RUN 23 +103°F 2 JULY 70

RUN 23, 103°F Engine Oil Test, 2 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.05 gpm (low)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.00 gpm (low)
Soak time N/A

Test Synopsis:

This run was chosen to present 103°F engine oil test data. Engine topping adjustment was accomplished on both engines.

The calibrated oil pumps were set at the low oil flow setting.

As the run progressed, the chamber temperature exceeded the scheduled 103°F; it reached a peak of 114°F at C/N 225 and then decreased and was back to the scheduled 103°F by C/N 350.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating installe

Both engines had calibrated engine oil pumps installed.

Test parameters not connected or not presented.

2-18-Main wheel brake return, hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Defective test parameters not presented (unless indicated otherwise

3-22-Cargo area forward waist level air temperature (erratic, but average temperature shown is good; data are presented).

4-13-Second stage hydraulic system pump outlet temperature.

5-07-Engine No. 1 oil cooler outlet oil temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-14-Engine No. 1 compressor case temperature, 3rd stage, 6 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-13-Engine No. 2 compressor case temperature, 3rd stage, 6 o'clock position.

Event Sheet:

CTR	Event
92	Engine No. 1 - start
100	Engine No. 1 throttle - forward
108	Engine No. 2 - start
115-121	Operate both engines at flight idle power
112-127	Operate engines at matched N_g and nominal flight idle power; allow temperatures to stabilize.

CTR	Event
128-158	Operate engines at matched N_g and nominal 50-percent torque; allow temperatures to stabilize.
163-189	Operate engines at matched N_g and nominal 80-percent torque; allow temperatures to stabilize.
210-280	Engine No. 1 - topping power adjustment
314-352	Engine No. 2 - topping power adjustment
353-389	Operate engine No. 2 at maximum power
415-426	Operate engine No. 1 at 100-percent torque
427	Operate both engines at matched N_g and 100-percent nominal torque.

RUN 24, 103°F Engine Oil Test, 7 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.05 gpm (low)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.60 gpm (high)
Soak time N/A

RUN 24 +103°F 7JULY 70

Test Synopsis:

This was a continuation of run 23, a 103°F engine oil test. Engine No. 2 oil pump was placed at a high flow setting of 6.60 gpm from the previous low setting of 6.00 fpm for run 23. Engine No. 1 oil pump remained at the low setting of 6.05 gpm.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating install

Both engines had calibrated engine oil pumps installed.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

Defective test parameters not presented (unless indicated otherwis

3-22-Cargo area forward waist level air temperature (erratic, but average temperature shown is good; data is presented).

4-13-Second stage hydraulic system pump outlet temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clo position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clo position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clo position.

Event Sheet:

CTR	Event
19	APP - start
21	Vent fan - ON
22	Comm/nav equipment - checked
40	Guns - checked
43	Cargo hook and rescue hoist - checked
45	Vent fan - OFF
52	All doors and ramp - closed
54	AFCS servos - checked
55	Stick trim - checked
55	EAPS (No. 2) - open
60	Rotor brake - OFF
60-66	Engine starters - check operation

CTR	Event
67	Engine speed trim - checked
68	AFCS - checked
70	Second stage interlock - checked
75	Engine No. 1 - start
80	Flight control and first stage interlock - checked
83	Engine No. 1 throttle - forward
86	APP - OFF
88	Engine No. 2 - start
93	Flat pitch and engine overspeed protection system - checked
95	Minimum governing microswitches - checked
102	Engine No. 1 anti-ice - ON, then OFF
103	Crossfeed - checked
108-126	Engine No. 2 to ground idle
127-157	Operate both engines at flight idle
136-157	Operate engines at matched N_g
161-162	Operate both engines at 100-percent torque
163-164	Operate engines at matched N_g and nominal 100-percent torque
166-179	Operate engine No. 2 at 100-percent torque and allow all temperatures to stabilize
183-213	Operate engine No. 1 at 100-percent torque and allow temperatures to stabilize
216-226	Operate engine No. 1 at 80-percent torque and allow all temperatures to stabilize
229-269	Operate engine No. 2 at same N_g previously set on engine No. 1 (at 80-percent torque) and allow temperatures to stabilize.
273-275	Operate engine No. 2 at 80-percent torque
277-280	Operate both engines at 50-percent torque
286-297	Operate engines at matched N_g and nominal 50-percent torque and allow temperatures to stabilize
301	APP - start
302	Throttles - ground idle
306	Throttles - shut off
308	APP - shutdown
313	End test

RUN 25A, 125°F Engine Oil Test, 8 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.05 gpm (low)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.00 gpm (low)
Soak time N/A

RUN 25A +125°F 8 JULY 70

Test Synopsis:

This run was chosen to present 125°F engine oil test data. The calibrated oil pumps were set at the low oil flow setting.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating installed.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

3-1 through 3-28 (all parameters on switch box position 3)-Heater duct and aircraft compartment temperatures (not presented).

Defective test parameters not presented (unless indicated otherwise).

4-13-Second stage hydraulic system pump outlet temperatures.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clock position.

Event Sheet:

CTR	Event
49	Engine No. 1 - start
54	Rotor brake - OFF
57	Engine No. 1 throttle - forward
	NOTE: APP EGT 670°C while starting engine No. 1.
60	APP - OFF
64	Engine No. 2 - start
71-108	Operate both engines at flight idle and allow temperatures to stabilize
106	APP - start
111	Engines and APP - shutdown to check engine No. 1 low oil level light
117	APP - start
139	Rotor brake - OFF

CTR	Event
140	Engine No. 1 - start
145	Eng No. 1 throttle - forward
148	Engine No. 1 - power reduced to clear test chamber
157	Engine No. 1 throttle - forward
159	APP - OFF
162	Engine No. 2 - start
166	Engine No. 2 throttle - set at 100-percent N_f
171-207	Operate both engines at 50-percent torque and allow temperatures to stabilize
215-217	Set both engines at 80-percent torque
222-234	Operate engine No. 1 at 80-percent and allow temperatures to stabilize
242	Terminate test because of rotor head vibration

RUN 25B, 125°F Engine Oil Test, 13 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.05 gpm (low)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.00 gpm (low)
Soak time N/A

Test Synopsis:

This is a continuation of run 25A (125°F engine oil test) and presents 80-percent torque data for engine No. 2 and maximum torque data for both engines with the oil pumps set at the low oil flow setting. These engine power settings were not used during run 25A.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating installe

Both engines had calibrated engine oil pumps installed.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

3-1 through 3-28 (all parameters on switch box position 3)-Heater duct and aircraft compartment temperatures (not presented).

Defective test parameters not presented (unless indicated otherwise

4-13-Second stage hydraulic system pump outlet temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'cloc position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'cloc position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'cloc position.

Event Sheet:

CTR	Event
35	Engine No. 1 - start NOTE: APP EGT 620°C while starting engine No. 1.
41	Engine No. 1 throttle - forward
46	APP - OFF
48	Engine No. 2 - start
52	Engine No. 2 throttle - set at 100-percent N_f
59-78	Operate engine No. 2 at 80-percent torque and allow temperatur to stabilize.
80-91	Operate engine No. 1 at flight idle (14-percent torque) and allow temperatures to stabilize.

RUN 25B +125°F 13JULY 70

CTR	Event
95-120	Operate engine No. 2 at flight idle (14-percent torque) and allow temperatures to stabilize.
122-154	Operate engine No. 1 at maximum available torque (97-percent) and allow temperatures to stabilize.
164-191	Operate engine No. 2 at maximum available torque (91-percent) and allow temperatures to stabilize.

RUN 25C +125°F 13 JULY 70

RUN 25C, 125°F Engine Oil Test, 13 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.45 gpm (high)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.60 gpm (high)
Soak Time N/A

Test Synopsis:

This run is a continuation of the 125°F engine oil test. Previous 125°F tests were runs 25A and 25B.

This run presents 125°F data with the oil pumps at the high oil flow settings. Previous runs 25A and 25B were conducted with the oil pumps at the low flow setting. The next test, run 26, presents data for medium oil flow.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating installed.

Both engines had calibrated oil pumps installed.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

3-1 through 3-28 (all parameters on switch box position 3)-Heater duct and aircraft compartment temperatures (not presented).

Defective test parameters not presented (unless indicated otherwise)

4-13-Second stage hydraulic system pump outlet temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clock position.

Event Sheet:

CTR	Event
272	Engine No. 1 - start
	NOTE: APP EGT peaked at 634°C while starting engine No. 1.
274	Rotor brake - OFF
277	Engine No. 1 throttle - forward
280	Engine No. 2 - start
283	Engine No. 2 throttle - set at 100-percent N_f
288-315	Operate both engines at 50-percent torque and allow temperature to stabilize.

CTR	Event
321-346	Operate engine No. 2 at flight idle (13-percent torque) and allow temperatures to stabilize.
321-346	Operate engine No. 1 at 80-percent torque and allow temperatures to stabilize.
355-375	Operate engine No. 1 at flight idle (13-percent torque) and allow temperatures to stabilize.
355-375	Operate engine No. 2 at 80-percent torque and allow temperatures to stabilize.
380-400	Operate engine No. 2 at maximum available torque (92 percent) and allow temperatures to stabilize.
400	Operate engine No. 2 at maximum available torque (91 percent) with EAPS doors closed.
404-429	Operate engine No. 1 at maximum available torque (99 percent) and allow temperatures to stabilize.
445	APP - start
447	Throttles - shutdown
462-463	Engine No. 1 starter - check operation.

NOTE:
APP EGT peak 630°C while motoring engine No. 1.

RUN 26, 125°F, Engine Oil Test/Second Stage Hydraulic System Cooling, 14 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.25 gpm (medium)
Engine No. 2 Pump (S/N 595) at Nominal Setting of 6.30 gpm (medium)
Soak time N/A

RUN 26 +125°F 14JULY 70

Test Synopsis:

This run presents the final 125°F engine oil test data with the oil pumps at the medium flow setting. Previous runs (25A and 25B) presented data for low oil flow settings and run 25C presented data for high oil flow setting.

This run also contains data showing second stage hydraulic system cooling characteristics. From C/N 219 to C/N 232 the second stage hydraulic system was pressurized without rotor operation resulting in an overheat condition (temperature of 135°C/275°F or higher) after 5 minutes. Due to the cooling effect caused by the turning rotors, such an overheat condition had not been noted with the main rotors turning.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 had -12 fuel control, EAPS, and armor plating installed.

Both engines had calibrated engine oil pumps installed.

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 3-26-Heater output airflow differential pressure (not presented).

3-1 through 3-28 (all parameters on switch box position 3)-Heater duct and aircraft compartment temperatures (not presented).

Defective test parameters not presented (unless indicated otherwise).

4-13-Second stage hydraulic system pump outlet temperatures.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperature, 5th stage, 4:30 o'clock position.

8-18-Engine No. 2 compressor case temperature, 5th stage, 9 o'clock position.

Event Sheet:

CTR	Event
41	Engine No. 1 - start
	NOTE: APP EGT peaked at 650°C while starting engine No. 1.
46	Rotor brake - OFF
50	Engine No. 1 throttle - forward

CTR	Event
55	Engine No. 2 - start
60	Engine No. 2 throttle - set at 100-percent N_f
64-69	Operate both engines at 50-percent torque and allow temperatures to stabilize.
94-123	Operate engine No. 1 at 80-percent torque and allow temperatures to stabilize.
94-123	Operation engine No. 2 at flight idle (12-percent torque) and allow temperatures to stabilize.
128-153	Operate engine No. 2 at 80-percent torque and allow temperatures to stabilize.
130-153	Operate engine No. 1 at flight idle (12-percent torque) and allow temperatures to stabilize.
156-175	Operate engine No. 2 at maximum available torque (90 percent) and allow temperatures to stabilize.
177-202	Operate engine No. 1 at maximum available torque (96 percent) and allow temperatures to stabilize.
206	Operate both engines at maximum available torque.
208	Operate both engines at 80-percent torque.
211	Throttles - ground idle
214	APP - start
216	Throttles - shutoff
219-232	Second stage hydraulic fluid overheating after rotor shutdown (5 minutes).
232	APP - shutdown
234	End test

RUN 28-1 0°F 31 JULY 70

RUN 28, 0°F, Engine Oil Test/Second Stage Hydraulic System Cooling, 31 July 1970
Engine No. 1 Pump (S/N 597) at Nominal Setting of 6.25 gpm (medium)
Soak time 25 hours

Test Synopsis:

This run provides supplementary engine oil test data and second stage hydraulic system cooling data with static rotors (reference data at C/N 14 through 117).

An attempt was made during this period of the climatic laboratory tests to repeat the low temperature runs for the purpose of obtaining heater data with rotor operation and to test fixes for the low temperature problems. However, very few fixes were made and heavy icicles which formed on the ceiling of the main test chamber prevented rotor operation at the -45 and -65°F temperatures. Rotors were operated during this run.

Litters were installed for this second series of low temperature tests to identify their effect on heat distribution.

APP starts were made by using the single standard start accumulator charged to 3,000 psi.

Pertinent information.

Engine No. 1 had -13 fuel control and no EAPS.

Engine No. 2 was inoperable because of a previous failure due to FOD

Litters were installed in the aircraft cargo compartment:

Right center - four high

Right aft - four high

Left aft - three high

Test parameters not connected or not presented.

1-4-Free air temperature (not connected).

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

8-1 through 8-28-Engine No. 2 surface temperatures (not presented because of inoperable engine).

Box positions 1, 3, 5, 6, 7, 8 are not presented for the initial portion of the run, because it is intended to present only hydraulic system data.

Defective test parameters not presented (unless indicated otherwise)

4-13-Second stage hydraulic system pump outlet temperature.

7-12-Engine No. 1 compressor case temperature, 3rd stage, 3 o'clock position.

7-19-Engine No. 1 compressor case temperature, 5th stage, 3 o'clock position.

7-20-Engine No. 1 compressor case temperatures, 5th stage, 4:30 o'clock position.

Event Sheet:

CTR	Event
8	APP - start
14-117	Second stage hydraulic system - pressurized for 34 minutes without the cooling effect of main rotor operation
117	APP - shutdown
	NOTE: The test was stopped at this point because of a failed heater vibrator and ignitor. The time reference was reset to zero minutes, thus the time figures for the data below will not be in sequence with those above. There was also an electrical power failure at the climatic laboratory which resulted in a 3 second shutdown. The test data presented below start after resumption of the test following the second shutdown.
181	APP - start
184	Heater - start, CABIN SELECT
189	Entrance door, cargo door and ramp door - open
192	All doors and ramp - closed
195	Rotor brake - off
201	Engine No. 1 - start
	NOTE: A defective engine dual start valve caused engine No. 2 to motor while engine No. 1 was starting.
209	Engine No. 1 throttle - forward
	NOTE: Engine No. 2 not started due to previous FOD.
210-212	Operate engine No. 1 at 36-percent torque with main rotors at flat pitch
212-300	Operate engine No. 1 at average 50-percent torque
252-258	Main transmission pressure fluctuation
264	Left rudder creeping
282	Heater ducts over aft litters adjusted to direct flow to aisle away from litter
301	Heater - OFF, vent switch ON
301	Throttles - shutoff
306	APP - shutdown
308	End test

25 August 1970
Soak time 11/23 hours

Test Synopsis:

This run was taken from the third series of low temperature tests conducted during the climatic laboratory tests. This third series was conducted for landing gear retraction and extension tests. Since the aircraft was resting on jacks, the rotors were not operated for safety reasons.

The soak time is shown as two figures, 11 and 23 hours; the difference between them represents the time it took to change the temperature in the test chamber. Since the aircraft temperature as well as the chamber temperature was constantly decreasing during this time, the larger figure of 23 hours is included, since it represents useful soak time.

This run was chosen to present data showing second stage hydraulic system cooling characteristics at -45°F without rotor operation (the most critical condition).

The second stage hydraulic system was operated for 71 minutes (C/N 12 to 213) without rotor operation. During this time the hydraulic temperature was constantly rising, reaching a high of over 93°C (200°F) at shutdown.

APP starts were made by using the test accumulator in addition to the standard start accumulator. Both accumulators were charged to 3,000 psi for the starts.

Pertinent information.

Engines and rotors were not operated.

Test parameters not connected or not presented.

Box positions 1, 3, 5, 6, 7, 8, test parameters not presented. Only those test parameters pertinent to hydraulic system data (box positions 2 and 4) are presented.

Defective test parameters not presented (unless indicated otherwise).

4-13-Second stage hydraulic system pump outlet temperature.

Event Sheet:

CTR	Event
12	APP - start (both accumulators used at a charge pressure of 3,000 psi in place of the normal cold weather value of 4,000 psi).
12-213	Second stage hydraulic system - pressurized. The second stage hydraulic system was pressurized for 71 minutes without rotor operation.
213	APP - shutdown
215	APP - start (both accumulators used at an initial pressure of 3,000 psi)
220	APP - shutdown
224	End test

RUN 35, -65°F, Heater Test and Second Stage Hydraulic System Cooling,
26 August 1970
Soak time 10 hours

RUN 35 -65°F 26 AUG 70

Test Synopsis:

This run is taken from the third series of low temperature tests conducted during the climatic laboratory tests. This third series was conducted for landing gear retraction and extension tests. Since the aircraft was resting on jacks the rotors were not operated for safety reasons.

This run is presented to substantiate the -65°F heater data shown in the climatic laboratory test report (reference 3) and to present data showing second stage hydraulic system cooling characteristics at -65°F without rotor operation (the most critical condition).

The second stage hydraulic system was operated for 24 minutes without rotor operation (C/N 67 to C/N 127).

APP starts were made by using the test accumulator in addition to the standard start accumulator. Both accumulators were charged to 4,000 psi for the starts. During the subsequent run 36, APP starts were made at the more desirable pressure of 3,000 psi.

Pertinent information.

Engines and rotors were not operated.

The litters were removed from the cargo compartment previous to this run.

Test parameters not connected or not presented.

Box positions 1, 6, 7, 8, engine and rotor data not presented, since engines and rotors were not operated.

2-18-Main wheel brake return hydraulic pressure (not connected).

2-19 through 2-26-Heater output airflow differential pressure (not presented).

5-1, 5-5 through 5-21-Engine and gearbox data not presented, since they were not operated.

Defective test parameters not presented (unless indicated otherwise

4-13-Second stage hydraulic system pump outlet temperature.

Event Sheet:

CTR	Event
	NOTE: High temperature reading at heater combustion air inlet (parameter 3-05) is indicated in the data during the initial portion of the run. This was apparently due to heat from a personnel heater used for applying heat to maintenance personnel on top of the aircraft.
32	APP - start
35	APP inadvertent shutdown - due to the inadvertent APP shutdown, there was a 14-minute loss of instrumentation data at this point.
X	Heater - ON, CABIN SELECT. External power used as power source

CTR	Event
36	Instrumentation - restarted after 9 minutes of heater operation.
48	APP - start abort due to frozen "speed" switch.
62	Doors - closed
67	APP - start after heat applied to "speed" switch.
67-127	Second stage hydraulic system - pressurized for 24 minutes without rotor operation.
84-96	Landing gear - extension and retraction tests conducted
86	External power - OFF
121	Heater - OFF
125	APP - OFF
130	End test
