AWARD NUMBER: W81XWH-18-1-0081

TITLE: Peer Social Support During In Vivo Exposure for PTSD: A Program to Address Dropout from Prolonged Exposure

PRINCIPAL INVESTIGATOR: Ronald Acierno, PhD

CONTRACTING ORGANIZATION: Medical University of South Carolina
Charleston, SC 29425

REPORT DATE: APR-2019

TYPE OF REPORT: ANNUAL

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release; Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.
**Title:** Peer Social Support During In Vivo Exposure for PTSD: A Program to Address Dropout from Prolonged Exposure

**Authors:** Dr. Ronald Acierno

**Performing Organization:** Medical University of South Carolina

**Abstract:**
This study seeks to address the problem of dropout from evidence-based treatment for PTSD. We will evaluate whether the opportunity to receive social support during in vivo exposure therapy assignments from Veterans who themselves have successfully competed PE (i.e., the therapeutic equivalent of an exposure therapy ‘workout buddy’) is effective in reversing dropout and improving PTSD outcomes. To achieve this objective, we will use a between group, randomized controlled repeated measures design comparing PE + Exposure Workout Buddy vs. PE + Peer General Support (i.e., the standard VA Peer Support program methods involving a peer who does NOT engage in any support during in vivo homework) to evaluate the ‘PE + Exposure Workout Buddy’ adjunctive therapy component in terms of its ability to increase likelihood that Veterans will (a) return to and complete treatment & (b) evince reduced PTSD symptomatology at post-treatment and 3- & 6-month follow-up. An exploratory objective is to determine whether the hypothesized differential advantage of the workout buddy program is more pronounced for Veterans who receive PE via telehealth vs. receiving PE in person, as data from previous studies indicate that this may be the case.

1. INTRODUCTION:
Post-traumatic Stress Disorder (PTSD) is a significant problem for Veterans and Active Duty personnel. Although effective treatments for PTSD exist (e.g., Prolonged Exposure, PE; Cognitive Processing Therapy; CPT) and have, at great expense, been widely disseminated by VA and DoD, over of those 30% who start treatment subsequently drop out prior to completion. In our first preliminary study we addressed published survey data from Veterans indicating that dropout was related to logistical barriers such as travel time, cost, and stigma associated with care from mental health settings, and so overcame these barriers by delivering treatment via home-based telehealth. However, dropout remained virtually unchanged. Veterans in our study who dropped out of treatment, including that delivered via home based telehealth, were interviewed and a majority responded that they would (a) consider returning to treatment and (b) would be more likely to complete treatment if a peer who had themselves successfully completed treatment were available to help them with exposure homework. In keeping with this feedback, our second preliminary study examined the feasibility of using peers to (a) encourage Veterans who had dropped out of PE to return to treatment and (b) offer support during in vivo (real world) exposure therapy homework assignments (e.g., as they would during ‘gym workouts’). Preliminary findings indicate that such an approach is feasible, and potentially effective, in that over 50% of dropouts from PE agreed to return to treatment and 30% of these actually did so immediately. We will evaluate whether the opportunity to receive social support during in vivo exposure therapy homework from Veterans who themselves have successfully competed PE (i.e., the therapeutic equivalent of an exposure therapy ‘workout buddy’) is effective in reversing dropout and improving PTSD outcomes; and, secondarily, to determine whether this program is particularly helpful for those receiving PE via telemedicine.

The major tasks of the SOW include: (1) enroll 100 Veteran participants with PTSD who previously dropped out or are at risk of dropping out of treatment and randomly assign to either PE + Peer General Support or PE + Exposure Workout Buddy; and (2) collect measures of PTSD and other psychopathology, attendance, and patient satisfaction at pre-treatment, post-treatment, and follow-up.

2. KEYWORDS:
PTSD; social support; exposure therapy; peer support

3. ACCOMPLISHMENTS:
➢ What were the major goals of the project?
Objective 1: To determine relative differences in treatment dose obtained, measured in terms of the number of sessions completed upon return to treatment, in response to ‘PE + Exposure Workout Buddy’ vs. ‘PE + Peer General Support’ in individuals who have previously dropped out of evidence based treatment for PTSD. Whether differences are amplified or diminished with respect to prior identified risk factors such as age, race, gender, substance use, or social support will also be determined.

Objective 2: To determine differential effectiveness, measured in terms of therapeutic gains over time on measures of PTSD symptomatology, of ‘PE + Exposure Workout Buddy’ vs. ‘PE + Peer General Support’ with therapy dropouts in (i.e., ‘treatment outcome’). Whether differences are amplified or diminished with respect to race, gender, age, substance use, or social support will also be determined.

➢ What was accomplished under these goals?
• Start-up activities and regulatory approvals have been submitted and obtained
  ○ IRB approval was obtained on 03-APR-2018
- HRPO approval was obtained on 03-AUG-2018
- VA R&D approval was obtained on 07-JUN-2018

- Study personnel have been trained on the PE and peer protocols, as well as the televideo delivery protocols. Additionally, all study staff have also completed a certified program of instruction in the protection of human subjects in research (e.g., the University of Miami CITI course).
- Study assessment forms and data entry forms have been created. Staff have organized all case report forms (CRFs), regulatory binders, detail protocols, study procedures, and refined other study materials.
- Patient and therapist workbook materials have been finalized to be used during treatment sessions.
- Randomization procedures and all databases have been set up to ensure high quality data entry and data security throughout the course of the study.
- Screening and recruitment of potential peers and participants began 20-AUG-2018.
- Principal investigator and staff completed initial training sessions with peers. Resource materials were distributed.

Recruitment successes are as follows:

Between 15-MAR-2018 and 14-MAR-2019, 19 peers were screened and 18 were determined eligible, bringing our total enrolled peers to date since the initiation of study procedures on 15-MAR-2018 to 18, 17 of which remain active.

Between 15-MAR-2018 and 14-MAR-2019, 20 participants were screened and 10 were enrolled, bringing our total enrolled participants to date since the initiation of study procedures to 10. Additionally, 2 post assessments have been completed. There were no 3- or 6-month follow up assessments due during this period.

Below is a chart of to-date PEER enrollment.

*Overall recruitment is greater than predicted sample size to account for potential attrition or withdrawal immediately following consent but before any study treatments can be provided.
Recruitment activities that were implemented during year 1 include:

- Added new volunteer personnel to assist with study recruitment.
- Discussed potential referral streams with providers from Post-Traumatic Stress Disorder Clinic Team (PCT) and primary care.
- Identified providers in Charleston VA catchment area and CBOCs to contact for referral collaboration.
- Established procedures to identify potential participants who successfully completed Prolonged Exposure therapy to serve as peers.
- Developed recruitment letter to send to list of potential participants once recruitment activities begin.
- Added study information to research newsletter which is distributed monthly to healthcare providers at the RHJ VAMC and CBOCs.
- Met with local wounded Veterans group to disseminate flyers.
- Received IRB approval for new study flyer and updated assessment questionnaires.
- Developed study brochure.
- Expanded peer recruitment to local Savannah CBOC and enrolled first CBOC participants.
- Posted new flyers at Ralph H. Johnson VAMC and Savannah CBOC.
- Attended meeting with Veterans Enrichment Center (VEC) and PTSD Clinic Team (PCT) at Charleston VAMC to discuss referral of peers.

What opportunities for training and professional development has the project provided?
Study therapists were trained on PE treatment with the addition of peers, independent evaluators were trained on assessment measures, and peers were trained on protocol procedures. Further, staff have received on-going Prolonged Exposure (PE) training and consultation by Dr. Edna Foa and her team in conjunction with another DOD award, The Efficacy of 90-Minute vs 60-Minute Sessions of Prolonged Exposure for PTSD: A Randomized Control Trial in Active Duty Military Personnel (PI: Edna Foa, PhD).

How were the results disseminated to communities of interest?
DOD IPR will receive reports of study progress.

What do you plan to do during the next reporting period to accomplish the goals?
Recruitment will continue; we will focus heavily on distributing information to local providers both at the Charleston VAMC and CBOCs in order to garner more direct referrals. We will be present at staffing meetings for PTSD Clinical Team (PCT) to recruit patients who dropped out of treatment with providers. We will continue to post flyers around the Charleston VAMC and CBOCs, as well send recruitment letters.

4. IMPACT:
What was the impact on the development of the principal discipline(s) of the project?
Though too early to report at this time, the clinical outcomes may be significant. Over 30% of those who access treatment for PTSD drop out prematurely. Previous studies indicated that Veterans, who were surveyed after dropping out of PE, stated that they would be more likely to complete treatment if they had a peer who had already completed treatment and were available to help them with exposure homework. A subsequent pilot study was implemented and the feasibility of the program, measured in terms of successful peer recruitment, training, and patient coordination with peer/therapist for in vivo exposure meetings, and patient willingness to return treatment (52%) appears to be strongly supported.
What was the impact on other disciplines?
Nothing to report

What was the impact on technology transfer?
Nothing to report

What was the impact on society beyond science and technology?
Nothing to report

5. CHANGES/PROBLEMS:

Changes in approach and reasons for change
No changes

Actual or anticipated problems or delays and actions or plans to resolve them
No problems

Changes that had a significant impact on expenditures
No changes

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents
No changes

Significant changes in use or care of human subjects
No changes

Significant changes in use or care of vertebrate animals
N/A

Significant changes in use of biohazards and/or select agents
N/A

**Study/Product Aim(s)**

Objective 1: To determine relative differences in treatment dose obtained, measured in terms of the number of sessions completed upon return to treatment, in response to ‘PE + Exposure Workout Buddy’ vs. ‘PE + Peer General Support’ in individuals who have previously dropped out of evidence based treatment for PTSD. Whether differences are amplified or diminished with respect to prior identified risk factors such as age, race, gender, substance use, or social support will also be determined.

Objective 2: To determine differential effectiveness, measured in terms of therapeutic gains over time on measures of PTSD symptomatology, of ‘PE + Exposure Workout Buddy’ vs. ‘PE + Peer General Support’ with therapy dropouts in (i.e., ‘treatment outcome’). Whether differences are amplified or diminished with respect to race, gender, age, substance use, or social support will also be determined.

**Approach**

Using a between group, randomized controlled repeated measures design comparing PE + Exposure Workout Buddy vs. PE + Peer General Support (i.e., the standard VA Peer Support program methods involving a peer who does NOT engage in any support during in vivo homework) to evaluate the ‘PE + Exposure Workout Buddy’ adjunctive therapy component in terms of its ability to increase likelihood that Veterans will (a) return to and complete treatment & (b) evince reduced PTSD symptomatology at post-treatment and 3- & 6-month follow-up.

**Accomplishments this year:**

- Between 15-MAR-2018 and 14-MAR-2019, 19 peers were screened and 18 were determined eligible, bringing our total enrolled peers to date since the initiation of study procedures on 15-MAR-2018 to 18, 17 of which remain active.
- Between 15-MAR-2018 and 14-MAR-2019, 20 participants were screened and 10 were enrolled, bringing our total enrolled participants to date since the initiation of study procedures to 10. Additionally, 2 post assessments have been completed. There were no 3- or 6-month follow up assessments due during this period.
- Principal investigator and staff met with primary care team at local CBOC to discuss study and set up system to refer.
- Discussed potential referral streams with providers from Post-Traumatic Stress Disorder Clinic Team (PCT) and primary care.
- Identified providers in Charleston VA catchment area and CBOCs to contact for referral collaboration.
- Established procedures to identify participants who successfully completed Prolonged Exposure therapy to serve as peers.
- Developed recruitment letter.
- Added study information to research newsletter which is distributed monthly to healthcare providers at the RHJ VAMC and CBOCs.
- Met with local wounded Veterans group to disseminate flyers.
- Received IRB approval for new study flyer and updated assessment questionnaires.
- Expended peer recruitment to local Savannah CBOC and enrolled first CBOC participants.
- Posted new flyers at Ralph H. Johnson VAMC and Savannah CBOC.
- Attended meeting with Veterans Enrichment Center (VEC) and PTSD Clinic Team (PCT) at Charleston VAMC to discuss referral of peers.

**Goals/Milestones**

**YR1 Goal** – Institutional Human Subject Approvals Submitted
- IRB, VA Research, DoD HRPO approvals obtained

**YR2 Goals** – Recruitment, Reports
- Establish recruitment protocols and procedures
- Recruit and consent participants

**YR3 Goal** – Recruitment, Reports
- Continue to recruit and consent participants

**YR4 Goal** – Complete Recruitment, Analyze Data, Submit Publications
- Submit final report and presentations to DoD

**Comments/Challenges/Issues/Concerns**
- None at this time

**Budget Expenditure to Date**
- Actual Expenditure: $96,928 (as of 03/14/2019)
