1. INTRODUCTION.

Since the direct solution of systems of linear equations by elimination is now well understood when the matrix is full or band, attention has turned to the problem of elimination of systems when the matrix is arbitrarily sparse. When the sparse matrix arises from the discretization of an elliptic partial differential equation, it has a special structure and special properties which make iterative methods attractive. Even here, however, one can often find an ordering of the equations which makes elimination competitive (George[3]). But all too frequently the matrix has an arbitrarily sparse structure, e.g. in network analysis and econometric problems.

Here we present an error analysis of (point) Gaussian elimination when the matrix is arbitrarily sparse. The analysis is presented in terms of the structure of the elimination graphs arising in the elimination process. The only assumption we make is that the leading principal minors are non-zero, i.e. that the (1,1) entry in each reduced matrix is non-zero (cf. Forsythe and Moler [2], pp. 27-36).

Since the graphs of band and full matrices are special elimination graphs, the error analyses for band and full matrices follow as special cases.

2. MATRICES AND GRAPHS.

Let M be an $n \times n$ matrix with non-zero leading principal minors; hence M is non-singular and the LU decomposition of M exists and is unique. If M is symmetric, then $M = LDL^t$.

Rose [4] associated an undirected graph with a symmetric matrix and interpreted the LDL^t factorization graph-theoretically by undirected elimination graphs. Bunch and Rose [1] made the extension of the association of directed graphs with general square matrices and of the interpretation of the LU factorization by directed elimination graphs.

The directed graph of M , $G(M) = (X, \alpha)$, with vertex set X and arc set α , is defined as follows: a vertex $x_i \in X$ is associated with row i of M , and $(x_i, x_j) \in \alpha$ (an arc from x_i to x_j is in G) if and only if $m_{ij} \neq 0$ and $i \neq j$. The vertices X are regarded as ordered; i.e., $X = \{x_i\}_{i=1}^n$.

Let the matrix M be written as $M = \begin{bmatrix} a & r^t \\ c & B \end{bmatrix}$, where a is 1×1 , r and c are $(n-1) \times 1$ and B is $(n-1) \times (n-1)$. Then the first step of the LU factorization of M can be written as

$$M = \begin{bmatrix} 1 & 0 \\ c/a & I \end{bmatrix} \begin{bmatrix} a & r^t \\ 0 & B - cr^t/a \end{bmatrix} .$$

If $G(M)$ is the directed graph of M , the elimination graph G_y is obtained from G by deleting y together with its incident arcs and adding an arc (x,z) whenever there exists a (directed) x, z path of length 2 containing y . G_y is the graph of the matrix obtained by "eliminating" the variable corresponding to y in Gaussian elimination; e.g., G_{x_1} is the graph of $B-cr^t/a$. The accidental creation of zeros during the elimination process is ignored. For a more detailed discussion, see Bunch and Rose [1], Section 2.

Let G_1, \dots, G_{n-1} be the sequence of elimination graphs defined recursively by $G_0 = G(M)$ and $G_i = (G_{i-1})_{x_i}$. Let $|S|$ be the number of elements in the set S . Let $r_i = |\{y \in X_{i-1} : (x_i, y) \in a_{i-1}, G_{i-1} = (X_{i-1}, a_{i-1})\}|$ and $c_i = |\{y \in X_{i-1} : (y, x_i) \in a_{i-1}, G_{i-1} = (X_{i-1}, a_{i-1})\}|$ be the out-degree and in-degree, respectively, of vertex x_i in the elimination graph G_{i-1} .

Note that r_i+1, c_i+1 is the number of non-zero elements in the first row, column of the reduced matrix of order $n-i+1$, i.e. the reduced matrix whose graph is G_{i-1} .

Define $e_{ik} = 1$ if there is an arc from x_i to x_k and $e_{ki} = 1$ if there is an arc from x_k to x_i in G_{i-1} . Otherwise, let $e_{ik} = 0$ and $e_{ki} = 0$. We count a division as a multiplication and a subtraction as an addition.

When M is symmetric, then $r_i = c_i = d_i$, and Rose [4] has shown that the factorization $M = LDL^t$ requires $\sum_{i=1}^{n-1} d_i (d_i + 3) / 2$ multiplications and $\sum_{i=1}^{n-1} d_i (d_i + 1) / 2$ additions, while the backsolving of $LDL^t x = b$ requires $n + 2 \sum_{i=1}^{n-1} d_i$ multiplications and $2 \sum_{i=1}^{n-1} d_i$ additions.

When M is general, Bunch and Rose [1] have shown that the $M = LU$ factorization requires

$\sum_{i=1}^{n-1} (r_i + 1) c_i$ multiplications and

$\sum_{i=1}^{n-1} r_i c_i$ additions, while the

backsolving $LUx = b$ requires

$n + \sum_{i=1}^{n-1} (r_i + c_i)$ multiplications and

$\sum_{i=1}^{n-1} (r_i + c_i)$ additions.

Examples: Let M be an $n \times n$ matrix.

(1) If M is symmetric and full, then $d_i = n - i$ and solving $Mx = LDL^t x = b$ requires $n + \sum_{i=1}^{n-1} d_i (d_i + 7) / 2 = \frac{1}{6}n^3 + \frac{3}{2}n^2 - \frac{2}{3}n$ multiplications and $\sum_{i=1}^{n-1} d_i (d_i + 5) / 2 = \frac{1}{6}n^3 + n^2 - \frac{7}{6}n$ additions.

(2) If M is symmetric and band, with bandwidth $2m+1$, then $d_i=m$ for $1 \leq i \leq n-m$ and $d_i=n-i$ for $n-m+1 \leq i \leq n-1$. Solving $Mx=LDL^t x=b$ requires $(\frac{1}{2}m^2 + \frac{7}{2}m + 1)n - \frac{1}{3}m^3 - 2m^2 - \frac{5}{3}m$ multiplications and $(\frac{1}{2}m^2 + \frac{5}{2}m)n - \frac{1}{3}m^3 - \frac{3}{2}m^2 - \frac{7}{6}m$ additions.

(3) If M is general and full, then $r_i=n-i=c_i$ and solving $Mx=LUx=b$ requires $n + \sum_{i=1}^{n-1} (r_i c_i + 2c_i + r_i) = \frac{1}{3}n^3 + n^2 - \frac{1}{3}n$ multiplications and $\sum_{i=1}^{n-1} (r_i c_i + c_i + r_i) = \frac{1}{3}n^3 + \frac{1}{2}n^2 - \frac{5}{6}n$ additions.

(4) If M is general and band, with bandwidth $2m+1$, then $r_i=m=c_i$ for $1 \leq i \leq n-m$ and $r_i=n-i=c_i$ for $n-m+1 \leq i \leq n-1$ when no pivoting is needed, while $c_i=m$ for $1 \leq i \leq n-m$, $c_i=n-i$ for $n-m+1 \leq i \leq n-1$, $r_i \leq 2m$ for $1 \leq i \leq n-2m$, $r_i \leq n-i$ for $n-2m+1 \leq i \leq n-1$, when partial pivoting is used. Solving $Mx=LUx=b$ requires $(m^2+3m+1)n - \frac{2}{3}m^3 - 2m^2 - \frac{4}{3}m$ multiplications and $(m^2+2m)n - \frac{2}{3}m^3 - \frac{3}{2}m^2 - \frac{5}{6}m$ additions when no pivoting is needed, and $\leq (2m^2+4m+1)n - \frac{13}{6}m^3 - 4m^2 - \frac{11}{6}m$ multiplications and $\leq (2m^2+3m)n - \frac{13}{6}m^3 - \frac{7}{2}m^2 - \frac{4}{3}m$ additions when partial pivoting is used.

3. ERROR ANALYSIS OF TRIANGULAR FACTORIZATION.

$$\begin{aligned} \text{Let } \|x\|_{\infty} &\equiv \max_{1 \leq i \leq n} |x_i|, \quad \|M\|_{\infty} \equiv \max_{1 \leq i \leq n} \sum_{j=1}^n |m_{ij}|, \\ \|x\|_1 &\equiv \sum_{i=1}^n |x_i|, \quad \|M\|_1 \equiv \max_{1 \leq j \leq n} \sum_{i=1}^n |m_{ij}|. \quad \text{If } M=M^t, \text{ then} \\ \|M\|_1 &= \|M\|_{\infty}. \end{aligned}$$

Due to the finite precision arithmetic, we obtain the triangular factorization of a perturbation of M , i.e. $LU=M+F$.

Let $M^{(1)} \equiv M$. Then the elimination is defined sequentially for $1 \leq k \leq n-1$ by the following: given $M^{(k)}$, let $L^{(k)}$ be defined by $\ell_{ij}^{(k)} = 1$ for $1 \leq i \leq n$, $\ell_{ik}^{(k)} = f\ell(m_{ik}^{(k)}/m_{kk}^{(k)})$ for $k+1 \leq i \leq n$, $\ell_{ij}^{(k)} = 0$ otherwise, then $M^{(k+1)} \equiv f\ell((L^{(k)})^{-1}M^{(k)})$, i.e. $m_{ij}^{(k+1)} \equiv$

$$\begin{cases} 0 & \text{for } k+1 \leq i \leq n, j=k \\ f\ell(m_{ij}^{(k)} - \ell_{ik}^{(k)} \times m_{kj}^{(k)}) & \text{for } k+1 \leq i, j \leq n \\ m_{ij}^{(k)} & \text{otherwise.} \end{cases}$$

Then $U=M^{(n)}$ and $L=L^{(1)}L^{(2)} \dots L^{(n-1)}$, i.e.

$$L_{ij} = \begin{cases} 0 & \text{for } i < j \\ 1 & \text{for } i = j \\ L_{ij}^{(j)} & \text{for } i > j \end{cases} .$$

Following the notation of Forsythe and Moler [2], §21, let u be the unit round-off, e.g., $u = \frac{1}{2}\beta^{1-t}$ for rounded operations in t digit, base β arithmetic. Then

$$l_{ik}^{(k)} = (m_{ik}^{(k)} / m_{kk}^{(k)}) (1 + \delta_{ik} e_{ik}), \text{ where } |\delta_{ik}| \leq u, \text{ or}$$

$$0 = m_{ik}^{(k)} - l_{ik}^{(k)} m_{kk}^{(k)} + \epsilon_{ik}^{(k)}, \text{ where } \epsilon_{ik}^{(k)} \equiv m_{ik}^{(k)} \delta_{ik} e_{ik} \text{ for}$$

$k+1 \leq i \leq n$, and for $k+1 \leq i, j \leq n$:

$$m_{ij}^{(k+1)} = (m_{ij}^{(k)} - l_{ik}^{(k)} m_{kj}^{(k)} (1 + \delta_{ij} e_{ik} e_{kj})) / (1 + \delta'_{ij} e_{ik} e_{kj}),$$

where $\delta'_{ii} = 0$, $|\delta'_{ii}| \leq u$ for $2 \leq i \leq n$, $|\delta_{ij}| \leq u$ for $1 \leq i, j \leq n$, or

$$m_{ij}^{(k+1)} = m_{ij}^{(k)} - l_{ik}^{(k)} m_{kj}^{(k)} + \epsilon_{ij}^{(k)},$$

where $\epsilon_{ij}^{(k)} \equiv -l_{ik}^{(k)} m_{kj}^{(k)} \delta_{ij} e_{ik} e_{kj} - m_{ij}^{(k+1)} \delta'_{ij} e_{ik} e_{kj}$. Let $\epsilon_{ij}^{(k)} = 0$

otherwise.

Let $|l_{ik}^{(k)}| \leq \tau$ for all i, k and $|m_{ij}^{(k)}| \leq \sigma$ for all i, j, k . Then $|\epsilon_{ik}^{(k)}| \leq \sigma u e_{ik}$ for $k+1 \leq i \leq n$ and $|\epsilon_{ij}^{(k)}| \leq (\tau+1) \sigma u e_{ik} e_{kj}$ for $k+1 \leq i, j \leq n$.

Let $F^{(k)} \equiv M^{(k+1)} - M^{(k)} + L^{(k)} M^{(k)}$ for $1 \leq k \leq n-1$;

$$\text{then } F = \sum_{k=1}^{n-1} F^{(k)} \text{ and } |F'_{ij}| \leq \begin{cases} u(\tau+1)\sigma \sum_{k=1}^{i-1} e_{ik} e_{kj} & \text{for } i \leq j \\ u(\tau+1)\sigma \sum_{k=1}^{j-1} e_{ik} e_{kj} + u\sigma e_{ij} & \text{for } i > j \end{cases}$$

$$\text{Thus, } \|F\|_{\infty} \leq u\sigma \max_{1 \leq i \leq n} \left\{ \sum_{j=1}^{i-1} e_{ij}^{+(\tau+1)} \left[\sum_{j=1}^{i-1} \sum_{k=1}^{j-1} e_{ik} e_{kj}^{+} + \sum_{j=i}^n \sum_{k=1}^{i-1} e_{ik} e_{kj}^{+} \right] \right\}$$

$$\text{and } \|F\|_1 \leq u\sigma \max_{1 \leq j \leq n} \left\{ \sum_{i=j+1}^n e_{ij}^{+(\tau+1)} \left[\sum_{i=2}^j \sum_{k=1}^{i-1} e_{ik} e_{kj}^{+} + \sum_{i=j+1}^n \sum_{k=1}^{j-1} e_{ik} e_{kj}^{+} \right] \right\}.$$

If $M=M^t$ and $LDL^t=M+F$, then $F=F^t$, $e_{ij}=e_{ji}$ for all i, j ,

$$|F_{ii}| \leq u(\tau+1)\sigma \sum_{k=1}^{i-1} e_{ik}, \quad |F_{ij}| \leq u(\tau+1)\sigma \sum_{k=1}^{j-1} e_{ik} e_{jk}^{+} + u\sigma e_{ij} \text{ for } i > j,$$

$$|F_{ij}| \leq u(\tau+1)\sigma \sum_{k=1}^{i-1} e_{ik} e_{jk}^{+} + u\sigma e_{ij} \text{ for } i < j, \text{ and } \|F\|_{\infty} = \|F\|_1 =$$

$$\max_{1 \leq i \leq n} \sum_{j=1}^n |F_{ij}| \leq u\sigma \max_{1 \leq i \leq n} \left\{ \sum_{\substack{j=1 \\ j \neq i}}^n e_{ij}^{+(\tau+1)} \left[\sum_{j=1}^{i-1} \sum_{k=1}^{j-1} e_{ik} e_{jk}^{+} + \sum_{k=1}^{i-1} e_{ik}^{+} \sum_{j=i+1}^n \sum_{k=1}^{i-1} e_{ik} e_{jk}^{+} \right] \right\}.$$

4. ERROR ANALYSIS OF BACKSOLVING.

Solving $Ly=b$, where L is unit lower triangular, we obtain the exact solution of $(L+\delta L)y=b$. Here $y_1=b_1$ and

$$y_i = f_l(-l_{i1}y_1 - l_{i2}y_2 - \dots - l_{i,i-1}y_{i-1} + b_i) =$$

$$(-l_{i1}(1+\delta_{i1})y_1 - \dots - l_{i,i-1}(1+\delta_{i,i-1})y_{i-1} + b_i) / (1+\delta_{ii}), \text{ where}$$

$$\delta_{11}=0, |\delta_{ii}| \leq u \text{ for } 2 \leq i \leq n, |\delta_{i1}| \leq 1.01u(1 + \sum_{k=2}^{i-1} e_{k1})e_{i1} \text{ for } 2 \leq i \leq n,$$

$$|\delta_{ij}| \leq 1.01u(1 + \sum_{k=j+1}^{i-1} e_{kj})e_{ij} \text{ for } 2 \leq j < i \leq n. \text{ Then}$$

$$\|\delta L\|_1 \leq 1.01u \max_{i,j} |l_{ij}| \max_{1 \leq j \leq n} \{ \sum_{i=j}^n |\delta_{ij}| \} \leq$$

$$1.01u \tau \max\{ \frac{1}{2}c_1(c_1+1), \max_{2 \leq j \leq n-1} \{ \frac{1}{2}c_j(c_j+1)+1 \} \} \text{ since}$$

$$\sum_{i=1}^n |\delta_{i1}| \leq 1.01u \sum_{i=2}^n (1 + \sum_{k=2}^{i-1} e_{k1})e_{i1} = 1.01uc_1(c_1+1)/2 \text{ and}$$

$$\sum_{i=j}^n |\delta_{ij}| \leq 1.01u \{ 1 + \sum_{i=j+1}^n (1 + \sum_{k=j+1}^n e_{kj})e_{ij} \} = 1.01u[\frac{1}{2}c_j(c_j+1)+1]$$

$$\text{for } 2 \leq j \leq n-1, \text{ while } \|\delta L\|_\infty \leq 1.01u \tau \max_{1 \leq i \leq n} \{ e_{i1} + \sum_{k=2}^{i-1} e_{k1}e_{i1} + \sum_{j=2}^{i-1} (1 + \sum_{k=j+1}^{i-1} e_{kj})e_{ij} + 1 \} \leq 1.01u \tau \{ 1 + c_1 - 1 + \sum_{j=2}^{n-1} c_j + 1 \} = 1.01u \tau (1 + \sum_{j=1}^{n-1} c_j).$$

Solving $Ux=y$, where U is upper triangular, we obtain the exact solution of $(U+\delta U)x=y$. Here $x_n = f_l(y_n/u_{nn}) =$

$$y_n / [u_{nn}(1+\delta_{nn})] \text{ and } x_i = f_l \left(\frac{-u_{i,i+1}x_{i+1} - \dots - u_{in}x_n + y_i}{u_{ii}} \right) =$$

$$\frac{-u_{i,i+1}(1+\delta_{i,i+1})x_{i+1} - \dots - u_{in}(1+\delta_{in})x_n + y_i}{u_{ii}(1+\delta_{ii})(1+\delta'_{ii})} \quad \text{for } 2 \leq i \leq n,$$

where $\delta'_{nn}=0$, $|\delta'_{ii}| \leq u$ for $1 \leq i \leq n-1$, $|\delta_{ii}| \leq u$ for $1 \leq i \leq n$,

$$|\delta_{in}| \leq 1.01u(1 + \sum_{k=i+1}^{n-1} e_{kn})e_{in} \quad \text{for } 1 \leq i \leq n-1, \text{ and}$$

$$|\delta_{ij}| \leq 1.01u(2 + \sum_{k=i+1}^{j-1} e_{kj})e_{ij} \quad \text{for } 1 \leq i < j \leq n-1. \text{ Then}$$

$$\|\delta U\|_1 \leq \max_{i,j} |u_{ij}| \max_{1 \leq j \leq n} \{ |\delta'_{jj}| + \sum_{i=1}^j |\delta_{ij}| \} \leq$$

$$1.01u \max \left\{ \max_{1 \leq j \leq n-1} [2 + \sum_{i=1}^{j-1} (2 + \sum_{k=i+1}^{j-1} e_{kj})e_{ij}], 1 + \sum_{i=1}^{n-1} (1 + \sum_{k=i+1}^{n-1} e_{kn})e_{in} \right\},$$

$$\text{while } \|\delta U\|_\infty \leq \max_{i,j} |u_{ij}| \max_{1 \leq i \leq n} \{ |\delta'_{ii}| + \sum_{j=i}^n |\delta_{ij}| \} \leq$$

$$1.01u \max_{1 \leq i \leq n-1} \left\{ 2 + \sum_{j=i+1}^{n-1} (2 + \sum_{k=i+1}^{j-1} e_{kj})e_{ij} + (1 + \sum_{k=i+1}^{n-1} e_{kn})e_{in} \right\} \leq$$

$$1.01u \max_{1 \leq i \leq n-1} \left\{ 2 + 2r_i - 2e_{in} + \frac{1}{2}r_i(r_i - 1) + e_{in} \right\} \leq$$

$$1.01u \max_{1 \leq i \leq n-1} \left\{ 2 + \frac{1}{2}r_i(r_i + 3) \right\}.$$

When $M=M^t$, $U=DL^t$, $r_i=c_i \Xi d_i$ and we obtain $(D+\delta D)z=y$ and $(L^t+\delta L^t)x=z$. Here $z_i = fl(y_i/d_{ii}) = y_i/[d_{ii}(1+\delta_{ii})]$ where $|\delta_{ii}| \leq u$ for $1 \leq i \leq n$, so $\|\delta D\|_1 = \|\delta D\|_\infty \leq u \max_i |d_{ii}| = u\rho$, where $\rho = \max_i |d_{ii}|$.

$$\|\Delta L^t\|_1 \leq 1.01\tau \max\left\{ \max_{1 \leq j \leq n-1} \left[1 + \sum_{i=1}^{j-1} \left(1 + \sum_{k=i+1}^{j-1} e_{kj} \right) \right], \sum_{i=1}^{n-1} \sum_{k=i+1}^{n-1} e_{kn} e_{in} \right\}$$

$$\text{and } \|\Delta L^t\|_\infty \leq 1.01\tau \max_{1 \leq i \leq n-1} \left\{ 1 + \frac{1}{2} d_i (d_i + 1) \right\}.$$

5. ERROR ANALYSIS OF ELIMINATION.

Solving $Mx=b$ in finite precision, we obtain the exact solution of $(M+\delta M)x=b$, where $\delta M=F+(\delta L)U+L(\delta U)+(\delta L)(\delta U)$, or when $M=M^t$, $\delta M=F+LD(\Delta L^t)+[L(\delta D)+(\delta L)D+(\delta L)(\delta D)][L^t+\Delta L^t]$.

$$\|L\|_1 \leq 1+\tau \max_{1 \leq j \leq n-1} c_j, \quad \|L\|_\infty \leq 1+\tau \max_{2 \leq i \leq n} \sum_{j=1}^{i-1} e_{ij} \leq 1+(n-1)\tau,$$

$$\|U\|_1 \leq \sigma(1 + \max_{1 \leq i \leq n-1} \sum_{j=i+1}^n e_{ij}) \leq n\sigma, \quad \|U\|_\infty \leq \sigma(1 + \max_{1 \leq j \leq n-1} r_j),$$

$$\|L^t\|_1 = \|L\|_\infty, \quad \|L^t\|_\infty = \|L\|_1, \quad \text{and} \quad \|D\|_1 = \|D\|_\infty \leq \rho.$$

$$\text{Thus, in general, } \|\delta M\|_1 \leq 1.01u\sigma \left\{ \max_{1 \leq j \leq n} \left\{ \sum_{i=j+1}^n e_{ij} + \right. \right.$$

$$\left. \left. (\tau+1) \left[\sum_{i=2}^j e_{ik} e_{kj} + \sum_{i=j+1}^n \sum_{k=1}^{j-1} e_{ik} e_{kj} \right] \right\} \right\}$$

$$+ \tau \max_{1 \leq j \leq n-1} \left[1 + \frac{1}{2} c_j (c_j + 1) \right] \left[1 + \max_{1 \leq i \leq n-1} \sum_{j=i+1}^n e_{ij} \right]$$

$$+ \max_{1 \leq j \leq n-1} \left\{ \max_{i=1}^{j-1} \left[2 + \sum_{k=i+1}^{j-1} e_{kj} \right] e_{ij} \right\},$$

$$\left. \left. \left. 1 + \sum_{i=1}^{n-1} \left(1 + \sum_{k=i+1}^{n-1} e_{kn} \right) e_{in} \right\} \left\{ 1 + \tau \max_{1 \leq j \leq n-1} c_j \right. \right. \right.$$

$$\left. \left. \left. + 1.01u\tau \max_{1 \leq j \leq n-1} \left[1 + \frac{1}{2} c_j (c_j + 1) \right] \right\} \right\}. \quad \|\delta M\|_\infty \quad \text{can be bounded}$$

similarly. Similar bounds are obtainable when $M=M^t$.

6. THE BAND AND FULL CASES.

When M is a band matrix with bandwidth $2m+1$, then $e_{ij}=0$ for $|i-j|>m$; under Gaussian elimination with partial pivoting, $e_{ij}=0$ for $i>j+m$ and for $i<j+2m$.

With no pivoting, $\|F\|_{\infty} \leq \sigma\{m+(\tau+1)m^2\}$, $\|L\|_{\infty} \leq 1+m\tau$, $\|\delta L\|_{\infty} \leq 1.01u\tau\{\frac{1}{2}m^2+\frac{1}{2}m+1\}$, $\|U\|_{\infty} \leq (m+1)\sigma$, and $\|\delta U\|_{\infty} \leq 1.01u\sigma\{\frac{1}{2}m^2+\frac{3}{2}m+2\}$; thus $\|\delta M\|_{\infty} \leq 1.01u\sigma\{\tau m^3+\frac{1}{2}(5\tau+3)m^2+\frac{1}{2}(7\tau+5)+\tau+2+1.01u\tau(\frac{1}{4}m^4+m^3+\frac{9}{4}m^2+\frac{5}{2}m+2)\}$.

If M is diagonally dominant, then $\tau \leq 1$, $\sigma \leq 2$, and $\|\delta M\|_{\infty} \leq 1.01u\{2m^3+8m^2+12m+4+1.01u(\frac{1}{2}m^4+2m^3+\frac{9}{2}m^2+5m+4)\}$.

With partial pivoting, $\tau=1$, $\sigma \leq 2^{2m-1}-(m-1)2^{m-2}$ (Wilkinson[5]), $\|F\|_{\infty} \leq u\sigma\{5m^2+4m\}$, $\|L\|_{\infty} \leq 1+m\tau$, $\|\delta L\|_{\infty} \leq 1.01u\{\frac{1}{2}m^2+\frac{1}{2}m+1\}$, $\|U\|_{\infty} \leq (2m+1)\sigma$, and $\|\delta U\|_{\infty} \leq 1.01u\sigma\{2m^2+3m+2\}$; thus $\|\delta M\|_{\infty} \leq 1.01u\sigma\{3m^3+\frac{23}{2}m^2+\frac{23}{2}m+3+1.01u(m^4+\frac{5}{2}m^3+\frac{9}{2}m^2+4m+2)\}$.

When M is full, $e_{ij}=1$ for all i, j . Thus $\|F\|_{\infty} \leq u\sigma\{n-1+(\tau+1)(\frac{1}{2}n^2-\frac{1}{2}n)\} = \frac{1}{2}u\sigma n\{(\tau+1)n-\tau+1\}$, $\|L\|_{\infty} \leq 1+(n-1)\tau$, $\|U\|_{\infty} \leq n\sigma$, $\|\delta L\|_{\infty} \leq 1.01u\tau\{n(n-1)/2+1\}$, $\|\delta U\|_{\infty} \leq 1.01u\sigma n(n+1)/2$, and $\|\delta M\|_{\infty} \leq 1.01u\sigma\{\tau n^3+n^2+(2-\tau)n+1.01u\tau(n^4+2n^2+2n)/4\}$.

With partial or complete pivoting, $\tau=1$ and $\|\delta M\|_{\infty} \leq 1.01u\sigma\{n^3+n^2+n+1.01u(n^4+2n^2+2n)/4\}$.

7. REMARKS.

From §§3-5 we see that the error matrix arising in sparse elimination depends on the fill-in occurring during elimination. In the band case we know a priori the structure of the matrix. However, in the arbitrarily sparse case we must view elimination in the context of optimal ordering, i.e. an ordering of the equations so that fill-in is minimized. Given a fixed ordering, our analysis here bounds the errors occurring in the computation.
