FOREWORD

This report presents selected detailed test data accumulated during the climatic laboratory phase of the Category II climatic tests from 5 March to 27 August 1970. Test results, conclusions and recommendations are presented in the basic report: Climatic Laboratory Evaluation of the HH-53C Helicopter, ASTDE-TR-70-29, 7 December 1970.

The test helicopter, S/N 68-10354, was a rescue version of the H-53.

Test authorities of the program were AFSC Project 482A, ASD Project 482A(605), and AFFTC Project Directive No. 71-24.

Foreign announcement and dissemination by the Defense Documentation Center are not authorized because of technology restrictions of the U.S. Export Control Acts as implemented by AFR 400-10.

Prepared by:

JOHN L. BARBAGALLO
Systems Engineer

ABSTRACT

The HH-53C underwent extreme environmental tests as part of the Category II All Weather tests. Testing was accomplished at the Climatic Laboratory, Eglin AFB, Florida ~~(reference 1)~~, at Eielson AFB, Alaska ~~(reference 2)~~, and in a desert environment at El Centro Naval Air Facility, California, ~~(reference 3)~~. Test data from these tests are published as data supplements to the basic technical reports and are printed under separate cover.

NGB	nose gearbox
N_r	rotor speed (pct rpm)
OAT	outside air temperature (deg C)
PA	pressure altitude (ft)
press.	pressure (lb per sq in.)
RH	right hand
T_5	turbine inlet temperature (deg C)

INTRODUCTION

GENERAL

The test helicopter, S/N 68-10354, was a rescue version of the H-53. The HH-53C test helicopter has the same systems as the CH-53 aircraft, so the climatic tests are also valid for the CH-53. The aircraft systems were instrumented to show environmental effects (reference 4).

TEST HISTORY

The new vehicle, S/N 68-10354, and test instrumentation were originally accepted by the Air Force at the Sikorsky Aircraft plant at Stratford, Connecticut, on 4 December 1969. Subsequently, adverse weather tests and climatic laboratory tests were conducted by the Aeronautical Systems Division (ASD). After the climatic laboratory test, the responsibility for conducting Category II tests for the HH-53C was transferred to AFFTC at Edwards AFB, California. The HH-53 was then flown to Eielson AFB, Alaska, where arctic tests were completed from 6 January to 26 February 1971. The aircraft remained at Eielson AFB for the artificial phase of the icing program. The artificial icing tests were conducted from 19 through 31 March 1971. The aircraft departed for Elemdorf AFB, Alaska, on 3 April 1971 to seek natural icing conditions. The natural icing phase was completed on 10 April 1971, but systems evaluation continued until 13 April, at which time the helicopter returned to Edwards AFB. The aircraft was then flown to El Centro, California, to complete extremely hot temperature tests. Testing was conducted from 14 June to 7 August 1971, when the helicopter was returned to Edwards AFB to instrument it for the follow-on performance tests. Follow-on performance tests (high altitude, high power) were conducted from 25 September to 17 November 1971. Salt water ingestion tests were conducted from 18 to 28 November 1971.

TEST SYNOPSIS AND DATA

GENERAL

The climatic laboratory test phase consisted of 36 tests (referred to as runs). It should be noted that the climatic laboratory tests consisted of normal aircraft operation, even though the aircraft was secured to the test chamber floor. A Flight Manual type checklist was used for operation and all components were operated, including guns, rotors, and engines (up to maximum power was used on the engines).

The amount of time/starts accumulated on major aircraft components during the climatic laboratory tests is as follows:

Engine No. 1	26 hrs
Engine No. 2	28 hrs
APP	43 hrs
APP Starts	129
Rotor Drive System	27 hrs
Accessory Gearbox	70 hrs

For test runs 22 through 26, additional instrumentation was installed in the engine oil systems, including calibrated oil pumps (which were operated at various flow rates). The engines were operated at various power settings up to maximum power and oil temperatures were allowed to stabilize. Tests were conducted at test chamber temperatures of 70, 103, and 125 degrees F. The engines approached, but did not exceed, the engine oil temperature limit.

A summary of all the tests is presented in table I.

Sixteen runs were selected for presentation in this report: 2, 4, 6, 15, 19, 21, 22, 23, 24, 25A, 25B, 25C, 26, 28, 34, 35. Data from these runs are presented. Portions of the data have been deleted when it was evident that errors existed because of instrumentation malfunction.

AIRCRAFT INSTRUMENTATION

The aircraft instrumentation consisted of a low speed digital tape recording system and a photopanel mounted on a test table. In addition, an oscillograph was used during the climatic laboratory tests and the icing tests. All of these were connected to the aircraft test instrumentation wiring in the aircraft. The Air Force furnished the instrumentation systems and the contractor (Sikorsky Aircraft Corporation) instrumented the aircraft. The photopanel and oscillograph were capable of recording much faster than the digital tape recording system and therefore were particularly useful for recording data during APP and engine starts. Excluding the reference and time parameters, there were approximately 195 parameters recorded on the digital tape recording system, approximately 40 parameters on the photopanel system, approximately seven paramaters on the oscillograph at the climatic laboratory, and three parameters on the oscillograph during the icing tests. The aircraft test instrumentation was normally operated for each test mission from preflight to after engine shutdown.

The digital tape system was capable of recording a complete sweep of all parameters in approximately 20 seconds. The parameter sweep and the interval between sweeps could be varied.

The photopanel camera was capable of operating at a maximum speed of four frames per second to record rapid transients. The camera control could be slaved to the digital system so that a frame of photopanel data would be recorded for each digital sweep.

Data reduction of the information recorded on the digital tape was accomplished by using computer processing, which provided prints of data in tabular format. The computer processing system also provided selected data printout in graphical format. The selected photopanel data were reduced by hand and are presented in tabular form.

GROUND STATION INSTRUMENTATION

The following ground station instrumentation was used:

1. Climatic laboratory test chamber air temperature. A continuous-reading recorder was used to record the test chamber temperature. Recordings were taken 24 hours a day.

2. Climatic laboratory test voice recording. A voice recording system which was part of the climatic laboratory was also used. All aircraft aircrew and other test participants made voice comments on test procedures and progress, time correlation, and significant occurrences.

3. Climatic laboratory test chamber pressure differential (compared to ambient air pressure). A continuous reading recorder was used to record the test chamber pressure differential. Recordings were taken 24 hours a day.

4. Data playback unit (quick-look data printer). This data playback unit was used for all test phases. It provided printed tabular "raw" data from the aircraft digital instrumentation recorder tape. The raw data had to be manually converted to real data. It was used to obtain information for troubleshooting the aircraft digital instrumentation system or to monitor suspected problem areas in the aircraft systems.

PARAMETER LIST.NG

The aircraft test parameters are listed in the following tables:

Table II - photopanel

Table III - digital magnetic tape

Table IV - oscillograph

HOW TO USE THE TABULATED DIGITAL DATA

Following are the reduced, edited, and tabulated digital data from 16 of the climatic laboratory runs. Each of the tests were selected for the most representative climatic data or to document specific subsystem tests. Data are presented for each temperature level and test condition. In the tabulated data that follow, the individual digital test parameters (temperature, pressure, rpm, etc.) are designated by three numbers (such as 1-01) and the abbreviated name of the parameter (see table II for non-abbreviated names). The first number from 1 to 8 of the three-number designation is the switch box number. Generally, boxes one and two contain pressure, flow, rpm, and engine power parameters, while boxes three through eight contain temperature parameters. The second two numbers in the designation (01 to 29) give the step position within the box.

Elapsed time is given in minutes and seconds (hours for soak data). The first column of numbers on each page is entitled SWEEP COUNT. This column lists the number of times that the test parameters have been sampled at any particular time. The numbers in the column are referred to as counter numbers (C/N). The counter numbers are cumulative and are used to identify events and to correlate data with events. The correlation of the data trends throughout each test is made by referring to the applicable event sheet for the tabulated data for each flight, noting the counter number at which an event took place, and then referring to the data at that counter number. The elapsed time between counter numbers is normally about 20 seconds, but could be varied by the operator.

Unless otherwise noted, an asterisk indicates that a data point has been removed because of defective instrumentation or other causes resulting in erroneous data.

Table I

OF CLIMATIC LABORATORY TESTS

Remarks
Check of aircraft and instrumentation.
Check of aircraft and instrumentation.
Abort - winch pump failure (powers engine start system).
Instrumentation failure - much of digital data lost. Photo recorder and hand-recorded data available. Right rudder pedal creep experienced.
Heater would not start on first try.
Instrumentation failure; no digital data
APP would not start.
APP would not start. Fire extinguisher bottle leaked pressure.
APP generator failure.
APP run. Engine start. Heater operation. Flight control check. No preheat on APP speed switch (2 starts).
Utility reservoir failed. No preheat on speed switch (4 starts total).
Fuel puddles in exhaust. Heater would not start first try. APP speed switch preheated (1 start).
Ice on main rotor blades. APP speed switch stuck; released after heating (3 starts total with preheat).
APP speed switch stuck on 2nd start despite preheat (5 starts total with preheat).
Heater and rotor brake failure - APP speed switch preheated.
Heater inoperable.
Heater inoperable. Engine No. 2 nose gearbox failure.
Heater partial operation. Engine No. 2 inoperable.
Temperature cycled from -65°F to 125°F to 70°F. Engine No. 2 inoperable.
Engine No. 2 inoperable.
Climatic lab repair.
Engine No. 2 again operational; shakedown run to check engine No. 2, instrumentation, etc.
Engine test lube pumps at low flow setting.
Engine No. 1 test lube pump at low setting. Engine No. 2 test lube pump at high setting.

Table I (Concluded)

Remarks
Instrumentation failure; no digital data. Engine test lube pumps at low setting rotor head vibration.
Engine test lube pumps at low and high settings.
Engine test lube pumps at medium settings.
Rotor head vibration. Engine test lube pumps at medium setting.
Engine No. 2 failure (FOD) - IGB (internal gearbox) replaced. Cold weather test belts installed No. 1 engine/nose gearbox oil cooler.
Heater failure (ignitor vibrator).
Litters installed. Engine No. 2 inoperable. Engine No. 1 test lube pump at medium setting.
Litters installed. Engine No. 2 inoperable. No rotor operation (icicles).
Hydraulic leaks.
Litters installed. Engine No. 2 inoperable. No rotor operation (icicles). ABEX winch pump installed.
APP check.
APP would not start (hydraulic start system inadequate).
APP start system (start valve).
APP start valve preheated. Litters installed. Engine No. 2 inoperable. No rotor operation (icicles).
Engine No. 2 inoperable. Engine No. 1 and rotors operated. Main rotor vibration.
Landing gear installed. Litters removed. Engine test lube pumps removed. Aircraft tiedown removed.
Landing gear check.
Landing gear check.
Instrumentation failure; most digital data lost. Landing gear data hand-recorded. Heater operated; some data available. No engine or rotor operation.
Heater duct louvers tested at both horizontal and vertical flow positions.
APP generator failure. Gear blow-down test partially accomplished.

[1]Connected 7 September 1970 (end of climatic laboratory tests).

[2]Connected 1 July 1970 (run 22, climatic laboratory tests).

[3]Recorded on photopanel (positions 1 and 9) as of 10 September 1971.

[4]Replaces original from 25 March through 3 August 1970 (climatic laboratory tests 6 through 29).

[5]Installed 4 February 1971 (arctic test 14).

[6]Used from 27 February through 1 October 1970 (climatic laboratory tests).

[7]Replaces original from 1 July through 7 September 1970 (climatic laboratory tests 22 to end of climatic laboratory test).

[8]Changed 1 July 1970 (climatic laboratory run 22).

[9]Parameters not connected from 7 September 1970 to 24 May 1971.

TEST SYNOPSES, EVENT SHEETS AND DATA

RUN 2, 70°F, 13 March 1970
Soak time 25 hours

Test Synopsis:

This run was chosen to represent baseline data prior to the low and high temperature tests. Tests at 70°F were also conducted at intervals during the climatic laboratory tests.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control and EAPS.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

1-6-Engine No. 1 fuel flow (not connected).

1-11-Engine No. 2 fuel flow (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

3-22-Cargo area forward waist-level air temperature (erratic, but average temperature shown is good) data are presented.

4-13-Second stage hydraulic pump outlet temperature.

Defective test parameters not presented (unless indicated otherwise).

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-13-Engine No. 1 compressor case temperature, 3rd stage, 4:30 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-06-Engine No. 1 ignition exciter mount temperature.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clock position.

Event Sheet:

CTR	Event
9	APP start
12	Comm/nav radios and radar altimeter - ON, check operation
19	Rescue hoist - check operation
23	Cargo winch - check operation
26	All doors and ramp - closed
50	AFCS servos - checked
51	Stick trim - checked
52	EAPS - open

CTR	Event
55	Rotor brake - OFF
63	Engine speed trim - check
65	AFCS - checked
66	Second stage interlock - checked
74	Engine No. 1 - start
80	Flight control and first stage interlock - checked
82	Engine No. 1 throttle - full forward
85	APP - OFF
89	Engine No. 2 - start (no starter dropout)
98	Flat pitch and engine overspeed protection system - checked
99	Minimum governing microswitches - check
102	Generator dropout and pickup - check
129	Engine No. 1 anti-ice - ON, then OFF
136	Crossfeed - check
142	Pitot heat - ON, then OFF
148-151	Gradually increase torque of both engines to 100-percent
151-156	Operate both engines at 100-percent torque
162-170	Operate both engines at 50-percent torque
172-179	Operate both engines at 14-percent torque
197	Engine No. 1 - shutdown, engine No. 2 at 70-percent torque
203	Engine No. 1 - restart with emergency start switch at EMERGENCY
208	Engine No. 2 - shutdown, engine No. 1 at 50-percent torque
213	Engine No. 2 - restart
218	EAPS (engine No. 2) - closed
220	APP - start
221	Comm/nav equipment - OFF
223	Refueling probe - extend and retract
229	Throttles - shutoff
231	AFCS - OFF
234	APP - shutdown
237	Instrumentation - OFF, end test

RUN 4 0°F 19 MAR 70

RUN 4, 0°F, 19 March 1970
Soak time 47 hours

Test Synopsis:

This run was chosen to present 0°F test data. Another 0° test (run 28) is also presented later to show heat distribution with litters installed (litters were not installed for this run). All of the equipment was operate including the miniguns (using dummy ammunition). The engine dual start valve problem became evident during this run as both engines motored, even though No. 1 was selected.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control and EAPS.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

1-6-Engine No. 1 fuel flow (not connected).

1-11-Engine No. 2 fuel flow (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Defective test parameters not presented (unless indicated otherwise)

2-15-Utility hydraulic pump outlet pressure.

3-22-Cargo area forward waist level air temperature (erratic, but average temperature shown is good; data are presented).

4-13-Second stage hydraulic pump outlet temperature.

Box 6-Engine component temperatures (much of the entire box 6 position instrumentation had bad data; when possible, good data were retrieved).

6-09-Engine No. 1 aft inboard isolation mount mass temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-18-Engine No. 1 compressor case temperature, 4th stage, 9 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

Event Sheet:

CTR	Event
10	APP - start
	NOTE: This is the second start attempt;

CTR	Event
13	Heater - ON, COCKPIT SELECT
	NOTE: Pilot's overhead ducts full open momentarily, then closed; pilot's floor ducts full open, cabin duct deflectors set at 45-degree angle
17	Heater - max heat
21	Guns - check operation and stow
40	Cargo winch - check operation
51	Rescue hoist - check operation
51	Rotor brake - set
51-59	Engine starters - check operation
	NOTE: Both starters turn, even though only one is selected.
60	All doors - closed, ramp open
65	Engine No. 1 - start
	NOTE: No starter dropout
69	Rotor brake - OFF
70	Flight control and first stage interlock - checked
76	Engine No. 1 throttle - forward
79	APP - OFF
80	Ramp door - closed
85	Engine No. 2 - Start
	NOTE: No starter dropout
95	Engine No. 2 throttle - 100-percent N_f
97	Flat pitch and engine overspeed protection system - checked
98	Engine No. 1 anti-ice - ON, then OFF
100	Windshield anti-ice - ON, then OFF
103	Crossfeed - checked
106	Minimum governing microswitches - checked
112	Pitot heat - ON, then OFF
128-133	Operate both engines at 50-percent torque (engine No. 2 operated with EAPS doors in both the open and closed positions
137-147	Operate both engines at 100-percent torque (engine No. 2 operated with EAPS doors in both the open and closed positions
150-163	Power - set to cruise (50-percent torque)
151-157	Fuel transfer - checked
164	Engine No. 1 - shutdown
167	Engine No. 1 - restart with emergency start switch in EMERGENC
171	Engine No. 2 - shutdown

CTR	Event
175	Engine No. 2 - restart
181-187	Operate both engines at ground idle (engine No. 2 EAPS doors closed)
185	Heater - OFF, vent switch ON
186	APP - start
188	Throttles - shutoff
189	Rotor brake - normal
190	Fuel control levers - closed
196	APP - shutdown
198	End start

RUN 6, -25°F, 25 March 1970
Soak time 26 hours

Test Synopsis:

This run was chosen to present -25°F test data.

Although considered marginal at this temperature, the single standard production APP start accumulator was used and was able to start the APP.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control and EAPS.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

1-6-Engine No. 1 fuel flow (not connected).

1-11-Engine No. 2 fuel flow (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Defective test parameters not presented (unless indicated otherwise)

3-22-Cargo area forward waist level air temperature (erratic, but average temperature shown is good; data are presented).

4-13-Second stage hydraulic pump outlet temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-13-Engine No. 1 compressor case temperature, 3rd stage, 4:30 o'clock position.

7-18-Engine No. 1 compressor case temperature, 3rd stage, 9 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clock position.

RUN 6 -25°F 25 MAR 70

Event Sheet:

CTR	Event
8	APP - start
10	Comm/nav radios and radar altimeter - ON
10	Heater - failed to start - started later
18	All doors and ramp - closed
30	AFCS servos - checked
30	Stick trim - checked
32	EAPS (No. 2) - open
32	Windshield anti-ice - ON

CTR	Event
33	Rotor brake - ON
36-39	Engine starters - check operation
44	Engine speed trim - checked
45	AFCS - checked
47	Second stage interlock - checked
54	Heater - start
63	Engine No. 1 - start
	NOTE: Rotor brake did not hold, rotors turned. No starter dropout.
71	Rotor brake - OFF
71-74	Flight control and first stage interlock - checked
75	Engine No. 1 throttle - forward
79	APP - OFF
83	Engine No. 2 - start
91	Flat pitch and engine overspeed protection system - checked
94	Minimum governing microswitches - checked
94-101	Engine No. 1 anti-ice - ON, then OFF
96	Generator dropout and pickup - checked
100	Crossfeed - checked
105	EAPS (No. 2) - closed
113-116	Operate both engines at 50-percent torque
117-125	Operate both engines at 80-percent torque
119	EAPS (No. 2) - open
126-132	Operate both engines at 100-percent torque
132	Heater rheostat changed from 9 o'clock position (increase heat)
133-144	Operate both engines at 80-percent torque
140	Heater rheostat changed from 12 o'clock to 3 o'clock position (increase heat)
146-150	Operate both engines at 50-percent torque
151	Collective - set to flat pitch
152-155	Operate both engines at flight idle (17-percent torque)
157-159	Operate No. 1 engine at ground idle
160-163	Operate No. 2 engine at ground idle
165	Heater - OFF
165	APP - start
168	Comm/nav equipment - OFF
169	Windshield anti-ice - OFF
172	Throttles - shutoff
173	Rotor brake - NORMAL

CTR	Event
176	AFCS - OFF
177-182	Second stage hydraulic temperature increasing due to loss of cooling from rotor
177-182	Engine starters - check operations
182	End test (APP still running)

RUN 15, -45°F, 13 May 1970
Soak time 24 hours

RUN 15 -45°F 13 MAY 70

Test Synopsis:

This run was chosen to present -45°F test data. Another -45°F run (run 34) is also presented later to show cooling characteristics of the second stage hydraulic system without rotor operation. The APP start was accomplished by using both start accumulators (the standard plus the additional test accumulator). Both accumulators were normally used for starts at -25°F or lower.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control and EAPS.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

1-6-Engine No. 1 fuel flow (not connected).

1-11-Engine No. 2 fuel flow (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Defective test parameters not presented (unless indicated otherwis

3-22-Cargo area forward waist level air temperature (erratic, but average temperature shown is good; data are presented).

4-13-Second stage hydraulic system pump outlet temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'cloc position.

7-13-Engine No. 1 compressor case temperature, 3rd stage, 4:30 o'clock position.

7-14-Engine No. 1 compressor case temperature, 3rd stage, 6 o'cloc position (unusable data deleted from initial portion, but remainde of data are retained).

7-18-Engine No. 1 compressor case temperature, 4th stage, 9 o'cloc position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'cloc position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'cloc position.

Event Sheet:

CTR	Event
10	APP start

NOTE:
Heat applied for 25 minutes to APP speed monitor switch to overcome cold-temperature sticking.

CTR	Event
14	Heater start, cabin select
	Comm/nav equipment - checked
39-75	Engine starters - check operation
94	All doors and ramp - closed
96	AFCS servos - checked
98	Stick trim - checked
99	EAPS (No. 2) - open
100	Rotor brake - OFF
101	Engine speed trim - checked
102	AFCS - checked
104	Second stage interlock - checked
106	Engine No. 1 - start
120	Engine No. 1 - shutdown. Rotor is turning, but rotor brake light is on indicating rotor brake may be partially applied causing a fire hazard.
164	Engine No. 1 - restart
170	Flight control and first stage interlock - checked
171	Engine No. 1 throttle - forward
175	APP - OFF
178	Engine No. 2 - start
188	Flat pitch and engine overspeed protection system - checked
194	Minimum governing microswitches - checked
195	Engine No. 1 anti-ice - ON, then OFF
195	Windshield anti-ice - ON
196	Crossfeed - checked
196	Generator dropout and pickup - checked
201-209	Operate both engines at 50-percent torque
212-220	Operate both engines at 80-percent torque
222-230	Operate both engines at 100-percent torque
233	Collective - set to flat pitch
236	Heater - OFF
238	APP - start attempt. No start; speed switch stuck.
243	Comm/nav equipment - OFF
247	Throttles - shutoff
250	End test

HH-53C LOW SPEED - CLIMATIC
HANGAR (EGLIN A.F.B.)

RUN 19, -65°F, 23 May 1970
Soak time 24/64 hours

RUN 19 -65°F 23 MAY 70

Test Synopsis:

This run was chosen to present -65°F test data. Engine No. 2 was not operated, as it had a failed nose gear box. In addition, the heater was operable only part time during this run and the data that are presented for the heater are not typical for this temperature (the insulation was loose and hanging) another -65°F run (run 35) is also presented to show heater data, but the rotors could not be operated during that run. There are no acceptable -65°F heater data available for operation with rotors turning.

The soak time is shown as two figures (24 and 64 hours). The first and smaller figure (24 hours) represents the soak time at -65°F. The second and larger figure (64 hours) is the useful soak time; the difference being the time it took to change the temperature in the test chamber. Sinc the chamber temperature as well as the aircraft temperature was constantly decreasing during this time, it is identified as useful soak time.

It was necessary to apply heat to the APP start valve to start the APP (the valve did not fully open).

Both start accumulators were used for the initial APP start.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 was inoperable because of nose gear box which failed during previous run (run 18, -65°F, 21 May 1970).

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

1-6-Engine No. 1 fuel flow (not connected).

1-11-Engine No. 2 fuel flow (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Box 8, engine No. 2 surface temperatures (not presented because of inoperable engine).

Defective test parameters not presented (unless indicated otherwise

1-15-Main rotor rpm.

3-22-Cargo area forward waist level air temperature (erratic but average temperature shown is good; data is presented).

4-13-Second stage hydraulic system pump outlet temperature.

6-13 through 6-20-Engine No. 1 inlet lip temperatures (erratic when engine anti-ice is operated; defective portions deleted).

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'cloc position.

7-13-Engine No. 1 compressor case temperature, 3rd stage, 4:30 o'clock position.

7-14-Engine No. 1 compressor case temperature, 3rd stage, 6 o'cloc position.

7-18-Engine No. 1 compressor case temperature, 4th stage, 9 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clock position.

Event Sheet:

CTR	Event
79	APP - start after three unsuccessful attempts. Cause was defective APP start valve; valve had to be heated to provide proper operation.
125	Windshield anti-ice - ON low
165	Comm/nav equipment checked; Doppler was inoperative.
165	Heater - start after previous unsuccessful attempts due to defective vent fan; heater at MAX HEAT SELECT position.
175	AFCS servos - checked
181	Stick trim - checked
182	EAPS (No. 2) - open
185	Engine No. 1 anti-ice - ON, then OFF
189	Rotor brake - ON
194	Engine No. 1 starter - check operation
198	Engine speed trim - checked
200	Second stage interlock - checked
221	Engine No. 1 - start
225-230	Operate engine No. 1 at ground idle
231	Rotor brake - OFF
237	Flight control and first stage interlock - checked
241	Engine No. 1 throttle - forward
251	APP - OFF
	NOTE: Engine No. 2 not started due to previous failure of nose gearbox.
255	Minimum governing microswitches - checked
271	EAPS (No. 2) - closed
272-275	Operate engine No. 1 at 50-percent torque.
276	Flight controls - exercise
276	Air refueling probe - extend and retract
295-306	Operate engine No. 1 at 80-percent torque
304	Flight controls - exercise
306	Heater - OFF; vent fan motor failed.
312-324	Operate engine No. 1 at 100-percent torque.

326	Flight controls - exercise
328-331	Operate engine No. 1 at 80-percent torque
357	APP - start
362	No. 1 throttle - Ground idle
363	No. 1 throttle - shutoff
364	Rotor brake - normal
368	Motor engine No. 1 to charge accumulators
369	Rescue hoist - check operation
387-404	AFCS - check operation
436	APP - shutdown
441	End test

RUN 21, 125°F, 28 May 1970
(Includes second stage hydraulic system cooling data)
Soak time 35 hours

RUN 21 +125°F 28 MAY 70

Test Synopsis:

This run was chosen to present 125°F test data. The marginal power of the APP was evident as APP automatic shutdown occurred during this run due to opening of the high exhaust gas temperature circuit breaker when the APP was subjected to the load of motoring an engine (such as for starting).

The second stage hydraulic system cooling problem (static rotors) was demonstrated during this run. This occurred after counter number 259 when the main rotor stopped turning after engine shutdown. The second stage hydraulic system continued to be pressurized to the end of the run, a period of 11 minutes. Portions of the second stage hydraulic system exceeded 275°F (135°C), as can be seen by referencing parameters 4-12 through 4-16 at counter number 280 and beyond.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 was inoperable because of nose gearbox which failed during a previous run (run 18, -65°F, 21 May 1970).

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

1-6-Engine No. 1 fuel flow (not connected).

1-11-Engine No. 2 fuel flow (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Box 8, engine No. 2 surface temperatures (not presented because of inoperable engine).

Defective test parameters not presented (unless indicated otherwise)

3-22-Cargo area forward waist level air temperature (erratic, but average temperature shown is good; data are presented).

4-13-Second stage hydraulic system pump outlet temperature.

7-18-Engine No. 1 compressor case temperature, 4th stage, 9 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

Event Sheet:

CTR	Event
15	APP - start

NOTE:

APP EGT 465°C during start.

CTR	Event
18	Vent fan - ON
	NOTE: Main transmission chip detector light actuated.
19	Comm/nav equipment - checked
	NOTE: Doppler would not operate during previous low temperature tests, but is now operating at high temperature.
32	Guns - check power and condition
34	Cargo hook - check operation
37	Rescue hoist - check operation
38	Cargo winch - check operation
	NOTE: Winch inoperative.
45	AFCS and stick trim - checked
	NOTE: Fast movement of controls bleeds down second stage hydraulic pressure; this is considered normal for this system.
49	EAPS - open
52	Rotor brake - ON
57-59	Engine No. 1 starter - check operation
	NOTE: APP automatic shutdown due to EGT overheat circuit breaker actuation.
68	APP - restart
	NOTE: APP EGT 466°C during start.
72-73	Engine No. 2 starter - check operation
	NOTE: APP automatic shutdown due to EGT overheat circuit breaker actuation.
78	APP - restart
	NOTE: Start aborted due to EGT overheat circuit breaker activation.
99	APP - restart
	NOTE: APP EGT during start was 525°C.
102	Engine speed trim - check
109	Engine No. 1 - start aborted
	NOTE: Engine start aborted and APP automatic shutdown occurred due to APP overtemp of 638°C during engine start.

CTR	Event
125	APP - restart - aborted
	NOTE: Start aborted due to EGT overheat circuit breaker activation.
131	Engine No. 1 - start
	NOTE: APP overtemp of 638°C occurred during engine start.
137	Rotor brake - OFF
139	Flight control and first stage interlock - checked
146	Engine No. 1 throttle - forward
	NOTE: Fuel filter bypass light on. Main transmission chip light and oil pressure fluctuation noted. Engine No. 2 not started because of previous nose gearbox failure.
154	APP - OFF
148-171	Operate engine No. 1 at flight idle
164	Air refueling probe - extended and retracted
165	Minimum governing microswitches - checked
172-175	Engine and APP - shutdown to inspect main transmission chip detector plugs
	NOTE: Sump detector had chips but did not warrant main transmission change.
183	APP - restart
189	Engine No. 1 - restart
193-196	Operate engine No. 1 at ground idle
198	Engine No. 1 throttle - forward
200	APP - OFF
208-212	Operate engine No. 1 at 50-percent torque
216-239	Operate engine No. 1 at 75-percent torque
	NOTE: Engine No. 1 could not get more than 75-percent torque due to the need for a topping adjustment.
242	APP - start
244	Throttle - shut off
249-252	Motor engine No. 1
	NOTE: APP EGT overheat of 700°C occurred during motoring.
259-293	Second stage hydraulic system pressurized for 11 minutes without cooling effect of main rotor operation
263	AFCS - check
293	APP - shutdown
293	End test

NOTE: (applies to runs 22 through 28)

Runs 22 through 28 include engine oil test data. The purpose of the engine oil test was to measure temperatures needed to identify the cooling capability of the oil system at various ambient air temperatures, engine power conditions, and oil flow rates. The oil system was extensively instrumented (figure 1) by adding some new parameters and exchanging with some existing parameters. Calibrated oil pumps were installed which were capable of three flow rates:

Pump Setting	Engine No. 1 Pump Flow (S/N 597) (gpm)	Engine No. 2 Pump Flow (S/N 595) (gpm)
Low	6.05	6.00
Medium	6.25	6.30
High	6.45	6.60

The flow rates were calibrated at 17,070 N_g (100-percent engine gas generator rpm), 225°F oil temperature, and 60 psig oil pump discharge pressure.

RUN 22, 70°F Engine Oil Test, 1 July 1960
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.05 gpm (low)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.00 gpm (low)
Soak time N/A

Test Synopsis:

This was the first run after a one month break in the testing. Aircraft and instrumentation repairs were made during this time. The failed nose gearbox (engine No. 2) was replaced and both engines were operated. Engine oil test parameters were also installed. It was necessary to replace some of the previous parameters to provide the necessary oil temperature parameters. The standard engine armor plating was installed on engine No. 2 to check for possible effects on engine operating temperature maintenance, etc.

This run was chosen to present baseline 70°F data in the middle of the climatic laboratory tests. This run also provided baseline 70°F dat for the engine oil test.

The calibrated engine oil pumps were set at the low oil flow settin

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating insta

Both engines had calibrated engine oil pumps installed.

Test parameters not connected or not presented.

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Defective test parameters not presented (unless indicated otherw

4-13-Second stage hydraulic system pump outlet temperature.

5-07-Engine No. 1 oil cooler outlet oil temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'cl position.

7-14-Engine No. 1 compressor case temperature, 3rd stage, 6 o'cl position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'cl position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'cl position.
