Focused Work by Individuals

Visualizing work in process is a common building block of agile methodologies and frameworks/

Common Metrics: Teams

Teams Using Scrum:

User Story Size: Story Points, Ideal Days, Hours...

Team Velocity: Story Points (or Stories) delivered per sprint

Notice Anything Missing?

Sprint Burndown: Trend line for story points completed during a sprint

Release Burnup: Trend line for accumulation of finished work across sprints

Teams Using Kanban:

Work In Process: Number of work items are being worked at a given point in time

Throughput: Work items completed per unit of time

Cycle- or Lead-Time: The duration of time a work item spends in a particular state

Things You Can Expect to See Teams Measuring

This is the Team's Data

Figures 1&2 from Page 5, PARCA Desk Guide

The WBS reported for EVM can align to a workflow-based waterfall development oriented hierarchy as found in MIL-STD-881C* (see Figure 1). However, an outcomebased Agile structure that focuses on customer driven deliverables (see Figure 2) is also acceptable. Both WBS hierarchies are product-based and supported by the DoD EVMSIG and MIL-STD- 881C.

Little's Law in Agile Metrics

Three Metrics Emphasized*:

- 1. Work In Progress (the number of items that we are working on at any given time),
- 2. Cycle Time (how long it takes each of those items to get through our process), and
- **3. Throughput** (how many of those items complete per unit of time).

Actionable Agile Metrics for Predictability An Introduction

Barriers to Actionable Metrics

Metrics often focus exclusively on:

- Appeasing an authority role
- Demonstrating competence
- Validating the chosen path

This may engender trust concerns, and often conflicts with the concept of an empirical process – one where we learn from looking at facts that inform tactical/strategic options.

Opportunities Created by Agile Approaches

Greater user involvement – even if through a 'Product Owner' proxy

- Focus on quality attributes valued by the user as user stories are written
- Confirm level of utility in what is demonstrated at the end of each iteration

More frequent delivery of products – even if early drops are to a simulation environment

- Verify requirements earlier, with more opportunities to recover when needed
- Integration events of smaller scope help mitigate risk of quality-driven delays
- Operational benefit from new capabilities can be validated incrementally as well

Experience suggests that simply asking "is it going according to plan?" is inadequate

Deterministic Thinking

A World Full of Choices

Common Perceptions

According to Mark Twain...

It ain't what you don't know that gets you in trouble. It's what you know for sure that just ain't so.

Value Flow: Utilization is the Wrong Goal

100% Utilization:

- Magnifies the impact of variation
- Maximizes task-switching overhead
- Assures slower overall progress

Change is inevitable, plan to learn

Multi-tasking is a myth we don't accurately comprehend

Maximum Utilization is Counterproductive

Program Management

Large scale program management involves on-going balancing of resources brought to bear against priorities.

- Pushing for resolution of estimates and actuals below a certain level of detail reveals the boundaries of interpretability for the Quantifiable Backup Data used to manage
- Large grained estimates for program budgets and short-term forecasts for team workload do not share the same estimation basis, nor do they respond to the same type of corrective actions

Precision vs. Consistency

Build Incrementally, Adjusting Along the Way

Hone the approach as we iterate

Build from initial minimum result to robust capabilities

Plan to learn and adjust to increase value of outcomes

Work Prioritization & Size Estimation – Iterative Development

User Value Assessment

The relative value of features in the backlog can be assessed by assigning "business value" measures.

These measures are used to adjudicate among features competing to "go next."

Features are accepted into the workflow one at a time, or in groups.

We need a way to consistently determine which feature (or group of features) is more important.

Size Estimation

Teams using story point estimation are taught to focus on relative magnitudes, not absolute volume of work being estimated.

Fibonacci points (1, 2, 3, 5, 8, 13, 21) often used, as well as "ideal hours/days."

User Stories are selected for work with the question "does this fit in the time I have?"

We need to commit to accomplishable work scope each iteration, and make reasoned tradeoffs in scope when necessary.

Economies of Batch Size

Specify, then implement, then test & then ship **ALL** requirements

> U-Curve optimization problem as described in Principles of Product Development Flow, by Don Reinertsen

Inventory of Partially Complete Work

Traditionally, *projective documents* like requirements and design specifications represent the backlog of software inventory.

These reflect decisions and constraints which have not yet been validated.

Holding costs for these documents are not well understood.

Transaction Costs are Visible

The cost of personnel and infrastructure to perform the work can be readily assessed

• In fact, we are biased toward amortizing these effectively because they are visible

DevOps offers many opportunities for making economic gains by addressing transactions

- Collaborate with developers and operations staff for continuity
- Use tools to assure reliability and consistency

Late Releases Become "Feature Magnets"

As things start to slip

- Influential people get 'their priorities' moved up, rather than deferred
- Pressure increases on early releases
- Functions slated for final release can't be guaranteed...

Economic Framework

Prioritizing based on the **Cost Of Delay** enables a focus on flow.

- Attributes of value derived from the delivered work contribute to decisionmaking
 - Desirability
 - Time Criticality
 - Risk Reduction
 - Opportunity Enablement
- Priorities chosen in to balance varying work item size and importance.

Rapid Incremental Delivery Changes Priorities

- Optimize Proximity of Talent
- Simplicity is Robust
 - Test is Documentation
 - Agile is not Local
- Innovation is a Forcing Function

Call To Action

Understand the Full Value Stream

- Metrics can lead to local optimization at global expense, if you are not careful
- Many traditional metrics focus on accuracy of forecasts, not performance

Set Goals

- Aspire to succeed for your users, not just the funding authority
- Measure successive approximations of the desired end state

Experiment and Learn

• An empirical approach means we look at outcomes and act

Performance Matters Most
