed are through lowering temperature and the practice of yoga. Research in all these methods is recommended.

Jarger, J., Shedd, Joyce L. & Harford, E. ON THE DETECTION OF EXTREMELY SMALL CHANGES IN SOUND INTENSITY. A.M.A. Arch. Otolaryng., Feb. 1959, 69, 200-211.

18,151

A unique method for the clinical assessment of differential intensity discrimination is described. Short (200 msec.) one-db intensity increments are superimposed, at five-second intervals, on a pure tone of constant amplitude at a sensation level of 20 db. The patient responds to the momentary changes in loudness. Findings on selected individual cases are reported to show how the test scores vary with different kinds of hearing loss. Results obtained on 75 patients with various types of hearing loss are reviewed.

Humphreys, C.M., Imalis, O. & Gutberlet, C. PHYSIOLOGICAL RESPONSE OF SUBJECTS EXPOSED TO HIGH EFFECTIVE TEMPERATURE AND ELEVATED MEAN RADIANT TEMPERATURES. Abstract of article in: Am. Soc. Heat. & Vent. Eng. Trans., 1946, 52(1290), 153-166.

18,153

To determine the physiological effect of a four-hour exposure to "effective temperatures" ranging from 80 to 95 degrees, "relative humidity" ranging from 30 to 70 per cent, and "mean radiant temperatures" elevated to 40 degrees above air temperature, 36 Ss were studied under simulated ship's boiler room conditions. The Ss wore Navy clothing and rotated in light activities. The data collected were body temperatures (rectal and oral), pulse rate, weight before and after test, weight of consumed water and expelled urine, blood pressure, dry and wet bulb temperatures, globe thermometer reading, and air velocity. The resulting relationships were shown graphically.

Tamler, E., Merg, E., Jampolsky, A. & Nawratzki, I. ELECTROMYOGRAPHY OF HUMAN SACCADIC EYE MOVEMENTS. A.M.A. Arch. Ophthalmol., Oct. 1939, 62, 657-661.

18,168

The results of an electromyographic study of saccadic eye movements (rapid versions) performed during a previously reported study of coactivity of human extraocular muscles are reported here. Photographic records of the saccade are analyzed for activity of the agonist, inhibition of the antagonist, coactivity of the extraocular muscles, and durations of different degrees of excursion. The evidence is examined with reference to the question as to whether the saccadic eye movements are or are not ballistic.

18,169

A study of coactivity of extraocular muscles (simultaneous increased contraction of muscles which are normally antagonistic in their primary field of action) during following movements of the eye between tertiary positions was attempted using multiple channel electromyography. Movements between tertiary positions were defined as horizontal movements in upper and lower fields of gaze and vertical movements in right and left fields. The target was a small light. While no coactivity was found in tertiary plane movements, the type of muscle activity that was found was discussed in this paper.

Schwab, R.S. THE STUDY OF FATIGUE IN NORMALS AND PATIENTS WITH NEUROLOGICAL AND PSYCHIATRIC DISORDERS. FINAL REPORT. 1947-1957. Contract NSORI 76/VIII, Rep. NR 113.14, Oct. 1958, 21pp. *Harvard University*, Cambridge, Mass.

18,176

This is a final report of a long term study of fatigue in normal Ss and in those with psychiatric difficulties and neurologic disorders. Subjective feelings of tiredness and objective deficit or impairment are considered separately throughout the report. Situations where fatigue of both types are encountered in both military and civilian settings are listed and the source of subjects is defined. Studies conducted with various equipments and tests are discussed: step-test and hanging-bar test; and electronic ergography. A summary of results from each of the above is given. Finally, the problems of differential diagnosis and the methods found most successful are treated.

Scharf, B. & Stevens, J.C. THE FORM OF THE LOUDNESS FUNCTION NEAR THRESHOLD. Rep. PMR 232, ca. 1959, 4pp. *Psychological Labs., Harvard University*, Cambridge, Mass.

18,182

The form of the loudness function near threshold was investigated by two methods: ratio production and magnitude estimation. In the former, the S adjusted a 1000-cycle tone to sound either half as loud or twice as loud as a "standard" 1000-cycle tone. The level of the standard was set at five different values between 10 and 50 db. Sixteen Ss were tested. In the latter method, the S assigned numbers proportional to the apparent loudness of a 1000-cycle tone presented at six different levels. A standard stimulus (at about 10 db) was identified as "10" at the beginning of one series; in another, the standard (of about 20 db) was called "20." The results were presented graphically.

Ratliff, F., Miller, W.H. & Hartline, H.K. NEURAL INTERACTION IN THE EYE AND THE INTEGRATION OF RECEPTOR ACTIVITY. *Ann. N.Y. Acad. Sci.*, Nov. 1958, 74(Art. 2), 210-222. (The Rockefeller Institute for Medical Research, New York, N.Y.).

18,196

The complexity of the nervous center in the retina and the interplay of excitatory and inhibitory influences yielding patterns of optic nerve activity are discussed. This paper examines two important processes in this integrative action: 1) the enhancement of differences in neural activity from differently illuminated regions of the retina, and 2) the enhancement of neural responses to temporal changes in intensity. Both processes are studied in an invertebrate eye and in the more complex retinas of vertebrates and related to the detection and signalling of information about contrast.

Rath, G.J., Ruenick, A. & Savage, Terry R. THE FORMATION OF ABSTRACTS BY THE SELECTION OF SENTENCES. Rep. NC 164, June 1959, 15pp. IBM Research Center, Yorktown Heights, N.Y.

18,197
Two studies on the formation of abstracts by selection and rating of key sentences in an article were reported. The first compared sentence selection by men and machines. Six Ss picked the 20 most representative sentences from each of ten scientific articles and rated them in order of importance. The same articles were analyzed according to five auto-abstracting programs on the IBM 704 and the score for each sentence prepared. Intersubject differences, intermachine program differences, and the man-machine differences with respect to sentence selection were compared. The second study investigated the reliability of humans in preparing abstracts by the above method by asking five Ss to prepare abstracts on the same material at two different times and comparing the results. Blackwell, H.R. THE EFFECTS OF CERTAIN PSYCHOLOGICAL VARIABLES UPON TARGET DETECTABILITY. FINAL REPORT. Contract NOBS 72038, ERI Rep. 2455 12 F, June 1958, 28pp. Institute for Research in Vision, Ohio State University, Columbus, Ohio.

18,541
Four studies were made of the effects of psychological variables upon visual detection thresholds for simple circular targets. The variables (knowledge of time of occurrence; of target size, duration, location, and frequency; and observer criterion) represented differences that exist between laboratory and field conditions. The effect of these differences in each case was expressed in terms of the contrast factor, that is, the factor by which target contrast must be multiplied in order to compensate for the presence of the difference. Cautions were given concerning practical use to be made of the factors as given here.

Blackwell, H.R. A GENERALIZED METHOD FOR SPECIFICATION OF INTERIOR ILLUMINATION LEVELS ON THE BASIS OF PERFORMANCE DATA. SUMMARY DESCRIPTION. *Illum. Engng.*, June 1958, 1(11), 588-589. (Dept. of Psychology & Ophthalmology & Vision Research Lab., University of Michigan, Ann Arbor, Mich.).

18,543

A summary description of a generalized method for specifying the interior illumination requirements of practical visual tasks on the basis of visual performance criteria is presented. These are basically two components of the method: visual performance graphs for standard circular targets, and a device for equating various practical visual tasks to standard circular targets. Specification curves and sample illumination levels for practical visual tasks are given.

Blackwell, H.R. & Kriegerstein, A.B. THE EFFECTS OF SIZE AND SHAPE OF VISUAL DETECTION FOR CONTINUOUS POINT TARGETS AT VARIOUS BACKGROUND LUMINANCE. FINAL REPORT. Contract NBS 72038, ERI Proj. 2455, Rep. 2455 11 F, June 1958, 18pp. Institute for Research in Vision, Ohio State University, Columbus, Ohio.

18,548

A summary of experimental studies on the effects of target size and shape upon detection by the human eye are presented. The temporal forced-choice variant of the method of constant stimuli was used. The target was presented foveally with an exposure duration of 0.25 sec. at 5.52 ft.-l. background luminance. Targets were of uniform luminance differing in size from 1 to 4.00 square min. and in shape over a wide range of target types: rectangles, multiple-angled figures, and single geometrical figures. The data were analyzed as a function of size and an effort was made to derive empirical methods for analyzing the form factor. General theoretical formulations were made in terms of the classical contribution theory of detection.

Blackwell, H.R. & Lee, G.T., Jr. A STUDY OF VISUAL PERFORMANCES OF THE HUMAN EYE BY WHITE LIGHT. FINAL REPORT. Contract NBS 72038, ERI Proj. 2455 9 F, June 1958, 18pp. Institute for Research in Vision, Ohio State University, Columbus, Ohio.

18,550

To examine the meaningfulness of the classical distinction between the absolute and the difference thresholds for luminance changes and to study the possibility that the human eye can be "photoretrained" with white light, the value of the threshold luminance increment was measured for each of a number of background luminance levels and for a totally dark background. Target and background were white light targets subtended one and 45 min. of arc, and exposure duration was 0.01 sec. Threshold luminance increments were analyzed as a function of background luminance and expressed in terms of the two objectives as stated above.

Blackwell, H.R. & McGready, D.M., Jr. FOCAL CONTRAST THRESHOLDS FOR VARIOUS DURATIONS OF SINGLE PULSES. FINAL REPORT. Contract NBS 72038, ERI Proj. 2455, Rep. 2455 13 F, June 1958, 31pp. Institute for Research in Vision, Ohio State University, Columbus, Ohio.

18,552

Visual detection thresholds were determined for circular targets as a function of the level of background luminance, target size, and target exposure duration. The temporal forced-choice variant of the method of constant stimuli was used, the data being analyzed by a variant of the probit analysis. Two highly experienced observers made 81,000 observations in 162 sessions. Background luminance varied from zero to 100 ft.-l., target diameter from 0.002 to 51.2 min. of arc, and exposure duration from 0.001 to one sec. Tabular and graphical data from smoothed curves of the functional relations between all principal variables were obtained.

Blackwell, H.R. & Moldauer, Ann B. DETECTION THRESHOLDS FOR POINT SOURCES IN THE NEAR PERIPHERY. FINAL REPORT. Contract NBS 72038, ERI Proj. 2455, Rep. 2455 14 F, June 1958, 18pp. Institute for Research in Vision, Ohio State University, Columbus, Ohio.

18,554

The effect of the extent to which a target falls eccentric to the fixational center upon the threshold contrast was studied. Visual detection thresholds for the foveal center and for 32 locations in the peripheral retina within a radius of 12 degrees from fovea were obtained on two observers. Nine levels of background luminance (zero to 75 ft.-l.) were used with a circular target (one min. of arc), exposure duration of 0.01 sec., and the temporal forced-choice variant of the method of constant stimuli. The data were analyzed separately for each of eight meridians.

Ward, C.J., P.E. & Taylor, J.E. VARIATIONS IN SPATIAL SENSITIVITY WITHIN THE HUMAN FIELDS. FINAL REPORT. Contract NRC 7238, HRL Proj. 2425, Rep. 2425 10 F, June 1954, 8pp. Institute for Research in Vision, Ohio State University, Columbus, Ohio.

18,552

Spatial sensitivity curves were measured at each of three foveal locations in each of three human eyes, utilizing a circular target subtending one min. of arc. Target exposure duration was 0.1 sec.; an artificial pupil of 4.34 mm diameter was used; the method was the temporal frequency method of variation of contrast. The data were analyzed for effect of location and of individual eyes. An interpretation of the findings was obtained.

Flacher, F.E. ASSUMED SIMILARITY MEASURES AS MEASURES OF TEAM EFFECTIVENESS IN SURVEYING. Contract NRC 07135, Tech. Rep. 6, Feb. 1953, 2pp. Bureau of Research and Service, College of Education, University of Illinois, Urbana, Ill.

18,552

This is one of a series of studies on group effectiveness; it attempts to determine in one way how much importance the interpersonal relations within a group have in determining total team effectiveness. Student surveying parties, comprising three to four men each, were assigned 71% to participate. Accuracy of work as noted by the instructor was used as the criterion. Interpersonal perception was measured by means of "Assumed Similarity" scores derived from responses to a personality questionnaire. Three scores were used here: assumed similarity of self to most preferred co-worker, to the non-preferred co-worker, and between the preferred and rejected co-workers. Various hypotheses were tested by relating the scores to the criterion.

Cook, J.J., Hartmann, W. & Ehart, Mary G. INVESTIGATION OF THE CHARACTER AND PROPERTIES OF ASSUMED SIMILARITY MEASURES. Contract NRC 07135, Tech. Rep. 7, Feb. 1953, 1pp. Bureau of Research and Service, College of Education, University of Illinois, Urbana, Ill.

18,553

This is one of a series of studies on group effectiveness. A technical analysis of the instrument (personality questionnaire) from which "Assumed Similarity" scores were derived in earlier studies (see 18,552) is summarized. In addition to the reliability report, the extent to which assumed similarity is a general attitude and to what extent it depends instead on the content of test items, and the extent to which assumed similarity is measured in four ways reflects the same general quality are studied by statistical procedures.

Fiedler, F.E., Hartmann, W. & Ehart, Mary G. CORRECTION AND EXTENSION OF THE RELATIONSHIP OF INTERPERSONAL PERCEPTION TO EFFECTIVENESS IN BASKETBALL TEAMS. Contract NRC 07135, Suppl. to Tech. Rep. 3, Feb. 1953, 7pp. Bureau of Research and Service, College of Education, University of Illinois, Urbana, Ill.

18,554

This was one of a series of studies on group effectiveness. Additional data were presented here on an earlier study on interpersonal perception relations to effectiveness of basketball teams. In the early study, interpersonal perception was measured by means of "Assumed Similarity" scores designed to indicate how similar one person considers himself to be to others, or how similar he considers two other persons to be. High school teams (14) were measured at the beginning of the season and 12 at the end of a season with a criterion measure of proportion of games won by a certain date. Additional analyses of the reliability of the criterion were presented.

Brace, R.E. HUMAN STUDIES FROM THE PSYCHOLOGICAL LABORATORY OF CLARK UNIVERSITY. XXVII. COMPLETE SPATIAL SENSITIVITY IN THE PERIPHERAL REGION OF THE HUMAN EYE. Ann. N.Y. Acad. Sci., April 1947, 23, 254-257. (Columbia Research Lab., Washington, D.C.).

18,555

To determine the limits within which spatial sensitivity curves in the peripheral retina of the human eye, monocular sensitivity thresholds were measured for test flashes appearing on the side and in the temporal portion of the peripheral retina (30 degrees from the fovea) by a method of modified limits. Twelve circular areas (from 0.460 to 0.920 min. of visual angle in diameter) were used with intensity of the flash varied in constant logarithmic steps. Data from three Ss were analyzed by plotting logarithm of threshold intensity against logarithm of the radius of stimulus area and noting departure from perfect summation.

Bryan, G.L., Rigney, J.W., Swenson, D.M. & Axelrod, W. ANALYSIS OF OFFICER ELEMENTS IN COMBAT INFORMATION CENTER DUTIES. Contract NRC 228(02), Proj. NR 153 093, Tech. Rep. 14, Oct. 1954, 9pp. Electronics Personnel Research, University of Southern California, Los Angeles, Calif.

18,558

This report is one of a series to be concerned with the development of standards for the qualification of officers in Combat Information Center duties. The nature of the problem is discussed in the first portion; the remainder is devoted to an explanation and description of three job analysis methods that were developed. These methods are based on complementary viewpoints for describing a job and are designed to yield complementary results. Specific forms and instructions are appended.

18,559

Bryan, G.L. (Principal Investigator). AN EVALUATION OF A METHOD FOR SHIPBOARD TRAINING IN OPERATIONS KNOWLEDGE. Contract NRC 228(02), Proj. NR 153 093, Tech. Rep. 18, Sept. 1956, 36pp. Electronics Personnel Research, University of Southern California, Los Angeles, Calif.

18,559

Conflicting requirements and restrictions of the shipboard environment which limit the effectiveness of training programs were discussed. A study undertaken to evaluate a possible training method that would supplement current procedures was described. The standard multiple-choice item was modified by developing short verbal explanations to accompany each alternative which were then concealed by paper tabs that could be easily removed. A series of test items was administered to three groups as follows: 1) only one response was allowed, 2) responses continued until the keyed (correct) answer was located, and 3) same as the second group except that the explanations were added opposite each alternative. Suggestions for use of a trainer based on the findings were presented. T. I.

18,560

Bryan, G.L., Rigney, J.W. & Van Horn, C. AN EVALUATION OF THREE TYPES OF INFORMATION FOR SUPPLEMENTING KNOWLEDGE OF RESULTS IN A TRAINING TECHNIQUE. Contract NRC 228(02), Proj. NR 153 093, Tech. Rep. 19, April 1957, 23pp. Electronics Personnel Research, University of Southern California, Los Angeles, Calif.

18,560

To determine the relative effectiveness of three different kinds of explanations when employed in a multiple-choice trainer format (see 18,559), a selection of items from among those used in the previous study was made. For each item three kinds of explanations were written: 1) correct definition or description of chosen alternative, 2) principal reason why alternative was correct or incorrect, and 3) probable operational consequences of the course of action represented by the alternative. The tests were administered to three groups of Ss, one group responding to only one type of explanation. A criterion test was given one week later. Differences between the two tests were analyzed.

Cooper, F.S., Liberman, A.N., Harris, Katherine S., & Grubb, Patti M. SOME INPUT-OUTPUT RELATIONS OBSERVED IN EXPERIMENTS ON THE PERCEPTION OF SPEECH. Presented at Second International Congress on Cybernetics, Moscow, Sept. 3-10, 1956, 12pp. Association Internationale de Cybernetique, Moscow, Belgium. (Haskins Laboratory, New York, N.Y.)

18,569

Some ten years of work on the perception of speech sounds are reviewed in terms of such perceptual relationships as the inter-sensory transfer between the auditory patterns of words and their spectrographic pictures, and the very close relationship that seems to exist between the perception of speech sounds and the articulatory gestures involved in their production. It is felt that these considerations provide the rationale for a further experimental approach to the problem of characterizing the phonemes of language in measurable terms.

Farley, M.E. (Chm.). THE SAFETY THE MOTORIST GETS. Rep. SP 163, June 1959, 37pp. Society of Automotive Engineers, Inc., New York, N.Y.

18,580

Four papers dealing with the question of what automotive engineers are doing to assure safety in the modern American automobile are included in this report. The specific aspects of the automobile that are treated are: 1) the chassis, 2) the body, 3) electrical-accessory, and 4) over-all car appraisal. Various phases of product development to meet the changing requirements of traffic conditions and the human factor in the vehicle-driver complex are discussed. Quality control methods that are used to assure that the safety designed in is actually built into the car are discussed thoroughly.

18,613

Brown, R.H. SPATIAL EFFECTS IN HUMAN VISUAL RESOLUTION. *J. Gen. Psychol.*, 1946, 35, 77-86. (USN Research Lab., Washington, D.C.)

18,613

To determine how spatial effects operate in the visual resolution of a simple test object, foveal intensity thresholds were measured with white light for the resolution of a narrow bar on a dark background. The length of the bar subtended 7.92, 17.2, 28.0, or 51.0 min. of visual angle at the eye; each bar length was also varied in width from 0.129 to 5.06 min. of visual angle. Threshold data were analyzed as functions of visual angle subtended by the bar. The results were interpreted quantitatively by considering stimulus length a parameter in an equation for intensity discrimination.

Pritchard, B.S. & Blackwell, H.R. PRELIMINARY STUDIES OF VISIBILITY ON THE HIGHWAY IN FOG. FINAL REPORT. Grant-47B, Proj. 2557, Rep. 2557 2 F, July 1957, 44pp. Engineering Research Institute, University of Michigan, Ann Arbor, Mich.

18,619

A program of studies was reported which was intended to lay the foundation for an understanding of the problem of improving visibility on the highway in fog. The major effort was devoted to measurements of the precise optical properties of natural (and artificial) fogs, including transmittance and the polar distribution of light. Two new measurement devices were described and data gathered by means of these devices were presented. Two general methods for improving the design of street lights for use in fog were described and evaluated on a scale-model simulator. The usefulness of the simulator was discussed.

Lewis, D. DEVICES FOR STUDYING INTERFERENCE IN PSYCHOMOTOR PERFORMANCE: III. THE DOUBLE-DISK PURSUIT APPARATUS. Contract NSORI 57, SOC Proj. 20 M 1, SOC TR 57 2 13, ca. 1950, 18pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

18,674

The aim was to induce a decrement in rotary pursuit performance following interpolated practice. Three increasingly complex pursuit devices Koerth-type rotor and two models of the Double-Disk Pursuit Apparatus (the second provided a variable pursuit pattern) were employed to this end. In general the interpolated tasks required performance in reverse of the original. Time-on-target was the measure of performance. Means for all Ss on each trial in the three blocks of trials (original, interpolated, and relearning) were presented for each device.

Travis, R.C. MEASUREMENT OF ACCOMMODATION AND CONVERGENCE TIME AS PART OF A COMPLEX VISUAL ADJUSTMENT. Contract W33 038 AC 14559, Rep. 2, May 1947, 20pp. Tufts University, Medford, Mass.

18,676

Accommodation and convergence time of 50 college students were measured in five experimental situations (two trials of ten fixations for each): left eye, right eye, both eyes, near stimuli only, and far stimuli only. S focused the stimulus, reported the number beside the break in the circle, operated the lever to expose the next stimulus--all as quickly as possible. The data were obtained from the successive refixations of near and far, all near, or all far stimuli. Means, standard deviations, ranges, and reliability coefficients were computed. Two additional studies were carried out: 1) on the effects of practice; and 2) on the separate roles of acuity, perceptual speed, and motor speed in the above experimental task.

Kappauf, W.E., Smith, W.M. & Bray, C.W. A METHODOLOGICAL STUDY OF DIAL READING. APPENDIX I. Contract W 33 038 AC 14480, Rep. 3, Aug. 1947, 42pp. Dept. of Psychology, Princeton University, Princeton, N.J. (University of Illinois, Urbana, Ill.).

18,677

A procedure for testing dial reading accuracy was developed. It consisted of simultaneous presentation of 12 dials and scoring of the dial reading performance in terms of errors and average time. Six Ss were used to test the procedure in a preliminary study of dial size, design, reading attitude, S differences, and practice effects. Sizes were 2.8, 1.4, and 0.7 in. diameter; graduation was by tens, fives, and units; all scales were 0 to 100. Analysis of the time and error data was aimed at improvements in procedure.

Lewis, D.; Smith, P.N. & McAllister, Dorothy E. RETRO-ACTIVE FACILITATION AND INTERFERENCE IN PERFORMANCE ON THE MODIFIED TWO-HAND COORDINATOR. Contract N00R 166(00), Proj. NR 783 002, SDC Proj. 20 M LE, SDC TR 166.00 2, Dec. 1951, 19pp. USN Special Devices Center, Port Washington, N.Y. (State University of Iowa, Iowa City, Iowa).

18,680

This study was concerned with the retroactive effects of different levels of interpolated learning in the performance on the Modified Two-Hand Coordinator. Six groups of ten Ss (female) were trained in the standard coordinator task to a given performance level; five then received practice on the reversed task until each had attained a different proficiency level; the sixth served as controls. Relearning was the same for all groups. Three measures of performance were obtained: time on target (sec.), number of errors, and persistence of errors (sec.). These were examined by simple analyses of variance. T. G. I. R 6

Hamilton, C.E. & Blackwell, H.R. THE EFFECT OF AN HORIZON-LINE LUMINANCE GRADIENT UPON TARGET DETECTABILITY IN ITS VICINITY. FINAL REPORT. Contract N00S 72038, Rep. 2455 8 F, April 1957, 41pp. Vision Research Labs., Engineering Research Institute, University of Michigan, Ann Arbor, Mich. (Institute for Research in Vision, Ohio State University, Columbus, Ohio).

18,681

This report summarized three series of experiments concerned with the effects of an horizon-line luminance gradient upon the detectability of targets in its vicinity. Targets were viewed foveally against nonuniform background fields of photopic luminances, peripherally against nonuniform fields of scotopic luminances, and against uniform fields which ranged from photopic to scotopic. Trained Ss of 20/20 acuity observed. Viewing was binocular and unrestricted. Targets were one-sec. duration. The temporal forced-choice procedure was used. A "considerable range" of target sizes and shapes and background luminances were tested. The discussion included a detailed analysis based on the veiling luminance concept. T. G. I. R 3

Flory, L.D. COMMUNICATION BETWEEN THE SCIENTIST AND THE MILITARY. ORO SP 75, Nov. 1956, 26pp. Operations Research Office, Johns Hopkins University, Baltimore, Md.

18,699

The present article is aimed at promoting better understanding and cooperation between the scientist and the military. This problem of perfecting communications between men of widely different environment, training, motivation, etc. is first discussed historically, as it developed out of the rapidly changing technology in the military sciences. Next the numerous administrative and organizational problems attending research are presented and exemplified. Finally, the conditions surrounding the civilian scientist in the military and the civilian scientist in research contracts with the military are examined and compared. Areas of misunderstanding are pointed up and some suggestions for improved relations are given. R 18

18,703

Mand, Barbara. FLEXIBILITY IN INTELLECTUAL PERFORMANCE. Contract N00R 694(00), Proj. NR 151 113, Ph.D. Thesis, April 1958, 142pp. Educational Testing Service, Princeton, N.J.

18,703

Individual differences in flexibility in problem-solving were investigated. The primary hypothesis was that such flexibility was different from ability. Tests of problem-solving flexibility were developed that paralleled the traditional mental abilities tests in content. These flexibility and ability tests plus personality and interest tests were administered to a group of high school students selected from college preparatory courses. Reliabilities were computed for most of the tests. The major relationships examined were between the flexibility and ability tests, among the flexibility subtests, between these and other measures of flexibility, and between the flexibility and the personality and interest tests. 18,714

Ely, J.H., Bowen, H.M. & Orlansky, J. MAN-MACHINE DYNAMICS. CHAPTER VII OF THE JOINT SERVICES HUMAN ENGINEERING GUIDE TO EQUIPMENT DESIGN. Contract AF 33(616) 419, Proj. 7180, Task 71501, WADC TR 57 582, Nov. 1957, 113pp. USAF Aero Medical Lab., Wright-Patterson AFB, Ohio. (Dunlap and Associates, Inc., Stamford, Conn.).

18,714

This report discusses the factors which affect human performance in tracking and watchkeeping tasks. In the first part closed loop systems and human transfer functions are described. Part II is devoted to the important design factors in such systems: pursuit and compensatory displays, intermittency, machine dynamics, aided tracking, and quickening. The third part provides detailed information about human time lags and the factors affecting them. Finally, specific recommendations are set forth for minimizing performance decrement in such activities. G. I. R 116

18,743

Harbold, G.J. & O'Connor, M.F. EFFECTS OF VARYING MODE OF SIGNAL PRESENTATION ON HEARING THRESHOLDS OBTAINED WITH BEKESY-TYPE AUDIOMETER. Proj. NMO05.13 2005, Sub-task 1, Rep. 9, ca. 1959, 18pp. USM School of Aviation Medicine, Pensacola Air Station, Fla.

18,743

This was a systematic study of some of the characteristics of the Bekesy audiometer. All built-in stimulus variables were responded to in all combinations by 17 naval aviation cadets. The variables were speed (slow and fast); tone (steady and pulsed); and frequencies (ascending and descending). Mean hearing levels and their standard deviations were obtained. A six-dimensional (subjects, tones, ears, speed, pulse-steady, ascending-descending) analysis of variance was performed on these hearing levels as an aid in evaluating the instrument.

Flickinger, D.D. MAN--THE ESSENTIAL FACTOR IN SYSTEMS. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 2-4. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (USAF Air Research and Development Command Headquarters, Andrews AFB, Washington, D.C.).

18,756

This address is aimed at defining the present state of human factors concepts and setting forth some objectives for the human factors researcher. The concepts include man's roles in systems, man's versatility of performance, factory designing, and testing environment versus operational environment. Some changes in human factors agencies and their programs are outlined.

18,757

Linville, W.K. SENSITIVITY OF SYSTEM DESIGN TO SYSTEM OBJECTIVES. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 5-8. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Institute for Defense Analyses, Washington, D.C.).

18,757

This paper discusses the role of human factors in system engineering when the objectives of a system are examined to determine what its function is and to evaluate its performance of that function. Considering a system as being composed of various levels or layers, the objectives derive from the exterior system which, in turn, involves human factors assessments. The problem of design of a computer system is used to illustrate this type of analysis.

18,758

Drenick, R.F. AN APPROACH TO THE SYNTHESIS OF INFORMATION PROCESSING SYSTEMS. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 9-11. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Bell Telephone Laboratories, Inc., Murray Hill, N.J.).

18,758

A mathematical model is proposed and briefly sketched which may aid in answering these questions in regard to information processing systems: what decision-making agencies should be created, what decisions should be turned over to them, what information should be channeled to them, and what aids should be supplied them to support their activities. The task of the system here considered is a strategic game which differs from the conventional game problem in that the aim is to determine game deterioration and manner of recouping same as a result of certain limitations placed on one or both players. The problem is formulated; solutions, however, are not yet ready to report.

18,759

Truxal, J.G. SYSTEMS ENGINEERING AS THE MATURATION OF CONTROL ENGINEERING. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 12-19. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Polytechnic Institute of Brooklyn, Brooklyn, N.Y.).

18,759

This discussion has three parts: "the first section describes briefly the basic characteristics of control engineering--the techniques for determination and manipulation of a mathematical model for a physical situation--; and indicates the types of models which have been most highly developed by control engineers. The following section describes briefly the extension of these model concepts in systems engineering as necessitated by the modified requirements when the systems engineer must view the overall, and, often complex, system. The final section describes one specific area of recent work in control systems engineering as an illustration of current trends in this field."

Beaunariage, D.C. AN APPROACH TO SYSTEMS INTEGRATION FOR MANNED SYSTEMS. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 22-24. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Radio Corporation of America, Waltham, Mass.).

18,760

This paper presents a method for organizing and executing a typical systems development program which insures equal treatment for the man in accomplishing systems integration. The main components of the program are: preliminary studies, system analysis, subsystem development, system evaluation, product design, and manufacturing. The essential item emphasized throughout is the effective working together of the control systems engineers group and the human engineering factors group. Other important items include early specification of human performance requirements and feedback of task and equipment analyses to the proper groups.

Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Lockheed Aircraft Corporation, Marietta, Ga.).

18,764

Human engineering research programs in industry, with particular reference to the aircraft industry, are discussed under the following topics: how they originate, where they are located in the organizational structure, what kind of skills they use, what they do, and some of the advantages and disadvantages of selected approaches.

18,765

Sharkey, V.J. THE APPLICATION OF HUMAN FACTORS TO SYSTEM DESIGN. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 59-66. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (USAF Operational Applications Lab., AFRC, Bedford, Mass.).

18,765

Three phases of system design—conceptualization, development test, and prototype production—are each discussed in terms of the role played by human factors personnel. Important functions in the first phase revolve around providing human operator data, either already available or conducting research to obtain same. In the second, design of consoles, testing of capabilities, and identification of training requirements are essential. In the third, assistance in system specifications is the main function.

Stapp, J.P. FROM HYPOTHESIS TO REALITY IN SPACE FLIGHT. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 82-83. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (USAF Aero Medical Field Lab., Holloman AFB, N.M.).

18,766

This address consisted of some introductory remarks on the unrealities, e.g., flying saucers, versus realities, e.g., Sputnik, in space flight and the showing of the motion picture film of Major D. Simon's balloon flight.

18,767

Grether, M.F. DATA ON SENSORY MECHANISMS (INPUTS). From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 85-88. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

18,767

The problem of defining the maximum capabilities of the human sense organs is discussed in terms of the two levels of sensory data: threshold data which "answer the question of whether or not a signal or stimulus can be seen, heard, felt, etc." and perceptual performance data which "answer the questions of how easily a signal or stimulus can be understood and translated into appropriate action." The difficulties in utilizing these data in the operational situation are indicated and a few recommendations given.

18,768

Edwards, W.D. HUMAN FACTORS DATA ON THE HIGHER MENTAL PROCESSES. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 89-93. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (USAF Personnel and Training Research Center, Lackland AFB, Tex.).

18,768

The problem of applying data on the higher mental processes to systems design is considered. Some experimental findings of a research program devoted to examining the nature of the decision-making process are discussed. Specifically, these findings are from experimentation on four classes of decision determiners: boundary conditions, values, probabilities, and strategies. Their implications for systems design are indicated.

18,769

Senders, J.W. SOME COMMENTS ON MOTOR SKILLS DATA. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 94-96. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Minneapolis-Honeywell Regulator Company, Minneapolis, Minn.).

18,769

Those factors which limit the usefulness of the psychological data on motor skills and motor acts to the systems designer are discussed and illustrative studies are cited. The factors include: 1) inadequate engineering-type descriptions of experimental conditions; 2) lack of experimentation on multiple-channel-type tasks; 3) differences in performance criteria from laboratory to operational situations; and 4) lack of experimentation on coordination among components of a large task, i.e., interaction effects and loading factors.

Miller, R.B. PERSONNEL REQUIREMENTS AND OPTIONS IN SYSTEMS PLANNING. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 97-100. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (International Business Machines Corporation, Poughkeepsie, N.Y.).

18,770

This paper discusses the optimum allocation of functions to man versus machine, given that the system requirements have been completely identified and that human functions can be provisionally identified. The major options other than function allocation and job structure include training and training aids, human engineering, procedure design, and personnel selection. A format for specifying human as distinguished from system requirements is discussed.

18,771

Saul, E.V. HUMAN FACTORS DATA: THEIR ORIGIN, FORM, CLASSIFICATION AND AVAILABILITY. Report from: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 101-110. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Institute for Psychological Research, Tufts University, Medford, Mass.).

18,771

This paper points out some significant problems encountered in providing documentation services to human factors specialists and presents some information intended to aid them in their literature searches. The topics thus discussed include: origins of human factors data, e.g., military and commercial, classified and unclassified; subject-matter classification and attendant terminology problems; form and availability of these data.

Licklider, J.C.R. SOME HUMAN FACTORS IN THE DESIGN OF A CONTROL SYSTEM FOR A SPACE SHIP. From: "Proceedings of the National Symposium on Human Factors in Systems Engineering, Philadelphia, Pennsylvania, December 3-4, 1957," 111-117. Human Factors Society of America, Arlington, Va. & Institute of Radio Engineers, Philadelphia, Penn. (Bolt Beranek and Newman, Inc., Cambridge Mass.).

18,772

An approach to the design of the control system for a manned space ship is outlined and relevant human factors are discussed. First, the mission is analyzed into 12 phases, e.g., departure, orbit acquisition, landing approach; the control requirements of each phase are considered. Next, alternative ways of handling the phase requirements are indicated. The man-machine control arrangements which are discussed include: attitude control, horizontal position control, braking control, and coordination of control actions. Also considered are capabilities and costs of alternative subsystems, subsystem simulation, and synthesis and evaluation of the over-all control system.

Javitz, A.E. HUMAN ENGINEERING IN EQUIPMENT DESIGN. *Electrical Manufacturing*, Oct. 1956, 108-126.

18,776

This review of the human engineering literature is realistically written for the comprehension and use of the design engineer. The material is organized to answer two basic questions: what are the design functions of human engineering and what are the associated techniques. The research, development, and applied categories of work are described and the general design stages indicated. The areas where human engineering techniques have been used are discussed and illustrated. They include data processing and systems analysis, discriminability of controls and displays, reliability and maintainability, automation, and civilian design. Finally, the function of the human engineer on the design team is considered.

Melton, A.W. MILITARY PSYCHOLOGY IN THE UNITED STATES OF AMERICA. *Amer. Psychologist*, Dec. 1957, 12(12), 740-746. (University of Michigan, Ann Arbor, Mich.).

18,788

Military psychology is defined here as being co-extensive with all psychology with its unique unifying characteristic merely the specific contexts of application. The requirements for a military psychologist are examined briefly. The principal trends and emphases of contemporary military psychology in the United States are then discussed.

18,791

Malhotra, M.S. & Wright, H.C. AIR EMBOLISM DURING DECOMPRESSION AND ITS PREVENTION. *RNP 60/996*, UPS 186, RNPL 9/59, Dec. 1959, 16pp. Royal Naval Personnel Research Committee, MRC, London, England. (Royal Naval Physiological Lab., MRC, Alverstoke, Hants, England).

18,791

Investigations were made into the causes of air embolism and methods of its prevention during simulated ascents at the constant rate of five ft./sec. in a compression chamber, on animals—mainly rabbits. In three series of experiments the animals were tracheotomized and the outlet from the trachea closed at a pressure equivalent to 60 ft. of water. In the first series, no control method was used; in the second, a firm binder was applied to the abdomen prior to ascent; and in the third, the chest was squeezed manually just before the trachea was closed. Various physiological measures were taken, including autopsies, to assess the results.

Miles, S. & Mackay, D.E. THE NITROGEN NARCOSIS HAZARD AND THE SELF CONTAINED DIVER. *RNP 60/995*, UPS 184, RNPL 4/59, May 1959, 5pp. Royal Naval Personnel Research Committee, MRC, London, England. (Royal Naval Physiological Lab., MRC, Alverstoke, Hants, England).

18,792

To investigate whether nitrogen narcosis may be affective in relatively shallow dives, simple tests involving memory and mental skill were carried out by 16 helmeted divers. The tests were performed in and out of the water, at the surface, and on the bottom during the latter part of a series of dives varying from 60 min. at 100 ft. to 25 min. at 180 ft. Performance was compared for these conditions and discussed in relation to the problem of expected narcotic effects upon divers wearing self-contained air breathing sets and thus not under the control of a surface unit.

Cornell University. HUMAN FACTORS BULLETINS. A COLLECTION OF HUMAN FACTORS BULLETINS SHOWING HUMAN ENGINEERING PRINCIPLES FOR IMPROVED SAFETY. 1959, 28pp. Daniel and Florence Guggenheim Aviation Safety Center, Cornell University, New York, N.Y.

18,793

A collection of Human Factors Bulletins is presented in order to acquaint engineers with the importance of using physiological, psychological, and related data in the design of aircraft. No claim is made that the field of human engineering is covered, but rather the importance of using information already available to improve safety is stressed. Illustrative bulletin topics are optimum allocation of tasks among men and machines, RT, some applications of body weight to design, hand operated control forces, instrument panels, and human requirements and performance limitations at various altitudes.

Lucier, O., Fischl, M.A. & Courtney, D. APPLICATION OF A SYSTEMS CONCEPT TO PERSONNEL RESEARCH: FINAL REPORT. Contract N0MR 2212(00), Proj. J, Rep. 22, Aug. 1958, 129pp. Courtney and Company, Philadelphia, Penn.

18,817
This is a first report in a project devoted to the development of information gathering and information analysis techniques to support and implement the general objectives of providing command with techniques and procedures for effective personnel decisions. The development of the techniques is based on considering the personnel organization as a system and applying the systems concept to it. Only the first stage is detailed here: determination of the feasibility of introducing the feedback concept into the Navy's personnel research system. This is done by sending men to the fleet to see kinds of data available there, to explore the possibility of additional data, and to obtain the general idea for a skeleton system for the flow of information to and from command. 18,819
Woodson, W. HUMAN ENGINEERING SUGGESTIONS FOR DESIGNERS OF ELECTRONIC EQUIPMENT. Jan. 1955, 7pp. USN Electronics Lab., San Diego, Calif.

18,819
The importance of considering the human component in a system was discussed and the relationship between men and machines clarified by listing some functions in which each (man or machine) excels the other. Checklists of common faults and design suggestions were presented as background for good human engineering design. A selected list of "100 Human Engineering Considerations for Improving Man-Machine Effectiveness" was drawn from experience in actual application of human engineering principles to electronic equipment design. Topics dealt with were visual displays, panel layouts, console design, multiple layout, environment, and maintenance. R 3

Weston, H.C. THE EFFECT OF AGE AND ILLUMINATION UPON VISUAL PERFORMANCE WITH CLOSE SIGHTS. Trans. Amer. Acad. Ophthalm. Otolaryng., March-April 1949, 394-400. (Reprinted from Brit. J. Ophthalm., Sept. 1948, 32, 645-653).

18,822
The results of an experimental investigation in which 12 Ss performed a series of visual tasks, graded in difficulty, involving the perception of fairly small detail, were summarized. Each task in the series was performed at each of six values of illumination (from 0.5 to 500 ft.-c) so chosen as to form a geometric series in a range likely to be used in practical situations. Ratio of brightness of task to surrounding brightness was maintained. The 12 Ss ranged in age from 19 to 47 years and were distributed by age into five groups. The performance data were presented as functions of age and illumination for each task in the series. T. G. I. R 3

Wolf, E. EFFECTS ON VISUAL THRESHOLDS OF EXPOSURE TO THE RADIATION BELOW 4000 ANGSTROMS. Trans. Amer. Acad. Ophthalm. Otolaryng., March-April 1949, 400-413. (Harvard University, Cambridge, Mass.).

18,823
A study of the effect on visual sensitivity of ultraviolet emission of various fluorescent light sources was reported. The course of dark adaptation following exposure to the light source was the criterion measure. In one series, the Ss were exposed for ten min. to the radiation of a fluorescent "daylight" lamp with a crown glass screen permitting ultraviolet above 2,800 Angstroms to reach the eye or with Noviol-A passing only wavelengths above 4,100 Angstroms. Other series of tests used fluorescent "white," "softwhite," and "gold" lights. Finally, Ss were exposed to either one hour or ten min. of reading under these lights. The resulting dark adaptation data were discussed in relation to room lighting problems. G. R-9

Wever, E.G., Lawrence, Marie & von Békésy, G. A NOTE ON RECENT DEVELOPMENTS IN AUDITORY THEORY. Proc. Natl. Acad. Sci. Wash., June 1954, 40(6), 508-512. (Princeton University, Princeton, N.J.).

18,829
This note considered recent auditory research. Two approaches for study of the pattern of cochlear action were discussed: direct observation in fresh human temporal bones in which suitable exposures were made and the use of electrical potentials on anesthetized cats. The results were interpreted in terms of auditory theory. Further studies on the relation of the pattern of cochlear action and locus of stimulation were mentioned. The crucial problem now under consideration was how any given segment of the basilar membrane gets the energy that makes it vibrate—whether from neighboring parts of the membrane or from the cochlear fluid. Wilson, S.G., Jr. RADIATION-INDUCED CENTRAL NERVOUS SYSTEM DEATH. A STUDY OF THE PATHOLOGIC FINDINGS IN MONKEYS IRRADIATED WITH MASSIVE DOSES OF COBALT-60 (GAMMA) RADIATION. Rep. 59 58, April 1959, 18pp. USAF School of Aviation Medicine, Brooks AFB, Tex.

18,830
A study of the pathologic findings in monkeys irradiated with acute doses of whole-body gamma radiation, ranging from 400 to 40,000 r, was made. Twenty of the 99 animals receiving from 400 to 40,000 r exhibited severe signs of central nervous system damage which persisted until death. Autopsies were made to study pathologic alterations of the central nervous system and on lesions occurring simultaneously in the remaining viscera, particularly in the gastrointestinal tract. The observed changes were compared to those described by other authors. The concept of "leukocyte devitalization" was introduced. T. G. I. R 11

Roy, S.N. & Roy, J. A NOTE ON A CLASS OF PROBLEMS IN 'NORMAL' MULTIVARIATE ANALYSIS OF VARIANCE. Contract AF 18(600) 83, AFOSR TN 57 749, Nov. 1957, 6pp. University of North Carolina, Chapel Hill, N.C.

18,839

This note considers some problems in "normal" multivariate analysis of variance. The model is as follows: let the columns of X (pxn) be independent, nonsingular, p-dimensional, normal variates with a common variance-covariance matrix and expectations given by $EX = A\xi$ where A (rpm) is a matrix of known constants and ξ (m x 1) is a matrix of unknown parameters. Under this model the hypothesis $H: \xi = B\eta$ where B (m x k) is a given matrix of constants and η (k x 1) is a matrix of unknown parameters is considered. It is shown that the hypothesis is completely testable only under certain conditions.

Tinker, M.A. BRIGHTNESS CONTRAST, ILLUMINATION INTENSITY AND VISUAL EFFICIENCY. *Amer. J. Optom. & Acad. Optom.*, May 1959, 36, 221-236. (Department of Psychology, University of Minnesota, Minneapolis, Minn.).

18,844

To evaluate speed of perception in reading versus visibility as techniques for determining the illumination requirements for adequate vision in reading under varying degrees of brightness contrast between print and paper, 367 Ss were tested on either a standard speed of reading test or on five-letter words from these tests, individually displayed. The test materials were printed on paper of different reflectances so that the brightness contrasts were 0.756, 0.591, 0.348, and 0.217. Illumination intensities used were 5, 25, 50, 100, 200, and 400 ft.-c. Visibility of print and speed of reading were measured under each condition of light intensity and brightness contrast. The findings were related to the problem of specifying illumination.

Shapley, L.S. COMPLEMENTS AND SUBSTITUTES IN THE OPTIMAL ASSIGNMENT PROBLEM. Res. Memo. 2240, Aug. 1958, 8pp. Rand Corporation, Santa Monica, Calif.

18,848

When studying a process that depends intricately on several input activities it is sometimes of interest to know whether two given activities are complements or substitutes--that is, whether they reinforce or interfere with each other's influence on the process as a whole. The optimal assignment problem is considered here to be such a process and the complementarity-substitutability relationships between its elements are established. It is shown that man-machine pairs are complementary while man-man and machine-machine pairs are substitutes.

Gruber, H.E. & Clark, W.C. PERCEPTION OF SLANTED SURFACES. *Percept. Mot. Skills*, 1956, 6, 97-106. (University of Colorado, Boulder, Colo. & University of Michigan, Ann Arbor, Mich.).

18,929

To provide further data on factors influencing the perception of slant, especially distance of observation and size and density of the units of texture composing the stimulus surface, two experiments were conducted using actual slanted surfaces viewed through a reduction screen aperture. The S's task was to adjust a comparison variable (rod) so that it appeared to be in a plane parallel to the stimulus surface (white dots on black background). In the first experiment, 15 Ss made judgments of four surface textures, three slants, and four distances. In the second, unit size and stimulus slant were held constant and texture density was varied (three surfaces). An explanation of the findings was offered.

Clark, W.C., Smith, A.H. & Rabe, Ausma. RETINAL GRADIENTS OF OUTLINE AS A STIMULUS FOR SLANT. *Canad. J. Psychol.*, 1955, 2(4), 247-253. (Queen's University, Kingston, Ontario, Canada).

18,934

Seven observers were used to determine whether or not monocular gradient of outline convergence is, like surface texture gradient, a sufficient stimulus for the perception of slant and the relative stability or ambiguity of the related percepts. The observers recorded their perceptions of the slant of rectangular and trapezoidal film-forms produced under low illumination by white figures against a black background. Essential conditions were monocular vision and fixed head at a distance which minimized or eliminated accommodation. The stimuli were presented in the fronto-parallel plane and at angles of 20 degrees and 40 degrees with the background. The results were related to the theory of psychophysical correspondence.

Legg, J.C., Jr. AIRPORT SURVEILLANCE RADAR APPROACH STUDY. Task 64541, WADC TN 56 350, Jan. 1957, 9pp. USAF Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.

18,969

To evaluate the Airport Surveillance Radar (ASR) Approaches, the accuracies of this type of approach were determined. The test procedures and equipment used were as close to those of a normal radar approach control center as weather, safety, and traffic conditions would permit. Fifty-three ASR approaches were completed and recorded by photo theodolite. The results were analyzed for accuracy and graphs constructed which show the limits within which 95 percent of all approaches can be expected to fall. It was recommended that these results be used as criteria in determining requirements for an approach and landing system using ASR as the feeder element.

Blatt, S.J. & Stein, M.I. EFFICIENCY IN PROBLEM SOLVING. J. Psychol., 1959, 48, 193-213. (Psychosomatic and Psychiatric Institute for Research and Training, Michael Reese Hospital, Chicago, Ill. & Center for the Study of Creativity and Mental Health, University of Chicago, Chicago, Ill.).

19,010
The characteristics of processes involved in solving purely "rational" problems that consist solely of logical relationships and their relationships to efficiency were investigated. By means of an electromechanical apparatus S was presented with a series of logical relationships which he had to derive and then coordinate for the final solution. Efficiency was defined as one who asked the smallest number of unnecessary questions (redundant, nonabstract, or unique). Time for various phases of the task were recorded also. Ss were 35 Ph.D. chemists. Analysis of the data was related to the various hypotheses originally stated. Intelligence and personality variables were related to the findings.

Sturtevant, J.V. PERCENT DIVERSION VERSUS MEASUREMENT LIMITS. Rep. 117, April 1952, 31pp. United States Steel Corporation, New York, N.Y.

19,011:
This working paper discusses the problem of quality control in manufactured products, each item of which should possess a certain measured value of one or more particular quality characteristics. Setting limits on measurement values on an economical basis for both producer and consumer is necessary. Tables of percentages for any set of measurement values are presented for normally distributed data and also for those that deviate from the normal. Limits for a product having two or more characteristics that must be controlled are also discussed with tabulation and interpretation procedures given.

Woolman, M. EVALUATING FLIGHT PERFORMANCE. FINAL REPORT. Rep. 55 1, Aug. 1953, 63pp. USAF Air Training Command, Scott AFB, Ill.

19,013
Objective and subjective grading methods in use at McConnell Air Force Base for evaluating flight performance are presented. Objective grades (called Sensitive Indicators) are instrument readings taken at standard check points during flight maneuvers that reflect a complex pattern of previously learned responses. Reliability studies on these grades are given. A Performance Proficiency Scale is described and its use in subjective grading is discussed. Some training results obtained from these methods are presented.

Haythorn, W.W. THE USE OF SIMULATION IN LOGISTICS POLICY RESEARCH. Rep. P-1791, Sept. 1959, 43pp. Rand Corporation, Santa Monica, Calif.

19,074
This paper is the initial form of one chapter in a book entitled Sequential Decisions and Simulation (editors, Rosenstiel and Ghouila-Houri) to be published in France by Dunod, Paris. The chapter reported here provides a short description of two large systems simulation experiments that were performed by the Logistics Systems Laboratory of the Rand Corporation, a nonprofit research corporation established to provide the USAF with scientific assistance in its long-range planning. Some discussion of the philosophy underlying the methodology used is followed by a methodological description of 1) an evaluation of proposed supply policies and procedures and 2) a support-planning study of a ballistic missile system.

Lerner, R.M. A METHOD OF SPEECH COMPRESSION. Contract AF 19(604) 5200, Rep. 36 41, Aug. 1959, 121pp. Lincoln Lab., Massachusetts Institute of Technology, Lexington, Mass.

19,103

A study was undertaken to determine what improvements could be effected in the operation of Vocoder-type speech compression systems by properly making use of the structure introduced into the speech waveform by the period voicing of most sounds. Basic to the experimental work was the observation that the waveform of voiced speech sounds are quasi-periodic. The principles underlying the pitch-synchronous processing of speech were reviewed, and speech-processing systems were studied from a signal theory point of view. The experimental apparatus, a pitch-synchronous speech chopper, was built and its performance evaluated in terms of the intelligibility of words in its output and in terms of subjective quality.

Misbat, T.R. & Happ, W.M. FLOW-GRAPH ANALYSIS. A VISUAL FORM OF ENGINEERING MATHEMATICS. Rep. LMSD 48357, Dec. 1958, 36pp. Missiles & Space Div., Lockheed Aircraft Corporation, Sunnyvale, Calif.

19,121

A self-contained course in flow-graph analysis is designed. The value of this technique is shown to lie in its ability to provide both a general view of the interdependence of variables and a particular view of any required aspect. Rules are developed from the simplest possible mathematical structures. Although transistor engineering (to which flow-graph analysis is particularly suited) is employed in some specific examples, the main work is treated in general terms that are applicable in many branches of engineering. An analysis of the mechanical differential gear is appended.

Jones, F.P. PSYCHOPHYSICAL REEDUCATION AND THE POSTURAL REFLEXES. May 1953, 13pp. Institute for Psychological Research, Tufts University, Medford, Mass.

19,146

A method of re-education that is psychophysical in the sense that it brings about a change in the person as a whole by introducing a change in his total pattern of reaction is described. The basis of the method is control of a basic, reflex mechanism lying in the unconscious poise of the head to influence the way muscle tension (or tone) is distributed throughout the body. Studies of animal posture and human posture are cited as evidence for the physiological base on which the method operates. An hypothesis is presented requiring experimental testing to throw new light on this postural mechanism.

Adams, R.J. & Starnmeyer, W.R. ANTARCTIC 'DAY' OF A NAVAL DENTIST. J. Amer. Dent. Ass., Aug. 1959, 52, 322-326. (USN Medical Research Lab., New London Submarine Base, Conn.). (NRL Rep. 325).

19,229

The dentist's activities in the antarctic were recounted. His professional duties were to care for the routine and emergency dental needs of the personnel and to organize and conduct a study of the effects of the stresses of antarctic life on oral health; other activities included assisting in construction of office and quarters, assisting in shoveling snow into snowmelters to provide the water supply for the office, and washing the dental linen supplies. The oral health program consisted of periodic examinations to detect changes in soft tissue health, dental materials performance, and any other aspects of oral hygiene that might lead to more serious and general physical breakdown.

Wierke, R.E. & Schwartz, I. EFFECT OF CONTACT LENSES ON THE RED/GREEN RATIO. Contacta, Nov. 1959, 3(11), 1-2. (USN Medical Research Lab., New London Submarine Base, Conn.). (NRL Rep. 328).

19,253

This study compared the effects of spectacles and contact lenses on the red/green ratio. Four Ss—two myopes, a hyperope, and an emmetrope—were tested using a MacAdam colorimeter with a ten-degree bipartite field, red and green on one side, yellow and blue on the other. Ss made 30 matches using spectacle lenses and 30 after a suitable period of acclimation to contact lenses. The refractive errors and red/green ratios for the right eye of all Ss were tabulated and compared for the two lens conditions. The findings were briefly discussed in terms of everyday color discrimination.

Liebow, A.A., Stark, J.E., Vogel, J. & Schaefer, K.E. INTRAPULMONARY AIR TRAPPING IN SUBMARINE ESCAPE TRAINING CASUALTIES. US Armed Forces med. J., March 1959, 13(3), 265-289. (USN Medical Research Lab., New London Submarine Base, Conn.). (NRL Rep. 330).

19,255

Two casualties of submarine escape training are reported in detail. These cases both suffered interstitial emphysema and air embolism. The role of involuntary intrapulmonary air trapping in each case is discussed. Also, the problem of detecting persons liable to suffer involuntary air trapping when breathing air at supra-atmospheric pressure and subjected to the stress of rapid decompression is discussed. Several categories of such persons are indicated. It is felt that these findings should be of civilian interest due to skin diving with self-contained underwater breathing apparatus.

Farf, A. & Leonard, J.L. TECHNIQUES FOR RECORDING SURFACE BI-ELECTRIC CURRENTS. *Med. Res. Rep.* 809, May 1958, 21pp. (E.M.I. Electronics Ltd., San Diego, Calif.).

19,278

This paper describes the techniques for recording surface bioelectric d.c. which have been adopted at the E.M.I. Electronics Laboratory. Some of the remarks used for d.c. recording are indicated, e.g., ECG, EEG, SGC, as well as the problem of d.c. artifacts and bioelectric overlap. General principles for avoiding electrode artifacts, use of chlorided silver, and the detailed mechanics of electrode preparation are discussed, along with preparation of skin, methods of electrode placement, and effects of electrode area. Finally, the proper instrumentation for use with such electrodes is described.

Neckwerth, J.F. & Neckwerth, R.H. EYE FIXATIONS RECORDED ON CHANGING VISUAL SCENES BY THE TELEVISION EYE-MARKER. *J. Opt. Soc. Amer.*, July 1958, 48(7), 437-445. (Applied Psychology Research Unit, MRC, Cambridge, England).

19,298

Improvements in the corneal reflection method of recording eye movements are reviewed and an improved procedure for analyzing eye movements during the viewing of motion pictures is described. Two closed-circuit television cameras are used together to produce one composite picture: one camera picks up the corneal reflection of light (spot magnified about 100 times) and a second one simultaneously provides the scene to the screen in front of S and to a second display where the corneal reflection or eye marker is superimposed. The composite eye-scene display may be recorded by a motion picture camera. The spot can be calibrated to the region of regard within one or two degrees. Areas for application of the technique are visual aiming, visual search, and thinking.

Shackel, B., Sloan, R.C. & Marr, H.J.J. DETECTOR PLOTS. *Electronics*, Jan. 1958, 36-39. (E.M.I. Electronics Ltd., Hayes, Middlesex, England).

19,301

This paper discusses the eye movement recording technique, electro-oculography, and the major problems encountered in employing it successfully. A complete measuring apparatus built to overcome these difficulties: small size of potential, noise potential from skin and from electrodes, is described and illustrated. Basically, it is an electronic system with two identical channels to amplify and record eye movements separately in the horizontal and vertical planes of rotation. A pen recording and motion picture film of a crt display are obtained. Detailed descriptions of the amplifier, crt display, and electrodes are included. Examples of records obtained from the apparatus are shown.

Levitt, F.L. & Angoff, W.L. HOMEOSTATIC THEORY OF SMALL GROUPS III. Contract NCE 454(12), Tech. Rep. 4, March 1959, 13pp. (The Group Psychology Branch, CNE, Washington, D.C. (Rutgers University, New Brunswick, N.J. & New Jersey State University, New Brunswick, N.J.)).

19,358

The homeostasis theory of small groups suggests that if a disturbance occurs which would tend to lower either Formal Achievement (FA) or the Group-based Satisfaction (GMS) some sort of compensatory effect will occur within conditions predicting FA or GMS so that these latter criteria will remain stable. This hypothesis was tested by an analysis of attitude survey data taken from telephone operators in 32 exchanges. Four predictors derived from these data were studied using a statistical model previously employed in the analysis of delivery truck drivers. Multiple correlations between the predictors and FA and GMS were computed. The implications of the findings for the hypothesis were discussed.

Eisler, M. & Olson, Costa. A MEASUREMENT OF SUBJECTIVE SIMILARITY. *Scandinavian Journal of Psychology*, 1959, 11, 1-10 & *Acta Psychologica*, 1959, 16, 1-10. (University of Stockholm, Stockholm, Sweden).

19,466

The mechanism of perception of similarity in the dimension of pitch was investigated. A preliminary experiment was carried out to determine tones judged to be of equal loudness at various frequencies (50, 200, 500, 2,500, 5,000, 7,000, 10,000, and 13,000 cps). In a second experiment, similarity estimates were obtained for pairs of tones by having the S rate them on a ten-step scale. And finally, a third experiment was conducted to obtain a magnitude function of pitch from which scale values were found of the tones in the similarity experiment. The mathematical form of the similarity function was derived. The results were interpreted in terms of Nelson's concept of adaptation level.

Lowenstein, G. & Goussard, Irene E. ELECTRONIC PUPIL-LOCATING. A NEW INSTRUMENT AND SOME CLINICAL APPLICATIONS. *A.M.A. Arch. Ophthalmol.*, March 1958, 59, 352-353. (Ophthalmology Dept., College of Physicians & Surgeons, Columbia University, New York, N.Y. & Institute of Ophthalmology, Presbyterian Medical Center, Columbia University, New York, N.Y.).

19,564

An electronic direct-writing instrument for accurate recording of the pupillary movements of the two eyes is described. The working principles of the instrument are discussed along with descriptive details and methods of use. Some clinical applications of the method are given. G. L. R 25

19,570

Marx, P., Clemens, W.W., MacEwan, Charlotte & Connors, J. AN ANALYTICAL AND EMPIRICAL EXAMINATION OF SOME PROPERTIES OF IPSATIVE MEASURES. Contract NMR 477(08) & Public Health Research Grant R 743 (C2), Oct. 1956, 91pp. University of Washington, Seattle, Wash.

19,570

The properties of the "ipsative" units in psychological measurement are examined in this paper. An ipsative matrix is defined and developed; an empirical example is discussed; and mathematical derivations or proofs are presented for the properties of the ipsative variables. T. R 14

19,639

Slivinske, A.J., Robertson, J.C., Ugeow, A. & Nello, Nancy K. VIBRATORY COMMUNICATION: FEASIBILITY AND APPLICATION. Contract NMR 656 (17), Proj. TACOM (0655), Oct. 1959, 164pp. Psychology Lab., Pennsylvania State University, State College, Penn.

19,639

This report described and interpreted the results of a series of studies concerned with the transmission of information by vibratory signals and the feasibility of this mode of communication in an applied situation. Four major issues were examined: feasibility--the effects of performance on a simulated pilot's task upon the reception of vibratory signals was assessed; cross-modality legibility--visual and auditory coded signal reception were compared with vibratory; detectability--detection of intermittent vibratory signals in a vigilance situation was compared with similarly obtained visual and auditory data; codability--the coding procedure that would best utilize the tactile modality was sought. The data were discussed in terms of information theory. T. G. I. R 83

Killingham, W.V. INTERDEPENDENCE OF SUCCESSIVE JUDGMENTS. I. COMPARATIVE JUDGMENT. II. AFFECTIVE JUDGMENT. III. ABSOLUTE JUDGMENT. Proj. RM 14 02 11, Subtask 12, Rep. 2, July 1957, 17pp. US School of Aviation Medicine, Pensacola Air Station, Fla.

19,694

Interdependence of successive judgments was investigated in the context of comparative, affective, and absolute judgments. In the first case, Ss were presented with a series of 36 pairs of lines ranging from six to seven in. in length; the task was to indicate the longer line. In the second test, a series of 25 geometric designs with four test cards imbedded in the series in all possible permutations was shown to independent groups of Ss; the task here was to indicate a liking or disliking for each item. Finally, Ss were required to judge the population of 26 countries by assigning a rating to each according to where it should stand in relation to all countries in the world. Methodological and theoretical implications of the findings were discussed. T. G. R 33

Zaccaria, P.A., Bailey, J.T., Tejes, E.C., Stafford, A.R., et al. DEVELOPMENT OF AN INTERVIEW PROCEDURE FOR USAF OFFICER APPLICANTS. Proj. 7701, Task 7702, AFPMR TR 56 43, Feb. 1956, 29pp. USAF Personnel Research Lab., Lackland AFB, Tex.

19,696

This report describes the development and preliminary analyses of an interview procedure and report form suitable for use in all Air Force procurement programs where in selection is to be based to an extent upon the findings of an interview board. The procedure is suitable for use by three-man boards with little prior training and is designed to furnish a reliable estimate of officer potential but not of technical proficiency or any other area better measured by other means. The importance of the interview scores as predictors of officer performance remains to be determined. Recommendations for use of the procedure are made. T. R 7

19,708

Austin, F.H. PHYSIOLOGICAL INSTRUMENTATION OF PILOTS FOR TEST AND OPERATIONAL FLIGHTS IN NAVY HIGH PERFORMANCE JET AIRCRAFT. PHASE I - PRELIMINARY INVESTIGATIONS. AGARD Rep. 740, May 1959, 8pp. Advisory Group for Aeronautical Research & Development, NATO, Paris, France.

19,708

Research on pilot physiological and psychological reactions in flight which is being conducted at the Naval Air Test Center is described briefly. As a result of initial investigations, criteria are being developed for new equipment for inflight monitoring of the pilot. The goal is to have the test pilot as fully instrumented as the airplane itself.

19,719

Birnbaum, A. PROBABILITY AND STATISTICS IN ITEM ANALYSIS AND CLASSIFICATION PROBLEMS. EFFICIENT DESIGN AND USE OF TESTS OF MENTAL ABILITY FOR VARIOUS DECISION-MAKING PROBLEMS. Rep. 58 16, Nov. 1957, 25pp. USAF School of Aviation Medicine, Brooks AFB, Tex. (Teachers College, Columbia University, New York, N.Y.).

19,719

The application of the Neyman-Pearson and Wald theories of inference and statistical decision-making to problems of efficient design and use of tests of a single ability is described. It is shown that a number of mathematical difficulties that arise in the classical model can be overcome by representing the item characteristic curve by a logistic function rather than the usual normal ogive. Fox, H.M. PSYCHOLOGICAL AND PITUITARY-ADRENAL RESPONSES TO STRESS. PROGRESS REPORT. Contract DA 49 007 MD 213. Jan. 1959. 20pp. Harvard University, Cambridge, Mass.

19,771

This was a report from a long period research investigation of the pituitary-adrenal responses to psychological stress. In this report period analysis of variance was used to compare the effect of individual differences among 18 normal Ss with differences in the same individual from day to day for five weeks of daily observation. Differences in 17-hydroxycorticoid output, 17-ketosteroid output, and flicker fusion were studied. Some tentative correlations of relatively constant adrenal steroid levels, uropepsin, and personality structure were presented. T. R 17

19,772

Frankenhaeuser, Marianne. EFFECTS OF PROLONGED GRAVITATIONAL STRESS ON PERFORMANCE. Nordisk Psykologi, 1959 10, 48-64. (University of Stockholm, Stockholm, Sweden)

19,772

Effects of prolonged radial acceleration on performance were studied in a series of eight experiments. The types of performance measured were: 1) visual choice RT; 2) visual acuity; 3) accuracy of movement; 4) perceptual speed; 5) reading speed, color naming, and reactions to self-induced stress (the Stroop test); 6) ability to concentrate (100-3 Test) by counting backwards from 100 subtracting three each time; 7) ability to multiply one- and two-digit numbers; and 8) time perception (reproducing or halving durations between auditory signals). Results obtained during two- to ten-min. exposure to three g and under normal conditions before and after centrifugation were compared. T. R 18

Kulke, G.K. & Reed, H.J. INFORMATION CAPACITIES OF MANUALLY PLOTTED DISPLAYS. Contract NMR 45403, Proj. NR 145 088 & Contract NS CRI 16601, Proj. 145 089, Rep. 1953-494 03 03, 1953, 25pp. Tufts University, Medford, Mass.

19,818

An empirical study was made of the informational capacity of manually plotted vertical displays as used in Combat Information Centers of certain major combatant vessels of the USN. The display was operated by six plotters working from the rear of the board under various conditions of input load. The analysis procedure involved selecting a 50 percent sample of all positions plotted and analyzing these for accuracy in bearing and range. These data were then studied for effect of load and beginning or end of plotting period. Observations were made as to degree of physical interference encountered by the six plotters and appearance of the board under conditions of high load conditions. T. G. I. R 11

Lyman, J. HARNESSING—HERE AND HEREFTER. Artificial Limbs, Sept. 1955, 2(3), 1-3. (University of California, Los Angeles, Calif.).

19,832

Harnessing as used here meant the coupling between the human being and the inanimate mechanism of an artificial limb or protheses. The functions the harness serves are defined and discussed in relation to present day knowledge and usage. The inadequacies of present techniques in providing for sensory functions are discussed along with a forecast of future technological developments in this area.

Masiewicz, H.L. DESIGN SPECIFICATION FOR TRAINER T-6. LAUNCH CONTROL OFFICER'S CONSOLE ASSEMBLY. AFB 3020-592 6110 0 1005. Contract AF 04(645) 4, Rep. AZD 27 044, July 1959, 36pp. Convair, General Dynamics Corporation, San Diego, Calif.

19,837

This specification covers the requirements for design and construction of Trainer T-6, Launch Control Officer's Console Assembly. The trainer will be utilized to provide a training medium for instruction in the following specialties and courses: 1) guided missile operations officer, and 2) missile systems analyst technician. Functional practice in 1) equipment reaction during countdown and missile commit sequence through to antifire and coolants and 2) operational countdown of the missile and procedures to follow when confronted with malfunctioning of subsystems are provided. T. 1.

Mitchell, J.H. DISPLAYS I: CATHODE RAY TUBES. Contract NMR 494(03), Proj. NR 145 088, Rep. 1954 494 03 18, Feb. 1954, 47pp. Tufts University, Medford, Mass.

19,845

The theory, construction, current thinking, and research into the use of CRT as instruments for presenting information are collated. Designed for general duty line officers of the Navy and nonelectronic engineers, this report employs a nonspecialized vocabulary and a progressive development in subject complexity. Since it is the first of a series of handbooks upon devices for displaying information, the material is limited to those CRT methodologies about which the Department of Systems Analysis, Tufts College, has documented information and to data collected prior to December 28, 1953. Psychological Research Associates, Inc., Encino, Calif. HUMAN FACTORS PRINCIPLES AND SPECIFICATIONS IN THE DESIGN OF GROUND SUPPORT EQUIPMENT. Rep. R 1067. April 1959. 229pp. Rocketdyne Div., North American Aviation, Inc., Canoga Park, Calif.

19,868

This manual provides two different but important kinds of information for the design engineer: general principles and detailed specifications. The human factors principles consist either of general rules or of descriptions of design steps essential to insure that sound human factors practices are observed in the development of Rocketdyne ground support equipment. The human factors specifications consist of dimensions, tolerances, and other specific information to be used in implementing basic human factors design decisions. The several chapters deal with control, display of information, coding, labeling, panel layout, console design, maintenance, workspace and facilities, and environmental considerations.

USAF Operational Applications Laboratory. JOB KNOWLEDGE TEST FOR SAGE DIRECTION CENTER GAP-FILLER DATA RADAR MAPPERS. TRIAL EDITION. Aug. 1958. 58pp. USAF Operational Applications Lab., Hanscom AFB, Mass.

19,911

This test is composed of three parts as follows: 1) general knowledge of the Radar Mapper, Gap-Filler Data position, with 25 multiple-choice questions; 2) actual pictures taken from the scope of a gap-filler mapping console from which the testee is required to map the excess data, permanent echoes, and weather returns; and 3) 13 problems presented for solution.

19,917

Vaggoner, J.H. NAVIGATION TECHNIQUES AND DISPLAYS FOR INTERPLANETARY SPACE FLIGHT. QUARTERLY PROGRESS REPORT. Contract AF 33(616) 5524, Proj. 9(610.6190) & OSURF Proj. 813, Task 50786, Rep. (813)-5 297, May 1959, 13pp. Mapping & Charting Research Lab., Ohio State University Research Foundation, Columbus, Ohio.

19,917

This is a progress report of work accomplished on a research study of navigation techniques and displays for interplanetary space flight. A literature survey on space navigation and related physical phenomena along with a search for detailed information on recent developments of sensing and measuring devices is being conducted. Investigations now underway are summarized. Two papers are included as appendices: "Preliminary determination of an improved value for the astronomical unit" by Walter Mitchell, Jr. and "General factors relating to space ship instrument panels" by Henry Rowe, M.D. R 4

19,918

Warren, R.E. PERSPECTIVE ANALYSIS OF APPROACH-LIGHT PATTERNS. Tech. Rep. 96, Aug. 1949, 115pp. US Airport Development Div., CAA, Indianapolis, Ind.

19,918

The perspective studies of eight different approach lighting systems are described. Twelve studies of each system were made showing how each pattern will appear to the pilot who is letting down on the proper approach path or on one of several erroneous paths. Four studies assume unlimited visibility while the remaining eight assume that the approach lights are visible for approximately 1,000 ft. only.

Groth, Hilde & Lyman, J. RELATION OF THE MODE OF PROSTHESIS CONTROL TO PSYCHOMOTOR PERFORMANCE OF ARM AMPUTEES. J. appl. Psychol., April 1957, 41(2), 73-78. (University of California, Los Angeles, Calif.)

19,978

This study tested the hypothesis that a "voluntary closing" type of prosthesis control system will lead to superior psychomotor performance for arm amputees when compared with a "voluntary opening" type of system because of the closer "imitation of natural function" said to be provided by the former system. Comparisons of both types of control systems for hook and hand prosthetic terminal devices were made for 17 amputees, using performance time as a criterion measure on three simple manipulation tests: Minnesota Rate of Manipulation Placing Test, Table Setting Test, Cup Test. S's preference for various types of device was determined by a questionnaire. The differences among conditions were tested with the Nonparametric Signed Rank Test for Paired Observations. T. G. I. Miller, J.G. TOWARD A GENERAL THEORY FOR THE BEHAVIORAL SCIENCES. Amer. Psychologist, Sept. 1955, 10(9), 513-531. (Mental Health Research Institute, University of Michigan, Ann Arbor, Mich.)

20,246

This article presents general behavior systems theory as a series of related definitions, assumptions, and postulates about all levels of living systems from viruses through cells, organs, individuals, small groups, and societies. Specific terms in the theory, such as system boundary, subsystem, coding, and equifinality, are defined and the role of formal identity, analogy, and electronic models in theory development is discussed. The article concludes with the presentation of 19 specific theorems derived from the general theoretical framework and empirically testable at all levels of organization. T. G. I. R 12

20,247

Roby, T.B. AN OPINION ON THE CONSTRUCTION OF BEHAVIOR THEORY. Amer. Psychologist, March 1959, 14(3), 129-134. (Institute for Psychological Research, Tufts University, Medford, Mass.)

20,247

This paper discussed five aspects of theory construction which require increased emphasis on the behavioral sciences: 1) comprehensive, general theories on a par with miniature systems development; 2) genuinely speculative theories which are permitted to develop before being subjected to direct empirical test; 3) a more explicit determination of the sense in which theoretical models are rated in the real world; 4) a working language for theoretical expression based on simple common denominator terms and lending itself to symbolic manipulation; 5) a reciprocal interaction between behavior theory on the one hand and mathematics and logic on the other.

Carran, A.B. RELIABILITY OF ACTIVATION LEVEL DURING ADAPTATION TO STRESS. *Science*, March 1959, 129(3351), p.784. (Experimental Psychopathology Lab., Longview State Hospital, Cincinnati, Ohio).
- 20,272
This study was designed to appraise the reliability of the basal skin resistance (BSR) level of mental patients during stress. Two groups of 16 patients each, one on tranquilizers and the other nondrugged, were instructed to look at a large field of flickering light. Readings of BSR, separated by one-half min. intervals, were made during the following periods: 1) 0.5 to 1.5 min., 2) 9 to 11.5 min., and 3) 16 to 17 min. After a three-day interval, the procedure was repeated. Two test-retest reliabilities were computed. As a subsidiary experiment, the BSRs of the drugged and nondrugged groups were compared to evaluate the validity of BSR measures of activation level.

- 20,347
This study was designed to investigate the normal response duration curve of the arousal response to photic stimulation, and to determine the effect of simultaneous sound stimuli and attention on the duration of the arousal response. The cortical arousal responses of 80 normal Ss to single flashes of constant intensity were recorded under various conditions of auditory stimulation, attention and motivational instruction. The duration of the arousal response was analyzed and discussed in terms of its consistency and sensitivity to extraneous stimuli.

Libet, B., Feinstein, B. & Wright, E.W., Jr. TENDON AFFERENTS IN AUTOGENETIC INHIBITION IN MAN. *EEG clin. Neurophysiol.*, Feb. 1959, XI(1), 129-140. (Biomechanics Lab. & Physiology Dept., University of California, San Francisco, Calif.).
- 20,348
This study investigated the range of changes in the human EMG with different muscle lengths and analyzed the mechanisms for these changes. To test the hypothesis that the major factor producing the lower EMG in lengthened muscle is the initiation of inhibitory afferent impulses from tendon organs of the stretched muscle, the EMG of the anterior tibial and gastrocnemius muscle of 15 male Ss were taken before and after local anesthesia of the tendon with procaine. The EMG of eight patients with degeneration of afferent fibers from the muscles were taken also. The role of autogenetic inhibition in regulating some normal motor functions was discussed.

van Wulfften Palthe, P.M. PSYCHOLOGICAL CAUSES IN AIRCRAFT ACCIDENTS. *Aeromedica Acta*, 1958, VI, 69-80.

20,415

This article discusses human factors of a psychological character in aircraft accidents. Among the topics considered are emotional fainting, the mental influence of isolation, confusional states, emotional overbreathing, the effect of flicker, and vision in an empty visual field.

R 8

20,416

van Wulfften Palthe, P.M. SENSORY AND MOTOR DEPRIVATION AS A PSYCHOPATHOLOGICAL STRESS. *Aeromedica Acta*, 1958, VI, 155-168.

20,416

To investigate the effects of sensory and motor deprivation upon psychological and physiological functions, 25 Ss spent two to three hrs. in a totally dark and soundproof decompression chamber under conditions of total or partial isolation from communication with the experimenter. EEG, ECG, respiration, eye movements, and galvanic skin resistance were measured. Subjective experience and an auditory projective test were recorded. The effect of isolation on vegetative functions, consciousness, and subjective feelings were discussed.

20,417

Puister, G.J. THE INFLUENCE OF FLICKER ON THE LEVEL OF CONSCIOUSNESS. *Aeromedica Acta*, 1958, VI, 169-172.

20,417

To determine the effect of photic flicker on the level of consciousness, 26 Ss were tested on the Bourdon-Wiersma stipple test while their EEG were recorded. The experimental group was given photic stimulation at 9 and 17 cps on the second and third tests and performed the first and fourth tests without flicker. The control group performed without light interference throughout all four tests. Time, error, and omission scores were analyzed for differences within and between groups, and the results were discussed.

Begbie, G.H. ACCURACY OF AIMING IN LINEAR HAND-MOVEMENTS. *Quart. J. exp. Psychol.*, May 1959, XI (Part 2), 65-75. (Physiology Dept., Edinburgh University, England).

20,882

To study the accuracy of aiming in a horizontal plane, when the direction and length of the path can be altered, six Ss were required to draw 128 lines of four different lengths in eight different directions from a starting point toward a target point. Half the trials were run with eyes closed, half with eyes open. Accuracy was recorded by examining whether the line went to the right or the left of the target point, and by how much. Performance as a function of length, direction, and bias of the lines, and of opening or closing the eyes, was discussed with relation to a theory of movement control.

Besserer, C.W. & Besserer, Hazel C. (Eds.). GUIDE TO THE SPACE AGE. 1959. 320pp. Prentice-Hall, Inc., Englewood Cliffs, N.J. (Space Technology Laboratories, Inc., Los Angeles, Calif.).

21,002

This book aims to help standardize the specialized language associated with modern space technology and guided missileery and to present the material in a form valuable to technical and near-technical people and easily understood by the nontechnical reader. It is a complete compendium of terms currently in use; the terms are defined in layman's language, arranged alphabetically, and cover as broad an area as possible under the necessary bounds of national security. There is a cross-reference system for exactness; mathematical equations are kept to a minimum; and illustrative drawings and diagrams are used wherever possible for clarification.

Morant, G.M. BODY MEASUREMENTS IN RELATION TO WORK SPACES IN AIRCRAFT. Report from: "Anthropometry and Human Engineering. A Symposium on Anthropometry, Human Engineering and Related Subjects. AGARD Aeromedical Panel, Scheveningen, The Netherlands, 3 and 4 May, 1954." AGARDograph 5, 1955, 3-17. Butterworths Scientific Publications, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

21,054

This paper discusses the way in which information regarding body measurements may be used to insure that the dimensions of the spaces in aircraft in which personnel operate are as well suited to them as circumstances permit. The conclusions presented are based on research and its application in practice by the British Royal Air Force. The data and discussions are given under two headings: 1) the collection and reduction to convenient form of suitable body measurements for samples of community users; and 2) the use of this information in the design stage, or in modifying particular work spaces, or in selection of personnel.

AGARD Aeromedical Panel, Scheveningen, The Netherlands, 3 and 4 May 1954." AGARDograph 5, 1955, 41-46. Butterworths Scientific Publications, London, England. (RAF Institute of Aviation Medicine, Farnborough, Hants, England).

21,056

The program of research in adapting the airplane to the pilot as carried on in the United Kingdom is discussed. In particular, the efforts to standardize all aspects of interceptor fighter cockpits are mentioned. From these initial efforts, participation in early planning design and development stages has emerged. An assessment of the results of the program, some general rules on application of the results, and some future problems are discussed.

21,057

Grether, W.F. INSTRUMENT DIALS, INSTRUMENT ARRANGEMENT, AND COCKPIT DESIGN. Report from: "Anthropometry and Human Engineering. A Symposium on Anthropometry, Human Engineering and Related Subjects. AGARD Aeromedical Panel, Scheveningen, The Netherlands, 3 and 4 May 1954." AGARDograph 5, 1955, 47-62. Butterworths Scientific Publications, London, England. (USAF Aero Medical Lab., Wright-Patterson AFB, Ohio).

21,057

Some problems of human engineering (the cockpit for maximum efficiency and safety of human operations) are discussed with reference to work in the Psychology Branch of the USAF Aero Medical Laboratory at Wright Field. The problems chosen for discussion are 1) visibility of instrument markings; 2) selection of basic instrument type according to method of use; 3) control-instrument movement relationships; 4) design and arrangement of engine instruments for ease of checkreading; 5) arrangement of flight instruments; 6) standardization of design, location, and method of actuation of cockpit controls; and 7) warning lights.

21,058

Hoover, G.W. A METHODOLOGY FOR INSTRUMENT DISPLAY DESIGN. Report from: "Anthropometry and Human Engineering. A Symposium on Anthropometry, Human Engineering and Related Subjects. AGARD Aeromedical Panel, Scheveningen, The Netherlands, 3 and 4 May 1954." AGARDograph 5, 1955, 63-72. Butterworths Scientific Publications, London, England. (USN Office of Naval Research, Department of the Navy, Washington, D.C.).

21,058

An attempt is made to establish a methodology for display design for those flight instruments which provide data normally obtained from visual contact without permitting the design decisions to be influenced by personal opinion. An analysis is made of both operational requirements and psychophysiological requirements, and a program of design development is described.
T. I.

21,059

Whillans, M.G. HUMAN FACTORS IN AIRCRAFT DESIGN. Report from: "Anthropometry and Human Engineering. A Symposium on Anthropometry, Human Engineering and Related Subjects. AGARD Aeromedical Panel, Scheveningen, The Netherlands, 3 and 4 May 1954." AGARDograph 5, 1955, 113-123. Butterworths Scientific Publications, London, England. (Defence Research Medical Labs., Toronto, Ontario, Canada).

21,059

Some observations, criticisms, and suggestions related to human factors in aircraft design are offered. The topics selected for discussion are: 1) simplification of tasks, 2) visual problems, 3) heat, and 4) safety and escape.

Pierce, Jones, J. THE READABILITY OF CERTAIN STANDARD TESTS. Calif. J. Educ. Res., March 1954, 1(2), 1-3. (University of Oregon, Eugene, Ore.).

21,075

This report presents information concerning the readability of four standard tests which are employed in high schools, colleges, etc. Readability is measured by the Flesch method; only the "reading ease" scores were used in the present determinations. The four tests thus described are: Kuder Preference Record, the Bell Adjustment Inventory, the Minnesota Multiphasic Personality Inventory, and Judgments Characteristic of the Socially Competent Person.

Richardson, Bellows, Henry & Co., Inc., New York, N.Y. DEVELOPMENT OF EVALUATION PROCEDURES FOR PROTOTYPE DEVICES, SUPPLEMENT I: TO THE DEVELOPMENT OF AN EVALUATION PROCEDURE FOR TRAINING AIDS AND DEVICES. Contract N7 ONR 38302, Proj. NR 783 008, Proj. SDC 20 M 2, SDC TR 383 2 1, Feb. 1950, 76pp. USN Training Device Center, ONR, Port Washington, N.Y.

21,078

This report consists of several parts: 1) a review of background materials--a bibliography of literature sources, classification of training aids and devices, areas of evaluation of training accomplishment, and a list of business and industrial firms; 2) development of preliminary procedures for description and rating of training aids and devices (free answer, check-list description, and factor rating); 3) field trial of the free-answer and check-list procedures and their revision; 4) establishing a method for obtaining criteria for the training value of aids and devices; 5) pilot study for validation of the above procedures and their scoring; and 5) four different device evaluation blanks, each designed for determining effectiveness and usefulness of the device in question. T.

21,212

Dreyfuss, H. DESIGNING FOR PEOPLE, 1955, 240pp. Simon and Schuster, Inc., New York, N.Y.

21,212

In this book, Henry Dreyfuss, one of America's foremost industrial designers, tells how he has approached and carried out his work during the past 25 years. He discusses how the designer works, the importance of anthropometric information and of testing. His five-point formula includes utility and safety, maintenance, cost, sales appeal, and appearance. Applications of these techniques of design to many objects, from alarm clocks to destroyers, are discussed and illustrated. Some questions commonly asked by people unfamiliar with the field are included with Mr. Dreyfuss's answers. The book is illustrated with 32 pages of photographs.

DuBois, P.H.; Manning, W.H. & Spies, C.J. (Eds.). FACTOR ANALYSIS AND RELATED TECHNIQUES IN THE STUDY OF LEARNING. A REPORT OF A CONFERENCE HELD AT WASHINGTON UNIVERSITY, SAINT LOUIS, MISSOURI, 19-20 FEBRUARY 1959. Contract N0NR 816(02), Tech. Rep. 7, Aug. 1959, 190pp. Psychology Dept., Washington University, St. Louis, Mo.

21,213

Nine papers presented at a conference on factor analysis and related techniques in the study of learning are presented with their accompanying discussion. Topics include an analytic approach to factor analysis; a bibliography of factor analytic studies of learning; the triangular method of factor analysis; computation of the inverse of a matrix of correlations; learning, prediction, and the simplex method; simplex theory in learning and training; abilities and the learning of psychomotor skills; determination of generalized learning curves by factor analysis; and learning and human ability--a theoretical approach.

Rudner, R.S., Gordon, E.S. & Gordon, Rachel. AN ESSAY ON THEORY CONSTRUCTION AND THE EFFECTS OF SOME TRAINING SITUATIONS ON GROUP PRODUCTIVITY. Contract NOMB 494(03). Proj. NR 145 088, Rep. 1954 494 03 22, Aug. 1954, 210pp. Tufts University, Medford, Mass.

21,281.

"...this essay progresses from a discussion of relatively abstract and general considerations involved in the logic of theory construction in empirical science, to concrete and detailed description of one particular experiment." Chapter I, "On the Logic of Theory Construction," deals with the formalization of a theory, problems of concept formation and introduction in such theories, and problems of partial formalization. Chapter II, "Effects of Some Training Situations on Small Group Productivity," contains a partial formalization of a segment of a theory of small groups. Chapter III describes the experiment. A series of eight appendices presents instructions, description of the laboratory, and descriptions of the design considerations and experimental runs. T. G. R 23

Schutz, W.C. GROUP BEHAVIOR STUDIES, III: SCALING OF A PERSONALITY TEST FOR CONSTRUCTING COMPATIBLE GROUPS. Contract NOMB 494(03), Proj. NR 145 088, Rep. 1954 494 03 24, Aug. 1954, 36pp. Tufts University, Medford, Mass.

21,285

This study presented a refinement and extension of the original personality test. The technique of scale analysis with the intensity function was selected as the theoretically most defensible and practically most feasible method of objectifying the test. The original test was thereby expanded and given to 500 Ss. From the scale analysis of these data several scales were proposed and augmented with new items. This latter test was given to 200 naval and army Ss; 13 scales were developed on the naval Ss and validated on the army Ss. The foldover technique was used to determine the intensity function, and a zero point was determined for each scale. These new scales were related to the original test. T. G. R 7

21,309

Vitro Corporation of America. ELECTRONIC EQUIPMENT RELIABILITY PROGRAM. Contract NOMB 63389, Tech. Rep. 47, June 1953, 19pp. Silver Spring Lab., Vitro Corporation of America, Silver Spring, Md.

21,309

A method of measuring the "level of inherent reliability" of an electronic equipment is developed, and the guide lines by which the reliability of the equipment may be estimated in advance of actual production are determined. The major effort in the present phase is making necessary arrangements for early initiation of field observations and working out procedures for laboratory analyses of data from Vitro observation and other sources. At the present time, observers are accompanying two naval vessels and will soon be with a third. Observation also has begun at two shore facilities. Analysis of about 13,000 failure reports from the Bureau of Ships has been completed. Part and tube application analyses on several equipments also are in progress. T. I.

21,357

Eakin, G.J. & Campbell, G.F. HUMAN OPERATOR TRANSFER FUNCTION INVESTIGATION. Contract AF 33(038) 9204, Rep. TE 665 F 5, Oct. 1957, 99pp. Cornell Aeronautical Laboratory, Inc., Buffalo, N.Y.

21,357

"The phase and amplitude ratio of r^{-1} transfer function used by a pilot in flying an aircraft with several different handling characteristics were obtained from flight test data. The transfer function obtained relates aircraft pitch angles (as the input to the pilot) to stick force (as the output...). This data was obtained during flight tests of an artificially stabilized F-94A aircraft. During the flight tests, three sets of short period pitch axis aircraft response characteristics were utilized. At each of the three sets of characteristics, several values of stick force/g and stick displacement/g were provided. Pilot transfer functions are presented for all of the combinations of response characteristics and stick force and stick travel/g." T. I. R 6

21,438

Backlund, F. & Bergstrom, S.-S. SUBJECTIVE SCALING BASED ON THRESHOLD MEASUREMENTS. Rep. 4, Feb. 1959, 11pp. Psychological Lab., University of Uppsala, Uppsala, Sweden.

21,438

This report presents a method of obtaining subjective scales by means of absolute threshold measurements. The application of the method to data on the perception of motion and time is described. G. R 11

21,440

Banet, L. & Hirschman, A. THE PROTECTION AFFORDED BY WINDOW SCREENING MATERIALS AGAINST INTERNAL THERMAL RADIATION. FINAL REPORT. Proj. 5046 3, Part 95, Tech. Obj. AM-7, Rep. AFSWP 952, June 1956, 18pp. USN Material Lab., Brooklyn Naval Shipyard, N.Y.

21,440

To evaluate the ignition and thermal responses of window materials under exposure to a nuclear detonation, the protective value of various window coating materials was evaluated by two methods: 1) field measurements utilizing passive paper thermal indicators and 2) laboratory spectrophotometric measurements of the transmittance of the materials. The results of the two methods were compared and conclusions presented. T. G. I. R 6

21,486.

de Lhery, G.P., Derksen, W. & Monahan, T.I. THE SPECTRAL REFLECTANCE AND TRANSMITTANCE OF STANDARD FABRICS FOR THERMAL RADIATION EFFECTS STUDIES. FINAL REPORT. Proj. 5046 3, Part 91, NS 081 001, AFSWP Rep. 957, Aug. 1956, 16pp. USN Material Lab., Brooklyn Naval Shipyard, N.Y.

21,486.

This report presented data on the radiant absorbance, spectral reflectance, and transmittance of standard fabrics employed in thermal radiation research. These cotton fabrics, varying in color from undyed to deep black, were measured for radiation of wave lengths from 0.40 to 2.7 microns. The spectral characteristics of white sheeting, olive green cotton sateen, and wind-resistant poplin were determined also. T. G. R 4

21,487

Derksen, W.L. & Bates, J.J. THE INFLUENCE OF AIR SUPPLY AND AIR FLOW ON BURNS BEHIND IRRADIATED FABRICS. FINAL REPORT. Proj. 5046 3, Part 100, NS 081 001, AFSWP Rep. 1000, June 1956, 10pp. USN Material Lab., Brooklyn Naval Shipyard, N.Y.

21,487

To investigate the protection afforded by fabric systems against burns caused by intense radiant energy, the influence of air flow on burns under a fabric was studied. A fabric mounted on a skin simulant was exposed to thermal radiation under three conditions of flow--zero air supply, air moving at 0.86 ft./sec., and air moving at 10 ft./sec. The temperature use of the skin simulant and the radiant exposure required for sustained ignition of the fabric were determined for each of the air velocities. The relevance of data on air supply in evaluating the protection afforded by uniform assemblies was discussed. T. R 2

Duntley, S.Q. NOMOGRAPHS FOR CALCULATING VISIBILITY BY SWIMMERS, I. NATURAL LIGHT. Contract NOMB 72039, Proj. NS 714 100, Task 3, Rep. 3 I, May 1958, 29pp. S.Q. Duntley, 1475 Virginia Way, La Jolla, Calif.

21,489

This report presents nomographic charts for calculating the limiting range at which swimmers can sight any flat horizontal object lying on the sea bottom. It includes directions for the use of the nomographic charts, as well as illustrative numerical examples. The charts cover nine adaptation levels, ranging from brightest day to darkest night. T. G.

21,595

Maggio, R.C. & Gilhooly, T.B. HEAT-REFLECTING TEXTILES AS PROTECTIVE BARRIERS AGAINST INTENSE THERMAL RADIATION. FINAL REPORT. Proj. 5046 3 Part 77, NS OSI 001, Rep. AFSMP 849, March 1955. 13pp. USN Optics & Nucleonics Branch, Brooklyn Naval Shipyard, N.Y.

21,595

This report investigated the relative effectiveness of four heat-reflecting fabrics--aluminum foil-on-fabrics, aluminum deposits, white organic coatings, and bleached goods--as protection against radiant heat. The fabrics were mounted on an epoxy-resin skin simulant and on human skin and irradiated with thermal energy. The maximum temperature rises, time of exposure, and thermal effects during and after exposure to radiation were noted. Critical radiant exposures to cause destruction were determined. Physical properties, including reflectance, transmittance, and absorptance were presented for each textile.

Silvernail, C.J. A VARIABLE-RANGE SIMULATOR. Contract N0BS 72039, Proj. NS 714 100, Task 1, Rep. 1 3, June 1958. 6pp. S. O. Duntley, 1475 Virginia Way, La Jolla, Calif.

21,651

This report describes a variable-range viewer which may be used with binocular and terrestrial telescopes to view small test charts in the laboratory under well-controlled, realistically simulated outdoor conditions. A variable magnification optical system covers object distances from 2 to 20 miles. Changes in the simulated range automatically introduce contrast attenuation by the atmosphere. Any meteorological range from 2 to 100 miles may be preset. Applications of the viewer to optical research are discussed.

Altes, S.K. & Chu, J.H. FEASIBILITY STUDY, WIDE ANGLE TELEVISION DISPLAY. Contract 1928(00), NAVTRADEVEN TR 1507 1, Nov. 1956. 186pp. USN Training Device Center, ONR, Port Washington, N.Y. (Technical Products Dept., General Electric Company, Syracuse, N.Y.).

21,701

This study provides the simulation engineer with information on the means and methods of using television to present a wide angle, nonprogrammed visual display of a real world environment to a trainee. Relevant characteristics of the viewer, resolution requirements for such displays, and basic limitations of these systems are considered briefly. The techniques examined include Schmidt optical system, multiple tubes, light valve systems, dark trace tubes, direct view storage tubes, virtual image systems, light amplifying screens, and film intermediary projection systems. System characteristics and performance estimates are given as well as recommendations for further study.

Vernon, J.A. PROJECT HIDEAWAY. A PILOT FEASIBILITY STUDY OF FALLOUT SHELTERS FOR FAMILIES. Contract CDM SR 60 15, Dec. 1959. 36pp. Psychology Dept., Princeton University, Princeton, N.J.

21,889

To determine whether a family could remain confined in a family fallout shelter for a period of 14 days, a family of five members remained in a simulated fallout shelter for two weeks. The design of the shelter was described. Findings with respect to ventilation, heat, humidity, odor, illumination, cooking provisions, toilet facilities, refuse, activity schedules, attitudes and health were discussed. Recommendations for illumination, cooking equipment, recreation, shelter design, refuse disposal, and the art of taking shelter were made.

21,991

Military trainees (153) served as Ss in this experiment to determine the effect of position radius and magnitude of loading of CONTROL CRANKS on performance in a following tracking task. Two different positions, three sizes of radii, and three magnitudes of loading of control cranks were used. Average time-on-target was analyzed and discussed.

T. R 7

22,087

In this report a series of studies of human performance in information transmission are presented. Estimates are made of the peak information rates that men can process under near-optimal conditions. The sequential tasks investigated were piano playing, typing, reading, and doing mental arithmetic. For piano playing, scripts of random music were sight read by three skilled musicians. Such factors as the number of keys used and the speed at which the music was played were varied. The typing experiments involved skilled typists who transcribed random sequences of equiprobable symbols. The information rates estimated for oral reading and mental arithmetic are based primarily on the data of previous studies.

Mertzan, M., Orlansky, J. & Seitz, C.P. PERSONALITY ORGANIZATION AND ANOXIA TOLERANCE. ca. 1943, 41pp. New York City College, N.Y.

22.168
To determine whether submarine compressed air contains any toxic substances which would affect its suitability as a respiratory medium for use in submarine escape appliance at great depths, samples of compressed air were taken from the tanks of ten submarines operating in the New London area. The samples were analyzed for oxygen, carbon dioxide, carbon monoxide, hydrogen sulfide, arsine, stibine, aldehydes, dusts, oil vapors, and odors. Results were discussed with reference to safety standards for submarine escape appliances.
T. R 5

22.586
The problem was to determine "whether there are differences in personality patterning as indicated by the Porschach test between persons who can adjust adequately to severe conditions of anoxia and those who cannot..." 40 male Ss in groups of 2 or 3 were given the group Porschach in the City College nitrogen dilution chamber at sea level and 18,500 ft. (conditions controlled at: 70°F, 58% humidity, .6% CO₂). Normal O₂ supply deprivation lasted about 50 min., of this about 30 min. was maximum deprivation. Pulse readings were taken before and during the session. Anoxia tolerance ratings and patterns of personality organization were analyzed in detail; areas of application are considered.

22.737
Tufts University. THE EFFECT OF GREEN FILTERS ON DETAIL VISION AND DEPTH PERCEPTION IN SUNLIGHT. Rep. 12, March 1943, 7pp. Tufts University, Medford, Mass.

22.231
In this study of an analytical space suit model, three thermal problems have been examined which occur in the design of space suits to be used when personnel are outside the parent vehicle. The first concerns the temperature variation of an infinite thermal conductivity suit exposed to extreme conditions of heating and cooling. The second is related to temperature differences which may occur from the top to the bottom of the suit, thereby causing physiological discomfort. Finally, the scheme whereby these temperature differences might be ameliorated by circulating a fluid in passages behind the suit material was examined.
G. R 3

22.737
The effect of the darker green lumarith 0-4403, manufactured by Celanese Celluloid Corporation, on acuity and depth perception was tested. A testboard consisting of nine rows of four E's, placed 200 ft. from the observer, was read both with and without the filter five times. Brightness of the E's varied between 3300 and 6700 ft.-L; size of the E's varied, the median row requiring a visual acuity of 1.66. Scores of the three observers are presented. The distance of simple objects was estimated for green-on-left and green-on-right conditions. This test also was conducted in sunlight. Constant error, critical ratio and standard deviation data are presented.

22.579
This paper first discusses the usefulness of psycho-acoustic tests to the otologist in his diagnosis of hearing difficulties. A brief discussion of how some of the present tests have come to be suggested is followed by a presentation of one line of reasoning as to how a complete and mutually exclusive battery of such tests might be constructed and how a "profile" of test results may correlate higher with diagnosis than results from any one or two tests.

22.756
A study of the effects of various types of desert terrain (level hard surface, level sandy surface, and sand dune slopes) on the energy cost of carrying loads of different weights (25, 30, and 40 lbs.) representative of loads the combat soldier might be expected to carry was made. The energy cost of walking, climbing, and load carrying was determined by measurement of oxygen consumption. Pulse rates and rectal temperatures were also measured as indicators of stress. One study using nine Ss and one using four Ss in all conditions are reported. Recommendations are made as to limitations on man's capacity for physical work in the desert.

13. ABSTRACT This bibliography is the first in a planned series of bibliographies of literature pertinent to the field of human factors engineering. It covers literature from the time period of 1940 through 1959. This bibliography consists primarily of: (1) an index to the human factors literature, and (2) the annotated bibliography.		

Security Classification

Human Factors Engineering Bibliography						

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
