Contract DAHC04-68-C-0037

Duration of Contract: June 1968 - June 1971 Amount of Contract: \$105,000

STIMULATED RAMAN AND CONCENTRATION SCATTERING

Final Technical Report

Contractor: President and Fellows of Harvard College

Principal Investigator: N. Bloembergen, 617/495-3336

Project Scientist: H. Lowdermilk, 617/495-4466

This research was supported by the Advanced Research Projects Agency of the Department of Defense and was monitored by the U.S. Army Research Office-Durham, Box CM, Duke Station, Durham, North Carolina 27706 under Contract No. DAHC04-68-C-0037.

## July 1971

This document has been approved for public release and sale; its distribution is unlimited. Reproduction in whole or in part is permitted by the U. S. Government.

## STIMULATED RAMAN AND CONCENTRATION SCATTERING

## A. Personnel:

During the period on this contract June 1968 - June 1971, the following scientific personnel has been associated with it,

Dr. N. Bloembergen, Gordon McKay Professor of Applied Physics, Dr. C. S. Wang, Research Fellow,

Mr. W. H. Lowdermilk, Graduate Student.

Mr. Lowdermilk was granted the Ph.D. degree by Harvard University in June 1971. His Ph.D. thesis was based on the research supported by this contract.

## B. Statement of Problem Studied:

In the first year of this contract attention was mainly devoted to the stimulated raman scattering in heavy hydrogen gas  $D_2$ . The effect was observed and preliminary data were compared with previously published results on  $H_2$ . At the same time a theoretical study was made of transient raman scatter, ng in collaboration with a project supported by the Joint Services Electronics Program. This theoretical investigation resulted in a publication in the Physical Review, listed below as reference 1.

Since stimulated raman gain in  $D_2$  is considerable lower than in  $H_2$  at the same pressure and temperature, considerable effort was spent on the construction of a cryostat, able to maintain a high-pressure  $D_2$  cell at  $77^{\circ}$ K. At that time the focus of attention shifted to the

Į –

phenomenon of stimulated concentration scattering in gaseous mixtures. It was realized that the available equipment of a controlled ruby laser oscillator plus a ruby amplifier could be used advantageously to the concentration scattering problem. Since the atmosphere is a mixture of gases, a basic understanding of propagation characteristics of high power laser beams in gaseous mixtures was desirable.

The last two years of effor: under this contract were therefore exclusively devoted to the study of stimulated concentration scattering. The theory of the effect was published in the Physical Review (reference 2) and was also incorporated as Appendix A in Technical Report No. 1, dated October 1970. What is believed to be the first unambiguous demonstration of stimulated concentration scattering was the change of frequency of the back scattered light in a mixture of  $SF_6$  and He as a function of the partial He concentration. This result was published in Physical Review Letters (reference 3) and also appeared as Appendix B in Technical Report No. 1, dated October 1970.

During the final year of the contract detailed experimental results have been obtained in mixtures of He and  $SF_6$  and mixtures of He and Xe. Furthermore a quantitative interpretation has been given in terms of machine computations based on theoretical formulae derived in reference 2. All the required thermodynamic quantities for the gases used are known and this research stimulated the investigation of pontaneous concentration scattering in binary gas mixtures under a separate program. The very good agreement between theory and experiment, as well as details of experimental techniques are fully described in Technical Report No. 2, dated June 1971, which also served as the Ph. D.

-2-

thesis, submitted by W. H. Lowdermilk. A condensed version of this Technical Report is now being prepared for publication in the Physical Review.

The main conclusion of the research performed under this contract is that good insight has been obtaine in the hydrodynamic response of gas mixtures at high frequencies. On the basis of our results it is safe to conclude that concentration effects are <u>not</u> important for the propagation characteristics of high power laser beams in the atmosphere.
