Investigation of the Effect of Water Saturation on the Velocity of Ultrasonics in Certain Rocks at High Pressures 7.S. Lebedev, D.V. Korniyets

(Institute of Geophysics, Ukrainian SSR Academy of Sciences, Kiev)

Studying the influence of water saturation in magmatic rock on changes in elastic properties under conditions of high thermodynamic parameters is quite timely, since it is connected with explaining the factors affecting changes in the speed of elastic waves in the plutonic zones of the earth's crust Only isolated works on this question are known.

We conducted investigations to clarify the features of the changes in the velocity of ultrasound (v_p) at atmosphere pressure and over the whole range of confined pressures (to $5 \cdot 10^3 \text{kgf/cm}^2$) in samples of several types of magmatic rock of the Ukrainian layer with the natural moisture content (air-dry), water saturated and dry*. For this two identical cylindrical samples were prepared from each of four ore specimens of diorite, granodiorite-sorbite, quartz monzonite and porphyritic granite. After measuring the initial speed (v_{po}) at natural moisture content the experimental samples underwent water saturation under vacuum conditions. Then the velocity (v_{p1}) was again determined in them, after which all samples (experimental-water saturated and air-dry control) were covered with a water

impermeable oil film and subjected to the first experimental cycle at confined pressure. Further, after removal of the protective covering the experimental samples were dried at 100° C and satyrated with water again. Each such process ended with a measurement of the speed (Vp2 and Vp3, respectively). Then these samples were again covered with protective film and subjected to a second trial under high P with simultaneous registration of the change in $v_p^{=}f(p)$. Finally the experimental samples were dried again and for the last time subjected to test under high P. Aside from the data obtained in the above sequence, the total porosity and volume moisture content of the samples were determined.

Analysis of the experimental results allows one to establish that forced water saturation of air-dry magmatic rock samples with a porosity n<1% changes v_{p0} very little. In rocks with n=1.3-2.4% an increase in v_{p0} is observed, but only by 0.1-0.15 km/sec. The most considerable change in v_p (by 8-24%) is only characteristic of samples which were dried. However even after water saturation their speed (v_{p3}) still remained lower than the initial by 2-5%. Therefore water saturation does not fully compensate for the disturbance of acoustical contact between rock grains.

FTD-HC-23-1608-74

2

The results of experiments at high pressures (P), partially presented in the figure as graphs of $v_p = f(p)$, show that an intense increase in v_p in the rock samples studied occurs independent of their water saturation on increasing P from atmospheric to $0.6-1\cdot 10^3$ kgr/cm². Then monotonic changes in rate are observed. Even in the initially air-dried and then watersample the value of v_p wis 0.25-0.55 km/sec lower saturated than that at $1 \cdot 10^3 \text{kgf/cm}^2$. The presence of liquid in the intergranular spaces of the samples enhances the disturbed acoustical contact and increases the initial speed which leads only to a less clearly expressed increase in v_p in the range up to $1 \cdot 10^3$ kgf/cm². At higher pressures a further elevation in v_p occurs in water saturated and dry samples with the same gradually decreasing gradient. Therefore the water saturation does not prevent the gradual compression of the rocks. The correlation of the v_p value in rock samples at high pressures also does not reveal any effect connected with moisture content, since the nearly linear portions of the graphs (respectively curve pairs 1,2 and 3,4) coincide or are located within the confidence limits of the values. Thus one may conclude that the degree of water saturation does not exert a significant effect on the rate of propagation of elastic waves in magmatic rocks of the deep layers of the earth's crust.
