ABSTRACT

This volume contains the Logistics Information Requirements Catalog (LIRC) which is used as a tool for application of the Navy Logistics Management Information Requirements Methodology described in Volume I. The catalog is provided in a separate volume in order to accommodate later revisions resulting from identification of additional logistics information requirements.

The catalog contains a compilation of information element titles grouped by information subclasses within information classes. Information classes are arranged sequentially by the Information Class Code followed by four zeros. Opposite the code in the catalog is the title of the information class as shown on the Information Catalog Index Guide. Under the code and title is a brief narrative description of the type of information contained in the class. The first indentation level under the narrative is the information element title preceded by its code. Indented beneath each information subclass is the list of information element titles preceded by the seven-digit information element code. The information element code is a hierarchical buildup combining the three significant digits of the information class code, the fourth and fifth digits of the information subclass code; and as the sixth and seventh digit, the sequence number of the information element in the list.
