May 7, 1991

The Honorable Daniel K. Inouye Chairman, Subcommittee on Defense Committee on Appropriations United States Senate

Dear Mr. Chairman:

This is a supplement to our report entitled <u>Test and Evaluation: Projects</u> <u>Funded by DOD's Central Test and Evaluation Investment Program (GAO/</u> NSIAD-91-111). This supplemental report provides more detailed descriptions of the test and evaluation projects.

Please contact me on (202) 275-8400 if you or your staff have any questions concerning this supplemental report. Major contributors to the supplement are listed in appendix V.

Sincerely yours,

2 9. Mat sau

Paul F. Math Director, Research, Development, Acquisition, and Procurement Issues

GAO/NSIAD-91-1118 Test and Evaluation Program

Appendix I Air Force Projects

Stores Certification Capability Upgrade Program	Stores certification is the process used by the services to properly load a munition, such as a missile or a bomb, on an aircraft; carry it to a target; release it; and determine its bombing accuracy. Until an aircraft/stores combination is certified, the weapon system cannot use the munition in combat. The overall objectives of the Stores Certification Capability Upgrade Program are to cut the process time and cost in half, use the process during development testing instead of after hardware is deliv- ered, and standardize applications for all the services.		
	The project supports 21 subprojects that will focus on simulation and analysis software, test range instrumentation, and technical data base standardization. The software is expected to cut down on the time-con- suming and costly flight testing associated with the current process (eight subprojects). To verify the integration of the stores on the air- craft, the Air Force plans to improve the ground and airborne instru- mentation capabilities (nine subprojects). To save time and staff-hours, the Air Force also plans to develop and manage standard data bases (four subprojects).		
Justification for the Project	According to Office of the Secretary of Defense (OSD) and Air Force offi- cials, the program was initiated by the Air Force to eliminate a 4-year backlog in its stores certification process and to ensure that another backlog does not develop. (The backlog was recently reduced to 3 years.)		
	Air Force officials told us that the program is their highest priority and that Central Test and Evaluation Investment Program (CTEIP) funding is generally used only for the program's multiservice applications. How- ever, there are some unique service applications for this project that are funded only by the Air Force. Air Force officials explained that the Navy has a small backlog of certifications and the Army contracts out for its certifications.		
	All existing and future weapon systems that release munitions in flight will benefit from this project. Programs and technologies supported include the A-10, B-2, Direct Airfield Attack Combined Munition, F-14, F-15, F-15E, F-16, F-18, F-111, Advanced Tactical Fighter, Advanced Tactical Aircraft, Advanced Medium-Range Air-to-Air Missile, Advanced Short-Range Air-to-Air Missile, Sensor-Fused Weapon, Durandal, Short- Range Attack Missile II, Maverick, Shrike, High-Speed Anti-Radiation Missile, fuel tanks, and gun pods.		

	Appendix I Air Force Projects
Interrelationships Among CTEIP Projects	Although the project does not duplicate other CTEIP efforts, it does com- plement the Air Force's Global Positioning System project, the Army's Smart Munitions Test Suite, and the Navy's Common Airborne Instru- mentation System project. For example, the Standard Aircraft Instru- mentation subproject developed under the stores certification program will support the Common Airborne Instrumentation System project. In addition, the stores certification program will provide funds to the Army's Smart Munitions Test Suite project to acquire equipment valued at \$18 million. However, the Army is having difficulty executing this project.
	According to Air Force officials, the large backlog occurred in the mid-1980s because Air Force aircraft/stores combinations were allowed to be used without certifications. Because the Air Force programs did not provide funding for the certifications in the past, an official told us, the Air Force had not provided the funding, and the only funding available to correct the problem was CTEIP. To address the backlog, however, the Air Force plans to supplement \$105.5 million in CTEIP funding with its own funding of \$101.8 million, as shown in table I.1. According to an Air Force official, the CTEIP effort motivated the Air Force to increase its funds from \$8 million to \$101.8 million.

Dollars in millions		
Fiscal year	CTEIP	Air Force
1990	\$6.3	\$1.0
1991	14.2	0.9
1992	25.0	12.9
1993	27.1	21.4
1994	16.4	15.9
1995	16.5	18.3
1996	0	19.7
1997	0	11.7
Total	\$105.5	\$101.8
		والمتقابي الشريع المتهيد والمتراجع

We were told that because the Army only has helicopters that carry munitions, it spends about \$10 million for stores certification. The Navy takes a different funding approach for its stores certification process by building the cost into the individual weapon programs. If the Navy programs do not provide the funding, the certification is denied.

Table I.1: CTEIP and Air Force Funding for the Stores Certification Capability

Upgrade Program

Execution of the Project for Fiscal Years 1990 and 1991

During fiscal year 1990, the Air Force was able to execute the stores certification program because it prepared the initial documentation for contract awards prior to receiving CTEIP funds and because it used purchase orders, which are easy to execute. CTEIP funds have been used chiefly to support five test range instrumentation subprojects: Standard Aircraft Instrumentation (SAI), Image Data Automated Processing System (IDAPS), Airborne Weapon Test Instrumentation (AWTI), Mobile Time-Space-Position-Information System (Mobile TSPI), and High Speed Video (HSV). The Air Force contracts awarded in fiscal year 1990 for these five main subprojects are listed in table 1.2.

for Five Main Subprojects (Fiscal Year	Project	Contractor	Date of award	Amount
1990)	SAI	ISN Corp., Shalimar, Fla. SRI Corp., Shalimar, Fla. SCI Technology, Atlanta, Ga.	February 1990 March 1990 June 1990 September 1990	\$126,959 99,497 1,427,440 143,160
	IDAPS	Environmental Research Institute of Michigan, Ann Arbor, Mich.	March 1990	1,296,347
	AWTI	TEAS Corp., Eglin Air Force Base, Fla.	May 1990	260,000
		Harris Corp., Melbourne, Fla.	April 1990	250,000
	Mobile TSPI	Diversified Engineering, Richmond, Va.	September 1990	350,000
		IBM, Fort Walton Beach, Fla.	August 1990	46,590
	HSV	TEAS Corp., Eglin Air Force Base, Fla.	May 1990	64,583
		Arizona Board of Regents, University of Arizona, Tucson, Ariz.	June 1990	150,000
		University of Central Florida, Orlando, Fla.	August 1990	20,000
	Total			\$4,234,576

The Air Force did not anticipate problems executing the \$13.4 million for use in fiscal year 1991. Generally, the Air Force planned to use the CTEIP funds to support the same subprojects. Funds would be placed on existing contracts or new contracts could be easily awarded. Also, purchase orders could be issued for some items.

Outyear Funding Profiles By comparing the funding of the program as of April 1989 to the revised outyear funding profile as of August 1990, we found that the stores certification program is scheduled to receive additional funding amounting to \$13.3 million over the life of the project. According to Air Force officials, most of this increase (\$11 million) will cover costs associated with meeting the needs of the Navy. As shown in table I.3, the funding will also be stretched out from fiscal years 1994 to 1995.

Table I.3: Funding Profiles for the Stores					
Certification Capability Upgrade Program	Dollars in millions				
	Fiscal year	Funding as of April 1989	Funding as of August 1990		
	1990	\$23.5	\$6.3		
	1991	26.1	14.2		
	1992	25.0	25.0		
	1993	15.1	27.1		
	1994	2.5	16.4		
	1995	0	16.5		
	Total	\$92.2	\$105.5		
Global Positioning System Range Applications Joint Program Office Development	The Global Positioning System (GPS) is a satellite system designed to pro- vide users with worldwide, three-dimensional position and velocity information along with coordinated universal time. Currently, no system can accurately monitor or measure in real-time the hundreds of partici- pants, aircraft, vehicles, missiles, and targets that make up a compre- hensive test. The GPS Range Applications Joint Program Office (RAJPO) project will allow for the development and initial acquisition of a new generation of receivers, transmitters, and control centers based on GPS technology. Once the equipment is developed, the services are expected to purchase the equipment for use at their test ranges. At that time, each of the nine				
Justification for the Project	also will establish r plies and a depot-le OSD initiated this pr could be used by al 1987 to 1989, OSD's	ided a full complement of GPS maintenance requirements, suc- evel repair capability, to support roject to develop and acquire G I the services on their test rang- financial support for the prog- nning in 1990, CTEIP funding w	PS equipment that ges. From fiscal years fram amounted to		

Interrelationships Among CTEIP Projects	The Air Force's GPS RAJPO project complements and does not duplicate other CTEIP projects. The Air Force's GPS equipment will be acquired by the Navy and the Army under separate CTEIP projects. Unlike the Air Force, the Navy and Army do not plan to use their own funding to acquire the equipment.			
Execution of the Project for Fiscal Years 1990 and 1991	Funding for the Air Force GPS RAJPO project was increased from \$23.5 million as of March 1990 to \$25 million in June 1990 to accelerate the development of GPS equipment. By consolidating and miniaturizing this equipment, OSD believes that future savings may be realized. The increased funding also allowed for cost growth.

Red Mission Analysis

Red Mission Analysis (RMA) is a project to develop a system to create models and run simulations representing airborne Soviet and other threats. Intelligence analysts using RMA will be able to easily create digital models of threats, such as a MIG-29 aircraft or an Exocet missile, based on the most current, complete, and accurate information available. These models can then be placed into combat scenarios and run against other models representing the electronic combat systems of the United States and other North Atlantic Treaty Organization countries to evaluate how the systems perform. .

The Air Force initiated the project but consulted with the Army and Navy to ensure the project was applicable to their needs by incorpo- rating the ability to model and simulate land and undersea threats. So far, however, Army and Navy personnel have been involved only infor- mally in the project.			
To more effectively test its electronic combat systems, the Air Force has developed a "scientific test process" for testing at each stage of develop ment from computer simulation to flight testing. RMA would be used throughout the process as the baseline threat reference. The Air Force believes the threat models in use now are fragmented, incomplete, some times conflicting, and costly because the models usually have to be redeveloped each time a new system is tested.			
Weapon systems with either offensive or defensive electronic combat systems could be tested using RMA. These weapon systems include the B-1, F-14, F-15, Light Helicopter Experimental, and Advanced Tactical Fighter.			
Four Air Force CTEIP projects complement one another as part of the service's "scientific test process." Besides RMA, the projects are the Elec tronic Combat Digital Evaluation System (ECDES), Air Force Electronic Warfare Evaluation Simulator, and Real-Time Electromagnetic Digitally Controlled Analyzer and Processor Upgrade. Though ECDES and RMA can each exist without the other, it becomes much easier and less expensive for RMA to be used by all levels of the testing community, from digital laboratories to flight ranges, if ECDES is developed as well. ¹			
Prototype software for RMA is being developed in conjunction with a larger Air Force effort, Modeling and Simulation Techniques Evaluation Research (MASTER). The Air Force's Foreign Technology Division has been developing the software for more than 5 years. The Air Force is contributing \$2 million to the development of the software, and CTEIP is funding \$3.6 million for this effort over the life of the project.			

¹ECDES is to provide a system for creating a library of models that will become the baseline for the actual field testing of U.S. and other North Atlantic Treaty Organization electronic warfare systems. However, the CTEIP project was terminated in fiscal year 1990.

Execution of the Project for Fiscal Years 1990 to 1992	Congress cut all funding for RMA in fiscal year 1990. Because all of RMA's funding for that year was supposed to go to the MASTER effort and RMA is a major funding source for that effort, MASTER was delayed somewhat. However, MASTER is still on schedule to deliver prototype software in fiscal year 1992. Eighty-five percent of RMA's funds for fiscal years 1991 and 1992 will be going to the MASTER effort.			
Outyear Funding Profiles	By comparing the funding of the program as of April 1989 to the revised outyear funding profile as of August 1990, we found that RMA is sched- uled to receive an additional \$500,000 over the life of the project (see table I.6). The congressional cut in fiscal year 1990 led CTEIP to rework RMA's budget profile; completion of the project will be delayed by a year, and the budget will be stretched out, with less funding provided each year. The project's action officer said that even though the funding strategy was imposed by CTEIP, the Air Force should be able to adjust the project based on the level of funding provided.

Air Force Electronic Warfare Evaluation	indoor ground test fac	nic Warfare Evaluation Simulator (AFE ility, is designed to test aircraft electro mers, against enemy systems, such as	onic counter-	

The simulator project was initiated by the Air Force and has multiser-Justification for the vice applications. Because AFEWES will be the only facility able to simu-Project late several Soviet SAMS, the Air Force expects heavy use of it by all three services and by allied foreign governments. Over the past 5 years, the Air Force has used the facility 47 percent of the time, the Navy 19 percent, the Army 5 percent, foreign governments 22 percent, and others 7 percent. According to an Air Force official, the threats that AFEWES simulates are 10 or more years out of date. Because AFEWES does not currently simulate up-to-date threats, it cannot test weapon systems with advanced avionics. The B-1 program cancelled testing at the facility because of these limitations. Weapon systems that will benefit from the upgrades include the F-15, EF-111A, ALQ-131, and Advanced Tactical Aircraft. AFEWES is one of the electronic warfare projects that are part of the Air Interrelationships Among Force's "scientific test process" for testing electronic warfare systems. **CTEIP** Projects The other projects are ECDES, RMA, and the Real-Time Electromagnetic Digitally Controlled Analyzer and Processor (REDCAP) Upgrade. AFEWES can use the ECDES/RMA models and integrate actual hardware and personnel into the testing process. Field test results are used to validate the models. In turn, the models are used to validate the field test, thus lending more credibility to both results. AFEWES is related to the Air Force's REDCAP facility in that each represents a part of the electronic environment that an aircraft would face in combat. The primary difference between the two facilities is that REDCAP simulates enemy command, communications, and control systems, whereas AFEWES simulates threat systems. The Air Force will fund test analysis equipment and upgrade AFEWES's existing simulators to maintain currency with the rapidly changing threat environment. The Air Force is contributing \$171 million for these upgrades, which includes \$21.4 million for the reconfigurable simulators also being funded by CTEIP. The following table shows the outyear funding profiles for both CTEIP and Air Force funding.

	Appendix I Air Force Projects
	,
Real-Time Electromagnetic Digitally Controlled Analyzer and	REDCAP is a ground test facility that simulates parts of an enemy air defense system, such as early warning radars and command, control, and communication (C3) systems. It is the only facility for testing air- craft penetration tactics, electronic combat concepts, and equipment operating in a hostile C3 environment.
Processor Upgrade	The Air Force and CTEIP are jointly funding upgrades for REDCAP. The upgrades will modify existing simulators and add advanced simulators to keep pace with developments in U.S. and foreign electronic combat systems. The CTEIP project is funding the integration of a Soviet C3 system with an existing Soviet radar simulator. In addition, CTEIP is funding the development of a prototype link between REDCAP and the Navy's Air Combat Environment Test and Evaluation Facility (ACETEF) to demonstrate that two or more electronic combat test facilities can be linked in real-time and that these links will enhance the capabilities of both facilities.
Justification for the Project	The Air Force initiated these upgrades and added ground and sea por- tions of the Soviet radar system to meet multiservice needs. Currently, REDCAP is used almost exclusively by the Air Force. However, the Air Force expects the Army, Navy, and others to increase their use of the facility because of the upgrades and the data link with ACETEF.
	The threat that REDCAP simulates is 10 to 15 years out of date, according to the Air Force. Therefore, weapon systems are not being adequately tested in the current environment. Air Force documents show that the REDCAP upgrades will be used to test numerous systems, including the B-1B, B-2, F-14, F-15, F-15E, F-16, F/A-18, EF-111A, Advanced Tactical Fighter, Advanced Tactical Aircraft, CV-22A, and Combat Talon aircraft.
Interrelationships Among CTEIP Projects	REDCAP is one of the electronic warfare projects that are part of the Air Force's "scientific test process" for testing electronic warfare systems. The other projects are AFEWES, RMA, and ECDES. REDCAP and AFEWES are similar facilities but are not duplicative because they have different objectives.
	The Air Force is providing the bulk of the funding of the project, \$49.2 million, compared with \$10.4 million from CTEIP. The Air Force is funding the upgrade to the Integrated Air Defense System simulator to

	Appendix I Air Force Projects	
	represent the current version of the Soviet threat, the design and de- opment of new Early Warning/Ground-Controlled Intercept radar sin lators, and the acquisition of a new computer system to support all o	mu-
	the upgrades.	,
Execution of the Project for Fiscal Years 1990 to 1992	The project got off to a slow start in fiscal year 1990; it was 3 month late in beginning to obligate funds. Calspan Corporation, which oper- the current facility, was awarded the contract for the upgrades in two phases, one in September 1988 and the other in March 1990. The \$800,000 in CTEIP funding for fiscal year 1990 was spent almost ever between the Soviet radar simulator upgrade and data link.	ates vo
	For fiscal years 1991 and 1992, all the CTEIP funding will go to the Soradar upgrade.	ovie
Outyear Funding Profiles	By comparing the funding of the program as of April 1989 to the revolutyear funding profile as of August 1990, we found that the project had been reduced in funding by \$2.2 million (see table I.9). Originally CTEIP was going to fund development of the Early Warning/Ground-Controlled Intercept simulator, which is currently being funded by the Air Force. Instead, CTEIP is now funding the Soviet radar simulator upgrade, which the Air Force considers a higher priority and which is clear tri-service applications.	t y, he

	1991 2.0	\$0 3
	1992 6.0	6
		\$10
	Although this schedule shows the CTEIP project completed by fiscal year 1992, the overall project has been stretched out 1-1/2 years unt fiscal year 1994 because of the combination of CTEIP and Air Force funding cuts. The stretch-out and these cuts have left a projected shortfall of \$16 million in fiscal year 1993 for the project. The programanager is hoping that a combination of cost-cutting measures and s additional funds from the Air Force will allow the project to be completed without any substantive impact.	am som

	guard against possible collisions. Third, existing assets on the ground will be linked to ensure greater coverage during a test. Fourth, a sched- uling system will be created to coordinate the actual tests that are to be conducted. Finally, an experiment control center will be developed to improve the coordination among existing assets.
Justification for the Project	This project was initiated by the Air Force; however, OSD has taken the initiative to bring all the services together for this effort. The Air Force, which is the executive agent, is responsible for the space test support center, space safety system, and experiment control center; the Army is responsible for linking the ground facilities (internetting); and the Navy is responsible for the scheduling system.
	A Space Test Range Architecture Study, dated September 1988, which was sponsored by the Strategic Defense Initiative Organization and con- ducted by the Air Force with tri-service participation, initiated the Space Test Capability project. The approach is to build initially on existing Air Force, Army, and Navy assets for test support requirements posed by new space systems over the next decade.
	The programs and technology supported by this project include ongoing programs: ballistics, boosters, Combined Release and Radiation Effects Satellite, Geostationary Operational Environmental Satellite, Inertial Upper Stage, National Oceanic and Atmospheric Administration Satel- lites, Relay Mirror Experiment, and Space Transportation System. In addition, formal support has been requested for Complementary Space Experiment/Zenith Star, Laser Geodynamic Satellite-2, Light Amplifica- tion by Simulators Emission of Radiation Test, Launch Observation Sat- ellite-X, Laser Atmospheric Compensation Experiment, Midcourse Space Experiment, Special Program Flight Experiment, Space-Based Surveil- lance and Tracking System Validation Satellite, Space Technology
r	 Experiments Platform, Software Technology for Adaptable Reliable Systems, and Technology for Autonomous Satellites. Finally, preliminary support has been requested for Advanced Photovoltaic Electronics Experiment, Aero-Assist Flight Experiment, Array of Low X-Ray Imaging Sensors, Boost Surveillance and Tracking System, Electric Insertion and Transfer Experiment, International Solar Terrestrial Physics, Kinetic Energy Antisatellite, Meteorological Satellite, National Aerospace Satellite, Neutral Particle Beam, Pegasus, Polar Ozone Aerosol Measurement II, Satellite Relay Proof of Concept, Strategic Defense System, Survivable Solar Power Subsystem Demonstrator, Tether Dynamic Explorer-1, Ultra-High Frequency Follow-On, and Zest.

GAO/NSIAD-91-111S Test and Evaluation Program

Interrelationships Among CTEIP Projects	The DOD Space Test Capability project was designed to eliminate duplica- tion among the services. According to an Air Force official, the project consolidates the space testing needs of the services, which were similar in concept but not duplicative. The Air Force is generally responsible for all space testing and has taken the lead role. The Army is interested in linking the existing ground test facilities to assist its command and con- trol functions, and the Navy is interested in tests conducted by multiple test participants at sea.

. A second statement of the second s

	Appendix I Air Force Projects
	space. The sensors will be tested to determine their ability to differen- tiate missiles from other heat patterns that are placed against an Earth or space background.
	There are two phases to the project: Phase I will develop and validate the technological concept for the project by producing a Transportable Direct Write Scene Generator, and phase II will produce a Focal Plane Array Test Chamber with full threat capability to satisfy a broad range of user requirements for current and future programs.
Justification for the Project	The project was initiated by the Air Force and meets multiservice and multiagency needs. Brilliant Pebbles and other Strategic Defense Initia- tive programs, Air Force surveillance and Navy reconnaissance satel- lites, and Army anti-ballistic missile programs all plan to use this facility.
	According to the Air Force, existing scene generators cannot adequately create realistic threat environments to properly test current and upcoming space-related systems. In addition, current treaties and budget restrictions limit the amount of field or space-based testing that can be done in this area, so a realistic, laboratory-based scene generation capa- bility is critical for properly testing these systems.
Interrelationships Among CTEIP Projects	This project does not duplicate any other CTEIP projects. However, the project is receiving \$1.1 million from the Air Force's Boost Surveillance and Tracking System (BSTS) project during fiscal years 1990 and 1991. This system will be the initial user of phase I and will purchase the Transportable Direct Write Scene Generator modified for some unique requirements of that project. In addition, several contractors are building Focal Plane Array Test Chambers (phase II) that are designed for specific program applications rather than, in this project, for a broad range of user requirements.
Execution of the Project for Fiscal Years 1990 and 1991	The project did not get underway until February 1990 because of funding delays. BSTS provided \$300,000 for initial investigations on the application of the scene generation technology to BSTS. Once CTEIP funding became available, the project was restructured to reflect the delayed start of the project and the new funding and requirements of BSTS. Because of the late start, the project was able to spend only \$2 million in fiscal year 1990, rather than the \$2.5 million originally

In both cham- which allows s while the jet

Justification of the Project	The Air Force initiated the upgrade, and the project meets the needs of all three services and other agencies. All major new weapon systems, particularly aircraft, will use the Climatic Test Chamber. In addition, the Federal Aviation Administration, National Aeronautics and Space Administration, the Coast Guard, and others plan to use the facility. Currently, the Air Force uses the facility about 50 percent of the time, the Navy about 30 percent, the Army 10 to 20 percent, and other agen- cies the rest of the time. However, some weapons cannot be fully tested now because of limited air handling capacity. For example, the B-1B could have only three of its four engines running at idle during testing and then not for very long.
Interrelationships Among CTEIP Projects	Because this is a one-of-a-kind facility, it does not duplicate other CTEIP projects. The Air Force provided about \$11 million in fiscal years 1989 and 1990 as an interim effort to keep the facility operating and safe before the CTEIP project began.
	The Air Force considered the project to be too expensive to handle on its own, especially considering the use of the facility by the other services. The Air Force also considered charging users, including private industry, to pay for the renovation and upgrades, but the costs would have made using the facility prohibitively expensive.
Execution of the Project for Fiscal Years 1990 to 1992	This project received \$100,000 in fiscal year 1990 for initial design work and travel expenses. The integration of the project's design will get underway in fiscal year 1991 by the Civil Engineering Office at Eglin Air Force Base and be completed in fiscal year 1992. The U.S. Army Corps of Engineers will serve as the procurement agent for the project.
Outyear Funding Profiles	The cost of the project has grown from \$49.4 million to \$62.6 million, as shown in table I.14, because the design costs were added in and the inflation rate was recalculated. The original funding profile was changed to allow for a more efficient design phase and for testing to continue while the project is being designed. Originally, phase I of the project was to be designed in fiscal year 1991 and then built in fiscal year 1992. Phase II was to be designed in fiscal year 1993 and built in fiscal year 1994. Now, the whole project will be designed in fiscal years 1991 and 1992, and construction will take place in fiscal years 1993 and 1994. Full-scale renovation will not start until early fiscal year 1994 after the last currently scheduled test is completed. The

project manager expects the facility to be operational by November 1995.

Table I.14: Funding Profiles for theClimatic Test Chamber Upgrade Project

Fiscal year	Funding as of April 1989	Funding as of August 1990
1990	0	\$0.1
1991	\$1.8	1.6
1992	15.6	4.8
1993	7.0	23.3
1994	25.0	32.8
Total	\$49.4	\$62.6

Army Projects

Smart Munitions Test Suite	The Smart Munitions Test Suite is used to evaluate the launch and sepa- ration of munitions that search, detect, identify, and track targets until the munitions make contact. The Army's testing capabilities have not kept pace with the development of these "smart" munitions because of the absence of requirements developed by the smart weapons commu- nity, the low priority assigned to this need, and a lack of funding. The test suite is to be an independent, mobile system so that it can be trans- ported from range to range. It will initially be installed at White Sands Missile Range.		
	The test suite project is a complement of eight systems that will increase the capabilities of test ranges to support the smart munitions testing requirements. These systems are the Munitions/Submunitions Tracking System (MSTS), Submunitions Telemetry System, Target Illumination Measurement System, Target Array Mapping System, Atmospheric Characterization System, Test Facility Control System, Test Monitoring Instrumentation, and High Resolution Millimeter Wave Radar System.		
Justification for the Project	Smart munitions present problems for the test community because a large number of high-speed objects are released below the horizon and must be tracked from varying stand-off ranges. As a result, a new gener- ation of tracking, sensing, and mapping systems is needed to evaluate and verify their performance.		
	According to OSD and Army officials, this project is basically an Army initiative. An Army official told us that the Army fielded the first gener- ation of smart munitions without adequate testing and that the next generation of smart munitions would benefit from the project. Current test programs include the Army Tactical Missile System and the Multiple-Launch Rocket System applications of the Sense and Destroy Armor munitions and the Terminally Guided Weapon. Future programs will include other submunition-dispensing weapons.		
Interrelationships Among CTEIP Projects	According to an Army official, this project does not duplicate other CTEIP projects. However, there is a plan under the Air Force stores certification project to purchase a part of the test suite for use at Eglin Air Force Base at a cost of \$18 million. The Army is having difficulty executing a contract for the capability at White Sands Missile Range, which may have an impact on the Air Force acquisition. In addition, other CTEIP projects, such as the Multiple Object Tracking Radar and Aerial Cable Facility, will also be used for smart munitions testing. The Army has		

	Appendix II Army Projects		
	been buying parts f been able to fully fu	for this test suite on a piecemeal basis but has not und it.	
		Force are each providing about \$10 million to gration of the suite into the range.	
Execution of the Project for Fiscal Years 1990 and 1991	Execution of this project has been stretched out because the Army was not ready to enter into contracts when funding was received in fiscal year 1990. The Army issued a solicitation for the MSTS. There was one bidder, and the bid was about 60 percent above the estimated costs. The Army is now reviewing other options, such as scaling down the MSTS, as well as gathering requirements data for the MSTS and the entire test suite.		
	ment of the MSTS. If this system, accord moved up in the acc	ecution plans include contracting for the develop- the contracting process does not move forward for ing to the program manager, other systems could be quisition schedule. However, the MSTS is the founda- est suite and will take the longest to develop.

GAO/NSIAD-91-111S Test and Evaluation Program

	Army Projects
Army Range Global Positioning System	The Army Range GPS uses satellites to provide time-space-position infor- mation from aircraft, missiles, and ground vehicles involved in tests. These tests are conducted in canyons, over mountainous terrain, and at low altitudes; employ pop-up maneuvers; use growing numbers of players; and are conducted two or more times a day. Tests conducted during 1988 involved as many as 10 aircraft and 3 ground vehicles. The mix, number, staging areas, and flight pattern changed on an almost daily basis.
	This project will equip White Sands Missile Range with the initial com- ponents of the GPS for early missile testing, including player, ground, data relay, and some computational equipment. It also provides GPS starter kits for other test ranges. One subproject, Trajectory Data Selector, is included as an option subject to additional funding.
Justification for the Project	The GPS project was initiated by OSD to interface with the Air Force and Navy GPS projects. The original project was changed to take advantage of the Air Force and Navy GPS applications. Plans for GPS projects at other Army ranges were also changed from range-unique systems to a standard GPS system.
	White Sands Missile Range's current time-space-position information systems cannot handle the three tests per day that are required. If this project is not completed, White Sands Missile Range cannot support range users employing GPS equipment.
	Systems and facilities that would benefit from this project include Patriot, Chaparral, Hawk, High Energy Laser Systems Test Facility, Air- Launched Cruise Missile, Copperhead, Multiple-Launch Rocket System, Short-Range Attack Missile, and Forward Area Air Defense System.
Interrelationships Among CTEIP Projects	This project does not duplicate other CTEIP projects, although it does par- allel the Air Force and Navy GPS projects being funded by CTEIP. Also, according to an Army official, GPS could be used, along with other projects, such as the Multiple Object Tracking Radar and target control, in place of the CTEIP Air Defense Capability project.
	According to an Army official, about \$50 million in Army funds will be spent to integrate the GPS package into White Sands Missile Range.

Appendix II

	Appendix II Army Projects			
Execution of the Project for Fiscal Years 1990 and 1991	Project activity for fiscal year 1990 included awarding two contracts one to assist with design and integration into White Sands Missile Ray and the other to conduct site surveys and design a solar-powered trai to move the equipment around the site. Both contracts were awarded established DOD contractors. Lockheed is one of the in-house contract for White Sands Missile Range, and the Navy has an ongoing contract with Stanford Research Institute. The Army contracts awarded in fis- year 1990 are listed in table II.2.			issile Range ered trailer awarded to contractors contract
Table II.2: Contracts Awarded for the				
Army Range Global Positioning System (Fiscal Year 1990)	Project GPS design and integration	Contractor Stanford Research Institute, Arlington, Va.	Date of award May 1990	Amou \$100,00
	Site survey and trailer design	Lockheed Engineering Systems, White Sands Missile Range	March 1990	130,00
	Total			\$230,00
	In fiscal year 1991, the program manager plans to transfer \$3.6 million to the Air Force GPS Range Applications Joint Program Office for the Army's first installment on the procurement of the systems. Also, he plans to spend \$1.2 million on vans and other mobile systems to house the personnel and equipment needed for the GPS at White Sands Missile Range.			
Outyear Funding Profiles	By comparing the funding of the project as of April 1989 to the revised outyear funding profile as of August 1990, we found that the Army GPs is scheduled to receive significant increases in funding over the life of the project (see table II.3). Additional CTEIP funding was provided to the project from another CTEIP project, the Air Defense Capability, because of a change in scope from the original GPs project and a need to provide GPS "starter kits" for all Army ranges. Starting in fiscal year 1992, money will be spent to begin the procurement of GPS equipment at the other ranges.

	1991	6.9	5.1	
	1992	9.0	9.5	
	1993	8.2	12.0	
	1994	4.0	15.0	
	1995	0	20.3	
	Total	\$28.9	\$62.3	
	Army's Kwajalein Atoll range GBR-X hardware during acquisitio radar to provide new capabilities, such as an imaging X-band m tion, needed to satisfy user requirements that are not now being the range. The X-band modification will allow the tracking of m targets simultaneously. The GBR-X is expected to become operation range asset in fiscal years 1994 or 1995.			
Justification for the Project	The GBR-X upgrade project was initiated by the Army and, according to the Army CTEIP program manager, would benefit all the services. For a \$46 million investment in the design of the GBR-X, the Kwajalein range would be acquiring a range asset to replace two to three existing radar The SDIO would bear the cost of GBR-X acquisition—about \$500 million. Without the upgrade, the GBR-X would be of little or no use to the range after the SDIO finished its tests.		all the services. For a the Kwajalein range o three existing radars. —about \$500 million.

Multiple Object Tracking Radar Procurement

MOTR is a general-purpose tracking radar, intended to (1) track up to 10 objects simultaneously at a range of up to 400 kilometers, (2) produce a higher volume of more accurate data than the single-object tracking radars currently in use, and (3) reduce staff needs.

The CTEIP project will fund the procurement of four MOTRS. They will be placed at White Sands Missile Range, Yuma Proving Ground, and the Navy Pacific Missile Test Center. The project will pay for varying amounts of installation costs at each of the Army locations. Finally, the project provides an option to purchase an additional 14 MOTRS. However,

	Appendix II Army Projects
	as of August 31, 1990, none of the services had made any commitments to purchase any of the additional 14.
Justification for the Project	The MOTR project, initiated by OSD, will provide the capability to test increasingly complex multiple-player weapon systems, which cannot be supported by most existing radars that track only one object. According to an Army official, the multiple-tracking capability was needed 15 years ago, and any system that required a multiple-tracking ability, such as the first generation of smart munitions, was not adequately tested. The MOTR can be used in 90 percent of the range missions. Two single-tracking radars will be replaced by each MOTR.
	Procurement of the MOTRS will benefit the following systems: Patriot, Aries, Multiple-Launch Rocket System, Aerobee, Advance Medium Air- to-Air-Missile, MQM-107, Advanced Air-to-Air Missile, Aegis, Harpoon, Advanced Tactical Fighter, and Close-in Weapon Systems.
Interrelationship Among CTEIP Projects	According to an Army official, the MOTR Procurement does not duplicate any CTEIP efforts. The Navy has a CTEIP project to integrate its two MOTRS into the Pacific Missile Test Center. This project will fund the infrastruc- ture, including a concrete pad for the Army MOTRS. Because the radar can be rotated to point in different directions, these MOTRS will also be used by the Air Force at Vandenberg Air Force Base.
	In the past, the Army and Air Force provided funds to purchase four MOTRS. The Army purchased two MOTRS for White Sands Missile Range, and the Air Force purchased one MOTR for the Eastern Space and Missile Center at Patrick Air Force Base and another for the Western Space and Missile Center at Vandenberg Air Force Base. The CTEIP project will pro- vide \$230,000 for test and maintenance equipment for the second MOTR to be delivered at White Sands.
Execution of the Project for Fiscal Years 1990 and 1991	The Army had difficulty executing the project in 1990. Because of ques- tions regarding incremental funding of the MOTRs, the acquisition plan for the procurement was not approved until May 1990. As a result, the MOTR Procurement was pushed back 1 year. A solicitation has now been issued for the procurement, and the contract is expected to be awarded in May 1991.

	Appendix II Army Projects		
	change, however, if and two in 1993 ba	for the purchase of one MOTR ea f it proves to be less expensive sed on order quantity savings proposal. The MOTRS would the more years.	e to order two in 1991 information generated
Outyear Funding Profiles	outyear funding pr found that MOTR is s the project because fiscal year 1993, m	funding of the project as of Ap ofile as of August 1990, as sho scheduled to receive additiona of inflation and the purchase oney has been included for a c otrs, although this contract m lable.	own in table II.6, we I funds over the life of of spare parts. 	Total	\$81.3	\$103.1
	(GAO/NSIAD-91-111). Although not show	n in the table II.6, the more Pre	ocurement will begin in
	Pacific Missile Test	d end in 1998. The first MOTR w Center in fiscal year 1991, wi FOTR will be ordered for Yuma 1	th delivery expected in

fiscal year 1992 for delivery in 1995. The third MOTR will be ordered for White Sands Missile Range in fiscal year 1993 for delivery in 1996. Finally, the fourth MOTR will be ordered for Pacific Missile Test Center in fiscal year 1994, with delivery expected in 1997.¹

If CTEIP funding is removed from this project, the Army will not support the acquisition of the MOTRS.

¹For each of the two MOTRs placed at Pacific Missile Test Center, the CTEIP project will provide \$230,000 for test and maintenance equipment. In addition, the project will provide \$380,000 and \$630,000 for the installation of the MOTRs at White Sands and Yuma, respectively.

	Appendix II Army Projects
Target Control-White Sands Missile Range	The Target Control project is aimed at modernizing and upgrading the Drone Formation Control System at White Sands Missile Range. This system is used for automatic tracking and control of multiple drones and ground targets.
	The Target Control project will develop a tri-service system for control- ling drone aircraft and a mobile capability to move to remote locations for performing more realistic tests. It is also intended to provide addi- tional capabilities to control multiple advanced threat targets, helicopter targets, and all other service aerial targets to be tested at White Sands Missile Range.
Justification for the Project	This project was initiated by OSD and is managed by the Army. However, according to an Army official, the project is not considered as important as other Army CTEIP projects. It also has little support from the Air Force and none from the Navy. In addition, OSD is planning to replace the current target control system beginning in fiscal year 1995.
	The current facility cannot control more than 6 aerial or 12 ground targets simultaneously. Realistic testing requires that the system control more. In addition, a mobile control system is needed for use in remote areas where on-site control systems are not available. Also, the tech- nology of the current system is out of date, and parts are not available. The systems that would benefit from this project are Patriot, Advanced Medium Range Air-to-Air Missile, Forward Area Air Defense System, Multiple-Launch Rocket System, and Hawk.
Interrelationships Among CTEIP Projects	This project does not duplicate any other CTEIP projects. It performs some of the functions needed for the Air Defense Capability project and, according to the Army CTEIP program manager, can be used in place of that part of the Air Defense Capability. It also supports the Smart Muni- tions Test Suite, which will attempt to track and control smart munitions.
v	According to an Army official, the services are performing tests with the old equipment, and each range is working on some target control improvements. This official estimated that the Army is spending between \$0.5 million and \$4 million per year on target control. The Air Force and Navy are spending similar amounts.

	Appendix II Army Projects	
Execution of the Project for Fiscal Years 1990 and 1991	The Army had trouble starting the project in fis the Army could not reach agreement with the of nical approach for the project. The Navy still is shifted \$3.1 million from this project to other CT GBR-X and Aerial Cable Facility projects, because tion. 	Appendix II Army Projects
Air Defense Capability	The Air Defense Capability project will be a joint Army and Air Force effort to develop, acquire, and integrate the test and evaluation equip- ment needed to simulate realistic combat environments for the testing of air defense and air-to-air weapon systems. Test and evaluation equip- ment is needed to generate a realistic combat environment in the Euro- pean theater to subject the equipment and personnel operating the equipment to the stress levels expected during an actual battle.
	The Air Defense Capability will be mobile so that the equipment can be taken to various geographic areas. The project will provide funding for hardware and software that are not tied to a particular weapon system and therefore will allow for testing at multiple sites. The equipment is to be capable of testing joint mobility operations and provide real-time data analysis and casualty assessments, threat simulation interaction, and other capabilities.
Justification for the Project	According to an Army official, this project was initiated by the Army and would benefit the Army and the Air Force. Both services have requirements to simulate a realistic combat environment. However, this project is not considered as important as other Army CTEIP projects. Also, according to Army project documents, there is a lack of tri-service commitment for this project.
	The systems that will benefit from this project are the following: For- ward Area Air Defense System; Joint Surveillance/Target Attack Radar System; Phoenix; Advanced Tactical Fighter; High-Speed Anti-Radiation Missile; and other air defense, air-to-air, and air-to-ground missiles.
Interrelationships Among CTEIP Projects	According to an Army official, other projects being funded by CTEIP or the Army complement certain aspects of the Air Defense Capability pro- ject. The Army is receiving CTEIP funds for the Target Control, MOTR, and GPS projects, which can be used for air defense testing. The Air Defense Capability project also interfaces with the Air Force's GPS project and the Navy's Combat Environment Realism System and Common Airborne Instrumentation System.
v	The Army is funding other complementary projects that can be used to test an air defense capability. Included in that funding are the Mobile Automated Instrumentation System, which produces real-time casualty assessments, for \$70 million; threat simulators for \$30 million; and targets for \$10 million.

GAO/NSIAD-91-111S Test and Evaluation Program

An Army official told us that during fiscal year 1990 the Air Defense Capability project office was not ready to obligate money when the funding became available. Therefore, some money was shifted from the project to the GPS project, which has a higher priority and a need for additional funding to provide GPS equipment at all Army ranges. Funding for the GBR-X project was also increased.

	object) trackin radars cannot low altitudes) realism. In ado radars' perma tracking. Flexi	in outer sea range operations to four precision (single- g radars at San Nicolas Island. Current PMTC tracking incorporate sea clutter (small, erratic moving objects at rejections; however, new MOTRs are to be capable of such lition, according to a Navy official, due to the current nent positions at PMTC, there are two blind spots in bility in positioning of the new, transportable MOTRs te this problem.
	rent precision	that require concurrent support from more than the cur- tracking radars include the following: Aegis, Phoenix, dard Missile variants, Close-In Weapon System, and to-Air Missile.
Interrelationships Among CTEIP Projects	vide for the in ject, the Army	es not duplicate other CTEIP projects because it will pro- stallation, not the acquisition, of MOTRS. Another CTEIP pro- s MOTR Procurement project, deals with acquisition. Navy official, the project receives no Navy funding.
v	tracking of up to 10	procurement project is purchasing two MOTRs (radars capable of simultaneous objects) for PMTC. According to a Navy official, the Navy plans to move its we installation sites to allow for a variety of test configurations.
	Page 45	GAO/NSIAD-91-111S Test and Evaluation Program

Appendix III Navy Projects CTEIP will provide funding for the installation of Army MOTRS through the MOTR Procurement project, and, according to the Navy, the Air Force has funded support sites for MOTRS at Vandenberg Air Force Base. This project received no funding in fiscal year 1990. According to a **Execution of the Project** Navy official, because of a slip in the MOTR Procurement project for Fiscal Years 1990 and schedule, the Navy does not expect to receive its MOTRS as originally 1991 planned. Therefore, site survey will not begin until fiscal year 1991. The MOTR Installation program office informed us that the Navy has requested \$200,000 for fiscal year 1991, which will be spent on planning, site survey, evaluation of current PMTC ground communication and power facilities for MOTR compatibility, and management. This amount is less than the \$1.3 million scheduled allotment for fiscal year 1991 and, according to the project manager, is due to the delay in the MOTR Procurement project. By comparing the funding of the program as of April 1989 to the OSD-**Outyear Funding Profiles** revised outvear funding profile as of August 1990, we found that the MOTR Installation is scheduled to receive an additional \$2 million over the life of the project (see table III.1). According to a Navy official, the MOTR Installation program office believed that most of the cost for installing the MOTRS was included in the MOTR procurement package; therefore, the Navy's original budget included only site survey, partial installation, provision of a limited number of spare parts, and training. He added that the new, increased budget will include complete installation. Table III.1: Funding Profiles for the **Multiple Object Tracking Radar** Dollars in millions **Installation Project** Fiscal year Funding as of April 1989 Funding as of August 1990 1990 0 0 1991 \$0.6 \$1.3 1.9 1992 1.2 0.9 0.7 1993 1994 0.4 0.4 0 0.7 1995 1996 0 0.1 \$5.1 Total \$3.1

Page 46

GAO/NSIAD-91-111S Test and Evaluation Program

	According to the MOTR Installation program office, the current, unofficial budget total for MOTR Installation is slightly higher and is extended by 1 year (estimated completion in 1997) due to slippage in procurement. The office also stressed a shortfall of \$300,000 for operational training and \$3.5 million for a central, tri-service spare parts depot for major items.
Navy Range Global Positioning System	The GPS is a satellite system designed to provide users with worldwide, three-dimensional position and velocity information along with coordi- nated universal time. Currently, no system can accurately monitor or measure in real-time the hundreds of participants, aircraft, vehicles, missiles, and targets that make up a comprehensive test.
	This Navy Range GPS project will purchase equipment developed under the Air Force's GPS Range Applications Joint Program Office project. This GPS equipment will support testing activities at the following Navy test and evaluation ranges: Pacific Missile Test Center, Point Mugu, Cali- fornia; Naval Air Test Center, Patuxent River, Maryland; Naval Air Weapons Center, China Lake, California; and Atlantic Undersea Test and Evaluation Center, Andros Island, Bahamas. The Pacific Missile Test Center is the lead range.
Justification for the Project	The GPS concept was initiated by OSD to develop and acquire GPS equip- ment that can be used by all the services. It is intended to improve standardization and interoperability of test ranges, expand range cov- erage area, and enhance test range operations. Although this project will provide assets only for Navy ranges, the GPS concept is intended to have a multiservice application.
	Some programs that will benefit from the availability of GPS equipment include the following: Advanced Air-to-Air Missile, S-3A, Tomahawk, F-14, Advanced Tactical Fighter, Advanced Medium-Range Air-to-Air Missile, Short Range Attack Missile II, V-22, High-Speed Anti-Radiation Missile, MK XV, A-6, EA-6B, SH-600B, MK-50, and AN/SQQ-89. The Navy's Operational Test and Evaluation Force lists requirements for time-space-position information; GPS equipment is also required by Navy antisubmarine warfare ranges.

 $\begin{array}{c} \left\{ \mathbf{x}_{1}, \mathbf{y}_{2}, \mathbf{y}_{3}, \mathbf{y}_$

a Thur

Interrelationships Among CTEIP Projects	This project does not duplicate other CTEIP efforts. According to the Air Force GPS project manager, that project is developing GPS equipment that will be purchased through the Navy and Army GPS projects. Two other CTEIP projects, the Deep Water Range and Portable Tracking System, also will use GPS equipment for their in-air tracking subsystems.

	Appendix III Navy Projects
	distinguish this range from other underwater ranges are those of the
	convergence zone and bottom bounce, to accuracies of 50 meters. ²
	The Deep Water Range will have five subsystems: (1) in-water tracking, (2) in-air tracking, (3) communications, (4) automated data processing equipment, and (5) a satellite data link. It therefore provides large open ocean areas for free-play exercises with multiple players.
Justification for the Project	The Deep Water Range was initiated by the Navy and is a single-service project. According to the Navy, current facilities cannot accommodate newer, longer range undersea warfare weapons. The requirements for a deep range offering convergence zone and bottom bounce test capabili- ties are established in the Navy's Long Term Underwater Support Resource Plan.
	The Navy states that this project will support new generation antisub- marine warfare weapons and combat systems that are now being planned. Some additional systems supported include the Vertical Launch ASROC, MK50 Advanced Lightweight Torpedo, MK48 Advanced Capa- bility Torpedo, sonobuoy development, Light Airborne Multi-Purpose System MK1, Arleigh Burke (DDG-51) Guided Missile Destroyer, AN/SQQ-89 Sonar System, SSN-21 Seawolf-class Submarine, and AN/BSY 1 and 2 combat systems.
Interrelationships Among CTEIP Projects	The Deep Water Range does not duplicate other CTEIP projects, but there is resource sharing and interaction among them. The Navy GPS, Portable Tracking System, and Deep Water Range all depend on GPS instrumenta- tion for in-air tracking. While both the Deep Water Range and Portable Tracking System test antisubmarine warfare weaponry, they have dif- ferent capabilities. The Portable Tracking System emphasizes test realism; it will be transported for testing in a variety of ocean environ- ments and depths but will not be capable of precise convergence zone and bottom bounce testing.
· · ·	² "Convergence zone" is the path followed by sound energy transmitted downward in the ocean to a depth where it is refracted toward the surface, so that the signal again reaches the surface at a distance from the source. The signals are then successively reflected and refracted to reappear at the

depth where it is refracted toward the surface, so that the signal again reaches the surface at a distance from the source. The signals are then successively reflected and refracted to reappear at the surface in similar patterns at intervals out to several hundred miles. "Bottom bounce" is the form of sound transmission in which sound waves strike the bottom in deep water at relatively steep angles and are reflected toward the surface.

1995	0	22.1
1996	0	10.2
Total	\$55.0	\$64.2

^aDue to rounding, this figure differs slightly from the amount shown in appendix II of our report on CTEIP (GAO/NSIAD-91-111)

The year-to-year changes in the project budget are driven by the CTEIP management office. According to the project manager, the gradual buildup represents more realistic spending and is more consistent with the push to reduce project risk.

Portable Tracking System	The Portable Tracking System (PTS) will test undersea weaponry in diverse water environments. The system will track weapons deployed in varying water depths, acoustic conditions, and climates. According to the PTS program office, test and tracking hardware and a mobile range operations system will be transported to different ocean test sites.		
	Five subsystems will comprise the PTS: (1) in-water tracking, which will track submarines and torpedoes in deep, shallow, and arctic water conditions; (2) in-air tracking, which will use GPS instrumentation to track surface ships and fixed- and rotary-wing antisubmarine warfare aircraft; (3) portable range operations; (4) communications; and (5) submarine self-track, which will allow submarines to track their own position in relation to other range elements. Some of these subsystems will use existing equipment, whereas others will require new developments.		
Justification for the Project	According to a Navy official, PTS was initiated by the Navy. It is a single- service project that will supplement existing and planned fixed-range capabilities. While fixed ranges can track underwater weaponry, they cannot do so in a wide variety of environments. The need for a system to test antisubmarine warfare weaponry in realistic and varied combat conditions is stated in the Navy's Long Term Underwater Support		

	Appendix III Navy Projects
	Resource Plan. According to a Navy official, the project is also supported by the Navy's Operational Test and Evaluation Force.
	PTS will support Vertical Launch ASROC, MK48 Advanced Capability Torpedo, MK50, stealth weapons, Light Airborne Multi-Purpose System MK1, and Aircraft Carrier Inner-Zone Antisubmarine Warfare Heli- copter upgrades, sonobuoy developments, AN/BSY-1 and AN/BSY-2, SSN-21, DDG-51, and AN/SQQ-89. According to the project manager, the Test and Evaluation Master Plan for AN/SQQ-89 has been re-written to include the PTS requirement.
Interrelationships Among CTEIP Projects	This project does not duplicate other CTEIP projects. According to a Navy official, CTEIP'S PTS, Deep Water Range, and Navy Range GPS projects are interrelated in that they will use the same equipment for in-air tracking. In addition, although both PTS and Deep Water Range will permit in- water testing of antisubmarine warfare systems, they have different capabilities. The in-water subsystem of PTS is much more complex than that of the Deep Water Range, allowing for in-water testing in a variety of ocean environments. Joint review of these two CTEIP Navy ranges is being conducted to facilitate the sharing of resources and knowledge.
	The Navy does not directly fund the PTS project, according to a Navy official. However, \$55 million of Atlantic Undersea Test and Evaluation Center facilities will be used to support PTS. In addition, the Naval Underwater Systems Center contributed to the construction of models for transponders and signal processors that will be used with PTS. This official also said that the study for these models was conducted in 1986 and was valued at \$64,000.
Execution of the Project for Fiscal Years 1990 and 1991	The PTS program office executed the funds allotted for fiscal year 1990. Between outside contracts and in-house efforts, the project received \$970,000 that year, as shown in table III.6.

The
Execution of the Project for Fiscal Years 1990 and 1991	During fiscal year 1990, the CAIS project was scheduled to receive \$2.7 million. However, according to the CTEIP program manager, the funding for the project was reduced because the Navy could not execute it. The reduced funding was spent on office staff, contractor support, travel, and utilities. During fiscal year 1991, the Navy expects to award the primary CAIS development contact. According to the project manager, the majority of the fiscal year 1991 funds will be spent on the primary contract for development of the instrumentation, with the remainder of the funds going for management and administration.

v

	Appendix III Navy Projects
	According to a Navy official, the CAIS project's budget will be spent on the core contract, valued at \$25 million, and low-rate initial production of the common airborne instrumentation packages, valued at \$15 mil- lion. The remaining funds will support management, utilities, and flight testing.
Air Combat Environment Test and Evaluation Facility	The Air Combat Environment Test and Evaluation Facility (ACETEF) is an integrated ground test facility for testing fully integrated aircraft (tactical-sized aircraft) and aircraft systems in an anechoic chamber that offers a secure and controlled environment. ³ The facility, which is supported by several laboratories, allows for simulation of the combat environments and the direct stimulation of the aircraft hardware and flight crew in the anechoic chamber. ⁴
	The CTEIP project upgrades ACETEF by providing funding for four existing laboratories (Electronic Warfare Integrated Systems Test Laboratory, Closed Loop Threat Facility, Advanced Flight Simulator, and Aircrew Systems Evaluation Facility), the development of two new laboratories (Communications, Navigation, and Identification Laboratory and Offen- sive Sensors Laboratory), and the integration of all laboratories into an interoperable test and evaluation complex. The Operations and Control Center provides the cornerstone for total integration of this software- intensive project.
Justification for the Project	According to OSD and Navy officials, this project, which was initiated by the Navy, has multiservice applications. For example, the facility is planned to support a wide variety of users over the next several fiscal years. However, we found that the Navy used the anechoic chamber more than 80 percent of the time during fiscal year 1989. According to a Navy official, other systems are scheduled as backups, but Navy sys- tems are given priority. In addition, we were told that ACETEF serves as a model for future DOD integrated ground test facilities.
	Some programs supported by ACETEF include the F-14, F-18, A-6, EA-6B, E-2C, P-3, S-3, CH-53, SH-60, and AV-8.
. •	³ An anechoic chamber is an enclosure that reduces reflected sound waves to the lowest possible level. ⁴ Simulations deceive both the aircraft and flight crews into believing that they are in actual combat. On the other hand, stimulations by computer-controlled environment generators provide radio fre- quency, electro-optical, and laser stimuli that duplicate, as closely as possible, real signals.

Page 57

Appendix III	
Navy Projects	

Interrelationships Among CTEIP Projects	Although the project does not duplicate other CTEIP efforts, we were told it interrelates most directly with two Air Force upgrading projects, the Air Force Electronic Warfare Evaluation Simulator and the Real-Time Electromagnetic Digitally Controlled Analyzer and Processor. However, at the time of our work, there was no real-time link among them.
	According to Navy officials, ACETEF is currently valued at \$250 million. Navy officials told us that ACETEF would be funded without CTEIP, but at a lower level of funding extended over a longer period of time. The Navy will provide about \$3 million to \$4 million annually for improvement and modernization and \$10 million to \$15 million from user fees to pay for operations and maintenance on a yearly basis. Currently, CTEIP is projected to provide \$180.2 million to upgrade, develop, and integrate the laboratories.
	Although the ACETEF project is currently a one-of-a-kind facility that claims multiservice usage, we found that the Air Force is building a large anechoic chamber for bomber-size aircraft at Edwards Air Force Base and a small anechoic chamber for fighter aircraft and an Electronic Warfare Integrated Systems Test Laboratory at Eglin Air Force Base. These facilities are not yet fully developed or integrated, but, according to Navy officials, plans are underway to build laboratory support at Edwards.
Execution of the Projects for Fiscal Years 1990 and 1991	During fiscal year 1990, ACETEF received \$9.2 million to support the Electronic Warfare Integrated Systems Test Laboratory; the Closed Loop Threat Facility; the Communications, Navigation, and Identification Laboratory; and the Operations and Control Center. The first project was reduced by \$450,000 during fiscal year 1990. Because the Navy pre- pared early for the project by preparing the appropriate documentation, it was able to quickly award contracts. The Navy contracts awarded and in-house costs incurred in fiscal year 1990 are listed in table III.9.

v

Table III.9: Contracts Awarded and in-House Costs incurred for the Air CombatEnvironment Test and Evaluation Facility(Fiscal Year 1990)

Project	Contractor	Date of award	Amount
Electronic Warfare Integrated Systems Test Laboratory	ASDI, Baltimore, Md. American Systems International, Chantilly, Va.	December 1989 January 1990	\$2,337,000 620,000
Closed Loop Threat Facility	Digital Equipment Corporation, Merrimack, N.H.	March 1990	409,000
Communication, Navigation, and Identification	Digital Equipment Corporation, Merrimack, N.H.	May 1990	458,000

Operations and Control Center	Amherst Corporation, Landisville, Pa.	January 1990	175,000
	BDM, Albuquerque, N.M.	May 1990	450,000
In-house ^a	·····		3,990,000
Total			\$9,150,000

^aAdditional procurement, including Los Alamos, Naval Air Test Center, and other efforts.

According to Navy officials, ACETEF's multifaceted structure allows for flexibility in response to changing funding levels. Priority is given to less expensive, short-term subprojects in reduced funding scenarios. Contracts have been developed for fiscal year 1991; proposals have been submitted for a \$15 million contract for the Communication, Navigation, and Identification Laboratory (total value over 5 years) and a \$5 million contract with General Electric, Daytona Beach, Florida, for the Advanced Flight Simulator visual system.

Outyear Funding Profiles

By comparing the funding of the program as of April 1989 to the revised outyear funding profile as of August 1990, the ACETEF project has been reduced in funding by \$16.5 million over the life of the project (see table III.10). We were informed that (1) \$16 million for part of a large, anechoic facility originally proposed for CTEIP was cut because the Air Force built a similar facility at Edwards Air Force Base; (2) the development of two subprojects was extended by 1 year; and (3) the project was stretched out.

Table III.10: Funding Profiles for the Air Combat Environment Test and	Dollars in millions

He added

Page 61

GAO/NSIAD-91-111S Test and Evaluation Program

After further study, the Navy concluded that a new, more realistic budget would be \$47.8 million. This increased funding is to ensure that final equipment is adequately tested. (The original budget did not provide for all the required testing.)

Table III.12: Funding Profiles for the Combat Environmental Realism System

Dollars in millions	Jollars in millions				
Fiscal year	Funding as of April 1989	Funding as of August 1990			
1990	0	\$0.3			
1991	\$9.1	5.1			
1992	12.1	8.6			
1993	14.1	7.5			
1994	5.3	4.0			
1995	0	5.5			
1996	0	6.8			
1997	0	10.0			
Total	\$40.6	\$47.8			

According to a Navy official, the stretch-out of the CERS project budget was mandated by OSD. The estimated \$55 million cost for phase II is not included in the outyear funding profile.

Underwater Weapon Simulator The Underwater Weapon Simulator will test underwater weapons and countermeasures in a secure environment. Ocean, tactical, and acoustic environments are to be modeled to test weapons over a full range of operational conditions. Weapon hardware is planned to be placed in the simulator to test its interaction with various computer-driven stimuli, known as hybrid simulation.

> This project involves three hybrid simulators with varying capabilities. Hardware for all three is identical; variations among them are a reflection of different software. CTEIP will fund software development for all three and hardware purchases for two. Those totally funded will be at the Naval Ocean Systems Center in San Diego, California, which will be dedicated primarily to lightweight torpedoes, and at the Naval Coastal Systems Center in Panama City, Florida, which will be dedicated to mines and acoustic countermeasures. The third facility, currently unfunded, will be at the Naval Underwater Systems Center in Newport, Rhode Island, and will test primarily heavyweight torpedoes and new submarine developments.

Justification for the Project	The simulator project was initiated by the Navy and benefits only the Navy. Two simulators currently are in operation, and each sponsored more than 18,000 test runs in 1989. According to the Navy's Long Term Underwater Support Resource Plan, these simulators are no longer useful and are not capable of responding to increasingly complex simu- lation requirements.		
	Navy weapons tested by the new simulators will include such systems as torpedoes (MK46, MK48 ADCAP, and MK50), surface ship torpedo defense systems, and undersea mines and countermeasures. The Navy's Operational Test and Evaluation Force supports the need for the project and said it will benefit from the simulator's test data.		
Interrelationships Among CTEIP Projects	This project does not duplicate other CTEIP efforts. Although the Navy does have two underwater weapon simulators already in operation, as well as a test tank for performance under pressure, it claims that these facilities are no longer adequate. The Navy does not currently fund the project, although the Navy has proposed funding the third simulator at the Naval Underwater Systems Center.		
Execution of the Project for Fiscal Years 1990 and 1991	All fiscal year 1990 funds have been distributed for this project; money has been placed on either existing or new contracts, as shown in table III.13.

Interrelationships Among CTEIP Projects	This project does not duplicate other CTEIP efforts. According to the project manager, no Navy improvement and modernization funding was made available for the ARM Targets project because transportable, reurable targets are not considered range assets. However, a Radio Frequency Targets Program Office has been in operation at China Lake, California, since 1985. The project manager added that previous target operations were funded by individual ARM programs. Until now, developments have focused on specific systems and ranges, with no concept of general usage or reuse. New, advanced targets are intended to be more generic in nature than previous systems. The ARM Targets project manager expects the funding to the Radio Frequency Target Program Office (approximately \$2.8 million in fiscal years 1990 and 1991) to decrease as the ARM Targets program assets a developed and used. Instead of developing new targets, the program office will be used to modify and maintain the targets for weapon-specific programs.			ing was cable, reus- to Fre- ta Lake, ous target ow, devel- to concept d to be Radio Fre- t fiscal n assets are rogram

	thirds of the funding is expected to fund the development of advanced targets and one-third to upgrade old targets.			
Outyear Funding Profiles	By comparing the funding of the program as of April 1989 to revised outyear funding profile as of August 1990, we found ARM Targets budget has changed only minimally (see table II operating capability was delayed by 6 months as a result of t year 1990 congressional cut. According to a Navy official, th budget increase is attributed to inflation associated with this redistribution.

Appendix IV OSD and Defense Nuclear Agency Projects

Test Technology Development and Demonstration	The Test Technology Development and Demonstration project supports the evaluation of emerging technologies that can be used by the test and evaluation community. The technology being developed by the services through their research and development programs is often directly applicable to improvements in DOD's ability to test and evaluate its weapon systems. OSD believes that these advanced technologies should be evaluated for DOD-wide application.
	According to its program manager, the test technology project supports the services' basic research efforts with 11 subprojects: optical adjunct, chemical agent sensor, standard test targets, trajectory measurements, electromagnetic gun, radio frequency, signature modeling, complex dis- play, electro-optical signature modeling, dim targets, subminiature telemetry, and time-space-position information engine. The program manager said that in the future the new subprojects would focus on the services' development efforts.
Justification for the Project	The program manager told us that this project was initiated by OSD. According to OSD, the sophistication of major weapon systems greatly exceeds the ability of current testing technologies to reliably gather and evaluate test data. No coordinated DOD-wide program exists to adapt new technology from the research and development community to meet test and evaluation needs, and a coordinated tri-service effort is needed to bridge the gap between research and technology and test and evalua- tion support systems. According to this project's program manager, all the basic research efforts proposed by the services for fiscal year 1990 were funded under this project.
	The program manager told us that the programs and technology sup- ported by the project included advanced weapon systems that exceeded the capability of current test and evaluation systems to adequately test functions such as low observables, high-power microwave, and data fusion.
Interrelationships Among CTEIP Projects	The test technology project does not duplicate other CTEIP projects. How- ever, the program manager told us that the project complements others. For example, the trajectory measurements subproject will support the Army's Smart Munitions Test Suite, which will develop a capability to test smart munitions.

	Although the services have performed limited work in the past addressing the objectives of this project, OSD believes that more studies are needed. According to this project's program manager, the services should have been conducting these studies all along. He told us that over the past few years OSD provided about \$1 million to support similar studies that are now conducted under this CTEIP project.

Justification for the Project	This project was initiated by DNA; however, the simulator will fulfill pri- marily Army testing requirements because the Army has the largest set of systems that must meet the survivability criteria for the blast and thermal effects of nuclear weapons. A backlog of approximately 300 systems, more than 200 of which belong to the Army, has not been tested against blast and thermal effects.		
	Navy shipboard e	ll be used to test most Army mobile tactical s quipment, the Peacekeeper Rail Garrison, and face blast and thermal effects.	
Interrelationships Among CTEIP Projects		y officials, a simulator of this size is not avai also no other CTEIP projects that provide the ty offers.	
Execution of the Project for Fiscal Years 1990 to 1992	Funding for the project, \$74.4 million in fiscal years 1990 and 1991, was transferred from the CTEIP budget to the MILCON account because the sim ulator is essentially a construction project. Design and construction are on schedule, with construction scheduled to start in the third quarter of fiscal year 1991 and continuing through fiscal year 1992. CTEIP funding does not begin until fiscal year 1992.		
Outyear Funding Profiles	revised outyear f funding for the pr table IV.3). (As en MILCON.) An addit	funding of the project as of April 1989 with unding profile as of August 1990, we found the roject has decreased by almost \$67.6 million (aplained above, funding for the project was stational \$6.8 million was added to the CTEIP budg of fund upgrades to the simulator beyond what	hat (see hifted to get in

The Radiation Effects Test Facility is intended to provide DOD with the ability to test the effects of powerful doses of radiation on space-based subsystems. Satellites and other space systems will be tested for their ability to survive and function in a nuclear conflict. The facility will augment (and perhaps replace) underground nuclear testing and enhance the theoretical analysis of radiation effects. This project consists of three parts: an X-ray nuclear weapons effects simulator, the housing of the simulator, and the data acquisition moni- toring and control system. Essentially, CTEIP is funding a large, powerful X-ray simulator that is designed for the testing community rather than the research community.
DNA initiated the project to meet multiagency and multiservice test
•••
inherent part of all major and nonmajor systems that must perform crit- ical missions in nuclear conflicts.
Existing, above-ground simulators are believed to be too small to test whole subsystems and have inadequate instrumentation and diagnostics because they were built for research rather than testing. In addition, some lack the security required for classified weapon systems, and the radiation generators are of outdated technology. Further, underground testing is done only once or twice a year and may be stopped entirely if a comprehensive test ban treaty is successfully negotiated. Most space- based weapon systems, such as Strategic Defense Initiative programs and military satellites (especially communications and navigation satel- lites), will use the facility.
The Radiation Effects Test Facility project does not duplicate other CTEIP projects.
DNA will provide \$20.9 million from fiscal years 1990 to 1994 for research and development of inductive energy storage technology, which is to provide a more powerful and maintainable X-ray generator than the conventional water line technology.

for Fiscal Years 1990 and 1991	The project obligated funds under five contracts in fiscal year 1990 totaling \$770,000, as shown in table IV.4. Tasks included architectural and engineering support and other aspects of project initiation. Most o the tasks were added on to existing contracts. Before CTEIP funding wa approved, DNA used its own money to get the tasks started and then wa reimbursed when the CTEIP money became available.		nitectural n. Most of nding was
