ABSTRACT

This report contains propellant test results from cartons of TP-H1011 bulk propellant representing LGM-30 F and G First Stage Minuteman Motors. This report uses a statistical approach to analyze the bulk carton propellant. Testing was accomplished in accordance with MMEMP Project M-41785M, DO 12 Nr 2MP-155P, 72NE068.

An analysis of all parameters indicates that seven years of aging at 77°F temperature has not greatly affected the properties of the propellant. No potential problems are expected in the propellant for at least two years past the oldest data point.

Each point on the regression plot represents all samples at that particular age. The number of samples at each point is indicated on the sample size summary sheet on the page accompanying each regression plot. The data range at any age can be found by suitable inquiry of the GO85 System.

GLOSSARY OF TERMS AND ABBREVIATIONS

| | |
|---------------------|---|
| Aging Trend | A change in properties or performance resulting from aging of material or component |
| CSA | Cross Sectional Area |
| E | Modulus (psi), defined as stress divided by strain along the initial linear portion of the curve |
| EB | End Bonded |
| EGL | Effective Gage Length |
| em | Strain at maximum stress |
| er | Strain at rupture |
| DB | Dogbone |
| Degradation | Gradual deterioration of properties or performance |
| "F" ratio | The ratio of the variance accounted for by the regression function to the random unexplained variance. The regression function having the most significant "F" ratio is used for plotting data. The ratio is also used in detecting significant changes in random variation between succeeding time points. |
| JANNAF | Joint Army, Navy, NASA, Air Force Committee |
| MAGCP | Propellant Lab Section at OOAMA |
| OOAMA | Ogden Air Materiel Area, Air Force Logistics Command |
| Regression Equation | The general form of the regression equation is $Y = a + bx$ |
| Regression Line | Line representing mean test values with respect to time |
| S_b | Standard error of estimate of the regression coefficient |
| S_e or $S_{Y.X}$ | Standard deviation of the data about the regression line |

GLOSSARY OF TERMS AND ABBREVIATIONS (cont)

| | |
|--------------------------------------|--|
| SM | Maximum Stress |
| S _r | Stress at rupture |
| Standard Deviation (S _y) | Square root of variance |
| Strain Rate | Crosshead speed divided by the EGL |
| "t" test | A statistical test used to detect significant differences between a measured parameter and an expected value of the parameter (determines if regression slope differs from zero at the 95% confidence level) |
| Variance | The sum of squares of deviations of the test results from the mean of the series after division by one less than the total number of test results |
| 3 Sigma Band | The area between the upper and lower 3 sigma limit. It can be expected that 99.73% of the inventory represented by the test samples would fall within this range assuming that the population is normally distributed. |
| 90-90 Band | It can be stated with 90% confidence that 90% of the inventory represented by the test samples would fall within this range assuming that the population is normally distributed. |

INTRODUCTION

A. PURPOSE:

Quality assurance tests have been conducted for eleven years on First Stage LGM-30A, B, F and G Minuteman Motor propellant blocks to evaluate the effects of aging on TP-H1011 propellant. This report contains only those tests conducted on propellant from LGM-30F and G as instructed in Test Directive GTD-1C, Amendment 1, LGM-30 First Stage Operational Propellant Laboratory Testing.

Statistical analysis of the tests performed should provide early warning if serious degradation trends occur. Annual evaluation of the propellant provides data for input into engineering reliability for service life predictions. Testing was performed in accordance with MMEMP Directive GTD-1C, Amendment 1.

B. BACKGROUND:

LGM-30F and G testing was started in 1966 with phase testing at 24 month intervals (Report Numbers 78 - zero time; 104, 162, 185-Phase I, 176, 239, 257-Phase II). Report Number 257 was the first time that LGM-30F and G data were reported in statistical analysis by itself. The present report is a continuation of testing and statistical analysis by the GO85 system.

Zero time testing for LGM-30A, B, F and G was started as soon as possible after receipt of the propellant by MAGCP. Data from these tests were used to establish a base line for each test parameter.

The LGM-30F and G propellant test matrix (Table 1) is used to determine the number of specimens to be taken from each propellant loaf and the specific test or tests to which these specimens are to be subjected. Very low rate and low rate tensile specimens are taken on all LGM-30F and G blocks. Specimens for other physical and combustion tests are taken from every third (LGM-30F and G) block.

TABLE 1
SAMPLE PLAN

The Procedure for determining tests to be performed on propellant batch samples of IGM-30 F & G First Stage Motors are as follows:

1. Divide the USAF motor serial numbers into three groups by dividing the last three digits of each serial number by three to determine the remainder integer, e.g., $154 \div 3 = 51$ with a remainder integer of 1.
2. Use the remainder integer to enter the following matrix to determine the group of tests to be performed on the forward, middle, and aft batch samples associated with a particular motor serial number.

| TP-H1011 PROPELLANT BATCH SAMPLE | | GROUP MATRIX | | |
|----------------------------------|--|--------------|----------|-----------|
| | | GROUP I | GROUP II | GROUP III |
| Forward | | 1 | 2 | 0 |
| Middle | | 0 | 1 | 2 |
| Aft | | 2 | 0 | 1 |

Each group will receive the following tests:

| TEST MATRIX | | |
|--------------------|-------------------|-----------------------|
| GROUP I | GROUP II | GROUP III |
| High Rate Triaxial | Dynamic Response | High Rate Hydrostatic |
| Creep | Stress Relaxation | Sol Gel |
| Biaxial Low Rate | Burning Rate | DSC |
| TGIE | Heat of Explosion | TGA |
| Hardness | Pressure Time | DTA |
| Ignitability | | Impact |

NOTE: Low Rate and Very Low Rate Tensile tests are performed on all blocks.

STATISTICAL APPROACH

Linear regression analysis was used as the method of data evaluation. Data from different time periods were used to establish a least squares trend line for the data. The variance about the regression line, obtained using individual values of the dependent variable, was used to compute a tolerance interval such that at the 90% confidence level, 90% of the sample distribution falls within this interval. This tolerance interval was extrapolated to a maximum of 24 months. The "t" values and the significance of this statistic, which are reported for each regression model, give an indication of the "statistical significance" of the slope of the trend line as compared to a line of zero slope. Data were plotted by the computer. The "y" axis is computed so that the values at one inch intervals are peculiar to the data spread of the parameter tested.

TEST RESULTS

VERY LOW RATE TENSILE:

The strain properties are decreasing with the stresses and modulus increasing. All of the regressions show a statistically significant increase or decrease, but should not affect the propellant serviceability at this time (Figures 1 thru 5).

LOW RATE BIAXIAL TENSILE:

Strain at maximum stress, maximum stress, and strain at rupture show a statistically significant increase. However, it should be noted the slope of the curves is relatively flat. Stress at rupture and modulus show no significant trend (Figures 6 thru 10).

LOW RATE TENSILE:

For all parameters except strain at rupture a statistically significant increase is shown (Figures 11 thru 15).

HIGH RATE TRIAXIAL:

Strain at maximum stress and strain at rupture show no significant trends. Maximum stress, stress at rupture, and modulus show a statistically significant trend (Figures 16 thru 20).

HYDROSTATIC TENSILE:

No significant trend is shown except for modulus. The modulus trend is decreasing, but the slope is gradual and should not present a problem at this time (Figures 21 thru 25).

TENSILE TESTING SUMMARY:

Stresses and modulus are gradually increasing with age as expected. Very low rate tensile strain shows a gradual decrease. Low rate tensile strain at rupture shows no significant change; all other strain graphs show a gradual increase. No operational problems are indicated in the propellant at this time.

CREEP COMPLIANCE:

The regressions show a decreasing trend except for strain at rupture which shows an increase. This agrees well with the tensile results (Figures 26 thru 30).

STRESS RELAXATION:

Data were obtained at temperatures of -65, -40, 20, 77, 100, 120, 140, 160 and 180°F (Figures 31 thru 66). At -65, -40 and 20°F the trends show a decrease except for stress relaxation modulus at -40 degrees F at 10 sec (Figure 35) and 20 degrees F at 1000 sec (Figure 42). For all other temperatures no significant changes are shown except for stress relaxation modulus at 120 degrees F, 10 and 50 sec (Figures 51 and 52) and 140 degrees F 1000 sec (Figure 58).

CONSTANT STRAIN:

The regression analysis indicates a statistically significant downward trend of the rupture strain although the slope is gradual (Figure 67).

DYNAMIC RESPONSE:

The storage shear modulus at 200 and 500 Hz shows a decrease in the slope of the regression line. This slope is closer to zero or flat than in the previous report (Figures 68 thru 71).

The loss tangent at 200 and 500 Hz shows a gradual increase in the slope of the regression line (Figures 68 thru 71).

FAILURE ENVELOPE:

The majority of the points are reasonably close to the curve (Figure 72).

DTA:

The endotherm shows a statistically significant increase. However, the slope of the regression line is relatively flat.

The first exotherm shows a statistically significant decrease and the second and third exotherms show no significant change.

The ignition temperature shows a statistically significant increase.

Where a significant change is shown the slope of the regression line is gradual (Figures 73 thru 77).

HEAT OF EXPLOSION:

Although the regression slope is statistically significant, the slope of the regression line is close to zero and therefore, no operational problems are expected at this time (Figure 78).

PRESSURE TIME:

The data are widely scattered on both the time to maximum pressure and the maximum pressure regressions. No aging trends are evident (Figures 79 and 80).

BURNING RATE:

Although this test shows a statistically significant increase, it should be noted that if the zero time testing points were eliminated (possible post-cure) the slope of the regression line would be practically flat (Figure 81).

IGNITABILITY:

The ignition threshold shows no significant trend (Figure 82).

IMPACT SENSITIVITY:

The regression shows no significant change (Figure 83).

SHORE HARDNESS:

Very little change is occurring in the hardness (Figure 68).

SOL GEL:

The weight swell ratio, cross link density and density data show a statistically significant trend. However, the slopes are very flat and the propellant service life may be extended for at least two years from the date of last testing. The percent extractables by weight shows no significant trend (Figures 35 thru 88).

CONCLUSIONS

Seven years of aging at ambient temperature (77°F) has not greatly affected the properties of the propellant. Some test parameters indicate slight aging trends, but nothing that would adversely affect the operational characteristics of the rocket motor propellant.

From the statistical analysis, it does not appear that significant propellant degradation is occurring and the propellant reliability should not be affected for at least two years past the last data point. Since failure limits are not available for the parameters tested, this statement is based on the fact that the slopes of the regression curves are relatively close to zero or flat.

RECOMMENDATIONS

It is recommended that testing be continued on a regular basis to evaluate the effects of aging on motor propellant, and to assure that the propellant will perform as designed.
