

AWARD NUMBER: W81XWH-18-1-0420

TITLE: Targeting Resistance in Colorectal Cancer with a Novel Lineage-Tracking Technology

PRINCIPAL INVESTIGATOR: Amy Brock

CONTRACTING ORGANIZATION: The University of Texas at Austin
Austin, TX 78712

REPORT DATE: August 2019

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release;
Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.

REPORT DOCUMENTATION PAGE

Form Approved
OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. **PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.**

14. ABSTRACT This proposal addresses the FY17 PRCRP Topic Area of Colorectal Cancer and the Military Relevance Focus Area "Gaps in cancer prognosis, treatment and/or survivorship" that impact the health of military service members, veterans, and their beneficiaries. Treatment of colorectal cancer is complicated by the high degree of intratumoral heterogeneity. Recent studies have demonstrated the utility of DNA barcode libraries in monitoring heterogeneous cell populations. This is achieved by labeling each cell with a unique, heritable sequence; lineage abundance is tracked over time by sequencing the barcode ensemble. Changes in clonal dynamics after perturbations, such as treatment with a pharmacological agent, reveal variation in lineage survival or growth rate. This approach enables the simultaneous observation of many lineage trajectories to reveal high-resolution details of cancer population dynamics. With this tool, the ability to concurrently track clonal fitness dynamics and generate lineage-specific genomic and transcriptomic data over longitudinal studies provides new insight into the response to therapeutics.

1. INTRODUCTION:

This proposal addresses the FY17 PRCRP Topic Area of Colorectal Cancer and the Military Relevance Focus Area "Gaps in cancer prognosis, treatment and/or survivorship" that impact the health of military service members, veterans, and their beneficiaries. Treatment of colorectal cancer is complicated by the high degree of intratumoral heterogeneity. Recent studies have demonstrated the utility of DNA barcode libraries in monitoring heterogeneous cell populations. This is achieved by labeling each cell with a unique, heritable sequence; lineage abundance is tracked over time by sequencing the barcode ensemble. Changes in clonal dynamics after perturbations, such as treatment with a pharmacological agent, reveal variation in lineage survival or growth rate. This approach enables the simultaneous observation of many lineage trajectories to reveal high-resolution details of cancer population dynamics. With this tool, the ability to concurrently track clonal fitness dynamics and generate lineage-specific genomic and transcriptomic data over longitudinal studies provides new insight into the response to therapeutics.

2. KEYWORDS:

Colorectal carcinoma, tumor heterogeneity, chemotherapy, chemoresistance, clonal dynamics, lineage tracing

3. ACCOMPLISHMENTS:

What were the major goals of the project?

There are two major goals of the project, as described in the approved SOW.

Aim 1: To utilize a novel cell lineage tracking system BAAR to measure cell lineage dynamics and isolate specific lineages of interest in cultures of patient-derived colorectal carcinoma.

Aim 2: To demonstrate the utility of BAAR for the identification of tumor subpopulations that vary in chemosensitivity and resistance.

In the current grant period, we have focused on Specific Aim 1, which includes 2 Major Tasks and a number of Subtasks, as shown below.

Specific Aim 1: To utilize a novel cell lineage tracking system <i>BAAR</i> to measure cell lineage dynamics and isolate specific lineages of interest in cultures of patient-derived colorectal carcinoma cells.	Timeline
Major Task 1: To validate the BAASE lineage tracking and isolation in patient-derived colorectal carcinoma cells (mutant KRAS)	

Subtask 1: Local IRB review has been completed (March 2018) and all documents have been submitted for HRPO review and approval. No work will commence on colorectal cells until HRPO review and approval is complete.	1-3
Subtask 2: 3 CRC cells lines will be obtained from Drs. Eckhardt and Van Den Berg at the Developmental Therapeutics Lab and maintained as organo-cultures. These organo-cultures will be labeled with reference barcode libraries.	3-6
Subtask 3: Recall plasmids for the reference barcode sets will be constructed and confirmed by Sanger sequencing.	1-2
Subtask 4: Transfection parameters will be optimized for Recall plasmid delivery.	3-6
Subtask 5: Activation of a GFP reporter gene by the Recall plasmid will be measured by flow cytometry. The percent of GFP+ cells will be compared to the known composition of the reference populations to measure the false positive/false negative rates of lineage activation.	6-12
Milestone(s) Achieved: To use a low diversity reference population of barcodes to establish the parameters for barcode-driven reporter activation and low false positive/false negatives rates in primary CRC.	
Major Task 2: Label CRC cell with high diversity barcode library	
Subtask 1: An additional set of 3 cell lines will be obtained from the Developmental Therapeutics Lab and maintained as organo-cultures.	4-12
Subtask 2: All 6 cell lines from MT1 and MT2 ST1 will be labeled with a high diversity BAASE barcode library, using the parameter conditions optimized in Major Task 1.	9-12
Subtask 2: Activation of Recall plasmid GFP expression by flow cytometry. Transfection conditions, dCas9- VPR ratios, and timing of isolation from Major Task 1 will be confirmed in these 6 cell lines.	9-12
Milestone(s) Achieved: To confirm the experimental conditions for barcode-driven reporter activation and low false positive/false negative rates in six high diversity populations of barcode labeled primary CRC.	

What was accomplished under these goals?

In Major Task 1, we have completed Sub-tasks 1-3 for one CRC cell line. Due to delays in HRPO review (approved July 2019), we have so far been able to perform these studies with one CRC cell population. Having now established these proof-of-principle studies for one cell line, we are currently expanding to include additional cell populations.

Organoid cultures (**Figure 1**) were labeled with a barcode library and cells positive for the transduced barcodes were identified by mCherry expression and collected by FACS to instantiate the labeled cell population (**Figure 2A**).

In this step, we optimized the transduction conditions in order to achieve an MOI of 0.074. This is critical because an MOI greater than 0.1 would increase the likelihood of an individual cell receiving two different labels (by Poisson statistics), requiring more complicated informatics analysis to deconvolve the correct barcodes.

We tested the efficiency of various transfection protocols for these cells, including spinoculation and nucleofection, and multiple liposome-based delivery reagents. As shown in **Figure 2B** we were able to achieve 28% activation of GFP in organoid CRC cells using Lipofectamine reagent.

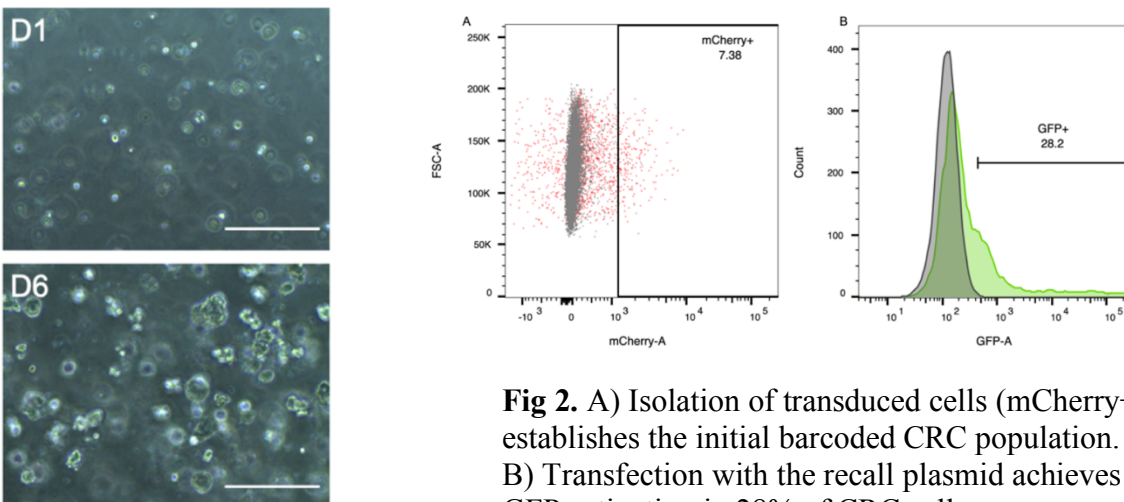

Fig 2. A) Isolation of transduced cells (mCherry+) establishes the initial barcoded CRC population. B) Transfection with the recall plasmid achieves GFP activation in 28% of CRC cells.

Fig 1. CRC organoid cultures at D1 and D6.

What opportunities for training and professional development has the project provided?

Graduate students supported by this grant participate in ongoing training and professional development activities. Within the department, trainees participate in weekly lab group meetings to share technical skills and gain practical experience in critical evaluation of the literature, oral communication and experiment design.

At the department level, students participate in two biweekly seminar series—one on Cancer Biology and one focused on Computational Oncology. A student-led troubleshooting session provides an additional setting for peer mentoring in computational work and statistical analyses. This session includes research scientists and postdocs, as well as graduate students, and is highly interactive.

At the college/university level, trainees have participated in two short courses through The University of Texas at Austin Genomics and Sequencing Analysis Core and the Texas Advanced Computing Center to improve technical skills in bioinformatics and computational biology. In combination with foundational course work, these classes have enabled students to gain new skills in informatics; this has proved useful for analysis of the NGS data in this project.

How were the results disseminated to communities of interest?

The PI has presented seminars locally at the Livestrong Cancer Center, Dell Medical School, to educate clinicians and researchers about the potential utility of the tools developed in this work.

What do you plan to do during the next reporting period to accomplish the goals?

In the current project period we have established all of the tools and systems required for this work. In next project period we will be focused on applying these tools— by treating barcoded patient-specific cell populations with cytotoxic and targeted therapeutic agents, measuring changes in clonal survival, and characterizing the resistant subpopulations. In addition, we will be able to expand the established methodology from one patient cell population to the additional cell lines described in the SOW. In our Statement of Work these tasks correspond to Major Task 1, Subtasks 3-5 and Major Task 2 in Specific Aim 1 and the studies described in Specific Aim 2.

4. IMPACT:

What was the impact on the development of the principal discipline(s) of the project?

Although this project is still in the early stages, it has accomplished the important step of demonstrating that this barcoding technology can be utilized in patient-derived tumor cells. This is a key step, as our earlier work has used only established, immortalized cell lines which have been maintained in laboratories for many years and thus have some biological differences from cancer cells that are treated in the clinic.

What was the impact on other disciplines?

Nothing to report.

What was the impact on technology transfer?

Nothing to report.

What was the impact on society beyond science and technology?

Nothing to report.

**5. CHANGES/PROBLEMS:
Changes in approach and reasons for change**

Nothing to report.

Actual or anticipated problems or delays and actions or plans to resolve them

We experienced a significant delay in HRPO review of our documents (supporting documents uploaded via eBRAP Aug 2018, supporting documents submitted by email Dec 27, 2018; HRPO clarification requested by email May 20, 2019; final decision received by email July 15, 2019).

HRPO agreed with the previous recommendation of our local institutional review board and this research was deemed exempt.

Therefore, the HRPO protocol file has been closed and we do not anticipate any additional related delays.

Changes that had a significant impact on expenditures

Expenditures related to the use of human cells were delayed until HRPO review was completed.

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents

Significant changes in use or care of human subjects

Nothing to report

Significant changes in use or care of vertebrate animals

Nothing to report

Significant changes in use of biohazards and/or select agents

Nothing to report

6. PRODUCTS:

- **Publications, conference papers, and presentations**

Journal publications.

Nothing to report

Books or other non-periodical, one-time publications.

Nothing to report

Other publications, conference papers and presentations.

Nothing to report

- **Website(s) or other Internet site(s)**

Nothing to report

- **Technologies or techniques**

Nothing to report

- **Inventions, patent applications, and/or licenses**

7. PARTICIPANTS & OTHER COLLABORATING ORGANIZATIONS

What individuals have worked on the project?

Name:	Amy Brock, Ph.D.
Project Role:	PI
Researcher Identifier (e.g. ORCID ID):	amybrock (eRA Commons)
Nearest person month worked:	1
Contribution to Project:	Dr. Brock oversees all aspects of the project, coordinates and plans studies, contributes to data analysis and interpretation and communication.
Funding Support:	n/a
Name:	Grant Howard
Project Role:	Graduate Student
Researcher Identifier (e.g. ORCID ID):	GRANT85 (eRA Commons)
Nearest person month worked:	5
Contribution to Project:	Mr. Howard constructed and validated the barcode library vector.
Funding Support:	n/a
Name:	Russell Durrett
Project Role:	Graduate Student
Researcher Identifier (e.g. ORCID ID):	
Nearest person month worked:	3
Contribution to Project:	Mr. Durrett assisted in design and construction of barcode libraries and performed analysis of library diversity.
Funding Support:	n/a
Name:	Daylin Morgan
Project Role:	Graduate Student
Researcher Identifier (e.g. ORCID ID):	
Nearest person month worked:	3
Contribution to Project:	Mr. Morgan established the plasmids for the study and optimized transfection conditions of PDO cells.
Funding Support:	n/a

Has there been a change in the active other support of the PD/PI(s) or senior/key personnel since the last reporting period?

Nothing to report.

What other organizations were involved as partners?

Nothing to report

8. SPECIAL REPORTING REQUIREMENTS

COLLABORATIVE AWARDS: N/A

QUAD CHARTS: N/A

9. APPENDICES: None
