FOREWORD

This report is prepared as a part of in-house effort under Project No. 1473, "Exploratory Development in Structural Mechanics," Task No. 147306, "Stress and Stability Analysis of Heterogeneous Anisotropic Plates and Shells and Arches." The work was carried out in the Advanced Theory Group and Structural Synthesis Group of the Theoretical Mechanics Branch, Structures Division of the Air Force Flight Dynamics Laboratory, Air Force Systems Command, Wright-Patterson Air Force Base, Ohio. Dr. N. S. Khot (FDTR) was the Project Engineer.

This report covers work conducted during the period September 1967 to May 1968. It was released by the author in August 1968.

This technical report has been reviewed and is approved.

ABSTRACT

The effect of initial geometric imperfections on the buckling and postbuckling behavior of composite cylindrical shells are subjected to uniform axial compression is studied in this report. The solution is obtained by employing von Kármán-Donnell nonlinear strain-displacement relations and the principle of stationary potential energy. Numerical results are given for various fiber orientations in the three-layer shell consisting of either glass-epoxy or boron-epoxy composites, with different initial imperfections. Results indicate that the boron-epoxy composite shells are less imperfection sensitive than the glass-epoxy composite shells. Isotropic shells are found to be more imperfection sensitive than composite shells. It is noticed that the increase or decrease in the classical buckling load with change in fiber orientation is generally accompanied by a decrease or increase in imperfection sensitivity of the shell.

SECTION I

INTRODUCTION

This report is concerned with the influence of initial geometric imperfections on the buckling and postbuckling behavior of laminated anisotropic cylindrical shells. It has been established that geometric imperfections reduce the buckling strength of isotropic cylindrical shells and the extent of the reduction has been studied by many authors (References 1 through 8). A similar reduction in buckling strength due to initial geometric imperfections is expected in the case of the anisotropic cylindrical shells. The increasing use of fiber composite cylinders in aerospace structures prompted this study.

von Kármán-Donnell large-displacement relations, modified to include geometric imperfections, are used in the analysis. The solution to the problem is obtained by the application of the principle of stationary potential energy.

The importance of initial geometric deviations on the buckling behavior of an isotropic shell has been recognized for some time. This can be seen from the early investigations of Flügge (Reference 1) in 1932 and Donnell (Reference 2) in 1934.

However, Flügge's linear and Donnell's nonlinear analyses failed to explain the magnitude of difference between the experimental and the theoretical results. In 1950, Donnell and Wan (Reference 3) changed the procedure adopted by Donnell sixteen years earlier and proposed a new method. This method was followed by several investigators (References 4 through 7) with some modifications.

In the procedure developed by Donnell and Wan, and followed by others, the total potential energy of the system is minimized with respect to the parameters defining the shape of initial deviation of shell geometry. This implies that the shape of the cylinder is altered during minimization of the total potential energy. Madsen and Hoff in Reference 8 were the first to point out the error in this approach. In this investigation, minimization is carried out only with respect to terms of the additional displacement in radial direction caused by the applied load.

The general theory of anisotropic shells was developed by Ambartsumyan (Reference 9) and Dong et al. (Reference 10). Tasi et al. (Reference 11) and Holston, et al. (Reference 12) investigated the buckling strength of filament wound cylinders where they used the small-deflection analysis presented by Chang and Ho (References 13 and 14). The effect of heterogeneity on the stability of composite shells subjected to axial compression is investigated by Tasi (Reference 15). Thurston (Reference 16) outlined a large-displacement analysis of filament wound cylinders under axial compression, where he proposes to solve the two non-linear partial differential equations by Newton's method. The effect of fiber orientation on buckling and postbuckling behavior of geometrically perfect fiber-reinforced cylinders under axial compression is investigated by Khot (Reference 17).

The numerical results presented in this report are for the geometrically imperfect three-layer glass-epoxy and boron-epoxy composite cylindrical shells.

SECTION II

PROBLEM FORMULATION

The coordinate system employed on the reference surface is shown in Figure 1; x is taken parallel to the generator, y is measured along the circumference, and z is positive in the inward direction.

1. STRAIN-DISPLACEMENT RELATIONS

The reference surface nonlinear strain-displacement relations based on the work of Donnell (Reference 2) for a cylindrical shell of radius R with initial radial imperfections \bar{W} are given by

$$\begin{aligned}\epsilon_x &= U_{,x} + \frac{1}{2} (W_{,x})^2 - \frac{1}{2} (\bar{W}_{,x})^2 \\ \epsilon_y &= V_{,y} + \frac{1}{2} (W_{,y})^2 - \frac{1}{2} (\bar{W}_{,y})^2 - \frac{1}{R} (W - \bar{W}) \\ \epsilon_{xy} &= V_{,x} + U_{,y} + W_{,x} W_{,y} - \bar{W}_{,x} \bar{W}_{,y}\end{aligned}\quad (1)$$

where U , V , and W are the components of the reference surface displacement vector, and \bar{W} is the initial deviation of the shell in inward direction from a circular cylindrical shape. W is the total displacement in the radial direction including \bar{W} . Then $(W - \bar{W})$ is the displacement produced by the applied load only. The total strains are then given by

$$\begin{aligned}\mathcal{E}_x &= \epsilon_x - zk_x \\ \mathcal{E}_y &= \epsilon_y - zk_y \\ \mathcal{E}_{xy} &= \epsilon_{xy} - zk_{xy}\end{aligned}\quad (2)$$

where

$$\begin{aligned}k_x &= W_{,xx} - \bar{W}_{,xx} \\ k_y &= W_{,yy} - \bar{W}_{,yy} \\ k_{xy} &= 2(W_{,xy} - \bar{W}_{,xy})\end{aligned}\quad (3)$$

2. STRESS RESULTANTS

The relations between resultant stresses and strains for the entire laminated wall are written as (References 10 and 18)

$$[N] = [A][\epsilon] - [D][k] \quad (4)$$

$$[M] = [D][\epsilon] - [D^*][k] \quad (5)$$

where the elements of (3×3) matrices $[A]$, $[D]$, and $[D^*]$ are given by

$$A_{ij} = \sum_{k=1}^n C_{ij}^{(k)} (h_{k+1} - h_k)$$

$$D_{ij} = \frac{1}{2} \sum_{k=1}^{k=n} C_{ij}^{(k)} (h_{k+1}^2 - h_k^2)$$

$$D_{ij}^* = \frac{1}{3} \sum_{k=1}^n C_{ij}^{(k)} (h_{k+1}^3 - h_k^3)$$

In the above definitions n is the number of laminae, k denotes the k^{th} layer bounded by z -coordinates h_k and h_{k+1} (Figure 1(b)), and $C_{ij}^{(k)}$ is the anisotropic stiffness matrix associated with the k^{th} lamina. Inversion of Equation 4 and substitution into Equation 5 yield

$$[\epsilon] = [a][N] + [d'][k] \quad (6)$$

$$[M] = [d][N] - [d^*][k]$$

where

$$[a] = [A]^{-1} \quad [d] = [D][a]$$

$$[d'] = [a][D] = [d]^T$$

$$[d^*] = [D^*] - [D][a][D]$$

3. POTENTIAL ENERGY

The total strain energy of a multilayered cylindrical shell of radius R and length L can be expressed as the sum of the following two expressions (Reference 17)

$$\begin{aligned} \Pi_1 = \frac{1}{2} \int_0^L \int_0^{2\pi R} & (a_{11} N_x^2 + a_{22} N_y^2 + a_{66} N_{xy}^2 + 2a_{12} N_x N_y \\ & + 2a_{16} N_x N_{xy} + 2a_{26} N_y N_{xy}) dx dy \end{aligned} \quad (7)$$

$$\begin{aligned} \Pi_2 = \frac{1}{2} \int_0^L \int_0^{2\pi R} & (d_{11}^* k_x^2 + d_{22}^* k_y^2 + d_{66}^* k_{xy}^2 + 2d_{12}^* k_x k_y \\ & + 2d_{16}^* k_x k_{xy} + 2d_{26}^* k_y k_{xy}) dx dy \end{aligned} \quad (8)$$

The energy associated with the work done by the uniformly applied axial compressive end load is given by

$$\Pi_3 = - \int_0^{2\pi R} [N_x]_{x=L} dy \int_0^L U_{,x} dx \quad (9)$$

The total potential energy is then given by

$$\Pi = \Pi_1 + \Pi_2 + \Pi_3 \quad (10)$$

4. EQUILIBRIUM AND COMPATIBILITY EQUATIONS

The equilibrium equations resulting from the first variation of the total potential energy with respect to the displacements U , V and W are given by

$$N_{x,x} + N_{xy,y} = 0 \quad (11)$$

$$N_{xy,x} + N_{y,y} = 0$$

$$\begin{aligned} \frac{N_y}{R} + N_x (W_{,xx} - \bar{W}_{,xx}) + 2N_{xy} (W_{,xy} - \bar{W}_{,xy}) + N_y (W_{,yy} - \bar{W}_{,yy}) \\ + M_{x,xx} + 2M_{xy,xy} + M_{y,yy} = 0 \end{aligned} \quad (12)$$

The three unknowns in Equation 11 can be replaced by a single unknown $F(x, y)$, the Airy stress function, which is defined as

$$\begin{aligned} N_x &= F_{,yy} \\ N_y &= F_{,xx} \\ N_{xy} &= -F_{,xy} \end{aligned} \quad (13)$$

Utilizing Equations 6 and 13 in Equation 12 the equilibrium equation in radial direction can be written as

$$\begin{aligned} & d_{12} F_{,xxxx} + (2d_{62} - d_{18}) F_{,xxxy} + (d_{11} + d_{22} - 2d_{66}) F_{,xxyy} \\ & + (2d_{61} - d_{26}) F_{,xyyy} + d_{21} F_{,yyyy} + F_{,xx} (W_{,yy} + \frac{1}{R}) + F_{,yy} W_{,xx} \\ & - 2F_{,xy} W_{,xy} - d_{11}^* (W_{,xxxx} - \bar{W}_{,xxxx}) - 4d_{16}^* (W_{,xxxy} - \bar{W}_{,xxxy}) \\ & - (2d_{12}^* + 4d_{66}^*) (W_{,xxyy} - \bar{W}_{,xxyy}) - 4d_{26}^* (W_{,xyyy} - \bar{W}_{,xyyy}) \\ & - d_{22}^* (W_{,yyyy} - \bar{W}_{,yyyy}) = 0 \end{aligned} \quad (14)$$

Eliminating U and V from Equation 1 the compatibility condition can be written as

$$\begin{aligned} \epsilon_{x,yy} + \epsilon_{y,xx} - \epsilon_{xy,xy} &= (W_{,xy})^2 - W_{,xx} W_{,yy} - \frac{1}{R} W_{,xx} \\ & - (\bar{W}_{,xy})^2 + \bar{W}_{,xx} \bar{W}_{,yy} + \frac{1}{R} \bar{W}_{,xx} \end{aligned} \quad (15)$$

The above equation can be expressed in terms of stress function by utilizing Equations 6 and 13 as follows

$$\begin{aligned} & d_{22} F_{,xxxx} - 2d_{66} F_{,xxxy} + (2d_{12} + d_{66}) F_{,xxyy} - 2d_{16} F_{,xyyy} \\ & + d_{11} F_{,yyyy} = -d_{12} (W_{,xxxx} - \bar{W}_{,xxxx}) - (2d_{62} - d_{16}) (W_{,xxxy} - \bar{W}_{,xxxy}) \\ & - (d_{11} + d_{22} - 2d_{66}) (W_{,xxyy} - \bar{W}_{,xxyy}) - (2d_{61} - d_{26}) (W_{,xyyy} \\ & - \bar{W}_{,xyyy}) - d_{21} (W_{,yyyy} - \bar{W}_{,yyyy}) + (W_{,xy})^2 - (\bar{W}_{,xy})^2 \\ & - (W_{,xx} W_{,yy} - \bar{W}_{,xx} \bar{W}_{,yy}) - (\frac{1}{R} W_{,xx} - \frac{1}{R} \bar{W}_{,xx}) \end{aligned} \quad (16)$$

5. RADIAL DEFLECTION FUNCTION, INITIAL IMPERFECTION, AND COMPATIBLE STRESS FUNCTION

The following trigonometric expressions are used to represent the total radial displacement, W and initial radial imperfection, \bar{W}

$$W = W_1 \cos \frac{\pi x}{\ell_x} \cos \frac{\pi y}{\ell_y} + W_2 \cos \frac{2\pi x}{\ell_x} + W_3 \cos \frac{2\pi x}{\ell_x} \cos \frac{2\pi y}{\ell_y} + W_4 \cos \frac{4\pi x}{\ell_x} + W_0 \quad (17)$$

$$\bar{W} = \bar{W}_1 \cos \frac{\pi x}{\ell_x} \cos \frac{\pi y}{\ell_y} + \bar{W}_2 \cos \frac{2\pi x}{\ell_x} + \bar{W}_3 \cos \frac{2\pi x}{\ell_x} \cos \frac{2\pi y}{\ell_y} + \bar{W}_4 \cos \frac{4\pi x}{\ell_x} \quad (18)$$

where W_0 through W_4 are the unknown coefficients in the radial displacement function and \bar{W}_1 through \bar{W}_4 are the amplitudes of the imperfections. ℓ_x and ℓ_y are the half-wavelengths in the axial and circumferential directions.

Equation 17, assumed to represent the total radial displacement, is of the same form as that used for investigating the postbuckling behavior of geometrically perfect anisotropic shells in Reference 17, and for isotropic shells in Reference 19. In the selection of the buckling configuration (Equation 17) assumption is made that the shell may not deform into a torsional buckling mode.

Substitution of the expressions for the assumed deflected shape and initial imperfection into the compatibility equation and subsequent solution yield the following expression for the stress function

$$F = \bar{F} - \frac{\bar{\sigma} y^2}{2} \quad (19)$$

in which $\bar{\sigma}$ is the applied axial compressive load and the expression for \bar{F} is as given below

$$\begin{aligned}
 \bar{F} = & F_1 \cos \frac{\pi x}{l_x} \cos \frac{\pi y}{l_y} + F_2 \sin \frac{\pi x}{l_x} \sin \frac{\pi y}{l_y} + F_3 \cos \frac{2\pi x}{l_x} + F_4 \cos \frac{2\pi y}{l_y} \\
 & + F_5 \cos \frac{2\pi x}{l_x} \cos \frac{2\pi y}{l_y} + F_6 \sin \frac{2\pi x}{l_x} \sin \frac{2\pi y}{l_y} + F_7 \cos \frac{3\pi x}{l_x} \cos \frac{\pi y}{l_y} \\
 & + F_8 \sin \frac{3\pi x}{l_x} \sin \frac{\pi y}{l_y} + F_9 \cos \frac{\pi x}{l_x} \cos \frac{3\pi y}{l_y} + F_{10} \sin \frac{\pi x}{l_x} \sin \frac{3\pi y}{l_y} \\
 & + F_{11} \cos \frac{4\pi x}{l_x} + F_{12} \cos \frac{4\pi y}{l_y} + F_{13} \cos \frac{4\pi x}{l_x} \cos \frac{2\pi y}{l_y} \\
 & + F_{14} \sin \frac{4\pi x}{l_x} \sin \frac{2\pi y}{l_y} + F_{15} \cos \frac{5\pi x}{l_x} \cos \frac{\pi y}{l_y} + F_{16} \sin \frac{5\pi x}{l_x} \sin \frac{\pi y}{l_y} \\
 & + F_{17} \cos \frac{6\pi x}{l_x} \cos \frac{2\pi y}{l_y} + F_{18} \sin \frac{6\pi x}{l_x} \sin \frac{2\pi y}{l_y} \quad (20)
 \end{aligned}$$

where the parameters F_1 through F_{18} which are the functions of parameters W_1 through W_4 and \bar{W}_1 through \bar{W}_4 , are as given below

$$\begin{aligned}
 F_1 &= \frac{-\left\{ \bar{A}_1 \left(G_1 - \frac{l_y^2}{R\pi^2} \right) - 2\bar{B}_1 \right\} \{ G_2 \} - \bar{A}_1 G_3 G_4}{G_2^2 - G_4^2} \\
 F_2 &= \frac{\bar{A}_1 G_3 G_2 + \left\{ \bar{A}_1 \left(G_1 - \frac{l_y^2}{R\pi^2} \right) + 2\bar{B}_1 \right\} G_4}{G_2^2 - G_4^2} \\
 F_3 &= \bar{A}_2 \left\{ -\frac{d_{12}}{a_{22}} + \frac{l_y^2}{4\mu^2 a_{22} R\pi^2} \right\} - \frac{\bar{C}_1}{32\mu^2 a_{22}} \\
 F_4 &= \bar{C}_1 \left\{ -\frac{1}{32\eta^2 a_{11}} \right\} + \bar{B}_0 \left\{ -\frac{1}{2\eta^2 a_{11}} \right\} \\
 F_8 &= \frac{\left\{ -\bar{A}_3 \left(G_1 - \frac{l_y^2}{4R\pi^2} \right) - 2\bar{B}_2 \right\} - \bar{A}_3 G_3 G_4}{G_2^2 - G_4^2} \quad (21)
 \end{aligned}$$

$$F_6 = \frac{\bar{A}_3 G_3 G_2 + \left\{ \bar{A}_3 \left(G_1 - \frac{l_y^2}{4R\pi^2} \right) - 2\bar{B}_2 \right\} G_4}{G_2^2 - G_4^2}$$

$$F_7 = - \left\{ 4\bar{B}_3 + 2\bar{B}_1 + 8\bar{B}_4 \right\} G_5 / (G_5^2 - G_6^2)$$

$$F_8 = \left\{ 4\bar{B}_3 + 2\bar{B}_1 + 8\bar{B}_4 \right\} G_6 / (G_5^2 - G_6^2)$$

$$F_9 = -4\bar{B}_3 G_7 / (G_7^2 - G_8^2)$$

$$F_{10} = 4\bar{B}_3 G_8 / (G_7^2 - G_8^2)$$

$$F_{11} = \bar{A}_4 \left\{ -\frac{d_{12}}{a_{22}} + \frac{l_y^2}{16\bar{\mu}^2 a_{22} \pi^2 R} \right\} - \frac{\bar{C}_3}{32\bar{\mu}^2 a_{22}}$$

$$F_{12} = -\bar{C}_3 / 32 \bar{\eta}^2 a_{11}$$

$$F_{13} = -\bar{B}_5 G_9 / (G_9^2 - G_{10}^2)$$

$$F_{14} = \bar{B}_5 G_{10} / (G_9^2 - G_{10}^2)$$

$$F_{15} = -8\bar{B}_4 G_{11} / (G_{11}^2 - G_{12}^2)$$

$$F_{16} = 8\bar{B}_4 G_{12} / (G_{11}^2 - G_{12}^2)$$

$$F_{17} = -2\bar{B}_2 G_{13} / (G_{13}^2 - G_{14}^2)$$

$$F_{18} = 2\bar{B}_2 G_{14} / (G_{13}^2 - G_{14}^2)$$

$$\bar{\mu} = \frac{l_y}{l_x}$$

$$\bar{\eta} = \frac{l_x}{l_y}$$

$$\bar{A}_1 = W_1 - \bar{W}_1$$

$$\bar{A}_2 = W_2 - \bar{W}_2$$

$$\bar{A}_3 = W_3 - \bar{W}_3$$

$$\bar{A}_4 = W_4 - \bar{W}_4$$

$$\bar{B}_1 = \bar{W}_1 \bar{W}_2 - \overline{W_1 W_2}$$

$$\bar{B}_2 = \bar{W}_3 \bar{W}_4 - \overline{W_3 W_4}$$

$$\bar{B}_3 = \bar{W}_1 \bar{W}_3 - \overline{W_1 W_3}$$

$$\bar{B}_4 = \bar{W}_1 \bar{W}_4 - \overline{W_1 W_4}$$

$$\bar{C}_1 = \bar{W}_1^2 - \overline{W_1^2}$$

$$\bar{C}_3 = \bar{W}_3^2 - \overline{W_3^2}$$

$$G_1 = d_{12} \bar{\mu}^2 + d_{21} \bar{\eta}^2 + (d_{11} + d_{22} - 2d_{66})$$

$$G_2 = a_{22} \bar{\mu}^2 + a_{11} \bar{\eta}^2 + (2a_{12} + a_{66})$$

$$G_3 = (2d_{62} - d_{16}) \bar{\mu} + (2d_{61} - d_{26}) \bar{\eta}$$

$$G_4 = 2\bar{\mu} a_{26} + 2\bar{\eta} a_{16}$$

$$G_5 = 81 a_{22} \bar{\mu}^2 + a_{11} \bar{\eta}^2 + 9(2a_{12} + a_{66})$$

$$G_6 = 54 \bar{\mu} a_{26} + 6 \bar{\eta} a_{16}$$

$$G_8 = 6 \bar{\mu} a_{26} + 54 \bar{\eta} a_{16}$$

$$G_9 = 32 a_{22} \bar{\mu}^2 + 2 a_{11} \bar{\eta}^2 + 8(2a_{12} + a_{66})$$

$$G_{10} = 32 \bar{\mu} a_{26} + 8 \bar{\eta} a_{16}$$

$$G_{11} = 625 a_{22} \bar{\mu}^2 + a_{11} \bar{\eta}^2 + 25(2a_{12} + a_{66})$$

$$G_{12} = 250 \bar{\mu} a_{26} + 10 \bar{\eta} a_{16}$$

$$G_{13} = 81 a_{22} \bar{\mu}^2 + a_{11} \bar{\eta}^2 + 9(2a_{12} + a_{66})$$

$$G_{14} = 54 a_{26} \bar{\mu} + 6 a_{16} \bar{\eta}$$

6. UNIT END-SHORTENING AND UNIFORM RADIAL DISPLACEMENT

The unit end-shortening caused by the uniformly applied compressive end load is given by

$$\bar{\epsilon} = -\frac{1}{L} \int_0^L U_{,x} dx \quad (22)$$

then, through utilization of Equations 1, 17, 18, and 19, and integrating Equation 22 end-shortening can be written as

$$\bar{\epsilon} = a_{11}\bar{\sigma} + \left[(W_1^2 - \bar{W}_1^2) + 8(W_2^2 - \bar{W}_2^2) + 4(W_3^2 - \bar{W}_3^2) + 32(W_4^2 - \bar{W}_4^2) \right] \frac{\pi^2}{8\ell_x^2} \quad (23)$$

The continuity condition for the circumferential displacement is given by

$$\int_0^{2\pi R} v_{,y} dy = \int_0^{2\pi R} \left[a_{12}F_{,yy} + a_{22}F_{,xx} - a_{26}F_{,xy} + d_{12}W_{,xx} + d_{22}W_{,yy} + 2d_{62}W_{,xy} - \frac{1}{2}(W_{,y})^2 + \frac{1}{2}(\bar{W}_{,y})^2 + \frac{W}{R} - \frac{\bar{W}}{R} \right] dy = 0 \quad (24)$$

Substitution of the assumed radial deflection function, initial imperfection and stress function into the continuity condition yields the following expression for W_0

$$W_0 = R a_{12}\bar{\sigma} + \left[(W_1^2 - \bar{W}_1^2) + 4(W_3^2 - \bar{W}_3^2) \right] \frac{\pi^2 R}{8\ell_y^2} \quad (25)$$

7. TOTAL POTENTIAL ENERGY

Utilizing Equations 17 through 25, the following expression for the total potential energy is obtained

$$\begin{aligned}
 \Pi \frac{4R}{\pi L d_{22}^*} = & \frac{1}{\omega^2} \left[\frac{T_1}{T_1^2 - T_2^2} \left\{ T_3^2 A_1^2 + 16 T_{13}^2 A_3^2 + T_4^2 (A_1^2 + 16 A_3^2) + 4 T_3 A_1 B_1 \mu^2 \right. \right. \\
 & + 64 T_{13} A_3 B_2 \mu^2 + 4 B_1^2 \mu^4 + 64 B_2^2 \mu^4 \left. \left. \right\} + \frac{T_2 T_4}{T_1^2 - T_2^2} \left\{ 2 T_3 A_1^2 \right. \right. \\
 & + 32 T_{13} A_3^2 + 4 A_1 B_1 \mu^2 + 64 A_3 B_2 \mu^2 \left. \left. \right\} + \frac{T_6}{T_6^2 - T_8^2} \left\{ (4 B_3 \right. \right. \\
 & + 2 B_1 + 8 B_4)^2 + 64 B_2^2 \left. \left. \right\} \mu^4 + \frac{T_7}{T_7^2 - T_8^2} 16 B_3^2 \mu^4 \right. \\
 & + \frac{T_9}{T_9^2 - T_{10}^2} 64 B_4^2 \mu^4 + \frac{T_{11}}{T_{11}^2 - T_{12}^2} 4 B_5^2 \mu^4 + 2 A_2^2 \omega^2 + 2 A_3^2 \omega^2 \\
 & + \frac{1}{32} C_1^2 + \frac{1}{2} C_3^2 - \frac{1}{2} C_1 A_2 \omega - 2 C_3 A_4 \omega + A_1^2 + 16 A_3^2 \\
 & + \left\{ 32 A_2^2 \kappa^2 + 512 A_4^2 \kappa^2 + \frac{1}{32} C_1^2 + \frac{1}{2} C_3^2 + 8 B_5^2 + C_1 B_5 \right. \\
 & + A_1^2 \phi + 32 A_2^2 \phi + 16 A_3^2 \phi + 512 A_4^2 \phi \left. \right\} \mu^4 - \kappa (A_2^2 + 4 A_4^2) 16 \omega \mu^2 \\
 & + \kappa (A_2 C_1 + 16 A_4 C_3) 2 \mu^2 + \rho \sqrt{\phi} (A_1^2 + 32 A_3^2) 2 \mu^2 \\
 & - \left. \left\{ C_1 + 8 C_2 + 4 C_3 + 32 C_4 \right\} 2 \sigma \mu^2 \omega \right] + \text{constants} \quad (26)
 \end{aligned}$$

where

$$\begin{aligned}
 P_i &= \frac{W_i}{(a_{22} d_{22}^*)^{1/2}} & \bar{P}_i &= \frac{\bar{W}_i}{(a_{22} d_{22}^*)^{1/2}} \quad i = 1 \text{ through } 4 \\
 \mu &= \frac{l_y}{l_x} \left(\frac{a_{22}}{a_{11}} \right)^{1/4} & \omega &= \frac{R}{(a_{22} d_{22}^*)^{1/2}} \frac{1}{N^2} \\
 N &= \frac{\pi R}{l_y} & \sigma &= \frac{\bar{\sigma} R}{2} \left(\frac{a_{11}}{d_{22}^*} \right)^{1/2}
 \end{aligned} \quad (27)$$

$$\begin{aligned}
 A_1 &= P_1 - \bar{P}_1 & A_2 &= P_2 - \bar{P}_2 \\
 A_3 &= P_3 - \bar{P}_3 & A_4 &= P_4 - \bar{P}_4 \\
 B_1 &= P_1 P_2 - \bar{P}_1 \bar{P}_2 & B_2 &= P_3 P_4 - \bar{P}_3 \bar{P}_4 \\
 B_3 &= P_1 P_3 - \bar{P}_1 \bar{P}_3 & B_4 &= P_1 P_4 - \bar{P}_1 \bar{P}_4 \\
 B_5 &= P_2 P_3 - \bar{P}_2 \bar{P}_3 & & \\
 C_1 &= P_1^2 - \bar{P}_1^2 & C_2 &= P_2^2 - \bar{P}_2^2 \\
 C_3 &= P_3^2 - \bar{P}_3^2 & C_4 &= P_4^2 - \bar{P}_4^2
 \end{aligned}$$

The values of T_1 through T_{13} appearing in the energy expression are as follows

$$\begin{aligned}
 T_1 &= \mu^4 + \alpha \mu^2 + 1 & T_8 &= 6\mu(\mu^2 \beta + 9\gamma) \\
 T_2 &= 2\mu(\mu^2 \beta + \gamma) & T_9 &= 625\mu^4 + 25\alpha\mu^2 + 1 \\
 T_3 &= \kappa\mu^4 + \psi\mu^2 + \lambda - \mu^2 \omega & T_{10} &= 10\mu(25\mu^2 \beta + \gamma) \\
 T_4 &= \mu(\nu\mu^2 + \xi) & T_{11} &= 16\mu^4 + 4\alpha\mu^2 + 1 \\
 T_5 &= 81\mu^4 + 9\alpha\mu^2 + 1 & T_{12} &= 4\mu(4\mu^2 \beta + \gamma) \\
 T_6 &= 6\mu(9\mu^2 \beta + \gamma) & T_{13} &= \kappa\mu^4 + \psi\mu^2 + \lambda - \frac{\omega}{4} \mu^2 \\
 T_7 &= \mu^4 + 9\alpha\mu^2 + 1 & &
 \end{aligned}$$

where the stiffness parameters α, β , etc. are defined by the following relations

$$\alpha = \frac{2a_{12} + a_{66}}{\sqrt{a_{11} a_{22}}}$$

$$\beta = \frac{a_{26}}{a_{11}^{1/4} a_{22}^{3/4}}$$

$$\begin{aligned} \gamma &= \frac{a_{16}}{a_{22}^{1/4} a_{11}^{3/4}} \\ \nu &= \frac{2d_{62} - d_{16}}{\sqrt{a_{22} d_{22}^*}} \sqrt{\frac{a_{11}}{a_{22}}} \\ \xi &= \frac{2d_{61} - d_{26}}{\sqrt{a_{22} d_{22}^*}} \sqrt{\frac{a_{22}}{a_{11}}} \\ \kappa &= \frac{d_{12}}{a_{22}} \sqrt{\frac{a_{11}}{d_{22}^*}} \\ \lambda &= \frac{d_{21}}{\sqrt{a_{11} d_{22}^*}} \\ \psi &= \frac{d_{11} + d_{22} - 2d_{66}}{\sqrt{a_{11} d_{22}^*}} \\ \rho &= \frac{d_{12}^* + 2d_{66}^*}{\sqrt{d_{11}^* d_{22}^*}} \\ \phi &= \frac{a_{11} d_{11}^*}{a_{22} d_{22}^*} \end{aligned} \tag{28}$$

The end-shortening $\bar{\epsilon}$ (Equation 23) may be redefined as a new parameter

$$\begin{aligned} \epsilon &= \sigma + \frac{1}{16} \left[(P_1^2 - \bar{P}_1^2) + 8(P_2^2 - \bar{P}_2^2) + 4(P_3^2 - \bar{P}_3^2) \right. \\ &\quad \left. + 32(P_4^2 - \bar{P}_4^2) \right] \frac{\mu^2}{\omega} \end{aligned} \tag{29}$$

where

$$\epsilon = \frac{\bar{\epsilon} R}{2 \sqrt{a_{11} d_{22}^*}} \tag{30}$$

8. NONLINEAR ALGEBRAIC EQUATIONS

The condition that for a given σ (i. e., applied axial compressive load) the total potential energy has a stationary value for small variation of P_1, P_2, P_3, P_4 is equivalent to

$$\frac{\partial V}{\partial P_1} = \frac{\partial V}{\partial P_2} = \frac{\partial V}{\partial P_3} = \frac{\partial V}{\partial P_4} = 0 \quad (31)$$

This yields the following four nonlinear algebraic equations

$$\begin{aligned} & \frac{T_1}{T_1^2 - T_2^2} \left\{ 2(T_3^2 + T_4^2)A_1 + 4T_3(B_1 + A_1P_2)\mu^2 + 8B_1P_2\mu^4 \right\} \\ & + \frac{T_2T_4}{T_1^2 - T_2^2} \left\{ 4T_3A_1 + 4\mu^2(B_1 + A_1P_2) \right\} + \frac{T_5}{T_5^2 - T_6^2} \left\{ 2(4B_3 + 2B_1 \right. \\ & + 8B_4)(4P_3 + 2P_2 + 8P_4)\mu^4 \left. \right\} + \frac{T_7}{T_7^2 - T_8^2} 32B_3P_3\mu^4 \\ & + \frac{T_9}{T_9^2 - T_{10}^2} \left\{ 128B_4P_4\mu^4 + \frac{C_1P_1}{8} - P_1A_2\omega + 2A_1 + \left\{ \frac{C_1P_1}{8} + 2P_1B_5 \right. \right. \\ & \left. \left. + 2A_1\phi \right\} \mu^4 + 4\kappa A_2P_1\mu^2 + 4\rho\sqrt{\phi}A_1\mu^2 - 4P_1\sigma\mu^2\omega \right\} = 0 \\ & \frac{T_1}{T_1^2 - T_2^2} \left\{ 4T_3A_1P_1\mu^2 + 8B_1P_1\mu^4 \right\} + \frac{T_2T_4}{T_1^2 - T_2^2} 4A_1P_1\mu^2 \\ & + \frac{T_5}{T_5^2 - T_6^2} \left\{ 8P_1(2B_3 + B_1 + 4B_4)\mu^4 \right\} + \frac{T_{11}}{T_{11}^2 - T_{12}^2} 8B_5P_3\mu^4 + 4A_2\omega^2 \\ & - \frac{C_1\omega}{2} + \left\{ 64A_2\kappa^2 + 16B_5P_3 + C_1P_3 + 64A_2\phi \right\} \mu^4 - 32\kappa A_2\omega\mu^2 \\ & + 2\kappa C_1\mu^2 - 32P_2\sigma\mu^2\omega = 0 \end{aligned}$$

$$\begin{aligned}
& \frac{T_1}{T_2 - T_2} \left\{ 32 A_3 (T_{13}^2 + T_4^2) + 64 T_{13} \mu^2 (B_2 + A_3 P_4) + 128 B_2 P_4 \mu^4 \right\} \\
& + \frac{T_2 T_4}{T_1^2 - T_2^2} \left\{ 64 T_{13} A_3 + 64 \mu^2 (B_2 + A_3 P_4) \right\} + \frac{T_5}{T_5^2 - T_6^2} \left\{ 16 (2 B_3 + B_1 \right. \\
& + 4 B_4) P_1 + 128 B_2 P_4 \left. \right\} \mu^4 + \frac{T_7}{T_7^2 - T_8^2} 32 B_3 P_1 \mu^4 + \frac{T_{11}}{T_{11}^2 - T_{12}^2} 8 B_5 P_2 \mu^4 \\
& + 64 \kappa A_4 P_3 \mu^2 + 2 C_3 P_3 - 4 A_4 P_5 \omega + 32 A_3 + \left\{ 2 C_3 P_3 + 16 B_5 P_2 + C_1 P_2 \right. \\
& \left. + 32 A_3 \phi \right\} \mu^4 + 128 \rho \sqrt{\phi} A_3 \mu^2 - 16 P_3 \sigma \mu^2 \omega = 0
\end{aligned}$$

$$\begin{aligned}
& \frac{T_1}{T_1^2 - T_2^2} \left\{ 64 T_{13} A_3 P_3 \mu^2 + 128 B_2 P_3 \mu^4 \right\} + \frac{T_2 T_4}{T_1^2 - T_2^2} 64 A_3 P_3 \mu^2 \\
& + \frac{T_6}{T_6^2 - T_6^2} \left\{ 32 (2 B_3 + B_1 + 4 B_4) P_1 + 128 B_2 P_3 \right\} \mu^4 \\
& + \frac{T_9}{T_9^2 - T_{10}^2} 128 B_4 P_1 \mu^4 + 4 A_4 \omega^2 - 2 C_3 \omega + \left\{ \kappa^2 + \phi \right\} 1024 A_4 \mu^4 \\
& - 128 \kappa A_4 \omega \mu^2 + 32 \kappa C_3 \mu^2 - 128 \sigma \mu^2 \omega P_1 = 0
\end{aligned}$$

The imperfection sensitivity of a cylindrical shell can be measured by a quantity ρ^* which is defined as the ratio of the buckling load of an initially imperfect shell to the classical buckling load. If σ_{\max} is considered as the buckling load of the imperfect shell and $\sigma_{c\ell}$ its classical buckling load then

$$\rho^* = \frac{\sigma_{\max}}{\sigma_{c\ell}} \quad (32)$$

For small imperfections the cylindrical shell passes through a maximum load σ_{\max} state before it snaps through. In case of large imperfections however, the cylinder does not experience snap-through and hence σ_{\max} is not well defined (see Figure 2). For a given shell σ_{\max} depends upon imperfection parameters \bar{P}_1 through \bar{P}_4 , μ , and ω .

The values of deflection parameters P_1 through P_4 can be obtained by solving Equation 32. The solution of this set of equations depends upon the parameters α through ϕ (stiffness), \bar{P}_1 through \bar{P}_4 (initial imperfection amplitudes), μ (aspect ratio), ω (circumferential wave number) and σ (applied axial load). End-shortening \mathcal{E} corresponding to the applied load σ can be calculated from Equation 29. The stiffness parameters α through ϕ can be calculated knowing the thickness of the shell, number of layers and the elastic properties of material in each layer (Reference 17). \bar{P}_1 through \bar{P}_4 depend upon the amplitudes of assumed deviations from the geometrically perfect cylindrical shell. The parameters μ and ω depend upon the wavelengths of assumed initial geometric imperfection. For isotropic cylindrical shells Koiter (Reference 20), Hutchinson (Reference 21), and Madsen and Hoff (Reference 8) predicted that the imperfections with wavelengths equal to those for small-deflection buckling mode are most critical. The parameters μ and ω for anisotropic cylindrical shells corresponding to buckling mode for small-deflection theory can be calculated from equations given in Reference 17.

9. NUMERICAL ANALYSIS

The set of nonlinear algebraic equations (Equation 32) can be solved by Newton-Raphson iterative technique (Reference 22). A FORTRAN IV computer program was written for IBM 7094 to solve the equations and to evaluate \mathcal{E} for given σ , or σ for given \mathcal{E} .

SECTION III

RESULTS AND CONCLUSIONS

From the theoretical analysis developed in the previous sections, it is seen that the behavior of the cylindrical shell depends upon ten stiffness parameters α , β , etc. Because of this large number of parameters, it is not possible to present meaningful general results in terms of stiffness parameters. Accordingly, a three-layer cylindrical shell of radius 6.0 inches and thickness 0.036 inch is selected to illustrate the application of the theory and to arrive at conclusive results. The thickness of each layer is 0.012 inch and all layers consist of either glass-epoxy or boron-epoxy composites. The elastic constants of the composites are as given below.

glass - epoxy	boron - epoxy
$E_{11} = 7.5 \times 10^6$ psi	$E_{11} = 40.0 \times 10^6$ psi
$E_{22} = 3.5 \times 10^6$ psi	$E_{22} = 4.5 \times 10^6$ psi
$\nu_{12} = 0.25$	$\nu_{12} = 0.25$
$G = 1.25 \times 10^6$ psi	$G = 1.5 \times 10^6$ psi
$\nu_{21} = \nu_{12} E_{22} / E_{11}$	

Two sets of fiber orientations are considered. The fiber orientations in outer, central, and inner layers, respectively, are 1) $\theta^\circ, -\theta^\circ, 0^\circ$, 2) $\theta^\circ, -\theta^\circ, 90^\circ$ where θ assumes values ranging from 0° to 90° with 10-degree intervals. The two sets will be referred by notation 1- θ and 2- θ , and the numerical value of θ will indicate corresponding fiber orientation. For example, 1.20 corresponds to fiber orientation ($20^\circ, -20^\circ, 0^\circ$). When θ is zero, fibers are axially oriented, and when it is 90° the fibers are circumferentially oriented (Figure 4). The stiffness parameters α , β , etc., for these sets of fiber orientation may be found in Reference 17. The critical classical buckling load parameter $\sigma_{c\ell}$, buckling load $\bar{\sigma}_{c\ell}$, aspect ratio parameter μ and the circumferential wave number for small-deflection theory are given in Tables 1 and 2 for glass-epoxy and boron-epoxy composite cylindrical shells. These values are calculated with the aid of the computer program given in Reference 17.

To study the influence of initial geometric imperfections, the relative values of the initial imperfection amplitudes and parameters are set to

$$\bar{W}_1 = +4\bar{W}_2 = -4\bar{W}_3 = 16\bar{W}_4 \quad (34)$$

and

$$\bar{P}_1 = +4\bar{P}_2 = -4\bar{P}_3 = 16\bar{P}_4$$

These are the same as those given by Yoshimura buckling pattern (Reference 8). The imperfection ratio \bar{W}^* is defined here as the ratio of the sum of initial imperfection amplitudes to the thickness of the shell t . The following relation is obtained from Equations 27 and 34.

$$\bar{P}_4 = \frac{\bar{W}^* t}{\sqrt{a_{22} d_{22}^*}} \cdot \frac{1}{17}$$

For a specified value of \bar{W}^* the initial imperfection amplitude parameters \bar{P}_1 through \bar{P}_4 can be calculated from Equations 34 and 35.

For isotropic cylindrical shells all stiffness parameters given in Equation 27 are zero except that $\alpha/2 = P = \phi = 1$. Figure 3 shows the curves of the end-shortening parameter ϵ against the axial load parameter σ for an isotropic shell for different values of imperfection ratio \bar{W}^* . When \bar{W}^* is zero σ_{max} is equal to σ_{c1} which is equal to unity for the isotropic shell. In Reference 8, only two terms, corresponding to \bar{W}_1 and \bar{W}_2 are used in the assumed \bar{W} function to study the behavior of an isotropic shell. It is observed that for an isotropic shell the values of σ_{max} evaluated from the theory developed for anisotropic shells in this report are comparable to those given in Reference 8.

Figures 4 and 5 show the load-shortening curves for glass-epoxy and boron-epoxy composite cylindrical shells for fiber orientation $(0^\circ, 0^\circ, 0^\circ)$. In Tables 3 to 18, the values of σ_{max} , $\bar{\sigma}_{max}$, ρ^* and ϵ_{max} are given for $\bar{W}^* = 0.01, 0.02, 0.04, 0.06, 0.08, 0.1, 0.2, \text{ and } 0.3$ for glass-epoxy and boron-epoxy composite cylindrical shells. The same results are also presented in Figures 6 through 13. The discontinuity in the curves simply indicate that for that range of orientation there is no snap-through. Figure 6 gives the variation of $\bar{\sigma}_{max}$ with the fiber orientation $(\theta^\circ, -\theta^\circ, 0^\circ)$ for a three-layer, glass-epoxy composite. Figure 7 shows the variation of imperfection sensitivity ρ^* for the same

set. From these figures, it is evident that increase or decrease in classical buckling load with change in fiber orientation is generally accompanied by a decrease or increase in imperfection sensitivity. The same behavior can be observed in the case of a glass-epoxy composite for fiber orientation ($\theta, -\theta, 90^\circ$). From Figures 8, 9, 12, and 13 similar behavior is observed for boron-epoxy composite shells. In Figures 7, 9, 11, and 13 the values of ρ^* for isotropic shells are given for the purpose of comparison. It can be seen that the composite shells are less imperfection sensitive than isotropic shells and boron-epoxy composite shells are less imperfection sensitive than glass-epoxy composite shells.

13. ABSTRACT <p>The effect of initial geometric imperfections on the buckling and postbuckling behavior of composite cylindrical shells subjected to uniform axial compression is studied in this report. The solution is obtained by employing von Kármán-Donnell nonlinear strain-displacement relations and the principle of stationary potential energy. Numerical results are given for various fiber orientations in the three-layer shell consisting of either glass-epoxy or boron-epoxy composites, with different initial imperfections. Results indicate that the boron-epoxy composite shells are less imperfection sensitive than the glass-epoxy composite shells. Isotropic shells are found to be more imperfection sensitive than composite shells. It is noticed that the increase or decrease in the classical buckling load with change in fiber orientation is generally accompanied by a decrease or increase in imperfection sensitivity of the shell.</p>
