

THE EFFECT OF CHRONIC HYPERCAPNIA ON OXYGEN
AFFINITY AND 2, 3 DIPHOSPHOGLYCERATE AS
RELATED TO SUBMARINE EXPOSURE

SUMMARY PAGE

THE PROBLEM

To better define the pH controlled regulation of oxygen release and its relation to changes in 2,3-diphosphoglycerate levels

affect 2, 3 DPG levels, follow the pH changes with a time lag.

In vitro the pH dependent changes in 2, 3 DPG take place within three hours under optimal conditions¹⁶.

In adaptation to high altitude, a fall in pH due to hypocapnia of hyperventilation occurs together with hypoxia resulting in a simultaneous rise in 2, 3 DPG and P₅₀.

Evidence indicating that the rise in pH contributes to the increase in 2, 3 DPG in hypoxia has been provided by Gerlach et al.¹⁷ who demonstrated that the increase in 2, 3 DPG produced by 24-hour exposure of rats to 11% O₂ was abolished when 5% CO₂ was added to the low oxygen gas mixture. In human subject, studied at high altitude, the 2, 3 DPG changes reached one-half of its maximum within six hours and the maximum within 24 hours after arriving at altitude¹⁸. Although the 2, 3 DPG changes in chronic hypercapnia are in opposite direction, the time sequence reported here is similar to that observed in altitude adaptation.

While the decrease of 2, 3 DPG follows the fall in pH with a time lag during the uncompensated phase of respiratory acidosis, the subsequent increase in 2, 3 DPG during the compensated phase of respiratory acidosis (three and seven days) does not exhibit a time lag but closely parallels the rise in pH. This difference in the relationship of pH

here demonstrate clearly that the red cell pH changes are the primary cause of the changes in oxygen affinity.

We have demonstrated in chronic hypercapnia the involvement of two mechanisms, which are pH dependent and are known to influence oxygen affinity: 1) changes in 2, 3 DPG, and 2) changes in red cell cations². The latter findings were obtained in previous work carried out under identical experimental conditions. The correlation coefficients between P₅₀ and 2, 3 DPG were 0.93 and between P₅₀ and red cell cations 0.97. There is obviously a relation between 2, 3 DPG changes and red cell cation permeability in chronic hypercapnia. It is not possible to state, at this time, how they are linked together.

The observed findings on 2, 3 DPG changes in chronic hypercapnia underline the significance of the pH controlled regulation of oxygen release from hemoglobin which has recently been emphasized by Astrup¹⁹ on the basis of clinical studies.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry, no matter how small, should be recorded to ensure the integrity of the financial statements. This includes not only sales and purchases but also expenses and income. The document further explains that proper record-keeping is essential for identifying trends, managing cash flow, and complying with tax regulations.

In addition, the document highlights the need for regular reconciliation of accounts. By comparing the company's internal records with bank statements and other external sources, discrepancies can be identified and corrected promptly. This process helps to prevent errors from accumulating and ensures that the financial data remains reliable.

The second part of the document focuses on the classification of assets and liabilities. It provides a detailed breakdown of how different types of assets, such as property, equipment, and inventory, should be valued and reported. Similarly, it outlines the methods for classifying liabilities, distinguishing between short-term and long-term obligations. This section is crucial for providing a clear picture of the company's financial position.

Finally, the document addresses the preparation of financial statements. It offers guidance on how to format and present the balance sheet, income statement, and cash flow statement. It stresses the importance of consistency in the reporting process and the need to adhere to established accounting standards. By following these guidelines, companies can ensure that their financial statements are both accurate and transparent.

13. ABSTRACT <p>The relationship between oxygen affinity and 2, 3 diphosphoglycerate (2,3 DPG) in the red cell has been studied in chronic hypercapnia induced by prolonged exposure of guinea pigs to 15% CO₂ in 21% O₂. Red cell pH fell to a minimum after six hours of exposure and subsequently rose without reaching initial values after seven days of exposure. Both oxygen half-saturation pressure (P₅₀) and the level of 2, 3 DPG of the red cells followed the time course of the pH changes. However, both parameters required 24 hours to reach a minimum, following which they increased steadily and were not different from control values after seven days of exposure.</p>
