OMB No. 0704-0188*

The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to the Department of Defense, Executive Services and Communications Directorate (0704-0188). Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ORGANIZATION.

CTA: CWO

Computer Resources: Cray XC30, Cray XC40, IBM iDataPlex [NAVY, MS]

Research Objectives: The scope of this project is to advance the analysis and prediction capability of the Navy's environmental modeling and forecasting systems through the improvement of the assimilation software. This project used three different variational assimilation systems: (1) Relo NCOM (3DVAR), (2) the adjointless 4DVAR, and (3) the NCOM-4DVAR. There were 8 funded NRL projects that focused on either adding or improving capabilities of 4DVAR in FY17, and the experiments performed under this HPC project went towards satisfying these efforts.

Methodology: This HPC project helped advance the NCOM-4DVAR assimilation system in FY17 through the following funded NRL projects: (1) The 6.4 Ocean Data Assimilation (ODA) project was tasked to test the NCOM-4DVAR within the operational COAMPS5 system and in the highly nonlinear regimes of the US East Coast and Agulhas. (2) The 6.2 Coupled Ocean-Atmosphere Variational Assimilation and Prediction System project merged the 4DVAR capabilities of the atmospheric and oceanic components of the Coupled Ocean/Atmospheric Mesoscale Prediction System (COAMPS) to create a coupled 4DVAR capability. (3) In the 6.2 Coupled Ocean-Acoustic Assimilative Model project, a number of validation experiments were performed of the coupled 4DVAR-NCOM and 4DVAR-RAM system. (4) The 6.2 Smart Glider Teams for Rapid Update of Local Analysis project tested a new capability for accurate and rapid characterization of the local ocean battlespace using coordinated teams of gliders and preserving the fidelity of their collective observations through innovative 4DVAR assimilation. (5) The 6.2 Calibration of Ocean Forcing with satellite Flux Estimates project, continued NCOM-4DVAR experiments to quantify ocean error covariance. (6) The 6.1 Adjointless 4dVar for operational Navy ocean models project performed experiments with this developed adjointless system in the Okinawa Trough and RIMPAC regions. (7) The 6.1 Propagation and Dissipation of Internal Tides on Coastal Shelves project continued the study of the year-long NCOM-4DVAR experiment on the Northwest Australia Shelf. (8) The 6.2 Submesoscale Prediction of Eddies through Altimeter Retrieval (SPEAR) project performed 3DVAR and 4DVAR experiments to test high-resolution assimilation to resolve submesoscale features.

Results: Numerous 4DVAR-NCOM experiments were performed under this FY17 HPC project with the overall result of further improving the analysis accuracy, prediction skill, portability and robustness of the system in various regions of interest and at different resolutions. A few of the specific advancements that were made include: how to operate the system at very high resolution (Fig. 1), the understanding of the modeling and prediction of internal tides, the coupling of assimilation systems from different models, and glider control.

DoD Impact/Significance: The 3D and 4D variational systems that were tested under this project went towards improving the Navy's capability of forecasting the ocean environment. Various validation studies for the 4DVAR-NCOM were performed and they showed more accurate analyses and model forecast fields than its predecessor, NCODA_VAR. Additionally, the work on coupling the assimilation systems for the ocean, atmosphere, and acoustic models made significant progress this fiscal year and these coupled systems will ultimately further improve the forecast skill of all three environments.

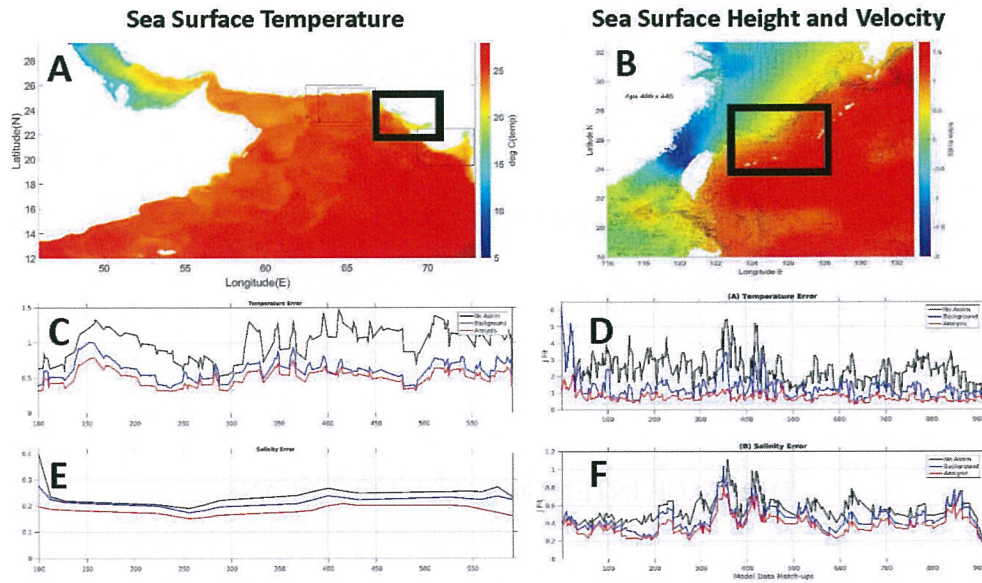

Figure 1. High resolution (1-km) ocean assimilation experiments were performed with the NCOM-4DVAR analysis/prediction system for subdomains (solid black squares) in the North Arabian Sea (Panel A) and the Western Pacific Ocean (Panel B) for the months of February and March, 2016. The resulting temperature (Panels C and D) and salinity (Panels E and F) error statistics are compared between the free run (no assimilation) (black line), the previous 24-hr forecast (blue line), and the 4DVAR analysis (red line). These results verify that the NCOM-4DVAR software is performing well at a high resolution. Since this system is computationally expensive to operate, these experiments could not have been performed on anything other than HPC resources.

FY17 NRL DoD High Performance Computing Modernization Program Annual Reports
