14. ABSTRACT

Background. Leishmaniasis is caused by the protozoan *Leishmania* and is generally transmitted by the bite of sand flies of the genus *Lutzomyia* or *Phlebotomus*. The disease has significant global impact, producing 10-20 million cases of leishmaniasis worldwide. Cutaneous leishmaniasis (CL) is characterized by chronic skin ulcers that can impact the individual's functional status, lead to expensive and untimely treatment, and result in disfiguring scarring. Leishmaniasis causes a spectrum of diseases that include localized cutaneous leishmaniasis (LCL), and destructive nasal and oropharyngeal lesions of mucosal leishmaniasis (ML). LCL in the New World is most commonly caused by species of the *Viannia* subgenus (*L. braziliensis*, *L. panamensis*, *L. guyanensis*, *L. peruviana*) and to a lesser extent by species of the *Leishmania* subgenus (*L. mexicana*, *L. amazonensis*). Historically, the leishmaniasis have had significant impact on military operations. Thousands of cases of visceral and cutaneous leishmaniasis occurred in soldiers in World Wars I and II. Military training and combat operations resulted in cases of CL in soldiers (USA, UK) deployed to Central America. More recently (2003-2004), CL was reported in almost 1,200 members of the U.S. Armed Forces deployed to Iraq and Afghanistan, and the infection is an ongoing concern in the OEF/OIF veteran population. Unpublished information indicates that the number of military personnel with cutaneous leishmaniasis could exceed 3,000.

Rationale. A major challenge in the diagnosis of leishmaniasis is that the disease occurs in remote and resource-limited areas of the world with poor or nonexistent primary health infrastructure. This also could be true during military field operations and training exercises where sophisticated laboratory equipment and medical personnel are scarce or not available. For CL or ML, scrapings of dermal tissues or punch biopsies of the lesions are necessary and the diagnostic sensitivity by histopathology, microscopy of smears or culture could be unacceptably low (40-70%). The highly sensitive PCR method cannot be implemented in resource-poor settings due to the high costs, personnel training and need of sophisticated equipment. Therefore, novel methods to detect leishmaniasis at the POC are urgently needed. To date, there is no field-standardized molecular method based on DNA amplification coupled with Lateral Flow reading to detect leishmaniasis. Isothermal amplification by RPA (Recombinase Polymerase Amplification) is a novel strategy to diagnose infectious diseases that can be used at the POC because it is highly sensitive, fast, inexpensive and able to work at most ambient temperatures. Furthermore, RPA does not require refrigeration of reagents and can be adapted easily to lateral flow detection.

Hypothesis: *RPA coupled with a Lateral Flow test strip (RPA-LF) to detect Leishmania DNA will have high sensitivity and specificity to diagnose cutaneous leishmaniasis at the point of care in a field setting.*

Study Design. We propose to utilize for the first time an RPA-based assay coupled with lateral flow (LF) reading to diagnose cutaneous leishmaniasis. We will test novel approaches that could enhance the success of the RPA method in the field, including 1) isolation of DNA from clinical samples using a mini (portable) extractor at the POC or FTA Whatman filter paper specially designed to improve DNA preservation and purification at POC. **Aim 1: To optimize the analytical sensitivity and specificity of the genus- and complex-specific RPA-LF tests using *Leishmania* isolates and clinical samples from collaborating study sites.** We successfully developed *Leishmania spp.* primer sets for RPA that specifically amplified *Leishmania* kinetoplast DNA and were able to detect the equivalent of <10 parasites in spiked clinical specimens. We will compare the analytical sensitivity and specificity of RPA-LF with qPCR using a broad panel of clinical *Leishmania* isolates from the field sites (NAMRU-6 in Peru and NAMRU-3 detachment in Ghana). **Clinical validation:** A minimum of 20 retrospective convenience samples of clinical specimens known to be parasite positive or negative by PCR sent to UTMB from the field sites will be evaluated by RPA-LF. **Aim 2: To prospectively determine the diagnostic sensitivity and specificity of the RPA-LF test for diagnosis of cutaneous leishmaniasis.** Sub-aim 2.1. New World CL (NAMRU-6): A prospective field trial of the diagnostic test will be conducted in Puerto Maldonado, Madre de Dios, Peru. Based on estimated RPA-LF sensitivity of 95% and specificity of 99% we will enroll 184 positive, parasite confirmed individuals and 42 parasite negative controls to have adequate statistical power. The sensitivity and specificity will be determined using microscopy of dermal samples, and qPCR as the gold standard. Sub-aim 2.2. Old World CL (NAMRU-3): A similar prospective field trial will be conducted through the NAMRU-3 Ghana detachment, at the Noguchi Memorial Institute for Medical Research. Considerable effort will be taken to ensure consistency at the two sites. Patients will be enrolled principally from the villages in the Ho, HoHoe, and Kpando districts of the Volta Region where CL outbreaks due to *L. major* were previously recorded.

The repeatability of the RPA-LF test will be determined in the NAMRU's field sites while the reproducibility will be determined in the central diagnostic lab at UTMB where a subset of samples (10%) of positive and negative individuals will be delivered by the investigators of NAMRU-3 and NAMRU-6.

Training: The project will provide training to field and laboratory personnel, as well as military personnel temporarily stationed in the field of endemic areas to ensure effective deployment of the POC test.

3. ACCOMPLISHMENTS:

What were the major goals of the project?

The overarching goal of this project is to test and evaluate a novel Leishmaniasis diagnostic (the RPA-LF) against different parasite species. Completing this study will provide an essential product for the warfighter. Our role in this project is to identify and isolate *Leishmania* samples in South America and to test the RPA-LF with retrospective (year 1) and prospective samples (year 2 & year 3).

What was accomplished under these goals?

During the third year of the project, we continued with enrollment of patients with leishmaniasis from the Peruvian amazon. Collected specimens were used for *Leishmania* detection by kinetoplast-based PCR, RPA-LF assay and species identification by Nested Real Time PCR.

During the reporting period (Fiscal Year 2017), we collected 36 samples from Madre de Dios which is the region with the highest number of cases in Peru. RPA-LF was performed on all collected samples resulting in 15 positives and 21 negatives. In parallel, kinetoplast-DNA PCR was performed on the same dataset resulting in 27 positives and 9 negatives.

We detected 18 *Leishmania braziliensis* and 1 *L. Lainsoni* by Realtime PCR whereas the remaining specimens did not yield detectable products.

Since the start of the project, we have collected 132 samples and performed molecular biology on all specimens. This represents 58% our target (overall sample size, n=226). KDNA-PCR and RPA-LF were performed on all specimens, resulting in 112 and 79 positives, respectively.

Specific Aim	Month	% Completion
Aim 1: To use simulated field conditions to optimize and produce the established RPA lateral flow diagnostic test for POC deployment.		
Sub-Aim 1.2: To determine if a simple DNA extraction method will provide adequate sensitivity for optimal test function under field conditions. Comparison of DNA yield, sufficient for RPA-LF test using a DNA mini-extractor vs. Whatman FTA filter paper utilizing dermal tissues spiked with <i>Leishmania</i> grown in the lab	1-3	100% Lab assays completed. Clinical samples from the field still require optimization of DNA purification
Sub-Aim 1.3: To determine if subgenus- and/or species-specific primer-probe sets can achieve the same analytical sensitivity and specificity as the genus specific primer-probe set using <i>Leishmania</i> isolates and clinical specimens from the field sites.	3-12	100% The analytical sensitivity of the RPA-LF was established for <i>Leishmania (Viannia) spp.</i> , <i>L. major</i> and <i>L. enriettii</i>
Kickoff Coordination Meeting of participating institutions	3	100% A UTMB meeting was organized with participants of all three study sites
Protocol submission for local IRB approval and HRPO approval	3	N-6 100% N-3 90% Ghana IRBs completed; pending final N-6 approval

Implementation of molecular laboratory in Madre de Dios and technology transfer of kDNA PCR procedures from Lima to Madre de Dios for on-site Leishmaniasis diagnosis in the endemic area	6-12	100% Training completed and equipment purchased.
Milestone Achieved: Local IRB and HRPO approved protocols	6	UTMB 100% NAMRU-6 100% NAMRU-3 80%
Milestone(s) Achieved: Coordination meeting completed Approvals of IRBs in place to initiate field studies in human populations RPA-LF test fully adapted for field application on-site molecular diagnosis of cutaneous leishmaniasis in Madre de Dios	12	See specific items described above in the table
Aim 2: To prospectively determine the diagnostic sensitivity and specificity of the RPA-LF for diagnosis of cutaneous leishmaniasis.		
Sub-aim 2.1. To recruit suspicious cutaneous leishmaniasis patients and evaluate the sensitivity/specificity of RPA-LF vs. standard kDNA PCR at NAMRU-6; Lima Peru. Delivery of subset of positive and negative clinical samples (10%) from NAMRU-6 to UTMB for reproducibility testing	12 - 36	85 samples have been sent to UTMB during the reporting period.
Technical meeting at NAMRU-3, Ghana	14	The technical meeting did not take place

<p>Sub-aim 2.2. To recruit suspicious cutaneous leishmaniasis patients and evaluate the sensitivity/specificity of RPA-LF vs. standard PCR at NAMRU-3, Ghana detachment, Noguchi Memorial Institute for Medical Research, Ho Volta region Delivery of subset of positive and negative clinical samples (10%) from NAMRU-3 to UTMB for reproducibility testing</p>	<p>12 - 36</p>	<p>No participants have been enrolled at Ghana during the reporting period</p>
<p>Technical meeting at NAMRU-6, Peru</p>		<p>100% 01 training Workshop in RPA-LF developed on May 02-06, 2016</p>
<p>Sub-aim 2.3. To determine differences in RPA-Lateral Flow sensitivity and specificity between NAMRU-6 and NAMRU-3.</p>	<p>45</p>	<p>50% Compared against kDNA, RPA sensitivity and specificity performed at NAMRU-6 is 70.54% (95%CI: 61-78%) and 100% (95%CI: 83-100%), respectively.</p>
<p>Aim 3: To prospectively determine associations between the sensitivity and specificity of RPA the Leishmania species.</p>		
<p>Sub-Aim 3.1: To identify the infecting Leishmania species of all isolates collected in NAMRU-6 for this project by a FRET-based Real Time PCR.</p>	<p>12-44</p>	<p>58% Real Time PCR was performed on all collected samples.</p>
<p>Sub-Aim 3.2: To identify if there is any association between the infecting Leishmania species and RPA-Lateral Flow sensitivity and specificity</p>	<p>12-44</p>	<p>0% We need to collect all samples to assess any potential association</p>
<p>Milestone(s) Achieved: Primary milestone: Validated RPA-Lateral Flow test for Point of Care utilization Secondary milestones: Updated epidemiological assessment of cutaneous leishmaniasis in the endemic areas of Peru and Ghana</p>	<p>48</p>	<p>0% All samples need to be collected in order to perform the statistical analysis</p>

What opportunities for training and professional development has the project provided?

- During the second year of the project, both, Luis Angel Hurtado and Rocio Santos, NAMRU-6 research scientists, were trained in 1. Isolation of DNA from cutaneous leishmaniasis samples of peruvian patient collected by FTA Whatman filter paper protocol, 2. Perform identification of *Leishmania* at genus level by kDNA-PCR, and 3. Determination of *Leishmania* species by Nested Real Time PCR FRET probes-based.
- A training Workshop in RPA-LF took place during May 2-6, 2016.

The participants were:

- Dr. Bruno Travi, UTMB (trainer)
- Dr. Maxy De Los Santos, NAMRU-6
- Blgist. Rocio Santos, NAMRU-6
- Blgist. Luis A. Hurtado, NAMRU-6
- Dr. Naiki Puplampu, NAMRU-3
- Dr. Diana Carolina Gallego, CIDEIM, Colombia
- Blgist. Jose Luis Malaga, UPCH-UTMB

This 05-days workshop consisted of 02 days of theory lectures, and 03 days of laboratory work, were 13 samples collected in Madre de Dios were analyzed.

- During the third year of the project, Dr. De Los Santos, Blgist. Rocio Santos and Blgist. Luis A. Hurtado received training on Leishmaniasis microscopy. This training is key since microscopy is still considered the gold standard for diagnosis and microscopy results could farther be used to assess the potential of RPA as a better alternative.

How were the results disseminated to communities of interest?

During the first year of the project, Dr. Bruno Travi and Dr. Christian Baldeviano presented progress on the project at the Military Health System Research Symposium (MHSRS) in Fort Lauderdale during August 17-20, 2015. No additional dissemination activities have been held during the following two years, as we preferred to collect all data for a final publication.

What do you plan to do during the next reporting period to accomplish the goals?)

Describe briefly what you plan to do during the next reporting period to accomplish the goals and objectives.

In coordination with the study PI, we have requested a 12 months no-cost extension. This will allow NAMRU-6 to continue working on specific aims #2 and #3 and reach our enrollment target of 226 participants and evaluate the sensitivity and specificity of the RPA-LF.

We will continue isolating patient samples in Puerto Maldonado, performing kinetoplast DNA PCR and real time PCR until reaching the overall proposed sample size. Finally we will compare the results of kDNA PCR to the RPA-LF. Completing this portion of the SOW during will be critical to assess the assay performance as a durable and potentially deployable test kit for US military personnel.

Statement of Work (SOW)

Statement of Work (SOW) – October 2014-2018

Aim 1: To use simulated field conditions to optimize and produce the established RPA lateral flow diagnostic test for POC deployment.

Sub-Aim 1.2: To determine if a simple DNA extraction method will provide adequate sensitivity for optimal test function under field conditions. Comparison of DNA yield, sufficient for RPA-LF test using a DNA mini-extractor vs. Whatman FTA filter paper utilizing dermal tissues spiked with *Leishmania* grown in the lab

Sub-Aim 1.3: To determine if subgenus- and/or species-specific primer-probe sets can achieve the same analytical sensitivity and specificity as the genus specific primer-probe set using *Leishmania* isolates and clinical specimens from the field sites.

Aim 2: To prospectively determine the diagnostic sensitivity and specificity of the RPA-lateral flow test for diagnosis of cutaneous leishmaniasis.

Sub-aim 2.1. To recruit suspicious cutaneous leishmaniasis patients and evaluate the sensitivity/specificity of RPA-Lateral Flow vs. standard kDNA PCR at NAMRU-6; Lima and Puerto Maldonado, Madre de Dios, Peru. Delivery of subset of positive and negative clinical samples (10%) from NAMRU-6 to UTMB for reproducibility testing

Sub-aim 2.2. To recruit suspicious cutaneous leishmaniasis patients and evaluate the sensitivity/specificity of RPA -Lateral Flow vs. standard PCR at NAMRU-3, Ghana detachment, Noguchi Memorial Institute for Medical Research, Ho Volta region

Delivery of subset of positive and negative clinical samples (10%) from NAMRU-3 to UTMB for reproducibility testing.

Sub-aim 2.3: To determine differences in RPA-Lateral Flow sensitivity and specificity between NAMRU-6 and NAMRU-3.

Aim 3: To prospectively determine associations between the sensitivity and specificity of RPA the *Leishmania* species.

Sub-Aim 3.1: To identify the infecting *Leishmania* species of all isolates collected in NAMRU-6 for this project by a FRET-based Real Time PCR.

Sub-Aim 3.2: To identify if there is any association between the infecting *Leishmania* species and RPA - Lateral Flow sensitivity and specificity.

4. IMPACT:

What was the impact on the development of the principal discipline(s) of the project?

Testing the RPA-LF on retrospective Leishmania samples isolated in Peru during year one confirmed the performance of the RPA-LF. Preliminary results on 74 of the samples sent to the Travi lab for analysis during this project period. One-hundred percent of the tested samples were confirmed positive for Leishmaniasis, demonstrating that the assay has high sensitivity to detect parasite from field isolates. Importantly, these results suggest that the RPA-LF could be used to detect Leishmaniasis from US military personnel operating in South America.

What was the impact on other disciplines?

The diagnostic method- isothermal amplification of DNA has impacted the field of molecular biology in austere environments. While the reaction mechanism is used in this project to detect cutaneous leishmaniasis, a parasite that has plagued US soldiers during the war on terror, the technology can be applied to detect a plethora of other pathogens. These pathogens include, but are not limited to: Malaria, HIV, and pox viruses.

What was the impact on technology transfer?

Testing the RPA-LF on retrospective cutaneous Leishmaniasis samples provides an additional proof of concept and only makes the RPA-LF a more enabling technology. We anticipate that the third year of the study (testing prospective samples) might attract commercial partners to help us develop this product further.

Describe ways in which the project made an impact, or is likely to make an impact, on commercial technology or public use, including: transfer of results to entities in government or industry; instances where the research has led to the initiation of a start-up company; or adoption of new practices.

Not applicable at this time. However, we anticipate that completing our testing of all prospective samples will allow to attract commercial partners.

What was the impact on society beyond science and technology?

Cutaneous Leishmaniasis infects approximately 1.2 million people worldwide each year. Infections leave patients disfigured. Rapid identification of infections in soldiers that travel to Leishmania endemic areas would reduce treatment delays and reduce the risk of unnecessary disfigurement during deployment.

Describe how results from the project made an impact, or are likely to make an impact, beyond the bounds of science, engineering, and the academic world on areas such as: improving public knowledge, attitudes, skills, and abilities; changing behavior, practices, decision making, policies

(including regulatory policies), or social actions; or improving social, economic, civic, or environmental conditions

Employment of a rapid diagnostic for cutaneous leishmaniasis could lead to more effective mass-treatment campaigns in countries that struggle with the parasite (endemicity). Because the RPA-LF assay lacks a requirement for a cold chain, the system is a candidate for use in austere settings where access to refrigeration systems is lacking. Rapid identification and treatment of leishmaniasis in these austere, endemic settings could reduce lost work hours and potentially increase productivity (Gross domestic product etc.) for nations where the parasite is endemic.

5. CHANGES/PROBLEMS:

Changes in approach and reasons for change

- Lt. Danett Bishop replaced Carmen Lucas as PI of protocol NMRCD.2007.0018 which covers this project.

Actual or anticipated problems or delays and actions or plans to resolve them

- Administrative issues regarding purchasing of reagents and materials from China have impacted the execution of RPA-LF assays in NAMRU-6, Lima.
- The protocol NMRCD.2007.0018 was on hold for up to three months due to IRB related issues. However, the protocol was finally IRB approved in June 2017 and enrollment restarted.
- Delays in NAMRU-3 protocol approval have prevented the execution of enrolment activities in the Ghana site.

Plans to solve the issues:

- International purchases have been made through the Henry M. Jackson Foundation and will be received during November 2017.

Changes that had a significant impact on expenditures

- Completion of minor electrical and plumbing upgrades to use equipment and reagents in NAMRU-6, Puerto Maldonado.
- Delay in purchase of reagents and equipment.

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents

N/A- none.

Significant changes in use or care of human subjects

N/A- none.

Significant changes in use or care of vertebrate animals

N/A- none.

Significant changes in use of biohazards and/or select agents

N/A-none.
