This Index has been prepared as part of the programme of the
Technical Information Panel of AGARD

(423)

THE MISSION OF AGARD

The mission of AGARD is to bring together the leading personalities of the NATO nations in the fields of science and technology relating to aerospace for the following purposes:

- Exchanging of scientific and technical information;
- Continuously stimulating advances in the aerospace sciences relevant to strengthening the common defence posture;
- Improving the co-operation among member nations in aerospace research and development;
- Providing scientific and technical advice and assistance to the North Atlantic Military Committee in the field of aerospace research and development;
- Rendering scientific and technical assistance, as requested, to other NATO bodies and to member nations in connection with research and development problems in the aerospace field;
- Providing assistance to member nations for the purpose of increasing their scientific and technical potential;
- Recommending effective ways for the member nations to use their research and development capabilities for the common benefit of the NATO community.

The highest authority within AGARD is the National Delegates Board consisting of officially appointed senior representatives from each member nation. The mission of AGARD is carried out through the Panels which are composed of experts appointed by the National Delegates, the Consultant and Exchange Program and the Aerospace Applications Studies Program. The results of AGARD work are reported to the member nations and the NATO Authorities through the AGARD series of publications of which this is one.

Participation in AGARD activities is by invitation only and is normally limited to citizens of the NATO nations.

The content of this publication has been reproduced
directly from material supplied by AGARD or the authors.

PREFACE

This index, for AGARD publications published during the period 1971-1973, differs from previous AGARD Indexes in that the Abstract Section (Part I) and the indexes (Part II) have been consolidated under a single cover.

By an arrangement with the U.S. National Aeronautics and Space Administration in Washington, the NASA computerized data base and abstracts have been used to prepare this publication.

There are five indexes - Subject, based on NASA Thesaurus nomenclature, Personal Author, Corporate Source, Report Number and Accession Number. Sample entries will be found on the first page of each index.

The 34 NASA categories have been used for abstract location. Abstracts are arranged by series and year in each category - N10.000 Series (STAR), and X70.000 Series, in that order. Abstract lookup from the indexes has been facilitated by use of page numbers. A typical citation with abstract is located immediately after the Table of Contents.

TABLE OF CONTENTS

PART I: ABSTRACTS

Abstracts are grouped under the following subject categories

page

01 Aerodynamics 1
Includes aerodynamics of bodies, combinations, internal flow in ducts and turbomachinery; wings, rotors, and control surfaces. For applications see 02 Aircraft and 32 Space Vehicles. For related information see also 12 Fluid Mechanics; and 33 Thermodynamics and Combustion.

02 Aircraft 25
Includes fixed-wing airplanes, helicopters, gliders, balloons, ornithopters, etc.; and specific types of complete aircraft (e.g., ground effect machines, STOL, and VTOL), flight tests; operating problems (e.g., sonic boom); safety and safety devices; economics; and stability and control. For basic research see 01 Aerodynamics. For related information see also 31 Space Vehicles, and 32 Structural Mechanics.

03 Auxiliary Systems 63
Includes fuel cells, energy conversion cells, and solar cells, auxiliary gas turbines; hydraulic, pneumatic and electrical systems; actuators; and inverters. For related information see also 09 Electronic Equipment; 22 Nuclear Engineering; and 28 Propulsion Systems.

04 Biosciences 67
Includes aerospace medicine, exobiology, radiation effects on biological systems, physiological and psychological factors. For related information see also 05 Biotechnology.

05 Biotechnology 91
Includes life support systems, human engineering, protective clothing and equipment, crew training and evaluation, and piloting. For related information see also 04 Biosciences.

06 Chemistry 111
Includes chemical analysis and identification (e.g., spectroscopy). For applications see 17 Materials, Metallic, 18 Materials, Nonmetallic, and 27 Propellants.

07 Communications 113
Includes communications equipment and techniques, noise, radio and communications blackout, modulation telemetry, tracking radar and optical observation, and wave propagation. For basic research see 23 Physics, General, and 21 Navigation.

page

08 Computers 151
Includes computer operation and programming, and data processing. For applications, see specific categories. For related information see also 19 Mathematics.

09 Electronic Equipment No Abstracts
Includes electronic test equipment and maintainability; component parts, e.g., electron tubes, tunnel diodes, transistors, integrated circuitry, microminiaturization. For basic research see 10 Electronics. For related information see also 07 Communications and 21 Navigation.

10 Electronics 165
Includes circuit theory; and feedback and control theory. For applications see 09 Electronic Equipment. For related information see specific Physics categories.

11 Facilities, Research and Support 171
Includes airports; lunar and planetary bases including associated vehicles; ground support systems, related logistics; simulators; test facilities (e.g., rocket engine test stands, shock tubes, and wind tunnels), test ranges; and tracking stations.

12 Fluid Mechanics 175
Includes boundary-layer flow; compressible flow; gas dynamics; hydrodynamics; and turbulence. For related information see also 01 Aerodynamics; and 33 Thermodynamics and Combustion.

13 Geophysics 187
Includes aeronomy, upper and lower atmosphere studies, oceanography; cartography; and geodesy. For related information see also 20 Meteorology; 29 Space Radiation; and 30 Space Sciences.

14 Instrumentation and Photography 189
Includes design, installation, and testing of instrumentation systems; gyroscopes; measuring instruments and gages; recorders, transducers; aerial photography; and telescopes and cameras.

15 Machine Elements and Processes 197
Includes bearings, seals, pumps, and other mechanical equipment; lubrication, friction, and wear, manufacturing processes and quality control; reliability; drafting; and materials fabrication, handling, and inspection.

16 Masers 199
Includes applications of masers and lasers. For basic research see 26 Physics, Solid-State.

17 Materials, Metallic 201
Includes cermets, corrosion, physical and mechanical properties of materials, metallurgy, and applications as structural materials. For basic research see 06 Chemistry. For related information see also 18 Materials, Nonmetallic, and 32 Structural Mechanics.

page

18 Materials, Nonmetallic 205
Includes corrosion; physical and mechanical properties of materials (e.g., plastics), and elastomers, hydraulic fluids, etc. For basic research see 06 Chemistry. For related information see also 17 Materials, Metallic; 27 Propellants; and 32 Structural Mechanics.

19 Mathematics No Abstracts
Includes calculation methods and theory, and numerical analysis. For applications see specific categories. For related information see also 08 Computers.

20 Meteorology 217
Includes climatology; weather forecasting; and visibility studies. For related information see also 13 Geophysics; and 30 Space Sciences.

21 Navigation 223
Includes guidance; autopilots; star and planet tracking; inertial platforms; and air traffic control. For related information see also: 07 Communications.

22 Nuclear Engineering No Abstracts
Includes nuclear reactors and nuclear heat sources used for propulsion and auxiliary power. For basic research see 24 Physics, Atomic, Molecular, and Nuclear. For related information see also: 03 Auxiliary Systems; and 28 Propulsion Systems.

23 Physics, General 241
Includes acoustics, cryogenics, mechanics, and optics. For astrophysics see 30 Space Sciences. For geophysics and related information see also: 13 Geophysics, 20 Meteorology, and 29 Space Radiation.

24 Physics, Atomic, Molecular, and Nuclear No Abstracts
Includes atomic, molecular and nuclear physics. For applications see: 22 Nuclear Engineering. For related information see also: 29 Space Radiation.

25 Physics, Plasma No Abstracts
Includes magnetohydrodynamics. For applications see: 28 Propulsion Systems.

26 Physics, Solid-State No Abstracts
Includes semiconductor theory, and superconductivity. For applications see: 16 Masers. For related information see also: 10 Electronics.

27 Propellants 251
Includes fuels; igniters; and oxidizers. For basic research see: 06 Chemistry; and 33 Thermodynamics and Combustion. For related information see also 28 Propulsion Systems.

28 Propulsion Systems 257
Includes air breathing, electric, liquid, solid, and magnetohydrodynamic propulsion. For nuclear propulsion see: 22 Nuclear Engineering. For basic research see 23 Physics, General; and 33 Thermodynamics and Combustion. For applications see: 31 Space Vehicles. For related information see also: 27 Propellants.

29 Space Radiation No Abstracts
Includes cosmic radiation; solar flares, solar radiation, and Van Allen radiation belts. For related information see also: 13 Geophysics, and 24 Physics, Atomic, Molecular, and Nuclear.

30 Space Sciences No Abstracts
Includes astronomy and astrophysics, cosmology, lunar and planetary flight and exploration, and theoretical analysis of orbits and trajectories. For related information see also: 11 Facilities, Research and Support; and 31 Space Vehicles.

31 Space Vehicles 277
Includes launch vehicles; manned space capsules, clustered and multistage rockets; satellites, sounding rockets and probes; and operating problems. For basic research see: 30 Space Sciences. For related information see also: 28 Propulsion Systems; and 32 Structural Mechanics.

32 Structural Mechanics 283
Includes structural element design and weight analysis; fatigue, thermal stress, impact phenomena; vibration; flutter; inflatable structures; and structural tests. For related information see also: 17 Materials, Metallic; and 18 Materials, Nonmetallic.

33 Thermodynamics and Combustion 299
Includes ablation, cooling, heating, heat transfer, thermal balance, and other thermal effects, and combustion theory. For related information see also: 12 Fluid Mechanics, and 27 Propellants.

34 General 301
Includes information of a broad nature related to industrial applications and technology, and to basic research; defense aspects; information retrieval, management; law and related legal matters; and legislative hearings and documents.

MANUAL ON AEROELASTICITY: SUBJECT AND AUTHOR INDEX
E. C. Pike, ed. Jan. 1971 28 p refs
(AGARD-R-578-71) Avail: NTIS

The Subject Index and Author Index cover all the chapters in the six loose-leaf volumes of the Manual on Aeroelasticity and were up to date in April 1970. Since that date new chapters of the manual have been published in the AGARD Report series. The Indexes are published in two forms, in the AGARD Report series as AGARD Report 578 and in loose-leaf form for insertion in Volume VI of the Manual. Entries are given by volume, chapter and page number. For example, II/9/56 denotes Volume II, Chapter 9, page 56. The letter S after a chapter number denotes a supplement to that chapter. The letters TG denote the section of tables and graphs in Volume VI. The abbreviation INTRO denotes the introductory survey in Volume I. Author

AERODYNAMIC INTERFERENCE
Jan. 1971 451 p refs Presented at Fluid Dyn. Panel Specialists' Meeting, Silver Spring, Md., 28 - 30 Sep. 1970
(AGARD-CP-71-71) Avail: NTIS HC$6.00/MF$0.95

Aerodynamic interference characteristics of various airframe-propulsion systems for commercial transport and military aircraft are discussed. Wing-fuselage store designs and body-wing and tail configuration effects are emphasized. For individual titles see N71-19354 through N71-19388.

N71-19354# Royal Aircraft Establishment, Farnborough (England). Aerodynamics Dept.
SOME REMARKS ON THE INTERFERENCE BETWEEN A SWEPT WING AND A FUSELAGE
D. Kuechemann *In* AGARD Aerodyn. Interference Jan. 1971 11 p refs (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

Principal physical interference effects which occur when a swept (or unswept) wing is joined to a fuselage are analyzed. The flow is dominated by what happens in the junction between the two bodies, here the interference is largest. The leading terms in the velocity field can be interpreted as being caused in part by the interference with the mirror image in a plane wall of the half wing outside the fuselage. This reflection effect depends mainly on the sweep angle and the dihedral angle. In addition there is a body interference effect at all sweep and dihedral angles. The method of singularities is applied to calculate the inviscid flow field for some simple cases with and without lift. Theoretical and experimental results demonstrate quite clearly the magnitude of the interference effect. Author

WIND TUNNEL INVESTIGATION OF THE VORTEX SYSTEM NEAR AN INCLINED BODY OF REVOLUTION WITH AND WITHOUT WINGS
F.-H. Groschel *In* AGARD Aerodyn. Interference Jan. 1971 15 p refs (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

The flow field on the suction side of a slender body of revolution with and without wings was investigated by means of a directional probe in a 3 m x 3 m low speed wind tunnel. Measurements have been conducted at Mach numbers Ma = 0.12 and Reynolds numbers Re = 500,000, based on free stream velocity and body diameter. The model was tested at angles of attack alpha = 7 deg, 10 deg, 15 deg, 20 deg. From the measured data, the cross flow velocities and the isobars of total pressure loss were computed. Position and strength of the vortices were determined as functions of the axial coordinate. There are significant deviations from the results of measurements at high subsonic or supersonic velocities, as well as from measurements at substantially lower Reynolds numbers. The strength of the body vortices is considerably reduced by the presence of the wings. Author

CONSIDERATIONS OF AERODYNAMIC INTERFERENCE IN SUPERSONIC AIRPLANE DESIGN
Edward J. Kane and Wilbur D. Middleton *In* AGARD Aerodyn. Interference Jan. 1971 16 p refs (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

Methods for optimizing the interferences between aircraft wing and body, wing and engine nacelles, and wing and trimming surfaces in supersonic flow are discussed. Theoretical concepts are reviewed and expanded where necessary to understand the physical relationship that leads to the most favorable arrangement of the configuration components. Specific applications are illustrated by examples employing analyses of both theoretical and experimental data. Author

N71-19357*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

RECENT EXPERIENCE IN USING FINITE ELEMENT METHODS FOR THE SOLUTION OF PROBLEMS IN AERODYNAMIC INTERFERENCE

Ralph L. Carmichael *In* AGARD Aerodyn. Interference Jan. 1971 5 p refs (See N71-19353 09-01)

(NASA-TM-X-66884) Avail: NTIS CSCL 20D

Discrete sets of elementary solutions of the linearized equations of gas dynamics for solving problems of flow about airplane configurations are combined in such a way that the boundary conditions of zero flow through physical surfaces are satisfied at large numbers of control points on the surfaces. Calculations using discrete elements and discrete control points provide solutions consistent with closed-form solutions that satisfy the boundary conditions everywhere. An existing computer program for predicting the flow about simple wing-body combinations is expanded to include bodies other than the main fuselage. Author

N71-19358# National Physical Lab., Teddington (England) Aerodynamics Div.

THEORETICAL AND EXPERIMENTAL INVESTIGATIONS OF WING BODY CONFIGURATIONS AT LOW SUPERSONIC SPEEDS

J. Bridgewater, R. C. Lock, and G. F. Lee *In* AGARD Aerodyn. Interference Jan 1971 11 p refs (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Wing-body combinations with modifications to the shapes of the basic bodies, wing leading edges and wing roots for reduced drag at transonic and low supersonic speeds were studied. Force and pressure measurements are given for a 55 deg swept wing mounted in turn on two asymmetrically waisted bodies. The first body was designed with the aid of the transonic area rule, and the second was a modified version of this design to give improved performance at low supersonic speeds. Additional experimental results are presented for a second wing having a much blunter leading edge shape so as to give a peaky type of pressure distribution in place of the roof-top pressure distribution of the first wing. Finally considered is the blending of varying wing section shapes near the root of swept wings at supersonic speeds in order to achieve a favorable combined wing-body pressure field inboard on the wind, thus offering the possibility of drag reduction without the use of body waisting. Author

N71-19359# Technische Hogeschool, Delft (Netherlands)

LIFT AND DRAG CHARACTERISTICS OF DELTA WING HALF CONE CONFIGURATIONS WITH SUBSONIC LEADING EDGES, USING SLENDER BODY THEORY

W. J. Bannink and J. W. Reyn *In* AGARD Aerodyn. Interference Jan 1971 11 p refs (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Configurations composed of a cone with a half-circular cross section mounted asymmetrically with respect to a delta wing of zero thickness with subsonic leading edges and placed in a supersonic flow, are studied using slender body theory. The lift and drag characteristics are compared to those of configurations having an identical wing and a symmetrically disposed circular cone of equal volume as the half cone. A disposition of a half cone on one side of the delta wing shows a drag reduction at a given lift compared to the symmetrical full cone configuration, provided the body diameter-wing span ratio is larger than 0.45 approximately. However, the high wing disposition is preferable to the low wing, since lower angles of incidence are required to attain a certain lift. Below the ratio of 0.45 the symmetrical system appears to be more favorable. The lift curve slopes of asymmetrical configurations studied are larger than those of symmetrical configurations. Author

N71-19360# Messerschmitt-Boelkow G.m.b.H., Munich (West Germany)

DOWNWASH INVESTIGATIONS ON TAILS OF MISSILES

G. Gregoriou and F. Lauda (DFVLR, Brunswick, West Germany) *In* AGARD Aerodyn. Interference Jan 1971 14 p refs (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

A numerical method was developed to calculate the downwash and hence the forces and moments on missile tails. This method is principally based on the linear lifting surface theory and can be applied in the compressible subsonic range at any angle of attack and bank. The results of the calculation indicate a nonlinear dependence of the average downwash angle on the angle of attack. Generally, theoretical results show good agreement with wind tunnel tests. Author

N71-19361*# National Aeronautics and Space Administration, Langley Research Center, Langley Station, Va.

EXTENSION OF A NUMERICAL SOLUTION FOR THE AERODYNAMIC CHARACTERISTICS OF A WING TO INCLUDE A CANARD OR HORIZONTAL TAIL

Barrett L. Shrout *In* AGARD Aerodyn. Interference Jan 1971 12 p refs (See N71-19353 09-01)

(NASA-TM-X-66886) Avail: NTIS CSCL 20D

A method for predicting the aerodynamic lifting surface characteristics of wing-horizontal tail configurations or canard wing configurations at supersonic speeds is discussed. The numerical solution has been programmed for a digital computer and is part of a complex of computer programs used in the design, optimization, and evaluation of aircraft configurations at supersonic speeds. The present method predicts lift, drag, and moment characteristics over a range of lift coefficients and for various control settings. Theoretical and experimental data are compared for wing-horizontal tail configurations and for canard-wing configurations at various Mach numbers. These comparisons show both the basic data with control deflections and some final trimmed drag polars. Some data are also presented to show the extent to which program limitations affect the accuracy of the analytic methods. Author

N71-19362# Office National d'Etudes et de Recherches Aerospatiales, Paris (France)

CALCULATION OF AERODYNAMIC INTERACTIONS BETWEEN LIFTING ELEMENTS OF AN AIRPLANE IN SUPERSONIC STATIONARY OR NONSTATIONARY FLOW [CALCUL D'INTERACTIONS AERODYNAMIQUES ENTRE LES ELEMENTS PORTANTS D'UN AVION EN ECOULEMENT SUPERSONIQUE STATIONNAIRE OU INSTATIONNAIRE]

Michel Enselme, Jean-Paul Boisseau, and Andre Guillois *In* AGARD Aerodyn. Interference Jan 1971 7 p refs In FRENCH, ENGLISH summary (See N71-19353 09-01)

Avail: NTIS HC $6.00 MF $0.95

After recalling the principle of analog computation of a lifting assembly in supersonic steady or unsteady flow a numerical process is presented that uses an explicit method for computing the solutions of the wave equation. Results obtained either by analog or by numerical computations are presented for wing-body or wing-pod interactions and for a wing of arbitrary planform in unsteady flow. Author

N71-19363# Naval Ship Research and Development Center, Washington, D.C.

THE EFFECT OF ANGLE OF ATTACK ON INDUCED ROLLING MOMENT FOR A LOW ASPECT RATIO MISSILE

Raymond P. Le Beau *In* AGARD Aerodyn. Interference Jan 1971 11 p refs (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Two wind tunnel tests were conducted to examine the characteristics of the induced rolling moment of two small span missile configurations at transonic Mach numbers for angles of attack up to 90 deg. The induced rolling moment at a roll angle of 22.5 deg was found to increase with angle of attack to a peak value then remain near that value to 90 deg. This peak occurred

at angles between 25 deg and 40 deg. It was also observed that negative values of induced rolling moment at a roll angle of 22.5 deg occurred for one configuration when the angle of attack was less than 20 deg. Author

N71-19364# National Aerospace Lab., Amsterdam (Netherlands). Dept. for Theoretical Aerodynamics.

AN APPROXIMATE METHOD FOR THE CALCULATION OF THE PRESSURE DISTRIBUTION ON WING BODY COMBINATIONS AT SUBCRITICAL SPEEDS

Th. E. Labrujere, W. Loeve, and J. W. Slooff *In* AGARD Aerodyn. Interference Jan. 1971 17 p refs (See N71-19353 09-01)

Avail: NTIS HC$6.00/MF$0.95

A method is described which makes it possible to calculate accurate pressure distributions on lifting configurations at Mach numbers up to the critical value. The compressible flow around a configuration is related to an incompressible flow by means of Goethert's rule, which is supplemented semi-empirically. The iterative scheme for solving the large system of linear, simultaneous equations that is involved with the incompressible flow problem is optimized. Assuming a simple wake configuration, the method has been applied to a number of lifting wing-body combinations. Comparisons with measured pressure distributions show that the method can be used when studying wing-body interference problems in subcritical, attached flow. Author

N71-19365# Naval Ordnance Lab., White Oak, Md.

AERODYNAMIC INTERACTION PHENOMENA PRODUCED BY A FIN PROTUBERANCE PARTIALLY IMMERSED IN A TURBULENT BOUNDARY LAYER AT MACH 5

Allen E. Winkelmann *In* AGARD Aerodyn. Interference Jan. 1971 12 p refs (See N71-19353 09-01)

Avail: NTIS HC$6.00/MF$0.95

Various flow visualization results are presented for a cylindrically blunted, unswept, unyawed fin partially immersed in a turbulent boundary layer. The model, consisting of a fin-flat plate combination, was mounted on the test plate nozzle wall of a boundary layer channel. Experiments were completed at a nominal Mach number of 5 and nominal free-stream Reynolds numbers per foot of 2.8 x 1 million and 7.4 x 1 million. Azobenzene tests show regions of high heat transfer to occur on the flat plate immediately upstream and downstream of the fin. Oil smear tests show in detail the surface shear directions and locations of separated flow which occur on the model. Schlieren and shadowgraph photographs indicate the complex shock wave structure which exists in front of the fin. Author

N71-19366*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio

FLIGHT AND WIND TUNNEL INVESTIGATION OF INSTALLATION EFFECTS ON UNDERWING SUPERSONIC CRUISE EXHAUST NOZZLES AT TRANSONIC SPEEDS

Daniel C. Mikkelson and Bernard J. Blaha *In* AGARD Aerodyn. Interference Jan. 1971 10 p refs (See N71-19353 09-01)

(NASA-TM-X-68887) Avail: NTIS CSCL 20D

A combined flight and wind tunnel test program is being conducted utilizing a modified F-106 aircraft, to investigate airframe installation effects on exhaust nozzle systems mounted on underwing engine nacelles. Flight tests in the transonic speed regime determined nozzle performance and boattail drag for variable flap ejector, conical plug, and auxiliary inlet ejector nozzle concepts. Wind tunnel tests were conducted on isolated models of these nozzles and also on a 1/20-scale model of the F-106 aircraft with simulated underwing engine nacelles. Wing and nacelle pressures from these wind tunnel tests are used to qualitatively explain the observed installation effects. The 1/20-scale model was also used to evaluate the effects of changes in nacelle geometry and angle-of-attack. Author

N71-19367# National Aeronautical Establishment, Ottawa (Ontario)

THE HALF CONE PRESSURE FIELD AND ITS SIGNIFICANCE TO SIDE MOUNTED INTAKES

D. J. Peake, D. J. Jones, and W. J. Rainbird *In* AGARD Aerodyn. Interference Jan. 1971 12 p refs (See N71-19353 09-01)

Avail: NTIS HC$6.00/MF$0.95

The supersonic, inviscid flow field about an isolated half cone has been computed and the result applied to a semi cone intake mounted adjacent to an aircraft fuselage. The pattern of the intake external flow was obtained from an aircraft model tested in a Mach number M = 1.8 airstream, incorporating a 25-degree semi-angle half cone. The fuselage boundary layer approaching the intake was turbulent, corresponding to a Reynolds number of 0.8 x 1 million based upon the intake capture dimension. The strong, three dimensional character of the interactions that occur between the intake shock system and the fuselage boundary layer imply that any boundary layer control system must be designed to remove the effects of three dimensional rather than two dimensional separations. Author

N71-19368*# National Aeronautics and Space Administration. Langley Research Center, Langley, Va.

AERODYNAMIC INTERFERENCE BETWEEN EXHAUST SYSTEM AND AIRFRAME

Jack F. Runckel *In* AGARD Aerodyn. Interference Jan. 1971 13 p refs (See N71-19353 09-01)

(NASA-TM-X-68808) Avail: NTIS CSCL 01A

Mutual aircraft afterbody and engine nozzle interferences are studied by a model experimental investigations of jet interference at subsonic, transonic, and supersonic speeds. Emphasis is placed on twin-engine fuselage configurations with nozzles installed near the terminus of the afterbody where the interactions of the nozzle exhausts and the external stream produce a complex flow field environment. Airframe interferences on nozzle performance considered are: installation locations in the afterbody, boattailing ahead of the nozzles, and effects of tails and protuberances. Nozzle shape and jet exhaust interference can alter aircraft performance and stability. The effect on afterbody drag of nozzle exit axial location appears to pose more problems than the lateral spacing of the nozzles. For closely spaced nozzles, the shape of the interfairing between the nozzles has a pronounced effect on afterbody and nozzle performance. Author

N71-19369# General Electric Co., Cincinnati, Ohio

AIRFRAME/PROPULSION SYSTEM INTEGRATION ANALYSIS USING THE PROPULSION SIMULATOR TECHNIQUE

John T. Kutney *In* AGARD Aerodyn. Interference Jan. 1971 21 p refs (See N71-19353 09-01)

Avail: NTIS HC$6.00/MF$0.95

The propulsion simulator technique was conceived to provide the analysis and evaluation of the total system performance in the wind tunnel of the new high bypass turbofan installations. This technique provides simultaneous simulation of the induction system and the exhaust system flows with correct geometric simulation and allows the total aircraft aerodynamics and the propulsion system interactions to be evaluated together without the use of additional or reference models. Examples of these data are presented including comparison of a C5A type scale model and full scale results of the TF39/B52 installation. The use of this technology for advanced programs of airframe engine integration for both the subsonic and supersonic flight spectrums is discussed. Author

N71-19370# Tennessee Univ., Tullahoma. Space Inst.

UNSTEADY AERODYNAMICS OF ROTOR BLADES OF A COMPRESSOR UNDER DISTORTED FLOW CONDITIONS

B. H. Goethert and K. C. Reddy *In* AGARD Aerodyn. Interference Jan. 1971 13 p refs (See N71-19353 09-01)

Avail: NTIS HC$6.00/MF$0.95

A theoretical investigation was undertaken to determine the interference effect between oscillating and distorted inlet flow and compressor stall. It was found that the dynamic effects on the single stage characteristics tend to make the stages less sensitive to pressure oscillations since the flow lacks the necessary time for building up the lift of the individual blades of the stage. On the other hand, the spacer volume in the stages themselves and between the stages produce time lags which tend to increase the stage pressure ratio and thus reduce the stall margin of the individual stages. Depending upon the geometry and the type of oscillations, either the beneficial effects of the dynamic response reduction of individual stages at higher frequencies or the detrimental effects of the spacer volume between the stages will prevail. Author

STUDIES OF AIRCRAFT FLOW FIELDS AT INLET LOCATIONS

Lyndell S. King and Terence W. Schmitt (Arnold Res. Organ., Inc.) *In* AGARD Aerodyn. Interference Jan. 1970 10 p refs (See N71-19353 09-01)

(NASA-TM-X-66885) Avail: NTIS CSCL 20D

A wind-tunnel investigation of the flow fields about fuselage configurations at transonic and supersonic speeds and at angles of attack up to 24 deg is reported. A family of seven fuselages with different cross sectional shapes was tested in conjunction with two nose shapes, two canopies, and two wings of different sweep. Flow field surveys were performed at two likely inlet locations – ahead of and under the wing – to assess the effects of forebody geometry throughout the Mach number and angle-of-attack envelope. The experimental data particularly indicate the strong influence of the canopy, nose droop, and fuselage shape on flow angularities in the forward survey plane. Nose droop and the canopy both tend to reduce sensitivity to positive angles of attack and to reduce the extent of influence of fuselage lower corner geometry. Under the wing, however, the flow field is dominated by the effects of the wing itself. Author

SOME RECENT RESEARCH ON SUPERSONIC INTAKES AT NGTE

M. C. Neale and F. W. Armstrong *In* AGARD Aerodyn. Interference Jan. 1971 18 p refs (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Drag investigations covering both supersonic and subsonic flight conditions are described, and attention is focused on the difficulty of minimizing supersonic pre-entry drag while retaining an adequate stability margin. The effects are shown of shear planes of varying strength generated in the supersonic compression field. Reynolds number effects are also described. A brief survey of prospects for mixed compression intakes offering an optimum combination of drag and high pressure recovery in supersonic flight is included. Author

CONFIGURATION ASPECTS OF PROPULSION INSTALLATION ON SUPERSONIC TRANSPORTS

Albert A. Van Duine, William W. Rhoades, and Walter C. Swan *In* AGARD Aerodyn. Interference Jan. 1971 8 p (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Intake decision closely related to configuration effects are outlined for supersonic transport applications. The general problems of propulsion pod placement and proper integration of pod and wing are discussed. The effects of wing flow field and aircraft maneuvers on intake performance and intake operating envelope are treated. Intake-to-intake and intake-to-wing spacing criteria are established relative to mutual intake interference and wing/body boundary layer effects. Finally, a propulsion comparison is made between a variable sweep configuration employing double engine pods and a fixed wing configuration employing single engine pods. Author

JET SIMULATION AND JET INTERFERENCE EFFECTS ON TAILPLANE

W. Geissler and R. Wulf *In* AGARD Aerodyn. Interference Jan. 1971 12 p refs (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Extensive wind tunnel tests with jet simulation have been carried out in the low speed wind tunnel on different models of the European airbus. Bypass engines able to simulate the correct ratios of jet to freestream velocity have been developed and are described. The results of force and downwash measurements show destabilizing influences of the airplane caused by jet-tailplane interference. Several steps have been undertaken in order to minimize these effects: the displacement of the engines in wing-tip direction seemed to be the best solution of this problem. In addition to force measurements on a complete model the determination of magnitude and direction of the flow velocities established the boundaries of jet influence. Author

THE COMPLEX AERODYNAMIC INTERFERENCE PATTERN DUE TO REAR FUSELAGE MOUNTED POWERPLANTS

P. R. G. Williams and D. J. Stewart *In* AGARD Aerodyn. Interference Jan. 1971 15 p ref (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

The complex interference effects due to rear fuselage mounted power plants on modern high subsonic aircraft are investigated. Results from wind tunnel and full scale flight tests obtained during design and development of BAC VC10 and 1-11 are discussed. Of particular interest are the favorable interference on the wing and comparisons between twin and four-engined configurations. The influences of changes in fuselage length, nacelle setting and rear fuselage shaping to reduce adverse pressure fields are illustrated. Typical pressure distributions and boundary layer traverses measured on the standard and super VC10 in flight are presented and comparisons are made with wind tunnel results. The data presented are evaluated for the probable mechanism of the complex interference forces set up by the presence of the power plants. Author

EXPERIMENTAL RESULTS OF HIGH BYPASS RATIO TURBOFAN AND WING AERODYNAMIC INTERFERENCE

J. E. Aldridge and J. L. Nye (GE) *In* AGARD Aerodyn. Interference Jan. 1971 12 p (See N71-19353 09-01)

Avail: NTIS HC $6.00/MF $0.95

Results of a wind-tunnel investigation into the interference effects of a pylon-wing-mounted, high-bypass-ratio turbofan on the aerodynamic characteristics of a twin engine subsonic airplane are presented. This was accomplished using a high-pressure, air turbine powered propulsion simulator mounted on a 1/7-scale semispan model of the airplane. Results show that significant interference does exist, and that it varies with free stream Mach number, engine power setting, and lift coefficient. Generally, the drag due to nacelle/body interference increases with Mach number, decreases as engine power is increased, and optimizes with lift coefficient. The interference level is either favorable or unfavorable depending on these parameters. The presence of the nacelle has no measurable effect on wing upper surface pressure distribution, however, wing lower surface, nacelle fan, and turbine cowl distributions are significantly altered. DETERMINATION OF LOW SPEED INTERFERENCE EFFECTS BY SUPERPOSITION
John L. Hess and Suzanne M. Faulkner *In* AGARD Aerodyn. Interference Jan. 1971 15 p refs (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

The application of a computer program for potential flow to problems of estimating aerodynamic interference is reported. Examples are presented of straightforward use of the program to calculate flow about more complicated configurations than could previously be handled. Superposition is also used to conserve computing time. The program greatly expands the usefulness of the superposition method. First, the component flows to be superposed may be any of the very general class of solutions that the program can calculate. Second, by comparing flows calculated by superposition with the same flows calculated exactly by the program, the limits of validity of the superposition principle can be determined with a new precision. Examples are presented of calculated flow fields and of comparisons of exact and superposed solutions. Author

A CALCULATIVE METHOD FOR PREDICTING STORE SEPARATION TRAJECTORIES AT SPEEDS UP TO THE CRITICAL SPEED
Jack N. Nielson, Frederick K. Goodwin, and Marnix F. E. Dillenius *In* AGARD Aerodyn. Interference Jan. 1971 14 p refs Sponsored by AFFDL (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

A theory has been developed for predicting the trajectories of external stores dropped from high-speed aircraft up to the critical speed. The method consists of three steps: (1) prediction of the non-uniform flow field in the vicinity of the store, (2) prediction of store forces and moments in the nonuniform flow field, and (3) calculation of the trajectory. A vortex lattice method used for the first step predicts well the flow field velocity components under the wing or fuselage. A simplified slender body method for calculating the normal force and moment on the external store is moderately successful by comparison with experiment. Calculated trajectories based on the simplified method are in fair agreement with experiment. Author

EXAMPLES OF AIRFRAME STORE INTERFERENCE
J. B. Barry *In* AGARD Aerodyn. Interference Jan. 1971 12 p refs (See N71-19353 09-01)
Avail: NTIS HC$6.00 MF$0.95

Effects of airframe-store interference on the side force and the drag increment due to pylon mounted underwing stores are discussed. The main features of the sidewash and pressure distributions in the flow field beneath a swept wing are described. It is noted that, while the loads on a store would be expected to vary significantly with its position under the wing, some of the interference forces may be regarded as buoyancy effects, implying opposing forces on the aircraft. Examples of measured side force on stores and pylons show that a qualitative correlation can be obtained with underwing sidewash data. Comparisons of the axial force on stores and pylons and the drag increment with estimates of the freestream drag of the store assembly, are presented and, at low speed and low to moderate C, these demonstrate the expected cancellation of some of the interference forces. Brief descriptions of methods being developed for the prediction of store and pylon side force and installed drag increment are included. Author

EVALUATION OF THE PREDICTION OF AIRPLANE STORE INTERFERENCE BY LINEAR THEORY
Gordon G. Grose and Dean R. Bristow *In* AGARD Aerodyn. Interference Jan. 1971 12 p refs (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

A ring-body analysis computer program is used to calculate the interference flow field at a store location due to a wing-body combination, and the resulting loads applied to the store. Interference loads predicted by linear theory are compared with test data on typical fighter bomber configurations at subsonic and supersonic speeds. The subsonic case consists of stowed load wind tunnel data on a body representing the SUU-16A gun pod mounted on the outboard wing pylon of the F-4C airplane. The supersonic case consists of loads on a sting supported store model in the vicinity of a swept wing-body combination representing a fighter bomber at Mach 1.6. The results of the comparison show the detailed survey of the interference flow field provided by the method, and indicate that it is a promising method of estimating store interference effects from the airplane geometry. ANALYSIS OF THE EFFECTS OF EXTERNAL STORES FASTENED UNDER AN ARROW WING ON THE LONGITUDINAL STABILITY OF THAT AIRCRAFT [ANALYSE DE L'INFLUENCE DE CHARGES EXTERNES FIXEES SOUS LA VOILURE D'UN APPAREIL A AILE EN FLECHE SUR LA STABILITE LONGITUDINALE DE CET AVION]
R. Taisserie *In* AGARD Aerodyn. Interference Jan. 1971 13 p In FRENCH, ENGLISH summary (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

Wind tunnel test results show that external stores fastened under a swept wing by pylons decrease longitudinal stability of the aircraft. Most of this stability loss comes from the increased deflection of the horizontal tail due to vortice field development at the pylon's trailing edge. This is caused by the force of the local sideslip at the lower part of the wing that produce a lateral lift force on the pylon. The deflection changes the stability of the aircraft as a function of the angle of attack. Author

SEPARATION CRITERIA FOR DENSELY PACKED STORES IN BOMB BAYS
Richard B. Holloway, Donald L. Sutcliffe, and James D. Woodward *In* AGARD Aerodyn. Interference Jan. 1971 10 p (See N71-19353 09-01)
Avail: NTIS HC$6.00/MF$0.95

Separation characteristics of the weapons in the densely packed B-52 bombing system configuration 1224-7 proved to be

dependent on the release sequence, release interval and release airspeed. Several different release sequences were investigated to solve bomb collision problems. A successful sequence was derived which provided satisfactory bomb release characteristics when a minimum clearance of one bomb diameter between adjacent bombs is provided as the bomb clears the guide rails. Flight tests indicated the optimal performance of a three-bay configuration with a minimum release interval of 80 to 50 milliseconds. Author

FLIGHT INVESTIGATION OF A TECHNIQUE FOR THE MEASUREMENT OF THE TOTAL AND INTERFERENCE DRAG OF EXTERNAL STORES
K. P. King. *In* AGARD Aerodyn. Interference Jan. 1971 13 p refs (See N71-19353 09-01)
Avail. NTIS HC $6.00/MF $0.95

Results are given of the flight investigation of a technique for the measurement of the drag of external stores which can be jettisoned. The technique is to drop the stores and evaluate the store drag from the resultant change in aircraft acceleration along the flight path. In an exploratory series of tests, 1000 lb bombs were dropped from a Hunter aircraft and the variation of the drag due to the stores as they separated from the aircraft was determined. The results indicate that, with this particular aircraft/store combination, there is no significant variation of the total installed drag with C sub L over the range tested but the *interference drag* varies linearly with C sub L squared. A METHOD FOR PREDICTING INTERFERENCE FORCES AND MOMENTS ON AIRCRAFT STORES AT SUBSONIC SPEEDS
F. D. Fernandes. *In* AGARD Aerodyn. Interference Jan. 1971 9 p refs (See N71-19353 09-01)
Avail. NTIS HC $6.00/MF $0.95

A method is developed for theoretically predicting the loading on aircraft stores at separation for subsonic flow. The method consists of predicting the flow field about the aircraft by using singularity distributions to represent the aircraft according to linear theory, the effect of the variable interference flow field is integrated over the store by using the free-air load distribution properties of the stores locally. Buoyancy effects are included. The loading over each store fin is given special consideration with regard to its interaction with the aircraft pylon and with other store surfaces. A FORTRAN computer program performs the calculations. Effects of aircraft wing, fuselage, pylons, and inlets are included. Store moment calculations under an F-4C aircraft are compared with test data. Author

A STUDY OF CAPTIVE FLIGHT DRAG AND SEPARATION CHARACTERISTICS OF LIFTING BODY (HALF BOMB AND HALF POD) STORE CONFIGURATIONS
Roger J. Furey and C. Joseph Martin. *In* AGARD Aerodyn. Interferen. Jan. 1971 11 p refs (See N71-19353 09-01)
Avail. NTIS HC $6.00/MF $0.95

The use of lifting bodies as a basic shape for externally carried stores is considered as a means of overcoming the large incremental drag and poor separation qualities of the more conventionally shaped aircraft stores. Wind-tunnel tests were conducted on a half-bomb and a half-pod to determine their captive flight drag and separation characteristics. Testing was conducted at Mach numbers of 0.74 and 1.88. The half-bombs were found to have as much as a 35 percent drag reduction, in a simulated captive flight condition, over its equivalent whole-bomb counterpart, and separated cleanly without the use of an ejection force under all conditions tested. The half-pod configuration produced as much as a 20 percent drag reduction over that of the equivalent whole-pod. It also separated cleanly although an ejection force was necessary in order to prevent a pitch-up maneuver and possible collision at the higher Mach number. Author

AIRCRAFT/STORE INTERFERENCE
Chris A. Kalivretenos. *In* AGARD Aerodyn. Interference Jan. 1971 16 p refs (See N71-19353 09-01)
Avail. NTIS HC $6.00/MF $0.95

A series of tests relating to the carriage and separation characteristics of a newly developed rocket launcher pod are reported. The objectives of the tests were to identify those flight conditions under which separation of the launcher might result in damage to the aircraft and to obtain data from which the separation behavior could be predicted. Included in this series of tests was a pod installation force test, a flow-field survey test and a pod jettison test. In each investigation, the loaded and empty rocket launcher pods were suspended from the centerline and outboard shoulder stations of the scaled triple ejector rack located on the inboard wing station of an A-4 aircraft model. The pod tends to pitch nose upward at high aircraft angles of attack and nose downward at low aircraft angles of attack. In full-scale tests the nose of the empty pod collides with the wing of the aircraft when launched from the shoulder station at airspeeds below 250 knots and the tail impacts the rack when launched from the centerline at airspeeds above 450 knots. PREDICTION OF STORE LAUNCH CHARACTERISTICS THROUGH STATISTICAL METHODS
Michael A. Sekellick. *In* AGARD Aerodyn. Interference Jan. 1971 11 p refs (See N71-19353 09-01)
Avail. NTIS HC $6.00/MF $0.95

Two statistical methods are presented which have the capability of generating equations to predict the separation characteristics of airborne stores from aircraft. A mathematical relation was found between a configuration, the launch conditions, and the associated *trajectory*. The aircraft/store combination was described by parameters representing the important geometric and physical features which affect separation behavior. Each launch event was catalogued in terms of such parameters and the resulting separation behavior. This data was then statistically analyzed to predict the outcomes of untried launch situations. Avail: NTIS

The simulation of wings by a lattice of lifting lines is summarized for the computation of unsteady aerodynamic forces on combinations including several lifting surfaces, such as wing-horizontal tail or fin-horizontal tail. It can be considered as a compromise between the doublet lattice method which is advantageous for its flexibility, and the so called lifting surface method whose results are more accurate for a given number of collocation points. A numerical program was developed for the application to wings lying in two parallel planes. The particular features of the method of calculation are presented, as well as some numerical results. SUBSONIC UNSTEADY AIRLOADS ON MULTIPLE LIFTING SURFACES

G. Boehm and H. Schmid *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfacing, Part 2, Apr. 1971, 28 p, refs (See N71-29338 17-01)

Avail: NTIS

A survey is presented of the main features of lifting lattice methods and particularly of lifting surface methods. Ways to extend existing methods to arbitrary lifting surface configurations are also discussed. The following is a short description of these fundamentals and a detailed discussion of the numerical methods as established by the authors. Results obtained will be presented and compared with other theories. Author

NEW DEVELOPMENTS AND APPLICATIONS OF THE SUBSONIC DOUBLET-LATTICE METHOD FOR NONPLANAR CONFIGURATIONS

W. P. Rodden, J. P. Giesing, and T. P. Kalman *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces, Part 2, Apr. 1971, 28 p, refs (See N71-29338 17-01)

Avail: NTIS

Procedures for calculating the normalwash induced by a doublet line in nonplanar configurations and for calculating the interference between wings and bodies are given. Applications are

made to a non-coplanar wing-tail combination, a number of empennage configurations, a wing-fuselage and a wing-nacelle combination. Also considered is the calculation of velocity components in the flow field during oscillatory motion and the calculation of the distribution of induced drag in steady flow. Examples of both calculations are also presented. Author

APPLICATION OF AFFDL UNSTEADY LOAD PREDICTION METHOD TO INTERFERING SURFACES

W. J. Mykytow, J. J. Olsen and S. J. Pollock *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces, Part 2 Apr. 1971 24 p refs (See N71-29338 17-01)

Avail: NTIS

The results of engineering applications of subsonic and supersonic lifting surface methods to some of the AGARD configurations and other interesting configurations, are presented. The subsonic kernel function program is applied to several aspects of the wing-tail interaction problem. The subsonic double lattice method is also applied to the problem. Results are also presented for a supersonic Mach box program developed for T-tails and cruciform tails along with comparisons with piston theory. Comparison between the subsonic kernel function and the doublet lattice method is generally quite good. While the double lattice method usually required greater computing times for the same accuracy as the kernal function method, it has some advantages in its favor such as ease of application and extension to more complicated configurations. The supersonic results presented here appear to be of the proper order of magnitude when compared with piston theory, however, more applications and careful checking are indicated. Author

MEASUREMENT OF UNSTEADY AIR LOADS OF INTERACTION BETWEEN LIFTING SURFACES IN TANDEM [MESURES DES FORCES INSTATIONNAIRES D'INTERACTION ENTRE SURFACES PORTANTES EN TANDEM]

A. Destuynder *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces Part 2 Apr. 1971 12 p refs In FRENCH, ENGLISH summary (See N71-29338 17-01)

Avail: NTIS

A series of wind tunnel tests were performed in view of analyzing the influence of several parameters on the aerodynamic interference between two lifting surfaces in tandem. The aim was to determine the magnitude of the coupling terms in order to provide a theoretical explanation of the flutter instabilities occurring on variable sweep airplanes. The tests were limited to two types of motion: pure translation and pure pitching oscillation of one wing. The model consisted of two rectangular or swept wings whose relative position could be adjusted continuously in the horizontal as well as in the vertical direction. Some comparisons between theory and experiment are given. Author

T-TAIL AEROELASTIC ANALYSIS FOR FOKKER F.28

J. Yff and R. J. Zwaan (Natl. Aero and Astronautical Res. Inst.) *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces, Part 2 Apr. 1971 15 p refs (See N71-29338 17-01)

Avail: NTIS

Data from an aeroelastic and flutter analysis are presented. The data include lateral gust loading, aircraft designs, and mission analysis. The results indicate that mass balancing of the rudder and aileron may be deleted, testing time for high speed flutter may be reduced, and the risks of extensive modifications to the design may be reduced. The tests also achieved the certification of the aircraft. E.H.W.

SOME RECENT INVESTIGATIONS ON FLUTTER IN SUBSONIC FLOW, CAUSED BY INTERFERENCE AERODYNAMIC FORCES BETWEEN WING AND TAIL OF A VARIABLE GEOMETRY AIRCRAFT

W. Seidel and O. Sensburg *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces, Part 2 Apr. 1971 10 p refs (See N71-29338 17-01)

Avail: NTIS

A method for routine flutter calculations utilizing interference aerodynamic forces between wing and tail is presented. The elastomechanic system of the aircraft is described by branch modes and the airforces for these branch modes are produced by superimposing air forces for arbitrary polynomials. The air forces are calculated for a distinct vertical offset between wing and tail with the exact kernel functions. A large variety of stiffness parameter variations was performed such as wing stiffness, fuselage stiffness and tailplane connection stiffness in order to get a better understanding of the flutter phenomenon involved and to find a cure for solving the problem. Some of the results are compared with results from wind tunnel model tests to establish the validity of the analytical method used. Author

UNSTEADY AIRFORCES FOR WINGS WITH CONTROL SURFACES. PART 1: LOADING FUNCTIONS
B. L. Hewitt *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces, Part 2 Apr. 1971 26 p refs (See N71-29338 17-01)
Avail: NTIS

An attempt was made, through the use of matched asymptotic expansion techniques, to define methods for finding the inner singular pressure loading functions associated with a wide variety of interaction effects on wings with unbalanced control surfaces. The work is basic in that it facilitates the construction of adequate loading forms which are necessary before attempting to obtain convergent lifting surface theory solutions. It extends the practical scope of Landahl's work and gives, as a result, sound reasons for modifying the loading recipes. Author

UNSTEADY AIRFORCES FOR WINGS WITH CONTROL SURFACES. PART 2: CALCULATION METHODS
B. L. Hewitt *In* AGARD Symp. on Unsteady Aerodynamics for Aeroelastic Analyses of Interfering Surfaces, Part 2 Apr. 1971 24 p refs (See N71-29338 17-01)
Avail: NTIS

Using the local loading solutions, a numerical method is described which accurately evaluates the associated discontinuous downwash distribution, w(2) for steady flow. W(2) is then regularised through the specified boundary conditions to give w(1) which can then be used to gain converged solutions for the residual loading. Full loading solutions are found for rectangular wing with control surface configurations in incompressible flow, and the results compared with other methods. The form of w(1) is calculated on a simple swept wing with control surface configuration, and is found to become irregular near the hinge line corners. Modifications to the originally chosen special loading form are suggested which should lead to convergent loading solutions for swept wings. Author

TECHNICAL EVALUATION REPORT ON AGARD SPECIALISTS' MEETING ON AERODYNAMIC INTERFERENCE
David J. Peake. May 1971 18 p refs Conf. held at Silver Spring, Md., 28 30 Nov. 1970
(AGARD-AR-34-71) Avail: NTIS

A critique of topics discussed at the AGARD meeting on aerodynamic interference is presented. Discussions evaluated include wing-body and wing-body-tail interference, airframe-propulsion interactions, and airframes-stores interference. The major advance is considered to be the treatment of a lifting wing-body combination in which a sheet of trailing vorticity from a wing was coupled with the finite element method. It is recommended that a calibration model of a wing-body combination be chosen for checking various computation schemes, and some high Reynolds number wind tunnel tests be conducted to provide details of the junction pressure distributions and the three-dimensional boundary layers and wakes. F.O.S.

A COMPARISON OF METHODS USED IN LIFTING SURFACE THEORY
D. L. Woodcock (RAE, Farnborough, Engl.) Jun. 1971 149 p refs Supplement to the Manual on Aeroelasticity, Part 6; see N65-24758
(AGARD-R-583-71) Avail: NTIS

A joint research project organized by the AGARD Structures and Materials Panel is reported. The purpose of the project is to establish the relative merits of different methods of calculating the air forces on oscillating wings, and to provide a standard which can be used in the future for comparison or test purposes. A scheme of cases to be considered was set up which covered variations of the parameters: planform geometry, mach number, reduced frequency and mode of oscillation. Contributions came from six countries using nearly thirty different methods and comprising nearly eight hundred calculations. The tabulated results are preceded by descriptions of the various methods used and by a comprehensive system of annotation. Author

Avail: NTIS

The conclusions and recommendations are presented concerning the correct representation in wind tunnel tests of the interaction between engine flow and airplane characteristics, and wall interference at high lift. A review of experimental methods in use for determining engine-airplane interference in transonic tests includes the following topics: (1) inlet airplane interference, (2) engine thrust with airplane drag and nozzle characteristics, (3) exhaust flow and airplane interference, and (4) determination of interference of the engine flow on the aerodynamic

characteristics of the complete configuration. It is concluded that all of the approaches have important unknowns and shortcomings; action is required by research groups to develop new techniques, and improve existing ones. F.O.S.

SCALE EFFECTS IN FLOWS OVER SWEPT WINGS
M. G. Hall *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 22 p refs (See N72-11854 03-01)
Avail: NTIS HC $8.00/MF $0.95

A review is given of the effects of variations in Reynolds number on the possible types of flow over a swept wing and the boundaries between them. Three main flow regimes are discussed in turn: the attached boundary layer which may be laminar or turbulent and where the position of transition is important; the thin wake which extends downstream from the trailing edge of the wing; and the regime of separated flow. Their interactions with the external flow and with each other are included. The flow structures are three dimensional in general. Reynolds number effects are best understood where simple extensions from two dimensions can be made. The most serious gaps in understanding are found where compressibility and strong interactions are important. Author

N72-11856# Royal Aircraft Establishment, Bedford (England)
SOME ASPECTS OF VISCOUS INVISCID INTERACTIONS AT TRANSONIC SPEEDS, AND THEIR DEPENDENCE ON REYNOLDS NUMBER
J. E. Green *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 12 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Current understanding of viscous-inviscid interactions is reviewed, with particular reference given to the characteristics of interactions on transonic swept wings and their dependence upon Reynolds number. Interactions of three different degrees are discussed: the weak interaction between boundary layer and wake development overall and the flow field at large; the strong but localized interaction beneath shockwaves and at trailing edges in fully attached flow; and the strong interactions which involve boundary layer separation and hence have an important effect on the entire flow field. Finally, the possibilities are discussed of manipulating the boundary layer in order to simulate, in the wind tunnel, the viscous-inviscid interactions found at flight Reynolds numbers. Author

A TYPE OF STALL WITH LEADING EDGE TRANSONIC FLOW AND REAR SEPARATION
J. Osborne and H. H. Pearcey *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 11 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Surface pressure measurements are presented for a leading edge, transonic flow which occurs for high angles of incidence and for stream speeds in the medium subsonic range. A shock induced separation develops in the first 5% of the chord, and also present is the rear separation that would be expected in the low speed stall of an aerofoil having a thickness/chord ratio greater than about 10%. Results for transition fixed and free reproduce respectively the classical features for turbulent and laminar-type interactions at the leading edge shock; these leave different disturbances in the reattached turbulent layer which then react differently on the rear separation. A few results are included for an intermediate effect on transition. The Reynolds number for all the tests was in the region of 2 x 1 million based on aerofoil chord. Author

REYNOLDS NUMBER REQUIREMENTS FOR VALID TESTING AT TRANSONIC SPEEDS
William B Igoe and Donald E Beals *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 5 p refs (See N72-11854 03-01)
(NASA-TM-X-67412) Avail NTIS HC $6.00/MF $0.95 CSCL 20D

The variation of wing shock location with Reynolds number has been examined for configurations for which both flight and wind tunnel wing pressure distribution data were available to determine if there is a minimum level of Reynolds numbers, short of full scale, at which reliable flow simulation can be achieved in transonic test facilities. The shock locations as a function of Reynolds numbers at conditions of constant Mach number and angle of attack were normalized so that shock position was obtained in relative terms from zero to unity for each configuration and condition studied. Normalizing the shock location permitted the comparison of data for different configurations and conditions on a common basis. Not enough data have been analyzed thus far to obtain conclusive results. Author

RECENT EXPERIENCE IN THE TRANSONIC TESTING OF TWO DIMENSIONAL SWEPT AND STRAIGHT WINGS WITH HIGH LIFT DEVICES
W. E. Grahame, J. W. Headley, and L. W. Rogers *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 17 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

The results of a series of transonic tests of two dimensional wings with various high lift devices are presented. The tests were performed in an aerodynamic transonic wind tunnel on an unswept wing with a jet flap and a swept wing with boundary control devices. Both wings were tested through a Mach range of M = 0.70 to M = 0.95 and a Reynolds Numbers range of 2.5 to 6.5 million per foot. Additional tests included a supercritical wing with slot blowing and a leading edge flap with a jet flap. Comparisons of wing pressure distributions and flow visualization studies illustrate the effectiveness of the jet flap and also the high lift devices in controlling flow separation. Longitudinal characteristics which show the effects of Reynolds number are also presented. Comparative analyses indicating the improvement obtained with each of the high lift devices is shown. Author

THE TRANSONIC PERFORMANCE OF TWO DIMENSIONAL JET FLAPPED AEROFOILS AT HIGH REYNOLDS NUMBERS
D. J. Peake, H. Yoshihara, D. Zonars, and W. Carter *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 39 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Tests in the NAE transonic wind tunnel were conducted to determine the effect of Reynolds numbers on the transonic performance of a 10% aft cambered profile with jet flaps - in particular the effect on the pressure distribution, drag divergence, and buffet onset. Distributed suction was applied on the sidewalls in the vicinity of the model to insure that the interaction of the shock was primarily with the airfoil boundary layer. The absence of sidewall suction had a significant effect upon the upper surface flow, with the shock being displaced upstream by about 15% of the chord. In the range of the Reynolds number tested, there was a noticeable effect of Reynolds number on drag divergence and a significant effect on buffet onset. Author

N72-11862# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany)
EXPERIMENTAL INVESTIGATION OF THE DRAG OF WINGS WITH A BLUNT TRAILING EDGE AT TRANSONIC SPEEDS
M. Tanner *In* AGARD Facilities and Tech for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug 1971 6 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

The possible improvement of aerodynamic profiles due to blunt trailing edges, drag and lift measurements was studied on two wings of finite span in a transonic wind tunnel. The Mach number had values from 0.5 to 2.2 and the Reynolds number was about R = 1,500,000. From these results it was possible to conclude that in order to achieve a drag reduction at transonic speeds the trailing edge thickness should not be excessive and the boattailing angle should be small. Furthermore, a special broken shape of the trailing edge is favorable for low drag at these Mach numbers. At supersonic speeds the attainable drag reduction at zero lift is greater than predicted by Chapman. The lift curve slope is greater for the wing with a blunt trailing edge than for the wing with a conventional sharp trailing edge. With the most efficient blunt trailing edge the maximum lift to drag ratio at transonic speeds is only a few per cent lower than for the wing with a sharp trailing edge. Author

N72-11863# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany)
FORCE AND PRESSURE MEASUREMENTS ON A SLENDER DELTA WING AT TRANSONIC SPEEDS AND VARYING REYNOLDS NUMBERS
W. Stahl, K. Hartmann, and W. Schneider *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 11 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Transonic wind tunnel investigations were carried out on a slender delta wing with aspect ratio A = 0.52 at Mach numbers 0.5, 0.7, 0.8, 0.9, 0.95, 0.975, 1.0, 1.1, and 1.2 for angles of incidence up to about 30 deg. Normal force and pitching moments were measured, as well as spanwise pressure distributions on the wing's pressure and suction side at five cross sections. The Reynolds number was held constant at a value of Re = 2,700,000 for all Mach numbers. The normal force and pitching moment coefficients showed a noticeable dependence on Reynolds number, the pressure distribution was influenced mainly around the suction peak. Successful attempts were made at low Reynolds number to influence the boundary layer on the wing's suction side by means of a carborundum band. Insight was obtained into the structure of the flow field, near sonic velocities, by using a newly developed smoke visualization technique and with the help of oil flow pictures. Author

BODIES OF REVOLUTION AT TRANSONIC SPEEDS: THE ESTIMATION OF REYNOLDS NUMBER EFFECTS
T. H. Moulden, D. J. Spring, R. O. Saisi, K. Aoyama, and J. M. Wu *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 13 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

The experimental data presented are taken from a series of tests on a body of revolution at transonic speeds. The test Reynolds number was of the order of one million. Both mounting strut and tunnel wall interference effects are discussed. A theoretical procedure is developed to take account of the viscous effects on the body. It is shown that the potential flow theory of Wu and Aoyama gives close agreement with experimental data. However, and particularly to study separation and Reynolds number effects, it is necessary to introduce boundary layer effects in the theoretical work. Taking the displacement surface as an equivalent body for the second approximation it is shown that only a small change in surface pressure distribution on the body is realized. Hence, it follows that in the absence of separation a large change in Reynolds number is of little

significance as far as surface pressures are concerned. The general conclusion is that for a body of revolution, tunnel and mounting interference effects are more significant than Reynolds number effects, provided the flow is not separated. Author

TRANSONIC TESTING OF THE ENGINE NACELLE AIR INTAKE AND AFTERBODY [ENTREE D'AIR ET ARRIERE CORPS DE FUSEAU MOTEUR EN TRANSSONIQUE]
J. Leynaert *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 10 p refs In FRENCH, ENGLISH summary (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

An example is presented of the study of a double-flux engine nacelle at high subsonic Mach numbers, the investigation being made at high Reynolds numbers with two separate models for the air intake and the afterbody. The test on the afterbody shows that the conditions of variable jets do not react significantly on the upstream flow around the nacelle intake and cowl; apart from the immediate vicinity of the exhaust, this fact justifies the large scale study of the air intake with a model supported downstream by a cylindrical tube replacing the jet. In the same way, mass-flow rate variations of the air intake do not react on the flow around the afterbody, in a given margin; this allows the study of the afterbody on an upstream sting. Author

The possibilities for scale effect on swept wings under supercritical flow conditions at high subsonic speeds are discussed on the basis of evidence from pressure plotting tests on a variety of wings. For the Super VC10, comparison of pressure distributions measured in flight and in model tests at R = 5.4 x 1 million shows some scale effect. For other designs however, the scale effect could be much greater; the paper shows that the underfixing technique has limitations when applied to a sweptback wing. Examples are included where the flow patterns are very complex with many interacting features; in such cases, it is often difficult even to forecast whether the scale effect is favourable or unfavourable. Further improvements in swept wing design will increase the likelihood of serious scale effect. Author

CORRELATION OF SOME TRANSONIC WIND TUNNEL TEST DATA TO FLIGHT TEST RESULTS FOR TWO SLENDER WING AIRPLANES
Sven Erik Nyberg *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 10 p (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Some of the flight test data obtained on two slender wing airplanes have been correlated to transonic wind tunnel test data obtained with 1/30 and 1/50 scale models. Static stability and control derivatives as well as damping and period in pitch and dutch roll oscillations as predicted by the wind tunnel tests show good agreement with flight tests. The predicted zero lift drag for one of the airplanes was higher than the flight test drag whereas the agreement in lift induced drag was satisfactory. Predicted component loadings have been found to agree well with flight test results. Air inlet pressure recovery was slightly higher in flight than in the wind tunnel. Flow distortion at engine face shows good correlation even at high angles of attack. It is concluded from these results, that for slender wing configuration, transonic wind tunnel test data are in general reliable, even if obtained at relatively low Reynolds number. Author

A COMPARISON OF SOME AERODYNAMIC DRAG FACTORS AS DETERMINED IN FULL SCALE FLIGHT WITH WIND-TUNNEL AND THEORETICAL RESULTS
Edwin J. Saltzman and Donald R. Bellman *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 22 p refs (See N72-11854 03-01)
(NASA-TM-X-67413) Avail: NTIS HC $6.00/MF $0.95 CSCL 20D

Reliable techniques for defining flight values of overall aircraft drag and turbulent skin friction, and the drag associated with local regions of separated flow are reported. Selected results from these studies are presented for several types of aircraft, including the X-15, the XB-70, lifting bodies, and military interceptors. These flight results are compared with predictions derived from windtunnel models or, for friction, with the Karman-Schoenherr relationship. The flight experiments have defined the turbulent skin friction to Reynolds numbers somewhat above 10 to the 8th power, the overall drag of two airplanes, base pressure coefficients for aircraft and for an aft-facing step immersed in a thick boundary layer. A flight application of a splitter plate for reducing base drag is discussed along with examples of the drag associated with afterbody flow separation for shapes having relatively large afterbody closure angles. FEASIBILITY OF TESTING A LARGE-CHORD, SWEPT-PANEL MODEL TO DETERMINE WING SHOCK LOCATION AT FLIGHT REYNOLDS NUMBER
Jones F. Cahill (Lockheed-Georgia Co.), Stuart L. Treon, and William R. Hofstetter *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 11 p refs (See N72-11854 03-01)
(Contracts F33615-69-C-1256, F33615-67-C-1777)
(NASA-TM-X-67414) Avail: NTIS HC $6.00/MF $0.95 CSCL 20D

As a part of a study of methods for simulating high Reynolds number aerodynamic characteristics of large aircraft, tests have been conducted in an 11 foot transonic wind tunnel to determine the feasibility of using a large chord wing panel model to investigate the variation of shock location with Reynolds number. The model was untwisted and was of constant chord and thickness. The airfoil section was that from one station on the span of a high speed transport airplane for which a substantial amount of flight and wind tunnel pressure distribution data had previously been obtained at widely different Reynolds numbers with indications of a large scale effect on

shock location. The major findings from this study were that the variation of shock location on the panel model was identical in character, but considerably smaller over the Reynolds number range from 8.8 million to 28.0 million than that indicated by existing data on the complete wing. Generally, the panel model data on shock location and trailing-edge pressure recovery tended toward better agreement with flight data than with previous wind tunnel data on smaller complete models. (NASA-TM-X-67415) Avail: NTIS HC $6.00/MF $0.95 CSCL 14B

The problems of obtaining representative transonic aerodynamic data in existing wind tunnels are examined. The problems are approached by reviewing those factors which influence the accuracy of measurement and flow simulation. Examples of flow simulation anomalies are given. Demands for increased accuracy and requirements for conducting transonic investigations under conditions increasingly more susceptible to simulation anomalies are cited. Author

SIMULATION OF FULL SCALE FLIGHT AERODYNAMIC CHARACTERISTICS BY TESTS IN EXISTING TRANSONIC WIND TUNNELS
Jones F. Cahill *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 8 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Although newly evolving concepts will enable the construction of relatively inexpensive wind tunnels capable of producing transonic aerodynamic data at flight Reynolds numbers, a substantial portion of future aircraft development testing will be done at subscale conditions. It is imperative, therefore, that methods be developed for accurate simulation of flight aerodynamic characteristics during tests at low Reynolds numbers. Several concepts for high Reynolds number simulation have been advanced, and some have been demonstrated for isolated cases. Some of these concepts are reviewed in the light of existing data. Author

SIMULATION OF TWO DIMENSIONAL AEROFOIL FLOW AT HIGH SUBSONIC MACH NUMBERS AND HIGH REYNOLDS NUMBERS BY MEANS OF AN EQUIVALENT BODY OF REVOLUTION
W. Lorenz-Meyer *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 9 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

In order to study the effect of high Reynolds numbers on the transonic flow past two-dimensional aerofoils, an equivalent body of revolution was constructed, having a four to five times larger chord size than the corresponding aerofoil, and giving the same rate of tunnel blockage. The contour of the body was calculated by means of a source-sink distribution. Force and pressure measurements have been performed in a transonic tunnel at Mach numbers from 0.5 to 0.925 and Reynolds numbers from Re sub l = 4 million to 16 million. In the subcritical range the results show good agreement with the calculated first-order potential flow. The evaluation of minimum pressure coefficient and shock position show that from Re sub L = 8 million no significant dependence on Reynolds number exists either at subcritical or supercritical speeds. ON THE POSSIBILITY OF DEDUCING HIGH REYNOLDS NUMBER CHARACTERISTICS USING BOUNDARY LAYER SUCTION
Cliff L. Bore *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 10 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

It seems that the most crucial differences of characteristics from wind tunnel models to full scale aircraft stem from the fact that the boundary layers on the model are usually relatively too thick. Consequently it has been suggested that full-scale behaviour may be more accurately simulated if the thickness of the boundary were reduced appropriately by means of suction through porous strips in the surface of the models. A suitable technique would afford convenient means for varying the boundary layer thickness without stopping the wind tunnel, and should be applicable to more model configurations than conventional underfixing of transition. The implications of these propositions are examined in the light of boundary layer calculations and data. Author

SOUND FIELDS GENERATED BY TRANSONIC FLOWS OVER SURFACES HAVING CIRCULAR PERFORATIONS
M. M. Freestone and R. N. Cox *In* AGARD Facilities and Tech. for Aerodyn. Testing at Transonic Speeds and High Reynolds Number Aug. 1971 8 p refs (See N72-11854 03-01)
Avail: NTIS HC $6.00/MF $0.95

Tests made on the sound waves radiated from perforated transonic tunnel liners having perpendicularly drilled holes have shown that a regular pattern of coherent wave fronts occurs. It is suggested that the coupling is caused by a disturbance propagating along the surface of the liner. Results from individual holes indicate that the mechanism for production of sound waves is similar to that observed from two dimensional cavities, and that the Strouhal numbers of the modes occurring can be predicted with reasonable accuracy for both normal and inclined holes using a model proposed by Rossiter. The use of free flight models for transonic testing at high Reynolds numbers is discussed. Several specific examples of experimental investigations are briefly reviewed to illustrate the scope of research that can be conducted by utilizing the advantages of free flight models. These advantages are primarily the lack of interference or constraints imposed by test facilities and model support systems and the dynamic freedom possessed by free flight models. High Reynolds numbers are obtained by using large models flown at relatively low altitudes. It is shown that models 10 meters or more in length will be required for research at Reynolds numbers sufficiently high to provide representative simulation of flow conditions for large modern aircraft. Several methods for launching models of this size are discussed. These methods include free drops from airplanes or balloons and ground launches with the use of internal or external rocket motors. All the launching methods discussed have been successfully demonstrated on flight vehicles of the size and weight required to attain the necessary test conditions. Author

ON THE USE OF FREON-12 FOR INCREASING REYNOLDS NUMBER IN WIND-TUNNEL TESTING OF THREE DIMENSIONAL AIRCRAFT MODELS AT SUBCRITICAL AND SUPERCRITICAL MACH NUMBERS
Stuart L Treon, William R Hofstetter, and Frank T Abbott *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 8 p refs (See N72-11854 03-01)
(NASA-TM-X-67417) Avail NTIS HC $6.00/MF $0.95 CSCL 14B

The aerodynamic suitability of Freon-12 for general wind-tunnel testing was investigated at low and high subsonic speeds. Static aerodynamic characteristics of two transport airplane models were determined from strain gage balance measurements in both air and Freon-12 at several Reynolds numbers. A low-speed high-lift configuration was evaluated at Mach number 0.25, and a high-speed cruise wing-fuselage combination was tested at Mach numbers up to 0.825. The data obtained in air and in Freon-12 agree well, even in stalled flow, until compressibility effects evidently become significant in air and in Freon-12 agree well, even in stalled flow, until compressibility effects evidently become significant in air. (NASA-TM-X-67418) Avail NTIS HC $6.00/MF $0.95 CSCL 14B

The critical need for high Reynolds number experimental capability at transonic speeds has been broadly recognized, because there have been demonstrated significant transonic scale effects on wing-shock position with related effects on drag-rise Mach number, buffet boundary, and pitching-moment characteristics. Of the various ground-based transonic facilities considered for provision of high Reynolds number capability, the conventional wind tunnel operated in a semicontinuous mode and utilizing an energy storage system is considered to have the greatest potential. A hydropumped-storage system is proposed to provide hydraulic energy on an intermittent schedule at the rate of 500,000 horsepower to propel hydraulic turbines directly coupled to the wind-tunnel fans. HIGH REYNOLDS NUMBER TRANSONIC WIND TUNNELS: BLOWDOWN OR LUDWIEG TUBE?
Jack D Whitfield, C J Schueler, and Rogers F Starr *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 17 p refs (See N72-11854 03-01)
(Contract F40600-71-C-0002)
Avail NTIS HC $6.00/MF $0.95

The results are given of a detailed comparison between a conventional blowdown transonic wind tunnel and a Ludwieg tube driven transonic wind tunnel, both designed to cover the same Mach-Reynolds number regime. It is concluded that the Ludwieg tube driven tunnel will provide superior flow at a significantly lower cost. The data production capabilities of a Ludwieg tube driven tunnel, with appropriate design features, were surprisingly high. The production capability of the Ludwieg tube exceeds the conventional blowdown tunnel at very high Reynolds numbers and compares favorably with existing transonic tunnels at intermediate Reynolds numbers. Experimental results from a small Ludwieg tube-driven transonic research tunnel are presented and discussed. The research tunnel is equipped with variable porosity test-section walls and an independently controlled plenum exhaust. Both static and dynamic pressure measurements are presented in preliminary form. Author

SOME FACTORS RELEVANT TO THE SIMULATION OF FULL SCALE FLOWS IN MODEL TESTS AND TO THE SPECIFICATION OF NEW HIGH REYNOLDS NUMBER TRANSONIC TUNNELS
J Y G Evans and C R Taylor *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 13 p refs (See N72-11854 03-01)
Avail NTIS HC $6.00/MF $0.95

Limitations and difficulties of achieving representative flow simulation in model tests are considered. Particular attention is given to obtaining design data for swept-winged aircraft at high lift coefficients, when the flow over the wing is locally transonic and sensitive to scale. Examination of the limitations due to model strength suggests that the maximum tunnel static pressure for tests at high lift conditions is about 5atm and consequently

that full scale Reynolds numbers could only be obtained in very large tunnels. Author

HIGH REYNOLDS NUMBER TESTING BY MEANS OF ROCKET SLEDS
Hans J Rasmussen *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 8 p refs (See N72-11854 03-01)
Avail NTIS HC $6.00/MF $0.95

Most aerodynamic ground testing is conducted in facilities which move air under controlled conditions over ground-fixed test models. This paper invites attention to the opposite approach. Aerodynamic ground testing by moving test specimen through ambient air along a rigorously defined straight line path by means of rocket sleds is reported. Some basic technical facets of rocket sled testing are reviewed and characteristics as well as current capabilities of this technique are discussed with emphasis on aerodynamic and structural design of the test vehicles, on typical test trajectories, and on electronic and photo-optical data acquisition. Similitude considerations governing aerodynamic testing by this technique are discussed and typical examples of past, current, and planned test activities in this area are reviewed. Concluding, merits and limitations of this technique as compared to other ground test approaches and to flight tests are outlined. Author

WIND TUNNEL INVESTIGATION OF BUFFET LOADS ON FOUR AIRPLANE MODELS
R. Vanino and E. Wedemeyer *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 15 p refs (See N72-11854 03-01)
Avail NTIS HC $6.00/MF $0.95

Buffet loads and buffet boundaries have been investigated in a transonic wind tunnel by measurements of bending moments at the wing roots for high subsonic Mach numbers. These tests were carried out for four airplane models having wings of different thicknesses and aspect ratios and also different angles of sweep. Simultaneous observation of oil flow patterns provided the means to study the relation between flow separation and buffeting. The test Reynolds numbers ranged from Re = 1 million to 2 million. Securing turbulent boundary layer at the shock position by means of artificial transition, no effect of Reynolds number of buffet boundaries was observed. For the models tested it was found that low sweep and low aspect ratio yield favorable buffet boundaries. Author

A SCHEME FOR A QUIET TRANSONIC FLOW SUITABLE FOR MODEL TESTING AT HIGH REYNOLDS NUMBER
J. Y. G. Evans *In* AGARD Facilities and Tech for Aerodyn Testing at Transonic Speeds and High Reynolds Number Aug 1971 5 p refs (See N72-11854 03-01)
Avail NTIS HC $6.00/MF $0.95

A wind tunnel suitable for future research and development towards better transonic aircraft should be able to achieve a Reynolds number, based on the mean chord of a typical swept-winged aircraft, of at least 40 million. Practical limits to model strength and stiffness dictate stagnation pressures below 7 atmospheres and consequently the test section must be at least 5 m in width. For this duty, a new type of facility is proposed, which combines the good driving efficiency of the continuous tunnel with the stored-energy advantage of intermittent running. Of particular importance, the tunnel would be relatively quiet to operate and should provide an extremely clean and steady flow. Author

SOME RECENT DEVELOPMENTS IN PLANAR INVISCID TRANSONIC AIRFOIL THEORY
H. Yoshihara (Gen. Dyn./Convair, San Diego, Calif.) Feb. 1972 38 p refs
(AGARD-AG-166; AGARD; graph-156) Avail: NTIS

Some recent efforts to calculate planar inviscid supercritical flow over airfoils are reviewed giving typical results achieved. The hodograph procedures of Nieuwland and Boerstoel, and Garabedian and Korn are first reviewed which yield shockless profiles. The unsteady finite difference procedure of Mannus and Yoshihara is then described and its use then illustrated by several lifting examples with shocks. This is then followed by a description of two steady procedures. The first is that of Murman and Cole, who used a line relaxation procudure to solve a boundary value problem composed of the transonic perturbation equations with planar boundary conditons. The second is the procedure of Steger and Lomax who used the exact equations, and quasi-planar boundary conditions, and the finite difference relaxation procedure of Murman and Cole. The review is concluded by making a brief assessment of the various methods. Author

AEROELASTICITY OF ROTARY WING AIRCRAFT
Rolland Dat *In* AGARD Helicopter Aerodyn. and Dyn. Mar. 1973 33 p refs (For availability see N73-22948 14-01)

The effects of aeroelasticity on the performance of rotary wing aircraft are discussed. Flutter instability is illustrated by the case of an airfoil and the theoretical tools used to investigate the flutter of a flexible wing are presented. Procedures for predicting the aerodynamic forces on the blades of rotary wings are developed. A formulation of the problem of forced vibration in forward flight is given. Mathematical models are included to support the theoretical considerations. Author

AERODYNAMIC AND DYNAMIC ROTARY WING MODEL TESTING IN WIND TUNNELS AND OTHER FACILITIES

Franklin D. Harris *In* AGARD Helicopter Aerodyn. and Dyn. Mar. 1973 62 p refs (For availability see N73-22948 14-01)

Procedures for testing models of rotary wing aircraft in wind tunnels are discussed. The test objectives involved in rotary wing tunnel tests are described. The characteristics of various testing facilities are analyzed and compared. Methods for obtaining and reducing wind tunnel data are presented. Cost considerations for models and test facilities are analyzed to provide basis for decision on construction and modification. Examples of typical wind tunnel tests conducted with rotary wing models are included. Author

PARAMETRIC TRENDS AND OPTIMIZATION; PRELIMINARY SELECTION OF CONFIGURATION, PROTOTYPE DESIGN AND MANUFACTURE

H. Huber *In* AGARD Helicopter Aerodyn. and Dyn. Mar. 1973 55 p refs (For availability see N73-22948 14-01)

The contribution of aerodynamic and dynamic inputs to the design synthesis of rotary wings is discussed. Aerodynamic rotor design is concentrated on disc loading, tip speed, and solidity selection. Rotor airfoil design is examined under the aspects of compressibility and stall problems. Fundamental flapping and inplane frequencies are shown to be the two basic parameters in dynamic rotor design. Methods of developing various trend curves and their interpretation is supplemented by formal and iterative optimization techniques. Author

(NASA-CR-136473, AGARD-AG-172) Avail: NTIS HC $4.25 CSCL 01A

Problems associated with unsteady stall are summarized and past experimental and theoretical studies, relating primarily to dynamic stall of helicopter rotor blades, are reviewed. The problems attendant to analytic treatment of dynamic stall, including identification of relevant flow elements and definition of unsteady separation, are then discussed, and the basis for a theory which accounts for viscous effects and viscous-inviscid interactions analytically is presented. Results of computations are compared with measured loading on an airfoil undergoing sinusoidal pitching motion. The amounts of lift overshoot and their variation with frequency are in good agreement. Analyses of wake-induced stall and stall flutter of a helicopter rotor blade are then presented. The results indicate that the large stall-related torsional oscillations which commonly limit helicopter forward speed are the response to rapid changes in aerodynamic moment which accompany stall and unstall, rather than the consequence of an aeroelastic instability. TECHNICAL EVALUATION REPORT
S F J Butler *In* AGARD Aerodyn Drag Oct 1973 11 p (For availability see N74-14709 06-01)

A primary objective of research on aerodynamic drag is the development and proving of prediction methods in a form suitable for direct use by aircraft development teams and by those who have to assess the relative merits of alternative designs. Aircraft drag estimation methods are needed at various levels of sophistication and reliability. Basic statistical analyses can form the basis of an acceptable forecasting procedure at the feasibility stage, although such an approach is essentially conservative and can lead to the perpetuation of low design standards, as well as being of little use when novel aircraft design concepts are under consideration. Of some significance is the ability to predict reliably the drag of a datum streamlined aircraft with fully-turbulent flow, against which achieved drag levels can be compared in a figure-of-merit approach. During the design development and refinement stage, the research aims include the achievement of drag design objectives and the limitation of drag growth. In this phase, drag predictions in practice must be prepared by a process of synthesis (rather than simple summation), within a format which can readily accommodate the changing sources of data.

A SURVEY OF DRAG PREDICTION TECHNIQUES APPLICABLE TO SUBSONIC AND TRANSONIC AIRCRAFT DESIGN
J H Patterson, D G MacWilkinson, and W T Blackerby *In* AGARD Aerodyn Drag Oct 1973 38 p refs (For availability see N74-14709 06-01)

The following aspects of aircraft drag prediction in the subsonic to transonic range are discussed: (1) preliminary estimation procedures, (2) estimation using wind tunnel test data, and (3) wind tunnel data and flight test data correlation. Inaccuracies in the approach to the use of flat plate skin friction, with appropriate shape factors, to predict profile drag are identified. Attempts to use low Reynolds number wind tunnel drag levels to predict full scale drag are shown to be reasonably successful. The prediction of C-5A aircraft drag characteristics from wind tunnel tests is discussed.

AERODYNAMIC DRAG AND LIFT OF GENERAL BODY SHAPES AT SUBSONIC, TRANSONIC AND SUPERSONIC MACH NUMBERS
Frankie G Moore *In* AGARD Aerodyn Drag Oct 1973 11 p refs (For availability see N74-14709 06-01)

Several theoretical and empirical methods are combined into a single computer program to predict drag, lift, and center of pressure on bodies of revolution at subsonic, transonic, and supersonic Mach numbers and for angles of attack to twenty degrees. The body geometries can be quite general in that pointed, spherically blunt, or truncated noses are allowed as well as discontinuities along the nose. Particular emphasis is placed on methods which yield accuracies of ninety percent or better for most configurations but yet are computationally fast. To handle the blunt nosed configurations, a new procedure has been employed that of combining modified Newtonian theory with perturbation theory. Theoretical and experimental results are presented for several projectiles and the comparisons meet the general accuracy requirements above. The combined perturbation - Newtonian theory gave pressures which compared better with experiment than any existing approximate technique in the lower supersonic speed regime.

ON SOME BASIC AND NEW ASPECTS ABOUT THE DRAG PROBLEM OF WINGS AND BODIES IN SUPERSONIC FLOWS
Arabindo Das *In* AGARD Aerodyn Drag Oct. 1973 26 p refs (For availability see N74-14709 06-01)

With the objective to determine optimum shapes of slender wings and bodies for minimum total drag in supersonic flows a comprehensive theoretical and experimental analysis of the problem has been carried out. The theoretical formulas for the various drag components which are necessary for a variational problem of drag minimization have been reviewed, summarized, partly modified or extended, and finally compared with experimental values. Based on the linearized mass flux concept already known in the literature a modified boundary condition leads to a certain improvement in the results of the linear theory. A simplified treatment of the modified linear theory is presented. A unified approach to the problem of minimization of wave drag due to volume and wave drag due to lift yields very simple analytical results. The optimum body shapes show a certain dependence on Mach number. For minimization of vortex drag the necessary wing twist yields a remarkable improvement, which could also be verified by experiment. While the known friction drag formulas from the literature have been checked with experimental values, the problem of base drag of axial symmetrical bodies has not been completely solved as yet; theoretical work on this topic is being continued.

MEASUREMENTS OF THE DRAG OF SOME CHARACTERISTIC AIRCRAFT EXCRESCENCES IMMERSED IN TURBULENT BOUNDARY LAYERS
L Gaudet and K G Winter *In* AGARD Aerodyn Drag Oct 1973 12 p refs (For availability see N74-14709 06-01)

Measurements are described of the drag of various forms of excrescence mounted on balances installed in the walls of the working section of the RAE 8ft x 8ft wind tunnel. The tests cover a range of Mach numbers between 0.2 and 2.8 (but not transonic) and a range of Reynolds number. The excrescences tested include two-dimensional steps and ridges, circular cylinders and wings mounted normal to the surface, and holes and fairings. It is shown, for excrescences which are of height small compared with the boundary layer thickness, that the scale effects on drag are well correlated in terms of the wall variables of the turbulent boundary layer, but that there is a dependence of drag on Mach number. For steps and ridges the effect of chamfering or rounding the upper corners was found to be beneficial at subsonic speeds but far less so at supersonic speeds. For circular holes the drag depends strongly upon the depth to diameter ratio. The fairings tested were either half-bodies of revolution with pointed or rounded ends or of square or rectangular section with pointed ends. The effects of different amounts of immersion of the bodies into the boundary layer was found in some cases by testing geometrically similar bodies of different sizes.

REMARKS ON METHODS FOR PREDICTING VISCOUS DRAG
A M O Smith and Tuncer Cebeci *In* AGARD Aerodyn Drag Oct 1973 12 p refs (For availability see N74-14709 06-01)

While predictions of low speed profile drag are accurate for monoelement airfoils at low angle of attack, the methods are not very accurate at higher angles of attack, or for multielement airfoils or for fatter bodies of revolution Two courses that might lead to possible improvement in accuracy have been investigated One was an attempt to perform direct shear and pressure stress calculations on an airfoil or body The other was an attempt to improve the Squire-Young momentum defect method by actually solving the wake for a short distance The first method was not successful but the second method shows promise Hence, it is tentatively concluded that refinement of the momentum defect method is the most promising path towards improved accuracy Author

TRANSONIC DRAG DUE TO LIFT OF PLANAR JET-FLAPPED AIRFOILS
H Yoshihara R Magnus and D Zonars (AFFDL) *In* AGARD Aerodyn Drag Oct 1973 8 p refs (For availability see N74-14709 06-01)

In contrast to the low speed case test results indicate that lift augmentation by the jet flap in the transonic regime is accompanied, not by a large thrust recovery, but by a significant increase in drag However to achieve moderate to high lifts the use of jet flaps rather than incidence has led to a significant reduction in the drag due to lift. To calculate the transonic jet flap flow a modified Spence jet flap condition is postulated and incorporated into the (unsteady) finite difference procedure. An example is then calculated and compared with experimental results Author

COMPARISON OF VARIOUS METHODS FOR CALCULATING PROFILE DRAG FROM PRESSURE MEASUREMENTS IN THE NEAR WAKE AT SUBCRITICAL SPEEDS
J Zwaaneveld *In* AGARD Aerodyn Drag Oct 1973 12 p refs (For availability see N74-14709 06-01)

Methods for calculating the profile drag from total and static pressure measurements in aircraft wake have been compared An analytical model of a compressible two-dimensional wake is used to obtain numerical results Both the oldest method of Betz and the widely used method of Jones allow the static pressure variation across the wake to be taken into account These methods are therefore suitable to treat the flow in the very near wake The third method developed by Squire and Young is in principle only valid when the static pressure variation across the wake is negligible To extend this method to the more general case, two modifications are considered, the first as proposed by Squire and Young, the second as presented by the author The latter modification makes use of the momentum integral equation with modified parameters The numerical results show this new approach to be in far better agreement with the method of Jones than the first mentioned modified version Author

NEW INVESTIGATIONS FOR REDUCING THE BASE DRAG OF WINGS WITH A BLUNT TRAILING EDGE
Mauri Tanner *In* AGARD Aerodyn Drag Oct 1973 9 p refs (For availability see N74-14709 06-01)

Investigations were conducted to determine methods for reducing the base drag of wings with blunt trailing edges Measurements were performed on a rectangular wing in a low speed wind tunnel The wing was fitted with broken trailing edges, splitter plates and splitter wedges The tests showed that the base drag could be substantially reduced by fitting a splitter wedge on the trailing edge For the most advantageous splitter wedge, the base drag was nearly zero In this case the maximum lift to drag ratio for the wing with a blunt trailing edge was as great as that for the corresponding wing with a conventional sharp trailing edge Author

A STUDY OF FLOW SEPARATION IN THE BASE REGION AND ITS EFFECTS DURING POWERED FLIGHT
A L Addy, H H Korst, R A White and B J Walker (Army Missile Command, Redstone Arsenal, Ala.) *In* AGARD Aerodyn Drag Oct 1973 15 p refs (For availability see N74-14709 06-01)

The effect of the separated flow region on the performance of aircraft and missiles during powered flight is discussed. The interaction between the propulsive jet and the free stream flows is emphasized. The Chapman-Korst component flow model allows the qualitative and quantitative discussion of the effects of the afterbody-base problem of all pertinent design and performance parameters. The usefulness of the component approach has been enhanced by semi-empirical modifications, improvements of individual components, and the development of computer programs. It is shown that the onset and location of plume-induced separation of the external flow can be predicted given a suitable boundary layer separation criterion. Author

ASSESSMENT OF THE INFLUENCE OF INLET AND AFTBODY/NOZZLE PERFORMANCE ON TOTAL AIRCRAFT DRAG
Philip P. Antonatos, Lewis E. Surber, James A. Laughrey, and Donald J. Stava. *In* AGARD Aerodyn. Drag, Oct. 1973, 28 p, refs (For availability see N74-14709 06-01)

The influence of propulsion system installation on aircraft drag is discussed. Using information from several investigations, different aspects of airframe propulsion integration are explored, each of which affects the assessment of aircraft drag. A great deal of apparently conflicting data has been generated on airframe-propulsion integration simply because the investigators concerned with different aspects of a system development have not properly integrated their own efforts to assure that theoretical analysis methods are consistent with wind tunnel test methods, that the test models are consistent with each other, and that adequate corrections for the effect of model mounting systems can be made. Even rather small inconsistencies in just a few of these considerations may result in errors of sufficient magnitude to affect aircraft design decisions adversely. A major part of the difficulty of making an accurate assessment of inlet/afterbody nozzle effect on aircraft drag is the prediction of flight performance from wind tunnel test data. Early system development should be studied carefully to assure that the program of airframe-propulsion integration and the demands on propulsion related drag assessment are consistent with drag estimate accuracy for the airframe. THE PROBLEM OF INSTALLING A MODERN HIGH BYPASS ENGINE ON A TWIN JET TRANSPORT AIRCRAFT c02
Walter C. Swan and Armand Sigalla. *In* AGARD Aerodyn. Drag, Oct. 1973, 12 p (For availability see N74-14709 06-01)

An examination of the engine placement on a modern jet transport presents new drag and stability problems. Large high bypass ratio engines create large annular and wetted area drag and blockage surfaces which can cause difficult configuration problems as well as large interference drag and stability effects. The option is open to conventional underwing and afterbody mounted installations as well as renewed opportunity for over-the-wing installations. In this paper the drag and stability consequences for each class of configuration is examined for a typical intermediate range transport. The results are equally valid for short haul and certain STOL missions. In some instances it is shown, proper pod shape and positioning may result in favorable drag increments, especially on modern swept wings with supercritical airfoil sections. Side effects such as pod influences on wing flutter, deep stall, and general sizing of the empennage are discussed. Author

N74-14728 National Aeronautical Establishment, Ottawa (Ontario)
THE DRAG RESULTING FROM THREE-DIMENSIONAL SEPARATIONS CAUSED BY BOUNDARY-LAYER DIVERTERS AND NACELLES IN SUBSONIC AND SUPERSONIC FLOW
David J. Peake and William J. Rainbird (Carleton Univ.). *In* AGARD Aerodyn. Drag, Oct. 1973, 22 p, refs (For availability see N74-14709 06-01)

Three-dimensional viscous flow separations and their effect on configuration drag are examined in high Reynolds number tests conducted in the NAE 5-ft x 5-ft blowdown wind tunnel in both subsonic and supersonic flow. In particular, emphasis is placed on the geometry of the system to divert the oncoming boundary layer about propulsion nacelles. To avoid significant three-dimensional separations, avoid imposing large adverse streamwise pressure gradients upon an oncoming boundary layer, such as those produced near stagnation point regions of bluff diverters, or adjacent to intakes operating below design mass flow. The avoidance of these strong streamwise pressure gradients is seen to be readily achieved by increasing the diverter slenderness ratio and by keeping intakes operating at design conditions by means of auxiliary by-pass arrangements. THE DRAG OF EXTEPNALLY CARRIED STORES: ITS PREDICTION AND ALLEVIATION
P. G. Pugh and P. G. Hutton. *In* AGARD Aerodyn. Drag, Oct. 1973, 11 p, refs (For availability see N74-14709 06-01)

The installed drag of stores makes a major contribution to the total drag of combat aircraft. It can be several times the sum of the free-air drags of the individual stores and its prediction and reduction are essential to the design of high-performance aircraft. Interference effects involved range from simple buoyancy to complex interactions involving viscous and wave drag phenomena. For the simpler cases there are good prospects that the installed drag can be accurately predicted either by current methods or by relatively straightforward extensions of these. However, empirical methods will continue to be needed for the prediction of the drag of complicated cases eg multiple store arrays at transonic speeds. Some examples are given to show the opportunities for reducing the installed drag either by redesigns to take advantage of improved mechanical systems or through the development of radically new installations. DRAG IN HYPERSONIC RAREFIED FLOW
Walter Wuest. *In* AGARD Aerodyn. Drag, Oct. 1973, 12 p, refs (For availability see N74-14709 06-01)

The drag force in hypersonic flow may be divided into cold pressure drag (incident molecules), temperature depending pressure drag (diffusively reflected molecules) and friction drag. The pressure drag dominates on blunt bodies which show a slighter drag variation with rarefaction whereas on slender bodies friction drag dominates and the total drag is strongly influenced by rarefaction. Relaxation and radiation do not appreciably alter the pressure drag but influence the flow field, stand-off distance of shock wave, and heat transfer. Author

DRAG OF LIFTING BODIES FOR PILOTS AT HIGH ALTITUDE [TRAINEE DE CORPS PORTANTS PILOTES A HAUTE ALTITUDE]
J. Allegre, C. Matrand, and M. F. Scibilia. *In* AGARD Aerodyn. Drag, Oct. 1973, 10 p, refs. In FRENCH, ENGLISH summary (For availability see N74-14709 06-01)

Lifting bodies with 60 deg swept delta wings fitted out with control devices, located near the trailing edge of the wings are analyzed. The present experimental study of the aerodynamic

behaviour of the wing is realized in a rarefied flow simulating a flight altitude of about 70 km. Experiments are performed in an open jet and continuously operating wind tunnel. The air flow is characterized by a Mach number of 8.1 and a free stream Reynolds number of 2200 per cm. Results show how much aerodynamic devices associated with the delta wing, like spoilers, remain efficient and can be used in order to control the trajectory at high altitude. Drag coefficient data are given in the range of incidences between minus 20 deg and 20 deg. A comparison between efficiencies of trailing edge solid spoilers and trailing edge fluid spoilers allows to point out some advantages of the fluid spoilers. In particular, this jet control mechanism can create a sufficient side thrust without entailing a large increase of the drag. Author

A REVIEW OF SUPERSONIC SPHERE DRAG FROM THE CONTINUUM TO THE FREE MOLECULAR FLOW REGIME
E. Vallerani *In* AGARD Aerodyn Drag Oct. 1973 15 p refs (For availability see N74-14709 06-01)

The evaluation of the sphere drag coefficient has been the object of extensive theoretical investigations for a long time. A large amount of experimental data has been collected to substantiate those studies and to provide the needed information for the flow regimes for which the theoretical approaches are still missing. The scope of the present review is to attempt the establishment of a more complete panorama of the supersonic sphere drag predictions over the entire range of flow regimes ranging from the continuum flow to the free molecular flow, in order to provide in a consistent form the design engineer of the information required for the aerodynamic design of space vehicles. The theoretical methods developed to cover the various flow regimes such as: (1) continuum low density, (2) free molecular, (3) near free molecular, and (4) intermediate have been reviewed and discussed in the light of the comparison with the pertinent experimental data available. New semiempirical formulas for the correlation of the experimental data are derived for the low density continuum flow and for the near free molecule flow regimes. For the intermediate flow regimes, ranging between the continuum flow and the free molecular flow, the results of a semiempirical method recently developed by the author are presented and discussed. THE INFLUENCE OF WAVE DRAG ON HYPERSONIC ENTROPY WAKE OBSERVATIONS
Wolfgang Merzkirch and Alois Stilp (Ernst-Mach-Inst.) *In* AGARD Aerodyn Drag Oct. 1973 6 p refs (For availability see N74-14709 06-01)

The conditions existing in the wake of a blunt hypersonic body are discussed. The two different flow regimes are defined as: (1) the viscous wake which originates from the separated boundary layer and (2) the inviscid or entropy wake formed by the streamlines which have traversed the curved part of the bow shock. The flow visualization of the entropy wake by schlieren photography is described. The observed schlieren pattern is analyzed with the aid of optical schlieren theory and can be related to the flight Mach number and the drag coefficient of the body. Author

DEVELOPMENT OF TECHNIQUES TO MEASURE IN-FLIGHT DRAG OF A US NAVY FIGHTER AIRPLANE AND CORRELATION OF FLIGHT MEASURED DRAG WITH WIND TUNNEL DATA
E. C. Rooney *In* AGARD Aerodyn Drag Oct. 1973 18 p (For availability see N74-14709 06-01)

Wind tunnel and flight drag measurement techniques and correlation of wind tunnel and flight drag data for a U.S. Navy fighter airplane are discussed. Wind tunnel drag data were obtained with aerodynamic, induction system and powered nozzle/afterbody models. A common reference afterbody configuration between aerodynamic and propulsion models was utilized to assure compatibility of thrust and drag measurements. Flight drag data were obtained from steady-state, quasi steady-state and dynamic (wind-up/down turn) maneuvers utilizing sensitive three-axis accelerometers to determine excess thrust and the internal pressure method for measuring engine thrust. Compressor airflow, afterburner pressure drop and nozzle coefficients used for computing engine net thrust were obtained from isolated engine tests at simulated flight conditions throughout the flight envelope. Wind tunnel data were used to account for propulsion system drag caused by subcritical inlet spillage and nozzle interference drag. Author

REVIEW OF DRAG MEASUREMENTS FROM FLIGHT TESTS OF MANNED AIRCRAFT WITH COMPARISONS TO WIND-TUNNEL PREDICTIONS
Jon S. Pyle and Edwin J. Saltzman *In* AGARD Aerodyn. Drag Oct. 1973 12 p refs (For availability see N74-14709 06-01)

In-flight studies of the overall and local components of drag of many types of aircraft were conducted. The primary goal of these studies was to evaluate wind-tunnel and semiempirical prediction methods. Some evaluations are presented in this paper which may be summarized by the following observations. Wind-tunnel predictions of overall vehicle drag can be accurately extrapolated to flight Reynolds numbers, provided that the base drag is removed and the boattail areas on the vehicle are small. The addition of ablated roughness to lifting body configurations causes larger losses in performance and stability than would be expected from the added friction drag due to the roughness. Successful measurements of skin friction have been made in flight to Mach numbers above 4. A reliable inflatable deceleration device was demonstrated in flight which effectively stabilizes and decelerates a lifting aircraft at supersonic speeds. Author

AN ASSESSMENT OF THE ACCURACY OF TRANSONIC DRAG MEASUREMENT IN A LARGE MODERN WIND TUNNEL
K. Fancett and T. Smith *In* AGARD Aerodyn Drag Oct. 1973 11 p refs (For availability see N74-14709 06-01)

The aeroballistic coefficients of bodies of revolution are needed for the mathematical modelling of their trajectories. The most significant coefficient required is zero yaw drag and the accuracy required is about 0.5% for a perfect trajectory model, compared with about 5% for lift and overturning moment. Lift, drag and overturning moment were measured over a range of yaw angles on two sting lengths in a 2.4 m x 2.7 m transonic wind tunnel. There was a marked difference in the measured drag values for these stings and a further investigation was made with five sting lengths. From these tests an empirical correction for the support system was derived which agreed well with a subsonic theoretical estimate. At speeds above Mach 1.0 the irregularity of the tunnel axial pressure distribution dominated the effects due to the support sytem and a combined correction was derived. It was found that the difference in measured values after correction was very much less than before, over the whole Mach number range, thus supporting the correction procedure applied. A statistical analysis of the residual coefficient errors has been summarized for the subsonic and transonic speed regions. The transonic percentage errors were generally less than the subsonic values, due to the larger coefficient values measured. Author

STING INTERFERENCE EFFECTS ON AFTERBODIES AT TRANSONIC SPEEDS
D. M. Sykes *In* AGARD Aerodyn Drag Oct. 1973 9 p refs (For availability see N74-14709 06-01)

The pressure distribution over the surface of three axisymmetric afterbodies at zero incidence has been measured and sting interference effects determined through the Mach number range from 0.70 to 1.15 in an octagonal, slotted wall wind tunnel. The afterbodies tested were a simple cylinder and conical boat-tails 1/2 calibre long with 7 1/2 deg angle and 1 calibre

long with 9 deg angle, each carrying a representative driving band. Sting diameter effects were determined using 4 calibre long cylindrical stings of diameter 1/8, 1/4, 3/8 and 1/2 calibre, and stingflare interference effects were determined for a 10 deg semi-angle cone on a 1/4 calibre sting. The tests showed that the ratio of sting to base diameter was the main parameter for interference effects, but data for diameter effect from afterbodies with other geometries was not fully correlated using this parameter. Successful correlation with other data has been achieved for the proximity of conial flares of different angles for subsonic flow conditions. Author

Possibilities to develop calculation methods for oscillating wings in transonic flow are discussed. Special attention is given to the question of linearization. Pressure measurements on an aerofoil with flap in transonic flow are analyzed. Correlations are made between steady, quasi-steady and unsteady results. Shock motion and shock strength are investigated. Also linearity is discussed. A calculation method for high subsonic flow is suggested. Author

INTERFERING LIFTING SURFACES IN UNSTEADY SUBSONIC FLOW: COMPARISON BETWEEN THEORY AND EXPERIMENT

Juergen Becker (Messerschmitt-Boelkow-Blohm, Munich) Jan. 1974 20 p refs Presented at 37th AGARD Structures and Mater. Panel Meeting, the Hague, 7-12 Apr. 1973

(AGARD-R-614) Avail NTIS HC $4.00

The results of experimental and analytical research work on the flutter with complete aircraft models showed considerable shifting of critical flutter speeds due to interfering aerodynamic forces, particularly where models of variable geometry were concerned. This was the reason for the development of aerodynamic interference procedures for two or more oscillating surfaces. In order to calculate interfering aerodynamic forces, theoretical procedures were developed which may be divided into lifting surface theories and double lattice methods. Measurements of unsteady pressure distributions on a variable wing-tail configuration, were compared with the results of the lifting surface theory. Author

Avail: NTIS

The way in which the design tradeoff process affects airplane economics is illustrated in relation to the impact of high lift system design on the final configuration selection. An assessment of representative high lift concepts, including boundary layer control, is given in terms of low-speed performance potential. For long-range transport airplanes operating from long runways, it is shown that well-designed mechanical flap systems are generally competitive with more sophisticated concepts involving blowing or suction boundary layer control (BLC). However, recent progress in high lift technology indicates that significant performance gains for long-range airplanes may be possible using BLC techniques. The gains for airplanes designed to operate from shorter fields appear attractive and achievable with today's technology. For STOL airplanes the use of BLC to provide high wing lift together with direct lift from the engines, or a more highly integrated form of lift augmentation such as the jet flap, is mandatory. The interaction between high lift system design and problems involving the stability and control characteristics of the airplane are considered. Author

ANALYSIS OF COMBAT AIRCRAFT APPLICATIONS FOR LIFT AUGMENTATION DEVICES

R. Tasseire. *In* AGARD Assessment of Lift Augmentation Devices Feb. 1971. 21 p. (See N71-20051 09-02)

Avail: NTIS

Problems associated with the design of high lift systems for combat aircraft are reviewed. Performance and flying qualities are considered. Low level high speed flying requires small wing thickness to chord ratio (about 5 to 7%), high sweep angle (35 to 45 degs), small aspect-ratio (3 to 4) and high wing loadings (about 400 to 600 kg per sq. meter). With such a wing, it is difficult to provide good take-off and landing performance for short field operation while maintaining good flying qualities at low speeds. Effective high lift devices are needed to achieve the low stalling speeds required for short takeoff and landing distances and their design must provide a satisfactory level of control in the low speed flight range. The review is intended to clarify the problems encountered in achieving these aims and to indicate ways of solving them. Author

OPTIMISING THE PROPULSIVE LIFT SYSTEM FOR TURBOFAN STOL AIRCRAFT CONSIDERING COST EFFECTIVENESS

H. T. Bowling. *In* AGARD Assessment of Lift Augmentation Devices Feb. 1971. 14 p. (See N71-20051 09-02)

Avail: NTIS

The results are presented of a comparison of three STOL high lift concepts which have been integrated with bypass-ratio turbofan engines. Transport aircraft configurations optimized using these concepts are compared along with significant characteristics of each system. The purpose of this comparison was to provide possible insight for future studies and testing. None of these systems were subjected to a highly detailed analysis and do not represent completely optimized concepts. Every effort was made to make the comparison as consistent as possible. A secondary purpose is the discussion and demonstration of a study methodology which was developed to integrate cost effectiveness into the early technical development of new airplane concepts. This methodology is primarily applied to a military STOL development program. However, some examples are shown of considerations of commercial cost effectiveness. Author

Wind tunnel tests, under as near to two dimensional conditions as possible, were carried out on a wing section with plain leading and trailing edge flaps having boundary layer control by blowing at the flap knees. A range of flap deflections were tested; results are presented for the condition with no leading edge flap deflection and with the trailing edge flap deflection 20 deg. Results suggest that the inviscid lift is achievable with a momentum coefficient which is dependent on the angle of incidence (or the lift), that under these conditions a pressure distribution will be measured which is very similar to the inviscid predictions, and that sensibly zero drag will result. Drag with high lift devices is also discussed. Author

Aspects of two dimensional flow research on high lift systems are discussed. A theoretical method is described for calculating two dimensional potential flow about multi-element high lift airfoils. The method is based on the distribution of vorticity on the airfoil contour. A wall blowing technique is also described which was developed for testing effectively complex high lift models in the wind tunnel. It was used to study the effect of leading edge and trailing edge devices on the aerodynamic characteristics of a 17% and a 10% thick airfoil. Finally, comparisons of calculated and experimental data obtained on some of the complex configurations tested are presented to demonstrate the usefulness of the methods described. Author

Flight operational experience and results from incident and accident analyses are important sources of basic information for improving flight safety and aircraft design. These sources can be effectively explored by in-flight recording of data, which define the flight condition, the navigational environment, and the technical functioning of the aircraft. Present aircraft integrated data systems (AIDS) provide an extensive data acquisition capability and allow for automatic data processing. The main technical features of these systems and the relevant data processing equipment are reviewed from a users' point of view. A survey is given of present and possible future applications of AIDS with emphasis on flight safety and aircraft design data recording. Some specific examples are discussed which illustrate the usefulness of flight recording. Author

PROVING THE OPERATIONAL CAPABILITY OF A HIGH PERFORMANCE FLIGHT CONTROL SYSTEM
E. C. Livingston, Jr. *In* AGARD Lessons with Emphasis on Flight Mech. from Operating Experience, Incidents and Accidents Mar. 1971 12 p (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

Two generalized approaches to the development and proof of a high performance flight control system are examined. The first approach is conventional in that no more than minimal simulation is utilized to confirm the system analysis and design. In the second approach, extensive use is made of complete closed-loop simulation, including an accurate dynamic model of the airframe, to confirm analysis and design. Examples encountered in the utilization of these two approaches are provided in order to illustrate the benefits of one approach over the other. Experience gained from the utilization of both of these approaches has shown the latter to be the best. The extensive use of flight simulators and an airframe test stand assures that the system will meet requirements after minimal retrofit and flight test. Author

OPERATIONAL PROVING OF AUTOMATIC FLIGHT CONTROL SYSTEMS FOR V/STOL FIGHTER AIRCRAFT
G Kissel and H Schmidtlein (Vereinigte Flugtech. Werke G m b H., Bremen, West Germany) *In* AGARD Lessons with Emphasis on Flight Mech from Operating Experience Incidents and Accidents Mar 1971 26 p refs (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

Four different types of automatic flight control systems for V/STOL fighter aircraft were flight tested within the past years. The VJ 101 C aircraft makes use of pure jet-thrust-modulation control in the thrust sustained flight regime for rolling and pitching and thrust vector control for yawing. The VAK 191 flying bedstead uses puff-pipe (bleed air) control with additional thrust augmentation for pitching. The main characteristics of the systems are: (1) stability augmentation system with high authority superimposed on the mechanical flight control system versus fly by wire system, (2) integrating control system versus proportional system, (3) pure VTOL versus V/STOL capability, (4) pure thrust modulation control versus puff-pipe control, and (5) puff-pipe control by means of fly by wire with mechanical back up. With all four systems acceptable handling qualities could be reached but it is shown that, especially in case of thrust modulation where the aircraft has nonlinear characteristics, for large control inputs a nonlinear control system gives higher stability. The OV-10A Bronco is one of the aircraft designed specifically for low level counterinsurgency warfare. The original design requirements for the aircraft as well as the engineering changes found necessary during the flight test stage are reviewed. Use of the Bronco in combat operations in Southeast Asia is summarized including loss and damage rate. As a result of these combat operations, conclusions are drawn as to the validity of the original requirements for the OV-10A. Design requirements desirable for the next counterinsurgency aircraft in light of the experience in Southeast Asia are recommended. Author

LESSONS FROM OPERATION AND TRIALS OF TWIN TURBO PROP AIRCRAFT ON ROUGH AIRFIELDS
M J Taylor *In* AGARD Lessons with Emphasis on Flight Mech from Operating Experience Incidents and Accidents Mar 1971 13 p refs (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

Trials and operations of a civil twin turboprop airliner and of its military counterpart have taken place over a period of nearly ten years. During this time both measured data and operating experience have been accumulated from movements on unprepared airfields. In particular the investigation into two landing accidents involving the civil type has led to performance measurements on grass and hard surfaces. Information is given on the following: (1) undercarriage load measurements, (2) airframe contamination and superficial damage, and (3) aeroplane performance. Author

AVOIDANCE OF AIRCRAFT TRAILING VORTEX HAZARDS
William A McGowan *In* AGARD Lessons with Emphasis on Flight Mech from Operating Experience, Incidents and Accidents Mar 1971 23 p refs (See N71-23410 12-02)
(NASA-TM-X-67125) Avail: NTIS CSCL 01C

Trailing vortices have been the cause of aircraft accidents. Results of accident investigations, theoretical exercises, wind tunnel experiments, and flight tests are used to describe the formation and severity of trailing vortices and the spatial extent of their influence, including factors governing persistence. This information is then used to outline procedures for ready application by pilots, tower operators, and those concerned with the flow of traffic during tactical operations. The procedures provide the necessary appreciation of the physical attributes of trailing vortices, the potential hazards involved when encountering them, and how best to avoid the dangerous portions of the wake during flight operations. Schemes under investigation to monitor remotely both the trailing vortex location and intensity in the airport area and to prohibit formation of high intensity vortices, through aircraft design, are discussed. THE HANDLING QUALITIES REQUIRED FOR SAFE OPERATION OF SINGLE ENGINE BOUNDARY LAYER CONTROLLED AIRCRAFT IN THE STOL MODE
S C Roberts *In* AGARD Lessons with Emphasis on Flight Mech from Operating Experience, Incidents and Accidents Mar 1971 16 p refs (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

Operations of single engine, boundary layer control, STOL aircrafts since 1958 are reported. The vehicles have been the high lift, super cub L-21, the modified Cessna L-19, the XAZ-1, and the XV-11A with wing loadings ranging from 13 lb/sq ft to 28 lb/sq ft. All of these aircraft had a distributed suction boundary layer control system for lift augmentation and XAZ-1 and the XV-11A also had shrouded propellers for static thrust augmentation. The performance, stability and control, and handling qualities of these aircraft have been evaluated and considerable experience gained in the operational aspects of such STOL aircraft with regard to the handling qualities required for safe operation in the STOL mode. APPROACH PATH CONTROL FOR REDUCED NOISE AND IMPROVED TRAFFIC CAPACITY
C. R. Clifford *In* AGARD Lessons with Emphasis and Flight Mech. from Operating Experience Incidents and Accidents Mar. 1971 22 p refs (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

Final approach control for transport aircraft consists primarily in aerodynamic performance during cruise. The specific objectives defined for the Boeing 727 and 737 in this respect, and the boundary layer control research with the 707 prototype, are outlined, together with results achieved. Steep angle, decelerating, and curving approaches have been considered singly and in combination. A simple speed control for decelerating approach on the normal glidepath angle is under development for the 747 and research activities include extending the capability of high quality area navigation equipment to control of flightpath, speed and configuration on final approach so as to minimize noise. Described are the operational characteristics of the airborne system for terminal path guidance on reduced noise trajectories, including the system configuration, functions of key elements, redundancy requirements, control law aspects, and cockpit displays Author

A REVIEW OF V/STOL AIRCRAFT ACCIDENTS IN THE US
John H. Enders and William E. Thurman *In* AGARD Lessons with Emphasis on Flight Mech. from Operating Experience, Incidents and Accidents Mar. 1971 14 p refs (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

V/STOL research and development aircraft accidents have occurred for the same major reasons and over the same operational phase spectrum as have accidents to conventional aircraft. Excluding hover and transition phases from the operational phases, a pattern of accident distribution of V/STOL aircraft is similar to that for conventional aircraft - about 55-60% during landing, about 20% in cruise, and about 20% during takeoff. The pattern of accidents suggests no clearly dominant remedial action to reduce these accidents across-the-board, but increased attention in each of the cause factor areas will effect an improvement. Nearly every accident investigation prompted changes in either design, methods of operation, management structure, pilot training methods, or maintenance procedures Author

WEATHER AS A FACTOR IN FATAL ACCIDENTS INVOLVING CIVIL TRANSPORT AIRCRAFT
J. Burnham *In* AGARD Lessons with Emphasis on Flight Mech. from Operating Experience, Incidents and Accidents Mar 1971 21 p refs (See N71-23410 12-02)
Avail: NTIS HC $6.00/MF $0.95

An analysis is given of the importance of weather in fatal accidents involving civil transport category aircraft during the period 1946-69. Out of a total of 1,433 accidents involving 25,801 fatalities, weather is known to have been a factor in 318 accidents involving 6,778 fatalities, and may have been involved in others. The average of 13 accidents per year in which weather was involved comprise about 10 per year in poor visibility, 2 per year due to gusts and 1 per year due to icing and other weather hazards. The only type of weather accident which has increased in frequency in recent years is that of approach and landing in poor visibility. Author

UNITED STATES ARMY HELICOPTER EXPERIENCES AND FUTURE REQUIREMENTS
Conrad L. Stansberry *In* AGARD Helicopter Guidance and Control Systems Sep 1971 6 p (See N72-11915 03-02)
Avail: NTIS

The U.S. Army has found the helicopter to be an extremely versatile vehicle in performing all functions of combat. It has been integrated into organizations throughout the Army force structure. The concepts of airmobility have been validated during combat operations in a counterinsurgency environment in Vietnam. At this time, the U.S. Army is in a period of transition requiring an assessment of the applicability of the airmobile concept in the mid and high intensity warfare environment. To improve the existing capability, new helicopters and evaluations of different types of units with organic airmobile elements to optimize the effectiveness of our combat units must be developed. It is expected that the concepts of airmobility warfare brought to fruition with the advent of the helicopter and applied so successfully in Vietnam can be applied with equal success on other battlefields in other areas in the future. OPTIMIZATION OF AUTOMATIC FLIGHT CONTROL CONCEPTS FOR LIGHT HELICOPTERS WITH ALL WEATHER CAPABILITY
H. Koenig and H. Schmitt *In* AGARD Helicopter Guidance and Control Systems Sep 1971 13 p refs (See N72-11916 03-02)
Avail: NTIS

All-weather equipment of minimum complexity for light helicopters is presented. The criteria for its selection include

mission performance requirements as well as consideration of weight, complexity and cost. The special features of a helicopter with hingeless rotor are discussed. The flight control system being developed is shown by a step-by-step process up to an optimal equipment for civilian and military application in all-weather flight. This report presents the validation of flight control systems of SAS and ASE performance level. Successful flight tests of the Ferranti FAS 2 and the BSW-FRG 14 flight control equipment have been conducted on the helicopter MBB-BO 105. Good agreement has been found between theoretical and simulation studies. The systems can be used for many important military purposes. Author

FLIGHT SAFETY WITH AUTOMATIC CONTROL: REQUIREMENTS AND IMPLEMENTATION [LA SECURITE DU VOL EN PILOTAGE AUTOMATIQUE EXIGENCES ET REALISATIONS]
A Guibaud and D Autechaud *In* AGARD Helicopter Guidance and Control Systems Sep 1971 6 p In FRENCH (See N72-11915 03-02)
Avail: NTIS

The breakdown of automatic pilots or auxiliary stabilization systems may have grave consequences for helicopter flight, since these aircraft often operate at low altitudes. Safety requirements constitute one part of a theoretical study of breakdowns. requirement implementation and testing were also studied. A probability analysis of simple and double breakdowns was undertaken. In the case of active breakdown of the automatic pilot, it is necessary to limit the rapid evolution of the apparatus and thus to increase the time allowed to the pilot to react and resume manual flight control. Surveillance devices are necessary on the automatic pilot in order to detect active breakdown and to rapidly suppress the erroneous command. Such compatibility and threshold devices are available on the Puma and Alouette 3 aircraft. Finally, surveillance of the flight control chain, from detectors to servo-command, can be done internal organization of the automatic pilot, extending the possibilities for surveillance devices without increasing cost. THE IMPLICATIONS OF OPERATING HELICOPTERS IN POOR VISIBILITY
J. E. Nethaway *In* AGARD Helicopter Guidance and Control Systems Sep 1971 20 p refs (See N72-11915 03-02)
Avail: NTIS

A method of weather minima calculation is proposed for small sites and is extended to allow an estimate to be made of the instrument or automatic approach performance requirements if the weather minima are to be achieved. As an example of the estimation technique an assumption is made of a 6 deg approach path coupled with a 60 kn (111 km/h) approach speed and it is suggested that 120 ft/700 yd (36m/640m) weather minima should be attainable. The equipment requirements necessary to achieve the weather minima are considered and possible developments for the future are discussed. The future developments could include improved displays based on cathode ray tubes, and also various levels of automatic flight path control. A radio/radar guidance aid is required and the overlap between it and the visual guidance system is discussed. The approach and landing system described implies a weight penalty, the extent of which depends on the severity of the weather to be overcome. With this in mind a tentative estimate is made of the equipment weight which may be necessary to achieve various weather minima. Finally, a study has been made of the statistical occurrence of low visibility in the UK from which it has been deduced that, for the approach conditions assumed, a helicopter should be able to complete approaches to land on about 98% of occasions in the year. PROGRESS OF THE USAF IN-FLIGHT PROGRAM: LOW SPEED CONTROL TO LANDING ON INSTRUMENT IN HELICOPTERS
Charles A. Scolatti *In* AGARD Helicopter Guidance and Control Systems Sep 1971 15 p refs (See N72-11915 03-02)
Avail: NTIS

A functional flight control-display system is described which provides the small and medium sized helicopter a manual-on-instrument capability from take-off to landing. The display solution is based upon extending the capability of the flight director as it is employed today in helicopters for flying fixed wing type profiles to encompass the unique portion of the low speed regime. With respect to automatics, pilot workload has been reduced and control maneuverability enhanced by introducing innovations to the design of stability augmentation systems in the yaw and collective channels. The flight control-display system was developed using beam guidance in anticipation of the upcoming guidance system proposed by the SC-117 Committee. Testing of the system elements is complete. Evaluation of the synthesized system will be completed by the end of the year. Work is beginning on having user command personnel test the system in its applied form on two UH-1N helicopters at the USAF Instrument Pilot Instructors School. Author

AN OPTIMUM MILITARY HELCIOPTER NAVIGATION SYSTEM
Marvin Taylor *In* AGARD Helicopter Guidance and Control Systems Sep 1971 11 p refs (See N72-11915 03-02)
Avail: NTIS

A low-cost, all-weather, self-contained navigation system was studied in order to fully exploit the many military capabilities of helicopters. Inertial, Doppler-Magnetic, and Doppler-Gyroscopic Navigation systems are analyzed to determine parametric requirements (such as gyro drift, torque scaling, and computer requirements) as a function of navigation accuracy. A study of these alternate candidate systems indicates an optimum approach is the combination of Doppler velocity with an accurate heading indicator utilizing low drift gyroscopes that can rapidly gyro-compass to true North during ground alignment. For subsonic application less precise gyro drift is required with this approach than for an equivalent all-inertial system. The various system configurations are functionally defined and cost vs performance analysis using typical parameters is performed for the alternate candidate systems. Author

SOME PROBLEMS IN THE DEVELOPMENT OF AN AUTOMATIC FLIGHT CONTROL SYSTEM FOR LIGHT HELICOPTERS
W. Wellern *In* AGARD Helicopter Guidance and Control Systems Sep 1971 15 p refs (See N72-11915 03-02)
Avail: NTIS

Some of the problems and their solution are discussed arising in the development of an automatic flight control system for light helicopters. The control system is the FRG 14/Stab. The cross coupling between the axes makes it essential to regard the helicopter control as multiloop control and to take account of all six degrees of freedom of the vehicle. These investigations were done with the aid of a program drawn up recently for analysis applied first to a light helicopter which is equipped with a hingeless rotor (BO 105). This type of rotor shows very high control effectiveness and very fast reactions to control inputs. Thus it seems to be necessary to include the nonlinearities of actuators and hydraulic booster in the investigation and to perform a simulation on the analog computer. Here the problem of limit cycles due to backlash arises. The limit cycles are reduced by ... of special nonlinear networks so that they are no longer perceived by passengers. Development of the FRG 14 System was continued by hardware simulation and concluded with good results in flight tests. Author

DIFFERENCES AND COMMONALITIES IN HELICOPTER

AND FIXED WING DOPPLER SENSOR TECHNOLOGY
K Maerz *In* AGARD Helicopter Guidance and Control Systems Sep 1971 5 p refs (See N72-11915 03-02)
Avail: NTIS

The possibilities and limitations of rotary and fixed wing compatible Doppler sensor designs are discussed. Measurement of velocities near zero at often relatively high values for the drift angle is a requirement for helicopters only. For fixed wing aircraft on the other hand operation at high altitudes at high speeds influence antenna and transmitter design. The lower mean speeds in helicopters put more weight on these measurement errors, which are constant relative to velocity, whereas in fixed wing aircraft in most cases measurement errors dominate which are proportional to velocity. In helicopters and VTOL aircraft fixed antenna installation is generally preferred. Whereas the use of noncoherent pulse systems is limited to fixed wing aircraft, continuous wave and FM Doppler sensors are successfully used in helicopter navigation systems. Author

AN INTEGRATED LOW ALTITUDE FLIGHT CONTROL SYSTEM FOR HELICOPTERS
James P. Murphy, Herman L. Walker, and Lawrence A. Kaufman *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 20 p refs (See N72-11915 03-02)
Avail: NTIS

After a brief introduction that highlights the need for the system and some design philosophies, the basic concepts for low altitude flight are presented indicating the modes of flight employed by IHAS, terrain following (TF), and terrain avoidance (TA). This is followed by a dissertation on the functional approach used to provide the relatively high degree of TF capability required. Block diagrams are utilized to identify the system sensors, central computer and output devices, i.e., displays and flight controls. Prior to a discussion of the equations solved by the central digital computer, the equipment mechanization is briefly described to familiarize the reader with the IHAS equipments. A commentary is presented on the setup and results of a simulation of the automatic TF system and is followed by a description and limited listing of results of the IHAS flight test program. It is shown that the high degree of TF capability provided agreed very well with the results predicted by analysis and simulation. Finally, some concluding remarks are provided to identify the significant accomplishments of the IHAS low altitude control system development. Author

AUTOMATIC APPROACH AND HOVER COUPLER FOR HH-53 HELICOPTERS
Robert A. Andes *In* AGARD Helicopter Guidance and Control Systems Sep 1971 7 p refs (See N72-11915 03-02)
Avail: NTIS

The Automatic Approach and Hover Coupler which provides the HH-53 rescue helicopter with the capability to automatically transition from forward flight, anywhere within the HH-53 flight envelope, to a hover over flat or rolling terrain, independent of gross weight and center of gravity is discussed. The approach coupler design is based on an approach trajectory characterized by a constant longitudinal deceleration of 8 knots/seconds and a constant rate of descent of 300 feet/minute until a groundspeed of 40 knots is reached. At this point the rate of descent is reduced to 100 feet/minute. The hover coupler provides altitude retention within + or - 3 feet and zero knot groundspeed within + or - 1.5 knots of the Doppler radar measured velocity. A hover trim control is also provided to permit a limited repositioning of the aircraft by the pilot/copilot/ crewman during the rescue operation. The couplers satisfactorily completed environmental qualification tests at Sikorsky Aircraft Company, Stratford, Connecticut, and operational test and evaluation by the Military Airlift Command, Eglin Air Force Base, Florida. TERRAIN AVOIDANCE RADAR FOR US ARMY
Otto H. Schoenberger *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 14 p refs (See N72-11915 03-02)
Avail: NTIS

The objectives and the conduct of the U.S. Army's development program are reported for providing a terrain avoidance/terrain following capability for Army rotary-wing aircraft. The over-all program goals are described. Control aspects of helicopters were considered in light of TA/TF requirements with an immediate realization of their importance in any TA/TF application. As such, the control system was developed first, including terrain following command computation and coupling provision to the flight control system. A unique method of in-flight simulation of terrain and radar sensor was conceived. This airborne terrain and radar simulator allows full in-flight evaluation of the control system, and offers unlimited flexibility as to the type of terrain over which the system is to be tested without subjecting the aircraft and crew to the hazards of testing a control system in close proximity to terrain. A variable parameter terrain avoidance radar is described to replace the terrain and radar simulator after initial evaluation of the control system. The primary objective for this radar was to provide a terrain sensor with technical flexibility sufficient to allow TA/TF performance evaluation over the complete performance spectrum, ranging from simple fixed beam manual terrain following to sophisticated simultaneous terrain following and terrain avoidance, using transverse profile type display and coupling into the flight control system. Technical details of the radar design are given, including selection of the parameters. Author

THE EFFECTS OF SEMIRIGID ROTORS OF HELICOPTER AUTOSTABILISER DESIGN
H. B. Johnson *In* AGARD Helicopter Guidance and Control Systems Sep 1971 13 p refs (See N72-11915 03-02)
Avail: NTIS

Theoretical studies carried out into the basic problems posed by 'semi-rigid' rotor designs are described, and the directions in which automatic stabilizers for these aircraft are likely to develop are indicated. Two problems in particular were examined, viz the pitching instability with angle of attack and forward speed, and the interaction between aircraft of motion and those of the rotor dynamics. The latter problem is concerned with the rolling motion termed the 'pendulum' mode resulting primarily from the increased coupling between fuselage and rotor. It is shown that a potential resonance between the 'pendulum' mode and the in-plane blade motion exists. Means of avoiding this by suitable design of the autostabilizer are suggested. Author

SOME DESIGN ASPECTS OF THE STABILITY AUGMENTATION SYSTEM FOR THE WG13 RIGID ROTOR HELICOPTER

D. Sweeting *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 12 p (See N72-11915 03-02)

Avail: NTIS

Some features of the AFCS designed for the Anglo-French WG13 rigid rotor helicopter are described and in particular those arising from the concept of a modular multi-role helicopter, designed both for high speed maneuverable flight at low altitudes and for operation in tightly controlled autopilot modes. A brief description of the system configuration including redundancy, safety features, sensors, and actuation system is given together with an indication of system size and weight, and electronics technology employed. The design requirements for the pitch stability augmentation system (SAS) are examined in relation to the conflicting requirements for low SAS authority for safety against the high control gains combined with large attitude changes required for stability and maneuverability. The concept of a collective autostabilizer independent of the pitch SAS is introduced which alleviates these design problems of the pitch channel and reduces considerably the effects of a pitch runaway. The design of the roll SAS channel is similarly influenced by the requirement for stability at high angles of bank during maneuvers while using the minimum of control authority; a type of roll rate demand system designed to operate over a wide range of bank angle is described together with the control system developed for the yaw axis. A FEASIBLE FEEL AUGMENTATION SYSTEM FOR HELICOPTERS

Herold S. Oakes *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 7 p (See N72-11915 03-02)

Avail: NTIS

A description and evaluation are given of the feel augmentation system (FAS). The FAS differs from most traditional automatic flight control systems in that, instead of augmenting the pilot's input to the control system by providing swash plate motion to stabilize the helicopter, it introduces only forces on the pilot's hand. If the pilot resists these forces, he then experiences the feel desired for continuing the maneuver he has started. If he does not resist the force, the stick will move and stabilize the aircraft so that it will stay in steady state trimmed flight. An extensive flight evaluation of the system in a CH-53A indicated a significant improvement in the handling qualities of the helicopter at high speeds, and that the aircraft could be maneuvered precisely at all airspeeds, permitting the pilot to use the entire V-N envelope. HELICOPTER IFR FLIGHT PATH CONTROL SYSTEM

Theodor A. Dukes *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 10 p refs (See N72-11915 03-02) (Contract DA-28-043-AMC-02412(E))

Avail: NTIS

Various aspects of piloted flight path control, including positioning, are discussed according to their significance in making decisions about the structure of the control system. The translational loop requirements, the choice of a nominal error coordinate system, and a discussion of the pilot's role, lead to a control system in which errors and error rates are displayed explicitly and the pilot uses essentially acceleration control in his main effort to control error rates or velocities in three dimensions. An integrated display contains all the information needed for the continuous loop closures. The proposed system is applicable to trajectory control in general so that considerable commonality in flying various tasks can be achieved. Author

PRECISE IFR HOVERING: AN OPERATIONAL NEED AND A FEASIBLE SOLUTION

William P. Keane and R. Joseph Milelli *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 9 p (See N72-11915 03-02)

Avail: NTIS

A man-machine simulation program was conducted which indicates the feasibility of developing an IFR hover capability with state-of-the-art sensors, controls and displays. Display alternatives included a simple hover indicator, a flight director and a fully integrated multi-colored CRT display. Control alternatives for the CH-54 aircraft included the CH-54 ASE and two alternate systems employing load cable information feedback and velocity feedback. IFR hover was shown to be a reasonable task from a pilot workload standpoint. Displays and controls couple strongly in finding the best solution. A wide range of performance was achieved with the best systems providing a hover accuracy of 1-2 feet. All tests were performed under simulated gust conditions. A formal analysis of variance was performed on the data. These results indicate the feasibility of accomplishing more precise construction and logistical tasks by the helicopter in the near future through the use of instrument hover. The unloading of containerized ships by the helicopter is a possible application with both commercial and military advantage. Author

ADVANCED DOPPLER INERTIAL NAVIGATION SYSTEM FOR TRANSPORT HELICOPTER

V. Krogmann *In* AGARD Helicopter Guidance and Control Systems Sep. 1971 14 p refs (See N72-11915 03-02)

Avail: NTIS

Conventional ground and in-air gyrocompassing techniques together with Doppler-inertial navigation are treated briefly. Main attention is paid to optimal ground and in-air alignment and Doppler-inertial-mixing. As far as the optimization is concerned, Kalman filter technique with a ten to fourteen element state vector is compared to a simple digital filter-technique based on recursive or non-recursive least squares. Comparison between the least-square-technique and the Kalman-filter shows that their respective performance is roughly in the same order of magnitude without position fixes. The least-square-technique is recommended because its airborne computer requirements are by far lower than the Kalman-filter loading. This technique, as well as the Kalman-filter has the ability to recover the position error caused by initial misalignment and the performance does not depend on the magnitude of the initial misalignment. The proposed system is based on the least-square technique. Assuming a 2 - 3 minutes ground alignment, the operational sequence for in-air alignment and Doppler-Inertial Navigation is described. The computer loading for both the ground and in-air alignment of this system is considered. Author

DESIGN AND EVALUATION OF A HELICOPTER GUIDANCE AID c21
R. N. Alcock, D. Alter, S. J. Robinsin, and R. P. Vincent *In* AGARD Helicopter Guidance and Control Systems Sep 1971 4 p (See N72-11915 03-02)
Avail: NTIS

A description of the microwave aircraft digital guidance equipment (MADGE) system is given. The system is designed as an approach aid for V/STOL and fixed wing aircraft and is particularly suited for military tactical applications and for use by helicopters. A typical MADGE ground installation comprises three man-portable units: (1) an azimuth approach angle measuring unit incorporating a transponder and means for encoding azimuth and elevation measurements, (2) an elevation, or glide-slope, angle measuring unit, and (3) an azimuth missed-approach angle measuring unit. In the aircraft there is a control panel, on which the approach data may be set by the pilot, and a transmitter-receiver, with circuits for distance measurement and for decoding the angle information. In civil applications the approach path can be pre-set for individual aircraft types. One or two monopole aerials, depending on aircraft aerial siting and observation problems, are used to give wide angle coverage. D.L.G.

FLIGHT TEST OF A HYDROFLUIDIC THREE-AXIS DAMPER ON A HELICOPTER
R. A. Evans and G. W. Fosdick *In* AGARD Helicopter Guidance and Control Systems Sep 1971 12 p refs (See N72-11915 03-02)
Avail: NTIS

Tests were conducted on a fixed-gain, three-axis hydrofluidic stability augmentation system (FSAS) in a UH-1C helicopter. The FSAS used a vortex rate sensor, two or more stages of amplification, and various shaping networks (lag, lag/lead, and high-pass) in each of the three axes, all mechanized with hydrofluidics. The system was designed, developed, bench tested and qualified for the environment. Reliability testing previously conducted estimated MTBF at 83,000 hours per axis (excluding servoactuator). Flight test results indicate pilot approval, operation over all airspeeds including hover, and excellent handling qualities. The FSAS performance was rated as better than that of the mechanical stabilizer bar by the pilots. Predicted high reliability was supported by a 60-hour, trouble-free fluidic controller operation. OPTIMALITY CRITERIA IN STRUCTURAL DESIGN
W. Prager (Brown Univ.) Dec. 1971 16 p refs
(AGARD-R-589-71) Avail: NTIS

The derivation of optimality conditions from extremum principles of structural theory is reviewed, with special emphasis on conditions for global optimality. Following a brief introduction, the optimal design of sandwich structures is discussed for a single behavioral constraint and for multiple constraints. Structural elements with solid sections are dealt with in a separate section. In addition, a three-dimensional problem is investigated that includes many problems of optimal structural design as special cases. A final section presents the previously considered optimality criteria in a unified way that frequently suggests the form of optimality conditions in new situations. Author

STABILITY AND CONTROL 747 FLIGHT TESTING
D. D. Archer *In* AGARD Flight Test Tech. Feb. 1972 12 p (See N72-20976 12-02)
Avail: NTIS

The basic development and FAA certification flight test program of the 747 aircraft was conducted using five test airplanes in an intensive program involving 1443 flight hours and a total of 10-2/3 months of flight testing. Each airplane was instrumented to perform assigned tasks, and sufficient duplication in instrumentation was provided to allow flexibility in re-assigning tests for schedule changes due to development contingencies. Stability and control tests were conducted on four of the airplanes and consisted of 90 hours of development tests and 72 hours of FAA tests for a total of 162 hours. In addition, airplane handling characteristics have since been evaluated by certification authorities of Great Britain, France, and Germany. All pilots who have participated in the test programs have judged the flight handling characteristics as excellent. Author

STABILITY AND CONTROL TESTS ON A SLENDER WING RESEARCH AIRCRAFT
P. L. Bisgood *In* AGARD Flight Test Tech. Feb. 1972 13 p refs (See N72-20976 12-02)
Avail: NTIS

A variety of flight test techniques has been used to measure the stability and control characteristics of a slender-wing research aircraft as part of a program aimed at comparing wind tunnel and flight measurements. Derivatives obtained by alternative methods in flight usually showed satisfactory agreement. Conventional methods of derivative extraction proved adequate in areas where mirror non-linearities occurred in the aerodynamic coefficients. Where more pronounced non-linearities exist, as in the longitudinal case, the results indicate that conventional techniques may not be entirely adequate. Author

THE DETERMINATION OF STABILITY DERIVATIVES AND PERFORMANCE CHARACTERISTICS FROM DYNAMIC MANOEUVRES
O. H. Gerlach *In* AGARD Flight Test Tech. Feb. 1972 23 p refs (See N72-20976 12-02)
Avail: NTIS

Three frequency ranges of interest to the flight dynamicist are distinguished: (1) the low-frequency or phugoid and spiral mode frequency range, (2) the intermediate or short-period and Dutch roll frequency range, and (3) the high-frequency or elastic modes frequency range. Until today most flight tests for the determination of stability derivatives have been directed towards the intermediate frequency range. Since for various reasons the frequency ranges show an increasing trend to overlap for several classes of modern aircraft, flight test techniques suitable for more than one frequency range may well receive more attention. Flight tests to determine derivatives in the combined low and intermediate frequencies are described. The importance of accurate measurements and of an adequate frequency content of the input signal in the flight tests is stressed. The rationale behind the choice of the shape of the input signal used in the flight tests is given. The application of the derivatives, not only for stability and control purposes, but also for the determination of performance characteristics, is discussed. Author

INLET/AIRPLANE INTERFERENCE AND INTEGRATION
Philip P. Antonatos, Lewis E. Surber, and Donald J. Stava *In* AGARD Airframe/Engine Integration May 1972 54 p refs (For availability see N72-27016 18-02)

The basic technological problems and potential solutions relating to the development of inlet and airframe design criteria are discussed. Results of analytical and experimental work emphasize details of closely coupled inlet airframe concepts. Inlet flow fields generated by basic forebody and forebody/wing combinations are reviewed together with an anlysis of the effects of variations in fuselage shape, forebody camber, wing geometry and inlet position. Problems associated with boundary layer development and vortex ingestion are discussed in terms of their effect on inlet design. Attitude effects such as angle of attack and angle of yaw are reviewed. The losses due to spillage, bleed and bypass flows are analyzed as they affect vehicle performance. Criteria are reviewed to minimize such loss for the development of optimal inlet/airframe performance. Specific problems relating to the subsonic-transonic flight regime and the supersonic regime are included.

NOZZLE/AIRFRAME INTERFERENCE AND INTEGRATION
Felix Aulehla and Kurt Loter *In* AGARD Airframe/Engine Integration May 1972 25 p refs (For availability see N72-27016 18-02)

The main parameters involved in the interference between internal and external flow are discussed. Also considered is how these parameters in principle affect afterbody drag. Then the definition of rear end drag is given in the conventional way and also in a more relative manner approaching the physical optimum. For configurations with single and twin engines installed in the rear end of the fuselage wind tunnel test results for various nozzle concepts are presented and discussed. The geometric variations in these tests comprise boattail angle, size and location of the base, nozzle interfairings and engine spacing. Proper consideration of these geometric parameters in nozzle/airframe integration, reduces additional afterbody drag drastically in the transonic flight regime.

EXPERIMENTAL DETERMINATION OF NOZZLE CHARACTERISTICS AND NOZZLE AIRFRAME INTERFERENCE
F. Jaarsma *In* AGARD Airframe/Engine Integration May 1972 45 p refs (For availability see N72-27016 18-02)

An outline is given under which circumstances certain jet flow and nozzle parameters should be simulated in the wind tunnel for both installed thrust and drag determination. The circumstances relate to the flight regimes, nozzle types and engine installation configurations. Next the technical requirements for the wind tunnel and the model are given and the difficulties in fulfilling these requirements are discussed. The techniques and schemes as used by the various groups in the AGARD countries are reviewed. Special attention is given to miniature turbo engine simulators.

DYNAMIC CHARACTERISTICS OF ENGINE INLETS
Demetrius Zonars *In* AGARD Airframe/Engine Integration May 1972 16 p refs (For availability see N72-27016 18-02)

Inlet random pressure fluctuations and their effects on reducing the stall margin of turbojet engines are discussed. A review is accomplished of the TF30/F-111 compatibility study over the past several years. The practicality of utilizing steady state and instantaneous distortion factors to determine inlet-engine compatibility is assessed and recent advances in inlet research configurations with associated steady state and dynamic distortions are presented. Finally, a complete random data acquisition, editing, and processing method is developed for accomplishing data analysis as an inlet diagnostic tool.

ENGINE INTEGRATION AND THRUST/DRAG DEFINITION
Allen E. Fuhs *In* AGARD Airframe/Engine Integration May 1972 21 p refs (For availability see N72-27016 18-02)

Various definitions relating to thrust and drag are considered. Since thrust minus drag is of primary interest, the background on drag determination is discussed. This is followed by testing techniques for full scale propulsion systems. Sources of installation losses are of considerable interest. Several different methods have evolved to account for various terms in a drag/thrust determination. Bookkeeping of forces and momentum flux is described. Any aircraft development is controlled by schedules and fixed resources. Influence of these constraints on engine-airframe integration is discussed. Some special integration problems, e.g., engine bleed air, are considered. Author

HANDLING QUALITIES CRITERIA
Jun. 1972 293 p refs Proc. of the AGARD Flight Mech. Panel Specialists Meeting, Ottawa, 28 Sep.-1 Oct. 1971
(AGARD-CP-106) Avail: NTIS HC $17.00

The proceedings of a conference on the handling qualities of aircraft are presented. Subjects discussed are: (1) flying qualities requirements and criteria for conventional and V/STOL aircraft (2) commercial flying quality standards and flight test validation, (3) establishment of flying qualities by analysis of current aircraft, simulation and analysis, and pilot opinion ratings, (4) special problems and interfaces in aircraft control, and (5) man machine relationships and research and development projects for improvement. For individual titles, see N72-32018 through N72-32038.

COMPARISON OF FRENCH AND UNITED STATES FLYING QUALITIES REQUIREMENTS
Jean-Claude Wanner and John W. Carlson (ASD) *In* AGARD Handling Qualities Criteria Jun. 1972 15 p (For availability see N72-32017 23-02)

The flying qualities requirements for French and United States aircraft are compared. It was determined that the two sets of criteria are basically the same in intent and goals. The complications in applying these criteria to modern, high performance aircraft are discussed. Concepts in level of handling qualities, application of flight envelope restrictions, and effects of system failures on flying properties are examined. Author

THE NATURE AND USE OF THE RULES FOR JUDGING THE ACCEPTABILITY OF THE FLYING QUALITIES OF FIXED WING AIRCRAFT
S. J. Andrews *In* AGAR.O Handling Qualities Criteria Jun. 1972 10 p ref (For availability see N72-32017 23-02)

The flying qualities requirements for the United Kingdom and the United States are compared. The documents involved in establishing the criteria are examined. The general content of the documents in relation to the requirements of the flight tester in assessing the acceptability of fighter aircraft, strike aircraft, and trainer aircraft is discussed. Comment is submitted on the flying qualities requirements for V/STOL aircraft. It is suggested that the requirements documents are of limited use to the flight tester because they are either out of date or inapplicable to new aircraft with special role demands or novel design features. It is recommended that, in addition to updating existing requirements, more attention should be given to the direct and immediate application of data from known and tried service aircraft. Author

FAA FLYING QUALITIES REQUIREMENTS
Richard Stiff and Robert F. LeSueur *In* AGARD Handling Qualities Criteria Jun. 1972 6 p (For availability see N72-32017 23-02)

The need for flexibility and change of Federal Aviation Regulations to accommodate new designs and innovations to flying vehicles is an ever-increasing and complex situation. The current philosophies and projected difficult areas associated with airplane handling qualities are discussed. The subject is not intended to be covered as to the specific conditions or types of airplanes but, rather, to cover the qualitative evaluation needs for determining compliance with the existing airworthiness rules. Recognizing that aircraft development and capability is an ever-improving science, the relationship of Federal rulemaking procedures to the application of judgment in the requirements to produce timely and adequate determinations of compliance is discussed with consideration of complex control systems and rapidly-expanding flight envelopes. REVISIONS TO V/STOL HANDLING QUALITIES CRITERIA OF AGARD REPORT 408
Seth B. Anderson and Laurel G. Schroers (Army Air Mobility Res. and Develop. Lab., Moffett Field, Calif.) *In* AGARD Handling Qualities Criteria Jun. 1972 8 p refs (For availability see N72-32017 23-02)

A brief review of selected handling qualities criteria for V/STOL aircraft shows that although a clearer understanding of the requirements for controversial areas such as roll control power, vertical flight path control, and transition is in hand considerably more research is needed to refine these criteria for operational IFR activity. Because many items interact to influence the pilots' overall impression of the aircraft's behaviour, additional work of a systematic nature must be done to clarify this aspect. A better definition of a gust model which includes discrete gust effects is needed to firm up criteria for both hover and STOL operation. Author

US MILITARY V/STOL HANDLING QUALITY REQUIREMENTS
Charles R. Chalk and Charles B. Westbrook (AFFDL) *In* AGARD Handling Qualities Criteria Jun. 1972 13 p refs (For availability see N72-32017 23-02)

The V/STOL aircraft handling qualities criteria specification is discussed. The evolution of the specification is traced over the five year period of its development. Problem areas requiring additional work are defined as well as research efforts to address some of the problem areas. Author

N72-32023 Canadair, Ltd., Montreal (Quebec)
APPLICATION OF V/STOL HANDLING QUALITIES CRITERIA TO THE CL-84 AIRCRAFT
O. E. Michaelsen *In* AGARD Handling Qualities Criteria Jun. 1972 26 p refs (For availability see N72-32017 23-02)

The design concepts and flight characteristics of the Canadair CL-84 tilt wing V/STOL aircraft as related to handling qualities are reviewed. The achieved characteristics are compared with the revised AGARD V/STOL Handling Qualities Criteria. It is shown that the CL-84 characteristics are in general accord with the Criteria. While a few of the Criteria values appear inappropriate for the CL-84, it is concluded that the handling qualities of the aircraft would be improved if the aircraft met most of the Criteria in the areas where it presently falls short. V/STOL HANDLING QUALITIES CRITERIA COMPARED WITH FLIGHT TEST RESULTS OF THE V/STOL SUPERSONIC FIGHTER VJ 101C AND THE V/STOL TRANSPORT AIRCRAFT DO 31E
G. K. Kissel and Horst Wuennenberg (Dornier AG, Friedrichshafen) *In* AGARD Handling Qualities Criteria Jun. 1971 16 p refs (For availability see N72-32017 23-02)

The V/STOL aircraft handling qualities criteria are compared with the flight test results for the VJ 101C V/STOL supersonic fighter aircraft and the DO 31E V/STOL transport aircraft. The main features of the takeoff and landing procedures are presented. The handling qualities of the two aircraft in hover and transition flights are compared with accepted recommendations. The influence of the stabilization system and its characteristics on the control power is examined. The effects of the jet induced downwash and of the hot gas recirculation are shown. Author

SIMULATION AND ANALYSIS IN ESTABLISHING FLYING QUALITIES CRITERIA
J. T. Gallagher *In* AGARD Handling Qualities Criteria Jun. 1972 25 p refs (For availability see N72-32017 23-02)

The application of simulation and analysis in establishing the flying qualities criteria for piloted aircraft is discussed. Two areas are identified where better criteria are needed in the specification: (1) the effects of turbulence and (2) the impact of control system dynamics on flying qualities. A discussion is presented on a program which employs ground based simulation and pilot analysis in an attempt to better define the impact of turbulence on flying qualities. Methods for overcoming existing shortcomings in the procedure are evaluated. Author

HANDLING QUALITIES CRITERIA FOR SUPERSONIC TRANSPORT
W. T. Kehrer *In* AGARD Handling Qualities Criteria Jun. 1972 5 p (For availability see N72-32017 23-02)

The content and tone of a criteria specification for commercial transports are presented. A criteria must insure safe handling qualities for all regimes of flight operation. In addition to the normal flight operations, operation to the extremes of the flight envelope, and operation in severe turbulence must be specified. Also to be considered are flight operations with systems failures. A criteria specification must also consider the critical combinations of these items that have a reasonable probability of occurrence. For example, the airplane must be able to operate safely in turbulence of some specified level following flight controls systems failures. Author

TURBULENCE MODELS FOR THE ASSESSMENT OF HANDLING QUALITIES DURING TAKE OFF AND LANDING
J. G. Jones *In* AGARD Handling Qualities Criteria Jun. 1972 15 p refs (For availability see N72-32017 23-02)

Properties of atmospheric turbulence at low altitude are reviewed, with particular reference to those aspects relevant to an aircraft on a landing approach or during take off. Measurements of power spectra are described and related to a simplified theoretical model. Looking beyond the power spectrum, an important property of turbulence is its intermittency, related to a tendency for aircraft response to show large peaks separated by regions of relative inactivity. Pilots appear to be particularly sensitive to this intermittent structure, and their subjective comments can be related to measured turbulence characteristics. It is shown how a discrete gust model for turbulence may be employed to predict the magnitude of large response peaks. As an example, the response to gusts of an aircraft constrained to fly at constant attitude is discussed, with particular reference to the effects of aircraft speed. Author

FLYING QUALITIES INTERACTION WITH ELASTIC AIRFRAMES
John H. Wykes *In* AGARD Handling Qualities Criteria Jun. 1972 13 p refs (For availability see N72-32017 23-02)

The trends in modern aircraft structural design and aerodynamics are such that vehicle flexibility increasingly impacts on vehicle flying (handling) qualities and the design processes necessary to provide satisfactory vehicles. In recent years, the flexibility effects on ride quality have impacted on handling qualities and, perhaps, should be added to handling qualities requirements or criteria. A presentation is given of some of the approaches currently being considered to reduce this interaction. These include such techniques as active seat isolation and active structural mode control. It is concluded that any ride quality solution method that includes inducing motion between the pilot and his controls and displays should be excluded by handling qualities criteria. The structural flexibility and flight controls interface is briefly examined, and a typical pilot-induced structural

excitation is discussed. It is suggested that a pilot prefilter, a modern stability augmentation system, and a structural mode control system designed to meet ride quality criteria can solve the problem without additional criteria. The handling qualities flexibility interaction and the vehicle design cycle are discussed. Author

PARAMETERS AFFECTING LATERAL DIRECTIONAL HANDLING QUALITIES AT LOW SPEEDS
K-H. Doetsch, Jr. *In* AGARD Handling Qualities Criteria Jun. 1972 13 p ref (For availability see N72-32017 23-02)

A study is undertaken of the factors affecting the lateral-directional handling qualities of aircraft in typical VMC STOL flight as certain modal parameters are varied. It is found that for the low flight-speed and the low dutch roll frequencies investigated, the side force equation takes on added significance in establishing the oscillatory mode through the vector contribution of the weight component acting along the y-axis. When this contribution is large, secondary effects on handling qualities can arise if the relationship between the yaw rate and sideslip vectors in the oscillatory mode is established solely by varying the derivatives of the moment equations because, under these circumstances, unusual groups of derivatives may be necessary to satisfy the imposed constraints. Similar deviations from normal values for the moment derivatives may be required to force the zeros from the poles in the bank angle to aileron-control transfer function while simultaneously maintaining the correct vector relationships in the oscillatory mode. PILOT VEHICLE ANALYSIS
R. J. A. W. Hoeman *In* AGARD Handling Qualities Criteria Jun. 1972 25 p refs (For availability see N72-32017 23-02)

An experiment is described in which measurements were performed on human operators in single axis tracking tasks. The controlled element used was a simulated transport aircraft, the angle of pitch was controlled by the human operator. The forcing function was a gust signal acting on the simulated aircraft. The aircraft was simulated at three centre of gravity positions at which it was stable, neutral and unstable respectively. During the test runs the human operators had to perform simultaneously an auditory additional task. On the basis of the results obtained from the experiment a new sampled data pilot model is discussed. Author

RECENT US NAVY FLYING QUALITIES RESEARCH
Raymond F. Siewert *In* AGARD Handling Qualities Criteria Jun. 1972 12 p refs (For availability see N72-32017 23-02)

The results of U.S. Navy sponsored flying qualities research conducted over the past five years are presented. Inflight variable stability airplane investigations were conducted in simulated carrier approaches to determine the effect of the principle flying qualities parameters on approach performance. Limits have been established on the values of the major longitudinal and lateral-directional parameters, to insure good carrier approach characteristics. In addition to the carrier approach studies, moving base simulator investigations were conducted to further develop criteria, and extend the aircraft maneuvering potential at high angles-of-attack. The inclusion of maneuvering force gradient and/or stick sensitivity has been determined as a requirement for a meaningful criterion. Author

N72-32038* National Aeronautics and Space Administration, Washington, D.C.
RECENT NASA HANDLING QUALITIES RESEARCH
Richard J. Wasicko *In* AGARD Handling Qualities Criteria Jun. 1972 25 p refs (For availability see N72-32017 23-02)

A comprehensive review of NASA research results documented since the mid-1950's and some recently completed programs on aircraft handling qualities are presented. In addition to handling qualities research pertaining to vehicle stability and control characteristics, investigations related to specialized piloting tasks, cockpit displays, and environmental factors are summarized. The background leading to NASA's handling qualities research activities is discussed, and programs that have received major emphasis are indicated. For general aviation aircraft, the survey includes investigations aimed at improving handling qualities by incorporating increasingly sophisticated stability augmentation and display systems, simplifying the approach and landing task for relatively inexperienced pilots, and establishing the basic effects of turbulence. Research on the specialized piloting problem of steeper instrument approaches for noise abatement and investigations with a representative first generation aircraft are reviewed in the section on subsonic jet transports. Supersonic cruise aircraft programs include a variety of simulation studies related to supersonic transport designs and flight tests with the XB-70 aircraft. Investigations of high angle of attack loss of control problems and a flight study of direct lift control utilization for formation flying and aerial refueling are discussed in the review of tactical military aircraft research. INTERACTION OF HANDLING QUALITIES, STABILITY, CONTROL AND LOAD ALLEVIATION DEVICES ON STRUCTURAL LOADS Summary Report
Clifford F. Newberry (Boeing Co., Wichita, Kan.) Jul. 1972 17 p refs

(AGARD-R-593) Avail. NTIS HC $3.00

A questionnaire was forwarded to working group members, soliciting answers from their respective countries on techniques used in considering the various interactions. The questionnaire discusses possible effects of load alleviation devices from both static and fatigue loads. Interactions between stability, control, and structural loads when structural modes coalesce with rigid body short period modes are also addressed. The replies received are summarized. The replies generally agree, although differences between manufacturers of fighter and transport aircraft are evident. Author

ROLE OF FLUID DYNAMICS IN AIRCRAFT STALL AND POSTSTALL GYRATIONS

G. J. Hancock. *In* AGARD Fluid Dyn. of Aircraft Stalling. Nov. 1972. 16 p. refs. (For availability see N73-14998 06-02)

The airworthiness requirements for stall and post stall behavior of an aircraft are reviewed. The definition of stall as the limiting condition for normal flight operations is established. The distinct dynamic and aerodynamic contributions to a stall maneuver and post stall gyration are described. The pilot's influence is assessed and some implications on airframe design are outlined. The effects of flow separation on wings, the control of flow separation, and the role of model experiments are reported. Author

THEORETICAL AND EXPERIMENTAL RESEARCH OF TAKE OFF DRAG DEFORMATION OF LOCAL SURFACE [RECHERCHES THEORIQUES ET EXPERIMENTALES SUR LES DECOLLEMENTS LIES A UNE DEFORMATION LOCALE DE SURFACE]

S. Burnel, G. B. Diep, P. Gougat, and B. Prunet-Foch. *In* AGARD Fluid Dyn. of Aircraft Stalling. Nov. 1972. 11 p. refs. In FRENCH (For availability see N73-14998 06-02)

A theoretical and experimental study was made of incompressible flow during takeoff. Velocity profiles were measured in the boundary layer by hot wire anemometers, and the signals obtained used to determine frequency distribution. Static pressure distribution on the inner surface was also determined. A plate containing a cavity was used to measure deformation on the hollow ledge. Spectral density fluctuations in velocity permits the measurement of natural instabilities in the boundary layer. The instabilities are correlated with exterior speed. Author

PARAMETRIC STUDIES OF SEPARATING TURBULENT BOUNDARY LAYER FLOWS

Andrzej Wortman and W. J. Franks. *In* AGARD Fluid Dyn. of Aircraft Stalling. Nov. 1972. 9 p. refs. (For availability see N73-14998 06-02)

A new technique for the exact solutions of laminar or turbulent two- or three-dimensional boundary layer flows has been developed. The technique differs from previous approaches in the use of functional analysis to obtain exact semianalytical solutions in a small fraction of the computer time normally required for such computations. The main advantage of the semianalytical aspect of the technique is that the functional forms of the relations in the governing differential equations are retained and the use of the computer is relegated to the performance of simple quadratures and fluid properties calculations. Thus, the study of the various turbulent viscosity models is a matter of programming the model into the subroutine where such calculations are performed. A wide range of eddy viscosity relations can therefore be studied in a few parametric runs. A typical three-dimensional calculation at a point on a body requires 3 seconds of IBM 360/65 computer time, so that extensive parametric studies can be performed quickly and economically. Author

N73-15004 Technische Hochschule, Stuttgart (West Germany). Inst. fuer Aerodynamik und Gasdynamik.
DESIGN OF AIRFOILS WITH HIGH LIFT AT LOW AND MEDIUM SUBSONIC MACH NUMBERS
F. X. Wortmann *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 9 p refs (For availability see N73-14998 06-02)

The design of airfoils with high lift at low and medium subsonic speeds is discussed. It is stated that the maximum lift of a symmetrical airfoil at low Mach numbers can be increased from 15 to 20 percent if the airfoil nose is modified and designed to yield lower velocity peaks and less pronounced laminar separation bubbles. The performance of the airfoil at various subsonic speeds and angles of attack is described. Author

N73-15005 National Aerospace Lab., Amsterdam (Netherlands).
COMMENTS ON THE METHODS DEVELOPED AT NLR FOR CONDUCTING TWO DIMENSIONAL RESEARCH ON HIGH LIFT DEVICES
O. DeVries *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 7 p refs (For availability see N73-14998 06-02)
Avail: NTIS

Two experimental approaches for analyzing two dimensional flow on high lift devices are described. The first method consists of pressure measurements at the mid-span section of a two dimensional wing with boundary layer control at the tunnel wall-wing junctions by blowing slots. The second approach consists of potential flow calculations by means of a singularity method with a source distribution on the contour of the airfoil. This is applied with a limited number of contour points on the airfoils. The calculations are compared with the experimental results. Author

N73-15006 Avions Marcel Dassault, Saint-Cloud (France).
BLOCKAGE CORRECTIONS IN BLOWING TESTS OF EFFECTS OF TAKE-OFF [CORRECTION DE BLOCAGE DANS LES ESSAIS EN SOUFFLERIE EFFETS DES DECOLLEMENTS]
Jean-Ch. Vayssaire *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 22 p refs In FRENCH, ENGLISH summary (For availability see N73-14998 06-02)

The application of blockage corrections to wind tunnel test measurements made on aircraft models is discussed. The procedure corrects the velocity to infinity upstream and restores to the wall-affected aerodynamic coefficients the values which are fairly equivalent to those obtained on a model placed in an unlimited fluid stream. The corrective blockage terms which modify the reference kinetic pressure are analyzed. The terms are affected by volume, wake, and separations. Each of them is usable in incompressible, compressible, two dimensional, and three dimensional flows on whole or half models. Author

N73-15007 Douglas Aircraft Co., Inc., Santa Monica, Calif.
AERODYNAMICS IN HIGH LIFT AIRFOIL SYSTEMS
A. M. O. Smith *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 27 p refs (For availability see N73-14998 06-02)

The aerodynamic processes that occur in flow past unpowered multi-element airfoils in the high lift attitude are discussed. Charts showing permissible pressure recovery for retarded flows are presented. The best possible load carrying pressure distributions are described, as well as airfoils that develop the maximum possible lift in fully attached flow. It is shown that for a given optimum type of pressure distribution a two-element airfoil can develop more lift than a single element airfoil shaped to develop the same pressure distribution. Author

THE LOW SPEED STALLING OF WINGS WITH HIGH LIFT DEVICES
D. N. Foster *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 12 p refs (For availability see N73-14998 06-02)

The mechanism of the stall of wing sections with high-lift devices in two dimensional flow is discussed. The similarities to the stalling mechanism for single airfoils, and the differences which arise as a result of the close proximity of the multiple lifting elements of the wing section to each other are described. The effect of sweepback is discussed for an infinite sheared wing and for a finite aspect ratio wing with high lift devices. The effects of practical features such as part-span flaps, and flap and slat support brackets, are illustrated by reference to flow patterns measured on a swept back wing. Author

A SIMPLIFIED MATHEMATICAL MODEL FOR THE ANALYSIS OF MULTIELEMENT AIRFOILS NEAR STALL
I. C. Bhateley and R. G. Bradley *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 12 p refs (For availability see N73-14998 06-02)

Potential-flow analysis methods, based on distributed-singularity models, are adequate for the prediction of aerodynamic characteristics for 2-D multiple-airfoil systems where viscous effects are negligible. However, for analysis and design of high-lift systems where viscous effects dominate, potential-flow methods are not adequate. In order that these viscous effects may be accounted for, a method has been formulated by which a solution is obtained through analysis of an equivalent airfoil system in potential flow. The mathematical model for the equivalent system consists of a linearly varying vorticity distribution over the surface of each airfoil element and a source distribution embedded inside each airfoil element to simulate the separated wake. The boundary-layer displacement thickness is superimposed on the airfoil contour to form an equivalent airfoil surface for each element. The flow downstream of a separation point is allowed to develop as a free streamline flow with no surface boundary conditions. The mathematical model is evaluated for cases where the location of the separation point is specified from experimental data. The predicted chordwise pressure distributions are shown to correlate well with experimental data for several multiple airfoils (including leading edge slats and trailing-edge slotted flaps) for angles of attack near stall. Author

THE EFFECT OF LEADING EDGE GEOMETRY ON HIGH SPEED STALLING
G. F. Moss, A. B. Haines (Aircraft Res. Assoc.), and R. Jordon (Aircraft Res. Assoc.) *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 16 p refs (For availability see N73-14998 06-02)

It is shown by means of an example how small modifications to the leading-edge profile of a sweptwing can result in large effects on lift performance at the stall in the higher range of subsonic speeds. The basic types of leading-edge pressure distribution for any one fixed geometry over the whole range of subsonic speed are discussed and the difficulties in designing a profile shape which gives a satisfactory compromise in wing performance across this range is emphasized. Two types of variable-geometry device at the leading edge are discussed, each of which allows some degree of optimization in the shape required for good aerodynamic performance across the range of Mach numbers. Author

A PRACTICAL LOOK AT THE STALL AND HIGH LIFT OPERATION OF EXTERNALLY BLOWN FLAP STOL TRANSPORT CONFIGURATIONS
David J. Moorehouse *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 13 p refs (For availability see N73-14998 06-02)

Some practical design aspects of the stall of powered-lift aircraft having externally blown flaps are considered. Techniques are examined for predicting the increment in maximum lift coefficient due to power. Numerical results are presented for an existing theory based on the assumption of a leading-edge stall and the use of basic jet-flap theory. The accuracy of the theory is better than might be expected, and an empirical factor is added to produce good correlation with measured values. A completely empirical approach is shown to be effective as a simple technique to provide quick approximations to the increment in maximum lift coefficients. Author

STALL/POST-STALL CHARACTERISTICS OF THE F-111 AIRCRAFT
Charles A. Anderson *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 9 p (For availability see N73-14998 06-02)

The stall/post-stall characteristics of the F-111 aircraft are described. The characteristics have been defined on the basis of wind tunnel tests, free-flight model tests, radio controlled drop model tests, analytical analysis, and flight tests. The extent of each type of testing is discussed and a summary of the results is presented. A discussion of the regression techniques used to obtain aerodynamic derivatives in the high angle of attack simulator is included. Author

POST-STALL AERODYNAMICS OF THE HARRIER GR1
Cliff L. Bore *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 7 p refs (For availability see N73-14998 06-02)

The post-stall aerodynamics of the Harrier GR1 aircraft are discussed. The requirement to achieve high usable lift coefficients during maneuvering at subsonic speeds, without incurring a weight penalty for leading edge devices is described. The resulting characteristics of boundary layer separation after buffet onset are analyzed. The effects of arrays of fences and vortex generators are examined. Author

PREDICTING THE LOW SPEED STALL CHARACTERISTIC OF THE BOEING 747
John K. Wimpress *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 9 p (For availability see N73-14998 06-02)

The pre-flight estimates for the Boeing 747, based on wind tunnel data obtained at a Reynolds Number of approximately 1 million, are presented. These test results were adjusted to full scale flight values using correlation factors developed from other Boeing transport airplanes. As an independent check, high lift data were obtained in a pressurized wind tunnel up to a Reynolds Number of 7.5 million and extrapolated to the full scale value of 40 million. Flight results show that the correlation factors were moderately successful in predicting stall speeds. Also, extrapolating the pressure tunnel data to full scale Reynolds Numbers predicted the flight value of maximum lift coefficient with reasonable accuracy. The wind tunnel data at all Reynolds Numbers predicted satisfactory handling characteristics throughout the stall that were confirmed during flight testing. Author

ON AIRFLOW SEPARATION AND BUFFET ONSET DURING FIGHTER AIRCRAFT MANEUVERING
Peter J. Butkewicz *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 10 p refs (For availability see N73-14998 06-02)

An experimental flight test program was sponsored to determine the buffet characteristics of four high performance aircraft. The aircraft were flown in transonic maneuvers encountering conditions of buffeting onset through heavy buffeting. The aircraft were instrumented with accelerometers, wing root strain gages, wing static pressure taps, and one wing was tufted for flow visualization photographs. The aircraft were flown in the baseline configuration as well as with various deflections of leading and trailing edge flaps. The results of the flight test program, the effects of mechanical high lift devices on buffet, and some wind tunnel/flight test correlations are presented. Author

THE DYNAMIC ANALYSIS OF BUFFETING AND RELATED PHENOMENA
J. G. Jones *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 10 p refs (For availability see N73-14998 06-02)

A dynamic analysis of buffeting and related aerodynamic phenomena is presented. The closed-loop interaction between the fluid motion, involving separated flow, and the motion of the wing surface is analyzed. The problem of formulating an appropriate theoretical model for buffeting is discussed. An analogous problem concerning the choice of appropriate analytical models for oscillatory rigid-body motion, known as wing rocking, is examined. Buffeting measurements obtained from flight tests of small combat trainer aircraft are included. Author

MANEUVER AND BUFFET CHARACTERISTICS OF FIGHTER AIRCRAFT
Edward J. Ray (McDonnell Aircraft Co., St. Louis), Linwood W. McKinney, and Julian C. Carmichael *In* AGARD Fluid Dyn. of Aircraft Stalling Nov. 1972 11 p refs (For availability see N73-14998 06-02)

The high subsonic and transonic characteristics of fighter aircraft and the factors affecting aerodynamic boundaries, such as maximum obtainable lift, buffet onset, pitchup, wing rock, and nose slice are discussed. Investigations were made using a general research configuration which encompassed a systematic matrix of wing design parameters. These results emphasized the sensitivity to section and planform geometry at the selected design point. The incorporation of variable-wing-geometry devices in the form of leading-edge slats or flaps was shown in a number of flight and wind-tunnel studies to provide controlled flow over a wide range of flight conditions and substantial improvements in maneuver capabilities. Additional studies indicated that the blending of a highly swept maneuver strake with an efficient moderately swept wing offers a promising approach for improving maneuver characteristics at high angles of attack without excessive penalties in structural weight. MISSION EFFECTS ON STABILITY AND MANEUVERABILITY
Charles B. Westbrook *In* AGARD Stability and Control Nov. 1972 13 p refs (For availability see N73-16989 08-02)

The relationship between the mission requirements of a piloted aircraft and its stability and maneuverability are defined. The framework utilized in current U.S. Air Force handling qualities requirements, i.e., classification of aircraft, flight phases, levels, states, etc., is described. Examples of various aircraft designed for one mission and then utilized for other missions are given. A discussion is presented of the problems encountered when the detailed mission requirements are not clear, such as with V/STOL aircraft, reentry vehicles, etc. Problems encountered with off-design conditions and operation at the limits of the flight envelope are discussed with examples. The various methods open to the designer for achieving the proper compromises in design of an aircraft are outlined.

THE ROLE OF THEORY AND CALCULATIONS IN THE REFINEMENT OF FLYING QUALITIES
W. J. G. Pinsker *In* AGARD Stability and Control Nov. 1972 13 p refs (For availability see N73-16989 08-02)

The present state of the art in handling qualities research and design is broadly surveyed with particular emphasis on the role of theory and paper studies in this field. The significance and scope of handling criteria is critically discussed as setting targets for flying qualities design. The capabilities and limitations of theory are then considered in such areas as derivative prediction, rigid-body stability and response calculations, predictions of stability under partial constraint and under active pilot control. Finally some general consideration is given to novel flying qualities problems associated with the introduction of stability and control augmentation systems.

FLY-BY-WIRE AND ARTIFICIAL STABILIZATION DESIGN
R L Schoenman *In* AGARD Stability and Control Nov. 1972 13 p (For availability see N73-16989 08-02)

The implementation of artificial stabilization to correct serious stability and control deficiencies is discussed for meeting the performance demands for aircraft which operate over a broad flight envelope such as VTOL, STOL, and SST. For this class of aircraft safety-of-flight is dependent on the integrity of these systems, and has resulted in the development of redundant system designs. The conventional SAS design approach is compared to that recommended for those vehicles which require augmentation for safety-of-flight. The impact of system redundancy on maintainability and operating costs is also discussed. A system is proposed which features integration of critical flight functions, and the use of digital computation to simplify system complexity Author

THE ROLE OF THEORETICAL STUDIES OF FLIGHT DYNAMICS IN RELATION TO FLIGHT TESTING
H. H. B. M. Thomas *In* AGARD Stability and Control Nov. 1972 13 p refs (For availability see N73-16989 08-02)

It is argued that calculations have an important role to play in the planning of, the conduct of, and the analysis of flight tests. This is especially true of those areas of flight testing which involve maneuvers near limiting flight conditions in which preflight calculations are invaluable in arriving at a clearer definition of the objective of a test. Provided the aerodynamic forces acting on the aircraft can be adequately and reliably represented, there is inherent difficulty about undertaking the solution of the equations of motion in an appropriate number of degrees of freedom with the aid of available digital computers. The real problem, therefore, lies in reducing to a manageable form the output of such computer studies and thereby achieving a deeper understanding of and a more ready interpretation of the results. As an illustrative example, the longitudinal motion of an aircraft involving an extended angle-of-attack range is considered. Author

THE OPERATION OF HELICOPTERS FROM SMALL SHIPS
J. B. B. Johnston *In* AGARD Advanced Rotorcraft Vol. 1 Feb. 1973 15 p (For availability see N73-21008 12-02)

Procedures for operating helicopters from the decks of small ships are discussed. The subjects presented are (1) an overall view of the operation, (2) types of helicopters in use, (3) types of ships used, (4) problem of deck size and superstructure, (5) nature and effect of air flow around the ship, and (6) problem of ship motion. Preliminary flight tests to investigate the identified problems are reported. Author

GREATER SAFETY, MAINTAINABILITY, AND RELIABILITY THROUGH IMPROVED HELICOPTER FLIGHT TESTING

Gerald E. Swecker *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 15 p refs (For availability see N73-21008 12-02)

Data obtained from helicopter flight test programs are presented. Greater safety, maintainability, and reliability are being assured through constantly improved flight testing techniques and the use of state-of-the-art instrumentation, data acquisition, and data reduction equipment. More stringent helicopter performance criteria are placing greater demands on the test agencies to devise new methods and procedures for collecting and analyzing data. Included are such programs as: (1) the AH-1G (Cobra) helicopter and a simplified approach to finding height loss during dive recovery from throttle chops; (2) recommendation of limiting AH-1G tail rotor control; (3) OH-6A g loads experienced at high frequencies during weapons firing; (4) recommended pilot cues to define a safe AH-1G envelope following engine failure; (5) investigation of large sideslip and pitch excursions following throttle chops in the TH-55 helicopter; (6) identification of requirements for AH-1G instrument-flight-rule (IFR) evaluation; (7) results from OH-58 and AH-1G helicopter height-velocity (H-V) (autorotational) testing with discussion of application to operational use; and (9) AH-1G maneuvering limits from return-to-target profiles. Tests conducted with the AH-1G helicopter determined return-to-target time, height lost during pullout from a dive, and other maneuvering characteristics. The concept of energy maneuverability has been established, and significant data have been added to the literature. Author

A NEW LOOK AT HELICOPTER LEVEL FLIGHT PERFORMANCE

Allen B. Hill *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 9 p (For availability see N73-21008 12-02)

Helicopter level flight performance data are presented as power coefficient (c sub p versus tip speed or advance ratio for a range of thrust coefficients (c sub t)). This data presentation was developed from momentum and blade element theory. The power coefficient is a nondimensional expression for the main rotor shaft horsepower required. The main rotor shaft horsepower required consists of profile, parasite and induced power. The advance or tip speed ratio is a nondimensional ratio of flight and main rotor rotational speed. The thrust coefficient is a nondimensional expression for thrust required. It should probably be called the weight coefficient, since vertical drag is normally ignored, and thrust is replaced by gross weight. A representative classic helicopter level flight performance curve is presented. Author

INFLUENCE OF ELASTIC COUPLING EFFECTS ON THE HANDLING QUALITIES OF A HINGELESS ROTOR HELICOPTER

G. Reichert and H. Huber *In* Agard Advanced Rotorcraft, Vol. 1 Feb. 1973 15 p refs (For availability see N73-21008 12-02)

Stability and control of a helicopter with a hingeless rotor system is mainly influenced by the elastic flapping motion of the rotor blades. On a rotor with torsionally flexible blades or elasticity in the control system there can be additional aeroelastic effects, which act as control inputs on the blades. After a short description of the rotor system and the analytical model, the reasons and the influences of elastic coupling effects on the stability and control behavior of a hingeless rotor helicopter are discussed. There are effects which result from the aerodynamic characteristics and from the chordwise mass-distribution on the blade. Additional coupling effects result from flapping and inplane deflections out of the pitching control axis similar to a pitch-flap-lag-coupling. Theoretical results are compared with flight test data. GROUND AND FLIGHT TEST EXPERIENCE WITH THE WESTLAND SCOUT HINGELESS ROTOR HELICOPTER

D. E. H. Balmford *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 12 p (For availability see N73-21008 12-02)

The flight test experience gained during the basic clearance of a Westland Scout helicopter fitted with a reduced scale version of the hingeless rotor system is discussed. The basic clearance was aimed at producing an aircraft with sufficient capability to embark upon a series of research tasks and as such was devoted to investigating the airworthiness and handling of the aircraft broadly within the limit of the flight envelope of the standard production Scout fitted with an articulated rotor. Provided that these limits could be approached reasonably closely it was considered that the aircraft would be adequate for its research tasks. A statement of the present status of flight testing of the Lynx helicopter is included. Author

SURVEY OF ROTARY WING LOADS AND STABILITY ANALYSIS PROBLEMS
H. I. MacDonald *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 6 p (For availability see N73-21008 12-02)

A survey of some of the problems encountered in the prediction of structural design loads and aeroelastic stability margins during the development of rotary wing aircraft is presented. The importance of accurate prediction of structural design loads for improved reliability performance, and stability of aircraft is stressed. Variations in analysis methods employed by various manufacturers are discussed. The complexity involved in the prediction of rotary wing loads and aeroelastic stability, the effects on cost effectiveness, and areas where complex analysis is advantageous are reported.

EVALUATION, DEVELOPMENT, AND ADVANTAGES OF THE HELICOPTER TANDEM DUAL CARGO HOOK SYSTEM
Gregory J. Wilson and Newton N. Rothman *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 8 p refs (For availability see N73-21008 12-02)

Helicopter transport of external cargo for military applications, efficient use of available rotary-wing equipment, and enhancement of aircraft safety is examined. Improvements in this technique could provide the transport of external cargo at the maximum speed of the helicopter, routine operation under instrument flight rules (IFR), precise placement of the load, and could eliminate the problems in hover such as the dust cloud and static electricity. Feasibility studies have shown the potential of the tandem dual hook concept as a viable base on which to build an improved cargo-handling system. Production incorporation of a dual cargo hook system is planned for the heavylift helicopter (HLH). The system incorporates other features such as variable longitudinal hook positioning, differential winching, load motion feedback, and augmentation of the cargo system operator's vision under conditions of poor light and thick dust. The requirements for an improved helicopter external cargo-handling system, the programs which have established the feasibility of a tandem dual cargo hook system, and the system slated for the heavy-lift helicopter are reported.

FIELDS OF APPLICATION OF JET FLAPPED ROTORS
M. Kretz *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 12 p refs (For availability see N73-21008 12-02)

Analysis of the field of application of the jet-flap rotor shows the cost-effectiveness of this technique when applied to heavy helicopter and stoppable rotor designs. Comparison with equivalent mechanically driven heavy-lift rotorcraft shows empty-weight gains of 30 to 40 percent. Initial cost gains for these vehicles is even higher, approaching 50 percent. The feasibility of an aircraft having a 0.85 Mach number capability and possessing a stoppable and stowable nonfolding two-bladed rotor has been established. The weight analysis also demonstrates the attraction of the jet-flap concept, which combines the features of both low weight and low cost, with a long duration hovering capability. The jet-flap rotor thus makes it possible for the same aircraft to have the high airspeed characteristics of a modern airplane coupled with the lowspeed advantages of a helicopter.

SURVEY OF TILT ROTOR TECHNOLOGY DEVELOPMENT
K. B. Gilmore *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 11 p refs (For availability see N73-21008 12-02)

A review is made of the development of tilt rotor technology since the XV-3 program in the late 1950's. A brief comparison of the capabilities of the tilt rotor with other rotary wing configurations for a transport mission is shown. Tilt rotor performance and dynamic model tests are described. Analytical methodology development is reviewed and predictions are shown to compare well with model test data in the areas of performance, aeroelastic stability and flying qualities. It is concluded that the technology is now in hand to develop a prototype vehicle.

DEVELOPMENT OF THE ABC ROTOR
Robert K. Burgess *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 17 p refs (For availability see N73-21008 12-02)

The development of the advancing blade concept (ABC) rotor

is traced from conception through small scale model wind tunnel testing, full scale analysis, design, fabrication and ultimate wind tunnel testing of a 40 ft diameter rotor. The principal design tradeoffs resulting from the early analyses and testing are discussed along with their expected impact on the full scale rotor characteristics. Materials and manufacturing methods employed are covered including the more important difficulties that were surmounted during the nearly five years of development. Finally, the major test programs are outlined including blade balancing, turbine test bed operation and full scale wind tunnel testing facility up to speeds of 180 knots and advance ratios of .91. Significant results of these tests are presented, and applications to aircraft systems discussed. Author

RAE EXPERIENCE IN THE USE OF A PILOTED GROUND-BASED SIMULATOR FOR HELICOPTER HANDLING STUDIES
T. Wilcock *In* AGARD Advanced Rotorcraft, Vol. 1 Feb. 1973 12 p refs (For availability see N73-21008 12-02)

Two studies using a ground-based piloted flight simulator for the assessment of helicopter handling qualities are described. The first simulation, of a Westland Wessex, was performed to establish the simulation techniques required for effective representation of handling behaviour. The second study was of the Westland Lynx, and was conducted prior to the first flight of that helicopter in order to provide assistance in the early development program. Results of the two simulations are discussed, and the experience gained from these tests is used to suggest some requirements for valid simulation. Author

ROTOR WAKES: KEY TO PERFORMANCE PREDICTION
Anton J. Landgrebe and Marvin C. Cheney, Jr. *In* AGARD Aerodyn. of Rotary Wings Feb. 1973 19 p refs (For availability see N73-21031 12-02)

The history of helicopter performance prediction methods and the influence of rotor wakes are traced from the simple momentum techniques used in the early years of propellers and rotors to the current state-of-the-art computer programs simulating the rotor's complex vortex structure. Analytical and experimental techniques are described which define the geometry of the vortex field of a hovering rotor and its effect on rotor performance. It was concluded that the most important factor which influences the prediction of hover performance was the interference caused by the tip vortex during its first revolution. Integrated performance in forward flight was generally not sensitive to variable inflow; however, when combined with unsteady airfoil data, variable inflow produced significant effects on blade torsional responses. AN ACTUATOR DISC THEORY FOR ROTOR WAKE INDUCED VELOCITIES
Robert A. Ormiston *In* AGARD Aerodyn. of Rotary Wings Feb. 1973 19 p refs (For availability see N73-21031 12-02)

A general actuator disc theory is presented for predicting the time-averaged downwash distribution and steady state force and moment response characteristics of helicopter rotors in forward flight. Particular attention is given to a proper definition of the rotor potential flow problem. The formulation of the theory is conceptually based on classical fixed wing lifting-line theory to enhance its versatility and provide insight about the complex physical features of the rotor downwash distribution. The method of solution expresses the rotor downwash in a fourier series where the coefficients are given as a summation of influence functions. It is shown that the rotor wake vorticity can be assumed to lie in a flat planar wake for a wide range of flight conditions, thus simplifying the Biot-Savart integration for the downwash. The vorticity elements in the flat planar wake are decomposed into simple circular and linear elements to further simplify the integrations. Author

THE STRUCTURE OF THE ROTOR BLADE TIP VORTEX
C. V. Cook *In* AGARD Aerodyn. of Rotary Wings Feb. 1973 14 p refs (For availability see N73-21031 12-02)

The results of a set of experiments to measure the velocity distribution through a helicopter rotor blade tip vortex are presented. The experiments were conducted on a single full scale rotor blade operating at a representative tip speed on a whirl tower. The rotor was mounted in the inverted position (thrusting downward) to reduce the ground effects and produce a steady flow through the rotor. The vortex velocity distributions were measured for a range of vortex ages and a number of blade loadings, the highest of which was above that normally associated with a hovering rotor. A vortex "age" range in terms of blade rotation of approximately 70 to 380 degrees of azimuth was covered. Flow visualisation using smoke was employed to determine the trajectory of the vortex and a hot wire anemometer to measure the induced velocities associated with the tip vortex. Author

A VORTEX ANALYSIS OF A SINGLE BLADED HOVERING ROTOR AND A COMPARISON WITH EXPERIMENTAL DATA
Robin B. Gray and George W. Brown *In* AGARD Aerodyn. of Rotary Wings Feb. 1973 14 p refs (For availability see N73-21031 12-02)

A theoretical method is developed for determining the geometry and strength distribution of the vortex wake generated by a single-bladed hovering helicopter rotor. The analysis begins with a simple model of the ultimate wake geometry and then proceeds to establish the corresponding nondimensional tip-vortex strength. This simple vortex-wake model is adjusted by procedures that are based on the Biot-Savart law to obtain a first approximation for the tip-vortex geometry. Next, an estimate of the blade collective pitch angle is found from blade-element considerations. Then, a first approximation for the geometries and strengths of the vortex-sheet filaments that are shed from the blade trailing edge is determined by marching inboard from the blade tip. Thus, a simultaneous solution for the filament strengths is not required. Futher adjustments to the wake geometry, the strenghts of the inboard filaments, and the collective pitch are made until succeeding changes become acceptably small. Author

ROTOR REQUIREMENTS BEYOND THE USUAL FLIGHT

DOMAIN OF ONERA LARGE WIND TUNNEL AT MONDANE [COMPORTEMENT D'UN ROTOR AU-DELA DU DOMAINE DE VOL USUEL A LA GRANDE SOUFFLERIE DE MODANE]

Michel Lecarme *In* AGARD Aerodyn of Rotary Wings Feb 1973 14 p In FRENCH. ENGLISH summary (For availability see N73-21031 12-02)

Several series of tests have been performed on a 4.150 meter diameter experimental rotor in the large wind tunnel The blades stiffness and available power of test equipment in the wind tunnel made a number of measurements and visualizations possible in some severe configurations and at high tip speeds. During the exploration of the test envelopes for various sets of blades, a tip speed ratio of .87 was reached, the retreating blade stall was studied at several values of preset parameters, such as: wind speed, rotor tip speed, rotor shaft tilt, and collective pitch The present rotor head is not provided with cyclic pitch control Operating limits for a conventional rotor were determined in terms of tip speed ratio Development of retreating blade stall is affected by the reverse flow area and vortex interactions and this stall produces disturbances which increase as the tip speed ratio decreases Author

AERODYNAMIC FACTORS INFLUENCING OVERALL HOVER PERFORMANCE

Evan A Fradenburgh *In* AGARD Aerodyn of Rotary Wings Feb 1973 11 p refs (For availability see N73-21031 12-02)

Improvements in basic rotor design practice are described and results of several series of model rotor tests are discussed Moderate values of blade root cutout are shown to have an unanticipated effect on hovering efficiency A large root cutout decreases figure of merit of the rotor, but also reduces vertical drag of a typical airframe below the rotor, cutting the aerodynamic penalty to about half of what tests of the rotor alone would indicate Tests of a tilt-rotor model show that, unlike the conventional single rotor helicopter configuration, the rotors do not benefit from a partial ground effect caused by the airframe in the rotor downwash field The relationship of blade twist and ground effect is discussed, and the influence of ground proximity on vertical drag is presented It is shown that net airframe vertical drag can be zero or negative when the aircraft is close to the ground Additional systematic experimentation is clearly needed, as is the development of theory to cover the various relationships involved in overall hover efficiency Author

THE DEVELOPMENT OF AN EFFICIENT HOVERING PROPELLER ROTOR PERFORMANCE PREDICTION METHOD

D C Gilmore and I S Gartshore (British Columbia Univ.) *In* AGARD Aerodyn of Rotary Wings Feb 1973 24 p refs (For availability see N73-21031 12-02)

The development of a method for predicting the performance of heavily loaded propellers and rotors in steady hovering flight is described The method has two particularly useful characteristics: (1) certain simplifying assumptions which allow consistency in the analytical model to be achieved with only a few small scale iterations and (2) a need for only a part of the wake to be specified The analytical model built up from three basic elements, includes a single vortex filament shed from the tip of each blade, a vortex sheet shed inboard of the point of maximum bound circulation on each blade, and an outboard sheet rolling up to form the tip vortex at an arbitrary angle Roll-up angle affects the circumferential variation of induced velocity components but not their mean values Application of the method to three propellers shows that accuracy of results is dependent upon realism of the assumed wake geometry Author

A COMPRESSIBLE UNSTEADY THEORY FOR HELICOPTER ROTORS

Charles E Hammond and G Alvin Pierce (Ga Inst of Tech.) *In* AGARD Aerodyn of Rotary Wings Feb 1973 15 p refs Prepared in cooperation with Army Air Mobility Res and Develop Lab., Ft Eustis, Va (For availability see N73-21031 12-02) (Contract DAHC04 68 C 0004)

An aerodynamic theory is presented which allows the determination of the unsteady aerodynamic loading on a reference section of a helicopter rotor blade in axial or hovering flight under compressible flow conditions The aerodynamics of the two-dimensional flow model are formulated using a kernel function approach By introducing the acceleration potential the governing integral equation for the flow and its attendant downwash boundary condition are developed and solved numerically using

a pressure mode assumption and a collocation technique The compressible aerodynamic theory thus developed is compared analytically with two other existing theories, one incompressible and one compressible, and is shown to agree with these theories provided that the appropriate limit is taken so that the flow models agree The ratio of blade oscillatory frequency to rotor rotational frequency is shown to be the correlation parameter between the two flow models Author

SOME ASPECTS OF THE DESIGN OF ROTOR-AIRFOIL SHAPES
G Reichert and S N Wagner *In* AGARD Aerodyn of Rotary Wings Feb 1973 22 p refs (For availability see N73-21031 12-02)

Analytical studies have shown that performance, stability and control of helicopters can be improved if some characteristics of rotor airfoils could be changed Starting from given airfoil shapes the characteristics of these airfoils are idealized by changing lift curve slope, maximum lift boundary and beginning of drag divergence The influences of these changes on the power required, the stability and control of hingeless rotor helicopters are studied Furthermore, the desirable characteristics of an airfoil or several airfoils of a rotor are defined using these idealized characteristics and analysing common missions of a given helicopter Similar studies of a larger field of missions and helicopters could lead to new areas of research and development to design advanced profile shapes of helicopters of the future Several analytical tools for the design of airfoils are discussed Author

RECENT DEVELOPMENTS IN ROTOR BLADE STALL
W J McCroskey *In* AGARD Aerodyn of Rotary Wings Feb 1973 13 p refs (For availability see N73-21031 12-02)

Developments in techniques for analyzing boundary layers of rotary wings are discussed The basic effects of rotation and crossflow due to forward flight have been identified and found to be insignificant for most cases of practical interest in helicopter aerodynamics Within the framework of classical thin boundary theory, unsteady viscous effects are also small Unsteady viscous-inviscid interaction appears to play an important role in retreating blade stall The characteristics of retreating blade stall are described based on vortex-like disturbance from the leading edge of the rotor blade Author

N73-21047 Royal Aircraft Establishment, Farnborough (England)
THE DERIVATION AND VERIFICATION OF A NEW ROTOR PROFILE ON THE BASIS OF FLOW PHENOMENA, AEROFOIL RESEARCH AND FLIGHT TESTS
H H Pearcey, P G Wilby, M J Riley, and P Brotherhood *In* AGARD Aerodyn of Rotary Wings Feb 1973 18 p refs (For availability see N73-21031 12-02)

An account is given of some of the considerations that governed the derivation of new profiles to be incorporated in the design of the rotor blades for the Lynx helicopter at its inception The changes relative to the NACA 0012 profile were conservative but were chosen to give consistent and significant all-round improvements to the shock-induced limits on the advancing blade to the retreating-blade thrust limits and to the loading that could be sustained without shock wave drag in hover The conservatism applied especially to the stalling characteristics which play such a dominant part in limiting rotor performance but which are so difficult to predict for the rotor environment The profiles were derived on the basis of steady flow aerofoil tests, but qualitatively similar improvements have been verified in oscillatory aerofoil tests and in flight A technique used in the latter tests is described for measuring pressure distributions along the blade chord and across the blade wake in the region of the rotor tip in flight Author

N73-21048 Army Air Mobility Research and Development Lab , Moffett Field, Calif
THE EFFECT OF PLANFORM SHAPE ON THE TRANSONIC FLOW PAST ROTOR TIPS
W F Ballhaus and F X Caradonna *In* AGARD Aerodyn of Rotary Wings Feb 1973 12 p refs (For availability see N73-21031 12-02)

A numerical relaxation algorithm capable of calculating the transonic inviscid flow about arbitrary planform rotors has been developed The essential feature of this method is a transformation in which arbitrary planforms are converted to rectangles and all boundary condition problems are transferred to the equation of motion Preliminary numerical calculations are presented for blades of various sweeps and profiles It is seen that three-dimensional effects remove sweep effects and can cause shocks which are locally more severe than would occur in less swept or even unswept planforms The method presents itself as a means of checking various rotor configurations before any tests are made Author

FUNDAMENTAL CONSIDERATION OF NOISE RADIATION BY ROTARY WINGS
Martin V. Lowson. *In* AGARD Aerodyn. of Rotary Wings. Feb. 1973. 18 p. refs. Sponsored by NASA and Natl. Gas Turbine Estab. (For availability see N73-21031 12-02)

An historical review of progress in understanding of rotor noise is presented. Initial work was principally on propellers, but has many obvious applications to noise from rotary wings. Current understanding of rotor noise radiation is then reviewed in some detail. The principal noise sources appear to be (1) discrete frequency due to distorted inflow, (2) low frequency broadband due to turbulent inflow, and (3) high frequency broadband due to tip effects. On a helicopter rotor each of these sources seems to be intimately connected with the shed vortex wakes. Tip modifications offer one method for controlling the effects. The implications for the designer are discussed. Rotor subjective noise levels appear to obey a velocity to the eighth power law, independent of thrust. Experiments to rectify some of the present deficiencies in knowledge are suggested. Author

WAKE CHARACTERISTICS OF A TWO DIMENSIONAL ASYMMETRIC AEROFOIL
Ibrahim Kavrak. *In* AGARD Aerodyn. Rotary Wings. Feb. 1973. 7 p. refs. (For availability see N73-21031 12-02)

The process by which dipole noise is generated by the turbulent wake behind an airfoil is discussed. The characteristics of the wake are investigated and compared to the drag and lift coefficients as well as the noise radiated. It is concluded that both the drag coefficient and the generated noise are closely related to the turbulent shear in the separated flow area. The maximum velocity defect is shown to be an important parameter which affects both the performance and the noise intensity. Author

MEASURE OF HELICOPTER NOISE DURING FLIGHT [MESURES DE BRUIT D'HELICOPTERES EN VOL]
Fernand DAmbra, Jean-Pierre Dedieu, and Alain Julienne (ONERA, Chatillon, France). *In* AGARD Aerodyn. of Rotary Wings. Feb. 1973. 15 p. refs. In FRENCH, ENGLISH summary (For availability see N73-21031 12-02)

Noise measurements have been performed on several helicopters. These tests were aimed toward a complete survey of helicopters' internal and external noise levels in several flight conditions. Data analysis of flyover tests follows conventional aircraft's acoustical certification procedure. Test results are corrected to duplicate nominal flight path and standard atmosphere conditions in several noise units. A statistical analysis of maximum noise levels has been performed and results are presented with their confidence level. The use of the trajectography equipment grants in addition the exact timing of acoustical spectra from which directivity patterns of noise radiated from the complete aircraft in flight and from particular noise sources can be obtained. Author

THE NOISE CHARACTERISTICS OF A LARGE CLEAN ROTOR
John W. Leverton. *In* AGARD Aerodyn. of Rotary Wings. Feb. 1973. 14 p. refs. (For availability see N73-21031 12-02)

A 2-bladed 56-ft diameter rotor was run on a tower in an inverted mode so that the problem of recirculation and the difficulties of measuring noise directivity characteristics could be overcome. This paper outlines the analysis procedure used and presents the detailed results obtained. From a practical point of view rotor noise can be considered to consist of rotational or discrete frequency noise, low frequency broadband noise and high frequency broadband noise. The spectrum characteristics and the directivity patterns of each of these sources have been examined as a function of the blade tip speed, the total rotor thrust and the measurement angle relative to the rotor disc plane. The trends associated with the overall noise, which is dependent on the relative magnitude of the individual sources, have also been studied. These results have been compared, where possible, with the trends given by theoretical and semiempirical prediction methods. Time history traces are also included, these show that even under ideal conditions rotor noise is impulsive in nature. Author

AIRCRAFT PERFORMANCE: PREDICTION METHODS AND OPTIMIZATION
J. Williams, ed. Mar. 1973. 345 p. refs. In ENGLISH and partly in FRENCH
(AGARD-LS-58) Avail: NTIS HC $19.25

The development and application of aircraft performance prediction methods are developed. The methods are applied to subsonic and supersonic aircraft. The basic topics discussed include (1) range and radius capabilities, (2) takeoff and landing operations, and (3) aircraft maneuvers. Problems of aerodynamic prediction, aircraft mass estimation, and engine selection are included. Parametric and optimization techniques for aircraft design synthesis are reported. For individual titles, see N73-24043 through N73-24054.

RANGE AND RADIUS-OF-ACTION PERFORMANCE PREDICTION FOR TRANSPORT AND COMBAT AIRCRAFT
Robert K. Page. *In* AGARD Aircraft Performance: Prediction Methods and Optimization. Mar. 1973. 32 p. refs. (For availability see N73-24042 15-02)

Numerical methods for determining the range and radius of action performance of transport and combat aircraft are presented. The data required for the prediction process are explained. Conditions which govern the choice of method to be used are analyzed. The following parameters are examined to show the effect on aircraft range: (1) optimum cruising speeds, (2) cruise height schedules and integrated range, (3) effect of various aircraft and engine characteristics. Mathematical models are included to support the theoretical concepts and tables of data are provided to show application of data. Author

INFLUENCE OF PILOT AND AIRCRAFT CHARACTERISTICS ON STRUCTURAL LOADS IN OPERATIONAL FLIGHT
J. R. Sturgeon May 1973 29 p refs
(AGARD-R-598) Avail: NTIS HC $3.50

Some aircraft handling problems met in operational conductions are described and compared with flight test conditions. It is concluded that errors in flight instrumentation and physiological cues have a substantial influence on control capability. A unified strategy for flight in all operational conditions is required to reduce these problems. A strategy, aimed at minimising structural loads and aerodynamic problems in all flight conditions, is proposed that will restore to pilot and autopilot flying the positive stability in pitch and yaw which is a classic requirement for aircraft operating in the stick free mode. Proposals are made for improving the requirements of flight instruments to reduce control problems during complex maneuvres and flight in severe wind shear conditions. Author

ESCAPE MEASURES FOR COMBAT HELICOPTER CREWS
Aug. 1973 39 p refs
(AGARD-AR-62) Avail: NTIS HC $4.00

A study was conducted to determine the requirements and characteristics of escape systems for use with helicopters. It was stated that escape systems are feasible but that the rotary wing creates the greatest obstacle to emergency seat ejection. It was recommended that helicopter escape concepts be considered under the following categories: (1) an escape system for retrofit into helicopters already in production or in service, (2) an escape system for a near term solution, and (3) an escape system for a far term solution. The conclusion of the study was that a retrofittable escape system is practical only if it requires an absolute minimum of development time and does require major changes to the helicopter. The only likely candidates to satisfy the requirement are manual bailout or sideward ejection. Author

ROTARY WING DESIGN METHODOLOGY
Andrew Z Lemnios *In* AGARD Specialists Meeting on Helicopter Rotor Prediction Methods Aug 1973 14 p refs (For availability see N74-10908 02-02)

A nonlinear aeroelastic blade loads analysis is described for calculating the coupled responses, airloads distributions and performance of helicopter rotors The analysis is divided into two major parts (1) calculation of blade transient stability behavior by means of linearized, coupled equations of motion, (2) calculation of periodic blade dynamics and airloads distributions using fully coupled, nonlinear equations of motion The analysis includes six response modes and two input control modes The equations of motion include all nonlinear inertial coupling effects and nonlinear aerodynamic effects such as reverse flow, Mach number variations, large induced flow angles, unsteady aerodynamics, and variable inflow Additional features to the analysis are the inclusion of feedback mechanical coupling among the assumed modes and the inclusion of springs and dampers for each mode Author

CURRENT LOADS TECHNOLOGY FOR HELICOPTER ROTORS
Richard Gabel *In* AGARD Specialists Meeting on Helicopter Rotor Prediction Methods Aug 1973 11 p refs (For availability see N74-10908 02-02)

Prediction of fatigue design loads is essential for proper sizing of helicopter rotor systems The C-60 rotor loads computer program is discussed It incorporates the effects of airfoil section geometry, compressibility, stall, three dimensional flow, unsteady aerodynamics, and nonuniform inflow to provide reliable rotor loads for steady-state flight conditions even into the blade stall region Rotor loads predictions are compared with actual flight test data from Boeing CH-47 and Model 347 helicopters An approach to component sizing is presented in which a fatigue design loads histogram is constructed using calculated steady-state flight loads and empirically determined maneuver loads Current efforts to improve rotor loads predictions through incorporation of fully coupled lag pitch-flap routines, simulation of control system dynamics, and development of maneuver loads programs are discussed Author

N74-10911 Advisory Group for Aerospace Research and Development, Paris (France)
PREDICTION OF HELICOPTER ROTOR LOADS
J Gallot *In its* Specialists Meeting on Helicopter Rotor Prediction Methods Aug 1973 8 p refs In FRENCH, ENGLISH summary (For availability see N74-10908 02-02)

The correct design of a rotor requires quite a precise knowledge of the alternating loads to which blade and hub are submitted The problem of the stress evaluation, from the early design stage, may lead very sophisticated methods, because the blade is operating in a very complex environment Nevertheless simplified methods may give sufficiently precise results to set up correctly the dimensions of the main elements of the rotor The method described here supposes simple aerodynamics, independent of blade elastic deformations The degree of simplification achieved in this theoretical method seems to be justified by the correlation obtained with experimental airloads measured on a model rotor and stresses recorded on the same rotor or a full-scale semi-articulated rotor Author

LOADS PREDICTION METHODS FOR HINGELESS ROTOR HELICOPTERS
G Reichert *In* AGARD Specialists Meeting on Helicopter Rotor Prediction Methods Aug 1972 12 p refs (For availability see N74-10908 02-02)

The special loading condition of the hingeless rotor helicopter is discussed For the prediction of the loads, the aeroelastic behaviour of the rotor blades including characteristic coupling effects has to be considered To determine the properties of the hingeless rotor system in an analytical approach, a mathematical model can be used, which simulates the aerodynamic and dynamic behaviour adequately There is good experience with an aerodynamically and dynamically equivalent system of an articulated

rotor with high hinge offset. Analytical data as well as flight test data will be shown for different flight conditions including maneuvers. There is relatively good correlation. The loads necessary for the structural design of the rotor can be predicted reasonably well. The methods are not satisfactory for control loads in stalled conditions and for high harmonic vibratory loads. Author

INTEGRATED ROTOR/BODY LOADS PREDICTION
R. M. Carlson and A. W. Kerr (Lockheed-Calif., Burbank) *In* AGARD Specialists Meeting on Helicopter Rotor Prediction Methods Aug. 1972 8 p refs (For availability see N74-10808 02-02)

An interdisciplinary analysis, which has grown out of a requirement for a nonlinear handling qualities evaluation tool, has been mechanized in a fashion which provides a capability to predict rotor loads affected by rotor/airframe interaction in steady-state and transient flight conditions. The modeling philosophy in developing this analysis combines the capabilities of a team of analysts from several specialties to create a versatile model which provides consistent data for numerous applications. This philosophy is presented in addition to a description of the model and a summary of its range of applications. Examples involving rotor loads prediction are presented: (1) evaluation of clearance between rotor blades and fuselage during extreme maneuvers, (2) estimation of four-bladed rotor reactionless inplane mode stability and loads, and (3) general maneuver capability and transient loads estimation. Also presented are areas proposed for continued development and refinement of the model to further increase the range of applications. Author

MARKINGS FOR PROPELLER CONSPICUITY
T. C. D. Whiteside (RAF Inst. of Aviation Med.) Sep. 1973 17 p refs
(AGARD-AR-58) Avail: NTIS HC $3.00

The general problem of marking propellers so that they may be seen is discussed. The propeller must be conspicuous to persons waiting near it when the aircraft is on the ground but, on the other hand, in taxying and in flight it must not be distracting or annoying to the pilot. Other factors to be considered are the conspicuity at low and at high rpm; the conspicuity against various backgrounds since markings easily visible against a dark ground may not be visible against a light ground; the use of coloured markings which, although easily seen on a stationary propeller, become desaturated when the propeller is turning, and finally, the presence of brightness and of colour contrast with the background. In theory, to obtain maximal brightness contrast, black and white markings should be used so that the blades may be seen against either light and dark background. As black matt paint may appear grey since it scatters incident light, the markings should be in a gloss finish. Author

REVIEW OF DATA AND PREDICTION TECHNIQUES FOR WIND PROFILES AROUND MANMADE SURFACE OBSTRUCTIONS
Walter Frost *In* AGARD Flight in Turbulence Nov. 1973 18 p refs (For availability see N74-17720 09-02)
(Contract NAS8-27387)

A review of experimental data and analytical models related to flow over bluff obstacles is presented to provide a survey of basic flow theory available to analyze atmospheric wind patterns and man-made surface obstructions. Primary emphasis is placed on the distortion of shear flows approaching and passing over buildings or bluff surfaces such as fences or steps. The various physical phenomena of pressure and velocity variation in the

separated flow regions surrounding the body, velocity profiles in the displaced flow over the body, and the origin and decay of induced turbulence along the boundaries of the separated regions are described. Author

PROGRESS IN THE MATHEMATICAL MODELLING OF FLIGHT IN TURBULENCE
O. H. Gerlach, G. A. J. VandeMoesdijk, and J. C. VanderVaart. *In* AGARD Flight in Turbulence Nov. 1973 38 p refs (For availability see N74-17720 09-02)

Problems of mathematical modelling of aircraft flight in turbulence are discussed. The simulation of flight in the lower atmosphere during the approach and landing portions of the flight are emphasized. The discrepancy between the usual Gaussian representation of atmospheric turbulence and the actual non-Gaussian atmosphere is analyzed. A parameter is introduced to characterize the actual turbulence sensed by the pilot. A method is presented for finding the range of altitudes at which the most significant disturbances are encountered during the approach. Author

N74-17726 British Overseas Airways Corp., London (England).
BOAC EXPERIENCE WITH TURBULENCE
Ernest Chambers. *In* AGARD Flight in Turbulence Nov. 1973 13 p (For availability see N74-17720 09-02)

The effectiveness of airborne radar in giving adequate warning of convective turbulence in clouds is discussed. Some encounters with turbulence in clear air are described and matters relating to the forecasting, reporting, and dissemination of turbulence occurrence are presented. The development of an airborne clear air turbulence detector is recommended and the performance requirements of the detector are developed. Problems with low level wind shear are also examined. Author

AIRCRAFT RESPONSE TO TURBULENCE-CREW COMFORT ASSESSMENTS USING POWER SPECTRAL DENSITY METHODS
Brian Young. *In* AGARD Flight in Turbulence Nov. 1973 9 p refs (For availability see N74-17720 09-02)

The effects of atmospheric turbulence on the efficiency of a flight crew are analyzed. The factors are identified as (1) atmospheric turbulence levels, (2) the characteristics of the aircraft in responding to turbulence, including the effects of structural modes, and (3) the tolerance of the crew to the level and duration of vibration at the crew station. The use of power spectral density techniques for assessing crew ride comfort is explained. In addition to defining aircraft response in both vertical and lateral turbulence, it is possible to include the effects of structural modes, assess the effects of autostabilization, and include crew proficiency degradation as a parameter in operational studies. THE DETECTION OF AIRCRAFT WAKE VORTICES
Ralph D. Kodis. *In* AGARD Flight in Turbulence Nov. 1973 9 p refs (For availability see N74-17720 09-02)

The hazards created by the trailing vortices deposited in the wakes of heavy jet aircraft are discussed. In the terminal area this hazard leads to longer separation standards and reduced runway capacity. In order to shorten the required separations without compromising safety it is necessary to be able to detect the presence and motion of vortices in regions where they constitute a threat. The sensing techniques that have been developed are reported. The characteristics of acoustic and wind pressure sensors for detecting vortices are described. Author

N74-17732 Federal Aviation Administration, Washington, D.C. Office of Systems Engineering Management.
WAKE VORTEX AVOIDANCE SYSTEM PROGRAM (WVAS)
Lawrence Langweil. *In* AGARD Flight in Turbulence Nov. 1973 9 p refs (For availability see N74-17720 09-02)

A wake vortex avoidance system (WVAS) program is described. The objective of the program is to design and implement a ground based monitoring and predictive system at airports which will increase runway capacity by eliminating the need for larger separations between aircraft for safety from wake vortices. The program consists of three major tasks: (1) sensor development, (2) vortex behavior characterization and hazard definition, and (3) integration of these tasks into an overall system design. The meteorological factors which affect the performance of the proposed system are analyzed. Author

ON TURBULENCE ENVIRONMENT AND DESIGN CRITERIA
John C. Houbolt *In* AGARD Flight in Turbulence Nov. 1973 15 p refs (For availability see N74-17720 09-02)

Aircraft design criteria based on the effects of atmospheric turbulence are discussed. Emphasis is placed on the power spectral techniques, but equivalences to the discrete-gust procedure are shown. Consideration is given to large design loads, such as limit load and to repeated loads which affect structural fatigue. Mathematical models are provided to illustrate the gust design approaches and the basic spectral procedure. Author

N74-17735 NATO MRCA Development and Production Management Agency, Munich (West Germany)
DESIGN PROBLEMS OF MILITARY AIRCRAFT AS AFFECTED BY TURBULENCE
M. Hacklinger *In* AGARD Flight in Turbulence Nov. 1973 9 p ref (For availability see N74-17720 09-02)

The influence of atmospheric turbulence on the design of military aircraft is analyzed. The subject is treated in two main categories: (1) turbulence as a sizing factor in itself which determines static and fatigue strength of major parts of low load factor aircraft and (2) turbulence as an important design parameter of high load factor aircraft where stability of the augmented aircraft in manual or automatic terrain following flight, pilot proficiency under vibration, and the attitude accuracy of the aircraft as a weapons platform become important. The problem of designing for proper flight qualities in high speed tactical fighter missions is described with emphasis on analytical prediction of pilot task proficiency under the vibration environment created by airframe and flight control system characteristics. SOME CONSIDERATIONS OF THE INFLUENCE OF FATIGUE IN THE DESIGN OF STRIKE AIRCRAFT
A. N. Rhodes *In* AGARD Design Against Fatigue Dec. 1973 17 p (For availability see N74-19652 11-02)

After summarizing some of the factors which characterize strike aircraft with regard to their fatigue design, the types of external loading to which it will be subjected in service are considered. A consideration is also given to some of the factors which influence the choice of materials, aircraft layout and design. Qualification of the finished product is discussed, as are some of the techniques in monitoring service usage. Problem areas are highlighted. Author

FATIGUE DESIGN PRACTICE
K. Ahrensdorf *In* AGARD Design Against Fatigue Dec. 1973 18 p refs (For availability see N74-19652 11-02)

To define missions for fatigue analysis, mission breakdown and to estimate load spectra for combat or tactical aircraft a high degree of guesstimating is necessary. Available data as to operational mission and load spectra during aircraft development differ greatly, on the other hand these estimated data have a considerable influence on aircraft design. For this reason the aircraft design shall be in such a way that inspections in critical regions are possible and crack propagation is noncritical between inspection intervals. In addition, on all flying aircraft cg - acceleration measurements are necessary. Besides the results of full scale fatigue tests, to have available the complete information for individual life control of flying aircraft. Some aspects of the whole fatigue integrity program are discussed. Author

N74-19655 McDonnell Aircraft Co., St. Louis, Mo.
STRUCTURAL FATIGUE ANALYSIS AND TESTING FOR FIGHTER AIRCRAFT
L. F. Impellizzeri *In* AGARD Design Against Fatigue Dec. 1973 12 p refs (For availability see N74-19652 11-02)

The design of fatigue resistant structure includes a combination of fatigue testing analysis. A review of the structural design and development programs of the F-4 and F-15 aircraft highlights their spectrum fatigue testing and indicates that these tests are essential in providing a satisfactory level of structural integrity. An existing procedure is discussed which utilizes Neuber's rule and a cyclicly decaying residual stress function to continually track notch root stress-strain patterns. The technique was developed particularly to predict life for fatigue spectra with either a constant minimum stress or a constant mean stress. A modification of the technique is presented which simplifies its applicability for fatigue spectra with variable minimum and/or mean stresse. This also includes variable stress ratios. Life predictions using the modified technique are compared with spectrum test results on 7075-T6 aluminum and 6Al-4V titanium. An example is presented of crack initiation and crack growth caused by out-of-plane bending in a fighter airplane upper wing skin. The local structural detail is analyzed. Fatigue analysis in terms of crack propagation is performed based on the residual tension predicted by the elastic-plastic computer program as the crack extends. Calculated crack growth rates are compared with electron miscroscope photographs of the upper wing skin fracture surface showing striation spacings. Author

FATIGUE AND FRACTURE CONSIDERATIONS FOR TACTICAL AIRCRAFT
I. G. Hedrick, L. B. Wehle, and P. D. Bell *In* AGARD Design Against Fatigue (date) 15 p refs (For availability see N74-19652 11-02)

A review of some of the practical aspects of designing against fatigue is presented. An outline is included of the latest fatigue analysis method used at Grumman and a discussion of some of the more interesting fatigue problems encountered in the evolution of several Grumman aircraft. Some new technological developments are discussed including the F-14 electron beam welded titanium wing carry-through box. The capabilities of some special Grumman inspection techniques to improve quality are reviewed. Author

FULL SCALE FATIGUE REQUIREMENTS FOR RATIONAL FATIGUE LIFE PREDICTION

H. J. Zocher *In* AGARD Design Against Fatigue Dec. 1973 14 p refs (For availability see N74-19652 11-02)

After discussing a suitable fatigue life evaluation and certification procedure, some requirements are specified for full scale fatigue testing techniques which should be mandatory for future fatigue life substantiation. Test results obtained from two full scale fatigue tests utilizing different testing procedures are compared to service failures. The fatigue test which used the proposed improved testing technique with flight-by-flight loading sequence showed much better results which were in adequate correlation with service experience. THE ROLE OF THE MAJOR FATIGUE TEST IN THE ACCEPTANCE, CERTIFICATION AND SAFE UTILISATION OF STRIKE AIRCRAFT

R. D. J. Maxwell *In* AGARD Design Against Fatigue Dec. 1973 8 p refs (For availability see N74-19652 11-02)

The role of the major fatigue test in acceptance, certification, and safe utilization of a strike aircraft is examined from the writing of the aircraft specification to the monitoring of life consumption in service. Attention is focussed on problems associated with defining the test load conditions and interpreting the results in terms of the monitoring system used, including the use of relevent flight load measurements. A summary of the problem areas and suggested minimum standards of fatigue testing, flight measurement and dissemination of the information are included. Author

N74-19659 National Aero- and Astronautical Research Inst., Amsterdam (Netherlands)

RE-ASSESSMENT OF FATIGUE PERFORMANCE OF FIGHTER AIRCRAFT

G. M. VanDijk *In* AGARD Design Against Fatigue Dec. 1974 19 p refs (For availability see N74-19652 11-02)

Fatigue monitoring results obtained by means of strain-gauge recordings are scrupulously compared to the reference full-scale fatigue test loading, finally yielding a relative fatigue severity index. The comparative analysis among other things highlights the importance of ground loads, counting methods and local plasticity at notch roots. A complex notch stress-strain history analysis is carried out to assess the notch root stress history and residual stresses. Finally, a simplified calculation procedure is suggested to account for notch root plasticity and residual stresses. This simplified analysis is a sufficiently accurate substitute of the complex notch stress-strain history analysis. Author

N74-19660 Societe Nationale Industrielle Aerospatiale, Paris (France).

DESIGNERS' NEED FOR GENERAL INFORMATION FROM ANALYSIS OF FATIGUE TEST RESULTS AND SERVICE BEHAVIOR

William Barrois *In* AGARD Design Against Fatigue Dec. 1973 13 p refs (For availability see N74-19652 11-02)

The requirements in fatigue assessment for designing aircraft structures are discussed in terms of interpretative computation, a priori subjective classification of fatigue strength, and prediction analysis. The analyses of fatigue behavior in tests and in service, and the standardization of test loading are discussed along with interpretation methods of fatigue test results, and the establishment of general data on fatigue strength. F.O.S.

ABBREVIATED TEST LANGUAGE FOR AVIONICS SYSTEMS

D. A. Green Sep. 1972 61 p refs
(AGARD-LS-54) Avail: NTIS HC $6.25

The basic concepts of ATLAS and a selection of some of the more common verbs for constructing test procedures are presented. The overall organization is described of an ATLAS program i.e. the division into preamble and procedural sections. Following this the general structure of an ATLAS statement is discussed to illustrate the general layout of a statement and its internal fields. The fields discussed are as follows: the fixed field which involves the flag, statement number and verb, and the variable field which includes the measured characteristic, noun, statement characteristic, and the evaluation and connection fields. It is shown that the organization of the variable field is determined by the verb used in the fixed field. Author

PHYSICAL VULNERABILITY OF AIRCRAFT, VOLUME 1

F. D. Orazio Sep. 1972 48 p
(AGARD-AR-47-Vol-1) Classified Report

The overall utility of combat aircraft is influenced by the ability of the vehicle to absorb damage and still complete its mission and/or be repaired and returned to service rapidly. The report develops analysis techniques by which this characteristic of the aircraft may be assessed during the initial design phases and measured quantitatively as design features are established. The report also summarizes and evaluates the techniques which have been developed to reduce the physical vulnerability of aircraft.

X74-73501 Advisory Group for Aerospace Research and Development, Paris (France)

PHYSICAL VULNERABILITY OF AIRCRAFT, VOLUME 2

F. D. Orazio May 1973 234 p
(AGARD-AR-47-Vol-2)

Confidential Report

The overall utility of combat aircraft is influenced by the ability of the vehicle to absorb damage and still complete its mission and/or be repaired and returned to service rapidly. The report develops analysis techniques by which this characteristic of the aircraft may be assessed during the initial design phases and measured quantitatively as design features.

This study was conducted in response to a request from the North Atlantic Military Committee under the management of the Aerospace Applications Studies Committee.

AIRCRAFT VULNERABILITY ANALYSIS, VOLUME 3

D. Kardels May 1973 70 p
(AGARD-AR-47-Vol-3) Secret Report

The report describes a detailed computer model for assessing the physical vulnerability of an aircraft to a variety of weapons and illustrates the use of the model by examples by evaluating three weapon types: 20, 30 and 35 mm shells against the RF-84F aircraft. The model provides sub-routines for describing the target and threat evaluating the effect of the weapon on the components of the aircraft and assessing the impact of damage to component on the survivability of the aircraft. This volume constitutes an appendix to AR-47 Volume 2.

LOW ALTITUDE FLIGHT CONTROL PROBLEMS

Feb. 1971 274 p Presented at Symp. of the Guidance and Control Panel of AGARD, Brussels, 1-3 Sep. 1970
(AGARD-CP-72)

Classified Report

The papers presented at the Guidance and Control Panel

sponsored Symposium on Low Altitude Flight Control Problems held at NATO Headquarters, Brussels, Belgium in September 1970. The papers address the problem of aircraft flight control conducted at high speeds at very low altitude and in all weather environments.

X74-73507 Advisory Group for Aerospace Research and Development, Paris (France).
MILITARY APPLICATIONS OF V/STOL AIRCRAFT. VOLUME 2
Jun 1973 78 p Presented at 41st Meeting of the Flight Mech Panel of Agard, Brussels, 23-25 Oct 1972
(AGARD-CP-126-Vol-2)

Classified Report

Five papers are contained in this Volume of the Proceedings. Two of the papers are related to the development and service operation of the "Harrier" V/STOL tactical aircraft. Another paper describes the history of the US/FRG V/STOL tactical fighter program. The last two papers are on the subject of future requirements for V/STOL aircraft.

03 AUXILIARY SYSTEMS

Includes fuel cells, energy conversion cells, and solar cells, auxiliary gas turbines, hydraulic, pneumatic and electrical systems, actuators, and inverters. For related information see also 09 Electronic Equipment, Nuclear Engineering, and 28 Propulsion Systems

ENERGETICS FOR AIRCRAFT AUXILIARY POWER SYSTEMS
A. E. Fuhs, ed. (Naval Postgraduate School). Dec. 1972. 314 p. refs. Mostly in ENGLISH, partly in FRENCH. Proc. of 39th Meeting of the AGARD Propulsion and Energetics Panel held at Colorado Springs, 12-15 Jun. 1972.
(AGARD-CP-104) Avail: NTIS HC $17.75

The proceedings of a conference on the use of superconductivity technology for electrical power generation in aircraft and missiles are presented. The advantages of superconductivity for power generation are described. The subjects discussed include: (1) behavior of composite superconducting materials, (2) superconducting generators in aircraft, (3) cryogenic and inductive energy storage, (4) advanced airborne auxiliary power systems, (5) extraction of auxiliary power from air breathing propulsion systems, (6) electrical generation and distribution systems for supersonic aircraft, and (7) non radiating superconducting coils for energy storage. Line drawings, diagrams, charts, tables, and graphs are included to clarify the theoretical aspects. For individual titles, see N73-19031 through N73-19057.

N73-19031 Supertechnology Corp., Boston, Mass.
STABILITY OF A SUPERCONDUCTOR AS INFLUENCED BY THE SUBSTRATE
Ahmed Elbinderi *In* AGARD Energetics for Aircraft Auxiliary Power Systems. Dec. 1972. 11 p. refs. (For availability see N73-19030 10-03)

The effects of substrates on the stability of a superconductor are discussed. Metal cladding in superconductive technology has resulted in improved reliability in design and utilizing of critical current densities as an almost operating condition. The voltage versus current characteristics of superconductors are illustrated. A numerical analysis of the performance of multi-filament superconductors is presented. Several conclusions concerning the electrical properties of superconductors and the effects of various parameters are presented. PNF

N73-19032 Warwick Univ., Coventry (England). Dept. of Engineering.
THE BEHAVIOUR OF COMPOSITE SUPERCONDUCTING MATERIALS UNDER ac CONDITIONS
A. R. Eastham and R. G. Rhodes *In* AGARD Energetics for Aircraft Auxiliary Power Systems. Feb. 1972. 11 p. refs. (For availability see N73-19030 10-03)

Alternating current loss mechanisms in superconductors are described with particular emphasis on the recently developed composite materials. Alternating transport current losses of a wide range of commercially available superconductors of the bare wire and multifilament composite types are presented. The behavior in coil and cable configurations is compared, and it is shown that when self-field effects predominate, little reduction in ac loss results from using multifilament composites as opposed to bare superconducting wire. When transverse field effects predominate, a substantial decrease in loss is possible with composite materials. The effect of transposing the individual filaments within a composite has been investigated, and it is shown that the ac loss can be reduced for a limited range of conditions. Material requirements for low loss conductors are discussed. Author

N73-19033 Max-Planck-Institut fuer Plasmaphysik, Garching (West Germany).
USE OF SUPERCONDUCTORS FOR PULSED EXPERIMENTS IN PLASMA PHYSICS
A. P. Martinelli *In* AGARD Energetics for Aircraft Auxiliary Power Systems. Feb. 1972. 7 p. refs. (For availability see N73-19030 10-03)

Superconducting magnetics used in plasma experiments and as an essential component of possible future thermonuclear reactors are discussed. Many magnetic configurations for plasma experiments and for reactors as well consist of a stationary magnetic field produced by a superconducting magnet system on which a time dependent magnetic field is superposed. Examples are the sustained field configuration in theta pinch experiments, stellarators during switching on of the helical field, and tokamaks and stellarators during the field pulse used for ohmic heating of the plasma. The effect of pulsed magnetic fields on superconducting coils is studied in a number of non-stabilized single-core and multicore current carrying Nb-Ti superconductors in the form of short samples and small bifilar or inductive coils. Experimental results and calculation methods already reported are complemented and extended. The use and limitation of superconductors in pulsed magnetic configurations as field generating or field shielding coils are reported. Author

N73-19034 Union Carbide Corp., Tarrytown, N.Y. Linde Div.
HIGH FIELD PLASMA ARC-PLATED Nb3Sn SUPERCONDUCTING SOLENOIDS
R. Allar Reese *In* AGARD Energetics for Aircraft Auxiliary Power Systems. Feb. 1972. 8 p. refs. (For availability see N73-19030 10-03)

Critical current data on plasma sprayed Nb3Sn conductor for temperatures between 4.2 and 18 K and for magnetic fields up to 92 kilo Oersteds are reported. This data and stabilization data are used to study the effect on the mass of an airborne magnet system operating at temperatures above 4.2 K, and using aluminum vs copper stabilized conductor. The use of high conductivity aluminum is shown to substantially reduce the mass of the system. For the system considered, operation at elevated temperature is shown to result in a larger system mass since the increase in magnetic mass is much greater than the reduction in refrigerator mass. A comparison is made between refrigeration using a closed cycle refrigerator and using liquid helium carried on board. Author

SUPERCONDUCTIVITY IN STEADY STATE AND PULSED APPLICATIONS FOR FLIGHT VEHICLES
E. J. Lucas, R. J. Thome, and Z. J. J. Stekly *In* AGARD Energetics for Aircraft Auxiliary Power Systems. Feb. 1972. 9 p. Sponsored in part by AFAPL. (For availability see N73-19030 10-03)

The ability of the Type II superconductor to develop high magnetic fields while carrying high current densities naturally leads to applications that are related to power conversion and energy storage. Two major applications are presented: (1) MHD magnet systems and (2) pulsed inductive energy storage systems. The use of superconductors in winding for MHD magnets offer definite advantages in size and weight when compared with room temperature or cryogenic coils using normal conductor. This is primarily due to the higher attainable current density in

the windings and is graphically illustrated in plots which indicate the relative difference in total and component weights for a given field and field volume. As specific examples, weight and volume estimates are given for the magnet systems required for several power levels and a lightweight magnet system currently under development is described. A comparison of inductive energy storage systems making use of normally resistive cryogenically cooled and superconducting coils is presented, as well as a comparison between inductive and capacitive energy storage elements. The current state-of-the-art in pulsed superconducting energy storage is discussed together with a description of recent results using a model coil. Author

N73-19036 Cranfield Inst. of Technology (England)
PROSPECTS FOR SUPERCONDUCTING GENERATORS IN AIRCRAFT
J. T. Hayden *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 7 p refs (For availability see N73-19030 10-03)

A review is given of the characteristics of present conventional alternators and aircraft electrical power systems. Preliminary considerations in the use of superconducting windings in 400 Hz alternators indicate that it is difficult to argue a case in favour of using superconducting machines for typical systems in use at present. Futher, there is probably a minimum size of 400 Hz generator for which it is practical to introduce superconducting windings below which there is no significant reduction in weight. If systems requiring powers of a few megawatts are considered, then the case for superconducting machines is much more promising providing that some cryogen (such as liquid nitrogen or liquid hydrogen) is already in the aircraft and available for cooling intermediate heat shields. Continued development in lightweight airborne helium refrigerators is also needed. Author

N73-19037 Laboratoire Central des Industries Electriques (France)
APPLICATION OF SUPERCONDUCTIVITY TO HOMOPOLAR MACHINERY USING LIQUID METALS
J. P. Chabrerie, G. Fournet, and A. Maillfert *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 4 p refs (For availability see N73-19030 10-03)

The concept of a homopolar machine with multiple discs and superconducting field winding, using liquid metals for the armature sliding electrical contacts is described. The possibilities of these kinds of machines used as motors or power supplies are analyzed. These machines operate with a low voltage and a high armature current, and their main features are an important power-to-weight ratio and a good efficiency. The main results of several studies are presented. These studies have led to the development of a 60 kW flooded rotor homopolar motor operating at low speed (600 r/min). After a short description of the model motor and a brief account of the main test results, the paper concludes with the choice of liquid metals, their applications to more powerful machines and the influence of the use of liquid metals on the machine morphology itself. Author

N73-19038 Ferranti-Packard Electric, Ltd., Toronto (Ontario)
LIGHTWEIGHT SUPERCONDUCTION MAGNET FOR AIRBORNE MHD GENERATORS
David L. Atherton *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 9 p refs Sponsored by USAF Aeropropulsion Lab. and Canadian Defence Res. Board (For availability see N73-19030 10-03)

A large lightweight saddle-coil superconducting dipole magnet for airborne MHD generators is described. The magnet has a room temperature bore of 27.7 cm, a winding bore of 33 cm, a design field of 4.5 tesla, a magnetic length of 105 cm and a mass of 450 kilograms. The dipole field is generated by pancake winding whose cross sectional outline approximates overlapping circles. Lightweight necessitates high current density, 2,100a in a 2 mm square conductor containing 200 twisted Nb-Ti filaments in a copper matrix. The Lorenz repulsive force between opposite sides of the magnet is 3850 kilogauss per centimeter of coil length. There are also large compressive forces on the former and repulsive forces between the ends. The mechanical structure therefore uses a highly stressed lightweight structure of filament wound epoxy glass composite. The dewar uses superinsulation and vapour cooled radiation shields. Vibration and shock analysis and pressure vessel design criteria determine the minimum mass dewar design. Author

N73-19039 Magnetic Corp. of America, Cambridge, Mass.
SUPERCONDUCTING GENERATORS
Z. J. J. Stekly (Tex. Univ. Austin) and H. H. Woodson *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 14 p refs Sponsored by United Aircraft Corp. and AFAPL (For availability see N73-19030 10-03)

The development of alternating current machines using superconducting windings is discussed. The design philosophy and details of specific experimental generators are examined. The characteristics of the field winding based on electromagnetic, electromechanical, structural, and cryogenic effects are described. The design criteria resulting from the interaction of these parameters are developed. The results of a study of size and weight as a function of power level and frequency are presented. Author

N73-19040 Westinghouse Electric Corp., Pittsburgh, Pa. Research Labs
SUPERCONDUCTING ELECTRICAL MACHINERY
C. J. Mole, J. H. Parker, Jr., and L. R. Lowry *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 15 p refs (For availability see N73-19030 10-03)
(Contract F33615-71-C-1591)

The more important types of superconducting machines, the features and problems inherent in such machines, and the more promising applications are reviewed. Both ac and dc superconducting machines are discussed with particular emphasis on the application of ac machines for aircraft use. Recent and current developments in the field are reported. Author

N73-19041 Commissariat a l'Energie Atomique, Saclay (France)
ENERGY STORAGE AND DISCHARGE BY SUPERCONDUCTORS [STOCKAGE ET DECHARGE D'ENERGIE AU MOYEN DU SUPRACONDUCTEURS]
P. Genevey, G. Prost, J. Sole, and B. Girard *In* AGARD Energetics for Aircraft Auxiliary Power Systems Jan. 1971 8 p refs In FRENCH (For availability see N73-19030 10-03)

After an examination of the principles of electric energy storage and discharge, a detailed analysis was made of load operations, trapping, and different problems raised about storage and discharge. The effects of load operation on the utilization of high flux pumping and the discharge that is released by means of rapid transition superconductor commutators are also analyzed. Experimental results are included. Transl. by E.H.W.

N73-19042 Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Stuttgart (West Germany). Inst. fuer Energiewandlung und Elektrische Antriebe
RESEARCH ON CRYOGENICS AND INDUCTIVE ENERGY STORAGE AT THE DFVLR
C. Carpetis *In* AGARD Energetics for Aircraft Auxiliary Power systems Feb. 1972 7 p refs (For availability see N73-19030 10-03)

The use of superconducting coils for energy storage is discussed. The objective was to find the optimizing parameters and to define the problems which involve the technical use of inductive energy storage. It was determined that (1) the geometry of the coils is essential for optimal performance, (2) high critical current density rather than high critical field is important for optimal devices, and (3) the mass of the superconductor may be small as compared with the needed structural mass. The development of cryogenically cooled devices, particularly in the presence of time varying fields, is reported. Author

NONRADIATING SUPERCONDUCTING COILS FOR ENERGY STORAGE

M. Gayte, B. Girard, and A. Malardain *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 6 p refs (For availability see N73-19030 10-03)

The characteristics of superconducting coils as energy storage elements are investigated together with the main problems affecting their design: electromagnetic forces, energy radiation and discharge losses. An ellipsoid coil set into a shielding coil is then described; its outer field is zero and its shape suitable to withstand the electromagnetic forces. The relation stored energy/superconductor volume is particularly high. An experimental coil located in a stainless steel cryostat was built allowing for the control of the calculation method and the study of the effect of the differences between the real and the theoretical shapes. ADVANCED POWER GENERATION IN MISSILES

O. Stumpf, H. Loesor, and H. Sharf *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb 1972 13 p refs (For availability see N73-19030 10-03)

Power generating systems and their application in modern missiles for the production of hydraulic and/or electric energy are discussed. A system weight analysis for 5 different systems is described which shows the application regimes in terms of output power and mission time. Details of recently developed components are given. Author

N73-19045 AiResearch Mfg. Co., Phoenix, Ariz.

ADVANCED AIRBORNE AUXILIARY POWER SYSTEM

D. F. Swenski, L. W. Norman, and A. D. Meshew *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 12 p ref (For availability see N73-19030 10-03)

An advanced auxiliary power unit (APU) was combined with an accessory drive system to form an auxiliary power system (APS). This APS was used as an exploratory development test bed for the development of advanced technology components. The APS included a 300 equivalent shaft horsepower APU configured to furnish bleed air from a split flow impeller and shaft power at 130 F, sea level ambient conditions. The APS was designed to provide standby power separate from the accessories and engine drive train, checkout engine starting, and emergency power through a high-speed torque converter. The design of the APS was intended to form a test bed representing the optimum configuration as determined from a systems analysis, with a high degree of flexibility such that the components thus developed may be applicable to many other future APS designs. PULSE JET ENGINE AS A SOURCE OF ENERGY FOR AUXILIARY POWER UNITS: PULSE GAS TURBINE WITHOUT COMPRESSOR

W. K. Eick *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 12 p (For availability see N73-19030 10-03)

A short survey of the elements of an intermittent pulse jet engine, open on both sides, which has been tested up to the supersonic speed is presented. The results show that such an airbreathing unit can also be used as a gas generator acting upon a turbine rotor for taking off mechanical power. The basic design of the engine consists of a thin-walled welded steel construction of conical and cylindrical shape, without any mechanically moved, rotating or oscillating parts. A spark plug for intermittent external ignition for starting and a fuel control device belong to the basic version of the engine. The turbine is driven by the hot gases which are intermittently expelled from the combustion chamber. The power unit can also be selectively used after diversion as a propulsion engine. The low costs of manufacturing and maintenance for such engines are pointed out. The influence of the most important parameters is explained. The auto-ignition, based on the principle of residual gas including shock wave rate, is an important functional feature of the pulse jet engine. Author

N73-19048 Air Force Aero Propulsion Lab., Wright-Patterson AFB, Ohio. Auxiliary Power Units

DUAL MODE AUXILIARY POWER UNIT FOR HIGH MACH AIRCRAFT

Buryl L. McFadden, Jr. and Richard E. Quigley, Jr. *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb 1973 9 p refs (For availability see N73-19030 10-03)

Advanced high performance aircraft are projected to employ ramjet, turboramjet, and rocketramjet engines. Since ramjet engines do not incorporate rotating members, they cannot provide shaft horsepower for aircraft accessories and flight control systems. Therefore, some form of auxiliary power source will be required to furnish the hydraulic, electric, pneumatic and shaft power for the various aircraft systems during flight, thus the auxiliary power source must become the prime and only source of shaft power during high speed flight. Various power source configurations to accomplish this are reviewed with emphasis on the potential of a single dual mode power source sized to provide all flight vehicle power throughout the entire operating regime of the aircraft including ground standby. Since they are totally independent, such a configuration will permit design optimization of both the main propulsion engines and the power system. Author

N73-19045 British Aircraft Corp., Preston (England). Military Aircraft Div.

INTEGRATION OF AUXILIARY POWER SYSTEMS WITH THE MULTI-SPOOL ENGINE

Len W. Milsom *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb 1973 8 p (For availability see N73-19030 10-03)

As engine technology advances certain engine/airframe interface problems arise with aircraft auxiliary power systems. Using a modern strike aircraft as the principal example, this paper examines the difficulties in meeting the airframe mechanical power requirements of generating excessive wasted energy in air bleed systems and of dissipating the waste heat from engine and airframe accessories. Much closer collaboration between airframe and engine contractors at the early stage of an aircraft project, in order to develop a combined approach to the solution of these problems, is recommended. Author

EXTRACTION OF AUXILIARY POWER FROM AIRBREATHING PROPULSION SYSTEMS

Klaus Bauerfeind *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1973 13 p (For availability see N73-19030 10-03)

The characteristics of gas turbine engines for use as auxiliary power sources are discussed. The direct supply of mechanical power and pressurized air from turbines is examined. The most important criteria for the auxiliary power sources are identified as (1) maximum possible power delivery points, (2) compressor surge margins, (3) effect on handling characteristics of aircraft, and (4) effect on windmilling characteristics of turbine engine. Data are presented in the form of graphs to show interrelationships of turbine engine parameters. Author

A METHOD FOR PRELIMINARY ANALYSIS OF MHD GENERATOR PERFORMANCE

C. Casci, A. Coghe, and U. Ghezzi *In* AGARD Energetics for

Aircraft Auxiliary Power Systems Feb. 1972 12 p refs (For availability see N73-19030 10-03)

The characteristics of magnetohydrodynamic generators for aircraft and spacecraft applications are discussed. A method for analyzing the parameters of a magnetohydrodynamic generator is developed. The analysis is obtained by fixing the total enthalpic difference between the inlet and outlet sections of the duct and by examining the various possibilities through which such a condition may be achieved. Thermodynamic and electromagnetic quantities are studied in relation to the velocity difference between the inlet and outlet sections of the duct and by some other parameters, such as expansion ratio and form factor of the duct. DEVELOPMENTS IN AIRCRAFT ELECTRICAL POWER SYSTEMS

Robert H. Johnson *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 7 p refs (For availability see N73-19030 10-03)

A summary of Air Force research and development programs in aircraft electrical power systems and components is presented. The planning process used to validate research programs is discussed with emphasis on the resultant motivation to develop specific classes of technology. Specific programs discussed are: (1) solid state power controllers, (2) gate controlled switch technology, (3) solid state electric power simulator tests, and (4) high temperature electrical generators, wire, and connectors. APPLICATION OF SOLID STATE SWITCHING AND MULTIPLEXING TO AIRCRAFT ELECTRICAL SYSTEMS

Clyde W. Jones (AFAPL) and Jim Courter *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1973 9 p (For availability see N73-19030 10-03)

The application of solid state switching, multiplexing, and electrically programmable logic to aircraft electrical systems is discussed. The effects of the use of solid state switching technology on electrical system weight, reliability, electromagnetic interference, and quality of power delivered to loads are analyzed. A summary of problems encountered with proposed solutions, during a program in which a completely solid state electrical system for an A-7 aircraft was evaluated, is included. Areas of improvement and expanded capability are also enumerated. Author

ELECTRICAL GENERATION AND DISTRIBUTION SYSTEMS FOR FUTURE SUPERSONIC AIRCRAFT

A. Bainbridge *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 7 p refs (For availability see N73-19030 10-03)

The size of the total electrical load and the temperature range over which some components will have to operate make it necessary to study new generation and distribution techniques to satisfy the demands of future aircraft flying in the supersonic or hypersonic range. This paper is restricted to supersonic aircraft and discusses recent proposals for improved distribution systems incorporating solid state switching and using remote control of protective devices through a multiplexed system. The scope for high temperature wiring is briefly discussed and a few recent developments in generators and power cables are described, since the generating system is particularly vulnerable to extreme environmental conditions. PNEUMATICS IN SUPERSONIC ENERGETICS

John Wotton *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1973 15 p (For availability see N73-19030 10-03)

A pneumatics orientated integrated system concept developed for subsonic civil aircraft is examined in its relation to supersonic operation. The principle of waste heat extraction for the generation of auxiliary power supplies is found to be even more viable due to greater cabin pressure differential during cruise, and the level of engine compressor tapping required in consequence. The economics of engine bleed are examined in the light of virtually free electrical generation in the method employed. Pneumatic power conversion is shown to be at least competitive with hydraulic and other equivalents, and the requirements of power flying controls to be satisfactorily met. Author

THEORETICAL MODELS FOR PLASMA MOTION IN PULSED COAXIAL HYDROMAGNETIC GUNS

M. Andrenucci, M. Caprili, and R. Lazzeretti *In* AGARD Energetics for Aircraft Auxiliary Power Systems Feb. 1972 17 p refs (For availability see N73-19030 10-03)

A theoretical study of the performance of pulsed coaxial plasma guns is described. The electromechanical equations are derived for a snowplow model allowing for a variable initial mass-loading distribution. Computer results for two families of distributions are presented and analyzed. The values of the system parameters that yield highest value of kinetic efficiency are determined for widely varied conditions. A modified model allowing for the actual variation of the magnetic pressure with the radius is formulated and preliminary results for this model are discussed. Finally an account is given of the numerical methods employed in solving the sets of coupled differential equations describing the system in the assumed models. Author

ACCOUSTIC FATIGUE OF HUMANS EXPOSED TO NOISE

Gilbert C. Tolhurst In AGARD Adaptation and Acclimatisation in Aerospace Med. Mar 1971 8 p refs (See N71-20351 09-04) Avail NTIS

Since human fatigue is not truly a precise phase, by borrowing an analogy from the material sciences, an attempt has been made to outline both physiologically and psychologically the limits and ranges of the response to acoustic stimuli termed elasticity, deformation and destruction. The precision is no better or no worse than the same terms applied to metal fatigue. Present damage-risk criteria, if strictly applied by industry, the military, or by social services organizations, should materially reduce the incidence of noise induced hearing losses to approximately 85 to 95 percent of a population. Considerable amounts of data are needed to allow any particular individual's susceptibility to be predicted with precision. While considerable research effort has yielded ever increasingly elegant methods to quantify potentially hazardous noise environments, as well as communications interfering ones, the consequences of prolonged noise exposure need extensive experimental validation. The effect of varying the posture of eight subjects on their relaxed greyout thresholds has been studied Six angles of the seat back between 70 deg to the horizontal and 15 deg and rates of onset of acceleration of 1 0 g/sec and 0 1 g/sec were used The g thresholds of all subjects with both rates of onset, increased as the back angle decreased and were directly proportional to the reciprocal of the vertical distance between the eye and the haemodynamic indifference point The degree of neck flexion was observed to have little effect on the thresholds at any one angle Four subjects also wore an anti g suit for further threshold determinations with seat back angles of 70 deg 30 deg and 15 deg The increase in thresholds produced by the anti g suit was the same for each angle Comparison of the thresholds observed with the two rates of onset show that the 0 1 g/sec rate leads to higher thresholds than the 1 0 g sec rate These studies indicate that a near supine posture combined with an anti-g suit can provide relaxed g thresholds in the region of 6 to 8 g while permitting adequate forward vision Such a posture would have the added advantage of exposing the aircrew to + g sub x acceleration during ejection Author

Acclimatisation in Aerospace Med Mar 1971 21 p refs (See N71-20351 09-04)
(AMRL-TR-70-74) Avail NTIS

Spinal injury associated with escape from high performance aircraft has tended to occur more frequently in the aged than the younger aircrewman population. Although an age influence for this trauma has not been clearly demonstrated, it must be hypothesized. Osteoporosis is part of the normal aging process and accompanies most diseases affecting man. Disuse osteoporosis appears to be an exaggeration of the normal aging process. Mechanical stress, such as that produced by exercise and physical activity, is necessary for the retention of skeletal mass and may be a specific influence in controlling the adverse effects of osteoporosis. To produce a partial answer to the questions raised and their potential operational significance, 24 adult rhesus monkeys were subjected to 60 days of physical inactivity. The results show a decrease in spinal impact tolerance in terms of vertebral body fracture when experimentally produced osteoporotic primates were exposed to whole body longitudinal spinal impact. Histopathological examination at points of tendinous and ligamentous attachment show increased bone modeling activity. Author

Anxiety and impulsiveness have been studied within a conceptual framework that recognizes four classes of variables: (1) everyday life experiences, (2) psychometric tests and psychometric interviews, (3) laboratory behavioral measures, and (4) psychophysiological measures. The overall goal was to describe anxiety and impulsiveness across all four classes of variables for both stress and nonstress conditions. Examples of the relationship of the interaction of impulsiveness and anxiety to perceptual motor performance are presented within the context of a brief discussion of the overall research program. EFFECTS ON HUMAN PERFORMANCE OF COMBINED ENVIRONMENTAL STRESSES
Walter F Grether *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 10 p refs (See N71-20351 09-04)
Avail NTIS

Research studies of environmental effects normally expose subjects to only one stress at a time, while in operational flying there are usually several stresses acting simultaneously. The possibility exists that effects of such combined stresses may be greater than would be predicted from single stress studies. There have been relatively few laboratory studies of human performance in which the subjects have been exposed to such combined stresses. A critical review is presented of these past studies from the particular viewpoint of whether performance decrements from combined stresses are more severe than would be predicted from single stress studies. Although the number of past studies is not sufficient to present a consistent or conclusive picture, they do suggest that combinations of environmental stresses do not present a special hazard in flying that could not be anticipated from results of single stress studies. IS LABORATORY EXPERIMENTATION USEFUL FOR STUDYING HUMAN ADAPTATION TO UNINHABITABLE SENSORY ENVIRONMENTS? [L'EXPERIMENTATION EN LABORATOIRE EST-ELLE PERTINENTE POUR ETUDIER L'ADAPTATION DE L'HOMME AUX ENVIRONMENT SENSORIELS INHABITUELS]
Roger Angiboust *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 7 p In FRENCH; ENGLISH summary (See N71-20351 09-04)
Avail NTIS

Two experiments were conducted to study the adaptation of voluntary subjects to a degraded sensorial environment. These experiments showed that: (1) The behavioral and physiological response to an unusual environment depends on the subject's level of education and personal interest in the test. (2) Adaptation to an unusual environment can be modified by giving to the tested subjects psychoanaleptics which induce behavioral manifestations of inadaptation in subjects who had been so far free from them. In light of these experiments, it appears that, for the subject, the significant stimulus is not the physical one or the arrangement of physical stimuli which excites his senses, but the meaning which he gives to the overall experiment situation, and the way he feels it. The importance of the decrement of physical stimuli does not affect the behavioral manifestations of inadaptation. The same physical environment can be felt as a neutral, indifferent stimulus or, on the contrary, as an aggressive, nociceptive stimulus. Author

ENERGY METABOLISM DURING EXPOSURE TO EXTREME ENVIRONMENTS

C. F. Consolazio, H. L. Johnson, and H. J. Krzywicki *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 11 p refs (See N71-20351 09-04)

Avail NTIS

The energy requirements in a cold environment are practically unchanged as compared to a temperate environment, except for the 2 to 5% increase due to the wearing of the heavy clothes and footgear, providing that the individual is adequately clothed. However, the daily energy requirements for men living and working in a hot environment are increased. This is related to the increased requirement of the circulation in heat transport, the increased action of the sweat glands, increased caloric loss due to sweat vaporization and to the increase in body temperature. Balance studies including losses of nutrient in sweat indicate that these excretions are appreciable under conditions of profuse sweating. In the past, with the exception of sodium, very few investigators have recognized the fact that the mineral losses in sweat could be appreciable. The total mineral loss should include the mineral loss in sweat. This in turn would help in estimating more realistically the minimal daily allowances of minerals. Author

METABOLIC IMBALANCES AND BODY HYPOHYDRATION DURING FOOD DEPRIVATION (10 DAYS)

C. F. Consolazio, H. L. Johnson, and H. J. Krzywicki *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 8 p refs (See N71-20351 09-04)

Avail NTIS

During studies of 6 men who fasted completely for 10 days, significant metabolic stresses developed which could eventually lead to serious abnormalities. These observations included great body hypohydration resulting in large body weight losses, large nitrogen and mineral losses, and a marked ketosis. These findings are not unusual since both the body fat and protein stores must be utilized as energy sources. The maintenance of normal blood carbohydrate levels require a known quantity of protein breakdown. As a result, it was suggested that low anti-ketogenic diets and adequate mineral supplementation could prevent the marked ketosis, minimize protein catabolism, maintain fluid balance, and decrease the electrolyte excretion. EKG's and EEG's were normal in both groups during the entire study. It appears that restricted diets containing less than 500 calories/day are inadequate for short term performance. Although they spared water, the protein catabolism was still a major problem. Author

THE INFLUENCE OF ENVIRONMENTAL FACTORS IN AIRCRAFT CARRIER LANDINGS AND ACCIDENTS

Clyde A. Brictson *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 7 p refs (See N71-20351 09-04)

Avail NTIS

An analysis of carrier landing accidents during a five year period (1965 - 1969) showed that environmental causal factors contributed to 27% of all jet landing accidents. Pitching deck was the most frequently cited environmental causal factor and was cited in 15% of the landing accidents. The F4 aircraft had the highest percentage of environment related mishaps (36%), half of which were pitching deck accidents (18%). Furthermore, pitching deck conditions were found to be related to two accident types, hard landings and undershoots, which accounted for 93% of all landing accidents. Pilot/aircraft height tracking responses under different levels of deck pitch were analyzed and results indicate that deck motion in excess of four feet may result in a 180 deg phase relation between deck pitch and pilot height tracking for certain aircraft. Synchronized records of deck motion and pilot aircraft height tracking during final approach to night carrier landing deck chasing phenomenon and provide graphic evidence of the consequences of 180 deg phase lags, especially for high accident risk aircraft. EFFECT OF ACUTE AND CHRONIC EXPOSURE TO 21 mm Hg AMBIENT P SUB CO2 ON EXERCISE RESPONSE OF NORMAL MAN

R. D. Sinclair, J. M. Clark, and B. E. Welch *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 9 p refs (See N71-20351 09-04)

Avail NTIS

Physiologic responses to the interacting stresses of exercise and hypercapnia were studied in 4 young male subjects who were well trained and in excellent physical condition. The subjects performed light, intermediate and heavy exercise on a bicycle ergometer while breathing air and during acute (15-30 minutes) and chronic (15-20 days) exposure to an ambient P sub CO2 of 21 mm Hg. Simultaneous measurements of V sub E, V sub O2, V sub CO2, pulse rate, rectal temperature, and arterial P sub O2, P sub CO2 and pH were made at rest and from the 12th-15th minute of steady state exercise in the supine P sub O2 position. Increases in V sub E, V sub O2 and V sub CO2 were linear in response to increasing work load for all experimental conditions but the average magnitudes of these parameters at similar work loads were essentially equal in acute and chronic hypercapnia. At each work load average V sub E was higher and average V sub CO2 was lower in hypercapnia than the corresponding values in air. Average V sub O2 and pulse rate varied little for the same work load in the different experimental conditions. The differences between mean arterial P sub CO2 during acute and chronic hypercapnia and arterial P sub CO2 during air breathing increased progressively with increasing work load. Decreases in arterial pH from resting control values were also progressive with increasing work load, but were similar in magnitude for the three experimental conditions owing to differences in metabolic acidoses. VOLITIONAL CONTROL OF VISUAL ACCOMMODATION

Robert J. Randle *In* AGARD Adaptation and Acclimatisation in Aerospace Med Mar 1971 13 p refs (See N71-20351 09-01) (NASA TM X-66955) Avail NTIS CSCL 06P

Research was conducted in an attempt to show that volitional control is possible in most individuals when feedback is provided which indicates to the subject his present accommodation level. The feedback was provided by modulating an audio oscillator with the output of a servo-controlled infrared optometer which continuously

monitored the refractive state of the subject's eye. Six young males with normal vision were trained to control their accommodation first using a tone and then without it. A specific task they learned was to accommodate toward 0 diopters when a 3-diopter checkerboard target was extinguished and they viewed a dark empty field. Their performance was compared against six untrained subjects on two dark empty field test tasks. The tasks were (1) to maintain infinity focus while viewing a dark empty field for 3 minues, and (2) to go to infinity focus from a 3-diopter target when it was extinguished and a dark field ensued during a 3 minute period. A statistical analysis of the results showed that the trained group made significant reductions in their dark field myopia under these conditions, but the untrained subjects did not. Author

DISORIENTATION INCIDENTS REPORT BY MILITARY PILOTS ACROSS 14 YEARS OF FLIGHT
Brant Clark. *In* AGARD. The Disorientation Incident, Part 1. Mar. 1972. 7 p. refs (See N72-25031 16-04).
(Grant NGL-05-046-002)
(NASA-CR-126786) Avail: NTIS HC $3.00; CSCL 06S

The historical background of spatial disorientation problems among flying personnel is discussed. Recent incidents involving disorientation in flight were compared with incidents reported 14 years earlier. The incidents were very similar for various types of aircraft. The findings suggest that disorientation is currently experienced in a wide variety of flight operations and will continue to be experienced by flying personnel as an uncorrectable flight hazard. ORIENTATION ERROR ACCIDENTS IN ARMY AVIATION AIRCRAFT
W. Carroll Hixson, Jorma I. Niven, and Emil Spezia (Army Board for Aviation Accident Res.). *In* AGARD. The Disorientation Incident, Part 1. Mar. 1972. 16 p. refs (See N72-25031 16-04).
Avail: NTIS HC $8.75

To initiate the action necessary to establish the magnitude of the orientation-error problem in Army aviation, an interservice research program was organized under the joint sponsorship of the U. S. Army Aeromedical Research Laboratory, the U. S. Army Board for Aviation Accident Research, and the Naval Aerospace Medical Research Laboratory. The first step was the construction of an operational definition of an orientation-error accident. The assimilation of data pertaining to the incidence and cause of such accidents and their actual and relative costs in terms of fatalities, injuries, and aircraft damage was then set as the working objective of the program. Accordingly, the decision was made to implement a five-year longitudinal study of all major and minor orientation-error accidents involving Army aviation flight operations beginning with July 1966. Incidence and cost data are presented for all Army aviation major and minor orientation-error accidents detected in the search of the accident files for the period July 1966 to July 1967. Separate and totalized statistical data are provided for fixed wing and rotary wing aircraft as well as for accidents occurring in Vietnam and those occurring elsewhere. Author

DISORIENTATION, FACT AND FANCY
Paul E. Tyler and Paul A. Furr. *In* AGARD. The Disorientation Incident, Part 1. Mar. 1972. 6 p. refs (See N72-25031 16-04).
Avail: NTIS HC $8.75

The experiences of 2,000 naval aviators with disorientation during various flight conditions are presented. An analysis of all naval flight accidents for calendar year 1969 in which a disorientation incident contributed to the accident was made. It is shown that the majority of accidents coded as related to disorientation were erroneously coded. It was concluded that approximately 96 percent of aviators experience disorientation at some time, but that this disorientation contributes to a very small percentage of the accidents. Author

PSYCHOPHYSIOLOGICAL AND ENVIRONMENTAL FACTORS AFFECTING DISORIENTATIONS IN NAVAL AIRCRAFT ACCIDENTS
Earl H. Ninow, William F. Cunningham, and Frederick A. Radcliffe. *In* AGARD. The Disorientation Incident, Part 1. Mar. 1972. 4 p. refs (See N72-25031 16-04).
Avail: NTIS HC $8.75

Psychophysiological and environmental factors, 12 in number, which most affect disorientation related mishaps are presented. These factors are listed in order of number of occurrence and it is indicated that often multiple factors are coded in conjunction with disorientation. Examples of disorientation related mishaps are presented to demonstrate psychophysiological and environmental factor involvement. A graph comparing attack and fighter pilot flight exposure to disorientation mishaps is charted to demonstrate the effect of experience upon control of disorientation. The chart indicates that flight experience does play a role in deterring of disorientation mishaps. Author

DISORIENTING EFFECTS OF AIRCRAFT CATAPULT LAUNCHINGS
Malcolm M. Cohen, Richard J. Crosbie, and Laurence H. Blackburn. *In* AGARD. The Disorientation Incident, Part 1. Mar. 1972. 6 p. refs (See N72-25031 16-04).
Avail: NTIS HC $8.75

A human centrifuge facility was used to simulate the acceleration profiles encountered in aircraft catapult launchings. Twelve subjects attempted to keep a continuously moving target at subjective eye level before, during, and after exposure to simulated catapult launch accelerations. Results demonstrated that subjective eye level was changed by exposure to the accelerative forces. The change in subjective eye level persisted, in some cases, for as long as three minutes after the simulated launch sequence was completed. The results are discussed in terms of the effects of rotated acceleration vectors on human spatial orientation, and the data are related to certain types of aircraft losses that have been reported following catapult launchings at night. EFFECTS OF ACOUSTIC STIMULI ON THE VESTIBULAR SYSTEM

C Stanley Harris *In* AGARD The Disorientation Incident, Part 1 Mar 1972 11 p refs (See N72-25031 16-04)

(AMRL-TR-71-58) Avail NTIS HC $8.75

The effects of noise intensity on the human vestibular system with resultant disorientation, nausea, and dizziness are discussed. The response of human subjects to accustic stimuli was measured using nystagmorgraphy, vertical perception, and a rail test of human equilibrium. Decrements in performance of 20 to 35 percent were obtained in high intensity noise of 140 decibels even when subjects wore ear protectors. Sound levels as low as 100 decibels were found to produce an adverse effect on task performance. It was also determined that noise levels affect human equilibrium at levels below those which will damage hearing. Author

ALCOHOL INDUCED POSTROTATORY FIXATIONAL NYSTAGMUS, A TRAINING FILM ON A SIMPLE METHOD OF DETECTING SLIGHT ALCOHOLIC INTOXICATIONS IN PILOTS

G Froehlich *In* AGARD The Disorientation Incident, Part 1 Mar 1972 3 p refs (See N72-25031 16-04)

Avail NTIS HC $8.75

A method for detecting moderate alcoholic intoxication in human subjects is presented. The method is based on observation of inability of intoxicated subject to suppress postrotatory fixational nystagmus. The subject, in a standing position, is turned around his vertical axis five times within ten seconds with his eyes open in a normally illuminated room. When the subject is stopped and asked to fix his vision on the examiner's finger held about 25 centimeters in front of his eyes, the intoxicated subject will be unable to fixate. The method involved was demonstrated by a motion picture. Author

ANALYSIS OF THE VESTIBULO-OCULAR COUNTERROLL REFLEX IN PRIMATES

A M Junker, C R Replogle, K A Smiles, R D Brown, and R H Wheeler (AF Inst. of Technol.) *In* AGARD The Disorientation Incident, Part 1 Mar 1972 10 p refs (See N72-25031 16-04)

(AMRL-TR-71-59) Avail NTIS HC $8.75

The vestibulo-ocular reflex manifest by counterroll was used to determine the response dynamics of the vestibular system and alterations in these dynamics subsequent to +Gx acceleration exposure. Six rhesus monkeys were tested before and after acceleration exposure to determine if significant changes had occurred in the vestibulo-ocular counterroll reflex. The tests consisted of constant speed rotation, pendular oscillations and multiple sine wave oscillations about the subject's cyclopean axis. Ocular counterroll was recorded using a linear resolver mechanically fixed to the monkey's eyeball. There is no significant decrease in the system gain with inputs up to 1 Hz. The observed phase lag can be accounted for by a time delay of approximately 0.2 seconds, and there is no significant response alteration caused by acceleration loading up to 7.5 +Gx. Author

TWO SPECIFIC KINDS OF DISORIENTATION INCIDENTS: JET UPSET AND GIANT HAND

R Malcolm and K E Money *In its* The Disorientation Incident, Part 1 Mar 1972 4 p refs (See N72-25031 16-04)

Avail NTIS HC $8.75

In certain circumstances (instrument flying conditions and severe turbulence), an inappropriate pilot input to aircraft controls leads to a dangerous nose down attitude of the aircraft. There have been something in excess of 26 of these jet upsets. In similar circumstances, there have been a few reports of what can be called the Giant Hand phenomenon, in which the pilot reports that the aircraft controls are forced into an extreme position and held there as if by a giant hand. Precipitating circumstances and underlying mechanisms of these two kinds of incidents are discussed, and some unpublished experimental observations are presented. Author

SPATIAL DISORIENTATION AND THE BREAK-OFF PHENOMENA

A J Benson *In* AGARD The Disorientation Incident, Part 1 Mar 1972 11 p refs (See N72-25031 16-04)

Avail NTIS HC $8.75

Reports of aircraft pilots concerning occurrence of disorientation with subsequent feelings of unreality and detachment are analyzed. It was determined that the reactions occurred during monotonous phases of flight in conditions where external visual orientation cues were restricted. Evidence is presented which suggests the spatial disorientation occurring as a concomitant of break-off was caused by minor degrees of vestibular asymmetry. The high incidence of anxiety reactions supports the view that in susceptible individuals break-off can be both a precipitant and a manifestation of anxiety neurosis. Author

THEORY OF DEVELOPMENT OF REACTIONS TO WHOLE BODY MOTION CONSIDERED IN RELATION TO SELECTION, ASSIGNMENT, AND TRAINING OF FLIGHT PERSONNEL

Fred E. Gundry, Jr. *In* AGARD The Disorientation Incident, Part 1 Mar 1972 17 p refs (See N72-25031 16-04)

Avail NTIS HC $8.75

A speculative theory, dealing with the development of reactions to whole body motion, is outlined. Functional aspects of reactions at several stages of maturation are considered in relation to conditioning mechanisms, which are, in turn, related to individual differences in development of motion reactivity, personality, and cognitive function. Unnatural feedback resulting from passive motion is discussed in relation to different control

tasks performed in different job assignments and in relation to individual differences in reactions to motion. Adaptation to the unnatural whole-body movement of flight is considered in this context and in relation to experiments illustrating that substantial changes in reactions to motion can be accomplished through habituation. Aviator selection tests, personality tests, flight aptitude tests, and several categories of training are considered in relation to the theoretical constructs. Author

PRACTICAL TECHNIQUES FOR DISORIENTATION FAMILIARIZATION AND THE INFLUENCE OF VISUAL REFERENCE AND ALCOHOL ON DISORIENTATION-RELATED RESPONSES
William E. Collins *In* AGARD The Disorientation Incident, Part 1 Mar. 1972 10 p refs (See N72-25031 16-04)
Avail: NTIS

Techniques and procedures for providing on-the-ground familiarization of aviation personnel with the effects of disorientation are discussed. The procedures are relatively inexpensive, effective for both participants and observers, and are readily accepted by aviators as pertinent to the aviation situation. The extent to which disorientation is affected by the type of visual information available to the pilot is examined under normal conditions and when alcohol is involved. Ways of demonstrating the deleterious effects of alcohol are described. Author

THE DISORIENTATION ACCIDENT: PHILOSOPHY OF INSTRUMENT FLYING TRAINING
T. G. Dobie *In* AGARD The Disorientation Incident, Part 1 Mar. 1972 4 p refs (See N72-25031 16-04)
Avail: NTIS HC $8.75

Patterns of disorientation occurrences in the United Kingdom RAF and Army for the period 1960-1970 are examined in order to formulate possible explanations and recommendations concerning, in particular, the philosophy of instrument flight training. The aircraft types most commonly involved and the circumstances confirm the likelihood of sensory incongruity being a contributory factor in the majority of cases. The underlying differences between primary and secondary disorientation are discussed. The predominant emphasis both in aeromedical indoctrination and instrument flying practice is concerned with preventing primary spatial disorientation, but insufficient effort is made towards ensuring that primary disorientation when it occurs, does not develop into the dangerous secondary stage. The various methods of simulation of instrument flying are examined. Author

WHAT IS THE MEANING OF THE MASTER-STEP-TEST IN EXAMINATIONS TO DETERMINE THE FITNESS FOR MILITARY FLYING DUTY
H. W. Kirchhoff and A. Dietz *In* AGARD Improved and Simplified Methods for the Clin. Evaluation of Aircrew, Part 2 Mar. 1972 3 p (See N72-25048 16-04)
Avail: NTIS HC $8.25

Long term examinations by means of an ECG were conducted on approximately 1000 pilots between 18 and 50 years of age. For the period of the past 14 years, at least 8 ECG's were obtained for each pilot. The examinations revealed the following results (1) Abnormal or conspicuous ECG alterations are found to a small extent in tests at rest and in master tests. (2) The number of conspicuous ECG findings increases with age. It became evident that special examinations, such as ergometer or hypoxia ECG, more frequently indicate abnormal ECG alterations than the routine procedures. Use of the master test is recommended only in routine examinations from the 35th year of age on. Author

THE AUTOMATIC ANALYSIS OF THE ECG AT REST, DURING AND AFTER EXERCISE WITH TWO DIFFERENT COMPUTER SYSTEMS

J. Zipfel, J. D. Meyer-Erkelenz, C. V. Kirschbaum, and H. W. Kirchhoff *In* AGARD Improved and Simplified Methods for the Clin. Evaluation of Aircrew, Part 2 Mar. 1972 5 p (See N72-25048 16-04)
Avail: NTIS HC $6.25

The quality of various lead systems and computer programs for ECG diagnosis is considered. For the evaluation of the standard leads, the Minnesota system can be used. The program of Arvedson was used for the Frank system, which is particularly suitable for computer. The ECG was recorded at rest and during exercise to detect the beginning of coronary artery disease. The quantified ergometer work load was used as exercise. Attention was directed towards the evaluation of ST-T changes. The results were compared with the diagnosis of a cardiology team for the two computers. It is concluded that at rest and in the postexercise period, the use of both computer systems is justified. Author

PROBLEMS IN THE CLINICAL ASSESSMENT OF RAISED ARTERIAL BLOOD PRESSURE IN AIRCREW
J. N. C. Cooke *In* AGARD Improved and Simplified Methods for the Clin. Evaluation of Aircrew, Part 2 Mar. 1972 3 p refs (See N72-25048 16-04)
Avail: NTIS HC $6.25

The further assessment of apparently raised blood pressure levels found on routine examination of aircrew members is considered. The initial problem is posed by difficulties in establishing definite limits of normalcy and in fixing any level of blood pressure that divides health from disease. In the Royal Air Force, a consultant physician makes an initial clinical assessment and decides if there is a requirement for detailed investigation. This investigation consists of a standardized comprehensive search for possible causes for a rise in blood pressure and for associated pathological conditions. After this investigation a number of subjects remain whose fitness for further flying must be judged upon their blood pressure alone. These figures are subject to great variability, compounded by known factors of anxiety, tension, observer error, and environmental influences. Some of these problems might be reduced by repeated recordings under standardized conditions and the use of automatic cuff recorders in the hope that comparisons over varying time intervals may show up clear trends of improvement or deterioration in an individual. Final disposal still depends largely on the statistical evidence for increased mortality and morbidity associated with raised blood pressure levels and the resultant need to institute treatment. A SIMPLIFIED SPACE TECHNOLOGY METHOD FOR CLINICAL AIRCREW MEASUREMENT OF FUNCTIONAL RESPIRATORY VALUES
Walton L. Jones and B. M. Bushman (Parkin-Elmer Corp., Pomona, Calif.) *In* AGARD Improved and Simplified Methods for the Clin. Evaluation of Aircrew, Part 2 Mar. 1972 11 p (See N72-25048 16-04)
(NASA-TM-X-68370) Avail: NTIS HC $3.00 CSCL 06E

A versatile, rapid, reliable respiratory gas analyzer based on mass spectrometer principles was developed for air crew pulmonary function measurement. The instrument can provide a continuous and simultaneous analysis of up to eight gases useful in pulmonary function evaluation. The principal gases include oxygen, carbon dioxide, nitrogen, and water vapor. The instrument is suited to air crew and space cabin applications because: (1) The quantity of gas diverted to the mass spectrometer is a negligible fraction of the expired gas; (2) The time response of the mass spectrometer is fast relative to the breath cycle time; (3) The mass spectrometer is capable of accurate partial pressure measurements; (4) The size, weight, and power requirements are compatible with most in-flight applications; (5) Simplicity and reliability of operation are stressed. PRESENT KNOWLEDGE OF COSMIC RAYS
O. C. Allkofer *In* AGARD Spec. Biophys. Probl. in Aerospace Med., Pt. 3 Mar. 1972 14 p refs (See N72-26045 17-04)
Avail: NTIS HC $8.50

The main features of cosmic radiation are outlined as far as they are of interest concerning radiation hazards in SST and manned space flights. The properties of the galactic and solar component and of the radiation belts are characterized. The interactions of the primary particles with the atmosphere and the earth's magnetic field are illustrated and figures are given for the altitude and latitude dependence. Finally, the modulation effects of the galactic component due to the solar influence are discussed. Author

ACTIVE DOSIMETRY OF COSMIC RADIATION
E. W. Fuller *In* AGARD Spec. Biophys. Probl. in Aerospace Med., Pt. 3 Mar. 1972 11 p refs (See N72-26045 17-04)
Avail: NTIS HC $8.50

The role assumed for active dosimetry in manned space missions and high altitude flight is to enable the exposure received during flight to be controlled by on-board monitoring. The radiation environment and the need for active dosimetry in the two circumstances are reviewed and then the instrumentation available and under development for this application is described. Methods of calibrating such instrumentation are also considered. It is concluded that satisfactory instruments for both applications are presently available but that there is a need for continuing development of more compact systems for high altitude aircraft. (NASA-TM-X-68460) Avail: NTIS HC $3.00 CSCL 06R

Experiments, conducted at cyclotrons together with observations by Apollo astronauts, suggest with little doubt that cosmic nuclei interacting with the visual apparatus cause the phenomenon of light flashes seen on translunar and transearth coast over the past four Apollo missions. Other experiments with high and low energy neutrons and a helium ion beam suggest that slow protons and helium ions with a stopping power greater than 10 to the 8th power eV/gram sq cm can cause the phenomenon in the dark adapted eye. It was demonstrated that charged particles induced by neutrons and helium ions can stimulate the visual apparatus. Some approaches to understanding the long term mission effects of galactic cosmic nuclei interacting with man and his nervous system are outlined. Author

MAGNETIC FIELDS AND MAN: WHERE DO WE STAND TODAY?

Dietrich E Beischer and Vernon R Renc *In* AGARD Spec Biophys Probl in Aerospace Med., Pt 3 Mar 1972 9 p refs Sponsored in part by NASA (See N72-26045 17-04)

(NASA-CR-127049) Avail NTIS HC $3.00 CSCL 06R

An assessment is made of the effects of very low and very high magnetic fields on man. In preparation for the Apollo flights, magnetic fields of 50 gamma were generated in the laboratory by two different methods. Human volunteers were tested with a comprehensive battery of physiological and psychological tests during and after continuous exposure for various time periods. No significant difference due to the low field was found for exposure periods of up to 10 days. Technological advancements in power generation, antisubmarine warfare and energy storage and transmission expose man to magnetic fields many orders of magnitude higher than those heretofore encountered. The only available information relevant to these conditions is based upon occasional observations in high energy physics laboratories and Soviet descriptions of clinical effects. Results of incidental human exposure and of primates exposed to high fields indicate that, while actual survival is not threatened by such exposures, high fields can influence man to a degree sufficient to cause serious performance decrement.

LASER SAFETY AND HOW TO PROMOTE IT

Myron L Wolbarsht *In* AGARD Spec Biophys Probl in Aerospace Med., Pt 3 Mar 1972 6 p refs (See N72-26045 17-04)

(Contract N00014-67-A-0251-0011)

Avail NTIS HC $8.50

The characteristics of lasers which may produce danger are briefly discussed with regard to the special characteristics of laser light and also the characteristics they share with other light sources. Types of personnel protection are considered as are regulations and safety programs in relation to the energy and power levels that are currently thought to be nonhazardous. The principles of hazard analysis are described in conjunction with their use at any particular safety level. Two of the programs carried on by the U S Navy Medical Department on laser safety are considered in detail. One deals with the functional decrement in visual acuity of monkeys by pulsed laser trains in the near infrared. The other is concerned with the determination of threshold levels for ocular injury by lasers in human volunteers.

COLOUR VISION REQUIREMENTS IN DIFFERENT OPERATIONAL ROLES
D. H. Brennan *In* AGARD Colour Vision Requirements in Different Operational Roles Nov. 1972 3 p refs (For availability see N73-19065 10-04)

Color vision in the various operational roles of the Royal Air Force and Army Air Corps was studied. It is considered that good color acuity, although playing a valuable part in the total process of visual perception is not of paramount importance. It

would be possible by altering the present chromaticities of red and green signal colors to admit for all aircrew duties, except those of close air support, the more severe grades of red green defective. It is thought, however, that the small gain in recruiting would not warrant the resulting expense and disruption of present services. The pseudo-isochromatic plates provide a simple and rapid method of detecting even minor anomalies of color vision. With present standards, the lantern is the best trade test for grading color defectives as fit or unfit for aircrew duties. Should standards be lowered it would be necessary to supplement the lantern with a quantitative test which should be related, if possible, to the role envisaged for the candidate. Author

COLOR VISION REQUIREMENTS FOR AIR CREW PERSONNEL OF THE FUTURE
Walter F. Grether *In* AGARD Colour Vision Requirements in Different Operational Roles Nov. 1972 7 p refs (For availability see N73-19065 10-04)
(AMRL-TR-71-116)

Color has unique value as a means of coding visually presented information. This was shown by experimental evaluations of alternate coding methods, such as pattern, size, intensity and flash rate. A reduction in color vision selection standards for flight personnel, such as the pilot, would require the replacement of color with other and potentially less efficient visual coding methods. Such a change would restrict the visual display choices available to the designers of future information presentation equipment, both airborne and ground. An examination of past trends and current equipment development indicates that the use of color for coding information used by flight personnel will probably be increasing rather than decreasing in the future. MEASUREMENT OF SUSCEPTIBILITY TO MOTION SICKNESS
K. E. Money *In* AGARD Predictability of Motion Sickness in the Selection of Pilots Feb. 1973 4 p refs (For availability see N73-21092 12-04)

Three different bases were suggested for predicting susceptibility to motion sickness in a specific vehicle. These are (1) history of motion sickness, (2) susceptibility to motion sickness in a laboratory device, and (3) laboratory vestibular and other tests. These techniques were reviewed, and their usefulness was assessed. It was concluded that the laboratory vestibular and other tests are without practical value. Susceptibility to motion sickness laboratory devices and history of motion sickness were used and have significant predictive value. Consideration of these techniques for selection of aircrew candidates includes a comparison of the economic and other advantages of elimination of most air sickness problems and the disadvantages of the testing expense and the loss of some candidates who would not actually have had difficulty with motion sickness. FACTORS CONTRIBUTING TO MOTION SICKNESS SUSCEPTIBILITY: ADAPTABILITY AND RECEPTIVITY
James Reason (Naval Aerospace Med. Res. Lab., Pensacola, Fla.) and Ashton Graybiel *In* AGARD Predictability of Motion Sickness in the Selection of Pilots Feb. 1973 15 p refs (For availability see N73-21092 12-04)

Evidence is presented to show that two perceptual factors, receptivity and adaptability, contribute to variation in motion sickness susceptibility. An attempt is made to integrate these two sources of variation into a neural mismatch theory of motion sickness. Two original studies are briefly reported. In the first, positive and significant relationships were obtained between measures of adaptability and (1) a personal history measure of susceptibility, (2) loss of well being during exposure to cross-coupled angular accelerations, and (3) a questionnaire measure of introversion. It was also found that adaptability and receptivity

are unrelated factors, and that, of the two, adaptability exerted the most potent influence upon susceptibility. Yet, among slow adapters only, there was some evidence to show that receptivity contributed to individual differences in proneness. The second study was concerned with the long-term retention of protective adaptation. Author

ASSESSMENT OF REACTIONS TO VESTIBULAR DISORIENTATION STRESS FOR PURPOSES OF AIRCREW SELECTION

Fred E. Guedry and Rosalie K. Ambler. *In* AGARD Predictability of Motion Sickness in the Selection of Pilots. Feb. 1973. 8 p. refs. (For availability see N73-21092 12-04)

Several tests are described which are useful for predicting individuals who will separate from air training because of airsickness and/or disabling anxiety toward flight. These tests are based on measures of immediate reactions to disorientation stress. It is desirable to have a futher diagnostic assessment of individuals to determine the underlying causes of differences in reactivity to disorientation stress and also to estimate the individual's likelihood of success in the light of other predictor variables. The disorientation stress tests significantly augment other aviator predictor variables, and they appear to be significantly correlated to several personality measures. A particular visual display and task were used that produced significantly more sickness than did other tasks during comparable vestibular stimulation. This test procedure was changed and a procedure was developed which appears practical for assessing individual differences in accommodation to intersensory conflict between the visual and vestibular systems. The changed procedure did not produce sickness, and the results indicate that a 57 per cent mean improvement in visual performance during vestibular stimulation can occur after only a 10-minute habituation schedule. At least part of the improvement in visual performance appears attributable to increased visual control over vestibular reflex control of the eyes. Author

N73-21097 Naval Aerospace Medical Research Lab., Pensacola, Fla.

MOTION SICKNESS QUESTIONNAIRE AND FIELD INDEPENDENCE SCORES AS PREDICTORS OF SUCCESS IN NAVAL AVIATION TRAINING

Robert S. Kennedy. *In* AGARD Predictability of Motion Sickness in the Selection of Pilots. Feb. 1973. 5 p. refs. (For availability see N73-21092 12-04)

The usefulness of two paper and pencil tests in predicting the likelihood of success in Naval aviation training is reported. Several years experience with a motion sickness questionnaire is reviewed, literature and theories related to motion sickness are surveyed, and a group-administered personality test is reported. The motion sickness questionnaire (MSQ) was empirically validated against an experimental procedure for producing motion sickness symptomatology (N = 100), and in a larger group (N = 802) scores on the questionnaire were statistically related to the likelihood of aviation training success. Refinements in the scoring improved the predictive ability of the MSQ (N = 660) and cross-validated successfully (N = 550). Author

THE USAFSAM SELECTION, TEST, AND REHABILITATION PROGRAM OF MOTION SICK PILOTS

Patrick J. Dowd. *In* AGARD Predictability of Motion Sickness in the Selection of Pilots. Feb. 1972. 10 p. refs. (For availability see N73-21092 12-04)

The USAF School of Aerospace Medicine biaxial stimulator was used to impose standardized Coriolis stimuli for the purpose of determining a subject's tolerance of this very disturbing stimulus. This test differentiates the nonsick (NS) individuals from the sick (S) ones within each peer group (navigators, pilots, and airman trainees) and is a valuable indicator of the level of resistance an individual has to Coriolis accelerations and as a selection tool for an individual's resistance to motion sickness. The results of this type of test (pilots: NS 299, S 51, navigators: NS 60, S 34, airman trainees: NS 91, S 19, pentathlon athletes: NS 14, S 0) can greatly assist in the overall selection of personnel in preflight, postflight, and in-training programs. TEST RESULTS ABOUT THE EFFECTIVENESS OF METIXENUM APPLIED AGAINST MOTION SICKNESS

Christian Henning. *In* AGARD Predictability of Motion Sickness in the Selection of Pilots. Feb. 1973. 4 p. refs. (For availability see N73-21092 12-04)

Thirty healthy subjects were tested in a spatial disorientation demonstrator (SDD) in order to compare the effectiveness of Metixenum and Meclocin under double blind comparison test conditions against motion sickness with statistical evaluation. Metixenum reduced all subjective symptoms significantly. Its efficacy was higher than that of Meclocin. Simultaneously recorded objective symptoms (post-rotatory vertigo sensation, heart rate, results of a walking balance test) were not significantly influenced. Autho.

RESPONSES OF BLIND FISH TO GRAVITATIONAL CHANGES AS ACHIEVED IN PARABOLIC FLIGHT

R. J. VonBaumgarten (Mich. Univ., Ann Arbor), G. L. Shillinger, Jr., and G. Baldright (Mich. Univ., Ann Arbor). *In* AGARD Predictability of Motion Sickness in the Selection of Pilots. Feb. 1972. 4 p. refs. (For availability see N73-21092 12-04)

Blind fish, during parabolic flight, display a measurable and consistent behavior. The most spectacular new behavioral response is the forward looping of blind fish in or near weightlessness. This response shows no measurable adaptation during the entire period of weightlessness of about 30 sec. During the entrance and exit of weightless parabolas (pushover and pullout), respectively, the fish assumes a forward tilted diving position. Parabolic flight with negative g in the range between 0 g and 1 g causes similar diving responses of the fish with the only difference being that the dive is directed toward the top of the fish tank. When the response to a g value less than 1 g is compared to the response to increased g load on the ground (escape or darting response) an essential difference is seen: higher horizontal acceleration or jerk on the ground causes fish to swim, or even dart, against the direction of inertial force; fish during weightless parabolas move into the direction of the inertial or gravitational force. Since the vestibular system of fish is homologous to that of man, the observed behavior of fish in weightless flight could help to better understand human performance and sensations in comparable situations. Drug effects on flight fitness and the evaluation, detection, and identification of drugs and alcohol in flying personnel are discussed. For individual titles, see N73-21103 through N73-21126.

N73-21103 Advisory Group for Aerospace Research and Development, Paris (France)
TECHNICAL EVALUATION REPORT, CONCLUSION, RECOMMENDATIONS
Heinz S. Fuchs *In its* The Use of Medication and Drugs in Flying Personnel Feb. 1973 13 p refs (For availability see N73-21102 12-04)

Inasmuch as flying effectiveness depends on an optimum degree of psychosomatic fitness, it is axiomatic that the need in a flyer for drugs should raise serious doubts as to his fitness to fly. Increasing age of the flying population is the major contributing factor since there is an increased incidence of disease commonly associated with aging. Improved diagnostic techniques and augmented information about normals and early disease have also had a significant influence upon both the types of problems evaluated and their disposition. The flight surgeon must keep well informed on all drugs, particularly newly accepted ones, so that no medication will be prescribed which might compromise flight safety. Individual susceptibility and hypersensitivity to drugs in general must always be considered. In certain situations drug therapy is warranted to prevent complications and to effect an improvement in long term prognosis. Another problem is acute illness, wherein drug therapy is warranted either to treat primarily the etiology of the disease or more frequently merely to control the symptoms in a self-limited condition. USE OF HYPNOTICS BY AIRCREW. 1: OPERATIONAL CONSIDERATIONS AND EXPERIMENTAL STUDIES
A. N. Nicholson and Catherine M. Wright *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 5 p refs (For availability see N73-21102 12-04)

The residual effects of hypnotic drugs for normalizing aircrew sleeping patterns on human nervous function and performance are studied. Delayed matching-to-sample tests on monkeys show that barbiturates do not affect matching-to-stimuli time, but some benzodiazepines increase response times up to 6 hrs after administration. G.G.

ASPECTS OF SLEEP REGULATION IN AIRLINE PILOTS
F. S. Preston *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 8 p refs (For availability see N73-21102 12-04)

Probably the greatest problem facing long haul civil airlines is the need to ensure that pilots are given adequate time while on a tour of duty to ensure sufficient sleep and so enable them to cope successfully with the ensuing period of work. The problem on long haul routes is greatly compounded by the effect of time zone changes, night flights and changes of a climatic nature which all effect the individual's ability to achieve sleep on arrival. There is definite evidence of cumulative sleep loss on longer trans-meridian routes. As a result, the individual pilot may be tempted to use hypnotics which he can purchase freely over the counter in some parts of the world without medical supervision. In addition, he may use alcohol for its hypnotic action or combined with other hypnotics which may affect not only his fitness to fly on the next day, but have addictive and cumulative effects. The problems are discussed for a long haul airline and some suggestions are made for controlling the situation from both the medical and executive standpoints. Author

THE EFFECTS OF INH CHEMOPROPHYLAXIS ON AVIATOR PERFORMANCE
Mark A. Hofmann *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 8 p refs (For availability see N73-21102 12-04)

A group of tuberculin positive, healthy aviators taking INH prophylactically at dosages of 300 mg daily for one year were maintained on flying status while simultaneously participating in a study to determine the effects of this drug therapy. This investigation measured performance on a number of laboratory tasks to include pursuit tracking, mental multiplication, digit span, reaction time and combinations of the above. No d[illegible]ments in

performance were observed in this performance as a function of drug treatment. Additionally, these aviators' physical state was assessed by measuring a host of physiological parameters during their year of therapy. There was no evidence of severe drug reactions. It was recommended that aviators be allowed to continue flying duties while taking INH at these dosage levels, but in the interest of safety, a regular program of careful clinical observation and periodic measurements of transaminase levels be conducted. THE PREDICTION OF FLIGHT SAFETY HAZARDS FROM DRUG INDUCED PERFORMANCE DECREMENTS WITH ALCOHOL AS REFERENCE SUBSTANCE

Karl E. Klein *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 12 p refs (For availability see N73-21102 12-04)

A modification of CNS activity resulting in a decrement of performance is the most unwanted side effect of drugs in active flying personnel. A procedure is described where hazard prediction is accomplished with ethanol as reference substance through the following steps: (1) Evaluation of dose-effect-relationship for ethanol with the performance test to be applied in toxicological drug studies, and (2) Examination of drug with the alcohol calibrated test method, estimation of the alcohol intoxication level equipotential in its performance decrement to the drug dose studied, definition of the operational significance of the drug induced performance changes by reference to the intoxication-hazard-relationship established for alcohol, prediction of the critical drug dose through extrapolation. Results with sedative, neuroleptic, tranquilizing and stimulating drugs are demonstrated and the advantage and limitations of the reference procedure discussed. Author

ETHYL ALCOHOL AND PILOT PERFORMANCE: MILITARY IMPLICATIONS OF IN-FLIGHT STUDIES

C. E. Billings, R. L. Wick, Jr., R. J. Gerke, and R. C. Chase *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 11 p refs (For availability see N73-21102 12-04)

Sixteen instrument-rated civil pilots flew 501 instrument landing system approaches in a light airplane at night under simulated instrument flight conditions while sober and while under the influence of .04, .08 and .12 G% blood ethyl alcohol concentrations. Data included continuous measurement of deviations from localizer and glide path centerline; note was made of all procedural errors. While the highly experienced pilots maintained better tracking performance than the less experienced subjects, particularly at high blood alcohol levels, both groups demonstrated progressive increases in the number and seriousness of procedural errors with each increase in alcohol level. These results indicate that alcohol-induced performance degradation may occur first in secondary tasks rather than in the primary flying task. They also indicate that there is potentially dangerous deterioration in the performance of even highly skilled aviators at blood alcohol levels as low as .04%. Author

DRUG USE AND PERFORMANCE

J. G. Goetomzyk, P. Parade, and H. Gewecke *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 5 p refs (For availability see N73-21102 12-04)

Psychological and physiological effects of acute cannabis intoxication are considered. It is shown that hashish smoking does not affect oxygen consumption in man. However, performance requirements in driving a car under the influence of the drug appear to be felt as stress which demands a response from a psychologically stimulated high energy level. Reduced performance capability manifests itself if actual stress situations are superimposed upon the normal task. It is concluded that hashish impairs the ability to drive safely. G.G.

USE OF SPECTRAL ANALYSIS PROCEDURES FOR THE EVALUATION OF DRUG EFFECTS

James F. Parker, Jr. and Thomas W. Frazier (Walter Reed Army Inst. of Res., Washington, D.C.) *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 9 p refs (For availability see N73-21102 12-04)

The use of spectral analysis procedures in the study of drug effects is described in an attempt to develop a more sensitive and meaningful index of performance change. Spectral analysis procedures use time series data in which basic biorhythmicities in performance are identified and studied as the subject is exposed to a stress condition (drug administration). Oscillatory performance profiles are transformed from the time domain to power spectra. These spectra then are examined by means of statistical coherence estimates. Changes in the coherence of these biorhythms provide a measure of the extent to which the organization of a complex performance has been disrupted by the stress condition. Subjects were administered a tranquilizing drug (chlordiazepoxide) under double-blind conditions. A significant loss of coherence was found for the performance of a vigilance task. No change was found in the accompanying physiological measures heart rate and rectal temperature. These results clearly show a drug induced desynchronization of performance in a human data processing activity. It is concluded that spectral analysis techniques may be of value as one tool in the complete evaluation of drug effects. Author

DRUG ABUSE DETECTION EFFORTS

George D. Lathrop, Harold L. Kaplan, and Jack E. Wallace *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 4 p refs (For availability see N73-21102 12-04)

Operational efforts to detect drug abuse by mass-screening urinalysis are summarized. Particular emphasis is given to the current analytical methods used to detect opiates, barbiturates, and amphetamines. Advantages and disadvantages of available methodology are presented to provide rational guidelines for establishing an accurate and forensically reliable toxicology laboratory. Methods of thin layer chromatography and gas-liquid chromatography offer unparalled detection accuracy for drugs of abuse, as well as a capability to analyze therapeutic levels of certain psychotropic drugs (tranquilizers, antihistamines) of specific concern in flying populations. Tandem research efforts to improve current methodology for the diethylamide of lysergic acid (LSD), tetrahydrocannabinols (THC), and methadone, and to develop new tests based on individual enzymatic changes, are briefly presented. THE IMPACT OF DIURNAL RHYTHM ON DRUG DOSING AND DRUG EVALUATION
H. W. Kirchhoff *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb. 1973 4 p (For availability see N73-21102 12-04)

The well known fact that the functional behavior of the human organism is subjected to a rhythmically occurring daily process is still being disregarded in clinical practice and pharmacology. Drug dosing, instead of sticking to the stereotyped pattern of 3 x 1 tablet/day, requires full consideration of the diurnal variations which occur in the human body involving mainly cardiovascular parameters. Drug evaluation, on the other hand, should also include careful studies in diurnal rhythm in order to obtain precise data on the duration and onset of drug action as well as on specific influence emerging in the course of the day, all the more since any approach of this kind will contribute to the elimination of untoward side effects and other hazardous influences which may be attributed to a drug. ANTIDIABETIC MEDICATIONS AND NAVIGATION PERSONNEL [MEDICAMENTS ANTIDIABETIQUES ET PERSONNEL NAVIGANT]
Roger Pannier and Gerard Leguay *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb 1973 6 p In FRENCH (For availability see N73-21102 12-04)

The use of antidiabetic drugs and the fitness of such people as navigation personnel are examined. It was determined that the insulin-dependent sugar diabetic is unfit for such jobs because he is subject to keto-acidosic accidents, hypoglycemia, and regimented diets unsuited for his job. In non-insulin dependent diabetics who are maintained by oral drugs, it was determined that those who use sulphenylureas are also unsuited for flying duties since this drug sometimes causes hypoglycemia. Diabetics taking biguanide, it was determined, may under exceptional circumstances become or continue to be flying personnel. These drugs do not produce hypoglycemia as do the other medicants studied. Transl. by E.H.W.

TRANQUILIZERS AND AVIATION
Heinrich Schulte-Wintrop *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb 1973 4 p refs (For availability see N73-21102 12-04)

The use of tranquilizers during periods of flying duty is still infrequent and no direct effects on flight safety have so far been positively observed; there is, however, a danger of such effects in case of excess dosage and use of ataractics such as diazepam. A potentiating effect by alcohol has been described in some cases, but the influence of alcohol alone appears to be the crucial factor in these cases. It is shown that ataractics like chlordiazepoxide fail to alleviate stress reactions in student pilots, but that the application of certain tranquilizers in treating different types of kinetosis seems promising. The prescription of tranquilizers should be avoided until the effects these medicaments have in combination with the varied strains encountered in aviation have been fully surveyed. Author

USE OF MEDICATION AND DRUGS, ESPECIALLY ALCOHOL BY FLYING PERSONNEL
Hugo Hembach *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb 1973 5 p refs (For availability see N73-21102 12-04)

Alcohol is the most common and most dangerous drug used by pilots. Three simple methods are described by which the blood alcohol can be determined. (1) By means of two tables pilots are able to determine the approximate level of blood alcohol concentration after the consumption of a known amount of alcoholic beverage over a given period of time. (2) the detection of the gross post-rotational nystagmus which is found whenever the central nervous system has been affected by alcohol, and (3) a semi-quantitative method of breath analysis for alcohol detection in the blood. These three methods make it possible to single out pilots who have alcohol in their blood and to prevent them from flying. Author

COMPARISON OF MENTAL AND PSYCHOMOTOR EFFECTS OF DIAZEPAM AND ETHANOL
J. F. W. Haffner et al. *In* AGARD The Use of Medication and Drugs in Flying Personnel Feb 1973 10 p refs (For availability see N73-21102 12-04)

Whether and to what extent a single, large therapeutic dose of diazepam affects mental and psychomotor functions in man was determined. The effects of diazepam in dosages of 10 and 20 mg/70 kg body weight have been compared with those of alcohol in amounts which were designed to produce blood levels of approximately 0.1%. Serum concentrations of diazepam were estimated in order to see whether it was possible to establish a correlation between dosages, serum concentrations and effects. It was shown that diazepam has a negative influence on the results of a series of tests with relevance to performance. In none of the tests was there any improvement in mean score after diazepam compared with placebo. However, a comparison of the test results reveals some differences between the effects of alcohol and diazepam. Author

AEROMEDICAL EVALUATION OF THE PHASED-DILUTION CONCEPT FOR OXYGEN BREATHING SYSTEMS

Robert W Krutz, Jr., William J Sears, Kenneth G Gould, Jr., and Richard W Bancroft *In* AGARD Current Status in Aerospace Med Feb 1973 7 p refs (For availability see N73-23057 14-04)

This series of studies was designed to compare the relative effectiveness of phased-dilution with current demand-diluter oxygen delivery systems in artificially ventilated dogs and in seated, quietly breathing humans. The arterial oxygen tension approximately doubled in the canine model with the phased-dilution oxygen delivery when compared with comparable quantities of premixed oxygen at ground level and at simulated altitudes of 10,000 and 18,000 feet in a decompression chamber. Arterial oxygen tensions in humans breathing in a random fashion were higher with the phased-dilution oxygen delivery system than with comparable quantities of premixed oxygen. Human arterial oxygen tensions measured with the phased-dilution technique at ground level and in a chamber at subatmospheric pressures equivalent to altitudes of 10,000 and 18,000 feet were less than predicted from the canine work. It appears that this more limited effectiveness is closely related to a respiratory dead space effect and is influenced by frequency and depth of breathing with a fixed bolus. Author

SPECIALIZED ANTHROPOMETRY REQUIREMENTS FOR PROTECTIVE-EQUIPMENT EVALUATION

Daniel J Thomas *In* AGARD Current Status in Aerospace Med Feb 1973 8 p refs (For availability see N73-23057 14-04)

Anthropometry was considered from the point of view of its application to problems of protective-equipment evaluation, human impact-acceleration experiments, and flying personnel populations. The difficulties of supplying data for all three areas of endeavor are discussed. A three-dimensional anatomically referenced basis for recording anthropometric data is offered as an adequate approach. Coordinate systems for the head and the first thoracic vertebral body are described. Author

HUMAN EXPOSURE CRITERIA TO LASER ENERGY

Donald I Carter, William E Mabson, and James F Culver *In* AGARD Current Status in Aerospace Med Feb 1973 5 p ref (For availability see N73-23057 14-04)

The United States Air Force is adapting laser technology to many combat and combat support uses. Some of these uses include distance measuring to assist in aiming airborne guns in the AC-130 gunships, boresighting guns on fighter aircraft, and target marking for accurate aerial bombing. The number of different lasers and their uses are increasing. Since these high energy monochromatic light beams can produce biological damage, safe exposure criteria are needed to assist in developing safe exposure distances, protective devices, and medical surveillance programs. STUDY ON SOME AIR FORCE OPERATIONAL ACTIVITIES IN ITALY, WITH REFERENCE TO THERMAL CONDITIONS AND THEIR EFFECTS ON ACCELERATION TOLERANCE AND PSYCHOMOTOR PERFORMANCE

Paolo Rota *In* AGARD Current Status in Aerospace Med Feb 1973 10 p refs (For availability see N73-23057 14-04)

Climate in Italy, in summer period, presents such characteristics that, in Air Force operational activities, performance of AF personnel can be affected. Because of this a series of researches was carried out in this field. After a brief survey on main features of Italian climate and summer climatic conditions in some AF bases, the results are reported on microclimatic data recorded in the interior of the cockpit and inside motor vehicles cabins while parking in summer daylight period. Physiological importance of these data, and the effects on working efficiency are discussed and evaluated by means of some heat stress indexes. Results of experimental parallel researches are also reported to assess the effects on acceleration tolerance and psychomotor performance, of situations simulating scramble take off. Author

SPATIAL DISORIENTATION IN FLIGHT: A HANDBOOK FOR AIRCREW

A. J. Benson (RAF Inst. of Aviation Med.) and E. Burchard (German AF Med. Corps.) Sep. 1973 43 p refs

(AGARD-AG-170) Avail: NTIS HC $4.25

It has been known for many years that aircrews suffer from false sensations and perceptions of aircraft motion and that these illusions may hazard the safety of the aircraft and its occupants. This handbook considers the various manifestations of spatial disorientation, their causes and consequences for the benefits of aircrews and their medical attendants. Author

PATHOPHYSIOLOGICAL CONDITIONS COMPATIBLE WITH FLYING

Heinz S. Fuchs, ed. (German Fed. Armed Forces, Bonn) Oct. 1973 152 p refs In ENGLISH and FRENCH Presented at AGARD Aerospace Med. Panel Specialist Meeting, Pensacola, Fla., 16-17 May 1973

(AGARD-CP-129) Avail: NTIS HC $9.75

Medical selection and maintenance procedures for aircrews are reported. The effects of ageing, flight stress, clinical and psychophysiological pathological factors on pilot flight fitness are considered. For individual titles, see N74-13785 through N74-13806.

N74-13785 German Federal Armed Forces, Bonn.

TECHNICAL EVALUATION REPORT, CONCLUSION AND RECOMMENDATIONS

Heinz S. Fuchs *In* AGARD Pathophysiol. Conditions Compatible with Flying Oct. 1973 10 p (For availability see N74-13784 05-04)

In the past, physical standards have been overly conservative because it was necessary to base aeromedical criteria on medical concepts derived from experience with diseased states in hospital patients. Increasing experience with aircrew populations, based upon specific studies to disclose the relationships between the pathophysiology of early disease and the psychophysiological requirements of flight, allows a more subtilized interpretation of diagnostic and clinical findings and gives now a wider and safer prognostication. Therefore, it is believed that there is a justification to change these standards - based upon systematic and scientific reevaluation, taking advantage of newly developed knowledge and research techniques. Because of the unique nature of the ageing aircrew population, it is frequently necessary to accomplish this research directly upon the flyers themselves rather than to extrapolate from general medical research. THE THOUSAND AVIATORS - AGING AND THE BLOOD PRESSURE

Robert E. Mitchell *In* AGARD Pathophysiol. Conditions Compatible with Flying Oct. 1973 3 p (For availability see N74-13784 05-04)

Blood pressure patterns are discussed for the members of a research group over a 32 year period and the implications of the patterns. In contrast to what was previously thought to be the case, namely that blood pressure levels not rise with increasing age, the latest survey indicates that there are many and important exceptions to this generality, after 45 years of age. Since this is the period when most naval aviators enter the administrative phase of their careers, the finding has less significance than if it occurred at an earlier age but has greater operational significance in the case of commercial airline pilots inasmuch as these men

continue to fly at age 60. It would appear that this late onset ... ed blood pressure justifies the more liberal standards fo... ission to flight training. At the same time personnel in an active flight status can be allowed to continue active flying if no complications are noted and treatment is not indicated.

ELEVATED BLOOD PRESSURE IN AIRCREW
D. R. Stoop, K. C. Stanton, and D. D. Brown. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 5 p. (For availability see N74-13784 05-04)

The evaluation, management, and disposition of the aircrew with elevated blood pressure are frequently difficult problems. Analysis of evaluations reveals an obvious reluctance on the part of the physician to establish a diagnosis of hypertension and a tendency to avoid drug therapy in spite of accepted evidence that early treatment reduces morbidity. The implications and potential problems in this approach have been discussed, and current practices and policies regarding the aircrew with hypertension have been presented and defended.

RETURNING AIRMEN WITH ABNORMAL EXERCISE TESTS AND NORMAL CORONARY ANGIOGRAMS TO FLYING STATUS
Victor F. Froelicher, Frank G. Yanowitz, A. J. Thompson, and Malcolm C. Lancaster. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 7 p. refs. (For availability see N74-13784 05-04)

Individuals with ST segment changes during and/or after exercise are considered to have an increased risk of developing the manifestations of CAD (Coronary Artery Disease). However, it is also known that both the double Master's test and maximal treadmill testing yield false positive and negative results reactive to CAD. The results of coronary angiography are presented in 63 asymptomatic aircrewmen with resting repolarization abnormalities and exercise testing responses suggestive of coronary artery disease. Fifty-four per cent had angiographic coronary artery disease, and many had high risk lesions. Forty-six per cent had no angiographic lesions and were recommended for return to flying duties. The findings in this study, the lack of significant complications, the concern for public safety, and the economics of maintaining a flying force justify the continued use of elective coronary angiography in selected asymptomatic aircrewmen.

MYOCARDIAL AND CEREBRAL FUNCTION DURING EXPOSURE TO CARBON MONOXIDE
Howard H. Erickson and Milton J. Hernandez-Perez. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 6 p. refs. (For availability see N74-13784 05-04)

Aircrew members exposed to carbon monoxide may sustain an increase in coronary blood flow and a reduction in oxygen delivery to the heart and brain. These factors may result in a decrement in man's performance in strategic and tactical weapon systems in an enemy defense environment. Since many of the stresses -- such as physical exertion, altitude hypoxia, and acceleration -- are cumulative, carbon monoxide may affect the heart and cardiovascular system of man during operational flying by decreasing still further the oxygen supply and reserve in the heart and brain.

CARDIAC VALVULOPATHIES AND FLIGHT TOLERENCE [CARDIOPATHIES VALVULAIRES ET TOLERANCE AU VOL]
G. Leguay. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 12 p. refs. In FRENCH (For availability see N74-13784 05-04)

Due to exceptional circumstances 8 pilots suffering from aortic insufficiency, aortic stenosis, and mitralis stenosis have been on flying status, aeromedically monitored up to 15 and 20 years. The cardiac valvulopathies raise a twofold problem: they may potentially endanger flight safety by leading to a sudden cardiac syncope and they can be aggravated by flying, particularly by acceleration forces. Flight safety, however, has never been threatened by these aircrew in the light of experience over several years. The tolerance of flying pilots suffering from moderate aortic insufficiency seems satisfactory, in particular in fighter pilots exposed to high g-loads.

VALUE OF CARDIAC MECHANOGRAMS IN EVALUATING FLYING PERSONNEL [INTERET DES MECANOGRAMMES CARDIAQUES DANS L'EXPERTISE DU PERSONNEL NAVIGANT]
R. Carre, C. Nogues, and B. Raviart. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 14 p. refs. In FRENCH (For availability see N74-13784 05-04)

Cardiac mechanograms provide useful information in the medical evaluation of aircrew and are obtained fast and easily by a noninvasive technique. The cardiogram itself provides an estimate of the elasticity of the arterial wall, and in that way gives criteria for atherosclerosis. The combined use of chronocardiographic methods (EGG, cardiogram) provides an opportunity of validating the contractibility of the cardiac muscle. These methods are important in the cardiologic survey of aircrew, both to detect atherosclerosis and monitor arterial hypertension.

ASTHMA IN MILITARY FLYING PERSONNEL [L'ASTHME DANS LE PERSONNEL NAVIGANT MILITAIRE]
R. Pannier. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 8 p. refs. In FRENCH (For availability see N74-13784 05-04)

Detection of bronchial asthma is based mainly on actually observed acute episodes. That is the reason why applicants for flight training will be accepted unless they are subjected to an acetylcholin test. It is well known that patients with bronchial asthma benefit from flying. However, because of its serious consequences if it occurs in flight, bronchial asthma is considered to jeopardize flight safety. It is important to realize that treatments have to be adapted to the aircrew tasks since some medications may be contraindicated for flying activities in view of their secondary effects. Therefore, applicants for flying duties suffering from bronchial asthma must be rejected; aircrew who develop bronchial asthma during an established career might be considered for a waiver on an individual basis, but as a rule they will not be authorized for primary control of aircraft.

IDIOPATHIC SPONTANEOUS PNEUMOTHORAX IN FLYING PERSONNEL [LE PNEUMOTHORAX SPONTANE IDIOPATHIQUE DANS LE PERSONNEL NAVIGANT]
Roger Pannier. *In* AGARD Pathophysiol. Conditions Compatible with Flying, Oct. 1973. 6 p. In FRENCH (For availability see N74-13784 05-04)

Rupture of subpleural blebs is considered the most frequent cause of idiopathic spontaneous pneumothorax. Idiopathic spontaneous pneumothorax can occur in flight in the course of rapid decompression, by ascent to altitude both in flight and in an altitude chamber when trapped air within these blebs expands and ruptures the thin pleural layer, by an hydrostatic hemodynamic effect, or incidentally without any concomitant exertion or any physical stress. Applicants for flight training reporting one episode of idiopathic spontaneous pneumothorax must be rejected; aircrew on active duty and with an established flying career must be grounded unless they have undergone successful pulmonary surgery. Ten out of thirteen aircrew who suffered from idiopathic spontaneous pneumothorax were kept on flying status after successful pulmonary surgery. The time of grounding ranged from 3 to 14 months.

AIRCREW'S FITNESS FOR FLYING DUTIES AFTER VERTEBRAL FRACTURES AND SPINAL SURGERY [APTITUDE AU VOL DU PERSONNEL NAVIGANT APRES FRACTURES DU RACHIS ET INTERVENTIONS CHIRURGICALES SUR LA COLONNE VERTEBRALE]
Roland-Paul Delahaye (Service de Sante pour l'Armee de l'Air, Paris), Robert Auffret, Jacques Mine (Hopital Begin, Saint-Mande), and Pierre-Jean Metges (Hopital Begin, Saint-Mande) *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 7 p refs In FRENCH (For availability see N74-13784 05-04)

Some features of flying such as vibration and accelerations, may sensitize the spine, ejection seat bail-out and/or crash can result in more or less deleterious spine injuries and fractures. After every accident, spinal disorders, or spinal surgery aircrew must be reexamined for flying fitness. After fractures it is of the utmost importance to determine the degree of spinal stability or instability, such as after spinal disorders e.g. osteoarthrosis or arthrosis, or surgery (laminectomy), or surgery for disc hernias or spondylolisthesis. Special emphasis has been given to the evaluation of aircrew with repeated vertebral traumas on damaged spines and fractures after surgery for spinal conditions. Author

AERONAUTICAL REHABILITATION OF FLYING PERSONNEL SUFFERING FROM ACUTE PSYCHIATRIC DISTURBANCES [LA REHABILITATION AERONAUTIQUE DES MEMBRES DU PERSONNEL NAVIGANT AYANT PRESENTE DES TROUBLES PSYCHIATRIQUES AIGUS]
R. Gelly and J. C. Hadni *In its* Pathophysiol Conditions Compatible with Flying Oct 1973 9 p In FRENCH (For availability see N74-13784 05-04)

Acute psychiatric symptoms combined with behavioral anomalies are normally aeromedical reasons for rejection both from flying and from regular military service. Based on an extensive case report survey, it can be demonstrated fairly clearly that such decisions are not always justified. Each case must be considered from an individual viewpoint since in many cases psychiatric symptoms and behavioral anomalies cannot be diagnosed with absolute certainty. In particular, some obviously serious crises merely reflect individual difficulties in the course of adaptation. Any decision must therefore be based on a diagnosis of the personality structure and personality tests must be considered a major element of psychopathological diagnosis. Psychotherapy can bring to a satisfactory solution some psychiatric syndromes which have been in the past considered irreversible. However psychotherapy in order to be successful must be associated with concurrent actions both in the professional environment and in further flying training, etc. Under these conditions the rehabilitation for flying duties of aircrew who had acute psychiatric troubles, possible. IMPORTANCE OF THE 4 - 5 c/sec RHYTHM IN THE EEG TO DETERMINE MILITARY FLYING FITNESS
H. Oberholz *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 3 p refs (For availability see N74-13784 05-04)

The 4 - 5 c/sec rhythm is probably a genetically determined variant of the normal EEG which may easily be misinterpreted as a fairly serious general alteration of the EEG. In order to differentiate between similar EEG patterns, the characteristics of this EEG-variant and the special mode of EEG registration were discussed and appropriate EEG's demonstrated. From the literature, the results of family examinations including possible causes of these EEG-variants were presented. Psychological peculiarities in persons showing this EEG variant were emphasized and criteria for the assessment of military flying fitness and preventive measures were proposed. Cases found were analyzed and the procedures applied to variant carriers presented. Author

MANAGEMENT OF GLAUCOMA IN AN AGEING FLYING POPULATION
Thomas J. Tredici, James L. Mims, III, and James F. Culver *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 3 p refs (For availability see N74-13784 05-04)

Ageing has definite and certain predictable effects on the visual apparatus. Loss of accommodation with age hampers important visual tasks in the cockpit. Disease processes that are common in any population will eventually also affect the flyer. The occurrence of narrow angle glaucoma in the flying population is so small that it is insignificant, however with relative maturation of a flying force a 2 to 3 percent figure does become significant. Glaucoma strikes a flyer after a great deal of time and money have been expended in his training and when his experience could be utilized to the maximum. Medical grounding of a significant number of experienced flyers can be considered a loss. Many flyers with increased intraocular pressure have been retained on flying status by a rationale of diagnosis and treatment. The visual effects of drugs utilized in the treatment of glaucoma have been evaluated. Presently only intraocular tension lowering drugs that do not effect visual function are being used. Author

CURRENT ASPECTS OF COCHLEAR FUNCTION APPLIED TO FLYING PERSONNEL [ASPECT ACTUEL DE LA FONCTION COCHLEAIRE CHEZ LE PERSONNEL NAVIGANT]
P. Blanc and J. Bastien (DCSSA, Paris) *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 3 p In FRENCH (For availability see N74-13784 05-04)

This 9-years survey is based upon 6 024 audiograms of flying personnel who have been rated for at least two years. The results of this investigation can be summarized as follows: (1) Any barotrauma on the middle ear may be neglected, an air passenger who has had stapedectomy for otosclerosis may travel by air without any risk. (2) occupational deafness was not found in flying personnel under investigation. (3) hearing discrimination deficits were found in some individuals since the aviation operational environment stresses aircrew by its considerable noise levels, and (4) 12 aircrew with intact ear drums were found to be suffering from moderate conduction deafness and presenting the classic otosclerotic syndrome. Two of them underwent cochlear

surgery and have flown to date 1 000 flying hrs each The audrometric results produced by surgery remained excellent

PURE TONE HEARING LOSSES IN PILOTS OF VARIOUS AIRCRAFT, AGE AND FLYING TIME AND ITS SIGNIFICANCE FOR INFLIGHT SPEECH COMMUNICATION
G H Froehlich *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 4 p (For availability see N74-13784 05-04)

The punch cards of 2000 pilots investigated in 1971 have been separated into 4 groups of flying time respectively age, subdivided into pilots of jet aircraft, piston engined aircraft and helicopters High tone hearing losses were increasing with age and flying time and in helicopter pilots more rapidly than in pilots of the other types of aircraft A number of pilot's speech audiograms have been investigated The intelligibility scores of hearing losses above 3000 Hz were excellent and there are no problems with inflight speech communications Hearing losses above 2000 Hz resulted in intelligibility scores of 72% at low and 85% at medium speech levels Less than 10% of the pilots above 45 years of age had hearing losses above 1500 Hz At medium speech levels they obtained only a score of 70%, 100% are frequently not reached even with high speech levels Together with the masking effect of inflight cabin noise, voice communication might be endangered, especially if the attenuation characteristics of headsets and flying helmets are poor In these cases, the use of properly fitting headgar is especially important to insure a favorable noise to speech ratio

PROTEINURIAS IN FLYING PERSONNEL [PROTEINURIES ET PERSONNEL NAVIGANT]
G Leguay *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 12 p In FRENCH (For availability see N74-13784 05-04)

Proteinurias have been found much more frequently among air transport aircrew than in fighter pilots More than 50% of all cases have been observed in aircrew between 20 and 25 years of age which is obviously caused by the age dependant incidence of the orthostatic proteinuria Chronic proteinurias are in most instances caused by chronic glomerulopathies If this condition is clinically stabilized, it may be considered compatible with flying Clearance impairment, however, necessitates a special diet, and the existence of a marked hypertension as well as the incompatibility with vaccinations indicates grounding of these aircrew To verify the interaction of proteinurias and flying, several individuals were exposed to acceleration forces on the human centrifuge No significant changes of proteinuria were observed during or after the centrifuge rides However, barometric stresses which occur when flying at different altitudes may be considered dangerous since these barometric pressure differences can exacerbate infectious lesions in ENT areas

THE OCCURRENCE OF HYPERLIPIDEMIA IN FLYING AND NONFLYING SUBJECTS OF THE USAFSAM CARDIOVASCULAR DISEASE STUDY
Dale A Clark, Kenneth A Narahara, and Margaret F Allen *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 6 p refs (For availability see N74-13784 05-04)

The subjects of a cardiovascular disease study were separated into flying and non-flying groups, and the occurrence of elevated lipid levels in these groups was tabulated The question of interest was whether the stresses of flight elevate serum cholesterol and predispose pilots to the development of atherosclerotic heart disease None of the percentages obtained in this investigation differ significantly between the two groups These data therefore indicate that the stresses associated with flying have no more effect on serum lipids than do the stresses experienced by a group of non-flying officers A corollary inference is that the prognostic significance of a given serum lipid level is the same whether observed in a flying or a non-flying officer

THE PROBLEM OF DIABETES MELLITUS IN AVIATION MEDICINE
Gerhard Renftle *In its* Pathophysiol Conditions Compatible with Flying Oct 1973 7 p refs (For availability see N74-13784 05-04)

Problems in aviation medicine which diabetes mellitus raise regulations, waivers, diet, and hypoglycemic agents, are discussed While the incidence rate is relatively low in student pilots, a higher number of cases is found during follow-up examinations among experienced senior or command pilots Onset at age 20 to 40 may have the course of either juvenile or adult type Annual evaluation of carbohydrate metabolism with a standard glucose tolerance test should be mandatory for every military or commercial pilot, and every private pilot after age 40 As sulfonylureas may cause hypoglycemia, any antidiabetic therapy should not be considered compatible with flying duties Individuals with decreased carbohydrate metabolism tend to hypoglycemic reactions especially in hazardous situations or fasting periods Waivers should be granted only for diabetic pilots whose carbohydrate metabolism is fully controlled with diet, confirmed by daily testing of urine and frequent postprandial blood sugar examinations A case report illustrates the fluctuating and reversible course of an incipient diabetes and its effective management in a highly motivated and cooperative senior pilot

N74-13805 School of Aerospace Medicine, Brooks AFB, Tex
THE REPEATABILITY OF AN ABNORMAL 2-HOUR GLUCOSE TOLERANCE TEST
J F Trabal, R G Troxler, and M C Lancaster *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 5 p refs (For availability see N74-13784 05-04)

The diagnosis of diabetes mellitus not only implies a chronic abnormality of carbohydrate metabolism and an increased risk of premature vascular disease, but in the flyer, this diagnosis implies an increased risk to flying safety by reason of physical performance degradation The glucose tolerance test (GTT) is the accepted standard for the diagnosis of nonmanifest diabetes A study of the repeatability of the 2-hour GTT was carried out in 162 flyers who had an initial GTT and a repeat GTT from 6 - 24 months later Of those initial tests considered abnormal, 55 to 60% reverted to normal on the repeat test The repeatability of the GTT varied with the criteria used and with the number of points on the GTT curve that was considered The effects of stress on glucose metabolism and the results of the modification of the criteria for the diagnosis of diabetes are discussed The results of this study illustrate the importance of basic definitions of diagnostic criteria for diseases which have a long term effect on the health of the flying population

GERMAN AIR FORCE EXPERIENCES WITH CERTAIN CRITERIA FOR GRANTING A WAIVER
Guenther Schirrmann *In* AGARD Pathophysiol Conditions Compatible with Flying Oct 1973 4 p refs (For availability see N74-13784 05-04)

During a period of 13 years there were 28,699 periodic physical examinations of aircrew with 602 granted waivers These medical waivers were primarily granted in the disciplines of ophthalmology and internal medicine and seem to be justified even after a critical review Prerequisite to this procedure is not only a profound medical knowledge and know-how, but also comprehensive flight surgeons experience A correlation of accidents/incidents caused by pilots with and without waivers indicates practically identical findings while the aircraft accident rate was 3.76% for pilots flying without a waiver, it was 3.45% for pilots flying with a waiver and is therefore identical An analysis of aircraft accidents involving the waiver group revealed

no evidence indicating that waivers are a triggering or contributing factor in accidents. The procedure seems to be sufficient to eliminate all flying safety risks. Author

RESULTS OF BEHAVIOUR THERAPY IN FLYING PHOBIA
P. J. OConnor, J. A. Lister, and J. W. Rollins *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 3 p (For availability see N74-18779 10-04)

The treatment of military crews and pilots for flying phobia by behavior therapy is discussed. Treatment was divided into three series. In series 1 seven cases were treated. Only men who were highly motivated towards military flying and possessed a robust personality were selected. Sixteen consecutive cases were treated in Series 2. No selection was made, all personnel diagnosed as having flying phobia were admitted for treatment. After evaluating the results it was decided to revert to treating select cases. Series 3 had eight cases. All men selected because they had good prognosis for recovery. It was concluded that there is a better chance of improving a pilot with flying phobia to the point where he can fly training type aircraft than for getting him well enough to return to high performance aircraft. Author

ASSESSMENT OF BEHAVIOUR THERAPY IN THE TREATMENT OF FLYING PHOBIAS
A. B. Goorney *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 7 p refs (For availability see N74-18779 10-04)

An accurate assessment of the effectiveness of behaviour therapy (or of any other therapeutic method) in the treatment of flying phobias is difficult due to lack of information. Nevertheless there is evidence to suggest that for selected cases behaviour therapy may be an effective treatment with a high percentage returned to full flying. Selection should be restricted to cases in whom anxiety is limited to a part of the total flying environment (focal anxiety). A mixed technique is suggested in which emotional control is regained through non-reinforcement. Author

CLINICAL STUDY OF LOSS OF AERONAUTICAL MOTIVATION [ETUDE CLINIQUE DES PERTES DE MOTIVATION AERONAUTIQUE]
R. Gelly *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 4 p In FRENCH (For availability see N74-18779 10-04)

Factors accountable for the loss of motivation or interest in flying by military crew trainees are examined. Some of the motivation loss was attributed to social and flight stress, expectations of trainee not met during training period, and psychological and psychiatric aptitude of trainee is exceeded by training. Transl. by E.H.W.

PARTIAL CEREBRAL HYPOXIC ATTACKS IN PILOTS AS CAUSE OF HYPOXIA INCIDENTS
H. Oberholz *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 4 p refs (For availability see N74-18779 10-04)

Screening methods for detecting and avoiding as well as determining the causes of cerebral hypoxic attacks in pilots during flying missions are introduced. Special attention was given to anomalies and variants of brain arteries, especially the Circle of Willis as the possible source of the attacks. Two case histories along with symptoms of the attacks are outlined. It was concluded from the data that the Circle of Willis in combination with hypoxia, low G forces, mental stress, extreme heat, and any kind of exhaustive or vestibular stimuli cause cerebral attacks. E.H.W.

CHARACTERISTICS OF LIFE STRESS IN A POPULATION OF MILITARY AVIATORS
Carlos J. G. Perry and John W. Gaines *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 2 p (For availability see N74-18779 10-04)

A description is given of a military aviator population with respect to the occurence of life stress events in its individual members. Questionnaires, inventories, and checklists were deliberately avoided to emphasize a broad range of freedom for the interviewer. During the course of such an interview life stress events were discovered that are missed by questionnaires. This was especially true of anniversary stress which was revealed only through persistent, patient questioning. A total of 320 life stress events were found during the study. Job stress was most frequently represented with personal health, marital, and parental relationships following in order of frequency. Author

PERSONALITY TRAITS AND FLIGHT APTITUDE [TRAITS DE PERSONNALITE ET APTITUDE AU VOL]

VanMassenhove and Flion *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 8 p In FRENCH (For availability see N74-18779 10-04)

Szondi's psychological testing method was used to determine the fitness and flight aptitude of student pilots. In particular an attempt was made to determine personality traits and correlate them with flight aptitude. Seventy nine student pilots were tested using two groups designated as Group A and Group B. Group A students were just entering training and Group B students were ending their training. A comparison was made of the two Groups' response to different flight environments. Detailed results are given in graphs. Transl. by E.H.W.

IN-FLIGHT PSYCHIC LOAD IN STUDENT-PILOTS, EVALUATED BY MEANS OF VANIL MANDELIC ACID (VMA) CHANGES IN URINARY EXCRETION

G. Paolucci and G. Biundo *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 2 p refs (For availability see N74-18779 10-04)

Sixty four air cadets were tested for in-flight psychic load and anxiety crises by vanil mandelic acid content in the urine. The tests were made in an effort to determine possible preexisting stress and the measurement of its degree. It was suggested that VMA content is proportional to the amount of stress, and that this method should be included in tests for selecting pilots.

INFLUENCE OF SOCIAL/RELATIONAL FACTORS ON OPERATIONAL FLYING CAPACITY: A SYSTEM-ORIENTED APPROACH

H. Merkus and J. J. VanderMaas *In* AGARD Clin. Psychol. and Psychiat. of the Aerospace Operational Environ. Dec. 1973 5 p refs (For availability see N74-18779 10-04)

The effectiveness of the psycho-social approach to treating military pilots with psychological problems or symptoms of such problems is examined. After an explanation about the viewpoints of the psycho-social model, a description is given of how the model is made applicable in psychiatric practice. Three case histories are presented to illustrate the use of the model.

METHODS OF MEASURING PHYSICAL FITNESS
H. W. Kirchhoff *In* AGARD Phys. Fitness in Flying Including the Aging and Aged Aircrew Mar. 1971 5 p (See N71-22301 11-05)
Avail: NTIS

Single stage, non-steady state, submaximal exercise procedures are commonly used in diagnostic and functional testing. The principal modes of imposing the workload are step climbing, bicycle ergometer riding and treadmill walking. These tests are generally available and safe. Despite many real and hypothetical deficiencies, they may yield, when standardized, qualitative and quantitative information of considerable value to individual clinical evaluations and to group comparisons. Steady state submaximal exercise tests determine a great number of values (V sub O2, V sub CO2, RQ, V sub E, specific ventilation, oxygen pulse, pulse rate, blood pressure and the ECG). Vita maxima tests are utilized to determine the maximum values of oxygen consumption and the physical working capacities. Author

PHYSICAL FITNESS, FLIGHT REQUIREMENTS AND AGE
Ralph F. Goldman *In* AGARD Phys. Fitness in Flying Including the Aging and Aged Aircrew Mar. 1971 9 p refs (See N71-22301 11-05)
Avail: NTIS

Muscular strength, cardio-respiratory capacity and relative body weight are frequently used criteria of physical fitness. These different aspects of fitness all alter predictably with age and can be altered by training. Considering the physical work involved in flight, it seems appropriate to consider to what degree physical fitness -- and which aspects of it -- should be important to an aircrew. Excess weight may require premature replacement of an individual because of the decreased longevity associated with being overweight, but should not hinder flight performance as long as the man fits into his workspace, and agility and reach are unimpaired. The energy cost of flying only averages 125 kcal/hr and even an average 65 year old in fair condition has a maximum work capacity at least 3 times that. Finally, the muscular forces required to fly modern aircraft are minimized by electro-mechanical control systems. Author

PHYSICAL FITNESS AS PART OF AIRCREW TRAINING
C. L. Allen *In* AGARD Phys. Fitness in Flying Including the Aging and Aged Aircrew Mar. 1971 9 p (See N71-22301 11-05)
Avail: NTIS

Physical fitness development of aircrew candidates in the Canadian Forces is an integral part of their training. Schedules have been established and promulgated for all levels of training from newly enrolled cadets to the advanced flying school stages. While all of the standard elements of physical conditioning, such as calisthenics, resistance training and sports activities are included, the emphasis is on cardio-respiratory development. Regular assessments of candidates are carried out, using the 12-minute distance as the vehicle for testing. All personnel are expected to maintain a good category, i.e. at least 1.50 miles in 12 minutes for ages under 30 years with a suitable reduction for older candidates. Author

PHYSICAL TRAINING STATUS IN RELATION TO STRESS TOLERANCES
H. M. Wegmann and K. E. Klein *In* AGARD Phys. Fitness in Flying Including the Aging and Aged Aircrew Mar. 1971 11 p refs (See N71-22301 11-05)
Avail: NTIS

The influence of physical fitness on stress tolerance was studied by comparing two different groups of subjects, one group including 11 highly trained athletes and the other group consisting of 11 untrained and unadapted students. Both groups were uniformly subjected to hypoxia, acceleration, exercise, and orthostatic stress, applying maximal loads for evaluating tolerances and submaximal loads for studying cardiovascular and hormonal stress responses. In summarizing the results the following conclusions were obtained. A better physical fitness does not imply higher tolerances to stressors other than exercise. There is no indication which supports the idea of an improvement of human tolerance to environmental extremes by physical exercise training. Author

A recent investigation made on 230 conventional and jet aircraft pilots in the French Air Force has provided a comprehensive picture of the incidence of toothache in flight and of its favoring factors Over a year of observations it was found that 6 52% of the investigated pilots suffered from toothaches in flight Pains developed according to a rather characteristic process during the various phases of flight (1) chronic pulpitis induces short lived, progressively appearing throbbing type pains which appear mostly during climbs, (2) wisdom teeth and periapical reactions on mortified teeth or improperly stopped radicular canals rather induce pains during descents and (3) periapical granulomas become painful in cruise flights without any marked speed variations the induction of such neuralgias is related, among other reasons, to the vibrations experienced by the pilot Author

The biological aspects of senescence are considered For the purpose of performing systematic work in this field it is necessary to differentiate and clearly define the various forms of calendar based or chronological senescence Besides this form of senescence governed by the unbiased time factor, there is also the most important form of biological senescence, including the two sub-forms of physiological and psychological aging The psychological chronograph records the personal time of an individual the decisive factor being the experiences the individual has lived through during that period Physiological senescence is determined by the development, growing and aging of morphae and the functions of organs The most rigorous criteria are imposed by calendar time, which sets absolutely unbiological upper and lower age limits The problem of flexible age limits is once more becoming most important Author

There appears to be acceptable evidence that exercise does affect biochemical and physiological parameters related to ischemic heart disease and to the myocardium itself It is remarkable that a physical fitness program of the German Institute of Aviation Medicine had an extraordinarily good effect on blood pressure, ECG and other parameters Since this program was begun increases in blood pressure have been considerably less frequent There occurred a lowering of the heart rate at rest and during exercise an improvement of orthostatic tolerance normalisation of exercise induced hypoxic electrocardiographic changes at low oxygen pressure and an increase of oxygen uptake respiratory volume and oxygen pulse during physical effort These data corroborate the concept of a preventive and rehabilitative value in physical and environmental-emotional conditioning programs The training program provides objective evidence for a clearly favorable influence of conditioning periods on cardio vascular function of the aging pilot Author

The thousand aviator project is a longitudinal study with the emphasis primarily on defining new physical standards for aviators and secondarily on an epidemiological study of aging. The present report is limited to a discussion of the electrocardiographic and blood pressure findings. Longitudinal changes in the resting electrocardiograms have shown that those individuals with a decrease in QRS amplitude and a leftward movement of the QRS vector appear to have a tendency to develop coronary artery disease. Some of the men in the group have shown a consistent rise in blood pressure, apparently related to weight gain and parental longevity. Otherwise there are no means by which the blood pressure pattern of an aging individual can be predicted. Author

MORBIDITY OF AIRCREW IN THE CANADIAN FORCES IN RELATION TO AGE
W. J. C. Stevenson. *In* AGARD Phys. Fitness in Flying Including the Aging and Aged Aircrew. Mar. 1971. 8 p. (See N71-22301 11-05)
Avail: NTIS

One of the factors in the consideration of the aging process in aircrews is the relationship of illness, injury, and physiological incidents. Evaluations of 268 pilots and air navigators, representing 6.8% of the established Canadian aircrew strength, were carried out because individuals either failed to meet prescribed medical standards or else had developed some difficult, obscure or border-line medical problems which raised a question of fitness to continue flying. Data indicate that diseases of the circulatory system were cause for removal from flying duties of the largest number of older aircrew members, while psychiatric disorders resulted in the greatest number of groundings in the younger group. Nine hundred seventeen healthy aircrewmen ranging in age from 25 to 49 years were evaluated for minor medical findings. During the same period, 348 pilots were evaluated as part of the selection process for special projects such as space flight. The differences between the groups and in subgroups according to age, in parameters bearing on physical fitness are described. The special project group was more fit than the other normal group as demonstrated by their response to maximal treadmill testing, had a lesser body fat fraction and lower blood lipid and glucose levels. Older subgroups demonstrated lower maximal treadmill exercise performance, had higher body fat fractions and tended to demonstrate higher levels of blood lipids and glucose. Author

Avail: NTIS

The influence of early, mild cardiovascular disease upon maximal exercise performance in 544 flyers, ages 40-49 years was considered. There were 300 normal subjects, 64 subjects with non-specific repolarization changes on the electrocardiogram, 114 subjects with hypertension and 66 subjects with coronary heart diseases. The NSTWC and hypertensive groups had significantly higher body fats than normals. There were no significant differences between the disease groups and normals with respect to blood sugar and serum lipids. Both the hypertensive and CHD groups had significantly lower maximal oxygen consumptions and total treadmill times than normals. Systolic blood pressures in all disease groups were significantly higher at rest than in normals. Systolic blood pressure increased as expected in normals and a parallel increase was seen in the disease groups. Diastolic blood pressure was unchanged at maximal exercise in normals, while all disease groups were significantly higher. Blood pressure levels in the hypertensive group were significantly higher at rest than the other disease groups and remained proportionately higher with exercise. Author

PSYCHOPHYSIOLOGICAL PROCESSES OF AGING
H. J. Gruenholer and K. Gerbert. *In* AGARD Phys. Fitness in Flying Including the Aging and Aged Aircrew. Mar. 1971. 7 p. refs. (See N71-22301 11-05)
Avail: NTIS

Facts observed so far concerning variations and decrement of cognitive, psychomotoric and retentive abilities with increasing age are reported. Generally it can be assumed that almost all psychophysical performance functions decrease as of the third decade of life. But abilities with increasing age are essentially dependent upon the level of original aptitude, type and extent of experience gained in the course of life, thinking patterns, and trained procedures consolidated through exercise. On the other hand particular decreasing capabilities can only be compensated by others within certain limits. As a result, adjustment and readjustment to requirements which cannot be met by means of confirmed behavior became increasingly difficult. An analysis of presently used methods to measure flying proficiency in aging pilots is given.

A SUMMARY OF HUMAN TOLERANCE TO PROLONGED ACCELERATION

A S Hyde and H W Raab *In its* Principles of Biodynamics Applicable to Manned Aerospace Flight Prolonged Linear and Radial Acceleration Mar 1971 p 37 56 refs (See N71-23337 12-05)
Avail NTIS

A summary of data from literature on human tolerance to prolonged acceleration is presented in the form of graphs. Standard terminology developed by the AGARD-NATO sponsored Working Group on Acceleration Terminology is used. Most of the graphs present the magnitude and duration of an acceleration to which an identified group of subjects has been exposed. Separate groups of graphs are provided for each direction of acceleration. Each group of graphs is further divided on the basis of the presence or absence of restraint of the subject and the presence or absence of special support systems (pads), and the number of axes involved. For each graph, a brief description of the subject's attitude

given and a table provided. Each table defines each point on each graph with respect to the following variables: vector magnitude, duration, average onset (G, second), back angle, cause of termination of experimental exposure, trauma, number of subjects involved, countermeasures used, support restraint, and the reference from which this information was obtained. This annotated bibliography brings together recent information not available in earlier literature reviews, concerning biodynamic research findings. Coverage was international and provides a representative view of current research efforts. The abstracts were taken directly from the initial source documents. The bibliography is divided into six sections: (1) prolonged acceleration (linear and radial), (2) angular acceleration, (3) impact, (4) vibration, (5) combined stresses, and (6) general documents. CLINICAL CAUSES FOR GROUNDING
Heinz S. Fuchs, Nov. 1971, 192 p., refs. Presented at the AGARD Aerospace Med. Panel Specialist Meeting, Oporto, Portugal, 21-22 Jun. 1971
(AGARD-CP-89-71) Avail: NTIS

Papers given at the AGARD Aerospace Medical Panel Specialist Meeting held in Oporto, Portugal from 21 to 22 June 1971 are presented. The subject was divided into two parts: the general aspects of clinical causes for grounding in the various air forces, and the specific aspects of grounding according to medical specialties. Each paper is followed by a discussion. A technical summary and an evaluation are included at the end. For individual titles, see N72-14091 through N72-14112.

STATISTICAL SURVEY ON THE CLINCIAL CAUSES OF TEMPORARY GROUNDING AND PERMANENT UNFITNESS OF IAF AIRCREWS
Gaetano Rotondo. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 29 p., refs. (See N72-14090 05-05)
Avail: NTIS

An analytical study of the clinical causes that most frequently lead to temporary or permanent loss of fitness among flying personnel was undertaken. A wide statistical survey was made on morbidity or rather some aspects of morbidity, in the personnel of the Italian Air Force, among the various categories or groups of categories connected with the flying service in general and with particular regard to pilots. Such a study was undertaken with the hope of detecting the physio psychic causes that have most weight and incidence in giving rise to unfitness for military service and for flying. It would then be possible to make practical suggestions in order to reduce the incidence of these causes and their disabling effects. Author

CLINICAL CAUSES FOR GROUNDING: A REVIEW OF ROYAL NAVAL EXPERIENCE, 1962 - 1970
I. H. Colley and F. St. C. Golden. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 11 p., refs. (See N72-14090 05-05)
Avail: NTIS

The clinical causes for permanent grounding in the British Fleet Air Arm for the period January 1962 to December 1970 inclusive were examined. Clinical groundings constitute 13% of the total groundings for all reasons. Psychiatric illness is responsible for 58% of clinical groundings and was the major cause of wastage in trained aircrews. ANALYTICAL STUDY OF THE CAUSES OF MEDICAL UNFITNESS OF FLYING PERSONNEL IN THE BELGIAN AIR FORCE [ETUDE ANALYTIQUE DES CAUSES D'INAPTITUDE MEDICALE DU PERSONNEL NAVIGANT DE LA FORCE AERIENNE BELGE]
J. Bande and R. Moorthamers. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 11 p., In FRENCH (See N72-14090 05-05)
Avail: NTIS

A comprehensive analysis was made of the causes of temporary and permanent unfitness, in cases treated by the ad hoc Medical Commission of the Belgian Air Force from 1965 to 1971. The study concerned 635 subjects, of whom 29.5% had a number of different disabilities. 7.6% of the cases were the object of permanent grounding and 12.9% were permanently limited in their fitness for the air service. 40% of the cases were accident victims. Of 904 disabilities, the pathology of the locomotor system was the most frequent involving afflictions of both the neuropsychiatric and digestive systems. After eliminating accident cases, the most frequent pathology was of the digestive and respiratory tracts. A study of the correlation between age of the subject and the length of disability as a function of pathological class gave no conclusive results. Transl. by K.P.D.

A REPORT BF AVIATOR GROUNDING AND AVIATOR SALVAGE IN HIGH PERFORMANCE FIGHTER AIRCRAFT
Romaine L. Bendixen. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 8 p., refs. (See N72-14090 05-05)
Avail: NTIS

The role of the flight surgeon in the United States Navy

and particularly the role of the dually designated physician-pilot, is considered in the evaluation, treatment, and disposition of aviators flying in high performance jet fighter aircraft. Personal observations and experiences of the author as a pilot instructor-flight surgeon with a McDonnell F-4 (Phantom II) training squadron form the basis for the presentation and discussion of several cases involving the question of grounding for major clinical reasons. An integral part of these discussions is an attempt to demonstrate the value of the pilot-physician. This report covers a relatively short span of time, October 1967 through July 1969, but is particularly significant in the number of interesting cases that arose requiring evaluation and disposition. USAF AEROMEDICAL CONSULT SERVICE EXPERIENCE IN CAUSES FOR GROUNDING OVER THE PAST FIFTEEN YEARS
Malcolm C. Lancaster. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 7 p, refs (See N72-14090 05-05)
Avail: NTIS

A marked change in the factors that relate to medical grounding of flyers in the United States Air Force (USAF) has occurred over the past 15 years. The increasing age of the flying population is the major causative factor producing this change. Improved diagnostic techniques and an increase in the fund of information about normals and individuals with early disease also had a significant influence upon both the types of problems evaluated and their disposition. The experience of USAF School of Aerospace Medicine over a period of 15 years is reviewed, and the trends and factors related to medical criteria for grounding USAF flyers are discussed. Author

CLINICAL CAUSES FOR PERMANENT GROUNDING OF AIRCREW WITHIN THE GERMAN ARMED FORCES
H. J. Grunholer and K. R. Mueller. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 9 p (See N72-14090 05-05)
Avail: NTIS

All clinical causes for permanent grounding of German armed forces pilots and other aircrew members were examined and analyzed statistically. The causes for medical disqualifications are divided into diagnostic groups or according to specific functions of organs and/or organ systems. Special emphasis is given to waivers and to certain psychological aspects. There were 24,396 physical examinations studied over a period of 11 years. Author

STATISTICAL ANALYSIS OF UNFITNESS OF FLYING PERSONNEL IN THE FRENCH AIR FORCE [STATISTIQUE DES INAPTITUDES DU PERSONNEL NAVIGANT DE L'ARMEE DE L'AIR FRANCAISE]
J. Nathie, P. M. Pingannaud, and A. Gibert. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 6 p, In FRENCH (See N72-14090 05-05)
Avail: NTIS

The physical fitness of flying personnel in the French Air Force is supervised by the Centers for Medical Evaluation of Flying personnel. A general study of 60,811 review evaluations made by the centers from 1960 to 1969 show that, among 1400 causes of observed unfitness (temporary unfitness excluded), the most numerous were neuropsychiatric disorders (381 causes) and inadequacy of the visual function (379 causes). These conclusions were made precise in a detailed study of the results in 1969, during which year 72 subjects were declared unfit. It appears that unfitness of neuropsychiatric origin is essentially motivated by psychological or psychosomatic difficulties. The disabilities recorded rarely led to the elimination of flying personnel, the majority being eventually discharged or reclassified into another specialty. The importance of statistical problems is emphasized and their solution by electronic data processing methods is proposed. Transl. by K.P.D.

N72-14099# Hellenic Air Force General Hospital, Athens (Greece). Dept. of Internal Medicine.
MEDICAL ASPECTS OF GROUNDING AND NONEFFECTIVENESS IN HELLENIC AIR FORCE PILOTS
C. E. Giannopoulos and H. G. Vissoulis. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 5 p, refs (See N72-14090 05-05)
Avail: NTIS

Based upon statistics from Greek pilots' individual health files, hospital records, and the Aviation Supreme Medical Board's certifications, a ten-year analytical study of the medical causes of admissions, waivers, suspensions and permanent groundings is presented. Data on the medical causes for elimination from flying training are also discussed comparatively. From an average strength of 642 rated pilots, 24 were permanently grounded for medical reasons. The major cause was due to sensory deficiencies which accounted for 9 groundings, or 37.5% of the total. Peptic ulcer disease is the most frequent cause for noneffectiveness and accounts for several permanent groundings. The incidence of coronary heart disease is exceptionally low and should be attributed to the younger age distribution of the surveyed population. The elimination of two cadets for thalassemia minor and the finding of several cases of thalassemia trait among rated pilots brings into focus the problem of thalassemia endemic in certain areas of Greece. CHANGING CONCEPTS IN MEDICAL REASONS FOR GROUNDING IN THE USAF AEROMEDICAL CONSULT SERVICE
John H. Triebwasser. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 9 p, refs (See N72-14090 05-05)
Avail: NTIS

Flying safety is the major factor underlying medical decisions regarding a given aviator's fitness to fly. Over the past 15 years medical concepts were modified as experience with an older

population and newer diagnostic techniques was gained. The incidence of degenerative disease has increased parallel with the age of the USAF aircrew member. Increasing emphasis must be placed on the early diagnosis of those conditions that could result in sudden incapacitation. Experience in aerospace medicine is limited to a younger, more healthy population than that found in a hospital. The significance of several electrocardiographic findings usually associated with disease in a sick population is not necessarily of the same importance in the Air Force patient population. Four conditions that were considered representative of significant organic heart disease are considered. These are electrocardiographic repolarization changes, cardiac arrhythmias, acquired bundle branch block, and aortic valvular insufficiency.

CARDIOLOGIC FINDINGS AS CAUSE FOR GROUNDING

H. W. Kirchhoff and A. Dietz. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 3 p. (See N72-14090 05-05)
Avail: NTIS

The routine cardiologic program performed at the Institute of Aviation Medicine of the German Air Force to determine fitness for military flying duty is described. It is comprised of an overall clinical examination, an electrocardiogram taken at rest and the so-called master two-step test. If required, the physician may order additional electrocardiographic, mechanocardiographic, and functional medical tests. Armed forces regulation serves as the criterion for the final assessment and lists all findings which preclude, or render questionable, flying duty.

INCIDENCE OF CORONARY RISK FACTORS IN PILOTS OF THE BUNDESWEHR

Klaus Jung. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 10 p. (See N72-14090 05-05)
Avail: NTIS

A group of 1000 pilots of different types of aircraft were examined with respect to distribution of various parameters which, in extreme cases, constituted coronary risk factors. Cigarette consumption, serum cholesterol level, systolic and diastolic blood pressure, physical activity, body weight, vital capacity, fasting blood sugar level, autoimmunesia, and family predisposition were studied in detail. For the sum of risk factors, the distributions were considered for total group, separate age groups, pilots grouped according to types of aircraft flown (total and in separate age groups), and for pilots under 30 years of age grouped according to aircraft flown and training status. Coronary stress is barely increased compared to a normal population. Prop pilots are at least coronarily jeopardized to the same extent as jet pilots. This is particularly true for older age groups. The greatest increment of psychophysical stress effects on the coronary system occurs between the start of training and the first flying experience, independent of the aircraft type flown.

CURRENT NASAL AND AURAL INDICATIONS FOR GROUNDING

P. F. King. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 6 p. refs (See N72-14090 05-05)
Avail: NTIS

The current indications for aircrew grounding due to nasal and aural disorders are described. The importance of careful preliminary selection is emphasized. The decreasing incidence of nasal infection was noted, together with the increasing part played by nasal allergy. The question of chronic bronchitis, bronchiectasis, and asthma which complicate nasal disease is discussed. Of the commoner aural lesions, otosclerosis as a cause of permanent grounding and the effect of stapedectomy are considered. Chronic otitis media and the indications for grounding compared with those permitting continued flying are examined. The relative and absolute indications for grounding in cases of chronic otitic barotrauma are discussed. Perceptive deafness and labyrinthine causes of vertigo and their influence on fitness to fly are also described.

CAUSES FOR PERMANENT GROUNDING AND REJECTION IN THE ENT DEPARTMENT OF THE INSTITUTE OF AVIATION MEDICINE OF THE GERMAN AIR FORCE

G. Froehlich. *In* AGARD, Clinical Causes for Grounding, Nov. 1971, 3 p. (See N72-14090 05-05)
Avail: NTIS

From 1959 to 1968 there were 22,800 periodic reexaminations of pilots and student pilots of the German armed forces. 55 or 0.24% of these were permanently grounded. In this group, 38 were students with marked high tone hearing losses due to impact noise at the shooting range. The remainder suffered from recurrent barotitis (3), vestibular disease (3), chronic sinusitis (2), allergic rhinitis (1), and Meniere's disease (1). The rates for permanent rejections of applicants for flight training decreased considerably after the adoption of more flexible hearing standards in 1966. Again most of the rejections were due to considerable hearing losses caused by impact noise. In a sample of 2000 initial examinations, the rejection rates were highest among young Army officers and Army NCO's and lowest among Air Force applicants. The main causes for temporary grounding of applicants were sinusitis, marked septal deviations, catarrhal otitis media, and chronic tonsillitis. All these cases were accepted for flying training if there was full recovery after proper treatment. Cases with simple mastoidectomy and small atrophic scars of the tympanic membrane are acceptable as well as cases with tympanoplasty type 1, provided the ears are functionally normal.

DIABETES MELLITUS IN FLYING PERSONNEL

W. J. C. Stevenson. *In* AGARD Clinical Causes for Grounding Nov. 1971 6 p refs (See N72-14090 05-05)

Avail: NTIS

The Central Aircrew Medical Board at the Canadian Forces Institute of Environmental Medicine assessed fifteen aircrew members in the past ten years who were referred because of abnormal glucose tolerance observed following incidental findings of reducing substances in the urine at time of routine urinalysis. The clinical findings, investigation procedures, and followup are discussed for two of the fifteen cases. These were referred because evidence suggested possible adult onset of diabetes mellitus. Four of the fifteen were permanently grounded; the remainder were returned to flight duties. One individual case was followed for ten years without development of the overt disease or any associated symptomatology. Reference is made to Canadian Air Force policy in dealing with cases of diabetes mellitus in aircrew members. Author

FLIGHT GROUNDING FOR PSYCHOLOGICAL AND PSYCHIATRIC REASONS [LES INTERDICTIONS DE VOL POUR RAISONS PSYCHOLOGIQUES ET PSYCHIATRIQUES]

Rene Gelly. *In* AGARD Clinical Causes for Grounding Nov. 1971 6 p In FRENCH (See N72-14090 05-05)

Avail: NTIS

Two sorts of psychopathology exist among aviators. The first is general, independent of the subject's professional life, and is associated with other aspects of his life. The second is a specific psychopathology which is due to the difficulties of aeronautic adaptation and which occurs almost uniquely in the domain of the subject's professional life. Observations made for French Air Force personnel in 1969 were collected and divided into classes in order to study the distinction implied in diagnosis, prediction, treatment, and deciding flight aptitude in psychological cases. The classes considered were the general psychiatry of flying personnel and their specific psychopathology. Information on diagnostics, aptitude decisions, and development over a year of observation was also collected. Therapy and medical administrative suggestions are presented for the two pathologies. ANALYSIS OF US ARMY HELICOPTER ACCIDENTS TO DEFINE IMPACT INJURY PROBLEMS
Joseph L Haley, Jr *In* AGARD Linear Acceleration of Impact Type 26 Jun 1971 13 p refs (See N72-19119 10-05)
Avail NTIS HC $6.00/MF $0.95

An overall view of the occupant injury experience in U S Army helicopters from January 1967 through December 1969 is presented These data show that 40 percent of all occupant fatalities occurred in survivable accidents This percentage shows the need for further improvement of helicopter crashworthiness The statistics further indicated that fire was the single largest fatality cause with head injuries next in rank A group of severe but survivable helicopter accidents of the same time period was studied The study included three types of Army helicopters Study results indicated that the problem of postcrash fire fatalities was more severe in the utility and cargo helicopters It was also shown that potentially hazardous displacement of the transmission and main rotor blades occurred in one of every three utility and cargo helicopter accidents studied Further a roll about the long axis usually occurred At least one roll occurred in 2 of 3 light observation helicopter accidents, 5 of 8 utility helicopter accidents, and 1 of 2 cargo helicopter accidents The tendency to roll highlights the need to consider sideward occupant restraint and transmission/rotor blade moorings in these helicopters Author

AN ASSESSMENT OF ACTIVE AND PASSIVE RESTRAINTS IN SERIOUS INJURY EUROPEAN CAR OCCUPANT COLLISIONS
G Murray Mackay *In* AGARD Linear Acceleration of Impact Type 26 Jun 1971 12 p refs (See N72-19119 10-05)
Avail NTIS HC $6.00/MF $0.95

A field study of road accidents numbering 105 vehicles selected from the severe and fatal injury end of the injury spectrum are examined The incidence of various crash configurations is outlined, together with the objects struck, and the rate with which the passenger compartment is penetrated The relative frequencies of side impacts, and multiple and complex collisions are described Each collision is examined in terms of the reduction in injuries to front seat occupants which might be obtained if an air bag was present In a similar manner each collision is examined to assess the benefit if a lap diagonal seat belt were worn An overall judgement is therefore obtained

on the relative benefits obtainable from airbags and belts. Belts are shown to be superior because they provide protection in a greater range of collision types. If a belt wear rate exceeding some 63% for drivers and 85% for front passengers were obtained then belts provide greater benefits than airbags. The importance of intrusion into the passenger compartment, especially in fatal collisions is emphasized as a restriction on restraint effectiveness in present day European car designs. Author

THEORETICAL MECHANICS FOR EXPRESSING IMPACT ACCELERATIVE RESPONSE OF HUMAN BEINGS

Daniel J. Thomas and Channing L. Ewing *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 7 p. refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

The theoretical requirements for expressing the kinematics of human impact acceleration experimentation are presented. Two basic coordinate systems for expression of the kinematic information are identified as: (1) the body reference frame, defined in terms of the experimental subject's anatomy, (2) the laboratory reference frame. A general set of rules for deriving these coordinate systems is described. Variables and parameters are defined in terms of the general set of rules. The resulting descriptions are compared with definitions for use in prolonged acceleration. Author

BIODYNAMIC MODELS AND THEIR APPLICATIONS

Henning E. vonGierke *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 18 p. refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

Progress in modeling the mechanical response of man exposed to various environmental forces is discussed. Starting with a mathematical description of the mechanical and physical characteristics of the integument, soft and hard tissue, the numerous approaches taken and the results obtained from modeling various integrated elements such as the human vertebral column under vibration and impact loads, the chest and respiratory system under vibratory and blast loads and of the whole body system for selected force input conditions and locations are reviewed. To derive a capability of modeling specific injury modes or experimentally observed probabilities of injury curves for various parenchymatous and hollow organs as a function of the force input variables, more detailed and specialized models are being used such as, for example, the lumped parameter, discrete parameter, and continuum mode. of the spine or models considering nonlinear tissue behavior. The status and value of these models for studying the body's physical and physiological response, for understanding and predicting injury mechanisms and probability of injury, for scaling the results of animal experiments, and for applying the models in protection engineering, such as escape and restraint systems design, are demonstrated. There is need for further experimental, as well as theoretical work, in support of these practical biomedical and hardware requirements. Author

THE BIODYNAMICS OF AIR BLAST

Clayton S. White, Robert K. Jones, Edward G. Damon, E. Royce Fletcher, and Donald R. Richmond *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 21 p. refs Sponsored by NASA and AEC (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

After pointing out that accelerative and decelerative events are associated with the direct and indirect effects of exposure to blast-induced winds and pressure variations, some of the relevant biophysical parameters were selectively noted and discussed. These included the pressure-time relationship, species differences, ambient pressure effects, the significance of positional (orientational) and geometric (situational) factors as they influence the wave form, the pressure dose and the biologic response, and data bearing upon the etiology of blast injury. The consequences of pressure-induced violent implosion of the body wall and the significance of the associated variations in the internal gas and fluid pressures were described and emphasized, as were alternating phases of forced hemorrhage and arterial air embolization, fibrin thrombi, coagulation anomalies, and renal, cardiac and pulmonary sequelae. Tentative biomedical criteria consistent with recent interspecies scaling and modeling studies for assessing primary blast hazards were presented. Author

LETHAL EFFECTS ON MAN OF UNDERWATER DETONATION OF A FIRECRACKER

Arthur E. Hirsch and Ayub K. Ommaya (NIH) *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 5 p. refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

A firecracker exploded in contact with the skin within six inches of the skull base in a young man while he was swimming underwater. The resultant severe head injury and death appeared to be directly related to this underwater explosion. Reconstruction of the mechanics of this injury indicate that when the head is subjected to impact energies between 440 to 1800 in-lb and impact impulse between 1.8 to 3.5 lb-sec, both skull fracture and brain injury can occur. HUMAN STRESS LOADS INDUCED THROUGH SIMULATED PRESSURES ON UNDERGROUND SHELTERS

G. Kleinhanss and H. Dupuis (Technischon Univ., Munich) *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 9 p. refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

Within the constraints of a simulated nuclear strike, the human stress loads to be expected were assessed through physical measurements taken on dummies placed in an underground shelter. Results verified that under the given conditions, exposure to shock would not cause detrimental effects to the health or a reduction in efficiency, due to physical factors, of operators manning control desks in the underground shelter. It is pointed out that results obtained on dummies may be applied analogously to man only to a limited extent since no dummies showing human physiological and dynamic behavior were available. The assessment results apply only to the movement vectors observed during this test on shelter floor and walls. Conceivably other vector variations may produce fundamentally different results. The measuring data related to three different seating arrangements indicate technical possibilities for shock reduction. Author

PARACHUTING IMPACT INJURIES AT HIGH DROP ZONE ELEVATIONS ENVIRONMENTAL EFFECTS
Stanley C. Knapp and George R. McCahan, Jr. *In* AGARD Linear Acceleration of Impact Type 26 Jun 1971 9 p refs (See N72-19119 10-05)
Avail: NTIS HC $6.00 MF $0.95

A review of parachuting injuries that are directly related to accelerative forces and impact is presented. The available and valid injury prediction statistics for a wide variety of parachuting activities is discussed. The environmental effects of wind shear, wind velocity, wind thermals, density altitude, terrain and topography, increased rates of descent, and temperature variations upon injury morbidity are analyzed. These effects were determined during experiments at 6,000 and 10,000 feet drop zone altitudes using the 32 feet parabolic apex vented-static line deployed parachute. Injury rates were four times greater than those expected or experienced at sea level elevations. The conclusions and recommendations will be of practical value in the training and outfitting of parachutists for jumps into high elevation drop zones. Author

BEHAVIOUR OF SOME SERUM ENZYME ACTIVITIES IN MAN, AFTER CRASH ACCIDENTS, CAUSING MASSIVE INJURIES
G. Paglucci, G. Biundo, and A. Balla. *In* AGARD Linear Acceleration of Impact Type 26 Jun 1971 5 p refs (See N72-19119 10-05)
Avail: NTIS HC $6.00 MF $0.95

Observations were made of blood serum enzyme activities in an effort to verify the fact that such activity causes massive injuries and fractures to the human body. Several people involved in severe road accidents were observed for activities of the following enzymes: (1) Glutamic oxalacetic transaminase (GOT); (2) Glutamic pyruvic transaminase (GPT); (3) Lactate and Malate dehydrogenase (LDP MHD); (4) Adalose (ALD); (5) Alkaline phosphates (ALKP); (6) Acid phosphate (AcP). Results show some enzyme activities increase in the most severely injured subjects and that a correlation exists between some enzyme activities and body damage. Results also indicate the possibility of evaluating the degree of body damage from certain enzyme activities and that some enzymes analyses, especially GOT, may be useful for diagnosis and medico-legal judgements. Through the application of appropriate scaling laws, animal experiments, particularly on primates, are shown to be of value in explaining hard tissue injury mechanisms and individual organ injury potential in man exposed to impact forces. In support of this approach rhesus monkeys were anesthetized, radiographed, positioned in an impact carriage, restrained by lap belt, torso harness, and limb retention straps, and exposed to + Gz seated rectangular acceleration time histories from predetermined drop heights. Shortly following impact all primates were radiographed, killed, and a necropsy performed. Attempts were made by means of an injury classification system to determine injury potential as a function of plateau acceleration and pulse duration for the spinal column. Type, frequency, and severity of vertebral body centrum fractures along with injury to the vertebral appendages were classified. Vertebral articular facets, apophyseal joints, disorders, and derangements proved difficult to identify radiographically due to poor X-ray film resolution, overlying soft tissue, and bony margin shadows. Necropsy demonstrated a large percentage of primates exhibited this type of lesion. Injury probabilities for the vertebral column established by radiographic and gross necropsy examination supplement and explain available knowledge on spinal injury mechanisms observed in the rhesus monkey. DESIGNING HELICOPTERS FOR IMPROVED CRASH SURVIVABILITY c02
Henry G. Smith. *In* AGARD Linear Acceleration of Impact Type 26 Jun 1971 14 p refs (See N72-19119 10-05)
Avail: NTIS HC $6.00/MF $0.95

The fundamental theory for providing attenuation of the crash impact is reviewed, with emphasis upon understanding the relationship of the fundamental parameters of the problem. Based upon operating statistical data in regard to potentially survivable crashes, along with engineering studies of any new helicopter design, design objectives can be established for the level of crash protection to be provided for the occupants. In problems of this type, a tradeoff always exists between size and weight penalties incurred for crash survivability versus the value of that same amount of size or weight for performance, payload, armor or armament. Methods of attenuating or absorbing the crash impact in a gradual manner are the key to the provision of high crash protection levels while imposing minimum weight penalties upon the helicopter. Operating experience confirms that improved helicopter crash survivability can actually be obtained in a military operational environment. In addition to the improvement of survivability, improved morale of the crew members was a side benefit. The current trends of crash protection for new helicopter designs are discussed with implications of further improvement from the crash survivability standpoint in future helicopters. Author

AUTOMOBILE STRUCTURAL CRASHWORTHINESS CONCEPTS FOR CRASH PROTECTION
Patrick M. Miller. *In* AGARD Linear Acceleration of Impact Type 26 Jun 1971 16 p refs (See N72-19119 10-05)
(Contract DOT-FH-11-6918)
Avail: NTIS HC $6.00/MF $0.95

A series of full scale automobile crash tests were conducted to determine the structural crashworthiness performance of conventional automobiles and to evaluate the performance of structural concepts designed to provide protection during frontal and lateral impacts with fixed objects. Conditions believed to be representative of severe single vehicle accidents, where automobiles impact narrow obstacles, were developed and used in the study. The objectives of the structural modifications were to produce a more uniform energy absorption, i.e., more uniform decelerations near 40 g's and 20 g's respectively for frontal and lateral collisions. The frontal structural modifications considered both front and rear engine vehicle designs and were evaluated under impacts with a rigid pole barrier where the collision speeds ranged from 35 MPH to 60 MPH. These structural modifications were designed so that the entire distance in front of the passenger compartment could be used for energy

absorption. The results demonstrated that the modifications when coupled with this restraint system provide for a force limiting system on the occupant for this range of impact conditions. Author

OPERATIONAL ASPECTS OF FORCES ON MAN DURING EJECTION. EXTRACTION ESCAPE IN THE US AIR FORCE, 1 JANUARY 1968 - 31 DECEMBER 1970
Robert H. Shannon. *In* AGARD, Linear Acceleration of Impact Type, 26 Jun. 1971, 8 p (See N72-19119 10-05)
Avail: NTIS, HC $6.00/MF $0.95

A study of 468 ejections in the United States Air Force (USAF) reported during the period 1 January 1968 to December 1970 disclosed that one in nine crew members involved received major or fatal injuries as a result of forces encountered from system initiation to parachute opening. In 49 cases the injuries received were classified as major (nonfatal), and three crew members were fatally injured. The majority of the major injuries were attributed to the initial forces of ejection and were primarily compression fractures of the vertebral column. These injuries continue to occur with consistent frequency, in spite of the fact that the maximum accelerations of the catapults in use today are well below human tolerances. The major factors which influence the incidence of ejection force injuries are the type catapult used, ejection posture, and age of the individual involved. Of the three, ejection posture appears to be the single most critical factor. The correlation of the individual's weight, by type catapult, was not remarkable. The frequency of injuries attributed to G-forces showed a significant increase over previous studies of USAF ejection escape experience. Although the incidence of high speed ejections has increased only slightly, G-force injuries occurred in 4 percent of all nonfatal ejections and accounted for 12 percent of the total major injuries. MEASUREMENT OF HUMAN RESPONSES DURING IMPACT
J. Sandover. *In* AGARD, Linear Acceleration of Impact Type, 26 Jun. 1971, 12 p, refs (See N72-19119 10-05)
Avail: NTIS, HC $6.00, MF $0.95

In response to a need for information on the dynamic properties of man when using ejection seats, equipment has been developed to simulate the transient acceleration of ejection. The equipment, and the data acquisition and processing systems, are described. The apparatus was used for mechanical impedance studies and performs adequately up to 30 Hz. The present experimental program is designed to provide information on the variations of mechanical response of individual subjects and between subjects, in a relatively restrictive experiment (e.g. hard seat, upright posture, low acceleration levels). The experiments so far indicate the existence of a series resonance at 9 to 10 Hz. The use of mechanical impedance techniques leads to accurate measurement of mechanical response at the input to the body but does not offer a great deal of evidence for the postulation of detailed models. For this reason internal and external transmissibility measurements are advocated. Some preliminary transmissibility measurements are recorded. Considered of the literature and the transmissibility measurements indicates deficiencies in many models of the body, and the need for a simple direct approach. Author

BLAST TESTING AIRCREW ESCAPE EQUIPMENT INCLUDING AN ACCOUNT OF A NEW TRANSONIC TEST FACILITY
J. M. Rayne. *In* AGARD, Linear Acceleration of Impact Type, 26 Jun. 1971, 8 p, refs (See N72-19119 10-05)
Avail: NTIS, HC $6.00/MF $0.95

The design of a facility and its performance in determining the effectiveness of aircrew equipment to air blasts up to Mach 1.3 are discussed. In this device the air speed decay profile is programmed and can be made to simulate a range of post ejection conditions from sea level to altitude. Tests on a protective helmet demonstrate that it will probably be practicable to give head protection up to about 700 kt at sea level. However, failures of the visor which have occurred, show that explosive disintegration of the whole helmet follows at air speeds from 600 kt upwards. Helmet and visor failures usually occur within 100 msec of exposure and the blast effect can be regarded as an impact. In testing helmets therefore, the total duration of exposure to severe blast does not appear to be important. On the other hand, fabric is destroyed by the effects of flutter and the extent of damage seems to be time dependent. Therefore, in testing fabric protective equipment the shape of the air flow decay curve may well be important. Author

RADIOLOGICAL STUDY OF SPINAL INJURIES TO PILOTS UNDERGOING SUDDEN EJECTION [ETUDE RADIOLOGIQUE DES LESIONS DU RACHIS CHEZ LES PILOTES AYANT SUBI UNE EJECTION]
R. P. Delahaye, H. Seris, R. Auffret, G. Gueffier, and P. J. Metges. *In* AGARD, Linear Acceleration of Impact Type, 26 Jun. 1971, 8 p, refs In FRENCH (See N72-19119 10-05)
Avail: NTIS, HC $6.00/MF $0.95

Spinal injuries to pilots caused by sudden ejection, are studied radiologically. The study was made in an attempt to determine the exact traumatic injury, the vertebrae involved, the localization, and the type of fractures. The fractures caused by the propulsion of the ejection seat are also studied. It was determined that the ejection seat usually caused injuries to the 6th, 7th, and 8th vertebrae; it was also determined that the position of the pilot upon ejection contributes to spinal injuries.

SOME OBSERVATIONS ON COMPRESSION FRACTURES OF THE SPINE IN EJECTED GREEK PILOTS
Pan. P. Symeonides. *In* AGARD, Linear Acceleration of Impact Type, 26 Jun. 1971, 3 p, refs (See N72-19119 10-05)
Avail: NTIS, HC $6.00, MF $0.95

The causes of compression fractures in Greek pilots during the decade 1960-1969 were investigated. Resumption of duties by pilots with such fractures was studied. It was found that 18 percent of the ejected pilots sustained compression fractures of the spine. All fractures occurred during ejection and were located at the dorsolumbar region of the spine (T10 to L3). There was

sufficient evidence that excessive tightening of the ejection seat belts (shoulder-buttocks) produces a permanent flexion of the spine which thus becomes more vulnerable during ejection. If the wedging of a vertebra following a fracture does not exceed 1/3 of the height of the vertebral body and the symptoms are mild enough, the pilot may return to the active service as jet pilot. If wedging is greater than 1/3, he should not resume his previous duties either as jet or helicopter pilot because the created local kyphosis of the spine renders the neighboring vertebrae more vulnerable. DESIGN CONSIDERATIONS FOR IMPACT TEST FACILITIES

Richard F. Chandler *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 10 p refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

With the advent of World War 2 pilot shortage necessitated scientific investigation of the causes of crash injury. These early investigations made use of a variety of test facilities, including swing seats, acceleration towers, drop towers, acceleration tracks, and deceleration tracks. The facilities served as a basis for similar devices in use today. The purpose of these facilities is to produce a controlled impact representative of an actual crash. Good simulation of the magnitude of acceleration changes is possible on these facilities, but none provide exact replication of the change in acceleration direction which is experienced in a crash. A LINEAR DECELERATION TRACK

A. F. Giles *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 9 p (See N72-19119 10-05)

Avail: NTIS HC $6.00, MF $0.95

The linear decelerator is housed in a building 52 m (170 ft) long and has a track length of 48 m (150 ft). The 545 kg (1200 lb) test vehicle is capable of carrying a payload of 160 kg (350 lb) and is propelled by rubber bungee ropes. It can attain a peak velocity of 23 metres/second (75 ft/sec). The arrester mechanism is capable of producing a peak vehicle deceleration of up to 50g and consists of a steel cable harness stretched across the track, each end being connected to the piston of a hydraulic cylinder. When the vehicle displaces the cables, movement of the pistons squeezes hydraulic fluid from each cylinder through a metered orifice, resulting in a controlled deceleration force on the vehicle. The profile shapes available are a half sine wave, a sine wave with a 50 millisecond plateau, a double peak, or a triple peak. Gravity onset rates can be varied from 60g/second to 750g/second. FIAT CATAPULTS

E. Franchini *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 8 p refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

An outline is drawn of several propulsion systems adopted to launch a car against an obstacle and the reasons are given why the catapult system was preferred. This system allows the possibility of launching a car indoor, it is simple and of low cost and has a high operational flexibility. A description is given of the low and medium speed impact catapult and of the new catapult for collisions at up to 80 km/h of cars up to 2000 weight. The catapult design diagrams are given. The control and operation devices and the measuring instrumentation, are described. The different types of test run with the catapult are illustrated. They include: (1) head-on collision against barrier at 90 degrees or at other angles of approach, (2) side impact against stationary car, (3) rear end collision, (4) wedging under stationary truck front, side or tail, (5) launching of car, raised clear of ground and placed transversally on the trolley to simulate the side skidding impact against barrier or pole, (6) sudden braking of a complete car to study the behavior of dummies in their impact against passenger compartment interior, (7) sudden braking of a dolly, on which a dummy is installed to study seat belts (or other restraint) or the impact of driver against steering wheel. Avail: NTIS HC $6.00, MF $0.95

Tests were conducted out of doors initially, but with the introduction of legislation a large number of certification and compliance tests became necessary and, mainly because of the unpredictable climate in the U.K., it was found necessary to build an indoor test rig. On this test rig a linear induction motor is used as the prime mover and it is capable of accelerating vehicles of up to 10,000 lb in weight to any speed up to 30 mph. Special provision was made for high speed cine photography and electronic instrumentation, and the entire test rig is automatically controlled. In order to safeguard personnel a comprehensive safety interlock system was incorporated. Author

Avail: NTIS HC $6.00/MF $0.95

The r sub x, g sub y, and g sub z linear acceleration and r dot sub x, r dot sub y, and r dot sub z angular acceleration terminology (the latter representing radians/sec sq) is reviewed. It is urged that the representation of human acceleration environments by accelerometers be filtered to be flat (with less than 0.5 db variation) in response from 0 to 240 Hertz, and then attenuated above 240 Hz at 12 db per octave, in preference to the more common representation by ac accelerometers (flat from about 10 to 2000 Hertz). This latter representation often obscures biologically important accelerations in metal ringing spikes. Illustrations are drawn from crash studies of airplane airbag restraint systems and from mathematical representations of passenger compartment loads for automobile crashes of various types. Author

BIOMECHANICS OF RESTRAINT AND IMPACT ATTENUATION SYSTEMS

Verne L. Roberts and James H. McElhaney *In* AGARD Linear Acceleration of Impact Type 26 Jun. 1971 9 p refs (See N72-19119 10-05)

Avail: NTIS HC $6.00/MF $0.95

The methodology and results from research program concerning the protective aspects of passive restraint systems are provided. The criteria which should be used in the evaluation of passive restraints are provided and the experimental and analytical tools to define restraint performance are discussed. Research indicates that passive restraints can provide protection equal to that provided by belt systems and that a passive

restraint must be carefully integrated with the vehicle interior to provide optimum protection Author

EARLY THOUGHTS ON COMPOUND STRAINS

Geoff Allen *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 8 p refs (For availability see N73-19143 10-05)

Jargon on the subject is briefly discussed, and it is reasoned that the term compound strains may frequently be more appropriate than combined stresses. Two compound strain problems of immediate and widespread importance, on which there is an urgent need to increase the present scanty information, are cited. The first is the effects of other mental and physical stresses on the signal to noise ratios required for communication; the second, the biodynamics of vibratory motion sickness, particularly the interaction with other loads such as vision, heat and odors. TWO EXPERIMENTS ON THE EFFECTS OF COMBINED HEAT, NOISE AND VIBRATION STRESS

Walter F Grether *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 8 p refs (For availability see N73-19143 10-05) (AMRL-TR-71-113)

Operational flying often exposes crew members to combinations of environmental stresses. To obtain a better understanding of such combined-stress effects a major experiment was conducted using heat, noise and vibration, both singly and in combination. Measurements were made of tracking ability, choice reaction time, voice communication, mental arithmetic, visual acuity, body temperature, heart rate, weight loss, and subjective ratings of the stress. On a number of these measures, did the combined triple stress produce significantly greater effects than did the most severe single stress. On the physiological measures only heat stress produced significant effects, and the addition of noise and vibration produced no further effects. On the performance measures, particularly the tracking test, impairment was slightly less for the triple stress condition than for vibration only. Thus there were no additive interactions, and in fact some evidence of antagonistic interactions. Author

COMBINED EFFECTS OF NOISE AND VIBRATION ON COGNITIVE AND PSYCHOMOTOR PERFORMANCE

Henry C Sommer and C Stanley Harris *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 10 p refs (For availability see N73-19143 10-05) (AMRL-TR-71-115)

Five studies on the combined effects of noise and vibration on psychomotor and cognitive performance are reported. Tracking and reaction time tasks were used as measures of psychomotor performance and a short term memory subtraction task was used as a measure of cognitive performance. The first study using tracking performance as a sensitive additive effect of noise and vibration on performance. However, this was not confirmed in a second study. Two additional studies conducted with the cognitive task indicated that detrimental effects on this task occurred only when noise and vibration were combined. Further, the effect seemed to be related to frequency of vibration: only 5 Hz 0.25 gz vibration combined with noise produced an adverse effect on the task. The final investigation was concerned with the effect combined noise and vibration stress had on cognitive performance as a function of time of day. The results indicate that time of day does not appear to be a particularly strong variable. Author

EMOTIONAL AND CARDIOVASCULAR STRESSES OF CENTRIFUGATION: EFFECT OF BETA RECEPTOR BLOCKADE ON HEART RATE RESPONSE

D H Glaister, M F Allnutt, M H Harrison, and P Fennessy *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 13 p refs (For availability see N73-19143 10-05)

Twenty four subjects were used in a double blind trial to investigate the effect of beta adrenergic blockade on the heart rate response to acceleration. Oxprenolol 0.2 mg/kg body weight or saline placebo was injected in paired trials and subjects then performed a tracking task and submitted to three centrifuge runs. Heart rate and blood pressure were monitored continuously. Oxprenolol reduced resting heart rate, and abolished a steady increase in base line heart rate seen in placebo experiments, and attributed to activation of the adrenal medulla. Tachycardia in response to +2G sub z acceleration was prevented by beta blockade except in a group of six subjects experiencing their first ever centrifuge ride. Heart rates at +3G sub z were lowered by oxprenolol, the persistent tachycardia being attributed to a baroreceptor reflex mediated through a reduction in vagal tone. Pulse pressure was reduced by oxprenolol especially during +3G sub z acceleration, an effect attributed to a reduction in cardiac output secondary to a fall in heart rate. Greyout tolerance was unaffected by beta blockade, but a small and unexplained decrement in tracking performance was observed. Author

ESTIMATES OF PHYSIOLOGIC RESERVE AFTER ACCELERATION EXPOSURE IN MAN

Frank R Lecoco, Richard L Lipman, and Sidney D Leverett, Jr *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 6 p refs (For availability see N73-19143 10-05)

A metabolic stressor was employed to provoke gluco-regulatory hormone response immediately after exposure of subjects to acceleration stress. 2-deoxy-D-glucose, a glucose analog which produces severe intracellular hypoglycemia, was infused in eight normal male volunteers during a control period, immediately after an initial experience with acceleration, and after their fourth exposure to acceleration. Blood glucose, free fatty acids, insulin, growth hormone, and cortisol, and urinary epinephrine and norepinephrine were measured before and after each infusion of 2-deoxy-D-glucose. Although acceleration stress was modest, readily discernible changes in gluco-regulatory response to the metabolic stressor were detected after exposure to acceleration. Author

PERFORMANCE MEASUREMENT USING PILOT CONTROLLED Gz MANEUVERING WITH SIMULATED OPERATIONAL TASK
D B Rogers, F M Holden, C R Replogle, G Potor, C N Day, R E VanPatten, K A Smiles, and G C Mohr *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 5 p refs (For availability see N73-19143 10-05)
(AMRL-TR-72-3)

A technique for human performance measurement using a closed loop centrifuge has been validated. The simulation utilized the pitch and roll dynamics of a high performance aircraft. The measurement criteria were hits on target using a display generated heads up gunsight on a maneuvering target aircraft. An important consideration was relationship between man as a passive rider versus man as an active participant in the generation of the Gz stress. Two important demonstrations resulting from this study are: (1) there is a significant difference in the ability of subject pilots to perform in closed versus open loop configuration, and (2) it is feasible to provide a mission related human performance metric in a selective simulation in which the +Gz forces are dynamically realistic. A predictive heads up gunsight display is utilized with target trajectories representative of aerial combat maneuvers. Author

PHYSIOLOGICAL STUDIES OF FATIGUE IN ACTIVITIES REQUIRING MENTAL CONCENTRATION IN HOT CLIMATE. THE INFLUENCE OF POSITIONING AND SENSORIAL IRRITATION
J Meyer-Delius *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 8 p refs (For availability see N73-19143 10-05)

Activities of vigilance without additional influence of psychical stress or energetic upset are demonstrated in hot and temperate climate with noradrenergetic reaction. Mental effort with slightly increased energetic metabolism required 20% more time in hot climate to complete tasks than was required by persons working under temperate conditions. In this case the pulse rate was rising continuously. Under identical conditions of climate and mental work, but with noise, the pulse rate was significantly higher than without sensory irritation. Excitation of the sensorial senses leads to an additional increase in the peripheral vascular constriction. Opposed to thermoregulation it can cause disregulation and thus fatigue. Author

THE USE OF PHYSIOLOGICAL PROTECTIVE MANEUVERS IN HIGH ACCELERATION ENVIRONMENTS
S J Shubrooks, Jr and S D Leverett, Jr *In* AGARD Performance and Biodyn Stress - Influence of Interacting Stresses on Performance Nov 1972 9 p refs (For availability see N73-19143 10-05)

The physiological effects of voluntary maneuvers used for protection against +G sub z acceleration were studied on the human centrifuge. During both 15-sec and 45 sec rapid onset +G sub z exposures, the increases in tolerance achieved with the Valsalva straining maneuver (forcefully exhaling against the completely closed glottis) were found to be equivalent to those achieved with the M-1 maneuver (forcefully exhaling against the partially closed glottis), either combined with use of an anti-G suit or without the suit during generalized muscular tensing. Directly measured head level arterial pressure responses correlated with these findings. The use of positive pressure breathing, at levels of 25-40 mm Hg, was also found to result in increases in tolerance, both with and without use of the anti-G suit, at least equal to those obtained with the M-1 maneuver with less accompanying discomfort and fatigue. BEHAVIOURAL ASPECTS OF AIRCRAFT ACCIDENTS
K G G Corkindale, ed (Inst of Aviation Med.) Dec 1973 72 p refs Papers presented at AGARD Aerospace Med Panel Specialists Meeting, Soesterberg, Netherlands, 7 Sep 1973
(AGARD-CP-132) Avail: NTIS HC $6.75

A conference was conducted to discuss the influence of human factors on aircraft accidents. The subjects discussed were: (1) human factors approach to aircraft accident analysis, (2) human factor in cyclic aircraft accident patterns, (3) the application of aircrew opinions on cockpit tasks and equipment to flight safety research, and (4) the psychologist's role in aircraft accident investigation. The primary purpose of the conference was to determine if research projects in human factors engineering could result in a reduction in the pilot error accident rate. For individual titles see N74-18798 through N74-18804.

PILOT FACTOR IN AIRCRAFT ACCIDENTS OF THE GERMAN FEDERAL ARMED FORCES
B Falckenberg *In* AGARD Behavioural Aspects of Aircraft Accidents Dec 1973 7 p refs (For availability see N74-18797 10-05)

An analysis with reference to the most frequent types of pilot error was made of 154 aircraft accidents which occurred in the years between 1967 - 1970. Of special interest were differences between pilots of jet, propeller aircraft and helic...

tors. The flying experience of the pilot, his age and other so called time-variable factors were also taken into consideration. In general errors predominantly occurred during low level flight and during the landing phase immediately before touch-down. In jet aircraft accidents the majority of errors committed by the pilot is due to an extreme workload in handling his aircraft. In pilots of the other categories, particularly on propeller driven aircraft, those types of errors are more pronounced which may be attributed to the pilot's flying attitude (in extreme cases resulting in violations). The findings of other authors relating to flying experience could be confirmed. As for the age distribution of pilots there were remarkable differences in comparison with the data in other publications. Author

HUMAN FACTORS APPROACH TO AIRCRAFT ACCIDENT ANALYSIS

Richard H. Shannon and Wayne L. Waag. *In* AGARD Behavioural Aspects of Aircraft Accidents. Dec. 1973. 10 p. refs. (For availability see N74-18797 10-05)

Naval accident reports involving the P-3 and F-4 aircraft were examined over seven and five year periods, respectively. The critical incident technique was used to catalogue, describe, and analyze operational flight crew errors in both aircraft. An in-depth study was performed in order to identify those problems which were common as well as specific to both aircraft. The P-3 and F-4 aircraft were selected because of their completely different fleet missions and handling characteristics. Human errors were categorized according to three types: (1) vigilance errors, (2) procedural errors, and (3) perceptual-motor errors. Phases of flight operation were divided into four segments: (1) servicing, preflight, postflight, (2) start, taxi, shutdown, (3) takeoff, landing, and (4) inflight. Four remedial areas were outlined for reducing human error: (1) crew coordination, (2) design, (3) discipline, and (4) training. From the F-4 accident reports, 437 human errors were isolated while the P-3 reports contained 345 errors. Twenty-eight major error categories emerged from the analysis of these errors. The accident reports were further analyzed for the errors which both aircraft had in common. Twenty common error groups were found to occur in the P-3 and the F-4, representing 22.5% and 18.8% of the total errors respectively. The flight segment of takeoff/landing, and the error type of procedures, shared the most commonality across the two aircraft. Author

THE HUMAN FACTOR IN CYCLIC AIRCRAFT ACCIDENT PATTERNS

Peter J. Dean. *In* AGARD Behavioural Aspects of Aircraft Accidents. Dec. 1973. 8 p. refs. (For availability see N74-18797 10-05)

An analysis of the human factors in aircraft accidents was conducted to isolate cyclic human factors which cause the accidents. The operational record of the CF-104 aircraft was used for the analysis. It was determined that the accidents tend to occur more frequently in January, April, July, and October than in the other months. The subjects discussed are: (1) the nature of the cyclic phenomena and how they influence man, (2) previous studies of cyclic patterns in aircraft accidents, and (3) specific cyclic factors related to aircraft accidents and recommendations for preventing aircraft accidents. Author

EVALUATION OF THE ROLE OF THE SIMULATOR IN TRAINING AIRBORNE ASW OPERATIONS

James E. Robins, Dorothy L. Finley, and Thomas G. Ryer. *In* AGARD Behavioural Aspects of Aircraft Accident. Dec. 1973. 8 p. Sponsored by Naval Training Equipment Center. (For availability see N74-18797 10-05)

The effectiveness of the U.S. Navy device 2F58B, a weapons trainer for the P3A and P3B aircraft, was investigated. The device provides tactics crews with team training in the detection, tracking, and destruction of modern deep diving submarines. Careful selection, variation, and control of problem conditions should enable instructors to train the tactics teams to analyze and respond to situations likely to occur during actual ASW missions. Study results indicate that learning takes place in the simulator and that there is positive transfer to the operational environment. There is room for improvement and modification of the training curriculum. Author

INCIDENCE, COST AND FACTOR ANALYSIS OF PILOT ERROR ACCIDENTS IN US ARMY AVIATION

Darwin S. Ricketson, Scott A. Johnson, Larry B. Bradham, and Richard P. Depp. *In* AGARD Behavioural Aspects of Aircraft Accidents. Dec. 1973. 19 p. refs. (For availability see N74-18797 10-05)

From 1959 through 1972 pilot error was a consistently large and costly cause of accidents. Past analytic and prevention efforts have not approached pilot error accidents in the context of malfunctions among the basic man-machine environment elements. Such an approach was proposed and seeks to identify the common human error events in pilot error accidents. A partial test of the approach was made with helicopter and airplane mishap information in its present form. A factor analysis produced nine distinct meaningful and representative helicopter and airplane factors. A component score analysis yielded pilot and mishap background information which was helpful in interpreting the factors. An experimental human error events reporting form was developed which holds promise for clearer identification of mishap causing system elements and corrective measures required. Author

PRACTICAL PROBLEMS IN CLINICAL NYSTAGMOGRAPHY. 1. GUIDELINES FOR SELECTION OF EQUIPMENT

Mary Jayne Capps *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 3 p refs (For availability see N74-20732 12-05)

The basic equipment needed for a thorough evaluation of the vestibular system includes an examination chair or table, a polygraphy suitable for recording nystagmus, a device for producing caloric stimuli, and an optokinetic stimulator. The required and optional features of each of these devices have been discussed. The basic equipment will permit the elicitation and recording of the various types of eye movements, i.e., caloric, optokinetic, positional, and spontaneous nystagmus. The evaluation of these phenomena provides a sufficiently complete picture of the state of the vestibular system. Author

N74-20735 Ohio State Univ., Columbus. Coll. of Medicine

PRACTICAL PROBLEMS IN CLINICAL NYSTAGMOGRAPHY. 2. SOURCES OF ERROR

Charles W. Stockwell and William E. Collins (FAA, Oklahoma City) *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 10 p refs (For availability see N74-20732 12-05)

The value of clinical nystagmography can be greatly diminished if certain errors are not recognized and avoided. Some errors are introduced by faulty recording techniques, including inadequate calibration, inappropriate choice of frequency filters, and failure to identify artifacts. Other errors are due to the extreme sensitivity of the nystagmus response to extravestibular influences. Caloric testing errors include inadequate stimulus control and failure to account for directional preponderance. These and other errors in nystagmography are pointed out and discussed, and corrective measures are suggested. Author

N74-20736 Royal Air Force Inst. of Aviation Medicine, Farnborough (England)

USE OF NYSTAGMOGRAPHY IN THE STUDY OF AIRCREW WITH SPATIAL DISORIENTATION

A. J. Benson *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 13 p refs (For availability see N74-20732 12-05)

Lateral nystagmus evoked by a stopping stimulus of 60 deg/sec was recorded by electro-oculography in 133 aircrew who had come under medical care because of airsickness, spatial disorientation, or other sensory disturbances in flight without illusory perception of aircraft orientation. Measures of the slow phase velocity, the time constant of decay, and total amplitude of the post-rotational nystagmus did not differ between the three groups. Measures of directional preponderance were found to have differences in variance structure between the groups. Measures of directional preponderance were found to have differences in various structure between the groups, but these were not well defined and hence of limited value in the selection or assessment of individual aircrew. A PROPOSED HABITUATION LABYRINTH (PRESENTATION OF SEVERAL RESULTS WITH THE P.N.T.) [A PROPOS DE L'HABITUATION LABYRINTHIQUE (PRESENTATION DE QUELQUES RESULTATS CHEZ LA P.N.T.)]

A. Gibert, P. Blanc, F. Lafontaine, P. Pialoux, and P. Fontaille *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 7 p In FRENCH (For availability see N74-20732 12-05)

Several methods, with special emphasis on damp sinusoidal stimulation, used to study labyrinth are introduced. Data are also given on the possible application of these methods in aeronautical and aerospace medicine. Habituation phenomena using the personnel navigation technique are given as well as information obtained by observing the phenomena in the course of professional apprenticeship. The possibility of observing the equilibration function during professional life, particularly during the course and abatement of the central peripheral vertiginous syndrome was discussed. A CONTRIBUTION TO THE ELECTRONYSTAGMOGRAPHIC METHOD CONCERNING THE INTERPRETATION OF NYSTAGMUS CHARACTERISTICS

C. Koch *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 5 p refs (For availability see N74-20732 12-05)

The evaluation of nystagmic characteristics is stressed both from a quantitative and qualitative standpoint. Descriptions of some of them (amplitude, frequency, duration) are given, the importance of which is well known as far as vestibular semiology and diagnostics are concerned. A new formula is proposed concerning the interpretation of the electronystagmographic recording. This formula makes it easier to define the nystagmus in degrees, thus constituting a basis for its classification. Author

DIFFERENTIAL DIAGNOSIS OF THE CALORIC NYSTAGMUS

Nicholas Torok *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 11 p refs (For availability see N74-20732 12-05)

Diagnostic considerations based upon the nystagmogram are limited. Quantitative assessment of horizontal canal sensitivity is available through the use of culmination frequency or culmination slow phase velocity. Three distinctive qualitative features of the caloric nystagmus were evaluated and were found to be suggestive or outrightly pathognomonic for retrolabyrinthine or central nervous system abnormalities. These are (1) vestibular decruitment, a disproportionate caloric responsiveness when a weak stimulus elicits a more intense nystagmic reaction than a strong stimulus is capable of creating, (2) hyperactive vestibular responsiveness, and (3) ocular fixation reversal phenomenon. Elimination of fixation decreases the nystagmus intensity instead of facilitating the evoked nystagmus. Author

NYSTAGMOGRAPHY: A USEFUL TOOL IN BASIC AND APPLIED INVESTIGATIONS

G. Melvill Jones *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 13 p refs (For availability see N74-20732 12-05)

Relatively gross eye movements are considered, in particular (1) quick saccadic gaze shifts from one fixation point to another, (2) the relatively slow smooth pursuit movements associated

with following a fixation point which is moving relative to the head. In many circumstances these two types of movement are integrated to produce a combined pattern of eye movement suitable for intermittent fixation on a visual field which is moving relatively to the head. Methods of recording nystagmus and its data reduction are discussed together with their applicability and hazards in relation to intended objectives. The experimental use of nystagmography is treated in terms of quick and slow phase eye movements and of head movements. Author

OPTOKINETIC NYSTAGMUS: ITS VALUE IN THE DIAGNOSIS OF CERTAIN VESTIBULAR LESIONS
Y. Morissette, S. M. Abel, and H. O. Barber. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 6 p. refs. (For availability see N74-20732 12-05)

Optokinetic nystagmus (OKN) was studied to explore its value in the localization of vestibular lesions. The stimulus consisted of a field of equidistant parallel black bars, either horizontal or vertical, moving across a white ground. The data showed that for subjects with normal vestibular function and unilateral labyrinthectomy, the slow phase velocity of OKN varied nonmonotonically with increases in the speed of the bars between 20 and 400 degrees of visual angle per second. This function reached a single maximum at approximately 60 to 80 degrees of bar velocity for horizontal OKN and at 40 degrees for vertical OKN. In subjects with neurological confirmed lesions of brain stem due to multiple sclerosis, tumor or ischemic disease the slow phase velocity of OKN did not change but remained constant at about 20 degrees/sec across the range of bar velocities studied. VISUAL-VESTIBULAR INTERACTION: THE ROLE OF THE LABYRINTH IN THE PRODUCTION OF OPTOKINETIC NYSTAGMUS AND *OPTOKINETIC AFTER NYSTAGMUS*
B. Cohen, S. Takemori, and T. Uemura. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 4 p. refs. (For availability see N74-20732 12-05)

OKN and OKAN were affected by unilateral and bilateral labyrinthectomy. The maximum velocity of slow phases of OKN induced by drum rotations above 60-75 deg/sec in either direction was lower after unilateral and bilateral labyrinthectomy. The frequency of OKN was also decreased, and the total deviation of the eyes was reduced for OKN induced by these drum speeds. Changes in OKN eventually recovered. OKAN was reduced in duration after unilateral labyrinthectomy, being initially shorter to the ipsilateral than to the contralateral side. OKAN could no longer be evoked after bilateral labyrinthectomy. This loss was permanent. These data demonstrate the importance of the vestibular system in maintenance of OKN and OKAN. Author

SELF-MOTION SENSATION, PSEUDO-CORIOLIS EFFECTS AND MOTION SICKNESS INDUCED BY OPTOKINETIC STIMULI
Johannes Dichgans and Thomas Brandt. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 3 p. refs. (For availability see N74-20732 12-05)

Psychophysiological experiments reported establish that the human sensation of self motion is evoked by stimulation of the labyrinthine receptors as well as by excitation of the visual sense. Circularvection, pseudo coriolis effect, and visually induced tilt of the apparent vertical produce oculogravic motion illusions and motion sickness phenomena due to vestibular visual interaction. EFFECTS OF SOUND ON THE VESTIBULAR SYSTEM
D. E. Parker, M. F. Reschke, and R. L. Tubbs. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 12 p. refs. (For availability see N74-20732 12-05)
(Contracts F33615-69-C-1246; F33615-73-C-4002)

The effects of sound on the vestibular systems of guinea pigs and monkeys were studied. Sound stimuli included: (1) Pressure transients, (2) infrasounds, and (3) intense audiofrequency sound. Biomechanical and physiological responses to these three types of stimuli were observed. Biomechanical responses examined included stapes displacement and perilymph pressure changes. Vestibular nerve activity, eye movements, and head movements are the physiological responses that were recorded. Monkey responses differed from guinea pig responses under several conditions; response differences suggest different mechanisms of acoustical vestibular stimulation in these two species. Author

NORMAL LIMITS FOR THE SEQUENTIAL BITHERMAL BINAURAL CALORIC TEST
Franklin O. Black, David D. Custer (Tech. Vocational Inst.), William G. Hemenway (Colo. Univ.), and John I. Thornby. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 9 p. refs. (For availability see N74-20732 12-05)

Analysis of bithermal binaural caloric test results gave a statistically significant response difference between ears for right handed normal subjects. There were no significant response differences due to temperature of stimulation and ear stimulated. Three tests for the determination of caloric nystagmus response abnormalities were developed, based upon analysis of intrasubject normal responses. A retrospective examination of caloric responses from patients with Meniere's disease provided preliminary support for clinical feasibility and increased sensitivity of the statistical methods advocated for clinical usage. HUMAN EYE MOVEMENTS DURING VARIOUS FORMS OF LINEAR ACCELERATION AND WEIGHTLESSNESS
R. J. VonBe[illegible]garten, P. Thomler (Mich. Univ.), C. F. Shillinger, Jr. (NASA Ames Res. Center), and G. Baldrighi (Mich. Univ.). *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 3 p. refs. (For availability see N74-20732 12-05)

Eye movements of human subjects were recorded electronystagmographically in complete darkness during rectilinear horizontal accelerations as achieved in cars on the ground and also during aircraft parabolic flight. The results were compared to the movements of blinded goldfish subjected to similar changes of gravitoinertial forces. The results indicate that there is a human correlation with the gravity reference response of fish. During horizontal forward accelerations on the ground the human eyes turn downward and during horizontal backward acceleration the eyes turn upward. The human eye response to g loads below 1 g and to weightlessness is the reverse of the tilt of the fish. While fish dive down during low g or loop forward during weightlessness, the eyes of subjects sitting upright in an aircraft which flies at 0 g move upward. Author

THERMOELECTRIC STIMULATION OF THE LABYRINTH
Hans Scherer. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 5 p. (For availability see N74-20732 12-05)

A new method of caloric labyrinth stimulation is described. The use of water as a stimulator is replaced by a copper plug positioned in the external ear canal. The plug's temperature is regulated by Peltier thermoelectric plates which are connected with a power supply and are able to produce on one of their sides either heat or cold. Every temperature necessary to stimulate the labyrinth can be applied. Electronic steering and the automatization of the whole test are easily applicable. The new method is especially useful in patients with lesions of the ear drum. Several typical examples of thermoelectric stimulation of the labyrinth and the nystagmic response are shown. Author

COMPUTER-ELECTRONYSTAGMOGRAPHY IN EVALUATING THE INFLUENCE OF PSYCHO PHARMACOLOGICAL DRUGS ON VIGILANCE
Juergen C. Aschoff and Wolfgang Becker. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 8 p. refs. (For availability see N74-20732 12-05)

Maximum velocity and duration of saccadic eye movements depend entirely on the magnitude of angular deflection of the eye ball, and on the state of alertness or fatigue. Tranquilizing drugs such as Diazepam are known to reduce significantly the maximum velocity, but accuracy and reaction time of these eye movements deteriorate, too. For evaluating these drugs, an on-line computer program has been developed whereby 500 saccadic eye movements are computed for their maximum velocity, duration, accuracy and reaction time. All desired parameters are plotted in amplitude subgroups with mean values + or - standard deviation. Various drugs have been tested using this method including a powerful new antidepressant drug Sulpiride. This antidepressant psychopharmakon showed no influence on velocity and reaction times and may even enhance accuracy of saccadic eye movements. Author

AUTOMATED NYSTAGMUS ANALYSIS

Charles M. Oman, John H. J. Allum, John R. Tole, and Laurence R. Young. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 9 p. refs (For availability see N74-20732 12-05)

(Grants NGR-22-009-025; NGR-22-009-156; NGR-22-009-701)

Several methods have recently been used for on-line analysis of nystagmus. A digital computer program has been developed to accept sampled records of eye position, detect fast phase components, and output cumulative slow phase position, continuous slow phase velocity, instantaneous fast phase frequency, and other parameters. The slow phase velocity is obtained by differentiation of the calculated cumulative position rather than the original eye movement record. Also, a prototype analog device has been devised which calculates the velocity of the slow phase component during caloric testing. Examples of clinical and research eye movement records analyzed with these devices are shown. Author

A MODEL FOR THE PREDICTION OF THE NYSTAGMIC RESPONSE TO ANGULAR AND LINEAR ACCELERATION STIMULI

G. R. Barnes and A. J. Benson. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 13 p. refs (For availability see N74-20732 12-05)

A model has been developed for the mechanism of saccadic generation in the vestibulo-ocular reflex arc in an attempt to explain variations in the pattern of nystagmic response to vestibular stimulation. The model has been developed using an analogue computer and an attempt has been made to relate the system to the known physiological evidence. The response of the model has been compared with results from experiments on human subjects, and satisfactory agreement has been obtained in conditions appropriate to stimulation of the canals by both periodic and transient angular accelerations and to stimulation of the utricular maculae by linear acceleration. The model effectively simulates the changes in frequency and duration of slow phase and saccadic eye movements observed experimentally. Author

VERTIGO IN DIVING

Carl Edmonds. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 10 p. refs (For availability see N74-20732 12-05)

Because vertigo is associated with nystagmus and this can be demonstrated in an objective manner, it has been attempted to differentiate the specific causes of vertigo from those of disorientation in general. It is fully appreciated that there is a strong correlation between these two symptoms. An aetiological classification of vertigo in diving is reported that considers aspects of unequal vestibular stimulation as well as unequal vestibular responses. Author

N74-20754 Duke Univ., Durham, N.C. Div. of Otolaryngology.

COCHLEAR AND VESTIBULAR INJURIES DURING DIVING

Joseph C. Farmer, Jr. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 8 p. refs (For availability see N74-20732 12-05)

Cochlear and vestibular damage can occur during all phases of diving. Inner ear damage during compression seems to be related to difficulties with middle ear pressure equalization while such damage occurring at stable deep depths seems to be related to experimental changes in inspired inert gas composition. Cochlear and vestibular damage during decompression seems to be a form of decompression sickness and can be the only manifestation of this problem. Twenty cases of such damage are presented in which there is a significant correlation between prompt recompression treatment and lack of residual deficites. Excessive noise is not uncommon during various diving conditions and can lead to temporary and presumably permanent auditory thresholds shifts. Author

N74-20755 Lund Univ. (Sweden). ENT-Dept.

EFFECTS OF INCREASED MIDDLE EAR PRESSURE ON THE VESTIBULAR SYSTEM

Oerjan Tjernstroem. *In* AGARD The Use of Nystagmography in Aviation Med. Dec. 1973 9 p. refs (For availability see N74-20732 12-05)

A technique is described for measuring changes in pressure in the middle ear. Fitted to the external ear canal is a rubber cuff which contains a small tube. A flowmeter, parallel with the tube, detects airflow between the external ear canal and the ambient air. The airflow is compared electronically with a reference airflow in another tube which emanates from an adjustable reference volume. By recording in this manner in a pressure chamber, pressure changes in the middle ear could be related to report vertigo and also to recorded nystagmus. Results indicate that alternobaric vertigo (A.V.) may occur with only moderate pressure changes and that some subjects who would otherwise be regarded as normal are especially susceptible to A.V., apparently as a result of a high forcing pressure on one side. SATELLITE VIEWED CLOUD COVER AS A DESCRIPTOR OF RADIO-RADAR PROPAGATION CONDITIONS
R. H. Blackmer, Jr. and S. M. Serebreny *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb. 1971 12 p (See N71-21409 10-07)
Avail: NTIS

Comparison is made between the appearance of a satellite viewed cloud cover and radio-radar propagation conditions to determine whether cloud cover can describe atmospheric conditions influencing radio-radar propagation. Radar performance records from the eastern Pacific Ocean and tropospheric scatter signals from the southwestern Pacific ocean were compared with satellite photographs of cloud cover over the respective areas. It is shown that the nature of the cloud cover helps to indicate whether propagation will be normal or abnormal but more research is needed to obtain quantitative propagation data over small scale areas. RAIN ATTENUATION AT MILLIMETER WAVELENGTHS
E. E. Altshuler, V. J. Falcone, and K. N. Wulfsberg *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb. 1971 10 p refs (See N71-21409 10-07)
Avail: NTIS

A program to determine the feasibility of using millimeter waves for space communication has been conducted and it has been shown that at 15 and 35 GHz atmospheric attentuation is relatively low except for conditions of heavy clouds and vecipitation. Rain attenuation was measured in Hilo, Hawaii and the following results were obtained. (1) total atmospheric attenuation is moderately low at 15 and 35 GHz for rainfall rates less than 1 mm/hr and zenith angles less than 45 deg. For higher rainfall rates and angles closer to the horizon the attenuation becomes prohibitive particularly at 35 GHz, (2) total atmospheric attenuation can be accurately calculated from a measurement of apparent sky temperature, and (3) atmospheric attenuations at 15 and 35 GHz are highly correlated. SIMULTANEOUS MEASUREMENTS OF PRECIPITATION ATTENUATION AND RADAR REFLECTIVITY AT CENTIMETRE WAVELENGTHS
K. S. McCormick *In* AGARD Tropospheric Radio Wave Propagation. Pt. 1 Feb 1971 12 p refs (See N71-21409 10-07)
Avail. NTIS

Measurements have been made of precipitation attenuation along slant paths through the troposphere Beacons at 4, 8 and 15 GHz were carried by an aircraft which flew in circular paths around a receiving antenna, with elevation angles to the aircraft for different flights between 3 and 20 degrees Simultaneous measurements of backscatter from precipitation along the propagation path were made using a 2 9 GH weather radar The radar data have been used to calculate values of the path attenuation, using empirical relations to relate attenuation to reflectivity factor Data were obtained for situations including moderate widespread rain, an intense shower, rain cells which apparently contained hail in their cores, and situations in which a distinct melting layer was present. On the basis of the measured data, it is concluded that the radar can be used to calculate values of path attenuation that give satisfactory agreement with the observed values, provided that hail or a melting layer is not intercepted by the radar beam Author

Avail NTIS

A radio wave passing through a turbulent propagation medium such as the troposphere, suffers distortions which are equivalent to the generation of new signals or propagation medium noise The desired signal will be modulated, causing unwanted noise and erroneous interpretation of the recieved signals This problem increases greatly when one or both terminals are moving rapidly through turbulent media The problem is greatly accentuated at elevation angles of less than 10 degrees because of the longer path the signal has to travel through the troposphere and because of multipath effects Aircraft-to-ground tests at S-band frequencies utilizing a 250,000 bit/sec rate and satellite-to-ground tests at X-band frequencies have been conducted at bandwidths of 8 MHz These tests are described and some of the results are summarized Author

EFFECTS OF TROPOSPHERIC LAYER STRUCTURE ON PROPAGATION AND SIGNAL DISTORTION

J. A. Lane *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb 1971 14 p refs (See N71-21409 10-07)

Avail: NTIS

The nature of elevated layers of large vertical gradient of refractivity in the troposphere is discussed. In addition to earlier observations with refractometers on aircraft, much important information has been obtained with balloon-borne instruments, optical radar (lidar), acoustic radar, and centimeter radar of high resolution. Some degree of stratification in the first few kilometers above ground is now known to be relatively common, but the precise effect of such stratification on signal strength, fading characteristics, Doppler spectrum, available bandwidth, space diversity and gain degradation has been investigated in relatively few investigations. The significance of dynamic stability is discussed and recent experiments of special importance are reviewed in relation to those results which are especially relevant to the physical nature of layer structure and theories of turbulence. REFLECTIONS FROM ELEVATED LAYERS IN TRANSHORIZON RADIO PROPAGATION

Gordon D. Thayer *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb 1971 14 p refs (See N71-21409 10-07)

Avail: NTIS

Computations of the power reflection coefficient R for some tropospheric elevated layers observed with radio refractometers show that the mean R varies fluctuation values from the chi to the minus 1 power dependence with standard deviations of from 3 to 14 db depend on the degree of smoothness assumed in predicting a scatter in the wavelength dependence as obtained from scaled frequency-diversity transhorizon radio experiments. The mean wavelength dependence derived from the chi to the minus 1 power model and the exact value depend on assumptions about the horizontal dimensions of individual layers compared with the size of the Fresnel zones. Published results indicate that the atmosphere consists of a mixture of large and medium layers. The randomness of the chi-dependence of real tropospheric layers makes it difficult to separate layer and turbulence mechanisms in radio propagation experiments. Author

PROPAGATION OF AN ELECTROMAGNETIC PULSE IN A DUCT BETWEEN GROUND AND ATMOSPHERIC LAYER

K. J. Langenberg *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb 1971 13 p refs (See N71-21409 10-07)

Avail: NTIS

The influence exerted onto an electromagnetic pulse by an atmospheric surface duct is studied based on a duct model consisting of a layer of relative permittivity overlying an infinitely conducting plane earth. At the height h this permittivity decreases discontinuously to the value epsilon sub 2. The source of the electromagnetic field is assumed to be a vertical magnetic dipole above the surface of the earth with arbitrary time varying moment. The application of a Hankel transform of zero order leads to an integral representation of the Fitzgerald vector in the imaging space of a Fourier transform describing the received signal at some point in a cylindrical coordinate system. The Fourier reverse transform of the modal expansion is calculated approximately by the method of stationary phase giving a clear picture of the characteristics of an incoming signal with the aid of the group velocity concept. PROPAGATION, 16 GHz AND 17 GHz, ON A TRANSHORIZON PATH OVER SEA

H. Jeske *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb 1971 10 p refs (See N71-21409 10-07)

Avail: NTIS

Transmission measurements were carried out on transhorizon paths over sea at wave lengths of 1.8 cm and 4.4 cm. During the experiments the radio field strengths and the meteorological data for the determination of the propagation properties were recorded simultaneously. The dominating feature of C band propagation over sea is ducting by a permanently existing low level evaporation duct. The theoretical and experimental dependence of field strength on the thickness of this evaporation duct is discussed. The duct mechanism is clearly identified. Only occassionally (in about 15% of time) the stratification of higher layers becomes predominant. Author

DUCT INFLUENCES ON LINE OF SIGHT PROPAGATION

H. W. Fruechtenicht *In* AGARD Tropospheric Radio Wave Propagation, Pt. 1 Feb 1971 9 p (See N71-21409 10-07)

Avail: NTIS

The influence of surface ducts on line-of-sight propagation of electromagnetic waves is investigated by model calculations. The theoretical considerations are based on ray-tracing techniques. A linear, parabolic, and a logarithmic profile as well as a two-layer-model and a three-layer model are employed to calculate the total field. Obviously only the beam reflected at the surface of the earth gives rise to a concentration of the electromagnetic energy inside a tube-like structure near the ground. The existence of the surface duct however is by no means sufficient for the development of the focusing effect. The surface of the earth is necessary as additional reflector. The theoretical dependence of the signal strength on the duct thickness according to a three layer model corresponds with the experiment. Author

BEYOND THE HORIZON PROPAGATION OVER SEA AT 170 AND 5000 MHz

F. Eklund, A. Blomquist and L. Nilsson *In* AGARD Tropospheric Radio Wave Propagation, Pat. 1 Feb 1971 6 p (See N71-21409 10-07)

Avail: NTIS

Investigations of anomalous propagation have been made at 170 and 5000 MHz over a sea path in the Baltic area of such a length that the receiving antennas were well beyond the radio horizon. The received signals are separated into the following types: standard atmosphere signals (tropospheric scatter signal), stable and not stable signals caused by ducting or reflections in

elevated layers. A comparison of the occurrence of different signal types as a function of the time of the year is given. The signals at 170 and 5000 MHz are often noncorrelated, which indicates that the propagation is governed by different mechanisms. The conclusion is drawn that, with regard to propagation forecasting, it is of special importance not only to predict the occurrence of elevated layers but also their effects at different frequencies. TROPOSPHERIC INFLUENCE UPON DIFFRACTION PATHS
A. T. Waterman, Jr. *In* AGARD Tropospheric Radio Wave Propagation. Pt. 1 Feb 1971 6 p refs (See N71-21409 10-07)
Avail: NTIS

Two characteristics of diffraction paths are emphasized as criteria for distinguishing them from other propagation paths: the presence of a physical obstacle obstructing the line of sight between transmitter and receiver, and the relatively slow fluctuation rate evident in the received signal. The troposphere affects signal characteristics in a variety of ways, not all of which are distinct and separable. Tropospheric scatter is a competing effect; when conditions are right for it to predominate, the primary result is a marked increase in fading rate. Strongly refracting vertical gradients of refractive index effectively change the geometry of the path, making the apparent obstacle height greater or less, and shifting the regions illuminated by narrow beam antennas. Phase perturbations at the diffracting aperture influence the correlation between spaced antennas, and thus the optimum spacing for diversity reception. Author

Avail: NTIS

Variations of diffraction link characteristics are analyzed with respect to changes in relative effects of diffraction and scatter components and due to variable meteorological conditions. A basic signal analysis is undertaken and it is shown that the expected received signal consists of three components: a diffraction, a scatter, and a reflection component. Experimental data discussed deal with two main points: (1) an explanation of the variations of the average received basic signal level of this link, and (2) an interpretation of occasionally occuring fading. The variations of the average received basic level of this mixed link correlate very closely with the variations of the ground temperature. A seasonal and diurnal effect was observed. A good correlation was found between fading periods, the presence of upper or lower inversion layers, and special wind characteristics as defined by direction and velocity. Author

METHOD OF CALCULATING PROPAGATION OF ELECTROMAGNETIC WAVES IN AN INHOMOGENEOUS ATMOSPHERE ABOVE ROUGH GROUND
Klaus-Dieter Becker. *In* AGARD Tropospheric Radio Wave Propagation. Pt. 1 Feb 1971 10 p (See N71-21409 10-07)
Avail: NTIS

It is shown, that the perturbation method for calculating the influence of roughness of the earth on the propagation of electromagnetic waves is also applicable in the case of an inhomogeneous atmosphere. The method itself is described in two steps. The solutions of Maxwell's equations for an inhomogeneous atmosphere are found by a method which reduces the problem to the solution of two modified wave equations. These can be formally solved by the two-sided two dimensional Fourier transform. The transition conditions on the rough surface of the earth are fulfilled by making a Taylor's expansion for the total field in the rough surface and by taking in account the perturbation formulation for the total electromagnetic field. The new transition conditions and the radiation condition of Sommerfeld and Muller lead to a system of integral equations for the reflection and transmission coefficients of the disturbed electromagnetic field. The intermodulation noise during propagation of a combination hertzian beam at 6 GHz and a wideband (32 MHz) is evaluated statistically for duration and depth of fading in order to clarify the effects of these phenomena in analog and numerical modulation. Obtained measurements show that intermodulation noise at median power becomes negligible before one minute because of the developing thermal noise as soon as fading passes beyond 10 db; therefore the noise is not detected during qualitative analysis of the combined propagation. Duration of fading follows the normal logarithmic quadratic law independent of depth. Transl. by G.G.

COMPARISON OF TURBULENT LAYER MODELS AND HIGH RESOLUTION FORWARD SCATTER RESULTS
Uve H. W. Lammers and John W. B. Day (Commun. Res. Centre) *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971, 9 p refs (See N71-23451 12-07)
Avail: NTIS HC $6.00/MF $0.95

The theoretical resolution of a long range, scanning forward-scatter system has been studied assuming narrow layers of homogeneously turbulent refractivity for the tropospheric height range from 5 to 15 km. Tropospheric composition, as determined experimentally through high resolution mapping techniques within the same regime, is analyzed for its spatial and temporal significance. The results indicate that a horizontal orientation frequently exists in the upper tropospheric structure. However, this is not the general case. Based on the common volume resolution and the range of the troposphere monitored, layers have been found to extend from 20 to 100 km and in rare cases up to 200 km with vertical widths from the resolution limit (0.7 km) to several kilometers. On the average, the turbulent homogeneity of the scattering medium is spatially and temporally quite limited, particularly in the vertical direction. Author

OBSERVATIONS WITH SYNCHRONOUSLY OFFSET BEAMS ON A 77 km PATH AT 1.8 AND 4.4 cm
H. D. Seehars *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971, 10 p (See N71-23451 12-07)
Avail: NTIS HC $6.00/MF $0.95

Radio experiments on transhorizon links due to variations of the wavenumber vectors or displacements of the constant wavenumber vectors in space indicate the variations of the wavenumber spectrum. Results of these experiments on 1.8 and 4.4 cm wavelengths point to shapes of refractive index wavenumber spectra that show a strongly marked variance, but indicate a median value close to 11/3 corresponding to the theory of Megaw-Obukhov. The test of the homogeneity leads to an increase of the vertical and horizontal nonhomogeneity with decreasing wavelength. Experiments on 4.4 cm point to a vertical inhomogeneity of about 1 db/100 m. Isotropy tests applied have demonstrated that there exists a weak anisotropy of turbulence which is not dependent on the frequency. Author

A STUDY OF THE EFFECTS OF TROPOSPHERIC AIR MASS MOVEMENTS ON THE FADING CHARACTERISTICS OF UHF TRANSMISSION BY THE USE OF A LABORATORY MODEL
W. G. Burrows *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971, 16 p refs (See N71-23451 12-07)
Avail: NTIS HC $6.00/MF $0.95

Various types of fading characteristics, obtained from a non-optical U.H.F. link, are simulated in a simple laboratory model. The fading characteristics obtained from both the real full scale system and the model are described, for the purpose of comparison, by their power spectra. Results are given to show that, by comparing the air mass movements created in the laboratory model to produce a particular type of fading and those which might exist for the particular meteorological conditions under which similar fading characteristics were obtained for the real full scale system, surface wind velocity is a significant parameter. This result, together with the unusual observations of air mass movements in the model, suggests that near surface circulatory air mass movement along a tropospheric path can give rise to significant distortion to the shape of the transmitter beam. This leads to the conclusion that transhorizon propagation in the tropospheric medium may be attributed to the effective divergence of a beam due to air mass lenses distributed along a given path. METHODS OF DISTINGUISHING SCATTER AND PARTIAL REFLECTION AT TROPOSPHERIC TRANSHORIZON PATHS
L. Fehlhaber *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971, 14 p refs (See N71-23451 12-07)
Avail: NTIS HC $6.00/MF $0.95

Two distinct theories of tropospheric transhorizon propagation have been set up during the past years. Scattering by random refractivity fluctuations and partial reflection from layer-like structures. More recent investigations showed that both mechanisms exist simultaneously with varying share and that this share depends on frequency, distance, altitude of the layer and on the state of the troposphere. In order to investigate the problem, of the sharing of the two mechanisms, a simplified model of partial reflection has been derived, taking into account known tropospheric parameters. This model has been worked out numerically, and it has been found to agree well with empirical data. From the results it can be infered that partial reflection from finite patches of steep refractivity gradients prevails with frequencies up to 200 MHz. With the higher frequencies scattering seems to predominate at all path lengths except the very short ones. Author

OBSERVATIONS ON A 12 GHz SCATTER LINE OVER A 210 km PATH
N. Abel *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971, 9 p refs (See N71-23451 12-07)
Avail: NTIS HC $6.00/MF $0.95

Knowledge on transhorizon propagation at frequencies above 10 GHz is important in radiocommunications wherever transhorizon links are used or problems of interference between different radio systems must be solved. Some first results from about one year of observations on a 12 GHz link over a 210 km path are presented. In certain cases, signal types attributed to tropospheric scatter, partial reflections, or attenuation and scattering by precipitation are distinguished, although the exact share of these propagation effects was not yet determined. Tropospheric scatter by far prevails and thus determines the mean transmission loss relative to free space, which was found to agree well with predicted values and seems to be some decibels smaller than at 2 GHz on a similar link. A correlation exists between transmission loss and atmospheric temperature near the scattering volume. Author

ANGLE DIVERSITY APPLIED TO TROPOSPHERIC SCATTER SYSTEMS
M. W. Gough *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971, 16 p refs (See N71-23451 12-07)
Avail: NTIS HC $6.00, MF $0.95

The generation of substantially independent signal paths over a tropospheric scatter link by directing two or more narrow beams at different scattering regions in the troposphere makes an attractive alternative to space diversity. The above factors are discussed and evaluated with the aid of a published theoretical treatment of tropospheric scattering which is well supported by experiment, and careful consideration is given to the influence of

atmospheric layering. It is shown how the aggregated losses enumerated above may be minimized for a specified angle diversity system by correct choice of horn feed dimensions in relation to a conventional paraboloid reflector. Various two way angle diversity systems involving quadruple and six fold diversity are evaluated and their optimized performances are compared with that of a conventional space-frequency quadruple diversity system using four antennas per link of like size. DEPOLARIZATION OF DIPOLE RADIATION IN A MEDIUM WITH A STATISTICALLY HOMOGENEOUS AND ISOTROPIC DISTRIBUTION OF DIELECTRIC CONSTANT

W. Mohr. *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971. 10 p. refs. (See N71-23451 12-07.)

Avail: NTIS HC $6.00, MF $0.95

The solutions of the vector wave equation with a Hertzian dipole as source term are considered in a medium with statistically homogeneously and isotropically fluctuating permittivity. For the two limits wavelength much greater or much smaller than the correlation length of the fluctuations, the autocorrelation function of the depolarized part of the field is calculated by approximation methods. The limit of small wavelength is treated by the perturbation method; in the limit of great wavelength a renormalized dyadic Green's function is used to calculate the first term of the staircase approximation for the Bethe-Salpeter equation. The physical aspects of the formulas are discussed. Author

EFFECT OF VEGETATION UPON ANTENNA PATTERN WITH SCATTER PROPAGATION ON UHF

R. Zapp. *In* AGARD Tropospheric Radio Wave Propagation, Part 2, FEB 1971. 7 p. refs. (See N71-23451 12-07.)

Avail: NTIS HC $6.00, MF $0.95

The pattern of an antenna radiating with a small elevation angle as used in scatter propagation is disturbed by scattering of the field at the vegetation of the antenna's foreground. The vegetation can be regarded as a configuration of randomly distributed scatterers with random scattering properties. The irregular motion of the vegetation caused by wind leads to similar fading and depolarization of the transmitted field as known from tropospheric scatter propagation. The scatterers are described by their dielectric constants. Using the perturbation expansion series are derived for the average value of the field. The formalism regards the scattered field as a superposition of all the fields scattered from each scatterer of a fixed configuration. The concept of randomness requires averages to be taken over a statistical ensemble of scatterer configurations. Their multidimensional probability distribution is re-expressed in terms of the one-scatterer distributions so as to take account of coherent scattering. Author

SIGNAL DISTORTION AND INTERMODULATION WITH TROPOSPHERIC SCATTER

P. A. Bello, L. Ehrman, and P. Alexander. *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971. 18 p. refs. (See N71-23451 12-07.)

Avail: NTIS HC $6.00, MF $0.95

Multipath models used in the past for predicting the signal distorting properties of troposcatter links are reviewed. The fundamental importance of the delay power spectrum in predicting signal distortion is developed in some detail. Suggestions are given for improving multipath modeling by including beam bending and scintillation. The concept of beam broadening as producing increased multipath is shown to be erroneous. Some attention is given to relationships between multipath spread and path loss. Author

CORRELATION BANDWIDTH MEASUREMENTS OVER TROPOSCATTER PATHS

Richard A. Branham. *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971. 21 p. refs. (See N71-23451 12-07.)

(Contract DAAB07-69-C-0251.)

Avail: NTIS HC $6.00, MF $0.95

Propagation measurements were made over four troposcatter paths; simultaneous measurements of cross-correlation coefficient versus frequency from zero to 9 MHz were obtained at 4.62 and 7.6 GHz in increments of 1 MHz. The paths were operated cyclically for two to five week periods to obtain the effects of season, terrain, weather, and time of day. Specialty is covering 200 kHz frequency increments up to 800 kHz were also made. The signal strengths were recorded on magnetic tape and reduced in a digital computer to yield cross-correlation versus frequency, and distributions of fade durations, rates, signal amplitudes and fade depths. Emphasis is primarily placed on the cross correlation measurements. Author

CHARACTERIZATION OF TROPOSPHERIC SCATTER CHANNELS BY IMPULSE RESPONSE MEASUREMENT

G. C. Bailey. *In* AGARD Tropospheric Radio Wave Propagation, Part 2, Feb. 1971. 12 p. refs. (See N71-23451 12-07.)

Avail: NTIS HC $6.00, MF $0.95

A new experimental program for evaluating the transmission capabilities of the troposphere scatter medium is reported. A correlation type impulse response measurement system and a recently completed tropospheric scatter radio test link are described. Results of evaluation tests of the impulse response measurement system are presented in order to indicate its measurement capabilities and the type of information which can be obtained from it. Examples of experiments conducted on the troposcatter simulator and results from these experiments are given. Author

CALCULATING TROPOSCATTER INTERCHANNEL

DISTORTION USING A MONTE CARLO METHOD

A Wasiljeff *In* AGARD Tropospheric Radio Wave Propagation. Part 2 Feb 1971 10 p refs (See N71-23451 12-07)
(Contract T-01012)
Avail NTIS HC$6.00/MF$0.95

Multichannel signals are simulated by sets of randomly phased sinusoids uniformly spaced in frequency. The amplitudes of the sinusoids are set according to the prescribed preemphasis characteristic, some of them are set to zero to form the idle channels. The signal is transformed into the time domain with the aid of fast Fourier synthesis. This time signal is the modulation function for the transmitted electromagnetic field. The field which reaches the receiver after having been scattered by a troposphere volume is described with the help of an integral including the spatial Fourier transform of the autocorrelation function of the dielectric constant in the tropospheric scatter volume. Analytical performance of demodulation of the calculated field in the receiver yields the distorted time function. Again the fast Fourier transform is used to analyze this function. The power density in the channels which had been originally idle is a measure of interchannel distortion. The process is repeated with a sequence of random noise samples from each sample with a set of independent random phases. The distortion is averaged to obtain the desired solution. The results of the Monte Carlo method approach those obtained by measurements with Gaussian noise. Author

PROPAGATION CHARACTERISTICS OF TROPOSPHERIC SCATTER RADIO LINKS IN THE 5 GHz RANGE WITH RESPECT TO PATH LOSS PREDICTIONS

Klaus Radermacher and Guenther Rappallier *In* AGARD Tropospheric Radio Wave Propagation. Part 2 Feb 1971 10 p refs (See N71-23451 12-07)
Avail NTIS HC$6.00/MF$0.95

Planning of stationary and use of mobile tropospheric scatter systems require prediction methods of tropospheric scatter losses for links in air, climate. Prediction methods are considered as to their application and compared to the current state of knowledge in the field of tropospheric scatter propagation. Test results obtained by field testing a new mobile tropospheric scatter system, operating in the band about 4.5 GHz, on four paths are compared with predictions. The test results were apparently, at times, adversely affected by anomalous weather conditions. Frequency saving operation with quadruple space diversity using two polarizations is possible. Author

SHORT TERM FORECAST OF SIGNAL BEHAVIOUR WITH TROPOSPHERIC SCATTER LINKS

D E Marquart *In* AGARD Tropospheric Radio Wave Propagation. Part 2 Feb 1971 49 p refs (See N71-23451 12-07)
Avail NTIS HC$6.00/MF$0.95

Forecasts of signal attenuation with tropospheric scatter links by means of meteorological values have shown that considerable increases of signal attenuation correlate with the passage of cold fronts through the scatter volume and that the intensity of this signal decrease is related to the age of the front. Considered is the present state of research work with particular attention on the interpretation of correlation results. A detailed comparison between predicted and observed signal behavior is presented. In addition, signal enhancements and their possible forecasts on the basis of the occurrence probability of super-refraction layers is dealt with. Other parameters determining general signal behavior are also treated. Author

PREDICTION OF TROPOSPHERIC RADIO TRANSMISSION LOSS OVER IRREGULAR TERRAIN

A G Longley and P L Rice *In* AGARD Tropospheric Radio Wave Propagation. Part 2 Feb 1971 8 p refs (See N71-23451 12-07)
Avail NTIS HC$6.00/MF$0.95

A method for calculating long term median radio transmission loss over irregular terrain at frequencies above 20 MHz is described. The model is particularly useful for area predictions of transmission loss as a function of distance, frequency, antenna heights, and terrain characteristics where individual path profiles are not known. Such predictions are needed for military communication and surveillance, for land mobile, broadcasting, and air-to-ground systems, and for calculating preliminary performance estimates for system design. The prediction model summarizes much of our present knowledge of tropospheric propagation theory and has been tested against measurements over a wide range of distances, for frequencies from 20 to 10 000 MHz, for terrain types ranging from smooth plains to rugged mountains, and with antenna heights ranging from very low to aircraft heights. STATISTICAL PROPAGATION MODEL FOR IRREGULAR TERRAIN PATHS BETWEEN TRANSPORTABLE AND MOBILE ANTENNAS

J P Murphy *In* AGARD Tropospheric Radio Wave Propagation. Part 2 Feb 1971 21 p refs (See N71-23451 12-07)
(Contract DAABO7-67-C-0104)
Avail NTIS HC$6.00/MF$0.95

A statistical model of tropospheric radio propagation loss that can be used by ground mobile radio communications systems

designers without the aid of a computer program is developed. Such a model provides a first order estimate of median values and standard deviation values of basic transmission loss for path over a particular type of terrain based on the assumption that path-to-path variability of basic transmission loss is close to that of a normal distribution in decibels. The method used to develop the model is closely related to the one used to develop the Egli model for radio propagation above 40 MHz over irregular terrain. The data used to develop the model have been measured on paths between antennas that are transportable and antennas that are mobile. The only independent parameters used are signal frequency, antenna heights and path distance. Author

THE STATE OF RADAR RANGE PREDICTION OVER SEA

H. Jeske. *In* AGARD Tropospheric Radio Wave Propagation Part 2 Feb. 1971 11 p refs (See N71-23451 12-07)

Avail: NTIS HC $6.00/MF $0.95

The methods of radar range prediction of marine cm radars are closely related to the boundary layer theory for the propagation conditions are governed by the low level evaporation duct in 85% of time. Over a wide range of atmospheric stability the logarithmic profile with a stability-dependent profile coefficient yields a good correlation between radio field strength and duct thickness. For strong deviations from the neutral equilibrium however more complicated profile forms are employed. Author

AUTOMATIC PROCESSING OF ARCTIC PACK ICE DATA OBTAINED BY MEANS OF SUBMARINE SONAR AND OTHER REMOTE SENSING TECHNIQUES

Leonard A. LeSchack, William D. Hibler, III (Army Cold Reg. Res. and Eng. Lab., Hanover, N. H.), and Frederick H. Morse (Maryland Univ., College Park). *In* AGARD Propagation Limitations in Remote Sensing Oct. 1971 19 p refs Original Contains Color Illustrations (See N72-16085 07-07)

(Contract N00014-70-C-0110; NR Proj. 307-322)

Avail: NTIS HC $6.00; MF $0.95

Three remote sensors have been used for examining the upper and under surface of the Arctic ice pack: an upward looking sonar mounted on a nuclear submarine transiting beneath the ice producing an under ice profile; a vertically mounted airborne laser producing an upper ice surface profile; and an airborne infrared scanner in the 8-14 micron range producing a heat picture of the ice surface. The sonar data were digitized and analyzed. Frequency distribution of amplitudes of the profile data indicates that young ice has a sharp, uni-modal distribution; older, more jumbled ice has a broad based uni-modal distribution; and old, much ridged ice has a bi-modal distribution. The same analytical techniques were used to process airborne laser profile data of pack ice. Analysis of profiles of multi-year ice and young ice show that the young ice has greater amplitude of all ridge spacings shorter than 20 m, than does the multi-year ice. Airborne infrared scanning imagery of pack ice was color contoured using a spatial data system. A simplified energy balance equation was used as a method to determine thickness of ice scanned. REMOTE PASSIVE MICROWAVE MEASUREMENTS OF THE SEA SURFACE
James P Hollinger *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 7 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

The important potential of all weather determination of ocean surface wind fields by means of remote passive microwave sensing is discussed The wind speed dependence of the microwave brightness temperature of the sea is interpreted as resulting primarily from small scale wave structure at wind speeds below about 15 to 20 m/sec and from the increasing coverage of sea foam at higher wind speeds Measurements of these two effects are presented and the characteristics of each described separately The two effects are combined to estimate the total microwave brightness temperature dependence of a wind driven sea as viewed from a satellite Taken together the two effects allow the determination of ocean surface wind fields over the entire range of wind speeds Author

REMOTE SENSING AND ATMOSPHERIC LAYERS
C. Fengler *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 8 p refs (See N72-16085 07-07)
Avail: NTIS HC $6.00/MF $0.95

Since absorption and scattering are well-known effects for the propagation limitations in remote sensing by electromagnetic waves refraction, reflection as well as ducting effected by atmospheric layers are considered. The reflection coefficient of Epstein profiles is treated in order to illustrate the effect of total reflection by grazing incidence. The deflection from a concentric layer of rays starting at the earth's surface and of rays coming from the outside of the earth is considered. The theoretical treatment is completed by presenting results of measurements of an earth - earth radio link as well as of a space - earth radio link evaluated under the aspect of the tropospheric layer structure.

ELECTROMAGNETIC SOUNDING OF ICE THICKNESS
C. R. Bentley and J. W. Clough *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 7 p refs (See N72-16085 07-07)
Avail: NTIS HC $6.00 MF $0.95

The efficiency of ice thickness determination in Antarctica and elsewhere has been vastly improved by the use of electromagnetic sounding. The electromagnetic sounder, which is basically a low frequency radar system is easily adapted to use in an aircraft and is capable of measuring thicknesses of ice as great as 4 km. Since pure ice has an extremely low conductivity, electromagnetic wave propagation at a frequency of around 35 MHz is essentially non-dispersive. Absorption takes place in close accordance with the high frequency tail of a Debye relaxation spectrum and is highly temperature dependent, the attenuation factor varying by 50-100 db/km over the range of temperatures (about 60 C) found in different glaciers. The attenuation in very cold ice is so small that it is substantially less than the normal spherical spreading loss. Losses occurring at the reflecting boundary are about 10-20 db for most earth materials, but may be more if the boundary is rough. At a sharp ice-sea water boundary, however, the reflection loss is only 0.5 db.

A MATHEMATICAL ANALYSIS OF THE PROPAGATION AND REFLECTION OF PLANE ELECTROMAGNETIC WAVES IN A NONHOMOGENEOUS ISOTROPIC MEDIUM
Richard A. Hevenor *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 9 p refs (See N72-16085 07-07)
Avail: NTIS HC $6.00 MF $0.95

Understanding of the propagation of electromagnetic waves in natural terrain surfaces can be aided by solving the vector wave equation for the case when the conductivity, the dielectric constant and the magnetic permeability are functions of soil depth. The problem to be analyzed is that of a nonhomogeneous half space where the conductivity and dielectric constant are arbitrary functions of depth. The basic approach employed is that of the geometrical optics solution of the wave equation. The final results yield expressions for the magnitude and phase of an electromagnetic field propagating in the nonhomogeneous medium for horizontal and vertical polarizations.

REMOTE SENSING OF TROPOSPHERIC STRUCTURES USING HIGH RESOLUTION RADAR
J. H. Richter, E. E. Gossard, and D. R. Jensen *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 13 p refs (See N72-16085 07-07)
Avail: NTIS HC $6.00/MF $0.95

A very sensitive, ultra high resolution radar has been developed for the purpose of studying the refractive index structure of the troposphere. The radar is a ground based, vertically pointing FM-CW radar with a range resolution of one meter. The radar and its performance characteristics are described. The radar routinely detects layer structures in the lower troposphere. These layers are always associated with gradients in the vertical refractive index profile, and are frequently very thin approaching the resolution of the radar. Very often they are perturbed by wave motions. Examples of various wave patterns are presented.

EFFECT OF BEAM WIDTH ON ACOUSTIC SIGNALS SCATTERED AT A ROUGH SURFACE
C. S. Clay and G. A. Sandness *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 8 p refs (See N72-16085 07-07)
Avail: NTIS HC $6.00 MF $0.95

Underwater acoustic experiments were made in a laboratory tank in which the signals were scattered at a wind-blown surface. The rms roughness and spatial correlation function of the surface were measured by wave height probes. The ratio of the mean rectified signal scattered at the rough surface and that reflected at the smooth surface was measured for vertical incidence. Even though the surface was rough the mean rectified signal was inversely proportional to the source-distance plus receiver-distance. At large roughness the reflection scattering function depends upon beam width and tends to the usual plane interface reflection function.

Correction procedures are described that provide real temperature data for a sea surface from infrared radiometric measurements. The primary error source is reflection of sky radiation from the surface; it is corrected by real measurements at sea level. The secondary error is caused by transmission through the air layer between the radiometer and the sea; it is corrected theoretically. Above described corrections provide absolute temperature values for the sea surface with an accuracy of about 0.1 degree. Transl by G.G.

FACTORS AFFECTING THE ACCURACY OF SEA SURFACE TEMPERATURE MEASUREMENTS FROM ITOS-SR DATA
J. Leese, W. Pichel, B. Goddard, and R. Brower *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 13 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

The improved TIROS satellite sensor package contains a two channel scanning radiometer which operates in the 5.2- to 7.3-micron visible range and the 10.5- to 12.5-micron infrared water vapor window. One of the primary applications of the IR data is the operational determination of global sea-surface temperatures. The objective is to make statistically-integrated measurements, over areas approximately 100 km on a side, which agree with ground truth measurements within a root-mean-square deviation no larger than 1 C. A quantitative error analysis of the ITOS system, combined with tests on real data, shows that the objective should be reached using only IR data in regions where the magnitude of the temperature gradient is less than 2 C per 100 km. In regions where the temperature gradients are 2 to 4 C per 100 km the inclusion of SR data from the visible channel to reduce cloud contamination errors should place the accuracy objective within accessible limits. ERBIUM LASER PROPAGATION IN A CO2 ATMOSPHERE IN THE NEAR INFRARED
Kenneth O. White, E. Howard Holt, Stuart A. Schleusener (New Mex. State Univ., Las Cruces), and Robert F. Calfee (NOAA, Boulder, Colo.) *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 5 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

The transmission of laser energy in a carbon dioxide atmosphere has been measured in the 1.54 micrometers spectral region. An erbium laser was used which had two output emission regions in the eye-safe realm of the spectrum. The CO2 sample was contained in a pressure and temperature controlled, 20 m, White cell. The monitor and transmitter laser pulses were detected by germanium photodiodes and recorded on a dual parameter pulse-height analyzer which provided a real-time indication of the transmission and the quality of the data. A spectral scan over the laser output was obtained by sending a portion of the laser beam through a 3.3 m grating spectrometer which was preset to a narrow spectral region within one of the two output regions of the laser. The spectrometer was scanned over the laser output and the transmission obtained as a function of wavelength. Data and theoretical calculations are presented for a 480 m path length, a temperature of 30 C, and a CO2 pressure of one atmosphere. Author

EFFECT OF ANGULAR VARIATION ON TERRAIN SPECTRAL REFLECTIVITY
Dwight D. Egbert and Fawwaz T. Ulaby *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 10 p refs (See N72-16085 07-07)
(Contract DAAK02-68-C-0089)
Avail NTIS HC $6.00/MF $0.95

A technique is described that determines the optimum filter combinations and the feasibility of multiband photography in the visible and near infrared regions in planning remote sensing missions. The test provides multispectral reflectivity curves not only for targets to be identified, but also for those backgrounds against which they are encountered. The procedure incorporates a method for determining spectral reflectance as a function of solar altitude, incidence look angle, and azimuth look angle. This angular dependence of reflectivity is significant and an aid in detecting certain targets. It was found that for one target-background pair (asphalt and grass) the contrast ratio ranges from 2.1 to 0.5.1 under different angle conditions. Author

THE USE OF COLOR AERIAL PHOTOGRAPHY IN THE RECONNAISSANCE OF SOILS AND ROCKS
Abraham Anson *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 10 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

A specialized interpretation of soils and rocks can be obtained from aerial photography in color. In using aerial color film, the three-layer emulsion presents a more readily understood spectral relationship than can be obtained from black-and-white film; the reconnaissance of inaccessible areas with their rock structures is more rapidly analyzed than solely by ground exploration. Geologists analyze soil conditions using 1:20,000 scale aerial color and infrared photographs together with sparse generalized ground information. Author

AN ANALYSIS OF MULTISPECTRAL IMAGERY FOR TROPICAL LAND USE DISCRIMINATION
Roland D. Mower *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 16 p refs (See N72-16085 07-07)
(Contract DI 14-08-0001-12077)
Avail NTIS HC $6.00/MF $0.95

Imagery data from a number of flight lines over Puerto Rico were analyzed to determine to what extent selected land use classes could be discriminated using conventional image interpretation techniques. The results were then compared with those obtained through use of a semi-automated densitometer/computer process. The semi-automated technique was also employed to determine which of the nine imagery channels (Ektachrome blue, green, red, and IR, multiband blue, green, red, and IR, and IR scanner) provides the best discrimination for each of the land use classes considered. A number of tentative conclusions were made regarding the relative performance of the imagery channels tested. Author

SEA BRIGHTNESS TEMPERATURES AT MICROWAVE FREQUENCIES

R J Wagner and P J Lynch *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 16 p refs (See N72-16085 07-07)
Avail NTIS HC $8.00/MF $0.95

A complete geometrical optics theory of rough-surface emission and scattering is developed which accounts explicitly for surface shadowing effects and the contributions of double-scattered radiation. The validity of the emission theory is tested by comparing the results with a case for which the exact solution is known. A theorem is proved which establishes, for the domain of geometrical optics, the existence of rigorous upper and lower bounds to the effects of surface roughness on brightness temperatures. The Peake representation yields the upper bound provided shadow corrections, at least, are included, while an alternative representation provides the lower bound. Microwave brightness temperatures for the sea are calculated for a cylindrical roughness model. Double scatter contributions are shown to be appreciable and, with their inclusion, accurate calculation of brightness temperatures is possible. A model for a wind driven spray layer is integrated into the theory and semi-empirical corrections for foam added, the results agree well with rough-sea data. Author

STATISTICAL METHODS OF INDIRECT PROBING OF THE ATMOSPHERE
V J Falcone, Jr and K Mano *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 5 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

Three statistical methods for inversion of the radiative transfer equation (or any Fredholm integral equation of the first kind) are examined. For the microwave region of the electromagnetic spectrum the unknown function to be determined under the integral of the radiative transfer equation is the atmospheric temperature. Westwater and Strand determine the temperature profile by applying linear estimation theory. Tikhonov on the other hand assumes a smoothing functional which is minimized by the Euler Lagrange equation. These two methods are shown to be equivalent when appropriate identification of terms is made, and where the regularization term of the smoothing functional is a linear differential operator. This equivalence is shown by use of Bayes estimation which is equivalent to the linear estimation theory and in which the same functional form as the smoothing functional is minimized. Author

IMAGE ANALYSIS BY MULTIPLEX CODING
Andre Girard *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 15 p refs In FRENCH ENGLISH summary (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

An incoherent radiation distribution is analyzed by means of a system whose radiation transducer is a flux detector receiving incoming signals in a coded form. The coding presents the characters of a multiplex method. It assures the optimum use of the available time to analyze the distribution under study, as the flux detector receives during the whole analysis time the radiation issued from all the elements of the space function. A gain in the signal/noise ratio is thus obtained as compared to direct analysis methods. The spectral range considered is in the infrared region. According to the first experimental results obtained the use of pseudo random binary cyclic codes seems the best in view of the practical advantages they offer. Author

AN APPLICATION OF THE MONTE CARLO METHOD TO REMOTE SENSING SYSTEMS
J Roettger *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 10 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

The reliability of remote sensing systems, making use of electromagnetic wave propagation, is considerably influenced by propagation limitations due to the varying refractive index of the passed and sensed medium. Monte-Carlo-calculations, simulating an experiment by statistical computer mathematics, are carried out for ionospheric off-great-circle propagation on the transequatorial radio path Lindau/West Germany - Tsumeb South West Africa. These calculations yield information about the error probability and reliability concerning the determination of sidereflection areas in the equatorial zone, using probability distributions of the parameters of ionospheric wave propagation. Statistical tests prove that the results, computed from remote measured data by means of a Monte Carlo technique, agree sufficiently well with direct measurements at the equator. Author

TURBULENCE AND REFRACTIVITY CHANGES AND THEIR SENSING BASED UPON THE WAVE MECHANICS THEORY
M Z V Krzywoblocki *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 10 p refs (See N72-16085 07-07)
Avail NTIS HC $6.00/MF $0.95

Some methods of the quantum field theory in statistical physics are applied to a Bose type of medium fluid. The application of the wave mechanics theory to a spatial domain in a turbulent field is outlined and the propagation of waves in a turbulent medium is formulated by the Tatarski method. This is accompanied by a discussion of wave scattering in the turbulent atmosphere as well as of the influence of the turbulent field upon the magnitude and the variation of the refractive index for radio waves. Successful application of the concept of remote sensing to the status of atmospheric turbulence and refractivity variations is shown. Author

The two scale composite rough surface model usually considered is one made up of large undulations over which small irregularities are superimposed. This general model may be further subdivided into two other models: (1) the large undulations are large in dimension than that of the illuminated area so that within the beam of illumination the picture is a tilted perturbed plane; and (2) the large undulations are of such a size that at least several undulations can be found within the beam. The first model is essentially the small perturbation model. The second model is much more complicated: the contribution from the small irregularities may be computed by summing powers from the large facets constituting the large undulations. The total contribution from the composite surface is then taken to be that from the large undulations plus that from the small irregularities averaged over the large undulations. If the non-coherent assumption is not made, the total scattered field from the illuminated area must be computed before evaluating the power. This is the approach adopted by this paper to calculate both the vertically and horizontally polarized scattering coefficients. Author

THE IDENTIFICATION OF INHOMOGENEOUS MEDIA FROM TRANSIENT DIFFUSION OF ELECTROMAGNETIC FIELDS

J N Towle *In* AGARD Propagation Limitations in Remote Sensing Oct 1971 9 p refs (See 16085 07-07)
(Grants NSF GK-2311 NSF GK-21218)
Avail NTIS HC $6.00/MF $0.95

For the purposes of magneto-telluric exploration the penetration of electromagnetic energy into the conducting strata presented by the earth's crust may be described by the parabolic equation of diffusion with a spatially dependent coefficient. A difference-differential solution to this equation is implemented on a hybrid computer and the resulting time dependent solutions are studied. Boundary conditions of the Neumann type, corresponding to the specification of magnetic field on the boundary, are appropriate for the determination of electric field in the conducting medium. The additional boundary conditions imposed by specification of electric field on the boundary provides the necessary information for the synthesis of a previously unknown conductivity profile. MORPHOLOGY OF RADIO-RADAR POLAR PROPAGATION EFFECTS
T. R. Hartz *In* AGARD Radar Propagation in the Arctic Jan. 1972 18 p refs (See N72-21121 12-07)
Avail NTIS HC $6.00/MF $0.95

A variety of observational data are reviewed for the polar upper atmosphere, and particularly for morphological patterns deduced for particle precipitation associated with auroral phenomena and with polar cap disturbances. The significance of different portions of such patterns are discussed with reference to particle energies, sources, and ionospheric changes during disturbed intervals. Statistical data are given on the diurnal, seasonal, and spatial variation of such associated propagation effects as absorption, scintillation, dispersion etc., along with their correlation with magnetic activity, spread F, sporadic E, visual aurora, and radio noise observations. In addition, the storm time variation of some of these phenomena are discussed from the point of view of their short term effects on radio wave propagation. Author

THE POLAR EXOSPHERIC PLASMA
J. O. Thomas and A. D. R. Phelps *In* AGARD Radar Propagation in the Arctic Jan. 1972 11 p refs (See N72-21121 12-07)
Avail NTIS HC $6.00/MF $0.95

The main features of the spatial distribution of plasma in the earth's polar exosphere deduced from satellite observations are described and related to recent measurements of incoming particles of magnetospheric origin, particularly in the low energy range (about 1000 eV). The topics include: (1) the termination of the terrestrial plasmasphere, (2) the identification and location of a ring or torus of enhanced plasma density surrounding each pole stationary with respect to the sun, and under which the earth rotates, (3) the geomagnetic control of ionization, with the recognition of effects occurring at certain universal times associated with the geometry of the geomagnetic axis earth-sun line system; and (4) the polar wind. Some of the main physical processes contributing to both static as well as dynamic features of the overall structure of the polar plasma distribution are introduced. Author

A DISCUSSION OF ARCTIC IONOGRAMS
R. A. Wagner and C. P. Pike *In* AGARD Radar Propagation in the Arctic Jan. 1972 20 p refs (See N72-21121 12-07)
Avail NTIS HC $6.00/MF $0.95

Examples of Arctic ionogram sequences, recorded on the AFCRL flying ionospheric laboratory, are presented. It is shown that: (1) ionogram sequences facilitate the interpretation of oblique incidence echoes from E and F layer heights. (2) Parameters of the Arctic ionosphere can be mapped by using the auroral oval as an ordering system. (3) Vertical and oblique incidence echoes appearing on ground station ionograms can be interpreted in terms of the station's position relative to the auroral oval. The analysis of a three-hour flight with six latitudinal scans underneath an aurora showed the close relationship between auroral-type spor[illegible] echoes and discrete auroras. The investigation of 49 latit[illegible]cans through the auroral oval during times of low mag[illegible]ctivity revealed the existence of a particle-produced E layer which is oval-aligned, is 2 to 6 deg wide in corrected geomagnetic latitude, and occurs at all corrected geomagnetic times. This layer produces the night E layer. An ionogram analysis procedure which uses oblique incidence F layer echoes is demonstrated, and the feasibility is suggested of monitoring the latitude of the southern edge of the polar F layer irregularity zone by using this technique. Author

POLAR PROPAGATION EFFECTS ON VHF-UHF RADARS
Walter G. Chestnut *In* AGARD Radar Propagation in the Arctic Jan. 1972 38 p refs (See N72-21121 12-07)
Avail NTIS HC $6.00/MF $0.95

The effects upon VHF-UHF radar which are considered are wave distortions caused by wave interaction with E and F region auroral ionization, including auroral backscatter (auroral clutter) and forward scatter that leads to amplitude and angle scintillation. Recent results of pulse-radar-backscatter studies from aurora are reviewed and theories of irregularity production are considered. Aurorally produced radar tracking and amplitude scintillation are discussed. Some results from aurorally disturbed monopulse tracking of satellites are presented. Author

OBSERVATIONS OF 46 MHz AURORAL RADAR PROPAGATION ON A NETWORK IN THE AURORAL ZONE

A. G. McNamara *In* AGARD Radar Propagation in the Arctic Jan. 1972 8 p refs (See N72-21121 12-07)

Avail: NTIS HC $6.00/MF $0.95

Four auroral radars are operated on a continuous basis at Ottawa, Thompson, Churchill, and Great Whale in Canada. The Ottawa radar is at 40 deg latitude and the other three are at approximately 57 deg in the auroral zone. The high incidence of auroral activity at these locations permits both statistical and detailed single event studies of radio aurora morphology and scattering mechanisms. In spite of magnetic aspect control, strong auroral backscatter signals are detected at all azimuths with aspect angles of up to 25 deg from the magnetic perpendicular. These observations create difficulties in explaining radar aurora in terms of ion acoustic waves developed from linear models such as the two-stream instability theory. As well as direct auroral backscatter, the radars sometimes detect sporadic E propagated ground scatter, usually in association with auroral disturbance. The simultaneous observations of these auroral phenomena by the multiple stations permit more definitive measurements of the processes involved. Author

AURORAL RADAR BACKSCATTER STUDIES FROM HOMER, ALASKA

W. G. Chestnut, J. C. Hodges, and R. L. Leadabrand *In* AGARD Radar Propagation in the Arctic Jan. 1972 11 p refs Sponsored in part by DASA, NSF, and RADC (See N72-21121 12-07)

Avail: NTIS HC $6.00/MF $0.95

Radar aurora were studied using a backscatter radar at six frequencies from 50 MHz to 3000 MHz. It was found that the frequency dependence of the volume scattering cross section of the auroral echoes is nearly exponential with frequency. The slope of this frequency dependence was found to vary with time but averaged 33 db per 1000 MHz. The magnetic aspect sensitivity was found to be nearly independent of frequency; the scattering cross section decreased by about 10 db per degree of aspect angle. Auroral radar echoes at a frequency of 139 MHz were compared with the location of particle precipitation as measured during fourteen passes of the OV1-18 satellite. It is found that, except for periods of very active aurora, nighttime radar aurora was never collocated with peaks in proton energy flux. Where a radar aurora was located, measured particle precipitation fluxes were adequate to produce equilibrium E region electron densities greater than 70,000 el/cc. Thus E region electron densities necessary for radar auroras seem to be produced by precipitating particles. Author

SOME PROPERTIES OF RADAR AURORAL ECHOES AS OBSERVED AT A FREQUENCY OF 1295 MHz

T. Hagfors *In* AGARD Radar Propagation in the Arctic Jan. 1972 16 p refs (See N72-21121 12-07)

Avail: NTIS HC $6.00/MF $0.95

Observations are described of radar auroras made at a frequency of 1295 MHz from Millstone Hill, Massachusetts. From maps of power returned versus azimuth, elevation angle, and range of specific events of diffuse aurora, it was found that a mean height of auroral echoes is close to 110 km, that the half power thickness is 7 km, and that the power scattered drops 3 db when the aspect angle with respect to the magnetic field is increased from zero to 0.4 deg. Spectral analysis of echoes returned from a volume of 10 x 10 x 10 cu km with a resolution of 600 Hz reveals a great variety of spectra, many of which are narrow and displaced as if from an ion-acoustic density instability. Other spectra are wide and contain contributions from approaching and receding waves simultaneously. The wide spectra apparently are associated with regions where the radar beam is normal to the electrojet current. Simultaneous observations of auroral echoes and particle precipitation show that radio auroras may be observed without any measurable electron precipitation. Author

ION-ACOUSTIC WAVES IN AURORA

P. A. Forsyth and G. F. Lyon *In* AGARD Radar Propagation in the Arctic Jan. 1972 5 p refs (See N72-21121 12-07)

Avail: NTIS HC $6.00/MF $0.95

Evidence is presented that ion-acoustic waves exist in the auroral plasma and that these waves contribute to the scattering of radio waves at both VHF and UHF frequencies. Recent results suggest that this kind of clutter will be observed even at latitudes where the line-of-sight may not be perpendicular to the magnetic field lines. It is also suggested that ion-acoustic waves may contribute to the angular scintillations observed at high latitudes for transionospheric propagation paths using UHF radio waves. Author

POLARIZATION OF WAVES SCATTERED FROM AURORA

A. Kavadas *In* AGARD Radar Propagation in the Arctic Jan. 1972 13 p refs (See N72-21121 12-07)

Avail: NTIS HC $6.00/MF $0.95

Various interactions which lead to depolarization and cross-polarization are examined and correlated to particular types of aurora and properties of the scattering medium. Experimental results obtained from complete polarization measurements are used to demonstrate the nature of these interactions and the resulting changes in the polarization of the propagating wave. The experimental results were obtained with a time-sharing polarimeter which recorded six orthogonal components of aurorally backscattered waves at 42 MHz. Waves scattered in the forward direction were studied with partial polarization measurements (two orthogonal components) of radio star scintillations. The polarization of the received wave correlates with magnetic activity. Author

NONSPECULAR IONOSPHERIC CLUTTER IN THE VHF AND UHF BANDS
G. N. Taylor *In* AGARD Radar Propagation in the Arctic Jan. 1972 9 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

The intensity of weak scattering from electron density irregularities in the high latitude ionosphere, in directions not perpendicular to the magnetic field is considered. Signals may cause clutter in sensitive radar systems at wavelengths between 10m and 0.1m. The literature is surveyed, to obtain typical and worst case values of the rms density deviation and scale size of the irregularities, and to select appropriate spatial autocorrelation functions. Assuming an isotropic distribution, scattering cross sections are calculated. It is concluded that nonspecular clutter is not likely to be more intense than the background incoherent (Thomson) scatter signals at wavelengths less than about 4m, unless the acf becomes markedly non-Gaussian. The spatial variability and spectral characteristics of incoherent and nonspecular clutter signals are discussed briefly. Author

N72-21135# Battelle Memorial Inst., Columbus, Ohio
A PROGRAM FOR THE INVESTIGATION AND SIMULATION OF AURORAL INSTABILITY MECHANISMS
J. T. Coleman *In* AGARD Radar Propagation in the Arctic Jan. 1972 11 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

A program is described for the simulation and analytical investigation of the scattering mechanisms of the radio aurora. The program is divided into two parts: the first is a simulation, on a scaled basis, of the important plasma mechanisms of the E region and its scattering conditions, and the second is a computation of the theoretical coherent interaction instability cross sections. Experimental evidence is presented for sensitivity of the coherent cross section to the drift current level, the local electron temperature, the local magnetic field intensity, gradients, and other parameters. The theoretical model estimates the differential radar cross section (in the hydrodynamic approximation) and includes the effects of relative drift between ions and electrons, and the gradient in electron density. In its present form, the model includes forward scatter, backscatter, and general bistatic scatter. The computation includes the frequency spectrum introduced by interaction with wave instabilities.

PHASE COHERENT HF RADAR OBSERVATIONS OF BARIUM RELEASES IN THE ARCTIC IONOSPHERE
G. D. Thome *In* AGARD Radar Propagation in the Arctic Jan. 1972 6 p ref (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

Radar observations are reported which show that the development of optical striations is accompanied by an abrupt broadening of the Doppler spectrum, leading to returns with Doppler widths comparable to those observed from the natural radio aurora. In contrast to the natural ionosphere, the barium plasma is generated at a known instant of time and is confined to a limited volume of space. This makes it possible to study the evolution of irregularities in this plasma as a function of time and to study their radar aspect sensitivity without using narrow beam antennas. Prior to optical striation development, the barium cloud behaves as a smooth overdense target, exhibiting a discrete Doppler spectrum and producing regular Faraday fading. After the development of striations, the Doppler spectrum becomes diffuse and Faraday fading is lost. Author

Polar observations from Spitzbergen show a trough or decrease in scintillation index, on the night side between an oval and a polar region. Using radio star data at 113 and 228 MHz, scintillation index increases of 0.50 to 7 were noted with increases in K index (propagation path intersection through the F layer (350 km) at 67 deg). Recordings of 136 MHz satellite signals from Narssarssuaq, Greenland also show that mean scintillation index increases during magnetic storms within the irregularity region. Thule observations of 40 MHz transmissions indicate the overhead pattern at invariant latitudes near 86 deg. A model is presented of a core of high electron density irregularities, probably centered above the auroral oval, but with a high occurrence of irregularities over the polar cap. In addition, the irregularity region at lower intensity extends below the oval at night. Author

ANGULAR DEVIATION OF RADIO WAVES
G. F. Lyon and P. A. Forsyth *In* AGARD Radar Propagation in the Arctic Jan. 1972 5 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

Angular deviations due to typical departures from horizontal stratification are modelled. In particular, the steep gradients and troughs in electron density typical of the polar ionosphere are considered. The results suggest that systems which depend upon precise measurements of angle of arrival for radio waves in the frequency range at least to the upper end of the VHF range may be subject to significant unavoidable error. HIGH LATITUDE SATELLITE SCINTILLATION
J. Frihagen and O. Bratteng (Auroral Obs., Tromsoe, Norway) *In* AGARD Radar Propagation in the Arctic Jan. 1972 8 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

Numerous measurements of the height of ionospheric irregularities giving rise to satellite scintillation have shown them to be located in the region 300-600 km above the ground. Observations show that there is no appreciable reduction in scintillation at 136 MHz when a satellite loses height from in excess of 1000 km to less than 300 km. When observed from Tromso (70 deg N) the mean scintillation depth at 136 MHz increases from south to north, increases with K, shows nighttime maxima and daytime minima. Some results of electron density from rockets launched from Andenes (69 deg N, 16 deg E) show strong irregularities, the electron density varying by up to 25% over a few tens of meters north of auroral forms. Over the auroral forms, the electron density varies smoothly. Author

SATELLITE SCINTILLATION BETWEEN 43 DEG AND 68 DEG NORTHERN LATITUDE FROM 1964 TO 1969

Gerd K. Hartmann *In* AGARD Radar Propagation in the Arctic Jan. 1972 12 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

Since November 1964 till May 1969 the radio signals from the beacon satellite Explorer 22 were continuously recorded at Lindau, for obtaining the ionospheric electron content from Faraday-effect- and dispersive-Doppler-effect measurements. The obtained amplitude and phase recordings were compared. When the root mean square phase deviation, during distortions, e.g. phase scintillation, was equal or greater 1 radian, fast amplitude scintillations that exceeded 6 dB amplitude variations were found. The narrow scintillation belt, which was observed between 50 deg and 60 deg northern geographic latitude consists of two independent sub-belts. It is suggested that the scintillation activity increases by a factor of 2 for weak scintillations and by a factor of 4 strong scintillations, when Kp exceeds 3c. A southward motion with increasing magnetic activity was observed. In summer the SOFM seems to be approximately 2 deg further north than in winter. Author

POLAR PROPAGATION EFFECTS ON HF RADARS
H. G. Moeller *In* AGARD Radar Propagation in the Arctic Jan. 1972 15 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

The CW and pulse transmission experiments in the auroral and subauroral region are reviewed. The phenomena that affect propagation are dispersion of F2 critical frequency and hence horizontal electron density gradients, field-aligned irregularities in the F2 and E region, auroral Es, and D region absorption. The variation of these phenomena in time and space and the correlation with magnetic activity are discussed. Following propagation, effects were observed due to these phenomena. Transmission paths transversing horizontal gradients of electron density become asymmetric which has to be taken into account in MUF calculations. Strong curtains of irregularities cause non-great-circle transmission. The NGR transmission may be advantageous if it results in a MUF enhancement, or in bypassing an area of enhanced absorption, it is disadvantageous as time delay of the received signals is increased. The enhancement is often observed by auroral Es. Author

FREQUENCY DISTORTION IN AURORAL HF PROPAGATION
J. S. Lomax *In* AGARD Radar Propagation in the Arctic Jan. 1972 12 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

The HF propagation in auroral regions results in greater frequency distortion of signals than that encountered at mid-latitudes. Observational data on the characteristics of this distortion as taken on a transauroral path between Palo Alto, California and Thule, Greenland are presented. Details of the frequency distortion are given in terms of measured power spectral densities, Doppler shifts, and the corresponding phase fluctuations. These quantities are in turn related to the temporal correlation function of the channel. Author

Measurements made on HF sky wave signals propagated over two high-latitude 2000 nmi paths terminating at a receiving site in central New York State are presented. Signal characteristics include propagation loss, spectral spreading, and temporal spreading as a function of signal bandwidth (either 7.7 kHz or 100 kHz). The transmitting sites were located at Thule, Greenland and Keflavik, Iceland so that HF propagation information could be collected on a path that was both in the polar cap region and in midlatitude, and on one that passes along and through the outer edge of the auroral oval. Oblique soundings were conducted over each path so that the mode(s) of propagation for the signal(s) measured could be determined. Analyses of the results obtained indicated that the spectral and temporal spreading are a very strong function of the mode of propagation, especially for signals transmitted over the Thule path. The data are depicted as a function of time of day to illustrate the diurnal variation of the parameters considered. Author

POLARIZATION EFFECTS ON SKY-WAVE PATHS AT HIGH LATITUDES
P. A. Bradley *In* AGARD Radar Propagation in the Arctic Jan. 1972 9 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

The principles involved in the determination of polarization coupling losses on sky-wave paths are briefly discussed. The way these losses depend on the limiting polarizations of the upgoing and downcoming waves at the bottom of the ionosphere are illustrated, and it is shown that at frequencies in excess of about 2 MHz simple expressions are available for these limiting polarizations which are independent of the form of the ionization profiles. Limiting polarizations and polarization coupling losses are functions of wave frequency and of ray-path directions with respect to the direction of the earth's magnetic field. At high latitudes, changes in the angle between the field and ray path directions lead to marked variations in polarization coupling losses for nearby paths. Sample calculations are presented for a range of conditions to illustrate single- and two-way path losses. The calculations include the case of two-hop paths where there are additional features associated with the change of polarization at ground reflection. The results show the importance of the optimum choice of aerial polarization. The way in which backscatter amplitude return patterns can be influenced by polarization effects is also illustrated. SPATIAL CORRELATION OF AURORAL RADIO ABSORPTION
K. Toman, R. J. Cormier, and J. J. Corbett *In* AGARD Radar Propagation in the Arctic Jan. 1972 9 p refs (See N72-21121 12-07)
(Contract F19628-70-C-0237)
Avail: NTIS HC $6.00/MF $0.95

The temporal behavior of auroral radio absorption was measured with riometers at medium and high latitude displays complex patterns which differ spatially. These differences may be limited to a time displacement of otherwise similar absorption patterns indicating a movement which could be interpreted in terms of a structured, locally enhanced, precipitating, energetic particle stream that moves over a geographic area. In order to assess numerically the spatial coherence of auroral radio absorption, a correlation study was undertaken of absorption patterns as recorded by more than eight riometer stations during five days of varying activity containing the magnetic storm of 18 April 1965. Using a day as the sample size, the results of this study provide a view of the spatial coherence of auroral absorption. Author

SWEEP FREQUENCY BACKSCATTER RADARS AS DETECTORS OF HIGH LATITUDE IONOSPHERIC PHENOMENA
Howard F. Bates *In* AGARD Radar Propagation in the Arctic Jan. 1972 9p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

Characteristics of irregularities causing high frequency scatter and propagation problems are examined, along with auroras producing these large and small scale irregularities. Auroral and nonauroral echoes were identified through high latitude, high frequency backscatter. Nonauroral echoes consist of F layer ground scatter, nonauroral sporadic E including E ground scatter, meteor echoes, and oblique spread F echoes. Auroral echoes were found to be caused by backscatter from both the E and F layers. J.A.M.

HIGH FREQUENCY BACKSCATTER OBSERVATIONS AT MEDIUM LATITUDES OF HIGH LATITUDE FIELD ALIGNED IRREGULARITIES
M. Crochet, D. Barreau, and J. C. deMaistre *In* AGARD Radar Propagation in the Arctic Jan. 1972 9 p refs In FRENCH; ENGLISH summary (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

Abnormal echoes ascribable to the presence of field aligned high latitude irregularities in the F layer were frequently observed from the Valensole station (44 deg N, 6 deg E), by means of decametric wave backscatter radar. A comparison of characteristic recordings with data collected simultaneously at the Lindau station (51 deg N, 10 deg E) where such echoes are regularly obtained reveals the influence of the station latitude on the observation of such phenomena. HF AURORAL BACKSCATTER AND THE SCINTILLATION BOUNDARY
Jules Aarons *In* AGARD Radar Propagation in the Arctic Jan. 1972 11 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

A 19 MHz backscatter unit was operated, and a series of measurements of radio star scintillations (30 to 228 MHz) and satellite beacon recordings (20 to 136 MHz) were made. A 50 MHz radar was added to the observing program. In a recent analysis of the dual frequency field aligned backscatter, a separation into E and F-layer returns was made. It was found that VHF auroral returns (from E-layer heights) were accompanied 49% of the time by HF returns. The two factors suggested to be responsible for the absence of a 1:1 correlation were probably absorption at HF and variations in antenna launch angle for the two systems. The HF auroral backscatter (E and F-layer heights) was accompanied only 11% of the time by VHF backscatter. During the 17 months of observation at low solar activity, the percentage of occurrence of 19 MHz field aligned scatter was 2%, of 50 MHz auroral scatter 0.5%. Author

FM/CW HF BACKSCATTER OBSERVATIONS OF RADIO AURORA
A. H. Katz *In* AGARD Radar Propagation in the Arctic Jan. 1972 8 p refs (See N72-21121 12-07)
(Contract F30602-70-C-0086)
Avail: NTIS HC $6.00/MF $0.95

Observations of HF backscatter from radio aurora using an FM/CW radar located at field sites near Rome, N. Y. (43.2 deg N, 75.5 deg W) are discussed. Both wideband (at 6.5-30 MHz, 3 kW average power) and narrowband (fixed frequency soundings at 20 kW average power) backscatter measurements were made. The wideband soundings determine the modes of propagation, frequency extents, and time delays of the backscattered energy. The high resolution narrowband soundings indicate the movements that occur in the radio auroral regions. Examples of these motions are presented, showing events that last for 5 minutes, exhibiting range changes which imply apparent velocities near or above the speed of sound at F-region heights. The wideband backscatter measurements were processed in a form which allows the absolute signal level of the backscattered energy to be determined. Author

A MODEL FOR THE STUDY AND PREDICTION OF AURORAL EFFECTS ON HF RADAR
Vaughn Agy *In* AGARD Radar Propagation in the Arctic Jan. 1972 10 p refs (See N72-21121 12-07)
Avail: NTIS HC $6.00/MF $0.95

A description is given of an ionospheric propagation model and its application to high latitude HF radar propagation. Computer simulation of the model makes possible the rapid determination of the area of (1-hop) coverage, and computation of auroral absorption and geometrical features of auroral clutter. The results are presented in a map on which are shown appropriate parameter contours. Operating frequency, station location, time, month, sunspot number, and clutter height are all arbitrary. The explicit approximations specifying the model can be changed within the basic framework of the computer program to bring about better agreement with observations. Author

COMPUTER AIDED EVALUATION OF RECONNAISSANCE IMAGE COMPRESSION SCHEMES USING AN ON-LINE INTERACTIVE FACILITY
J. C. Mott-Smith, F. H. Cook, and J. M. Knight (Mitre Corp., Bedford, Mass.) *In* AGARD Aerospace Telecommun. Systems Aug. 1972 20 p refs (For availability see N73-10187 01-07) (Contract F19628-71-C-0002)

A method is proposed of evaluating compression algorithms applied to pictures and applied to several well-known techniques, most of which already have one or more hardware implementations. General conclusions are that delta modulation and differential pulse code modulation which use three or fewer bits per picture element are detrimental, and that the zero- and first-order predictors may give some compression but certainly less than a factor of two on the average. The defects in the algorithms which limit their usefulness on pictorial data is identified with their poor correlation from one line of the picture to the next. The importance of proper data management for pictorial communication is illustrated, and by implication, shown to be much more important than the data compression algorithms. Relevant to the data management proposals, some methods of improving the cosmetic quality of sparsely sampled images are shown. Author

ON THE EFFICIENT BANDWIDTH UTILIZATION IN DIGITAL TRANSMISSION
S. Benedetto, V. Castellani, C. Cianci (Centro Studi e Laboratori Telecomunicazioni), and U. Mazzei (Studi e Laboratori Telecomunicazioni) *In* AGARD Aerospace Telecommun. Systems Aug. 1972 13 p refs (For availability see N73-10187 01-07)

The problem of the efficient bandwidth utilization of a digital transmission channel is investigated by working out a complete example with a rather realistic channel model. The bandwidth efficiency in digital transmission is contrasted by the channel distortion impairments. A useful shaping of the signal spectrum and the use of a transversal equalizer are analyzed. Multilevel SSB amplitude modulated signals are assumed. System performances are discussed and evaluated using two different criteria: the peak distortion of the received signal and the average error probability of the received sequence. A general description of the different parts of the system is first given and a detailed discussion of the evaluation procedures is presented. Results are given for PAM and partial response coded (PRC) signalling schemes. System evaluation is finally discussed in terms of bandwidth efficiency. Author

The principles of the multiplexing numerical system and the transmission methods utilized are given. An organizational air navigation control system is illustrated. Transl. by E.H.W.

N73-10195 Texas Instruments, Inc., Dallas
SYNTHESIS AND EVALUATION OF AN OPTIMUM SAMPLED DATA FM DEMODULATOR
Alan L. McBride *In* AGARD Aerospace Telecommun. Systems Aug. 1972 11 p refs (For availability see N73-10187 01-07) (Contract F30602-70-C-0180)

A digitalized or sampled-data FM demodulator recursive algorithm is synthesized and its signal-to-noise ratio performance evaluated. A recursive estimator is derived that optimally estimates the message of a noisy sampled FM process. The incoming analog noisy FM process is in-phase and quadrature sampled to reduce the bandpass RF waveform to a sampled baseband process.

The modulating process is modeled as a discrete linear filter by state variable techniques. The maximum a posterion (MAP) criterion is used to develop a recursive cost function. Minimization techniques used in optimal control theory are employed to derive the two-point boundary-value (TPBV) problem from this cost-function. Discrete invariant imbedding is then used to solve the TPBV problem and obtain the recursive solution algorithm. A single-pole message filter example is reviewed. Discussed in this example are performance curves obtained by simulation of the inverse output mean-square error versus input carrier-to-noise ratio. The demodulator is shown to exhibit FM threshold extension capability. Author

ADAPTIVE PRE-WHITENING FILTER
R. Klemm *In* AGARD Aerospace Telecommun. Systems Aug. 1972 7 p refs (For availability see N73-10187 01-07)

Some methods are shown for calculating the optimal linear pre-whitening filter function from real time computed correlation functions. The problem is due to the optimal detection of target signals in correlated noise in radar technique. In principle the received data are multiplied with the inverse of the correlation matrix of the noise, based on the Wiener theory, however, a linear function, that is, the first column of the inverse of the correlation matrix can also be given. Three methods are shown and discussed, by means of which it is possible to calculate the first column in real time without inverting the whole matrix. Author

A FLEXIBLE HARDWIRED FAST FOURIER TRANSFORM DIGITAL PROCESSOR
E. A. Palo and G. C. O'Leary *In* AGARD Aerospace Telecommun. Systems Aug. 1972 15 p refs (For availability see N73-10187 01-07)
(Contract F19628-71-C-0002)

A hardwired digital processor based on the Cooley-Tukey algorithm is presented. A laboratory prototype has been built with two modes of operation. As a cascade fast Fourier transformer, it can simultaneously calculate transforms of two independent, continuous data streams at word rates in excess of 3 MHz. As a nonrecursive digital filter, it can produce filter impulse responses of up to 32 points. The digital filter also operates from data sources with word rates exceeding 3 MHz. The processor has been integrated into a system with other signal processing components including a small general purpose computer. Laboratory demonstration of the processing system as a spectrum analyzer and as an adaptive filter for distortion correction is discussed. Author

THE ADAPTIVE EQUALIZATION OF TRANSMISSION SYSTEMS
K. H. Moehrmann *In* AGARD Aerospace Telecommun. Systems Aug. 1972 16 p refs (For availability see N73-10187 01-07)

After a general introduction some of the principles of adaptive optimization are explained using as example the automatic identification of the transfer function of a linear system under operating conditions. Then several techniques for the automatic minimization of the linear distortions in communication channels are discussed with emphasis on telephone channels for fast transmission of digital data. Some filter structures suited for this purpose are described together with several possible strategies to implement the settings of the variable filter elements automatically during a training period before information transmission or in an adaptive manner during transmission. Finally, after discussing the partial-response technique and the equalization of digital data signals transmitted at high bit rates over long-haul coaxial carrier systems, some related applications of adaptive techniques are described concerning the equalization of long cable systems used for analog transmission of television signals, the equalization of FM/FDM radio relay systems due to elimination of intermodulation distortion and the adaptive cancellation of echoes in long distance telephone circuits. Author

ADAPTIVE EQUALIZATION WITHOUT TEST TRANSMISSIONS
Chia-Chi Chen and Lester A. Gerhardt *In* AGARD Aerospace Telecommun. Systems Aug. 1972 14 p refs (For availability see N73-10187 01-07)
(Contracts DAAB07-69-C-0365, AF 49(638)-1627)

An extended gradient method for iteratively solving sets of linear equations has been developed and used here as the algorithm to perform adaptive equalization. Although stress has been placed on using this algorithm without test transmissions, for transversal equalizers, the algorithm may also be used with test transmissions as well as for recursive equalizers. Initially, stationary, binary, bipolar channels are equalized without test signals. For highly dispersive channels, the algorithm uses a variable history of past sequences to provide more effective equalization. The algorithm, if used when test signals are available, permits channels to be equalized with multilevel signals transmitted instead of confining transmission to the binary, bipolar case. The algorithm has also been proven useful for adapting as equalizer in conjunction with a time varying channel because it can accomodate to rapidly varying characteristics. Author

PROPAGATION CRITERIA WITH TACTICAL SATELLITE COMMUNICATIONS
H. J. Albrecht, M. Eggestad, and L. A. Maynard *In* AGARD Aerospace Telecommun. Systems Aug. 1972 13 p refs (For availability see N73-10187 01-07)

Tactical satellite communications may use a variety of frequency bands depending upon the application. Considering mobility and simplicity of equipment some of the more important aspects, the UHF range was found to be particularly suitable. In other words, operating frequencies are within the 200 to 400 MHz portion of the spectrum. Propagation criteria considered are (1) scintillation effects due to ionospheric irregularities, (2) ray deviation caused by atmospheric layers, (3) multipath effects, and (4) transparency of surrounding materials. Scintillations are analyzed on the basis of experimental and theoretical results obtained. The subject of ray deviation is closely related to abnormal tropospheric conditions. With regard to multipath effects, the general aspects of ground reflections are analyzed for the purpose of evaluating their importance with mobile surface terminals. The problem of penetrating surrounding materials may be essential, whenever a porous obstacle, such as vegetation, is present in the path between surface terminal and satellite. Author

SYSTEM CONSIDERATIONS IN TACTICAL SATELLITE COMMUNICATIONS
H. J. Albrecht, R. Makaruschka, and R. Menzel *In* AGARD Aerospace Telecommun. Systems Aug. 1972 15 p refs (For availability see N73-10187 01-07)

The use of wide band satellites with frequency conversion and hard limiting displays certain disadvantages and limitations, particularly if the bandwidth is restricted to, e.g., 500 kHz in

the UHF range This causes the number of links to be limited if simultaneous operation is envisaged Another possible system uses wide band satellites with adjustable characteristics, such as linear, quasi-linear, or hard limiter operation Considering wide bandwidths of the order of 10 MHz in the UHF range, some advantages may be gained by such adjustable characteristics under jamming conditions The vulnerability of the entire system can be reduced by single channel operation, employing satellites with separate channels covering the entire bandwidth of 10 MHz with multiple base band operation Among the feasible combined systems are those using UHF and SHF For tactical satellite systems, a possible configuration comprises a quantity of smaller terminals operating on UHF with a satellite receiving on UHF and retransmitting on SHF to a powerful master surface terminal, acting as net control and relaying the retransmitted signal on SHF to the satellite, which again establishes a UHF link to the desired smaller terminal Author

GROUND TERMINAL MEASUREMENT REQUIREMENTS WITH RESPECT TO SATELLITE COMMUNICATIONS LINK AVAILABILITY
A N Ince and A Wallrabe *In* AGARD Aerospace Telecommun Systems Aug 1972 12 p refs (For availability see N73-10187 01-07)

Communications satellite systems are considered with multiple ground terminals carrying many voice channels, linked to each other via a geostationary satellite To obtain the required link capacities with specified performance it is necessary to set the levels of the assessing carriers very carefully to achieve the appropriate sharing of the satellite output power The satellite system control center measures link parameters and instructs the ground terminals to adjust transmitter powers in order to counteract the performance degradation due to external factors. The accuracy with which the system parameters can be measured determines how well the carrier levels may be controlled and consequently the availability of the communication links Measurement methods for some of the most important quantities are given and the accuracy achieved with an experimental satellite terminal is discussed Author

KALMAN FILTERING FOR RAPID AND ACCURATE DETECTION OF CW INTERFERENCE ON DIGITAL TELECOMMUNICATIONS
R J Fredericks *In* AGARD Aerospace Telecommun Systems Aug 1972 24 p refs (For availability see N73-10187 01-07)

Application of the quasi-linear Kalman filtering algorithm to the problem of estimating the frequency, amplitude and, if desired

initial phase of one or more interfering CW signals is described. These unwanted sinusoids are assumed present in a background of noise and the useful signal bandwidth is assumed to be 20-25 kHz with the jammer(s) located anywhere in this spectral interval. Channel center frequencies located throughout the range 100 kHz to 1000 GHz are investigated without requiring any changes in the basic filter structure. While the state dynamics are linear the measurements are highly non-linear functions of the state variables. Because of the non-linearity in the measurements and the fact that the measurement noise is nonwhite various techniques such as the addition of a fourth variable with the dimensions of hertz to the state vector and the use of an adaptive measurement noise matrix are required to insure proper filter convergence. Results are given showing filter operation with J/N ratios from -9db upwards to over +20db. Typical frequency estimation errors after 1000-2000 microseconds with high J/N ratios are on the order of 10 Hz. Author

THE EFFECT OF INTERCHANNEL INTERFERENCE ON THE PERFORMANCE OF A PHASE MODULATED DIGITAL SYSTEM
M. C. Davies *In* AGARD Aerospace Telecommun. Systems Aug. 1972 17 p (For availability see N73-10187 01-07)

Computer programs employing simulation and analytical techniques were developed for calculating the error performance of 2- and 4-level coherent-phase-shift keyed (C.P.S.K.) and differential-coherent-phase-shift keyed (D.C.P.S.K.) systems containing filters of specified characteristics. The effect of these filters on the distortion in the wanted channel, and on the probability density and magnitude of the interference were taken into account. Some preliminary 2-level C.P.S.K. results from a versatile experimental test facility are in good agreement with the corresponding theoretical results. Author

GENERATION OF INTERMODULATION INTERFERENCE DUE TO NON-LINEAR EFFECTS IN THE NEAR FIELD REGIONS OF MULTIPLE TRANSMISSION COMMUNICATION SYSTEM
J. A. Betts and D. R. Ebenezer *In* AGARD Aerospace Telecommun. Systems Aug. 1972 12 p refs (For availability see N73-10187 01-07)

The co-location of transmitters and receivers for military mobile requirements, particularly when a multiple-frequency transmission capability is essential, produces a serious problem of intermodulation interference. The results of a laboratory investigation in which steel specimens have been subjected to two-frequency excitation (mainly in the HF range at 1.2 and 5.1 MHz) of known field strength and orientation are described. Particular attention has been given to the intermodulation level dependence upon surface preparation, which includes machined and polished, serrated, electrodeposited cadmium and cold-sprayed zinc finishes. Results are also described for stainless alloy and carbon steels. The effect of surface corrosion, which has hitherto been referred to as the rusty-bolt problem, is also described and its effect within an active transmission system has been distinguished from that on parasitic surfaces. DIRECTIONAL ANTENNAS FOR A NEW INTERFEROMETER SYSTEM (SIDELOBE SUPPRESSION, PHASE CHARACTERISTICS, SUPPRESSION OF GROUND REFLECTIONS)
H. Oertl and H. Goessl *In* AGARD Aerospace Telecommun. Systems Aug. 1972 8 p refs (For availability see N73-10187 01-07)

A new interferometer system with antennas mounted on El/Az-pedestals is considered. Each antenna consists of an array of 36 crossed dipoles. There is a Tschebyscheff amplitude distribution in the elevation plane and in the plane orthogonal to it. Since the distance between the three interferometer antennas is 5.7 lambda, the suppression of reflected signals must be better than 40 to 50 db to keep the phase error due to reflections in the order of 0.1 deg. A further method of suppressing ground reflections, i.e. the use of concentric wire-mesh fences around each antenna, is also mentioned. Another error of the antenna system is the phase pattern discrepancies between

EFFECTS OF ATMOSPHERIC ACOUSTIC GRAVITY WAVES ON ELECTROMAGNETIC WAVE PROPAGATION
Oct. 1972 508 p refs In ENGLISH, partly in FRENCH Presented at Specialist Meeting of the Electromagnetic Wave Propagation Panel of AGARD, Wiesbaden, 17-21 Apr. 1972
(AGARD-CP-115) Avail: NTIS HC $27.50

The generation, propagation, and effects of acoustic gravity waves on atmospheric transmission of electromagnetic waves are discussed. The formation of traveling ionospheric disturbances and their influence on radioelectric communications are emphasized. For individual titles, see N73-14132 through N73-14170.

GENERATION AND PROPAGATION OF SOUND WAVES BETWEEN THE IONOSPHERE AND THE LOWER ATMOSPHERE
Richard K. Cook *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct. 1972 8 p refs (For availability see N73-14131 05-07)

Various physical processes generate sound waves at infrasonic frequencies in the lower atmosphere. The results of an analysis for the generation of sound and propagation downwards due to the heating effects of auroral discharges, particularly those traveling at supersonic speeds in directions parallel to the earth's surface are presented. The shock waves from such discharges are propagated steeply downward with very little loss of energy from absorption by viscosity and heat conduction, and are frequently observed at infrasonic stations located at high latitudes. An estimate of auroral heating is derived from the observed strengths of infrasound at the earth's surface. Author

A MODEL FOR ACOUSTIC-GRAVITY WAVE EXCITATION BY BUOYANTLY RISING AND OSCILLATING AIR MASSES
Allan D. Pierce *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct. 1972

12 p refs (For availability see N73-14131 05-07)
(Contract F19628-70-C-0008)

A somewhat general mathematical model is developed for the study of the excitation of acoustic-gravity waves by rising and oscillating air masses. Sources are initially described by distributions of fluid dynamic quantities over a moving closed surface. Analysis then indicates that insofar as wave generation is concerned, such surface distributions are equivalent to concentrated point sources at the center of the volume. The resulting linearized inhomogeneous wave equations are derived and solved in terms of Green's functions. The case of an isothermal atmosphere is discussed in some detail. Author

ACOUSTIC GRAVITY WAVES AND DIFFUSION EFFECTS AT THE ATMOSPHERIC BOUNDARIES

F. W. G. Warren. *In* AGARD. Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation. Oct. 1972. 8 p. refs. (For availability see N73-14131 05-07)

The boundary conditions in the linear theory of acoustic gravity waves in the atmosphere are discussed. It is shown that diffusion effects at the boundaries may for the most part be ignored provided the vertical wave number is not too small. The results for gravity waves agree qualitatively with those obtained by Yanowitch (1967) but the details differ. An upper bound for the reflexion coefficient for small vertical wave numbers is obtained. It is recalled that the results hold only if the mean free path at high altitudes is small compared with the horizontal wavelength. Author

AURORAL INFRASONIC WAVE GENERATION MECHANISM

Charles R. Wilson. *In* AGARD. Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation. Oct. 1972. 20 p. refs. Sponsored in part by ARPA and NOAA. (For availability see N73-14131 05-07)
(Grant NSF GA-16821)

The morphology of auroral infrasonic wave (AIW) substorms as determined from infrasonic observations along a magnetic meridian through Alaska, shows that AIW are never observed propagating in a poleward direction even though auroral activity frequently occurred south of the stations. AIW have been shown to be infrasonic bow waves generated by supersonic westward, equatorward or eastward motions of auroral electrojet arcs. This asymmetry in the occurrence of AIW with respect to direction of motion of an arc is interpreted as an intrinsic asymmetry in the generation mechanism within the auroral arcs and not as a propagation effect. It is postulated that the basic acoustic pulse within the electrojet arcs is caused by collisions with the neutral gas of positive ions that are driven by electrodynamic drift in the E region of the auroral arc. If the supersonic translation of the primary auroral electron sheet has a component of motion parallel to the electrodynamic drift of the positive ions, then an auroral infrasonic shock wave will be produced in the E region ionosphere and propagate to the ground as a modified shock or bow wave. If, on the other hand, the auroral arc motion is anti-parallel to the drift of the positive ions, then no AIW will be produced. Author

DETECTION OF 2 Hz INFRASOUND PRODUCED BY MOVING AURORAL ELECTROJETS

Ludwik Liszka and Hans Westin. *In* AGARD. Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation. Oct. 1972. 12 p. refs. (For availability see N73-14131 05-07)

Two Hz infrasound was detected during a number of major geomagnetic storms using microphone arrays. The direction of arrival and the horizontal phase velocity of the infrasound at the microphone arrays were obtained. These quantities were compared with motions of the auroral electrojet as determined from geomagnetic observations at five Scandinavian stations. The comparison, using a ray tracing technique, has shown that only a part of the observed infrasound may be produced by supersonic motions of auroral electrojets. Author

ON WAVES GENERATED BY STATIONARY AND TRAVELING SOURCES IN AN ISOTHERMAL ATMOSPHERE UNDER GRAVITY

C. H. Liu and K. C. Yeh. *In* AGARD. Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation. Oct. 1972. 17 p. refs. (For availability see N73-14131 05-07)
(Grant NSF GA-13723)

Experimental evidence indicates that acoustic gravity waves in the neutral atmosphere can be generated by various natural and artificial sources such as earthquakes, severe weather fronts, nuclear detonations in the atmosphere, jet streams, supersonic displacements of auroral arcs, auroral substorms, solar eclipse, jet aircrafts, rocket launchings, etc. These various excitation mechanisms can be considered as one or a combination of the three types of sources: mass production, momentum production and energy production which can be studied in a very general fashion. For the case of stationary sources, it is shown that the transient response and the overall wave form at a given observation point depend on a number of parameters such as the height and the range of the observation point, the time of observation, the spatial and temporal dependence of the source, the nature of source, etc. Author

ACOUSTIC GRAVITY WAVES IN THE NEUTRAL ATMOSPHERE AND THE IONOSPHERE

Nambath K. Balachandran. *In* AGARD. Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation. Oct. 1972. 11 p. refs. (For availability see N73-14131 05-07)
(Contract DAAB07-69-C-0256. Grants DA-ARO(D)-31-124-71-G90, NSF GA-17454)
(Contrib. 1799)

Acoustic gravity waves from nuclear explosions are detected at large distance, from the source by sensitive microbarograph on the ground by high frequency Doppler technique at ionospheric levels and by long period seismographs. The dispersion of acoustic gravity waves at the ground level is explained by using normal mode approach for a stratified atmosphere. For acoustic gravity waves detected at the ground level, the short period acoustic modes have higher amplitudes than the long period gravity modes when stratospheric winds are in the direction of propagation of the waves. Dopplersonde records of ionospheric disturbances show more predominance of shorter period acoustic modes than the gravity modes. According to the normal mode theory and the Lamb wave theory, the energy density for long period waves decreases exponentially with height from the ground, thus providing insufficient energy for ionospheric disturbances. Author

MODELING OF NUCLEAR SOURCES OF ACOUSTIC-GRAVITY WAVES

Brian L. Murphy and Sheldon L. Kahalas. *In* AGARD. Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation. Oct. 1972. 17 p. refs. (For availability see N73-14131 05-07)
(Contract F44620-71-C-0086)

The relationship between hydrodynamic motions caused by a low altitude explosion and subsequent ionospheric disturbances is reviewed. Both the upward going shock and the rising fireball are considered as hydrodynamic sources. It is shown that different portions of the shock front may be classified in terms of the ionospheric disturbance they create. The portion of the shock front reflected from the 100-120 km altitude level produces disturbance periods the order of a minute for a megaton detonation. The portion of the shock front which propagates above the 100-120 km level is responsible through a complex nonlinear process for disturbance periods in excess of 10 minutes. It is shown that the fireball is most efficient in generating acoustic gravity waves when it reaches its stabilization altitude and approaches hydrodynamic equilibrium with the atmosphere. Author

EXPLOSIVE EXCITATION OF LAMB'S ATMOSPHERIC EDGE MODE
Joe W Posey and Allan D Pierce *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 12 p refs (For availability see N73-14131 05-07)
(Contract F19628-70-C-0008)

It has been previously demonstrated that far field ground level pressure observations of explosively generated acoustic gravity waves are often dominated by the Lamb atmospheric edge mode for the first cycle or two Particular attention is given to the excitation of this mode by a blast wave from a large atmospheric explosion It is found that the strength of the excitation is strongly dependent upon the tail of the blast wave A theoretical development shows that for the pure Lamb mode, a simple analytical relation exists between the energy of the source and the initial amplitude and period of the far field pressure waveform This relation is compared with some empirical data and appears to be in fair agreement with yield estimates based on seismic observations Author

JUSTIFICATION FOR THE USE OF HINES' ASYMPTOTIC RELATIONS FOR TRAVELING IONOSPHERIC DISTURBANCES
Norman J F Chang *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 10 p refs (For availability see N73-14131 05-07)

It is shown that internal gravity waves propagating at ionospheric heights must have propagation angles near the maximum permitted Thus, for traveling ionospheric disturbances (TIDs) the use of Hines' asymptotic relations is justified by ray tracing Verification of these relations is made by comparison of theoretical with experimental results for fifteen TIDs The effects of the temperature profile on the measurable properties of TIDs (wavefront tilts and periods) are discussed It is shown that for TIDs that originate below the mesopause, the atmosphere behaves like a bandpass filter with center frequency favoring waves with periods near 20 minutes Author

FULL WAVE CALCULATIONS OF ELECTRON DENSITY PERTURBATIONS CAUSED BY ATMOSPHERIC GRAVITY WAVES IN THE F2 LAYER
J Klostermeyer *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 11 p refs (For availability see N73-14131 05-07)

The coupled system of hydrodynamic equations which describes gravity wave perturbations in the neutral and ion gases is solved by a full wave method including the effects of height dependent temperature and winds Coriolis force, viscosity, thermal conduction, and ion drag Calculated results agree well with experimental data deduced from vertical incidence ionograms The numerical calculations are further combined with observed gravity wave parameters to obtain height profiles of the amplitude and phase of the electron density perturbation as functions of the geomagnetic inclination and the azimuth of wave propagation The calculated perturbation depends very strongly on height, inclination, and azimuth Its amplitude varies between 0 and 100 per cent of the undisturbed electron density, and its phase may change rapidly around the F-layer maximum Author

FURTHER REMARKS ABOUT TRAVELING IONOSPHERIC DISTURBANCES ATTRIBUTED TO JET STREAM ACTIVITY AT MID-LATITUDE
G B Goe *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 13 p refs (For availability see N73-14131 05-07)

Medium scale traveling ionospheric disturbances with periods of 12 to 30 minutes are detected during daytime winter at F region heights These disturbances are present when it is magnetically quiet and are attributed to the presence of active wind patterns associated with the jet stream at the height of the tropopause The active patterns on the tropopause wind analysis maps are recognized by horizontal wind shear as the direction of flow lies parallel to the isolines of constant wind speed The activity diminishes as the wind accelerates or decelerates in the direction of flow The ionospheric activity resulting from these active tropopause winds may be thought of as localized in terms of global circulation and hence is neither observed nor predicted on a global scale This is unfortunate as HF radio transmission is effected by the presence of such ionospheric disturbances Author

GENERATION OF ANOMALOUS IONOSPHERIC OSCILLATION BY THUNDERSTORMS
C A Moo and A D Pierce *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 8 p refs (For availability see N73-14131 05-07)
(Contract F19628-70-C-0008)

Radio HF Doppler sounding of the ionosphere shows oscillations during periods of thunderstorm activity These oscillations have periods in the range of 2 min to 5 min frequently for many hours duration The coherence of the oscillations is consistent with the interpretation generally given that they are caused by the passage of long wavelength infrasonic waves There are apparently no similar disturbances with the same period range associated with air motion in the troposphere during severe weather However convective activity is known to generate fluctuations and internal waves with periods near and above Brunt Vaisala periods A theory for the generation of these ionospheric 2 to 5 min period waves, based on concepts similar to those used by Lighthill in the theory of aerodynamic sound is proposed Author

A PHENOMENOLOGICAL INVESTIGATION OF AMPLITUDES AND SPECTRA OF GRAVITY WAVES
J P Schoedel *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 13 p refs (For availability see N73-14131 05-07)

Observations of the ionospheric electron content by means of geostationary beacon satellites very often exhibit oscillations of sinusoidal form. Faraday rotation records represent a good monitoring system for these oscillations. For the investigation of the oscillations the records of the electron content were filtered numerically. The amplitudes of effects caused by gravity waves can easily be demonstrated after the filtering. The filtered part of the data - representing the wave induced fluctuations - can be used for the computation of power spectra. The following facts are found: (1) The wave amplitude decreases rapidly with decreasing period length. (2) all periods can be observed, and (3) harmonic frequencies are usually not observed. Author

COMPARISON OF COMPUTED AND OBSERVED SHOCK BEHAVIOR FROM MULTIKILOTON, NEAR-SURFACE NUCLEAR EXPLOSIONS
Demetri P. Kanellakos and Raymond A. Nelson *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 16 p refs (For availability see N73-14131 05-07)
(Contracts F33657-68-C-1147, F33657-70-C-0090)

Comparisons are made between numerical hydrodynamic calculations of the propagation through the ionosphere of shock fronts arising from near surface nuclear explosions and experimental observations of the ionospheric disturbances associated with these shock fronts. The purpose of these comparisons is to provide a test of the validity of numerical hydrodynamic calculations at ionospheric heights. Experimental values obtained from ionograms taken for some nuclear test series clearly show an acceleration of the shock front at altitudes above 100 km. There is agreement between experimental and calculated values to within a few km for the primary shock front in spite of a lack of knowledge of the exact atmospheric parameters at the times of the tests. FM CW RADAR STUDIES OF PRODUCTION OF TURBULENT INSTABILITY WITHIN THERMALLY STABLE LAYERS BY INTERNAL WAVES
Earl E. Gossard and J. H. Richter (Naval Electron Lab. Center) *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 16 p refs (For availability see N73-14131 05-07)

A recent development in radar sounding has made the detailed structure of the troposphere visible to a degree previously not approachable. The radar sounder is an FM-CW system. The most outstanding features evident in the records are internal gravity waves, features resembling Kelvin-Helmholtz instability structures, multiple layering often displaying lamina only a few meters thick, and convection cells within the marine layer. A variety of atmospheric structural patterns are shown and compared with several hypothetical models of internal wave structures to obtain more insight into the atmospheric processes at work. Special attention is given to the distribution of Richardson's number in trapped and untrapped gravity waves. It is concluded that the multiple layers result from untrapped internal gravity waves whose propagation vector is directed nearly vertically within very stable height regions. Author

THE DETECTION AND STUDY OF GRAVITY WAVES WITH MICROWAVE RADAR
Isadore Katz *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 11 p refs Sponsored in part by AFCRL (For availability see N73-14131 05-07)

The use of ultra sensitive radars has resulted in a new ability to see structure and motion of the atmosphere not possible before. Among other things these radars detected gravity waves at the tropopause. Experimental proof has been obtained which shows incontrovertible evidence that Bragg scattering is the prime cause of the electromagnetic scattering phenomenon. The signal strength of the radar echoes was found to be a linear function of the spectral density of refractive index fluctuations in the atmosphere. A review of 26 gravity wave cases permits a tentative characterization of these waves in terms of sizes, shapes, persistence and conditions under which they occur. Author

OBSERVATIONS OF GRAVITY WAVES IN THE HEIGHT RANGE
G. E. Perona *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 10 p refs (For availability see N73-14131 05-07)

Acoustic gravity waves can successfully be detected in the D region of the ionosphere in spite of all the well known difficulties that characterize the interpretation of the data concerning that region. This possibility is demonstrated from a theoretic point of view and is successively confirmed by a careful analysis of VLF data and cross modulation data, related to the 50-70 km range. The limits on the amplitude, frequency and wavelength of acoustic gravity waves that may be detected at these levels, are outlined. Author

OBSERVATIONS OF GRAVITY WAVES IN THE HIGHER ATMOSPHERE BY MEANS OF METEOR TRAIN DETECTION
M. Glass (Lab. de Phys. de l'Ecole Normale Superieure), A. Spizzichino, and I. Revah *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 16 p refs In FRENCH, ENGLISH summary (For availability see N73-14131 05-07)

Over 1000 individual values of neutral wind can be obtained daily, within the 75-105 altitude range, with a meteor radar. Data processing and harmonic analysis significantly exhibit progressive waves whose vertical propagation can be tracked owing to the accuracy in location due to the radar. The length of the measurement period (10 days) makes it possible to acquire data on the life duration of the gravity waves observed. Returns from ionized traces produced by meteorites penetrating into the higher atmosphere are also obtained. The radar is extremely sensitive and therefore can detect over 1000 meteor echoes daily. Owing to a novel device for measuring the distance between the radar and the meteor echo, and to the accurate determination of the elevation and azimuth of this echo, the altitude can be determined within + or - 500 meters. The motions of the east-west component of the neutral wind within the 75-105 altitude range can be deduced from the Doppler effects on these echos. Waves are thus exhibited whose vertical propagation can be tracked since the altitude is known. Besides tidal motions, with periods ranging from 12 to 24 hours and over, shorter period oscillations are observed which can be compared to gravity waves. Author

NARROW BEAM HF RADAR INVESTIGATIONS OF MIDLATITUDE IONOSPHERIC STRUCTURE AND MOTION
Robert D. Hunsucker *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 14 p refs (For availability see N73-14131 05-07)

Data acquired from 1964 - 1968 with a narrow-beam azimuth and elevation scan high frequency backscatter sounder have been analyzed in detail. This analysis has revealed that the irregular structure of the midlatitude ionosphere is the rule rather than

the exception irregularities of varying scale size and apparent motion were present in about 90% of the observations The signatures observed by this HF radar system have been categorized into eight generic types which have been labelled with names roughly describing their appearance on the range-azimuth scan record The relative diurnal and seasonal occurrence as well as the qualitative sunspot cycle and geomagnetic correlation of these signatures are presented One particular type of signature was analyzed using a three dimensional computer ray t acing technique utilizing experimental data to modify an atmospheric gravity wave disturbance model The synthetic backscatter record was sufficiently similar to the experimental HF radar record to justify this approach in the interpretation of backscatter data Author

Wavelike disturbances were observed in the ionosphere following several nuclear explosions in early 1960's Supersonic shock waves within the atmosphere generated by large rockets can cause ionospheric electron density perturbations A CW phase path Doppler array in the New York area was operated during the Saturn Apollo 12 and 13 launches and recorded Doppler frequency fluctuations due to rocket launchings Cross correlation and power spectral analyses of the phase path path Doppler frequency variation records showed that the phase velocities of the signal arrivals were from south of the array with 700 800 m sec corresponding to periods in the range of 2 to 4 minutes Ionograms taken every 60 seconds from Wallops Islands showed clearly ionospheric disturbances due to rockets The group velocities were estimated to be of the order of 450 m sec 1 obtained from the earliest visible disturbances seen on CW phase path Doppler records and ionograms together with the rocket trajectory data Author

J Litva *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 23 p refs (For availability see N73-14131 05-07)

Observations of travelling ionospheric disturbances were obtained by way of a new technique which is described in detail, namely measurement of angle of arrival and amplitude variations of radio waves which propagated through the ionosphere from localized regions of enhanced emission on the solar disk The observations reported here show good evidence of TID wave trains consisting of 15 to 18 wave cycles The angular deflections of the solar line of sight at 51 7 MHz were measured to be between plus or minus 6 to plus or minus 20 minutes of arc from which electron number density perturbations are calculated to be of the order of 1 to 2 percent The observed variations in amplitude corresponding to the larger angle of arrival scintillations were about 5 db The TIDs were primarily of two types one with a period of approximately 6 minutes the other with a period of 21 minutes The former travelled with the speed of about 200 km hr and a corresponding wave length of 20 km The speed of the latter was between 800 and 2000 km hr and the corresponding wavelength between 300 and 700 km they also had a preferred line of travel which was orientated north south Author

THE EFFECT OF IONOSPHERIC DISTURBANCES ON THE BEARINGS OF INCOMING SKY WAVES
A D Morgan *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 19 p refs (For availability see N73-14131 05-07)

A series of experiments was conducted to examine the effects of TIDs on bearing measurements The receiving aerial used was a circularly disposed wide aperture array and the output from the array was processed by an automatic bearing measuring equipment The results showed that the bearing fluctuated with periods of the order of 20 minutes On some days, the bearing record showed a continuous sequence of these fluctuations whereas on other days, the fluctuations were almost absent On the assumption of a mirror type of reflection, the observed bearing error for a single hop path corresponded to ionospheric tilts of up to 9 degrees Further on this assumption, it is estimated that these tilts can change at the rate of up to one degree per minute The results also suggest the presence of systematic tilts, in the ionosphere, which change with the diurnal change of the solar zenith angle The implications of these results, on practical radio communication, are briefly discussed Author

IONOSPHERIC TILT MEASUREMENTS NEAR THE MAGNETIC DIP EQUATOR
R F Treharne *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 13 p refs (For availability see N73-14131 05-07)

Observations of ionospheric tilt have been made near the magnetic dip equator During the daytime these observations were hindered by the continuous presence of the intense irregularities in the E region but the observed tilts appeared to be larger and to have a systematic tilt not seen in temperate latitudes, the bias was to the east during the daytime and reversed in direction at sunset during the equinoctial months During the evening, if spread F was absent, the tilts of the F region could be observed more clearly These evening tilts were of much greater magnitude, had a much longer time scale than in temperate latitudes, and had superposed faster variations of a smaller scale which might be attributed to gravity waves Three nights of observations are available one in winter, two in summer In all three cases the maximum tilt (9 degrees) occurred near 2100 hours local time, the time normally associated with the equatorial rise in hF after sunset but in the first case (winter) the direction was north, whereas in the second (summer) it was west and in the third (also summer) it was east Author

AN APPROACH TO THE ANALYSIS OF COUPLING

BETWEEN ACOUSTIC-GRAVITY WAVES AND ELECTROMAGNETIC WAVES

H R Reemer *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 12 p refs (For availability see N73-14131 05-07)

The development of theoretical models for plasma media whose parameters are spatially variable, and the use of these models to study wave propagation in such media with the aid of high speed computers is reported. Some of these theoretical models can be used to study the first-order effects of a low frequency wave disturbance (e.g. an acoustic gravity wave at a fraction of a Hertz) on a high frequency electromagnetic wave (at kilohertz or megahertz) propagating in the ionosphere. The formulation of the model and its adaptation to the problem of interest via perturbation theory are first described, followed by a general outline of the way in which this theory can be used to calculate the first order effects of the acoustic gravity wave on the electromagnetic wave. Some communication systems implications of this theory are briefly discussed at the end of the paper. Author

HF RAY TRACING OF GRAVITY WAVE PERTURBED IONOSPHERIC PROFILES

P L George *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 17 p refs (For availability see N73-14131 05-07)

The results of a computer simulation of the direction of arrival of short range ionospheric radio ray paths in the presence of a medium scale travelling ionospheric disturbance (TID) are reported. The analytical representation of the TID is based both on actual observations of such disturbances and upon the theory of internal atmospheric gravity waves. Computed results of the time dependence of direction of arrival and Doppler shift, such as would be observed at a ground based station, show good qualitative agreement with observations. The relationship between the computed direction of arrival variations and certain characteristics of the TID model that produced them is examined at a low latitude and at a high latitude location. The accuracy of a simple geometrical model that has been proposed for tilt correction of apparent direction of arrival is evaluated. It is shown how the uncertain results derived from use of this model may be substantially improved by taking into account the direction of travel, velocity and scale of the TID, these parameters being derived by continuous observation at spaced stations. SOME EFFECTS OF ATMOSPHERIC GRAVITY WAVES OBSERVED ON A TRANSEQUATORIAL RADIO PATH

J Roettger *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 17 p refs (For availability see N73-14131 05-07)

The influence of atmospheric gravity waves on the point-to-point propagation of HF radio waves in the ionosphere is investigated for two cases. The gravity waves are propagating in direction of the great circle between two points, and the gravity waves are propagating transverse to the great circle direction. Measurements on a north-south directed transequatorial HF radio path using fixed frequency CW transmitters show periodical field strength variations during nighttime hours, which are assumed to be caused by focussing due to north-south propagating atmospheric gravity waves. Ray tracing calculations prove that periodical focussing can occur when ionospheric profiles perturbed by atmospheric gravity waves are employed. A power density analysis of the recorded field strength patterns is carried out in order to obtain indications about the main fading periods. Variations in propagation time and azimuth angle indicate traveling ionospheric disturbances moving from west to east in the equatorial zone. Author

PROPAGATION OF SUBMICROSECOND HF PULSES THROUGH TRAVELLING IONOSPHERIC DISTURBANCES

G M Lerfald, R B Jurgens, and J A Joselyn *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 21 p refs (For availability see N73-14131 05-07)

(ARPA Order 1361)

HF pulses of submicrosecond duration, received at a range of 1500 km after a single ionospheric reflection from the F region, have been analyzed to study the effects imposed on the pulses by the propagation process. The recorded pulses display a wide variation in form. One pulse characteristic is the pulse stretching attributable to ionospheric dispersion. Typically, for a 1 MHz receiver, the recorded pulse has a duration of about 15 msec. Frequently the recorded pulses also display structure due to polarization splitting and to the reception of time-shifted wavetrains from multiple reflection points (multipath). Some results from the statistical analysis of a large number of pulses include: (1) Occurrence distributions of pulse lengths yield effective ionospheric dispersion rates. (2) time series plots of pulse delay give the amplitude and period of changes in group path. (3) pulse characteristics typically do not change much on a time scale of a few seconds but often change markedly in a few minutes, and (4) detailed analysis of selected pulses shows that the time shifts of multipath components could be derived for the simpler cases. TRAVELLING IONOSPHERIC DISTURBANCES INITIATED BY LOW ALTITUDE NUCLEAR EXPLOSIONS

W Stoffregen *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 9 p refs (For availability see N73-14131 05-07)

Ionospheric disturbances travelling with a maximum velocity of approximately 630 m/s were recorded over the Scandinavian area after two large nuclear explosions. The disturbances in the ionosphere were most pronounced in the F region, as is evident from the ionograms and real height profiles. When the first wave arrived, a spontaneous increase of the height of the F2 layer was observed, followed by splitting of the F layer and a slower phase of recovery. At the E level, a sporadic E layer occurred with some delay and the D region ionization increased during two short periods with a delay of about one hour with respect to the disturbance in the F layer. The time delay of the disturbances at different levels of the ionosphere can be explained by the results of ray tracing studies of the propagation of acoustic gravity waves. Author

IONOSPHERIC DISTURBANCES GENERATED BY ACOUSTIC-GRAVITY WAVES RESULTING FROM A 100 kt TO 2000 kt NUCLEAR EXPLOSION ON THE GROUND, OBSERVED AT POINTS LOCATED BETWEEN 160 AND 1000 km FROM THE FIRING SITE

P M Halley *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 2 p (For availability see N73-14131 05-07)

During French nuclear experiences in Polynesia, travelling ionospheric disturbances were observed and their impact on high frequency band propagation was investigated. Various recordings of Doppler effect frequency shifts and of vertical or oblique soundings are interpreted as exhibiting mainly two disturbance components. (1) A rapid component which is a thermospheric wave whose instantaneous speed is approximately 720 m/s at a horizontal distance of 290 km and then diminishes as the distance increases. This oscillation wave may appear at a very great distance, where its velocity always exceeds 400 m/s. (2) A low component which could be a ground wave or a guided wave whose velocity is about constant and of the order of 305 m/s. This wave rises up to ionospheric altitudes where it becomes superimposed on the thermospheric wave. The impact of such a disturbance on oblique propagation and the resulting impairment of telecommunication possibilities are discussed. Author

NONLINEAR PROPAGATION AND IONOSPHERIC COUPLING OF ATMOSPHERIC WAVES GENERATED BY A NUCLEAR EXPLOSION
P Broche (Centre Univ de Toulon) *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 13 p refs In FRENCH, ENGLISH summary (For availability see N73-14131 05-07)

The disturbance generated in the ionosphere by a nuclear explosion was observed at several points, using the method which consists in measuring the Doppler effect on a HF radio transmission. Two aspects of the results are stressed (1) The time delay in the occurrence of the disturbance shows that its propagation between the ground and the ionosphere is nonlinear and makes it possible to define a numerical model to describe it, and (2) the time spectrum confirms the considerable influence of the geomagnetic field on the coupling between the motions of neutral particles and those of ionized particles Author

THE EFFECTS OF NUCLEAR-BURST-PRODUCED ACOUSTIC GRAVITY WAVES ON HF COMMUNICATION SYSTEMS
D L Nielson *In* AGARD Effects of Atmospheric Acoustic Gravity Waves on Electromagnetic Wave Propagation Oct 1972 15 p refs (For availability see N73-14131 05-07)

Acoustic gravity waves generated by high altitude nuclear explosions can momentarily affect the performance of HF communications Two changes can occur (1) the available propagation spectrum may at some point decrease such that the circuit is no longer operative at a given frequency, and (2) the time-delay and frequency distortions may increase the likelihood of error in a digital system All effects are subject to the relative orientation of the path, the source, and the geomagnetic field as well as the state of the ionosphere along the path Author

PROPAGATION OF 15.6 - 31.2 GHz AND 45 - 90 GHz COHERENT SIGNAL PAIRS
John F Sullivan and Harold M Richardson *In* AGARD Telecommun Aspects on Freq Between 10 and 100 GHz Apr 1973 11 p refs (For availability see N73-26121 17-07)

Two pairs of coherent signals have been transmitted through the atmosphere over a 23 1 km path well clear of terrain features The lower pair of signals spanned 15 6 GHz and the upper pair spanned 45 GHz of the millimeter spectrum There is no reason to believe that the entire band from 15 to 90 GHz could not be spanned coherently with appropriate apparatus However the entire band is not completely useful because of strong absorption near the oxygen absorption lines in the region of 60 GHz and strong temporal and spacially dependent attenuation in the presence of precipitation along the path It is shown that atmospheric structure imposes commonly minor modulation on mm wave propagation over a limited bandwidth from near zero to a few Hz, this modulation increases with carrier frequency, path length, and intensity of turbulence which in turn varies widely from time to time Within the limits of the available data, it is concluded that the theory of wave propagation perturbation by turbulent media is valid

SOME OBSERVATIONS OF SCATTERING FROM RAIN ON A 12 GHz TRANS-HORIZON LINK
N Abel *In* AGARD Telecommun Aspects on Freq Between 10 and 100 GHz Apr 1973 13 p refs (For availability see N73-26121 17-07)

A 12 GHz experimental transhorizon link of 210 km length was operated with an elevated receiving antenna beam which

intersected the transmitting antenna beam over approximately the last quarter of the path. The possible scattering angles ranged around 4 degrees, the half power beam width of both antennas was 1.8 degrees. Rain scatter signals were observed via the main lobe of the receiving antenna without any significant restraint, whereas the permanent, but narrow angle turbulence scatter signals were received via side lobes and therefore, reduced to values most barely above threshold. With the aid of fading character and of weather observations, a statistical distribution of rain scatter transmission loss was isolated from the data. During the strongest rain scatter events, the transmission loss was up to 20 db lower than the average loss for turbulence scatter in this particular configuration. Transmission loss values estimated on the basis of rain gauge data seem to be consistent with the measured ones. Author

THE INFLUENCE OF PRECIPITATION AND MULTIPATH FADING ON FREQUENCIES BETWEEN 10 AND 18 GHz

Odd Gutteberg (Norwegian Telecommun. Admin. Res. Estab., Kjeller) and Anton G. Kjelaas *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 7 p refs (For availability see N73-26121 17-07)

Taken the very short measuring time into consideration, the measured attenuation due to rain fits very well the values obtained from rainfall rate in one point applying the reduction coefficient given by Battesti et al. Multipath fading due to atmospheric stratification (duct) has been observed usually during night with nocturnal radiation. The fading depths observed due to multipath are about 1/3 in db of those caused by rain. Author

RAIN ATTENUATION STATISTICS FOR FREQUENCIES ABOVE 10 GHz FROM RAINGAUGE RECORDS

G. Drufuca *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 15 p refs (For availability see N73-26121 17-07)

Tipping bucket raingauge records have been used to generate statistics of rain attenuation at 11.2 GHz for a 5-mile microwave link. The knowledge of storm velocity measured by weather radar is used to transform records into profiles of rainfall rate versus distance. These profiles are then properly integrated over a 5-mile length obtaining simulated attenuation values. These are then compiled as probability curves. A comparison between the actual statistics of the link and the simulated statistics shows good agreement. Author

THE INFLUENCE OF RAINFALL ON LINE-OF-SIGHT PROPAGATION AT 110 GHz IN SE ENGLAND

D. T. Llewellyn-Jones and A. M. Zavody *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 6 p refs (For availability see N73-26121 17-07)

In the case of millimeter wave propagation through the atmosphere the problem exists of predicting link reliability on the basis of known rainfall data. This requires knowledge of the relationships between rainfall rate at one point and attenuation observed over a given path length. Various methods have been devised to provide more information on these problems at a frequency of 110 GHz. This work involves the use of raingauges and spatially separated propagation links. Some results are described, and it is seen that frequencies as high as 110 GHz have potential practical applications over line-of-sight paths of the order of 3 km length. Predicted reliabilities for some applications can be comparable to those obtained at frequencies near 30 GHz. Author

EXPERIMENTAL METHOD OF MEASURING PROPAGATION ATTENUATION OF RAIN [METHODE EXPERIMENTALE DE MESURE DE L'AFFAIBLISSEMENT DE PROPAGATION DU A LA PLUIE]

P. Misme, L. Boithias, and J. Battesti *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 6 p ref. In FRENCH (For availability see N73-26121 17-07)

After having given a theoretical definition of equivalent precipitation intensity, it is pointed out how this quantity may be calculated experimentally with the help of propagation results. The value of a reduction coefficient, function of the length of a connection and percentage of time are described. Consequently, with the help of experimental results, a method is developed that permits calculation of absorption as a product of rain for a percentage of any time and for all frequencies less than frequencies in the vicinity of 30 GHz and distances less than about 20 kilometers. AMPLITUDE FADING OF SATELLITE COMMUNICATIONS SIGNALS AT SHF

K. S. McCormick, R. L. Olsen, and L. A. Maynard *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 8 p refs (For availability see N73-26121 17-07)

For SHF satellite communications systems designed to operate at elevation angles less than several degrees, allowance must be made for fluctuations in the signal level caused by variations in the refractive structure of the troposphere. As part of a program to investigate these effects, the signals from satellite beacons at 7.3 GHz have been monitored during several periods over the last five years. The results show that in the summer months, the fading is greater than 10 db for 0.1% of the time at elevation angles below three degrees, while, for the winter months, fades greater than 6 db occur under the same conditions. A limited series of observations at resolute (latitude 75 N) show that in the Arctic, the fading in the summer is similar to that which occurs in Ottawa in the winter. Author

SLANT PATH ATTENUATION AT FREQUENCIES ABOVE 10 GHz

P. G. Davies *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 11 p refs (For availability see N73-26121 17-07)

Results obtained from solar tracking radiometer measurements made at 19 GHz and at 37 GHz have been studied to give data on attenuation (primarily caused by rain) on paths through the troposphere. Such information is required in the planning and operation of microwave links to and from satellites. The results are presented in statistical form as cumulative distributions of the percentage of the observation time for which the attenuation exceeds various values. Analysis of individual fades exceeding 5 and 10 db at both 19 and 37 GHz has also been carried out and the results are presented as histograms showing the number of fades as a function of fade duration. STATISTICS ON EARTH SATELLITE ATTENUATION AT TWO TEXAS LOCATIONS

A. W. Straiton, David N. Pate, and Bob M. Fannin *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz Apr. 1973 9 p refs (For availability see N73-26121 17-07)

Propagation experiments using the 15.3 GHz transmitter on the ATS-5 satellite as a signal source are reported. Signal strength

data were recorded at two locations at Austin in central Texas for twenty months and at Mount Locke in far west Texas for five weeks. The elevation angle in each case was near 54 deg. It is concluded that for high elevation angles severe attenuation is almost always associated with thunderstorms. Curves of percentage of time versus path attenuation for an average year are given for both sites. The height of the top of the thunderstorm cloud was found to be a fairly good single indicator of the intensity and duration of fades. Author

COMPARISON OF DIRECT AND INDIRECT MEASUREMENTS OF PRECIPITATION ATTENUATION AT 15.3 GHz
J. I. Strickland *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz. Apr. 1973. 8 p. refs (For availability see N73-26121 17-07)

The signal strength received at 15.3 GHz from the ATS-5 satellite was measured using a 9 metre antenna. The receiving antenna is also connected as a total-power radiometer, providing simultaneous measurements of the sky noise temperature at 15.3 GHz with an antenna beamwidth of 0.15 degrees. Attenuations, calculated from the measured sky temperatures, show very good agreement with the directly measured attenuations. Author

SPACE COMMUNICATIONS SYSTEMS CONSIDERATIONS AT 94 GHz
H. J. Wintroub and L. A. Hoffman *In* AGARD Telecommun. Aspects on Freq. Between 10 and 100 GHz. Apr. 1973. 17 p. refs (For availability see N73-26121 17-07)

The effects of atmospheric physical phenomena in determining satellite-ground radio link performance are considered. Experimental data are presented as a basis for the determination of link margins and tradeoffs between communication capacity and outage because of rain-induced attenuation or high atmospheric turbulence. State-of-the-art and predicted performance of future millimeter wave components are considered in formulating the spacecraft and ground terminal systems. Included are a beam swinging experiment using a precision controlled 4.57-m antenna to obtain data on wavefront tilt fluctuations, time histories of amplitude scintillation for 0.15-, 0.61-, and 4.57-m apertures, and statistical data on water vapor attenuation. SPREAD SPECTRUM COMMUNICATIONS
Jul. 1973. 196 p. refs
(AGARD-LS-58) Avail: NTIS HC $12.00

The theory, implementation, and application of state-of-the-art spread spectrum techniques to advanced communication systems are discussed. The fundamental and theoretical aspects of communication theory, digital communications theory, and spread spectrum communications are reported. The practical aspects of spread spectrum techniques, particularly the performance and synchronization considerations, and several state-of-the-art applications are described. Predictions of future communication systems with spread spectrum methodology are included. For individual titles, see N73-32054 through N73-32058.

SOME FUNDAMENTAL NOTIONS OF COMMUNICATION THEORY
Lester A. Gerhardt *In* AGARD Spread Spectrum Commun. Jul. 1973. 24 p. refs (For availability see N73-32053 23-07)

The basic concepts of communications theory to include the transmission of continuous signals and the use of discrete time signals are presented. A numerical analysis of communication signals, the spectral characteristics of the signals, and a probabilistic description of the signals are developed. The basic types of modulation, to include amplitude, pulse, and angle modulation and related forms are examined. The characteristics of the signal receiver with emphasis on signal detection and filtering are described. The effect of the sampling theorem on the spectral characteristics of signals is analyzed. The problems of quantization are outlined for discrete time and discrete amplitude signals. Author

DIGITAL COMMUNICATIONS THEORY
Geoffrey F. Gott *In* AGARD Spread Spectrum Commun. Jul. 1973. 16 p. refs (For availability see N73-32053 23-07)

The characteristics of digital communication systems and the processing of bandpass digital signals are discussed. The modulation and detection of frequency shift keyed and phase shift keyed signals are considered in binary and multilevel form. Emphasis is placed on radio frequency data transmission where spread spectrum techniques have application. Methods of providing protection against the effects of signal fading due to multipath propagation are analyzed. Elementary forward error correcting codes of the type used in radio frequency channels are examined. Author

INTRODUCTION TO SPREAD SPECTRUM TECHNIQUES
R. L. Harris *In* AGARD Spread Spectrum Commun. Jul. 1973. 21 p. (For availability see N73-32053 23-07)

The basic principles and operation of a spread spectrum communication system are discussed. Spectrum spreading by means of direct modulation is considered in detail and compared with an alternative method using frequency hopping. A key feature of any spread spectrum system is the pseudo random sequence and the basic properties and generation of such sequences are discussed. Finally the performance of a typical satellite communication system using spread spectrum as a multiple access method is calculated. Author

N73-32057 Communications Research Centre, Ottawa (Ontario)
PERFORMANCE AND SYNCHRONIZATION CONSIDERATIONS
N. G. Davies *In* AGARD Spread Spectrum Commun. Jul. 1973. 24 p. refs (For availability see N73-32053 23-07)

The performance of spread spectrum systems in the presence of various forms of channel noise is analyzed. The synchronization aspects of spread spectrum systems are examined. The subjects discussed are (1) acquisition by search in the time and frequency domains, (2) the use of preambles and special sequences for synchronization, and (3) the establishment of synchronization detection and tracking criteria. DETERMINATION AND USE OF RADAR SCATTERING CHARACTERISTICS
Sep. 1973. 171 p. refs. Conf. held at Bolkesjoe, Norway, 11-12 Oct. 1973, London, 15-16 Oct. 1973, The Hague, 18-19 Oct. 1973
(AGARD-LS-59) Avail: NTIS HC $10.75

Radar echoes and radar cross sections are reviewed for different classes of targets, main parameters affecting backscatter signal are analyzed. For individual titles, see N74-11955 through N74-11967.

N74-11955 EMI Electronics Ltd., Wells (England)
INTRODUCTORY LECTURE: TARGET SCATTERING CHARACTERISTICS OF IMPORTANCE TO RADARS
L. R. Cram *In* AGARD Determination and Use of Radar Scattering Characteristics, Sep. 1973, 4 p. (For availability see N74-11954 03-07)

Scattering characteristics of interest include the Doppler content, the range noise and the angular glint as well as the radar cross section (RCS), or radar echoing area (REA). A definition is given of these parameters (RCS or REA) and the physical reasons for variations around a target are discussed. Both amplitude and rate of change significantly affect radar performance. Reciprocally, the value of the radar echoing area can itself be affected by the radar paramaters such as modulation type, frequency and polarization. Target glint will affect the accuracy of directional information provided by the radar. The rates of change and frequencies of change of glint are also important. Radar parameters and the glint data interact with each other in that polarization characteristics of the radar affect the glint and its frequencies while the significance of glint frequencies depends on radar servo rates, etc. Targets which are of interest include land, sea and airborne vehicles. Sea and land reflections represent either clutter or targets in their own right. Birds represent hazards to aircraft so their radar scattering is also of interest. Author

COMPUTATIONAL AND ANALYTICAL DETERMINATION OF RCS
Edward M. Kennaugh *In* AGARD Determination and Use of Radar Scattering Characteristics, Sep. 1973, 9 p. refs (For availability see N74-11954 03-07)

Improvements in computational techniques for calculation of RCS now permit wider ranges of objects to be analyzed. The lecture reviews the state of the art at present, with a description of two basic approaches. The point matching or wire grid model utilizes a matrix description of a three dimensional shape and proceeds to calculate RCS through solution of a large order system of linear equations. The asymptotic or quasi optical solution identifies key contributions to RCS which may be given simple mathematical description and summed automatically, with proper account of phasing, as a function of attitude. The limitations and virtues of each method are described, and the possibility of combining both computational methods is explored. Illustrative examples are presented, and the importance of this tool as an adjunct to experimental RCS studies is discussed. Author

DYNAMIC FULL SCALE MEASUREMENT OF RCS
William F. Bahret *In* AGARD Determination and Use of Radar Scattering Characteristics, Sep. 1973, 16 p. refs (For availability see N74-11954 03-07)

Trade offs and technical considerations in dynamic measurements of radar cross section are discussed to establish requirements for instrumentation and techniques used for such measurements. Primary emphasis is given to aircraft targets although most of the discussion applies to sea or land based targets as well. Block diagrams of practical systems for measuring amplitude and angular scintillation are presented and discussed. Typical output data are related to the primary user requirements. Author

N74-11959 EMI Electronics Ltd., Wells (England)
MODELLING METHODS OF DETERMINING RADAR ECHO CHARACTERISTICS
L. A. Cram *In* AGARD Determination and Use of Radar Scattering Characteristics, Sep. 1973, 7 p. (For availability see N74-11954 03-07)

Optical modelling is now rarely used but ultrasonic modelling is far more effective. A well instrumented facility for ultrasonic modelling is described which operates in water with wavelength scaling from 1/10 to 1/40. Speedy operation and good range discrimination are particularly advantageous. Radio scale modelling has additional advantages and a radio scale modelling facility incorporating five different measuring equipments is described. Mutual interference is avoided by range gating the radars. Scaling is from 1/1 to 1/100 and many different radars operate from 1 GHz to 100 GHz. Targets of metal coated wood are suspended by nylon strings. Two general purpose equipments permit flexible choice of radar system, aerial type, wavelength and polarization. Other systems are specialized for investigating the end course of a missile radar, the reflections from sea waves and the effects of target glint on radar aiming errors. A radar system assessment team with computers completes the radio modelling facility. Author

N74-11960 EMI Electronics Ltd., Wells (England)
TARGET CHARACTERISTICS
S. C. Woolcock *In* AGARD Determination and Use of Radar Scattering Characteristics, Sep. 1973, 18 p. refs (For availability see N74-11954 03-07)

A knowledge of the radar scattering properties of complex targets is a necessary requirement for the detailed study of modern radar systems. The use of computers for such studies requires that these properties shall be described in compact form. By making radar measurements of high quality scaled models a better understanding of target reflectivity is being achieved. The dependence of the received signal on the frequency and polarization of the incident field as well as on the characteristics of the radar system is described. Reflections from simple shapes are discussed to show how the radar cross section can be computed by geometric optics, physical optics and by consideration of travelling wave echoes. The sources of radar reflection for an aircraft and for a missile shape are next discussed. These were determined by measurement. There follows an introduction to the concept of angular glint. Glint properties of a complex target are described and associated with the perturbations on phase fronts. Features of glint are highlighted, in particular the wander of the mean glint centre with the target outline. Finally an example is shown of Doppler spectra obtained from an aircraft. Spectral lines associated with moving parts are usually present. In this instance several frequency components have arisen which can be associated with the rotating turbines of engines. Author

N74-11961 Royal Radar Establishment, Malvern (England)
RADAR ECHOING AREAS OF FLYING ANIMALS
E. W. Houston *In* AGARD Determination and Use of Radar Scattering Characteristics, Sep. 1973, 11 p. refs (For availability see N74-11954 03-07)

The echo signal from a flying animal consists of at least two components, an average or mean component and an amplitude modulated component. The mean component is proportional to the slow variations in echoing area, resulting from long term variations of the animal's aspect as it flies past the radar. The modulation component follows the rapid variations generated by wing flapping or by transient fluctuations in echoing area produced, for example, by head movements. The periodic wingbeat modulation of the echo signal from even a small bird is distinctive and makes it easy to separate this form of target out from echoes. By selective measurements on flying animals

under laboratory conditions the task of specifying radar echoing areas can be reduced when these static cross sections are compared with dynamic echoing areas measured on animals in flight. Author

N74-11962 Royal Radar Establishment, Malvern (England)
RADAR SEA CLUTTER
Geoffrey Bishop *In* AGARD Determination and Use of Radar Scattering Characteristics Sep. 1973 21 p (For availability see N74-11954 03-07)

Radar sea clutter studies have been made based on a series of trails, in which X-band non-coherent radar measurements have been taken from a cliff top site in Cornwall, England. Horizontal, vertical and circular polarizations were transmitted using pulse lengths of 70 nanosec and 270 nanosec with an antenna beamwidth of 0.6. Horizontal, vertical or both hands of circular polarization were received. Amplitude distribution curves show the effects of change in sea state, polarization and pulse length on the cross sectional echoing area characteristics of sea clutter and moored buoy targets. Cross polarization effects have been studied. Autocorrelation analyses of the recorded radar returns show clutter decorrelation times varying from 5 milliseconds to several seconds. Author

N74-11963 Forschungsinstitut fuer Funk und Mathematik, Werthoven (West Germany)
THE USE OF TARGET AND CLUTTER DATA FOR DIFFERENT METHODS OF DISCRIMINATION BETWEEN TARGETS AND UNWANTED CLUTTER
Karl VonSchlachta *In* AGARD Determination and Use of Radar Scattering Characteristics Sep. 1973 21 p refs (For availability see N74-11954 03-07)

The signal processing procedures adopted in surveillance radars for discriminating target and clutter are based on results of statistical decision theory. The practical implementation is discussed with reference to two groups of radar and the influence of target and clutter characteristics are pointed out. A first group comprises the processing of incoherent video signals. The examples are the sequential detection device, the Scan to Scan MTI and procedures for fast switching between normal and MTI video signal. A second group deals with the processing of coherent radar signals. The Doppler information of moving targets is used for the discrimination between targets and unwanted clutter. A modern device applying the likelihood ratio test and using Doppler filters in the time domain is described. Further investigations are made for suppression of moving clutter by adaptive filtering. Author

PRESENTATION AND STORAGE OF RADAR CROSS-SECTION DATA
Carroll R. Griffin, Jr. *In* AGARD Determination and Use of Radar Scattering Characteristics Sep. 1973 24 p (For availability see N74-11954 03-07)

The data required to be taken in conjunction with the measurement of radar cross sections are divided into two categories, that associated with the target orientation or aspect and that associated with the radar measurement parameters. Several types of presentation are used, and various types of records of the data are available, both analog and digital. The standardization of data formats and conventions for target orientations are important objectives which should be established for the benefit of users of RCS data. Author

N74-11965 EMI Electronics Ltd., Wells (England)
USE OF RADIO MODELLING DATA
S. C. Woolcock *In* AGARD Determination and Use of Radar Scattering Characteristics Sep. 1973 13 p refs (For availability see N74-11954 03-07)

The U.K. radio modelling facility has permitted the amassing of much data concerning reflections from a wide variety of radar reflecting objects at many different frequencies and at all possible polarization configurations. The data must be reduced by a method which does not remove details of the scattering signal to which the radar system is sensitive. Three methods are in use: (1) Statistical summaries such as cumulative probability, spectral distribution, autocorrelation function or mean value and standard deviation, (2) look-up table (no data reduction) using computer storage data on echo characteristics of targets; and (3) multiple source mathematical models that represent a target by a number of elementary sources, each of defined strength, polar diagram and position. A radar analysis example is given where a simple computer program determines the performance of a sequential lobing radar in locating a shell whose polar echo characteristics are fed directly from a recording of the radio range data. Author

THE USE OF RCS DATA
William F. Bahret *In* AGARD Determination and Use of Radar Scattering Characteristics Sep. 1973 10 p refs (For availability see N74-11954 03-07)

Data requirements and limitations are emphasized that are associated with systems analysis involving radar cross section, rather than the mechanics of any actual analysis. Treated separately as increasingly sophisticated levels of target characterization are far zone, near zone, and glint data. Typical applications and practical requirements for these applications are discussed to define adequate methods for obtaining and presenting RCS data. The general theme is that applying RCS data is rather straightforward provided that truly pertinent and accurate data are available in suitable form. On the other hand, to settle for less in the way of RCS data is to gamble an expensive system design to save the relatively small investment for obtaining proper data. Author

N74-11967 EMI Electronics Ltd., Wells (England)
STATE OF THE ART AND FUTURE PROSPECTS
L. A. Cram *In* AGARD Determination and Use of Radar Scattering Characteristics Sep. 1973 [illegible] p (For availability see N74-11954 03-07)

The state of the art regarding radar scattering characteristics and their acquisition and use is summarized. It is indicated how a choice may be made among the various methods for finding and for using radar cross section data to assess radar performance. Those are many methods of collecting radar data. Each has its different disadvantages but when the various methods are used with care and within their limitations they give consistent and comparable results with one another. Hence bearing in mind the appreciable costs it is important to choose an optimum use of the various methods. This optimum will often mean some use of all of the techniques. Each radar systems investigation must be examined to determine the particular optimum procedure for finding the echo data needed for that study. Author

THE PROPAGATION OF ELECTROMAGNETIC WAVES OVER IRREGULAR TERRAIN
R W King and H Page *In* AGARD Propagation Effects of Freq Sharing Sep 1973 20 p refs Prepared in cooperation with Imp Coll of Sci and Technol (For availability see N74-13846 05-07)

A method is proposed for calculating the field strength of radio frequency signals propagated over irregular terrain, a typical application is to estimate the diffraction loss in the shadow of hills, or similar obstacles, for terrestrial transmitters working on frequencies between 50 and 1000 MHz Approximations are made in the theoretical treatment in order to make the method sufficiently simple to be used in the planning of practical systems The ground irregularities are regarded as approximating to one or other of a set of standard obstacles, the extent of the local irregularity which determines the effective obstacle shape is determined, thus enabling irregular ground to be approximated to a series of the standardized obstacles The diffraction loss is deduced first for single obstacles and then for multiple obstacles, the obstacles are assumed to be smooth, but the effect of roughness is discussed The theoretical results are compared with measurements using small scale models and also with practical field surveys Author

VARIATIONS IN DIFFRACTION LOSS DUE TO TROPOSPHERIC EFFECTS AT FREQUENCIES BETWEEN 180 MHz AND 10 GHz IN HILLY TERRAIN
Ake Blomquist, Folke Eklund, and Lennart Nilsson *In* AGARD Propagation Effects of Freq Sharing Sep 1973 13 p refs (For availability see N74-13846 05-07)

The variations in time of the diffraction loss at the frequencies 180, 2300 and 9350 MHz have been studied over a 30 km path in irregular terrain typical for central Sweden during a period of about 3 years In addition to these measurements, short term field strength recordings have been carried out at 44, 66, 88 and 1000 MHz The angular distance of the path was 0 38 deg The diffraction loss over the path was normally quite constant at the frequencies studied The stable signal had however, a superimposed component of very small amplitude with rapid fading probably due to turbulent scatter Mainly at night during summer it occured that the screening effect was considerably reduced due to propagation disturbances caused by layered tropospheric structures Two different types of signal can then be distinguished rapid amplitude variations of irregular character with a somewhat higher average level compared to the stable signal mentioned above, and rather slow amplitude variations with deep fading minima of regular character and with a much higher average level than the stable one Statistics of the variations in diffraction loss are presented and possible propagation mechanisms causing the variations are discussed Author

TROPOSPHERIC INFLUENCE ON THE SCREENING EFFECT DUE TO A MOUNTAIN RIDGE, ON 3 GHz
I Ranzi and P Giorgi *In* AGARD Propagation Effects of Freq Sharing Sep 1973 3 p (For availability see N74-13846 05-07)

During one year, measurements have been carried out of the basic propagation loss at 3 04 GHz in a 56 2 km path, comprising a mountain flat top of 933 m of height The annual median value of the basic propagation loss resulted to be 220 7 db, the median loss due to obstacle was 83 7 db, that is more than 45 db higher than the loss due to a knife edge obstacle The statistical analysis of the received signal showed the presence of a Rayleigh component and of a slow fading component, the monthly median value of the last component was about 10 db lower than the Rayleigh component on January and 3 db lower on June As the monthly median signal amplitude increased by about 14 db from January to June, it seems that an important contribution derived from partial reflections from relatively stable layers above the mountain top Author

PRECIPITATION MODELS FROM RADAR AND RAINFALL DATA
Frederick J Altman *In* AGARD Propagation Effects of Freq Sharing Sep 1973 18 p refs (For availability see N74-13846 05-07)

To guide estimates of attenuation and scattering of radio waves, a model for spatial distributions of reflectivity in storm cells has been fitted to digitized radar data The model assumes ellipses for contours of constant reflectivity factor Z with constant orientation and eccentricity within a horizontal cell cross section at a given time and evaluation The centers of the ellipses are assumed uniformly spaced on a straight line with areas linearly related to log Z except for cell tops and bottoms, and for splitting, the cross sections were similar at different heights, especially for the highest reflectivities In an attempt to relate reflectivity aloft to surface rainfall, similar radar data and hourly rainfall from 30 stations within a circular area about 200 km in radius were used to study precipitation distributions in time and space Both types of data were found to provide similar distributions, with useful correlations among several parameters Author

MEASUREMENTS OF PRECIPITATION SCATTER AT 11.6 GHz
F Dintelmann and F Ruecker *In* AGARD Propagation Effects of Freq Sharing Sep 1973 6 p refs (For availability see N74-13846 05-07)

A bistatical experimental study of precipitation scatter at 11.6 GHz is proposed that uses simultaneously steerable tranrmitting and receiving antennas separated by a large area. This allows for scatter observations on rainshowers crossing the radio link and to determine the structure and dynamics of rain cells. GG

N74-13856 Office of Telecommunications, Boulder, Colo
ESTIMATING ATTENUATION, SCINTILLATION, AND SCATTERING DUE TO RAINFALL FOR SATELLITE/GROUND SYSTEMS
H T Dougherty and E J Dutton *In* AGARD Propagation Effects of Freq Sharing Sep 1973 13 p refs (For availability see N74-13946 05-07)

A state-of-the-art engineering model is described for estimating the expected performance degradation of satellite-to-ground microwave systems because of atmospheric gases, clouds, and rain. The model incorporates an allowance for the spatial structure of atmospheric gases, clouds and rain as well as local and regional rainfall statistics. The estimates are in terms of attenuation and scintillation as well as the volume reflectivity which contributes to co-channel interference. Composite predictions are given for 15 GHz, as representative of microwave signals for small percentages of an average year. This prediction is a function of location and the angle-of-arrival at ground stations on the central east coast of the U S A. Author

SOME ASPECTS OF NEAR AND FAR ANGLE SIDELOBES IN DOUBLE-REFLECTOR ANTENNAS
J Dijk and E J Maanders *In* AGARD Propagation Effects of Freq Sharing Sep 1973 16 p refs (For availability see N74-13846 05-07)

Analysis and synthesis of the directive gain pattern of reflector antennas, especially Cassegrain antennas are considered. After a short introduction into the geometry of classical and shaped Cassegrain antennas, scalar aperture theory is used in a method to calculate the main lobe and near angle sidelobes of a blocked aperture. Scalar aperture theory is also used to calculate the sidelobes of mismatched shaped Cassegrain antennas. The second part of the paper deals with far angle sidelobes. An example of Kirchhoff integration is shown and finally it is demonstrated that by shaping main and subreflector power scattered by subreflector and supports may be transported in the correct phase to the aperture, decreasing far angle scattering. THE RADIATION DIAGRAMS OF ANTENNAS USED IN TERRESTRIAL MICROWAVE LINE-OF-SIGHT SYSTEMS
C Colavito and G Masone *In* AGARD Propagation Effects of Freq Sharing Sep 1973 8 p refs (For availability see N74-13846 05-07)

Measurements carried out on parabolic disk antennas used in terrestrial microwave line of sight relay systems are reported. These systems are allocated in the 7 GHz frequency band which is shared between terrestrial and satellite fixed services. The measurements have been performed in a field where the free space propagation conditions were approximated, as well as in the real installation conditions. In the two above mentioned situations, the smoothed envelopes of the radiation diagrams have been obtained for different types of antennas. Some conclusive remarks are made concerning the characteristics of the terrestrial radio relay antennas to be considered in the interference analyses. Author

SYNTHESIS OF APERTURE DISTRIBUTIONS FOR OPTIMUM GAIN WITH NOISE AND INTERFERENCE REJECTION
M Safak and P Delogne *In* AGARD Propagation Effects of Freq Sharing Sep 1973 12 p refs (For availability see N74-13846 05-07)

Synthesis of the aperture distributions yielding the best rejection of noise or interfering sources located in a given region of the radiation pattern is examined. Previous methods are reviewed. It is shown that they are not always optimum or require too much computer time, or yield too complicated distributions for practical purposes. The proposed method permits the optimization of the gain-to-temperature ratio for an arbitrary distribution of noise and interfering sources. It avoids superdirectivity and even unnecessary sophistication of the distribution. Results are presented for linear and circular apertures with symmetrical distributions. Author

DUCTING PROPERTIES OF ELEVATED LAYERS
C Fangler *In* AGARD Propagation Effects of Freq Sharing Sep 1963 9 p refs (For availability see N74-13846 05-07)

Field strength observed at VHF and UHF transhorizon paths exceeds considerably the average value in 10% of time. These 10% values are due to the influence of elevated layers if ground based layers are absent. In the referred observations at individual paths the obvious explanation by reflection processes fails because of ray geometry. Ducting mechanisms have to be assumed. The possibilities of ducting are generally considered in point of view of ray theory, wave optics, and path geometry for various tropospheric profiles. Author

THE OCCURRENCE OF VERY HIGH FIELD STRENGTHS AT BEYOND THE HORIZON PROPAGATION OVER SEA IN THE FREQUENCY RANGE 60 - 5000 MHz
Sture Wickerts and Lennart Nilsson *In* AGARD Propagation Effects of Freq Sharing Sep 1973 15 p refs (For availability see N74-13846 05-07)

The occurrence of enhanced fields has been studied over a sea path of 160 km at the frequencies 170 MHz, 460 MHz and 5000 MHz. For short periods also 60 MHz was used. Long term measurements of field strength have been performed since 1968, which includes some period of meteorological measurement. For these measurements an airborne refractometer, captive balloon sondes and an acoustic sounder were used. The received signals can be classified by the following three types. Standard atmosphere signal (tropospheric scatter signal), unstable high signal caused by reflection in elevated tropospheric layers, and stable high signal caused by ducting. The fact that the signals at different frequencies are only occasionally correlated indicates that the propagation is governed by different mechanisms in

different parts of the frequency spectrum. A case study of propagation under various tropospheric conditions and the long term statistics of the different signal types are given. Author

INTERFERENCE MEASUREMENTS AT 15.7 GHz OVER A LONG TRANSHORIZON PATH

R. L. Olsen and U. H. W. Lammers. *In* AGARD Propagation Effects of Freq. Sharing, Sep. 1973. 15 p. refs. Prepared in cooperation with AFCRL, H. G. Hanscom Field, Mass. (For availability see N74-13846 05-07)

Experiments are being carried out to obtain transmission loss statistics for 500 km overland path at 15.7 GHz. The interference situation simulated is that of a terrestrial transmitter interfering into the earth terminal receiver of a space communications system along the great circle path between them or at off path angles close to the great circle azimuth. The initial results of measurements over a six month period indicate that, for this path, the empirical method underestimates the transmission loss not exceeded for small percentages of the time by an amount which increases with the elevation angle of the earth station antenna. Additional analysis is also being carried out to determine the relative occurrences of turbulent scattering, hydrometer scatter (including cloud scatter), and ducting, and to separate the data accordingly. TROPOSCATTER PROPAGATION IN AN EQUATORIAL CLIMATE

R. Larson. *In* AGARD Propagation Effects of Freq. Sharing, Sep. 1973. 9 p. refs. Sponsored by the Min. of Defence (For availability see N74-13846 05-07)

A troposcatter link between Singapore and Penang was operated for almost two years. During this time continuous analogue recordings of received signal strength were made, and meteorological measurements were also made at both ends of the link. The radiometeorology proved to be very stable and was an excellent example of equatorial type climate. The measured median signal level was very close to the predicted value and also the hourly median signal levels followed a log-normal distribution with great fidelity, even to extreme percentage levels, both high and low. Consideration of the available data led to the conclusion that there was no evidence of any ducting at all, a pure scatter signal being received throughout. Fast fading records indicated that even at the highest signal levels a Rayleigh fading signal was present, and the log-normal and Rayleigh distributions have been combined to produce an overall distribution of instantaneous signal level. STATISTICS OF HIGH-LEVEL BEYOND-HORIZON SIGNALS AT 2.2 GHz AND 2.6 GHz, AND MEASUREMENTS OF THE VARIATION OF THE ARRIVAL-ANGLE-STRUCTURE

M. P. M. Hall. *In* AGARD Propagation Effects of Freq. Sharing, Sep. 1973. 10 p. refs. (For availability see N74-13846 05-07)

Continuous recordings of field strength were made simultaneously over two 300 km troposcatter paths, one over land at 2.6 GHz and the other partly over sea at 2.2 GHz. The recordings were made on 12 m diameter antennae at Chilbolton (near Winchester, UK). Periodically, the 25 m diameter steerable antenna was used to scan across the paths in bearing and elevation to determine the angular distribution of the arriving energy. An analysis is presented of the high signal strengths exceeded for small percentages of the time, of the relative duration of these enhancement periods, and of the changes in angular spread which occurred as the high signals built up and died away. Results from an analysis of the cross correlation of the outputs from large and small antennas are presented in order to determine if phase cancellation of unwanted interference may be feasible during periods when interference signals on troposcatter paths become unacceptable high. HF MEASUREMENTS OF OCEAN-WAVE DIRECTIONAL SPECTRA

Robert H. Stewart, Calvin Teague, Joseph W. Joy, and G. Leonard Tyler. *In* AGARD Propagation Effects of Freq. Sharing, Sep. 1973. 7 p. refs. Prepared in cooperation with Stanford Univ. (For availability see N74-13843 05-07)
(Contract N00014-69-A-0200-6012)

Bragg scattered HF radio waves were used to measure the directional spectrum of 0.14 Hz ocean waves during a time when they were in equilibrium with a constant and spatially homogeneous wind field. The radio data consisted of monostatic measurements of LORAN A radio signals backscattered from the ocean. These signals are pulsed, coherent, and vertically polarized and are resonantly scattered only by 0.14 Hz ocean waves moving radially toward or away from the transmitter-receiver point. The direction of arrival of the radio waves, and thus the directional distribution of the ocean wave energy, was determined by synthesizing a directional antenna having a maximum beamwidth of 5.10 deg. The synthesis was done by moving the receiver along two nearly orthogonal paths using the runway and taxiways of the island. The right-left ambiguity in the synthesized antenna was resolved by using a switched cardioid antenna which looked alternately to the right and the left as the basic receiving element. The angular dependence of the ocean wave directional spectrum is presented as a function of wind speed. Author

EXPLANATION OF VERY LOW FIELD STRENGTH LEVELS ON LINE-OF-SIGHT PATHS OVER SEA

H. W. Fruechtenicht. *In* AGARD Propagation Effects of Freq. Sharing, Sep. 1973. 12 p. refs. (For availability see N74-13846 05-07)

Line of sight propagation over sea may be treated by ray tracing. The method is applied to linear profiles and duct profiles of the refractive index. The model calculation show that the receiving field passes through a number of interferences lobes if the duct thickness is increased. This effect is verified by experiments. Furthermore the theoretical considerations yield that the sea evaporation duct causes a certain antenna height, where the receiving field may vanish. With increasing duct thickness, this special receiving point is shifted upwards. Vertical polarization puts it on a lower level than horizontal polarization. Moreover, with increasing duct thickness it is shifted upwards more slowly for vertical polarization than for horizontal polarization. Author

ANALYSIS OF 11 GHz BAND PROPAGATION IN PORTUGAL

J. A. Saraiva Mendes. *In* AGARD Propagation Effects of Freq. Sharing, Sep. 1973. 8 p. refs. (For availability see N74-13846 05-07)

Supplemental attenuation due to rain at 11 GHz on paths 20 km long in different places of Portugal is estimated. The cumulative distributions of clock hourly rain rates for Lisbon, Oporto and Coimbra are calculated and compared with those obtained directly from climatic data using the method proposed by Russak and Easley. Then, using the methods proposed by Quarta and by Boithias et al, the cumulative distributions of instantaneous attenuation due to rain are also calculated for Lisbon, Oporto and Coimbra. The results obtained with both methods are compared and discussed. It seems that the method proposed by Boithias et al cannot be widely used in Portugal. However, the reduction coefficients proposed by Boithias et al in order to obtain the equivalent rain rate along a path lead to distributions similar to those obtained with with the method proposed by Quarta. The estimated supplemental attenuation in a path 20 km long at 11 GHz is about 35 db for 0.001% of the year and for paths orthogonal to the dominant winds. Author

MEASUREMENT OF ATMOSPHERIC ATTENUATION AT THE FREQUENCIES OF 15, 19, AND 34 GHz
George G Haroules, Wilfred E Brown, and Gregory J Bishop *In* AGARD Propagation Effects of Freq Sharing Sep 1973 14 p refs (For availability see N74-13846 05-07)

There are two methods of determining atmospheric attenuation without having to use a space vehicle In the first, attenuation may be measured by observing the extinction of an exoatmospheric source as a function of the zenith angle The second method depends upon the measurement of atmospheric emission from which the corresponding attenuation is calculated using an assumed atmospheric mean temperature The magnitude of atmospheric attenuation and the relative time interval of its occurrence at millimeter wavelengths must include consideration of the elevation angle of observation Knowledge of the percentage of time during which relatively high values of attenuation are observed is irrelevant without consideration of the elevation angle of observation at the time of occurrence Attenuation statistics resulting from a twelve month observation program are presented The sun is used as a source of microwave radiation The dynamic range of atmospheric attenuation measurement capability is in excess of 30 db Author

ROBOT DATA SCREENING: AN INTELLIGENT (?) DATA SEARCH TECHNIQUE
Theodor D. Sterling *In* AGARD Artificial Intelligence Sep 1971 8 p refs (See N72-11174 02-08)
Avail: NTIS HC $6.00/MF $0.95

The process of robot data screening is described and an evaluation is made of its potential as a possible heuristic procedure to aid in sorting out the most important features in an aggregate of empirical observations. Robot screening uses a measure of relevance of variables derived from the usefulness of variables to serve as predictors for the outcomes of observations. It is pointed out that, although probability of correct cross-classification is a satisfactory method, entropy constitutes a more suitable criteria for determining relevance. In robot screening, the entropy produced with each cross classification is examined and those that indicate the largest change in entropy are selected. Special tests are then applied to each variable or variable combinations to see if its use is an improvement over the use of no or fewer predictors. As a final step, a search algorithm provides a practical method to converge upon the more useful cross-classification variable combinations. D.L.G.

ON TYE QUESTION ANSWERING SYSTEM DELFI AND ITS APPLICATION
J. Kontos and A. Kossidas *In* AGARD Artificial Intelligence Sep 1971 6 p refs (See N72-11174 02-08)
Avail: NTIS HC $6.00/MF $0.95

The latest version of the question-answering system DELFI is described and examples of its application are given. DELFI is based on the automatic generation of programs that express the meaning of English-like sentences via a procedural intermediate language. The general characteristics of DELFI are: mass storage data-base, variety of application, modular design and almost realistic scale of performance. The English-like sentences accepted by DELFI include statements, questions, commands, and conditional sentences. These sentences are parsed and translated by a grammar-directed semantic interpreter into programs in a high-level procedural language composed from procedural semantic components. The procedural semantic components used perform operations which are of logical, set processing, data flow control and program flow control kind respectively. The programs generated have access to the data-base for updating and retrieval. Examples of application of DELFI are given in data management, picture processing and simple problem solving. Author

AN APPROACH TO NATURAL LANGUAGE FOR COMMAND AND CONTROL SYSTEMS
A. Lanzara *In* AGARD Artificial Intelligence Sep 1971 9 p refs (See N72-11174 02-08)
Avail: NTIS HC $6.00/MF $0.95

The feasibility was examined of defining a highly user-oriented language, as close as possible to a natural language, for command and control systems. Several different language models were analyzed. Because of the recognized difficulty of computer programs to fully understand a natural language, the study goal was changed to the identification of a habitual language. The suitability of different models to describe the habitual language is discussed and the most promising model is selected. Possible methodology to be used to tailor the model to a particular command and control environment is also discussed. D.L.G.

WEATHER RADAR IMAGE PROCESSING

A W Bridgewater *In* AGARD Artificial Intelligence Sep 1971 13 p refs (See N72-11174 02-08)
Avail NTIS HC $6.00 MF $0.95

The use is explored of computer image-processing for feature extraction in PPI displays of radar backscatter. The picture is transformed or processed in order to reveal to the human analyst certain structural parameters of the patterns which are not directly accessible by visual inspection. Once identified, these parameters are extracted automatically and summary statistics of precipitation characteristics can be built up for long sequences of pictures. In the search for suitable features to describe the attenuation phenomena, the two-dimensional autocorrelation function of the image is shown to be useful. It is implemented digitally using the fast Fourier transform algorithm and it results in relatively regular, smoothly contoured structures which indicate average measures of ellipticity, directivity, periodicity, and correlation distances of the echo patterns. Data reduction methods for quantifying and extracting these features are described. Author

AUTOMATIC DETECTION OF VEHICLES IN AERIAL PHOTOGRAPHS OF HIGHWAYS
Juris G. Raudseps. *In* AGARD Artificial Intelligence Sep 1971 8 p (See N72-11174 02-08)
Avail NTIS HC $6.00 MF $0.95

The problem of time and effort involved in the data reduction process with information obtained through aerial photographs of highways is dealt with. An approach to automating the data reduction process is described. Techniques from the fields of interactive computer graphics and automatic pattern recognition are used in combination to reduce the amount of human effort required. A computer-controlled flying-spot scanner is used to scan the photographs. By means of a graphics tablet and stylus, a human operator selects ground reference points, delineates road boundaries, and may mark vehicles. The computer extrapolates the trajectories of vehicles to predict their positions in successive photographs. Their precise locations are then determined and recorded by applying pattern recognition techniques, matching the vehicle images in the current frame against their recorded images in the previous frame of photography. Avail NTIS HC $6.00 MF $0.95

Two nonparametric sequential classification procedures are applied to medical diagnosis problems. The procedures include (1) sequential classification using nonparametric partition, and (2) sequential classification using nonparametric ranking. Specific results of some real-data medical diagnosis are presented for the problems of separating primary liver cancer from primary cancer of the pancreas, and for the separation of those from normal cases. The measurements (features) used are blood chemistry and hematology values, urinalysis, X-ray and liver scan results, and ECG and EEG analysis. Classifications for the training data were determined according to the patients' most recent diagnosis, either by biopsy at surgery or pathology at autopsy. The results obtained from these two proposed procedures are compared and their corresponding advantages and disadvantages are discussed. Author

KINEMATIC ASPECTS OF PROJECT OF UNCONVENTIONAL LOCOMOTION VEHICLES
T. Leo and R. Vitelli. *In* AGARD Artificial Intelligence Sep 1971 10 p refs (See N72-11174 02-08)
Avail NTIS HC $6.00 MF $0.95

The development is reported of an unconventional locomotion vehicle, capable of moving on jointed legs and performing rectilinear displacements on an horizontal plane. Movement is automatically controlled by input signals but the degree of control is limited to translational speed. The problem considered involves the additional development of a steering control system. A theoretical study is described in which a heuristic approach to the problem is taken. The minimum possible number of degrees of freedom are used and stability conditions of vehicle motion and other given constraints on locomotion are respected. In addition, complete automation of the vehicle is maintained. D.L.G.

RECOGNIZING THREE DIMENSIONAL OBJECTS BY THEIR SILHOUETTES
J. Sklansky and G. A. Davison, Jr. *In* AGARD Artificial Intelligence Sep 1971 11 p refs Prepared in cooperation with Calif. Univ., Irvine (See N72-11174 02-08)
(Contract F33615-69-C-1314)
Avail NTIS HC $6.00 MF $0.95

A method is described for classifying or identifying a three-dimensional object from one or more of its silhouettes. The method is based on a low-cost parallel mechanism for computing the slope density of the edge of the silhouette. The proposed technique computes the slope density by a circularly nutating array of photodetectors. The slope density is then passed through a set of narrow-band-pass filters, yielding the Fourier harmonics of the slope density. In order to take account of varying aspect angles of the original object, the object is

represented by a number of prototypes, each prototype being a vector of the Fourier harmonics of the slope density. These prototypes appear in a decision tree that makes the final recognition. An experimental machine implementing this technique is described, and the results obtained with the machine for recognizing five classes of aircraft are given. Author

SEQUENTIAL STRUCTURE AND PARAMETER ADAPTIVE PATTERN RECOGNITION. PART 1. SUPERVISED LEARNING
D. G. Lainiotis. *In* AGARD, Artificial Intelligence, Sep. 1971, 11 p, refs (See N72-11174 02-08)
(Grants AF-AFOSR-1784-69, AF-AFOSR-0788-67E)
Avail: NTIS, HC $6.00/MF $0.95

Recursive filters for supervised learning Bayes-optimal adaptive pattern recognition with continuous data are derived. Both off-line (or prior to actual operation) and on-line (while in operation) supervised learning is considered. The concept of structure adaptation is introduced and both structure as well as parameter adaptive optimal pattern recognition systems are obtained. Specifically, for the class of supervised learning pattern recognition problems with Gaussian process models and linear dynamics, the adaptive pattern recognition systems are shown to be decomposable into a linear, non-adaptive part consisting of recursive, matched Kalman filters, a nonlinear part consisting of a set of probability computers that incorporates the adaptive nature of the system, and finally a linear part of the correlator-estimator form. Extensions of the above results to the M-ary hypotheses cases, where M > or = 2 are given. Author

SEMI-ADAPTIVE APPROACH TO PATTERN RECOGNITION
John M. Richardson. *In* AGARD, Artificial Intelligence, Sep. 1971, 7 p, refs (See N72-11174 02-08)
Avail: NTIS, HC $6.00/MF $0.95

Two kinds of approaches to pattern recognition, representing extreme limits of the adaptive-nonadaptive axis, are considered. These include (1) the adaptive approach in which the prior information is composed mainly of pre-classified training patterns with a very limited amount of information designed into the system, and (2) the nonadaptive approach in which the prior information is composed entirely of information designed into the system. Emphasis is placed on deriving some intermediate approaches by combining various aspects of the two described approaches. The methodology employed involves the use of mathematical models of pattern classes to which decision theory is applied. The models, although stochastic, are partially indeterminate in the sense that some of the probability parameters are not completely known. In the adaption phase both Bayesian and non-Bayesian techniques are considered for the reduction of model indeterminacy through pre-classified samples. D. L. G.

A GENERAL ORDER MINKOWSKI METRIC PATTERN CLASSIFIER
Pierre A. Devijver. *In* AGARD, Artificial Intelligence, Sep. 1971, 11 p, refs (See N72-11174 02-08)
Avail: NTIS, $6.00, MF $0.95

One general category of multiclass deterministic pattern recognition systems is defined by a linear structure in the input variables and an analytical criterion. This criterion requires the minimization of the average pth power of one Minkowski distance measure of order p in one particular decision space. Analytical reasoning indicates that the criterion yields an error-correcting procedure. The procedure results in a reduction of the number of misclassifications when the order of the criterion metric is increased. This feature renders the criterion particularly well suited to nonseparable problems. It is briefly mentioned how this design criterion may be used to produce optimized decision surfaces in the separable two class case, as it tends to maximize the minimum distance from each class to the decision surface. The Bayesian distribution-free classifier appears as a special case of the general category of classifiers defined by the criterion. Author

PREPROCESSING FOR PICTORIAL PATTERN RECOGNITION
R. H. Cofer and J. T. Tou. *In* AGARD, Artificial Intelligence, Sep. 1971, 13 p, refs (See N72-11174 02-08)
(Contract N00014-68-A-0173-0001)
Avail: NTIS, HC $6.00/MF $0.95

An integrated preprocessing system is presented for the purpose of line extraction. This system consists of six stages, each of which reduces an abstract, line defined, line network of a picture to a form which represents the physical line structure more meaningfully or efficiently. In operation, the picture is first stripped of all spurious objects and holes. A connected medial axis is then found for each object in order to reduce the line width. This is followed by removal of all 4-point loops, resulting everywhere in abstract lines of unit thickness. Noise branches, a natural result of the prior processing techniques, are then removed. For greater processing flexibility, the abstract line structure is then inserted into a list data structure composed of line, junction, and endpoint entries. The resulting structure is then further processed in order to improve the representation of those junctions of many lines. The final representation of the picture serves as an ordered, high level data base upon which further pattern analysis, recognition, or processing may be conducted. Author

A NAIVE METHOD FOR MACHINE RECOGNITION OF HAND WRITTEN NUMERALS
M. Beun. *In* AGARD, Artificial Intelligence, Sep. 1971, 10 p, refs (See N72-11174 02-08)
Avail: NTIS, HC $6.00/MF $0.95

A method for character recognition by machines is described. The character to be recognized is scanned to obtain a matrix of black and white dots, to which a thinning process is then applied. This process, which has built in a precaution not to destroy connectivity, produces a skeleton of which no further point can be removed without either destroying connectivity or eating away end points. Features as end points and junctions are now readily detected and their occurrence and relative positions provide the basis of a recognition scheme. The recognition scheme is so made up that more and finer recognition criteria can be added when needed, without basically affecting the recognition possibilities already attained. Moreover, as more experience is gained as to the most effective criteria, a completely fresh start often produces a new recognition scheme that is simpler and more powerful than its predecessors. HOLOGRAPHIC PATTERN RECOGNITION USING A MULTICHANNEL CORRELATOR
G. Winzer and N. Doukliss. *In* AGARD, Artificial Intelligence, Sep. 1971, 12 p, refs, Sponsored by Bundesmin. fuer Bildung und Wiss. (See N72-11174 02-08)
Avail: NTIS, HC $6.00, MF $0.95

A multichannel correlator for holographic matched filtering is described. The channels are separated spatially in the Fourier-plane. This arrangement allows individual filters to be realized for each channel for different spatial frequency ranges etc. The multichannel correlator is addressed by a generator of multiple object waves, e.g. by different directions of object illumination. Parallel and sequential evaluation of the correlation signals is possible. The efficiency and signal-to-noise ratio for

both modes of operation are discussed. In each channel linear superimposed multiple Vander-Lugt filters may be introduced to increase the overall capacity of learning steps. The risk of overexposure is very small because the centers of the frequency spectra are separated on the hologram filter plate. With a multichannel correlator combined matched and feature filtering may be performed. Preliminary experimental results show that this method can be successfully used in some cases where the results of simple matched filtering remain unsatisfactory. The results and discussions are presented from a more general point of view with some remarks concerning comparable methods and possible future aspects. Author

DIGITAL FILTERING PROCEDURES FOR A LINE IMAGE [PROCEDES DE FILTRAGE DIGITAL D'UNE IMAGE DE LIGNES]
J. C. Simon and A. Checroun. *In* AGARD. Artificial Intelligence. Sep 1971. 14 p. refs. In FRENCH; ENGLISH summary. (See N72-11174 02-08)
Avail: NTIS HC $6.00; MF $0.95

The use of computers to analyze data which modifies the usual representation concepts are discussed. The following constraints introduced by computers are analyzed: digitization, memory size, and algorithmic treatments. An adaptation of the conventional filtering processes of an image leads to digital filters, which are well suited to arithmetic computation. These principles are applied to the optimal storage of an image, to the reduction of information volume, and to the first level features extractions. The PPI radar information is processed by these methods. The aim is to reduce the available information to a few specific features that will describe a radar situation. Hill ridges are such features. They are automatically extracted and represented by lines, which are then coded and stored. Author

Avail: NTIS

The types of difficulties encountered in developing and maintaining airborne computer programs are reviewed. These include problems encountered in the initial development of the system program and the significant changes to the original program based on laboratory and flight tests of the over-all system. By assimilating results of previous system development experience and predicting the trends in airborne computer hardware development, characteristics are proposed for future airborne Guidance and Control computers. The proposed computer characteristics would minimize significant programming difficulties while retaining desirable hardware features (e.g., protected memory, small size, etc.). The features covered include word length tradeoffs, type of arithmetic, addressing techniques, subprogram linkages, etc., and in summary represent a functional specification for a class of future airborne computers using MSI or LSI techniques. Finally, the specific characteristics are presented of an airborne computer designed to meet these functional specifications. Author

AEROSPACE COMPUTER WORD LENGTH CONSIDERATIONS
G. W. Braudaway and C. J. Standish *In* AGARD Computers in the Guidance and Control of Aerospace Vehicles Feb. 1972 p 65-71 refs (See N72-21211 12-08)
Avail: NTIS

A number of data word and instruction format factors are described which must be considered when selecting the length(s) of instructions and data words to be implemented in an aerospace computer. The primary emphasis is on selection of data-word and instruction lengths under the constraint that data and instruction lengths are compatible. This is, the data-word length is an integral multiple of the instruction word length. This implementation is appropriate when data and instructions are to be stored in the same area of memory. In a section devoted to storage efficiency, the effects on implementation of removing this compatibility constraint are examined. Examples drawn from avionic navigation computations are used to illustrate the premise that variable word length arithmetic can be used to produce numeric results equivalent to those produced by uniform word length arithmetic while reducing storage requirements substantially. Additional storage savings can result from use of variable length instruction formats. The need is demonstrated for continued development of programming techniques for utilizing variable word length arithmetic and instruction formats efficiently. Author

COMPUTERS FOR LORAN C/D AND OMEGA NAVIGATION AND GUIDANCE SYSTEMS

James P. VanEtten and Gerald P. Zemlin *In* AGARD Computers in the Guidance Control of Aerospace Vehicles Feb. 1972 p 175-228 refs (See N72-21211 12-08)

Avail: NTIS

A synopsis is given of geometry fundamentals pertinent to position-accuracy assessment, the fundamentals of both the loran C/D and Omega systems (including technical summaries of low-frequency and very-low-frequency propagation), and the general effects of vehicle dynamics on system implementation. The application of the modern airborne digital computer to radio navigation signal processing tasks such as signal acquisition and signal tracking is described for both loran C/D and Omega, using advanced radio navigation sensor design approaches as a basis. The more common application of computers to the task of converting from hyperbolic radio coordinates to geographic coordinates of latitude and longitude, and from these to UTM northing and easting, is treated, and the problems entailed in correcting these geographic coordinates for variations in radio propagation are also addressed. Simplified techniques for application of hyperbolic radio navigation data to guidance functions are discussed. Finally, the implications of loran C/D and Omega processing tasks toward establishment of efficient architecture for airborne computers, are discussed, and short tables of desired instructions listed in order of importance are presented. COMPUTERS FOR SATELLITE BASED NAVIGATION AND GUIDANCE SYSTEMS

T. L. Rodrick and T. I. Fuse *In* AGARD Computers in the Guidance and Control of Aerospace Vehicles Feb. 1972 p 229-245 refs (See N72-21211 12-08)

Avail: NTIS

The considerations involved in selecting a computer for an airborne navigation satellite user are examined. The software is described which will be used by navigation satellite users and which determines the user's computer requirements. The navigation satellite systems which are treated, are ranging or range differencing systems in which the user is passive (does not transmit to the satellite). The software is described in modular fashion to illustrate how a variety of user needs can be satisfied by different combinations of the same modular components. A description of the Kalman filter design considerations for a combined navigation satellite/inertial system is included which shows how computer speed and memory requirements depend upon the filter state vector size. COMPUTERS FOR THE GUIDANCE AND CONTROL OF TACTICAL AIRCRAFT

W. J. Bernhart *In* AGARD Computers in the Guidance and Control of Aerospace Vehicles Feb. 1972 p 247-268 (See N72-21211 12-08)

Avail: NTIS

The navigational and guidance function provided a typical tactical application by utilization of a digital computer mechanization is analyzed. A brief description is given of the methods utilized to accomplish these functions and the sensors utilized in displaying pilot information and system configuration. The capabilities afforded the tactical vehicle by using digital devices for computation of navigational and guidance algorithms are summarized. Author

IMAGE STORAGE AND TRANSMISSION SYSTEMS FOR THE DISSEMINATION OF INFORMATION

Feb. 1972 44 p refs Conf. Proc. Presented at Joint Meeting, Oslo, 9 Sep 1971

(AGARD-CP-92) Avail: NTIS

Advanced systems of data processing are presented which involve the storage, retrieval, transmission, and reproduction of alphanumeric and pictorial data. Emphasis is placed on techniques of image conversion and display processes utilizing microfilms. For individual titles, see N72-22169 through N72-22173.

AN EXPERIMENTAL TEXT-ACCESS SYSTEM

Donald R. Knudson *In* AGARD Image Storage and Transmission Systems for the Dissemination of Inform. Feb. 1972 9 p refs Sponsored in part by NSF (See N72-22168 13-08)

Avail: NTIS

A system is described which was designed to provide remote access to 90,000 pages of microfilm storage. It is part of a computer-oriented model library for conducting user experiments with two types of library retrieval; one provides access to the computer-stored catalog data for a group of selected documents and the second provides access to the microfilmed text of those documents. The text-access system automatically retrieves, scans, and transmits requested pages to remote display terminals utilizing a wideband transmission network. The current system employs two types of image-storage devices: a direct-view storage tube and a photographic camera. The microfilm images are scanned by a flying-spot scanner, and the scan-line density and sweep rates are varied to accommodate the limitations imposed by the different display terminals. A single coaxial cable path links the terminals to each other and to the central scanning station. Video signals are preceded by encoded digital messages containing a terminal address and commands for controlling terminal functions. A combined catalog/text terminal was developed which displays either the digitally-encoded catalog data or the text video signal on the same cathode-ray tube. The text display electronics were added to a commercially available computer terminal utilizing a storage-tube display to provide access to both catalog and text from a single terminal. Author

COMPUTER AIDED INPUT OF GRAPHIC INFORMATION BY KEYBOARDING UNDER VISUAL CONTROL OF DISPLAY AS APPLIED TO CHEMICAL STRUCTURES

Hans-Stefan Neubert *In* AGARD Image Storage and Transmission Systems for the Dissemination of Inform. Feb. 1972 6 p (See N72-22168 13-08)

Avail: NTIS

A method is described, using computer supported keyboards with graphic displays, for processing and storing structural formulae of chemical compounds. By keyboarding the formula the graphic information is stored and the figure appears on the

screen where it can be verified visually and if necessary the input can be corrected. The proposed computer configuration allows the simultaneous input from 16 terminals. Author

PACKET-SWITCHING NETWORK
D. L. A. Barber *In* AGARD Image Storage and Transmission Systems for the Dissemination of Inform. Feb. 1972 12 p refs (See N72-22168 13-08)
Avail: NTIS

High speed store-and-forward packet-switching techniques are proposed as an alternative to the use of the public telephone network by remote access computing systems. The type of traffic generated when computer systems react with human beings and with each other is examined, and it is shown why the use of the telephone network has drawbacks. Packet-switching is demonstrated to be more appropriate for handling such traffic, and some existing and projected packet-switching schemes are described. The effect these schemes may have on the development of future computing systems is considered, both in respect of computer and terminal development. Author

PHOTOTRANSMISSION AND VIDEO STORAGE
Richard Schaphorst *In* AGARD Image Storage and Transmission Systems for the Dissemination of Inform. Feb. 1972 12 p refs (See N72-22168 13-08)
Avail: NTIS

Four advanced digital visual communication systems for transmitting animated television, single frame television, and facsimile are described in detail. The utilization of a video disc recorder for efficient storage of television images is discussed in application to the single frame TV system. The Digitel System designed for transmission over wideband circuits at 40 million bits/second provides high quality, fully animated color television service. The frame-to-frame Delta coding system operates at 16 million bits/second for digital transmission over conventional 5 MHz video circuits. The Vidicoder System stores TV pictures on a video disc recorder and provides for the digital transmission of a TV frame from one storage device to another up to 1 million bits/second. The Fastfax is a facsimile equipment which digitally transmits black/white and gray scale photographs over any communication channel up to 50 million bits/second. The four systems employ different picture coding and data compression techniques. DIGITEL employs two-bit Differential PCM; the Frame-to-Frame Delta System transmits brightness changes relative to a stored reference picture; the VIDICODER utilizes run length coding and bit plane coding; and the FASTFAX equipment employs run length coding and zero order interpolation processing. The relative performance and compression factors of these coding techniques are analyzed. Author

ESTABLISHING SMALL INFORMATION CENTRES IN INDUSTRY
John P. Bethell *In* AGARD Governmental Assistance for Tech. Inform. in Ind. and Simple Mechanization for Small Inform. Centres Mar. 1973 7 p refs (For availability see N73-24201 15-08)

The function of a small information center in mediating between its community and the wider information network is explained, using the analogy of small medical centers. The differences between the information requirements of industry and those of science are emphasized and the desirability of clearly evaluating an industry's need for information before establishing an information center is indicated. Some of the specific duties of an industrial information center are described and it is stressed that these can now be most efficiently performed by requiring that the senior staff of the center have a broad education in information and its applications. It is recommended that the attitude of the center's staff and its organizational and physical location should be such as to maximize the center's orientation towards its users. Management is warned that some time must elapse before an information center becomes fully effective. Author

THE DEVELOPMENT AND USE OF A MODERN DATA BANK
Dudley G. McConnell *In* AGARD Governmental Assistance for Tech. Inform. in Ind and Simple Mechanization for Small Inform. Centres Mar 1973 8 p (For availability see N73-24201 15-08)
CSCL 09B

The modern data bank emphasizes immediate access by a user community which may be large in number, widespread, and having varied needs. Electronic computers have been found very useful in the processing of stored information. The key to the design of a data bank is the optimum mix of human intellectual effort and mechanized processing. The elements of the NASA data bank are presented as one approach to the many trade-off decisions involved in the development of a data bank and integrated information system. Author

RETRIEVAL OF MICROFICHE - RANDOM ACCESS

Cathryn C. Lyon. *In* AGARD, New Develop. in Storage, Retrieval and Dissemination of Aerospace Inform., Dec. 1973, 7 p, (For availability see N74-16925 08-08)

Three sizes of microfiche retrieval systems are discussed: small, medium and large - that give random access to microfiche and film chips. There are other random systems but they are usually set up for retrieval of microfilm. This paper describes these systems and suggests indexing methods and index format for use with them. It is intended to stimulate thinking about applications that are adaptable to the readers' collections. Author

N74-16935 Defense Documentation Center, Alexandria, Va.

A MICROFICHE SYSTEM FOR SMALL USERS

Robert E. Sauter. *In* AGARD, New Develop. in Storage, Retrieval and Dissemination of Aerospace Inform., Dec. 1973, 11 p, refs (For availability see N74-16925 08-08)

Microfiche are particularly well suited to the reproduction, dissemination, storage and retrieval of documents or records, particularly those of 20-98 pages. Since fiche are flat microforms they are easily retrieved and can be quickly duplicated for mailing or reference. One of the major advantages of the microfiche is a possible savings of 70 percent or more in acquisition costs when a document is available in both microfiche and paper form. Another advantage is the elimination of document storage problems, since low-cost copies of microfiche can be produced at any point on demand. In many situations the most significant advantage is the savings in time and costs for packaging, shipping, storing and retrieving documents. The equipment for small users for duplicating microfiche copies is quite inexpensive when compared to the cost of roll film machines. Microfiche readers and reader printers are also considerably less expensive. The economies achieved are primarily due to simple designs, containing few moving parts or motors. Author

N74-16936 GEC Marconi Electronics Ltd., Chelmsford (England). Research Labs.

A COMPUTER-CONTROLLABLE ULTRAFICHE TERMINAL

F. Duerden. *In* AGARD, New Develop. in Storage, Retrieval and Dissemination of Aerospace Inform., Dec. 1973, 7 p, (For availability see N74-16925 08-08)

The Automated Microform Terminal is a hardware contribution to the problem of cost effectiveness in computer aided learning. But the resultant specification was found to meet a need in information retrieval wherever the retrieval is from a large (say 200,000 pages upwards to many millions) or potentially large base via a computer searched index structure where a fast response is required to a specific enquiry. The terminal exploits the high storage density, handleability, and low copy cost of 149 mm x 105 mm laminated ultrafiche (X 150 magnification). It has adequate precision to select and display any one out of 6000 individually addressable A5 pages from one fiche in 3 to 17 seconds under digital control either from computer or

keyboard. The addition of a small magazine or cassette under development, with automatic fiche selection and capacity for 1/4 million pages, makes the system capacity virtually open ended. Author

N74-16937 European Atomic Energy Community, Luxembourg

ABSTRACTS ON MICROFICHE FOR ON-LINE RETRIEVAL

Carl O. Vernimb. *In* AGARD New Develop. in Storage, Retrieval and Dissemination of Aerospace Inform. Dec. 1973 13 p (For availability see N74-16925 08-08)

A short description of the characteristics of the European nuclear documentation service is given: sources of information, structure of the thesaurus, file organization, retrieval strategy, system performance, and user behavior. Three recent developments are described: (1) installation of a terminal for system/user dialog, direct access to part of the data base (200,000 documents) allows for query adjustment by evaluating the relevance of titles presented on the screen; the adjusted query formulation is applied to the total data base of 1.3 million documents; (2) installation of a microfiche reader-printer with a capacity of close to 300,000 abstracts; the abstracts are presented on a ground-glass screen within 4 seconds after keying in the corresponding reference numbers; and (3) introduction of a relevance feedback routine; relevance decisions gathered when adjusting the query formulation are fed back into the computer together with the adjusted query; the descriptors are weighted according to their occurrence in relevant and irrelevant documents; the documents are ranked according to the sum of weights of their descriptors, and printed out in order of decreasing probability. Author

N74-16938 Mullard Research Labs., Salfords (England)

A RESEARCH WORKER'S VIEW ON THE FUTURE OF AUTOMATIC READING MACHINES

J. A. Weaver. *In* AGARD New Develop. in Storage, Retrieval and Dissemination of Aerospace Inform. Dec. 1973 8 p refs (For availability see N74-16925 08-08)

A general account of the justification for the use of automatic reading machines in a commercial data processing environment is presented. A broad outline of the tasks of the component parts of a reading system is given, together with an indication of how modern reading machines are being made more cost effective than their predecessors. A section is included on the recognition of handprinted material. Future techniques which may increase the capability of reading machines whilst maintaining the current trend towards reducing size and cost are considered. Optical character recognition has been in existence for several years - at a price. It will become very widely used over the next few years as prices fall and data processing managers realize how to use the technique effectively. Author

ALL CHANGE FOR AERONAUTICS

John E. Allen. *In* AGARD New Develop. in Storage, Retrieval and Dissemination of Aerospace Inform. Dec. 1973 5 p (For availability see N74-16925 08-08)

The continuing patterns of changes in design, methods, subjects, fashion and major frameworks of reference have not only increased the volume of aerospace information but its complexity. The information world has responded to this by evolving more and more sophisticated indexing languages, thesaurus classification and automated retrieval. However, there is no consensus of opinion of a best way to proceed and as time goes on and first and second generation automatic systems come into use it will be increasingly difficult to introduce later methods because of the large capital replacement cost involved in such major changes. Costs of complex information systems may become an unacceptable proportion of organisational activity. Moreover such complexity and the existence of automatic systems may make too large demands on staff time, leaving less for consideration of the library/user interface. Often, in aircraft design there are similar tendencies - advanced technology may give a somewhat better aircraft but often only at the expense of more cost, complexity, unreliability etc. Good aeroplanes result from good design which is a strict discipline in avoiding unnecessary elaboration, complexity or cost. In this sense a streamlining and avoidance of duplication, unnecessarily elaborate gadgets etc., may be advantageous. Author

COMPUTER AIDED DESIGN FOR MAXIMUM PRODUCTION YIELD OR MAXIMUM RELIABILITY
P W Becker and F Jensen (Storno A/S, Copenhagen, Denmark) *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 14 p refs (For availability see N74-13906 05-10)

The use of computer aided design is demonstrated as a means of optimizing electronic circuit or system production yield, or, ultimately, drift reliability A mathematical model for the yield or drift reliability is introduced, and methods for numerical evaluation hereof are briefly reviewed The unhappy task of assembling pertinent component data for the computations is also touched upon Various optimization techniques suitable for the problem at hand are next commented upon, and finally the theory is put into use by optimizing the yield of two transistor circuits The results and implications of the optimization are discussed

THE USE OF THE TRANSISTOR SIMULATION PROGRAM SITCAP FOR STATISTICAL MODELING OF BIPOLAR TRANSISTORS
H Deman, R Merten, and H Grevens *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 11 p refs (For availability see N74-13906 05-10)

The program SITCAP is a simulator of bipolar transistors for computer aided circuit analysis The main features of the program are its simple input-output structure and the new emitter model which is included in it The main aspects of the program are described and examples are given of the application of the program for studying the statistical properties of bipolar transistors It is demonstrated that in most cases the Gummel number must be taken as statistical variable, because the most important model parameters are correlated with it

TRANSISTOR EQUIVALENTS
O G Kjaerstad *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 12 p refs (For availability see N74-13906 05-10)

A method is presented to find the linear equivalent circuits of operational amplifiers and bipolar transistors The method is general and the same method can be used to find the equivalent circuits of other components The method is based upon using a CAD-program to minimize an error function by varying the component values of an equivalent circuit The error function is derived from the difference between the computed response of the component for example a transistor, and the known response The known response can be the measured frequency response or derived from the manufacturer's data The results of two projects are presented which include (1) operational amplifier

equivalent below 5 MHz, and (2) bipolar transistor equivalent below 30 MHz. A project to find the equivalent circuit at higher frequencies is outlined. Author

AN OPTIMIZATION TECHNIQUE TO CALCULATE BIPOLAR TRANSISTOR PARAMETERS
Ronald J. Covello (Ellsworth AFB, South Dakota) *In its* Computer Aided Design for Electron Circuits Oct. 1973 12 p refs (For availability see N74-13906 05-10)

Presently, a severe problem exists in nonlinear network analysis. Succinctly stated, this problem is that the measurement of the nonlinear parameters of bipolar transistors is time-consuming, difficult, and costly. An iterative computer technique is described for calculating these parameters using readily measured data. The technique uses a two level optimization process. Initially it assumes an arbitrary set of values for the parameters. It then calculates transistor currents based on these parameters and measured voltages. The calculated and measured currents are then compared and appropriate adjustments are made in the parameters. This process is repeated till calculated and measured values of transistor currents agree. At this time, the parameters are considered known. Results are shown which demonstrate the validity and applicability of the technique. Also, several minor modifications are suggested to optimize the process for production use. Author

LINEAR TRANSISTOR MODELS IN HF NETWORK ANALYSIS. ADAPTION BETWEEN MEASUREMENTS AND ANALYSIS BY COMPUTER
P. Stangerup *In* AGARD Computer Aided Design for Electron Circuits Oct. 1973 22 p refs (For availability see N74-13906 05-10)

It is demonstrated that the problem of including transistor data in linear analysis programs is easily overcome by means of a simple mathematical model. This model can without difficulty be made to cover at least one decade at frequencies up to 1 GHz. At the higher frequencies, the best representation of the transistor is the S-matrix. Therefore it is desirable to make greater use of analysis programs based entirely on the S-parameter representation. Author

STATE OF ART AND FUTURE TRENDS OF COMPUTER-AIDED DESIGN OF MICROWAVE INTEGRATED CIRCUITS
Hans-Norbert Toussaint and Reinmut Hoffmann *In* AGARD Computer Aided Design for Electron Circuits Jan. 1973 14 p (For availability see N74-13906 05-10)

The future trend of MIC design will be to combine the previously separate CAD branches into one CAD system. The hardware and software complement of this system is described. The principal constituents of the software are a conversion program which permits the network to be calculated directly from the circuit layout, and a data bank in which the measured properties of special MIC components (e.g. transmission line discontinuities, lumped elements) are stored. A COMPUTER PROGRAM FOR ANALYZING WAVEGUIDE STRUCTURES
Chuang-Jy Wu and Wayne Johnson *In* AGARD Computer Aided Design for Electron Circuits Oct. 1973 11 p refs (For availability see N74-13906 05-10)

A waveguide structure analysis program was developed in FORTRAN for implementation on an IBM 360/67 computer using the CP/CMS time sharing system. From an input of mechanical dimensions, equivalent circuits of waveguide obstacles are generated by using previously published theoretical and/or experimental results. Assuming that no evanescent mode interaction occurs between obstacles, an ABCD matrix manipulation is used to determine the overall network electrical response. In addition, a classical waveguide filter design program, temperature and mechanical stability tests, and a tuning procedure have been provided to help solve day to day engineering problems. Good agreement was obtained between measured and calculated results for waveguide transformers, and both bandpass and bandstop filters. The program is essentially a piece of powerful design equipment with broadband capability and provides the designer with instant tabulated performance information for analysis. Proper use of the program can save a considerable amount of model shop work and experimental effort in designing various types of waveguide networks. Author

DAP (DISTRIBUTION ANALYSIS PROGRAM) A PROGRAM FOR THE ANALYSIS AND DESIGN OF MICROWAVE CIRCUITS
Joseph L. Tauritz *In* AGARD Computer Aided Design for Electron Circuits Oct. 1973 23 p refs (For availability see N74-13906 05-10)

DAP is an easy to use computer program facilitating the analysis and design of microwave circuits employing lumped and distributed elements. At present it has been in general use for over two years in the Microwave Laboratory of the Delft University of Technology. DAP utilizes a modified chain matrix analysis scheme coupled to an extensive repertoire of microwave elements. Lumped and distributed elements such as resistors, capacitors, inductors, lossy transmission lines (both inline and stub), transformers, and arbitrarily specified ABCD matrices constitute the normal circuit elements. The program's versatility is enhanced by the ease with which new element models may be added by the user. The report includes an introduction to the mathematical basis of the program, with emphasis on its more unusual aspects, supplemented by a number of design examples. The creation of special purpose element types to facilitate phase shifter transistor amplifier and parametric amplifier analysis are described. A comparison with other presently available programs is made, serving designers in several Canadian cities. Author

MICROWAVE CIRCUIT ANALYSIS BY DIGITAL COMPUTER
C. Vidalon *In* AGARD Computer Aided Design for Electron Circuits Oct. 1973 10 p refs (For availability see N74-13906 05-10)

The program ACLINE was conceived for the treatment in the frequency domain of the most general form of linear active networks with lumped and distributed elements (stubs, lines, coupled lines, circulators, etc.). The components of the network may be described as black boxes, characterized by S, Y or Z parameters, and stored in a library with a code name. It is also possible to use subnetworks, that are, after treatment, considered as conventional black-boxes. Four types of controlled sources allow the optimum choice of active devices equivalent circuits. A great number of results may be obtained from ACLINE, including all parameters or functions currently used to characterize linear networks performances in the frequency domain. Sensitivities computation is made through two different methods. For a check over a great number of components a general method is used. A simple step-by-step optimization process may then be applied over a small number of sensitive parameters with a faster method (I A M.). Sophisticated mathematical models of microwave active devices are also included in the program (avalanche diode for example). Author

COMPUTER AIDED DESIGN ANALYSIS OF MODERN LARGE SCALE CIRCUITS AND SUBSYSTEMS

W. Hochwald. *In* AGARD Computer Aided Design for Electron. Circuits. Oct. 1973. 41 p. refs (For availability see N74-13906 05-10)

The SYSCAP (System of Circuit Analysis Programs) SELECT (System Evaluation of Large Scale Electronic Circuits and Transforms) family of computer programs ranks among the more powerful computer aids available to the design, production, reliability, and logistics engineer. As such, SYSCAP/SELECT encompasses proven technology in device modeling and mathematical structures, while stressing ease of usage and economy. Flexibility is provided to handle bipolar transistor electronics as well as MOS (Metal Oxide on Silicon) MSI/LSI (Medium and Large Scale Integrated) circuits on an individual basis, in hybrid configurations, or in conjunction with functional system elements. The capabilities, user features, and options of SYSCAP/SELECT are presented. A circuit example and a control loop subsystem design example are given. Theoretical background data are presented to substantiate the solution processes that are utilized. Application areas where SYSCAP/SELECT has proven to be cost effective are described with reference to the development cycle of complex modern electronic and electro-mechanical equipment. Author

THE NASA COMPUTER AIDED DESIGN AND TEST SYSTEM
J. M. Gould and K. Juergansen *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 13 p refs (For availability see N74-13906 05-10)

A family of computer programs facilitating the design, layout, evaluation, and testing of digital electronic circuitry is described. CADAT (computer aided design and test system) is intended for use by NASA and its contractors and is aimed predominantly at providing cost effective microelectronic subsystems based on custom designed metal oxide semiconductor (MOS) large scale integrated circuits (LSIC's). CADAT software can be easily adopted by installations with a wide variety of computer hardware configurations. Its structure permits ease of update to more powerful component programs and to newly emerging LSIC technologies. The components of the CADAT system are described stressing the interaction of programs rather than detail of coding or algorithms. The CADAT system provides computer aids to derive and document the design intent, includes powerful automatic layout software, permits detailed geometry checks and performance simulation based on mask data, and furnishes test pattern sequences for hardware testing.

COMPUTER AIDED DESIGN OF MULTILAYER PRINTED CIRCUIT BOARDS
W. E. Hillier *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 14 p refs (For availability see N74-13906 05-10)

The interactive computer layout of large multilayer printed circuit boards, including through via hole boards as well as buried via hole boards, is described. A full description of the software used is given together with details of the hardware and man machine interface. The system used is shown to be an extension of the internationally proven REDAC double sided P C B design package. The powerful software routines available for automatic routine and checking of the final layout are emphasized together with the ease with which the designer may interact with the program during its execution. It is shown that large layouts can be completed in a few weeks which would take a manual designer months to complete and would be very prone to manual designer error.

OPTIMISING AUTOMATIC TRACKING OF MULTILAYER BOARDS
H. G. Adshead *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 16 p refs (For availability see N74-13906 05-10)

The paper commences with a brief but critical appreciation of some known automatic tracking techniques for multilayer printed circuit boards, viz. Maze-Running, Line-Search and Channel-Allocation. The purpose is to bring out their inherent similarity and to propound their specific superiority under different combinations of controlling criteria dictated by technological constraints. Consideration is given to the prohibitive core and time requirement for a real life environment involving an approximately 500 x 500 track matrix associated with the request for orthogonally connecting about 1500 pin pairs, on each board. The evolution of an effective algorithm and list-structure capable of successfully handling this problem is discussed in detail. Several side issues of major significance are introduced. The efficient pre-sorting of the order in which wires are submitted to the main algorithm has been found to make a significant contribution to the efficiency of the entire system. Profile analysis is developed as a technique for comparing the relative merits of various topological placements of the logic network. The importance of the basic board layout and its relation to the algorithm employed is stressed.

A PARALLEL PRINTED CIRCUIT BOARD DESIGN SYSTEM
Donald R. Oestreicher *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 12 p refs (For availability see N74-13906 05-10)
(Contract F30602-70-C-0300)

A unique approach is described for the automatic design of printed circuit boards in which all functions can be accomplished in parallel. Instead of producing the layout wire by wire as is currently the rule, the layout is produced by traversing the board in a raster scan fashion, routing all relevant wires in parallel. This allows all design functions to be accomplished simultaneously. The fact that the layout functions are done concurrently provides for greater feedback among the different functions and therefore greater efficiency, as more relevant information is available to each function. The algorithm also makes great use of the commutivities introduced by integrated circuits. This is done by unbinding the circuit into a structure which describes all possible pin assignments, as defined by the relevant commutivities. This structure then maintains this information as the layout algorithm makes decisions to bind particular pins to particular logical signals. The structure not only remembers past decisions, but it also makes all derivative bindings required by the layout algorithm's decisions necessary to maintain the equivalence between the input circuit description and the actual implemented circuit.

COMPUTER AIDED PLACEMENT AND ROUTING OF HIGH

DENSITY CHIP INTERCONNECTION SYSTEMS

N H Crocker, R W McGuffin, R Naylor, and H Vosper *In* AGARD Computer Aided Design for Electron Circuits Oct 1973 26 p refs (For availability see N74-13906 05-10)

A novel approach to the problem of placement and interconnection of components is presented Conventional constraints, such as substrate or circuit board dimensions, are not considered at the outset, they are either absent or are suppressed until the stage is reached at which they are directly applicable The chosen approach was adopted to facilitate the placement and tracking of integrated circuit chips on a microwired array This form of construction, orthogonal tracks on either side of a dielectric layer connected by etched through-holes, has the advantage that the holes may be made within the width of a track The algorithms presented are technology-independent and may be applied to any interconnection system which incorporates this feature Initially, the logic is placed on a continuous plane From this state, it is gradually transmuted through various cellular structures defined, initially by the components, and finally by a combination of the components and their associated tracks The culmination is an arrangement which, at all stages, is determined by the logic and not the technology Author

LIGHT SIMULATOR MATHEMATICAL MODELS IN AIRCRAFT DESIGN
Alan H Lee *In* AGARD Simulation Jan 1971 23 p refs (See N71-16060 06-11)
Avail NTIS

Mathematical models are discussed from the viewpoint of a flight simulation user. Aerodynamic, flight control system, and atmospheric environment models are stressed. Some of their considerations are discussed relative to aircraft design phases. A quasi-elastic format for representing the aerodynamic characteristics of a large, flexible aircraft is described. It is shown that storing aerodynamic data in digital computers as spit functions has advantages. Such items as controller feel, hysteresis, and actuator characteristics should be included in the flight control system mathematical model. Turbulence and wind shears are essential to any realistic simulation program. The von Karman power spectral density function is preferred for turbulence generations. Emperical wind shears are also useful. Author

Various inputs of the simulation environment during Concorde cockpit development are considered. Computerized simulator trials started out with the variable stability Mirage 3B aircraft by considering external and internal visual displays, inertial perceptions and aural perception and verbal communications. Confrontation between simulation objectives and inputs and outputs of the crew members transfer functions with results from the various indices was used to define the environment simulation degree. THE SELECTION OF TASKS AND SUBJECTS OF FLIGHT SIMULATION EXPERIMENTS
Waldemar O. Beuhaus and Robert P. Harper, Jr. *In* AGARD Simulation Jan. 1971 17 p (See N71-16060 06-11)
Avail: NTIS

The limitations of various simulators directly affect the simulation tasks which can be performed and, hence, affect the validity of the evaluation results obtained. The ability of simulator pilots to produce valid and repeatable evaluations which are applicable to the real-world situation can be no better than the accuracy with which the simulator tasks represent the essential characteristics of the real world. Certain considerations in the selection of simulator tasks are discussed, and problems are set forth which should be considered in the design of simulation experiments. The selection and preparation of evaluation pilots are discussed in terms of the factors which appear to have substantial effects upon the program results. Experience in the real-world mission is one of several key elements which greatly enchances the evaluation results. Preparation of subjects considers the importance and nature of communication between the subject pilot and the analyst and participation of the subjects in the experimental design. Author

PILOT ASSESSMENT ASPECTS OF SIMULATION
George E. Cooper and Fred J. Drinkwater, III. *In* AGARD Simulation Jan. 1971 18 p refs (See N71-16060 06-11)
(NASA TM-X-66583) Avail: NTIS CSCL 05H

Pilot assessment aspects of flight simulation consider the use of pilot ratings in the evaluation of aircraft handling qualities. Critical questions raised by pilots are examined and discussed in order to develop solutions and improve understanding. It is important to involve the pilot as early as possible in developing a piloted simulation program by considering complaints arising from simulation experiences as well as questions arising related to the pilot's actual participation in the planning and conducting of experiments, the simulation facility, and the analysis of results. THE NEED FOR LARGE WIND TUNNELS IN EUROPE
Dec. 1972 86 p refs
(AGARD-AR-60) Avail: NTIS HC $7.00

The Report of the Large Wind-Tunnels Working Group of the AGARD Fluid Dynamics Panels, follows nine meetings between December 1971 and November 1972. Review of existing position and future prospects, the role of the wind-tunnel in research and development, existing European wind-tunnels, present national plans for wind-tunnels, future needs, options for new large low-speed and transonic tunnels, a proposed time schedule for provision of new tunnels, and proposals for a collaborative work program to clarify existing problems in wind-tunnel design and operation. It is concluded that the first priority is for a new large pressurized transonic wind-tunnel in Europe, four possible options for realization of this need are given, and an Engineering Study is proposed, with a Work Statement, to assess and evaluate the engineering requirements of the options. The second priority, of importance almost equal to the first, is for a new large low-speed wind-tunnel. This should be of 18 m or 25 m width, the Group has not been able to agree between these figures. Provision of new European supersonic and hypersonic facilities should begin when the subsonic and transonic requirements have been met, long term technical needs for these are defined. Author

SOME CONSIDERATIONS OF FUTURE LOW-SPEED TUNNELS FOR EUROPE
A. Spence and B. M. Spee (Natl. Aero- and Astronaut. Res. Inst., Amsterdam) *In* AGARD Probl. of Wind Tunnel Design and Testing Dec 1973 10 p Prepared in cooperation with

Natl. Aero- and Astronaut. Res. Inst., Amsterdam (For availability see N74-16987 08-11)

Two series of possible future low-speed windtunnels have been studied. The first series are high-Reynolds-number tunnels having a product of working section width in metres and maximum pressure in atmospheres kept constant at a value of 45, but including in addition a 60m atmospheric tunnel. The second series comprises atmospheric tunnels of widths ranging from 8m to 25m, and these are of more modest cost and generally lower capability than the first series. Very broad estimates of possible capital and running costs are given as an indication of the scale of expenditure which might be involved; no precise quotations have been obtained. Brief statements are made of the capabilities of the tunnels considered. Each series in turn appears to offer attractive possibilities for future provision of low-speed tunnels in Europe. Author

PROJECT STUDY OF A LARGE EUROPEAN TRANSONIC LUDWIEG TUBE WINDTUNNEL

H. Ludwieg, H. Grauer-Carstensen, and W. Lorenz-Meyer. *In* AGARD. Probl. of Wind Tunnel Design and Testing. Dec. 1973. 22 p. refs (For availability see N74-16987 08-11)

A study of a transonic Ludwieg Tube wind tunnel is presented. For a reliable extrapolation of windtunnel measurements to full-scale flight conditions of modern aircraft, a realistic simulation of flight Reynolds numbers at transonic speeds becomes increasingly important. It is shown, how the need for a high Reynolds number experimental facilitity can be satisified by a Ludwieg Tube tunnel. The Ludwieg Tube is characterized by its unsurpassed simplicity which guarantees a high degree of reliability. Design data, dimensions, and cost estimates for the described tube wind tunnel are presented. The basic facility characteristics are given. Author

FACILITIES FOR AERODYNAMIC TESTING AT HYPERSONIC SPEEDS

F. Jaarsma and W. B. DeWolf. *In* AGARD. Probl. of Wind Tunnel Design and Testing. Dec. 1973. 40 p. refs (For availability see N74-16987 08-11)

An assessment is made of the usefulness and potential of existing European hypersonic facilities, on the basis of the planned U.S. space shuttle project and a hypothetical hypersonic transport aircraft. With respect to aerodynamic testing of space shuttle type of vehicles it is pointed out that a significant gap exists between $M_\infty = 10$ and $M_\infty = 15$. At low-hypersonic Mach numbers the facilities in Europe will generally meet the minimum requirements for testing hypersonic transport models. European capabilities appear to be rather similar to those in the U.S. hypersonic wind tunnels, though the U.S. capabilities will be increased considerably in the near future. It is further concluded that European facilities fall short in their performance of what is required, in the field of propulsion (including supersonic combustion tests) and also of hardware testing. REPORT OF THE HIGH REYNOLDS NUMBER WIND TUNNEL STUDY GROUP OF THE FLUID DYNAMICS PANEL
Apr 1971 24 p refs
(AGARD-AR-35-71) Avail: NTIS

The working group considered transonic wind tunnel performance and operating characteristics required to support evolution of military and civil aeronautical and aerospace systems during the coming decade. These considerations, along with a review of experience on model testing at transonic speeds, led to the conclusion that the NATO nations should acquire, as soon as possible, two types of new wind tunnels. One tunnel should duplicate transonic flight Reynolds numbers and have a run time on the order of one second. The second should have a 16 ft test section and should provide Reynolds numbers that are 3 or 4 times the maximum presently available with a run time on the order of 10 seconds. It was also concluded that AGARD should support current research and development in design, operation, and test techniques in transonic tunnels of the continuous, conventional blowdown, and cryogenic tunnel type, and that AGARD should encourage expansion of these activities in the future. VARIATIONS ON A THEME OF PRANDTL
Peter Bradshaw *In* AGARD Turbulent Shear Flows Jan. 1972 10 p refs (See N72-20273 11-12)
Avail: NTIS HC $6.00; MF $0.95

Varieties of complex turbulent flow which are important in engineering are recognized as perturbations of classical thin shear layers to which Prandtl's approximation applies. The types distinguished are: (1) shear layers, (2) shear layers perturbed by small additional strain rates which produce appreciable changes in turbulence, and (3) shear layers perturbed by large additional strain rates. Examples are airfoil boundary layers, merging into a wake, boundary layers on curved surfaces, and reattaching shear layers. The essential phenomena of these turbulent flows are discussed, and it is concluded that a program of turbulence measurement should enable calculation methods to be extended to a wide range of complex flows. A discussion of the general types of calculation methods suitable for complex flows is included. Author

STRUCTURE OF THE REYNOLDS STRESS NEAR THE WALL
W. W. Willmarth and S. S. Lu *In* AGARD Turbulent Shear Flows Jan. 1972 20 p refs (See N72-20273 11-12)
(Contract N00014-67-A-0181-0015)
Avail: NTIS HC $6.00; MF $0.95

Experimental studies are reported on the flow field near the wall in a turbulent boundary layer using hot wire probes. Measurements of the product uv were made using conditional sampling and with the aid of a digital computer. The criterion used to determine when uv was to be sampled was when streamwise velocity at the edge of the sublayer had attained a certain value. It was found that 60% of the contribution to uv occurred when the sublayer velocity was lower than mean velocity. Measurements involving correlation of truncated u and v signals revealed that the largest portion of Reynolds stress and turbulent energy components occurs when $u < 0$, $v > 0$, or during an intense bursting process, the remainder occur during recovery. Contributions to the production of turbulence and Reynolds stress at a point near the wall are of large magnitude, short duration, and intermittent. A rough measure of the intermittency factor for uv is 0.55. Author

SPECTRAL DISTRIBUTIONS OF THERMAL FLUCTUATIONS IN A TURBULENT BOUNDARY LAYER [REPARTITIONS SPECTRALES DES FLUCTUATIONS THERMIQUES DANS UNE COUCHE LIMITE TURBULENTE]
L. Fulachier and R. Dumas *In* AGARD Turbulent Shear Flows Jan. 1972 10 p refs In FRENCH, ENGLISH summary (See N72-20273 11-12)
Avail: NTIS HC $6.00; MF $0.95

Temperature fluctuation spectra and spectral distributions of temperature velocity were measured in a turbulent boundary layer on a heated flat plate. The method of fluctuation diagramming was used for frequency-filtered signals in order to measure spectral correlation distribution. A comparison of thermal spectra and three velocity components is presented from the internal zone as far as the edge of the boundary layer. Balance equations are given for spectral distributions relative to temperature and the sum $Q(n)$ for the spectra of the velocity components. Spectral distributions of production terms and molecular dissipation are also considered. Author

INTERMITTENT STRUCTURES IN TURBULENT BOUNDARY LAYERS
R. F. Blackwelder and R. E. Kaplan *In* AGARD Turbulent Shear Flows Jan. 1972 7 p refs (See N72-20273 11-12)
(Grants NSF GK-24578, NSF GK-27800)
Avail: NTIS HC $6.00; MF $0.95

The intermittent structure in the outer region and the occurrence of intermittent bursts near the wall were investigated. The extent of these structures is characterized by the existence of streamwise momentum defects. Correlations suggest a connection between bursting that occurs in the wall region and the intermittent bulges of turbulence that protrude from the

outer reaches of the turbulent boundary layer. A scheme is presented for the detection of turbulent bursts near the wall. Conditional averaging showed that during the burst there was a substantial streamwise momentum defect followed by an extremely rapid acceleration. The measurements suggest that perhaps a local instability is the source of the break-up of the wall flow. Author

AN INTEGRAL METHOD FOR APPROXIMATE CALCULATION OF COMPRESSIBLE TURBULENT BOUNDARY LAYERS WITH STREAMWISE PRESSURE GRADIENT
H.-J. Kuester. *In* AGARD Turbulent Shear Flows. Jan. 1972. 20 p. refs. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

An approach is presented for the transformation function sigma sub x which avoids both sublayer and substructure hypotheses of compressible turbulent boundary layers. Agreement between theory and experiment was obtained using a modification of skin friction principles. Thermodynamic behavior is approximately described by a modified Crocco integral which accounts for non-unit Prandtl number, and variable pressure and/or wall temperature. The boundary layer parameters of the transformed flow were calculated by a method based on the integral equations for momentum and mechanical energy. The calculation method was applied to a variety of turbulent boundary layers with and without pressure gradient. Author

A SIMPLE ANALYSIS OF TWO DIMENSIONAL TURBULENT SKIN FRICTION WITH ARBITRARY WALL AND FREE-STREAM CONDITIONS
Frank M. White and George H. Christoph. *In* AGARD Turbulent Shear Flows. Jan. 1972. 10 p. refs. Supported by the AF. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

An approach is proposed for an approximate analysis of the two-dimensional turbulent boundary layer under a wide variety of arbitrary conditions. An effective formula is developed for the law-of-the wall which accounts for all of the different parameters considered. The wall law is combined with the differential momentum equation into a single first-order ordinary differential equation for the skin friction coefficient, suitable for computer or graphical solution and, in special cases, closed form solutions. Examples are given covering combinations of eight different effects: pressure gradient, heat transfer, compressibility, roughness, wall transpiration, transverse curvature, longitudinal curvature, and aqueous polymer solutions. The results indicate that the theory is not only the simplest existing analysis of the turbulent boundary layer but one of the most accurate. Author

AN EDDY VISCOSITY BASED ON THE SECOND PRINCIPAL INVARIANT OF THE DEFORMATION TENSOR
Willi Schoenauer. *In* AGARD Turbulent Shear Flows. Jan. 1972. 10 p. refs. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

Equations were derived for the time mean values of incompressible turbulent flow. The stress tensor was considered to be a function of the deformation tensor. The assumption of spatial homogenity and isotropy led to eddy viscosity dependence on the second principal invariant of the deformation tensor. The eddy viscosity function contains empirical coefficients which must be determined from measurements of turbulent equilibrium flows. Nonequilibrium flows were then described by relaxation equations. Equations for the turbulent boundary layer were derived. The empirical coefficients of the eddy viscosity function were determined for flat plate flow. Author

EFFECTS OF STRONG AXIAL PRESSURE GRADIENTS ON TURBULENT BOUNDARY LAYER FLOWS
Clark H. Lewis, E. W. Miner, and E. C. Anderson. *In* AGARD Turbulent Shear Flows. Jan. 1972. 14 p. refs. (See N72-20273 11-12)
(Contract NAS1-9337)
(NASA-CR-125903) Avail: NTIS CSCL 20D

Comparisons are made between predictions for nonreacting turbulent boundary layer flow using a finite difference method, and integral methods used to predict compressible turbulent flows with pressure gradient and wall heat transfer. Both rocket and hypersonic aerodynamic wind tunnel nozzles are considered. Cooled and heated walls were studied. Van Driest and Reichardt's models were considered in a two-layer eddy viscosity scheme. Under heated wall conditions (i.e. wall temperature greater than the adiabatic wall temperature), strong coupling effects were found between wall heating and axial pressure gradients. For cooled wall conditions, predictions of velocity and temperature profiles downstream from regions of strong favorable pressure gradients were in good agreement with limited experimental profile data. Limitations in the use of boundary layer transformations for heated wall flows are presented. A computer program was developed to predict nonreacting and equilibrium chemically reacting laminar and/or turbulent boundary layer flows for internal (nozzle) and external two-dimensional and axisymmetric flows. MACH NUMBER EFFECTS IN TURBULENT FLOW
J. J. D. Domingos. *In* AGARD Turbulent Shear Flows. Jan. 1972. 10 p. refs. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

Starting from fundamental assumptions of microscopic thermodynamics and continuum mechanics, the existence of a velocity potential for the flow of viscous fluids was proved as a general property. The implications are discussed and the role of compressibility as an essential feature of turbulence, either in subsonic or supersonic flows, is stressed. The apparently contradictory consequence of zero vorticity in flows which are derived from a potential is clarified through a discussion of concepts implicitly assumed in the usual definitions of mean density, mean velocity, and thermodynamic equations of state. The results are applicable to general supersonic viscous flows, because the theory is concerned with instantaneous velocity fields, without separation into mean and turbulent quantities. The solutions found are asymptotically exact solutions of the time-dependent three-dimensional Navier-Stokes equations for a viscous and compressible fluid which follows a polytropic evolution. A TWO LAYER MODEL OF HIGH SPEED, THREE DIMENSIONAL TURBULENT BOUNDARY LAYERS AND SUPERCRITICAL BOUNDARY LAYER INVISCID FLOW INTERACTIONS
Barry L. Reeves. *In* AGARD Turbulent Shear Flows. Jan. 1972. 21 p. refs. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

A two-layer model of the three-dimensional compressible turbulent boundary layer was developed which is applicable to flows with pressure gradient and surface mass transfer. The model is based on the small cross flow approximation in which the spreading metric is determined by the inviscid streamline pattern. A modified Mangler transformation was employed which permits transformation of the boundary layer equations to a two-dimensional form without transforming the turbulent stress or heat flux. The computational speed of the method is rapid enough to enable equations for the inviscid stream deflection to be coupled with method used for calculations of strong (supercritical) interactions, such as in the region downstream of the critical point in reattaching flows or in regions of strong

blowing. Solution of the inner (wall) layer for the velocity, enthalpy, stress and heat flux was obtained using mixing length theory and the thin layer Couette model. This solution led to a generalized compressible law of the wall with mass injection. In the outer wake layer an integral moment method was used along with appropriate matching conditions with the inner layer. Several solutions and experimental comparisons are presented. Results are also presented for relaxing flows where C sub f and (2C sub H)/C sub f initially are far from their equilibrium values. Author

APPLICATION OF AN IMPROVED MIXING LENGTH MODEL TO THE STUDY OF THREE DIMENSIONAL BOUNDARY LAYERS [APPLICATION D'UN SCHEMA AMELIORE DE LONGUEUR DE MELANGE A L'ETUDE DES COUCHES LIMITES TURBULENTES TRIDIMENSIONNELLES]
J. Cousteix, C. Quemard, and R. Michel. *In* AGARD Turbulent Shear Flows. Jan. 1972. 11 p. refs. In FRENCH, ENGLISH summary. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

An improved mixing-length model, previously applied to two-dimensional flow, is extended to cover the three-dimensional case, relying on the assumption that the turbulent shear stress acts in the same direction as the laminar. It is used to work out similar solutions to the local equations of a turbulent boundary layer with small cross-flow. In a compressible fluid with arbitrary pressure gradients, a digital routine enables sets of transverse and longitudinal boundary-layer profiles and the wall skin-friction components to be determined as a function of tow parameters expressing the influence of pressure gradients. A comparison with experimental results shows a measure of agreement. The model offers the requisite hypotheses on which to build an integral method of computing three-dimensional turbulent boundary layers. Author

A system of partial differential equations which can be used as a mathematical model for three-dimensional incompressible turbulent boundary layers is discussed. Certain mathematical properties of these equations are elucidated. The equations have a finite domain of dependence; this fact simplifies the problem of calculating three-dimensional boundary layer flows. The equations are solved numerically by means of a simple linear explicit finite difference scheme. The choice of an efficient difference scheme is guided by two criteria for the stability of linear difference schemes with constant coefficients. The method is used to calculate several experimental flows. Author

The results of comparing computations using a tentative model of turbulent shear flows with experimental data are presented for the axially symmetric free jet, the two-dimensional free shear layer, and the flat plate boundary layer. The need for more carefully designed and documented free turbulent flow measurements is discussed in relation to the problem of selecting more refined models. Some observations are also made concerning the application of double correlation closure schemes to the computation of turbulent flows other than classical incompressible shear layers. In particular, the possibility of other methods of calculating the behavior of chemically reacting turbulent flows is examined. Author

Compressible turbulent boundary layer velocity and temperature profiles with zero pressure gradient were collected and prepared for computer analysis. An assumed equation for these profiles was chosen allowing four constants to be adjusted by a nonlinear least squares technique. The four constants are a velocity scale, boundary layer thickness, the constant of the semi-log region and the wake constant. This equation is analogous to Coles incompressible law of the wall and wake but uses a generalized velocity to account for compressibility. Measurements from 45 adiabatic wall tests were analyzed covering a Mach number range from 2 to 6. Of these profiles, 29 included skin friction balance data which allowed direct evaluation of the universal constant of turbulence (mean value of $\kappa = .43$) through comparison between the shear velocity and the profile velocity scale. The constants of the semi-log and the wake region were found to be independent of Reynolds and Mach numbers. A similar analysis was carried out for the limited number of total temperature profiles. SOME BOUNDARY LAYER MEASUREMENTS ON A FLAT PLATE AT MACH NUMBERS FROM 2.6 TO 4.5
D. G. Mabey, H. U. Meier (Deutsche Forschungs-und Versuchsanstalt fuer Luft und Raumfahrt, Goettingen), and W. G. Sawyer. *In* AGARD Turbulent Shear Flow. Jan. 1972. 11p. refs. (See N72-20273 11-12)
Avail: NTIS HC $6.00/MF $0.95

An experimental investigation of the turbulent boundary layer on a large, thermally insulated flat plate is reported, in which Mach number and total temperature profiles and shear stress at the wall were measured. The measured velocity profiles are found to be in good agreement with theoretical treatments. Similarly, the measured skin-friction coefficients are predicted flat-plate skin-friction laws. The form of the total temperature profile close to the wall suggests an increase in turbulent Prandtl number as the wall is approached. At all conditions, the wall temperature was found to be higher than would be expected in adiabatic flow conditions, while there was a substantial deficit of enthalpy flux within the boundary layer. The objective was to assess the influence of streamwise pressure gradients upon two dimensional compressible turbulent boundary layers at high Reynolds numbers, in the absence of end-wall effects and longitudinal curvature effects. Boundary layers recovering to equilibrium conditions were emphasized. Measurements were made at a Mach 4 of pressure distribution, local skin friction, and boundary-layer profiles along the internal surface of a parallel, circular cross-section duct. The Reynolds number based on the duct length of 33 inches was almost 50 million. Results from three experiments are presented, namely a near zero pressure gradient flow, an adverse pressure gradient

case, and a flow relaxing downstream of a step-induced separation. The boundary layer predictions of all the methods were in reasonable agreement with experiment. The outstanding exception was the discrepancy observed between the calculated and experimental skin friction results in the adverse pressure gradient flow, which was attributed tentatively to the static pressure gradient across the boundary layer in the region of the streamwise pressure increase. Results obtained by flow visualization techniques have given inspiration for devising plausible models rather than have provided numerical data to be compared with experiments. Hot-wire anemometer records, especially by employing appropriate signal processing techniques have given quantitative data that can be used for direct comparison with theoretical predictions. Theoretical possibilities are reviewed, and arguments are presented for favoring a model consisting of random sprinkled, but deterministic flow structures against models based on travelling waves. A suggestion for a possible form of mean flow predictions schemes is outlined. Author

A correlation of the mean rate of dissipation on the center-line in terms of the orifice Reynolds number and axial position is established. Measurements of the velocity and velocity derivative are described for a jet of orifice Reynolds number of 1.2 x 10 to the 5th power. The spectrum of the square of the velocity derivative was found to be similar to those obtained for atmospheric boundary layer flows at very large Reynolds numbers when normalized with Kolmogoroff length and time scales. Spectra of higher order moments of the velocity derivative are also presented and compared to Novikov's predictions of the power law subranges. Author

VELOCITY AND DENSITY MEASUREMENTS IN A FREE JET
O. H. Wehrmann *In* AGARD Turbulent Shear Flows Jan. 1972 9 p refs (See N72-20273 11-12)
Avail NTIS HC $6.00/MF $0.95

The fluctuating properties in a turbulent flow are due to convection, diffusion, production, dissipation, and pressure transport. To perform an energy balance, not only velocity terms have to be measured, but also the pressure or density components of the pressure transport term. Velocity fluctuations can be measured by the hot-wire technique; in contrast to this, the local measurement of the density fluctuations presents a certain problem, especially if the disturbance of the flow field by a density measuring would have to be kept as small as possible. To obtain a local measurement, a focussed laser beam Mach-Zehnder interferometer was used. The flow measurements were made for the flow field behind a 2.5 cm nozzle at a flow velocity of 43 m/sec. The flow in the center of the nozzle at the exit plane was laminar or made turbulent by the insertion of a screen. Author

Avail NTIS HC $6.00/MF $0.95

Hot-wire measurements of mean velocity and normal turbulent stress in the direction of flow are presented for the flow field generated by a plane jet reattaching to a flat plate adjacent to the jet nozzle. Measurements were made in longitudinal and lateral traverses of the curved jet flow and in the two wall jet flows. Measurements were made in two series for thirteen different positions of the adjacent plate thereby providing data for differing values of jet curvature and jet pathlengths. Integral methods were used on the experimental data to evaluate the effect of jet curvature on the entrainment along the external and internal boundaries of the curved jet. Author

An experimental study was made of the turbulent mixing layer between two streams of different gases, especially nitrogen and helium. This was made in a flow apparatus, designed to produce good quality flow at pressures up to 10 atmospheres with run times as low as 1 or 2 seconds. High-speed measurement techniques, including a density probe, were used. Shadowgraphs of the turbulent mixing layer reveal a large-scale structure similar to that in the late stages of instability development in a laminar free shear layer. The similarity properties of the mixing layers are established from profiles of mean velocity and density, and from these the basic flow parameters are computed, spreading rate, dissipation rate, shear stress distribution. It is found that a large density ratio (e.g., 7:1) in the two streams does not have a great effect on the spreading rate; this contrasts with the large effect of Mach number on the turbulent spreading of a free shear layer at the edge of a supersonic flow. A brief analysis compares the effects of density nonuniformities in low speed flow and those due to compressibility at high Mach number. Author

Representative data, concerning the mean behavior of velocity and density in the wakes of hypersonic spheres launched at Mach 13 and a pressure times sphere density of 20 torr-inches, are given. The variation with axial distance of the

velocity, density, and temperature defects and of the velocity and density wake radii are given and are compared with other similar data and with schlieren data obtained under the same conditions. Data on turbulent characteristics such as velocity fluctuations, ionization scale lengths and wake intermittency are also given. Finally, the total momentum in the wake is estimated from the measured velocity and mass density distributions.

MEASUREMENTS OF THE INSTANTANEOUS SPATIAL DISTRIBUTION OF A PASSIVE SCALAR IN AN AXISYMMETRIC TURBULENT WAKE

Arthur M. Schneiderman. *In* AGARD. Turbulent Shear Flows. Jan. 1972. 12 p. refs. (See N72-20273 11-12.)

(Contract F04701-70-C-0128)

Avail: NTIS. HC $6.00; MF $0.95.

The spatial mixing field in the turbulent wake of a longitudinally aligned truncated cylinder at a Mach number of 2.5 and a Reynolds number of 1 million (based on diameter) is observed experimentally using the laser planogram technique. The instantaneous spatial distribution of a tracer material introduced at the model is characterized statistically by estimates of the probability density function, energy spectrum, and autocovariance coefficient of the measured fluctuations. Wake axis measurements over the region from 138 to 182 body diameters yield turbulent concentration fluctuations of 25% and skewness and kurtosis of +0.18 and +0.16, respectively. A centerline intermittency of approximately 82% is observed. A classical turbulence spectrum with a well defined break from a flat to a -5/3 power inertial subrange is found. The autocovariance coefficient yields a macroscale which is approximately half the transverse scale length. The wake boundary is observed to be substantially more contorted than had previously been suspected.

RECENT ATTEMPTS TO DEVELOP A GENERALLY APPLICABLE CALCULATION METHOD FOR TURBULENT SHEAR FLOW LAYERS

J. C. Rotta. *In* AGARD. Turbulent Shear Flows. Jan. 1972. 11 p. refs. (See N72-20273 11-12.)

Avail: NTIS. HC $6.00; MF $0.95.

Calculation methods are discussed, which are based on the differential equations for the Reynolds stresses. The considerations restrict themselves to two-dimensional flow fields, for which the usual boundary layer approximations apply. In many of the proposed methods of this kind the equation for the kinetic fluctuation energy plays a central role. The transport equation for the Reynolds shear stress includes as special cases Prandtl's eddy viscosity relation and Bradshaw's assumption of a constant ratio of shear stress to kinetic fluctuation energy. A differential equation for the integral length scale is derived from Navier-Stokes equations, and the closure assumptions are given. It turns out that the simplified version of the length scale equation used by some authors is not capable of reproducing the characteristics of different kinds of flows. The main reason for this shortcoming is found in an oversimplification of the turbulence production term of the length scale equation. The arguments are illustrated by calculated results.

AN EXPERIMENTAL STUDY OF THE COMPRESSIBLE TURBULENT BOUNDARY LAYER WITH AN ADVERSE PRESSURE GRADIENT

Robert E. P. Voisinet, Roland E. Lee, and William J. Yanta. *In* AGARD. Turbulent Shear Flows. Jan. 1972. 10 p. refs. (See N72-20273 11-12.)

Avail: NTIS. HC $6.00; MF $0.95.

The results of a detailed experimental investigation of the compressible turbulent boundary layer in an adverse pressure gradient regime are presented. The studies were conducted on a flat nozzle wall for Mach numbers between 4.1 and 4.9, at momentum thickness Reynolds numbers from 5600 to 69,000 and at wall-to-adiabatic-wall temperature ratios of 1.0 and 0.8. Complete and often redundant profile measurements were taken with Pitot and static-pressure probes and conical equilibrium and fine-wire temperature probes. The wall shear and surface heat transfer were measured directly with a skin-friction balance and a heat-transfer gage. The effect of the adverse-pressure-gradient flow on the boundary-layer flow structure, friction drag, and heat transfer, as compared with zero- and favorable-pressure gradient flow, is discussed. A test showing the effect of nozzle throat cooling on the downstream boundary layer is also reported. This throat cooling caused significant changes in the downstream temperature profiles and recovery factor with no effect on the local wall shear.

THE SUPERSONIC TURBULENT BOUNDARY LAYER IN AN ADVERSE PRESSURE GRADIENT: EXPERIMENT AND DATA ANALYSIS

Walter B. Sturek and James E. Danberg (Delaware Univ., Newark). *In* AGARD. Turbulent Shear Flows. Jan. 1972. 13 p. refs. (See N72-20273 11-12.)

Avail: NTIS. HC $6.00; MF $0.95.

Experimental measurements of the profile characteristics of the supersonic turbulent boundary layer in a region of moderate adverse pressure gradient along a two-dimensional isentropic ramp model are reported. The data are for a closely adiabatic wall at a tunnel nozzle setting of M = 3.54. Detailed surveys of impact pressure, static pressure and total temperature were made, and wall shear stress was measured using the Preston tube technique. In addition to the mean profile data, fluctuation data were obtained using constant temperature hot-wire anemometry in the zero pressure gradient flow upstream of the ramp model and in the adverse pressure gradient flow along the ramp model. Turbulent boundary layer equations applicable to compressible flow over a surface with longitudinal curvature are analyzed. Corrections for longitudinal curvature to the equation for conservation of streamwise momentum are shown to be small and of the same order of magnitude as the contribution of the wall shear stress. The data are shown to correlate in law of the wall and velocity defect dimensionless coordinates using an integral compressibility transformation that follows directly from Prandtl's mixing length approximation of the Reynolds stress. Eddy viscosity and mixing length distributions for the zero pressure gradient boundary layer were determined directly from the experimental data and agree qualitatively with previously published findings. The measured value of skin friction coefficient is 20 percent less for the flow over the ramp model than for the zero pressure gradient flow upstream.

TURBULENT BOUNDARY LAYERS AT SUPERSONIC AND HYPERSONIC SPEEDS

G. T. Coleman, G. M. Elfstrom, and J. L. Stollery. *In* AGARD. Turbulent Shear Flows. Jan. 1972. 9 p. refs. (See N72-20273 11-12.)

Avail: NTIS. HC $6.00; MF $0.95.

The growth of a compressible turbulent boundary layer over flat plate and compression corner models was studied at a Mach number of 9. Local Mach numbers between 3 and 9 were achieved on a flat plate by varying the incidence from 0 to 26.5 deg. The local unit Reynolds numbers used were between 150,000 and 700,000. The measurements, which include pressure and heat transfer rate distributions and pitot pressure profiles across the boundary layer, extend the range of existing data and are used to test some current predictive methods and to emphasize some features of lower Mach number flows. Heat transfer rate distributions at Mach numbers of 3, 5, and 9 show an increasing discrepancy between experiment and theory as the Mach number rises, the data being higher than the predicted

value but approaching it asymptotically with increasing momentum thickness Reynolds number (Re theta) The boundary layer profiles taken at Mach 9 grew fuller as Re theta decreased, both of these results are associated with the slow development of the wake component of the turbulent boundary layer profile at high Mach numbers Author

A SURVEY OF DATA FOR TURBULENT BOUNDARY LAYERS WITH MASS TRANSFER
Donald Coles *In* AGARD Turbulent Shear Flows Jan 1972 15 p refs (See N72-20273 11-12)
Avail NTIS HC $6.00 MF $0.95

A critical survey is made of available experimental data on turbulent boundary layers with mass transfer in the absence of complicating factors such as compressibility and pressure gradient Two approaches to the data show particular promise The first is the mixing length approach which leads (as is well known) to a set of modified coordinates such that the classical similarity laws outside the sublayer seem to remain valid down to the last detail at least for moderate values of suction or blowing The second approach is more original it is an attempt to generalize the kind of analysis often used to develop similarity laws for free shear flows such as wakes or jets while preserving intact an argument which extends these ideas to the case of boundary layer flow The essential step is the definition of a characteristic velocity (qua friction velocity) in terms of a characteristic stress (qua wall stress) which occurs somewhere in the layer A strong precedent for such a step can be found in the usual treatment of surface roughness So far, the best choice for the characteristic stress seems to be some kind of average value for the sublayer Author

The development of a turbulent boundary layer on a flat plate was experimentally investigated in the presence of an external turbulent flow generated by grids With reference to a turbulent boundary layer evolving in an undisturbed flow the following results were observed when the external turbulence level is increasing (1) the boundary layer grows more rapidly (2) the wall shear stress is higher, (3) in the outer region of the layer the mean velocity profile becomes flatter and the law of the wake is modified In the same region the turbulent levels are increased, and the turbulent shear stress and the turbulent kinetic energy production become larger Various integral length scales of the external turbulent flow were also used A discernable effect was observed on the integral scales of the boundary layer only A rearrangement of the external isotropic turbulence, due to the straining process of the mean existing velocity gradient in the boundary layer is tentatively proposed Author

SOME MEASUREMENTS OF THE DISTORTION OF TURBULENCE APPROACHING A TWO DIMENSIONAL BODY
P W Bearman *In* AGARD Turbulent Shear Flows Jan 1972 11 p refs (See N72-20273 11-12)
Avail NTIS HC $6.00 MF $0.95

A description is given of the distortion of grid generated turbulence as it approaches the stagnation region of a two dimensional body When L sub x / D is much greater than 1 (where L sub x is the scale of turbulence and D is a typical body dimension) along the mean stagnation streamline the longitudinal component of the velocity fluctuations attenuates like the mean flow Whereas if L sub x / D is much less than 1 the turbulence is distorted by the mean flow field and the longitudinal component of the velocity fluctuations will be amplified due to the vortex

stretching When L sub x/D = O(1) a combination of these effects is found with attenuation of energy at low wave numbers and amplification at high wave numbers Measurements of the pressure fluctuations at the stagnation point show that at low wave numbers the level of the pressure fluctuations can be predicted by assuming the turbulence to be irrotational Author

APPROXIMATION OF NAVIER STOKES EQUATIONS
R Teman *In* AGARD Numerical Methods in Fluid Dyn May 1972 6 p refs (For availability see N72-27293 18-12)

Methods of approximation of the full Navier-Stokes equations are discussed The problem considered is the unsteady flow (and sometimes the steady flow) of an incompressible viscous fluid in a bounded domain The problem possesses a unique solution in the case of a two dimensional flow In the case of a three dimensional flow, the problem possesses at least one solution but uniqueness is known only when the vectors f,g and u sub o are sufficiently small for Re fixed (laminar flow) Three kinds of approximation methods are described (1) the penalty method (2) perturbation and fractional step method and (3) the fractional step method Author

THE BLUNT BODY PROBLEM FOR A VISCOUS RAREFIED GAS FLOW
G. Moretti and M. D. Salas. *In* AGARD. Numerical Methods in Fluid Dyn. May 1972. 15 p. refs. (For availability see N72-27293 18-12)
(Contract Nonr-839(34))

A time-dependent technique developed for inviscid blunt body flows was extended to analyze the viscous layer regime (a rarefied gas situation where viscosity affects most of the shock layer but not the shock wave itself). Navier-Stokes equations were used. To maintain accuracy, the (nonlinear) mesh spacing was adjusted automatically to the nature of the velocity distribution between shock and body. In this way, a wide range of Reynolds numbers can be scanned. The technique could also be used at high Reynolds numbers, when the shock layer is practically inviscid and viscous effects are confined to a boundary layer. Discussion of numerical experiments is given.

(Contract Nonr-839(34))

A definition of the word technique, as related to numerical computations of time-dependent problems in gas dynamics, is given. Requirements of accuracy, economy, and flexibility are considered. A technique which attempts to satisfy them is presented. Emphasis is put on the consistency of the numerical procedure with the physical problem. The concepts of consistency, convergence, and truncation error are reexamined. Certain breakdowns in accuracy occurring in regions of continuous flow are explained. The physical role played by discontinuities and its numerical counterpart are discussed.

NUMERICAL TREATMENT OF TIME DEPENDENT THREE DIMENSIONAL FLOWS
K. G. Roesner. *In* AGARD. Numerical Methods in Fluid Dyn. May 1972. 31 p. refs. (For availability see N72-27293 18-12)

The numerical treatment of three-dimensional time-dependent flows of an ideal gas with constant ratio of specific heats was investigated. It is assumed that inside the flow field, no discontinuities occur. As boundaries, fixed or moving rigid body surfaces and shock waves were allowed. This type of gas flow is described by the Euler equations with appropriate initial and boundary conditions. The mathematical tools applied to this gas dynamical problem are (1) the method of characteristics, and (2) the method of fractional steps. The application of these methods is discussed for some definite problems, one being the time-dependent inlet flow through a nozzle with a three-dimensional shape of its contour, the other the time-dependent supersonic flow around blunt bodies with various shapes of their surfaces. A comparison was made between the two methods with respect to their effectiveness.

EXPERIMENTS ON MANAGEMENT OF FREE-STREAM TURBULENCE
R. I. Loehrke (Ill. Inst. of Tech., Chicago) and H. M. Nagib (Ill. Inst. of Tech., Chicago). Sep. 1972. 113 p. refs.
(AGARD-R-598) Avail: NTIS HC $7.75; CSCL 20D

The effects of various passive devices (screens, perforated plates, porous foam, and honeycomb-like matrices formed with closely packed plastic drinking straws) on free stream turbulence and mean velocity profiles are studied in air with hot wire anemometry and in water using hydrogen bubbles visualization. These turbulence manipulators are viewed as operators which suppress the level of the incoming turbulence and generate, primarily through documented instabilities, new turbulence with scales characteristic of the device and its shear layers. For honeycombs, the suppression of the incoming turbulence appears to be mostly due to the inhibition of lateral components of the fluctuating velocity. For most devices it is conjectured that part of the energy in the undesirable larger scales of motion drains away through the action of the Reynolds stresses of the smaller scale laminar and turbulent motions (including the instabilities). The performance of the manipulators is found to depend on the characteristics of the incoming turbulence, including its frequency spectra, level, and spatial distribution, and on the incoming mean flow profiles. The efficacy of devices generating large scale turbulences in smoothing out gross inhomogeneities in the mean velocity profiles is illustrated.

An extensive theoretical and experimental investigation of ducted mixing was conducted The basic objective was to develop an adequate engineering theory to describe the ducted mixing process, including chemical reactions Emphasis was placed on relatively long mixing systems in which the mixing layer may extend over most or all of the duct cross section at the exit plane The duct pressure distribution will be strongly influenced by the thick mixing layers, and will be very different from the inviscid pressure distribution Three distinct flow regimes are shown in the mixing flow In the first regime, turbulent mixing occurs between the secondary flow and the core of inviscid primary flow In the second regime, the inviscid core has dissipated, but a region of inviscid secondary flow exists near the duct wall The third regime occurs after the mixing layer has spread to the wall, and the flow is entirely turbulent Author

THE INFLUENCE OF THE FREE-STREAM REYNOLDS NUMBER ON TRANSITION IN THE BOUNDARY LAYER ON AN INFINITE SWEPT WING
E H Hirschel *In* AGARD Fluid Motion Probl in Wind Tunnel Design Apr 1973 11 p refs (For availability see N73-26279 17-12)

The three-dimensional compressible laminar boundary layer on an infinite swept wing at different sweep angles is calculated and stability and transition criteria are applied to it for free-stream Reynolds numbers ranging from values possible nowadays in transonic wind tunnels to values typically for full scale flight The distribution of the inviscid flow is taken from experiments on airfoils and exhibits for subsonic free stream Mach numbers supersonic regions terminating in shock waves at about 20 percent chord length Results are given for four different wing sections The techniques employed and their shortcomings are discussed Author

N73-26281 Royal Aircraft Establishment, Farnborough (England)
SOME EXAMPLES OF THE APPLICATION OF METHODS FOR THE PREDICTION OF BOUNDARY-LAYER TRANSITION ON SHEARED WINGS
D A Treadgold and J A Beasley *In* AGARD Fluid Motion Probl in Wind Tunnel Design Apr 1973 1 p refs (For availability see N73-26279 17-12)

The laminar boundary layer was calculated for the leading-edge region of four selected airfoils for cases where the supercritical region is terminated by a shock wave at about 20% chord The possibility of the boundary layer becoming turbulent before the shock wave is then considered according to four different criteria leading edge contamination, re-laminarisation sweep instability, and Tollmien-Schlichting instability Many simplifying assumptions have had to be made, since the purpose of the report is to demonstrate how the problem might be treated, rather than to present definitive results, and how the various mechanisms are seen in conjunction It is concluded that much more needs to be known before predictions can be made confidently with any degree of precision Author

THE NEED FOR HIGH REYNOLDS NUMBER TRANSONIC TUNNELS
C R Taylor *In* AGARD Fluid Motion Probl in Wind Tunnel Design Apr 1973 13 p refs (For availability see N73-26279 17-12)

The present generation of transonic tunnels cannot simulate full scale flow at critical points of the flight envelope for many

current aircraft designs and there is an urgent need for new tunnels which would permit model tests to be made at much higher Reynolds numbers. New tunnels are proposed that would allow good simulations of aircraft shape to be made for a wide range of model tests; this limits the maximum tunnel total pressure to about 8 bars. A Reynolds number range which covers about half the full-scale range is advocated, demanding a working section area of about 25m squared. The tunnels would have low levels of free-stream turbulence and be capable of operation under conditions giving little heat transfer to the model. Running times of at least 10 sec are required. Author

N73-26283 Royal Aircraft Establishment, Bedford (England)
ON THE INFLUENCE OF FREE-STREAM TURBULENCE ON A TURBULENT BOUNDARY LAYER, AS IT RELATES TO WIND TUNNEL TESTING AT SUBSONIC SPEEDS
J. E. Green. *In* AGARD, Fluid Motion Probl. in Wind Tunnel Design, Apr. 1973, 8 p, refs (For availability see N73-26279 17-12)

Published experimental measurements are reviewed which show the turbulent boundary layer to be highly sensitive to turbulence in the free-stream. In zero pressure gradient a small increase in the streamwise rms velocity fluctuation is found to have the same effect on the shape of the velocity profile as a fractional increase in Reynolds number roughly sixty times as great. It is concluded that this effect needs to be taken into account in planning new wind tunnels for subsonic and transonic testing at high Reynolds number. Further experimental work is needed to clarify the importance of turbulence scale, the influence of pressure gradients and influence of radiated pressure (as opposed to convected vorticity) fluctuations. Author

EFFECTS OF TURBULENCE AND NOISE ON WIND TUNNEL MEASUREMENTS AT TRANSONIC SPEEDS
Adalbert Timme. *In* AGARD, Fluid Motion Probl. in Wind Tunnel Design, Apr. 1973, 12 p, refs (For availability see N73-26279 17-12)

Current knowledge is reviewed of the effects of flow unsteadiness on steady and dynamic measurements on models in wind tunnels at transonic speeds. It is found that in most cases the influence of the pressure or velocity fluctuations on flow patterns such as boundary layers with transition or separation bubble flow or shock interaction is quantitatively known from experiments only for particular parameter combinations. No universal information about the turbulence effect in different situations is found, nor is there a general theory including all observed effects at conditions of interest. Only in the case of a turbulent boundary layer at zero pressure gradient a quantitative relation is known between the turbulence in the free stream and the boundary layer development. It is concluded, therefore, that new experimental work using advanced measuring techniques and a secured theoretical background is urgently needed for planning new wind tunnels for transonic testing at high Reynolds numbers. EFFECTS OF STREAMLINE CURVATURE ON TURBULENT FLOW
P. Bradshaw. Paris, GARD, Aug. 1973, 36 p, refs
(AGARD-AG-169, AGARDograph-169) Avail: NTIS HC $4.00

Streamline curvature in the plane of the mean shear produce surprisingly large changes in the turbulence structure of shear layers. These changes are usually an order of magnitude more important than normal pressure gradients and other explicit terms appearing in the mean-equations for curved flows. The effects on momentum and heat transfer in boundary layers are noticeable on typical wing sections and are very important on highly-cambered turbomachine blades; turbulence may be nearly eliminated on highly-convex surfaces, while on highly-concave surface momentum transfer by quasi-steady longitudinal vortices dominates the ordinary turbulence processes. The greatly enhanced mixing rates of swirling jets and the characteristic non-turbulent cores of trailing vortices are also consequences of the effects of streamline curvature on the turbulence structure. (AGARDograph-173, AGARD-AG-173) Avail: NTIS HC $6.50

The literature pertaining to the interaction of a sonic or supersonic gaseous jet with a transverse external flow has been reviewed. The flowfields associated with these interactions are complex, and knowledge of them is based largely on results of experiments. Numerous examples of data from flatplate experiments are presented. These include static pressure distribution, induced forces, flowfield survey, and flow visualization results. Analyses and correlation techniques for jet interaction flows are discussed. The region upstream of a jet in two dimensional flow is similar to the flow upstream of a forward-facing step, and the flow associated with a jet from a circular nozzle in a flat plate resembles the flow past a blunt nosed slender body. The single most important variable in determining the scale of these interactions is the ratio of jet momentum flux to the external flow dynamic pressure. When the external flow is subsonic, the interaction is sensitive to external flow Mach number in the high subsonic Mach number range and to the ratio between jet and external flow velocity in the low Mach number range. NONLINEAR TIME DEPENDENT PROBLEMS IN FLUID DYNAMICS

Samuel Z. Burstein *In* AGARD Advan. in Numerical Fluid Dyn. Feb. 1973 20 p refs (For availability see N74-22914 14-12)

Three nonlinear problems in inviscid fluid dynamics are discussed. First we consider unforced finite amplitude vibrations of an undamped gas in a resonant cavity. The effect of amplitude on the vibrational frequency and wave shape is obtained by numerical integration of the complete nonlinear equations. The second problem is a nonlinear vibration problem with finite amplitude motion generated by a thermal forcing function. The forcing function is represented by a dilute spray of combustible fuel droplets in an oxidizing environment. In the last problem a computation in transonic flow is described. Author

NUMERICAL TREATMENT OF BOUNDARY-LAYER PROBLEMS

Egon Krause *In* AGARD Advan. in Numerical Fluid Dyn. Feb. 1973 21 p refs (For availability see N74-22914 14-12)

Finite difference solutions for three-dimensional compressible laminar and incompressible turbulent boundary layers are discussed in detail. Several finite difference approximations are introduced with their respective stability limits as obtained from a linearized stability analysis and numerical calculation. The importance of the domain of dependence and the region of influence in three dimensional boundary layers is elucidated. The equations of motion are given in orthogonal and non-orthogonal coordinates. A discussion of surface and external flow orientated system of coordinates is included. For turbulent flows the eddy viscosity concept expressed through a mixing length is adopted for the description of the turbulent shear stresses. Three different approximations used in the recent literature for closure assumptions are compared with the transport equations for the components of the turbulent shearing stress in three dimensional flows as given by Bradshaw. The finite difference solution employed is an implicit one which does not require additional assumptions for the laminar sublayer. Second and fourth order finite difference approximations enable acceptable computation times. Several results of sample calculations demonstrate the application of the method presented. Author

SURVEY OF COMPUTATIONAL METHODS FOR THREE-DIMENSIONAL SUPERSONIC INVISCID FLOWS WITH SHOCKS

R. W. MacCormack and R. F. Warming *In* AGARD Advan. in Numerical Fluid Dyn. Feb. 1973 20 p refs (For availability see N74-22914 14-12)

Hyperbolic systems of partial differential equations governing supersonic inviscid flows are discussed and analyzed. Finite-difference analogues for integrating these systems in the interior of fluid domains are described from two points of view: a differential form approach and an integral form approach. The algorithms presented are analyzed for stability and accuracy. The concept of time splitting is discussed and supplied to these methods to achieve increased numerical efficiency. Techniques for treating conditions at the boundaries of the fluid domain and shock-wave discontinuities at surfaces within the domain are described. Author

TOTAL ELECTRON CONTENT AND SCINTILLATION STUDIES OF THE IONOSPHERE
Jules Aarons, ed (AFCRL) Mar 1973 112 p refs
(AGARD-AG-166, AGARDograph-166) Avail NTIS HC $7.75

The current state of knowledge of ionospheric total electron content is outlined with special emphasis placed on the North Atlantic region of the world due to NATO special requirements in this region A numerical model of total electron content, valid over the European continent under certain conditions, is presented for systems engineering use for an average background total electron content correction Typical values of total electron content are also given at various locations in the high, middle and equatorial latitudes With more observational data being taken at many locations, an overall satisfactory picture of the world wide behavior of this important parameter is beginning to emerge

A NUMERICAL MODEL OF TEC OVER THE MEDITERRANEAN AREA
John A Klobuchar *In* AGARD Numerical Models of Total Electron Content over Europe and the Mediterranean and Multi-Station Scintillation Comparisons Nov 1973 p 16-22 (For availability see N74-14084 05-13)

A numerical computer program subroutine model of the total electron content (TEC) of the ionosphere over the Mediterranean area was constructed using mean seasonal data taken at Athens, Greece Data for four seasons are available and a separate numerical model representation of the data was made for each season The TEC of the ionosphere produces an additional delay in the travel time of radio waves over their free space velocity Thus, a numerical representation of this additional time delay can be useful in planning and operating such systems

W. T. Sumerlin *In* AGARD Reliability of Avionics Systems Jul 1971 29 p refs (See N71-36776 23-14)
Avail NTIS

The reliability estimation of an avionic system, which includes gross estimates, rapid estimates, and detailed estimates is discussed. Probability of attainment is then studied by selective reliability allocation among subsystems, followed by feasibility estimates based on experience, complexity, failure rate summations and/or other effective techniques. Constraints including allowable degradation, alternative mode operation, environment, operator effectiveness, and excellence of maintenance will permit improved estimates. Failure mode and effect analyses serves to guide conceptual design decisions so as to eliminate single point failures and identify areas for judicious application of redundancy, requirements for high reliability parts, special environmental control, and beneficial choice of operating profile. CORRELATION BETWEEN ESTIMATION TESTS AND SYSTEM OPERATING DATA
M. M. Tall *In* AGARD Reliability of Avionics Systems Jul 1971 9 p refs (See N71-36776 23-14)
Avail NTIS

The relationships between estimation tests and operational reliability are studied by regression analysis. The analysis includes equipment complexity and average mission length. Eleven equipment pieces were tested and results show that in several cases the reliability surpassed goals established for the tests. Results also indicate the tests may be used to refine the designs and remove defects introduced by parts, materials, and manufacture. Only avionic systems are used for the tests.

COST EFFECTIVENESS OF BUILT-IN TEST PROVISIONS
M. M. Tall *In* AGARD Reliability of Avionics Systems Jul 1971 8 p refs (See N71-36776 23-14)
Avail NTIS

The feasibility of using built in test provisions (BIT) as a means of improving operational effectiveness of aircraft is discussed. The primary purpose of BIT is to indicate to the user if the prime equipment is operating satisfactorily. It provides information upon which a decision to abort, modify or continue a mission may be based. Bit may also be applied to passive devices. In highly complex equipment BIT may indicate degrade

performance of portions of the equipment as well as catastrophic failure, and indicate the use of any alternate mode of operations. The cost effectiveness of BIT is also discussed E.H.W.

HIGH INTENSITY DIRECT READING HEAT FLUX GAUGE
H. C. Hardee and A. B. Donaldson Apr. 1971 9 p refs Sponsored by AEC
(SC-DR-710194) Avail: NTIS

A high intensity direct reading heat flux gauge is described. The device can be used under a wide variety of field test conditions. The gauge is a quasi-steady state type and offers advantages over both the steady-state and the transient types. Because the signal output is directly proportional to the incident heat flux, data reduction errors are minimized. The device has the capability of a secondary, transient type measurement which provides a check on the primary measurement. A lab test was conducted in which the measurements obtained from the direct reading gauge were compared with measurements obtained from a calibrated steady-state gauge. Author (NSA)

Two electronical devices, which are implemented with complementary MOS-circuits are described One of these systems was part of an ESRO-payload, by the aid of which photographic and photometric measurements in the soft X-ray region had been carried out during a sounding-rocket flight The aim of the experiment was an investigation of the sun corona The electronical subsystem of the experiment had been developed for the measurement of the intensity of five emission-lines and for the convers on of these results into a PCM-signal The second device is a quartz-clock with a PCM-output, which is installed in a recording current meter for an application in oceanography It is specified for a very low power consumption and has to demonstrate the long-life qualities of complementary MOS-circuits for the undersea current meter is expected to have a lifetime of one year Due to this long time and due to the necessity of low power consumption, the seaprobe is an ideal platform for a qualification test of components, which are provided for an application in spacecrafts Though both devices have been developed as functional support for other experimenters, they are technological experiments of our institute and part of our activities, to test and to introduce new components Author

DATA STORAGE FOR SMALL SCIENTIFIC SPACECRAFT

A C Christmas and A H Spooner *In* AGARD Avionics in Spacecraft Sep 1971 5 p (See N72-19483 10-14)

Avail NTIS HC $6.00/MF $0.95

The reasons for on-board data storage are considered together with the type of storage necessary This covers spacecraft status, continuously changing experiments, survey or totalising experiments and the organization of data into a form which is suitable for storage These considerations together with telemetry and ground receiver requirements effectively specify the performance of a data storage system Practical examples are given showing how the requirements have been met The development, testing and orbital performance of an endless loop tape recorder, including the mechanical techniques used to meet the reliability, power and flutter requirements are described Future needs are considered and compared with possible developments to give a forecast of the type of data storage which will be employed in later spacecraft Author

A MODULAR SPACECRAFT PCM DATA CONDITIONING SYSTEM

L Smith and K McDonald (Marconi Space and Defense Systems, Ltd.) *In* AGARD Avionics in Spacecraft Sep 1971 17 p refs (See N72-19483 10-14)

Avail NTIS HC $6.00/MF $0.95

The PCM system developed for encoding and formatting data on board spacecraft is described A set of standard modules has been designed which can be arranged in various ways to meet the many demands presented by the program Within each module components are welded either to a nickel wire or a nickle-mylar interconnection matrix and then encapsulated to form slim cards These are assembled and wire-wrapped to a back panel to produce functional units such as an encoder or decoder Integrated circuits purchased to in-house specifications which call for 100% inspection at all stages of manufacture and test, have been used wherever possible The system accepts data in 3 forms (1) digital in parallel or (2) serial form and (3) analogue in the range plus or minus 5 volts The analogue data is converted into 8 bit words prior to insertion into the main data stream The maximum rate is 8,000 samples/sec which corresponds to a bit rate of 64 kHz System feasibility was demonstrated using a prototype model and this has been developed and engineered into fully operational X3 system

A VARIABLE COVERAGE SATELLITE ANTENNA SYSTEM

A R Dion and L J Ricardi *In* AGARD Avionics in Spacecraft Sep 1971 13 p refs (See N72-19483 10-14)

Avail NTIS HC $6.00 MF $0.95

A multi-beam antenna system and combiner switch capable of producing a variable-coverage radiation pattern are described The antenna consists of a waveguide lens illuminated by a 19-element feedhorn array The combiner switch consists of a corporate arrangement of variable power dividers, the latter is made up of two phase shifters and two conventional hybrid power dividers An earth-coverage radiation pattern with less than 2 dB ripple and an antenna gain of 20 dB is obtained by equally exciting all beams of the multi-beam antenna simultaneously Excitation of a single feedhorn results in a narrow beam with an antenna gain of 30 dB and a near-in side lobe level less than minus 20 dB The side-lobe level can be reduced appreciably by appropriately exciting the adjacent feedhorns The frequency bandwidth corresponding to 0.5 dB decrease in antenna gain is 10 percent A technique for computing the radiation properties of the antenna is described

DESIGN OF TELEMETRY AND TELECOMMAND LINKS FOR INTERPLANETARY SPACE PROBES
E Stolle *In* AGARD Avionics in Spacecraft Sep 1971 16 p refs (See N72-19483 10-14)
Avail NTIS HC $6.00/MF $0.95

The concept of spacecraft/earth telecommunication links is presented, and various system parameters with their influence on link performance are discussed. Of particular interest are (1) power division between carrier and sidebands, (2) modulation indices, (3) demodulation/detection losses of RF receiver, (4) subcarrier demodulator, (5) bit synchronizer, (6) number of subcarriers, and parameter tolerances. The design criteria such as data rate, bit error rate, and spacecraft effective radiated power are discussed. An optimization method is given based on a criterion of minimum required total signal to noise ratio at the receiver. Examples from the link design for the HELIOS solar probe demonstrate the practicality of the approach. Author

SOME ASPECTS OF MULTIPATH FADING IN AERONAUTICAL SATELLITE SYSTEMS
M J Sidford *In* AGARD Avionics in Spacecraft Sep 1971 15 p refs (See N72-19483 10-14)
Avail NTIS HC $6.00/MF $0.95

Information is presented which allows estimates to be made of the amplitudes and frequencies of the fades which occur in a satellite-to-aircraft radio link due to interference between the direct waves and those reflected from the earth's surface. A wide range of conditions is covered involving reflecting surface properties, frequency and polarisation of the radio waves, aircraft antenna radiation pattern, and satellite elevation angle. Experimental evidence of multipath fading over sea and ice is included, and recommendations are made for the aircraft aerial characteristics required to reduce this fading. Author

MEASUREMENT OF ANTENNA RADIATION PATTERNS ON SPACECRAFT
A Stembridge *In* AGARD Avionics in Spacecraft Sep 1971 11 p (See N72-19483 10-14)
Avail NTIS HC $6.00/MF $0.95

The measurement of antenna radiation patterns on spacecraft telemetry and telecommand antennas operating in the VHF (136 - 149 MHz) and UHF (435 - 470 MHz) frequency ranges is discussed. Measurements have been carried out on out-door ranges by full scale and model techniques which are described. Facilities for making measurements have been limited to models weighing less than 100 lb. A new facility, now under construction, using improved techniques and capable of handling models up to 500 lb in weight is described. General techniques and methods of presenting results are explained and typical antenna radiation patterns are given. Some comments on merits of anechoic chamber and out-door methods of measurement are made.

FLIGHT TEST INSTRUMENTATION SERIES VOLUME 3 THE MEASUREMENT OF FUEL FLOW
[illegible] France, Mar 1972 32 p refs
(AGARDograph 160 Vol 3 AGARD-AG-160-Vol-3) Avail NTIS HC $3.75

The main methods of fuel flow measurement are discussed and the prospective user is advised of the factors that should be considered in deciding which type of meter to use and what precautions to take in the installation. Details are given of the three main types of flowmeters in common use, namely turbine, orifice and angular momentum true mass. The theory of operation of each type of flowmeter is given together with details of accuracy, pressure drop, susceptibility to inlet and outlet conditions, form of output, and other key parameters likely to influence the choice of type of meter to be used. A quick reference summary is provided for the comparison of the performances of the three types of meter and various methods of calibrating flowmeters are discussed. A separate section is devoted to specialist flowmeters which are not in general use, but may have an application in flight test work. Particular emphasis is placed on solid state flowmeters which due to the need to obtain improved life and reliability, are the subject of much research work. Author

A UNIFIED APPROACH TO HANDLING NOISE IN MEASURING SYSTEMS
Peter K. Stein. *In* AGARD Flight Test Instrumentation Sep 1972 11 p refs (For availability see N73-10450 01-14)

A small portion of the new unified approach to the engineering of measuring systems is presented. The presentation and examples are selected to show the application of this approach to the determination, suppression, and documentation of noise levels in flight test measuring systems in which the initial measuring is of analog nature. A systematic methodology is developed for the determination and documentation of noise levels on any given test set up, at any time, before, during or after a test, and without specific knowledge of the environmental factors which cause these noise levels. A strong plea is made for the recognition of measurement systems engineering as a discipline in its own right, which can and must be incorporated into engineering curricula. The unified approach is offered as a starting point towards this end. The need for additional concept-research in this field is identified and the hope is expressed that united efforts among various nations will result in the production of measurement-oriented or measurement-conscious engineers of all disciplines and at all levels. AGARD FLIGHT TEST INSTRUMENTATION SERIES. VOLUME 2: IN-FLIGHT TEMPERATURE MEASUREMENTS
F. Trenkle, M. Reinhardt, W. D. Mace, ed., and A. Pool, ed.
Feb 1973 171 p refs
(AGARD-AG-160-Vol-2, AGARDograph 160 Vol 2) Avail: NTIS HC $10.75

The field of temperature measurements in aircraft at Mach numbers up to 2.3 and altitudes up to 80,000 feet is reported. After a general discussion of the requirements of aircraft temperature measurements, and the available temperature sensing technology, the detailed techniques of using resistance probes and thermocouples, as well as the associated electrical leads, circuits, and indicators are explained. A discussion of heat transfer processes, primarily between moving fluids and solids, includes terminology, the systematics of temperature measurements, and the concept of total temperature as the main operational parameter. One section deals with errors in temperature measurements, as functions of various parameters in gases, liquids and solids. Typical laboratory and in-flight calibration techniques for thermometery are described, followed by discussions of data handling, error analysis, and the limits of present methods. Author

PRINCIPLES OF HOLOGRAPHY
T. H. Gee *In* AGARD Laser Technol. in Aerodyn. Meas. Mar. 1972 13 p ref. (See N72-25493 16-16)
Avail: NTIS HC $14.50

The principles of holography are discussed. Holography is the process of recording complex wavefronts of light scattered by a scene (object) and subsequent release of the recorded wavefronts to reconstruct the original scene. The reconstruction contains all of the geometrical characteristics of the original scene which one would observe by viewing the scene through a window whose dimensions are those of the recording medium. The basis of the recording process is interferometry. A complex wavefront is made to interfere with a known reference wave and the result recorded by a square law detector. Author

The diffraction efficiency and signal-to-noise ratio for two-dimensional and volume diffuse-signal-beam holograms are calculated and experimentally determined. Calculations are based on the statistical properties of the signal beam, and exact integrals rather than series approximations are used. High signal-to-noise ratio and high diffraction efficiency are possible, with the peak calculated diffraction efficiency being 22% for two-dimensional and 64% for volume holograms. The experimentally achieved efficiencies were 12% for two-dimensional and 36% for volume holograms. Author

GENERAL ASPECTS OF HIGH TEMPERATURE CORROSION OF STRUCTURAL MATERIALS
Carl Wagner. *In* AGARD. High Temp. Corrosion of Aerospace Alloys. Mar. 1973. p 3-7. refs. (For availability see N73-23597 14-17)

An oxidation scale for high temperature corrosion of structural materials is examined and its requirements established. Scale requirements include (1) low concentration of ionic defects effective in metal ion transport, (2) negligible vaporization of oxides in the scale, and (3) freedom from pores or cracks and firm adherence to underlying alloy even during rapid temperature changes. MATERIALS CURRENTLY EMPLOYED IN HIGH TEMPERATURE COMPONENTS OF THE AIRCRAFT GAS TURBINE
M. Brunetaud. *In* AGARD. High Temp. Corrosion of Aerospace Alloys. Mar. 1973. p 31-42. In FRENCH. ENGLISH summary. (For availability see N73-23597 14-17)

General aspects of the high temperature components of the gas turbine are briefly reviewed, along with mechanical and chemical properties required of materials. Commercial nickel and cobalt base superalloys are reviewed in terms of their 1000-hour rupture strengths, together with some experimental alloys currently being developed. This last group includes powder metallurgy alloys, directionally solidified alloys, and alloys based on the refractory metals. Hot corrosion resistant superalloys contain high chromium contents, at the expense of high temperature strength. Designers are currently attempting to develop an intermediate group of high strength alloys with acceptable corrosion resistance complemented by aluminum-based diffusion coatings. Author

WHAT ARE THE ADVANTAGES AND LIMITATIONS IN THE USE OF EQUILIBRIUM THERMODYNAMICS FOR THE TREATMENT OF COMPLEX HIGH TEMPERATURE CORROSION REACTIONS?
M. Pourbaix. *In* AGARD. High Temp. Corrosion of Aerospace Alloys. Mar. 1973. p 63-78. refs. (For availability see N73-23597 14-17)

The conditions of thermodynamic stability of every species which may exist in a given system, whatever the complexity, may be represented by means of suitable diagrams. These enable one to predict the general conditions (temperature, pressure, composition of the gaseous phase) where a given solid or liquid compound may be stable, metastable or unstable. Three types of diagram are illustrated in which the ordinates and abscissae are respectively log P sub O2 and 1/T, RT ln P sub O2 and T, and E and T. The relative values of these methods of representation are discussed, and their applications to the studies of corrosion problems is outlined. Author

RELATIONS BETWEEN INITIAL METALLIC SUBSTRATE, AND FIRST STAGE OF THE REACTION AND FORMATION OF OXIDE LAYERS [RELATIONS ENTRE L'ETAT INITIAL D'UN SUBSTRAT METALLIQUE, LES PREMIERES ETAPES DE LA REACTION ET LA FORMATION DES COUCHES D'OXYDE]
J. Bardolle. *In* AGARD. High Temp. Corrosion of Aerospace Alloys. Mar. 1973. p 79-95. refs. In FRENCH, ENGLISH summary. (For availability see N73-23597 14-17)

The influence of surface preparation on the state of crystallization near the metal surface is summarized, and it is noted that the damaged layer introduced by mechanical polishing can be removed by electropolishing. Several examples are quoted on the effect of surface preparation on the growth of thin oxide films. Minor impurities in the metal or at the oxidizing surface may have a marked effect on the oxidation rate, and in particular on the scale, metal adhesion. Impurities may also change the ductility of the oxide. The mechanisms of the early stages of an oxidation reaction are briefly summarized, and ways in which the progress of these may affect the later oxidation are discussed. Author

TRANSPORT PROCESSES IN SCALES IN HIGH TEMPERATURE CORROSION

P Kofstad *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 97-116 refs (For availability see N73-23597 14-17)

Scales are characterized as (1) porous, (2) dense and compact, or (3) continuous, but containing appreciable porosity or voids Porous scales are no normally associated with protective oxidation behavior, and are not discussed, dense and compact scales are very uncommon in practice, but can usefully be discussed as a limiting ideal case The kinetics of the growth of a scale in which the rate limiting process is the transport of reactants and electrons through the scale is very briefly summarized The transport properties of a number of oxides are reviewed to determine which is the most desirable scale to be formed on an oxidation-resistant alloy Although it is clear that the formation of a Cr2O3 layer will result in a reduction in the oxidation rate of Ni and Co, there is no doubt that the most protective scale layer would be Al2O3, and this is consistent with observation There are many possible effects of impurities on diffusion rates in oxides, and the example of lower valent cations dissolving in an oxygen deficient MO2 oxide is briefly discussed The influence of porosity on the growth of a substantially compact scale is discussed, and it was concluded that on balance it is undesirable, often enhancing the oxidation rate and weakening the scale Selective and internal oxidation are clearly of great importance, and the latter is associated with the solution of oxygen in the metal The effects of the mechanism of oxygen diffusion, of pretreatment and microstructure of alloys, and of alloy composition are discussed Some aspects of reactions involving sulphur are also reviewed Author

N73-23605 Cranfield Inst of Technology (England)
WHAT IS THE ROLE OF STRESS IN OXIDATION, INCLUDING BOTH EXTERNALLY-APPLIED AND GROWTH STRESSES? WHAT ARE THE MODES OF STRESS-RELAXATION? HOW DOES THERMAL CYCLING AFFECT THE STRESSES AND STRESS RELAXATION?

P Hancock *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 117-128 refs (For availability see N73-23597 14-17)

The isothermal stresses generated during oxidation can be attributed to four main causes (1) the volume ratio between the metal and the oxide formed (2) the epitaxial relationship between the oxide and the metal, (3) composition changes in either the metal or the oxide, and (4) the influence of vacancies generated during oxidation In any single oxidation process all of these factors may contribute, but the influence of component geometry on these processes is often critical and invariably neglected Mechanisms of stress relief include cracking of the oxide film, plastic deformation of the scale, and in some circumstances deformation of the underlying metal The mechanisms of plastic deformation of the scales are reviewed and the effects of thermal stresses considered Author

ENVIRONMENTAL EFFECTS ON GAS/METAL REACTIONS AT ELEVATED TEMPERATURES

D E Rosner *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 129-144 refs (For availability see N73-23597 14-17)

To anticipate the effects of unusually severe operating conditions, or to design readily interpretable oxidation kinetic experiments, consideration is given to the conditions of convection, diffusion, and chemical change in the immediate vicinity of the gas/solid interface Recently exploited methods are outlined for accomplishing this by combining simple conservation principles with computational techniques and experimental data developed by chemical, mechanical, and aeronautical engineers for dealing with similar physical situations Important effects on gas/solid oxidation rates associated with gas flow rate enthalpy, pressure level, and/or chemical composition (especially dissociation) are discussed, both from the points of view of making reliable rate predictions based on available chemical and physical data, and designing kinetic experiments from which fundamental information can be extracted Author

N73-23607 Ohio State Univ, Columbus
VAPORIZATION LOSSES FROM Cr2O3 PROTECTIVE SCALES

R A Rapp *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 147-154 refs (For availability see N73-23597 14-17)

Vaporization thermodynamics and kinetics are reviewed The vaporization of Cr2O3 scales occurs with the formation of CrO3 and CrO(OH)2 vapor species The maximum possible rate of vaporization is given by the Hertz-Langmuir equation, but in the practical case the rate is limited by mass transport through a stagnant boundary layer, the thickness of which depends on the local gas velocity In turbulent near-sonic flow the vaporization rate may therefore approach the theoretical maximum It is suggested that the only possibility for the use of protective Cr2O3 scales in reactive high-velocity atmospheres is to separate the Cr2O3 scale from the environment by a compact and stable surface oxide which is low in the activity of Cr2O3 However, external spinel scales are generally spalled through thermal shock There is considerable evidence to suggest that the formation of a protective alpha-Al2O3 scale effectively inhibits the evaporative loss of chromium from an alloy Author

N73-23608 Pratt and Whitney Aircraft, East Hartford, Conn
ON THE EFFECTS OF OXIDE DISPERSIONS AND RARE-EARTH TYPE ELEMENTS ON THE OXIDATION OF Cr AND Al-CONTAINING ALLOYS

F S Pettit *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 155-172 refs (For availability see N73-23597 14-17)

The effects of oxide dispersions and rare-earth type elements on the oxidation of alloys upon which Cr2O3 or Al2O3 scales are formed is discussed It is shown that oxide dispersions and rare-earth type elements can both apparently affect the adherence, growth rate, and growth mechanism of Cr2O3 as well as the selective oxidation of chromium in alloys In the case of alloys upon which Al2O3 scales are formed however, oxide dispersions and rare earth elements appear to affect only the adherence of the scale The differences between effects produced by oxide dispersions and rare-earth type elements is examined Author

N73-23609 Liverpool Univ (England)
THE APPLICATION OF MULTICOMPONENT DIFFUSION THEORY TO THE OXIDATION AND CORROSION OF COMPLEX SUPERALLOYS

D P Whittle *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 173-200 refs (For availability see N73-23597 14-17)

The relevant phenomenological equations for multicomponent diffusion and methods of obtaining their solution are briefly presented Possible forms which the calculated diffusion paths may adopt are indicated and the relevance of these to the oxidation and sulfation of alloys is discussed The multicomponent diffusion equation was solved for transport in the alloy when one of the alloy components was being selectively removed by oxidation or sulfation Two cases are considered where the oxidant is insoluble in the alloy when the composition of the alloy/scale interface is important in determining which phase is stable in the scale, and when the oxidant is soluble and can diffuse into the alloy, possibly producing internal precipitation of sulphide or oxide The relevant conditions for internal precipitation are also presented In both cases, the importance of diffusional interaction is stressed Author

N73-23610 Admiralty Materials Lab, Poole (England)
WHAT ARE THE SEPARATE AND INTERACTING ROLES OF SULPHUR, SODIUM AND CHLORIDE IN HOT CORROSION?

J F G Conde *In* AGARD High Temp Corrosion of Aerospace Alloys Mar 1973 p 203-220 refs (For availability see N73-23597 14-17)

The origins of the sulfur, sodium and chloride contaminants are discussed and the conditions existing in the gas turbine are examined The chemistry of contaminants in the combustion environment is introduced and evidence is cited to show that in the short residence times available, gas phase sulfation of chloride

is not significant. The mechanism of salt deposition in the gas turbine on nozzles and blades is considered briefly and the role of the obvious contaminants, sulfur, sodium, and chloride is examined in relation to sulfidation and accelerated oxidation. A model is suggested in which periodically extremely local non-equilibrium conditions arise on the surface of nozzles and turbine blades due to impaction of sea-salt particles. It is suggested that such conditions may permit chloride to destroy the integrity of protective scale layers under low oxygen pressure conditions existing beneath liquid sulfate deposits. Author

N73-23611 Centre National de Recherches Metallurgiques, Liege (Belgium)
WHAT ARE THE EFFECTS OF ALLOYING ELEMENTS SINGLY OR IN COMBINATION ON HOT CORROSION?

A. Davin and D. Coutsouradis *In* AGARD High Temp. Corrosion of Aerospace Alloys Mar. 1973 p 221-233 refs (For availability see N73-23597 14-17)

As single additions only chromium or aluminium are reported to improve the oxidation resistance of nickel and cobalt appreciably, due to their forming protective scales of Cr_2O_3 and Al_2O_3 respectively at sufficiently high concentrations. When the two elements are added together, the presence of the chromium causes a stable layer of Al_2O_3 to develop at lower aluminum concentrations than in the binary systems, due to the gettering effect of the chromium in the metal which impedes the inward diffusion of oxygen and prevents internal oxidation of the aluminum. Author

N73-23612 Naval Ship Research and Development Center, Annapolis, Md.
ARE COBALT-BASE ALLOYS INTRINSICALLY MORE RESISTANT TO HOT CORROSION THAN ALLOYS BASED ON NICKEL?
W. L. Wheatfall *In* AGARD High Temp. Corrosion of Aerospace Alloys Mar. 1973 p 235-254 refs (For availability see N73-23597 14-17)

A literature search was made in an effort to determine if cobalt-base alloys are intrinsically better than alloys based on nickel relative to hot-corrosion resistance. Results of the search did not confirm whether cobalt alloys were inherently more resistant than nickel alloys. Failure to resolve this controversy was due mainly to two factors: (1) insufficient hot-corrosion data comparing pure nickel and cobalt, and (2) contradictions with regard to the roles of sulfur and the liquid sulfide phase in the hot-corrosion process. A discussion and comparison of results of a number of investigations are provided along with the listing of several questions which may serve as the basis for future research efforts to finally resolve whether or not cobalt-base alloys are intrinsically more hot-corrosion resistant than alloys based on nickel. Author

CAN FUEL ASH CORROSION BY VANADIUM BE COMBATTED BY ALLOYING OR COATING WITHOUT THE USE OF FUEL ADDITIVES?
K. J. Williams and P. J. Parry *In* AGARD High Temp. Corrosion of Aerospace Alloys Mar. 1973 p 255-266 refs (For availability see N73-23597 14-17)

Materials for nozzle guide vanes and turbine blades subject to attack by the products of combustion of vanadium-containing fuels are investigated. Previous operating experience of industrial gas turbines burning residual fuel is referred to, and current ASTM fuel specifications are considered. Relevant developments with alloys and coatings are reviewed. Recently announced alloys containing 35% - 50% chromium offer promising corrosion resistance, and an indication of the strength attainable in the 50% Cr base is given. High-chromium coatings applied by pack-chromising have performed well in recent burner-rig tests. There is a need for more comprehensive testing of these new materials under realistic conditions, and over a range of vanadium contents. Author

WHAT ARE THE PROSPECTS FOR THE SUCCESSFUL APPLICATION OF COATED REFRACTORY METALS IN UNCOOLED TURBINES? [QUEL EST L'AVENIR DES ALLIAGES REFRACTAIRES PROTEGES DANS LA CONSTRUCTION DES TURBOMACHINES?]
B. Roques *In* AGARD High Temp. Corrosion of Aerospace Alloys Mar. 1973 p 269-282 refs In FRENCH, ENGLISH summary (For availability see N73-23597 14-17)

Various protective coatings are investigated to determine the most effective application for refractory metal alloys used in the structural makeup of turbine engines. The results indicated that coatings based on SiO_2 and Al_2O_3 constitute foundations from which improved protective oxides may be developed. J.M.M.

N73-23615 Liverpool Univ. (England)
ARE THERE NEW APPROACHES TO ALLOYING WHICH MAY PRODUCE OXIDATION-RESISTANT REFRACTORY METAL ALLOYS?
J. Stringer *In* AGARD High Temp. Corrosion of Aerospace Alloys Mar. 1973 p 283-294 refs (For availability see N73-23597 14-17)

The oxidation mechanisms of Nb, Ta, Mo and W are briefly reviewed. Nb and Ta form non-protective porous scales of the pentoxides, and at the same time oxygen dissolves in the metal producing severe embrittlement. It was found that, at elevated temperatures, both Mo and W form volatile oxides, and reduction in the oxidation rate requires the stabilization of a foreign oxide or the development of a protective noble metal-rich layer at the surface. Some molybdates and tungstates appear to have promising properties, and chromium-rich alloys forming Cr_2O_3 layers also represent significant improvements. Unfortunately, all alloys so far developed which have significantly improved oxidation resistance are also very brittle. Author

METALLURGICAL ASPECTS OF FATIGUE AND FRACTURE
(AGARD-R-61-73) Avail: NTIS HC $7.75

The proceedings of a conference to investigate the fatigue and fracture behavior of aerospace structural alloys are presented. The effect of heat treatment to prevent stress corrosion was analyzed to determine possible changes in the mechanical properties of the materials. The subjects discussed include the following: (1) metallurgical aspects of fatigue and fracture toughness, (2) developments in fatigue and fracture, (3) thermomechanical procedures to improve the properties of high strength aluminum, magnesium, zinc, copper alloys, and (4) the influence of microstructure on the growth of fatigue cracks. For individual titles, see N74-23109 through N74-23112.

SOME RECENT DEVELOPMENTS IN FATIGUE AND FRACTURE
A. R. Rosenfield and A. J. McEvily (Battelle Columbus Labs.). *In* AGARD, Met. Aspects of Fatigue and Fracture Toughness, Dec. 1973, p. 23-54, refs (For availability, see N74-23108 14-17)

The microstructural origins of the fracture resistance of high strength steels are analyzed. Curves are presented to show schematic crack growth versus stress intensity. The mechanisms considered are fatigue cracking and stress corrosion cracking. Both phenomena exhibit three stages of crack growth as follows: (1) a threshold below which crack growth is not detected, (2) a steady state region, constant velocity for environmental attack and power law behavior for fatigue, and (3) an instability characterized by the fracture toughness for plane strain thick section behavior. IMPROVEMENT OF THE PROPERTIES OF HIGH STRENGTH Al-Zn-Mg-Cu ALLOYS BY THERMOMECHANICAL PROCEDURES
E. DiRusso and S. Signoretti (Aeron. Militare Italiana). *In* AGARD, Met. Aspects of Fatigue and Fracture Toughness, Dec. 1973, p. 55-76, refs (For availability, see N74-23108 14-17)

A thermomechanical processing technique for producing plates and forgings of 7000 series alloys (7075, 7049, 7475, 7050, etc.) showing a less transverse effect than similar conventionally processed materials was developed. This procedure, called Intermediate Thermomechanical Treatments (ITMT), is based on a combination of warm deformations and heat treatments which involve the recrystallization of the ingot in small equiaxed grains in an intermediate (or final) stage of the working. As a result of the processing, the alloys exhibit better ductility, toughness and stress corrosion properties for a given strength than conventionally processed materials, mainly in the short transverse direction. Moreover, it has been found that the contemporary application of ITMT and final FTMT thermomechanical treatments of T-AHA type, which, as is known, cause a super-hardening effect with an acceptable loss in ductility, may lead to decidedly new products with properties that are much superior to those of commercial traditional products. INFLUENCE OF MICROSTRUCTURE ON THE GROWTH OF FATIGUE CRACKS
G. Sertour and C. Bathias. *In* AGARD, Met. Aspects of Fatigue and Fracture Toughness, Dec. 1973, p. 77-90, refs (For availability, see N74-23108 14-17)

The application of the failure mechanism concepts to the development of fatigue induced cracks is discussed. The influence of microstructure on the propagation of fatigue induced cracks is analyzed. The metallurgic parameters which play a part at the very level of crack propagation mechanisms are examined. It is stated that the most important parameter which governs the development of fatigue induced cracks is the nature of the plastic deformations which occur at the crack tip. Such deformations are essentially related to the slip character and to the stacking fault energy. The influence of structure on fatigue induced crack development is reviewed with emphasis on the formation of striations and on the environment-structure interaction on crack growth. Author

HANDBOOK OF BRITTLE MATERIAL DESIGN TECHNOLOGY

W. H. Dukes, Feb. 1971. 161 p. refs

(AGARD-AG-152-71; AGARDOGRAPH-152) Avail: NTIS

Structural data on brittle nonmetallic refractory materials such as oxides, carbides, nitrides, and graphite are provided for use in designing reentry vehicles and propulsion systems. The term brittle materials is used to describe materials which show no plastic deformation under stress, but deform elastically until failure. The principles and practices for achieving reliability with structures constructed with brittle materials are described in detail. Design stresses, stress analysis, mechanical properties, and design criteria are discussed. F.O.S.

CHARACTERIZATION, SELECTION, AND USE OF HIGH STRENGTH STEELS

W. S. Owen. In AGARD, The Characterization and Appl. of Mater., May 1971. 19 p. refs. (See N71-27038 15-18)

Avail: NTIS

The principles and ideas on which modern ultra-high strength steels have been developed are outlined and a few concepts of basic importance are illustrated by a description of specific alloys and thermal and mechanical treatments which are applied to them. Considered exclusively are those alloys intended to possess a very high strength, as defined by the yield stress or the flow stress, at a small offset (less than 0.2% strain) combined with acceptable ductility. It is assumed that components made from these steels are subjected to static loading, a slow applied strain rate or very low frequency cyclic loading at temperatures within 100 degrees of room temperature. Of primary importance is the resistance of these alloys to stress corrosion and related effects. Most of the features of the structure of importance in this context are those which can be studied by optical microscopy. Author

NATURE, STATUS, AND SELECTION OF CERAMIC MATERIALS

Joseph A. Pask. In AGARD, The Characterization and Appl. of Mater., May 1971. 66 p. Sponsored by AEC. (See N71-27038 15-18)

Avail: NTIS

Ceramic materials are identified as having ionic covalent bonding, being composed of compounds, and being either crystalline or glassy. The oxides are of particular interest because of their chemical stability up to high temperatures. Brittle behavior makes them sensitive to flaws either intrinsic or extrinsic, thus requiring a uniform distribution of uniform flaws to achieve reliability. Intrinsic flaws can be correlated with character features. Extrinsic flaws in themselves are character features. Both of these features can be correlated with mechanical properties and behavior. A number of applications of ceramic materials based on their unique properties of chemical resistance, high strength/density rations, high modulus of elasticity/density ratios, hardness, optical transparency, and electrical resistance are revised. Polymeric substances are classified as either thermosetting or thermoplastic resins. The first category includes phenolic resins, urea and melamin formaldehyde resins, epoxy resins, unsaturated polyesters, and elastomers. These are polymeric substances, the synthesis of which is achieved during the processing by the curing phase. The second category includes polyvinyl resins, polyethylene, polyvinyl chloride, polystyrene. Their state essentially depends on temperature and time scale. Their properties are influenced not only by their chemical nature, but also by their molecular weight and molecular structure. The selection of a polymeric substance for a

given application depends on a number of physio-chemical characteristics thermal characteristics mechanical characteristics electric or optical characteristics, and on its cost Author

Composite materials consisting of an epoxy matrix longitudinally reinforced by oriented silica fibres have been tested for their mechanical properties. Primarily the elastic coefficients have been measured. For this purpose static and dynamic measurements have been performed. Specimen forms and test results are discussed. Other mechanical properties (U.T.S.) are also presented and discussed in view of the application of such fibre reinforced materials as structural elements. Author

Measurement of ultrasonic attenuation on composites has been shown to be a valuable qualitative method of testing these materials for voids or similar defects. Existence of these does seriously reduce the strength and indeed the elastic constants. It is therefore highly desirable that all samples are tested in this manner before further tests are carried out. The method has been applied to two composites: silica epoxy and silica phenolic sheets. Values of their elastic constants are given in the appendix. Author

A method for determining independent mechanical characteristics of an epoxy silica composite material in which the reinforcement is unidirectional is presented. The material takes the form of small dimension sheets. Its characteristics must allow the quantitative response prediction to all states of stress. In the linear domain the compliance tensor and in the non-linear domain a criterion of breaking strength is defined theoretically. The validity of the hypotheses and results have been confirmed by submitting the characteristics as a function of the angular position of the axes. The discussion of the results concerns chiefly the percentage of fiber, its distribution and the physical appearance of the material resulting from certain stress conditions. Author

A theoretical and experimental analysis has been performed to evaluate the elastic constants of a silica epoxy composite material. From a theoretical standpoint the material under test has been considered as an homogeneous body and assumed to be isotropic in the plane orthogonal to the fibers direction. Under these assumptions one can show that five independent elastic constants are sufficient to describe the elastic properties of the composite material. The values of these constants have then been plotted versus specific weight and strain rate of the samples by the use of ad hoc suitable equipments. Author

The large scatter in test data observed is consistent with previous experience in fiber reinforced materials. Such variance is usually due in part to fabrication variables, variation in constituent properties, and deficiencies in test methods. It also has been suggested that local stress concentrations, particularly in transverse normal and shear tests, affect behavior in the gross scale and account for part of the data spread. The specimens were prepared with most of the fabrication variables eliminated, yet the scatter in test results was still excessive. This suggests that conventional test methods are at fault or that wide variations in composite properties are intrinsic to this class of materials. In any case, the designers problem of predicting structural behavior or of specifying required properties of composites is considerably magnified by such uncertainties concerning material properties. The effects of temperature and fiber orientation on the load carrying capacity, strength, and fracture mode of SiO2 epoxy resin composites have been investigated by means of slow bend and impact tests. Although tough and strong when loaded parallel to its fibers, the composite is shown to be weak and brittle when loaded transversely. The composite exhibited little or no notch sensitivity for notches machined along planes normal to the fibers, whereas for the case of notches machined parallel to the fibers, the composite showed considerable notch sensitivity that depended on the test temperature. Increase in test temperature had the effect of reducing the load carrying capacity of both the notched and unnotched samples in both the slow bend and impact loading. Impact energy values measured for the specimens loaded parallel to their fibers showed a slight decrease with the rise in test temperature. Author

A simple method has been developed for the determination of the effective, in situ, linear and nonlinear stress strain response of the matrix and reinforcement from load-strain measurements made on composites. Two specimens with slightly different but predetermined value volume fractions of reinforcement are tested. An analysis of the load-strain data from the two specimens yields the average for the two specimens of stress-strain data for the reinforcement and for the matrix. It is shown that the method is independent of the shape of the component stress-strain curves and may be applied in the linear and nonlinear regions. General principles of specimen pair design are derived based upon a sensitivity analysis of the method which takes into account the precision of the measuring apparatus and the relative stiffnesses of the components of the composites. Results obtained in tensile strength measurements made on steel-wire-reinforced aluminum alloys are presented. Carbon steel wire whose final strength after incorporation in the composite was about 140 plus or minus 10 kg sq. mm. was coated with aluminum alloys and after hot pressing first subjected to tensile tests. With filament contents of 20 to 60 volume percent increases in strength of 200 to 350 percent were achieved, these values approaching the theoretical values. In dynamic tests on specimens reinforced with 20 volume percent the strength values measured after 2 x 10 to the seventh power load cycles were 50 percent higher than those of the unreinforced material. The mechanisms of low-cycle fatigue were studied in composites of aluminum reinforced with 34 vol. % of continuous beryllium filaments. Two series of composite specimens were tested. One series fabricated using as-drawn (rough surfaces) beryllium wire and another using electropolished (smooth surfaces) beryllium wire, to determine the effects of mechanical interlock at the filament-matrix interface on fatigue performance. Axial, strain-controlled fatigue tests were performed. The cyclic stress-strain curves were identical for the two series of composite specimens, while composites reinforced with as-drawn filaments exhibited longer fatigue lives than composites reinforced with electropolished filaments. This difference in fatigue lives between the two series of composites was attributed to the difference in the rate of crack growth parallel to filament-matrix interfaces. It was concluded that rough filament surfaces impede interfacial crack growth. Author

A new method is described for determining the life of the glass to resin bond in GRP exposed to water. The electrical conductance along the strands is measured as a function of time of exposure, and the bond life defined as the time taken for the conductance to attain a certain value. A comparison of several glass coupling agent combinations in epoxy resin exposed to boiling water showed a 7-fold range of bond life, with the S-glass HTS treatment combination giving the most durable bond. Relative bond lives at 60 and 100 C for an E-glass epoxy composite gave an overall activation energy of about 30 Kcal/mole for the debonding process. Author

DESIGN OF COMPOSITE MATERIALS
Walter Rosen *In* AGARD Composite Mat. May 1972 22 p refs (For availability see N72-29589 20-18)

Studies of the relationships between the effective properties of fiber composite materials and the mechanical and geometric properties of their constituents are reviewed. The aims of such studies are, first, to provide the ability to analyze the performance of structures utilizing these heterogeneous materials and, second, to provide guidelines for the development of improved materials. The rationale for designing a material to suit the application is described. The feasibility of accomplishing this aim through the use of high stiffness and high strength filamentary materials is discussed. It is emphasized that the design cycle with composites involves many more steps than the equivalent metallic structural design process. The relationship is developed governing the thermomechanical properties of composites. The importance of heterogeneity and anisotropy are treated. Theoretical results are presented for composite elastic moduli, thermal expansion coefficients, thermal conductivities, and specific heats. Results are presented in a form easily usable for parametric study of candidate materials during the preliminary design phase. The status is discussed of the understanding of the tensile, compressive, and shear strengths of unidirectional composites. The definition of the mode of failure is emphasized. Author

FIBER AND MATRIX MATERIALS FOR ADVANCED COMPOSITES
P. J. Diefendorf *In* AGARD Composite Mat. May 1972 20 p refs (For availability see N72-29589 20-18)

Composite materials provide a solution for the engineering use of high specific strength, high specific modulus, but brittle materials. These brittle materials are used as fibrous reinforcement to provide strength and stiffness in the composite. The fundamental principles for selecting the reinforcements are described, as well as the concepts used to form these materials into high strength filament. Detailed information on the preparation, structure and properties of boron, carbon and organic filament are presented. Matrix materials, which are used to transfer stress to the fiber and also prevent brittle failure, are discussed in less detail. The techniques for combining filaments and matrix into prepreg or other preforms, and the fabrication into structure are considered. Finally, the mechanical properties of composites based on boron, carbon, and organic fibers are presented. Author

EXPERIMENTAL METHODS FOR COMPOSITE MATERIALS
B. E. Read and G. D. Dean *In* AGARD Composite Mat. May 1972 28 p refs (For availability see N72-29589 20-18)

A wide range of techniques is discussed for measuring the elastic, viscoelastic, ultimate strength, thermal and electrical properties of fiber reinforced composites. Main emphasis is given to the determination of the basic properties of unidirectionally reinforced composites and for this purpose, the mechanical test samples considered are mainly in the form of rectangular bars. However, some consideration is given to methods involving honeycomb sandwich structures, circular rods, plates, rings and cylinders. For determining the state Youngs moduli and Poissons ratios, tensile and compressive tests are considered in addition to flexure methods (cantilever, 3-point and 4-point) and also the honeycomb sandwich technique. Methods for measuring the shear moduli include both torsion and off-axis tensile tests. Comparative elastic data obtained by these methods are collected and discussed for unidirectional silica fiber-epoxy, carbon fiber-epoxy, boron fiber-epoxy and boron fiber-aluminum composites. Creep and stress relaxation methods are outlined for studying time dependent viscoelastic behaviour and results illustrated for nylon-rubber and boron-epoxy composites. Several dynamic tests are described including the low frequency forced nonresonance torsion pendulum, audiofrequency resonance and ultrasonic pulse techniques. Dynamic elastic constants and damping factors are illustrated for carbon fiber-epoxy composites as a function of frequency and fiber volume fraction. Methods are assessed for determining the tensile, compressive, flexural and shear strength, fracture energy and fatigue life, and selected data are illustrated for some carbon fiber, boron fiber and glass fiber composites. Techniques for measuring the thermal expansion coefficient, thermal conductivity, heat capacity, electrical resistivity, dielectric constant and loss are outlined, and some results presented for unidirectional carbon fiber composites. Brief mention is made of magnetoresistive and thermomagnetic data obtained on a composite formed by the unidirectional solidification of an eutectic InSb-NiSb mixture. Author

GENERAL CONSIDERATIONS IN THE APPLICATIONS OF ADVANCED COMPOSITES

I. C. Taig. *In* AGARD Composite Mat. May 1972 14 p refs (For availability see N72-29589 20-18)

The characteristics of advanced composites are compared with those of conventional airframe materials. It is shown that many considerations other than conventional mechanical properties and fabrication technology influence the selection and realization of effective applications of composites. Particular attention is given to the assessment of cost effectiveness, to the achievement of integrity in a broad sense including protection against adverse environmental effects and to some practical aspects of producibility. Trends in material and manufacturing costs are presented to show that in the airframe industry most parts of the structure could benefit from the extensive use of composites in the next ten years. Expansion and redirection of the research and development effort will be needed to exploit the economic potential of the materials. Author

AIRFRAME APPLICATIONS OF ADVANCED COMPOSITES

I. C. Taig. *In* AGARD Composite Mat. May 1972 12 p refs (For availability see N72-29589 20-18)

A wide variety of primary and secondary structural applications of advanced composites are presented. It illustrates, using actual or projected examples, the progressive introduction into service of components of increasing complexity and cost effectiveness. All previously unpublished information relates to carbon fiber epoxy composites under development in the U.K., but to broaden the picture, the coverage also includes boron epoxy, carbon epoxy, and, to a lesser extent, boron aluminum applications in the U.S.A. The range of components covered includes composite reinforced metal members, sandwich panel structures such as doors, floors, and control surfaces, rod and tube members, box structures such as tail surfaces and wings, frames, bulkheads, and fuselage shell structures. Particular emphasis is given to the design principles and practical features embodied in each application, illustrating as far as possible the general considerations of the previous paper. Where information is available, mass savings and cost effectiveness data are quoted, and comments on the operating environment and experience in service are included. Author

MECHANICAL PROPERTIES OF HIGH PERFORMANCE PLASTIC COMPOSITES

Theodore J. Reinhart, Jr. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973 27 p refs (For availability see N73-27474 18-18)

Data and information are presented on high strength, high modulus reinforcing fibers and organic resin composites fabricated from these fibers. Glass, boron, graphite, various metallic, PRD 49-III, and silicon carbide fiber and composite properties are discussed. Combined fiber or hybrid composites containing boron and S-glass, and beryllium fibers and S-glass are discussed. The properties of the various forms of asbestos reinforcements are presented along with the mechanical properties of several asbestos reinforced epoxy-resin composites. Fatigue, creep, and stress rupture data are presented where data on similar composite constructions could be found in the literature. Author

CARBON FIBRE COMPOSITES: PROMISES AND PROBLEMS

W. G. Heath. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973 11 p refs (For availability see N73-27474 18-18)

Structures of carbon fiber composite show great promise in reduction of weight and freedom from fatigue and corrosion. They also permit the designer to tailor the material to match the applied loading. There are on the other hand serious problems to be overcome: the high cost of the material, its brittle nature, its susceptibility to erosion and its lack of robustness, the variability between apparently identical components, and the difficulty of making joints between sub-assemblies. This paper examines the promises and problems in turn, it shows how the promising features might be exploited more fully and seeks solutions to the problems. Author

PRODUCTION OF FIBROUS METAL COMPOSITES BY POWDER ROLLING

I. Crivelli Visconti, P. Jauch (Aeritalia, Naples), and C. Voto (Aeritalia, Naples). *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973 23 p refs (For availability see N73-27474 18-18)

The fundamental aspects of powder rolling are considered regarding both the production of continuous strips starting from metal powder and the production of fibrous metal composites obtained by contemporary rolling of powder with strong reinforcing wires. The method can be applied to a large number of matrix-fibers systems of aeronautical interest. After a description of the influence of each parameter regulating the physical properties of the green strip (like roll gap, feeding system type and size of powder, roll diameter, number of fibers), some of theoretical and experimental properties of systems of practical interest are reported. From the results obtained during the entire work on the described method the actual potential and advantages of this method of metal composites fabrication is discussed in relation to other similar methods and a few examples of possible applications are given. DESIGN AND FAILURE CRITERIA OF ADVANCED COMPOSITE PRIMARY STRUCTURE

Larry G Kelly *In* AGARD Impact of Composite Mater on Aerospace Vehicles and Propulsion systems May 1973 8 p (For availabilit, 73-27474 18-18)

The design, fabrication, and flight test of a boron epoxy F-111 stabilizer are discussed The applicability of this composite material to airframe construction and the ability to achieve significant weight savings are reported The material allowables and design philosophy utilized in the evolution of this structure are employed as an example of an approach to establishing logical failure criteria from which efficient designs can be developed with continuous aligned high modulus high strength composite materials One of the outstanding features of filamentary composite materials is their directional properties which provides the ability through crossplying of lamina to tailor a structure which meets specific loads and or stiffness requirements with a minimum amount to material and weight Thus a more efficient and reliable method of establishing design allowables for all laminates of interest was developed The approach selected was to experimentally determine the stress-strain response to simple unidirectional laminae at the required design temperature and with the aid of a mathematical model establish a failure envelope to serve as the designers tool for selection of a suitable laminate thickness and ply orientation for a given set of load conditions Author

ADVANCES IN BALLISTICALLY TOLERANT FLIGHT CONTROLS

I. E. Figge, Sr. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973. 8 p. refs (For availability see N73-27474 18-18)

Combat data indicate that helicopter flight control components are exceptionally vulnerable to catastrophic failure upon ballistic impact. The ballistic tolerance approach, which is to design the critical components to function after ballistic penetration, offers a solution to reduce vulnerability. Studies have shown that this approach can virtually eliminate catastrophic failure while achieving substantial weight saving and reduced production costs. Limited data indicate the approach is also adaptable to flight control bearings and attachments. Venting was found to reduce the damage on the exit side of sandwich structures and preslotting was found to prevent delamination of the exit face in the area of impact. Author

INSTABILITY OF LAMINATED COMPOSITE PLATES

G. Z. Harris. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973. 19 p. refs (For availability see N73-27474 18-18)

The response of general laminated plates to applied loading exhibits a coupling between bending and extensional modes of deformation. Such a laminate will, for example, undergo a bending response when load is applied in the plane of the laminate. Such coupling may be significant when shear or compressive loads are applied in-plane since the additional deformation modes may reduce the buckling load or affect the post-buckling stiffness of the laminate. The present paper considers the stiffness immediately after buckling of two types of panel which undergo bifurcational buckling. The first class of panel considered is one of angle-ply type. A solution is derived for the initial buckling of a rectangular panel to which is applied a constant end displacement. The pre-buckling response is one which exhibits no out of plane displacements, although the initial buckling load is affected by the existence of out-of plane coupling. The second class of panel is of cross-ply type, the buckling loads being derived for a long panel having a constant strain edge member and subjected to end load. Author

DESIGN AND MANUFACTURING ASPECTS OF COMPOSITE MATERIALS WITH ORGANIC MATRICES FOR APPLICATION AT HIGH TEMPERATURES

J. J. Cools. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973. 15 p. refs (For availability see N73-27474 18-18)

Some design and manufacturing aspects are presented of the mixed structure concept which was developed for application in aerospace structures subjected to high temperatures. In this concept a HM-composite material with an organic matrix is laminated between metallic faces to combine simultaneously the favorable features of both types of materials. The HM-composite material is the main load carrying component. The metallic faces protect the organic matrix against oxidation by air at high temperatures, provide an electrically conductive surface of the structure and contribute to stabilization against buckling. The mixed structure concept can also be applied to aerospace structures subjected to normal operating temperatures. Author

A LIMITED REVIEW OF THE APPLICATION OF ADVANCED FIBROUS COMPOSITES TO AERO GAS TURBINE ENGINES

A. W. H. Morris. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973. 16 p. refs (For availability see N73-27474 18-18)

CSCL 11D

A review of fiber reinforced composite material relevant to aero gas turbine engine application is presented for systems both commercially available and projected. Emphasis has been placed on those mechanical property requirements and fabrication problems which are peculiar to gas stream components. Although high strength and high elastic modulus composites are available in organic and inorganic matrices for low temperature application, these materials exhibit extremely poor impact and erosion characteristics which may limit use where foreign object damage is prevalent. Several engineering solutions to the problem are discussed. The application of composites in the high temperature turbine stage has difficulties such as fiber stability and thermal fatigue and is considered to be very impractical. The development of directionally solidified eutectics, which can loosely be described as composites, offers more encouragement as the next generation turbine material. Author

MATERIAL AND STRUCTURAL STUDIES OF METAL AND POLYMER MATRIX COMPOSITES

Robert A. Signorelli, Tito T. Serafini, and Robert H. Johns. *In* AGARD Impact of Composite Mater. on Aerospace Vehicles and Propulsion Systems. May 1973. 16 p. refs (For availability see N73-27474 18-18)

Fiber-reinforced composites and design analysis methods for these materials are being developed because of the vast potential of composites for decreasing weight and/or increasing use temperature capability in aerospace systems. These composites have potential for use in airbreathing engine components as well as aeronautical and space vehicle structures. Refractory wire-superalloy composites for use up to 2200 F or more and metal matrix composites for lower temperature applications such as aerospace structures and turbojet fan and compressor blades are under investigation and are discussed. The development of a number of resin systems, including the polyimides and polyphenylquinoxalines, is described and their potential for use at temperatures approaching 315 C (600 F) is indicated. Various molecular modifications that improve processability and/or increase thermal and oxidative resistance of the resins are also described. Structural analysis methods are discussed for determining the stresses and deformations in complex composite systems. Consideration is also given to residual stresses resulting from the curing process and to the foreign object damage problem in fan blade applications. Author

REACTION OF OZONE WITH NITROGEN OXIDES AT HIGH ALTITUDES
Harold S Johnston and Gary Whitten *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 13 p refs Sponsored by DOT (For availability see N74-14271 05-20)

Ozone formation in the stratosphere by the dissociation of oxygen by ultraviolet radiation below 242 nm is discussed Ozone is removed from the stratosphere by (1) the reaction of oxygen atoms and ozone (2) by transport to the troposphere (3) by catalytic reactions with free radicals based on water and (4) by catalytic reactions with the oxides of nitrogen The most important factor in the natural removal of stratospheric ozone appears to be catalytic cycles based on the oxides of nitrogen The natural source strength has been calculated by three different investigators There is about a factor of four uncertainty in the natural rate of injection of nitric oxide in the stratosphere There is about a factor of four uncertainty in the calculated rate of introduction of nitric oxide in the stratosphere from full scale operation of supersonic transports of current and past designs Within these two ranges of uncertainty, 500 supersonic transports would introduce nitric oxide in the stratosphere at a rate comparable to the known natural sources Author

DETAILED EXHAUST EMISSION MEASUREMENTS OF THREE DIFFERENT TURBOFAN ENGINE DESIGNS
A W Nelson *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 13 p refs (For availability see N74-14271 05-20)

A series of test programs was conducted to better define the exhaust emission characteristics of three different aircraft engine models the JT3D a low bypass ratio turbofan engine the JT8D a mixed flow turbofan engine and the JT9D a high bypass ratio turbofan engine Special investigations were conducted on the JT3D and JT9D engines to investigate inlet temperature and humidity effects Analysis of these data was supplemented with previously obtained data in order to increase the range of variables investigated For the mixed flow JT8D

engine special tests were conducted using an engine especially modified to physically separate the fan and core engine streams so that true undiluted emission measurements could be obtained. Three different methods were used to evaluate the emission levels of each engine model: multipoint rake, exhaust case pressure probes and super detailed traversing. Analysis of the latter method produced highly refined contour plots of CO, THC and NOX emission footprints as well as exhaust temperature and pressure variations at the plane of the tailpipe. The average emission levels obtained by each of the three measurement methods are compared. Author

PHOTO-OXIDATION OF AIRCRAFT ENGINE EMISSIONS AT LOW AND HIGH ALTITUDES

K. H. Becker and U. Schurath. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 9 p. refs. (For availability see N74-14271 05-20)

The mechanism of photochemical smog formation is examined. The applicability of photochemical smog formation to aircraft emissions is described. It is concluded that photo oxidation mechanisms of pollutants from aircraft and other sources in the troposphere undergo fundamental changes with altitude: radical and atom reactions and probably reactions of metastable oxygen molecules becoming more important in the colder regions of the troposphere. Serious contamination of the troposphere by aircraft is not expected, because the residence time of pollutants is short compared with emissions rates. Author

EFFECT OF SUPERSONIC TRANSPORT UPON THE OZONE LAYER, STUDIED IN A TWO-DIMENSIONAL PHOTOCHEMICAL MODEL WITH TRANSPORT

Egil Hesstvedt. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 8 p. refs. (For availability see N74-14271 05-20)

A steady state two-dimensional model of the stratospheric ozone layer is presented. Photochemical reactions involving oxygen, hydrogen, and nitrogen are considered along with the effect of a parameterized two dimensional transport, by mean motion and by eddies. A parameterized meridional distribution of NOx is applied, computed from one dimensional models. The model is in fair agreement with observed ozone data. The reduction of ozone from emission of NOx from supersonic aircraft is studied, assuming a fleet of 200 aircraft flying at given altitudes and uniformly distributed over the globe. The effect is found to depend critically upon the flight level. For mid-latitude, summer, the ozone column density is reduced by 0.4% for a flight level of 18 km. For flight levels 23 km and 28 km the reduction is 1.6% and 2.3%, respectively. Accordingly, the increase in UV radiation amounts to approximately 0.8%, 3.2%, and 4.6% for the same flight levels. CHEMICAL KINETIC IN THE STRATOSPHERE

G. Brasseur. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 13 p. refs. (For availability see N74-14271 05-20)

The production of ozone in the stratosphere by photodissociation of molecular oxygen is discussed. The specific chemical reactions are analyzed to identify the components involved and the reaction kinetics for various regions of the atmosphere. It is concluded that hydrogen compounds play a significant role in the formation of nitric acid and atmospheric chemical reactions must account for the formation and destruction of hydroxyl and hydroperoxyl radicals. PROBLEMS OF CHEMICAL POLLUTION BY AIRCRAFT. THE AIRPORT AND ITS IMMEDIATE ENVIRONMENT

T. V. Lawson. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 3 p. (For availability see N74-14271 05-20)

The chemical pollution of the airport and its environment is discussed. It calls for a careful study of all surveys so that the inbuilt implications of the model are obvious and it concludes that the problems of chemical pollution by the aircraft themselves are small. It suggests that much more progress will be made in attempts to reduce pollution around airports by concentrating upon organizations other than the engine manufacturers. It closes by suggesting that authors of technical papers be encouraged to supply an epilogue in which they summarize the findings of their work for the benefit of the lay public. Author

GROUND CONTAMINATION BY FUEL JETTISONED FROM AIRCRAFT

N. L. Cross and R. G. Picknett. IN AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 9 p. refs. (For availability see N74-14271 05-20)

A study of the problem of ground pollution produced by fuel jettisoned from aircraft under emergency conditions was conducted. The likely size distribution of drops produced when fuel is jettisoned is examined. The proportions of jettisoned fuel which survive evaporation to reach the ground are determined. It is stated that the contamination density on the ground depends on atmospheric stability, wind speed, and direction of flight relative to wind direction. Data obtained from flight tests of jettisoned fuel are presented in tables and graphs. Author

POLLUTION LEVELS AT LONDON (HEATHROW) AIRPORT AND METHODS FOR REDUCING THEM

D. M. Bruton. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 6 p. ref. (For availability see N74-14271 05-20)

Exhaust pollution levels at Heathrow Airport, London, England were conducted. Medical surveys of the interior of buildings were conducted to determine pollution levels. It was determined that pollution levels are below those of many urban areas and do not appear to represent either a short or long range hazard to health. Local pollution problems constitute a source of annoyance to ground personnel employed at the airport. Methods for reducing the exhaust fume emission by vehicle selection, engine tuning, and maintenance practices are recommended. Author

POLLUTION CONTROL OF AIRPORT ENGINE TEST FACILITIES

D. L. Baily, P. W. Tower, and A. E. Fuhs *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 32 p refs (For availability see N74-14271 05-20)

Engine test facilities are required to meet the same environmental standards as any other industrial facility. To meet the standards for smoke, noise, gaseous pollutants, etc., control equipment must be installed. Due to large mass flow rates, the control equipment is expensive; careful attention to design is necessary to control costs. Pollution control forces new constraints on exhaust stack temperature, flow uniformity, and pressure. Conversely, installation of pollution abatement apparatus may cause adverse operating conditions such as distorted flow into the engine and wrong augmentation ratio. The internal aerodynamics of engine test cells must be mastered to a level not possible previously. Scale models of test cells were fabricated in modules so that some 750 different combinations could be tested. Distortion at the engine face was measured and correlated in terms of component factors. Augmentation ratio and cell depression were measured. An analytical model correctly predicted the measured quantities except for distance from engine nozzle to augmenter inlet. With the data accumulated it should be possible to match pollution control requirements to test cell parameters. Author

EXHAUST EMISSION MEASUREMENTS ON THE GE T64-7 TURBOPROP-ENGINE

W. Bergt, G. Kappler, and G. Meikis *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 4 p refs (For availability see N74-14271 05-20)

Exhaust emission measurements have been carried out on the engine GE T64-7 with the objective to determine qualitatively the mass emission of the pollutants carbonmonoxide, unburnt hydrocarbons and oxides of nitrogen at different power ratings. Although for aircraft engine application the operating modes were just recently issued in the EPA proposed standards for control of air pollution, the engine was run through a 13-point California Test Cycle as applicable to Diesel engines for vehicles up to 6000 lb gross weight. The numerical evaluation of the measured exhaust emissions was carried out using the method of analysis established for the above mentioned test cycle. The measurements were taken for three different types of fuel: JP4, Diesel at 20 C and Diesel at 50 C. The exhaust gas sampling using heated sampling lines and the analytical system set up for the measurements were in agreement with SAE Specifications. The instruments used in the analytical system are shown. Author

NO FORMATION IN FUEL RICH FLAMES. A STUDY OF THE INFLUENCE OF THE HYDROCARBON STRUCTURE

K. H. Eberius and Th. Just *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 8 p refs (For availability see N74-14271 05-20)

The formation of nitric oxide in premixed propane, ethylene and acetylene flames at 1 atm has been measured. Large overconcentrations of NO were found in very fuel rich flames. The NO formation in flames could be reasonably separated into three classes: (1) Zeldovich mechanism with equilibrium O atom concentration, (2) Zeldovich mechanism with the remaining excess O atom concentration, and (3) other reactions involving radicals as CH, C, C2. The distinction of these classes can be made by studying the temperature dependence of the NO formation, by analysing the curvature of the NO profiles, or by relating the rate of NO formation to O atom concentrations and by measuring HCN in some flames. The analysis of the temperature dependence of the NO formation in propane flames gave evidence that in these flames with stoichiometric ratios between 1.2 and 1.4 and temperatures between 1850 K and 2400 K, reaction class (c) is the main reaction channel. A comparison of flames which have the same temperature at the same mixture strength, but differ in the chemical structure of the fuel, shows higher NO concentrations for acetylene flames and somewhat smaller NO concentrations for methane flames relative to the concentrations in propane flames. SOOT FORMATION IN RICH KEROSINE FLAMES AT HIGH PRESSURE

F. H. Holderness and J. J. Macfarlane *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 9 p refs (For availability see N74-14271 05-20)

Soot appearing in gas turbine exhaust products originates within the primary flame. Model combustor experiments are summarized in which soot formation was measured in a reacting kerosine/air flame of uniform composition. Operating conditions are 6 to 21 bar and equivalence ratio 0.8 to 1.8. Chemical equilibrium was not attained for equivalence ratios much above unity. The available oxygen reacted initially with a portion of the fuel, the remainder appearing as pyrolysis product. The total amount of this material, including soot, was roughly dependent on equivalence ratio, independent of other variables. The fraction fully degraded to soot increased sharply on raising pressure from 6 to 11 bar. There was a well defined threshold of soot formation at equivalence ratio 1.3 to 1.4 in premixed flames. Soot was observed at weaker conditions than this in spray flames and the formation rate rose to approximately 10 percent of the input carbon at equivalence ratio 1.8. Author

SOOT OXIDATION KINETICS AT COMBUSTION TEMPERATURES

John P. Appleton *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 11 p refs (For availability see N74-14271 05-20)

(Grant NSF GK-33933)

Comparisons between soot oxidation rate measurements obtained in laboratory flames and in a recent shock-tube investigation are made with previously reported measurements of the surface oxidation rate of bulk samples of pyrolytic graphite. On the basis of these comparisons it is concluded that the surface oxidation rate mechanisms for soot and pyrolytic graphite are the same and that the rates are predicted by a semiempirical expression, originally proposed for graphite oxidation, which expresses the specific surface oxidation rate in terms of the surface temperature and the gas-phase partial pressure of oxygen. This expression provides a method of estimating soot oxidation rates which is suitable for use in engineering design and performance studies of most practical combustion systems such as gas turbine combustors. PARAMETERS CONTROLLING NITRIC OXIDE EMISSIONS FROM GAS TURBINE COMBUSTORS

John B Heywood and Thomas Mikus *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 16 p refs (For availability see N74-14271 05-20)
(Grant NGR-22-009-378)

Nitric oxide forms in the primary zone of gas turbine combustors where the burnt gas composition is close to stoichiometric and gas temperatures are highest It was found that combustor air inlet conditions, mean primary zone fuel-air ratio, residence time, and the uniformity of the primary zone are the most important variables affecting nitric oxide emissions Relatively simple models of the flow in a gas turbine combustor, coupled with a rate equation for nitric oxide formation via the Zeldovich mechanism are shown to correlate the variation in measured NOx emissions Data from a number of different combustor concepts are analyzed and shown to be in reasonable agreement with predictions The NOx formation model is used to assess the extent to which an advanced combustor concept, the NASA swirl can, has produced a lean, well-mixed primary zone generally believed to be the best low NOx emissions burner type Author

(Grants AF-AFOSR-2299-72, AF-AFOSR-2200-72)

Primary pollutants emitted by aircraft gas turbine engines are carbon monoxide, hydrocarbons, aldehydes, smoke, particulates, and nitric oxide Factors controlling emissions of these pollutants are analyzed on the basis of aircraft engine exhaust composition and laboratory studies of gas turbine combustion processes Moreover, an analytical prediction of the effect of aircraft operating parameters on the emission of nitric oxide is also given The formation and destruction of these pollutants were investigated in a laboratory gas turbine combustor The oxidation of carbon monoxide, hydrocarbons and aldehydes was measured in the dilution zone where thermal quench phenomena were observed The apparent oxidation of particulates in the dilution zone was also observed The formation of nitric oxide was observed in the primary zone and in the first part of the dilution section of the combustor Operational conditions and engine parameters were studied analytically, yielding rational criteria for the prediction of their effect on the emmission of nitric oxide Author

N74-14293 Norwegian Inst for Air Research, Kjeller
A SYSTEMATIC APPROACH TO THE STUDY OF THE CONNECTION BETWEEN EMISSION AND AMBIENT AIR CONCENTRATIONS
Knut Erik Groenskeir *In* AGARD Atmospheric Pollution by Aircraft Engines Sep 1973 10 p refs (For availability see N74-14271 05-20)

A systematic approach to study the effect of a complex source distribution on the ambient air quality is described Measurements of emission, meteorological parameters, and ambient air concentrations are used to develop a quantitative model describing the important physical and chemical processes The model is mathematically formulated in a modified form of the continuity equation for the pollution component To improve the model, regression analysis can be used An example of this approach is given in the study of air pollution in Oslo where it has been shown that a systematic vertical motion is the most important process to clean the air in Oslo during inversion situations Some comments are made on the model approach to the air pollution problem around an airfield Author

SMOKE SUPPRESSANT ADDITIVE EFFECTS ON PARTICULATE EMISSIONS FROM GAS TURBINE COMBUSTORS

P. J. Pagni, L. Hughes, and T. Novakov. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 11 p. refs. (For availability see N74-14271 05-20)

(Grants NSF GK-27895; EPA-AP-385)

The effects of manganese based additives on the mass, size distribution, and chemical composition of particulate emissions from gas turbine combustors are described. Experiments show that the additive, 2-methyl cyclo pentadienyl manganese tricarbonyl, can increase mass emissions if used excessively. The additive shifts the emitted particle size distribution toward many more much smaller particles, thereby reducing visibility primarily by reducing the size of the emmited particles. X-ray photoelectron spectroscopy studies have determined that the chemical state of the emitted manganese is manganese monoxide. It is recommended that combustor redesign and collection techniques be employed whenever possible to suppress particulate emissions from aircraft and test facilities. Author

TECHNOLOGY FOR THE REDUCTION OF AIRCRAFT TURBINE ENGINE EXHAUST EMISSIONS

Donald W. Bahr. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 13 p. refs. (For availability see N74-14271 05-20)

Tests of both production and advanced engines were conducted to determine the emission characteristics of aircraft turbine engines. The results of these engine evaluations are presented. Also presented are the results of exploratory investigations to define and develop design approaches for reducing the carbon monoxide, unburned hydrocarbons, and nitrogen oxides emission levels of high performance, annular combustors - with already developed low smoke emission characteristics. In these latter investigations, the emissions level reductions obtainable through the use of advanced primary combustion zone stoichiometry control methods and advanced fuel injection techniques were evaluated. In addition, results are presented on the use of water injection techniques to suppress the formation of nitrogen oxides in combustors. It is concluded that future engines can be developed with significantly lower levels of these gaseous emissions than those of current engines. Author

DESIGN AND EVALUATION OF COMBUSTORS FOR REDUCING AIRCRAFT ENGINE POLLUTION

Robert E. Jones and Jack Grobman. *In* AGARD Atmospheric Pollution by Aircraft Engine. Sep. 1973. 8 p. refs. (For availability see N74-14271 05-20)

Various techniques and test results are briefly described and referenced for detail. The effort arises from the increasing concern for the measurement and control of emissions from gas turbine engines. The greater part of this research is focused on reducing the oxides of nitrogen formed during takeoff and cruise in both advanced CTOL, high pressure ratio engines, and advanced supersonic aircraft engines. The experimental approaches taken to reduce oxides of nitrogen emissions include the use of multizone combustors incorporating reduced dwell time, fuel-air premixing, air atomization, fuel prevaporization, water injection, and gaseous fuels. In the experiments conducted to date, some of these techniques were more successful than others in reducing oxides of nitrogen emissions. Tests are being conducted on full-annular combustors at pressures up to 6 atmospheres and on combustor segments at pressures up to 30 atmospheres. Author

AIRCRAFT GAS TURBINE POLLUTANT LIMITATIONS ORIENTED TOWARD MINIMUM EFFECT ON ENGINE PERFORMANCE

Robert E. Henderson and William S. Blazowski. *In* AGARD Atmospheric Pollution by Aircraft Engines. Sep. 1973. 13 p. refs. (For availability see N74-14271 05-20)

The proposed Environmental Protection Agency (EPA) regulations for aircraft engine emissions are examined in terms of their impact on the application to military aircraft gas turbine engines. A quantitative assessment of current engine emission levels, design trends, and potential emission control techniques is presented. It is concluded that special considerations must be afforded to military aircraft relative to direct application of EPA regulations; however, many future emission-reducing advances will be applicable to military gas turbines. U.S. Air Force goals were established to insure that new engines take advantage of this technology and are in accordance to the greatest degree possible with what EPA requires of commercial aircraft. These goals are in terms of minimum idle combustion inefficiency, maximum allowable oxides of nitrogen (lb/1000 lb fuel), and maximum allowable smoke number. The rationale behind using these parameters, and the means by which the numerical limitations were derived, are described. Author

ENVIRONMENTAL TOXICOLOGICAL IMPACT OF AIRCRAFT OPERATIONS

Kenneth C Back *In* AGARD Atmospheric Pollutation by Aircraft Engines Sep 1972 6 p refs (For availability see N74-14271 05-20)

Sources of pollution from aircraft operation include such chemical substances and decomposition products as aviation gasolines, jet fuels, advanced fuels, oils, lubricants, hydraulic fluids, coolants, deicers, and various additives used in these formulations These may enter the environment as the result of normal mission accomplishment and attendant ground operations, inadvertent malfunctions and spillage, and necessary periodic disposal processes Physiological effects of the more important compounds which are current problems with aircraft pollutants, problems associated with obtaining such biological data, mechanisms necessary to comply with current pollution control directives, and standards which are now functional are also discussed Author

THE STATUS OF HUMAN PERCEPTUAL CHARACTERISTIC DATA FOR ELECTRONIC FLIGHT DISPLAY DESIGN
Keith T. Burnett *In* AGARD Guidance and Control Displays Feb 1972 10 p refs (See N72-22621 13-21)
Avail: NTIS

The human factors literature was searched and analyzed for human perceptual characteristic data relating to the design of individual electronic flight displays. Some of the more interesting data obtained are summarized and include flicker, visual acuity, display resolution, luminance, alphanumeric legibility, scale legibility, information coding, display size, and the effect of environmental variables on these quantities. Wherever possible the data are analyzed and presented so as to point out significant variables and data trends not specifically discussed in the original works. Author

A LIMITED STUDY OF THE TRADE OFF BETWEEN LUMINANCE AND COLOR CODING IN ELECTRONIC AIRCRAFT DISPLAYS
Ralf Beyer *In* AGARD Guidance and Control Displays Feb 1972 9 p refs (See N72-22621 13-21)
Avail: NTIS

The effectiveness of luminance and color coding are compared as means for coding display elements in electronic displays. First a review of some past investigations is given. Next some experiments are described which contain an immediate-response task, a single-axis tracking experiment with discontinuous secondary task, tachistoscopic experiments, and the exploration of subjective judgements on different types of color coding in an experimental electronic display. In these experiments the only variable is the type of coding (luminance or color) used for the display elements and the various responses obtained are discussed. Author

WHAT COLOR DISPLAY ELEMENT
John A. Barnes *In* AGARD Guidance and Control Displays Feb 1972 11 p refs (See N72-22621 13-21)
Avail: NTIS

The results are presented of research directed toward determining the best possible colors to use for the elements of a multicolored aircraft display to insure a minimum number of instrument reading errors. A survey of the American manufacturers of multicolored mechanical aircraft displays provided a list of nine colors generally used as background colors and a like number of generally used pointer colors. An integrally illuminated test instrument was built which had the capability of presenting to a test subject any of these background and pointer colors in combination. The lighting of the test instrument was controlled at either of two illumination levels for each background color and was available, with this control, as a red lighting system or as a blue-white lighting system. These results provide the instrument manufacturers with twenty pointer and background combinations which can be expected to produce less than a one percent instrument scale reading error, regardless of the lighting system used and at illumination levels as low as .01 foot Lamberts. THE INTEGRATED COCKPIT PROCEDURE FOR IDENTIFYING CONTROL AND DISPLAY REQUIREMENTS OF AIRCRAFT IN ADVANCED TIME PERIODS
John V. Murphy and Bernard S. Gurman (ECOM, Fort Monmouth, N. J.) *In* AGARD Guidance and Control Displays Feb 1972 7 p refs (See N72-22621 13-21)
Avail: NTIS

An adaptation of the integrated cockpit research procedure was used to define control and display requirements for the next generation utility transport helicopter under consideration by the U.S. Army. A control and display requirements analysis was conducted based upon the derivation of specific functions necessary for accomplishing four specified missions. Control/display mechanization was derived from specific mission functions. A time-based load analysis was performed utilizing computer processing techniques to make task adjustments in real time and provide a printout of how the tasks in each mission segment could be adjusted to meet the mission requirement. The technique also provided an analysis of contingency situations and denoted overload conditions that occurred. The hard copy mock-up was a full-scale cockpit shell in which the alternative mission control/display configurations could be illustrated. The mock-up contained realistic flight controls and audiovisual projector units that simulated vertical and horizontal situation display formats. Author

DESIGN IMPLICATIONS OF A BETTER VIEW OF THE MULTICHANNEL CAPACITY OF A PILOT
O. H. Lindquist *In* AGARD Guidance and Control Displays Feb 1972 6 p refs (See N72-22621 13-21)
Avail: NTIS

A major result of a recently completed study is the prediction and measurement of multichannel pilot performance, which significantly increases his information handling capability beyond that predicted by today's techniques. Current techniques of predicting man/machine interactions were shown to be in error by an order of magnitude in some measurements related to human channel capacity. The results of this experimental work are presented and system design implications for pilot capability and limitations are discussed. Author

SYSTEMATIC MANUAL CONTROL DISPLAY DESIGN
W. F. Clement, D. T. McRuer, and R. H. Klein *In* AGARD Guidance and Control Displays Feb 1972 10 p refs Sponsored in part by NASA and JANAIR (See N72-22621 13-21)
(NASA-CR-126256) Avail: NTIS CSCL 01D

The principles are outlined of guidance and control display design based on interactions with human psychomotor activity. The implications for eye movement studies in flight control and monitoring tasks, and the relationship of eye scanning phenomena to pilot describing functions and remnant are summarized. Several measures of pilot workload in control tasks are discussed.

Excess control capacity, in particular has great promise in quantifying a practical definition of workload. It is a major workload connector with pilot opinion rating and whole-task effective time delay. Further connections with lead equalization, scanning workload, physiological measures of neuromuscular tension, and the effects of additional modalities on visual workload are illustrated. Author

A SYMBOL GENERATOR FOR THE ANTHROPOTECHNICAL EVALUATION OF INTEGRATED DISPLAYS
K.-F. Kraiss *In* AGARD Guidance and Control Displays Feb. 1972 7 p refs (See N72-22621 13-21)
Avail: NTIS

A freely programmable low-cost high-quality character-generator is described, which uses a hybrid principle of generation. The writing is performed by a combined stroke writing and Lissajous procedure that results in an increased display quality. The binary information needed is stored in a core memory. The applied circuit design enables the writing of a continuous curve, which may be arbitrarily composed of dots and lines. The presentation of alphanumeric symbols and complex geometric figures is performed using a 15 by 15 dot matrix for construction. Color coding capability is provided by a multilayer CRT. Since programming of the displayed picture is done by simple statements on punched tape, the generator becomes an excellent and flexible experimental device for the human engineering evaluation of electronic displays. An example for application is cited. Author

V/STOL DISPLAYS FOR APPROACH AND LANDING
David J. Walters and Ralf Beyer (DFVLR) *In* AGARD Guidance and Control Displays Feb. 1972 10 p (See N72-22621 13-21)
Avail: NTIS

The information requirements of a pilot carrying out a V/STOL approach and landing under adverse weather conditions are described, and solutions that were tried out experimentally are analyzed. Among the tentative conclusions are the following. (1) The amount of information needed for V/STOL displays and the independent motion in various axes pose problems in combining and integrating the information channels. It seems possible to combine both a horizontal and a vertical display in one format, the most difficult element to incorporate is the height information. (2) Most current displays were empirically designed without much regard for underlying principles. (3) An optimum cost effective mix of displays and controls appears to involve automatics for inner loop stabilization and displays with manual control for monitoring outer loop control. (4) Techniques of engineering displays for conventional flight appear adequate for V/STOL. Author

A NAVIGATION COMPUTER AND DISPLAY UNIT FOR HARRIER
Thomas S. Briggs *In* AGARD Guidance and Control Displays Feb. 1972 14 p refs (See N72-22621 13-21)
Avail: NTIS

The navigation display and computer for the Harrier strike aircraft is a compact, comprehensive, and self-contained navigation instrument. It contains a pictorial presentation of the navigational situation in the form of a projected moving map, together with the means of storing and selecting the coordinates of a number of destinations or fix points. A variety of numerical information such as latitude and longitude, time-to-go, and ground speed can be selected and displayed optically superimposed on the projected moving map. The display and computer contains all the facilities required for the management of the navigation aspects of the mission profile in one centralized area of the cockpit instrument panel. Particular attention is given to overcoming the viewing problems associated with the use of projected moving map displays in conditions of high ambient lighting, and to providing navigational control and operational facilities which are easy to use in practice. CONTEMPORARY MAP DISPLAYS
James J. McGrath *In* AGARD Guidance and Control Displays Feb. 1972 16 p refs (See N72-22621 13-21)
Avail: NTIS

A general review of developments and capabilities in airborne map display systems is presented. A brief overview of the complicated history of research, development, and operational use is presented first, and then the development of each of four basic types of map displays is traced from its origin to its present status. The four types are direct-view map displays, projected map displays, combined map/CRT displays, and electronically generated map displays. The main advantages and limitations of each type are noted, and the various ways in which the basic design concepts have been implemented are described. A number of design issues and operational problems of current importance are identified and briefly discussed. Author

A MULTIPURPOSE WIDE FIELD, THREE DIMENSIONAL HEAD UP DISPLAY FOR AIRCRAFT

Joseph A. LaRussa *In* AGARD Guidance and Control Displays Feb 1972 10 p ref (See N72-22621 13-21)

Avail: NTIS

A system useful to pilots for approach and landing and for navigation is described. Attitude, airspeed, altitude, and spatial location as derived both from analog display which is projected through the windscreen and superimposed on the real world view. The display is a three-dimensional roadway in the sky, down which the aircraft can be flown either for navigation or to a touchdown on the runway. The roadway may also be used to define a holding pattern or even a complete route from takeoff to touchdown. The three-dimensional analog display reduces pilot interpretation time and thereby provides for better aircraft control. Author

N72-22640# Motorola, Inc., Scottsdale, Ariz.

A TRUE 3D OR FLAT 2D DISPLAY

Jordon D. Lewis (Battelle Develop. Corp.) and George P. Walling *In* AGARD Guidance and Control Displays Feb 1972 6 p refs (See N72-22621 13-21)

Avail: NTIS

A display principle is described for a true 3-D display or a multicolor, solid state, flat panel display. The display volume or surface is a transparent material in which an isolated moving spot is created. Arbitrary 2-D or 3-D figures are generated by rapidly moving the spot in two or three dimensions refreshed at a sufficient rate to eliminate flicker. Data may be entered from conventional sources into the refresh memory, and manual interaction via a movable cursor is possible. The advantages of presenting 3-D information in a true 3-D format are discussed, and applications to display clutter reduction are described. The requirement for a compact, flat panel cockpit display is directly addressed. Author

UTILITY OF THE VERTICAL CONTACT ANALOG DISPLAY FOR CARRIER LANDINGS: A DIAGNOSTIC EVALUATION

Kenneth D. Cross and Frank R. Cavallero (Naval Missile Center) *In* AGARD Guidance and Control Displays Feb 1972 11 p refs (See N72-22621 13-21)

(ONR Proj. 0-0077; ONR Proj. 0-0078; ONR Proj. 0-0079)

Avail: NTIS

The accuracy of the pictorial vertical situation display generated by a digital computer was evaluated. Position and attitude errors were measured under each of five experimental conditions, a full-scale simulated carrier landing task and four part-tasks. The part-tasks were designed to assess the degree to which display resolution, temporal loading, and control complexity contribute to total system error. All three attitude parameters were controlled with a high degree of accuracy under all conditions. Control of vertical and lateral position in the full-scale simulation condition was accomplished with about the same accuracy and precision as that reported for actual (day) carrier landings in F-4 aircraft. The part-task data revealed that the largest contributor to lateral error was control complexity, whereas display resolution and temporal loading were found to be large and roughly equivalent contributors to vertical error. Author

RATE OF CLOSURE AS A PERFORMANCE AS A PERFORMANCE MONITORING PARAMETER
Eldon M. Bobbett and Kenneth R. Woodruff (Sys. Res. Labs., Inc., Dayton, Ohio) *In* AGARD Guidance and Control Displays Feb. 1972 11 p refs (See N72-22621 13-21)
Avail: NTIS

Surveys on approach and landing accidents revealed the need for rate-of-closure information. Presenting the information and subjecting it to operational criticism were accomplished with a simulation evaluation of a modified Attitude Director Indicator (ADI) incorporating the rate-of-closure information, a two phase flight test evaluation of the same indicator, and a simulation evaluation of a cathode ray tube ADI with rate-of-closure information presented similarly to how it is presented in the electromechanical ADI. The results are explicit in that rate-of-closure information is a requirement in the approach and landing modes and does a good job as a performance monitoring parameter. Author

THE ELECTROLUMINESCENT LIGHTING RESEARCH PROGRAM
David L. Turney and Leroy Addis (Lear Siegler, Inc., Grand Rapids, Mich.) *In* AGARD Guidance and Control Displays Feb. 1972 11 p refs (See N72-22621 13-21)
Avail: NTIS

Experiments flown in a T-39 aircraft by experienced pilots were designed to simulate different types of operational flights by progressively increasing the external visual task loading on the pilot. Both objective measurements and pilot opinion data were obtained on display illumination under external ambient illumination ranging from twilight to night no-moon conditions. Photometric data showed that the pilot's display lighting requirements were influenced by the outside illumination only when this illumination exceeded .001 foot candles. When the night illumination fell below this level, display illumination was primarily influenced by the pilot's preflight dark adaptation; the type of information required for successful mission completion, the priority the pilot placed on the information available, and the effects of cockpit lighting on display legibility. NUMERICAL ANALYSIS AND SIMULATION EVOLUTION
E. Heap *In* AGARD Guidance and Control of Tactical Missiles May 1972 7 p (For availability see N72-27681 18-21)

A review is given of the quantitative advantages and disadvantages of digital and analogue computer techniques for the simulation of missile guidance and control, and a methodology of using hybrid simulation is developed. It is shown how a hybrid computer can be used to aid the choice of an acceptable missile system within a wide spectrum of complexity, particularly when many non-linear factors and statistical aspects are involved. Using this facility mathematical modelling not only helps specific projects in their R & D phases, but it can contribute to management decisions in feasibility studies, in the choice of missile instrument combinations, and in the specification of their desired standard of performance. It can also safeguard against complex systems being over-designed to the detriment of their cost. Author

SELF-CONTAINED GUIDANCE TECHNOLOGY
R. W. Acus, Jr. *In* AGARD Guidance and Control of Tactical Missiles May 1972 18 p refs (For availability see N72-27681 18-21)

Inertial technology for a self-contained guidance capability applicable to tactical air-to-ground missiles is discussed. The basic inertial system, which consists of accelerometers, gyros and a computer, is immune to outside interference, and therefore ideally suited to military applications in a hostile environment. Inertial technology has progressed to a point where equipment size and cost are within reason for use with the tactical missile. The basic principles and limitations of inertial guidance, including theory of operation, and physical and analytic coordinate system stabilization are presented. Sources of error and the propagation of these errors are described. Various methods of alignment, and system mechanization are considered. The state of the art, and the research and development process for inertial systems is discussed. Factors influencing the research and development process are identified along with the relationship between inertial system reliability and cost. Author

N72-27691 Aeronautical Systems Div., Wright-Patterson AFB, Ohio
APPLICATION OF INERTIAL TECHNOLOGY TO A-G MISSILES
R. W. Acus, Jr. *In* AGARD Guidance and Control of Tactical Missiles May 1972 11 p refs (For availability see N72-27681 18-21)

Inertial technology for airborne, stand-off tactical weapon systems both as a midcourse guidance system and when used in conjunction with a terminal guidance sensor is discussed. The capabilities of pure inertial guidance are examined as the midcourse guidance system for a stand-off missile. The relationships between enemy defenses, aircraft capability, and missile performance are used to define a hypothetical mission and a set of guidance system requirements. Error magnitudes are selected and missile positional error is determined as a function of range. The stand-off range of this particular weapon system is limited by the performance of the midcourse guidance system. Various methods of improving midcourse guidance performance are explored. The advantages and limitations of an aided inertial system are reviewed with emphasis on retaining the advantages of the self-contained system. Author

PULSE DOPPLER MISSILE GUIDANCE: REPRESENTATIVE PARAMETERS AND ASSOCIATED FIRE CONTROL CONSIDERATIONS
Henry Zuerndorfer, Howard Lynn, and Gordon Kettering *In* AGARD Guidance and Control of Tactical Missiles May 1972 17 p ref (For availability see N72-27681 18-21)

The principal problems and solution options available for all-weather attack of small tactical targets are discussed. The requirement for all-weather operation against relatively small and possibly mobile targets dictates the use of microwave guidance sensors. The problems of detection and the tracking and fire control considerations associated with the attack of three generic types of tactical targets are presented. The characteristics of the available sensors are described and the applications for various situations are examined. Author

INERTIAL NAVIGATION COMPONENTS AND SYSTEM
Feb 1973 402 p refs In ENGLISH, partly in FRENCH Presented at the 15th Meeting of the Guidance and Control Panel of AGARD, Florence, 2-5 Oct. 1972
(AGARD-CP-116) Avail: NTIS HC $22.25

The proceedings of a conference on inertial navigation components and systems are presented. The objective of the meeting was to provide current information of inertial navigation developments and to discuss applications and test results. Emphasis was placed on concepts and techniques which show the trade-offs dealing with cost versus performance. The subjects discussed include: (1) strapped down inertial guidance systems, (2) inertial navigation systems for the space shuttle, (3) materials for the inertial navigation systems, (4) gyro stabilized platform applications, (5) inertial system for missile midcourse guidance, and (6) fault isolation and maintenance concepts for inertial navigation systems. For individual titles, see N73-20685 through N73-20717.

STRAPPED DOWN INERTIAL GUIDANCE SYSTEM STUDY
R. Baldassini Fontana *In* AGARD Inertial Navigation Components and Systems Feb 1973 42 p refs (For availability see N73-20684 11-21)

The sources and magnitudes of errors occurring in a strapped down environment are discussed. The functions of the accelerometers and gyroscopes in a strapped down system are described. The parameters which must be investigated and defined to evaluate the performance of a stabilized platform are tabulated. The requirements of inertial sensors for maintaining vehicle attitude, velocity, and position are examined. Mathematical models for determining the errors produced by various parameters which affect the inertial system are developed. Diagrams of typical strapdown systems are included. P.N.F.

FAILURE MANAGEMENT OF MULTIPLE GIMBAL INERTIAL SYSTEMS FOR SPACE SHUTTLE

David W Dove and Richard A McKern *In* AGARD Inertial Navigation Components and Systems Feb 1973 14 p refs Sponsored by NASA (For availability see N73-20684 11-21) CSCL 17G

A failure detection and isolation technique for use with four gimbaled inertial measurement units (IMU) is presented By using simulated boost and entry shuttle trajectories with specific gimbaled IMU models, failure detection thresholds are developed based on red line life dependent requirements and warning thresholds within the red-line thresholds based on expected worst case IMU performance Using these trajectories, established trajectory threshold, and multiple IMU models, various failure detection and isolation techniques are evaluated for application in both powered and unpowered flight phases The adequacy of the systems for both attitude and velocity detection methods is evaluated and recommendations for space shuttle applications are made Author

STRAPDOWN INERTIAL GYROSCOPE

Michele S Sapuppo *In* AGARD Inertial Navigation Components and Systems Feb 1973 10 p refs (For availability see N73-20684 11-21)

A miniature single-degree-of-freedom gyroscope has been developed for the application to a strapdown inertial guidance system This development is based on many years of experience with the design and development of high-performance pendulous integrating gyroscopic accelerometers (PIGA) By utilizing basic design principles of the gyroscopic element contained in the PIGA, which by nature of the PIGA operation presents a slew environment to the gyroscopic element, a strapdown gyroscope evolves which operates and performs exceptionally well under high linear accelerations and high slew rates This paper describes a strapdown gyroscope that is less than 1-1/2 inches in diameter by 2 inches in length and weighing under 1/2 pound The angular momentum is only 8.5 X 1,000 dyne cm sec, which gives it several natural benefits of small size, low power consumption, high reliability, and reasonable cost To achieve high performance with low angular momentum, low uncertainty torques are required about the output axis of the gyroscope The design of this strapdown gyroscope involved the systematic identification of each error source coupled with the introduction of subcomponent design principles to reduce these error magnitudes and therefore minimize the consequential sources of uncertainty torque Author

RAPID INITIALIZATION OF INERTIAL NAVIGATION SYSTEMS THROUGH PARAMETER ESTIMATION

Joseph A Desaro *In* AGARD Inertial Navigation Components and Systems Feb 1973 11 p refs (For availability see N73-20684 11-21)

The problem of rapid initialization of an inertial navigation system using an azimuth wander mechanization is treated in detail An error model is developed which contains all significant cross coupling terms and inertial component random drifts Determination of the initial azimuth wander angle is then identified as a parameter estimation problem where the parameter can assume any of a continuum of values (from 0 to 2 pi) Two methods of solving parameter estimation problems currently in

the literature are discussed. One of the methods is then extended to permit time optimal estimation of the initial azimuth angle. The platform controller is developed and the overall system described. Results of a computer simulation are presented. Author

INVESTIGATIONS ON THE OPTIMIZATION OF AIDED INERTIAL NAVIGATION SYSTEMS

Rainer S. Sindlinger *In* AGARD Inertial Navigation Components and Systems. Feb. 1973. 16 p. refs (For availability see N73-20684 11-21)

The stringent performance requirements for modern, self-contained aircraft navigation systems can only be met by integrated systems combining several independent navigation sensors, like inertial measurement unit, Doppler radar, and radio position fixing devices (e.g. Tacan). Some investigations on the optimization of such integrated navigation systems are discussed. It will be shown, that high navigation accuracy can be obtained even with medium-performance sensors by implementation of an optimal estimation and control filter, and by the use of methods reducing the influence of some inertial sensor errors on the system performance. The basic rule for the realization of an effective integrated navigation system is to use sensors with complementary characteristics, but with mutually balanced accuracy. Author

COMPLIANT SURFACES FOR A/B BEARING GYROS

James V. Johnston *In* AGARD Inertial Navigation Components and Systems. Feb. 1973. 8 p. refs (For availability see N73-20684 11-21)

A development study on a spherical, hydrostatic, compliant bearing for a directional gyro is discussed. The concept of the rubber air bearing and its subsequent development is traced through its analytical analysis and experimental hardware fabrication to the test results. Use of a compliant material for one of the bearing surfaces, which would grip the rigid surface when unpressurized, constitutes the novel concept of self caging. Included in this paper are the basic design curves developed for the compliant bearing. Use of these curves provides the bearing engineer with the basic tools necessary to design compliant air bearings. Unusual problems encountered in the fabrication and evaluation of rubber bearings are shown and discussed. Areas of further investigation are indicated which would enhance the rubber bearing development technologies. Author

GAS HYDRODYNAMIC LANDING GYROSCOPE WITH TWO DEGREES OF FREEDOM: METHOD OF EVALUATING PERFORMANCE [GYROSCOPE A DEUX DEGRES DE LIBERTE SUR PALIER A GAZ HYDRODYNAMIQUE METHODE D'EVALUATION DES PERFORMANCES]

Pierre Leger *In* AGARD Inertial Navigation Components and Systems. Feb. 1973. 19 p. refs. In FRENCH (For availability see N73-20684 11-21)

Two principle means developed to measure the functions and performance of a gyroscope with two degrees of freedom are outlined. A mathematical model representing the essential characteristics of the apparatus, given the formulation of parasitic coupling of the gyroscope under constant acceleration, is described. Statistical optimization was used to analyze multi-position effects according to the type of gyroscope and numerous redundancies present in a series of measurements. Probable coefficients of the model and the uncertainties associated with these coefficients are evaluated. Transl. by E.H.W.

INERTIAL SYSTEM ENHANCEMENT OF FLIGHT CONTROL

Max L. Lipscomb and Fred D. Smith *In* AGARD Inertial Navigation Components and Systems. Feb. 1973. 11 p. refs (For availability see N73-20684 11-21)

The functions of vehicle flight control to which a quality inertial system will contribute, and in a number of cases make possible, is discussed. The status of programs aimed toward more fully defining and implementing these flight control functions, including all weather landing as well as automatic steering, is outlined with the results achieved to date. Functional requirements which will be levied on the inertial system are listed and examined as to the parameters measured or computed, reliability, criticality relative to flight safety, practicality of the system for broad applications from both simplicity of operation and economical standpoints, and physical aspects. Both established and probable requirements of an acceptable system are noted. The requirements will of necessity stress the fact that such a system is a safety flight item and reliability is extremely critical. A brief survey is presented of the trends and developments toward the systems which will be required to achieve universal integration of inertial navigation system signals into the flight control system functions. Several different types of inertial systems now under development are discussed to illustrate the technology which may yield applicable systems. Author

ADVANCED PROCEDURES FOR SELF-ALIGNMENT AND CALIBRATION OF INERTIAL PLATFORMS
U K Krogmann *In* AGARD Inertial Navigation Components and Systems Feb 1973 18 p refs (For availability see N73-20684 11-21)

Starting with the nonlinear and linear model of the IMU in the gravity field of the rotating earth it is shown that the state-vector normally cannot be measured directly An optimal estimator is necessary to estimate system-state at discrete time Different estimation techniques applicable for alignment and calibration are treated in detail and compared with respect to complexity and efficiency Closed loop as well as quasi-closed loop techniques are contemplated using Kalman-Filter and weighted least squares The problem of estimator divergence is discussed briefly Author

N73-20707 Institut fuer Flugnavigation, Stuttgart (West Germany)
PROCEDURES FOR THE ESTIMATION OF THE IN-FLIGHT VERTICAL MISALIGNMENT OF PLATFORMS
Volkmar Held *In* AGARD Inertial Navigation Components and Systems Feb 1973 16 p refs (For availability see N73-20684 11-21)

Test flight measurements were made with a single-axis inertial platform mounted in a Transall C 160 test aircraft For additional velocity information the outputs of the Doppler radar were used The estimation of the platform vertical misalignment is performed in two different ways with a so called mean value procedure which needs only the integral of the platform accelerometer output and the appropriate component of the Doppler velocity and with a Kalman filter The dynamic and statistic values which are necessary to implement the filter are determined from the flight measurements Different filter models result in dependence on the platform horizontal reference axis orientation relative to the aircraft and on the aircraft acceleration according to gusts The results of the platform misalignment estimation show that the application of a Kalman filter procedure leads in all treated cases to the best estimation accuracy if an additional velocity measurement is used If no dippler velocity measurement is available for the estimation the errors are so large that it is not worthwhile to apply the sophisticated Kalman filter Author

N73-20708 Deutsche Forschungs und Versuchsanstalt fuer Luft- und Raumfahrt, Braunschweig (West Germany) Inst fuer Flugfuehrung
THE MODELLING ERROR SENSITIVITY OF DIGITAL FILTERS FOR THE ALIGNMENT OF INERTIAL PLATFORMS
Heinz Winter *In* AGARD Inertial Navigation Components and Systems Feb 1973 15 p refs (For availability see N73-20684 11-21)

The effect of incorrect or incomplete modelling of a typical inertial platform in sub-optimal filters on the alignment and calibration accuracy is analyzed. Closed-loop alignment with a 13-dimensional Kalman filter and open-loop alignment with a 4-dimensional regression filter are considered. Simplifications of the precomputed gain matrix and a fairly simple controller for closed-loop alignment are analyzed with respect to their effect on the alignment accuracy. It is shown that the modelling errors in the 4-dimensional regression filter lead to increasing uncertainty in the platform state estimation after a certain estimation time. The limitation of the azimuth alignment accuracy caused by the east gyro drift is discussed for different drift correlation times between 1.5 seconds and infinite time and is compared with the steady state azimuth alignment error in a third order gyrocompassing loop. GYRO CHARACTERISTICS FOR RAPID GYRO-COMPASSING

K. R. Brown and D. Anderson. *In* AGARD. Inertial Navigation Components and Systems. Feb. 1973. 18 p. ref. (For availability see N73-20684 11-21)

Inertial navigation system alignment, of course, includes finding north by gyrocompassing, and around 2.5 minutes must be met if the overall reaction time of the aircraft is not to be limited by the system. It is found that for all practical purposes the equipment must be switched on from cold and this necessitates the use of the inertial instruments before they reach their designed operating temperature. The results are given of a program of work over many years, to determine the parameters of single-axis floated gyroscopes, when used in inertial systems requiring rapid reaction under these conditions. New parameters of gyro drift have been obtained, and the new technique of system operation based on these is outlined. The performance obtained with an inertial navigation system using these techniques is given to illustrate the benefits to be gained. Author

PENGUIN MISSILE INERTIAL NAVIGATION SYSTEM-DESIGN CONSIDERATION FOR MIDCOURSE GUIDANCE

H. K. Johansen. *In* AGARD. Inertial Navigation Components and Systems. Feb. 1973. 13 p. (For availability see N73-20684 11-21)

The midcourse guidance of the Penguin ship to ship missile requires an inertial navigation system for attitude reference and position computation. The INS has a three axis platform with resolver outputs to the guidance system and seeker head. The cross-track position is computed by analog electronics. Later versions also incorporate down range navigation electronics. The mechanical design emphasizes simplicity in assembling and maintenance by making use of a complete package design. A rapid initialization technique for use on board small fast patrol boats is described. In azimuth resolver slaving is used and leveling is performed by using the platform accelerometers and by compensating for the ship horizontal accelerations. A modified tangent plane navigation scheme is used in the flight mode. Navigation accuracy better than 200 m at 25 km has been demonstrated. Results from error simulations and results from a rocket sled test program are shown. Author

N73-20712 Royal Aircraft Establishment, Farnborough (England). Avionics Dept.

FAULT DETECTION POSSIBILITIES IN A SYSTEM EMPLOYING KALMAN FILTERING

F. Gregson. *In* AGARD. Inertial Navigation Components and Systems. Feb. 1973. 10 p. refs. (For availability see N73-20684 11-21)

Kalman filtering is coming into use as a means of mixing sensor information in an integrated navigation system. Use of the technique, implying knowledge of the errors in the system and their statistics, should provide a basis for fault detection. The report quotes the basic Kalman filtering equations and discusses the indirect implementation normally used in airborne navigation applications. Types of faults in the sensors are categorized according to the way in which they would affect the operation of Kalman filtering. Criteria are established for detecting each category of fault. These are discussed with reference to a Doppler-inertial navigation system. The methods proposed for the detection of faults are shown to be relevant to the problem of divergence encountered in some Kalman filter implementations. It is concluded that it should be possible to detect faults. Location however may not be possible. Author

FAULT ISOLATION AND MAINTENANCE CONCEPTS OF AN ADVANCED INERTIAL NAVIGATION SYSTEM

Francis H. Murphy. *In* AGARD. Inertial Navigation Components and Systems. Feb. 1973. 9 p. (For availability see N73-20684 11-21)

The design concepts, hardware characteristics, and system tradeoffs are described which have been considered for a self-contained advanced inertial navigation system. Included in the system is an automatic self-annunciating fault isolation capability. The system is packaged in a single LRU and has been organized to be modular in construction with fault annunciation to both the module level for flight line level maintenance and to the functional circuit hybrid chip at the intermediate level. Details are presented on the various built-in test functions, as well as validation of the built-in test hardware by utilization of the BITE-on-BITE concept. Software monitoring is discussed, including built-in flight line self-test, calibration and in-flight performance monitoring utilizing existing redundancy within the platform subsystem. The utilization of a calibration computer card is also discussed. This card, an interchangeable replacement for the operational computer card, is utilized to perform periodic calibration of the platform subsystem without the need for any additional external support calibration equipment. The report concludes with a summary of the methods used to fault isolate and the maintenance action required at the various operational levels. Author

DATUM POSITIONS AND VELOCITIES FOR THE EVALUATION OF INERTIAL NAVIGATION SYSTEMS
R. F. Stokes and S. G. Smith. *In* AGARD Inertial Navigation Components and Systems. Feb. 1973. 21 p. (For availability see N73-20684 11-21)

The methods are described which were employed to obtain datum position and velocity information for use in evaluating inertial navigation systems with a performance of around 1 n. mile/h. The methods were designed to permit evaluations on a world-wide basis using whatever sources of position information are available. These are usually two inertial navigation systems, a Doppler dead reckoning position, range-range Tacan or DME, Decca, and loran C. The datum produced has to be accurate enough, and in a suitable form, for use in trying to identify the major sources of system error in the inertial navigation system under test. A lower accuracy datum, only suitable for use in statistical analyses, is also described. Various examples are given of the accuracies of the methods, of the quality of inertial navigation system error information obtained, and of the errors observed in Tacan, Decca and loran C fixes. The methods for identifying error sources are related to the type of datum obtained. The virtues of range-range Tacan, Decca, and loran C for providing fixes for these types of evaluation are also discussed. Author

LIFE CYCLE COST ANALYSIS OF INERTIAL SYSTEMS FOR AIRCRAFT AND AIR TO SURFACE MISSILES
Donald L. Hardy, Jr. and Russell M. Genet. *In* AGARD Inertial Navigation Components and Systems. Feb. 1973. 5 p. refs. (For availability see N73-20684 11-21)

Life cycle cost analysis of Inertial Navigation Systems (INS) is becoming more significant to all users today as performance goals more closely achieve their objectives. Cost of ownership models and analyses were developed that contribute to current and future assessments of this important area. These analyses are based on an extensive accumulation of inertial systems data. The current analyses include a critical assessment of the current model and its data, a taxonomic analysis of INS applications, and a sensitivity analysis of all input model parameters. These analyses have led to development of new models which will more accurately predict the cost of ownership of a given inertial system. The primary usefulness of the models will be for (1) generalized analysis of, and (2) discrimination between, the cost of ownership of aircraft and air to surface missile inertial systems. Specific references are made to the most sensitive parameters of any cost of ownership analysis concerning inertial navigation systems. These parameters are of great use in knowing how little data is actually needed to make management and technical discussions. The types of decisions and applications managers and design personnel need to make concerning inertial systems are also outlined. Author

AIR TRAFFIC CONTROL SYSTEMS
Apr. 1973. 371 p. refs. In ENGLISH and FRENCH. Presented at the 14th Meeting of the Guidance and Control Panel of AGARD, Edinburgh, 26-29 Jun. 1972.
(AGARD-CP-105) Avail: NTIS. HC $20.75

The proceedings of a conference on air traffic control developments and procedures are presented. The subjects discussed involve the following: (1) control concepts, (2) automation, (3) area and enroute navigation, (4) terminal navigation and control, (5) landing guidance, (6) surveillance, (7) communications, (8) collision avoidance, and (9) integrated communication, navigation, and identification system. For individual titles, see N73-23690 through N73-23721.

N73-23690 Electronic Systems Div., Bedford, Mass.
STATUS AND TRENDS IN MILITARY AIR TRAFFIC CONTROL SYSTEMS
Albert R. Shiely, Jr. *In* AGARD Air Traffic Control Systems. Apr. 1973. 3 p. (For availability see N73-23689 14-21)

The status and trends in military air traffic control systems are discussed. The air navigation facilities operated by U.S. Military Forces are described. The mission of the Air Defense Control System is explained. The development of automated air control systems, airborne search radar, and integrated communication, navigation, and identification systems is reported. Author

N73-23691 Eurocontrol Agency, Brussels (Belgium)
AIR TRAFFIC CONTROL IN THE EUROCONTROL AREA
G. H. Trow. *In* AGARD Air Traffic Control Systems. Apr. 1973. 18 p. (For availability see N73-23689 14-21)

The organization and operation of the Eurocontrol area air traffic control system are discussed. The member nations comprising the organization are identified. The accomplishments of the organization are presented. The problems peculiar to European flights because of national sovereignty are analyzed. The development of an improved system of air traffic control is reported. Maps of the Eurocontrol area of operation are included. Author

DECISIONS FOR THE 70'S
Robert J. Shank. *In* AGARD Air Traffic Control Systems. Apr. 1973. 15 p. (For availability see N73-23689 14-21)

The nature of the air traffic control system and procedures during the 1970's are almost completely determined by decisions made during the past twenty years. A brief review of this already-determined baseline system and its operation is included, and a set of objectives for the future and guiding principles will provide a background for the major decisions now confronting the world air traffic control community. The important proposed changes or improvements in the areas of surveillance, navigation, communications, collision avoidance, and instrument landing are examined, and the major issues for decision are proposed. ATC AUTOMATION, PRESENT AND FUTURE
C. G. H. Scholten. *In* AGARD Air Traffic Control Systems. Apr. 1973. 5 p. refs. (For availability see N73-23689 14-21)

A number of design principles in which future air traffic control systems should differ from present systems in order to cope with increased air traffic demands are discussed. The principles are that available air space and airports should be used in as flexible a manner as possible by using computers and that improved data links between ground and air will be required for pilot-computer communication. The need for a back up system in the event of complete computer failure to allow controllers to clear existing traffic safely is proposed. Author

AUTOMATION OF AIR TRAFFIC CONTROL IN ITALY, ROME CONTROL AREA
Camillo Martucci and Bruno Tincani. *In* AGARD Air Traffic Control Systems. Apr. 1973. 10 p. (For availability see N73-23689 14-21)

The physical structure and operative unit organization of the Rome, Italy air traffic control system are discussed. The automation of the system is described to include the functions and capabilities. The phases in which the automated system is being implemented are reported. Diagrams of the system components and network to show the operation of the system are provided. Author

STATUS AND TRENDS IN CIVIL AIR TRAFFIC CONTROL SYSTEMS
Gustav E Lundquist *In* AGARD Air Traffic Control Systems Apr 1973 5 p (For availability see N73-23689 14-21)

The status and trends on civil air traffic control systems are discussed The use of automation programs to increase air traffic control safety by providing the air traffic controller with better information on which to base decisions is examined The development of a network of computers, displays, and communications which will process, store, and distribute instrument flight rules is reported The operation of the system is described by illustrations and block diagrams Author

N73-23697 Singer-Kearfott, Fairfield, N J
AREA NAVIGATION: COST VERSUS OPERATIONAL BENEFITS
Jefferson Z Amacker *In* AGARD Air Traffic Control Systems Apr 1973 9 p refs (For availability see N73-23689 14-21)

Cost, complexity, and cockpit workload were compared for seven potential area navigation system configurations Cockpit workload was found to be minimum for the very simple and most sophisticated systems However, the sensitivity of the cost parameter is such that it increases dramatically with system complexity with relatively little gain in operational benefit A detailed study of the Mark 1, Mark 13, and ATA Operations Committee requirements document discerned that almost all required operational functions could be accomplished with minimum systems Author

AIRBORNE AREA NAVIGATION EQUIPMENT
C S Bridge and R J Holm *In* AGARD Air Traffic Control Systems Apr 1973 13 p (For availability see N73-23689 14-21)

A broad base of area navigation equipment, manufacturers and users exists Types of equipment extend from simple adaptation of VOR to triple inertial systems with multiple radio position inputs and digital computer processing Air transport equipment is grouped into Mark I, Mark II and Mark 13 systems which are described Area navigation systems are based upon, or augmented by, air data, VOR, Doppler, inertial, Loran A/C, Omega, and satellite Demonstrations and performance in recent flight tests show state-of-the-art for area navigation systems with consideration of projected requirements Examples of enroute navigation, vertical navigation, terminal area and landing are shown Controls, pictorial displays, automatic data entry and data link are discussed Author

N73-23699 Systems Control, Inc., Palo Alto, Calif
AN ATC/SURVEILLANCE MODELING APPROACH FOR SPECIFYING LANE SEPARATION STANDARDS
J S Tyler, D E Stepner, and J A Sorensen *In* AGARD Air Traffic Control Systems Apr 1973 12 p refs (For availability see N73-23689 14-21)
(Contract DOT-TSC-260)

The reduction in separation standards for both domestic and oceanic air routes because of increased travel demand is discussed The overall problem of relating lane separations to safety for different navigation systems, surveillance systems, and air traffic control procedures are considered A model is described which has the same general input/output format as the Reich model that has been used for specifying North Atlantic route separations Numerical results are presented to show the impact of inertial navigation systems and satellite surveillance on the separation standards and safety for the North Atlantic route structure Author

N73-23700 Aerospace Systems, Inc., Burlington, Mass
ANALYSIS OF TERMINAL ATC SYSTEM OPERATIONS
Richard B Noll, John Zvara, and Robert W Simpson (MIT) *In* AGARD Air Traffic Control Systems Apr 1973 15 p refs (For availability see N73-23689 14-21)
(Contract DOT-TSC-103)

The effects of automation in terminal air traffic control are analyzed with respect to the impact of the automation on the controller The present air traffic control system based on radar information and manual techniques is discussed and compared with an advanced system which uses a computer to generate alphanumeric radar displays and automated features A typical control operation is presented to demonstrate controller activity in both the present and an advanced system ARTS I is used to represent the advanced air traffic control system The principal features of ARTS I are described and the interface of the controller with the computer and the display equipment is discussed Author

N73-23701* National Aeronautics and Space Administration Langley Research Center, Langley Station, Va
AN ANALYTIC STUDY OF NEAR TERMINAL AREA OPTIMAL SEQUENCING AND FLOW CONTROL TECHNIQUES
Stephen K Park, Terry A Straeter, and John E Hogge *In* AGARD Air Traffic Control Systems Apr 1973 18 p refs (For availability see N73-23689 14-21)

Optimal flow control and sequencing of air traffic operations in the near terminal area are discussed The near terminal area model is based on the assumptions that the aircraft enter the terminal area along precisely controlled approach paths and that the aircraft are segregated according to their near terminal area performance Mathematical models are developed to support the optimal path generation, sequencing, and conflict resolution problems Author

N73-23702 Air Line Pilots Association, International Washington, D C
A REAL WORLD SITUATION DISPLAY FOR ALL WEATHER LANDING
J L DeCelles, E J Burke, and Ken Burroughs *In* AGARD Air Traffic Control Systems Apr 1973 9 p (For availability see N73-23689 14-21)

A flight data display for use in aircraft approach and landing under all conditions of visibility is described The device provides airborne self-contained glide path guidance for use in visual flight conditions In its most sophisticated form it provides total information for manual landing, or monitoring automatic landing and roll-out during reduced visibility It is stated that the heads up display symbology similar to that described is urgently required for see-to-land approaches and will be essential for pilot acceptance of automatic landings in actual nonvisual conditions Author

N73-23703 Royal Aircraft Establishment, Bedford (England) Blind Landing Experimental Unit
THE INFLUENCE OF THE FUTURE LANDING GUIDANCE SYSTEM ON INTEGRATION OF SHORT TAKE-OFF AND LANDING AND CONVENTIONAL AIR TRAFFIC AT A MAJOR AIRPORT
Nigel H Hughes *In* AGARD Air Traffic Control Systems Apr 1973 17 p refs (For availability see N73-23689 14-21)

Some of the benefits to air traffic control which may result from deploying landing guidance systems are identified The characteristics of short takeoff and landing aircraft intercept of the instrument landing system localizer and final approach path are studied and the final approach geometry is established STOL approach sequencing requirements are defined and sequencing geometry suggested The feasibility of nonvisual approach and landing guidance systems to ease air traffic control problems is discussed Avionics developments which are required to allow aircraft to take advantage of future landing guidance systems are described Author

N73-23704 Army Electronics Command, Fort Monmouth, N J
US ARMY AIR TRAFFIC MANAGEMENT NOW THROUGH 1980
Charles Grossman and Thomas E Daniels *In* AGARD Air Traffic Control Systems Apr 1973 11 p (For availability see N73-23689 14-21)

The requirements of an air traffic management system which will be capable of providing for the safe operation of large numbers of aircraft under instrument meteorological conditions (IMC) and thus afford the commander maximum utilization of his combat capability within reasonable constraints of money and equipment, a totally integrated ground and airborne system, are discussed. The requirements are based upon the assumption that the Army will continue to exploit and expand the air mobility concept in the future. In order to accrue the maximum benefits from such a concept the field commander must be afforded the means to effectively use his aircraft with minimum constraints. The absence of such a system currently precludes effective field exploitation of Army aircraft under adverse weather and visibility conditions, and furthermore precludes the onset of operations until weather predictions give reasonable assurance of resupply/evacuation. Author

N73-23705 Honeywell, Inc., Minneapolis, Minn. Government and Aeronautical Products Div
FUNCTIONAL DESIGN OF MICROWAVE LANDING SYSTEM (MLS) AIRBORNE EQUIPMENT AS INFLUENCED BY GROUND EQUIPMENT CONFIGURATION AND AIRCRAFT TYPE
Donald N Carlson and Charles L Seacord *In* AGARD Air Traffic Control Systems Apr 1973 10 p refs (For availability see N73-23689 14-21)

A description of a proposed microwave landing system (MLS) is presented, with particular emphasis on the functional design requirements of the airborne equipment. This system has the potential of meeting the expanded, more precise, and more complex needs generated by a growing aircraft population consisting of both conventional and unconventional (V/STOL) types. A modular approach to both ground and airborne equipment is identified as a means of achieving desired flexibility and low cost required for a truly universal system serving the full spectrum of user aircraft and aircraft types. Elements of the ground system are identified and their influence on the nature of the transmitted signal is described. Author

N73-23706 ITT Gilfillan, Inc., Van Nuys, Calif
THE PERFORMANCE OF THE DOPPLER MICROWAVE LANDING SYSTEM IN A MULTIPATH ENVIRONMENT
R A Rosien and L L Sanders *In* AGARD Air Traffic Control Systems Apr 1973 9 p (For availability see N73-23689 14-21)

The success of the Doppler microwave landing system in meeting the multipath challenge is described. Techniques which can be used to eliminate the effects of multipath are described. The various multipath sources are listed together with the specific requirements for each. Performance data is given which has been gathered from three sources: (1) computer simulation, (2) laboratory tests of an equipment model, and (3) field tests on two experimental Doppler systems. The data indicates that the Doppler MLS, utilizing the simplest form of signal processing, namely, a filter and zero crossing counter, may be adequate under limited accuracy and siting conditions. For performance in heavy multipath, some form of narrowband device will probably have to be employed in order to satisfy the accuracy and minimum coverage angle requirements. Author

LANDING GUIDANCE SYSTEM: HERMES
Nils Holme *In* AGARD Air Traffic Control Systems Apr 1973 8 p (For availability see N73-23689 14-21)

The basic principles of the landing guidance system Hermes are described. The system is based on the establishment and detection of a coded pattern of gamma radiation from radioactive sources. This principle offers a remarkable combination of high accuracy, extreme reliability and low cost, especially when applied to the final approach and runway for conventional/short takeoff and landing operations. The ground installation is purely mechanical, with no moving parts. All information is air-derived. Author

THE POTENTIAL OF A SYSTEM OF SATELLITES AS A PART OF AN AIR TRAFFIC CONTROL SYSTEM
P M Diamond *In* AGARD Air Traffic Control Systems Apr 1973 17 p (For availability see N73-23689 14-21)

The air traffic control (ATC) performance potential of satellite systems utilized in a data acquisition and communications role within a continental United States (CONUS) ATC system is discussed. The unique properties of satellite-based relays provide the only viable means of achieving complete coverage to ground level of the entire airspace, coupled with uniform and highly accurate surveillance position fixing. Position determination, identification, flow control, and collision avoidance functions can be implemented through the use of regional centralization of ground computation, resulting in important benefits to the utilization of the airspace and adaptability of the ATC system. It is shown that the concept of intermittent positive control (IPC) requires aircraft speed/acceleration restrictions and leads to the requirement for surveillance accuracies of 100 to 200 ft within the densely populated regions of airspace expected in the 1980s. A class of satellite systems is described which offers the requisite performance for both commercial carriers and general aviation with low anticipated costs of aircraft equipment. Author

N73-23710 Service Technique de la Navigation Aerienne, Paris (France)
TAM-TAM SYSTEM [SYSTEME TAM-TAM]
Jacques Louet *In* AGARD Air Traffic Control Systems Apr 1973 11 p In FRENCH (For availability see N73-23689 14-21)

The TAM-TAM (automatic transmission of messages of air traffic by multiplex) system as a possible data link in air-ground-air transmission during oceanic, continental, and terminal control area flight is discussed. Problems encountered and solutions to those problems are included. Transl by E H W

N73-23711 Mitre Corp., Bedford, Mass.
DERIVATION OF A WIDE AREA POSITION LOCATION CAPABILITY USING A SYNCHRONIZED TIME DIVISION MULTIPLE ACCESS COMMUNICATION SYSTEM
Victor A DeMarines and R L Thompson (ESD) *In* AGARD Air Traffic Control Systems Apr 1973 10 p ref (For availability see N73-23689 14-21)

A concept for the use of a high bandwidth time division communications system to provide a ground based, wide area, position location system is presented. General principles upon which the system is based and a discussion of computational techniques employed are covered. A discussion of system behavior as a function of system and random errors caused by individual element position uncertainty and geometric effects is included. Control mechanisms required to produce stable and reliable performance are also described. Results of a computer simulation are presented to provide estimates of capability under various conditions and to establish the system performance envelope. Author

SECANT: A SOLUTION TO THE PROBLEM OF MID-AIR COLLISIONS

J. L. Parsons *In* AGARD Air Traffic Control Systems Apr. 1973 11 p ref (For availability see N73-23689 14-21)

The principal characteristics of SECANT, a system for the separation and control of aircraft using non-synchronous Techniques, are described. This cooperative, transponding collision-avoidance system, designed to be compatible within the entire aviation community, is capable of accommodating the dense air traffic anticipated for the 1980s and beyond. It makes available to the pilot evasion or escape maneuvers in any direction - vertical, horizontal, or a combination. SECANT helps the pilot to avoid mid-air collisions by transmitting probes and receiving replies with a 1 microsecond pulse at 1000 pulses per second on 24 different frequencies. Various discriminants are used to eliminate undesired signals, and the false alarm rate is near zero. Author

A FRENCH COLLISION: AVOIDANCE SYSTEMS OF TIME-FREQUENCY TYPE. CRITICAL ANALYSIS OF TEST RESULTS

Roland Moreau *In* AGARD Air Traffic Control Systems Apr. 1973 9 p refs In FRENCH, ENGLISH summary (For availability see N73-23689 14-21)

Performance tests of a system for air traffic control and collision avoidance are discussed. The system is described and the method of operation is outlined. The precision obtained is analyzed and compared with established standards. Modifications of the signal format are examined. Problems raised by the introduction of the new air traffic control system are reported. Author

N73-23714 Royal Air Force Inst. of Aviation Medicine, Farnborough (England)

HUMAN FACTORS PROBLEMS IN CONFLICT DETECTION AND RESOLUTION

V. D. Hopkin IN AGARD Air Traffic Control Systems Apr. 1973 8 p ref (For availability see N73-23689 14-21)

Conflict detection and resolution as human factors problems in air traffic control are discussed. It is contended that this assumption is probably incorrect, primarily because of the large differences in urgency, information, procedures and facilities in various phases of flight. The controller's responses depend on the confidence he has in the data available to him, and on his knowledge of how accurate it is likely to be. Automated aids may not be properly used if they include no indication of the accuracy, quality and comprehensiveness of the data on which automated computations are being made. Relevant research methods for human factors studies on conflict detection and resolution are indicated. Author

PROBLEMS INVOLVED IN ATC AUTOMATION

David L. Stoddart *In* AGARD Air Traffic Control Systems Apr. 1973 11 p (For availability see N73-23689 14-21)

The two major problems involved in A T C automation, suitable man-machine interfaces and system reliability, are considered. These problems are placed in perspective by examining the need for automation and by considering the information required by the controller, and how this should be displayed. Suggested man-machine interfaces are examined, including synthetic plan displays, tabular displays, touchwires, keyboards, rolling balls and light pens. The operational and technical advantages and disadvantages of these devices are discussed. The problem of reliability is introduced and the need for fail safe systems explained. Various methods of achieving reliability are considered, including triplicated hardware and systems having preferred and reconfigured functional organization. The implications of these systems are discussed and a system design suggested. Author

N73-23716 Defence and Civil Inst. of Environmental Medicine, Downsview (Ontario)

THE MAN-COMPUTER INTERFACE PROBLEM IN TERMINAL AUTOMATION

Leslie Innes *In* AGARD Air Traffic Control Systems Apr. 1973 6 p refs (For availability see N73-23689 14-21)

The main concern in the several large air traffic control automation programs which have been implemented has been the provision of information to the controller in a more accurate and more easily assimilable form. The aim was, if not to reduce the controller's workload, to at least keep it within acceptable limits. Experience with these systems to date is reviewed, and the conclusion reached that in few instances has this aim been achieved. Without adequate isolation of the controller from the requirement to continually interact with the computer, workload is inevitably increased to an unacceptable degree, due to the additional tasks imposed on the controller by the demands of the automated aspects of the system. The development of the Canadian Forces automated terminal control concept involved evaluation of several methods of simplified man-computer interaction, carried out within constraints imposed by limited available manpower in the controller trade, and limited funding for the program. A solution has been developed which appears to adequately act as a compromise between these conflicting requirements. Author

INTEGRATION OF COMMUNICATION FUNCTIONS, NAVIGATION, IDENTIFICATION, AND TRAFFIC CONTROL [INTEGRATION DES FONCTIONS DE COMMUNICATION, DE NAVIGATION, D'IDENTIFICATION ET DE CONTROLE DE TRAFIC]

Lj. Milosevic and P. Mollie (Service Tech. des Telecomm. de l'Air) *In* AGARD Air Traffic Control Systems Apr. 1973 11 p In FRENCH (For availability see N73-23689 14-21)

The economic aspects of replacing separate aircraft landing and anticollision equipment with an integrated time-frequency system are discussed in detail. A comparison was also made of the relative cost value of replacing equipment mounted on the aircraft. Transl. by E H W

N73-23718 Department of Transportation, Washington, D C

SATELLITE CONSIDERATIONS IN FUTURE AIR TRAFFIC CONTROL SYSTEMS

D. E. Findley *In* AGARD Air Traffic Control Systems Apr. 1973 9 p (For availability see N73-23689 14-21)

A program for improving the air traffic control system of the United States is discussed. The program is involved with deployment and implementation of major improvements for certain enroute and terminal area air traffic control functions. Development efforts are proposed for the following subjects: (1) traffic surveillance, (2) conflict prediction, (3) resolution and avoidance, (4) landing guidance, and (5) automation of air traffic control functions. The background for the formulation of a concept of the air traffic control system for the 1980 time period and beyond is considered. Emphasis is placed on the use of artificial satellites to meet the air traffic demands. Author

CONCEPTUAL ANALYSIS OF ICNI SYSTEMS

J. H. Craigie *In* AGARD Air Traffic Control Systems Apr. 1973 7 p refs (For availability see N73-23689 14-21)

The development of an improved communications, navigation and identification (ICNI) system for command and control, air traffic control, and mission execution is discussed. The program is mainly directed toward the requirements of four major Air Force Commands. The special requirements for each type of Air Force mission are analyzed to show the variations required in the proposed system. Author

N73-23720 Mitre Corp., Bedford, Mass.
A PRACTICAL DESIGN OF AN ICNI SYSTEM
C. Eric Ellingson *In* AGARD Air Traffic Control Systems Apr. 1973 14 p (For availability see N73-23689 14-21)

The key factors which have resulted in the proliferation of communications, navigation, and identification equipment in aircraft are discussed. The advantages of interconnective communications capability and common position location capability in reducing complexity of the system while improving operational capability are examined. A specific candidate communication system is proposed and its capabilities are analyzed. Author

N73-23721 Office of the Secretary of Defense (Research and Engineering), Washington, D.C.
INTEGRITY OF ICNI SYSTEMS
Robert Lyle Linden *In* AGARD Air Traffic Control Systems Apr. 1973 3 p (For availability see N73-23689 14-21)

An analysis of integrated communications, navigation, and identification systems for aircraft operation is presented. Advances in electronics solid state devices, logic circuits, and discrete function modules are described to show application to systems integration. The anticipated improvements in operational capability through system integration are analyzed. Author

TESTING OF AN ATTITUDE CONTROL UNIT FOR SOUNDING ROCKETS
Hartmut Siemann *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 8 p (For availability see N74-14345 05-21)

After a general view of the structure of an attitude Control unit for sounding rockets a short description of the equipment available for the test of attitude control systems is given. On this basis a test philosophy is shown which allows a thorough testing of the attitude control unit at optimal costs. This can be done by a test program which examines every phase of the attitude control maneuver completely but without redundancy. Within this scope also environmental tests are dealt with. In the following some practical guidelines for preparation and execution of the tests are given, whereby the engagement of the customer plays a significant role. Author

N74-14350 Central Inertial Guidance Test Facility, Holloman AFB, N.Mex
LABORATORY EVALUATION OF ELECTRO-OPTICALLY AIDED SPACE NAVIGATION SYSTEMS
Walter G. Peterson *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 10 p refs (For availability see N74-14345 05-21)

A key step in any development program is the laboratory testing which provides a means of demonstrating the design concept and hardware performance. The success of this testing is dependent upon both laboratory accuracy and the faithfulness with which the systems' operational environment is duplicated within the laboratory. The greatly increased accuracy and complexity of electro-optically aided space navigation systems that are currently being developed, force the test engineer to devise new test methods in order to insure the validity of his results. This paper seeks to explain the approach that the Central Inertial Guidance Test Facility (CIGTF) is pursuing to meet this challenge. It discusses the way past systems have been tested and the methodology which will be used to evaluate future ones. Author

TRENDS TOWARDS STANDARDIZED SOFTWARE AND HARDWARE FOR TEST SYSTEMS
B. Eichenauer, M. Mall, and G. Schweizer (Dornier-System G.m.b.H.) *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 20 p refs (For availability see N74-14345 05-21)

The use of automatic test equipment for check-out of aircraft before flight is discussed. A check-out system comprises an equipment to stimulate the system to be tested with defined test signals, measuring units, the interconnection system for the connection of all parts with the required test signals and measuring units, the process computer with the interface unit and input/output peripherals. There is a requirement for a variety of different stimuli and measuring units. Examples are ac and dc test signal sources, hydraulic transducers, mechanical transducers, instruments measuring current, voltage, power, pressure, rotations. The required software is as important for the operation of a check out system as the hardware itself. The test procedures for the specific

system to be tested, the specification for the stimuli and the measuring units to be applied and the basic software for the computer and the process peripherals as well as the user program for the specific check-out equipment and the system to be tested are all parts of the software complex Author

AIRCRAFT INERTIAL SYSTEM TESTING AND EVALUATION IN THE UNITED KINGDOM
R F Stokes and S G Smith *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 49 p (For availability see N74-14345 05-21)

Internal system testing by Government Departments in the United Kingdom is undertaken by two Establishments - RAE Farnborough and A and AEE Boscombe Down For historical reasons most flying is done at A and AEE where a fully instrumented aircraft has been provided for precise navigation trials but the methods used are largely derived at RAE Details of the reference equipment available, its advantages and drawbacks are given together with a description of the methods used to obtain a high quality, world-wide position and velocity reference Various methods of obtaining statistical performance parameters are discussed and their consistency is demonstrated The problems of performance diagnosis are illustrated with a worked example which also shows the use of a digital mathematical model of an IN system Some ideas on a possible new approach to inertial system testing are also given Author

INERTIAL GUIDANCE SYSTEM SLED TESTING
G R Mozer *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 31 p refs (For availability see N74-14345 05-21)

The techniques used for precision sled testing of inertial and terminal guidance systems and components under high sustained linear accelerations with superimposed vibration on the Holloman fifty-thousand foot high speed rocket sled test track are discussed This track is instrumented with a precision position and time measuring system which measures the sled velocity to better than 0.02 feet/second Sledborne magnetic tape recorders and radio frequency (RF) telemetry are used to obtain data Time digitization of guidance system data for automatic computer processing is utilized Strapped-down and gimballed systems have been tested Accelerometers are tested in system configuration by installing them on a modified inertial platform Static calibration of accelerometer bias and scale factor, gyro drift coefficients, and inertial component non-orthogonality measurements are made between sled runs Accelerometer error models include terms which are a function of steady state acceleration inputs and dynamic acceleration sensitive terms Propagation of individual error sources as a function of acceleration profile is examined Author

N74-14355 Thomson-CSF, Bagneux (France)
ROLE OF SIMULATIONS IN THE STUDY AND DEVELOPMENT OF THE CROTALE SYSTEM
G Paretti *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 21 p In FRENCH and ENGLISH (For availability see N74-14345 05-21)

After a general description of the CROTALE Weapon System, the main stages of the technical program development are indicated Then the role of simulations is discussed in further detail and the methodology of their use, on several levels, is stressed Attention is drawn to the basic character of a constant adjustment of simulations to experimental results Finally, an application of methodology is illustrated by a practical example, and simulation results are compared to test results Author

TERMINAL GUIDANCE SYSTEM TESTING
Felix E Morgan *In* AGARD Testing Philosophy and Methods of Guidance and Control Systems and Subsystems Oct 1973 21 p ref (For availability see N74-14345 05-21)

Through the proper combination of complementary non-destructive tests and verification by a limited number of live firings, it is now possible to increase the test cost effectiveness (test validity divided by test cost) for terminally guided weapon systems These non-destructive tests are conducted under an 'integrated test' concept This concept dictates complementary tests in varied test arenas each providing some benefit not available in the others The results of all these non-destructive tests are then incorporated into a guidance performance propagation computer program to arrive at 'guidance only' total system performance The validity of the performance propagation for the particular system under test may then be verified by a limited number of live launches These valid guidance performance indicators can then be combined with non-guidance performance data to predict total weapon system effectiveness over a wider realm of launch parameters This can also be done at a lower cost than would have been possible utilizing only a large number of live launches The Guidance Test Division at Holloman AFB, New Mexico, is conducting such integrated tests This paper presents the detailed descriptions of the test facilities, test methods, and data reduction techniques required to arrive at the performance indicators inputs to the guidance performance propagation computer program Author

OPTICS OF THE SEA (INTERFACE AND IN-WATER TRANSMISSION AND IMAGING)
Aug 1973 431 p In ENGLISH, partly in FRENCH (AGARD-LS-61) Avail: NTIS HC $23.75

The proceedings of a conference on the optical properties of the sea are reported. The subjects discussed include the following: (1) reflection and refraction of light at the sea surface, (2) refractive index fluctuations in sea water, (3) the theory of small angle scattering, (4) underwater visibility and imaging, (5) sources of light for underwater illumination, (6) long range vision techniques, and (7) spatial filtering and image restoration. For individual titles, see N73-33620 through N73-33638.

INTRODUCTION TO THE ELECTROMAGNETISM OF THE SEA [INTRODUCTION A L'ELECTROMAGNETISME DES MERS]
P. Halley *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 38 p refs In FRENCH (For availability see N73-33619 24-23)

The Debye theory of polarization of liquids was used to calculate real permittivity and conductivity of the sea. Also, visible light temperature measurements were used to observe superficial temperature and chemical composition of the sea surface. The effects of surface emissitivity, reflection, and refraction are discussed. Transl. by E.H.W.

RADIANCE DISTRIBUTION BELOW THE SEA SURFACE
Kjell Norgard *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 22 p refs (For availability see N73-33619 24-23)

Radiance distribution as a function of depth are the most basic radiometric quantities for describing the structure of the solar and global field of radiation in the upper layers of the sea. Immediately below the sea surface the radiance distribution is chiefly determined by the radiance distribution above the surface and by the reflecting and refracting properties of the air - water interface. Through the processes of absorption and scattering by the water itself and by dissolved and suspended matter the initial radiance distribution is progressively changed with increasing depth. A survey is given of concepts of inherent and apparent optical properties, and simple models describing their interrelations and relations to the radiance distribution through the classical time-independent equation of radiative transfer are presented. Some experimental data are presented and discussed. A brief account of the polarization of the underwater light field is given. Author

REFRACTIVE INDEX FLUCTUATIONS IN SEA WATER
Henri Hodara *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 14 p refs (For availability see N73-33619 24-23)

Mathematical methods for predicting the effects of thermal and saline inhomogeneities on optical imaging systems are presented. Temperature and salinity variations cause corresponding fluctuations in the refractive index resulting in loss of resolution. Formulas are developed for the refractive index changes in terms of their gradient with respect to salinity and temperature. It is stated that a dual-scan system is fairly immune to temperature and slinity fluctuations. Author

VARIATION OF OPTICAL SEA PARAMETERS WITH DEPTH
J. Ronald V. Zaneveld *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 22 p refs (For availability see N73-33619 24-23)

The depth dependence of light scattering and attenuation parameters in the ocean are discussed. The theoretical dependence of optical parameters on the concentration, size distribution and physical parameters of the particulate matter is discussed. A simple model for the depth dependence of particulate matter concentrations is presented. Results agree qualitatively with observed distributions. The interrelation of optical parameters, particle concentration, and hydrographic parameters as obtained from experimental observations in several areas is discussed. Author

DIFFUSION OF LIGHT BY SEA WATER. EXPERIMENTAL RESULTS AND THEORETICAL APPROACH [DIFFUSION DE LA LUMIERE PAR LES EAUX DE MER. RESULTATS EXPERIMENTAUX ET APPROCHE THEORIQUE]
Andre Morel *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 75 p refs In FRENCH (For availability see N73-33619 24-23)

Several theories - Rayleigh, Rayleigh-Gans, and Mie used to calculate light propagation in sea water as a function of

absorption and diffusion are discussed The effects of polarization, polydispersed and spherical particles, and long wave radiation are also discussed Definitions of various parameters used and experimental results are given in an appendix Transl by E H W

N73-33628 Tetra Tech, Inc , Pasadena, Calif
THEORY OF SMALL ANGLE SCATTERING
Willard H Wells *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 19 p refs (For availability see N73-33619 24-23)

The fundamental description of light scattering by particles in sea water is presented The volume scattering function is defined as the amount of light scattered per meter into a differential solid angle in a given direction For multiple scattering a derived quantity called the point spread function is needed to describe the intensity blur distribution at a given range Numerical relationships are developed to show the effects of various parameters on visibility conditions Author

N73-33629 Tetra Tech, Inc , Pasadena, Calif
EXPERIMENTAL RESULTS OF SMALL ANGLE SCATTERING
Henri Hodara *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 17 p refs (For availability see N73-33619 24-23)

The characteristics of light scattering at large angles, small angles, and very small angles For each of the angular ranges, the relative contributions from refraction and diffraction are calculated It was determined that large angle scattering is mostly due to diffraction, while refraction is responsible at small angles The results of scattering measurements by point spread function and by modulation transfer function are presented Author

N73-33630 Tetra Tech, Inc , Pasadena, Calif
FACTORS AFFECTING LONG RANGE VISION
Willard H Wells *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 10 p refs (For availability see N73-33619 24-23)

The various phenomena which affect long range underwater vision are discussed The most important factors are (1) decay of light in narrow and broad beams (2) light backscattered from particulate matter, (3) return light whose image information is scrambled by small angle scatter enroute to the detector (4) the statistics of detected photons and (5) signal to noise ratio criteria for imaging Mathematical models are presented to show the effects of the various factors Author

N73-33631 Tetra Tech, Inc , Pasadena, Calif
CRITERIA FOR VISION RESOLUTION, SIGNAL-TO-NOISE RATIO CONTRAST
Henri Hodara *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 13 p refs (For availability see N73-33619 24-23)

The vision criteria of resolution, signal to noise ratio and contrast are discussed The concepts are applied to calculate the ultimate resolution of underwater imaging systems It is stated that a signal to noise ratio of five is sufficient to ensure image quality Mathematical models of the factors affecting underwater vision are developed Author

N73-33632 Tetra Tech, Inc , Pasadena, Calif
MEDIUM AND SYSTEM TRANSFORM FUNCTIONS
Willard H Wells *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 16 p (For availability see N73-33619 24-23)

The application of Fourier techniques to calculate the spread of scattered light surrounding other distributions is discussed for cases of a circular spot, a beam with Gaussian profile and a linear stripe The quantities needed for round trip propagation from transmitter to receiver are defined A formula for particle backscattering is developed A table of blur and offset distributions and the related Fourier transforms and transfer functions is included Author

N73-33633 Tetra Tech, Inc , Pasadena, Calif
SOURCES: ARC, FLASH, INCANDESCENT AND LASER LAMPS
Henri Hodara and Willard H Wells *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 17 p refs (For availability see N73-33619 24-26)

The major classes of incoherent and coherent sources of light for underwater applications are discussed A performance comparison figure for lamps is developed based on the square root of the round trip light attenuation from lamp to camera taking into account the source, the medium, and the receiver spectral sensitivity It is stated that the selection of a lamp is dictated by efficiency In that respect, incoherent sources are superior to lasers for most underwater illumination applications Author

N73-33634 Tetra Tech, Inc , Pasadena, Calif
RECEIVERS: PHOTOELECTRIC AND PHOTOGRAPHIC DETECTORS
Henri Hodara and Willard H Wells *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 15 p (For availability see N73-33619 24-23)

A procedure for comparing photoelectronic and photographic detectors is discussed The criterion is based on the product of the signal to noise ratio and the spatial bandwidth The subjects discussed are (1) fundamentals for comparing detector performance, (2) units for measuring resolution, (3) characteristics of photoelectronic image detectors, and (4) characteristics of photographic film used with photoelectronic equipment Author

N73-33635 RCA Service Co , Inc , Patrick AFB, Fla
UNDERWATER LENSES AND OPTICAL PORTS
Lawrence E Mertens *In* AGARD Optics in the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 25 p refs (For availability see N73-33619 24-23)

Basic theoretical and practical aspects of using lenses and ports in underwater imaging systems are reviewed Terminology is defined and formulas for estimating field of view distortion and other aberrations are presented Several types of optical systems for correcting aberrations are reviewed The depth of field and relative aperture are compared for several lens port combinations Applications of short focal length, long focal length, and supplementary lenses are reviewed Author

N73-33636 Tetra Tech, Inc , Pasadena, Calif
LONG RANGE VISION TECHNIQUES
Willard H Wells *In* AGARD Optics in the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 13 p refs (For availability see N73-33619 24-23)

Techniques for long range vision are discussed Two methods, range gating and dual scan with parallax are described The treatment assumes unsaturated photoelectronic detectors that are limited by photon noise not contrast A range gated system with radar like pulses offers the ultimate solution for long range vision as far as eight attenuation lengths and beyond with badly degraded resolution The best alternative to range gating is a dual scan system in which the illuminator and receiver are separated for parallax The practical limit is about seven attenuation lengths unless range gating is added to eliminate luminance in nearby water Author

N73-33637 Tetra Tech, Inc , Pasadena, Calif
SPATIAL FILTERING AND IMAGE RESTORATION
Henri Hodara *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 12 p (For availability see N73-33619 24-23)

The exponential dependence of the ocean transfer function on range and the application to image restoration are discussed An inverse filter to restore photographs of flood lit targets blurred by turbulence is described and the limitations are analyzed The resolution degradation caused by a mismatch between filter and medium transfer functions is calculated The signal to noise ratio required to achieve various restorations is analyzed Author

N73-33838 Terra Tech, Inc., Pasadena, Calif
FORTRAN ALGORITHMS FOR UNDERWATER OPTICS
Willard H Wells *In* AGARD Optics of the Sea (Interface and In-Water Transmission and Imaging) Aug 1973 17 p (For availability see N73-33819 24-23)

The application of FORTRAN algorithms for underwater optics is discussed The functions performed by various subroutines are described An example of a complete computer program is provided The selected program has utility for fundamental studies of water properties It accepts a number of point spread functions measured at different distances and computes the spatial frequency decay function from each of them Author

AERONAUTICAL SIGNIFICANCE OF POLYCYCLIC SATURATED HYDROCARBONS [INTERET AERONAUTIQUE DES HYDROCARBURES POLYCYCLIQUES SATURES]
G. Verdie. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 12 p refs In FRENCH (See N72-11668 02-27)
Avail: NTIS HC $6.00/MF $0.95

The range of an airplane depends on the amount of energy used. When reservoir capacity is too limited, it is possible to extend the range by using a higher energy fuel. In this sense, high energy polycyclic saturated hydrocarbons are possible fuels for supersonic aeronautics in the near future, especially since their thermal stability is superior to that of present fuels. Essential fuel characteristics are presented together with the results of experimentation, industrial fabrication problems and future perspectives are considered. Transl. by K.P.D.

FUELS FOR SUPERSONIC AND HYPERSONIC AIRCRAFT
A. Lewis, H. Strawson, and J. G. Kirtley. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 12 p refs Sponsored in part by Min. of Aviation Supply (See N72-11668 02-27)
Avail: NTIS HC $6.00/MF $0.95

The first generation of supersonic aircraft is being designed to operate on existing kerosene-type fuels. The limitations of these fuels are reviewed and possibilities considered for propellants for higher-speed aircraft, serving the triple purpose of cooling the airframe, cooling engine components, and providing propulsive energy. Problems of vapor deposition in hot fuel systems are covered and the possibilities explored of increasing the cold-sink value of the fuel by precooling or by endothermic decomposition. The calorific values of different fuels and the importance of recombination of dissociated combustion products is stressed. Ways of speeding such recombination are indicated. Author

COOLING OF ADVANCED ENGINES BY ENDOTHERMIC REACTIONS OF HYDROCARBON FUELS
L. E. Faith, G. H. Ackerman, and H. T. Henderson. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 8 p refs Sponsored by AFAPL (See N72-11668 02-27)
Avail: NTIS HC $6.00/MF $0.95

The fuel used in an engine is a convenient coolant, absorbing heat as sensible heat and latent heat of vaporization. Certain hydrocarbon fuels can furnish additional heat sink in the form of endothermic reactions. Possible endothermic reactions include thermal reactions such as cracking, and catalytic reactions such as dehydrogenation, dehydrocyclization, and depolymerization. Of these, the catalytic dehydrogenation of naphthenes to aromatics is the most promising type of reaction. For example, the dehydrogenation of methylcyclohexane over platinum/alumina catalyst furnishes a reaction heat sink of approximately 1000 Btu/lb fuel, which is slightly greater than the cooling capacity due solely to sensible heat and latent heat of vaporization. This reaction is very selective and proceeds rapidly to achieve high conversion of methylcyclohexane to toluene and hydrogen. The total heat sink for such a reaction system compares favorably with that of hydrogen when these heat sinks are normalized by the heat of combustion of the fuel. Author

APPLICATION OF ANALYTICAL TECHNIQUES FOR THE ANALYSIS OF ADDITIVES AND CONTAMINANTS IN ADVANCED HYDROCARBON FUELS
W. G. Scribner. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 7 p refs (See N72-11668 02-27)
(Contract F33615-69-C-1325)
Avail: NTIS HC $6.00/MF $0.95

A rapid method based on a specific ion electrode technique was adapted and verified for the determination of micrograms/g quantities in fuel of a fluorine-containing additive. A measurement method for ng/g levels of lead in hydrocarbon fuels is described, and the noninterference of allowed fuel additives is demonstrated. Examples are also cited where polar compound contaminants at the microgram/g level were isolated and identified by a combination of column chromatography and infrared spectrophotometry. Various factors which must be considered in method adaptation are reviewed, and the need for close communication between the fuel handling engineer and the analyst to expedite the solution of fuel contamination problems is stressed. THE POSSIBILITIES OF ACTUALLY TESTING THE COMBUSTION CHARACTERISTICS OF AVIATION FUELS WITH APPROPRIATE EQUIPMENT
H. Gemperlein. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 11 p refs (See N72-11668 02-27)
Avail: NTIS HC $6.00/MF $0.95

Small-scale combustion chamber rigs are described, with which combustion characteristics of aviation fuels are being tested. The relationship of the chemical constitution of the fuels and their chemical-physical properties, and the processes during preparation and combustion of fuel is determined. Investigation is conducted at different air and fuel temperatures and at differently high pressures in the combustion chamber in a parallel flow. Temporally consecutive processes during fuel preperation and combustion may also be specially separated and thereby provide for a measurement with customary probes as well as spectroscopic methods. AVIATION FUEL LUBRICITY
R. A. Vere. *In* AGARD, Aircraft Fuels, Lubricants, and Fire Safety, Aug. 1971, 13 p, refs (See N72-11668 02-27)
Avail: NTIS HC $6.00; MF $0.95

A laboratory test rig was developed to evaluate European jet fuels with regard to lubricity. This has shown differences in the lubricity levels of different fuels. Active lubricity agents were identified as fully saturated heterocyclic compounds and polynuclear aromatics. The addition of a surface active additive such as a corrosion inhibitor also significantly improve lubricity but can incur conductivity problems in the field due to its synergistic effects with antistatic additive. The feasibility of a fuel lubricity test by chemical, physical or mechanical techniques are being studied. Author

FLAME INHIBITION CHEMISTRY
R. M. Fristrom and R. F. Sawyer. *In* AGARD, Aircraft Fuels, Lubricants, and Fire Safety, refs (See N72-11668 02-27)
(Grant NSF GI-12)
Avail: NTIS HC $6.00; MF $0.95

Techniques involving diverse mechanisms are employed in extinguishing flames and fires. Mechanisms were divided into two broad categories: (1) physical mechanisms when mechanical or thermal effects are dominant, and (2) chemical mechanisms when chemical effects are involved. Flame extinguishment viewed from the standpoint of the effects on the elementary reaction processes is reviewed. A simplified hydrogen-oxygen flame chemistry is used as an illustration. The complications introduced by chemical inhibition are pointed out. The chemical kinetic information in the area of hydrogen atom scavenging and oxygen flame radical recombination is surveyed. Author

FLAMMABILITY PROPERTIES OF JET FUELS AND TECHNIQUES FOR FIRE AND EXPLOSION SUPPRESSION
B. P. Botteri. *In* AGARD, Aircraft Fuels, Lubricants, and Fire Safety, Aug. 1971, 11 p, refs (See N72-11668 02-27)
Avail: NTIS HC $6.00; MF $0.95

Results of investigative efforts to establish the practical flammability envelopes and associated combustion damage potential for conventional jet fuels such as JP-4, JP-8 (similar to JET A-1), and JP-5 under simulated hostile operating environment conditions are presented. Testing included liquid-space gunfire hits to assess external fire hazard and vertical (liquid to vapor) firing trajectories to determine explosion hazard associated with projectile-induced fuel sprays and mists. All tests were performed in instrumented replica target tanks varying in volume from 16 to 90 gallons. Principal test variables were fuel temperature, pressure, fuel depth, external void space, and internal and external air flow. All tests were conducted utilizing 0.50-caliber armor piercing incendiary projectiles. These tests indicate a considerable extension in the flammability range of all fuels compared to the equilibrium flammability limit values which are commonly utilized for fire safety analyses. In view of the fire and explosion potential exhibited by all conventional jet fuels, additional measures must be employed to achieve an effective fire-protection capability. Progress in the use of reticulated polyurethane foam, halogenated hydrocarbon chemical extinguishment, and other fuel-tank-inerting techniques is also reviewed. Author

INFLUENCE OF MOLECULAR STRUCTURE ON SELF-IGNITION PROPERTIES OF HYDROCARBONS [INFLUENCE DE LA STRUCTURE MOLECULAIRE SUR CERTAINES PROPRIETES D'AUTO-INFLAMMATION DES HYDROCARBURES]
G. DeSoete. *In* AGARD, Aircraft Fuels, Lubricants, and Fire Safety, Aug. 1971, 12 p, refs, In FRENCH; ENGLISH summary (See N72-11668 02-27)
Avail: NTIS HC $6.00; MF $0.95

The adiabatic compression method was used to determine delays in self-ignition by different hydrocarbon-air mixtures as a function of pressure and temperature. A comparison of experimental results makes it possible to evaluate the effect of some special molecular structure characteristics on the overall activation energy. In particular, the presence of tertiary carbon atoms and double carbon-carbon bonds results in a decrease in this activation energy. Tests made with mixtures of two different hydrocarbons show that the kinetic parameters controlling the dependency of ignition delay on temperature vary in such a way that the delay with a mixture tends to approach that of the pure component having the shortest delay at the temperature considered. This phenomenon was found to be all the greater as the relative concentration of this component in the binary mixture is higher. Author

IGNITION OF FUELS BY A HOT PROJECTILE
O. P. Sharma and W. A. Sirignano. *In* AGARD, Aircraft Fuels, Lubricants and Fire Safety, Aug. 1971, 16 p, refs (See N72-11668 02-27)
Avail: NTIS HC $6.00; MF $0.95

Theoretical investigations were performed by approximating (1) the flow at the forward end of the projectile to a stagnation flow towards a hot axisymmetric body, (2) the flow over its surface to a laminar flow over a hot plate, and (3) the flow in the wake of the projectile to a plane laminar mixing of the cold unreacted mixture with the hot combustion products. After the premixed mixture is exhausted there is a possibility of ignition of unmixed reactants by the hot inert products which are left behind and are sandwiched between the oxidizer and the fuel. A theoretical analysis for the ignition delay time as a function of the temperature and the width of the hot gas region is also presented. Author

INFLUENCE OF PROMOTERS (FREE RADICALS) AND INHIBITORS ON DIFFUSION FLAMES [INFLUENCE DES PROMOTEURS (RADICAUX LIBRES) ET DES INHIBITEURS SUR LES FLAMMES DE DIFFUSION]

J Combourieu, C Falinower, and G Denis *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 11 p refs In FRENCH, ENGLISH summary (See N72-11668 02-27)

Avail NTIS HC $6.00/MF $0.95

The laminar diffusion flames of acetylene with molecular oxygen and with molecular oxygen partly dissociated were stabilized in a low pressure vessel. A partial dissociation of O2 into O atoms was produced by a powerful microwave discharge. Concentration profiles of stable species were determined with a microprobe and a mass spectrometer. Temperature profiles were obtained from a silica-coated thermocouple. The intensities of spectral emission were recorded for excited species with a spectrophotometer. The complex structure of these diffusion flames shows that the combustion of C2H2 involves several steps. The partial dissociation of O2 emphasizes the significant role played by O atoms in the combustion of C2H2. The influence of halogenated inhibitors is very different according to the kind of inhibitor and whether it is added to the oxidizer or the fuel. Author

CONTRIBUTION TO THE SELECTION OF FIRE EXTINGUISHING SYSTEMS AND AGENTS FOR AIRCRAFT FIRES

R Fiala *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 10 p refs (See N72-11668 02-27)

Avail NTIS HC $6.00/MF $0.95

A fire extinguishing-system in aircraft is described which uses the exhaust gase of a solid-propellant gas generator to pressurize the extinguisher bottle. The extinguishing efficiency of this hot-bottle-system is compared with that of the current extinguishing system. The amount of agent which is necessary to extinguish a diffusion flame was measured for a number of halons, dry powders, and mixtures of dry powders and halons. The ability of agents to prevent reignition of the extinguished fuel surface by hot parts was also tested. Author

ELECTROSTATIC CHARGING IN THE HANDLING OF AVIATION FUELS

H Strawson and A Lewis *In* AGARD Aircraft Fuels, Lubricants and Fire Safety Aug 1971 11 p refs (See N72-11668 02-27)

Avail NTIS HC $6.00 MF $0.95

Electrostatic charging of the fuel during fueling can result in the possibility of incendiary sparking in aircraft tanks; some of the more recent experimental results on the different phases of this process are presented. These results confirm that in the absence of special precautions, discharges creating a tank explosion hazard can exist during aircraft refueling in certain circumstances. Unless the fuel conductivity is controlled, however, these hazardous circumstances cannot be precisely predicted. The use of a static dissipator additive eliminates the hazard. Methods of introducing the additive and of maintaining the correct conductivity during fuel distribution are discussed, as well as possible side effects and interactions with other fuel additives. On the basis of world-wide airline use over many years, supported by many laboratory tests, it is concluded that the additive provides a safe, simple and trouble-free solution to the problem. Author

FIRE HAZARD EVALUATION OF THICKENED AIRCRAFT FUELS

J M Kuchta, J N Murphy, A L Furno, and A Bartkowiak *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 11 p refs (See N72-11668 02-27)

Avail NTIS HC $6.00 MF $0.95

Various gelled or emulsified fuels were proposed for reducing the aircraft crash-fire hazard. Results are presented from bench-scale tests for screening the fuels and from large-scale drop tests for evaluating their fire hazard under simulated crash conditions. Jet A and Jet B type thickened fuels were investigated. Their minimum autoignition temperatures and burning rates varied little, whereas their flash points, volatility rates, self-spread rates, and flame spread rates varied noticeably with either the base fuel or thickening agent composition. minimum ignition energies are also compared for liquid sprays. The performance of the thickened fuels, particularly Jet B emulsions, was not very promising under impact conditions. In fuel drops made from a 150-ft three-tower facility, the fireball size and radiation intensity varied with impact velocity, impact angle, and type of fuel container. Author

FIRE AND EXPLOSION PROTECTION OF [illegible] TANK ULLAGE

J A. MacDonald and H. W. G. Wyeth *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 7 p refs (See N72-11668 02-27)

Avail NTIS HC $6.00 MF $0.95

The conditions that can lead to an explosion within aircraft fuel tank ullages are examined, and the need for protection systems is reviewed. Principles employed in providing the desired degree of protection are outlined, such as oxygen reduction, vapor or mist inerting, and plastic foam fillers. Comparisons were made between the various sytems and their relative merits were also discussed. It is concluded that plastic foam is an effective system provided that the material is compatible with the environment. Liquid nitrogen is also attractive from the weight aspect but could impose logistic problems. Author

INVESTIGATION OF FIRE EXTINGUISHING POWDERS BY MEANS OF A NEW MEASURING PROCEDURE

R Fiala and G Winterfeld *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 12 p refs (See N72-11668 02-27)

Avail NTIS HC $6.00/MF $0.95

In order to optimise fire extinguishing systems it is necessary to compare the extinguishing efficiency of solid and gaseous (or liquid) extinguishing agents. A measuring procedure is described which allows this direct comparison. It makes use of the relationship between the maximum flow velocity at the burning limit of a flame-holder stabilized flame and the laminar burning velocity of the fuel-air-mixture which is given by DAMKOHLER's first number. Comperative results achieved with this procedure for several fire extinguishing agents are given. Author

SIMULATED CRASH TESTS AS A MEANS OF RATING AIRCRAFT SAFETY FUELS

R E Miller and S P Wilford *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety Aug 1971 13 p refs (See N72-11668 02-27)

Avail NTIS HC $6.00/MF $0.95

Two tests are described for assessing the fire resistance of Avtur containing polymeric additives which reduce its ability to form flammable mists. In the standard test a tank containing ten or twenty gallons of fuel is propelled on a rocket sled at speeds of 114 or 188 ft/sec and decelerated after contact with an aircraft arrester wire. Fuel is allowed to spill from a slit in the tank onto a series of ignition sources. In the run on test the tank travels at speeds up to 240 ft/sec past a series of ignition sources while spilling fuel from a slit on the leading edge. The velocities of spilled fuel relative to the surrounding air which occur in these tests are shown to be comperable to those occurring during survivable aircraft crashes. Author

THERMAL STABILITY OF A TRI-METHYL-PROPANE ESTER BASED LUBRICATING OIL [CHAMP D'APPLICATIONS D'UNE HUILE BASEE SUR UN ESTER DU TRIMETHYLOL-PROPANE]

F Reynaud *In* AGARD Aircraft Fuels Lubricants, and Fire Safety Aug 1971 22 p refs In FRENCH ENGLISH summary (See N72-11668 02-27)

Avail: NTIS HC $8.00 MF $0.95

Following a general discussion on the increased performance requirements of lubricating oils made mandatory by increased operating temperatures, the operational possibilities of a tri-methyl-propane ester in two domains of application are described. The first area of application considered was a conventional circuit with oil temperature around 230 C. By adding appropriate additives, a formula was developed with very satisfactory characteristics, particularly in regard to oxidation corrosion. The second area of usage studied was at the 380 C level. The formula appeared not to be well adapted to the new conditions, with some additions losing their efficiency. However the ester remained valid as a base. D L G

SOLID LUBRICATION FOR AERO PROPULSION SYSTEMS

M. R. Chasman. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety, Aug. 1971, 13 p, refs (See N72-11688 02-27)

Avail: NTIS HC $8.00 MF $0.95

Self contained solid lubricated bearings were developed for application to current and future aircraft propulsion and power generation equipment. The capability for long life operation over a wide range of temperatures in an air environment was demonstrated. The approach was to use solid lubricants as a sacrificial retainer material in 20 mm and 35 mm bore bearings. In some cases stainless steel and titanium shrouds were used to provide added strength to the solid lubricant retainers. Lubricants were selected based on their strength, oxidation, friction, and wear properties. It was necessary to deviate from oil and grease lubricated bearing design to achieve acceptable life. Bearing clearance, number of balls, retainer to land clearance, and ball pocket size were optimized. Hundreds and in some cases thousands, of hours of life were demonstrated. Author

SYNTHETIC LUBRICANTS FOR SUPERSONIC AIRCRAFT

H.-D. Corn. *In* AGARD Aircraft Fuels, Lubricants, and Fire Safety, Aug. 1971, 6 p (See N72-11688 02-27)

Avail: NTIS HC $8.00 MF $0.95

Classifications and characteristics of synthetic aero turbine oils are reviewed. These oils are classified as type 1 and type 2 lubricants. The type 1 lubricants are defined as blends of a diester basestock and an additive package. Although still being used in jet engines, their use in advanced turbines is considered to be limited by marginal resistance to thermal and oxidative stress. Type 2 lubricants, developed to meet the increased requirements of more sophisticated aircraft, are defined as blends of a hindered tri- or tetraester basestock and an additive package. The burden placed on these lubricants by sustained flight at supersonic speeds is discussed, and the development of an advance complex ester lubricant with a novel additive package for Mach 2 + engines is reported. TECHNICAL EVALUATION REPORT ON PROPULSION AND ENERGETICS PANEL 37TH MEETING ON AIRCRAFT FUELS, LUBRICANTS, AND FIRE SAFETY

R. B. Whyte and L. Gardner. Paris, AGARD, May 1972, 9 p, refs

(AGARD AR-44) Avail: NTIS HC $3.00

The discussions which took place at a meeting on aircraft fuels, lubricants, and fire safety are presented. The subjects discussed are: (1) fuels production, analysis and testing; (2) fuel handling; (3) lubricants; and (4) fire safety research. It was concluded that from an operational aspect the fuels and lubricants used for aircraft engines are satisfactory up to at least Mach 2.2. It was recommended that additional developments be undertaken to provide refueling systems capable of dealing with larger volumes of fuel at higher rates of flow than exist in present equipment. Avail: NTIS HC$6.00; MF$0.95

Turbine cooling effectiveness and efficiency are defined for subsequent use in descriptions of cooling performance. The factors affecting the choice of cooling design point and the sources of cooling air are discussed. In particular, the use of 5th stage H.P. compressor air in place of compressor delivery air is shown to result in lower rotor blade temperatures for the H.P. turbine. The differing environments and requirements for turbine stator and rotor blades are discussed together with the importance of combustion chamber outlet gas temperature profiles. The turbine rotor and stator blades are convection cooled and are fairly conventional. The evolution of the various blade cooling designs is described together with summaries of their cooling performance. Author

TEMPERATURE MEASUREMENTS WITH THERMOCOUPLES INCLUDING ERRORS CAUSED BY CATALYTIC EFFECTS

P. Stollmann *In* AGARD High Temp. Turbines Jan. 1971 10 p refs (See N71-17372 07-28)

Avail: NTIS HC$6.00; MF$0.95

Several methods for the temperature measurement in combustion gas are discussed, especially the ones dealing with thermocouples. Corrections for compensation of the influences due to flow velocity, radiation, and heat conduction are described. In case of using noble metal thermocouples the possible errors by catalytic effects are studied. Experimental results are presented which show the ignition of a fuel-air mixture outside the boundary

layer of the probe, initiated by the catalytic influence of the platinum surface. The reproducible catalytic effects, which initiate or force reactions in a gaseous fuel-air-mixture are dependent on the external flow conditions, gas temperature, gas velocity, fuel-air-ratio and the distribution and evaporation of the fuel. Coating the noble metal surfaces with Al2O3 avoids the catalytic effects. Author

DESIGN OF SMALL DIMENSION TURBINE BLADE BY THEORETICAL ANALYSIS [DESSIN D'UNE AUBE DE TURBINE DE PETITE DIMENSION AU MOYEN DE PROCEDURES THEORIQUES]

C. Loudet. *In* AGARD High Temp. Turbines, Jan. 1971, 28 p, refs. In FRENCH; ENGLISH Summary (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

The method of blade boundary layer optimization due to Le Foll is used for the calculation of a small turbine blade in incompressible flow, with Goldstein's method for the resolution of the inverse potential flow problem. A blade with a cusped trailing edge has been calculated for the following flow conditions: inlet angle 32 deg, outlet angle 54.8 deg, and Reynolds number based on the chord and outlet velocity. This blade gives a theoretical loss coefficient based on the dynamic outlet pressure, of 4.45%. The calculated losses are in good agreement with the experimental results, taking into account the fact that a truly two-dimensional flow could not be obtained during the tests. Author

EFFUSION COOLING OF TURBINE BLADES

H. Prechter, A. Schoenpeck, and N. Scholz. *In* AGARD High Temp. Turbines, Jan. 1971, 14 p, refs. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

Theoretical and experimental investigations into the aerodynamic and thermodynamic performance of effusion cooled turbine blades are presented. To estimate the aerodynamic and cooling performance an extensive computer programme has been worked out, the physical background of which is described in this report. Few available experimental test results are drawn on to back up the theoretical procedure. Some parametric studies are presented showing the chord- and spanwise temperature distributions for an effusion cooled blade with different coolant flow distribution. The cooling effectiveness is investigated for various parametric changes and compared with that of an internally cooled blade. The aerodynamic behaviour reveals a considerable increase in profile loss coefficient of a porous turbine blade both with and without coolant effusion. The effect on overall engine performance by using an effusion cooled high pressure turbine in a modern turbojet engine is briefly discussed. Author

EXPERIENCE WITH TRANSPIRATION COOLED BLADES

S. Lombardo and S. L. Moskowitz. Sulcola in Guerra Aerea. *In* AGARD High Temp. Turbines, Jan. 1971, 20 p, refs. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

The propulsion system requirements of advanced aircraft necessitate incorporation of significant technological advances in the state of the art of major components in the engine. These advances evolve from the use of advanced design concepts coupled with accurate testing to substantiate the performance and durability through component and full-scale engine testing. Achievement of high turbine inlet temperatures in turbine engines through the use of transpiration air cooled turbine blades is considered. Briefly reviewed are the various transpiration air cooled turbine blades evaluated. This evaluation includes blade design aspects, modes of fabrication and material of construction. The results of component and full scale engine testing up to 3000 F (1650 C) are also presented. Author

TURBINE COOLING: ITS LIMITATIONS AND ITS FUTURE

Jack B. Esgar. *In* AGARD High Temp. Turbines, Jan. 1971, 25 p, refs. (See N71-17372 07-28)

(NASA TM X-66702) Avail: NTIS CSCL 21E

The relative merits of convection, transpiration, and full coverage film cooling methods were analytically investigated for gas turbine inlet temperatures from 2000 to 3500 F, gas pressures from 5 to 40 atmospheres, and cooling air temperatures from 600 to 1200 F. Effects of wall thickness and material temperature were also investigated. Transpiration or full coverage film cooling will probably be necessary to permit operation at gas turbine inlet temperatures on the order of 3000 F and compressor pressure ratios of 20 or higher. Film coverage from cooling is often superior to transpiration cooling because oxidation problems with transpiration cooled materials reduce allowable metal operating temperatures. Increasing allowable metal temperature 100 F or reducing cooling air temperature 200 F can do more to improve convection cooling than is possible by improvements in current advanced state of the art convection cooled blade or vane design. HIGH TEMPERATURE TURBINE DESIGN CONSIDERATIONS

S. N. Suciu. *In* AGARD High Temp. Turbines, Jan. 1971, 29 p, refs. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

The major technological developments which have made possible the trend towards higher temperatures in modern aircraft gas turbine engines are discussed. The relative importance of manufacturing processes, material developments, cooling techniques, analytical design procedures, rupture and cyclic life considerations, and aerodynamic and mechanical design improvements are discussed along with illustrative examples and technical data. The

need for a balanced design approach is stressed, and examples are given where trade offs can be made. It is noted that the advances in aircraft engines during the last 10 years have been based on the evolution of sound engineering principles, extensive component and engine development, and careful consideration of the operational requirements rather than a tremendous breakthrough or revolutionary concept in any one area. EXPERIMENTAL INVESTIGATION ON A SINGLE-STAGE AIR-COOLED GAS TURBINE

W Kuehl *In* AGARD High Temp. Turbines Jan 1971 14 p refs (See N71-17372 07-28)

Avail NTIS HC $6.00/MF $0.95

Temperature measurements made within the convection air-cooled rotor blade of a gas turbine during operation cannot deliver complete information of the temperature field, for the number of measuring points is limited by technical considerations. But by using the analogy between the heat flux and the electric current within a three-dimensional model it is possible to determine the heat flow in a complete blade, i.e. the full temperature field within the blade and also the local gas side and coolant side heat transfer coefficients. This paper describes the way from temperature measurements at the turbine rotor to the complete temperature field within the rotor blade. Author

Avail NTIS HC $6.00/MF $0.95

Metallurgists involved in the development of materials for high temperature gas turbines are challenged by problems of increasing difficulty leading them to explore continually new areas. Some of the current approaches used for the improvement of cobalt and nickel base alloys are reviewed and illustrated. The scope is not limited to an increase in strength but also to insuring structural stability, hot corrosion resistance, coatability. Processing variables such as hot deformation of normally cast alloys, controlled and directional solidification of conventional or eutectic type alloys, powder metallurgy techniques, are evaluated. FIBRE STRENGTHENED NICKEL-BASE ALLOY

A. W. H. Morris and A. Burwood-Smith *In* AGARD High Temp. Turbines Jan 1971 15 p refs (See N71-17372 07-28)

Avail NTIS HC $6.00 MF $0.95

The development and application of high temperature composites for gas turbine blading is discussed. Of the currently available reinforcements examined, only tungsten-5% rhenium wire affords acceptable stability in nickel-base alloys and a satisfactory increase in stress-rupture strength, but only by incurring a weight penalty. The maximum volume fraction reinforcement is controlled by composite density and blade geometry, at the low levels imposed the advantage of reinforcement is controlled by composite density and cooled blade. If adopted, fibre reinforcement is likely to be used in solid blades in engine stages where cooling is prohibitive and then only as a selected area reinforcement. Indeed the whole question of application may rest on the thermal fatigue behavior. Laboratory tests on cylindrical specimens indicate very poor thermal fatigue crack resistance. Application of the newer low density single crystal alumina fibre is also discussed. Author

MATERIALS DEVELOPMENT FOR HIGH TEMPERATURE TURBINES [EVOLUTION DES MATERIAUX POUR TURBINES A HAUTE TEMPERATURE]

Robert Brunetaud *In* AGARD High Temp. Turbines Jan 1971 8 p In FRENCH, ENGLISH summary (See N71-17372 07-28)

Avail NTIS HC $6.00 MF $0.95

Turbine blades and vanes work in complex conditions with creep, thermal fatigue, corrosion, erosion, etc. Base cobalt and base nickel alloys are developed for these turbine parts in new processes (vacuum melting, vacuum precision casting, unidirectional solidification). Spectacular advantages are possible with niobium alloys but the problems of niobium coatings are not resolved. Low cycle fatigue has to be considered more than creep aspects in disk fabrication. New techniques of isothermal forging or the use of wrought sintered products are indicated for the manufacturing of modified alloys from materials used for blades. Author

Six commercially available aluminide coatings were evaluated by simulated long time environmental testing. The environment was the combustion products of JP-5 fuel and air at 0.25 Mach. Coating performance was assessed by weight change and metallographic methods. Electron microprobe X-ray analyses and, to a limited extent, X-ray diffraction were carried out to identify phases and define compositional differences which could be related to performance. Types of aluminide coatings included in this evaluation program

were those containing significant quantities of (1) silicon, (2) chromium applied either before or after the aluminum, and (3) ceramic material. Coatings were also represented that were hyper- and hypo-stoichiometric in the beta-NiAl system. In general, the coatings with the greatest initial aluminum reservoir (thickness) provided the greatest protection. Hyper- rather than hypo-stoichiometric coatings appeared to provide longer protection at the maximum test temperature. The substrate also influenced coating performance with the coatings on B1900 showing consistently better performance than coatings on IN-100. Author

APPLICATION OF FILM COOLING TO GAS-TURBINE BLADES

C. Liess and J. Carnel. *In* AGARD High Temp. Turbines. Jan. 1971. 11 p. refs. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

The injection of a secondary flow into a high velocity main stream was investigated. The secondary flow was heated and injected by a row of inclined holes into a main flow at ambient temperature. The geometry of the injection holes and the main flow velocity corresponded to conditions encountered on real turbine blades. After a brief review of the application of film cooling to gas turbine blades the results of the measurements are presented. The tests concerned the adiabatic wall effectiveness and the flow field downstream of the injection hole. The test results show that approximate two-dimensional flow conditions can be obtained not far downstream of the holes provided that the spacing to diameter ratio of the holes is small. Author

EVALUATION OF FILM COOLING PERFORMANCE ON GAS TURBINE SURFACES

D. E. Metzger, J. R. Biddle, and J. M. Warren. *In* AGARD High Temp. Turbines. Jan. 1971. 10 p. refs. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

Film cooling of gas turbine components is often characterized by relatively short cooled lengths and injection geometries which are dictated primarily by fabrication and stress considerations. For many of the resulting configurations, film cooling information based on adiabatic wall temperatures alone is inadequate for design purposes. In addition, the complexity of the film cooling process makes extrapolation of results from one injection configuration to another uncertain. A transient method is described that has been used to rapidly assess the relative performance of various film cooling configurations. Advantages as well as some inherent disadvantages of the method are discussed. The experimental facilities are described, and typical results are presented for a variety of flush, angled injection ports. Emphasis is placed on recent results obtained for high injection rates with variable injection angle where the heat transfer is dominated by the film flow and effective heat transfer coefficients are much larger than those associated with the primary flow alone. COOLING OF TURBINE DISTRIBUTION BLADES THROUGH IMPACT EFFECT [REFROIDISSEMENT DES AUBES DE DISTRIBUTEUR DE TURBINE PAR EFFET D'IMPACT]

E. Bassinot. *In* AGARD High Temp. Turbines. Jan. 1971. 19 p. refs. In FRENCH. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

One of the improved methods for turbine cooling is the utilization of the impact effect in generating a discharge flow that allows very sensitive temperature corrections. Discussed are experimental studies that use slotted blades surfaces for distributing cooling air through impacting pressure and theoretical calculations of the effects of certain parameters on the impact. The experimental blade consisted of a heat resistant exterior shell and an inner lining that served as distributor of the cooling air and guided it into the convective cooling regions. The functional motor pressure provided the impact effect. It is concluded that this improved impact cooling method is suitable for distributing blades of advanced turbomachinery. Transl. by G.G.

COOLING OF TURBINE BLADES BY LIQUID METALS [REFROIDISSEMENT DES AUBES DE TURBINES PAR LES METAUX LIQUIDES]

E. Le Grives and J. Genot. *In* AGARD High Temp. Turbines. Jan. 1971. 20 p. refs. In FRENCH, ENGLISH summary. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

Mass transfer conditions in thermosiphon or evaporative cycles under high centrifugal acceleration are first briefly analyzed. Sodium-potassium alloys are shown to be best suited on account of their heat transfer ability with air cooled exchangers at the blade roots. A high rotation speed test set-up on which the heat flux on the blades is comparable to that of a real turbine has been extensively used for an experimental study of these processes. Both cycles lead to a temperature drop as high as 650 C at the blade tips with a mass flow rate of cooling air of 10 g per sec kW. However, several advantages are shown to be expectable for the evaporative cycle in view of its application to high temperature gas turbine cooling. Author

A FLUID-COOLED 2350 F ENTRY TEMPERATURE AXIAL FLOW TURBINE

Edward T. Johnson. *In* AGARD High Temp. Turbines. Jan. 1971. 17 p. refs. (See N71-17372 07-28)

Avail: NTIS HC $6.00; MF $0.95

A brief description of the overall program for the design and evaluation of a thermosiphon fluid-cooled axial flow turbine is given. The objective of the program was to demonstrate the thermosiphon system's capability to perform (adequately cool) at an inlet gas temperature of 2300 F. Although the original objective cooling at 2300 F (1260 C) was achieved, difficulty was experienced in obtaining the aerodynamic efficiency, proper fabrication of the blades, and a specific horsepower of 213 HP/lb/sec. Despite the aforementioned problems, this program did prove the capability of the annular combustor, finned nozzle vanes, and fluid cooled blade cooling system while operating at gas temperatures of 2350 - 2450 F. Avail NTIS HC $6.00; MF $0.95

Internally air cooled turbine rotor blades usually have a non-uniform temperature distribution. The non-uniform stress pattern thus created is redistributed by creep occurring at different rates within the blade depending on the local value of stress and temperature. The effect of this process on the blade life is discussed and experiments to check the validity of some of the assumptions are described. The stress patterns in rotating discs are modified when plastic strain occurs dependent on the strain-hardening characteristics of the disc material. This places limitations on the use of conventional material properties as design data. These limitations and the effect of the material stress strain curve on stress redistribution are discussed. STRESS ANALYSIS FOR ELEVATED TEMPERATURE LOW-CYCLE FATIGUE WITH HOLD-TIME
Erhard Krempl. *In* AGARD High Temp Turbines Jan 1971 17 p refs (See N71-17372 07-28)
Avail NTIS HC $6.00; MF $0.95

The behavior of structural materials under simulated service conditions at elevated temperature is shown to be characterized by strain rate (frequency) sensitivity, creep, relaxation and cyclic hardening or softening. These phenomena and prior deformation history have a considerable effect on the subsequent deformation and fracture behavior. A realistic stress analysis for elevated temperature low-cycle fatigue with hold time has to consider these material properties so that the stresses can be computed throughout the component as a function of time. It is shown that none of the conventionally used descriptions of material behavior (elasticity, plasticity, creep or viscoelasticity) can reproduce all the important observed phenomena. A new approach is proposed which considers time dependent, nonlinear, and history effects. Author

Avail: NTIS

The most important consideration in the selection of a power plant for any application is to maximize return on investment, or to maximize cost effectiveness. It must be indicated that the small gas turbine can yield more return or profit while satisfying operational requirements, than other engines, or its choice cannot be justified. The critical requirements of the propulsion systems for helicopters, vehicles, marine craft, electrical power generation, and total energy systems for buildings are discussed, and the engine characteristics necessary for the turbine to be the preferred choice are indicated. Installation requirements and ancillary components, exhaust emission levels and certain other technical goals are specified. Small gas turbines are arbitrarily considered to be less than 2,000 HP or less than 10 lb/sec airflow. Author

CYCLES OF A GAS TURBINE [CYCLES DE TURBINES A GAZ]

P. Alesi and R. Laurens *In* AGARD Small Gas Turbines for Helicopters and Surface Transport May 1971 11 p In FRENCH (See N71-26951 15-28)

Avail: NTIS

The power of a gas turbine is defined by the following four parameters: air flow, overall pressure ratio, turbine inlet temperature, and components efficiencies. The flow depends directly on turbomachine geometry, whereas the compression rate is a cyclic variable. The temperature in front of the turbine is also a cyclic variable but its value is limited by cooling problems of the turbine materials. Compression output and loss are functions of geometry at each cycle stage before flow clearance is minimized through increased compression. It is concluded that the power of a gas turbine is primarily determined by its thermodynamic cycle and its geometrical shape. Transl. by G.G.

ANALYSIS OF SMALL GAS TURBINE ENGINE COMPONENTS

Erwin Schnell *In* AGARD Small Gas Turbines for Helicopters and Surface Transport May 1971 23 p refs (See N71-26951 15-28)

Avail: NTIS

Aircraft gas turbines are to be developed for lowest weight and smallest volume, therefore they are built without utilization of the exhaust heat but for high pressure ratios. For vehicle gas turbines, however, the specific fuel consumption is the determining factor and therefore the heat exchanger is an essential component of the engine. For small gas turbine engines cooled turbine blades can only be used to a limited extent. In certain cases higher efficiencies can be expected with radial turbines than with axial turbines having unfavorable aspect ratios. Two shaft engines (having a free power turbine) compete with single shaft engines; auxiliary attachments (hydraulic torque converter or hydrostatic transmission) render the single shaft engine feasible to be used for traction purposes. Light engines with powers ranging between 300 and 1500 hp will be essentially used for the propulsion of ground vehicles that is for industrial applications 1.5 kg of weight per hp should satisfy most users A lower weight will be appreciated, of course but not at any cost Fuel consumption in particular, will remain an important item in the cost of operation Besides, the air intake filtering, sound-proofing and exhaust devices are costly and bulky Since they are proportional to the air flow rate, they will be three times larger for a turbine than for a diesel engine The cost per hp of present diesel engines remains an objective for the gas turbine to reach Now, this cost should still decrease considerably with high super charging simultaneously with the weight per hp which should reach 1 kg/hp in the near future The essential asset of the turbine is its extremely light weight which is however counterbalanced by the heat recovery device Author

Avail NTIS HC $6.00 MF $0.95

Full scale thrust performance tests are described which were made in an altitude test cell on a prototype two stream propelling nozzle fitted to a turbojet engine installed within a simulated aircraft nacelle The tests were made at conditions representing flight at Mach 2 at 20 km altitude Nozzle thrust efficiency obtained from these full scale tests was compared with that from a 1/10 scale model test rig The preliminary analysis gave unexpectedly low full scale efficiencies and, to investigate this, special tests were made with the secondary part of the nozzle removed As a result of the primary nozzle test corrections were made to secondary nozzle test points which yielded satisfactory agreement between full scale and model Author

Experimental investigations of the inlet, engine, and exhaust nozzle of a supersonic propulsion system are described. Exhaust nozzle results are presented which are compared with wind tunnel and flight results to assess the accuracy of flight measurements. Comparisons are also presented for nozzle performance obtained with a cold jet, a powered turbojet simulator, and a solid jet boundary simulator. The effect of the local boundary layer on nozzle performance is also discussed. The need for good dynamic measurements during inlet-engine testing is illustrated for transients such as inlet unstart and engine stall. The transient nature of inlet distortion and its effect on the engine are presented for two different operating conditions. Author

WIND TUNNEL TESTING OF V/STOL ENGINE MODELS: SOME OBSERVED FLOW INTERACTION AND TUNNEL EFFECTS
R. A. Tyler and R. G. Williamson. *In* AGARD Inlets and Nozzles for Aerospace Eng. Dec 1971 12 p refs (See N72-16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

The interpretation of force measurements on V/STOL related models incorporating inflows and/or outflows is discussed in relation to investigations concerned mainly with the transition performance of lift fan configurations. These utilize balance-mounted, powered models of about 1000 hp in the closed test section of a 10 ft x 20 ft V/STOL propulsion tunnel. With models producing strong downwash, an overriding testing limit arises in closed wind tunnels from the formation of a stable floor vortex system due to the interaction of stagnating model flow with the mainstream. An experimental study of this effect as it relates to downward directed jets is described. Vortex formation limits are correlated in terms of a jet force coefficient for a wide range of jet inclinations to the vertical, and for both single and paired jets. Interference velocity measurements with limited data from the main program and other sources are used to deduce corresponding tunnel flow breakdown limits. These testing limits are shown to be sensitive to model characteristics. Author

VECTORED THRUST IN AIR COMBAT
C. R. James. *In* AGARD Inlets and Nozzles for Aerospace Eng. Dec 1971 8 p ref (See N72-16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

Advantages of thrust vectoring in air combat are evaluated using a manned air combat simulator. This simulator consists of two fighter cockpits linked by digital computer driven visual displays which present each pilot with a properly oriented image of the opponent aircraft. Real time digital computation permits each pilot to fly his aircraft anywhere within the performance and strength limits of the airframe as he strives to maneuver into position to fire his weapons. Engagements include three cases: (1) a baseline conventional fighter, (2) a vectored thrust version of the baseline, and (3) the vectored thrust configuration with a 1500-pound weight penalty. The conventional fighter is the common opponent for all engagements. Engagements are scored by relative time in advantageous positions and by win/lose/draw results. Advantages of thrust vectoring are quantified and the sensitivity of advantages to weight penalty is determined. The experiments are described, results are summarized and analyses presented based on aircraft performance parameters. Results are also correlated with previous experiments. Author

AERODYNAMICS OF THRUST REVERSER DESIGN
W. J. Lewis (Rolls-Royce Ltd., Bristol, Engl.) and H. Prechtl. *In* AGARD Inlets and Nozzles for Aerospace Eng. Dec 1971 11 p ref (See N72-16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

For a number of applications the clamshell target type thrust reverser is an attractive solution for producing a braking force from a jet engine. This type of reverser consists of a pair of buckets which, in the stowed position, form part of the aircraft fuselage or engine nacelle and are moved into the jet efflux downstream from the final nozzle to provide thrust reversal. The important geometric design parameters can be determined from consideration of the flow in the thrust reverser system. Their effect on the aerodynamic performance was established from model tests and is discussed in detail. For the optimization of the operating mechanism in connection with fail-safe requirements, the load on the bucket and its point of application is important and is related to the reverser geometry. The problem of hot gas and debris ingestion into the engine intake is pointed out. Several solutions to overcome this problem are investigated together with the implications they have for performance and design. Author

SOME APPLICATIONS OF BOUNDARY LAYER CONTROL BY BLOWING TO AIR INLETS FOR V/STOL AIRCRAFT
I. McGregor. *In* AGARD Inlets and Nozzles for Aerospace Eng. Dec 1971 13 p refs See N72-16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

The use of jet blowing as a means of boundary layer control in intakes appears to have several advantages for V/STOL aircraft. The principles involved are discussed, giving two examples: a two dimensional inlet under static conditions and a ducted lifting fan at low forward speed. Some results of the effects of slot blowing on the behavior of the intakes of a model of a V/STOL strike aircraft at subsonic speeds are presented and compared with those obtained using a naturally aspirated suction bleed. It is concluded that boundary layer control by blowing could lead to a small improvement in net thrust and a significant reduction in flow distortion at entry to the compressor. Sensitivity of intake performance to incidence is also much reduced. Author

SOME ASPECTS OF PROPULSION FOR THE AUGMENTOR WING CONCEPT
D. C. Whittley. *In* AGARD Inlets and Nozzles for Aerospace Eng. Dec 1971 14 p refs Sponsored in part by NASA, Defence Res. Board of Canada, and Canadian Dept. of Ind. (See N72-16685 07-28)
(NASA-CR-125540) Avail: NTIS CSCL 21E

Many modern concepts for STOL and V/STOL aircraft rely on integration of the propulsion system with the wing to create favorable lift interactions, and are known as powered lift concepts. A study of powered lift, concerning management and control of the various propulsive streams or jets, is presented, each concept having its own particular objectives and requirements. Some specific objectives of this kind are described which relate to the augmentor wing. Consideration is given to three aspects of the subject namely the augmentor flap itself, the wind ducting and augmentor primary nozzle, and the choice of powerplant or engine cycle. More generally, comments are made regarding noise attenuation and the prospect for achieving a low overall noise level for jet STOL aircraft of the future. Author

RAPID MIXING NOZZLES FOR V/STOL APPLICATIONS

C. M. Chesters. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 11 p, refs (See N72-16685 07-28)
Avail: NTIS HC $6.00/MF $0.95

If the maximum potential of a V/STOL aircraft is to be achieved, it must be capable of operating from a variety of both prepared and unprepared sites. The use of high thrust to weight ratio jet lift engines with convergent or annular nozzles restricts this capability due to ground erosion, debris and hot gas recirculation and noise. Model and full scale tests demonstrated the benefits to be obtained from the use of rapid mixing nozzles with acceptable thrust lost and engine length penalties. The scope of the investigation extended to an examination of the possibilities of thrust vectoring and of the performance of thrust augmentors using rapid mixing nozzles. Author

THE PROPULSION JET OF A VTOL AIRCRAFT
L. Schwantes. *In* AGARD, Inlets and Nozzles for Aerospace, refs (See N72-16685 07-28)
Avail: NTIS HC $6.00/MF $0.95

The three regions of a vertical takeoff propulsion jet (the free jet, the wall jet and the zone of separation of the wall jet from the ground due to wind effects and buoyancy forces) were investigated with a three dimensional model jet. Behind the convergent nozzle the jet accelerates up to supersonic velocity maintaining the core nearly five nozzle diameters. Because of the lower turbulence of the jet with high spreed, jet decay and the three dimensional spread are lower than those of the jet with small nozzle velocity. At the hot wall jet there is a strong influence of nozzle distance from the ground or velocity profile. The decisive parameter characterizing the recirculation flow is the radius of separation of the wall jet from the ground. The behavior of the radius of separation for different jet parameters and several wind velocities is presented. Author

FLOW ANALYSIS IN AXISYMMETRIC SUBSONIC INLETS OF SMALL GAS TURBINES
P. M. Gallet. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 15 p, ref. Prepared in cooperation with Ecole Royale Militaire (See N72-16685 07-28)
Avail: NTIS HC $6.00/MF $0.95

Complicated axisymmetric air inlets are used in small gas turbines, thus disturbing the flow at the compressor entrance. A streamline curvature method to calculate the flow in the passage and at the compressor eye is presented. A universal theory of the discontinuities of curvature was applied. Additional annulus boundary layer calculations may help in the analysis of a channel. Some experimental and theoretical results are shown which tend to confirm the validity of the theory. Author

FLOW DISTORTION AND PERFORMANCE MEASUREMENTS ON A 12 INCH FAN-IN-WING MODEL FOR A RANGE OF FORWARD SPEEDS AND ANGLE OF ATTACK SETTINGS
Uwe W. Schaub and Robert W. Bassett. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 13 p, refs (See N72-16685 07-28)
Avail: NTIS HC $6.00/MF $0.95

The model comprising a 12-in. diameter fan buried in a NACA 0015 section wing with a constant chord of 40 in., was tested at various angles of attack and air speeds in the 10x20 ft closed propulsion wind tunnel. Tunnel interference corrections were estimated. Typical corrections were indicated for the whole testing range which became limited at very low crossflow ratios as a result of uncertainty in the correction in angle of attack. Flow distortion due to crossflow occurred in both the inlet and exit planes. In the crossflow ratio range zero to 0.27 inflow distortion was observed to be velocity distortion at essentially constant total pressure whereas outflow distortion appeared to be a distortion of the exit plane static pressure field. Author

THE DESIGN, DEVELOPMENT, AND TESTING OF A SUPERSONIC TRANSPORT INTAKE SYSTEM
E. Tjonneland. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 17 p, refs (See N72-16685 07-28)
Avail: NTIS HC $6.00/MF $0.95

The performance criteria, including engine airflow matching requirements of an axisymmetric mixed-compression intake for a supersonic transport application are described and related to the selection of the design features of the intake variable-geometry components. Viscous technology is applied to the design and development of the boundary layer control system to account for intake viscous interactions and to scale model results to full-scale designs. Small, low angle bleed holes 20 deg to the surface yield high flow coefficients. Hole diameters of approximately half the height of the boundary layer displacement thickness are used to improve the cleanliness of the supersonic diffuser flow and to maximize pressure recovery of the bleed air. Vortex valves are incorporated in a fluidic normal shock stability system to allow operation at peak intake recovery and remain started during atmospheric or engine transients. Author

FREE-JET TESTS OF A FULL SCALE SUPERSONIC INTAKE ENGINE COMBINATION
P. F. Ashwood. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 19 p, refs (See N72-16685 07-28)
Avail: NTIS HC $6.00/MF $0.95

Results are presented from an experimental investigation on a full scale Concorde power plant in 5 ft x 5 ft free jet test facility to investigate intake engine compatibility at supersonic speeds under both steady state and transient conditions. The main aim of the test program was to study the behavior of the power plant when running under the control of its flight systems, in particular during the transients that result from the sudden application of side slip or from rapid engine power changes. Initial tests with the intake alone enabled surveys to be made of the engine face pressure distribution and fluctuation over a wide range of test conditions. The major part of the program was undertaken with an Olympus 593 two spool turbojet engine coupled to the intake in a test configuration which reproduced the precise geometry of the port outer power plant of the prototype Concorde aircraft. CONTROL CONCEPT AND WIND TUNNEL TESTING OF A SUPERSONIC INTAKE CONTROL SYSTEM
H. N. Larsen and R. G. Schweikhardt. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 23 p, refs (See N72 16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

The controller is independent of other intake controllers and of airplane data systems. During started intake operation, throat Mach number is controlled with a translating centerbody and variable position cowl throat doors; normal shock position is controlled with secondary air valves and overboard bypass doors. These two control loops use intake duct pressure ratio signals for feedback. The desired pressure ratio reference value is scheduled with centerbody position and biased with intake controller error signals to provide for varying intake Mach number and angle of sideslip. Using vortex valves as an auxiliary normal shock stability system, model tests showed that the controller can maintain peak intake recovery while accommodating the required disturbances. Hot and cold day engine intake air flow matching is automatically controlled with increased secondary valve air flow or an intake activated engine rpm trim control. An external compression mode which maintains stable intake air flow with low compressor face distortion provides for unstarted supersonic intake operation. Author

AN AERODYNAMIC DRAG STUDY OF JET ENGINE NOZZLES
Dave Bergman. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 12 p, refs (See N72 16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

To aid nozzle analysis in areas where analytical methods are lacking, a wind tunnel program was conducted to investigate and measure the external drag characteristics of several nozzles at both on- and off-design exhaust conditions. This study involves nozzles of the centerbody plug, the convergent, and the convergent-divergent types. Flow through nacelle nozzles and solid wall jet plume simulators, each used frequently in airplane model tests, were included in the program. Results show large changes in external drag with variations in exhaust flow and describe the behavior of jet plume shape and entrainment effects. The results also provide insight into methods for simulating exhaust flow effects on airplane models which do not incorporate high pressure exhaust flow. Author

JET EFFECTS ON BOATTAIL PRESSURE DRAG AT SUPERSONIC SPEEDS
J. A. P. Stoddart. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 11 p, refs (See N72 16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

An analysis is presented of supersonic boattail pressure drag measurements in the presence of single or twin propulsive jets. Using theoretical inviscid pressure distributions as a datum, the decrease in boattail pressure drag coefficient with increasing nozzle pressure ratio is shown to be a function of the difference between the measured base pressure coefficient and a reference base pressure coefficient. The boattail shapes are classified into two groups, one of which experiences a much stronger influence of the propulsive jet than does the other. Correlations of measured base pressure coefficient in the presence of a propulsive jet are also presented for convergent-jet conical nozzles. Author

A FLIGHT INVESTIGATION OF STEADY STATE AND DYNAMIC PRESSURE PHENOMENA IN THE AIR INLETS OF SUPERSONIC AIRCRAFT
Frank W. Burcham, Jr., and Donald R. Bellman. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 12 p, refs (See N72 16685 07-28)
(NASA TM X-67495) Avail: NTIS CSCL 20D

The difficulty of achieving adequate inlet performance and stability (and avoiding engine compressor stalls at supersonic speeds has led to the investigation of pressure phenomena in the inlets of several supersonic aircraft. Results of tests with the F-111A airplane are presented showing the inlet steady state and dynamic performance. The inlet total pressure distortion that causes compressor stall is discussed, and the requirement for high response instrumentation is demonstrated. A duct resonance encountered at Mach numbers near 2.0 is analyzed and shown to be due to a normal shock oscillation at the duct fundamental frequency. Another type of resonance in the engine fan duct is shown to be a possible cause of reduced engine stall margin in afterburning operation. Plans for a comprehensive inlet study of the YF-12 airplane are discussed including flight tests and full scale, 1/3 scale, and 1/12 scale wind tunnel tests. Author

INLET-ENGINE COMPATIBILITY ANALYSIS
S. H. Ellis. *In* AGARD, Inlets and Nozzles for Aerospace Eng., Dec. 1971, 10 p, refs (See N72 16685 07-28)
Avail: NTIS HC $6.00; MF $0.95

The destabilizing factors considered in compatibility analysis are reviewed, instrumentation and test techniques are discussed, and examples of compatibility data are given for a propulsion system consisting of a supersonic inlet and a turbofan engine. The primary destabilizing factor, inlet distortion, is measured with high response instrumentation capable of describing complex time-variant distortion patterns. The maximum time variant distortions determined from model inlet tests are simulated during component and engine testing to define both loss in stall margin with distortion and the attenuation of distortion as it passes through the engine. The losses in stall margin due to engine causes such as throttle transients, control tolerances, and component interactions are analyzed by dynamic simulations to identify potential system problems prior to system testing. Attention is focused on potential problems by compatibility audits that show the allocation of stall margin between destabilizing influences and identify areas where component improvement is needed. Avail NTIS HC $6 00/MF $0 95

At high supersonic speeds the efficiency of the inlet strongly depends on the diminution of the Mach number before the normal shock Theoretical investigations show that this deceleration can be increased by replacing the internal compression in the bladeless channel by a supersonic rotor Due to the deceleration of the relative flow and the increase of the circumferential velocity from rotor inlet to outlet, a significant augmentation of the static pressure ratio is achieved Moreover, the Mach number can be decreased by the transfer of mechanical energy to the rotor After the transition to subsonic velocities in the stator, the energy was returned to the flow either by a conventional compressor, or by a second supersonic rotor accelerating the flow between the combustion chamber and the nozzle Static pressures and temperatures in this turbojet engine, which operates with subsonic combustion, are comparable to those of the supersonic combustion ramjet Author

ON THE TWO DIMENSIONAL BOUNDARY LAYERS AS THEY APPEAR ON TURBOMACHINE BLADES

K. D. Papailiou, A. Satta (Cagliari Univ.), and F. Nurzia (Genova Univ.) *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 1-27 refs (For availability see N73-19794 10-28)

Universal curves were developed which relate general properties of optimized boundary layers suitable for the critical side of a blade, to overall design variables The problem of maximum deceleration was considered and universal curves were developed which establish the deceleration which can be realized giving a length and the initial conditions for the boundary layer These universal curves were established for incompressible flow Using Le Foll's method with the introduction of a typical Mach number as an additional parameter, it should be possible to extend the universal design curves to compressible flow The effects of curvature on turbulence are discussed and it is shown that Bradshaw's model could be used not only for differential but also for integral methods Author

PRACTICAL CALCULATIONS OF TRANSITIONAL BOUNDARY LAYERS

H McDonald and R W Fish *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 29-53 refs (For availability see N73-19794 10-28)

A general finite-difference procedure for computing the behavior of compressible two-dimensional boundary layers is presented together with a turbulence model which allows quantitative predictions of the location and extent of the transition region between laminar and turbulent flow as it is influenced by such disturbances as surface roughness and free-stream turbulence Reverse transition, i.e., relaminarization, caused by large favorable streamwise accelerations, is also quantitatively predicted by this procedure The solution procedure depends upon the calculation of the streamwise development of a turbulent mixing length whose magnitude is governed by the turbulence kinetic energy equation A large number of comparisons between predictions and measurements were made and in general very good agreement was obtained Author

PREDICTIONS OF BOUNDARY LAYER TRANSITION ON TURBOMACHINERY BLADES

J Dunham *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 55-71 refs (For availability see N73-19794 10-28)

Transition may occur either in the form of natural transition or as a laminar separation bubble ending in reattachment as a turbulent boundary layer Existing theories of both types are applied to predicting the available transition observations on turbomachinery blading Owing to the high free stream turbulence level in a turbomachine, many blades must exhibit natural transition, but too few experimental measurements are available to test the predictions adequately More experiments were conducted involving bubble transition, and after modifying the theory to allow for free stream turbulence predictions agree fairly well with measurements of the position and length of transition bubbles Author

THE EFFECT OF FREE STREAM TURBULENCE LEVEL ON TURBULENT BOUNDARY LAYER BEHAVIOUR

G David Hurfman, D R Zimmerman, and W A Bennett *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 89-115 refs (For availability see N73-19794 10-28)

The results of an experiment to determine the effect of free-stream turbulence level on the classic boundary layer properties indicate the following (1) The boundary layer thickness increases with increasing turbulence level This was considered as being due to the increased entrainment brought about by the highly excited state of the boundary between the shear layer and the free-stream (2) The mean velocity remains largely unchanged in the inner region, however, there is a marked reduction in the wake component as the free-stream turbulence level increases (3) The skin friction increases with increases in the turbulence level (4) The shape factor decreases slightly with increased turbulence level due to the reduced wake component D L G

ANALYTICAL APPROACH FOR THE LOSS AND DEFLECTION BEHAVIOUR OF CASCADES IN TRANSONIC FLOW INCLUDING AXIAL MASS FLOW VARIATION

Leonhard Fottner *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 113-139 refs (For availability see N73-19794 10-28)

The method described contains a calculation of the viscous transonic flow past cascades of slender, slightly cambered profiles, and includes the local supersonic field, the terminal compression shock and a variation of the axial mass flow density across the cascade The influence of a change in axial velocity across the cascade is considered by introducing additional strips of sources and sinks into the singularity method Thus, there are induced velocities on the profile surface which have to be added to the surface velocities of the plane case The local supersonic field which builds up downstream of the sonic point is treated by an empirically corrected supersonic expansion The location strength of the compression shock terminating the supersonic field downstream is obtained by an empirically corrected normal shock relation The viscous effect is determined by means of a boundary layer calculation along the profile contour The problem of interaction between the boundary layer and the normal shock, which is particularly important in the consideration of viscous effects, is closely investigated with the aid of the available test data The entire flow loss is determined from the shock losses and the profile losses The latter are obtained from the boundary layer values at the trailing edge with consideration of possible small separation areas and the mixing losses produced in the wake Author

INCOMPRESSIBLE FLOW THROUGH CASCADES WITH SEPARATION
W Geller *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 171-186 refs (For availability see N73-19794 10-28)

A singularity method is given for calculating the flow in a cascade with constant blade-surface pressure distribution in the complete region between separation points on the upper and lower surfaces. The contours of blades are replaced by vortex sheets. Source distributions on the contours in the region of separation are used for simulating displacement effects of the separated wake. The position of separation points must be estimated before starting the calculation. Their actual position is found by boundary-layer computation. As shown by comparison of theoretical and experimental results, calculated pressure distributions and flow deflection angles generally agree well with measured data, while the corresponding drag coefficients agree satisfactorily. THE EFFECT OF AXIAL VELOCITY RATIO ON THE AERODYNAMIC COEFFICIENTS OF A COMPRESSOR CASCADE IN VISCOUS FLOW
U Stark *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 205-220 refs (For availability see N73-19794 10-28)

Both theoretical and experimental investigations of the effect of axial velocity ratio on the aerodynamic coefficients of two compressor cascades with NACA 65-(10)06 profiles are described. For the potential flow calculations the Pollard-Horlock method was selected. Boundary-layer calculations were performed based on the potential flow velocity distributions. The aerodynamic coefficients were calculated from the boundary-layer parameters at the blade trailing edge. The experimental investigations were carried out in a low-speed cascade tunnel. Both the theoretical and experimental results show a considerable effect of the axial velocity ratio on the aerodynamic performance of compressor cascades. The agreement between theory and experiment is quite satisfactory in as far as no severe flow separation occurs. Author

THE INFLUENCE OF AXIAL VELOCITY DENSITY RATIO ON COMPRESSOR CASCADE PERFORMANCE IN COMPRESSIBLE FLOW
W Heilmann *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 221-240 refs (For availability see N73-19794 10-28)

Results of theoretical and experimental investigations on the influence of the ratio between the axial velocity density upstream and that downstream on the performance of plane compressor cascades in compressible flow are presented. Tests were performed in a 7-inch transonic wind tunnel where upstream turbulence levels were varied. It could be demonstrated that the change in cascade performance with the axial velocity density ratio substantially depends upon the blade boundary layer behaviour. At fully turbulent boundary layers the axial velocity density ratio influences only the separation point positions. At laminar-turbulent boundary layers in addition the transition point position from which the separation point positions depend will be influenced. Boundary layer calculations conducted in the theoretical part of the investigation have qualitatively confirmed the experimentally achieved results as far as the influence of the axial velocity density ratio on the transition and separation point position is concerned. Total pressure loss at various axial velocity density ratios was calculated by applying an approximative method of determining the characteristic boundary layer values in separated flow and then comparing with the test results. THE ROLE OF BOUNDARY LAYERS IN AXIAL FLOW TURBOMACHINES AND THE PREDICTION OF THEIR EFFECTS
N J Seyb *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 241-259 refs (For availability see N73-19794 10-28)

The prediction of boundary layer conditions within a turbomachine is reviewed from the engine designer's viewpoint. A brief outline of the problems and compromises forced on the aerodynamicist is given followed by a discussion of the boundary layer prediction methods currently in use. Because of the extremely complicated flow patterns present in a turbomachine only the simplest cases (i.e. flow in two-dimensional cascades) have responded adequately to theoretical treatment. Simple and practical methods are described for the prediction of the boundary layer parameters, transitional and laminar separation points, bubble sizes and heat transfer coefficients, etc for any cascade, incidence, Reynolds number, turbulence level, etc. Comparisons between experiment and prediction are given and it is shown that there is good agreement. A CALCULATION METHOD FOR THE EXTERNAL HEAT TRANSFER TO TURBINE BLADES
D K Hennecke *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 261-273 refs (For availability see N73-19794 10-28)

A complex calculation method was devised to predict the local temperature distribution in a cooled turbine blade. The report is devoted exclusively to one of the key elements of the procedure which is an integral type boundary layer analysis to predict the distribution of the external heat transfer coefficient. The analysis has been adapted to the special requirements of turbine blade cooling research. Thus it accounts for the combined effects of compressibility, laminar as well as turbulent flow regions, favorable and adverse pressure gradients, smooth and or rough blade surfaces, lateral convergence or divergence, and temperature dependent fluid properties. Furthermore, in the evaluation of the heat transfer coefficient a pressure gradient in flow direction and a longitudinal temperature gradient within the wall are considered. The method also allows injection into the boundary layer either local (film cooling) or continuous (effusion cooling). Results are presented graphically for a cooled turbine blade with

a certain profile and specified flow conditions. For this example, the various features, listed above, were studied individually and the magnitude of their effects on the heat transfer coefficient is demonstrated. Author

METHOD OF CALCULATING THREE DIMENSIONAL TURBULENT BOUNDARY LAYER SEPARATION WITH APPLICATION TO A SIMPLE TURBOMACHINE CASE [METHODE DE CALCUL DE LA COUCHE LIMITE TURBOULENTE TRIDIMENSIONNELLE JUSQU'A LA SEPARATION APPLICATION A UN CAS SIMPLE DE TURBOMACHINE]
R. Michel *In* AGARD Boundary Layer Effects in Turbomachines Dec. 1972 p 277-292 refs In FRENCH; ENGLISH summary (For availability see N73-19794 10-28)

The proposed method is based on the determination of similarity solutions for three-dimensional turbulent boundary layers; solutions established from an improved mixing length model. The characteristics of the families of streamwise and crosswise velocity profiles obtained in this way are then used in a method for solving boundary layer global equations. Applied and tested previously for aeronautics problems, the technique is extended to treat turbomachinery problems, taking into account, among other things, the effects of rotation walls. The case of the swirling flow in the diffuser of a centrifuge compressor is examined, and the position of separation, i.e. the circle on which the wall streamlines accumulate, is determined as a function of the inlet angle. It is also found that a rotation at the diffuser walls entails a much slower thickening of the boundary layers, and a noticeable recession of separation. Author

MEASURED AND CALCULATED TURBULENT BOUNDARY LAYER FLOW IN A VANELESS RADIAL DIFFUSER
C. B. V. D. Voorde and J. Bos *In* AGARD Boundary Layer Effects in Turbomachines Dec. 1972 p 293-310 refs (For availability see N73-19794 10-28)

A method is presented for predicting two-dimensional flow through a radial diffuser with flat parallel walls. The method is based on the integral entrainment method and is valid until the flow is fully developed. Equations are given for prediction of the velocity distribution across the diffuser width at any arbitrary station, prediction of the radial distribution of the static pressure recovery, and calculation of the diffuser efficiency from the predicted and measured flow. An experiment conducted for validation of the prediction method is described. During the experiment very accurate measurements were made of the velocity distribution across the constant diffuser width at various stations along a diffuser radius. The experimental values concurred well with predicted values. D. G.

APPLICATION OF BOUNDARY LAYER FENCES IN TURBOMACHINERY
H. Pruemper *In* AGARD Boundary Layer Effects in Turbomachines Dec. 1972 p 311-331 (For availability see N73-19794 10-28)

The major secondary flows occurring in turbine stages are presented and their causes and their effect on the total flow are discussed. Through visualization of the flow lines near the wall and accurate measurement of the three-dimensional loss distribution of cascades with short and longer blades, detailed information may be obtained on the mechanism of the secondary flows and the secondary losses thereby produced. In the course of experimental tests aimed at possibilities of suppressing secondary flows and secondary losses incidental thereto, the method of using boundary layer fences on the profile suction sides of the blades proved to be particularly effective and economical. Finally, the experimental results obtained from the application of this method in a turbine stage are presented. Author

SECONDARY FLOW RESEARCH AT THE VON KARMAN INSTITUTE
J. W. Selvage *In* AGARD Boundary Layer Effects in Turbomachines Dec. 1972 p 333-361 refs (For availability see N73-19794 10-28)

Experimental work in cascade secondary flows accomplished in the past ten years is reviewed with the objective of pointing out difficulties common to the field. Investigations included tip clearance effects, low aspect ratio effects, and the beginnings of basic research on the influence of blade loading and inlet boundary layer characteristics on common compressor blade profiles. The objectives of current investigations is to select critical configurations for in-depth study of the end-wall boundary layer development through the cascade with a view toward refining the experiment for use in the truly three-dimensional environment of a stator row. An initial experiment on end-wall flows is outlined and typical data shown. An improved technique is discussed, including test apparatus and probes to be used. Other topics discussed include an interesting method of reducing secondary flow losses (partial blade slotting) and the critical analysis of a simple, but geometrically limited, theory predicting secondary flow losses at high blade loading conditions. ANNULUS WALL BOUNDARY LAYERS IN AXIAL FLOW TURBOMACHINES
W. Bitterlich and K. Rubner *In* AGARD Boundary Layer Effects in Turbomachines Dec. 1972 p 393-413 refs (For availability see N73-19794 10-28)

The influence of annulus wall boundary layers, which differ considerably from ordinary boundary layers, is shown as it affects the entire flow in turbomachines. Starting from the measured velocity distributions, the radial balance in the axial gaps and in the cascade channel of the rotor and stator is established by means of the conservation equations for mass, momentum and energy. The special effects of the transitions between stationary and moving cascades within the region of the annulus wall boundary layers are illustrated. The velocity distributions measured in the boundary layer region are thus explained. In contrast to what had been generally assumed, strong gradients of total enthalpy occur within the boundary layer. For the blade momentum, boundary values at the annulus walls and at the mean radius can be indicated, so that a qualitative distribution of blade momentum may be established. The theoretical statements and results have been confirmed by experimental investigations on a single-stage axial-flow compressor having a

very small hub-tip ratio. Theory and experiment show clearly that the influence of wall friction is not confined to the boundary layer region but, even with a small hub-tip ratio, affects the entire flow channel. Author

RESULTS OF INTERACTION OF SHOCK WAVE WITH TURBULENT BOUNDARY LAYERS AT MODERATE MACH SUPERSONIC NUMBERS [RESULTATS SUR L'INTERACTION CHOC-COUCHE LIMITE TURBULENTE A DES NOMBRES DE MACH MODEREMENT SUPERSONIQUES]

J. Delery and J. C. LeBalleur *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 419-440 refs In FRENCH, ENGLISH summary (For availability see N73-19794 10-28)

Reflection of an oblique shock wave on a turbulent boundary layer was studied experimentally on a two-dimensional plane set-up at two Mach numbers, 1.62 and 1.92. In both cases the upstream flow was uniform and the Reynolds number was around 100,000. The variable parameter was the shock intensity. Particular attention was paid to the set-up design for minimizing the perturbation effects and also for obtaining a good measuring precision, especially for boundary layer probings. Author

N73-19816 Von Karman Inst. fo. Fluid Dynamics, Rhode-Saint-Genese (Belgium)

SHOCK WAVE BOUNDARY LAYER INTERACTION IN CASCADES

H. Griepentrog *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 441-456 refs (For availability see N73-19794 10-28)

Experimental data obtained with compressor cascades were analyzed to determine the main parameters that affect the shock boundary layer interaction region. These parameters were found to include (1) the displacement thickness of the boundary layer upstream of the shock, (2) the shock intensity, and (3) the pressure gradient downstream of the shock. Taking these parameters into account, a simple model of the interaction was designed. The model only considers the external effects, such as pressure distribution on the blade surface. The model presented is considered only a tentative one and further research is indicated to understand the interaction of a quasi-normal shock with a turbulent boundary layer in compressor cascades. BEHAVIOR OF BOUNDARY LAYER IN SUPERSONIC STRAIGHT AND ANNULAR BLADE CASCADES, FIXED AND MOBILE [COMPORTEMENT DE LA COUCHE LIMITE SUR GRILLE D'AUBES SUPERSONIQUES PLANES ET ANNULAIRES]

Jean Fabri and Roland Sovrano *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 457-468 refs In FRENCH, ENGLISH summary (For availability see N73-19794 10-28)

Fundamental research on supersonic axial flow compressors requires an accurate knowledge of section performances. Straight and annular supersonic blade cascades were used for the investigation, the latter one being either fixed or rotating. The effect of boundary layer development in these blade cascades is described. Schlieren pictures of the flow field and shock configuration as well as pressure distributions on the blades (straight and fixed annular cascades) or on the casing (fixed and rotating annular cascades) were taken. The conclusion from the analysis is that at low backpressure, i.e. started supersonic flow in the cascades, flow configuration and pressure distributions are very similar on all three experimental set-ups. However, at high back pressure, with strong shock waves induced in the blade channel, shock wave-boundary layer interaction is quite different in static and rotating cascades. It seems however that owing to the effect of centrifugal forces induced by flow rotation in the annular cascade, the difference between flow patterns in this type of experimental set-up and on rotors is not very great. HIGH SPEED SCHLIEREN FILM OF THE PULSATING FLOW IN A TRANSONIC TURBINE CASCADE

O. Lawaczeck *In* AGARD Boundary Layer Effects in Turbomachines Dec 1972 p 469-473 refs (For availability see N73-19794 10-28)

A high speed schlieren film is discussed that was taken in a cascade wind tunnel on a supercritical flow through a special type of a turbine cascade. The flow pattern near the leading edges shows that the upstream flow is stationary although nonstationary effects were noted near the trailing edge. The question is posed as to whether the nonstationary effects are initiated by the disturbances originated by the free jet boundary of the cascade or by the interaction between the trailing edge shock and the wake of the blade. (AGARD-AG-167 AGARDograph-167) Avail. NTIS HC $4.75

The AGARD Propulsion and Energetics Panel conducted a survey on the methods used to test the rotating components of turbomachines. The objective was to assess the advantages and usefulness of the so called elementary tests compared with the tests conducted on complete turbomachines. Based on a detailed analysis of the answers received from the questionnaires and an exchange of views among the experts appointed by the Panel, general conclusions are presented on the value and use of cascade test data, testing and measuring equipment for cascade tests, testing techniques for supersonic compressor cascade, tests on compressor or turbine stage(s), and on a complete compressor or turbine. Reynolds number effects, cold testing of turbines, and compressor stability and distortion tests. Author

ROTATIONAL DYNAMICS
Martin A. Frik *In* AGARD Attitude Stabilization of Satellites in Orbit Sep 1971 14 p refs (See N72-12861 03-31)
Avail: NTIS

The fundamentals of the rotational dynamics of satellites are considered. Basic geometric and kinematic relations are reviewed and the Euler equations describing the rotational motion of rigid bodies are derived. The torque free motion of dynamically symmetrical as well as unsymmetrical satellites is investigated, including a stability analysis of permanent rotations about axes of principal moments of inertia. External torques, such as gravity-gradient, magnetic, aerodynamic, and solar radiation torques, which are caused by the interaction of an orbiting satellite with its environment, are discussed. Finally, for some types of nonrigid satellites the equations of motion are considered. Author

SPACECRAFT ATTITUDE SENSORS WITH EMPHASIS ON THE ORBITING ASTRONOMICAL OBSERVATORY
Thomas E. Huber *In* AGARD Attitude Stabilization of Satellites in Orbit Sep 1971 16 p refs (See N72-12861 03-31)
(NASA-TM-X-67384) Avail: NTIS CSCL 22B

The sensors that provide references for the OAO control system are coarse sun sensors, fine sun sensors, Adcole aspect sensors, rate and position sensors, inertial reference unit, boresight tracker, gimbal star trackers, fixed head tracker, and magnetometers. The coarse and fine sun sensors are analog type sensors and are part of the OAO control loop. The aspect sensors are digital type and are used with the magnetometers primarily for attitude determination. The inertial sensors are used to slew or reposition the vehicle and are also used to inertially hold the spacecraft. The gimbal trackers and boresight tracker are used for stellar control, holding the vehicle to an attitude accuracy of one arc minute. Author

PASSIVE AND SEMI-ACTIVE ATTITUDE STABILIZATIONS: DUAL SPIN SATELLITES
P. W. Likins and P. Y. Willems *In* AGARD Attitude Stabilization of Satellites in Orbit Sep 1971 11 p refs (See N72-12861 03-31)
Avail: NTIS

Dual-spin systems find space applications in missions for which the ability to point some instruments or a platform with a good spin stabilization is required. The equations of motion of a deformable system including internal moments are derived. The equilibrium configurations of such a system in free space and in an inverse square field are obtained. The attitude stability of a deformable gyrostat, a convenient idealization of a dual-spin satellite, is investigated. The effect of dissipation in both sections of the system is discussed and a rigorous method permitting the stability determination is set forth. Author

PASSIVE AND SEMI-ACTIVE ATTITUDE STABILIZATIONS: FLEXIBLE SPACECRAFT
Peter W. Likins *In* AGARD Attitude Stabilization of Satellites in Orbit Sep 1971 13 p refs (See N72-12861 03-31)
Avail: NTIS

The influence of spacecraft nonrigidity is identified as the pre-eminent current problem in attitude stabilization of passive and semi-active spacecraft. Attitude control anomalies in the flight histories of eight satellites are attributed to nonrigidity, manifested either as unexpected internal energy dissipation or unanticipated structural deformations. Recent progress in the development of methods for analysis of flexible spacecraft is surveyed, with attention to discrete coordinate methods, vehicle normal coordinate methods, and hybrid coordinate methods. New results are provided for each of these analytical procedures, and the utility of these results is discussed in the context of anticipated future spacecraft. Author

ACTIVE STABILIZATION
W. G. Hughes *In* AGARD Attitude Stabilization of Satellites in Orbit Sep 1971 17 p refs (See N72-12861 03-31)
Avail: NTIS

A survey is given of the principal devices available for the generation of control torque, covering mass expulsion systems (cold gas, hot gas, electric), momentum exchange system (reaction wheels, control moment gyros), and magnetic torquers. For reaction wheel systems, the complete linearized equations of motion in three axes, the effect of interaxis couplings are studied. Control in a single axis is considered in detail. Mass expulsion and magnetic techniques for momentum unloading are discussed. Control moment gyro systems are described. Pure jet systems are studied from the viewpoint of achieving high precision while preserving economy in the use of jet fuel. Difficulties arising from jet delay and sensor delay and noise are minimized by the use of a signal processing technique which incorporates a model of the spacecraft dynamics. Finally, the special properties of inertially referenced systems are considered, together with the gyrocompassing technique for use in earth-pointing spacecraft. Author

DEVELOPMENT RESULTS OF THE ESRO TD SATELLITE PNEUMATIC SYSTEM
Werner Inden *In* AGARD Attitude Stabilization of Satellites in Orbit Sep 1971 20 p refs (See N72-12861 03-31)
Avail: NTIS

The attitude control requirements and principles of the ESRO TD satellite are reviewed, and the propulsion system are explained. The TD propulsion system is an argon cold gas system with no redundant parts which is based on the life time of 1/2 to 1 year in orbit. The test results of development, qualification, and flight acceptance are illustrated as the influence of the dynamic response on thrust, the problem of leakage and contamination, the regulation as a function of mission time. The successful subsystem qualifications, especially vibration tests, are shown. Development techniques for nozzles, system filling and leakage checkout are described. The performance of the small nozzles (0.02 N) used on TD is shown. Author

GENERAL GUIDELINE FOR THE DESIGN OF MANNED AEROSPACE VEHICLES
Jean-Claude Wanner *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 8 p refs (For availability see N73-23881 14-31)

The Franco-British airworthiness authorities reviewed the set of technical specifications required for Concorde airliner to insure the safety of the missions of this new transport aircraft. In order to guide the definition of these new regulations, a theoretical method was developed for evaluating the feasibility of the missions of manned aerospace vehicles. The method is based on an investigation of the way of occurrence of accidents. It has been seen that an accident is due to a set of incidents which can be classified into only three different types. The study of each type of incident, the probability of occurrence which has to be reduced in order to increase the safety, is very useful to help the designer of a new project to choose between possible solutions, taking into account the reliability of the systems, the possible human errors and the flight conditions. THE INFLUENCE OF COST AND TECHNICAL RISK ON THE DESIGN OF THE AVIONICS SYSTEM FOR THE SPACE SHUTTLE
Howard T. Wright *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 9 p (For availability see N73-23881 14-31)

The evolution of the Space Shuttle Program from its inception to the release of the request for proposal in April of 1972, has been influenced primarily by cost considerations. Various configurations were studied, and cost pre-flights were traded against developmental cost. These studies indicated operational costs between 4.5 million and 15.8 million dollars per flight. The baseline configuration was based on the best competition between development and operational cost considerations. The configuration selected was a small orbiter vehicle with an external hydrogen and oxygen tank and two solid rocket engines. This configuration results in operational cost per flight of approximately 11 million dollars. Author

AUTOMATIC ACQUISITION AND TRACKING METHODS EMPLOYED IN THE JOINT SERVICES IN-FLIGHT DATA TRANSMISSION SYSTEM (JIFDATS)
T. N. Leiboff *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 21 p (For availability see N73-23881 14-31)

JIFDATS is an all-weather, day-night, multi-sensor in-flight data transmission system designed for use by all the military services. The normal operating mode for JIFDATS is automatic. Except for the usual checkout, servicing and maintenance activities in which personnel take a large part, the only need for personnel functions is to establish the proper conditions for system operation, turn on the system, and monitor the operation to

assure continuity of data transmission. In each case though, there is a manual back-up mode for bypassing the automatic features of acquisition and tracking. A scenario of a typical tactical reconnaissance mission is presented showing the various steps taken by the operator in the sensor aircraft, the operator in the relay aircraft, and personnel at the surface terminal during each phase of the mission. It is shown how the relay aircraft automatically acquires the sensor aircraft which is transmitting a low bandwidth signal on an omni-directional antenna, while it rotates its high-gain narrow beam directional antenna. The sensor aircraft locks on to the relay while the relay and ground terminals acquire and track. Author

DETERMINATION OF AN OPTIMAL TRAJECTORY IN THE PRESENCE OF RISK
A. Tiano, P. Dagnino, and M. Piattelli. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 19 p. refs. (For availability see N73-23881 14-31)

A controlled dynamic system is considered that displaces within an assigned space, where r moving targets are contained. An optimal control sequence transfers the system from an initial point to a preset terminal point so that the optimal trajectory is the one which, complying with some safety constraints imposed by the targets, minimizes a given cost function. Assuming that the system may be supplied with periodical information about the motion of the targets, a numerical algorithm utilizing a dynamic programming procedure is determined. This procedure is applied to two practical problems: (1) Marine anticollision aided by computerized radar systems in the presence of N targets, and (2) determination of an optimal evasion strategy in the presence of cyclonic disturbances. SPACE STATION INFORMATION SYSTEM REQUIREMENTS: A CASE HISTORY OF MAN-MACHINE SYSTEM DEFINITION
C. R. Gerber. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 8 p. (For availability see N73-23881 14-31)

The NASA space station definition studies incorporate a multiplicity of automated supporting functions to enhance the useful work capability of very few men. The SS information system is the means by which the men interface with all subsystems, space experiments, other vehicles, ground support facilities and personnel. It is therefore a driver in determining what program and mission objectives can be satisfied. The study resulted in the definition of an information subsystem consisting of a unique combination of multi-processing computation, internal data distribution via a digital data bus, crew interfacing via a set of multi-purpose display and control consoles, and external data distribution via a combination of VHF, S, and K band RF links. AUTOMATED TECHNIQUES FOR SPACECRAFT MONITORING
H. Richard Segnar. *In* AGARD Automation in Manned Aerospace Systems. Feb. 1972. 12 p. refs. Sponsored by NASA (For availability see N73-23881 14-31)
CSCL 22B

The feasibility of implementing automated spacecraft monitoring depends on four factors: sufficient computer resources, suitable monitoring function definitions, adequate spacecraft data, and effective and economical test systems. The advantages of automated monitoring lie in the decision-making speed of the computer and the continuous monitoring coverage provided by an automated monitoring program. Use of these advantages introduces a new concept of spacecraft monitoring in which system specialists, ground based or onboard, freed from routine and tedious monitoring, could devote their expertise to unprogrammed or contingency situations. MULTILOOP ATTITUDE CONTROL SYSTEM FOR A SATELLITE WITH FLEXIBLE BOOMS
R. DiLorenzo and E. DeBernardis. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 13 p. refs. (For availability see N73-23881 14-31)

A class of momentum exchange devices control configurations has been considered, namely that which provide a momentum quite larger along one body axes rather than along the other ones. The general equations of a satellite controlled in such a way have been used in order to provide a control system which is independent from the particular devices used; these equations have been modified in order to take into account that the satellite has a couple of flexible booms. A simple multiloop controller has been designed for such equations, and it is shown that to adapt it to each particular actuators configuration it is only necessary to design three very conventional inner control loops. Finally, a simulation of the full flexible systems has been made using FORTRAN 5, with reasonable numerical values of the satellite dynamics parameters, where it is shown that a controller designed considering rigid the whole satellite results either in instability or very degraded pointing accuracy. CSCL 09B

A deterministic simulator is described which models the Automatically Reconfigurable Modular Multiprocessor System (ARMMS), a candidate computer system for future manned and unmanned space missions. Its use as a tool to study and determine the minimum computer system configuration necessary to satisfy the on-board computational requirements of a typical mission is presented. The paper describes how the computer system configuration is determined in order to satisfy the data processing demand of the various shuttle booster subsytems. The configuration which is developed as a result of studies with the simulator is optimal with respect to the efficient use of computer system resources. Author

EXTENSION OF SIMULA 67 FOR PROCESS CONTROL
Juliusz H. Kardasz. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 13 p. refs. (For availability see N73-23881 14-31)
Copyright

An extension of SIMULA 67 towards process control is reported. The extension is prepared with an idea of using it to control large systems of interconnected devices where the necessity for real time simulation arises, in order to define a future behaviour of the system. This extension combines both characteristics of procedural and fill-in-the-blank (format oriented) languages. The programming requirements for process control

applications are discussed and a comparison is made between some algorithmic languages with respect to the degrees in which they meet these requirements. This discussion shows that SIMULA 67 requires the introduction of less new concepts than other languages in order to be extended for process control. These new concepts include first of all the interface with a process which is introduced by an external class to be implementation defined. A procedural language is used for constructing the body of the system, composed of procedures and classes.

SYSTEMS PERFORMANCE MONITORING FOR ADVANCED MANNED SPACECRAFT

T. V. Chambers. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 16 p. refs. (For availability see N73-23881 14-31)

CSCL 22B

Optimum system mechanizations for advanced manned spacecraft are considered. Several studies have proposed automation of the onboard system management task, with functions such as system status monitoring, configuration management, and redundancy management being accomplished under computer control. An experimental system was used in the laboratory to investigate hardware and software requirements for accomplishing these onboard system management functions. A performance monitor system is proposed for the space shuttle. This system provides support to the flight crew in the management of all onboard systems but does not perform critical switching functions during the flight phase.

A GENERAL PURPOSE COMPUTER FOR SPACEBORNE APPLICATIONS

S. Bcasso and R. Camberale. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 18 p. (For availability see N73-23881 14-31)

A modular expandable computer system is studied for a wide range of possible space missions. The main goals in designing the computer have been maximum flexibility and reliability, minimum weight and power consumption and growth capability to fit future mission requirements. The study resulted in a stored program, 16 bit, parallel machine, with microprogrammed control which allows full arithmetic and logic capability. Input-output includes program-controlled and direct-memory-access channels. The main points of trade-off for system design are presented and a description of the basic computer units at the functional block level is given.

THE EXPERIMENTAL EVALUATION OF AUTOMATED NAVIGATION SYSTEMS

J. G. Carr. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 13 p. (For availability see N73-23881 14-31)

Certain aspects of automated avionics systems which are being examined in the RAE Comet exercise are described. The emphasis is on navigation systems and includes the work on digital computers and on-board digital communication techniques, software developments including the use of high level programming languages, and the use of computer controlled electronic displays. The laboratory work using simulated navigation sensor inputs into an experimental system comprising a digital computer and electronic displays is described. A Comet 4 aircraft has been re-equipped as a flying laboratory for this work. The installation in the cabin of the aircraft and some of the current experimental investigations are described. The cockpit of the Comet has also been modified by the addition of experimental electronic displays to the second pilot's instrument panel.

CURRENT STATUS OF MODELS FOR THE HUMAN OPERATOR AS A CONTROLLER AND DECISION MAKER IN MANNED AEROSPACE SYSTEMS

A. V. Phatak and D. L. Kleinman. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 10 p. refs. (For availability see N73-23881 14-31)

Mathematical models of human decision processes and adaptive behavior have been proposed for specific control situations. Accepted techniques and models for analyzing and predicting human performance in complex multi-control and multi-display situations commonly found in aerospace systems are surveyed. The models have been developed or proposed for the related human functions of information processing, decision making and control. The relative advantages, disadvantages and limitations of each of the modeling schemes are discussed and prospects for mechanizing all or part of the decision functions performed by human operators are considered, specific examples being in the automation of human failure detection and adaptation to sudden changes in the system operating conditions.

MANUAL LANDING IN FOG

R. R. Newbery. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 19 p. refs. (For availability see N73-23881 14-31)

The results of 18 fog flying sorties using a Category II operation terminated by a manual landing have been analyzed in an attempt to learn more about the pilot's capabilities in this environment. Measurements were made to correlate the pilot's decision making process with actual fog structures in real operation. A wide variety of fog structure and visual sequences are illustrated which demonstrate the lack of relationship between the visual segment at high decision heights, the height at which visual contact is first made and the runway visual range measurement. The pilots felt that Category II operation was straightforward provided that good quality approach performance, strict crew drills a accurate RVR reporting to give warning of shallow or changing fog conditions along the runway, were maintained.

MONTE CARLO SIMULATION OF DEGRADED MAN-MACHINE PERFORMANCE

Gerald P. Chubb. *In* AGARD Automation in Manned Aerospace Systems. Mar. 1973. 11 p. refs. (For availability see N73-23881 14-31)

System vulnerability is a function of both human and hardware vulnerabilities to anticipated threat environments. The feasibility of considering the interaction of man and machine degradation under nuclear attack conditions has recently been demonstrated. It appears that the technique may be useful in identifying certain situations where automation may be particularly useful under these attack conditions, although the requirement is not obvious from analyses of system performance under nominal operating conditions. The approach taken appears generalizable to other degradation conditions, such as inflight malfunctions and conventional weapons battle damage. Given suggested changes in man-machine task sequencing, the model can aid in assessing how these changes may affect selected systems effectiveness measures. A number of refinements and extensions to the current capabilities of this model are envisioned and briefly discussed.

HUMAN FACTORS IN LOW WEATHER OPERATION OF TRANSPORT AIRCRAFT
J. W. Wilson *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 5 p (For availability see N73-23881 14-31)

Practical experience gained during the manufacturer's flight development testing and airline in-service operation of a failure-survival Category 3 automatic landing system is reviewed for indications of the extent to which human factors have affected the design of the system and the techniques used by the airline in order to reach the very high safety levels that are necessary. The important factors influencing the complexity of the task are: (1) Provision of adequate monitoring devices located in the optimum area of each crew member's primary visual scan, to enable the pilot to keep ahead of the operation of the automatic control systems, (2) application of identical procedures for use in Category 1, 2 or 3 weather, (3) design of the system and development of procedures such that the maximum number of manual and automatic functions that require action, checking or monitoring can be completed before the final stage of the approach to land, and (4) the decision to land should be made as low as possible, compatible with a go-around performance which will not normally result in touchdown. AVIONIC SYSTEMS INTEGRATION USING DIGITAL COMPUTERS
Erwin C. Gangl *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 5 p (For availability see N73-23881 14-31)

Present weapon systems use a multiplicity of signal formats and transmission techniques for information transfer within an integrated avionics system. The implementation of a serial digital data bus as the primary means of functionally communicating and interconnecting the various equipments is described. If a system is logically partitioned to the data it supplies, requires or processes, then with a flexibly designed digital data bus and standard interfaces, it can easily be integrated through the computer software. Modification or redesign of the multiplexed data bus concept is a matter of reconfiguration of the building blocks, adding and deleting as required and then changing the software to reintegrate the new configuration, saving the costly rewiring and redesigning of the computer converter box. The computer is now a separate line replaceable unit, not subject to obsolescence due to systems modifications. Author

THE EXPONENTIAL PROBABILITY DISTRIBUTION AND ITS USE IN ASSESSING THE PERFORMANCE STATISTICS OF AEROSPACE SYSTEMS
D. A. Lloyd *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 31 p refs (For availability see N73-23881 14-31)

The statistics of the output state variables of automatic aerospace systems are of considerable interest and of wide application, particularly in the case of manned systems. The paper shows that the exponential probability distribution can be used as an approximation to the distributions of the output state variables of practical aerospace systems for a wide range of practical situations. The use of the exponential distribution as a practical mathematical tool is suggested in the assessment of some of the performance statistics of aerospace systems both for preliminary calculations and for final calculations involving the extrapolation of test results. POTENTIAL TELEOPERATOR APPLICATIONS IN MANNED AEROSPACE SYSTEMS
Edwin G. Johnsen *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 5 p refs (For availability see N73-23881 14-31)

CSCL 05H

The trend of teleoperator development is toward digital computer controlled systems which utilize local sensor-computer-actuator loops to avoid obstacles and to sense manipulator grip-and-slip. The potential applications of advanced teleoperator technology to manned aerospace systems include long manipulator booms to be mounted on the shuttle. These can transfer cargo from the space shuttle and can acquire and retrieve objects in space. Free-flying teleoperators capable of acquiring, inspecting, repairing or refurbishing satellites in orbit are another space application. Another potential application of teleoperator technology is the concept of using an anthropomorphous teleoperator in lieu of man to control aircraft or spacecraft normally controlled by a human pilot. MAN-MACHINE CONSIDERATIONS IN THE DEVELOPMENT OF A COCKPIT FOR AN ADVANCED TACTICAL FIGHTER
S. Joel Premselaar and D. E. Frearson (AFFDL) *In* AGARD Automation in Manned Aerospace Systems Mar. 1973 20 p (For availability see N73-23881 14-31)

A revolutionary cockpit concept for a 1975-85 one-man, multi-mission fighter aircraft completed an initial simulation phase recently. The design goal of this concept is to achieve a one-man workload level by presenting the pilot only the information necessary for the particular mission segment he is performing, and yet provide maximum flexibility in terms of pilot options. Key elements of the cockpit design are: Multiple, time-shared electronic displays, keyboard and voice command computer input devices, wrap-around cockpit arrangement for ease of access to the control-display devices, an integrated total energy command, and a system of dependent automation that permits reduced pilot workload during anomalies. The simulator provides a one-of-a-kind capability for examination of the flight deck design issues involved in tailoring the power and flexibility of the computer to the capabilities and limitations of the human pilot in the performance of his mission. The reduction of nonlinear programming problems to a sequence of linear programming problems is discussed Important properties of linear programming problems and methods of their solution are described The nonlinear programming problems considered first are those in which all constraints are expressed as inequalities and in which only two variables are involved Methods of reducing the nonlinear problems are outlined The simplest approach linearizes the constraints and merit function in the neighborhood of an arbitrary point The cutting plane method

employs the property that linearized constraints in convex problems necessarily lie entirely outside the feasible region. The move limit method makes use of artificial limits on the variation of the design variables in a typical linearized computation. In all of these methods, the coefficients of the design variables in the objective function of the primal problem are nearly always all positive. N E N

UNCONSTRAINED MINIMIZATION APPROACHES TO CONSTRAINED PROBLEMS
R. L. Fox. *In its* Structural Design Appl. of Mathematical Programming Tech., Feb. 1971, p. 55-78, refs (See N71-20128 09-32)
Avail: NTIS

Several unconstrained minimization methods are discussed and their advantages and disadvantages are presented. The basic idea of these methods is to convert the constrained problem, with its objective function and equality and inequality constraints, into a problem in which some new function is minimized without regard for constraints. The solution to the original problem is developed through a sequence of unconstrained minimizations. The reliability of the algorithms, their sequential nature, and the straightforward formulation and implementation of these methods are described. Formulations employing interior penalty functions are discussed in order to apply the unconstrained minimization methods to the solution of the constrained problem. Formulations employing exterior penalty functions, and penalty functions for equality constraints are also mentioned. N E N

FEASIBLE DIRECTION METHODS
J. S. Kowalik. *In its* Structural Design Appl. of Mathematical Programming Tech., Feb. 1971, p. 79-93, refs (See N71-20128 09-32)
Avail: NTIS

Algorithms for solving a general nonlinear programming problem, and which have proved to be successful and applicable to structural optimization problems are discussed. The advantages and disadvantages of the methods are compared from theoretical and computational viewpoints. Zoutendijk's usable feasible directions method efficiently reduces the problem to a sequence of linear programming problems, is finite for quadratic programming problems, and can handle nonconvex problems. A modified feasible directions method utilizes some ideas of the cutting plane method. Rosen's gradient projection method uses projections of the objective function gradient into the manifold defined by currently active constraints. The method works with vectors which are feasible and usable and replaces linear optimization subproblems with matrix inversion schemes. Gellatly's optimum vector method determines the direction of search from a set of simultaneous linear equations which can be solved by the stable Choleski decomposition method. N E N

Computer programs developed for the optimum design of idealized aerospace structures of arbitrary geometry, including optimization algorithms and segments for finite element analysis, are described. These programs are concerned mainly with the choice of member cross sectional areas and thicknesses, but some include facilities which permit the lengths and spacings of members to be varied within a prescribed topology. Rigorous optimization procedures are emphasized. Computer programs developed to apply mathematical programming techniques to the least weight design of complex stress skin structures and major subsequent contribution are discussed. Application of iterative procedures for the generation of fully stressed designs is also described. Author

Avail: NTIS

The relationship between optimum design of structure as it is now formulated in almost classical terms and reliability or safety of structures is studied. The kinds of structures for which reliability or failure probability can reasonably be analyzed and have been presented particularly in a redesign or optimization procedure are discussed. As the topic concerns safety in a probabilistic framework, some attention is given to relevant questions of probability, sensitivity, failure costs, limited empirical information, analysis errors, and safety philosophy. Several examples of optimization with reliability or failure probability constraints are presented. Author

OPTIMIZATION UNDER AEROELASTIC CONSTRAINTS
H. Ashley, S. C. McIntosh, Jr., and W. H. Weatherhill. *In its* Structural Design Appl. of Mathematical Programming Tech., Feb. 1971, p. 144-173, refs. Sponsored by NASA and the AF (See N71-20128 09-32)
(NASA CR-117198) Avail: NTIS CSCL 20K

Two major lines of development in the optimization of aeroelastic constraints for high performance aircraft design are discussed. The optimization of problems with one dimensional space variable can be identified as a variational problem and reduced to systems of first order ordinary differential equations. Discretization by assumed-mode and finite element methods are also described, and the control variables are replaced with a finite vector of n adjustable element properties. Minimization of the chosen merit function amounts to a search of n-vectorspace. Mathematical discussions of examples are given for each method, and the importance of each method in future development is indicated. N E N

Parametric analysis and automated search methods for preliminary design optimization are compared, and methods of optimization that go beyond parametric analysis are investigated. Indirect methods, such as the calculus of variations, are mentioned. Direct methods of optimization are discussed including selection of design variables, constraint formulation, methods with and without derivatives, one dimensional search methods, and convergence criteria. The indirect methods solve auxiliary problems, while the direct methods adopt a hill-climbing strategy on the objective function directly. Operational results of direct search methods are given, and the field of man-computer interactive design is briefly described. N.E.N.

THE ELEMENTS OF FRACTOGRAPHY
D. A. Ryder (Manchester Univ.). Nov. 1971 196 p refs (AGARD-AG-155-71, AGARDograph-155) Avail: NTIS

This monograph is intended to serve as an introduction to Fractography which may be defined as the examination of fracture surfaces at magnifications ranging from x1 to x100,000. The terminology and current ideas on fracture are introduced in an elementary account of those factors that control the mechanical properties of engineering materials. Fracture is discussed in general terms and the instruments available for fracture surface analysis are considered. The experimental and operational techniques needed in fractography are discussed with a variety of factors, especially artefacts in replicas prepared for transmission electron microscopy, that can influence the interpretation of experimental results. The application of fractography to the investigation of service failures and the use of the technique in fracture research are described. Author

ENGINEERING UTILITY AND SIGNIFICANCE OF STRESS CORROSION CRACKING DATA
W. E. Anderson. *In* AGARD Specialist's Meeting on Stress Corrosion Testing Methods Jan. 1972 23 p refs (See N72-21900 12-32)
Avail: NTIS HC $6.00/MF $0.95

Some historical experiences with cracking and fracture problems are explored to indicate the significance of corrosion acting concomitantly with stress. These experiences suggest that cracks develop either in 'open' or 'closed' areas; and, either at regions accessible to the ambient environment and direct view, or at regions which are structurally hidden. Special attention was given to aircraft structures and various other materials. Data cover specimen configurations, methods suitable for low cost testing of specimens, and estimates of service life under loading and environmental conditions. A definition of stress corrosion is included. Author

SOME IMPORTANT CONSIDERATIONS IN THE DEVELOPMENT OF STRESS CORROSION CRACKING TEST METHODS

R. P. Wei (Lehigh Univ.), S. R. Novak (US Steel Corp., Monroeville, Pa.), and D. P. Williams. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods. Jan. 1972. 10 p. refs (See N72-21900 12-32)

(Contract N00014-68-A-0514)

(NASA-TM-X-68303) Avail: NTIS CSCL 14B

The need for recognizing certain potentially serious problems in the development of standard test methods for stress corrosion cracking studies is discussed. The importance of recognizing and satisfying the basic assumptions of the linear-elastic fracture mechanics analysis in experimentation is re-emphasized. The effects of nonsteady-state crack growth, including incubation, must be taken into account in determining the crack growth kinetics. These effects and the influences of steady-state crack growth kinetics, as well as a host of geometrical, material and environmental variables, must be considered in arriving at suitable criteria for K_ISCC (apparent threshold for stress corrosion cracking) determinations. CURRENT PROGRESS IN THE COLLABORATIVE TESTING PROGRAMME OF THE STRESS CORROSION CRACKING (FRACTURE MECHANICS) WORKING GROUP

A. H. Prest and P. McIntyre. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods. Jan. 1972. 17 p. refs (See N72-21900 12-32)

Avail: NTIS HC $6.00; MF $0.95

A preliminary analysis is presented of the initial results of the Collaborative Testing Program of the Stress Corrosion Cracking (Fracture Mechanics) Working Group of the ESSC Corporate Laboratories. In this analysis the results are interpreted in terms of the influences of specimen geometry, maximum fatigue precracking stress intensity, test temperature and laboratory error. It is concluded that the only significant errors can be attributed to differences in the calibration and accuracy of testing equipment between the participating laboratories and to failure to adhere to the recommended testing procedure which is found to be satisfactory for the material and environment which were used. MEASURING THE DEGREE OF CONJOINT ACTION BETWEEN STRESS AND CORROSION IN STRESS CORROSION

Franklin H. Cocks. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods. Jan. 1972. 7 p. (See N72-21900 12-32)

Avail: NTIS HC $6.00; MF $0.95

A stress corrosion testing method which allows a quantitative separation between the effects of stress and those of corrosion in causing stress corrosion damage is described. This test involves the measurement of the reduction in subsequent stress corrosion life which is brought about by initially exposing the sample to the corrosive environment without any stress being applied (precorrosion). If a given alloy is susceptible only to the combination of stress and corrosion (true stress corrosion), then such a preexposure would not be expected to greatly reduce its subsequent stress corrosion lifetime. If, however, a corrosion process that is not accelerated by stress is required to initiate the failure process, then such preexposure without applied stress may be found to be almost as damaging as an equal amount of exposure carried out under stress. A stress corrosion index (SCI) is defined which quantitatively measures these effects. Data obtained by this method are presented for a high strength aluminum alloy (7075) tested in buffered NaCl solution. For specimens of this alloy having a machined surface finish, 80% of the time required to produce failure in normal stress corrosion tests is found to be due to a process which is not accelerated by applied stress. An explanation for this behavior is offered in terms of the existence of a highly deformed surface layer within which any well defined grain boundaries have been destroyed. This surface layer must be penetrated by pitting before a true stress corrosion process can begin. Author

THE pH AND POTENTIAL MEASUREMENTS DURING STRESS CORROSION OF ALUMINUM ALLOYS

J. A. Davis. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods. Jan. 1972. 15 p. refs (See N72-21900 12-32)

Avail: NTIS HC $6.00; MF $0.95

A technique was described for using small tip diameter microelectrodes to study the stress corrosion behavior of various aluminum alloys exposed to chloride environments. Several general observations concerning the stress corrosion behavior of aluminum alloys were made: (1) propagation of a stress corrosion crack is always accompanied by a decrease in pH near the crack tip; (2) increasing the stress intensity to above K_ISCC (threshold stress intensity for stress corrosion cracking) results in a rapid active shift in corrosion potential; and (3) as cracks progress, the corrosion potential slowly drifts in the active direction. A general mechanism for stress corrosion based on these observations is that crack propagation occurs by active path dissolution with a minimum applied stress required to rupture the passive film and initiate crack propagation. SCREENING TESTS OF SUSCEPTIBILITY TO STRESS CORROSION CRACKING
G. J. Riefer and J. G. Garrison. *In* AGARD, Specialists Meeting on Stress Corrosion Testing Methods, Jan. 1972, 9 p, refs (See N72-21900 12-32)
Avail: NTIS HC $6.00, MF $0.95

For five high strength alloys susceptibilities to the propagation of stress-corrosion cracking (SCC) were assessed. Using 3.5% NaCl solution as the medium, both parent and weld metals were investigated. Specimens were studied under freely corroding conditions, and also cathodically protected at the potentials given by cadmium and by zinc sacrificial anodes. The cantilever test was used, the test specimens, cut from 1/2- and 3/4-in plates, were bars notched on both the sides and the top. Prior to tests a pre-crack was always produced at the base of the top notch by fatiguing in air. The equipment was designed so that specimens, loaded as cantilevers, were broken by means of a steadily rising load. This was applied by dripping water at a constant rate into a container suspended from the end of the cantilever beam. Results were reported in terms of the nominal stress intensities K* at fracture. While, strictly speaking, only of qualitative significance, reproducibility of the K* values was good and the effects of metallurgical and environmental factors could be readily estimated. Author

FACTORS INFLUENCING THRESHOLD STRESS INTENSITY VALUES AND CRACK PROPAGATION RATES DURING STRESS CORROSION CRACKING TESTS OF HIGH STRENGTH STEELS
A. H. Priest and P. McIntyre. *In* AGARD, Specialists Meeting on Stress Corrosion Testing Methods, Jan. 1972, 12 p, refs (See N72-21900 12-32)
Avail: NTIS HC $6.00, MF $0.95

Threshold stress intensity values for stress corrosion cracking (KISCC) of a number of steels was shown to be related to the formation of a continuous stretch zone at the fatigue crack tip. Both KISCC and crack propagation rate (KIC) values are influenced by the yield strength and inclusion density of the steel. The relative values of KISCC determined by arrest and initiation methods and stress corrosion crack growth rates are influenced by the effectiveness of stress corrosion cracks as stress concentrators since intergranular cracks become progressively more blunt as they propagate while the reverse can be true of transgranular cracks. Observed stress corrosion crack propagation rates are also influenced by the failure to attain equilibrium in specimens of conventional length and by the presence of crack curvature and crack branching where these occur. ACOUSTIC EMISSIONS AND SLOW CRACK GROWTH IN HIGH STRENGTH STEEL
R. W. Staehle and G. E. Kerns. *In* AGARD, Specialists Meeting on Stress Corrosion Testing Methods, Jan. 1972, 12 p, refs (See N72-21900 12-32)
Avail: NTIS HC $6.00, MF $0.95

Acoustic emission techniques were used to study stress corrosion cracking in high strength material. Pre-fatigue cracked single cantilever specimens were loaded and exposed to gaseous and aqueous environments. Acoustic emission signal shape and total resonance counts were recorded for specimens of different strength levels tested in different environments. Also, the phenomenon of wave reflection was reduced in order to examine the frequency content and energy of the emission. The results show that a higher strength level produces more acoustic activity regardless of environment. Also, the generated stress wave is of a high frequency and low energy nature. Author

INFLUENCE OF TEST METHOD ON STRESS CORROSION BEHAVIOR OF ALUMINUM ALLOYS IN SEA WATER
George J Danek *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods Jan 1972 11 p refs (See N72-21900 12-32)
Avail NTIS HC $6 00/MF $0 95

Highlights are presented of recent investigations on sea water stress corrosion behavior of high strength aluminum alloys Rolled 7000-series plate was used to show a significant influence of specimen orientation on sea water stress corrosion response The results suggested that tests in the short transverse direction are essential in ascertaining stress corrosion behavior of high strength aluminum alloys in either smooth or precracked specimens Based on these results a number of high strength hand forgings, representing the 2000-, 6000-, and 7000-series were tested as bent beam and precracked cantilever specimens taken in the short transverse direction Inconsistencies are observed when the sea water stress corrosion results from precracked cantilever specimens are compared to those from smooth specimens The results indicate that each of the two techniques provides important information, and both methods should be used in assessing the sea water stress corrosion behavior of high strength aluminum alloys Author

Avail NTIS HC $6 00 MF $0 95

It is shown that the method of testing with precracked specimens may be affected as much or more than traditional smooth specimen methods On the basis of estimated threshold stress intensities obtained with precracked cantilever beam specimens rankings of alloys are reported that are unrealistic compared to service experience and estimated threshold stresses obtained from tests of smooth beam specimens Tests of the same alloys with bolt loaded precracked double cantilver beam specimens ranked the alloys in good agreement with rankings obtained from tests of smooth tensile specimens Author

Experiments were conducted on corrosion under tension of two of the principal aluminum alloys used in the French aircraft industry A-U2GN and A-U4SG A number of systematic tests were made using classical tests methods under conditions of flexure, with a constant imposed load Processes occurring during corrosion and stress corrosion are most often electrochemical reactions and certain study techniques are described for electrochemical methods, in order to establish a correlation between observed phenomena and the particular microstructures of the alloys In the case of the a-U2GN alloy, an explanation is advanced based on sensitivity to intercrystalline corrosion and the role of constraint, as well the desensitizing which occurs after proper heat treatment Heat treatment of the alloy A-U4SG diminishes the susceptibility of the material to intercrystalline corrosion, while sensitivity to stress corrosion remains significant The influence of aeration on the solution appears to be of major importance Transl by K P D

In order to evaluate and to compare the stress corrosion behavior of more complicated structural parts for example die forgings from the two different alloys 7079-T6 and AZ 74 61, various types of specimens were taken from critical locations on the forging These locations are the area around the jack point hole, the main parting plane and the area of the first two rows of bolt holes C rings precracked DCB specimens, and smooth tension specimens were examined, using a standard 3 5 % NaCl alternate immersion test The test specimens were periodically inspected in order to find out the time to failure (tension specimens), the time to the first crack or to complete fracture (C-rings), and the crack length as a function of time as well as the threshold stress value (DCB specimens) The results show that forgings from the alloy AZ 74 61 are superior to those of 7079-T6 Author

MICROSCOPIC IDENTIFICATION OF STRESS CORROSION CRACKING IN STEELS WITH HIGH YIELD STRENGTH
E. H. Phelps. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods Jan. 1972 14 p refs (See N72-21900 12-32)
Avail: NTIS HC $6.00; MF $0.95

The microscopic features of stress corrosion cracking in steels with high yield strength are reviewed with the objective of establishing specific characteristics by which stress corrosion can be identified. Photomicrographs of stress corrosion cracking obtained under known exposure conditions on specimens of alloy steels, of precipitation-hardenable stainless steels, and of maraging steels are presented and discussed. The most consistent feature of stess corrosion cracking in these steels is that it usually is initiated at multiple sites on the steel surface. Cracking may be intergranular or transgranular, depending on the alloy system and the environment. Branching occurs in some instances but is not a consistent characteristic of stress corrosion cracking in steels with high yield strength. Author

HOT SALT STRESS CORROSION CRACKING OF TITANIUM ALLOYS: OVERVIEW AND IMPACT ON SPACE SHUTTLE APPLICATION
W. Barry Lisagor and James E. Gardner. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods Jan. 1972 10 p refs (See N72-21900 12-32)
(NASA-TM-X-68304) Avail: NTIS CSCL 11F

The test program described was conducted to determine if onset of hot salt stress corrosion cracking would occur in the cumulative exposure of time, temperature, and stress currently considered for titanium heat shields in the shuttle mission. In addition, efforts were made to assess the effects of cyclic exposure on cracking, to compare the resistance to cracking of the two proposed prime candidate alloys (Ti-6Al-4V and Ti-6Al-2Sn-4Zr-2Mo), and to determine the effect of Mach 3 airflow on cracking behavior. The results indicate that cracking will occur on salt coated specimens continuously exposed in laboratory ovens for 100 hours at temperatures and stresses proposed for shuttle TPS application. However, both cyclic exposure and exposure in a Mach 3 airstream tend to decrease the damage observed. The Ti-6Al-4V alloy exhibited a higher threshold stress than the Ti-6Al-2Sn-4Zr-2Mo alloy but suffered more apparent damage once onset of cracking occurred. Author

THE USE OF SLOW STRAIN RATE EXPERIMENTS IN EVALUATING RESISTANCE TO ENVIRONMENTAL CRACKING
James E. Reinoehl and Walter K. Boyd. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods Jan. 1972 5 p refs (See N72-21900 12-32)
Avail: NTIS HC $6.00; MF $0.95

An experimental procedure is described for evaluating resistance to stress corrosion cracking. Relative degrees of susceptibility to environmental cracking and embrittlement can be determined as a function of mechanical ductility (parameters reduction in area, elongation, etc.) or as a function of electrochemical polarization parameters (electrode potential, pH, solution composition, etc.) by pulling cylindrical tensile specimens at a slow strain rate while they are subjected to controlled electrochemical and environmental conditions (electrode potential, solution composition, temperature, etc.). FRACTURE INITIATION AND STRESS CORROSION CRACKING OF WELDED JOINTS OF ALPHA TYPE TITANIUM ALLOYS
C. Chassign and P. R. Krahe. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods Jan. 1972 6 p refs (See N72-21900 12-32)
Avail: NTIS HC $6.00; MF $0.95

The almost instantaneous failure of some welded joints of certain Ti-Al-Sn alpha-type alloys when in contact with carbon tetrachloride vapor, was studied and related to the slight surface contamination developed during argon arc welding. Analysis of the contaminated layers with the Castaing-Slodzian ion probe showed that a substantial amount of oxygen penetration had occurred during the welding operation. Testing showed that the susceptibility to stress corrosion was related to the extent of this penetration and microcracks were observed to form on the welded surfaces after loading, but before contact with the corrosion medium. As oxygen in solid solution in titanium reduces its ductility, these mechanical cracks propagate under the action of a constant load deeper into the more contaminated samples. Author

PRELIMINARY REPORT ON THE RESEARCH ON THE INFLUENCE OF THERMOMECHANICAL TREATMENTS ON STRESS CORROSION CRACKING BEHAVIOUR OF AISI 4340 STEEL
R. DeSantis, L. Matteoli, and T. Songa. *In* AGARD Specialists Meeting on Stress Corrosion Testing Methods Jan. 1972 5 p refs (See N72-21900 12-32)
Avail: NTIS HC $6.00; MF $0.95

Two grades of 4340 AISI steel were selected, air-melted and electroslag-remelted. Experimental results are presented which were obtained by testing the hardness of two specimens of both steel grades subjected to thermomechanical treatments. The hardness recovery of the steels tempered at 200 C is very small, if not absent, and sometimes it takes place after a very long tempering time. This phenomenon is very marked for the 300 C tempered steels. In this case long tempering time causes a second decrease of the hardness in a way typical for aging phenomena. No clear relation seems to exist between the metallurgical grade of the material and the behavior upon deformation and second tempering. Moreover, there were significant differences in the results obtained on different specimens of the same material. Author

THE ACCUMULATION OF FATIGUE DAMAGE IN AIRCRAFT MATERIALS AND STRUCTURES
J Schijve (Natl. Aerospace Lab., Amsterdam) Jan. 1972 125 p refs
(AGARD-AG-157; AGARDograph-157) Avail NTIS

The available literature in the field of fatigue damage accumulation is surveyed and analyzed. Physical aspects of fatigue damage accumulation are discussed, including interaction and sequence effects. Empirical trends observed in variable-amplitude tests are summarized including the effects of a high preload, periodical high loads, ground-to-air cycles and the variables pertaining to program loading, random loading and flight-simulation loading. This also includes results from full-scale fatigue test series. Various theories on fatigue damage accumulation are recapitulated. The significance of these theories for explaining empirical trends as well as for estimating fatigue properties as a design problem is evaluated. For the latter purpose reference is made to the merits of employing experience from previous designs. Fatigue testing procedures are discussed in relation to various testing purposes. Emphasis is on flight-simulation tests. Finally several recommendations for further work are made. Author

NONDESTRUCTIVE TESTING OF CARBON FIBRE REINFORCED POLYMERS
C. N. Owston *In* AGARD, Nondestructive Testing and Inspection Applied to Composite Mater. and Structures Feb. 1972 p 1-21 Sponsored by Min. of Aviation Supply (See N72-24934 15-32)
Avail NTIS HC $3.75

Ultrasonic, radiographic, eddy current, and acoustic emission techniques are described, and possible failure mechanisms, especially in fatigue, are discussed. It is concluded that nondestructive testing of carbon fiber composites is feasible. Care must be exercised in realizing that composites are not metals, and the interpretation of the indicators may be different. There are few case histories of failure with composites and predictions of the importance of defects is less certain than for metals. In general, variations in the fibrous part of the composite are easy to locate and predictions of failure are easier to make. Techniques for looking at the matrix are not so good and there is less confidence in nondestructive testing where the performance of the component is markedly matrix dependent. Author

ACOUSTIC FATIGUE DESIGN DATA. PART 1
A. G. R. Thomson (Eng. Sci. Data Unit Ltd.) May 1972 58 p refs
(AGARD-AG-162-Pt-1 AGARDograph-162-Pt-1) Avail NTIS HC $5.00

The problem of acoustic fatigue life of a structure subjected to jet noise is introduced. A framework of a design procedure applicable especially to skin panels is described. A method of estimating the near field sound pressure levels due to high velocity jet noise is described including its limitations. Methods are described to predict the first two groups of natural frequencies of flat and singly curved skin-stringer structures with four different end conditions. The parameters considered are: (1) stringer torsional stiffness, (2) aspect ratio of a typical section, and (3) the number of half-waves across the frame pitch. A method of estimating the root mean square in rectangular skin panels subject to random acoustic loading is presented. Author

A COMPARISON OF METHODS USED IN FLUTTER RESEARCH
H. G. Kuessner (DFVLR, Goettingen, West Germany) Aug. 1972 141 p refs
(AGARD-R-592) Avail NTIS HC $9.25 CSCL 01C

The eigenfrequencies, modes and generalized masses of the F104G aircraft have been calculated from the drawings by the finite element method. The idealization of the structure by different types of elements and the formation of the corresponding mass matrix by adding lumped masses are described. The structure is divided into isolated substructures. By several condensation procedures the number of symmetric and antisymmetric unknowns has been reduced stepwise from 8250 + 7948 to 170 + 162. The rigid body modes have been eliminated by 3 + 3 supports and by a modified mass matrix. The results of the calculation of 24 modes are described and illustrated. Only 13 of them were comparable with corresponding measurements of two independent ground vibration tests. Whereas the eigenfrequencies agree within a few percent, the mode shapes and the corresponding generalized masses show large differences and suggest the need for further improvements of the calculation method. A SHORT SURVEY ON POSSIBILITIES OF FATIGUE LIFE ASSESSMENT OF AIRCRAFT STRUCTURES BASED ON RANDOM OR PROGRAMMED FATIGUE TESTS
W. Barrois *In* AGARD Symp. on Random Load Fatigue Oct. 1972 21 p refs (For availability see N73-16896 07-32)

After considering designers' needs and detailing the various physical parameters that are significant in the fatigue behavior of specimens and structures, several types of fatigue tests are reviewed. Prediction methods of structure fatigue life from fatigue tests of components, assemblies and structures undergoing constant amplitude loadings are surveyed. After considering fatigue tests under programmed loadings, the case of random loadings is briefly discussed. It is concluded that describing random loadings by their root mean squares is not sufficient to predict the fatigue lives of structures even when the shape of the load power spectrum is known, except in cases of comparative prediction where the only change is the general intensity of the spectrum. The possibility of test acceleration by increasing the general loading intensity is considered. Author

EFFECTS OF TEST FREQUENCY ON FATIGUE CRACK PROPAGATION UNDER FLIGHT-SIMULATION LOADING
J. Schijve *In* AGARD Symp. on Random Load Fatigue Oct. 1972 17 p refs (For availability see N73-16896 07-32)

Fatigue crack propagation in 2024-T3 and 7075-T6 sheet material was studied at three test frequencies, viz. 10, 1, and 0.1 cycles per second. The flight simulation loading was based on a gust spectrum. The design stress level was adopted as a second variable. Differences between the crack propagation rates at the three test frequencies were small and unsystematic. The propagation was much slower than predicted from constant amplitude test data. Moreover, the macro-cracking behavior appeared to be different. Author

THE FATIGUE LIFE UNDER THREE DIFFERENT LOAD SPECTRA - TESTS AND CALCULATIONS
Walter Schuetz *In* AGARD Symp. on Random Load Fatigue Oct. 1972 10 p refs (For availability see N73-16896 07-32)

One of the more important problems in the fatigue life prediction of military airplanes is caused by the difference between the load spectrum used in the full scale fatigue test and the load spectrum in service. Complex flight by flight tests with two types of notched specimens and a bolted joint simulating a skin fitting joint were carried out under three different load spectra occurring in service of a German military airplane. It is shown that Miner's rule can be used as a transfer function relative Miner rules to calculate the lives with high accuracy for the notched specimens and with less accuracy for the bolted specimens. INFLUENCE OF THE GROUND ON THE NEAR FIELD NOISE LEVELS OF JET-SUPPORTED V/STOL AIRCRAFT
Rudolf Scholten. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 12 p. refs (For availability see N73-29905 20-32)

A method for calculating the near field noise level of a free jet (no ground effect) by means of a modified Lighthill theory using measured reference sound fields is explained. The shortcomings of the reference fields presently used as well as a means to eliminate them, are shown. In addition, determining frequency spectra in the near sound field by means of a modified Strouhal number is described. The validity of the modified Lighthill theory is proven by means of two different engine jets. Wall jet sound fields (sound fields of an engine jet directed vertically towards the ground) and the influence of the essential parameters affecting the sound field are discussed. Increased noise levels due to grouned effect are examined using V/STOL aircraft operation as an example. Author

DYNAMIC LOADING OF AIRCRAFT SURFACES DUE TO JET EXHAUST IMPINGEMENT
D. L. Lansing, J. A. Drischler, T. J. Brown, and J. S. Mixson. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 9 p. refs (For availability see N73-29905 20-32)
CSCL 01C

High lift wing concepts being considered for application to commercial STOL transports are discussed. The flow patterns which produce dynamic loads on these wings are indicated. Measurements of surface pressure and acceleration on a one half scale model of an externally blown double slotted flap are reported. Root mean square values, power spectra, and scaling parameters are shown. Author

SURFACE PRESSURE FLUCTUATIONS FROM JET IMPINGEMENT ON AN INCLINED FLAT PLATE
P. Westley, J. H. Woolley, and P. Brosseau. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 18 p. refs (For availability see N73-29905 20-32)

The influence of jet impingement pressure fluctuations on the structural design of short takeoff aircraft that use externally blown flaps is discussed. An experiment is described in which the surface pressure fluctuations on a flat plate were measured when an impinging cold air jet was blown at the plate with various speeds, inclination angles, and separation distances. The measured surface sound pressure levels and their spectra are reported. Author

PRESSURE FLUCTUATION INPUTS AND RESPONSE OF PANELS UNDERLYING ATTACHED AND SEPARATED SUPERSONIC TURBULENT BOUNDARY LAYERS
Charles F. Coe and Wen J. Chyu. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 20 p. refs (For availability see N73-29905 20-32)
CSCL 20D

Results of an investigation of surface pressure fluctuations and response of panels underlying attached and separated turbulent boundary layers and shock waves are summarized. Extensive tests of a large assortment of axisymmetric and two dimensional models have been conducted at transonic and supersonic Mach numbers to 3.6 to study the pressure fields. Assorted fixed edge flat panels have been tested at Mach numbers from 1.6 to 3.6 in attached and completely separated flow fields

and also in mixed flow with a step induced shock wave oscillating on the panels. The surface pressure fluctuations are described in terms of broadband rms. spectral density and spatial correlation information. The effectiveness of parameters for scaling the pressure fluctuations is also illustrated. Measurements of the amplitude and strain response of the panels are compared with response computations by the normal method of analysis. Author

ACCURATE FINITE ELEMENT MODELLING OF FLAT AND CURVED STIFFENED PANELS
G. M. Lindberg. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 21 p, refs. (For availability see N73-29905 20-32)

The dynamics of stiffened panels were analyzed using three different stiffener models. The more exact, complete beam finite element method was used in preference to the T-beam approach. A rectangular cylindrical shell finite element has been derived and was used to study the dynamic of singly curved stiffened panels. The major effect of the curvature is to increase the lowest frequencies and to broaden the banded nature of the results. Higher frequencies are little affected by the changes in curvature. Author

RESPONSE AND FATIGUE CHARACTERISTICS OF LIGHT ALLOY MACHINED PLANK STRUCTURES
D. C. G. Eaton. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 17 p, refs. (For availability see N73-29905 20-32)

The response and fatigue characteristics of light alloy integrally machined planks are discussed. The vibration characteristics are compared with those of equivalent fabricated conventional structures. The characteristics are reviewed with emphasis on the related acoustic fatigue implications. Methods of predicting dynamic stresses are considered and comparisons are made with practical results. A research program for obtaining information to be used in preparing design guides is discussed. Problems associated with noise induced crack propagation in machined plank structures are reported. Author

DESIGN AND SONIC FATIGUE CHARACTERISTICS OF COMPOSITE MATERIAL COMPONENTS
N. D. Wolf and M. J. Jacobson (Northorp Corp., Hawthorne, Calif.). *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 18 p, refs. (For availability see N73-29905 20-32)

A summary of two programs concerned with the design and acoustic testing of composite material components is presented. Equations are developed for both a simplified thuory and a more general theory in matrix form for predicting natural frequencies, mode shapes and stresses in unstiffened and cross-stiffened advanced composite panels subjected to acoustic loads. Sonic fatigue test results on simple 8-ply boron-epoxy and 6-ply cross-stiffened graphite-epoxy panels are described. This includes panal damping values, fatigue life stress data and a description, where appropriate, of panel fatigue failures. Also a series of 72 beam specimens was fatigue tested with shaker excitation to develop S-N data for various simulated joint configurations. The beams consisted of a graphite-epoxy or boron-epoxy material bonded or riveted to a graphite epoxy or titanium alloy stiffener. S-N data up to 10 to the 8th power cycles were obtained. Frequencies and strains predicted by the analytical procedures are compared with experimentally measured values. Author

N73-29919 Rohr Corp., Chula Vista, Calif.
SONIC FATIGUE OF DIFFUSION-BONDED TITANIUM SANDWICH STRUCTURE
I. Holehouse. *In* AGARD, Symp. on Acoustic Fatigue, May 1973, 15 p, refs. (For availability see N73-29905 20-32)

The sonic fatigue characteristics of titanium sandwich structures using a liquid interface diffusion (LID) bonding process are discussed. Test panels were subjected to sound levels of up to 170 db for extended time periods. Various failure modes and times to failure were observed. Sufficient strain and acoustic data were taken to develop a semi-empirical design analysis nomograph. A single degree of freedom random response equation combined with a finite element approach for determining natural frequencies and static stress values was used. The effect of skin repairs and facing to core bond voids were investigated by testing panels with programmed defects. Author

THE USE OF FRACTURE MECHANICS PRINCIPLES IN THE DESIGN AND ANALYSIS OF DAMAGE TOLERANT AIRCRAFT STRUCTURES
Howard A Wood *In* AGARD Fatigue Life Prediction for Aircraft Struct and Mater May 1973 13 p refs (For availability see N73-29924 20-32)

Current trends in the usage of high strength structural materials for aerospace applications are reviewed. The manner in which fracture control procedures may be implemented to achieve a higher degree of damage tolerance are discussed. The application of fracture requirements to two current designs is related. These experiences have contributed to the formulation of specifications for use across the board on all new systems. Important aspects of the proposed USAF damage tolerance criteria, including initial damage assumption and crack growth analyses, are discussed. Author

CORROSION FATIGUE - OR - HOW TO REPLACE THE FULL SCALE FATIGUE TEST
W. E. Anderson. *In* AGARD, Fatigue Life Prediction for Aircraft Struct. and Mater., May 1973, 10 p. refs (For availability see N73-29924 20-32)

The effect of environment and stress-cycling in real-time on in-service structural failure is discussed. Comparative calculations of cracking from a fastener hole are used as the basis of the investigation. A method to overcome the limitations of full-scale fatigue test data is proposed. The method involves sacrificial examination of selected portions of airframes and testing of the structural materials under several environmental and stress histories. Application of the procedure for calculating scheduled repair times for individual airframes based on respective flight experiences is proposed. Author

N73-29930 Aeronautical Systems Div., Wright-Patterson AFB, Ohio
ON FATIGUE ANALYSIS AND TESTING FOR THE DESIGN OF THE AIRFRAME
Walter J. Crichlow. *In* AGARD, Fatigue Life Prediction for Aircraft Struct. and Mater., May 1973, 36 p. refs (For availability see N73-29924 20-32)

The experimental and analytical techniques for controlling time to fatigue crack initiation in design of aircraft structure are reviewed to define improvements that may be gained from available research knowledge. Discrepancies among simple theory, experiment, and service are being better explained by accountability for residual stress systems created by higher than average loading peaks recurring randomly throughout the service load spectrum. Analytical accounting for the generation, decay, and recreation of residual stress spectra is an essential adjunct to the experimental approach for not all parts can be critically tested, and not all load spectra variations can be accommodated in test. Recent advances in residual stress analyses are reviewed. Failure theory, interaction matrix, chemical (corrosion), and mechanical (fretting) environmental aspects are explored. Variability of results are discussed in terms of design life reduction factors. Author

N73-29931 Battelle-Northwest, Richland, Wash.
A RATIONAL ANALYTIC THEORY OF FATIGUE REVISITED
W. E. Anderson. *In* AGARD, Fatigue Life Prediction for Aircraft Struct. and Mater., May 1973, 9 p. refs (For availability see N73-29924 20-32)

Fatigue of airframe structures is viewed from the standpoint of crack initiation and extension. By employing a rational analytic theory of fatigue, the aspect of crack extension is treated in terms of the maximum stress-field-parameter, and the minimum to maximum load excursion ratio. Initiation is treated as that period prior to development of a well-behaved crack. A number of airframe fatigue test data are thereby examined and compared with interpreted service experiences. The principal differences seem to stem from environmental influences in service that are not represented during laboratory experiments. Author

N73-29932 Air Force Flight Dynamics Lab., Wright-Patterson AFB, Ohio
A SUMMARY OF CRACK GROWTH PREDICTION TECHNIQUES
Howard A. Wood. *In* AGARD, Fatigue Life Prediction for Aircraft Struct. and Mater., May 1973, 31 p. refs (For availability see N73-29924 20-32)

The use of material growth rate data and analytical retardation models in predicting crack growth under variable amplitude loading is reviewed. Retardation models of current interest are discussed and compared. An effective stress model is described, including the mathematical formulation, applicability and usage limitations. Comparison of analyses and tests for typical spectra are shown. A primary factor in the accurate prediction of spectrum crack growth behavior is the proper representation of basic growth rate data including consideration of R factor shift and possible limit, threshold levels of stress intensity, closure effects and environment. The relative significance of each of these parameters on total crack growth life is discussed. Author

N73-29933 Hawker Siddeley Aviation, Ltd., Hatfield (England)
THE R.Ae.S. - ESDU CUMULATIVE DAMAGE HYPOTHESIS
J. A. B. Lambert. *In* AGARD, Fatigue Life Prediction for Aircraft Struct. and Mater., May 1973, 16 p. refs (For availability see N73-29924 20-32)

The limitations of a cumulative damage hypothesis for estimating the fatigue life of airframes are described. The major source of error is identified as being due to neglecting the redistribution of stresses that occurs when a part yields at a stress concentration. A method which takes the localized yielding effects into account is proposed. The procedure involves estimating the change in the actual mean stress of subsequent stress cycles after yielding has occurred. Author

N73-29934 Industrieanlagen-Betriebsgesellschaft m.b.H., Ottobrunn (West Germany)
FATIGUE LIFE PREDICTION: A SOMEWHAT OPTIMISTIC VIEW OF THE PROBLEM
Walter Schuetz. *In* AGARD, Fatigue Life Prediction for Aircraft Struct. and Mater., May 1973, 32 p. refs (For availability see N73-29924 20-32)

Lack of correlation between the fatigue life predicted from calculations and tests and the service life actually obtained is discussed. This may be due to one or several of the following causes: (1) incorrect load spectra were assumed in the calculations and applied in the tests including the full scale test, (2) Miner's Rule was used in the life calculations, (3) unexpected failures occurred, starting from material flaws in non-redundant structure built of high strength materials, and (4) the load sequence in the tests including the full scale test was too much simplified. It is suggested that major improvements in the accuracy of fatigue life prediction should be possible using modern methods and modern data. These are compared to hitherto existing methods for life calculations in the design stage, for component testing and for the full scale fatigue test. Author

SECOND SYMPOSIUM ON STRUCTURAL OPTIMIZATION
Nov. 1973, 390 p. refs, Struct. and Mater. Panel Symp. held at Milan, 2-4 Apr. 1973
(AGARD-CP-123) Avail: NTIS, HC $21.50

The symposium papers are presented with the major emphasis placed on methods which are already in or are rapidly nearing a practical operational status. The papers demonstrate a remarkable diversity of practical applications of the various approaches to structural optimization. For individual titles see N74-15597 through N74-15617.

N74-15597 Brown Univ., Providence, R.I.
NECESSARY AND SUFFICIENT CONDITIONS FOR GLOBAL STRUCTURAL OPTIMALITY
W. Prager. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 12 p. refs, Sponsored by AROD (For availability see N74-15596 06-32)

A method is discussed by which necessary and sufficient conditions for global structural optimality can be derived for a wide variety of design constraints. The importance is stressed of conditions that are not only necessary but also sufficient for global optimality. To present the method, minimum mass design of a truss with prescribed elastic compliance is treated when

the truss is to be derived from a given basic layout, and when the layout is left open. Use of the method for other constraints, alternative states of loading, and structures of other types is illustrated by examples. Computational aspects of structural optimization are discussed. Author

APPLICATION OF OPTIMALITY CRITERIA APPROACHES TO AUTOMATED DESIGN OF LARGE PRACTICAL STRUCTURES

V. B. Venkayya, N. S. Khot, and L. Berke. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 19 p., refs. (For availability see N74-15596 06-32)

A unified approach for the derivation of optimality criteria for the design of optimum structures is presented. The design conditions included requirements of generalized stiffness, specified displacements, dynamic stiffness, and stiffness for general stability. Recursion relations for achieving the optimality criteria are derived for all these cases. Both single and multiple stiffness requirements are considered. The formulation considers isotropic, anisotropic, and layered composite structures. Four categories of design examples are selected to illustrate the versatility of the method. The first group is designed for static loads with constraints on stresses, displacements, and minimum sizes. The second group of examples is designed for dynamic loads with periodic time dependence. The third group consists of layered composite structures subjected to static loads. The fourth group is concerned with static stability requirements. The results of many of these examples are compared with those available in the literature. Author

N74-15600 Case Western Reserve Univ., Cleveland, Ohio.

RECENT DEVELOPMENTS IN THE CASE OPTIMIZATION PROGRAM

Fred Moses. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 8 p., refs. (For availability see N74-15596 06-32)

Three optimization problem types and respective solutions are identified. A penalty function approach is used for design of elements such as welded girders, columns, prestressed concrete beams, and simple gabled frames which have complex design code constraints but relatively few design variables. The second problem type includes a modified Zoutendijk feasible direction method and has been used for structural system constraints such as deflection, stability, and flutter. The third problem type includes discrete variables involving sizes, inventory, and fabrication costs and can often be handled by dynamic programming. The influence of optimum design on safety and reliability remains a continuing area of research, and models of reliability analysis and design are discussed. Author

N74-15601 Liverpool Univ. (England). Dept. of Civil Engineering.

STRUCTURAL DESIGN APPLICATIONS OF GEOMETRIC PROGRAMMING

A. B. Templeman and S. K. Winterbottom. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 16 p., refs. (For availability see N74-15596 06-32)

The technique of geometric programming is described for the solution of non-linear optimization problems. The form in which the method was first developed, now usually known as prototype geometric programming, is presented in some detail and this is followed by a description of more recent developments which have considerably extended the scope and usefulness of the method. It is demonstrated that many problems arising in optimum structural design may be formulated in such a way as to be easily and rapidly solved using geometric programming. Finally the problem of designing minimum weight space trusses to satisfy stress and deflection constraints is examined and it is shown that by using a further extended approximate form of geometric programming optimum designs may be derived iteratively using only a few cycles of analysis and iteration. Author

N74-15602 Royal Aircraft Establishment, Farnborough (England). Structures Dept.

THE OPTIMISATION OF STATICALLY INDETERMINATE STRUCTURES BY MEANS OF APPROXIMATE GEOMETRIC PROGRAMMING

A. J. Morris. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 17 p., refs. (For availability see N74-15596 06-32)

Application of approximate geometric programming in the least weight design of statically indeterminate structures is described. It is shown how the facility of standard geometric programming to obtain bounds on a minimum weight design is preserved. The advantages of coupling geometric programming with a modern projected gradient method are also described. Numerical examples, which are used to illustrate the method, involve up to two load conditions with active constraints on stresses and displacements. Author

N74-15603 Middle East Technical Univ., Ankara (Turkey).

APPLICATION OF DISCRIMINATE FUNCTION TECHNIQUE TO RANDOM SEARCH

M. O. Kiciman and M. Akguel. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 10 p., refs. (For availability see N74-15596 06-32)

Statistical methods of discrimination were used as a decision-making tool in nonlinear constrained optimization problems. A linear discriminant function form is proposed as an aid to the preliminary designer. It is assumed that a design problem with a large number of variables is given, and only an approximate answer that will aid the decision maker is required. The possibility is discussed of representing each design point in a reduced design space by means of pooling the variables. The optimization procedure based on a combination of direct search and discriminant function method was applied to typical test problems and to a grid design problem. The grid has a stiffness dependent loading condition with a cost function not directly dependent on some of the design variables. This particular choice was made in order to illustrate the complete generality of the method. Author

N74-15604 Istituto di Elaborazione dell'Informazione, Pisa (Italy).

INTEGER PROGRAMMING ALGORITHMS FOR OPTIMUM STRUCTURAL DESIGN

Aldo Cella. *In* AGARD, Second Symp. on Structural Optimization, Nov. 1973, 14 p., refs. (For availability see N74-15596 06-32)

A large variety of structural design problems is constrained by the practical necessity of selecting the design parameters from an enumerable set of discrete values. The resulting solution space has a grid-like pattern, and an enumerative combinatorial algorithm seems most appropriate for the problem. A branch-and-bound algorithm was developed for the optimal design of a large class of linearly elastic structures discretized into finite elements and subjected to stress, deflection, and stiffness constraints. Sensitivity coefficients were developed for all those constraints. The algorithm is of the enumerative kind, having decision rules that are specific to the solution space associated with structural problems. The resulting numerical procedure was applied to the optimal design of a number of aerospace-type structures, such as the hammerhead of a large-scale radiotelescope and the supporting structure of an orbiting telescope. (Contracts F33615-70-C-1282 F33615-72-C-1275)

Design of modern aircraft requires that aeroelastic considerations be included as early as possible to avoid addition of excessive weight for prevention of aeroelastic instabilities A computational approach for minimum weight design of flutter critical lifting surfaces is presented which has generality in the selection of analysis methods and demonstrated applicability to problems involving a large number of design variables A key feature of the method is the calculation of derivatives of the flutter speed with respect to design parameters These analytically derived derivatives are computed in such a way that they are economical for large scale problems The mathematical programming method which utilizes the derivatives is based on the method of feasible directions with a simplex algorithm to solve a linearized direction finding problem Results are presented which show that the method can efficiently reduce the structural weight of lifting surface designs involving at least 99 design variables Author

MINIMUM WEIGHT DESIGN OF SURFACE EFFECT VEHICLES USING THE SIEVE-SEARCH TECHNIQUE
James R Ball and Ronald A Gellatly *In* AGARD Second Symp on Structural Optimization Nov 1973 14 p refs (For availability see N74-15596 06-32)
(Contract MA-4687)

Past and present methods for the optimization of structural systems for minimum weight use mathematical programming or numerical search techniques This procedure has lead to an intractable situation whereby large computer costs and mathematical complexity arises More economical and more flexible procedures for structural optimization of large scale systems have therefore been sought A new approach to determine the minimum weight of such systems has been developed and is labeled the sieve search technique In performance of optimization studies using this technique the guiding philosophy was to generate an optimal arrangement of preoptimized components An essential element of the technique is the use of data banks which contain minimum weight and associated geometry of the structural components These banks are generated using classical methods of optimization An additional facet of the technique is the use of simplified engineering analysis methods during the redesign phase of the optimization cycle Author

OPTIMISATION OF AIRCRAFT STRUCTURES WITH MULTIPLE STIFFNESS REQUIREMENTS
I C Taig and R I Kerr *In* AGARD Second Symp on Structural Optimization Nov 1973 14 p refs (For availability see N74-15596 06-32)

A general optimality theorem is presented for structures whose members have stiffnesses proportional to their masses and which are designed by generalized stiffness requirements The theorem is used to derive an iterative procedure for optimum structure design Modifications to the basic theorem to deal with practical constraints such as minimum material gauges and strength or stability requirements to be introduced The method to be used where stiffness requirements are directly specified for loading

conditions or where vibration frequency or aeroelastic efficiency requirements are stipulated. A useful feature of the method when used in conjunction with automated design procedures, is that the optimization can operate with real structure variables and constraints so that there is no subsequent design operation required to convert idealised structure dimensions to feasible detail sizes. Several examples are quoted to show that very favorable results and computing times are obtainable for demonstration problems. The ability to handle major structural optimization is also illustrated by applications to actual airframe structures. Author

APPLICATION OF A DESIGN ANALYSIS SYSTEM TO A SPACE SHUTTLE PRELIMINARY DESIGN c31

W. Lansing, P. Mason, W. Dwyer and J. C. Cooper. *In* AGARD Second Symp. on Structural Optimization. Nov. 1973. 14 p. refs. (For availability see N74-15596 06-32)

In a broad sense, interdisciplinary design analysis systems are optimization tools, of which the specialized computer programs which resize structures of fixed topology are merely a part. This interrelationship is portrayed by describing briefly the Integrated Design Analysis System (IDEAS) and showing how its Automated Structural Optimization Program (ASOP) is incorporated within the basic system. Application to a preliminary design of the space shuttle is presented and ways in which ASOP is being improved are discussed. Author

OPTIMIZATION AND DESIGN OF THE REAR FUSELAGE OF THE A 300 B AIRCRAFT STRUCTURE c02

D. Schulz. *In* AGARD Second Symp. on Structural Optimization. Nov. 1973. 15 p. refs. (For availability see N74-15596 06-32)

A method is described for the automatically controlled calculation of a skin stringer structure. The method was programmed and applied for the first time for the development of the Airbus A 300 B. The method can be considered as a link in a process chain, the target of which is the overall development of aircraft structures. It starts with the calculation of statically indeterminate forces and ends up with the statical strength analysis. Input and output data for the calculations of statically indeterminate forces are used as input data for structure dimensioning or strength analysis program. The structure dimensioning program iteratively modifies the originally defined wall thicknesses so that the reserve factors required to prevent failure under tensile, compression and shear loads are reached or only slightly exceeded in all critical load cases. The originally defined structural concept (stringer and frame spacing as well as stringer shapes) is not changed in this case. Final dimensioning is influenced by manufacturing considerations. On completion of the dimensioning work the dimensions are laid down and the strength analysis is carried out in a single computer run. The flow of the program is demonstrated in the example of the Airbus A 300 B rear fuselage. Author

THE DOUBLE ITERATION METHOD IN STRUCTURAL OPTIMIZATION

Daniel H. Fimifer. *In* AGARD Second Symp. on Structural Optimization. Nov. 1973. 10 p. refs. For availability see N74-15596 06-32)

Most structural optimization processes require a large number of iterations to be performed, involving at each step a detailed stress analysis of the current design. Considering that a gross analysis is comparatively very economical, it is possible to perform most iterations on a simplified mesh, with only occasional refined analyses to correct the remodeling effects. Although the overall number of steps (referred to as primary iterations) necessary to achieve the optimum is then higher than by conventional procedures, only those involving a detailed analysis (or secondary iterations) are significant timewise. That double iteration scheme was employed in determining the minimum weight design, assumed to be fully stressed, of a tanker web frame, using the stress ratio method. Satisfactory convergence was reached after 2 secondary iterations whereas by standard calculations 8 to 10 would have normally been required. Author

HOMOLOGOUS DEFORMATION OF STIFFENED SHELLS FOR RADIO TELESCOPE STRUCTURES

J. F. Kowalewski and H. A. Ziebarth. *In* AGARD Second Symp. on Structural Optimization. Nov. 1973. 13 p. refs. (For availability see N74-15596 06-32)

In radio telescopes all surface elements have to reflect incoming radio waves to a defined focus, i.e. the surface should be an exact paraboloid. As a telescope has to be tilted elastic deformations caused by rotating the telescope about a horizontal axis are inviable. But these deformations should be homologous, i.e. should change only the position of the focus, the focal length and the axis of the paraboloid. The report deals with the homology conditions for the displacements and the rotations of the tangents of the surface and the change of the parameters of the paraboloid. It is shown how to find the optimum design of a reflector shell, which complies with these homology conditions. Author

OPTIMIZATION OF THE LAYOUT OF TRUSSES COMBINING STRATEGIES BASED ON MICHELL'S THEOREM AND ON THE BIOLOGICAL PRINCIPLES OF EVOLUTION

A. Hoefler, U. Leysser, and J. Wiedeman. *In* AGARD Second Symp. on Structural Optimization. Nov. 1973. 8 p. refs. (For availability see N74-15596 06-32)

A method developed for finding the optimum layout of plane trusses is reviewed. Both strategies employed are described in some detail, giving special attention to the problem of selecting the proper set of points at the beginning of the optimization process. An example of the application of the evolution strategy is given. When both strategies are combined, having each one perform the function in the optimization process it is best suited for, their specific disadvantages can be eliminated. Thus an initial design is found using linear programming, while the evolution strategy is used to find better positions of the joints. This constitutes one cycle of optimization. More cycles will follow if the improved positions of the joints require a change in the set of the optimum bars. The problem of a cantilever truss loaded at the tip is solved using the combined strategies. The optimum structure for this case being known, a comparison is made showing the efficiency of the method. Author

A philosophical, non-technical approach is used to demonstrate that information is both an inherent part of life and a part of the fabric of living, and that information is being presented to the individual continuously throughout his life, by his own senses, by other people, and by the various media of communication. Also that this information may be unheeded or heeded, and stored in his memory, or may be stored in suitable forms by mechanical, electronic, and other means. Once stored, it may be later retrieved and applied to any appropriate purpose. Information is increasingly being recognized as a prime resource, and the problems of maintaining the store of this resource and of its exploitation are being recognized and solutions sought. Author

Selectivity is an essential factor in the transfer of information and the Selective Dissemination of Information (SDI) is a technique for providing individual users or groups of users with announcements of a limited number of documents specifically of interest to them. For large systems, selection of relevant documents is achieved by a computer program which compares a file of bibliographic data on current reports, journals, articles, etc., with the interest profile of the SDI user. The selected references can be provided to the user in card form useful for foreign or as a computer printed listing containing the main document bibliographic data descriptor terms and in some cases, a short abstract. A review was made of various automated systems which have developed in North America and Europe during recent years. Some experiences of both large and small SDI systems are discussed and detailed aspects such as profile construction, cost, profiles, and economics, and user surveys are considered. As an alternative to printed output an outline is given of a system using on-line access to a central information store enabling the user to have selected references displayed visually at his remote console. Information Analysis Centers (IACs) are discussed in three parts: concept, mission, and operation. Since there is an array of existing scientific and technical information services, ranging from the conventional library, through special libraries and document depots to IACs, the presentation considers what an IAC is, how it relates to other information services, and its fundamental concept. The mission of an IAC is considered in the light of its users or peer group, how unpublished information is obtained and used, and

how feedback helps the IAC achieve its mission. Two non-government supported IAC are described along with one government center. Also considered are operational aspects (administration and management) of an IAC. Based on close contact with over a dozen operating IAC's, actual experiences pertaining to the recruitment and utilization of competent research scientists and engineers in information analysis work, advantages of working in an IAC environment, key problems in day-to-day operation, and the ever present problem of money are discussed. THE VON KARMAN LECTURE LESSONS LEARNED AND FUTURE DIRECTIONS IN THE MANAGEMENT OF TECHNICAL PROGRAMS
Robert C. Seamans. Sep. 1972. 36 p. Lecture held at Brussels, 28 Sep. 1972.
Avail: NTIS. HC $4.00

Advances in technology management, learned at NASA and DOD, are briefly reviewed. The NASA programs involved feedback from the customer, accurate assessment and control using detailed schedules of tasks and costs, and a three-way balance between performance, schedule, and cost. The defense management added the condition that new systems must also be produced and operated in large numbers. Illustrations are given using major new weapon aircraft systems. Competitive prototyping and future directions in military programs are described, along with the application of aerospace technology to civil needs. It is concluded that NATO countries must look for better ways to provide effective defense forces and meet growing civil needs. Improved technology management is of critical importance, and proptotype programs must be carefully selected with a minimum of duplication. Papers on the challenge facing NATO, the future of defense cooperation among NATO nations, and technical cooperation among NATO nations are appended. N.E.N.

THE LIKELIHOOD OF LOOKING AT A TARGET
Charles P. Greening. *In* AGARD. Air to Ground Target Acquisition. Nov. 1972. 6 p. (For availability see N73-19959 10-34)

Visual search behavior is characterized by brief glimpses of the terrain, separated by rapid eye movements, or saccades. The likelihood of looking at a target with any particular glimpse is, in most models of search behavior, assumed to result from either random motion or a mechanically systematic search pattern. In the present study, it is assumed that the observer uses extra-foveal vision to evaluate the terrain before each saccade, to maximize the likelihood of looking at the target. Quantitative data on extra-foveal search, obtained in a different context by Williams, show that such behavior is lawful and predictable. The results are here applied to dynamic air-to-ground yielding target acquisition predictions which compare favorably with those obtained by other methods. Author

MODELING OF RANDOM HUMAN VISUAL SEARCH PERFORMANCE BASED ON THE PHYSICAL PROPERTIES OF THE EYE
Ian Overington. *In* AGARD. Air to Ground Target Acquisition. Nov. 1972. 12 p. refs. (For availability see N73-19959 10-34)

The physical properties of the eye lens and retina together with the involuntary eye movements (tremor and drift) are considered as the basic factors defining single glimpse detection probability. Introduction of the concept of convolution of object profiles with the spread function of the eye lens which allows extension of such single glimpse predictions to unsharp objects is discussed along with the effects of atmospheric attenuation and range dependency of subtended size. Using this comprehensive formula for single glimpse probability as an input a cumulative search probability model is developed for random search which takes account of search field of view, visual lobe effects and the transition from single glimpse to multiple glimpse situation at any part of the field of view. THE K FACTOR IN AIR-TO-GROUND ACQUISITION MODELLING
D. G. Silverthorn. *In* AGARD. Air to Ground Target Acquisition. Nov. 1972. 14 p. refs. (For availability see N73-19959 10-34)

This paper illustrates that correspondence obtained between the shapes of the probability-range curves is good both for field and simulated field detection data, but that actual performance levels are much lower than predicted. A degradation factor (the K factor) has been introduced to cover this discrepancy and a similar fudge factor has been invoked to cover differences between simulated and direct field trial data. The paper examines the factors on which K is dependent and describes relevant experiments and the associated attempts at modelling them. It is at once a progress statement and an indication of the necessary further studies. Author

CALCULATION AND SIMULATION OF THE EFFECTS OF TWO COMPLEX SEARCH SITUATIONS
C. I. Howarth, J. R. Bloomfield, and M. E. Dewey. *In* AGARD. Air to Ground Target Acquisition. Nov. 1972. 12 p. refs. (For availability see N73-19959 10-34)

Two attempts were made to elucidate complex search situations. In the first, using Howarth and Bloomfield's theoretical work as a basis, calculations were made of the cumulative search time data likely to occur when a target that was an extreme example of a distribution of objects was presented among a sample of these objects. The calculations covered variations in (1) the target-nontarget cut-off point, (2) the size of the visual lobe area associated with the target, and (3) the response time that was necessary after a target was located. The second, a simulation study making use of the Monte Carlo method, treated a situation in which a number of targets were presented among many nontarget objects. A single target, which had a small visual lobe area associated with it, was presented with a variable number of targets with large visual lobe areas. The size of the visual lobe areas associated with the two kinds of target was varied, as were the number of the large lobe area targets and the length of the response times necessary after a target had been

located. The likely effect of these variations on the time needed to locate the single target is reported. In general, more time was needed the smaller the lobe area of the single target is reported. In general, more time was needed the smaller the lobe area of the single target, the greater the lobe area of the large lobe targets, the greater the number of the latter present, and the longer the response times. The cumulative curves obtained changed in shape as the four variables altered in these directions. The change in shape is likely to be found with human observers who adopt the most suitable strategy for locating the small lobe area target. Author

THE EFFECT OF COMPLEX BACKGROUNDS ON ACQUISITION PERFORMANCE

M. B. Brown. *In* AGARD Air to Ground Target Acquisition Nov 1972 6 p refs (For availability see N73-19959 10-34)

The relationship between the subjective effect of structured target backgrounds on acquisition performance and physical attributes of the scene luminance structure was investigated both theoretically and experimentally. The theoretical attempts are described to classify various aspects of complexity, and an experiment was carried out using synthetic target material. The results showed that certain targets are more easily recognized than others for all the complex backgrounds used, and also indicated that recognition may be regarded as the detection of detail. A large variability between subjects was observed. Part of this variation can be attributed to eyesight differences and to experience. Author

PERIPHERAL ACUITY WITH COMPLEX STIMULI AT TWO VIEWING DISTANCES

J. R. Bloomfield. *In* AGARD Air to Ground Target Acquisition Nov 1972 10 p refs (For availability see N73-19959 10-34)

Visual acuity is defined in terms of the minimum resolvable visual angle or its reciprocal. This assumes, implicitly, that acuity is independent of viewing distance. In the current study, this assumption was tested for peripheral acuity using two viewing distances. A complex visual display was used for the acuity task. The display contained a regular 17 by 10 arrangement of discs. The display was exposed for 0.25 seconds, with the observer fixating a particular point in it. Measurements were made of the threshold distance from the fixation point at which a single, smaller target disc could be detected. The data, obtained from eight observers, supported the assumption that peripheral acuity is independent of viewing distance, the threshold distance remaining unchanged for four sizes of target, in spite of the large change in viewing distance. This implies that performance in air-to-ground target acquisition should not be directly affected by variations in viewing distance. Author

A MODEL FOR THE INHERENT CONTRAST CONDITIONS IN FULL-FORM OBJECTS

Max R. Nagel. *In* AGARD Air to Ground Target Acquisition Nov 1972 21 p refs (For availability see N73-19959 10-34)

The concept was developed of a simple model that is representative of the luminance and contrast conditions on full-form objects. A reasonably realistic approach is a sphere that is exposed to the irradiation from the entire sky, the sun, and the ground, taking into account the considerable variation of the luminance in the sky. Based primarily on measurements of the sky luminance in the Pikes Peak region of Colorado, U.S.A., calculations were made of the inherent contrast in such a model when it is viewed from any direction with fields of view of various sizes. Other calculations were concerned with the model object's contour contrast against its background and with its color. Representative results of these calculations are shown and discussed. Author

AIR-TO-GROUND VISIBILITY OF LIGHTS AT LOW BACKGROUND LEVELS

John H. Taylor. *In* AGARD Air to Ground Target Acquisition Nov 1972 8 p refs (For availability see N73-19959 10-34)

After sunset and before sunrise the visual task of the airborne observer becomes radically different from that which he must perform during the daylight hours. The range at which targets will be seen depends upon the physical properties of the source, such as its intensity and color, the length of time for which it is exposed to view, the transmissivity of the atmospheric path of sight, and the visual performance capabilities of the observer. This paper describes some new data which apply to this problem, and suggests that the relationship between visibility and flash duration may be somewhat more complex than has usually been assumed. The results have application to both aggressive and defensive needs, and are of interest to the signalling community in general. Author

AIR-TO-GROUND TARGET ACQUISITION WITH FLARE ILLUMINATION

Robert L. Hilgendorf. *In* AGARD Air to Ground Target Acquisition Nov 1972 11 p refs (For availability see N73-19959 10-34)

This paper is concerned with the results from three recent experiments. Experiment 1 dealt with the effect of shielding a 25,000,000-lumen flare source and determining the optimal number of flares to be used for a given target area. No statistically significant effect was found due to flare shielding. For the given target area simulated, it appeared that there was no additional benefit derived from igniting more than two flares over a simulated area of about 1.5 kilometers by 5 kilometers. Experiment 2 dealt with shielding of a 60,000,000 lumen source, and again, no statistically significant effect was found due to the flare shielding. Experiment 3 dealt with the visual acuity under simulated flare light. In this experiment each of eight groups of five subjects performed simulated observer altitude ranging in 152-meter increments from 152 to 1,219 meters. For the slant ranges simulated (1,029 to 1,587 meters), 610 meters was the best altitude for visual performance. Like the other findings, this could have significant impact on tactical planning for night missions. The parameters of this study have now been blown-up to real-world size and the Aerospace Medical Research Laboratory, in conjunction with the Air Force Armament Laboratory, is conducting flight tests to validate the altitude data of the experimental simulations. A DESIGN CONCEPT FOR A DUAL HELICOPTER NIGHT SCOUT SYSTEM

William J. Kenneally. *In* AGARD Air to Ground Target Acquisition Nov 1972 11 p refs (For availability see N73-19959 10-34)

Limited but promising operational experience with helicopter borne night vision systems (both low light level TV and forward looking infrared) has spurred an interest in the application of night vision technology to second generation airborne systems. The limited quantitative performance data on these first generation systems, coupled with the significant advances in night vision technology made during the intervening period, place severe

restrictions on the system designer attempting to make logical system tradeoffs. The scope of the paper is to examine various relevant data on the subject and to develop a design concept for such a second generation scout system. Author

REALISTIC CONSIDERATIONS OF TARGET ACQUISITION ON LINES OF COMMUNICATIONS

Roy K. Frick, Diane E. Summers, and Thomas E. Tyson *In* AGARD Air to Ground Target Acquisition Nov. 1972 10 p refs (For availability see N73-19959 10-34)

An approach is presented to determining the probability of acquiring targets by a search aircraft which flies along an enemy line of communication (LOC). A line of communication is defined as a route, e.g., a road, waterway, or railroad, and the targets of interest are trucks, boats, or other appropriate carriers. The analysis approach consists of three areas of investigation: (1) analyzing the contour (twists and turns) of a route for purposes of establishing a preferred flight path plus determining the frequency distributions of LOC aspects relative to this flight path; (2) computing the probability of detecting a target, given a set of LOC, target, and flight path conditions; and (3) integrating the results of the first two areas of investigation to produce the probability of target acquisition for the overall set of conditions. The methodology presented can be applied to investigate conditions of target acquisition for existing lines of communication in the real world. Author

THE EFFECTS OF BRIEFING ON TELEVISUAL TARGET ACQUISITION

K. R. Parkes *In* AGARD Air to Ground Target Acquisition Nov. 1972 9 p refs (For availability see N73-19959 10-34)

Evidence from a number of studies indicates that the nature of the briefing information available to the observer has a marked effect on target acquisition performance. Low-level forward oblique photographs of the target and surrounding terrain have been found to be a particularly effective form of briefing information, but such photographs may not always be available. In the experiment reported, an evaluation was made of the extent to which, in the absence of suitable oblique photographs, perspective representations of the target and surrounding terrain, derived from maps, facilitated televisual target acquisition performance. The effectiveness of these perspective views, used as briefing material in addition to maps, was compared with that of maps used alone, and maps used together with oblique photographs. The results show that, while not as effective as oblique photographs, the perspective views brought about some improvement in performance as compared with the maps alone. Author

THE USE OF KELLY'S REPERTORY GRID TECHNIQUE FOR ASSESSING SUBJECTIVE ESTIMATES OF IMPORTANT PARAMETERS FOR TARGET ACQUISITION

A. J. Mitchell *In* AGARD Air to Ground Target Acquisition Nov. 1972 12 p refs (For availability see N73-19959 10-34)

Kelly's Repertory Grid Technique was employed to study the area of subjective factors involved in visual acquisition of targets, in the hope of covering the discrepancy between the data obtained from psychophysical studies and actual field data. Two experiments were conducted using highly trained aircrew which have led to the definition of some subjective parameters and estimates of their importance. Through analysis three major overlying components were elicited. These major components were: (1) The target has visual prominence against the background. (2) The target is in a helpful built-up environment or Target is in an urban environment. (3) There are geographical and map identification features around the target to aid acquisition. Author

SOME PSYCHOMETRICS IN RELATION TO TARGET ACQUISITION

Sandra J. Seale *In* AGARD Air to Ground Target Acquisition Nov. 1972 7 p refs (For availability see N73-19959 10-34)

The variance associated with acquisition performance arises from between subject differences and within subjects differences. A recent intensive study was conducted, using a pattern discrimination test, the Witkin Embedded Figures Test (EFT). Previous experimental work using this test indicated that it would be suitable for the target acquisition situation in that it would estimate analytical ability, which was hypothesized as being a factor contributing to the variation in acquisition performance. Although no overall significance was found between EFT scores and measures of acquisition performance under various briefing conditions, the study highlighted the difficulties involved in using psychometric tests in the context of target acquisition. The paper examines these difficulties and illustrates the contribution to the methodology in this area. Author

TECHNICAL AND OPERATIONAL ASPECTS OF EXTERNALLY MOUNTED AIRCRAFT EQUIPMENT
T VanOosterom *In* AGARD AGARD Ann Meeting, 1973 Dec 1973 p 29-34 (For availability see N74-21610 12-34)

It is pointed out that the installation of additional equipment in an aircraft is often impossible due to space limitations. Consideration is given the choice which must be made between redesigning or modifying the fuselage or housing the equipment in an external speedpack or pod. Several advantages of a pod mounted system are indicated and specific design aspects which may require advanced applications of science and technology are discussed. It is concluded that the pod concept has the potential to solve in many cases, the problems inherent in the implementation of new operational equipment within the inventory of an air force. It is also concluded that for many applications the pod concept will have a superior operational cost effectiveness in comparison with an aircraft integrated system.

THE HINGELESS ROTOR - A CONCEPT TO INCREASE MISSION EFFECTIVENESS AT REDUCED COSTS
P Barth *In* AGARD AGARD Ann Meeting, 1973 Dec 1973 p 40-50 refs (For availability see N74-21610 12-34)

The mechanical simplification of helicopters by elimination of blade attachment hinges is discussed. Emphasis is placed on the Bolkow system which features fiberglass rotor blades of high elasticity rigidly attached to a stiff hub. The stated advantages of the system are: (1) The hingeless rotor design needs only about 30 percent of the parts of an articulated rotor, (2) Control becomes more powerful, faster and more direct, and nearly independent of thrust, (3) The rotor blades can offer more than 10,000 hours of service life compared to 1,000 to 2,000 hours for comparable helicopters, (4) The fiberglass material is corrosion proof and tests have shown that it is insensitive to notches, (5) The hingeless rotor is most promising in fulfilling modern military requirements for air mobility.

RESEARCH WORK AND COSTS. THE ROLE OF DATA PROCESSING
P Bohn *In* AGARD AGARD Ann Meeting, 1973 Dec 1973 p 51-53 In ENGLISH and FRENCH (For availability see N74-21610 12-34)

An overview is presented on research work and costs in aircraft manufacturing with emphasis placed on the changes which have taken place as a result of the introduction of powerful computers. It is pointed out that computers provide a means to improve the modelling of physical phenomena and to demonstrate the resulting effects on the whole aircraft. Aircraft manufacturers are now in a position to achieve trade-offs which were at one time inconceivable, especially as far as costs are concerned. It is predicted that in the future, research work will require more highly trained engineers, extremely powerful computers, and very bulky data files. These requirements are based on: (1) In-flight development time is becoming increasingly short, and is devoted more and more either to the development of electronic systems, or to the analysis of abnormal flight patterns or failure investigations, (2) Official agencies and industrial firms everywhere must more and more frequently accept contracts for the development of prototypes, (3) Optimization, Obtained by computers, permits the manufacturer to simplify without incurring any penalties as regards the objectives.

IMPACT OF TECHNOLOGY ON COST REDUCTION
John F Brooke *In* AGARD AGARD Ann Meeting, 1973 Dec 1973 p 53-60 (For availability see N74-21610 12-34)

The results are discussed of a United States Air Force survey conducted to identify those technologies which hold the greatest promise of reducing life-cycle costs. The analysis indicates that the cost reducing aspects of seventeen identified technologies could achieve a ten year life cycle savings on the order of $450 million. Five of these technologies, considered to be representative examples, are discussed in detail and include: (1) advanced composites, (2) weldbond joining, (3) metal working and munitions, (4) replaceable tread tire concept, and (5) aircraft battery technology.

SMALL TACTICAL MISSILES FOR 1980 AND BEYOND VOLUME 1 SUMMARY [LES PETITS MISSILES TACTIQUES A L'HORIZON 1980 ET AU DELA TOME 1 SOMMAIRE]
Roger Maquet and Charles Boisgard Dec 1973 60 p In FRENCH
AGARD AR-57-1-Vol-1-
NATO Confidential Report

The case is made in this report for a NATO approach to tactical missile developments for the 1980's via technology programmes which lead into building block programmes of major sub-systems having applications to more than one missile system and then for linking together these various separate development programmes into a planned development programme of the number of closely associated missiles.

Based on a comprehensive survey of the advances in sub-system technologies and supporting techniques which will be available by 1980-1985 and on the estimated characteristics of the threat of the 1980's, the method of approach led to the definition of some 80 conceptual system designs corresponding to 41

missile system types classified into 7 target oriented missile families. These conceptual system designs are analyzed in order to derive the cases for commonality and modularity and the most promising technologies and techniques for the 1980's.

Characteristics of superconducting generators for aircraft power systems, with emphasis on effects of electromechanical transients and control parameters on stability p0064 N73-29039

ACCELERATION (PHYSICS)
Tables of comparative equivalents using standardized terminology for use in centrifuge studies p0094 N72-21118

Fundamental principles and physiology of effects of acceleration on human body p0094 N71-23339

Annotated bibliography of work related to biodynamics research studies [NASA-CR-117128] p0064 N72-27344

Techniques for determining stability of helicopter encountered in accelerated flight p0193 N73-36186

Analysis of experimental conditions of centrifuge simulation to fatigue [AGARD-R-586-71] p0213 N72-15033

Linear acceleration of impact type causing human injuries (conferences) [AGARD-CP-88-71] p0098 N72-17119

Biodynamics of ejection during accelerative and decelerative events p0100 N72-19114

Linear and angular acceleration technology, human acceleration simulation, adequate airbag restraint systems and mathematical models of automobile crash loads p0102 N72-19155

Physiological tests of vestibulo-ocular reflexes by oscillation to determine effects of positive acceleration on dynamics of vestibular system of rhesus monkeys [AMRL-TR-71-59] p0072 N72-25040

Relation between measured C.G. vertical acceleration and loads at C.G. of military aircraft p0231 N73-16034

Collection and processing of gust and turbulence data obtained from recording accelerometers mounted at center of gravity of various aircraft [AGARD-R-605] p0246 N73-20023

PIGA: Accelerative tests on vestibular [illegible] centrifuge and vibration tests of inertial guidance systems p0236 N74-14042

ACCELERATION PROTECTION
Acceleration protection system design using crash and restraint harnesses, ejection seats, shock absorbing tests p0014 N72-19057

ACCELERATION STRESSES (PHSIOLOGY)
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure in relation to lung breathing and fluid and fluorocarbons in which body water is [illegible] respiration [NASA-CR-117199] p0068 N71-20358

ACCELERATION STRESSES (PHYSIOLOGY)
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure in relation to lung breathing and liquid fluorocarbons in which body water is [illegible] respiration [NASA-CR-117199] p0068 N71-20358

Biodynamics, aerospace medicine, acceleration stress, human tolerance, centrifuge, test facilities, and computerized [illegible] [AGARDOGRAPH-150] p0094 N71-23337

Tables of comparative equivalents using standardized terminology for use in centrifuge studies p0094 N72-21118

Fundamental principles and physiology of effects of acceleration on human body p0094 N71-23339

Tabular and graphical presentation of physiological responses to specific acceleration stresses p0102 N72-19146

Physiological tests of vestibulo-ocular reflexes by oscillation to determine effects of positive acceleration on dynamics of vestibular system of rhesus monkeys [AMRL-TR-71-59] p0072 N72-25040

Mechanical factors affecting acceleration stress tolerance studied by using a centrifuge fatigue p0205 N73-19149

Human performance during sustained acceleration stress p0205 N73-19151

Visual acuity and other effects on pilot performance during acute and sustained acceleration stress [AMRL-TR-72-3] p0206 N73-19154

Physiological factors in human tolerance to acceleration p0206 N73-19156

Human performance during sustained acceleration stress and acceleration and oxygen stress [illegible] p0208 N73-20147

ACCELERATION TOLERANCE

ACOUSTIC PROPERTIES
[illegible] p0[illegible] N72-[illegible]

Analysis of helicopter internal and external noise levels for various flight conditions and timing of acoustical spectra p0052 N73 21055

Analysis of acoustic factors involved in wind tunnel tests to show contributions from various sources p0173 N73 26247

Development of method for calculating near field noise level of free jet and influence of ground effect on noise produced by V STOL aircraft operation p0292 N73 29907

Application of laser as test technique for determining response and life of aircraft structures subject to engine noise field excitation p0294 N73 29922

ACOUSTIC SCATTERING

Underwater acoustic beam width effects on signal scattering through surface of sea floor p0123 N72 16102

ACOUSTIC SIMULATION

Acoustic fatigue design data Part 3 design criteria for aircraft structural elements to reduce effects of acoustic stress [AGARDOGRAPH 162 PT 3] p0298 N74 19550

ACOUSTICS

Physiological and psychological limits and ranges of human response to acoustic stimuli p0067 N71 20352

ACUITY

Audiometric evaluation of aging pilots hearing acuity in relation to flying time p0093 N71 22320

ADAPTATION

North Atlantic Treaty Organization conference on adaptation and acclimatization in aerospace medicine [AGARD CP 82 71] p0067 N71 20351

Stresses and adaptation problems associated with large scale long range fast reaction time air troop deployments p0069 N71 20360

Effects of adaptation and pharmacodynamics of adaptation of human beings to degraded sensorial environments p0069 N71 20364

Adaptability and receptivity factors affecting motion sickness susceptibility in pilots p0078 N73 21095

ADAPTIVE CONTROL

Adaptive and nonadaptive approach to pattern recognition with Bayesian and non Bayesian techniques compared p0153 N72 11190

ADAPTIVE FILTERS

Matrix method for calculating adaptive gain while tracking in digital processing p0132 N73 10197

Fast Fourier transform digital processor as spectrum analyzer and adaptive filter p0132 N73 10198

Automatic equalizers of telephone channels for fast transmission of digital data p0132 N73 10199

Algorithm for adaptive digital filters of data communication channels p0132 N73 10200

ADHESIVE BONDING

Nondestructive tests and their application for inspection of adhesive bonded structures welded joints and riveted or bolted joints p0197 N72 19542

ADIABATIC CONDITIONS

Adiabatic compression method for determining self ignition delay in hydrocarbon air fuel mixtures p0252 N72 11682

Influence of adiabatic air compression on power of hydraulic motors and pumps p0066 N73 19955

ADRENAL METABOLISM

Temperature and noise irradiation effects on human energetic metabolism during vigilance task p0106 N73 19155

ADRENERGICS

Mental and cardiovascular acceleration stress effects on heart rate studied by beta adrenergic blockage p0165 N73 19149

AERIAL PHOTOGRAPHY

Pattern recognition techniques for automatic determination of vehicles in aerial photographs of highways p0152 N72 11362

Aerial multispectral color photographs for remote recognizance of soils and rocks p0124 N72 16110

Noise and error effects on differential pulse code modulation transmission of sampled aerial imagery p0131 N73 10190

On line computer technique for evaluating reconnaissance image compression algorithms p0131 N73 10191

AERODYNAMIC CHARACTERISTICS

Conference on theoretical methods and wind tunnel techniques for transonic aerodynamic testing of aircraft at high Reynolds numbers [AGARD CP 83 71] p0011 N72 11351

Transonic wind tunnel testing for predicting flight performance characteristics of aircraft p0013 N72 11865

High Reynolds number aerodynamic ground testing by moving test specimens on rocket sleds p0216 N72 11865

Flight test problems for determining stall and spin characteristics of high performance aircraft p0035 N72 20979

Development of flight test procedures for use with advanced aircraft to determine stores performance characteristics p0035 N72 20980

Techniques and procedures for conducting flight tests of lifting body type aircraft during transonic and supersonic flight conditions [NASA TM X 6808] p0035 N72 20986

Determination of performance data and stability and control characteristics from aircraft performance under unsteady flight conditions p0036 N72 20992

Aerodynamic characteristics of CL 84 tilt wing V STOL aircraft and comparison with handling qualities criteria documents p0038 N72 32023

Analysis of aerodynamic characteristics of VJ 101C and DO 31E V STOL aircraft and comparison with criteria contained in handling requirements documents p0039 N72 32024

Application of simulation and analysis techniques for establishing flying qualities criteria for piloted aircraft p0039 N72 32026

Development and application of pilot rating to determining performance and handling criteria of aircraft p0039 N72 32028

Properties of atmospheric turbulence at low altitudes and effect on aircraft during landing approach and takeoff p0039 N72 32030

Application of model helicopter rotor experiments to determining dynamic stall of rotary wings and predicting aerodynamic loads developed p0017 N73 14002

Numerical analysis of unsteady aerodynamic forces on helicopter rotor blades to determine lift distribution as function of velocity component normal to blades p0017 N73 14003

Proceedings of conference on fluid dynamics of aircraft stalling to include stall and post stall aerodynamic characteristics of various military aircraft [AGARD CP 102] p0041 N73 14998

Design characteristics and performance of airfoils with high lift at low and medium subsonic speeds and various angles of attack p0042 N73 15004

Analysis of aerodynamic processes occurring in flow past unpowered multi element airfoils in high lift attitude p0042 N73 15007

Analysis of aerodynamic stall characteristics of wing sections with high lift devices in two dimensional flow p0042 N73 15008

Development of procedure for determining characteristics of high lift systems where various effects dominate p0042 N73 15009

Analysis of stall and post stall characteristics of F 111 aircraft by development of regression techniques to obtain aerodynamic derivatives p0043 N73 15013

Post stall aerodynamic characteristics of Harrier GR 1 aircraft and development of lift augmenting devices p0043 N73 15014

Development of F 28 transport aircraft wing and analysis characteristics to show effects of boundary layer fences p0043 N73 15015

Wind tunnel tests to obtain preflight estimates of stall speed and low airspeed performance of Boeing 747 aircraft p0043 N73 15016

Aerodynamic design engineering development and flight testing of naval aircraft for operation at high angles of attack p0043 N73 15020

Conference on flight handling qualities and requirements p0044 N73 16993

Revisions to V STOL handling qualities based on criteria p0044 N73 16994

Role of theory and calculations in refinement of flying qualities p0044 N73 15999

Predicting flying qualities by wind tunnel tests p0045 N73 17000

Effect of angle failure on aerodynamic characteristics of supersonic aircraft p0045 N73 17003

Evaluation of fluid dynamics of aircraft stalling to determine effects of three dimensional flow wing sweep twist and high lift devices [AGARD AR 49] p0046 N73 18023

Success of speed record establishment by SA 341 helicopter to include aircraft preparation procedures and requirements for successful completion p0047 N73 21018

Review of tilting rotor technology and comparison of tilting rotor performance with standard rotary wings p0048 N73 21027

Proceedings of conference on fluid dynamics of rotary wings and aerodynamic characteristics of rotary wing systems [AGARD CP 111] p0049 N73 21031

Analytical and experimental techniques to define geometry of vortex field of hovering rotary wing and effect on rotor performance p0049 N73 21032

Improvements in basic rotary wing design and tests to determine effects on helicopter performance p0050 N73 21038

Aerodynamic characteristics of rotary wings under aerial flow conditions and development of numerical analysis techniques p0050 N73 21039

Development of method for predicting performance of heavily loaded propellers and rotors in steady hovering flight p0050 N73 21040

Analysis of unsteady aerodynamic environment of rotary wings and research projects to improve understanding of rotor unsteady airfoils p0050 N73 21041

Analysis of unsteady aerodynamic loading on reference section of helicopter rotor blade in axial or hovering flight under compressible flow conditions p0050 N73 21044

Development of concept of circulation control applied to rotary wings to show effects on hover transition and high speed cruise performance p0051 N73 21050

Wind tunnel tests to determine effects of nonrotating components on helicopter performance and application for helicopter design optimization p0051 N73 21052

Proceedings of conference on rotary wings to investigate rotor wakes aerodynamic characteristics at hover and high advance ratio and aerodynamic noise properties [AGARD AR 61] p0052 N73 21937

Analysis of aerodynamic and dynamic properties of rotary wing aircraft for application to design development and evaluation of helicopters [AGARD LS 63] p0017 N73 22948

Basic dynamics of rotary wings mechanics of helicopter flight and aerodynamic characteristics of advanced rotary wing concepts and configurations p0017 N73 22951

Analysis of effects of aerodynamic and dynamic parameters on design synthesis of rotary wings and application of optimization techniques p0018 N73 22958

Flight test procedures for rotary wing aircraft with emphasis on performance and flying qualities p0018 N73 22959

Numerical analysis of aircraft takeoff performance based on phases of takeoff and forces exerted on aircraft as basis for aircraft design p0053 N73 24051

Analysis of aerodynamic characteristics affecting selection of short takeoff transport aircraft p0055 N73 27012

Aerodynamic characteristics of high lift wing concepts for application to commercial short takeoff transport aircraft p0292 N73 29908

Drag of supercritical airfoils in transonic flow comparison with conventional airfoil drag coefficients p0020 N74 14719

Development of techniques to measure in flight drag of the US Navy fighter airplane and correlation of flight measured drag with wind tunnel data p0022 N74 14734

Rational calculation of design gust loads in relation to present and proposed airworthiness requirements effects of atmospheric turbulence on aerodynamic configuration of short haul aircraft p0059 N74 17440

AERODYNAMIC COEFFICIENTS

Numerical analysis of aerodynamic loads and coefficients for tandem and T tail surfaces harmonically oscillating in subsonic flow p0007 N71 29335

AGARD report on engine airplane interference and wall correction in transonic wind tunnel tests [AGARD AR 38 71] p0010 N71 36400

Conclusions and recommendations concerning wind tunnel tests of interaction between engine flow and wall corrections in transonic wind tunnels p0010 N71 36401

Wall corrections for airplanes with interference lift in transonic wind tunnel tests p0011 N71 36403

Wind tunnel measurements of Reynolds number effect on force and pressure coefficients for slender delta wing at transonic speed p0012 N72 11863

Comparison of flight test and wind tunnel data to determine areas of agreement when nonlinearities appear in aerodynamic coefficients of slender wing aircraft p0036 N72 20990

Development of numerical process for extracting aerodynamic coefficients from flight test data p0036 N72 20991

Application of blockage correction factors to wind tunnel test measurements on aircraft models p0042 N73 15006

Analysis of aerodynamic processes occurring in flow past unpowered multi element airfoils in high lift attitude p0042 N73 15007

Design aspects of stall of powered lift aircraft with externally blown flaps and methods for predicting increment in maximum lift coefficient due to power p0042 N73 15011

Influence of degree of turbulence on aerodynamic coefficients of cascades p0268 N73 19798

Effect of axial velocity ratio on aerodynamic coefficients of compressor cascade in viscous flow p0269 N73 19804

Presentation of helicopter level flight performance as power coefficient compared with tip speed or advance ratio for range of thrust coefficients p0047 N73 21014

Analysis of effects of Reynolds number on aerodynamic stalling of rotary wings and relationship of Reynolds number to aerodynamic coefficients of blade elements p0018 N73 22957

Aerodynamic coefficients for calculating transport aircraft performance using wind tunnel and scale models p0053 N73 24046

Objectives of dynamic tests in low speed wind tunnels and techniques for measuring oscillatory derivatives and transient motion effects p0173 N73 26244

Appendix A data item service for aircraft drag estimation collection dissemination and development of aerodynamic drag prediction data p0020 N74 14717

Transonic drag due to lift of planar jet flapped airfoils p0020 N74 14720

An assessment of the accuracy of transonic drag measurement in a large modern wind tunnel aeroballistic coefficients of bodies of revolution for mathematical modeling p0022 N74 14736

AERODYNAMIC CONFIGURATIONS

Swept wing body configurations for reduced drag at supersonic speed p0002 N71 19358

Computer program for determining low speed interference effects of flow fields about arbitrary bodies by superposition p0005 N71 19377

Symposium on unsteady aerodynamic forces loads and configurations for aeroelastic analysis of interfering surfaces [AGARD CP 80 71 PT 2] p0008 N71 29338

Analysis of aerodynamic characteristics of VJ 101C and DO 31E V STOL aircraft and comparison with criteria contained in handling requirements documents p0039 N72 32024

Development of criteria specification for supersonic transport aircraft and application to safe handling qualities for all regimes of flight operations p0039 N72 32027

Analysis of factors in stall and post stall operating conditions and effect on aircraft configurations p0039 N72 32029

Proceedings of conference to analyze static and dynamic loads exerted on helicopter rotary wings and application to improved helicopter design [AGARD R 595] p0016 N73 14000

Design characteristics and performance of airfoils with high lift at low and medium subsonic speeds and various angles of attack p0042 N73 15004

Aerodynamic configurations of swept wings to improve lift performance at stall in higher range of subsonic speeds p0042 N73 15010

Modifications of Jet Provost and Strikemaster trainer aircraft to provide adequate stall warning without excessive penalty on maximum lift at low speed p0042 N73 15012

Analysis of high subsonic and transonic characteristics of fighter aircraft and factors affecting aerodynamic boundaries for various wing design parameters p0043 N73 15019

Flight tests of Westland Scout helicopter fitted with reduced scale version of rigid rotor to determine airworthiness and handling characteristics p0047 N73 21017

Survey of problems encountered in prediction of structural design loads and aeroelastic stability margins during development of rotary wing aircraft p0048 N73 21020

Aerodynamic characteristics of circulation controlled rotor and fundamental problems of stopped rotor aircraft p0048 N73 21024

Development of jet flap rotor and application to heavy helicopter and stoppable rotor designs p0048 N73 21025

Review of tilting rotor technology and comparison of tilting rotor performance with standard rotary wings p0048 N73 21027

Development of advancing blade concept rotary wing and wind tunnel tests of full scale model p0048 N73 21029

Proceedings of conference on fluid dynamics of rotary wings and aerodynamic characteristics of rotary wing systems [AGARD CP 111] p0049 N73 21031

Aerodynamic characteristics of rotary wings under axial flow conditions and development of numerical analysis techniques p0050 N73 21039

Analysis of unsteady aerodynamic environment of rotary wings and research projects to improve understanding of rotor unsteady airloads p0050 N73 21041

Effect of rotary wing airfoil modifications on performance stability and control of helicopters p0051 N73 21045

Development of technique for rotor blade design and measurement of pressure distribution along the blade chord and across blade wake near rotor in flight p0051 N73 21047

Development of algorithm for calculating inviscid flow about arbitrary planform rotors and application to analyzing various rotary wing configurations p0051 N73 21048

Development of concept of circulation control applied to rotary wings to show effects on hover transition and high speed cruise performance p0051 N73 21050

Aerodynamic dynamic and aeroelastic problems of rotary wing design for helicopters and V STOL aircraft with application to flexible rotor systems p0051 N73 21051

Wind tunnel tests to determine effects of controlling components of helicopter performance and application for helicopter design optimization p0051 N73 21052

Fundamentals of rotary wing aerodynamics and application to performance considerations of helicopters p0017 N73 22950

Effects of aeroelasticity on performance of rotary wings and procedures for predicting aerodynamic forces on rotary wing blades p0017 N73 22952

Effects of aerodynamic drag on rotary wing performance and methods for predicting influence of stall and compressibility parameters p0017 N73 22954

Development and application of aircraft performance prediction methods for subsonic and supersonic transport and fighter aircraft [AGARD LS 56] p0053 N73 24042

Parametric and optimization techniques for aircraft design synthesis to show principles of data flow for concept development p0053 N73 24049

Review of V STOL development programs to compare basic characteristics of XC 142A X 19A and X 22A aircraft under various flight conditions p0054 N73 27003

Design, development and flight characteristics of YAK 191 B V STOL strike reconnaissance aircraft p0054 N73 27006

Propulsive lift technology program for development of short takeoff aircraft propulsion systems and lift augmentation devices p0055 N73 27009

Design, development and evaluation of Buffalo Sonic Augmentor Wing research aircraft using internally blown flap for lift augmentation p0055 N73 27010

Technical evaluation report on Fluid Dynamics Panel Specialists Meeting on Aerodynamic Drag [AGARD AR 58] p0018 N74 10905

Rotary wing design methodology based on coupled aeroelastic blade loads analysis p0056 N74 10909

Helicopter rotor loads prediction and correlation techniques for numerical analysis of aerodynamic data p0056 N74 10911

Rotor system design and evaluation using a general purpose helicopter flight simulation program p0056 N74 10913

The prediction of loading actions on high speed semi rigid helicopters p0056 N74 10914

Loads prediction methods for hingeless rotor helicopters p0056 N74 10915

Technical Evaluation report application of aerodynamic drag research to design of aircraft p0019 N74 14710

Measurements of the drag of some characteristic aircraft excrescences immersed in turbulent boundary layers p0019 N74 14714

Remarks on methods for predicting viscous drag aerodynamic drag prediction for high angles of attack and multielement airfoils p0020 N74 14718

New investigations for reducing the base drag of wings with a blunt trailing edge effects of splitter plates and splitter wedges on aerodynamic drag coefficients p002C N74 14723

Drag of lifting bodies for pilots at high altitude p0021 N74 14731

Development of techniques to measure in flight drag of a US Navy fighter airplane and correlation of flight measured drag with wind tunnel data p0022 N74 14734

AERODYNAMIC DRAG

Review of drag measurements from flight tests of finned aircraft with comparisons to wind tunnel predictions p0022 N74 14735

An assessment of the accuracy of transonic drag measurement in a large modern wind tunnel aeroballistic coefficients of bodies of revolution for mathematical modelling p0022 N74 14736

AERODYNAMIC FORCES

Symposium on unsteady aerodynamic forces loads and configurations for aeroelastic analysis of interfering surfaces [AGARD CP 80 71 PT 2] p0008 N71 29338

Computer programs for calculating airforce coefficients of wing horizontal tail and fin horizontal tail oscillating in subsonic flow p0009 N71 29342

Method for calculating flutter using interference aerodynamic forces between wing and tail p0009 N71 29345

Calculated values of air forces on oscillating thin wings obtained by linearized potential flow [AGARD R 583 71] p0010 N71 35198

Design and development of instrument for measuring aerodynamic loads and fatigue characteristics of aircraft structures [AGARD R 597] p0041 N73 13019

Analysis of velocity profiles in boundary layer produced by incompressible flow during takeoff p0041 N73 15001

Collection and processing of gust load data obtained from counting accelerometers mounted at center of gravity of various aircraft [AGARD R 605] p0046 N73 20023

Calculation and measurement of aerodynamic forces on oscillating airfoil with and without aerodynamic staling p0050 N73 21042

Influence of various aerodynamic forces on rectangular wing performance with harmonic movement parallel to stream flow movement p0050 N73 21043

A review of supersonic sphere drag from the continuum to the free molecular flow regime p0022 N74 14732

Interfering lifting surfaces in unsteady subsonic flow Comparison between theory and experiment [AGARD R 614] p0023 N74 18654

AERODYNAMIC HEATING

Effects of streamline curvature and adjacent flow applied to boundary layer conditions on wing sections of turbomachine blades [AGARD AG 169] p0184 N74 12042

AERODYNAMIC INTERFERENCE

Integrated rotor body loads prediction p0057 N74 10916

Comments on NASA Langley research on transonic unsteady aerodynamics Potter calculation method [NASA TM X 69997] p0023 N74 18652

Aerodynamic interference induced by reaction control flow distribution of some supersonic gaseous jets interfering with transverse external flow [AGARDOGRAPH 177] p0184 N74 18923

AERODYNAMIC LOADS

Computerized prediction of interference flow fields for wing fuselage store location of bombs and all p0005 N71 29381

Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in unsteady supersonic and subsonic flow including interference lift [AGARD CP 80 71 PT 1] p0007 N71 29331

Aerodynamic load prediction for oscillating surfaces in unsteady supersonic and subsonic flow p0007 N71 29334

Numerical analysis of aerodynamic loads and flutter for tandem and T tail surfaces harmonically oscillating in subsonic flow p0007 N71 29335

Wing interference lifting line lattice simulation and application to aerodynamic loads on tandem wings in unsteady flow p0008 N71 29336

Prediction of method for calculating aerodynamic loads on tandem delta wings with oscillations in supersonic flow p0008 N71 29337

Symposium on unsteady aerodynamic forces loads and configurations for aeroelastic analysis of interfering surfaces [AGARD CP 80 71 PT 2] p0008 N71 29338

Kernel functions of subsonic unsteady airfoil and lifting surface p0008 N71 29339

Survey of aerospace industry to determine various techniques used in predicting aerodynamic loads flutter stability control and load alleviation data for structural loads [AGARD R 592] p0040 N73 13020

Design and development of instrument for measuring aerodynamic loads and fatigue characteristics of aircraft structures [AGARD R 597] p0041 N73 13019

Proceedings of conference to analyze static and dynamic loads exerted on helicopter rotary wings and application to improved helicopter design [AGARD R 595] p0016 N73 14000

Application of nozzle jet interaction effects to determine lift loss of rotary wings and prediction of aerodynamic load developed p0017 N73 14002

Numerical analysis of unsteady aerodynamic forces on helicopter rotor blades to determine lift distribution as function of velocity component normal to blades
p0017 N73 14003

Relation between measured C.G. vertical accelerations and loads at T tail of military aircraft p0291 N73 16904

Calculation of induced load effects on controllability of rigid and flexible aircraft p0045 N73 17004

Survey of problems encountered in prediction of structural design loads and aeroelastic stability margins during development of rotary wing aircraft p0048 N73 21020

Analysis of unsteady aerodynamic loading on reference section of helicopter rotor blade in axial or hovering flight under compressible flow conditions p0050 N73 21044

Aerodynamic characteristics of helicopters with emphasis on airloads, aeroelasticity, and mechanical instabilities
p0017 N73 22949

Effects of aeroelasticity on performance of rotary wings and procedures for predicting aerodynamic forces on rotary wing blades p0017 N73 22952

Analysis of effects of aerodynamic and dynamic parameter on design synthesis of rotary wing, and application of optimization techniques p0018 N73 22958

Analysis of aircraft structural loads in operational flight to determine effects of pilot performance and aircraft characteristics
[AGARD R 608] p0055 N73 27895

Proceedings of conference on acoustic fatigue to show effects of aerodynamic loads, response of structures, structural design, and fatigue test methods
[AGARD CP 113] p0292 N73 29905

Specialists Meeting on Helicopter Rotor Prediction Methods
[AGARD CP 122] p0055 N74 10908

Rotary wing design methodology based on non-linear aeroelastic blade loads analysis p0056 N74 10909

Prediction of helicopter rotor loads based on alleviating aerodynamic loads imposed on rotary wing and rotor hub p0056 N74 10911

Helicopter rotor loads predictions assumptions and techniques for numerical analysis of aerodynamic loads
p0056 N74 10912

The prediction of loading actions on high speed semi-rigid helicopters p0056 N74 10914

Loads prediction methods for hingeless rotor helicopters p0056 N74 10915

Integrated rotor, body loads prediction
p0057 N74 10916

On the prediction of aerodynamic loads on oscillating wings in transonic flow
[AGARD R 612] p0023 N74 18653

AERODYNAMIC NOISE

Structural vibration and noise effects on man in aerospace operations
[AGARDOGRAPH 151] p0076 N73 17098

Airborne noise in aerospace operations and bioacoustics effects on man p0076 N73 17100

Analysis of aerodynamic noise produced by rotary wings and methods for noise reduction based on shed vortex wakes and blade tip modification p0052 N73 21053

Generation of aerodynamic noise by turbulent wake behind rotary wing airfoil and relationship to drag and lift coefficients p0052 N73 21054

Analysis of helicopter internal and external noise levels for various flight conditions and timing of acoustical spectra p0052 N73 21055

Noise spectrum characteristics and directivity patterns for rotary wings as function of blade tip speed, total rotor thrust, and angle of rotor disc plane p0052 N73 21058

Proceedings of conference on rotary wings to investigate rotor wakes, aerodynamic characteristics at hover and high advance ratio, and aerodynamic noise properties
[AGARD AR 61] p0052 N73 21931

Fundamentals of helicopter noise generation and propagation to include noise control procedures and cost effectiveness of noise reduction p0017 N73 22953

Effects of turbulence and noise on wind tunnel measurements at transonic speeds p0184 N73 26284

AERODYNAMIC STABILITY

Flaps and leading edge modifications for improved aerodynamic control stability of military aircraft
p0029 N71 23422

Effects of semi-rigid rotors on helicopter autostabilizer design p0032 N72 11928

Analysis of aircraft structural flexibility and flight controls interface with application to aircraft design criteria
p0039 N72 32031

Flight tests to determine buffet characteristics of four high performance aircraft during transonic maneuvers
p0043 N73 17017

Flight tests of XH-51 helicopter to determine effects of gyroscopic and control spring modifications on stability and control p0047 N73 21015

Analytical and experimental techniques to define geometry of vortex field of hovering rotary wing and effect on rotor performance p0049 N73 21032

AERODYNAMIC STALLING

Flow model for shock induced leading edge transonic flow, turbulence and rear separation in low speed stall of airfoil p0011 N72 11858

Flight test procedures for determining stall and spin characteristics of high performance aircraft
p0025 N72 20979

Inlet random pressure fluctuation effects on turbojet engine stall characteristics p0037 N72 27022

Developments in unsteady aerodynamics of helicopter rotary wings to analyze stall flutter, transient effects of interactions and wake induced instabilities
p0017 N73 14001

Proceedings of conference on fluid dynamics of aircraft stalling to include stall and post stall aerodynamic characteristics of various military aircraft
[AGARD CP 102] p0041 N73 14998

Analysis of parameters affecting aircraft stall and post stall gyrations to include aerodynamic configurations and pilot performance p0041 N73 14999

Analysis of annular part of separation bubble, in two dimensional incompressible flow for various shaped objects p0041 N73 15000

Development of method for calculating small separation zones near leading edge of airfoil at incidence
p0041 N73 15002

Analysis of aerodynamic stall characteristics of wing sections with high lift devices in two dimensional flow
p0042 N73 15008

Aerodynamic configurations of swept wings to improve lift performance at stall in higher range of subsonic speeds p0042 N73 15010

Design aspects of stall of powered lift aircraft with externally blown flaps and methods for predicting increment in maximum lift coefficient due to power
p0042 N73 15011

Modifications of Jet Provost and Strikemaster trainer aircraft to provide adequate stall warning without excessive penalty on maximum lift at low speed p0042 N73 15012

Analysis of stall and post stall characteristics of F-111 aircraft and development of regression techniques to obtain aerodynamic derivatives p0043 N73 15013

Post stall aerodynamic characteristics of Harrier GR-1 aircraft and development of lift augmenting devices
p0043 N73 15014

Development of F-28 transport aircraft wing and analysis characteristics to show effects of boundary layer fences
p0043 N73 15015

Wind tunnel tests to obtain pre-flight estimates of stall speed and low air speed performance of Boeing 747 aircraft p0043 N73 15016

Analysis of aerodynamic buffeting and related phenomena to include development of models for oscillatory rigid body motion p0043 N73 15018

Evaluation of fluid dynamics of aircraft stalling to determine effects of three dimensional flow, wing sweep back, and high lift devices
[AGARD AR 49] p0046 N73 18023

Wind tunnel tests of rotary wing to determine retreating blade stall at several preset parameters and effect of reverse flow area p0049 N73 21037

Calculation and measurement of aerodynamic forces on oscillating airfoil with and without aerodynamic stalling
p0050 N73 21042

Developments in techniques for analyzing boundary layer characteristics of rotary wings based on unsteady viscous-inviscid interaction p0051 N73 21046

Analysis of effects of Reynolds number on aerodynamic stalling of rotary wings and relationship of Reynolds number to aerodynamic coefficients of blade elements
p0018 N73 22957

Dynamic stall
[NASA CR 136473] p0018 N74 13709

AERODYNAMICS

Subject and author index on aeroelasticity documents
[AGARD R 578 71] p0001 N71 17432

Aerodynamics and applications of lift augmentation devices, AGARD lecture series
[AGARD LS 43 71] p0025 N71 20051

Aerodynamic effects of mechanical high lift devices on conventional airfoils p0025 N71 20052

Aerodynamics of pneumatic high lift devices
p0025 N71 20053

Aerodynamics of variable sweep aircraft design
p0025 N71 20054

Aerodynamics of two dimensional flow on high lift systems p0027 N71 20067

Critique of topics discussed at AGARD meeting on aerodynamic interference
[AGARD AR 34 71] p0010 N71 31459

Design and aerodynamic performance of clamshell target thrust reverser p0264 N72 16695

Role of theoretical studies of flight dynamics in relation to flight testing p0045 N73 17017

AEROELASTICITY

Subject and author index on aeroelasticity documents
[AGARD R 578 71] p0001 N71 17432

Optimization of aeroelastic constraints for aircraft design using differential equation idealization and finite element approximation

AEROSPACE SYSTEMS

Cost research by NATO of manpower, training, and personnel requirements to support evolution of aeronautical and aerospace systems during next decade
[AGARD AR 35-71] p0175 N71 25073
Application of digital computer technology to aerospace systems and impact of new technologies
p0122 N72 21212
Advantages and disadvantages of federated and integrated computer system organizations for information with aerospace systems p0155 N72 21213
Analysis of ablation processes for aerospace systems
[AGARD AG 161] p0299 N72 24959
Onboard computers for automatic control of manned aerospace systems considering human factors integration
[AGARD CP 114] p0278 N73 23881
Exponential probability distribution analysis for extrapolating aerospace system performance statistics from test results p0281 N73 23903
Computerized teleoperator applications in manned aerospace systems p0281 N73 23904

AEROSPACE VEHICLES

Software and hardware technology for application of computer systems to guidance and control of aerospace vehicles
[AGARDOGRAPH 158] p0155 N72 21211
Generation and checkout of computer programs for real time control of aerospace vehicles p0155 N72 21215
Design and characteristics of auxiliary power source to operate electrical, hydraulic, and pneumatic subsystems on ramjet powered aerospace vehicles p0265 N73 19048
Conference on high temperature corrosion of alloys for aerospace applications
[AGARD CP 120] p0201 N73 22592
NATO national reports on high temperature corrosion of aerospace alloys p0203 N73 23518
Characteristics of carbon fiber composite materials and applications for structures with reduced weight, fatigue reduction, and increased resistance p0210 N73 27477
Production of various metal composites by rolling of powder with strong emphasis on development and application to aerospace vehicle structures p0212 N73 27478
Design and manufacturing of composite materials with organic matrices for use in aerospace vehicle structures subjected to high temperatures p0212 N73 27489
Application of high strength structural materials for aerospace vehicles and use of passive control concepts for improved damage tolerance p0294 N73 29928

AEROTHERMODYNAMICS

Lift augmentation devices effect on STOL engine - fan 2 thermodynamic problems p0026 N71 24642
Analysis of requirements, instruments and procedures for measurement of aerodynamic temperatures up to Mach 3.0 and altitudes up to 80 000 feet
[AGARD AG 160 VOL 2] p0196 N73 22499

AFTERBODIES

Aircraft afterbody and engine exhaust interference at subsonic, transonic, and supersonic speeds
[NASA TM X-66888] p0033 N71 19768
Transonic performance of double flow engine nacelle, intake and afterbody at high Reynolds numbers
p0033 N72 [illegible]
Wind tunnel tests of afterbody thrust and correction for models with simulated hollow nacelles p0263 N72 16689
Optimization parameters for afterbody adaptation and ejector performance p0264 N72 16696

AGE FACTOR

Age and exercise factors influencing osteoporosis, bone strength, and alleviation tolerance investigated using rhesus monkeys
[AMRL TR 70-74] p0068 N71 20359
The thousand aviators - Aging and the blood pressure p0084 N74 13786
Elevated blood pressure in aircrew p0085 N74 13707
Management of glaucoma in an aging flying population p0086 N74 13799
Pure tone hearing losses in pilots of various aircraft age and flying time and its significance for in flight speech communication p0087 N74 13801
Pilots in prime of flying personnel p0087 N74 13802
The problem of diabetes mellitus in aviation medicine - control of hypoglycemic reactions in flying personnel p0087 N74 13804

AGING (BIOLOGY)

Physical fitness of flying personnel and aging effects on flight crew performance
[AGARD CP 81-71] p0091 N71 22301
Physical fitness assessment of older pilots in relation to flight requirements and physiological responses p0091 N71 22304
Exercise effects on physical fitness and cardiovascular system of aging pilot p0092 N71 22313
Electrocardiographic and blood pressure standards of physical fitness for aging pilots p0092 N71 22314
Coronary system diseases in aging flight crews and removal from flying status p0092 N71 22315
Aging effects on military flight crew body composition and physical exercise performance p0093 N71 22316
Cardiovascular disease effects in aging flying personnel on physical exercise performance p0093 N71 22317
Arteriosclerosis and exercise - roentgenographic abnormalities in aging pilots of French Air Force p0093 N71 22318
Aging effects on pilot psychophysiology at altitude and flying proficiency p0093 N71 22319
Audiometric evaluation of aging pilots hearing acuity in relation to flying time p0093 N71 22320
Formula to predict physical fitness of flying personnel - Norwegian Air Force during aging process from spirometric measurements p0094 N71 22321

AIR BREATHING ENGINES

Development of techniques for evaluating performance of air breathing engines and measurement of significant operating parameters
[NASA TM X-68305] p0035 N72 20983
Development in the fabrication and composite materials for application to air breathing engines, aeronautical vehicles and space vehicle components p0212 N73 27491

AIR COOLING

Mathematical model for calculating blade temperatures in convective cooled gas turbines p0257 N71 17375
Effectiveness of air cooling blade designs - Glyptal 593 gas turbine engine p0257 N71 17376
Heat transfer in air cooling and sweat cooling techniques for high temperature gas turbine engine components p0258 N71 17383
Temperature field measurements with a convective cooled rotor blade of gas turbine engine p0259 N71 17387
Air cooling systems for nozzle guide vanes of aircraft gas turbines p0260 N71 17396
Operational design criteria for gas turbine engines p0261 N71 17402

AIR FLOW

Perforated gas ejection for turbine blade film cooling with low mainstream losses
[NASA CR-[illegible]] p0259 N71 17388
Impact tube - method for turbine rotor blades p0260 N71 17397
Performance evaluation for jet engine airflow matching requirements of aerodynamic inlet-compressor interface for supersonic transport p0265 N72 16703
Application of laser beams for measurement of aerodynamic flow fields at supersonic and hypersonic speeds p0269 N72 25503
Development and characteristics of dual slotted aerodynamic devices made for flow distribution measurement in wind tunnels for engine flow west and across high lift wing sections p0269 N72 25506
A physical model of turbulence required for aerodynamic measurements at transonic speeds during wind tunnel tests p0173 N73 26742
Effects of streamline curvature on turbulent flow and heat transfer in gas flows on wing sections and turbine blades
[AGARD AG 169] p0184 N74 12042
A review of supersonic diffusion from the compressor to the transonic fan engine p0622 N74 14732
Performance of a two-dimensional p0174 N74 16983
Aerodynamic interference between jet exhaust and nozzle afterbody
Flow distribution at rear of supersonic gaseous jets obtained by a Pitot sensor external flow
[AGARDOGRAPH 137] p0184 N74 18923

AIR INTAKES

Transonic performance of double flow engine nacelle intake and afterbody at high Reynolds numbers
p0033 N72 11868

AIR MASSES

Mathematical model for acoustic gravity wave excitations moving air masses p0134 N73 14135

AIR NAVIGATION

Analysis of tasks required for data processing equipment in advanced aircraft navigation systems
p0156 N72 21222
Non-linear control of delta modulated voice signals in air navigation telecommunication system
p0131 N73 10194
Proceedings of conference on inertial navigation components and systems with emphasis on concepts and techniques involving cost and performance tradeoffs
[AGARD CP 116] p0227 N73 20684
Application of inertial-aerial hybrid system and Kalman filter algorithm to fixed feedback gain p0229 N73 20701
Fault detection possibilities in integrated navigation system employing Kalman filtering p0231 N73 20712
Life cycle cost analysis of inertial navigation systems for aircraft and land surface vehicles p0232 N73 20717
Proceedings of conference on air traffic control developments and procedures
[AGARD CP 105] p0232 N73 23689
Air traffic control facilities operated by U.S. Federal Aviation Administration and developments in improved air traffic control systems p0232 N73 23690
Organization and operation of European air traffic control system and development of improved equipment for identification and tracking p0232 N73 23693
Comparison of cost, complexity, and concept evaluation for several area navigation system configurations p0232 N73 23697
Characteristics of airborne area navigation equipment and operational implementation problems p0232 N73 23698
Analysis of North Atlantic area navigation to determine impact of inertial navigation and satellite derived position fixes p0233 N73 23699
Development and characteristics of forward area tracking and landing guidance system for military aircraft operations p0234 N73 23708
Development of a low altitude, high resolution, all weather, ground based area position indicator system p0234 N73 23711
Analysis of operational requirements and development of navigation equipment for aircraft and ground based systems for improvement of capability p0235 N73 23720
Analysis of integrated communications, navigation and identification system for aircraft operation and proposals for improved capability p0235 N73 23727
[illegible] p0236 N74 14345
[AGARD LS 60] p0236 N74 14345

AIR POLLUTION

Proposal for international air pollution monitoring and analysis system p0113 N71 29531
Space satellite propagation of digital beacon signals for monitoring air pollution - Faraday rotation and radar techniques p0122 N72 21697
International survey of air pollution by aircraft engines and fuels
[AGARD AR 43] p0211 N72 21699
Analysis of air pollution caused by air traffic - emissions, levels of impact and comparison with air pollution in urban areas p0277 N73 24788
Atmosphere, Pollution, Aircraft Engines
[AGARD CP 125] p0278 N74 14271
Reduction of NO formation in the primary p0277 N74 14272
United States Department of Transportation research program on the high altitude pollution problem p0277 N74 14273
Nitrogen oxides - water vapor reaction in the troposphere and stratosphere p0278 N74 14275
Photographic analysis of aircraft engine exhaust at high altitudes p0278 N74 14277
Effect of supersonic transport on the ozone layer - stratospheric photochemical aspects with emphasis on nitrogen oxides p0278 N74 14278
Problems of chemical pollution by aircraft - The airport and its immediate environment p0278 N74 14281
Relative contribution of emissions from airport in the UK and the global atmosphere p0278 N74 14282
Pollution levels at London Heathrow Airport and methods of treating them p0279 N74 14284
Pollution from aircraft engines - gas turbine p0279 N74 14285
Exhaust emissions of aircraft engines on the GE CJ-805-3 turbojet engine p0279 N74 14286
NO formation in flame tubes - A study of the influence of the pressure and temperature p0279 N74 14287
Measurement of nitrogen oxides in the stratosphere - Correlation with [illegible] p0279 N74 14288
Factors controlling gaseous emissions from gas turbine engines p0279 N74 14290
A systematic approach to the study of the relationship between emission and ambient air concentrations p0280 N74 14291
Results of a study of the exhaust emissions of current production aircraft engines p0281 N74 14294
Session 4 - Design Operating Variables - Combustor design and operating variables for low pollution control p0280 N74 14297
Modification of turbojet engine combustion chamber for reduction of pollutant emissions p0280 N74 14298

AIR TO AIR MISSILES

A preliminary study on the influence of fuel staging on nitric oxide emissions from gas turbine combustors p0221 N74 14331

Motorist point of view on the effects of low burning rates on pollution p0221 N74 14303

Technical evaluation report on AGARD Technical Meeting on Atmospheric Pollution by Aircraft Engines - requirement to analyze contribution to air pollution near airports from various sources

[AGARD AR 63] p0222 N74 15349

AIR TO AIR MISSILES

Mission requirements for air to air missile and digital computer program to synthesize requirements into preliminary design p0220 N72 27682

AIR TO SURFACE MISSILES

Inertial guidance techniques for midcourse guidance and terminal guidance systems with application to control and guidance of tactical standoff missiles p0227 N72 27691

Life cycle cost analysis of inertial navigation systems for aircraft and air to surface missiles p0232 N73 20217

AIR TRAFFIC CONTROL

Proceedings of conference on air traffic control developments and procedures

[AGARD CP 105] p0232 N73 23689

Air traffic control facilities operated by U S military forces and developments in improved air traffic control systems p0232 N73 23690

Characteristics of air traffic control system to include description of electronic components and projects for developing improved equipment p0232 N73 23692

Development of automated air traffic control system using computer techniques to provide flight safety for increased air traffic p0232 N73 23693

Organization, functions, and capabilities of automated air traffic control system for Rome, Italy p0232 N73 23694

Integrated SAN VAN VOR and DME system for locating and controlling high altitude aircraft p0232 N73 23695

Status and trends of civil air traffic control systems and development of automated network for increased flight safety p0233 N73 23696

Comparison of cost, complexity, and cockpit workload for seven area navigation system configurations p0233 N73 23697

Analysis of North Atlantic air route structure to determine impact of inertial navigation and satellite surveillance on separation reduction p0233 N73 23699

Analysis of terminal air traffic control procedures to determine impact of automation on air traffic controller personnel p0233 N73 23700

Numerical analysis of optimal control and sequencing of air traffic control operations in real terminal area p0233 N73 23701

Analysis of short takeoff and landing aircraft landing guidance systems and application of air traffic control procedures for improved sequencing p0233 N73 23703

Development and characteristics of air traffic management system for operation of military aircraft under instrument meteorological conditions p0234 N73 23704

Development and characteristics of microwave landing system with emphasis on functional design requirements for airborne equipment p0234 N73 23705

Development of Doppler microwave landing system and techniques for eliminating effects of multipath transmissions p0234 N73 23706

Development and characteristics of forward area homing and landing guidance for military aircraft operations p0234 N73 23708

Application of artificial satellites for data acquisition and communication functions in air traffic control system p0234 N73 23709

Development of high bandwidth time division communications system to provide ground based wide area position location system p0234 N73 23711

Development and characteristics of system for separation and control of aircraft to avoid midair collisions p0235 N73 23712

Performance tests of air traffic control system to determine effectiveness in prevention of midair collisions p0235 N73 23713

Analysis of air traffic controller responses under stress conditions to show effects of accuracy, quality, and comprehensiveness of available data p0235 N73 23714

Analysis of man machine interfaces and system reliability for air traffic control automation systems p0235 N73 23715

Analysis of interface between controller and computer in automated air traffic control system p0235 N73 23716

Analysis of development program for improving IFR air traffic control procedures for 1980 time period p0235 N73 23718

Conceptual analysis of improved communication, navigation and identification system for military applications p0235 N73 23719

Analysis of communications, navigation, and identification equipment for aircraft and proposed system for improvement in capability p0236 N73 23720

Analysis of integrated communications, navigation, and identification system for aircraft operation and proposals for improved capability p0236 N73 23721

Air carriers experience with wide area navigation and atmospheric turbulence encountered in air traffic control operations reports and pilot experience p0358 N74 13727

AIR TRANSPORTATION

Stresses and adaptation problems associated with large scale, long range, rapid reaction time aerial troop deployments p0069 N71 20360

United States Department of Transportation research program for high altitude pollution p0217 N74 14223

AIR WATER INTERACTIONS

Influence of solar energy absorption and air water interactions on seasonal thermocline of sea p0241 N73 33623

AIRBORNE EQUIPMENT

Cost ownership analysis of avionic equipment p0190 N71 36784

Conference on propagation ranges of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements

[AGARD CP 90 71] p0121 N72 16085

Airborne remote multispectral photographic infrared and side looking radar sensing for locating construction materials p0121 N72 16087

Analysis of remote Arctic ice pack sensing data obtained by submarine sonar, airborne laser and infrared scanning imagery p0121 N72 16088

Design and performance of microwave radiometer for airborne sensing of sea ice thickness p0121 N72 16089

Impact of technological developments on airborne data acquisition system and ground data processing station p0195 N73 10457

Analysis of effect of mass on operation of airborne superconductor magnetic system with aluminum stabilized conductor p0063 N73 19034

Characteristics of large lightweight saddle coil superconducting dipole magnet for airborne magnetohydrodynamic generators p0064 N73 19038

Characteristics of airborne area navigation equipment and application to air traffic control functions p0233 N73 23698

Development and characteristics of microwave landing system with emphasis on functional design requirements for airborne equipment p0234 N73 23705

Aircraft Navigation systems testing with a high precision reference - development of Completely Integrated Reference Instrumentation System (CIRIS) p0237 N74 14353

AIRBORNE SPACEBORNE COMPUTERS

Computerized Apollo spacecraft attitude control system p0278 N73 12870

Software and hardware technology for application of computer systems in guidance and control of aerospace vehicles

[AGARDOGRAPH 158] p0155 N72 21211

Application of digital computer techniques to aerospace systems and impact of new technologies p0155 N72 21212

Advantages and disadvantages of federated and integrated computer system organizations for utilization in control aerospace systems p0155 N72 21213

Hardware organization and system design of guidance and control computers p0155 N72 21214

General on and checkout of computer programs for real time control of aerospace vehicles p0155 N72 21215

Programming characteristics of future guidance and control computers p0156 N72 21216

Data word length considerations for aerospace computer implementation to obtain required precision levels p0156 N72 21217

Aerospace computer memory technology and application of particular techniques to various system requirements p0156 N72 21218

Aerospace computer input output techniques for control and display phase of interfacing equipment p0156 N72 21219

Fault isolation capabilities for general purpose digital computer used in guidance and control applications p0156 N72 21220

Guidance and control computer actuated display system techniques p0156 N72 21221

Analysis of tasks required for data processing equipment in advanced aircraft navigation systems p0156 N72 21222

Central digital computers for helicopter guidance and control systems p0156 N72 21223

Navigation guidance computer requirements for integrated navigation system using combination of outputs of inertial Doppler and loran equipment p0157 N72 21224

Application of airborne digital computers to Loran C, D and Omega navigation and guidance systems p0157 N72 21225

Selection of computers for satellite based navigation and guidance system designed for aircraft users p0157 N72 21226

Digital computers for navigation and guidance systems and fire control systems in tactical aircraft p0157 N72 21227

Pattern recognition display and computer system with projected display map as means of storing and retrieving coordinates and time related data superimposed on map p0224 N72 22603

Airborne computers for a total concept of manned aerospace systems considering how airborne functions integrate [AGARD CP 114] p0238 N73 23881

Computerized integrated navigation, guidance, and control system with graphic displays for a supersonic fighter p0238 N73 23882

Design of airborne flight data transmission system for automatic acquisition and tracking p0278 N73 23885

Space station information subsystem for automated support of manned operations p0279 N73 23887

Feasibility of automated spacecraft monitoring using real time computer telemetry p0279 N73 23888

Simulation model for optimum spaceborne computer system design controlling shuttle booster subsystems p0279 N73 23891

Onboard computer system for in flight monitoring of space shuttle in support of flight crew p0280 N73 23893

Systems design for spaceborne computer engineering module p0280 N73 23894

Computerized inertia less guidance system for aircraft flight control p0280 N73 23895

Computerized automated avionics system with electronic display for Comet 4 aircraft navigation p0280 N73 23896

Serial digital data bus for integrated avionics system interface p0281 N73 23902

AIRCRAFT

Cost effectiveness of built in test provisions in aircraft operations p0189 N71 36780

AIRCRAFT ACCIDENT INVESTIGATION

Accident investigations, flight control systems, and operational recordings for improved aircraft flight mechanics

[AGARD CP 75 71] p0027 N71 23410

Landing accidents investigations for Hawker Siddeley 748 aircraft with performance measurements on rough surfaces p0028 N71 23417

Pattern of accident distribution for V STOL aircraft in United States of America p0029 N71 23426

Flight mechanics problems in accident investigations for VJ 101 aircraft p0030 N71 23428

Weather factors in civil transport aircraft accidents p0030 N71 23431

Reliability design of manned supersonic aircraft considering safety hazards p0278 N73 23883

The psychologist's role in aircraft accident investigation p0197 N74 18807

AIRCRAFT ACCIDENTS

Influence of environmental factors in aircraft carrier landings and accidents p0070 N71 20369

Aircraft accident injuries and reconstruction from head impact p0099 N72 19123

Personal observations of 340 fatal aircraft accidents for confirmation of lacerations by stems p0095 N72 19124

History of aircraft crash injury studies and facilities for simulation p0103 N72 19150

Protective helmets designed to lessen effects of head injury due to impact in aircraft accidents p0104 N72 19160

Analysis of spatial disorientation occurrences among military pilots and classification according to types of aircraft and nature of accidents p0071 N72 25033

Analysis of military aircraft accidents caused by spatial disorientation p0071 N72 25034

Statistical analysis of military aircraft accidents to determine incidents caused by spatial disorientation p0071 N72 25035

Psychophysiological and environmental factors involved in aircraft accidents of military aircraft and effect of flying experience, including spatial disorientation p0071 N72 25036

German Air Force experiences with certain criteria for granting a waiver p0087 N74 13805

Behavioral aspects of aircraft accident - conference on human factors research projects for reduction of pilot error aircraft accidents

[AGARD CP 132] p0106 N74 15797

Pilot factor in aircraft accidents of the German Federal Armed Forces p0106 N74 15798

Human factors approach to aircraft accident analysis - identification of human engineering deficiencies leading to human error in aircraft accidents p0107 N74 15799

The human factor in pilot aircraft accident patterns - statistical analysis of CF 104 aircraft accident patterns p0107 N74 18800

Incidence cost and factor analysis of pilot error accidents in US Army aviation p0107 N74 18804

AIRCRAFT APPROACH SPACING

Numerical analysis of optimal cost and sequencing of air traffic control operations in real terminal area p0233 N73 23703

Analysis of short takeoff and landing aircraft landing guidance systems and application of air traffic control procedures for improved sequencing p0233 N73 23703

AIRCRAFT CARRIERS

Influence of environmental factors in aircraft carrier landings and accidents p0070 N71 20369

Flight test techniques and data analysis for operational suitability of aircraft for operation on aircraft carriers p0093 N72 20988

Accuracy of vertical motion data displays in simulating carrier landings - Navy Air Force contributed research on display resolution, temporal lead/lag, and motion cues p0225 N72 27684

Flight evaluation and simulation investigation of display and approach techniques for all weather landing of aircraft on small carriers - effect of display parameters on approach performance p0349 N72 31031

AIRCRAFT COMMUNICATION

TACAN system - [illegible] p0235 N73 23716

AIRCRAFT CONFIGURATIONS

Finite element computer program for estimating supersonic aerodynamic interference
[NASA TM X-68884] p0001 N71-19357

Flow field interference beneath swept wing fuselage store installations on aircraft p0005 N71-19380

Wind tunnel model boundary layer refraction through suction for accurate simulation of high Reynolds number full-scale aircraft characteristics p0014 N72-11875

Techniques and procedures for conducting flight tests of lifting body type aircraft during reentry and supersonic flight conditions
[NASA TM X-68306] p0035 N72-20386

Flight tests to determine buffet characteristics of low high performance aircraft during transonic maneuvers p0043 N73-15017

Evaluation of flight dynamics of aircraft wake to determine effects of three dimensional flow using sweep back and high lift devices
[AGARD-AR-49] p0046 N73-18023

Analysis of requirements, instruments and procedures for measuring the flight performance of aircraft operating at Mach 2.2 and the design to 80,000 feet
[AGARD-AG-160-VOL-2] p0096 N73-20499

Proceedings of conference on results of aircraft development tests, including data on experience, flight tests and evaluation of structural aspects
[AGARD-CP-121] p0046 N73-21008

Proceedings of conference on status, application of V/STOL aircraft to future civil and military requirements, progress in research and development
[AGARD-CP-126-VOL-1] p0054 N73-27000

Review of V/STOL aircraft research and development programs to increase effectiveness of aircraft and develop necessary improvements p0054 N73-27007

Flight test and evaluation of C-8A Buffalo V/STOL aircraft with application to specific military roles p0054 N73-27008

Assessment of the influence of inlet and nozzle performance on total aircraft drag p0021 N74-14726

Prediction of installed thrust and fuel consumption for advanced transport aircraft p0021 N74-14727

Trailing edge flap, spoiler/slot deflector and aileron drag reduction by reflexing, or development of new aircraft configurations p0021 N74-14729

Review of drag reduction methods for application to manned aircraft with comparisons to wind tunnel predictions p0022 N74-14735

AIRCRAFT CONTROL

Low altitude flight control problems
[AGARD-CP-22] p0061 N74-73506

Active control systems for high maneuverability and operational requirements for improved aircraft flight mechanics
[AGARD-CP-76-71] p0027 N71-23476

Rapid rigid leading edge model actuators for improved aerodynamic control stability, efficiency, and lift p0029 N71-23422

Combination of reduced visibility and turbulence loss of aircraft control and inadvertent aircraft maneuvers p0032 N72-25041

Proceedings of conference on handling qualities and performance criteria for conventional and V/STOL aircraft
[AGARD-C-106] p0038 N72-32017

Comparison of French and U.S. criteria for aircraft performance and cost of with application to complicated high performance aircraft p0038 N72-32018

Comparison of flight quality criteria documents for United Kingdom and US aircraft to show areas of integration and assessment acceptability of aircraft p0038 N72-32019

Procedures for application of some Federal Aviation Regulations in determining basic handling qualities of piloted aircraft p0038 N72-32020

Review of basic flight qualities criteria for V/STOL aircraft with emphasis on instrument flight characteristics p0038 N72-32021

Development of V/STOL aircraft by digital flight qualities criteria specification and analysis of deficiencies p0038 N72-32022

Analytical criteria for evaluation of high performance aircraft advanced stability and control augmentation systems p0039 N72-32023

Analytical design objectives in pilot handling qualities for control systems and effects on flight characteristics of transport aircraft p0040 N72-32032

Measurement of human operator performance in simulated flight and actual flight during terminal configured maneuvers p0040 N72-32034

Stability and control systems for advanced flight vehicles and pilots
[AGARD-AR-48] p0041 N73-13018

Summaries of papers presented on safe operating aircraft stability and control
[AGARD-CP-119] p0043 N73-16989

Design criteria for stability, and control of military aircraft p0044 N73-16995

Failure of control and warning systems in military aircraft and techniques of overcoming them in aircraft p0044 N73-16998

Control requirements for flight vehicles operating in supersonic maneuvering flight p0045 N73-17016

Fixed wing aircraft handling qualities criteria p0045 N73-17017

Criteria for designing manual control systems for military transport aircraft p0045 N73-17018

Analysis of interactions between aircraft mechanical equipments and performance requirements of aircraft power systems p0065 N73-19349

Structural concepts of rotary wing systems capabilities to show changes in design of specific vertical takeoff aircraft components p0048 N73-21021

Development and application of computer models for vertical takeoff aircraft configurations and effect on improved aircraft performance p0048 N73-21023

Development and application of aircraft performance predictive methods for subsonic and supersonic transport and fighter aircraft
[AGARD-LS-56] p0052 N73-24042

Parametric and optimization techniques for aircraft design systems, showing pitfalls of data flow for component development p0053 N73-24043

Numerical analysis of aircraft takeoff performance based on phases of takeoff and forces exerted for aircraft as basis for aircraft design p0053 N73-24057

Development of two methods for optimizing design of subsonic swept wing jet transport aircraft p0054 N73-24054

Review of V/STOL aircraft research and development programs to increase effectiveness of aircraft and develop necessary improvements p0054 N73-27007

Design, development and characteristics of the 3 V/STOL aircraft to provide solution of several critical problems caused by ground effect and transition flight p0054 N73-27004

Design, development and evaluation of Boeing Supersonic Wing research aircraft using variable sweep inboard flap and lift augmentation p0059 N73-27010

Design, development and requirements for short takeoff transport aircraft for military applications using civil aircraft construction procedures p0055 N73-27011

Analysis of aerodynamic characteristics affecting selection of short takeoff transport aircraft p0055 N73-27012

Analysis of research and development programs and testing of short takeoff transport aircraft in Germany p0056 N73-27013

Technical evaluation report: Application of aerodynamic data base to design of aircraft p0019 N74-14730

A survey of flight prediction techniques applicable to subsonic and supersonic aircraft design p0019 N74-14731

Aircraft drag prediction for project analysis and performance evaluation p0019 N74-14716

The problem of installing a modern high bypass engine on a transport aircraft p0021 N74-14722

Flight test techniques and results of interference effects between aircraft components
[AGARD-CP-140] p0057 N74-17720

Optimum clearance envelopes and test techniques for determination of power specified flight characteristics for military aircraft p0059 N74-17734

Design problems of military aircraft as affected by interference, analytical prediction of aircraft proficiency, wide vibration environment p0059 N74-17735

Data requirements for turbulence in the earth's atmospheric shear layer for STOL design criteria. Development of new attitude and mode for determining importance of gust parameters on STOL aircraft performance p0059 N74-17737

Structural loads and gust criteria. Discussion of gust load analysis methods for application to aircraft design p0059 N74-17739

Rational calculation of design gust loads relative to prescribed flight envelope requirements, effect of atmospheric turbulence on selection of design gust velocities for aircraft p0059 N74-17740

Some considerations of the influence of fatigue on the design of new aircraft p0067 N74-19653

Fatigue design philosophies p0067 N74-19654

Fatigue and damage tolerance philosophies for military aircraft p0069 N74-19656

Designers need for general information from analysis of fatigue features in airframes behavior p0061 N74-19660

AIRCRAFT ENGINES

Aerodynamic noise reduction caused by rear fuselage propulsive jet interaction in BAC aircraft p0004 N71-19376

Lift engine jet deflection effects on STOL aircraft. Part 1: Interference drag, base pressure and afterbody p0026 N72-26061

Lift engine jet deflection effects on STOL aircraft. Part 2: Pressure drag problems p0026 N72-26062

Pitching and efflux characteristics of small gas turbine engine for lift applications and future vehicles
[AGARD-LS-46-71] p0263 N73-26951

Comparison of low weight small turbine engines for lift engines p0263 N73-26955

The role of propulsion in aircraft noise, lower generation of aerodynamic noise and shielding p0263 N73-26963

Comparison of thrust, fuel and take engine power plants for aircraft lift and propulsive engines p0263 N73-26964

Technical evaluation report: Application of aerodynamic data base to design of aircraft p0019 N74-14730

A survey of flight prediction techniques applicable to subsonic and supersonic aircraft design p0019 N74-14731

Aircraft drag prediction for project analysis and performance evaluation p0019 N74-14716

The problem of installing a modern high bypass engine on a transport aircraft p0021 N74-14722

Flight test techniques and results of interference effects between aircraft components
[AGARD-CP-140] p0057 N74-17720

Assessment of high temperature stability of synthetic lubricants for aircraft gas turbines p0254 N72 11695
Analytical methods for early stage detection of oil deterioration in aircraft engines p0254 N72 11698
Thermal stability of dimethyl propane ester based lubricating oil for aircraft engines p0254 N72 11699
Feasibility analysis of solid lubricated ball bearings for aircraft propulsion systems application p0255 N72 11700
Engine aircraft interference thrust inlets nozzles and propulsion systems conference [AGARD CP 91 71] p0263 N72 16685
Program design for study of engine aircraft interference problems p0263 N72 16686
International survey of air pollution by aircraft engines and fuels [AGARD AR 42] p0217 N72 21590
Engine airplane interference corrections in calculating model aircraft performance from wind tunnel test data p0037 N72 27017
Analysis of gas turbine engine requirements and performance when main propulsion system furnishes auxiliary power source p0965 N73 19050
Performance of aircraft gas turbine components in hot corrosive environments p0201 N73 23599
Chemical and mechanical properties of aircraft gas turbine engine components p0201 N73 23600
Analysis of parameters affecting choice of engines for transport and combat aircraft during design process p0053 N73 24048
Analysis of air pollution caused by aircraft engine emissions in vicinity of airports and comparison with air pollution in city areas p0221 N73 24785
Analysis of techniques and equipment required for fuel test of jet aircraft engine nozzles in wind tunnels p0173 N73 26245
Propulsive lift technology program for development of short takeoff aircraft propulsion systems and lift augmentation devices p0955 N73 27909
Detailed exhaust emission measurements of three different turbofan engine designs p0217 N74 14276
Photo oxidation of aircraft engine emissions at low and high altitudes p0218 N74 14277
Effect of supersonic transport upon the ozone layer studied in a two dimensional photochemical model with transport p0218 N74 14278
Technology for the reduction of aircraft turbine engine exhaust emissions p0221 N74 14300
Design and evaluation of combustors for reducing aircraft engine pollution p0221 N74 14302
Aircraft gas turbine pollution control directed toward minimum effect on engine performance p0221 N74 14304
Technical evaluation report on AGARD Technical Meeting on Atmospheric Pollution by Aircraft Engines requirement to analyze contribution to air pollution near airports from various sources [AGARD AR 63] p0222 N74 15349

AIRCRAFT EQUIPMENT

Procedure for measuring performance of aircraft fire extinguishing powders p0253 N72 11691
Negative g strap for restraint and performance during aircraft aerobatics vibration and crash impact p0104 N72 19158
Operating characteristics of integrated aircraft command and control systems p0225 N72 22637
Procedure for determining noise levels on flight test measuring systems p0195 N73 10456
Simulation of flight on Concorde for improving characteristics of flight control system p0046 N73 17014
Evaluation of conference to investigate current and future development of aircraft electrical and auxiliary power systems [AGARD AR 52] p0063 N73 18081
Proceedings of conference on application of superconductivity technique to auxiliary power systems for aircraft and missiles [AGARD CP 104] p0963 N73 19030
Characteristics of conventional alternators and aircraft electrical power systems and comparison with electric systems using superconductors p0964 N73 19036
Features and parameters of superconductive electric machines and design of synchronous electric generator for airborne use p0964 N73 19040
Characteristics of auxiliary power unit combined with accessory drive to form auxiliary power system for aircraft electric power supply p0965 N73 19045
Design principles of auxiliary power units of secondary power system for operation of aircraft equipment p0965 N73 19046
Analysis of interface between aircraft mechanical power requirements and performance requirements of auxiliary power systems p0965 N73 19048
Air force research and development program on aircraft electrical power systems by showing planning process for developing specific classes of technology p0966 N73 19052
Application of solid state switching and time shared digital computer logic to aircraft electrical systems p0966 N73 19053
Development of electrical generating and distribution systems for supersonic aircraft using solid state switching and remote control discrete load devices p0966 N73 19054
Development of integrated control system for supersonic aircraft based on pneumatic power generation p0056 N73 19056
Structural concepts of rotary wing system capabilities to show changes in design of specific vertical takeoff aircraft components p0048 N73 21021
Economic analysis of integrated time frequency systems for aircraft p0235 N73 23717
Analysis of integrated communications navigation and identification systems for aircraft operation and proposal for improved capability p0236 N73 23721
Markings for propeller composites [AGARD AR 56] p0057 N74 12713
Aircraft inertial system testing and evaluation in the United Kingdom p0237 N74 14352
The application of aircrew opinions on cockpit tasks and equipment to flight safety research p0107 N74 18802
Technical and operational aspects of externally mounted aircraft equipment p0305 N74 21614

AIRCRAFT FUELS

Aircraft fuels lubricants and fire safety conferences [AGARD CP 84 71] p0251 N72 11668
Small scale combustion chamber tests for combustion characteristics determination of aviation fuel p0251 N72 11674
Quiescent liquid separators for diesel and water removal from fuel p0252 N72 11676
Fire resistant protection of aircraft fuel systems emphasizing hydrogen treated fuel p0252 N72 11677
Theoretical analysis of fuel ignition by hot propeller and gust induced delay time as function of temperature and width of hot gas region p0252 N72 11683
Fire extinguishing systems in aircraft using gases of solid propellant gas generator to pressurize extinguisher bottle p0253 N72 11685
Electrostatic charging and handling of aviation fuels including surface gap sparking of fuel tanks p0253 N72 11686
Crash safe turbine fuel program and general results p0253 N72 11687
Post crash fire safety of helicopter turbine engine fuels p0253 N72 11688
Simulated crash tests to assess fire resistance of aircraft fuel containing polymer additives p0254 N72 11692
Use of halocarbon substitutes to extinguish aircraft fuel fires p0254 N72 11693
International survey of air pollution by aircraft engines and fuels [AGARD AR 42] p0217 N72 21590
Discussion of aircraft fuels and lubricants to include pyrolysis testing and fire safety [AGARD AR 44] p0255 N72 21811

AIRCRAFT GUIDANCE

Feasibility evaluation of microwave aircraft flight guidance equipment for helicopter approach and landing guidance system p0034 N72 11936
Software and hardware technology for application of computer systems to guidance and control of aerospace vehicles [AGARDOGRAPH 158] p0155 N72 21271
Hardware organization and system design of guidance and control computers p0155 N72 21274
Programming characteristics of future guidance and control computers p0156 N72 21276
Fast operational capabilities for general purpose digital computers used in guidance and control applications p0156 N72 21220
Guidance and control computers, scaled display systems, tech. que p0156 N72 21221
Central digital computers for helicopter guidance and control systems p0156 N72 21223
Application of airborne digital computers to Loran C/D and Omega navigation and guidance systems p0157 N72 21225
Selection of computers for satellite based navigation and guidance system designed for aircraft users p0157 N72 21226
Digital computers for navigation and guidance systems and flight control systems in tactical aircraft p0157 N72 21227
Design guidelines for optimal integrated flight control and guidance displays for V/STOL aircraft [NASA CR 126153] p0224 N72 22630
Organization and operation of a control air traffic control system and development of improved equipment for identification and reporting p0232 N73 23691
Characteristics of air traffic control systems to include descriptions of elements components and projects for developing improved equipment p0232 N73 23692
Development and automated traffic control system using computer techniques to provide flight safety for increased aircraft p0232 N73 23693
Organization functions and capabilities of automated aircraft control system for Rome Italy p0232 N73 23694
Future air traffic control system requirements and development of automated systems for increased flight safety p0233 N73 23696
Evaluation of air navigation techniques for light aircraft for free flight digital system configurations p0234 N73 23697
Survey of air traffic control systems including use of aircraft computers p0233 N73 23701
Analysis of short takeoff and landing aircraft landing guidance systems and application of air traffic control procedures for improved sequencing p0233 N73 23703
Development and characteristics of instrument landing system using radiative materials along runways for glide slope and alignment information p0234 N73 23707
Development and characteristics of forward area homing and landing guidance for military aircraft operations p0. 14 N73 23708
Applications of optical satellites for data acquisition and communication functions in air traffic control system p0234 N73 23709
Development and characteristics of system for separation and control of aircraft to avoid midair collisions p0235 N73 23712
Performance tests of air traffic control system to determine effectiveness in prevention of midair collisions p0235 N73 23713
Analysis of man machine interfaces and system reliability for air traffic control automation systems p0235 N73 23715
Analysis of interface between controller and computer in automated air traffic control system p0235 N73 23716
Analysis of development programs for improving U.S. air traffic control procedures for 1980 time period p0235 N73 23718
Conceptual analysis of purpose for computer program for air traffic control implementation system for military applications p0235 N73 23719
Analysis of communications navigation and identification equipment for aircraft and proposed system for improvement capability p0236 N73 23720

AIRCRAFT HAZARDS

Safety measures to eliminate aircraft fueling vapor hazards [NASA SM X 67125] p0028 N71 23418
Extinguishing flames and fires on aircraft p0252 N72 11680
Flammability properties of jet fuels and its hazards for the aid explosion suppression inside simulated missile operating environment conditions p0252 N72 11681
Various gelled or emulsified fuels for reducing aircraft crash fire hazard p0252 N72 11689

AIRCRAFT INDUSTRY

Survey and analysis of application of nondestructive inspection methods to aircraft structures [AGARD R 587 71] p0197 N72 19541
Aircraft industry survey for analysis of nondestructive inspection methods application to commercial aircraft for 1966 to 1976 p0197 N72 19543

AIRCRAFT INSTRUMENTS

Guidance and control display design for aircraft and spacecraft conference [AGARD CP 96] p0223 N72 22621
Tradeoffs between automatic and manual control electronic aircraft displays and experiments involving immediate response via long term concepts and human judgement p0223 N72 22623
Criteria for elements of multipurpose aircraft display to assure maximum number of instrument readings p0223 N72 22624
Integrated concept research project used to identify goals and display requirements for advanced aircraft p0223 N72 22625
Prediction and measurement of crash hazard pilot performance and systems design implications for pilot recall bias and limitations p0223 N72 22626
Assessment of design aircraft cockpit layout and displays control system p0224 N72 22629
Airborne map display systems using dynamic projected symbology on CRT and electronic alphanumeric displays p0224 N72 22634
Electronic head up display systems for military aircraft p0225 N72 22635
Engineering and operational factors of electromechanical aircraft displays p0225 N72 22636
Spacecraft display technology applied to aircraft guidance and control displays p0225 N72 22641
Flight test data on stereoscopic eye slightest display panel on aircraft concept p0226 N72 22644
Design of aircraft flight test instrumentation systems p0195 N73 10457
Analysis of aircraft instruments and displays for approach control and landing of V/STOL aircraft [AGARD AR 51] p0196 N73 16439
Development of heads up flight data display for aircraft approach and landing all conditions of visibility p0233 N73 23702
Economic analysis of integrated time frequency system for aircraft p0235 N73 23717

AIRCRAFT LANDING

Influence of environmental factors on aircraft accidents landings and accidents p0028 N71 23369
Speed and field length safety factors for approach and landing maneuvers of Bingel aircraft p0028 N71 23429
Systems performance and safety of helicopter approach and landing and landable flight guidance p0034 N72 11939
V/STOL display requirements for approach and landing operations with emphasis on obstacle p0224 N72 22632
Multipurpose waste heat thrust augmentor for improving flight performance of aircraft gas turbine engines and other applications including ablative p0227 N72 22634

Rate of closure as performance monitoring parameter during approach and landing p0226 N72 22643

Propagation of atmospheric turbulence as visual studies and effect on aircraft during landing approach and takeoff p0039 N72 32030

Inflight variable stability airplane investigations during carrier approaches to determine effect of flying qualities parameters on approach performance p0040 N72 32037

Analysis of aircraft instruments and display devices for approach control and landing of V/STOL aircraft [AGARD AR 51] p0196 N73 18439

Analysis of procedures and problems involved in operating helicopters from decks of ships p0246 N73 21013

Development of heads up flight data display for aircraft approach and landing during all conditions of visibility p0233 N73 23702

Analysis of short takeoff and landing aircraft landing guidance systems and application of air traffic control procedures for improved sequencing p0233 N73 23703

Development of Doppler microwave landing system and techniques for eliminating effects of multipath transmissions p0234 N73 23706

Development and enactment of instrument landing systems using radiative materials along runways for glide slope and alignment information p0234 N73 23707

Development and characteristics of forward area homing and landing guidance for military aircraft operations p0234 N73 23708

Methods for evaluating and predicting aircraft performance of turbojet and turbofan aircraft operating in conventional and short takeoff modes p0053 N73 24044

Progress in the mathematical modeling of flight turbulence - effects of atmospheric turbulence during approach and landing of aircraft p0058 N74 12725

The effect of gusts and wind shear on aircraft STOL approach and landing - simulation and flight test of flight control system for short takeoff aircraft p0058 N74 12730

Wake vortex Avoidance System program (WVAS) - 10 year 3 experimental and ground based monitoring and predictive system for safety from wake vortices p0058 N74 12732

Application of energy management concepts to flight path control - attitude command control augmented flight path with e phasized landing approach p0060 N74 12744

AIRCRAFT LAUNCHING DEVICES

Status of electromagnetic launching for aircraft p0006 N71 19388

Human factors engineering tests to determine aircraft pilot compatibility during catapult launching p0071 N72 25037

AIRCRAFT MAINTENANCE

Development of integrated systems for performing carrier operations - helicopter applications p0191 N72 [illegible]

Improvements in military helicopter flight recorders to provide data for safety and operational investigations p0042 N73 21011

AIRCRAFT MODELS

Wind tunnel and flight tests of a model of a powered lift aircraft p0033 N73 [illegible]

Guidance and control methods and flight test results for terminal area flight tests of a full scale powered lift aircraft [AGARD CP 83 71] p0017 N72 31854

Free flight models for dynamic testing at high Reynolds numbers [NASA TM X 62416] p0035 N72 31838

An experimental investigation of the V/STOL transport aircraft configuration with boundary layer control by blowing and upper surface blowing [NASA TM X 62412] p0035 N72 31919

Flow direction and pressure measurements on 12 inclined wing models for use in forward speed and type of stall control tests - closed wind tunnel p0065 N72 36702

Free flight model testing of aircraft research and development p0145 N73 17012

AIRCRAFT NOISE

Noise effects on hearing and speech - review of ground support personnel hearing damage criteria p0077 N73 17051

Development of criteria for helicopter external noise - level of perceived noise and other effects on community acceptance of V/STOL aircraft operations p0092 N73 20932

AIRCRAFT PARTS

Reliability and quality control aspects of aircraft electronic systems p0142 N73 21032

AIRCRAFT PERFORMANCE

Flight simulator and advanced concepts for evaluating operational performance of aircraft flight control systems p0213 N73 23113

Operational performance and handling safety requirements for highly augmented aircraft - example of the XV-5A V/STOL aircraft p0228 N73 23179

Computational techniques for the analysis of engine airframe interference - application to the XV-5A aircraft p0241 N73 24340

Aerodynamic characteristics of a model of a tilt wing V/STOL aircraft p0241 N73 24341

Proceedings of conference on aircraft flight test procedures data acquisition data processing and correlation with wind tunnel test results [AGARD CP 85] p0034 N72 20976

Flight test program and data acquisition techniques for evaluation of Boeing 747 aircraft p0034 N72 20977

Mathematical models for determining flight performance of Concorde aircraft p0034 N72 20978

Flight tests of VTOL aircraft DO 31 p0035 N72 20981

Methods and instruments for determining performance of Concorde aircraft p0035 N72 20982

Development of flight test procedures for use with advanced aircraft to determine performance characteristics p0035 N72 20986

Flight tests performed following initial delivery overhaul repair and overhaul as performed by Canadian Armed Forces p0036 N72 20987

Flight tests to determine suitability of aircraft for operation on aircraft carriers p0036 N72 20988

Flight test procedures for determining turning capability of military aircraft p0036 N72 20989

Determination of performance and stability and control characteristics from aircraft performance under service ready flight conditions p0036 N72 20992

Proceedings of conference on handling qualities and performance criteria for conventional and V/STOL aircraft [AGARD CP 106] p0028 N72 32017

Comparison of French and US criteria for aircraft performance and control with application to completed high performance aircraft p0038 N72 32018

Comparison of presently available documents for United Kingdom and US aircraft to show areas of deficiency in assessing acceptability of aircraft p0038 N72 32019

Procedures for accident investigation of Federal Aviation Regulation requirements governing flying qualities and performance of aircraft p0038 N72 32020

Revisions to the data requirements criteria for V/STOL aircraft to emphasize measurement of flight characteristics p0038 N72 32021

Development of a V/STOL aircraft handling qualities criteria specification - analysis of deficiencies p0038 N72 32022

Aerodynamic characteristics of CL 84 tilt wing V/STOL aircraft at low speeds with flaring and gust response determination p0038 N72 32023

Analysis of criteria for evaluation of flight performance aircraft and its systems for aircraft equipped with control augmentation systems p0039 N72 32025

Application of a time domain data analysis technique for estimating stability derivatives of a piloted aircraft p0039 N72 32026

Development of criteria and flight tests for supersonic transport aircraft adjustments to the flying qualities criteria for application to the Concorde p0039 N72 32027

Development of a digital computer program for determining performance and handling qualities of aircraft p0039 N72 32028

An analysis of the lateral control power requirements for aircraft configurations p0039 N72 32029

Analysis of factors affecting takeoff performance and establishment of the critical takeoff field length p0040 N72 32031

Analysis of criteria for predicting aircraft performance and control characteristics in the powered lift flight regime p0040 N72 32032

Review of research efforts in the handling qualities development of powered lift configurations p0040 N72 32038

Design development and operational problems of the XC-142A tilt wing V/STOL aircraft [AGARD AR 39] p0045 N72 32041

Analysis of factors affecting aircraft performance and operating procedures for flight operations p0041 N73 16993

Mathematical flight dynamics model of the Sikorsky CH-53A helicopter with application to pilot training and performance measurement and evaluation p0042 N73 17032

Pilot workload and performance measurements during CH-53A aircraft operational suitability tests p0043 N73 17051

Flight tests of the Canadian forces CH-113 Labrador helicopter p0043 N73 17052

Analysis of the effects of atmospheric turbulence on aircraft motion at low altitudes p0043 N73 17053

Analysis of the effects of atmospheric turbulence on aircraft motion at low altitudes p0043 N73 17054

Analysis of the effects of atmospheric turbulence on aircraft motion at low altitudes p0043 N73

AIRCRAFT PRODUCTION

Nondestructive tests applied to quality control of airframes made of boron composites p0290 N72 24936

AGARD Annual Meeting 1973 conference on research and development in Greece and use of science and technology to meet military requirements at reduced costs p0304 N74 21610

Techniques oriented towards cost reduction in aircraft production p0305 N74 21613

Research work and costs the role of data processing in aircraft production p0305 N74 21617

Impact of technology on cost reduction in aircraft production p0305 N74 21618

AIRCRAFT RELIABILITY

Physical vulnerability of aircraft volume 1 [AGARD AR 47 VOL 1] p0061 X74 73500

Physical vulnerability of aircraft volume 2 [AGARD AR 47 VOL 2] p0061 X74 73501

Aircraft vulnerability analysis volume 3 [AGARD AR 47 VOL 3] p0061 X74 73502

Helicopter design for improving crash survivability of aircraft and occupants p0101 N72 29141

Reliability design of manned supersonic aircraft considering safety hazards p0278 N73 23883

AIRCRAFT SAFETY

Accident investigations flight control systems and operational recordings for improved aircraft flight mechanics [AGARD CP 76 71] p0027 N71 23410

Operational flight data analysis for improved aviation safety levels p0027 N71 23411

Onboard data acquisition for improved aircraft design and operational flight safety p0027 N71 23412

Operational performance and handling safety requirements for single engine boundary layer controlled aircraft STOL mode p0028 N71 23419

Human factors and safety requirements in aircraft design p0029 N71 23423

Systems performance and safety in helicopter approach and landing and radioelectronic guidance array p0034 N72 11939

Stability and control systems for advanced aircraft flight mechanics and safety [AGARD AR 48] p0041 N73 13018

Procedures for evaluating fatigue quality of aircraft structures based on fatigue life crack propagation and residual strength p0294 N73 29925

AIRCRAFT SPECIFICATIONS

Design development and requirements for short take off transport aircraft for military applications using civil aircraft production procedures p0055 N73 27011

Analysis of research and development programs involving construction of short takeoff transport aircraft in Germany p0055 N73 27013

AIRCRAFT STABILITY

Wind tunnel studies of external store induced flow field instability effects on longitudinal stability of arrow wing aircraft p0005 N71 19387

Proceedings of conference on aircraft flight test procedures data acquisition data processing and correlation with wind tunnel test results [AGARD CP 85] p0034 N72 20976

Flight test procedures for determining stall and spin characteristics of high performance aircraft p0035 N72 20979

Stability and control flight test procedures for V STOL aircraft in general and specific applications to P 1127 and Harrier aircraft p0036 N72 20980

Analysis of factors affecting lateral directional handling qualities of aircraft during short takeoff flight p0040 N72 32033

Analysis of methods for predicting aircraft performance and recommendations for computer programs to provide accurate prediction capability p0040 N72 32036

Inflight variable stability airplane investigations during carrier approaches to determine effect of flying qualities parameters on approach performance p0040 N72 32038

Review of research projects on aircraft handling qualities vehicle stability and control characteristics p0040 N72 32038

Survey of aerospace industry to determine various techniques used in considering interactions of handling qualities stability control and load alleviation devices on structural loads [AGARD R 593] p0040 N73 11029

Stability and control systems for advanced aircraft flight mechanics and safety [AGARD AR 48] p0041 N73 13018

Summaries of papers presented at conference concerning aircraft stability and control [AGARD CP 119] p0043 N73 15989

Relationship between mission requirements of piloted aircraft stability and maneuverability p0044 N73 16995

Design criteria for satisfactory stability and control of military aircraft p0044 N73 16996

Prediction of aeroelastic fatigue moment effects on stability and control p0045 N73 17006

Influence of powered controls on stability and maneuverability p0045 N73 17008

Artificial stabilization to correct control deficiencies for high performance aircraft p0045 N73 17009

Automatic method for determining stability and control derivatives from flight data p0045 N73 17017

Handling characteristics of V STOL aircraft based on data obtained from flight tests simulator operation and analytical studies [AGARD R 577 PT 2] p0055 N73 27906

The problem of installing a modern high bypass engine on a twin jet transport aircraft p0021 N74 14727

Experience with a low altitude turbulence model for autoland certification correlation of gust model data with statistical analysis of flight test results p0059 N74 17738

CSAS design for good handling in turbulence development of design criteria for stability augmentation systems for alleviation of gust effects p0059 N74 17741

Theoretical horizontal tail loads and associated aircraft responses of an autopilot controlled jet transport flying in turbulence analysis of problem areas associated with rigid aircraft controlled by simple autopilot p0059 N74 17742

The design of automatic flight control systems to reduce the effects of atmospheric disturbances flight tests of experimental automatic pilots on BAC 111 aircraft p0060 N74 17743

AIRCRAFT STRUCTURES

Aerodynamic interference characteristics of airframe propulsion systems of transport and military aircraft [AGARD CP 71 71] p0001 N71 19353

Optimization of interferences between aircraft components in supersonic flow p0001 N71 19356

Three dimensional interactions in half cone pressure fields and effects on inlets mounted adjacent to aircraft fuselage p0003 N71 19367

Transfer functions in modelling human pilot and dynamic structural aircraft responses [AGARD R 580 71] p0006 N71 23210

Mathematical modeling of aircraft structural response modes to active control system p0007 N71 23212

Computation and measurements of dynamic aircraft transfer functions to atmospheric turbulence p0007 N71 23213

Survey and analysis of application of nondestructive inspection methods to aircraft structures [AGARD R 587 71] p0197 N72 19541

Stress corrosion cracking in aircraft structures and various materials historical review p0285 N72 21901

Survey and analysis of literature on fatigue damage accumulations in aircraft materials and structures [AGARD AG 157] p0290 N72 22918

Conference on Structural Applications of Advanced Composites [AGARD LS 59] p0203 N72 23583

Composites in structural design process p0209 N72 29592

Primary and secondary structural applications of advanced composites p0210 N72 29596

Analysis of aircraft structural flexibility and flight control interface with application to aircraft design criteria p0039 N72 32031

Calculating eigenfrequencies modes and generalized masses for F 104G aircraft from drawings by finite element method [AGARD R 592] p0290 N72 33915

Random load fatigue of aircraft structures conference [AGARD CP 118] p0291 N73 16896

Fatigue life assessment of aircraft structures based on random or programmed fatigue tests and loadings p0291 N73 16897

Physical aspects of fatigue damage accumulation including interaction and sequence effects p0291 N73 16899

Parametric and optimization techniques for aircraft design synthesis to show principal effects of data flow for component development p0053 N73 24049

Use of reinforced boron and carbon fiber composites in aircraft structures p0211 N73 27484

Construction of glider aircraft using glass fiber and carbon fiber reinforced plastic composite materials for weight reduction and increased strength p0211 N73 27486

Application of composite materials and sandwich structures to reduce vulnerability of aircraft structures to projectile impact p0212 N73 27487

Design and manufacturing of composite materials with organic matrices for use in aerospace vehicle structures subjected to high temperatures p0212 N73 27489

Development of fiber reinforced composite materials for application in air breathing engines aeronautical vehicles and spacecraft components p0212 N73 27491

Summaries of papers presented in AGARD conference on random fatigue [AGARD AR 54] p0292 N73 28884

Analysis of response and fatigue characteristics of light aircraft integrally machined planks with emphasis on basic fatigue properties p0292 N73 29912

Methods for determining aircraft structural response to acoustic fatigue p0293 N73 29913

Structural response and endurance tests of aircraft structural components to determine effect of load sequence testing on acoustic fatigue p0294 N73 29920

Application of spectrum test technique for determining response and life of aircraft structures subject to random noise field excitation p0294 N73 29922

Development of experimental program for determining response and fatigue resistance of lightweight aircraft structures p0294 N73 29923

Development of procedures for predicting fatigue life of aircraft structures based on fracture mechanics crack propagation and residual static strength analysis [AGARD LS 62] p0294 N73 29924

Procedures for evaluating fatigue quality of aircraft structures based on fatigue life crack propagation and residual strength p0294 N73 29925

Procedures for predicting fatigue life of aircraft flying under various load conditions using data obtained by counting accelerometer p0294 N73 29927

Optimization of aircraft structures with multiple stiffness requirements p0297 N74 15612

Structural fatigue analysis and testing for fighter aircraft p0060 N74 19655

AIRCRAFT SURVIVABILITY

Application of composite materials and sandwich structures to reduce vulnerability of aircraft structures to projectile impact p0212 N73 27487

AIRCRAFT WAKES

Comparison of various methods for calculating profile drag from pressure measurements in the near wake at subcritical speeds p0020 N74 14721

The detection of aircraft wake vortices development of acoustic and wind pressure sensors for vortex detection p0058 N74 17731

Wake Vortex Avoidance System program (WVAS) design and implementation of ground based monitoring and predictive system for safety from wake vortices p0058 N74 17732

Vortex wake research inflight investigation of turbulent wake generated by C 5 aircraft p0058 N74 17733

AIRFOIL PROFILES

Design characteristics and performance of airfoils with high lift at low and medium subsonic speeds and various angles of attack p0042 N73 15004

Effect of rotary wing airfoil modifications on performance stability and control of helicopters p0051 N73 21045

AIRFOILS

Aerodynamic effects of mechanical high lift devices on conventional airfoils p0025 N71 20052

Two dimensional wind tunnel tests on airfoils with high lift devices p0025 N71 20056

Representations of flow separation bubbles near airfoil leading edge p0027 N71 20064

Flow model for shock induced leading edge transonic flow turbulence and rear separation in low speed stall of airfoil p0011 N72 11858

Equivalent body of revolution for simulating high Reynolds number effect on transonic flow past two dimensional airfoil p0014 N72 11874

Development of two experimental approaches for analyzing two dimensional flow on high lift devices p0042 N73 15005

Analysis of aerodynamic processes occurring in flow past of powered multi element airfoils in high lift attitude p0042 N73 15007

Analysis of aerodynamic stall characteristics of wing sections with high lift devices in two dimensional flow p0042 N73 15008

Development of procedure for determining characteristics of high lift systems where viscous effects dominate p0042 N73 15009

Aerodynamic configurations of swept wings to improve lift performance at stall in higher range of subsonic speeds p0042 N73 15010

Calculation and measurement of aerodynamic forces on oscillating airfoil with and without aerodynamic stalling p0056 N73 21042

Generation of aerodynamic noise by turbulent wake behind rotary wing airfoil and relationship to drag and lift coefficients p0057 N73 21054

Effects of aeroelasticity on performance of rotary wings and procedures for predicting aerodynamic forces on rotary wing blades p0057 N73 22952

Remarks on methods for predicting viscous drag aerodynamic drag prediction for high angles of attack and multielement airfoils p0020 N74 14718

Transonic drag rise to lift of planar jet flapped airfoils p0020 N74 14720

AIRFRAME MATERIALS

Properties and selective applications of high strength steels aluminum and titanium alloys polymeric materials reinforced materials and composite materials in aerospace engineering [AGARD LS 51 71] p0205 N71 27038

Properties and selective applications of aluminum alloys in airframe construction p0206 N71 27044

Properties and selective applications of titanium alloys in airframes and jet engines p0206 N71 27045

Comparing characteristics of advanced composites with those of conventional airframe materials p0210 N72 29595

Primary and secondary structural applications of advanced composites p0210 N72 29596

Metallurgical aspects of fatigue and fracture toughness considering effects of microstructure on the mechanical properties of airframe materials [AGARD R 610] p0204 N74 23108

The metallurgical aspects of fatigue and fracture toughness effects of microstructure on the mechanical properties of airframe structural materials p0204 N74 23109

AIRFRAMES
High bypass turbofan powered transport aircraft noise prediction for airframe engine interaction effects at various approach speeds p0263 N73 19369
Effect of vortex generator devices on effective STOL aircraft performance. Part 1: Wind tunnel investigations p0226 N73 20761
Nondestructive tests applied to quality control of structures made of boron composite p0290 N73 24936
Interference problems of airframe engine integration in aircraft design optimization
[AGARD LS 53] p0237 N72 27016
Analysis of crack fatigue life of structures subject to aerodynamic loads and application to design of aircraft structures. Part 1
[AGARD AG 152 PT 1] p0290 N72 29893
Design and development of instruments for measuring aerodynamic loads and fatigue characteristics of aircraft structure
[AGARD R 592] p0041 N73 13019
Development of aeroelastic structural design data to reduce effects of acoustic fatigue failure by conventional sandwich panels. Part 2
[AGARD AG 142 PT 2] p0293 N73 14898
Development of a theoretical model for the prediction of aircraft performance p0348 N73 21023
Research work on fatigue and fracture of aircraft structural materials and the application of research results to aircraft operational problems
[AGARD CP 113] p0279 N73 27474
Application of fracture mechanics to materials and structures. Proceedings of the Second Conference
p0311 N73 27482
Application of digital techniques to the control and monitoring of aircraft engines
p0311 N73 27483
Application of composite materials to helicopter structures. Proceedings of the Specialists' Meeting
p0311 N73 27485
Application of a full scale fatigue test to the prediction of the performance and safe life of aircraft structures
[AGARD R 668] p0305 N73 27861
Research on fatigue in aircraft and helicopter materials and structures
[AGARD CP 131] p0292 N73 29904
Design considerations for improved fatigue resistance of high strength aircraft structural materials
p0293 N73 29905
Effect of environment and complex load history on fatigue life
p0293 N73 29906
Fatigue life prediction for aircraft structures and materials
p0293 N73 29907
Application of fracture mechanics to design. Part 3
[AGARD-CP-PART-3] p0298 N73 29910

AIRLINE OPERATIONS
p0318 N74 14784

AIRPORTS
p0318 N74 14793
p0318 N74 14801
p0318 N74 14793

AIRSPEED
p0310 N73 29922

ALCOHOLS
[AGARD-CP-PART-III] p0298 N73 29911

ALERTNESS
p0136 N72 19165

ALGORITHMS
Method of programming to find an optimum design for aerospace vehicle trajectory, applied to boost and interplanetary flight
[AGARD AG 149 71] p0283 N73 20178
Feasible direction algorithms for solving general constrained parameter optimization problems p0284 N73 20155
Computer programs for optimum least weight design of complex elastic redundant structures p0284 N73 20156
Problems and applications of adaptive and self-organizing algorithms for pattern recognition p0152 N73 11185
Edge detection algorithms, two dimensional Fourier transforms and digital methods for scene preprocessing and clustering p0152 N73 11186
Algorithms for reducing estimate variance of a complex mission p0111 N73 10189
Algorithms for adaptive digital filters of data communication systems p0112 N73 10200
Application of human oriented attributes and Kalman type algorithms to fixed leading edge p0239 N73 20201
Integer programming algorithms for optimal configuration design p0295 N74 15674

ALIGNMENT
Performance of gyro stabilized platforms when used in inertial systems requiring rapid alignment p0211 N73 20279
Alignment and calibration of inertial platforms for aircraft applications p0221 N73 20771

ALIPHATIC COMPOUNDS
p0294 N73 31904

ALL WEATHER AIR NAVIGATION
[AGARD CP 86 71] p0040 N73 13016
p0211 N73 20192
Optical sensors for all weather landing systems
[AGARD R 594] p0305 N73 31407

ALLOYS
p0102 N73 19143
Review of advanced materials of NATO countries. Part 1: Titanium alloys
p0298 N73 29912
Metallurgical factors affecting the fatigue strength of aluminum alloy sheet
p0284 N73 29917
[AGARD AR 38] p0291 N73 24903

ALTERNATING CURRENT
p0305 N73 29932

ALTITUDE
p0287 N73 31926

ALTITUDE TOLERANCE
p0287 N73 31927

ALUMINUM
p0288 N73 31944

ALUMINUM ALLOYS
p0288 N73 31945
p0288 N73 31946

ALUMINUM COATINGS
Performance of aluminide coatings on standard high temperature gas turbine engine alloys
[NASA CR 115374] p0259 N71 17393

ALUMINUM COMPOUNDS
p0213 N73 27491

ALUMINUM OXIDES
Thermal expansion behavior of platinum-Al2O3 fiber composites at high temperatures
[AGARD AR 38] p0291 N73 24905
p0292 N73 31937

AMPLIFIERS
p0305 N74 15914

AMPLITUDE DISTRIBUTION ANALYSIS
p0112 N73 19451

ANALOG TO DIGITAL CONVERTERS
p0306 N74 15956

ANGIOGRAPHY
p0301 N74 13784

ANGLE OF ATTACK
p0302 N73 29851

ANGULAR ACCELERATION
p0301 N74 15954

ANGULAR DISTRIBUTION
p0301 N74 15955

ANGULAR MOMENTUM
p0301 N74 15800

ANNOTATIONS

ANNUAL VARIATIONS
p0243 N73 31927

ANNULAR FLOW
p0302 N73 31951
p0302 N73 31954

ANTENNA ARRAYS
p0305 N73 31911

ANTENNA DESIGN
p0305 N74 15956

ANTENNA RADIATION PATTERNS
Pattern test of overhead single antenna experiment tests to determine effects of A-3 body and sea water p0288 N73 21919
Simplified mathematical theory and experimental investigation of scattering of electromagnetic waves p0288 N73 31926
Stress corrosion of titanium alloys p0288 N73 21921
Assessment of the capability of state of the art inertial navigation systems to show factory stress yield strength and rate of strain hardening in the material after forging p0228 N73 20693
Effects of aerodynamic appendages and antenna elements on the airborne earth surface target signature response p0202 N73 33608
Acoustic fatigue tests of aluminum alloy structural elements of the narrow chord fan blade of the YF-100 engine p0294 N73 29927
Development and experimental program for determining response and fatigue life of lightweight aircraft structures p0294 N73 29923

ALUMINUM COATINGS
Performance of aluminide coatings on standard high temperature gas turbine engine alloys
[NASA CR 115374] p0259 N71 17393

ALUMINUM COMPOUNDS
p0213 N73 27491

ALUMINUM OXIDES
Thermal expansion behavior of platinum-Al2O3 fiber composites at high temperatures
[AGARD AR 38] p0291 N73 24905
p0292 N73 31937

AMPLIFIERS
p0305 N74 15914

AMPLITUDE DISTRIBUTION ANALYSIS
p0112 N73 19451

ANALOG TO DIGITAL CONVERTERS
p0306 N74 15956

ANGIOGRAPHY
p0301 N74 13784

ANNULAR FLOW
p0302 N73 31951
p0302 N73 31954

ANTENNA ARRAYS
p0305 N73 31911

ANTENNA DESIGN
p0305 N74 15956

ANTENNA RADIATION PATTERNS

Development of multi-beam antenna system and combiner switch for producing variable coverage radiation pattern for satellite communication system
p0193 N72 19507

Facilities and techniques for measuring antenna radiation patterns of spacecraft telemetry and telecommand antennas
p0194 N72 19512

Characteristics of directional dipole antenna array for very high frequency radio interferometer p0134 N73 10213

Introductory lecture. Target scattering characteristics of importance to radars
p0144 N74 11955

Introductory survey to session 3. Control of antennae side lobes
p0147 N74 13857

ANTHROPOMETRY

Anthropometry and medical re evaluation of pilots
p0074 N72 25055

Anthropometry for protective equipment evaluation and human impact acceleration experiments
p0084 N73 23066

ANTIFRICTION BEARINGS

Development of spherical hydrostatic compliant bearing for directional gyroscope
p0229 N73 20695

ANTIGRAVITY

Negative g strap for restraint and performance during aircraft acrobatics vibration and crash impact
p0104 N72 19158

ANTISUBMARINE WARFARE

Evaluation of the role of the simulator in training airborne ASW operations
p0107 N74 18801

ANXIETY

Relationship of interaction of impulsiveness and anxiety to perceptual motor performance in human beings
p0069 N71 20361

APOLLO SPACECRAFT

Computerized Apollo spacecraft attitude control system
p0078 N72 12870

APOLLO 16 FLIGHT

BIOSTACK experiment on Apollo 16 for studying combined effects of heavy high energy nuclei and space flight factors on resting biological systems
p0083 N73 23062

APPLICATIONS OF MATHEMATICS

Intuitive graphical and simplified mathematical treatment of rotational dynamics as applied to human centrifuges
p0094 N71 23340

APPROACH

Systems performance and safety of helicopter approach and landing and advanced navigation techniques
p0034 N74 11939

V STOL displays requirements for approach and landing under adverse weather conditions
p0224 N72 12632

Multipurpose wide field three dimensional head up display for aircraft pilots during approach and landing and other maneuvers under all attitude changes
p0225 N72 22639

A study of several aircraft flight path display or simulating carrier landing systems as limited by display resolution temporal loading and control sensitivity
p0225 N72 22642

Rate of control as performance factor during [illegible] approach and landing
p0226 N72 22643

The effect of gusts and wind shear for automatic STOL approach and landing simulation and flight test of flight control system for short takeoff aircraft
p0058 N74 17730

APPROACH CONTROL

Speed and field length safety factors for supersonic transport landing in terms of Breguet aircraft
p0023 N71 23120

Advanced concepts for approach and runway control systems in Boeing transport aircraft
p0029 N71 23425

Method for calculating weather minima at small sites to determine economic and social aspects of improvements for military helicopters
p0031 N72 11913

Automatic approach and hover computer for rescue helicopters
p0032 N72 11924

In flight variable stability airplane investigations of carrier approaches to determine effect of flying qualities parameters on approach performance
p0040 N72 32037

Analysis of aircraft instruments and display devices for approach control and landing of V STOL aircraft
[AGARD AR 51]
p0019 N73 18439

APPROACH INDICATORS

Automatic approach and landing system with flight warning signal for Caravelle jet aircraft testing
p0030 N71 23429

APPROXIMATION

Approximation of pressure distribution over a body in hypersonic streams at subsonic speeds
p0001 N71 19364

Approximation of two dimensional subsonic boundary layer under arbitrary wall and free flow conditions
p0176 N72 20229

Numerical approximations of non Gaussian probabilities in hydrodynamics
p0181 N72 22225

Three approximation methods for the Navier Stokes equations for two and three dimensional steady flow
p0181 N72 22240

APTITUDE

Color aptitude of pilots for camouflage detection and [illegible]
p0001 N71 19198

Personality traits as flight aptitude predictors
p0081 N73 18781

AQUEOUS SOLUTIONS

Electrolyte stress intensity values and crack propagation rates for stress corrosion of high strength steel in aqueous environment
p0281 N72 22241

ARCTIC REGIONS

Models of Arctic ionosphere
p0128 N72 21123

Arctic ionogram sequences and auroral oval
p0126 N72 21125

Effects of arctic ionospheric characteristics on radio and radar propagation
[AGARD AR 33]
p0130 N72 22136

AREA NAVIGATION

Comparison of cost complexity and cockpit workload for seven area navigation system configurations
p0233 N73 23697

Characteristics of airborne area navigation equipment and application to air traffic control functions
p0233 N73 23698

Development of high bandwidth time division communications system to provide ground based wide area position location system
p0234 N73 23711

ARMED FORCES

Stresses and adaptation problems associated with large scale long range rapid reaction time aerial troop deployments
p0069 N71 20380

ARMED FORCES (FOREIGN)

Oxygen consumption and work capacity in fitness evaluations on Canadian Armed Forces personnel
p0092 N71 22311

Clinical causes for permanent grounding of German armed forces flying personnel
p0096 N72 14097

Neuropsychiatric and other causes for permanent grounding of French Air Force flying personnel
p0096 N72 14098

Ten year analysis of medical factors in flying and flight training in Great Britain Air Force
p0096 N72 14099

Description of routine cardiologic program to determine flight fitness for German Air Force
p0097 N72 14102

Long term electrocardiograms in analysis of rhythmic heart disturbances of German Air Force
p0097 N72 14103

Physiological factors possibly contributing to coronary risk among German Air Force pilots
p0097 N72 14104

Naval and aural disorders and flight fitness in German armed forces
p0097 N72 14107

Ophthalmological reasons for grounding pilots of German Air Force
p0097 N72 14108

Possible diabetes mellitus in flight crews Canadian Air Force
p0098 N72 14109

Psychiatric reasons for permanent grounding of flight crew members in Royal Air Force
p0098 N72 14110

Psychological factors in pilot grounding in German Air Force
p0098 N72 14111

Clinical requirements for German Air Force pilots
p0077 N73 19063

Color vision requirements of Canadian Armed Forces, including their standard tests
p0077 N73 19070

Color vision requirements of Great Britains Armed Forces
p0077 N73 19072

Operational performance of helicopters in French Army
p0046 N73 21011

Physiological method for selecting and observing student pilots in Belgian Air Force for motion sickness
p0079 N73 21099

Selection of student pilot candidates of the Belgian Air Force by psychometric tests
p0088 N74 18788

ARMED FORCES (UNITED STATES)

U S Army helicopter experience in Vietnam and future helicopter requirements and developments
p0030 N72 11916

Role of flight surgeon and physician pilot in evaluation and treatment of jet fighter pilots
p0095 N72 14094

Trends and factors relative to medical causes for grounding flyers based on USAF School of Aerospace Medicine experience
p0096 N72 14095

Medical aeronautical management and reasons for grounding or relief for Air Force flying personnel
p0096 N72 14096

Observations of aged medical cases reviewed by Navy Special Board of Flight Surgeons
p0096 N72 14100

Cardiac condition as factor in evaluating flight fitness of Air Force personnel
p0096 N72 14101

Factors in medical suspension of Air Force flying personnel
p0097 N72 14105

Effects of CO fumes exposure during ejection extraction escape in USAF
p0102 N72 19144

Comparison of a pilot state analyzer and detection and control personnel
p0078 N73 19073

ARMOR

Materials and design of protective armor
p0102 N72 19143

ARROW WINGS

Wind tunnel studies of aeroelastic stress and load distribution in wings to investigate dynamic stability of arrow wing aircraft
p0001 N71 19182

ARTERIOSCLEROSIS

Arteriosclerosis in fibromyalgia in aircraft observers and pilots of French Air Force
p0093 N71 22318

ARTIFICIAL INTELLIGENCE

[illegible] pattern recognition artificial intelligence with emphasis on [illegible] applications
[AGARD CP 34 71]
p0011 N72 11124

Applications and research to establish requirements for artificial intelligence and speech recognition systems
p0151 N72 11115

Digital data processing problems in photographic interpretation systems
p0151 N72 11116

Edge detection algorithms two dimensional Fourier transforms and linguistic methods for computer processing of natural scenes
p0152 N72 11186

Method for automatic recognition and classification of three dimensional objects by their silhouettes
p0152 N72 11188

Interactive graphic techniques for handling pictorial data and applications to pattern recognition and artificial intelligence
p0154 N72 11203

ARTIFICIAL SATELLITES

Characteristics of attitude control system and onboard computer used with ANS astronomical satellite for ultraviolet and X ray measurements in space
p0191 N72 19491

Development of Canopus star sensor for stabilization of X4 technology satellite
p0192 N72 19499

High latitude modes of scintillation in radio signals from radio sources and satellites
p0128 N72 21137

Application of artificial satellites for data acquisition and communication functions in air traffic control system
p0234 N73 23709

ASPECT RATIO

Transonic wind tunnel model measurements of buffet loads and boundaries at various sweep and aspect ratio wing roots
p0016 N72 11886

ASTHMA

Asthma in military flying personnel
p0085 N74 13792

ASTRONAVIGATION

Characteristics of sensors for spacecraft attitude determination by reference to earth horizon in visible and infrared spectra
p0192 N72 19495

ASYMMETRY

Coexistence of two dimensional and asymmetric flow in channel with constant cross section
p0237 N72 16716

ASYMPTOTIC METHODS

Asymptotic expansion techniques to define pressure loading effects on wings with unbalanced control surfaces
p0010 N71 29348

ATHLETES

Heat tolerance of athletes during muscular exercise in various thermal environments
p0070 N71 20366

ATLANTIC OCEAN

Total electron content of ionosphere with emphasis on North Atlantic region
[AGARD AG 166]
p0187 N73 22350

ATMOSPHERIC ATTENUATION

Conference on atmospheric attenuation and rainfall effects on ultrahigh frequency telecommunication systems
[AGARD CP 107]
p0140 N73 26121

Multiple scattering and attenuation of radio signals caused by rainfall
p0140 N73 26122

Ultrahigh frequency coherent radio signal transmission for differential phase shift measurements due to vapor and oxygen absorption lines
p0141 N73 26131

Role of atmospheric ducts in the phenomena of interference over large distances
p0145 N74 13849

Measurement of atmospheric attenuation at the frequencies of 15 19 and 34 GHz atmospheric effects on microwave transmission
p0149 N74 13870

ATMOSPHERIC BOUNDARY LAYER

Effects of acoustic gravity wave diffusion in atmospheric boundaries
p0133 N72 14136

Problems in the simulation of atmospheric boundary layer flows natural wind environment in atmospheric boundary layer for aerospace and aeronautical applications
p0057 N74 17722

ATMOSPHERIC CHEMISTRY

Atmospheric Pollution by Aircraft Engines
[AGARD CP 125]
p0217 N74 14271

Reduction of NO formations by premixing
p0217 N74 14272

United States Department of Transportation research program for high altitude pollution
p0217 N74 14273

Reaction of ozone with nitrogen oxides at high altitudes
p0217 N74 14274

Nitrogen oxides nuclear weapon testing chloride and stratospheric ozone
p0217 N74 14275

Photo oxidation of aircraft engine emissions at low and high altitudes
p0218 N74 14277

Chemical kinetics in the stratosphere atmospheric composition and atmospheric chemistry based on photolysis initiation reactions
p0218 N74 14279

Relative air pollution emissions from the airport in the UK and neighboring urban areas
p0218 N74 14282

ATMOSPHERIC CIRCULATION

Mathematical models for acoustic gravity wave perturbations in gravity fluid phases
p0134 N73 14135

Problems in the simulation of atmospheric boundary layer flows natural wind environment in atmospheric boundary layer for aerospace and aeronautical applications
p0057 N74 17722

Review of data and typical boundary layer profiles around manmade surface obstructions summary of rules of thumb and computational procedures
p0057 N74 17724

ATMOSPHERIC COMPOSITION

Ultrahigh resolution radar for sensing refractive index structure of troposphere
p0123 N72 16101

Characteristics of electron affinity operation mass spectrometer for satellite application and analysis of atmospheric data aperture
p0192 N72 19494

Design engineering for radio communication systems including propagation considerations
p0141 N73 26128

Chemical kinetics in the stratosphere — atmospheric composition and atmospheric chemistry based on photolysis reactions
p0218 N74 14279

Relative air pollution emissions from an airport and the UK and neighbouring urban areas
p0218 N74 14281

Pollution levels at London Heathrow Airport and methods for reducing them
p0218 N74 14284

Pollution control of aircraft engine test facilities
p0219 N74 14285

ATMOSPHERIC DENSITY

A systematic approach to the study of the connection between emission and ambient air concentrations
p0220 N74 14293

ATMOSPHERIC DIFFUSION

Effects of acoustic gravity wave diffusion on atmospheric boundaries
p0135 N73 14136

ATMOSPHERIC MODELS

Three fluids circulation model for analysis of troposphere structure and dynamics
p0114 N71 21411

Atmospheric simulation model for analysis of tropospheric ultrahigh frequency signal fading
p0118 N71 23456

Models of Arctic troposphere
p0126 N72 21123

Tropospheric propagation models and ground to flight latitude HF radio propagation
p0133 N72 21153

Precipitation models from radar and rainfall data for predicting radio scattering in rainstorms
p0146 N74 13854

A systematic approach to the study of the connection between emission and ambient air concentrations
p0220 N74 14293

ATMOSPHERIC OPTICS

Proceedings of conference on electromagnetic and optical properties of sea water for application to submarine mapping, communications and visibility [AGARD-CP-61]
p0241 N73 33619

Radiance distribution in the fixed-depth cross-sections of ocean and estimation of analysis of ocean's and apparent optical properties
p0241 N73 33621

ATMOSPHERIC PHYSICS

Problems in the simulation of atmospheric boundary layer flows — small-scale convection in atmospheric boundary layer for aerospace and aeronautical applications
p0067 N74 17722

Turbulence and mesoscale horizontal temperature gradients in the lower stratosphere — factors affecting frequency of occurrence and accuracy of forecasting
p0067 N74 17723

ATMOSPHERIC REFRACTION

Climatology and atmospheric refractive models for worldwide satellite wave propagation
p0114 N71 21452

Tropospheric refractivity variation effects on radio wave scatter propagation
p0117 N71 23402

Effects of atmospheric layer inhomogeneities on line-of-sight electromagnetic wave reflections
p0122 N72 16099

Wave mechanical theory for processing remote sensing of atmospheric turbulence with radial velocity
p0125 N72 16116

ATMOSPHERIC SCATTERING

Atmospheric stratification effects on VHF and UHF line-of-sight propagation at 170 and 15,000 MHz over a cold desert terrain
p0116 N71 21421

Perturbation method for calculating scattering of electromagnetic waves propagating in a horizontally stratified atmosphere
p0117 N71 23432

ATMOSPHERIC STRATIFICATION

Tropospheric stratification effects on line-of-sight propagation at VHF and UHF
p0116 N71 21410

Radio refractivity variations for tropospheric elevated layers during transhorizon propagation
p0116 N71 21424

Electromagnetic pulse propagation in the layer between ground and atmospheric layer
p0116 N71 21425

Ducting in microwave propagation over the Persian Gulf over sea
p0116 N71 21427

Ray tracing analysis of satellite to ship microwave propagation above sea surface
p0116 N71 21428

Atmospheric stratification effects on line-of-sight propagation at 170 and 15000 MHz over a cold desert terrain
p0116 N71 21429

Tropospheric scatter research on multipath loss and transmission data tests
[AGARD-CP-70-71]
p0117 N71 23451

Scattering by wavelike variations in elevated layers of refractive properties over sea
p0118 N71 23454

Multipath at master for partial reflection from troposphere layers over the ocean propagation
p0118 N71 23457

Radio refractivity prediction method using stratified atmospheric layer models
p0120 N71 23464

Effects of atmospheric layers on line-of-sight electromagnetic wave reflections
p0123 N72 16098

Effects of cloud liquid water and carbon dioxide on microwave temperature measurements
p0124 N72 16105

Multipath propagation and time delay of short high frequency radio waves caused by ionospheric layers
p0140 N71 26124

Diurnal properties of elevated layers
p0142 N73 11811

ATMOSPHERIC TEMPERATURE

Effects of the UV heating on the diurnal radiative atmospheric temperature variations
p0074 N72 10111

Statistical estimating techniques for inversion of radiative transfer equation for determining atmospheric temperature from microwave radiation measurements
p0125 N72 16113

ATMOSPHERIC TURBULENCE

Computation and measurements of dynamic aircraft transfer functions to atmospheric turbulence
p0067 N71 23213

Analysis of wave slope distributions due to atmospheric turbulence
[AGARD-R-586-71]
p0117 N72 21531

Wave mechanical theory for processing remote sensing of atmospheric turbulence with radial velocity variations
p0125 N72 16116

Properties of atmospheric turbulence at low altitudes and effect on aircraft during landing approach and takeoff
p0039 N72 32030

Acoustic gravity wave generation by transient sources in isothermal atmosphere
p0135 N73 14139

Acoustic gravity wave propagation models in atmosphere and vertical atmosphere following nuclear explosion
[CONTRIB-1799]
p0135 N73 14140

Infrasonic wave generation and atmospheric propagation of gravity wave sources
p0136 N73 14142

Excitation of Lamb atmospheric edge mode by tail of large atmospheric explosion
p0136 N73 14143

Detection of tropospheric turbulence and gravity atmospheric waves by radar sounding
p0137 N73 14151

Effects of rain and atmospheric turbulence on ultrahigh frequency space communication
p0143 N73 26143

Flight test techniques and procedures for certification and operation of aircraft in turbulence and effects on aircraft operations
[AGARD-CP-140]
p0057 N74 17723

Turbulence measurement and flight tests — numerical force analysis techniques for clear air turbulence
p0057 N74 17727

Turbulence and mesoscale horizontal temperature gradients in the lower stratosphere — factors affecting frequency of occurrence and accuracy of forecasting
p0057 N74 17723

Progress in the mathematical theory of turbulence — effects of atmospheric turbulence on flight approach and landing of aircraft
p0058 N74 17725

Airborne experiment on turbulent scalar and velocity fields in atmospheric boundary layer — instrumentation and aircraft requirements
p0058 N74 17727

Aircraft response to turbulence — new control system concepts using power spectral density methods — factors affecting operational effectiveness of area navigation systems
p0058 N74 17729

Optical turbulence compensation and display — optical and electronic techniques for improving visual performance through atmospheric turbulence
p0059 N74 17734

Design criteria of military aircraft to alleviate effects of atmospheric turbulence — analytical methods of pilot-vehicle control system evaluation
p0059 N74 17735

Helicopter flight control and operation in turbulence — analysis of helicopter vertical and pitch response and effects on atmospheric turbulence
p0059 N74 17736

Operational problems in turbulence — research aircraft and flight test techniques for detecting important clear air turbulence — STOL aircraft performance
p0059 N74 17737

Sequence of events leading to turbulence — model for clear air turbulence — correlation of pilot reports with statistical analysis of flight test results
p0059 N74 17738

Spectral and statistical characteristics of atmospheric turbulence as applied to flight simulation requirements
p0059 N74 17739

Numerical solution of three-dimensional time-dependent incompressible Navier-Stokes equations — effects of atmospheric turbulence on aircraft, and application of short-period approximation
p0059 N74 17740

U.S.A.F. Test Pilot School ground handling simulator — development of the programs for stability augmentation systems for flying qualities
p0059 N74 17741

Structural analysis techniques — a basic statistical approach for establishing design criteria for aircraft subjected to atmospheric turbulence
p0060 N74 17742

Application of linear theory of elasticity and fracture mechanics to predict failure of aircraft structure
p0060 N74 17743

Flutter of a swept wing airplane with active lift distribution control system in atmospheric turbulence
p0060 N74 17744

A new approach to gust alleviation — flexible aircraft with many active control surfaces — application to control system design
p0060 N74 17745

ATOMIC ENERGY LEVELS

Perturbation expansions for atomic energy levels — many-body theory of atomic energy level
p0099 N72 25491

ATS-5

ATS-5 satellite VHF/UHF propagation experiment — preliminary results of radio frequency calibration
p0115 N71 23419

Measurements of ionospheric scintillation effects on ATS-5 satellite signals
p0116 N71 23419

Predetection recording of the gust and fading statistics for ATS-5 ultrahigh frequency signal transmission to earth
p0142 N73 26141

Ultrahigh frequency propagation attenuation measurements by ATS-5 weather radar and radiometer
p0143 N73 26142

ATTACK AIRCRAFT

Application of inertial navigation to improvement of reentry platforms or strike aircraft
p0230 N73 20704

ATTENUATION

Synthesis of passive filters with infinite attenuation poles realized with weak nonlinear components applied to high degree Cauer filters
p0167 N74 13923

ATTITUDE (INCLINATION)

Diurnal variations in ionospheric drift near magnetic dip equator due to gravity waves
p0138 N73 14160

ATTITUDE CONTROL

Computerized Apollo spacecraft attitude control system
p0278 N72 10870

Testing of an attitude control unit for sounding rockets
p0236 N74 14349

ATTITUDE GYROS

Special grade instrumentation for precision attitude reference system
p0229 N73 20699

ATTITUDE STABILITY

Testing of an attitude control unit for sounding rockets
p0236 N74 14349

AUDITORY DEFECTS

Pure tone hearing loss — reports of various aircraft age and flying time and of no significant hearing loss in young adults
p0087 N74 13807

Normal values for the sequential binaural alteration test
p0109 N74 20746

AUDITORY PERCEPTION

Audiometric evaluation of auditory pitch hearing acuity in relation to flying time
p0093 N71 22320

AUDITORY STIMULI

Physiological and psychological effects of noise and vibration — response to acoustic stimuli
p0067 N71 20367

Effects of long-term exposure to auditory thresholds to discrete frequency and octave bands, pure tones and speech
p0067 N71 20383

Effects of noise on the vestibular system of guinea pigs and cats
p0109 N74 20745

AURORAL ARCS

Auroral infrasonic wave generation and downward propagation into lower atmosphere
p0134 N73 14134

Auroral infrasonic shock wave generation by supersonic auroral arcs
p0135 N73 14137

AURORAL ELECTROJETS

Auroral infrasonic shock wave generation by supersonic electrojet arcs
p0135 N73 14137

Observations of weak infrasonic emission during magnetic storms and its relation to the auroral electrojets
p0135 N73 14138

AURORAL IONIZATION

Forward and backscattering caused by wave interaction with auroral ionization and theories of irregularity production
p0126 N72 21126

AURORAS

Auroral ionization irregularities and auroral oval
p0126 N72 21125

Auroral radar research for stations at and near the auroral zone for communications, navigation and satellite tracking
p0127 N72 21127

VHF backscatter from auroral irregularities — relationship between auroral and geomagnetic latitude
p0127 N72 21128

Radio auroras and meteors
p0127 N72 21129

Radio auroras at frequencies of 3295 MHz
p0127 N72 21130

Radio wave scattering from auroral curtains
[AGARD-AM-X-68301]
p0127 N72 21131

Ion acoustic waves in auroral plasma and radio wave scattering
p0127 N72 21132

Some theoretical investigations of scattering mechanisms of auroral echoes
p0128 N72 21135

Radio propagation effects of refractive auroral and ionospheric irregularities
p0129 N72 21142

Power spectral densities, Doppler shifts and bandwidths of backscattered signals from auroral irregularities
p0129 N72 21143

Spectral correlation of auroral and atmospheric radio echoes
p0129 N72 21144

Auroral back and side scatter from meteor trails
p0130 N72 21150

Radio wave propagation at VHF over the auroral zone
p0130 N72 21151

AUTOMATA THEORY

Operation of discrete time-variable systems by sampled-data feedback processors
p0165 N72 21179

Application of learning automata to stochastic resource allocation
p0169 N74 13918

Application of learning automata to the control of signalized traffic
p0169 N74 13919

Automata theory and its application to adaptive control
p0170 N74 13921

AUTOMATIC CONTROL

Automatic control of aircraft and missiles
p0212 N72 11978

Effects of sensor noise on the automatic control of the human operator
p0212 N72 11979

Automatic analysis of ECG at rest during and after exercise with two computer systems p0073 N72 25052
Techniques for control and guidance of tactical missiles with emphasis on cost reliability and performance [AGARD LS 52] p0226 N72 27681
Numerical analysis of adjoint equations yielding error sensitivities in linear systems applied to guidance and control of tactical missiles p0226 N72 27684
Automated technical control system for military communications facility p0133 N73 10120
Organization functions and capabilities of automated air traffic control system for Rome Italy p0232 N73 23694
Feasibility of automated spacecraft monitoring using real time computer telemetry p0279 N73 23888
Tactical integrated electronic systems for Swedish military aircraft p0279 N73 23889
Computerized simulation of multibody attitude control system for satellite with flexible booms p0279 N73 23890
Exponential probability distribution analysis for extrapolating aerospace system performance statistics from test results p0281 N73 23903
A research worker's view on the future of automatic reading machines p0161 N74 16938

AUTOMATIC FLIGHT CONTROL

Operational performance of Hawker Siddeley aircraft automatic flight approach and landing control system p0028 N71 23414
Operational performance of automatic V STOL flight control systems using jet thrust or air bleed p0028 N71 23415
Human factors and control system failures in jet upsets during turbulence encounters p0029 N71 23424
Some problems in developing automatic flight control systems for light helicopters p0031 N72 11922
Automatic approach and hover coupler for rescue helicopters p0032 N72 11926
Onboard computers for automatic control of manned aerospace systems considering human factors integration [AGARD CP 114] p0278 N73 23881
Computerized inertialess guidance system for aircraft flight control p0280 N73 23895
Design of aircraft digital system for automatic flight control p0281 N73 23900

AUTOMATIC LANDING CONTROL

Operational performance of Hawker Siddeley aircraft automatic flight approach and landing control system p0028 N71 23414
Automatic approach and landing system with flash warning signal for Caravelle aircraft control p0030 N71 23429
Experience with a low altitude turbulence model for autoland application — correlation of gust model data with statistical analysis of flight test results p0059 N74 17739

AUTOMATIC PILOTS

Breakdown of automatic pilots or auxiliary stabilization systems on helicopters p0031 N72 11916
Theoretical horizontal tail loads and associated aircraft responses of an autopilot controlled jet transport flying in turbulence — analysis of problem areas associated with rigid aircraft controlled by simple autopilot p0059 N74 17742
The design of automatic flight control systems to reduce the effects of atmospheric disturbances — flight tests of experimental automatic pilot on BAC 111 aircraft p0060 N74 17743

AUTOMATION

Development of automated air traffic control system using computer techniques to provide flight safety, increase air traffic p0232 N73 23693
Analysis of terminal air traffic control procedures to determine impact of automation on air traffic controller personnel p0233 N73 23700

AUTOMOBILE ACCIDENTS

Airbag diesel belt analysis as responsible person survey European car collisions p0099 N72 19130
Structural crashworthiness performance of conventional automobiles and performance of structural devices designed for protection p0101 N72 19142
Guided sled apparatus for simulation of automobile collisions p0103 N72 19152

AUTOMOBILES

Restraints for passengers in automobiles p0098 N72 19122
Safety systems — factors affecting automobiles and impact studies p0103 N72 19151

AUXILIARY POWER SOURCES

Experimental diesel powered gas turbine fuel cell development for aircraft primary and auxiliary power systems [AGARD AR 56] p0063 N73 18081
Proceedings of conference on application of supercritical cycle gas turbine to auxiliary power systems for aircraft missiles [AGARD CP 104] p0063 N73 19031
Characteristics of auxiliary power unit coupled with a variable drive to form auxiliary power system for aircraft electric power supply p0063 N73 19045
Design principles of auxiliary power unit for aircraft primary power system — design study of aircraft gas turbine p0063 N73 19046
Design parameters and characteristics of intermittent pulse jet engine for use as auxiliary power source p0065 N73 19047
Design and characteristics of auxiliary power source to operate electric hydraulic and pneumatic subsystems in ramjet powered aerospace vehicles p0065 N73 19048
Analysis of interface between aircraft mechanical power requirements and performance requirements of auxiliary power systems p0065 N73 19049
Analysis of gas turbine engine requirements and performance when main propulsion system furnishes auxiliary power source p0065 N73 19050
Development of integrated control system for supersonic aircraft based on pneumatic power generation p0066 N73 19056

AVALANCHE DIODES

Generation of superhigh frequency power using negative impedance characteristics of avalanche diodes in reflection amplifiers p0194 N72 16511

AVIONICS

Cost effectiveness failure analysis and design techniques for measuring reliability of avionics systems [AGARD LS 47 71] p0188 N71 36776
Reliability estimation including failure effect analysis of avionic systems p0189 N71 36777
Effectiveness of reliability programs for avionic equipment p0189 N71 36779
Cost ownership analysis of avionic equipment p0190 N71 36784
Proceedings of conference on avionics in spacecraft covering component technology instrumentation satellite subsystems and satellite systems [AGARD CP 87 71] p0190 N72 19483
Guidance and control display design for aircraft and spacecraft conference [AGARD CP 96] p0223 N72 22621
Analysis of aircraft instruments and display devices for approach control and landing of V STOL aircraft [AGARD AR 51] p0196 N73 18439
Onboard computers for automatic control of manned aerospace systems considering human factors integration [AGARD CP 114] p0278 N73 23881
Operational cost and technology development aspects in design of space shuttle avionics systems p0278 N73 23884
Extended computer language for real time simulation of process control in large systems p0279 N73 23892
Serial digital data bus for integrated avionics system interface p0281 N73 23902
Applications of spread spectrum communications techniques to avionics system p0143 N73 32058
Advanced test language for avionics systems [AGARD-LS 54] p0061 N74 22634

AXIAL FLOW

Aerodynamic characteristics of rotary wings under axial flow conditions and development of numerical analysis techniques p0050 N73 21039

AXIAL FLOW TURBINES

Design and performance of thermosiphon fluid cooled high density temperature axial flow turbine p0260 N71 17339
Role of boundary layers in axial flow turbomachines and prediction of their effects p0269 N73 19806
Application of boundary layer fences in turbomachinery p0270 N73 19810
Prediction of annulus wall boundary layers in axial flow turbomachines p0270 N73 19813
Analysis annulus wall boundary layers in axial flow turbomachine p0270 N73 19814

AXISYMMETRIC BODIES

Sting interference effects on afterbodies at transonic speeds p0072 N74 14737

AXISYMMETRIC FLOW

Axisymmetric inlet flow and separation theories for axial gas turbines p0265 N72 16701

B

B 52 AIRCRAFT

Optimal launch release intervals for B 52 aircraft terminal system p0005 N71 19383

BAC AIRCRAFT

Aerodynamic interference caused by rear fuselage mounted power plants on BAC aircraft p0004 N71 19375

BAC 111 AIRCRAFT

The design of automatic flight control systems to reduce the effects of atmospheric disturbances — flight tests of experimental automatic pilot on BAC 111 aircraft p0060 N74 17743

BACK INJURIES

The risk of injury to special airborne station and crew Evaluation of ejection seat p0086 N74 13795

BACKSCATTERING

Backscatter properties of grass vegetation for radar frequencies and wavelengths p0122 N72 16651
Coherent approach for radar detectability from backscattering surface [NASA CR 124842] p0123 N72 16117
Analysis of data backscatter for the sea state prediction of materials and structure response to wave loads p0270 N72 16139
Forward and backscattering wavelength wave radar with application to the theory of precipitation p0126 N72 21129
VHF bistatic CW auroral backscattering and influence of daytime seasonal and geomagnetic latitude p0127 N72 21128
Radar aurora studies using backscatter radar p0127 N72 21129
Sweep frequency backscatter radars as detectors of high latitude ionospheric phenomena p0129 N72 21147
High frequency backscatter observations of high altitude field aligned irregularities in F region p0130 N72 21149
HF auroral backscatter scintillation theory and satellite beacon investigation p0130 N72 21150
Narrow and wideband FM CW HF backscatter observations of radio aurora p0130 N72 21151
HF measurements of ocean wave directional spectra using Bragg backscatter angle p0148 N74 13887

BAILOUT

Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews [AGARD AR 62] p0055 N73 31954

BALL BEARINGS

Feasibility analysis of solid lubricated ball bearings for aircraft propulsion systems application p0255 N72 11700

BANDWIDTH

Error probability and bandwidth efficiency in digital transmission channel p0131 N73 10192

BARIUM

Development of optical striations and Doppler spectrum broadening due to barium plasmas in ionosphere p0128 N72 21138

BAYES THEOREM

Recursive filters for supervised learning Bayes optimal adaptive pattern recognition with continuous data p0153 N72 11189
Adaptive and nonadaptive approach to pattern recognition with Bayesian and non Bayesian techniques considered p0153 N72 11190

BEARING (DIRECTION)

Ionospheric disturbance effects on sky wave bearing measurement p0138 N73 14159

BELGIUM

Selection of student pilot candidates of the Belgian Air Force by psychomotor tests p0088 N74 18788

BENDING

Response of general laminated plates to applied loads with coupling between bending and extensional modes of deformation p0212 N73 27488

BENDING FATIGUE

Cantilever bending tests for determining susceptibility of high strength alloys to stress corrosion cracking p0287 N72 21311

BENDING VIBRATION

Analysis of helicopter blade flutter for both hinged and hingeless rotor blades [AGARD R 607] p0052 N73 21920

BERYLLIUM

Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference [AGARD CP 63 71] p0206 N72 12492
Explosive bonding technique for strengthening aluminum with beryllium wires p0208 N72 12502
Manufacturing of aluminum beryllium composites by hot pressing p0208 N72 12503
Stress strain fatigue mechanisms of beryllium reinforced aluminum composites having rough or smooth surfaces p0208 N72 12504
Analysis of structural diffusion mechanism between beryllium fiber and aluminum matrix p0208 N72 12507

BERYLLIUM ALLOYS

Analysis of microplasticity of materials used in inertial navigation systems to show factor stress yield stress and rate of strain hardening in the nonlinear region p0228 N73 20692

BIBLIOGRAPHIES

Gyroscope theory and applications to inertial guidance and navigation vehicle stabilization and related uses bibliography [AGARD R 582 71] p0189 N71 20997
Mathematical programming techniques applied to aerospace structural design algorithmic tools applications and literature review [AGARD AG 149 71] p0283 N71 20128
Mathematical programming applications to structural design optimization literature review p0283 N71 20132
Biodynamics aerospace medicine acceleration stresses human tolerances centrifuges test facilities and annotated bibliography [AGARD(OSTRAPH) 150] p0094 N71 23337
Annotated bibliography of worldwide biodynamics research findings [NASA TM X 67178] p0095 N71 23344

BINAURAL HEARING

Special tests for the experimental differential binaural audiotest p0130 N74 20746

BIODYNAMICS

Biodynamics aerospace medicine acceleration stresses human tolerances centrifuges test facilities and annotated bibliography [AGARD(OSTRAPH) 150] p0094 N71 23337
Equipment and facilities for biodynamics research (NATO countries) p0095 N71 23347
Equipment and facilities for biodynamics research (NATO countries) p0095 N71 23343

Annotated bibliography of worldwide biodynamics research findings
(NASA TM X 67138) p0095 N71 23344

Biodynamic and bioengineering applications to operational problems resulting in crash injuries
p0098 N72 19121

Biodynamics of sports injuries applied to sports equipment design p0099 N72 19128

Biodynamic models of human response to various environmental forces p0100 N72 19133

Biodynamics of air blast durations and decelerative events p0100 N72 19134

Conference on operational flight stress effects on human biodynamics and performance
(AGARD CP 101) p0104 N73 19143

Combined stress effects on human communication and motion sickness biodynamics p0104 N73 19144

Effects of sound on the vestibular system of guinea pigs and monkeys p0109 N74 20745

BIOENGINEERING

Biodynamic and bioengineering applications to operational problems resulting in crash injuries
p0098 N72 19121

BIOLOGICAL EFFECTS

Biological effects of UHF electromagnetic radiation on human organism p0016 N72 26053

Drug effects on vision of flying personnel
p0082 N73 21121

Comparison of alcohol and diazepam effects on human mental and psychomotor functions p0082 N73 23126

BIOMEDICAL DATA

Proceedings of conference on medical aspects of spatial disorientation and effects on safe aircraft operations
(AGARD CP 95 PT 1) p0021 N72 24031

BIOMETRICS

The use of cystagmography in aviation medicine
aerospace medicine meeting on cystagmography
(AGARD CP 128) p0167 N74 20732

Aeromedical research and clinical applications of averaged electroencephalography computer techniques for precise measurements of average eye movements
p0110 N74 22759

Automated nystagmus analysis computer techniques for real time data processing p0110 N74 22759

BIOPHYSICS

Conference on biophysical aspects of selected problems of the gastrointestinal effects of high altitude flight maneuvers sled flight and ground based equipment
(AGARD CP 95 PT 3) p0335 N72 26045

Biophysical hazards of boundary layer noise during SST and manned space flight p0335 N72 26046

BIPOLAR TRANSISTORS

The use of the transistor simulation program SLIMAP for statistical modeling of bipolar transistors
p0165 N74 19913

Transistor equivalent circuit models parameters provided consists of operational amplifiers bipolar transistors
p0165 N74 19914

An optimization technique to calculate bipolar transistor parameters from measurements
p0166 N74 19915

Short description Model of bipolar transistor having 10 linear parameters as the geometric dimensions
p0166 N74 19917

BIRDS

Radar tracking of birds in flight animals
p0184 N74 19861

BLADE TIPS

Development of a tip driven wind tunnel model fan for the free tip driven fan system p0048 N71 23126

Procedures for measuring velocity distortion through helicopter rotor blade tip nozzles using single hot film anemometer p0049 N71 23134

BLAST LOADS

Biodynamics of air blast durations and decelerative events p0100 N72 19134

BLINDNESS

Blindness response to gravitational changes in operational flight p0029 N71 23125

BLOOD

Effects of positive gz acceleration on blood oxygen saturation and pleural pressure relationships in dogs breathing air and oxygen at sea level and at reduced body weight and normal respiration
(NASA CR 112391) p0068 N71 20079

Methods for determining blood gas parameters
p0 8 N73 2 128

BLOOD CIRCULATION

Myocardial and pulmonary blood flow in man during acute and chronic effects of hypoxia and positive acceleration
p0048 N74 19783

BLOOD PRESSURE

Effects of hemorrhage and blood pressure stabilization on physiological effects of negative gz
p0002 N71 23114

Physiological effects of negative gz acceleration
p0024 N72 20004

The theory of aviation Application of the blood pressure cuff to the leg for protection against positive gz
p0048 N74 19780

Elevated blood pressure and gz
p0048 N74 19781

BLOWDOWN WIND TUNNELS

Comparison between free flight and blowdown wind tunnel drag data for a family of bodies of revolution at high Reynolds number and mach number
p0016 N72 11884

Performance and operational characteristics of high Reynolds number blowdown and shock wind tunnels for transonic model testing p0016 N72 11884

BLOWING

Jet blowing for intake boundary layer control on a STOL aircraft p0264 N72 16697

BLUNT BODIES

Transonic wind tunnel determination of blunt trailing edge effects on drag and lift characteristics of wing profile
p0012 N72 11862

Extension of time dependent technique for investigation of blunt body flow to viscous flow p0182 N72 27303

Aerodynamic drag and lift of general body shapes at subsonic transonic and supersonic Mach numbers
p0019 N74 14712

Drag in hypersonic rarefied flow effects of cold pressure drag and friction drag p0021 N74 14730

The influence of wave drag on hypersonic entropy wake observations flow regimes in wake of blunt body visualized by schlieren photography p0022 N74 14733

BOATTAILS

Jet effects on boattail pressure drag at supersonic speeds on single or twin propulsive jets p0266 N72 16008

BODIES OF REVOLUTION

Wind tunnel vortex flow study results for bodies of revolution with or without wings p0063 N71 19355

Reynolds number effects on flow past bodies of revolution at transonic speed p0071 N72 11864

Equivalent body of revolution theory analysis at high Reynolds number effect on transonic flow past two dimensional airfoil p0014 N72 11874

Magnus characteristics of elongated projectiles
(AGARD AG 171) p0019 N74 14711

Aerodynamic drag and lift of general body shapes at subsonic transonic and supersonic Mach numbers
p0019 N74 14712

An assessment of the accuracy of transonic wind tunnel measurement at large scale reynolds number simulations with emphasis on bodies of revolution for aircraft and missiles
p0022 N74 14718

BODY WING AND TAIL CONFIGURATIONS

Aerodynamic interference characteristics of a flare propulsion system of high speed missile
(AGARD CP 71) p0061 N71 19313

Low speed wind tunnel investigation of high lift devices for wing body configurations with flap and wing body flaps
(NASA TM X 62986) p0062 N71 19361

Calculation methods for wing body interference of supersonic aircraft at static mach numbers and flow
p0062 N71 19362

Approximate pressure distribution on wing body configurations at low supersonic speeds p0063 N71 19364

Wind tunnel testing of small wall interference effects on configurations and correlation between wall and free air
p0076 N71 19340

BODY WING CONFIGURATIONS

Integration of boundary and turbulent wing flow for lift, drag and plane theory results p0037 N72 22018

BOEING AIRCRAFT

A new approach to the application of boundary layer transition measurements to Boeing transport aircraft
p0029 N71 23127

BOEING 747 AIRCRAFT

Flight test program and data analysis techniques for the performance evaluation of Boeing 747 aircraft p0034 N72 26021

Wind tunnel tests of static stability and control at low speed and low speed performance of Boeing 747 aircraft p0043 N73 15016

BOLTZMANN TRANSPORT EQUATION

Application of transport equation for Reynolds stress to calculating two dimensional flow past finite flow wing
p0179 N72 27298

BOMBS (ORDNANCE)

Optimal terminal guidance for a class of air to ground homing systems p0060 N71 19181

BONES

Spinal response to transmitted impact forces during simulated ejection escape and landing stress applied to human spine
(AMRL TR 70 74) p0049 N71 23151

BORIDES

Boride and silicide coatings for columbium alloys for thermal protection of reusable space vehicles
p0201 N71 10776

BORON

The effect of boron fibers and whiskers on the compressive strength of composites
p0211 N71 27483

Performance of fabricating and testing boron aluminum structural components for space shuttle orbiter
p0211 N71 27484

Performance of fabricating and testing of composites with boron nitride coated fibers
p0211 N71 27485

BORON COMPOUNDS

Application of boron epoxy composite materials for the space shuttle orbiter with emphasis on the structural design
p0211 N71 27486

Application of boron aluminum composite material to the space shuttle orbiter wing structure program definition phase
p0211 N71 27487

Investigation of boron tungsten fiber reinforced composite materials for space shuttle structural applications
p0211 N71 27488

BOUNDARY LAYER CONTROL

High lift wing characteristics wing with plain hinged flaps and boundary layer control and wing with drag and high lift devices extended p0027 N71 20065

Operational performance and handling safety requirements for single engine boundary layer controlled aircraft in STOL mode p0028 N71 23419

Wind tunnel model boundary layer reduction through suction for accurate simulation of high Reynolds number full scale aircraft characteristics p0014 N72 11874

Transonic wind tunnel model measurements of buffet loads and boundaries at various sweep and aspect ratio wing roots p0016 N72 11886

Jet blowing for intake boundary layer control on V STOL aircraft p0264 N72 16697

Development of two experimental approaches for analyzing two dimensional flow on high lift devices
p0042 N73 15005

Development of a 28 transport aircraft wing and analysis experiments to show effects of boundary layer fences
p0043 N73 15015

BOUNDARY LAYER FLOW

Gauging effects between wall heat transfer and wall pressure gradients in turbulent boundary layer flow
(NASA CR 125903) p0176 N72 26281

Effects of adverse pressure gradients on supersonic turbulent boundary layer flow p0179 N72 27299

Low speed wind tunnel investigation of boundary layer flow characteristics of streamwise vortices
p0180 N72 27302

Analytical investigation of boundary layer control by incipient separation
p0041 N73 15003

Development of two experimental approaches for analyzing two dimensional flow on high lift devices
p0042 N73 15005

Measured and predicted flow fields in subsonic asymmetric diffusers with fully developed turbulent inlet flow
p0269 N73 19807

Measured and predicted flow fields in subsonic asymmetric diffusers with fully developed turbulent inlet flow
p0270 N73 19809

Application of boundary layer theory to inlet design
p0270 N73 19810

Development of a high performance boundary layer bleed system for a supersonic inlet
p0055 N73 21046

Effects of oblique pressure fluctuations on response of panels partially attached and separated from their boundary layers at low mach numbers
p0292 N73 29916

BOUNDARY LAYER SEPARATION

Flow separation on lifting wings
p0025 N71 25005

Representation of flow separation bubbles near a sharp edge
p0025 N71 25004

Flow model for three dimensional leading edge separation flows Evidence of line separation in low speed flow of air
p0071 N72 11858

Analysis of parameters affecting separation bubbles and application to hingeless controls
p0041 N73 14999

Analysis of laminar part of separation bubbles
p0041 N73 15000

Development of method for calculating laminar separation bubbles and trailing edge of airfoil at low speeds
p0041 N73 15002

Method for calculating three dimensional turbulent boundary layer separation with application to simple three dimensional case
p0270 N73 19808

Theoretical model for three dimensional separation and trailing edge type disturbance in turbulent boundary layer
p0271 N73 19811

BOUNDARY LAYER TRANSITION

Boundary layer transition measurements in free flight at high unit Reynolds number
p0268 N71 17180

Experimental investigation of the interaction between two dimensional boundary layers and cylindrical models at supersonic speeds
p0268 N73 19796

Experimental investigation of the interaction between two dimensional boundary layers and cylindrical models at supersonic speeds
p0268 N73 19797

Influence of free stream disturbances on the transition of boundary layers on a swept wing
p0183 N74 27283

Application of the method for part span leading edge suction to a swept wing
p0184 N74 27628

BOUNDARY LAYERS

Experimental investigation of the aerodynamic characteristics of a supersonic inlet with emphasis on boundary layer effects
p0062 N72 26284

Boundary layer control by means of a gas jet
(AD A01 765) p0068 N73 10014

Boundary layer control by means of a gas jet
p0068 N73 10014

Measurements of the boundary layer on a smooth flat plate in supersonic flow
p0179 N72 27297

Experimental investigation of the interaction between two dimensional boundary layers and cylindrical models at supersonic speeds
p0268 N73 19796

Experimental investigation of the interaction between two dimensional boundary layers and cylindrical models at supersonic speeds
p0268 N73 19797

Influence of free stream disturbances on the transition of boundary layers on a swept wing
p0183 N74 27283

Application of the method for part span leading edge suction to a swept wing
p0184 N74 27628

Boundary layer control by means of a gas jet
p0068 N73 10014

Measurements of the boundary layer on a smooth flat plate in supersonic flow
p0179 N72 27297

Experimental investigation of the aerodynamic characteristics of a supersonic inlet with emphasis on boundary layer effects
p0062 N72 26284

Boundary layer control by means of a gas jet
(AD A01 765) p0068 N73 10014

Boundary layer control by means of a gas jet
p0068 N73 10014

Measurements of the boundary layer on a smooth flat plate in supersonic flow
p0179 N72 27297

Experimental investigation of the interaction between two dimensional boundary layers and cylindrical models at supersonic speeds
p0268 N73 19796

Experimental investigation of the interaction between two dimensional boundary layers and cylindrical models at supersonic speeds
p0268 N73 19797

Influence of free stream disturbances on the transition of boundary layers on a swept wing
p0183 N74 27283

Application of the method for part span leading edge suction to a swept wing
p0184 N74 27628

BOUNDARY VALUE PROBLEMS
Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in unsteady supersonic and subsonic flow including interference lift
[AGARD CP 80 71 PT 1] p0007 N71 29133
Aerodynamic load predicting for control surfaces in unsteady supersonic and subsonic flow
p0007 N71 29334
Numerical analysis of aerodynamic loads and coefficients for tandem and T tail surfaces harmonically oscillating in subsonic flow p0007 N71 29335
Wing interference kernel in lattice simulation and application to aerodynamic loads on tandem wings in unsteady flow p0008 N71 29336
Advances in numerical fluid dynamics
[AGARD LS 64] p0184 N74 22914
Boundary conditions for difference approximation of hyperbolic differential equations p0185 N74 22915
BRAGG ANGLE
HF measurements of ocean wave directional spectra using Bragg backscatter angle p0148 N74 13867
BRAIN
Myocardial and cerebral function during exposure to carbon monoxide effects of hypoxia on pilot performance p0065 N74 13789
BRAIN CIRCULATION
Influence of altitude and drugs on cerebral circulation in smokers and non smokers p0082 N73 21125
Partial cerebral hypoxic attacks in pilots as cause of hypoxia incidents p0088 N74 18786
BREGUET AIRCRAFT
Speed and field length safety factors for approach and landing mechanics of Breguet aircraft p0028 N71 23420
BREGUET 941 AIRCRAFT
Flight tests for determining handling qualities and operational characteristics of Breguet 941 STOL aircraft p0054 N73 27008
BRIGHTNESS TEMPERATURE
Remote sensing microwave sensing of sea surface roughness using water brightness temperature to determine wind fields p0122 N72 16095
Geometrics optics theory for microwave brightness temperatures of rough sea surface emissions for remote sensing data interpretation p0124 N72 16112
BRISTOL SIDDELEY OLYMPUS 593 ENGINE
Efficiency of air cooling blade design for Olympus 593 gas turbine engine p0257 N71 17376
BRITTLE MATERIALS
Structural data on brittle nonmetallic materials for use in designing reentry vehicles
[AGARD AG 152 71] p0205 N73 20027
BROMINE COMPOUNDS
Effects of chemical fire extinguishing agents containing bromotrifluoromethane on cardiovascular and nervous systems of dogs monkeys and baboons
[AGAPD R 599] p0077 N73 17106
BUBBLES
Representations of flow separation bubbles near airfoil leading edge p0027 N71 20064
BUFFETING
Method for estimating transonic buffet boundary and Reynolds number effects for straight and swept wings
p0011 N72 11857
Transonic wind tunnel determination of Reynolds number effect on jet flapped airfoil drag divergence pressure distribution and buffet onset p0012 N72 11861
Transonic wind tunnel model measurements of buffet loads and boundaries at various sweep and aspect ratio wing roots p0016 N72 11866
Flight tests to determine buffet characteristics of four high performance aircraft during transonic maneuvers
p0043 N73 15017
Analysis of aerodynamic buffeting and related phenomena to include development of models for oscillatory rigid body motion p0043 N73 15018
Prediction of buffet onset for aircraft recent progress in wind tunnel and flight test data correlation
p0021 N74 14725
BURSTS
Bursts and streamwise momentum defects in wall region and turbulent boundary layer p0175 N72 20277

C

C BAND
Airborne measurements on radio attenuation and radar reflectivity of precipitation by microwave frequencies
p0115 N71 21417
C 5 AIRCRAFT
Vortex wake research inflight investigation of turbulent wake generated by C 5 aircraft p0058 N74 17733
C 130 AIRCRAFT
Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of rig vertical acceleration and gust velocity measured on transport aircraft
[AGARD R 579 71] p0030 N71 25080
CALIBRATING
Advanced procedures for self alignment and calibration of inertial platforms p0230 N73 20706
CALORIC REQUIREMENTS
Human caloric requirements when working in extreme climatic environments p0070 N71 20367
CALORIC STIMULI
Differential diagnosis of the caloric nystagmus qualitative characteristics of labyrinthine or CNS abnormalities p0108 N74 20740
Normal limits for the sequential bithermal binaural caloric test p0109 N74 20746
Thermoelectric stimulation of the labyrinth by Peltier regulated ear canal plug p0109 N74 20748
CAMERAS
Characteristics of lenses and ports for underwater imaging systems to compare depth of field and relative aperture for several lens port combinations p0242 N73 33635
CANADA
Equipment and facilities for biodynamic research in US and Canada p0095 N71 23342
Color vision requirements of Canadian Armed Forces including their standard tests p0077 N73 19070
Information dissemination services of technical information service of National Research Council of Canada p0159 N73 24211
CANADAIR AIRCRAFT
The human factor in cyclic aircraft accident patterns statistical analysis of CF 104 aircraft accident patterns p0107 N74 18800
CANTILEVER BEAMS
Laboratory equipment for testing stress corrosion of bolt loaded WOL specimens and monitoring crack growth p0287 N72 21914
Acoustic emission technique for determining crack growth rate in high strength cantilever steel type specimens p0287 N72 21917
Precracked cantilever beam stress long term beam exposure tests for determining stress corrosion of Al alloys in sea water p0288 N72 21919
CARBIDES
Borides carbides and nitrides of silicon or deltium resistant refractory compounds for use in gas turbines and reentry vehicles p0203 N73 23616
CARBON DIOXIDE
Physiological responses to interacting stresses of exercise and hyperoxia under acute and chronic exposure to ambient P sub CO2 of 21 mm Hg p0070 N71 20370
Near infrared measurements on exhaust gas transmission in carbon dioxide atmosphere p0124 N72 16108
CARBON FIBERS
Ultrasonic radiographic eddy current and acoustic emission techniques for nondestructive tests of carbon fiber reinforced polymers and failure mechanisms
p0290 N74 24935
Characteristics of carbon fiber composite materials and application for structures with reduced weight fatigue reduction and corrosion resistance p0210 N73 27477
Application of glass composites all carbon composites and PRD 49 organic fiber material for airframe and spacecraft construction p0211 N73 27482
Application of glass reinforced and carbon reinforced composite materials for helicopter structures and rotary wings p0211 N73 27483
Use of reinforced boron and carbon fiber composites in aircraft structures p0211 N73 27484
Construction of glider aircraft using glass fiber and carbon fiber reinforced plastic composite materials for weight reduction and increased strength p0211 N73 27486
Application of glass and carbon fiber reinforced structures for gas turbine engine components to operate in high temperature environments p0213 N73 27495
Performance and fatigue strength of compressor blades fabricated from carbon fiber composites and boron composite wires p0213 N73 27496
CARBON MONOXIDE POISONING
Myocardial and cerebral function during exposure to carbon monoxide effects of hypoxia on pilot performance p0085 N74 13789
CARBON STEEL
Random fatigue tests on normalized carbon steel with 0.7 percent carbon p0291 N73 18902
CARBON TETRACHLORIDE
Failure of welded joints in Ti Al Sn alpha type alloys in CCl4 vapor p0289 N72 21929
CARDIOGRAPHY
Value of cardiac mechanograms in evaluating flying personnel p0085 N74 13791
CARDIOLOGY
Description of routine cardiologic program to determine flight fitness for German Air Force p0097 N72 14102
CARDIOVASCULAR SYSTEM
Cardiac and neural effects of UHF radar energy on frogs p0068 N71 20354
Exercise effects on physical fitness and cardiovascular system of aging pilot p0092 N71 22313
Cardiac conditions as factor in evaluating flight fitness of Air Force personnel p0096 N72 14101
CARGO AIRCRAFT
Development and characteristics of dual cargo hook system for use on military transport helicopters
p0048 N73 21022
CASCADE FLOW
Influence of degree of turbulence on aerodynamic coefficients of cascades p0268 N73 19798
Analytical approach for loss and deflection behavior of cascades in transonic flow including area mass flow variation p0268 N73 19800
Singularity method for calculating incompressible flow through cascades with separation p0269 N73 19802
Effect of axial velocity ratio on aerodynamic coefficients of compressor cascade in viscous flow p0269 N73 19804
Influence of axial velocity density ratio on compressor cascade performance in compressible flow
p0269 N73 19805
Experiments with cascade secondary flows
p0270 N73 19811
Shock wave boundary layer interaction in compressor cascades p0271 N73 19816
Boundary layer behavior in supersonic straight and annular blade cascades of fixed and mobile types
p0271 N73 19817
High speed schlieren film of pulsating flow in transonic turbine cascade p0271 N73 19818
CASCADES
Effects of boundary layer flow patterns on upright cascade blade performance p0262 N73 19803
CASSEGRAIN ANTENNAS
Some aspects of near and far angle scatter in double reflector antennas p0147 N74 13858
CATALYSIS
Catalytic surface effects on thermocouple combustion gas temperature measurements in jet engines
p0257 N71 17379
CATAPULTS
Catapult system for launching automobiles and impact studies p0103 N72 19153
CAVITIES
Sound field generation by transonic flow over perforated surface liners in wind tunnels p0014 N72 11878
CENTRAL ELECTRONIC MANAGEMENT SYSTEM
Design of aircraft digital system for automatic flight control p0281 N73 23900
Human factors in design of aircraft inflight monitoring and automatic landing systems for low weather operation p0281 N73 23901
CENTRAL NERVOUS SYSTEM
Syringomyelia in central nervous system affecting flying fitness p0083 N73 23061
CENTRAL NERVOUS SYSTEM DEPRESSANTS
Alcohol reference memo 4 for predicting drug modifications of central nervous system activity and pilot performance decrease p0081 N73 21112
CENTRAL NERVOUS SYSTEM STIMULANTS
Hashish smoking effects on human oxygen consumption during physical stress and safe driving ability
p0081 N73 21115
CERAMICS
Properties and selective applications of ceramic materials p0205 N71 27041
CEREBRUM
Influence of altitude and drugs on cerebral circulation in smokers and non smokers p0082 N73 21125
Partial cerebral hypoxic attacks in pilots as cause of hypoxia incidents p0088 N74 18786
CERTIFICATION
German Air Force experiences with certification criteria for granting a waiver p0087 N74 13806
CHANNEL CAPACITY
Frequency correlation measurements on multipath tropospheric scatter propagation p0119 N71 23465
Impulse response measurements and radio test link for evaluating tropospheric scatter propagation channel capacity p0119 N71 23466
CHANNELS (DATA TRANSMISSION)
Feasibility analysis of packet switching networks for remote access computing systems p0158 N72 22171
Digital computer techniques for filtering and transmission of telecommunication data p0131 N73 10192
Error probability and bandwidth efficiency in digital transmission channel p0131 N73 10193
Operational performance and transmission measurements on worldwide Defense Communications System network p0133 N73 10208
CHARACTER RECOGNITION
Applying training process to matrix of black and white dots for numeral recognition p0153 N72 11193
CHARACTERISTICS
Drag and separation effects of separated flow on aerodynamic drag p0020 N74 14722
CHECKOUT
Analysis of stimuli and commands subsystem for checkout and inspection of EUROPA 3 launch vehicle
p0191 N72 19490
Application of digital computers for automatic testing and data processing during checkout of satellites
p0193 N72 19501
CHEMICAL ANALYSIS
Urinalysis methodology for detection of abusive and therapeutic drugs in man p0081 N73 21117
Chromatographic and polarographic methods for determining metabolic levels of hypnotic drugs in blood plasma and urine of man p0081 N73 21118
A new analytical technique for continuous NO detection in the range from 0.1 to 5000 PPM p0218 N74 14280
NO formation in flat ch flames A study of the influence of the hydrocarbon structure p0219 N74 14287
CHEMICAL COMPOSITION
Jet fuel specifications for military and civil aircraft p0253 N72 11563
measure of ozone constituents in the stratosphere by occultation (UV) p0211 N74 14298
CHEMICAL PROPERTIES
Properties and selection of thermoset and thermoplastic polymers p0205 N71 27047

Discussion of aircraft fuels and lubricants to include production analysis testing and fire safety
[AGARD AR 94] p0255 N72 27811
Chemical and mechanical properties of aircraft gas turbine engine components p0201 N73 23600

CHEMICAL REACTIONS
Effects of repassivation and crack velocity on stress corrosion cracking in alloys p0286 N72 27907
One and two D core theories for analyzing ducted mixing and burning of coaxial streams p0183 N73 17253
Thermodynamic stability diagrams of high temperature O2 corrosion reactions p0201 N73 23602
Reaction of ozone with nitrogen oxides at high altitudes p0217 N74 14274

CHEMICAL TESTS
Methods for determining blood alcohol levels in pilots p0082 N73 21124

CHEMOTHERAPY
Drug therapy effects on flying effectiveness and psychosomatic fitness of flying personnel p0080 N73 21103
Chemotherapy for air crews in Great Britain p0080 N73 21105
Effects of human biorhythms on chemotherapy and drug evaluation p0082 N73 21119
Suitability of insulin dependent and oral drug dependent diabetics as navigator personnel p0082 N73 21120
Drug effects on vision of flying personnel p0082 N73 21121
Flight safety factors in prescribing tranquilizing drugs for flying personnel p0082 N73 21123
Management of glaucoma in an ageing flying population p0086 N74 13799
The problem of diabetes mellitus in aviation medicine control of hypoglycemic reactions in flying personnel p0087 N74 13804

CHIRP SIGNALS
Application of chirp modulation to improve effectiveness of satellite to aircraft communication p0194 N72 19514

CHLORIDES
Sulfur sodium and chloride contaminants in gas turbines p0202 N73 23610

CHROMIUM
Addition of hafnium or aluminum to improve oxidation resistance of nickel and cobalt alloys p0203 N73 23611

CHROMIUM ALLOYS
Effects of oxide dispersions and rare earth elements on oxidation of Cr and Al containing alloys p0202 N73 23608

CHROMIUM OXIDES
Vaporization thermodynamics of Cr2O3 protective scales under transonic flow conditions p0202 N73 23607

CIRCUIT BOARDS
Computer aided design of multilayer printed circuit boards p0168 N74 13934
Optimizing automatic tracking of multilayer boards p0168 N74 13935
A parallel printed circuit board design system p0168 N74 13936

CIRCUIT DIAGRAMS
SIGMA - An integrated system of computer aided complex circuit design p0168 N74 13933

CIRCUIT RELIABILITY
Reliability related to computer aided circuit design - A user's view p0165 N74 13909
Reliability and computer aided design p0165 N74 13910
Computer aided design for maximum producibility or maximum reliability p0165 N74 13911

CIRCUITS
The teaching of CACA in Denmark p0165 N74 13907
Computer aided analysis of electronic circuits on a small machine p0167 N74 13925
IMAG 2 - Electronic circuit simulations p0167 N74 13927
The NASA computer aided design and test system p0168 N74 13931

CIVIL AVIATION
Weather factors in fatal civil transport aircraft accidents p0030 N73 23431
Drug screening data for civil aviation personnel obtained by urinalyses p0080 N73 21104
Status and trends of civil air traffic control systems and development of automated network for increased flight safety p0233 N73 23696

CL 84 AIRCRAFT
Aerodynamic characteristics of CL 84 tilt wing V STOL aircraft and comparison with handling qualities criteria documents p0038 N72 32023
Flight test and evaluation of CL 84 tilt wing V STOL aircraft with applications to specific military roles p0034 N73 27007

CLEAR AIR TURBULENCE
Dissipation rate measurements and correlations of air turbulence similar to atmospheric boundary layer flow p0178 N72 20792
Turbulence at medium and high flight levels - Commercial forecasting techniques for clear air turbulence p0057 N74 12721
BOAC experience with in flight turbulence performance recorders for clear air turbulence detection service p0058 N74 12726
Some experiments on methods of analysis and effects of turbulence on aircraft responses and flight tests for detecting clear air turbulence p0060 N74 12744

CLIMATOLOGY
Climatology and atmospheric refraction models for worldwide radio wave propagation p0114 N71 21412
Italian thermal conditions affecting acceleration tolerance and psychomotor performance of flying personnel p0084 N73 23068

CLIMBING FLIGHT
Development of methods for predicting aircraft flight maneuver and climb performance to show effects of excess power and load factor p0053 N73 24045
Numerical analysis of minimum time climbing procedure and minimum fuel climbing procedure for typical subsonic aircraft p0053 N73 24052

CLINICAL MEDICINE
Clinical causes for permanent grounding of British air fleet crews p0095 N72 14092
Clinical causes for permanent grounding of German armed forces flying personnel p0096 N72 14097
Clinical observations of massive injury causing serum enzyme activity in man after crash accidents p0101 N72 19138
Naval research on laser caused visual acuity decrement in monkeys and ocular injury in humans p0036 N72 28056
Clinical procedures for selecting pilot personnel based on predisposition to motion sickness p0078 N73 21094
Clinical psychology and psychiatry of the aerospace operational environment - conference [AGARD CP 133] p0088 N74 18779
Fear of flying and its treatment - a military pilot's p0088 N74 18781
Results of behavior therapy on flying phobia p0088 N74 18782
Depression in aircrew p0088 N74 18784
Clinical study of loss of aeronautical motivation in military flight crews p0088 N74 18785
Part of cerebral hypoxic attacks of pilots as cause of hypoxia incidents p0098 N74 15786
Clinical application of nystagmography in diagnosis of human nervous system pathology p0108 N74 20733
Practical problems in clinical nystagmography p0108 N74 20734
Guidelines for selection of equipment facility for vestibular tests p0108 N74 20734
A proposed lab station laboratory with presentation of several results with the PNT p0108 N74 20737
Review on nystagmography in flying navigation personnel p0108 N74 20738
Nystagmography - A useful tool in basic and applied investigations of human neurophysiological system p0108 N74 20743

CLOUD COVER
Satellite cloud cover observations for determining radio and radar propagation characteristics p0214 N71 21414

COAXIAL FLOW
One and two D core theories for analyzing ducted mixing and burning of coaxial streams p0183 N73 17253

COAXIAL PLASMA ACCELERATORS
Analysis of performance of pulsed coaxial guns based on snowplow model allowing for variable initial mass loading distribution p0066 N73 19057

COBALT ALLOYS
Cobalt and nickel based alloy metallurgy for high temperature gas turbine materials p0259 N71 17389
Addition of chromium or aluminum to improve oxidation resistance of nickel and cobalt alloys p0203 N73 23611
Comparison of cobalt alloys and nickel alloys relative to hot corrosion resistance p0203 N73 23612

COBALT 60
Development and characteristics of instrument landing system using radioactive materials along runways for glide slope and alignment information p0234 N73 23707

COCHLEA
Current aspects of cochlear function applied to flying personnel p0086 N74 13800
Cochlear and vestibular injuries during diving - inner ear damage and auditory defects p0110 N74 20754

COCKPIT SIMULATORS
Human factors in aircraft simulation [AGARD CP 79 70] p0171 N71 16060
Human factors in future pilot cockpit simulation p0171 N71 16065
Human factors in developing a piloted simulation program for evaluating aircraft handling aspects [NASA TM X 66583] p0172 N71 16069
Integrated cockpit research programs used to identify control and display requirements for advanced aircraft p0223 N72 22625
Assessment of design aircraft cockpit layout and display control system p0224 N72 22629
Summary of conference on flight simulation p0054 N73 16952

COCKPITS
Problems of cockpit development p0044 N73 16991
Computerized design of fighter aircraft cockpit and pilot control system considering man machine interaction p0281 N73 23905

CODING
Color vision test requirements for aircrew personnel of future advanced coding evaluation [AMRL TR 71 116] p0078 N73 19076

COGNITION
Combined visual and cognitive effects of environmental and psychophysiological factors [AMRL TR 71 115] p0105 N73 19147

COHERENT LIGHT
Principles of holography and various methods for production of holograms p0199 N72 25435
Comparison of coherent and conventional light sources to show advantages of coherent light for optical experiments p0199 N72 25497
Application of aerodynamic holography for optical recording and flow visualization in wind tunnels and research facilities p0199 N72 25498
Calculation of diffraction efficiency and signal to noise ratio for two dimensional and volume diffuse signal holograms p0199 N72 25501
Applications of lasers as indirect light source for high speed photography p0200 N72 25504

COHERENT RADIATION
Application of laser beams for measurement of aerodynamic flow fields at supersonic and hypersonic speeds p0200 N72 25503
Application of incoherent and coherent light sources for underwater illumination and comparison of efficiency for various conditions p0242 N73 33633

COLLISION AVOIDANCE
Proceedings of conference on air traffic control developments and procedures [AGARD CP 105] p0232 N73 23689
Air traffic control facilities operated by U S military forces and developments in improved air traffic control systems p0232 N73 23690
Organization and operation of Eurocontrol air traffic control system and development of improved equipment for identification and reporting p0232 N73 23691
Status and trends of civil air traffic control systems and development of automated network for increased flight safety p0233 N73 23696
Numerical analysis of optimal sort of and sequencing of air traffic control operations in area terminal area p0233 N73 23701
Development and characteristics of air traffic management system for operation of military aircraft under instrument meteorological conditions p0234 N73 23704
Development and characteristics of system for separation and control of aircraft to avoid midair collisions p0235 N73 23712
Performance tests of air traffic control system to determine effectiveness in prevention of midair collisions p0235 N73 23713
Analysis of level pace program for improving US air traffic control productivity for 1980 time period p0235 N73 23718
Computerized conflict resolution device for aiding operator and controller in collision avoidance trajectory control p0279 N73 23886

COLLISIONS
External store interference caused by rocket launcher pod positioning on aircraft wing p0006 N71 19387
Simulation of frontal collisions and injuries sustained by adverse using safety belts and air bags p0104 N72 19159

COLLOCATION
Box collocation method for calculating aerodynamic loads on tandem delta wings with oscillations in supersonic flow p0008 N71 29337

COLOR
Tradeoffs between luminance and color coding in electronic aircraft displays and experiments involving time shared monocular tracking tachistoscope and human judgement p0223 N72 22623
Colors for elements of multicolored aircraft display to insure minimum number of instrument reading errors p0223 N72 22624
Display principle for 3 D or multicolor solid state 2 D panel displays p0225 N72 22640
Universal system for assigning colors to terrain [AGARD AG 159] p0187 N72 25346

COLOR VISION
Color vision requirements for flying personnel of various armed forces conferences [AGARD CP 99] p0077 N73 19065
Three color receptors of Young Helmholtz and opponent color types of information processing p0077 N73 19066
Color vision requirements for German Air Force personnel p0077 N73 19067
Color aptitude of dyschromatopsic French navigators and pilots p0077 N73 19068
Color vision testing and selection procedures for flying personnel since World War I p0077 N73 19069
Color vision requirements of Canadian Armed Forces including their standard tests p0077 N73 19070
Standardization of tests and classification of color perception abnormalities in military personnel p0077 N73 19071
Color vision requirements of Great Britain's Armed Forces p0077 N73 19072
Comparisons of accident rates among color defective and normal personnel p0078 N73 19073
Color vision tests as predictive indicators of flying task performance p0078 N73 19074
Man color flying research light and naturalness terms and color vision personality p0078 N73 19075
Color vision requirements for aircrew personnel of future advanced coding evaluation [AMRL TR 71 116] p0078 N73 19076

COMBAT
Advantages of three seat fighter aircraft for combat simulation p0264 N72 16694

Application of night vision technology helicopter night scouts p0303 N73 19970
The reduction of airframe costs with particular reference to combat aircraft p0305 N74 21615

COMBINED STRESS
Combined stress effects on human communication and motion sickness biodynamics p0104 N73 19144
Combined heat noise and vibration effects on aircrew performance
[AMRL TR 71 113] p0105 N73 19146
Combined noise and vibration effects on human mental and psychomotor performance
[AMRL TR 71 115] p0105 N73 19147
Measures to determine psychophysiological reactions of military flight crews to flying stress p0105 N73 19148
Temperature and noise irradiation effects on human energetic metabolism during vigilance task p0106 N73 19152

COMBUSTION CHAMBERS
Small scale combustion chamber rigs for combustion characteristics determination of aviation fuel p0251 N72 11674
An experimental research on the behavior of a continuous flow combustion chamber p0220 N74 14296

COMBUSTION EFFICIENCY
Application of gas analysis techniques to determine combustion efficiency in turbine engines and rocket engine combustion chambers
[AGARD AG 168] p0111 N73 31830
Gas sampling and analysis in combustion phenomena
[AGARDOGRAPH 168/FR] p0111 N74 22799

COMBUSTION PHYSICS
Application of gas analysis techniques to determine combustion efficiency in turbine engines and rocket engine combustion chambers
[AGARD AG 168] p0111 N73 31830
NO formation in fuel rich flames A study of the influence of the hydrocarbon structure p0219 N74 14287
Parameters controlling nitric oxide emissions from gas turbine combustors p0219 N74 14291

COMBUSTION PRODUCTS
Analysis of air pollution caused by aircraft engine emissions in vicinity of airport and comparison with air pollution in urban areas p0271 N73 24788
Atmospheric Pollution by Aircraft Engines
[AGARD CP 125] p0217 N74 14221
Detailed exhaust emission measurements of three different turbofan engine designs p0217 N74 14230
Exhaust emission measurements on the GE T64 7 turboprop engine p0219 N74 14286
NO formation in fuel rich flames A study of the influence of the hydrocarbon structure p0219 N74 14287
Soot formation in rich kerosine flames at high pressure p0219 N74 14289
Parameters controlling nitric oxide emissions from gas turbine combustors p0219 N74 14291
An experimental research on the behavior of a continuous flow combustion chamber p0220 N74 14296
Session 4 Design Opening remarks combustor design policy making and pollution control p0220 N74 14297
Technical evaluation report on AGARD Technical Meeting on Atmospheric Pollution by Aircraft Engines requirement to analyze contribution to air pollution near airports from various sources
[AGARD AR 63] p0222 N74 15349

COMBUSTION TEMPERATURE
Catalytic surface effects on thermocouple combustion gas temperature measurements in jet engines p0257 N71 17379
Soot oxidation kinetics at combustion temperatures p0219 N74 14290

COMET 4 AIRCRAFT
Computerized automated avionics system with electronic display for Comet 4 aircraft navigation p0280 N73 23896

COMFORT
Environmental tests of V STOL vibration effects on human comfort
[NASA TM X 66958] p0068 N71 20356

COMMAND AND CONTROL
Selection of natural language for effective man machine communication in command and control systems p0151 N72 11138
Development of user oriented language for command and control of spacecraft and satellites p0193 N72 19506
Operating characteristics of integrated aircraft command and control system p0226 N72 22637
Conceptual analysis of improved communication navigation and indentification system for military applications p0235 N73 23779
Computerized integrated control and information management system with graphic display for manned space flight p0278 N73 23182

COMMERCIAL AIRCRAFT
Aircraft industry survey for analysis of nondestructive inspection methods application to commercial aircraft for 1968 to 1970 p0197 N72 19543

COMMUNICATION EQUIPMENT
Application of public satellites for data acquisition and communication functions in air traffic control system p0234 N73 23709
Development of light bandwidth time division communications system to provide ground based aircraft position location system p0234 N73 23711
Analysis of communications navigation and identification equipment for aircraft and proposed system for improvement in capability p0236 N73 23720
Analysis of integrated communications navigation and identification system for aircraft operation and proposal for improved capability p0236 N73 23721
Proceedings of conference on spread spectrum techniques and application to digital communications systems
[AGARD LS 58] p0143 N73 32053
Principles and operation of spread spectrum communication system with application to satellite communication systems p0143 N73 32056
Applications of spread spectrum communications techniques to avionics systems p0143 N73 32058

COMMUNICATION THEORY
Development of user oriented language for command and control of spacecraft and satellites p0193 N72 19506
Proceedings of conference on spread spectrum techniques and application to digital communications systems
[AGARD LS 58] p0143 N73 32053
Fundamental concepts of communication theory to include transmission of continuous signals and use of discrete time signals p0143 N73 32054
Characteristics of digital communication systems and processing of bandpass digital signals using spread spectrum techniques for data transmission p0143 N73 32055
Principles and operation of spread spectrum communication system with application to satellite communication systems p0143 N73 32056
Performance of spread spectrum communication systems to include effects of various forms of channel noise and synchronization aspects of system p0143 N73 32057
Applications of spread spectrum communication techniques to avionics systems p0143 N73 32058

COMPENSATORY TRACKING
Adaptive tracking task for evaluating drug alcohol effects on human flight performance p0080 N73 21109

COMPETITION
Sports medicine parameters necessary for maintaining competitive form p0081 N73 21115

COMPLEX SYSTEMS
Automated sizing of large structures by mixed optimization methods p0297 N74 15611

COMPONENT RELIABILITY
Methods of testing rotating components of turbomachines compared with tests on complete turbomachines
[AGARD AG 167] p0271 N73 26800

COMPOSITE MATERIALS
Properties and selective applications of high strength steels aluminum and titanium alloys polymeric materials ceramic materials and composite materials in aerospace engineering
[AGARD LS 51 71] p0205 N71 27038
Mechanical properties of fiber reinforced materials p0206 N71 27043
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference
[AGARD CP 63 71] p0206 N72 12492
Mechanical properties of silica fiber reinforced epoxy composite materials p0207 N72 12493
Ultrasonic measurements on silica epoxy and silica phenolic sheets in liquid filled tank p0207 N72 12494
Extensometric measurements of elastic modulus on resin fiber composite materials p0207 N72 12495
Linear and nonlinear stress characteristics of epoxy silica composite materials p0207 N72 12496
Theoretical and experimental determination of elastic constants in silica epoxy composite materials p0207 N72 12497
Error sources in elastic stress measurements on fiber reinforced composite materials p0207 N72 12498
Temperature and fiber orientation effects on mechanical behavior of silica dioxide epoxy composite materials p0207 N72 12499
Axial tension tests for stress strain response of matrix and reinforcing fibers in glass epoxy resin composites p0207 N72 12500
Manufacturing of aluminum beryllium composites by hot pressing p0208 N72 12503
Photoelastic measurement of monolithic nent welding by reinforcing resins of composite materials p0208 N72 12506
Methods for calculating and predicting viscoelastic constants of composite materials p0209 N72 12508
Conference on Structural Applications of Advanced Composites
[AGARD LS 55] p0209 N72 29589
Relationship between effective properties of fiber composite materials and mechanical and geometric properties of their constituents p0209 N72 29590
Fundamental principles for selecting reinforcements for composite materials p0209 N72 29591
Composites in structural design progress p0209 N72 29592
Techniques for measuring plastic viscoelastic ultimate and physical mechanical properties of fiber reinforced composites p0209 N72 29593
Methods for optimum design of composite structures p0209 N72 29594
Comparing characteristics of advanced composites with those of conventional airframe materials p0210 N72 29595
Primary and secondary structural applications of advanced composites p0210 N72 29596
Effects of substrates on stability of superconductor and electrical properties of superconductors for various conditions p0063 N73 19031
Development and application of composite materials for vertical takeoff aircraft airframes and effect on improved aircraft performance p0048 N73 21023
Proceedings of conference on application of composite materials in construction of aerospace vehicles and propulsion systems
[AGARD CP 112] p0210 N73 27474
Physical and mechanical properties of high strength high modulus reinforcing fibers and organic resin composite materials p0210 N73 27475
Analysis of properties of fiber reinforced materials with plastic and metallic matrix composition and application to gas turbine engines p0210 N73 27476
Characteristics of carbon fiber composite materials and application for structures with reduced weight fatigue reduction and corrosion resistance p0210 N73 27477
Production of fibrous metal composites by rolling of powder with strong reinforcing wires and application to aerospace vehicle structures p0210 N73 27478
Design of filamentary composite materials for application to construction of airframes and spacecraft structures p0210 N73 27479
Application of boron epoxy composite materials for airframe construction with specific development of F 111 stabilizer p0211 N73 27480
Application of composite materials for structural purposes to show limitations and failure characteristics p0211 N73 27481
Application of glass composites all carbon composites and PRD 49 organic fiber material for airframe and spacecraft construction p0211 N73 27482
Application of glass reinforced and carbon reinforced composite materials for helicopter structures and rotary wings p0211 N73 27483
Use of reinforced boron and carbon fiber composites in aircraft structures p0211 N73 27484
Application of composite materials to reinforce metallic structures for low cost improvement in structural stability of airframes p0211 N73 27485
Application of composite materials and sandwich structures to reduce vulnerability of aircraft structures to projectile impact p0212 N73 27487
Response of general laminated plates to applied loads with coupling between bending and extensional modes of deformation p0212 N73 27488
Design and manufacturing of composite materials with organic matrices for use in aerospace vehicle structures subjected to high temperatures p0212 N73 27489
Application of reinforced composite materials for construction of aeronautical gas turbine engines p0212 N73 27490
Development of fiber reinforced composite materials for application to air breathing engines aeronautical vehicles and spacecraft components p0212 N73 27491
Production of laminated fibrous composite materials from directional solidification of eutectic alloys and application to gas turbine blades and vanes p0212 N73 27492
Application of directionally solidified eutectics for design and construction of gas turbine engines p0212 N73 27493
Application of glass and carbon fiber reinforced structures for gas turbine engine components to operate in high temperature environments p0213 N73 27495
Performance and fatigue strength of compressor blades fabricated from carbon fiber composites and boron composite wires p0213 N73 27496
Application of boron aluminum composite material for construction of turbine blades with low notch sensitivity in high cycle fatigue p0213 N73 27497
Design fabrication and test of boron polymide reinforced titanium fan disks to operate at high temperatures p0213 N73 27498
Performance and endurance of compressor disks bound with boron composite wires p0213 N73 27499
Failure analysis of fiber reinforced composite rocket engine case using distortional energy and maximum strain theories of failure p0213 N73 27500
Analysis of programs for acoustic testing of composite material components and development of theory for predicting natural frequencies mode shapes and stresses in composite panels p0293 N73 29918
Directory of research activities on in situ composites
[AGARD R 609] p0304 N74 17664

COMPOSITE STRUCTURES
Nondestructive test to failure aspects and quality control of composite structures and materials conference
[AGARD R 590] p0290 N72 24934
Nondestructive tests applied to quality control of aircraft parts made of boron epoxy composites p0290 N72 24936
Response of general laminated plates to applied loads with coupling between bending and extensional modes of deformation p0212 N73 27488

COMPRESSIBILITY
Existence of velocity potential for viscous fluid flow and use of compressibility in turbulent subsonic viscous flow p0176 N72 20282

COMPRESSIBILITY EFFECTS
Prediction of buffet onset for aircraft: recent progress in wind tunnel and flight test data correlation
p0021 N74-14725

COMPRESSIBLE BOUNDARY LAYER
Effects of adverse pressure gradient on compressible turbulent boundary layer flow p0179 N72-20299

COMPRESSIBLE FLOW
Starting conditions of mixed compression axisymmetric hypersonic inlet p0067 N72-16715
Model for compressible turbulent boundary layer: applicable to flows with pressure gradient and surface mass transfer p0136 N72-20283
Influence of axial velocity density ratio on compressor cascade performance in compressible flow
p0269 N73-19805
Effects of aerodynamic drag on rotary wing performance and methods for reducing influence of stall and compressibility parameters p0017 N73-22954

COMPRESSOR BLADES
Interference effect between oscillating and distorted inlet flow on compressor stall p0003 N71-19370
Effects of boundary layer flow patterns on upright cascade blade performance p0269 N73-19803
Effect of axial velocity ratio on aerodynamic efficiency of compressor cascade in vaneless flow p0263 N73-19804
Performance and fatigue strength of compressor blades fabricated from carbon fiber composites and boron composite wires p0213 N73-22496

COMPRESSORS
Velocity distribution measurements downstream of asymmetric inlet for compressor matching p0267 N72-16714
Performance and endurance of compressor rotors bonded with boron composite wires p0213 N73-22493
Hydraulic compressor wind tunnel p0174 N74-16992

COMPUTER DESIGN
Using cellular logic for pattern recognition
p0154 N72-11198
Hardware organization and system design of guidance and control computers p0155 N72-21214
Aerospace computer input output techniques for consideration in design phase of interfacing equipment
p0156 N72-21219
Research activities of electronics laboratory in development of inertial navigation systems to include applications for space missions and commercial aviation
p0227 N73-20686
Systems design for spaceborne computer engineering module p0280 N73-23894

COMPUTER GRAPHICS
Integrated preprocessing system for the extraction of binary pictures p0153 N72-11192
Applying thinning process to matrix of black and white dots for numerical recognition p0153 N72-11193
Signal analysis and computer graphics for signal classification systems p0154 N72-11201
Interactive graphic techniques for handling pictorial data and applications to pattern recognition and artificial intelligence p0154 N72-11203
Detecting boundaries of objects in gray pictures
p0155 N72-11205
Problem solving using man machine interaction for pattern recognition by dynamic pictorial information
p0155 N72-11206
Hybrid character generator combining stroke writing and curvilinear procedure for anthropotechnical evaluation of integrated displays p0224 N72-22628
An evolving operational computer aided design system using high level graphical language p0167 N74-13929
A computer controllable ultrafiche terminal
p0160 N74-16936
A research workers view on the future of automatic reading machines p0161 N74-16938

COMPUTER PROGRAMMING
Unconstrained minimization formulations of nonsmooth problem and penalty functions p0284 N71-20134
Automatic medical diagnosis using nonparametric sequential pattern classification procedures
p0152 N72-11184
Programming characteristics of future guidance and control computers p0156 N72-21216
Data word length considerations for aerospace computer implementation to obtain required precision levels
p0156 N72-21217
Analog computer program for analysis of external electrocardiographic monitoring p0074 N72-25053

COMPUTER PROGRAMS
Computer program for determining flow field interference effects of flow fields about arbitrary bodies by superposition p0005 N71-19377
Computerized prediction of flow field interference forces and moments on aircraft stores at subsonic speeds
p0006 N71-19385
Computer programs for evaluating subsonic flow over wing tail wings with folded tips T tails and cruciform tail surfaces p0009 N71-29341
Computer programs for calculating airborne deflection of wing horizontal tail and fin horizontal tail oscillating in subsonic flow p0009 N71-29342
Question answering system DELFI for automatic generation of programs to express semantic content of English sentences in procedural intermediate language
p0151 N72-11177
Generation and checkout of computer programs for real time control of aerospace vehicles p0155 N72-21215
Analysis of methods for predicting aircraft performance and recommendations for computer programs to provide accurate prediction capability p0040 N72-32036
Systems design for spaceborne computer engineering module p0280 N73-23894
Computer programs for analyzing optical properties of sea water p0243 N73-33638
Current loads technology for helicopter rotors: Based on rotor loads computer program for determining fatigue design loads p0056 N74-10910
A computer program for analyzing waveguide structures p0166 N74-13919
Microwave circuit analysis by digital computer
p0166 N74-13922
A numerical model of TEC over the Mediterranean area
p0187 N74-14086

COMPUTER STORAGE DEVICES
Digital filtering procedures for the images with plane position indicators p0155 N72-11704
Aerospace computer memory technology and application of particular techniques to various system requirements
p0156 N72-21218

COMPUTER SYSTEMS DESIGN
Serial digital data bus for integrated avionic systems interface p0281 N73-23902

COMPUTER SYSTEMS PROGRAMS
Extended computer language for real time simulation of process control on large systems p0279 N73-23892

COMPUTER TECHNIQUES
Computer aided input of graphic information on chemical structures by keyboarding under visual control of display device p0157 N72-22170
Design and operation of communications system utilizing computer output on microfilm: test plan for application to commercial organization p0156 N72-22173
Automatic analysis of ECG at rest during and after exercise with two computer systems p0073 N72-25052
On line computer technique for evaluating reconnaissance image compression algorithms p0131 N73-10191
Real time computerized message switching and data transmission systems for military communications network p0133 N73-10206
Automated technical control system for military communications facility p0133 N73-10207
Development of automated traffic control system using computer techniques to provide flight safety for increased air traffic p0232 N73-23633
Analysis of interface between controller and computer in automated air traffic control system p0235 N73-23716
Electronic computer processing of data stored on data banks p0153 N74-24212
An optimization technique for a computer controlled synthesis program: Iterative computer method
p0166 N74-13915
Unified transistor model for HF network analysis: Adaption between measurements and analysis by computer
p0166 N74-13916
Trends towards standardized software and hardware for test systems: Based on process computer with interface unit and input output peripherals p0236 N74-14361
New developments in storage retrieval and dissemination of aerospace information
[AGARD CP 136] p0159 N74-16925
A computer produced keyword indexing system for technical reports in the library of the Aircraft Research Association Limited p0159 N74-16926
Aerospace information services: Progress with the ESRO ELDO computerized information network
p0160 N74-16928
The role of CSTI in information research and development p0160 N74-16929
Current ASLIB research on mechanism
p0160 N74-16930
Microfilm and reprographic systems: A state of the art review p0160 N74-16932
Remote transmission and automated retrieval techniques p0160 N74-16933
Retrieval of microfiche: Random access
p0160 N74-16934
A microfiche system for small users p0160 N74-16935
Abstracts on microfiche for on line retrieval
p0161 N74-16937
A change for aeronautics p0161 N74-16939
Automated cytogram analysis: On line computer technique for eye data processing p0110 N74-20751
Research work and costs: The role of data processing in aircraft production p0305 N74-21617

COMPUTERIZED DESIGN
Computerized optimization of thermal resistant gas turbine blades p0260 N71-17400
Computerized prediction of aerodynamic lift and characteristics for wing horizontal tail and canard wing configurations
[NASA TM X-66886] p0002 N71-19361
Mathematical programming techniques applied to aerospace structural design: algorithm tools applications and literature review
[AGARD AG-149-71] p0283 N71-20128
Basic concepts of mathematical programming applied to structural design of aerospace vehicles
p0283 N71-20129
Assessment of structural design philosophy combining computerized structural analysis with mathematical programming p0283 N71-20130
Mathematical programming applications to structural design optimization: Literature review p0283 N71-20132
Computer programs for optimum least weight design of complex elastic aerospace structures
p0284 N71-20136
Computerized design of stiffened cylindrical shells and ablating composite heat shield p0284 N71-20137
Computer aided optimization techniques in aircraft design p0286 N71-20140
Computerized design of fighter aircraft cockpit electronic control systems considering man machine interaction
p0281 N73-23905
Parametric and optimization techniques for aircraft design synthesis to show principles of data flow for component development p0053 N73-24049
Computer aided design for electronic circuits: Conference
[AGARD CP 133] p0165 N74-13906
The teaching of CACA in Denmark p0165 N74-13907
Economics of CAD: A new approach
p0165 N74-13908
Reliability related to computer aided circuit design: A users view p0165 N74-13909
Reliability and computer aided design
p0165 N74-13910
Computer aided design for maximum production yield or maximum reliability p0165 N74-13911
Computer aided design concepts p0165 N74-13912
Transistor equivalent networks to linear equivalent circuits of operational amplifiers and bipolar transistors
p0165 N74-13914
State of art and future trends of computer aided design of microwave integrated circuits p0166 N74-13918
Computer optimization of microwave integrated circuits design p0166 N74-13920
DAP (Distribution Analysis Program): A program for the analysis and design of microwave circuits
p0166 N74-13921
Synthesis of passive filters with infinite attenuation points realized with weakly nonlinear components applied to high degree Cauer filters p0167 N74-13923
Computer design of equal ripple equalizers
p0167 N74-13924
Computer aided analysis of electronic circuits on a small machine p0167 N74-13925
Structure and application of computer program ICAN: Integrated circuit AC analysis p0167 N74-13926
Computer aided design analysis of modern large scale circuits and subsystems p0167 N74-13928
An evolving operational computer aided design system using high level graphical language p0167 N74-13929
Specification and design languages for hardware p0168 N74-13930
The NASA computer aided design test system
p0168 N74-13931
SIGMA: An integrated system of computer aided computer circuit designs p0168 N74-13932
A computer aided design system for logic and integrated digital networks p0168 N74-13933
Computer aided design of multilayer printed circuit board p0168 N74-13934
Optimum automatic tracing of multilayer boards
p0168 N74-13935
A parallel printed circuit board design system
p0168 N74-13936
Computer aided placement and topological hybrid microelectronic circuits p0168 N74-13937
Eight computer considerations of digital computers and control for design automation systems p0168 N74-13938

COMPUTERIZED SIMULATION
Technical and human engineering requirements for simulating pilot flight p0177 N71-16565
Computerized prediction of separated flow trajectories dropped from bomber aircraft at high speed
p0006 N71-19379
Computerized prediction of interference flow field for wing fuselage store location on bomber aircraft
p0006 N71-19381
Computerized simulation of tropospheric scatter channel distortion using Monte Carlo method p0119 N71-23467
Mission requirements for air to air missile and digital computer program to synthesize requirements into preliminary design p0226 N72-27682
Analysis of digital and analog computer techniques for simulation of missile guidance and control and application of hybrid simulation procedures p0226 N72-27687
Computerized simulation of gravity wave perturbed traveling ionospheric disturbances using radio ray paths
p0139 N73-14161
Computerized simulation of unified attitude control system for satellite with flexible booms
p0279 N73-23890
Simulation model for optimum spaceborne computer system design: controlling of attitude boom subsystem
p0279 N73-23891
The use of the transistor simulation program SITCAP: Transistor ordering of bipolar transistors
p0165 N74-13913
HYAC 2: Electronic circuit simulation
p0167 N74-13922

CONCORDE AIRCRAFT
Human factors in Concorde cockpit simulation
p0171 N71-16065
Evaluation of fuel cycle aspects of intake engine combination of Concorde power plant p0265 N72-16704

Concorde power plant development emphasizing flight test problems p0265 N72 16705
Mathematical models for determining flight performance of Concorde aircraft p0034 N72 20978
Methods and instruments for determining performance of Concorde aircraft p0035 N72 20982
Passive dosimetric interpretation of cosmic radiation dose rate onboard French prototype of Concorde 01 supersonic transport aircraft p0015 N72 26052
Processing of Concorde digitally recorded data p0195 N73 10453
Simulation of flight in Concorde for improving characteristic of flight control system p0048 N73 17013
Reliability design of manned supersonic aircraft considering safety hazards p0278 N73 23883
measure of minor constituents in the stratosphere by Concorde 001 p0219 N74 14288

CONFERENCES
Human factors in aircraft simulation
[AGARD CP 79 70] p0171 N71 18060
Advanced cooling systems and heat resistant materials for turbine blades of high temperature aeronautical gas turbine engines
[AGARD CP 73 71] p0257 N71 17372
Critical review and round table discussion data for colloquium on reactions between gases and solids
[AGARD AR 32 71] p0261 N71 19177
Aerodynamic interference characteristics of airframe propulsion systems of transport and military aircraft
[AGARD CP 71 71] p0001 N71 19353
Aerodynamics and applications of lift augmentation devices AGARD lecture series
[AGARD LS 43 71] p0025 N71 20051
North Atlantic Treaty Organization conference on adaptation and acclimatization in aerospace medicine
[AGARD CP 82 71] p0067 N71 20351
Tropospheric characteristics and their effects on electromagnetic wave propagation and radio signal transmission
[AGARD CP 70 71 PT 1] p0114 N71 21409
Physical fitness of flying personnel and aging effects on flight crew performance
[AGARD CP 81 71] p0091 N71 22301
Conference on high temperature turbines detailing effect of film cooling on blade profile loss
[NASA TM X 67123] p0261 N71 22699
Tropospheric scatter propagation and prediction of radio transmission characteristics
[AGARD CP 70 71] p0117 N71 23451
Symposium on unsteady aerodynamic forces loads and configurations for aeroelastic analysis of interfering surfaces
[AGARD CP 80 71 PT 2] p0008 N71 29338
Conference papers on artificial intelligence with emphasis on pattern recognition and man machine interactive problem solving
[AGARD CP 94 71] p0151 N72 11174
Aircraft fuels lubricants and fire safety conferences
[AGARD CP 84 71] p0251 N72 11668
Conference on theoretical methods and wind tunnel facilities for transonic aerodynamic testing of aircraft at high Reynolds numbers
[AGARD CP 83 71] p0011 N72 11854
Helicopter guidance and control systems conference
[AGARD CP 86 71] p0030 N72 11915
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference
[AGARD CP 63 71] p0206 N72 12492
Satellite attitude control systems NATO conference
[AGARD LS 45 71] p0277 N72 12867
General and specific medical causes for grounding flying personnel conferences
[AGARD CP 89 71] p0095 N72 14090
Conference on propagation aspects of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements
[AGARD CP 90 71] p0121 N72 16085
Engine aircraft interference thrust inlets nozzles and propulsion systems conference
[AGARD CP 91 71] p0263 N72 16885
Design testing and use of heat exchangers in industries and aerospace vehicles conference
[AGARD LS 57] p0299 N72 18946
Linear acceleration of impact type causing human injuries conferences
[AGARD CP 88 71] p0098 N72 19119
Proceedings of conference on avionics in spacecraft covering component technology instrumentation satellite subsystems and satellite systems
[AGARD CP 87 71] p0190 N72 19483
Turbulent boundary layers jets and wakes conferences
[AGARD CP 93] p0175 N72 20273
Proceedings of conference on aircraft flight test procedures data acquisition data processing and correlation with wind tunnel test results
[AGARD CP 85] p0034 N72 20976
Characteristics and effects of Arctic ionosphere on radio and radar propagation conference
[AGARD CP 97] p0126 N72 21121
Standardization of test procedures for determining stress corrosion cracking in high strength alloys and steels under various environments conference
[AGARD CP 98] p0285 N72 21900
Video storage and transmission systems for documentation and dissemination of information conferences
[AGARD CP 92] p0157 N72 22168
Guidance and control display design for aircraft and spacecraft conference
[AGARD CP 96] p0223 N72 22621
Nondestructive test for failure inspection and quality control of composite structures and materials conference
[AGARD R 590] p0290 N72 24934
Proceedings of conference on medical aspects of spatial disorientation and effects on safe aircraft operation
[AGARD CP 95 PT 1] p0071 N72 25031
Aeromedical requirements and examination techniques for aircrews conference
[AGARD CP 95 PT 2] p0073 N72 25048
Proceedings of conference on applications of laser technology for aerodynamic measurements
[AGARD LS 49] p0199 N72 26403
Conferences on biophysical approaches to solving problems of ionizing and nonionizing radiation effects during high altitude flight manned space flight and ground based equipment
[AGARD CP 95 PT 3] p0075 N72 26045
Numerical analysis of one two and three dimensional fluid flow conferences
[AGARD LS 48] p0181 N72 27293
Conference on Structural Applications of Advanced Composites
[AGARD LS 55] p0209 N72 29589
Proceedings of conference on handling qualities and performance criteria for conventional and V STOL aircraft
[AGARD CP 106] p0038 N72 32017
Conference on expanded aerospace telecommunication system requirements and digital data transmission methods
[AGARD CP 103] p0130 N73 10187
Proceedings of conference to analyze static and dynamic loads exerted on helicopter rotary wings and application to improved helicopter design
[AGARD R 595] p0016 N73 14000
Conference on acoustic gravity wave effects on atmospheric transmission of radio communication signals
[AGARD CP 115] p0134 N73 14131
Proceedings of conference on fluid dynamics of aircraft stalling to include stall and post stall aerodynamic characteristics of various military aircraft
[AGARD CP 102] p0041 N73 14998
Random load fatigue of aircraft structures conferences
[AGARD CP 118] p0291 N73 16806
Summaries of papers presented to conference concerning aircraft stability and control
[AGARD CP 119] p0043 N73 16989
Summary of conference on flight simulation p0044 N73 16992
Conference on flight handling qualities and requirements p0044 N73 16993
Evaluation of conference to investigate current and future development in aircraft electrical and auxiliary power systems
[AGARD AR 50] p0063 N73 18081
Summary of conference on stress corrosion testing methods
[AGARD AR 52] p0292 N73 18931
Proceedings of conference on application of supersonic jet technologies to auxiliary power systems for aircraft and missiles
[AGARD CP 104] p0063 N73 19030
Color vision requirements for flying personnel of various armed forces conferences
[AGARD CP 99] p0077 N73 19065
Conference on operational flight stress effects on human biodynamics and performance
[AGARD CP 101] p0104 N73 19143
Proceedings of conference on metal navigation components and systems with emphasis on concepts and technologies saving cost and performance tradeoffs
[AGARD CP 116] p0227 N73 20684
Proceedings of conference on rotary wing aircraft developments to include operational experience flight tests and evaluation of structural concepts
[AGARD CP 121] p0046 N73 21008
Proceedings of conference on fluid dynamics of rotary wings and aerodynamic characteristics of rotary wing system
[AGARD CP 111] p0049 N73 21031
Predictability of pilot anthropometric data for pilot selection conferences
[AGARD CP 109] p0078 N73 21092
Conference on detection evaluation and identification of drugs and alcohol in flying personnel and effects on flight fitness
[AGARD CP 108] p0079 N73 21102
Annual AGARD meeting in Brussels Belgium p0304 N73 21881
Proceedings of conference on rotary wings to investigate rotor materials and dynamic characteristics of blade and hub advance ratio and aerodynamic noise properties
[AGARD AR 61] p0052 N73 21931
Aerospace medicine research including human tolerance to various stress factors conferences
[AGARD CP 110] p0083 N73 23057
Conference on high temperature corrosion of alloys for aerospace applications
[AGARD CP 120] p0201 N73 23597
Conference on atmospheric attenuation and rainfall effects on ultrahigh frequency telecommunication systems
[AGARD CP 107] p0140 N73 26121
Proceedings of conference on military applications of V STOL aircraft to include current and proposed research projects to meet military requirements
[AGARD CP 126 VOL 1] p0054 N73 27000
Proceedings of conference on application of composite materials in construction of aerospace vehicles and propulsion systems
[AGARD CP 112] p0210 N73 27474
Summaries of papers presented to AGARD conference on random load fatigue
[AGARD AR 54] p0292 N73 28884
Proceedings of conference on acoustic fatigue to show effects of aerodynamic loads response of structures structural design and fatigue test methods
[AGARD CP 113] p0292 N73 29905
Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews
[AGARD AR 62] p0055 N73 31954
Proceedings of conference on spread spectrum techniques and application to digital communications systems
[AGARD LS 58] p0143 N73 32053
Proceedings of conference on electromagnetic and optical properties of sea water for application to surveillance mapping communications and visibility
[AGARD LS 61] p0241 N73 33619
Technical evaluation report on Fluid Dynamics Panel Specialists Meeting on Aerodynamic Drag
[AGARD AR 58] p0018 N74 10935
Specialists Meeting on Helicopter Rotor Prediction Methods
[AGARD CP 122] p0055 N74 10908
Pathophysiological conditions compatible with flying
[AGARD CP 129] p0084 N74 13784
Propagation effects of frequency sharing
[AGARD CP 127] p0145 N74 13846
Computer aided design for electronic circuits conference
[AGARD CP 130] p0165 N74 13906
Atmospheric Pollution by Aircraft Engines
[AGARD CP 125] p0217 N74 14271
Testing philosophy and methods of guidance and control systems and subsystems applied to navigation systems for aircraft spacecraft and missiles
[AGARD LS 60] p0236 N74 14345
Aerodynamic Drag
[AGARD CP 124] p0018 N74 14709
Second Symposium on Structural Optimization
[AGARD CP 123] p0295 N74 15596
New developments in storage retrieval and dissemination of aerospace information
[AGARD CP 136] p0159 N74 16925
Flight in turbulence proceedings of conference on atmospheric turbulence and effects on aircraft operation
[AGARD CP 140] p0057 N74 17720
Clinical psychology and psychiatry of the aerospace operational environment conference
[AGARD CP 133] p0088 N74 18779
Behavioural aspects of aircraft accidents conference on human factors research projects for reduction of pilot error aircraft accidents
[AGARD CP 132] p0106 N74 18797
Design against fatigue conference on the fatigue life assessment of tactical aircraft
[AGARD CP 141] p0060 N74 19062
The use of cinematography in aviation medicine aerospace medicine meeting on cinematography
[AGARD CP 128] p0107 N74 20732
AGARD Annual Meeting 1973 conference on research and development in Greece and use of science and technology to meet military requirements at reduced costs p0304 N74 21610
Metallurgical aspects of fatigue and fracture toughness conference on effects of microstructure on mechanical properties of airframe materials
[AGARD R 610] p0204 N74 23108
The 1971 AGARD Annual Meeting p0306 N74 23494
International conference management p0305 N74 23495

CONNECTIVE TISSUE
Structural and mechanical characteristics of human connective tissue p0101 N72 19140

CONSERVATION EQUATIONS
Conservation equations for analyzing supersonic and mixing flow regimes of supersonic ejectors p0185 N73 17249

CONSTRAINTS
Unconstrained minimization formulations of constrained problems and penalty functions p0284 N71 20134
Restraints for passengers in automobiles p0098 N72 19122
Linear and angular acceleration terminology human acceleration simulation Airplane ejection systems and mathematical models of automobile crash loads p0103 N72 19165
Protective aspects of passive restraints for vehicles p0103 N72 19156

Simulation of frontal collisions and injuries sustained by cadavers using safety belts and air bags
p0104 N72 19159

Application of discriminate function technique to random search in nonlinear constrained structural optimization problems
p0296 N74 15603

CONSTRUCTION MATERIALS

Dilatometric thermal expansion measurements on high temperature structural materials
[AGARD AR 31 71]
p0299 N71 25358

Properties and selective applications of high strength steels
p0205 N71 27040

Properties and selective applications of thermosetting and thermoplastic polymers
p0205 N71 27042

Effects of environmental stresses on materials used in constructing glide re try vehicles
p0201 N73 23601

Refractory metal alloys with protective coatings for use in structural compone ts of turbine engines
p0203 N73 23614

Analysis of heat transfer properties and thermophysical properties of materials used for aircraft and spacecraft construction
[AGARD R 606]
p0300 N73 25968

Application of composite materials for structural purposes to show limitations and failure characteristics
p0211 N73 27481

The metallurgical aspects of fatigue and fracture toughness effects of microstructure a mechanical properties of airframes and construction materials
p0204 N74 23109

Influence of microstructure on the growth of fatigue cracks analysis of processes which govern crack propagation rate
p0204 N74 23112

CONTAMINANTS

Techniques for study ng crack morphology contaminants and electrochemistry in stress corrosion
p0189 N72 21928

Sulfur sodium and chloride contaminants in gas turbines
p0232 N73 23610

CONTAMINATION

Analytical techniques applied to additive and contaminant analysis advanced by location for switchgear oil and fluorine impurities
p0251 N72 11673

CONTINUOUS RADIATION

VHF bistatic CW auroral backscattering and influence of daytime seasonal and geomagnetic latitude
p0127 N72 21128

CONTINUOUS WAVE RADAR

Ultrahigh resolution radar for sensing refractive index structure of troposphere
p0123 N72 16101

CONTINUUM FLOW

A review of supersonic sphere drag from the continuum to the free molecular flow regime
p0022 N74 14732

CONTRAST

Model for inherent contrast conditions in fall form objects
p0303 N73 19960

CONTROL EQUIPMENT

Application of active controls to suppression of flutter for supersonic aircraft
p0045 N73 17005

CONTROL SIMULATION

Analysis of digital and analog computer techniques for simulation of missile guidance and control and application of hybrid simulation procedures
p0226 N72 27687

CONTROL SURFACES

Calculation of pressure distributions over wings with harmonically oscillating control surfaces using source-box method
p0009 N71 29346

Application of lifting surface theory to wing with control surfaces in steady subsonic flow
p0009 N71 29347

Asymptotic expansion technique for lifting problems in loading effects on wings with subsonic leading control surfaces
p0010 N71 29348

Unsteady pressure measurements on harmonically oscillating sweptback wing with two control surfaces in incompressible flow
p0010 N71 29350

CONTROLLABILITY

Flight testing military transport aircraft for handling and performance in STOL applications
p0026 N71 29060

Survey of aerospace industry to determine various techniques used in considering integrations of handling qualities stability control and load alleviation devices on structural loads
[AGARD R 593]
p0040 N73 11020

Flight tests for determining handling qualities and operational characteristics of Breguet 941 STOL aircraft
p0054 N73 27068

CONVECTIVE HEAT TRANSFER

Heat exchangers and forced convection liquid metal heat transfer
p0299 N72 18948

COOLING SYSTEMS

Advanced cooling systems and heat resistant materials for turbine blades of high temperature aeronautical gas turbine engines
[AGARD CP 73 71]
p0257 N71 17372

Effectiveness of turbine cooling systems for high temperature engines
[NASA TM X 66702]
p0258 N71 17385

Impact cooling method for turbine rotor blades
p0260 N71 17397

Heat transfer in liquid metal cooled gas turbine blades
p0260 N71 17398

CORE STORAGE

Principles of write to data-coincide for storage of video information in small memory systems
p0154 N72 11193

Aerospace computer memory technology and application of particular techniques to various system requirements
p0156 N72 21218

CORIOLIS EFFECT

Stabilization of turbulent shear layer flow in rotating systems by coriolis forces
p0180 N72 20305

Biaxial simulator improving standardized coriolis stimulus for selection test and rehabilitation of motion sick pilots
p0079 N73 21098

CORROSION

Research organizations investigations and programs on high temperature research from eleven NATO countries and Spain
[AGARD R 585 71]
p0302 N71 36382

Research and development of NATO countries in high temperature corrosion of aerospace alloys
[AGARD R 591]
p0201 N72 20491

Conference on high temperature corrosion of alloys for aerospace applications
[AGARD CP 120]
p0201 N73 23597

High temperature corrosion scale for heat resistant alloys
p0201 N73 23598

Performance of aircraft gas turbine components in hot corrosion environments
p0201 N73 23599

Thermodynamic stability diagrams of high temperature O2 corrosion reactions
p0201 N73 23602

Comparison of cobalt alloys and nickel alloys relative to hot corrosion resistance
p0203 N73 23612

CORROSION RESISTANCE

Corrosion resistant materials for nozzle guide vanes and turbine blades subject to vanadium containing fuel combustion
p0203 N73 23613

Methods of oxidation and corrosion resistance in refractory metal alloys used in gas turbine engines
p0203 N73 23617

NATO national reports on high temperature corrosion of aerospace alloys
p0201 N73 23618

CORROSION TESTS

Stress corrosion tests of 7XXX series high strength aluminum alloys in laboratory environment
p0285 N72 21903

Stress corrosion tests of titanium alloys and electron beam welded titanium alloys
p0287 N72 21912

Precracked cantilever beam and constant exposure tests for determining stress corrosion of A alloys in sea water
p0288 N72 21919

Summary of conference on stress corrosion testing methods
[AGARD AR 52]
p0292 N73 18931

COSMIC RAYS

Biophysical hazards of cosmic radiation during flight of manned space flight
p0075 N72 26046

Active dosimeters for protection and control of cosmic rays in supersonic aircraft
p0075 N72 26047

Passive dosimetry for measuring cosmic radiation dosage and its effects during manned space flight
p0075 N72 26048

Relative biological effects of heavy cosmic ray ions on human tissue
p0075 N72 26049

Effects of accelerated particles and cosmic rays on light microscope human eye
[NASA TM X 68460]
p0075 N72 26051

Passive dosimetry for biological effects of cosmic radiation aboard Apollo prototype of Command and Service module spacecraft
p0075 N72 26052

COST ANALYSIS

Cost flow weight analysis of avionic equipment
p0190 N71 36784

Life cycle cost analysis of inertial navigation systems for aircraft and air to surface missiles
p0232 N73 20772

Integrated information support system ISSS cost analysis of computer processing system and costs of using such systems
p0159 N73 24206

COST EFFECTIVENESS

Operating economics of short haul civil STOL aircraft considering cost effectiveness
p0026 N71 29061

Cost effectiveness analysis of solar turbine engines for stationary and commercial applications
p0262 N71 26952

Cost effectiveness failure analysis and design techniques for nonassuring reliability of avionics systems
[AGARD LS 47 71]
p0189 N71 36776

Cost effectiveness of built in test provisions in aircraft operations
p0189 N71 36780

Fundamentals of the logistics engineering and analysis of the cost effective control over lives and cost effectiveness of components
p0013 N73 22953

Educational and applied technological developments in design of space shuttle transportation systems
p0278 N73 23884

Economics of CAD A new approach
p0165 N74 15908

Terminal guidance system testing based on accident report test and analytical techniques for logistics cost effectiveness test cost effectiveness
p0237 N74 14366

A research workers view of the future of aeronautical testing facilities
p0161 N74 16938

COST ESTIMATES

Considerations and trends of cost information analysis centers
p0113 N71 19526

COST REDUCTION

Engine configurations for improved fuel economy and reduced cost
p0177 N71 16162

Data processing and data interchange to reduce aircraft data processing costs
p0159 N73 24207

AGARD Annual Meeting 1973 conference on research and development in Greece and use of science and technology to meet military requirements at reduced costs
p0304 N74 21610

Techniques oriented towards cost reduction in aircraft production
p0305 N74 21613

The reduction of airframe costs with particular reference to combat aircraft
p0305 N74 21615

The hingeless rotor A concept to increase mission effectiveness at reduced costs
p0305 N74 21616

Research work and costs the role of data processing in aircraft production
p0305 N74 21617

Impact of technology on cost reduction in aircraft production
p0305 N74 21618

COSTS

Profile construction cost benefits economics and user surveys in transfer of technology aids selective dissemination of information
p0301 N71 23506

COUPLING

Coupling effects between wall heating and axial pressure gradients in turbulent boundary layer flow
[NASA CR 125903]
p0176 N72 20281

CRACK INITIATION

Analysis of crack initiation and crack propagation in high strength Al alloys in different environments
p0288 N72 21918

Techniques for controlling time to fatigue crack initiation in design of aircraft structures and application of residual stress analyses
p0295 N73 29930

Application of growth rate data and statistical relationship models for predicting crack growth under variable amplitude loading
p0295 N73 29932

CRACK PROPAGATION

Effects of repassivation and crack velocity on stress corrosion cracking in alloys
p0286 N72 21907

Threshold stress intensity values and crack propagation rates for stress corrosion of high strength steels in aqueous environments
p0287 N72 21911

Laboratory equipment for testing stress corrosion of bolt loaded WOL specimens and measuring crack growth
p0287 N72 21914

Wedge model for determining susceptibility of Zn Mg Cu aluminum alloys to stress corrosion cracking
p0287 N72 21915

A nondestructive technique for determining crack growth rate in high strength cantilever steel type specimens
p0287 N72 21917

Analysis of crack initiation and crack propagation in high strength Al alloys in sulfate chloride solutions
p0288 N72 21919

Crack growth study and effect of change in specimen severity and shape on fatigue behavior of low alloy steel under loading
p0291 N73 16898

Fatigue crack propagation under flight simulation loading at 10 1 and 0 1 cycles per second
p0291 N73 16900

Some recent developments in plastic and fracture mechanics relating to the brittle fracture of high strength steels
p0204 N74 23110

Influence of microstructure on the growth of fatigue cracks analysis of processes which govern crack propagation rate
p0204 N74 23112

CRACKING (FRACTURING)

Application of linear elastic fracture mechanics to developing stress corrosion cracking standard
[NASA TM X 68303]
p0286 N72 21905

Cantilever bending test for determining susceptibility of high strength alloys to stress corrosion cracking
p0287 N72 21911

Microscopic characteristics of stress corrosion cracking in steel with high yield strength
p0289 N72 21926

Steam cell apparatus for evaluating resistance to stress corrosion cracking
p0289 N72 21927

Techniques for ultrasonic crack morphology contaminants and electrochemistry in stress corrosion
p0289 N72 21928

Influence of microstructure on the growth of fatigue cracks analysis of processes which govern crack propagation rate
p0204 N74 23112

CRASH INJURIES

Linear elastic fracture mechanics for predicting critical stress intensity factors and crack growth rates in aircraft structures
p0288 N72 21908

Crash injury research needs an operational philosophy and procedure
p0098 N72 19120

Biodynamic and biomedical applications to operational problems resulting in crash injuries
p0098 N72 19121

Aircraft design engineer and crash injury research
p0099 N72 19123

Exposure to extreme fumes and gases from burning and thermal fire fighting
p0099 N72 19126

Aircraft helicopter accident analysis for defining impact survivability and the implications for new designs
p0099 N72 19129

Safety design study for crash survivable flight data recorder
p0100 N72 19137

Crash survivability of passenger aircraft seating systems
p0101 N72 19138

History of aircraft crash injury studies and facilities for investigation
p0101 N72 19153

Protective helmet design and impact effects of head injury due to aircraft accidents
p0104 N72 19160

Models for head injury prediction and helmets and prediction of optimum helmet performance p0104 N72 19161

CRASH LANDING
Landing accidents investigations for Hawker Siddeley 748 aircrafts with performance measurements on rough surfaces p0028 N71 23417
Simulated crash tests to assess fire resistance of aircraft fuels containing polymeric additives p0254 N72 11692

CRASHES
Linear and angular acceleration terminology human acceleration simulation airplane airbag restraint systems and mathematical models of automobile crash loads p0103 N72 19155

CREEP STRENGTH
Development and conduct of national and international programs to determine variations in creep test techniques and establishment of standard creep test procedures [AGARD R 581 71] p0285 N71 25449

CROP GROWTH
Backscatter properties of ground vegetation for radar waves at X band and K$_u$ band frequencies p0122 N72 16093

CRYOGENICS
Application of superconducting coils for energy storage and determination of optimizing parameters for inductive energy storage p0064 N73 19042

CRYSTALLIZATION
Influence of surface preparation surface texture and initial oxidation on metal surface crystallization p0201 N73 23603

CURVATURE
Axisymmetric inlet flow and curvature theories for small gas turbines p0265 N72 16701

CURVE FITTING
Universal curves which relate general properties of two dimensional boundary layers on turbomachine blades p0268 N73 19795

CUSHIONS
Acceleration protection system design impact testing of restraint harnesses and ejection seat cushions and applications p0104 N72 19157

CYBERNETICS
Development of schematic representation of pilot workload and functions for various portions of aircraft flight and reaction to various stimuli p0040 N72 32035

CYCLIC LOADS
Effect of environment and stress cycling on in service structural failure of adhesives and procedures for predicting safe operational conditions p0295 N73 29929

CYLINDRICAL SHELLS
Computerized design of stiffened cylindrical shells and ablating composite heat shield p0284 N71 20137

D

D REGION
Electromagnetic cross modulation and very low frequency propagation techniques for measuring acoustic gravity waves in ionospheric D region p0137 N73 14153

DARK ADAPTATION
Effects of accelerated particles and cosmic rays on light flashes in human eye [NASA TM X 68460] p0075 N72 26051

DARKROOMS
Practical problems in clinical nystagmography Guidelines for selection of equipment facility for vestibular tests p0108 N74 20734

DATA ACQUISITION
Characteristics of electronically operated mass spectrometer for satellite applications and analysis of atmospheric data acquisition p0192 N72 19494
Flight test program and data acquisition techniques for evaluation of Boeing 747 aircraft p0034 N72 20977
Characteristics of flight test instruments and techniques for overcoming limitation and sources of error p0035 N72 20984
Development of flight test procedures for use with advanced aircraft to determine cruise performance characteristics p0035 N72 20985
Comparison of flight test and wind tunnel data to determine areas of agreement when uncertainties appear in aerodynamic coefficients of slender wing aircraft p0036 N72 20990
Determination of performance data and stability and control characteristics from aircraft performance under nonsteady flight conditions p0036 N72 20992
International survey of air pollution by aircraft engines and fuels [AGARD AR 40] p0217 N72 21590
Development of airborne flight data acquisition and data processing systems [AGARD LS 50] p0195 N73 10450
In flight data acquisition and processing systems p0195 N73 10452
Impact of technological development on airborne data acquisition system and ground data processing station p0195 N73 10457
Procedures for testing rotary wing aircraft models in wind tunnels to include design of test facilities cost of models and facilities and methods of obtaining data p0018 N72 22955
Data collection problems for small documentary centers p0159 N73 24208
Procedures for predicting fatigue life of aircraft flying under various load conditions using data obtained by counting accelerometer p0294 N72 29927
Appendix A data item service for aircraft drag estimation collection dissemination and development of aerodynamic drag prediction data p0020 N74 14717

DATA CONVERTERS
Principles of video to digital converter for storage of video information in small memory systems p0154 N72 11197

DATA LINKS
TAM TAM system for use during oceanic continental and terminal control area flight p0234 N73 23710

DATA MANAGEMENT
Development of methods for presenting aircraft performance data and comparison of specific methods to show sources of discrepancies p0053 N73 24050
Information dissemination services to industry p0159 N73 24210

DATA PROCESSING
Feasibility and applications of scientific and technical information analysis centers [AGARD CP 78 71] p0113 N71 19526
Concept mission and operation of scientific and technical information analysis centers p0113 N71 19527
Robot data screening process to select relevant variables in data search p0151 N72 11176
Radar pattern recognition for image data processing with meteorological radar systems p0151 N72 11181
Development of numerical process for extracting aerodynamic coefficients from flight test data p0036 N72 20991
Processing of Concorde digitally recorded data p0195 N73 10453
Analysis of deterministic and random flight data p0195 N73 10455
Application of computer techniques for determination of flutter characteristics of aircraft and comparison with model matching data analysis [AGARD R 596] p0046 N73 18030
Three color receptors of Young Helmholtz and opponent color types of information processing p0077 N73 19066
Design of airborne flight data transmission system for automatic acquisition and tracking p0278 N73 23885
Data recording and data interchange for reducing data processing costs p0159 N73 24207
Electronic computer processing of data stored in data banks p0159 N73 24212
Aeromedical research and clinical applications of averaging techniques in nystagmography computer techniques in clinical measurements of average eye movements p0110 N74 20750
Automated nystagmus analysis on line computer technique of eye data processing p0110 N74 20751

DATA PROCESSING EQUIPMENT
Development of airborne flight data acquisition and data processing systems [AGARD LS 50] p0195 N73 10450
In flight data acquisition and processing systems p0195 N73 10452
Selection of dynamic data processing systems p0195 N73 10454
Impact of technological development on airborne data acquisition system and ground data processing station p0195 N73 10457
Integrated microform machine processing system and costs of using such system p0159 N73 24206

DATA PROCESSING TERMINALS
Feasibility analysis of packet switching networks for remote access computing systems p0158 N72 22171
TAM TAM system for use during oceanic continental and terminal control area flight p0234 N73 23710

DATA RECORDING
Characteristics of satellite television recording systems using continuous line scanning with constant open aperture p0192 N72 19498
Development of pulse code modulation system for encoding and formatting data using satellite onboard equipment p0193 N72 19503
Processing of Concorde digitally recorded data p0195 N73 10453
Data recording and data interchange for reducing data processing costs p0159 N73 24207
Analysis of structural response to acoustic loading and preparation of data sheets for various conditions of acoustic loads p0293 N73 29914

DATA REDUCTION
Feasibility and applications of scientific and technical information analysis centers [AGARD CP 78 71] p0113 N71 19526
Concept mission and operation of scientific and technical information analysis centers p0113 N71 19527
Analysis of deterministic and random flight data p0195 N73 10455
Use of radio ranging data for radar target assessment p0145 N74 11965
The use of RCS data for radar systems design p0145 N74 11966

DATA SAMPLING
Signal to noise ratio performance of optimum digitized FM demodulator p0131 N73 10195

DATA STORAGE
Development and characteristics of data storage equipment for use on small scientific spacecraft p0193 N72 19502
Development and operation of programmable PCM telemetry encoder for data storage and processing during space missions p0193 N72 19504
Video storage and transmission systems for documentation and dissemination of information conferences [AGARD CP 92] p0157 N72 22188
Data collection problems for small documentary centers p0159 N73 24208
Electronic computer processing of data stored in data banks p0159 N73 24212
Preservation and storage of radar cross section data p0145 N74 11964

DATA SYSTEMS
Development and characteristics of data storage equipment for use on small scientific spacecraft p0193 N72 19502
Development of pulse code modulation system for encoding and formatting data using satellite onboard equipment p0193 N72 19503
Development and operation of programmable PCM telemetry encoder for data storage and processing during space missions p0193 N72 19504
Application of digital computers for automatic testing and data processing during checkout of satellites p0193 N72 19505
Video storage and transmission systems for documentation and dissemination of information conferences [AGARD CP 92] p0157 N72 22168
Computer aided input of graphic information on chemical structures by keyboarding under visual control of display device p0157 N72 22170
Methods employed to obtain datum position and velocity information for evaluation of inertial navigation systems and identification of error sources p0212 N73 20716
Design of airborne flight data transmission system for automatic acquisition and tracking p0278 N73 23885
Functions of small industrial information center p0158 N73 24203
Integrated microform machine processing system and costs of using such systems p0159 N73 24206
Data collection problems for small documentary centers p0159 N73 24208

DATA TRANSMISSION
Tropospheric turbulence effects on superhigh frequency transmissions at low elevation angles p0135 N71 21422
Video storage and transmission systems for documentation and dissemination of information conferences [AGARD CP 92] p0157 N72 22168
Microfilmed test access system which automatically retrieves scans and transmits to remote display terminals utilizing wideband transmission network p0157 N72 22169
Algorithm for reducing redundancy during image transmission p0131 N73 10189
Noise and error effects on differential pulse code modulation transmission of sampled aerial imagery p0131 N73 10190
Automatic equalizers of telephone channels for fast transmission of digital data p0132 N73 10199
Algorithm for adaptive digital filters of data communication channels p0132 N73 10200
Real time computerized message switching and data transmission systems for military communications network p0133 N73 10206
TAM TAM system for use during oceanic continental and terminal control area flight p0234 N73 23710
Fundamental concepts of communication theory to include transmission of continuous signals and use of discrete time signals p0143 N73 32054
Characteristics of digital communication systems and processing of bandpass digital signals using spread spectrum techniques for data transmission p0143 N73 32055
Principles and operation of spread spectrum communication system with application to satellite communication systems p0143 N73 32056
Performance of spread spectrum communication systems to include effects of various forms of channel noise and synchronization aspects of system p0143 N73 32057

DEBYE SCHERER METHOD
Debye potential or theory for determining electromagnetic wave propagation in sea p0241 N73 33022

DECELERATION
Biodynamics of airblast during accelerative and decelerative events p0100 N72 19134
Linear deceleration and test vehicle p0103 N72 19151

DECISION MAKING
Robot data screening process to select relevant variables in data search p0151 N72 11176
Space station information subsystem for automatic support of manned operations p0279 N73 23887
Simulation of pilot decision making process in manual landing operation during fog p0280 N73 23898
Monte Carlo simulator for man machine task sequencing considering pilot performance degradation p0280 N73 23899

DECISION THEORY
Application of pattern recognition techniques to fault interference estimation of average Markowski distance in decision space p0153 N72 11191

DEFENSE COMMUNICATIONS SYSTEM (DCS)
Operational performance and transmission measurement on worldwide Defense Communications System network p0133 N73 10209

DEFENSE PROGRAM
Director's annual report to the North Atlantic Military Committee 1971 p0306 N74 23496
DEFORMATION
Equations for time mean values of viscous and turbulent flow and eddy viscosity dependence on second invariant of deformation tensor p0176 N72 20280
DEHYDRATION
Metabolic imbalances and body hypohydration during food deprivation for 10 days p0070 N71 20368
DELTA MODULATION
Number of control of delta modulated vocal signals in an integration telecommunication system p0131 N73 10194
DELTA WINGS
Lift and drag interference characteristics of delta wings with leading edges p0002 N71 19359
Numerical method for analyzing aerodynamic loads on tandem delta wings with oscillations in supersonic flow p0008 N71 29367
Wind tunnel measurements at Reynolds number effect on force and pressure coefficients for slender delta wing at transonic speed p0012 N72 11861
Correlation of flow visualization tests flown with full scale results of slender wing airplanes for vortex flaps configuration development p0013 N72 21866
Drag of lifting bodies for prior at high altitude p0021 N74 14731
DEPLOYMENT
Stresses and installation problems associated with large scale to large rectilinear scientific loop deployments p0069 N71 20360
DEPOLARIZATION
Four-stream scattering description effects of dipole adsorption statistically homogeneous and isotropic dielectric constant medium p0119 N71 23467
Nonspherical raindrop depolarization of electromagnetic wave in oblique frequency radiation p0142 N73 26123
Rain depolarization of linear and circularly polarized microwaves p0141 N73 26137
DESCENT TRAJECTORIES
Computerized prediction of separated store trajectories dropped from fighter aircraft at high speed p0005 N71 19379
Environmental effects on parachute impact forces at 6,000 to 12,000 feet using parabolic aperture and standard deployed para flute p0131 N72 19137
DETACHMENT
Analysis of high temperature environment, aerodynamic and data turbulent during flight and relationship to spatial development p0072 N72 25042
DETERIORATION
Analytical methods for early stage detection of oil deterioration in aircraft engines p0254 N72 11698
DIABETES MELLITUS
Possible diabetes melitus in flying crews Canadian Air Force p0098 N72 14129
Systematic of insulin dependent and insulin independent diabetes as navigation personnel p0082 N73 21129
Optimization of supervision of diabetic flying personnel p0085 N74 13796
The problem of diabetes mellitus evaluation of the use of [illegible] in diabetic flying personnel p0087 N74 13804
Theoretical statistical aspects of [illegible] test diagnosis of diabetes mellitus in pilots p0087 N74 13805
DIAGNOSIS
Diagnostic and functional measurements of human disorders p0 N73 22303
Diagnostic techniques and physiological measurements p0092 N73 22312
Automatic medical diagnosis using computer interpretive [illegible] p0152 N72 11184
Clinical electrodiagnosis of progress of lower motor [illegible] p0074 N72 25058
Technical information report on [illegible] p0084 N74 13785
Returning aircrew with abnormal electrocardiograms and coronary angiograms to flying status p0085 N74 13788
Value of [illegible] signals in [illegible] personnel p0086 N74 13793
Asthma in military flying personnel p0085 N74 13792
Diagnostic validity of [illegible] tests [illegible] test diagnosis of diabetes mellitus in pilots p0087 N74 13805
Purpose of [illegible] in aviation medicine [AGARD-CP-128] p0067 N74 20772
Clinical application of [illegible] of [illegible] p0098 N74 20733
Differential diagnosis of the various myelopathies particular consideration of [illegible] CNS at cervical [illegible] p0098 N74 20735
Myelography in the [illegible] and applied investigations of the [illegible] p0098 N74 20741
Some aspects of [illegible] in the diagnosis of [illegible] p0101 N74 20742

The bioelectric monitoring of the [illegible] by Peltier regulated [illegible] p0109 N74 20748
DIELECTRIC PROPERTIES
Analysis of radar backscatter from the sea dielectric properties of materials and slant range radar measurements p0126 N72 16119
DIES
Stress corrosion behavior of die forgings made from Al Zn Mg Cu alloys p0288 N72 21922
DIESEL ENGINES
Comparison of an all gas turbine and diesel engine power plants for aircraft and ground vehicle propulsion p0262 N71 26658
DIETS
The problem of diabetes mellitus in aviation medicine control of hypoglycemic reactions in flying personnel p0087 N74 13804
DIFFERENTIAL EQUATIONS
Optimization of aerospace vehicle constraints by a staff element using differential equation idealization and finite element approximation [NASA-CR-117198] p0284 N71 20139
Boundary conditions for difference approximation of hyperbolic differential equations p0185 N74 22915
DIFFRACTION PATHS
Optimal multiple access systems and improved path parameters for space country [illegible] p0115 N71 21427
Tropospheric effects on microwave propagation over diffraction paths p0117 N71 21439
Very high frequency signal fading in the tropo-scatter path propagation p0117 N71 21431
DIFFRACTION PATTERNS
Calculation of diffracted effects and signal to noise ratio by two dimensional wave diffuse signal beam path theory p0199 N72 25510
DIFFUSE RADIATION
Measurement of light scattering at various angles and power spectral for laser and modulation transition and [illegible] properties p0242 N73 33629
Application of focusing techniques to accurate spread of satellite signal for monitoring spot gain and profile and beam improvement p0242 N73 33632
DIFFUSERS
Prediction for predicting performance characteristics of several throat diffusers ejector systems p0183 N73 17250
DIFFUSION
Laminar diffusion flames of acetylene oxygen mixtures p0263 N72 11684
DIFFUSION THEORY
Mixing experiments with [illegible] p0202 N73 23659
DIGITAL COMPUTERS
Applications of digital computers for automatic testing and data processing during the test of satellites p0193 N73 19553
Application of digital computer techniques to aerospace systems development of new techniques p0155 N72 11212
Tactical integrated communication system for Soviet military aircraft p0229 N73 23889
Conceptual aircraft digital system [illegible] flight control p0283 N73 23970
Computerized techniques applications to integrated aerospace systems p0283 N74 13974
DIGITAL DATA
Kwajalein range digital data telemetering [illegible] interference suppression digital transmissions p0133 N73 22213
Processing of [illegible] data p0196 N73 30483
Digital [illegible] for [illegible] p0143 N73 32055
DIGITAL FILTERS
Digital filtering procedures for images with [illegible] p0155 N72 11204
Digital computer techniques for filtering and processing of telemetered aircraft data p0131 N73 10192
Fast Fourier transform digital processing spectrum and bandwidth [illegible] p0132 N73 10198
Automatic evaluation of telephone channels for fast [illegible] data p0132 N73 10199
Application of adaptive digital filters to data communication [illegible] p0132 N73 10200
Minimum power sensitivity of digital filters for a given set of coefficients p0239 N74 10718
DIGITAL NAVIGATION
Feasibility examination of [illegible] p0034 N72 13336
DIGITAL SIMULATION
Mathematical models for [illegible] p0288 N73 23891
DIGITAL SYSTEMS
Advanced digital visual [illegible] systems for television [illegible] p0158 N72 22172
Digital telecommunication techniques [illegible] p0177 N71 10188
The NASA computer switched [illegible] system p0168 N74 13331
Digital [illegible] [AGARD-CP-114] p0184 N74 18424
DIGITAL TECHNIQUES
Conference on expanded aerospace telecommunication system requirements and digital data transmission methods [AGARD-CP-103] p0130 N73 10187
Error probability and bandwidth efficiency of digital transmission channel p0131 N73 10193
Digital receiver for data rate moderate data rate phase shift keyed signals in real time p0132 N73 10196
Feasibility of an digital implementation of worldwide analog communications systems p0133 N73 10209
DISCRETE FUNCTIONS
Procedures for calculating normal wash in complex configurations and interference between wings and bodies p0008 N71 29340
DISEASES
Symptomatic differential [illegible] p 083 N73 23061
DISORDERS
Nasal and mental disorders and flight fitness in German armed forces p0097 N72 14107
DISORIENTATION
Perceptual problems in [illegible] p0071 N72 25031
Analysis of spatial disorientation reports by flying personnel during 24 year period [NASA-CR-132578] p0071 N72 25032
Analysis of spatial orientation illusions during [illegible] p0071 N72 25033
Analysis of [illegible] caused by spatial disorientation p0071 N72 25034
Statistical analysis of [illegible] to determine incidence caused by spatial disorientation p0071 N72 25035
Psychophysiological and performance factors involved in [illegible] p0071 N72 25036
Human factors [illegible] p0071 N72 25037
Correlation of [illegible] p0071 N72 25038
Analysis of a flight [illegible] p0071 N72 25041
Analysis of a flight [illegible] p0071 N72 25042
Development of criteria for [illegible] p0071 N72 25045
Application of [illegible] p0071 N72 25047
Spatial disorientation in flight [illegible] [AGARD-AG-126] p0084 N74 12748
DISPERSIONS
Effects of [illegible] p0202 N73 23608
DISPLAY DEVICES
[illegible] [AGARD-CP-36-71] p0030 N72 11915
[illegible] p0033 N72 11920
[illegible] p 214 N72 11948
[illegible] p0156 N72 21221
[illegible] p0152 N72 22169
[illegible] p0152 N72 22170
[illegible] [AGARD-CP-95] p0223 N72 22623
[illegible] p0223 N72 22622
[illegible] p0223 N72 22624
[illegible] p0223 N72 22625
[illegible] p0223 N72 22626
[illegible] [NASA-CR-126254] p0223 N72 22627

Hybrid character generator combining stroke writing and Lissajous procedure for anthropotechnical evaluation of integrated displays p0224 N72 22628
Assessment of design aircraft cockpit layout and display control system p0224 N72 22629
Design guidelines for pictorial integrated flight control and guidance displays for V STOL aircraft [NASA CR 126153] p0224 N72 22630
Evaluation of integrated flight display for hovering phase of IFR landing of VTOL aircraft p0224 N72 22631
V STOL display requirements for approach and landing under adverse weather conditions p0224 N72 22632
Harrier aircraft navigation display and computer unit with projected moving map means of storing and selecting coordinates and numerical data superimposed on map p0224 N72 22633
Airborne map display systems using direct view projected combined map CRT and electronically generated map displays p0224 N72 22634
Electronic head up display systems for military aircraft p0225 N72 22635
Engineering and operational factors of electronic multisensor aircraft displays p0225 N72 22636
Solid state electroluminescent materials for display devices p0225 N72 22638
Multipurpose wide field three dimensional head up display for aircraft pilots during approach and landing and other maneuvers involving altitude changes p0225 N72 22639
Display principle for 3 D or multicolor solid state 2 D panel displays p0225 N72 22640
Spacecraft display technology applied to aircraft guidance and control displays p0225 N72 22641
A survey of vertical contact landing display simulating carrier landings and error contributed by display resolution temporal loading and control complexity p0225 N72 22642
Rate of closure as performance monitoring parameter during approach and landing p0226 N72 22643
Flight test data on all electronic prospective flight display panel in aircraft cockpit p0226 N72 22644
Display design for guidance and control [AGARD AR 43] p0194 N72 25419
Display systems for all weather terminal operational capability of V STOL aircraft [AGARD R 594] p0196 N73 11407
Analysis of aircraft instruments and display devices for approach control and landing of V STOL aircraft [AGARD AR 51] p0196 N73 18439

DISTANCE MEASURING EQUIPMENT

Integrated SAWVAN VOR and DME system for locating and controlling high altitude aircraft p0232 N73 23695

DISTORTION

Forebody and forebody wing cowling wind data for subsonic wind performance and distortion during flight p0266 N72 16719

DIURNAL VARIATIONS

Diurnal variations in ionospheric drifts magnetic dip equator due to gravity waves p0138 N73 14160

DIVING (UNDERWATER)

Outbreaks of vertigo in subtropical atmospheres and among underwater divers with theoretical explanations of etiology involved p0072 N72 25043
The use of cystagmography in aviation medicine aerospace medicine meeting on cystagmus [AGARD CP 128] p0107 N74 20732
Vertigo in diving p0132 N74 20753
Cochlear and vestibular disorders following diving inner ear damage and auditory late ns p0110 N74 20754

DO 31 AIRCREST

Flight tests of VTOL aircraft DO 31 p0035 N72 26981
Analysis of aerodynamic characteristics of VTOL aircraft DO 31E V STOL aircraft and comparison with criteria contained in handling requirements documents p0035 N72 32024
Design development and characteristics of Do 31 V STOL aircraft touchdown dynamics operational problems caused by ground effect and transition flight p0054 N73 27034

DOCUMENT STORAGE

Multiplexed text address system which automatically retrieves stores and transmits large mass of data between multiple remote computer networks p0157 N72 22159

DOCUMENTATION

Organizational and effectiveness of specialized documentation centers p0113 N71 19523
Video storage and retrieval systems for the rapid input and dissemination of aerospace research [AGARD CP 92] p0152 N72 22158
Computer display of graphic information in man machine systems by keyboard light pen and rotary display device p0152 N72 22170

DOCUMENTS

Quarterly and annual report to the North Atlantic Military Committee 1972 p0306 N74 21499

DOGS

Effects of positive G acceleration on blood oxygen saturation oxygen pressure and pulmonary diffusion capacity in dogs breathing air and 40% oxygen in helium body water content and regulation [NASA CR 137290] p0068 N71 20358

DOPPLER EFFECT

Antenna response patterns Doppler spectra and amplitude distributions of transhorizontal microwave scatter propagation p0117 N71 23453
Development and characteristics of laser Doppler velocity instrument to measure velocities of flowing fluids p0200 N72 25505
Development and characteristics of dual scatter laser Doppler velocimeter for flow distribution measurement in wind tunnels helicopter downwash and across high lift wing sections p0200 N72 25506

DOPPLER NAVIGATION

Possibilities and limitations of rotary and fixed wing compatible Doppler sensor designs p0031 N72 11923
Advanced Doppler inertial navigation system for transport helicopters p0033 N72 11935
Navigation guidance computer requirements for integrated navigation system using combination of outputs of inertial Doppler and loran equipment p0157 N72 21224
Development of Doppler microwave landing system and techniques for eliminating effects of multipath transmissions p0234 N73 23706

DOPPLER RADAR

Application of patterns recognition techniques with Doppler radar for detection of personnel moving at rate comparable with clutter producing environment p0152 N72 11182
Development of optical striations and Doppler spectrum broadening due to barium plasmas in ionosphere p0128 N72 21136

DOSAGE

Effects of human biorhythms on chemotherapy and drug evaluation p0082 N73 21119

DOSIMETERS

Active dosimetry for protection and control of cosmic rays in supersonic aircraft p0075 N72 26047
Passive dosimetry for measuring cosmic radiation dosage and its effects during manned space flight p0075 N72 26048
Passive dosimetric interpretation of cosmic radiation dose rate onboard French prototype of Concorde 001 supersonic transport aircraft p0075 N72 26052

DOUBLE PRECISION ARITHMETIC

Data word length considerations for aerospace computer implementation to obtain required precision levels p0156 N72 21217

DOWNWASH

Numerical analyses of downwash fields behind wings of arbitrary p0022 N71 19369
Numerical method for evaluating fluctuating downwash distribution for steady flow over swept wings oscillating in p0019 N71 29349
Development of actuator disc theory for predicting time averaged downwash distribution and response characteristics of helicopter rotors in forward flight p0049 N73 21033
Analysis of unsteady aerodynamic loading on reference section of helicopter rotor blade in axial or hovering flight under compressible flow conditions p0050 N73 21044

DRAG MEASUREMENT

Procedures for calculating normal wash in nonplanar configurations and the interference between wings and bodies p0008 N71 29347
A survey of drag prediction techniques applicable to subsonic and transonic aircraft design p0019 N74 14711
An unsteady wake drag and lift of general body shapes at subsonic transonic and supersonic Mach numbers p0019 N74 14712
On some basic and new aspects about the drag problem of wings and bodies in supersonic flows p0019 N74 14713
Measurements of the drag of some transonic aircraft excrescences immersed in turbulent boundary layers p0019 N74 14714
Problems of estimating the drag of a full scale aircraft correlation of flight test data and scale model test data p0019 N74 14715
Aircraft drag prediction for project appraisal and preliminary design p0019 N74 14716
Review of methods for predicting viscous drag aerodynamic drag and lift for high angles of attack and maneuver attitudes p0020 N74 14719
Drag of geometrical objects in subsonic flow comparison with other results and drag coefficients p0020 N74 14719
Comparison of various methods for calculating profile drag from pressure measurements in the far wake at subsonic speed p0020 N74 14721
Drag and separation effects of separated flow on aerodynamic drag p0020 N74 14722
New investigations for reducing the base drag of wings with a blunt trailing edge effects of splitter plates and splitter wedges on aerodynamic drag coefficients p0020 N74 14723
The drag of externally carried stores its prediction and alleviation drag reduction by redesign or development of new aircraft installations p0021 N74 14729

DROP SIZE

Ground contamination by fuel jettisoned from aircraft p0218 N74 14285

DROP TESTS

Photographic recording of aerodynamic interference in wind tunnel simulation of jettisoned drop loads from aircraft p0005 N71 19378

DROPS (LIQUIDS)

Ground contamination by fuel jettisoned from aircraft p0218 N74 14283

DROSOPHILA

Natural ionizing radiation effects on multiplication of circulating gametes and Drosophila melanogaster development p0075 N72 26056

DRUGS

Effects of educational and pharmacological dynamics on adaptability of human beings to degraded sensorial environments p0069 N71 20364
Metrazepam and Meclocinum double blind comparison test conditions against motion sickness p0079 N73 21100
Conference on data from evaluation and testing of drugs and alcohol affecting performance and effects of flight fitness [AGARD CP 108] p0079 N73 21102
Drug screening data for civil aviation personnel obtained by urinalysis p0080 N73 21104
Residual effects of hypnotic drugs on human nervous functions and performance p0080 N73 21106
Pilot performance and sleep patterns during duration flights and control of hypnotic drug and alcohol use p0080 N73 21107
Physiological aspects of sleep induction after awakening after prolonged flight times p0080 N73 21108
Adaptive tracking task for evaluating drug after effects on human flight performance p0080 N73 21109
Effects of sonicaid treatment on pilot performance p0080 N73 21111
Sports medicine parameters necessary for maximum competitive form p0081 N73 21114
Urinalysis methodology for detection of abusive and therapeutic drugs in man p0081 N73 21117
Ophthalmological examination of cardiovascular drugs effects on performance of navigation personnel p0082 N73 21122
Influence of alcohol and drugs on cerebral circulation in subjects and non smokers p0082 N73 21125

DUCTED FLOW

One and two D wave theories for analyzing ducted mixing and burning of coaxial streams p0183 N73 17253

DUCTS

Electromagnetic pulse propagation in duct between ground and atmospheric layer p0116 N71 21425
Ray tracing analysis of duct effect on line of sight wave propagation above sea surface p0116 N71 21428
Role of atmospheric ducts in the phenomena of interference over large distances p0146 N74 13849
Ducting properties of elevated layers p0147 N74 13862
The occurrence of very high field strengths at beyond the horizon propagation over sea in the frequency range 60 5000 MHz p0147 N74 13863
Explanations of very low field strength levels on line of sight paths over sea due to meteorological conditions p0148 N74 13868

DYNAMIC CHARACTERISTICS

Dynamic characteristics and linear control theory for aircraft simulation p0171 N71 16061
Wind tunnel static and dynamic performance tests with F 111A and YF 12 aircraft [NASA TM X 67495] p0266 N72 16709
Mathematical models for measuring operating forces and performance of gyroscope with two degrees of freedom p0229 N73 20696
Dynamic full scale measurement of RCS p0144 N74 13849

DYNAMIC CONTROL

Mathematical modeling of aircraft ship boat response to pilot or control system p0002 N72 23212
Extended capability and usage for real time simulation of process control digital systems p0229 N73 23892

DYNAMIC MODULUS OF ELASTICITY

Ultrasonic measurements of elastic constants of thermoplastic sheets and fiber sheets p0297 N72 22494

DYNAMIC PROGRAMMING

Problem solving using mathematical operations for battlefield recognition and planning tactical operations p0150 N72 22256

DYNAMIC RESPONSE

Transducers for measuring dynamic loads and pressures in aircraft applications [AGARD R 583 72] p0248 N73 11719
Human factors considerations in the design of tracking systems p0267 N72 21214

Theoretical mechanics for expressing kinematics of human impact acceleration using two coordinate systems p0100 N72 19132

Biodynamic models of human response to various environmental forces p0100 N72 19133

Selection of dynamic data processing systems p0195 N73 10454

Methods for determining aircraft structural response to acoustic fatigue p0293 N73 29913

DYNAMIC STRUCTURAL ANALYSIS

Swept wing body configurations for reduced drag at supersonic speed p0002 N71 19358

Aerodynamic configuration effects of propulsion system integration into supersonic transport design p0004 N71 19373

Transfer functions in modeling human pilot and dynamic structural aircraft responses [AGARD R 580 71] p0006 N71 23210

Power spectrum method for determining gust frequency response functions in dynamic aircraft design p0007 N71 23211

Mathematical modeling of aircraft structural response modes to active control systems p0007 N71 23212

Computation and measurements of dynamic aircraft transfer functions to atmospheric turbulence p0007 N71 23213

Design and development of instrument for measuring aerodynamic loads and fatigue characteristics of aircraft structures [AGARD R 597] p0041 N73 13019

E

EAR

Groups of flight crew personnel due to nasal and aural disorders p0097 N72 14126

Nasal and aural disorders and flight fitness in German armed forces p0097 N72 14127

EAR PRESSURE TEST

Effects of increased middle ear pressure on the vestibular system — human vertigo due to pressure changes in Eustachian tubes p0110 N74 20755

EARTH ALBEDO

Characteristics of sensors for spacecraft attitude determination based on infrared horizon scanning and albedo spectra p0192 N73 19495

EARTH ATMOSPHERE

Ray tracing method for calculating paths of acoustic and gravity waves in atmosphere p0134 N73 14133

EARTH RESOURCES

Radar imagery applications for studying earth resources p0121 N72 16099

EARTH SURFACE

Perturbation method for calculating surface roughness effects on electromagnetic wave propagation in an inhomogeneous atmosphere p0117 N71 21432

ECONOMIC ANALYSIS

Economic analysis of microwave time frequency system for aircraft p0235 N73 23717

A microwave system for small users p0160 N74 16935

ECONOMIC FACTORS

Increased satisfaction of user needs and increased economics in operation of information systems [NASA CR 67142] p0301 N71 23504

ECONOMICS

Profile construction and the ability, economics, and user surveys in the stratification design of sound communication of information p0101 N71 23506

EDDY VISCOSITY

Equations for some mean values of incompressible turbulent flow and eddy viscosity dependence on second invariant of deformation tensor p0176 N72 20280

EDUCATION

Effects of education and personality on adaptability of human beings to degraded sensorial environment p0069 N71 20364

French school for training aviation personnel p0036 N72 20993

Organization and operation of US Air Force Test Pilot School p0036 N72 20994

Procedures for training pilots in assessment of flight systems during attendance at Empire Test Pilot School, England p0036 N72 20995

Organization, operation, and curriculum of U.S. Navy Test Pilot School at Patuxent Naval Air Station, Maryland p0037 N72 20996

Education and technical training for the total aviation [AGARD CP 153] p0140 N74 16335

EFFECTIVENESS

Effectiveness of reliability programs for aerospace equipment p0183 N73 36779

EJECTION

Testing system of ejection seat to determine effectiveness against an object moving at high speed ejection p0102 N72 19147

EJECTION INJURIES

Effects of flail chest injuries on pressure suit performance during escape from aircraft p0102 N72 19124

Human head and neck injury criteria evaluated for aerospace and ejection stresses p0102 N72 19145

Pathological examination of spinal injuries in pilots caused by sudden ejection p0102 N72 19148

Nonfatal ejection vertebral fracture comparison between US British and Swedish armed services p0083 N73 23019

EJECTION SEATS

Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews [AGARD AR 62] p0055 N73 31954

EJECTORS

Optimization parameters for afterbody adaptation and ejector performance p0264 N72 16696

Designs and performance predictions for high performance subsonic ejector systems [AGARDOGRAPH 163] p0183 N73 17248

Conservation equations for analyzing supersonic and mixing flow regimes of supersonic ejectors p0183 N73 17249

Procedure for predicting performance characteristics of second throat diffusers in ejector systems p0183 N73 17250

Ejector flow model for predicting performance characteristics of supersonic ejector systems p0183 N73 17251

Semiempirical methods for designing ejectors for various applications p0183 N73 17252

ELASTIC PROPERTIES

Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference [AGARD CP 63 70] p0206 N72 12492

Theoretical and experimental determination of elastic constants in silica epoxy composite materials p0207 N72 12497

Error sources in elastic stress measurements in fiber reinforced composite materials p0207 N72 12498

Methods for calculating and predicting viscoelastic constants of composite materials p0209 N72 12508

Application of linear elastic fracture mechanics to developing stress corrosion cracking test standards [NASA CR X 58353] p0286 N72 21906

ELASTOPLASTICITY

Design optimization of spacecraft structures made of elastic perfectly plastic materials p0283 N71 20131

ELECTRIC CONDUCTORS

Analysis of alternating current loss in channel superconductors with comparison of performance in coil and cable configurations p0063 N73 19032

ELECTRIC DISCHARGES

Utilization of superconductors to store and discharge electric energy p0064 N73 19041

Effects of electromagnetic forces, energy addition, and discharge losses on design of superconducting coils for energy storage elements p0064 N73 19043

ELECTRIC ENERGY STORAGE

Utilization of superconductors to store and discharge electric energy p0064 N73 19041

ELECTRIC EQUIPMENT

Effects of substrates on stability of superconductors and electrical properties of superconductors for various conditions p0063 N73 19031

Characteristics of superconducting electric generators to show effect of electromechanical electromagnetic and cryogenic parameters on design p0064 N73 19039

Figures and characteristics of superconducting electrical machines and design of synchronous electric generators for airborne use p0064 N73 19040

Characteristics of power generating systems and application in missiles for production of hydraulic and electric energy p0065 N73 19044

Characteristics of auxiliary power unit combined with accessory drive to form a unitary power system for aircraft electric power supply p0065 N73 19045

Design principles of auxiliary power units of secondary power systems for operation of aircraft equipment p0065 N73 19046

Analysis of interface between aircraft mechanical power requirements and performance requirements of auxiliary power systems p0065 N73 19049

Analysis of gas turbine engine requirements and performance when main propulsion system furnishes auxiliary power source p0065 N73 19050

Air Force research and development programs on aircraft electrical power systems to show planning process for developing specific classes of technology p0066 N73 19052

Application of solid state switching, multiplexing, and electronically programmable logic to aircraft electrical systems p0066 N73 19053

Development of electrical generating and distribution systems for supersonic aircraft using solid state switching and remote control of protective devices p0066 N73 19054

ELECTRICAL ENGINEERING

Engineering and operational factors of electromagnetic noise aircraft displays p0225 N72 22636

Multipath rainfall measurements for planning ultrahigh frequency radiolink p0142 N73 26137

ELECTRICAL PROPERTIES

Generation of subnanosecond frequency power using negative impedance characteristics of avalanche diodes in reflection amplifiers p0194 N72 19511

Technique for measuring elastic moduli, ultimate strength, thermal and electrical properties of filament wound composites p0209 N72 29593

ELECTRO OPTICS

Characteristics of electro optical terminal guidance systems and correlation and related techniques used to update and control of tactical missiles p0227 N72 20888

Laboratory evaluation of electro optically aided space navigation systems — description of design principles and hardware performance p0236 N74 14350

ELECTROCARDIOGRAPHY

Long term electrocardiographic analysis of thirteen heart disturbances of foreign Air Force p0097 N72 14103

Long term ECG examinations of pilots using tests at rest and in exercise tests p0233 N72 25056

Characteristic potential techniques by telemetering electrocardiography of flight personnel p0233 N72 25057

Automatic analysis of ECG at rest during and after exercise with help of computer systems p0233 N72 25058

Analog computer programs for analysis of extended electrocardiographic recordings p0074 N72 25063

Importance of the 4.5 Hz component in the EEG to determine military flying fitness psychological factors in EEG patterns p0086 N74 13797

ELECTROCHEMISTRY

Techniques for study of hydrogen embrittlement and electrochemical stress corrosion p0289 N72 21928

ELECTRODES

Microelectrodes for measuring dissolved gases, pressure, corrosion of alumina, and a 1020 steel exposed to hydrogen sulfide p0296 N72 21909

ELECTROLUMINESCENCE

Solid state electroluminescent materials for display devices p0225 N72 22618

Flight test data on electroluminescent lighting for panel and alpha/num p0226 N72 22634

ELECTROMAGNETIC ABSORPTION

Variable reflectance waveguide [illegible] p0126 N72 16158

Microwave radiometer system for measuring atmospheric temperature profiles p0141 N73 29173

ELECTROMAGNETIC COMPATIBILITY

Panel on effects of frequency sharing [AGARD CP 127] p0145 N74 18845

ELECTROMAGNETIC INTERFERENCE

Characteristics of superconducting electric generators to show effect of electromechanical electromagnetic and cryogenic parameters on design p0064 N73 19039

Figures and characteristics of superconducting electrical machines and design of synchronous electric generators for airborne use p0064 N73 19040

Characteristics of power generating systems and application in missiles for production of hydraulic and electric energy p0065 N73 19044

Characteristics of auxiliary power unit combined with accessory drive to form a unitary power system for aircraft electric power supply p0065 N73 19045

Design principles of auxiliary power units of secondary power systems for operation of aircraft equipment p0065 N73 19046

Analysis of interface between aircraft mechanical power requirements and performance requirements of auxiliary power systems p0065 N73 19049

Analysis of gas turbine engine requirements and performance when main propulsion system furnishes auxiliary power source p0065 N73 19050

Air Force research and development programs on aircraft electrical power systems to show planning process for developing specific classes of technology p0066 N73 19052

Application of solid state switching, multiplexing, and electronically programmable logic to aircraft electrical systems p0066 N73 19053

Development of electrical generating and distribution systems for supersonic aircraft using solid state switching and remote control of protective devices p0066 N73 19054

ELECTRICAL ENGINEERING

Engineering and operational factors of electromagnetic noise aircraft displays p0225 N72 22636

Multipath rainfall measurements for planning ultrahigh frequency radiolink p0142 N73 26137

ELECTRICAL PROPERTIES

Generation of subnanosecond frequency power using negative impedance characteristics of avalanche diodes in reflection amplifiers p0194 N72 19511

Technique for measuring elastic moduli, ultimate strength, thermal and electrical properties of filament wound composites p0209 N72 29593

ELECTRO OPTICS

Characteristics of electro optical terminal guidance systems and correlation and related techniques used to update and control of tactical missiles p0227 N72 20888

Laboratory evaluation of electro optically aided space navigation systems — description of design principles and hardware performance p0236 N74 14350

ELECTROCARDIOGRAPHY

Long term electrocardiographic analysis of thirteen heart disturbances of foreign Air Force p0097 N72 14103

Long term ECG examinations of pilots using tests at rest and in exercise tests p0233 N72 25056

Characteristic potential techniques by telemetering electrocardiography of flight personnel p0233 N72 25057

Automatic analysis of ECG at rest during and after exercise with help of computer systems p0233 N72 25058

Analog computer programs for analysis of extended electrocardiographic recordings p0074 N72 25063

Importance of the 4.5 Hz component in the EEG to determine military flying fitness psychological factors in EEG patterns p0086 N74 13797

ELECTROCHEMISTRY

Techniques for study of hydrogen embrittlement and electrochemical stress corrosion p0289 N72 21928

ELECTRODES

Microelectrodes for measuring dissolved gases, pressure, corrosion of alumina, and a 1020 steel exposed to hydrogen sulfide p0296 N72 21909

ELECTROLUMINESCENCE

Solid state electroluminescent materials for display devices p0225 N72 22618

Flight test data on electroluminescent lighting for panel and alpha/num p0226 N72 22634

ELECTROMAGNETIC ABSORPTION

Variable reflectance waveguide [illegible] p0126 N72 16158

Microwave radiometer system for measuring atmospheric temperature profiles p0141 N73 29173

ELECTROMAGNETIC COMPATIBILITY

Panel on effects of frequency sharing [AGARD CP 127] p0145 N74 18845

ELECTROMAGNETIC INTERFERENCE

[illegible] p0119 N73 21407

[illegible] p0142 N73 26137

Effects of [illegible] p0145 N74 18843

[illegible] p0145 N74 18844

Propagation effects of frequency sharing [AGARD CP 127] p0145 N74 18845

The [illegible] p0147 N74 18853

ELECTROMAGNETIC MEASUREMENT

Statistics of high level beyond horizon signals at 2.2 GHz and 2.6 GHz and measurements of the variation of the arrival angle structure radio interference and tropospheric scatter p0148 N74 13866

ELECTROMAGNETIC MEASUREMENT

Electromagnetic cross modulation and very low frequency propagation techniques for measuring acoustic gravity waves in ionospheric D region p0137 N73 14153

ELECTROMAGNETIC NOISE

Performance of spread spectrum communication systems to include effects of various forms of channel noise and synchronization aspects of system p0143 N73 32057

ELECTROMAGNETIC PULSES

Electromagnetic pulse propagation in duct between ground and atmospheric layer p0116 N71 21425

ELECTROMAGNETIC RADIATION

Biological effects of UHF electromagnetic radar emissions on human organism p0076 N72 26053

Navy research and instrumentation for analyzing nonionizing radiation effects on human personnel p0076 N72 26054

Comparison of ionospheric radio wave propagation and acoustic gravity wave propagation p0134 N73 14132

Analysis of radome design techniques and development of specifications for radome construction [AGARD AR 53] p0140 N73 23108

Debye polarization theory for determining electromagnetic wave propagation in sea p0241 N73 33622

ELECTROMAGNETIC SCATTERING

Radio wave scattering from auroral ionization [NASA TM X 68302] p0127 N72 21131

Intensity of weak scattering from electron density irregularities in ionosphere p0128 N72 21134

Simulation and investigation of scattering mechanisms of radio aurora p0128 N72 21135

ELECTROMAGNETIC WAVE TRANSMISSION

Tropospheric characteristics and their effects on electromagnetic wave propagation and radio signal transmission [AGARD CP 70-71 PT 1] p0114 N71 21409

Tropospheric scattering and delay effects on electromagnetic wave propagation in space communications p0114 N71 21413

Electromagnetic pulse propagation in duct between ground and atmospheric layer p0116 N71 21425

Ray tracing analysis on duct effect in line of sight wave propagation above sea surface p0116 N71 21428

Atmospheric stratifications causing anomalous signal propagation at 170 and 5000 MHz over sea surface beyond horizon p0116 N71 21429

Perturbation method for calculating surface roughness effects on electromagnetic wave propagation in inhomogeneous atmosphere p0117 N71 21432

Transmission loss in troposphere-stratosphere propagation on 12 GHz scatter link p0118 N71 23458

Effects of atmospheric layers on remote sensing by electromagnetic wave reflections p0123 N72 16098

Geometrical optics solution for plane electromagnetic wave propagation and reflection in nonhomogeneous isotropic medium p0123 N72 16100

Conference on acoustic gravity wave effects in atmospheric transmission of radio communication signals [AGARD CP 115] p0134 N73 14131

Asymptotic expansion solutions of wave generation and downward propagation into lower atmosphere p0134 N73 14134

Mathematical models for acoustic gravity wave excitations by gas masses p0134 N73 14135

Theoretical plasma perturbation model for calculating coupling effects between acoustic gravity waves and electromagnetic waves in ionospheric disturbances p0135 N73 14162

Explanation of very low field strength fluctuations on slant paths over sea due to meteorological conditions p0146 N74 13868

ELECTROMAGNETISM

Debye polarization theory for determining electromagnetism of the surface p0241 N73 33620

ELECTROMYOGRAPHY

Clinical electrodiagnosis in prognosis of lower motor neuron lesions p0074 N72 25058

ELECTRON BEAM WELDING

Stress-corrosion tests of titanium alloys and electron beam welded titanium alloys p0287 N72 21917

ELECTRON DENSITY (CONCENTRATION)

Intensity of weak scattering from electron density irregularities in ionosphere p0128 N72 21134

Radio signals from Explorer 22 for ionospheric electron content p0128 N72 21141

Full wave solution for electron density perturbations caused by gravity waves in E2 region p0136 N73 14145

Numerical models of total electron content over Europe and the Mediterranean and middle latitude scintillation occurrences [AGARD AG 164] p0187 N74 14084

A numerical model of TEC over Europe for support of communication conditions p0187 N74 14085

A numerical model of TEC over the Mediterranean area p0187 N74 14086

Electronics and space activities in Greece wave propagation and electron density research p0305 N74 21612

ELECTRON MICROSCOPES

Application of scanning electron microscope for failure analysis and nondestructive tests of semiconductor devices p0191 N72 19488

ELECTRONIC EQUIPMENT

Techniques for determining reliability of electronic equipment after acceleration tests p0190 N71 36786

Systems performance and safety in helicopter approach and landing and radioelectronic guidance array p0034 N72 11939

Development and characteristics of microelectronic equipment for improved reliability and reduced weight and size of electronic components p0191 N72 19484

Characteristics of solid state power amplifiers for direct amplification using doublers and tripers and application to interplanetary space probes p0194 N72 19510

Human perceptual characteristic data relating to individual electronic flight display design p0223 N72 22627

Tradeoffs between luminance and color coding in electronic aircraft displays and experiments involving immediate response tracking tachistoscope and human judgement p0223 N72 22823

Electronic head up display systems for military aircraft p0225 N72 22835

Engineering and operational factors of electronic multisensor aircraft displays p0225 N72 22636

Research activities of electronic laboratory in development of inertial navigation systems to include applications for space missions and commercial aviation p0227 N73 20686

Tactical integrated electronic systems for Swedish military aircraft p0279 N73 23889

Computerized design of fighter aircraft cockpit electronic control system considering man machine interaction p0291 N73 23905

Computer aided design for electronic circuits conference [AGARD CP 130] p0165 N74 13906

Computer aided design for maximum production yield or maximum reliability p0165 N74 13911

Electronics and space activities in Greece wave propagation and electron density research p0305 N74 21612

ELECTRONIC MODULES

Hybrid microcircuit technology for spacecraft electronic equipment to improve reliability and service life p0191 N72 19485

Systems design for spaceborne computer engineering module p0280 N73 23894

ELECTRONIC RECORDING SYSTEMS

Practical problems in clinical cystagmography. 2. Choice of ...

Effects of increased or decreased ear pressure on the vestibular system. 1. Human vertigo due to pressure changes in Eustachian tubes p0110 N74 20755

ELECTRONICS

Method for computing photo electronic and photographic detectors based on product of signal to noise ratio times spatial bandwidth p0242 N73 33634

Techniques for long range vision under water using range gating and flash scan with parallax techniques p0242 N73 33636

ELECTRONS

Total electron content of ionosphere with emphasis on North Atlantic region [AGARD AG 166] p0187 N71 22350

ELECTROSTATIC CHARGE

Electrostatic charging in handling of aviation fuels resulting in accidentally igniting of fuel vapors p0253 N72 11686

ELECTROSTATIC GYROSCOPES

Mathematical models for measuring inertial qualities of spherical rotors supported with electric suspension p0228 N73 20693

Development of electrostatic gyro systems p0229 N73 20698

ELECTROSTATIC PROBES

Segmented spark electrostatic probe and microwave probe and electrostatic probe array methods for measuring turbulent wave properties in hypersonic spheres p0178 N72 20296

EMULSIONS

Various options for emulsified fuels for reducing aircraft exhaust pollutant p0253 N72 11689

ENDOCRINE SECRETIONS

Influence of long duration flight missions on metabolic and endocrine functions of pilots and navigators p0106 N73 19152

ENDOTHERMIC REACTIONS

Cooling advanced engines by endothermic reactions of hydrocarbon fuels by absorbing sensible and latent heat p0251 N72 11672

ENERGY ABSORPTION

Influence of water vapor on absorption and of water droplets on transmission at the sea level p0241 N73 33623

ENERGY DISSIPATION

Dissipation rate measurements and correlations with turbulence structure in atmospheric boundary layer flow p0178 N72 20292

ENERGY STORAGE

Development of high specific energy electrochemical systems with high current densities and applications to power conversion and energy storage p0063 N73 19035

Application of superconductive magnets for energy storage and transmission of electric energy parameters by cryogenic energy storage p0064 N73 19042

Effects of electromagnetic radiation on high energy radiation and discharge characteristics and design of superconducting magnetic energy storage electrodes p0064 N73 19043

ENGINE COOLANTS

Cooling advanced engines by endothermic reactions of hydrocarbon fuels by absorbing sensible and latent heat p0251 N72 11672

ENGINE DESIGN

Design of gas turbine engines for high operating temperature p0258 N71 17386

Operational design criteria for gas turbine engines p0261 N71 17402

Design and performance of gas turbine engines for helicopters and surface transport vehicles p0262 N71 26953

Interference problems of airframe engine integration in aircraft design optimization [AGARD LS 53] p0037 N72 27016

Determination of thrust and drag characteristics for integrated aircraft engine design optimization p0038 N72 27023

Proceedings of conference on application of composite materials in construction of aerospace vehicles and propulsion systems [AGARD CP 112] p0210 N73 27474

Application of reinforced composite materials for construction of aeronautical gas turbine engines p0212 N73 27490

Production of lamellar and fibrous composite materials from directional solidification of eutectic alloys and application to gas turbine blades and vanes p0212 N73 27492

Application of directionally solidified eutectics for design and construction of gas turbine engines p0212 N73 27493

Directional solidification of eutectic alloys. 4. Application to turbine blades and gas turbine engine components p0213 N73 27494

Session 4 - Design. Opening remarks. Combustor design policy making and pollution control p0220 N74 14297

Modernization of turbomachine combustors for pollution studies p0220 N74 14298

ENGINE FAILURE

Effect of engine failure on aerodynamic characteristics of supersonic aircraft p0045 N73 17003

ENGINE INLETS

Transonic performance of double flow engine nacelle air intake and afterbody at high Reynolds numbers p0013 N72 11866

Analysis of intake duct noise of turbofan engine and effect on duct structure due to acoustic fatigue p0293 N73 29916

Assessment of the influence of inlet and afterbody on the performance on total aircraft drag p0021 N74 14726

ENGINE MONITORING INSTRUMENTS

AGARD flight test instrumentation series. Volume 4. The measurement of engine rotation speed [AGARD AG 160 VOL 4] p0196 N74 14116

ENGINE PARTS

Components for low weight small volume aircraft gas turbine engines p0262 N71 26955

Performance of aircraft gas turbine components in hot corrosion environments p0201 N73 23599

Chemical and mechanical properties of aircraft gas turbine engine components p0201 N73 23600

Methods of testing rotating components of turbine rotors compared with tests on complete turbine rotors [AGARD AG 167] p0271 N73 26800

ENGINE TESTS

Development of techniques for evaluating performance of air breathing engines and measurement of significant operating parameters [NASA TM X 68305] p0015 N72 20981

Detailed exhaust emission measurements of three different turbofan engine designs p0217 N74 14278

Exhaust emission measurements of the GE T64-7 turboprop engine p0219 N74 14286

ENGINEERING MANAGEMENT

Advanced NASA and DOD technology management techniques and application to NATO programs for defense and civil needs p0303 N73 11968

ENVIRONMENT EFFECTS

Effects of environmental stresses on materials used in construction of gliders recently verified p0220 N73 27460

Environmental toxicological impact of aircraft operations p0222 N74 14306

ENVIRONMENT POLLUTION

Problems of chemical pollution by aircraft. 1. A general assessment of the environment p0218 N74 14275

Ground contamination by fuel jettisoned from aircraft p0218 N74 14283

Pollution levels at the Los Angeles International Airport and methods for reducing them p0219 N74 14284

ENVIRONMENTAL TESTS

Environmental tests of V/STOL aircraft. Effects of temperature and ...

[NASA TM X 68904] p0068 N73 20956

The incidence of aircraft fatigue and its relationship to statistical distribution of flight-by-flight load spectra in commercial operations p0069 N73 20964

Heat tolerance of articles during ground exposure to various thermal environments p0070 N73 20966

Specifications and test procedures for determining stress corrosion cracking in high strength alloys at ambient temperature environments. Handbook p0285 N72 21900 [AGARD CP 98]

Stressing systems and environmental methods used by European Federation on stress corrosion tests
p0285 N72 21904

Analysis of crack initiation and crack propagation in high strength Al alloys in different environments
p0288 N72 21918

Effects of heat treatment size specimen type and test environment on two precipitation hardened stainless steels during stress corrosion cracking tests p0288 N72 21923

High temperature environmental testing of gas metal interactions to simulate severe operating conditions
p0202 N73 23606

ENVIRONMENTS

Combined environmental stress effects on human performance p0069 N71 20362

ENZYME ACTIVITY

Clinical observation of massive injury causing serum enzyme activity in man after crash accidents
p0101 N72 19138

EOLE SATELLITES

Passive gravity gradient method for stabilization of Eole and Heos satellites p0278 N72 12867

Sun-satellite attitude measurement and control system components p0278 N72 12869

EPOXY RESINS

Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference [AGARD CP 63 71] p0206 N72 12492

Linear and nonlinear stress characteristics of epoxy resin composite materials p0207 N72 12496

Theoretical and experimental determination of elastic constants in solid epoxy composite materials
p0207 N72 12497

Temperature and fiber orientation effects on mechanical behavior of silicon dioxide epoxy composite materials
p0207 N72 12499

Axial torsion tests for stress strain response of brittle and reinforcing fibers in glass epoxy resin composites
p0207 N72 12500

Electrical conductance capacitance tests for determining stress strain limits of glass fibers in a composite material or reinforced plastic materials exposed to water
p0208 N72 12505

Photoelastic measurement of orientation and work in by reinforcing resins of composite materials
p0208 N72 12507

Application of boron epoxy composite materials to airframe construction with specific development of F 111 stabilizer p0211 N73 27480

EQUIPMENT SPECIFICATIONS

Techniques for determining system and equipment reliability requirement p0190 N71 36783

Equipment designed for accurately measuring mechanical response of materials to impact p0102 N72 19145

Flight tests performed following initial delivery inspection and methods performed by Canadian Armed Forces p0036 N72 20987

Operational and technological development aspects in design of space shuttle avionic systems
p0278 N73 23884

EQUIVALENT CIRCUITS

Transistor equivalents — a method to find linear equivalent circuits of operational amplifiers and hybrid transistors
p0165 N74 13914

ERBIUM

Near infrared measurement of erbium fluorescence in an carbon dioxide atmosphere p0024 N72 16108

ERROR ANALYSIS

Error sources in elastic stress measurements on fiber reinforced composite materials p0207 N72 12498

Error correction procedures for calibration of infrared sea surface temperature measurements p0124 N72 16105

Error sources in sea surface temperature measurements by satellite based scanning infrared sensor
p0124 N72 16107

Monte Carlo calculation of error probability distribution in sensing systems caused by refractive index of sensed medium p0125 N72 16115

Characteristics of flight test instruments and techniques for overcoming limitations and sources of error
p0035 N72 20984

Numerical analysis of effects of various parameters affecting accuracy and stability of strapdown inertial navigation systems p0277 N73 20681

Development and evaluation of failure detection and recovery techniques for use with fault tolerant inertial measuring units p0278 N73 20683

Methods proposed to obtain operational reliability allocations for evaluation of reliability of navigation systems and identification of error sources p0232 N73 29716

Practical problems in inertial system design [AGARD AR 82] p0108 N74 20735

ESCAPE SYSTEMS

Effects of O2 excess on ejection during high altitude escapes evaluated by USAF p0092 N72 19114

Presentation of symposium to obtain escape speeds and configurations of emergency ejection systems for helicopter crew [AGARD AR 62] p0055 N73 31114

ESRO SATELLITES

Pneumatic system used with ESRO satellite attitude control system p0278 N72 12858

ESTERS

Synthesis and properties of aliphatic ester for turbine lubrication in jet aircraft p0254 N72 11696

Synthetic high temperature lubricants thickened by complex esters for supersonic aircraft p0255 N72 11701

ESTIMATES

Reliability estimation including failure effect analysis of avionic systems p0189 N71 36777

Regression analysis of estimation tests and system operating data p0189 N71 36778

Estimating attenuation scintillation and scattering due to rainfall for satellite ground systems p0147 N74 13856

EULER EQUATIONS OF MOTION

Numerical analysis of three dimensional ideal gas flow and Euler equations of motion p0182 N72 27307

EUROPA 3 LAUNCH VEHICLE

Analysis of stimuli and commands subsystem for checkout and inspection of EUROPA 3 launch vehicle
p0191 N72 19490

EUROPE

European jet fuel lubricity evaluation
p0252 N72 11679

Stressing systems and environmental methods used by European Federation stress corrosion tests
p0285 N72 21904

Existing positions and future prospects of wind tunnels in European research [AGARD AR 60] p0172 N73 20269

Numerical models of total electron content over Europe and the Mediterranean and multi station scintillation comparisons [AGARD AG 166A] p0187 N74 14084

Multi station observations November 1971 March 1972 p0187 N74 14087

EUTECTIC ALLOYS

Production of laminar and fibrous composite materials from directional solidification of eutectic alloys and application to gas turbine blades and vanes p0212 N73 27492

Application of directionally solidified eutectics for design and construction of gas turbine engines
p0212 N73 27493

Directionally solidified eutectic alloys for application to turbine blades and gas turbine engine components
p0213 N73 27494

EVOLUTION (DEVELOPMENT)

Natural space radiation effects on manned exploration of circumterrestrial orbits and the manned exploration of the moon and planets p0075 N72 26050

EXERCISE (PHYSIOLOGY)

Age and exercise effects on the isometric muscle performance strength and alternation between isometric and dynamic exercise in monkeys [AMRL TR 70 74] p0068 N71 20355

Heat tolerance of athletes during exercise at various thermal environments p0076 N71 20366

Physiological responses to the acting stresses of heat and hyperbaria under dry and humid atmospheres at ambient P sub CO2 of 23 mm Hg p0073 N71 20370

Physical fitness of flying personnel and aging effects on flight performance [AGARD CP 81 71] p0091 N71 22301

Physical fitness training schedules for Canadian Forces flying personnel p0091 N71 22305

Physical exercise effects on stress tolerances of trained and untrained subjects p0091 N71 22306

Physical exercise and fitness tests for German Air Force flying personnel p0091 N71 22307

Oxygen consumption and heart rate measurements for estimating exercise tolerance of military personnel
p0091 N71 22309

Physical exercise and environmental psychological parameters methods in an experimental study
p0092 N71 22310

Exercise effects on physical fitness and fitness tests in systems of aging pilots p0092 N71 22313

Aging effects on military flight crew body compositions and physical exercise performances p0093 N71 22316

EXHAUST GASES

Analysis of air pollution caused by aircraft engine emissions in vicinity of airport and investigation with air collection in urban areas p0211 N73 27488

Atmospheric Pollution by Aircraft Engines [AGARD CP 125] p0212 N74 14271

Reduction of NO in natural gas premixed
p0212 N74 14272

United States Department of Transportation research program of high altitude pollutants p0217 N74 14273

Detailed exhaust emission measurements of three different turbofan engine designs p0217 N74 14276

Pollutant formation through engine emissions at low and high altitudes p0218 N74 14277

Effect of supersonic transport upon the ozone layer studied in a two dimensional photochemical model with transport p0218 N74 14278

A new optical technique for measuring NO in stratosphere in the range from 0.1 to 5000 PPM p0218 N74 14280

Problems of chemical pollution by aircraft The airport and the immediate environment p0218 N74 14281

Pollutant emission of airport ground traffic
p0219 N74 14285

Exhaust emission measurements on the CJ 610 7 turbojet engine p0219 N74 14286

Exhaust emission of military subsonic gas turbine engines p0220 N74 14292

Development and verification of an analytical model for predicting emissions from gas turbine engine combustors during low power operation p0220 N74 14295

Technology for the reduction of aircraft turbine engine exhaust emissions p0221 N74 14300

A preliminary study on the influence of fuel staging on nitric oxide emissions from gas turbine combustors
p0221 N74 14301

Design and evaluation of combustors for reducing aircraft engine pollution p0221 N74 14302

Motorist point of view on the effects of low burning rates on pollution p0221 N74 14303

Aircraft gas turbine pollutant limitations oriented toward minimum effect on engine performance
p0221 N74 14304

Photometric measurements of exhaust smoke trails by jet engines p0221 N74 14305

Technical evaluation report on AGARD Technical Meeting on Atmospheric Pollution by Aircraft Engines requirement to analyze contribution to air pollution near airports from various sources [AGARD AR 63] p0222 N74 15349

EXHAUST NOZZLES

Flight and wind tunnel evaluations of flow field effects on performance of supersonic underwing exhaust nozzle at transonic speeds [NASA TM X 66887] p0003 N71 19366

Aircraft afterbody and engine nozzle interference at subsonic transonic and supersonic speeds
[NASA TM X 66888] p0003 N71 19368

Inlet engine and exhaust nozzle tests for supersonic propulsion system [NASA TM X 67494] p0263 N72 16692

External drag characteristics of jet engine exhaust nozzles using wind tunnel tests p0266 N72 16707

Theoretical study of the residual emissions of polluting products in turbojet exhausts p0220 N74 14294

EXHAUST SYSTEMS

Reduction of particulate emissions of turbine engine exhaust systems p0251 N72 11675

Survey of wind tunnel testing procedures for nozzles and exhausts p0263 N72 16688

EXOSPHERE

Spatial distribution of plasma in polar exosphere based on satellite data p0126 N72 21124

EXPIRED AIR

Respiratory gas analyzer for airview pulmonary function measurements [NASA TM X 68320] p0074 N72 25057

EXPLORER 22 SATELLITE

Radio signals from Explorer 22 for ionospheric electron count p0128 N72 27141

EXPLOSIONS

Fire and explosion protection using foam including oxygen reduction vaporization cooling and closed loop filters p0253 N72 11679

Evaluation of Lamb atmospheric edge mode by use of large explosive explosions p0136 N73 31149

EXPLOSIVE WELDING

Explosive bonding technique for strengthening aluminum with beryllium wires p0208 N72 12502

EXPLOSIVES

Lethal heat ignites torpedo warhead explosive caused by detonation of low caliber p0100 N72 19135

EXTERNAL STORES

Computerized prediction of separated store trajectories dropped from turbine aircraft at high speed
p0005 N71 19379

Flight test measurements and reference and aerodynamic results affects caused by jettisoning of external stores from F 4 aircraft p0006 N71 19384

Computerized prediction of flow field interference forces and moments on aircraft stores at subsonic speeds
p0006 N71 19385

Wind tunnel evaluation of three body store configurations for captive flight drag and separation characteristics
p0006 N71 19386

Statistical prediction of external store separation characteristics from aircraft p0006 N71 19388

The drag of externally carried stores its speed loss and alleviation drag reduction by passage or development of new aircraft installations p0021 N74 14729

EXTERNALLY BLOWN FLAPS

Design aspects of stall of powered lift aircraft with externally blown flaps and methods for predicting onset maximum lift coefficient due to power
p0042 N73 15011

EXTREMUM VALUES

Cumulative frequency distributions determined by extreme value analysis used for failure analysis and interpretation of wind shear at low altitude and gust velocity measured on test aircraft [AGARD R 624 71] p0030 N71 25080

EYE EXAMINATIONS

Standardization of tests and classification of color perception abnormalities in military personnel
p0071 N73 19071

EYE MOVEMENTS

Naval research on laser caused visual injury to primates monkeys and man [AD 744 172] p0026 N72 25056

Application of extra foveal vision to visual search and acquisition in the ground search p0062 N73 19960

Modeling of random human visual search and scanning based on physical properties of eye p0062 N73 19961

Nystagmography - A useful tool in basic and applied investigations of human neurophysiological system
p0108 N74 20741

Human eye movements during various forms of linear acceleration and weightlessness - electronystagmographic recordings of human and fish responses to gravitoinertial conditions
p0109 N74 20747

F

F REGION

Intensity variations in satellite scintillations in F region
p0128 N72 21138

High frequency backscatter observations of high latitude field aligned irregularities in F region p0130 N72 21149

F layer electron density fluctuations and disturbances following nuclear explosion at ionospheric height
p0140 N73 14169

Multistation observations November 1971 - March 1972 p0187 N74 14047

F 2 REGION

Full wave solution for electron density perturbations caused by gravity waves in F2 region p0136 N73 14145

F 2 AIRCRAFT

Flight test measurements on interference and aerodynamic drag effects caused by jettisoning of external stores from F 2 aircraft p0006 N71 19384

F 14 AIRCRAFT

Role of flight simulation in development of S 3 and F 14 aircraft p0045 N73 17001

F 28 TRANSPORT AIRCRAFT

Aeroelastic and flutter analysis for T tail of Fokker F 28
p0009 N71 29344

Development of F 28 transport aircraft wing and analysis characteristics to show effects of boundary layer fences
p0043 N73 15015

F 104 AIRCRAFT

Calculating eigenfrequencies modes and generalized masses for F 104G aircraft from drawings by finite element method
[AGARD R 592] p0290 N 2 1

The human factor in recycle aircraft accident pattern - statistical analysis of CF 104 aircraft accident patterns
p0107 N74 18800

F 111 AIRCRAFT

Inlet steady state and dynamic performance tests with F 111A and YF 12 aircraft
[NASA TM X 67495] p0266 N72 16709

Analysis of stall and post stall characteristics of F 111 aircraft and development of regression techniques to obtain aerodynamic derivatives p0043 N73 15013

Application of boron epoxy composite materials for airframe construction with specific development of F 111 stabilizer p0211 N73 27480

FAILURE ANALYSIS

Optimum structural design and reliability analysis
p0284 N71 20138

Cost effectiveness failure analysis and design techniques for measuring reliability of avionics systems
[AGARD LS 47 71] p0189 N71 36776

Reliability estimation including failure effect analysis of avionic systems p0189 N71 36737

Failure of welded joints in Ti Al Sn alpha type alloys in CCl_4 vapor p0289 N72 21929

Ultrasonic radiographic eddy current and acoustic emission techniques for nondestructive tests of carbon fiber reinforced polymers and failure mechanisms
p0290 N72 24935

Correlation between full scale fatigue test failures and actual service failures for several military aircraft
p0291 N73 16931

Failure analysis of three section mixed compression nozzle engine case using distortion energy and maximum strain theories of failure p0213 N73 27500

Techniques for controlling fatigue crack initiation in design of aircraft structures and application of residual stress analyses p0295 N73 29930

Development of rational analytic theory for analyzing fatigue of airframes based on maximum stress field parameter and maximum load excursion ratio
p0295 N73 29931

Application of growth rate data and analytical retardation models to predicting crack growth under variable amplitude loading p0295 N73 29932

Analysis of errors in fatigue life prediction procedures and methods for improving accuracy of prediction analysis techniques p0295 N73 29934

FAILURE MODES

Development and evaluation of failure detection and isolation technique for use with four gimbaled inertial measuring units p0228 N73 20093

FAN IN WING AIRCRAFT

Flow distortion and performance measurements on 12 in. annular wing model for range of forward speeds and range of attack settings in closed wind tunnel
p0265 N72 16702

FANS

Design fabrication and test of boron epoxy wide chord fan on fan disks to operate at high temperatures
p0213 N73 27498

FAST FOURIER TRANSFORMATIONS

Edge detection algorithms two dimensional Fourier transforms and linguistic methods for computer processing of natural scenes p0152 N72 11186

Fast Fourier transform digital processor as spectrum analyzer and adaptive filter p0132 N73 10198

FATIGUE (MATERIALS)

Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of vertical acceleration and gust velocity measured on transport aircraft
[AGARD R 579 71] p0030 N71 25080

Techniques applications and scope of fractography
[AGARD AG 155 71] p0285 N72 13882

Survey and analysis of literature on fatigue damage accumulation in aircraft materials and structures
[AGARD AG 157] p0290 N72 22918

Effects of fretting on fatigue of materials and development of anti fretting compounds and metal working procedures to reduce fretting
[AGARD AR 45] p0290 N72 28902

Physical aspects of fatigue damage accumulation including interaction and sequence effects
p0291 N73 16899

Fatigue crack propagation under flight simulation loading at 10 1 and 0 1 cycles per second p0291 N 3 18900

Random fatigue tests on normalized carbon steel with 0 7 percent carbon p0291 N73 16902

Application of composite materials to structural purposes to show limitations and failure characteristics
p0211 N73 27481

Summaries of papers presented to AGARD conference on random load fatigue
[AGARD AR 54] p0292 N73 28884

Analysis of response and fatigue characteristics of light alloy integrally machined planks with emphasis on acoustic fatigue properties p0293 N73 29912

Analysis of effect of damping on response of structure to acoustic excitation and experimental method for determining damping coefficients p0295 N73 29917

Sonic fatigue characteristics of titanium sandwich structures and numerical analysis of natural frequencies and static stress values p0293 N73 29919

Structural response and endurance tests of aircraft structural components to determine effect of typical environment on acoustic fatigue p0294 N73 29920

Development of procedures for predicting fatigue life of aircraft structures based on fracture mechanics crack propagation and residual static strength analysis
[AGARD LS 62] p0294 N73 29924

Development of fatigue life prediction procedures based on measured stress time histories and mathematical model for description of random vibrations p0294 N73 29926

Techniques for introducing stress to fatigue crack initiation in design of aircraft structures and application of residual stress analyses p0295 N73 29930

Development of procedure for estimating fatigue life of airframes to eliminate errors caused by neglecting effect of stress redistribution after localized yielding
p0295 N73 29933

Some considerations of the influence of fatigue on the design of strike aircraft p0060 N74 19653

Fatigue design practice p0060 N74 19654

Fatigue and fracture considerations for tactical aircraft
p0060 N74 19656

The metallurgical aspects of fatigue and fracture toughness effects of microstructure on mechanical properties of airframes and propulsion materials
p0204 N74 23109

Influence of microstructure on the growth of fatigue cracks analysis of processes which govern crack propagation rate p0204 N74 23112

FATIGUE LIFE

Stress strain fatigue life behavior of beryllium sintered aluminum powders having high oxide to surface
p0208 N72 12504

Fiber load conditions and elements for determining stress that some life of glass fiber resin reinforced laminated or reinforced plastic materials exposed to water
p0208 N72 12505

Random load fatigue of aircraft structures - conference
[AGARD CP 118] p0291 N73 16896

Fatigue life assessment of aircraft structures based on random or programmed fatigue tests and loadings
p0291 N73 16897

Crack growth study and effects of change in spectrum severity and shape on fatigue behavior of 7075 T6 aluminum under random loading p0291 N73 16898

Fatigue life prediction of military aircraft under three different test spectra p0291 N73 16900

Current high technology for helicopter rotors - based on Army Lives computer program for determining fatigue design loads p0056 N74 10919

Design against fatigue - conference on the fatigue life assessment of tactical aircraft
[AGARD CP 141] p0060 N74 19652

Full scale fatigue requirements for rational fatigue life prediction p0061 N74 19657

FATIGUE TESTS

Fatigue testing at high temperatures
[AGARD R 604] p0292 N73 18916

Development of method for determining response of test type structures subjected to high intensity acoustic loading p0293 N73 29915

Sonic fatigue characteristics of titanium sandwich structures and numerical analysis of natural frequencies and static stress values p0293 N73 29919

Acoustic fatigue tests of aluminum alloy structural elements under narrow band random loading with zero mean stress applied p0294 N73 29921

Development of experimental program for determining response and sonic fatigue resistance of lightweight aircraft structures p0294 N73 29923

Development of procedures for predicting fatigue life of aircraft structures based on fracture mechanics crack propagation and residual static strength analysis
[AGARD LS 62] p0294 N73 29924

Procedures for evaluating fatigue quality of aircraft structures based on fatigue life crack propagation and residual strength p0294 N73 29925

Procedures for predicting fatigue life of aircraft flying under various load conditions using data obtained by counting accelerometer p0294 N73 29927

Structural fatigue analysis and testing for fighter aircraft p0060 N74 19655

The role of the major fatigue test in the acceptance certification and safe utilization of strike aircraft
p0061 N74 19658

Re assessment of fatigue performance of fighter aircraft p0061 N74 19659

Designers need for general information from analysis of fatigue test results and service behavior
p0061 N74 19660

FEAR OF FLYING

Fear of flying and its treatment in military pilots
p0088 N74 18781

Results of behaviour therapy in flying phobia
p0088 N74 18782

Assessment of behaviour therapy in the treatment of flying phobias p0088 N74 18783

FEEDBACK CONTROL

Design of stability and orientation system for WG13 rigid rotor helicopter p0033 N72 11930

Flight test of three axis hydrofluidic stability augmentation system in helicopter p0034 N72 11937

Application of hybrid computer system and Kalman filter algorithm to fixed feedback gains p0229 N73 26701

C S A S - design for rapid handling in turbulence - development of design criteria for stability augmentation systems for alleviation of gust effects p0059 N74 11741

FIBER ORIENTATION

Application of fiber epoxy solidified eutectics for design and construction of gas turbine engines
p0212 N73 27493

Directionally solidified eutectic alloys as applications to turbine blades and gas turbine engine components
p0213 N73 27494

Failure analysis of fiber reinforced composite roll test engine case using distortional energy and maximum strain theories of failure p0213 N73 27500

FIBER STRENGTH

Design of filamentary composite materials for application to construction of airframes and spacecraft structures
p0210 N73 27479

FIELD STRENGTH

Tropospheric scattering field strength analysis by synchronously offset radio beacon transmissions
p0118 N71 23455

FIGHTER AIRCRAFT

Analysis of high subsonic and transonic characteristics of fighter aircraft and factors affecting aerodynamic boundaries for various wing design parameters
p0043 N73 15010

Numerical methods for determining range and data of action performance of transport and combat aircraft and effects of various parameters on performance
p0052 N73 24043

Analysis of parameters affecting choice of engines for transport and combat aircraft during design process
p0052 N73 24048

Development of techniques to measure in flight drag of a US Navy fighter airplane and correlation of flight measured drag with wind tunnel data p0022 N74 14734

Design against fatigue - conference on the fatigue life assessment of tactical aircraft
[AGARD CP 141] p0060 N74 19657

Some considerations of the influence of fatigue on the design of strike aircraft p0060 N74 19653

Fatigue design practice p0060 N74 19654

Structural fatigue analysis and testing for fighter aircraft p0060 N74 19655

Fatigue and fracture considerations for tactical aircraft p0060 N74 19656

Full scale fatigue requirements for rational fatigue life prediction p0061 N74 19657

The role of the major fatigue test in the acceptance certification and safe utilization of strike aircraft
p0061 N74 19658

Re assessment of fatigue performance of fighter aircraft p0061 N74 19659

FILM COOLING

Performance experiments for film cooled blade blow cooling with injection through holes
[NASA CR 116376] p0209 N72 10388

Film cooling of gas turbine blades by a single row of holes p0260 N73 13394

Effective heat transfer coefficients - boundary conditions of gas turbine surfaces p0260 N73 13395

Technological aspects of film cooling for blades in high temperature gas turbines p0261 N73 27484

Conference on high temperature turbines detailing effect of film cooling on blade profile loss
(NASA TM X 67123) p0261 N71 22699

FILTERS
Dual purpose filter separators for dirt and water removal from fuel p0252 N72 11676

FINITE DIFFERENCE THEORY
Finite difference procedure for computing behavior of two dimensional boundary layers and turbulence model to predict location and extent of transition region p0268 N73 19796
Numerical treatment of boundary layer problems - finite difference solutions p0185 N74 22918

FINITE ELEMENT METHOD
Finite element computer program for estimating airplane aerodynamic interference
(NASA TM X 66884) p0001 N71 19357
Optimization of aeroelastic constraints for aircraft design using differential equation idealization and finite element approximation
(NASA CR 117198) p0284 N71 20139
Finite element methods for fluid flow problems p0182 N72 27305
Calculating eigenfrequencies modes and generalized masses for a 104G aircraft from drawings by finite element method
(AGARD R 592) p0291 N72 33915
Analysis of dynamics of stiffened plates using finite element modeling of flat and curved stiffened panels p0293 N73 29511

FINNED BODIES
Interference flow field of a flat plate configuration in supersonic turbulent boundary layer change p0003 N71 19365

FINS
Computer programs for calculating aerodynamic coefficients of wing horizontal tail and fin horizontal tail oscillations in subsonic flow p0009 N71 29342

FIRE CONTROL
Digital computers for navigation and guidance systems and fire control systems in tactical aircraft p0157 N72 21227

FIRE EXTINGUISHERS
Extinguishing flame and fires on aircraft p0262 N72 11680
Fire extinguishing system in aircraft using exhaust gases from gas turbine for generation of pressurized extinguisher bottle p0263 N72 11685
Procedure for measuring performance of aircraft fire extinguishing powders p0253 N72 11691
Use of fluorocarbon surfactants for sealing aircraft fuel tanks p0254 N72 11693
Effects of chemical fire extinguishing agents containing bromotrifluoromethane on cardiovascular and nervous systems of dogs monkeys and baboons
(AGARD R 599) p0077 N73 17106

FIRE PREVENTION
Simulated crash tests to assess fire resistance of aircraft fuels containing polymeric additives p0254 N72 11692

FIRES
Aircraft fuels lubricants and fire safety - conference
(AGARD CP 84 71) p0251 N72 11666
Flammability properties of aircraft fuels and techniques for fire and explosion suppression under simulated aircraft operating environment conditions p0252 N72 11681
Various gelled or emulsified fuels for reducing aircraft post fire hazard p0253 N72 11689
Fire and explosion protection of fuel tanks stages testing oxygen radiation vapor environment and plastic foam filters p0253 N72 11690

FISHES
Blind fish responses to gravitational changes during parabolic flight p0079 N73 21301

FIXED POINT ARITHMETIC
General and checkout of computer programs for real time control of aerospace vehicles p0155 N72 21215
Programming characteristics of future guidance and control computers p0156 N72 21216
Data word length considerations for aerospace computer implementation to obtain required precision levels p0156 N72 21217

FLAMES
Thermal diffusion flames of acetylene oxygen mixtures p0253 N72 11684

FLAMMABILITY
Conversion of aircraft fuels and lubricants to include protection against freezing and fire safety
(AGARD AR 44) p0255 N72 27855

FLAPPING HINGES
Analysis of helicopter blade flutter for both hinged and hingeless rotor blades
(AGARD R 607) p0052 N73 21920

FLAPS (CONTROL SURFACES)
Flaps and leading edge modifications for improved aerodynamic control stability of military aircraft p0029 N71 23422
Experimental boundary layer determination of Reynolds number effect on flapped airfoil drag divergence pressure distribution and buffet onset p0252 N72 11863
Design aspects of start of powered lift aircraft with externally blown flaps a current assessment of the technology required to maximize lift coefficient for take off p0262 N73 15013

FLARES
Air to ground target acquisition with flare illumination p0303 N73 19988

FLAT PLATES
Turbulent boundary layer measurements on large thermally insulated flat plate at Mach numbers 2.5 to 4.5 p0177 N72 20286
Effect of quasi external isotropic turbulence on turbulent boundary layer development on flat plate p0180 N72 20306
Analysis of surface pressure fluctuations from jet impingement on inclined flat plate with application to design of aircraft with externally blown flaps p0292 N73 29909
Analysis of structural response to acoustic loading and preparation of data sheets for various conditions of aerodynamic loads p0293 N73 29914

FLEXIBLE BODIES
Passive and semi active attitude control for flexible satellites p0277 N72 12865
Analysis of aircraft structural flexibility and flight controls interface with application to aircraft design criteria p0039 N72 32031

FLEXIBLE WINGS
Influence of aeroelasticity on flight mechanics of flexible aircraft p0044 N73 16991
Calculation of induced load effects on controllability of rigid and flexible aircraft p0045 N73 17004

FLIGHT CHARACTERISTICS
Characteristic flight effects on toothache developments in aircraft pilots p0092 N71 22309
Analysis of aerodynamic buffeting and related phenomena to include development of models for oscillatory rigid body motion p0043 N73 15018
Analysis of high subsonic and transonic characteristics of fighter aircraft and factors affecting aerodynamic boundaries for various wing design parameters p0043 N73 15019
Simulation of flight on Concorde for improving characteristics of flight control system p0046 N73 17013
Application of computer techniques for determination of flight characteristics of aircraft and comparison with model matching data analysis
(AGARD R 596) p0046 N73 18030
Helicopter flight performance in a turbulent environment p0046 N73 21009
Flight characteristics and performance of Fanestron type helicopter tail rotor p0046 N73 21028
Development and application of aircraft performance prediction methods for subsonic and supersonic transport and fighter aircraft
(AGARD LS 56) p0052 N73 24042
Several methods for determining range and radius of action performance of transport and combat aircraft and effects of various parameters on performance p0052 N73 24043
Development of methods for predicting aircraft flight maneuver characteristics to show effects of excess power and loading p0053 N73 24045
Development of computer programs for determining minimum time trajectory and comparison with predicted method of computation p0053 N73 24053
Flight control and flight characteristic problems of Dassault Mirage 3 (5) aircraft p0054 N73 27002
Design development and flight characteristics of VAK 191 B V STOL close support aircraft p0054 N73 27006
Review of stall research from flight tests of manned aircraft with correlations to wind tunnel predictions p0022 N74 14735

FLIGHT CONDITIONS
Influence of environmental factors on aircraft accidents and accidents p0029 N71 20369
Review of V STOL development program - flight operating characteristics of XC 142A X 19 and X 22A aircraft undertaken - flight conditions p0054 N73 27001

FLIGHT CONTROL
Low altitude flight control problems
(AGARD CP 72) p0061 N74 23506
Flight simulation and software test stand for evaluating operational performance of aircraft flight control system p0022 N73 23455
In flight manual demonstration capability of low level flight control display system for helicopters p0031 N73 31929
Integrated low altitude flight control system for military helicopters p0032 N73 31924
Terrain avoidance radar for US Army rotary wing aircraft p0032 N73 31927
Evaluation test engine/airframe system by utilizing measured performance factors for spares p0033 N73 31931
Design guide aids to optimize integrated flight control and guidance systems for V STOL aircraft
(NASA CR 126153) p0224 N72 22639
Contributions of reduced stability and turbulence to loss of aircraft control and airborne rear collision avoidance p0072 N72 25041
Acceleration of the effects of variation of instrument lag means of reducing glide angles of spiral descent/ascent p0073 N72 25046
Direct lift control for guidance and stabilization
(AGARD AR 43) p0194 N72 25419
Simulation with pilots for evaluation of advanced terminal flight control systems p0046 N73 17011
Development of integrated control system for supersonic aircraft based on pneumatic power generation p0066 N73 19056
Measurements of accelerative stress effects on pilot maneuvering ability and flight control performance
(AMRL TR 72 3) p0106 N73 19154
Contributions of quality inertial system to vehicle flight control p0229 N73 20700
Integrated SAVE - VOR and DME system for locating and controlling high altitude aircraft p0232 N73 23895
Flight control and flight transition problems of Dassault Mirage 3 (5) aircraft p0054 N73 27002
Influence of pilot and aircraft characteristics on structural loads in operational flight - recommendations for improvements in flight instruments to reduce control problems
(AGARD R 608) p0058 N74 17728
The effect of jets and wind shear for automatic STOL approach and landing - simulation and flight test of flight control system for short takeoff aircraft p0058 N74 17730
Application of energy management concepts to flight path control in turbulence - strategy for control of airspeed and flight path with emphasis on landing approach p0060 N74 17744

FLIGHT CREWS
Vibration effects on performance of helicopter flight crews p0068 N71 20355
Posture effects on flight crew tolerance to positive acceleration p0068 N71 20357
Application of psychotherapy in aviation psychiatry for treatment of syndromes of reactive nature p0069 N71 20365
Physical fitness of flying personnel at various ages effects on flight crew performance
(AGARD CP 81 71) p0091 N71 22301
Coronary system diseases in aging flight crews and removal from flying status p0093 N71 22315
Statistical study of physiological and psychological factors in grounding of Italian Air Force flight crews p0095 N72 14091
Clinical causes for permanent grounding of British airfleet crews p0095 N72 14092
Analysis of causes of temporary and permanent grounding in Belgian Air Force p0095 N72 14093
Grounding of flight crew personnel due to nasal and aural disorders p0097 N72 14106
Possible diabetes mellitus in flight crews Canadian Air Force p0098 N72 14109
Causes and effects of temporary and permanent grounding of flight crew members in Royal Air Force p0098 N72 14110
Design development and testing of helmets for flight crews p0104 N72 19162
Handbook on aviation medicine for safe operation and physical health of aircrew during flight
(AGARD AG 155) p0071 N72 24058
Aeromedical requirements and examination techniques for airmen - conference
(AGARD CP 95 Pt 2) p0073 N72 25048
Raised atrial blood pressure levels in airline crewmembers p0074 N72 25054
Respiratory gas analyzer for airflow pulmonary function measurements
(NASA TM X 68370) p0024 N72 25057
Noise effects on hearing conservation in aircraft and ground support personnel of aerospace operations p0077 N73 17101
Combined heat noise and vibration effects on airflow performance
(AMRL TR 72 112) p0105 N73 19146
AGARD conference on aid to ground target acquisition
(AGARD CP 170) p0302 N73 19959
Effect of tracking information on target acquisition performance of observers p0301 N73 19972
Use of Kelly Reliability and Technique for assessing subjective estimates of important parameters for target acquisition p0304 N73 19973
Physiological aspects of see through displays airview alternate pilot and flight tactics p0080 N73 21308
Spatial orientation in flight - A bibliography for airview
(AGARD AG 170) p0084 N74 12748
Aircraft response to turbulence - new control actuation means using power spoilers for ride smoothing - factors affecting operational effectiveness of crew airview level and environment p0058 N74 17729
Results of behavioral therapy in flying phobia p0088 N74 18782
Assessment of behavioral therapy - the treatment of flying phobia p0088 N74 18783
Depression in airview p0089 N74 18784
Clinical study of loss of aeromedical qualification due to military flight view p0088 N74 18785
Evaluation of the use of thermistors in a three ASW operations p0167 N74 18802
The application of airview operational techniques and equipment to flight safety research p0167 N74 18812

FLIGHT FITNESS
Physical fitness of flying personnel and aging effects on flight crew performance
(AGARD CP 81 71) p0091 N71 22301
Physical fitness assessment of older pilots relative to flight requirements of transport aircrews p0091 N71 22304
Use of a computer for medical assessment of flying personnel - problems
(AGARD CP 89 71) p0095 N72 14090

Development of integrated control system for supersonic aircraft based on pneumatic power generation p0066 N73 19056
Measurements of accelerative stress effects on pilot maneuvering ability and flight control performance
(AMRL TR 72 3) p0106 N73 19154
Contributions of quality inertial system to vehicle flight control p0229 N73 20700
Integrated SAVE - VOR and DME system for locating and controlling high altitude aircraft p0232 N73 23895
Flight control and flight transition problems of Dassault Mirage 3 (5) aircraft p0054 N73 27002
Influence of pilot and aircraft characteristics on structural loads in operational flight - recommendations for improvements in flight instruments to reduce control problems
(AGARD R 608) p0058 N74 17728
The effect of jets and wind shear for automatic STOL approach and landing - simulation and flight test of flight control system for short takeoff aircraft p0058 N74 17730
Application of energy management concepts to flight path control in turbulence - strategy for control of airspeed and flight path with emphasis on landing approach p0060 N74 17744

FLIGHT CREWS
Vibration effects on performance of helicopter flight crews p0068 N71 20355
Posture effects on flight crew tolerance to positive acceleration p0068 N71 20357
Application of psychotherapy in aviation psychiatry for treatment of syndromes of reactive nature p0069 N71 20365
Physical fitness of flying personnel at various ages effects on flight crew performance
(AGARD CP 81 71) p0091 N71 22301
Coronary system diseases in aging flight crews and removal from flying status p0093 N71 22315

The thousand aviators. Aging and the blood pressure active flying status after age 60 p0084 N74 13786
Cardiac valvulopathies and flight tolerance. Flight safety of pilots suffering aortic insufficiency p0085 N74 13790
Asthma in military flying personnel p0085 N74 13792
Idiopathic spontaneous pneumothorax in flying personnel p0085 N74 13793
Aircrew's fitness for flying duties after vertebral fractures and spinal surgery p0086 N74 13794
The risk of minor spinal abnormalities in aircrews. Evaluation of ejection cases p0086 N74 13795
Aeronautical rehabilitation of flying personnel suffering from acute psychiatric disturbances p0086 N74 13796
Importance of the 4 - 5 c/sec rhythm in the EEG to determine military flying fitness. psychological factors in EEG patterns p0086 N74 13797
Ophthalmological supervision of diabetic flying personnel p0086 N74 13798
Management of glaucoma in an ageing flying population p0086 N74 13799
Current aspects of cochlear function applied to flying personnel p0086 N74 13800
Proteinurias in flying personnel p0087 N74 13802
The occurrence of hyperlipidemia in flying and nonflying subjects of the USAFSAM cardiovascular disease study p0087 N74 13803
The problem of diabetes mellitus in aviation medicine control of hypoglycemic reactions in flying personnel p0087 N74 13804
The repeatability of an abnormal 2 hour glucose tolerance test - diagnosis of diabetes mellitus in pilots p0087 N74 13805
German Air Force experiences with certain criteria for granting a waiver p0087 N74 13806
Influence of social relational factors on operational flying capacity. A system oriented approach p0089 N74 18731

FLIGHT HAZARDS

Human factors and control system failures in jet upsets during turbulence encounters p0029 N71 234.4
Analysis of spatial disorientation occurrences among military pilots and classification according to types of aircraft and nature of accidents p0071 N72 25033
elevated blood pressure in aircrew p0085 N74 13787
BOAC experience with turbulence - performance requirements for clear air turbulence detecting sensor p0058 N74 17726
Airline's experience on turbulence - avoidance of atmospheric turbulence through air traffic control meteorological reports and pilot experience p0058 N74 17727
The detection of aircraft wake vortices - development of acoustic and wind pressure sensors for vortex detection p0058 N74 17731
Wake Vortex Avoidance System program (WVAS) - design and implementation of ground based monitoring and predictive system for safety from wake vortices p0058 N74 17732
Pilot factor in aircraft accidents of the German Federal Armed Forces p0106 N74 18798
Evidence cost and factor analysis of pilot error accidents in US Army aviation p0107 N74 18804

FLIGHT INSTRUMENTS

Human perceptual characteristic data relating to advanced electronic flight display design p0273 N72 22622
Influence of pilot and aircraft characteristics on structural loads in operational flight - recommendations for improvements in flight instruments to reduce control problems
[AGARD R 608] p0058 N74 17728

FLIGHT LOAD RECORDERS

Design development and application of flight recorders and crash location instruments used in NATO nations
[AGARD AR 39] p0195 N72 32457

FLIGHT MECHANICS

Engineering analysis on flight mechanics for simulating pilot behavior in aircraft p0172 N71 16068
Accident investigations, flight control systems and operational recordings for improved aircraft flight mechanics
[AGARD CP 76 71] p0027 N71 23410
Operational flight data analysis for improved aviation safety levels p0027 N71 23411
Onboard data acquisition for improved aircraft design and operational flight safety p0027 N71 23412
Design modifications on short takeoff Bronco aircraft resulting from combat operations tests p0029 N71 23416
Landing accidents investigations for hawker Siddeley 748 aircrafts with performance measurements on rough surfaces p0028 N71 23417
Safety measures to eliminate aircraft trailing vortex hazards
[NASA TM X 67125] p0028 N71 23418
Flight mechanics problems in accident investigations for VJ 101 aircraft p0030 N71 23428
Stability and control systems for advanced aircraft flight mechanics and safety
[AGARD AR 48] p0041 N73 13018
Influence of aeroelasticity on flight mechanics of flexible aircraft p0044 N73 16991
Flight control and flight transition problems of Dassault Mirage 3 - 5 aircraft p0054 N73 27002

FLIGHT PATHS

Theory and operation of proposed helicopter IFR flight path control system p0033 N72 11933
Probability of acquiring targets by search aircraft which flies along enemy line of communication p0304 N73 19971

FLIGHT RECORDERS

Onboard data acquisition for improved aircraft design and operational flight safety p0027 N71 23412
Design development and application of flight recorders and crash location instruments used in NATO nations
[AGARD AR 39] p0195 N72 32457

FLIGHT SAFETY

Flight safety performance of V STOL Harrier military aircraft having jet control p0029 N71 23427
Helicopter design for improving crash survivability of aircraft and occupants p0101 N72 19141
Helicopter flying in poor light and featureless terrain and color vision abnormality p0078 N73 19075
Proceedings of conference on air traffic control developments and procedures
[AGARD CP 105] p0232 N73 23689
Air traffic control facilities operated by U S military forces and developments in improved air traffic control systems p0232 N73 23690
Organization and operation of Eurocontrol air traffic control system and development of improved equipment for identification and reporting p0232 N73 23691
Characteristics of air traffic control system to include description of electronic components and plans for developing improved equipment p0232 N73 23692
Organization functions and capabilities of automated air traffic control system for Rome Italy p0232 N73 23694
Analysis of North Atlantic air route structure to determine impact of inertial navigation and satellite surveillance on separation reduction p0233 N73 23699
Analysis of terminal air traffic control procedures to determine impact of automation on air traffic controller personnel p0233 N73 23700
Development and characteristics of air traffic management system for operation of military aircraft under instrument meteorological conditions p0234 N73 23704
Development and characteristics of microwave landing systems with emphasis on functional design requirements for airborne equipment p0234 N73 23705
Development and characteristics of system for separation and control of aircraft to avoid midair collisions p0235 N73 23712
Analysis of man machine interfaces and systems ergonomics for air traffic control automation systems p0235 N73 23715
Conceptual analysis of improved communication navigation and identification system for military applications p0235 N73 23719
BOAC experience with turbulence - performance requirements for clear air turbulence detecting sensor p0058 N74 17726
Experience with a low altitude turbulence model for autoland certification - correlation of pilot model data with statistical analysis of flight test results p0059 N74 17739
The application of air new operations concepts tasks and equipment to flight safety research p0107 N74 18802

FLIGHT SIMULATION

Human factors in aircraft simulators
[AGARD CP 79 70] p0171 N71 16059
Dynamic characteristics and environmental factors for aircraft simulation p0171 N71 16061
Flight simulations for accelerated development of aircraft at reduced cost p0171 N71 16062
Sensory factors of motion vision and hearing for piloted flight simulation p0171 N71 16064
Psychological and environmental factors in selecting pilot simulator tasks p0172 N71 16067
Engineering analysis on flight mechanics for simulating pilot behavior in aircraft p0172 N71 16068
Human factors in developing a piloted simulation program for evaluating aircraft handling aspects
[NASA TM X 65583] p0172 N71 16069
Wind tunnel evaluation of lifting body store configurations for captive flight drag and separation characteristics p0006 N71 19386
Minimum level of Reynolds number for reliable flow simulation in transonic test facilities
[NASA TM X 67412] p0012 N72 11859
Feasibility of transonic wind tunnel testing of large cord swept wing panel model for simulating wing shock location at flight Reynolds number
[NASA TM X 67414] p0013 N72 11870
Measurement accuracy and flow simulation for transonic testing in wind tunnels
[NASA TM X 67415] p0014 N72 11872
Transonic wind tunnel testing requirements for simulating transonic aerodynamic data at flight Reynolds numbers p0014 N72 11873
Equivalent body of revolution for simulating high Reynolds number effect on transonic flow past two dimensional airfoil p0014 N72 11874
Wind tunnel model boundary layer reduction through suction for accurate simulation of high Reynolds number full scale aircraft characteristics p0014 N72 11875
Specifications for high Reynolds number wind tunnel design for flow simulation in swept wing aircraft development tests p0015 N72 11883
Advantages of thrust vectoring in manned air combat simulation p0264 N72 16694
Application of methods of simulation of instrument flying as means of reducing occurrences of spatial disorientation in flight p0273 N72 25046
Application of simulation and analysis techniques for establishing flying qualities criteria for piloted aircraft p0039 N72 32026
Measurement of human operator performance in single axis tracking task during simulated turbulent conditions p0040 N72 32034
Fatigue crack propagation under flight simulation loading at 10 - 1 and 0 1 cycles per second p0291 N73 16900
Summary of conference on flight simulation p0044 N73 16992
Role of flight simulation in development of S 3 and F 14 aircraft p0045 N73 17001
Simulation of flight in Concorde for improving characteristics of flight control system p0046 N73 17012
Biaxial simulator improving standard rod controls stimulator for selection, test, and rehabilitation of motion sick pilots p0079 N73 21098
Rotor system design and evaluation using a general purpose helicopter flight simulation program p0056 N74 10913
Role of simulations in the study and development of the CROTALE system - ground to air close defense weapon system p0237 N74 14355
Progress in the mathematical modeling of flight in turbulence - effects of atmospheric turbulence during approach and landing of aircraft p0058 N74 17725

FLIGHT SIMULATORS

Human factors in aircraft simulation
[AGARD CP 79 70] p0171 N71 16060
Flight simulator mathematical modeling for aircraft design p0171 N71 16063
Technical and human engineering requirements for simulating pilot flight p0171 N71 16066
High bypass turbofan powered propulsion simulator for airframe engine integration analyses at subsonic and supersonic speeds p0003 N71 19369
Flight simulator and airframe test stand for evaluating operational performance of aircraft flight control system p0027 N71 23412
Developments in aerodynamic test facilities to show past experience present status free flight techniques and future plans
[AGARD R 653] p0172 N73 18250
Evaluation of helicopter handling qualities based on ground based piloted flight simulator tests p0049 N73 21030

FLIGHT STABILITY TESTS

Correlation of transonic wind tunnel test data with flight test results for slender wing airplanes for design data configuration development p0013 N72 11868
Transonic wind tunnel testing requirements for simulating transonic aerodynamic data at flight Reynolds numbers p0014 N72 11873

FLIGHT STRESS

Effects of environmental stresses on materials used in constructing aircraft cockpit canopies p0201 N73 23601

FLIGHT STRESS (BIOLOGY)

Conference on operational flight stress effects on human body armor and performance
[AGARD CP 101] p0104 N73 19141
Flight test programs to study human factors problems and flight crew performance in military aircraft p0105 N73 19145

Combined heat noise and vibration effects on aircrew performance
[AMRL TR 71 113] p0105 N73 19146
Measures to determine psychophysiological reactions of military flight crews to flying stress p0105 N73 19148
Human stress expenditures in operational airlift mission flights p0106 N73 19151
Influence of long duration flight missions on metabolic and endocrine functions of pilots and navigators p0106 N73 19152
The occurrence of hyperlipidemia in flying and nonflying subjects of the USAFSAM cardiovascular disease study p0087 N74 13803

FLIGHT SURGEONS
Role of flight surgeon and physician pilot in evaluation and treatment of jet fighter pilots p0095 N72 14094
Operation of and medical cases reviewed by Navy Special Board of Flight Surgeons p0096 N72 14100

FLIGHT TEST VEHICLES
Proceedings of conference on aircraft flight test procedures data acquisition data processing and correlation with wind tunnel test results
[AGARD CP 85] p0034 N72 20976
Flight test procedures for determining stall and spin characteristics of high performance aircraft p0035 N72 20979
Flight tests to determine buffet characteristics of four high performance aircraft during transonic maneuvers p0043 N73 15017

FLIGHT TESTS
Flight testing military transport aircraft for handling and performance in STOL applications p0026 N71 20060
XB-126 jet flap research aircraft development and testing p0027 N71 20066
Accident investigations flight control systems and operational recordings for unpiloted aircraft flight mechanics
[AGARD CP 76 71] p0027 N71 23413
Design modifications on short takeoff Bronco aircraft resulting from combat operations tests p0028 N71 23416
Flight test evaluation of military aircraft low altitude high speed performance p0029 N71 23421
Comparison of wind tunnel and flight data techniques for determining full scale aerodynamic flight drag factors
[NASA TM X 67413] p0013 N72 11869
Free flight models for transonic testing at high Reynolds numbers
[NASA TM X 67416] p0015 N72 11878
Electronic navigation system for SA 330 helicopter and flight test methods p0032 N72 11919
Flight test of three axis hydraulic stability augmentation system for Sikorsky helicopter p0034 N72 11931
Composite power plant development engineering flight test problems p0265 N73 16765
Proceedings of conference on aircraft flight test procedures data acquisition data processing and correlation with wind tunnel test results
[AGARD CP 85] p0034 N72 20976
Flight test program and data acquisition techniques for evaluation of Boeing 747 aircraft p0034 N72 20977
Mathematical models for determining flight performance of Concorde aircraft p0034 N72 20978
Stability and control flight test procedures for V STOL aircraft in general and specific application to P 1127 and similar aircraft p0035 N72 20980
Flight results of VTOL aircraft DO 31 p0035 N72 20981
Chase techniques flight test instruments and techniques for overcoming limitations and sources of error p0035 N72 20984
Development test of flight test procedures for use with advanced aircraft to determine noise characteristics p0035 N72 20985
Techniques and procedures for conducting flight tests of lifting body type aircraft during transonic and supersonic flight conditions
[NASA TM X 68306] p0035 N72 20986
Flight tests performed following aircraft delivery to determine repair and overhaul as performed by Canadair Aircraft Ltd p0036 N72 20987
Flight test procedures for determining ferry range capability of military aircraft p0036 N72 20989
Comparison of flight test and wind tunnel data to determine areas of agreement and deficiencies as applied to aerodynamic coefficients of delta wing aircraft p0036 N72 20990
Development test of numerical process for estimating aerodynamic coefficients from flight test data p0036 N72 20991
Determination of performance data and handling qualities characteristics from aircraft performance in transient and steady flight conditions p0036 N72 20992
Organization and operations of U S Air Force Test Pilot School p0036 N72 20994
Procedures for training pilots to assess control of flight systems during attendance at Empire Test Pilot School England p0036 N72 20995
Organization operation and curriculum of Naval Test Pilot School at Patuxent Naval Air Station Maryland p0037 N72 20996
Flight test data on air data instrumentation and guidance devices aircraft project p0226 N72 22644
Comparison of the U S MIL 1795 criteria for specifying performance and control with application to current high performance aircraft p0018 N72 32018
Procedures for application and revision of Federal Aviation Regulations in determining handling qualities and performance of aircraft p0038 N72 32020
Analysis of criteria for evaluation of high performance aircraft and results obtained on aircraft equipped with control augmentation systems p0039 N72 32025
Development and application of pilot rating to determining performance and handling criteria of aircraft p0039 N72 32028
Development of airborne flight data acquisition and data processing systems
[AGARD LS 50] p0195 N73 10450
Design of aircraft flight test instrumentation systems p0195 N73 10451
Selection of dynamic data processing systems p0195 N73 10454
Analysis of deterministic and random flight data p0195 N73 10455
Procedure for determining noise levels in flight test measuring systems p0195 N73 10456
Role of theoretical studies of flight dynamics in relation to flight testing p0045 N73 17011
Automatic method for determining stability and control derivatives from flight data p0046 N73 17012
Flight test program to study human factors problems and flight crew performance in military aircraft p0105 N73 19145
Analysis of procedures and problems involved in operating helicopters from decks of ships p0046 N73 21010
Improvements in military helicopter flight test techniques to provide data for safety maintainability and reliability p0047 N73 21013
Flight tests of XH 51 helicopter to determine effects of gyroscope and control spring modifications on stability and control p0047 N73 21015
Discussion of speed record establishment by SA 341 helicopter to include aircraft preparation procedures and requirements for successful completion p0047 N73 21018
Flight test procedures for rotary wing aircraft with emphasis on performance and flying qualities p0018 N73 22959
Flight test and evaluation of CL 84 tilt wing V STOL aircraft with application to specific military roles p0054 N73 27007
Flight tests for determining handling qualities and operational characteristics of Breguet 941 STOL aircraft p0054 N73 27008
Problems of estimating the drag of a helicopter correlation of flight test data and scale model test data p0059 N74 14715
Review of drag measurements from flight tests of current aircraft with comparisons to wind tunnel predictions p0022 N74 14735

FLIGHT TIME
Pure tone hearing losses in pilots of various aircraft and flying time and its significance for flight speed communications p0087 N74 13803

FLIGHT TRAINING
Medical elimination of students undergoing primary flight training p0073 N72 25049
Personality traits and flight aptitude p0089 N74 18789
In flight psychophysiological studies evaluated by means of Yant Mandel Acid MAA changes in urinary excretion p0089 N74 18790

FLOW
Drag and separation effects of separated flow on aerodynamic drag p0020 N74 14722

FLOW CHARACTERISTICS
Flow phenomena and test facilities for transonic speeds
[AGARD AR 37 71] p0172 N72 32162
Two dimensional wind tunnel tests to determine flow characteristics of supersonic turbulent boundary layer with pressure gradient p0139 N72 20306
Application of blockage corrections to two dimensional wind tunnel measurements of aircraft models p0042 N73 15008
Analysis of aerodynamic characteristics of wing sections with high lift devices in two dimensional flow p0042 N73 15008
Development of method for analyzing performance of military helicopters operating from ships flight deck propulsive and flow characteristics p0065 N73 19067
Wind tunnel tests of rotary wing model representing trade off at several pressure altitudes and effect of reverse flow area p0049 N73 27037
Aerodynamic characteristics of rotary wing model and flow conditions and development of analytical techniques p0055 N73 27049
Analysis of instrumentation requirements for supersonic research aircraft at transonic speeds during wind tunnel tests p0173 N73 26044
Dynamics
[NASA CR 135473] p0038 N74 13760
Aerodynamic Drag
[AGARD CP 124] p0018 N74 14709
Aerodynamic drag and lift of general body shapes at subsonic and supersonic Mach numbers p0019 N74 14712
A study of flow separation on the base region and its effects on long powered flight trajectories from two stage rocket vehicles at transonic flow p0021 N74 14734
Analysis of separated flow over flat plate normal to free stream flow regime p0022 N74 14736
The influence of wave drag on hypersonic entropy wake observations flow regimes in wake of blunt body visualized by schlieren photography p0022 N74 14733

FLOW DISTORTION
Flow distortion and performance measurements on 12 in fan in wing model for range of forward speeds and angle of attack settings in closed wind tunnel p0265 N72 16702
Distortion of grid generated turbulence in stagnation region of two dimensional body p0180 N72 20307

FLOW DISTRIBUTION
Aerodynamic interference characteristics of airframe propulsion systems of transport and military aircraft
[AGARD CP 71 71] p0001 N71 19353
Flight and wind tunnel evaluations of flow field effects on performance of supersonic underwing exhaust nozzle at transonic speeds
[NASA TM X 66887] p0003 N71 19366
Wind tunnel surveys of flow fields about wing fuselage store configuration inlets of transonic and supersonic aircraft
[NASA TM X 66886] p0004 N71 19371
Aerodynamic flow field interference effects on supersonic intakes p0004 N71 19372
Experimental studies of flow distribution near wall in turbulent boundary layer p0175 N72 20275
Integration of forebody and forebody wing flow fields into airplane design criteria p0003 N72 27018
Designs and performance of test ducts for high performance supersonic inlet systems
[AGARDOGRAPH 163] p0183 N73 12248
Conservation equations for analysis of separated and swirling flow regions of supersonic nozzles p0183 N73 12249
Effects of boundary layer flow patterns on propeller and blade performance p0269 N73 19803
Development of optical method for determining geometry and strength distribution of vortex wake generated by a semi loaded swinging helicopter rotor p0049 N72 21035
Development of inverse aerodynamic computer program for calculating airfoil surfaces with velocity distributions p0173 N73 26241
Analysis of interference and cross flow on slotted and transonic wind tunnels caused by model support systems p0173 N73 26242
Aerodynamic interference and its relation to model flow distortion of subsonic supersonic gaseous jets interacting with transverse external flow
[AGARDOGRAPH 132] p0194 N74 19353

FLOW EQUATIONS
Development of procedures for determining planar inviscid supersonic flow over airfoils
[AGARD AG 156] p0016 N72 22007
Development of procedures for determining three dimensional high lift systems wherein vortex sheet is present p0042 N73 15009

FLOW GEOMETRY
Effects of streamline curvature on turbulent flow applied to boundary layer problems in wings airfoils and rotating blades
[AGARD AG 169] p0184 N73 12042

FLOW MEASUREMENT
Measurements of air flow characteristics in the vicinity of wide deviation nozzle typical of vectored thrust engines
[AGARDOGRAPH 150 VOL 3] p0194 N72 25429
Application of laser beam for measurement of aerodynamic flow fields at supersonic and hypersonic speed p0140 N72 25593
Development and application of data acquisition and processing techniques for measurement of flow fields p0200 N72 25595
Development and application of data acquisition and processing techniques for measurement of flow fields in wind tunnels helicopter downwash and in vicinity of full scale wing sections p0200 N72 25596

FLOW RESISTANCE
Compact heat exchanger with air and gas side heat transfer area and geometrical parameters for gas turbine power plants p0299 N72 18947

FLOW STABILITY
Stabilization of turbulent boundary layer flow by suction system design criteria p0180 N72 20305

FLOW THEORY
Development of procedures for determining planar inviscid supersonic flow over airfoils
[AGARD AG 156] p0016 N72 22007

FLOW VISUALIZATION
Flow visualization tests over airfoil and wing models at supersonic speeds using a schlieren system p0178 N72 20297
Application of aerodynamic interchangeability for optimum wind tunnel simulation of transonic and supersonic facilities p0199 N72 25498
Magnetic shock tube for studying blunt body flows
[AGARD AG 135] p0018 N74 13775
Three dimensional wake flow hypersonic entropy wake observations flow regimes in wake of blunt body visualized by schlieren photography p0022 N74 14733

FLUCTUATION THEORY
Fluctuating pressure inside of a duct due to acoustic excitation of the duct and its acoustic transmission p0138 N72 20293

FLUID DYNAMICS
Numerical analysis of one two and three dimensional fluid flow conferences
[AGARD LS 48] p0181 N72 27293
Evaluation of fluid dynamics of aircraft stalling to determine effects of three dimensional flow wing sweep back and high lift devices
[AGARD AR 49] p0046 N73 18023
Fluid motion problems in design and operation of low speed and transonic wind tunnels
[AGARD R 602] p0183 N73 26279
Advances in numerical fluid dynamics
[AGARD LS 64] p0184 N74 22914
Nonlinear time dependent problems in fluid dynamics p0185 N74 22916
Numerical treatment of fluid dynamical stability problems p0185 N74 22921

FLUID FLOW
Harwell heat transfer and fluid flow information analysis center p0113 N71 19530
Design testing and use of heat exchangers in industries and aerospace vehicles conference
[AGARD LS 57] p0299 N72 18946
Development and characteristics of laser Doppler velocity instrument to measure velocities of flowing fluids p0200 N72 25505
Numerical analysis of Navier Stokes equations for time dependent nonlinear fluid flow p0181 N72 27299
Finite element methods for fluid flow problems p0182 N72 27305

FLUID JETS
Angular momentum exchange systems jet expulsion systems and magnetic torquers for active satellite attitude control p0277 N72 12866

FLUID MECHANICS
Mathematical aspects of fluid mechanics and numerical analysis of partial differential equations p0181 N72 27294
MATHEMATICAL MODEL FOR FLUID MECHANICS p0182 N72 27308

FLUORESCENCE
Sequential spark electron beam fluorescence probe and electrostatic probe array methods for measuring turbulent wake properties in hypersonic spheres p0178 N72 20296

FLUOROCARBONS
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure relations in dogs breathing air and liquid fluorocarbons in whole body water immersion respirator
[NASA CR 117199] p0068 N71 20358
Effects of chemical fire extinguishing agents containing bromotrifluoromethane on cardiovascular and nervous systems of dogs monkeys and baboons
[AGARD R 599] p0077 N73 17106

FLUTTER
Application of active controls to suppression of flutter for supersonic aircraft p0045 N73 17005
Application of a general method for flutter optimization p0297 N74 15609

FLUTTER ANALYSIS
Aeroelastic and flutter analysis for T tail of Fokker F 28 p0009 N71 29344
Method for calculating flutter using interference aerodynamic forces between wing and tail p0009 N71 29345
Analysis of helicopter blade flutter for both hinged and hingeless rotor blades
[AGARD R 607] p0052 N73 21920
Effect of surface pressure fluctuations on response of panels underlying attached and separated turbulent boundary layers and shock waves p0292 N73 29910
Comments on NASA Langley research on transonic unsteady aerodynamics flutter calculation methods
[NASA TM X 69997] p0023 N74 18652

FLY BY WIRE CONTROL
Artificial stabilization to correct control deficiencies for high performance aircraft p0045 N73 17009

FLYING PERSONNEL
Physiological test program to evaluate physical fitness of flying personnel p0091 N71 22302
Diagnostic and functional measurements of human physical fitness p0091 N71 22303
Physical fitness training schedules for Canadian Forces flying personnel p0091 N71 22305
Physical exercise and fitness tests for German Air Force flying personnel p0091 N71 22307
Physical exercise and environmental emotional psychotherapeutic methods in aerospace medicine p0092 N71 22310
Aging effects on military flight crew body compositions and physical exercise performances p0093 N71 22316
Cardiovascular disease effects in aging flying personnel on physical exercise performance p0093 N71 22317
Formula for predicting physical fitness of flying personnel in Belgian Air Force during aging process from spirometric measurements p0094 N71 22321
Trends and factors related to medical causes for grounding flyers based on USAF School of Aerospace Medicine experience p0096 N72 14095
Medical practice management and research for grounding in relation to Air Force flying personnel p0096 N72 14096
Clinical causes for permanent grounding of German armed forces flying personnel p0096 N72 14097
Neuropsychiatric and other causes for permanent grounding of French Air Force flying personnel p0096 N72 14098
Cardiac conditions as factor in evaluating flight fitness of Air Force personnel p0096 N72 14101
Factors in medical suspensions of Air Force flying personnel p0097 N72 14105
Psychopathology among French Air Force flying personnel p0098 N72 14112
French school for training navigation personnel p0036 N72 20993
Development of procedures for exposing aviators to effects of spatial disorientation in ground based simulator p0073 N72 25045
Clinical evaluation and medical treatment of spatial disorientation problems in flying personnel p0073 N72 25047
One channel portable tape recording system for long term ECG recording of flying personnel p0073 N72 25051
Aptitude for recovery from vertigo in flying personnel p0074 N72 25059
Color vision requirements for flying personnel of various armed forces conferences
[AGARD CP 99] p0077 N73 19065
Color vision testing and selection procedures for flying personnel since World War 1 p0077 N73 19069
Color vision tests as predictive indicators of flying task performance p0078 N73 19074
Color vision requirements for air crew personnel of future including coding evaluation
[AMRL TR 71 116] p0078 N73 19076
Conference on detection evaluation and identification of drugs and alcohol in flying personnel and effects on flight fitness
[AGARD CP 108] p0079 N73 21102
Drug therapy effects on flying effectiveness and psychosomatic fitness of flying personnel p0080 N73 21103
Drug screening data for civil aviation personnel obtained by urinalyses p0080 N73 21104
Chemotherapy for air crews in Great Britain p0080 N73 21105
Suitability of insulin dependent and oral drug dependent diabetics as navigation personnel p0082 N73 21120
Ophthalmological examination of antimalarial drugs effects on performance of navigation personnel p0082 N73 21122
Flight safety factors in prescribing tranquilizing drugs for flying personnel p0082 N73 21123
Pathophysiological conditions compatible with flying
[AGARD CP 129] p0084 N74 13784
Technical evaluation report conclusion and recommendations pathophysiological standards for flying personnel certification p0084 N74 13785
Elevated blood pressure in aircrew p0085 N74 13787
Value of cardiac mechanograms in evaluating flying personnel p0085 N74 13791
Idiopathic spontaneous pneumothorax in flying personnel p0085 N74 13795
Aircrew fitness for flying duties after vertebral fractures and spinal surgery p0086 N74 13794
The risk of minor spinal abnormalities in aircrews Evaluation of ejection cases p0086 N74 13795
Aeronautical rehabilitation of flying personnel suffering from acute psychiatric disturbances p0086 N74 13796
Importance of the 4 5 c sec rhythm in the EEG to determine military flying fitness psychological factors in EEG patterns p0086 N74 13797
Ophthalmological supervision of diabetic flying personnel p0086 N74 13798
Management of glaucoma in an ageing flying population p0086 N74 13799
Current aspects of cochlear function applied to flying personnel p0086 N74 13800
Proteinuries in flying personnel p0087 N74 13802
The occurrence of hyperlipidemia in flying and nonflying subjects of the USAFSAM cardiovascular disease study p0087 N74 13803
The problem of diabetes mellitus in aviation medicine control of hypoglycemic reactions in flying personnel p0087 N74 13804
The repeatability of an abnormal 2 hour glucose tolerance test diagnosis of diabetes mellitus in pilots p0087 N74 13805
German Air Force experiences with certain criteria for granting a waiver p0087 N74 13806
Interest of nystagmography in flying navigation personnel p0108 N74 20738
Manual of aeronautical medicine and application to navigator personnel
[AGARDOGRAPH 154(FR)] p0089 N74 22727

FLYWHEELS
Design development and application of electrically driven flywheels for stabilization of synchronous satellites p0192 N72 19493

FOG
Simulation of pilot decision making process in manual landing operation during fog p0280 N73 23898

FOOD INTAKE
Metabolic imbalances and body hypohydration during food deprivation for 10 days p0070 N71 30358

FORCE DISTRIBUTION
Specialists Meeting on Helicopter Rotor Prediction Methods
[AGARD CP 122] p0055 N74 10908
Rotary wing design methodology based on nonlinear aeroelastic blade loads analysis p0056 N74 10909
The prediction of loading actions on high speed semi rigid helicopters p0056 N74 10914
Integrated rotor body loads prediction p0057 N74 10916

FORCED CONVECTION
Heat exchangers and forced convection liquid metal heat transfer p0299 N72 18948

FOREBODIES
Forebody and forebody wing configuration data for supersonic inlet performance and distortion during maneuvering flight p0286 N72 16710

FORGING
Stress corrosion behavior of die forgings made from Al Zn Mg Cu alloys p0288 N72 21922
Improvement of the properties of high strength Al Zn Mg Cu alloys by thermomechanical procedures ductility toughness and stress corrosion properties of steel plates and forgings p0204 N74 23111

FORMING TECHNIQUES
Fabrication of cobalt alloy and nickel alloy gas turbine blades and disks p0259 N71 17392

FORTRAN
Computer programs for analyzing optical properties of sea water p0243 N73 33638

FORWARD SCATTERING
Forward and backscattering caused by wave interaction with auroral ionization and theories of irregularity production p0126 N72 21126
Measurement of light scattering at various angles using point spread function and modulation transformation function techniques p0242 N73 33629

FOURIER TRANSFORMATION
Fast Fourier transform digital processor as spectrum analyzer and adaptive filter p0132 N73 10198

FOVEA
Application of extra foveal vision to predicting target acquisition in air to ground search p0132 N73 19960

FRACTOGRAPHY
Techniques applications and scope of fractography
[AGARD AG 155 71] p0285 N72 13882

FRACTURE MECHANICS
Mechanical properties of fiber reinforced materials p0206 N71 27043
Application of linear elastic fracture mechanics to developing stress corrosion cracking test standards
[NASA TM X 68303] p0286 N72 21905
Determination of stress corrosion cracking parameters for 300M steel p0286 N72 21906
Stress corrosion index for measuring combined action between stress and corrosion in stress corrosion of Al alloys p0286 N72 21908
Ultrahigh vacuum for determining effects of hydrogen on fatigue and fracture properties of Ni 200 p0287 N72 21916
Metallurgical aspects of fatigue and fracture toughness conference on effects of microstructure on mechanical properties of airframe materials
[AGARD R 610] p0204 N74 23108

FRACTURE STRENGTH
The metallurgical aspects of fatigue and fracture toughness effects of microstructure on mechanical properties of airframes and construction materials p0204 N74 23109
Some recent developments in fatigue and fracture microstructural origins of fracture resistance of high strength steels p0204 N74 23110

FRACTURING
Causes of compression fractures and resorption of dunes by Greek pilots after recovery p0102 N72 19149
Aircrew fitness for flying duties after vertebral fractures and spinal surgery p0086 N74 13794
The risk of minor spinal abnormalities in aircrews Evaluation of ejection cases p0086 N74 13795

FRANCE
Research equipment methods and facilities at Propulsion Test Center France p0263 N72 16890
French school for training navigation personnel p0036 N72 20993
Color aptitude of dyschromatopsia French navigators and pilots p0077 N73 19068

FREE FALL
Exposure to extreme forces through human accidental and suicidal free falls p0099 N72 19125

FREE FLIGHT
Free flight models for transonic testing at high Reynolds numbers
[NASA TM X 67416] p0015 N72 11878
Role of free flight models in aircraft research and development p0045 N73 17002

FREE FLOW
Approximation of two dimensional turbulent boundary layer under arbitrary wall and free flow conditions p0170 N72 20232
Effect of free stream turbulence level on turbulent boundary layer behavior p0268 N73 19799

FREE JETS
Free jet tests of full scale supersonic intake engine combination of Concorde power plant p0265 N72 16704

FRENCH SATELLITES
Passive gravity gradient method for stabilization of Foton and Peole satellites p0278 N72 12867

FREON
Aerodynamic suitability of Freon 12 for wind tunnel testing of transport aircraft models at increasing Reynolds numbers and subcritical and supercritical Mach numbers [NASA TM X 67417] p0015 N72 11879
FREQUENCY ASSIGNMENT
The identification of military utilization of frequency bands above 10 GHz [AGARD AR 42] p0149 X74 73498
The identification of military utilization of frequency bands above 10 GHz [AGARD AR 42 REV] p0149 X74 73499
FREQUENCY COMPRESSION DEMODULATORS
Signal to noise ratio performance of optimum digitalized FM demodulator p0131 N73 10195
FREQUENCY CONTROL
Mathematical model for frequency correlation function of tropospheric scatter channel p0119 N71 23464
Frequency correlation measurements on multipath tropospheric scatter propagation p0119 N71 23465
Economic analysis of integrated time frequency system for aircraft p0235 N73 23717
FREQUENCY DISTRIBUTION
Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of cg vertical acceleration and gust velocity measured on transport aircraft [AGARD R 579 71] p0030 N71 25080
FREQUENCY MEASUREMENT
Power spectral densities Doppler shifts and phase fluctuations of frequency dispersive auroral HF propagation p0129 N72 21143
FREQUENCY RESPONSE
Power spectrum method for determining gust frequency response functions in dynamic aircraft design p0007 N71 23211
Impulse response measurements and radio test link for evaluating tropospheric scatter propagation channel capacity p0119 N71 23466
FRETTING
Effects of fretting on fatigue of materials and development of anti fretting compounds and metal working procedures to reduce fretting [AGARD AR 45] p0290 N72 28932
FRICTION FACTOR
Compact heat exchangers with large amounts of heat transfer area per volume unit and heat transfer friction power relation p0299 N72 18947
FROGS
Cardiac and neural effects of UHF radar energy on frogs p0068 N71 20364
FUEL COMBUSTION
Corrosion resistant materials for nozzle guide vanes and turbine blades subject to vanadium contaminated fuel combustion p0203 N73 23613
FUEL CONSUMPTION
Numerical analysis of maximum time climbing procedure and minimum fuel climbing procedure for typical subsonic aircraft p0053 N73 24052
FUEL FLOW
Main methods of fuel flow measurement and factors for consideration in design and type of meters to use for various requirements [AGARDOGRAPH 160 VOL 3] p0194 N72 25420
FUEL SYSTEMS
Aviation fueling facilities and fueling operation p0252 N72 11678
FUEL TANKS
Electrostatic charging and handling of aviation fuels resulting in incendiary sparking in fuel tanks p0253 N72 11686
Fire and explosion protection for fuel tanks utilizing oxygen reduction vapor control inerting and plastic foam fillers p0253 N72 11690
FUEL TESTS
Properties evaluation of lubricants and fuels for use in advanced aircraft gas turbine [NASA CR 122842] p0254 N72 11694
FULL SCALE TESTS
Correlation between full scale fatigue test failures and actual service failures for several aircraft p0291 N73 16991
FUSELAGES
Three dimensional nature of cabin and cockpit pressure bulkheads and effects on stresses imparted adjacent to aircraft fuselage p0003 N71 19362
Optimization and design of the rear fuselage of the A 300 B aircraft structure p0298 N74 15614

G

GAS ANALYSIS
Application of gas analysis techniques to determine combustion efficiency in turbine engines and rocket engine combustion chambers [AGARD AG 168] p0111 N73 31830
Gas sampling and analysis in combustion phenomena [AGARDOGRAPH 168(FR)] p0111 N74 22799
GAS BAGS
Safety belts and air bags for highway accident prevention p0099 N72 19124
Air bag and seat belt analysis as restraints for various Army European car collisions p0099 N72 19130
GAS BEARINGS
Development of spherical hydrostatic compliant bearing for directional gyroscope p0229 N73 20695
GAS DYNAMICS
Numerical analysis of time dependent gas dynamics and accuracy in regions of continuous flow p0192 N72 27304
GAS FLOW
Turbulent mixing layer between two different gas streams such as nitrogen and helium p0178 N72 20299
Numerical analysis of viscous gas flow and shock formation p0181 N72 27300
Numerical analysis of three dimensional ideal gas flow and Euler equations of motion p0182 N72 27301
Physical structure of turbulent shear flows in nonreacting gase flow [AGARD AR 46] p0182 N73 11262
GAS GENERATORS
Development of techniques for evaluating performance of air breathing engines and measurement of significant operating parameters [NASA TM X 68305] p0035 N72 20983
GAS INJECTION
Mathematical models for calculating turbulent boundary layer injected with gas p0180 N72 20303
GAS MIXTURES
Adiabatic compression method for determining self ignition delay in hydrocarbon air fuel mixtures p0252 N72 11682
GAS TURBINE ENGINES
Advanced cooling systems and heat resistant materials for turbine blades of high temperature aeronautical gas turbine engines [AGARD CP 73 71] p0257 N71 17372
High enthalpy temperature for improved performance of turbogenerators and gas turbine engines p0257 N71 17373
Mathematical model for calculating blade temperatures in convective cooled gas turbines p0257 N71 17375
Heat transfer and heat flux measuring sensors for gas turbine engines p0257 N71 17377
Design and component test of cooled radial gas turbine engine p0258 N71 17381
Aerodynamic and thermodynamic performance of sweat cooled gas turbine engine blades p0258 N71 17382
Heat transfer in air cooling and sweat cooling techniques for high temperature gas turbine engine components p0258 N71 17383
Transpiration cooled blades for high temperature inlets to gas turbine engines p0258 N71 17384
Design of gas turbine engines for high operating temperature p0258 N71 17386
Two temperature field measurements within convection cooled rotor blade of gas turbine engine p0259 N71 17387
Cobalt and nickel based alloys metallurgy for high temperature gas turbine materials p0259 N71 17389
Thermal control coatings for refractory gas turbine materials p0259 N71 17391
Performance of aluminide coatings on simulated high temperature tests of gas turbine engine rotors [NASA CR 116374] p0259 N71 17393
Film cooling of gas turbine blades by injection through holes p0260 N71 17394
Effective heat transfer turbine cooling systems of gas turbine surfaces p0260 N71 17395
Air cooling systems for nozzle guide vanes of aircraft gas turbines p0260 N71 17396
Operational design criteria for gas turbine engines p0261 N71 17402
Production and efficiency of small gas turbine engine for helicopter and surface vehicles [AGARD LS 46 71] p0261 N71 26951
Cost effectiveness as critical selection requirement for small gas turbines in military and commercial operations p0262 N71 26952
Design and performance of gas turbine engines for helicopters and surface transport vehicles p0262 N71 26953
Cost aspects for low weight small volume aircraft gas turbine engines p0262 N71 26955
Engineering aspects and manufacturing of gas turbine engines for helicopters and ground transport vehicles p0262 N71 26956
Cost parameters of small gas turbine and thermal gas power plants for aircraft and ground vehicle propulsions p0262 N71 26958
Analysis of lubricant system used in helicopter gas turbine engine p0264 N72 11697
Analysis of gas turbine engine requirements and performance of advanced propulsion systems for aircraft and high power sources p0265 N73 30959
Performance of aircraft gas turbine components in hot corrosive environments p0201 N73 23599
Chemical and time hardening properties of aircraft gas turbine engine components p0201 N73 23600
Analysis of gas turbine blade fiber reinforced materials with cast and metallic matrix composition and application to gas turbine engines p0210 N73 27476
Application of reinforced composite materials for construction of aeronautical gas turbine engines p0212 N73 27493
Directional solidification of refractory alloys and application to turbine blades and gas turbine engine components p0213 N73 27494
Parameters controlling nitric oxide emissions from gas turbine combustors p0219 N74 14291
Factors controlling pollutant emissions from gas turbine engines p0220 N74 14292
Development and verification of an analytical model for predicting emissions from gas turbine engine combustors during low power operation p0220 N74 14295
Motorist point of view on the effects of low burning rates on pollution p0221 N74 14303
GAS TURBINES
Conference on high temperature turbines detailing effect of film cooling on blade profile loss [NASA TM X 67123] p0261 N71 22699
Cost effectiveness as critical selection requirement for small gas turbines in military and commercial operations p0262 N71 26952
Thermodynamic cycle and power output parameters of gas turbine p0262 N71 26954
Thermodynamic properties of small gas turbines for power generation in aeronautics space and industry p0262 N71 26957
Properties evaluations of lubricants and fuels for use in advanced aircraft gas turbine [NASA CR 122842] p0254 N72 11694
Assessment of high temperature stability of synthetic lubricants for aircraft gas turbines p0254 N72 11695
Axisymmetric inlet flow and convective theories for small gas turbines p0265 N72 16701
Sulfur sodium and chloride contaminants in gas turbines p0202 N73 23610
Methods of coating internal components to resist corrosive hot gases in gas turbine engines p0203 N73 23617
Production of fibrous and filiform composite materials from directional solidification of eutectic alloys and application to gas turbine blades and vanes p0212 N73 27492
Application of glass and carbon fiber reinforced structures on gas turbine engine components to operate in high temperature environment p0213 N73 27495
Application of boron aluminum composite material for construction of turbine blades with low notch sensitivity in high cycle fatigue p0213 N73 27497
An experimental research on the behavior of a premixed low combustion chamber p0220 N74 14296
Smoke suppressant additive effects on particulate emissions from gas turbine combustors p0221 N74 14299
A preliminary study of the influence of fuel properties on particulate emissions from gas turbine combustors p0221 N74 14301
Aircraft gas turbine powerplant thrusts and specific fuel consumption effects on engine performance p0221 N74 14304
GAS METAL INTERACTIONS
High temperature environmental testing of gas metal interactions to simulate severe operating conditions p0202 N73 23606
GAS SOLID INTERFACES
Critical review and tabulation of data for colloquium on reactions between gases and solids [AGARD AR 32 71] p0261 N71 19177
GELLED PROPELLANTS
Crash safe turbine fuel program using gelled fuel p0253 N72 11687
Various gelled or emulsified fuels for reducing aircraft crash fire hazard p0253 N72 11689
GEOGRAPHIC APPLICATIONS PROGRAM
Research and development program for military reconnaissance photographic systems using a borne radars, infrared and photographic data p0121 N72 16086
GEOMORPHOLOGY
Variable coefficient parabolic equations of diffusion for analyzing inhomogeneous media through inverted telluric penetration spectra p0125 N72 16110
GERIATRICS
Diagnostic chronological and physiological criteria in geriatrics p0092 N73 22312
GERMANY
Communication requirements for German Air Force personnel p0077 N73 19067
German cooperation in international aerospace research p0304 N73 26959
GIMBALLESS INERTIAL NAVIGATION
Computerized gimballess guidance system for aircraft flight control p0289 N73 25895
GLASS
Electrical contact resistance measurements for determining stress strain behavior of glass fibers reinforced plastic materials exposed to water p0208 N72 32565
GLASS FIBERS
Axial tension tests for stress strain properties of glass and reinforcing fibers in glass epoxy resin composites p0207 N72 32560
Application of glass composites and plastic materials and PPS 49 organic fiber materials for airframe and space craft construction p0211 N73 27482
Application of glass reinforced and carbon reinforced composite materials for the design of fuselages and lifting wings p0211 N73 27483
Composition of glass fibers and resins and their reinforced plastic properties for weight reduction and improved strength p0211 N73 27486

Application of glass and carbon fiber reinforced structures for gas turbine engine components to operate in high temperature environments p0213 N73 27495

GLAUCOMA

Management of glaucoma in an ageing flying population p0086 N74 13799

GLIDERS

Construction of glider aircraft using glass fiber and carbon fiber reinforced plastic composite materials for weight reduction and increased strength p0211 N73 27486

GLUCOSE

The repeatability of an abnormal 2 hour glucose tolerance test diagnosis of diabetes mellitus in pilots p0087 N74 13805

GRAPHITE

Dilatometric thermal expansion measurements on high temperature structural materials [AGARD AR 31 71] p0299 N71 25358

Thermal expansion behavior of platinum, Al2O3, tungsten alloys and graphites [AGARD-AR-38] p0299 N72 24980

Physical and mechanical properties of high strength high modulus reinforcing fibers and organic resin composite materials p0210 N73 27475

GRAPHS (CHARTS)

Intuitive graphical and simplified mathematical treatment of rotational dynamics as applied to human centrifuges p0094 N71 23340

Tabular and graphical summary of human tolerances to prolonged acceleration stresses p0094 N71 23341

Computer aided input of graphic information on chemical structures by keyboarding under visual control of display device p0157 N72 22170

GRAVITATIONAL EFFECTS

Spatial disorientation in flight A handbook for aircrew [AGARD AG 170] p0084 N74 12748

GRAVITATIONAL WAVES

Conference on acoustic gravity wave effects in atmospheric transmission of radio communication signals [AGARD CP 115] p0134 N73 14131

Comparison of ionospheric radio wave propagation and acoustic gravity wave propagation p0134 N73 14132

Effects of acoustic gravity wave diffusion on atmospheric boundaries p0135 N73 14136

Acoustic gravity wave generation by transient sources in isothermal atmosphere p0135 N73 14139

Nuclear source model for generating ionospheric disturbances through acoustic gravity waves p0135 N73 14141

Asymptotic methods for determining propagation angles of internal gravity waves traveling at ionospheric heights p0136 N73 14144

Full wave solution for electron density perturbations caused by gravity waves in F2 region p0136 N73 14145

Relationship between atmospheric gravity waves and spread F conditions caused by solar activity p0136 N73 14146

Ionospheric gravity wave electron amplitudes and spectra p0137 N73 14149

Detection of tropospheric turbulence and gravitational waves by radar sounding p0137 N73 14151

Microwave radar detection and photography of gravitational waves in troposphere p0137 N73 14152

Electromagnetic cross modulation and very low frequency propagation techniques for measuring acoustic gravity waves in ionospheric D region p0137 N73 14153

Radar observations of meteor trains for detecting high altitude gravity waves p0137 N73 1415

High frequency radar backscattering technique for determining ionospheric structure and gravity wave disturbances p0137 N73 14155

Gravity wave effects on occurrence time changes of daily traveling ionospheric disturbances p0138 N73 14156

Theoretical plasma perturbation model for calculating coupling effects between acoustic gravity waves and electromagnetic waves in ionospheric disturbances p0138 N73 14162

Computerized simulation of gravity wave perturbed traveling ionospheric disturbances using radio ray paths p0139 N73 14163

Atmospheric gravity wave effects on ionospheric transequatorial radio wave propagation in presence of traveling ionospheric disturbances p0139 N73 14164

Acoustic gravity wave effects in traveling ionospheric disturbances following nuclear explosions p0139 N73 14166

Nonlinear propagation and ionospheric coupling of atmospheric waves following nuclear explosion p0140 N73 14168

GREAT BRITAIN

Procedures for training pilots in assessment of flight systems during attendance at Empire Test Pilot School, England p0036 N72 20995

Color vision requirements of Great Britain's Armed Forces p0077 N73 19072

Chemotherapy for air crews in Great Britain p0080 N73 21105

GREECE

AGARD Annual Meeting, 1973 Conference on research and development in Greece and use of science and technology to meet military requirements at reduced costs p0304 N74 21610

Research and development activities in Greece p0305 N74 21611

Electronics and space activities in Greece wave propagation and electron density research p0305 N74 21612

GROUND BASED CONTROL

Measurement methods and error analyses by ground terminals for optimizing satellite communications link p0133 N73 10203

GROUND CREWS

Noise effects on hearing conservation in aircrew and ground support personnel of aerospace operations p0077 N73 17101

Drug screening data for civil aviation personnel obtained by urinalyses p0080 N73 21104

GROUND EFFECT

Development of method for calculating near field noise level of free jet and influence of ground effect on noise produced by V/STOL aircraft operation p0292 N73 29907

GROUND EFFECT MACHINES

Minimum weight design of surface effect vehicles using the sieve search technique p0297 N73 15810

GROUND SPEED

Possibilities and limitations of rotary and fixed wing compatible Doppler sensor designs p0031 N72 11923

GROUND STATIONS

Multiradiation observations November 1971 March 1972 p0187 N74 14087

GROUND SUPPORT EQUIPMENT

Development of integrated system for performing checkout of space launchers and aircraft systems p0191 N72 19489

Pollution control of airport engine test facilities p0219 N74 14285

GROUND TESTS

High Reynolds number aerodynamic ground testing by moving test specimens on rocket sleds p0016 N72 11885

GROUND AIR GROUND COMMUNICATIONS

Characteristics of air traffic control system to include description of electronic components and projects for developing improved equipment p0232 N73 23692

Status and trends of civil air traffic control systems and development of automated network for increased flight safety p0233 N73 23696

GUIDANCE (MOTION)

Display design for guidance and control [AGARD AR 43] p0194 N72 25419

GUIDANCE SENSORS

Application of guidance laws to control and guidance of tactical missiles to reduce amount of miss distance p0227 N72 27689

Characteristics of command to line of sight guidance and semi active homing missile systems applied to guidance and control of tactical missiles p0227 N72 27692

Testing of an attitude control unit for sounding rockets p0236 N74 14349

GUIDE VANES

Air cooling systems for nozzle guide vanes of aircraft gas turbines p0260 N71 17396

Corrosion resistant materials for nozzle guide vanes and turbine blades subject to vanadium containing fuel combustion p0203 N73 23613

GUST ALLEVIATORS

CSAS design for good handling in turbulence development of design criteria for stability augmentation systems for alleviation of gust effects p0059 N74 17741

A new approach to gust alleviation of a flexible aircraft using an open loop device application to control system of SE 210 aircraft p0060 N74 17745

GUST LOADS

Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of c.g. vertical acceleration and gust velocity measured on transport aircraft [AGARD R 579 71] p0030 N71 25080

Collection and processing of gust load data obtained from counting accelerometers mounted at center of gravity of various aircraft [AGARD R 605] p0046 N73 20023

Flight in turbulence proceedings of conference on atmospheric turbulence and effects on aircraft operation [AGARD CP 140] p0057 N74 17739

Structural loads and gust criteria comparison of gust load analysis methods for application to aircraft design p0059 N74 17739

A new approach to gust alleviation of a flexible aircraft using an open loop device application to control system of SE 210 aircraft p0060 N74 17745

GUSTS

Power spectrum method for determining gust frequency response functions in dynamic aircraft design p0007 N71 23211

GYROSCOPES

Gyroscope theory and applications to inertial guidance and navigation, vehicle stabilization and related uses bibliography [AGARD R 582 71] p0189 N71 20002

Development of single degree of freedom gyroscope for application to strapdown inertial guidance systems p0228 N73 20688

Methods for predicting acceptance tests and reliability tests of gyroscopes as part of inertial platform quality control processes p0228 N73 20689

Development of spherical hydrostatic compliant bearing for single axis gyroscope p0229 N73 20695

Mathematical models for measuring operating functions and performance of gyroscope with two degrees of freedom p0229 N73 20698

Dynamically tuned gyros in strapdown systems p0229 N73 20697

Parameters of single axis floated gyroscopes when used in inertial systems requiring rapid gyrocompassing for alignment p0231 N73 20703

GYROSCOPIC STABILITY

Three axis gyro stabilized torpedo platform p0230 N73 20702

H

H-126 AIRCRAFT

H-126 jet flap research aircraft development and testing p0027 N71 20066

HABITUATION (LEARNING)

A proposed habituation labyrinth (Presentation of several results with the P.N.f) p0108 N74 20737

HALF CONES

Lift and drag interference characteristics of delta winged half cones with leading edges p0002 N71 19359

Three dimensional interactions in half cone pressure fields and effects on intakes mounted adjacent to aircraft fuselage p0003 N71 19367

Tables of half cone angles for Mach numbers 3 to 20 [AUTONDOGRAPH 137 PT 3] p0175 N72 15269

HANDBOOKS

Handbook on aviation medicine for safe mental and physical health of aircrew during flight [AGARD AG 154] p0071 N72 24058

Spatial disorientation in flight A handbook for aircrew [AGARD AG 170] p0084 N74 12748

Manual of aeronautical medicine and application to navigation personnel [AGARDOGRAPH 154(FRI)] p0089 N74 22727

AGARD handbook including AGARD by laws p0306 N74 23497

HARMONIC MOTION

Influence of various aerodynamic forces on rectangular wing performance with harmonic movement parallel to slow flow movement p0050 N73 21043

HARMONIC OSCILLATION

Numerical analysis of aerodynamic loads and coefficients for tandem and T tail surfaces harmonically oscillating in subsonic flow p0007 N71 29335

Calculation of pressure distributions over wings with harmonic oscillating control surfaces using kernel function method p0009 N71 29346

Unsteady pressure measurements on harmonically oscillating swept wing with two control surfaces in incompressible flow p0010 N71-29350

HARNESSES

Acceleration protection system design impact testing of restraint harnesses and ejection seat cushions and implications p0104 N72 19157

HARRIER AIRCRAFT

Harrier aircraft navigation display and computer unit with projected moving map means of storing and selecting coordinates and numerical data superimposed on map p0224 N72 22633

Post stall aerodynamic characteristics of Harrier GR 1 aircraft and development of lift augmenting devices p0043 N73 15014

Design concept operational performance and military employment of AV 8A Harrier aircraft p0054 N73 27005

HAWKER SIDDELEY AIRCRAFT

Operational performance of Hawker Siddeley aircraft automatic flight approach and landing control system p0028 N71 23414

HEAD (ANATOMY)

Lethal head injuries to man swimming or underwater caused by detonation of firecracker p0100 N72 19135

Protective helmets designed to lessen effects of head injury due to impact in aircraft accidents p0104 N72 19160

Models for head injury prediction and helmets and prediction of optimum helmet performance p0104 N72 19161

Factors, standards, and techniques involved in testing protective headgear p0104 N72 19162

HEAD UP DISPLAYS

Development of heads up flight data display for aircraft approach and landing during all conditions of visibility p0233 N73 23702

HEALTH PHYSICS

Health hazards and effects predictions of personnel exposed to irradiated nuclear blast waves in protective shelters p0100 N72 19136

Effects of chemical fire extinguishing agents containing bromotrifluoromethane on cardiovascular and nervous systems of rhesus monkeys and baboons [AGARD-CP-99] p0077 N73 17106

HEARING

Noise effects on hearing conservation in aircrew and ground support personnel of aerospace operations p0077 N73 17101

HEART

Physiological factors possibly contributing to coronary risk among Greek Air Force pilots p0092 N72 14104

HEART DISEASES
Physical fitness of flying personnel and aging effects on flight crew performance
[AGARD CP 81 71] p0091 N71 22301
Electrocardiographic and blood pressure standards of physical fitness for aging pilots p0092 N71 22314
Coronary system diseases in aging flight crews and removal from flying status p0093 N71 22315
Cardiovascular disease effects on aging flying personnel on physical exercise performance p0093 N71 22317
Arteriosclerosis and electrocardiographic abnormalities in aging pilots of French Air Force p0093 N71 22318
Long term electrocardiograms in analysis of rhythmic heart disturbances of German Air Force p0097 N72 14103
Returning airmen with abnormal exercise tests and normal coronary arteriograms to flying status p0085 N74 13788
Cardiac valvulopathies and flight tolerance - flight safety of pilots suffering aortic insufficiency p0085 N74 13790
Value of cardiac mechanograms in evaluating flying personnel p0085 N74 13791
HEART FUNCTION
Myocardial and cerebral function during exposure to carbon monoxide - effects of hypoxia on pilot performance p0085 N74 13789
HEART RATE
Oxygen consumption and heart rate measurements for estimating exercise tolerance of military personnel p0091 N71 22308
Mental and cardiovascular acceleration stress effects on heart rate studied by beta adrenergic blockage p0105 N73 19149
HEAT EXCHANGERS
Design testing and use of heat exchangers in industries and aerospace vehicles - conference
[AGARD LS 57] p0299 N72 18946
Compact heat exchangers with large amounts of heat transfer area per volume unit and heat transfer fluid friction power relation p0299 N72 18947
Heat exchangers and forced convection liquid metal heat transfer p0299 N72 18948
Heat exchangers in process and power industries p0299 N72 18949
HEAT FLUX
Heat transfer and heat flux measuring sensors for gas turbine engines p0257 N71 17377
Development and characteristics of high intensity, short rearing heat flux gage of quasi steady state type
[SC DR 710194] p0190 N71 36789
HEAT RESISTANT ALLOYS
Thermal control coatings for refractory gas turbine materials p0259 N71 17391
Fabrication of cobalt alloy and nickel alloy gas turbine blades and disks p0259 N71 17392
Conference on high temperature corrosion of alloys for aerospace applications
[AGARD CP 120] p0201 N73 23597
High temperature corrosion scale for heat resistant alloys p0201 N73 23598
Multicomponent diffusion theory as applied to oxidation corrosion and sulfidation of complex heat resistant alloys p0202 N73 23600
Comparison of cobalt alloys and nickel alloys relative to hot corrosion resistance p0203 N73 23612
Methods of oxidation and corrosion resistance in refractory metal alloys used in gas turbine engines p0203 N73 23613
NATO rationalization tests on high temperature properties of aerospace alloys p0203 N73 23618
HEAT SHIELDING
Computerized design of stiffened cylindrical shells and ablating composite heat shields p0284 N71 20117
Hot salt stress corrosion cracking of titanium alloys used as radiation heat shields in space vehicles
[NASA TM X 68304] p0289 N72 21926
HEAT TOLERANCE
Heat tolerance of athletes during muscular exercise in various thermal environments p0070 N71 20366
HEAT TRANSFER
Heat transfer prediction for turbine blade design p0257 N71 17374
Heat transfer and heat flux measuring sensors for gas turbine engines p0257 N71 17377
Hanover heat transfer and fluid flow information analysis center p0113 N71 19530
Heat transfer processes in liquid propellant rocket engines
[AGARD AG 148 71] p0299 N72 12950
Design testing and use of heat exchangers in industries and aerospace vehicles - conference
[AGARD LS 57] p0299 N72 18946
Compact heat exchangers with large amounts of heat transfer area per volume unit and heat transfer fluid friction power relation p0299 N72 18947
Heat transfer and pressure distribution rates and point pressure profiles for turbulent boundary layers at subsonic and hypersonic speeds p0179 N72 20301
Calculation method for external heat transfer to turbine blades p0263 N73 19807
Techniques for measuring heat transfer in short duration and rapidly varying flows
[AGARD AG 145] p0300 N73 20945
Effects of streamline curvature on turbulent flow applied to boundary layer conditions on wing sections and turbomachine blades
[AGARD AG 169] p0186 N74 11042
HEAT TRANSFER COEFFICIENTS
Heat transfer and exchange measurements on fixed turbine blades in high temperature combustion chamber p0257 N71 17378
Heat transfer in air cooling and sweat cooling techniques for high temperature gas turbine engine components p0258 N71 17383
Effective heat transfer coefficients in film cooling systems of gas turbine surfaces p0260 N71 17395
Heat transfer in liquid metal cooled gas turbine blades p0260 N71 17398
Conference on high temperature turbines detailing effect of film cooling on blade profile
[NASA TM X 67123] p0261 N71 22699
HEAT TREATMENT
Effects of heat treatment, size, specimen type, and test environment on two precipitation hardened stainless steels during stress corrosion cracking tests p0288 N72 21923
Influence of thermomechanical treatment on stress corrosion cracking of steel p0289 N72 21930
Improvement of the properties of high strength Al-Zn-Mg-Cu alloys by thermomechanical procedures - effects on toughness and stress corrosion properties of steel plates and forgings p0204 N74 23111
HEAVY IONS
Relative biological effects of heavy cosmic rays on living tissue p0075 N72 26949
HEAVY NUCLEI
BIOSTACK experiment on Apollo 16 for studying ionizing radiation of heavy high energy cosmic particles and flight factors on resting biological systems p0083 N73 23067
HELICOPTER CONTROL
In flight manual on instrument capability of the Sperry flight control display system for helicopters p0031 N72 11930
Theory and operation of proposed helicopter IFR approach control system p0033 N72 11933
Analysis of operation of equipment and test facilities for system for precise IFR helicopter approach p0033 N72 11934
Feasibility evaluation of microwave aircraft digital guidance equipment for helicopter approach and landing guidance systems p0034 N72 11936
Flight test of three axes hydraulic stability augmentation system [illegible] p0034 N72 11937
Systems performance, safety, helicopter approach and landing and navigation guidance and [illegible] p0034 N72 11939
Flight tests of XH-51 helicopter to determine effects of gyroscope and control mixing on stability and control p0047 N73 21975
Effect of elastic flapping of rotor blades on stability and control of helicopter equipped with hingeless rotor system p0047 N73 21976
Flight characteristics and performance of forestry type helicopter rotor p0048 N73 21028
Evaluation of helicopter handling qualities based on ground based piloted flight simulator tests p0049 N73 21030
Effect of rotary wing aerodynamics on helicopter dynamic stability and control characteristics p0051 N73 21045
HELICOPTER DESIGN
Helicopter design for improving crash survivability of aircraft occupants p0103 N72 19141
Proceedings of conference on fixed, rotary wing and variable sweep configurations
[AGARD R 595] p0016 N73 14077
Proceedings of conference on rotary wing aircraft development and future requirements, experience, flight test and evaluation of structural concepts
[AGARD CP 121] p0046 N73 21029
Flight tests of Kaman K-Solid helicopter fitted with reduced scale servo controlled rotor to determine handling qualities and hub loads characteristics p0047 N73 21017
Survey of problem areas in the prediction of aerodynamic loads and aeroelastic stability characteristics of rotors for development of rotary wing aircraft p0048 N73 21023
Aerodynamic characteristics, performance predictions and fundamental problems of helicopter rotors and all p0048 N73 21024
Wind tunnel tests to determine effects of aerodynamic components on helicopter performance and apply results to helicopter design optimization p0051 N73 21052
Analysis of aerodynamic and dynamic properties of rotary wing aircraft for application to tests to development and evaluation of helicopters
[AGARD LS 63] p0027 N73 22948
Aerodynamic characteristics of helicopter rotors and effects on aircraft aeroelastic and mechanical stability p0027 N73 22949
Fundamentals of rotary wing aerodynamics and hydrodynamics to performance considerations of helicopters p0027 N73 22950
Basic dynamics of rotary wings applied to helicopter flight and aerodynamic characteristics of advanced rotary wing concepts and configurations p0027 N73 22951
Special Aircraft Meeting on Helicopter Rotor Blade Pitch Control Methods
[AGARD CP 122] p0055 N74 10908
Rotary wing design methodology based on nonlinear aeroelastic blade loads analysis p0056 N74 10909
Current loads restrictions for helicopter rotors based on rotor loads computer program for determining fatigue design loads p0056 N74 10910
Prediction of helicopter rotor loads based on alternating aerodynamic loads imposed on rotary wing and rotor hub p0056 N74 10911
Helicopter rotor loads predictions - assumptions and techniques for numerical analysis of aeroelastic models p0056 N74 10912
Rotor system design and evaluation using a general purpose helicopter flight simulation program p0056 N74 10913
The prediction of loading actions on high speed semi rigid helicopters p0056 N74 10914
Loads prediction methods for hingeless rotor helicopters p0056 N74 10915
Integrated rotor body loads prediction p0057 N74 10916
Influence of turbulence on helicopter design and operation analysis of structural loads gust worthiness and passenger comfort affected by atmospheric turbulence p0059 N74 17736
HELICOPTER ENGINES
Performance and efficiency of small gas turbine engines for helicopter and surface vehicles
[AGARD LS 46 71] p0261 N71 26951
Design and performance of gas turbine engines for helicopters and surface transport vehicles p0262 N71 26952
Experimental gas turbine technology of gas turbine engines for helicopters and transport vehicles p0262 N71 26956
HELICOPTER PERFORMANCE
Evaluation of helicopter operational system effectiveness and related performance parameters - conference p0033 N72 11931
Systems performance and safety, helicopter approach and landing and navigation guidance p0034 N72 11939
Development of theoretical aerodynamics of helicopter rotor wings for transonic flow - compressibility effects of oscillating airfoils and advancing blade tips p0047 N73 21001
Helicopter flight performance in natural environment p0046 N73 21009
Analysis of proposed navigation system for helicopters [illegible] p0046 N73 21010
Operational performance of helicopters in Europe p0046 N73 21011
Presentation of helicopter level flight performance with power coefficient compared with speed coefficient for a range of rotor configurations p0047 N73 21014
Experiments of XH-51 helicopter to determine effects of gyroscope and control mixing on stability and control p0047 N73 21015
Effect of elastic flapping of rotor blades on stability and control of helicopter equipped with hingeless rotor system p0047 N73 21016
Discussion of speed and flight envelope of Sikorsky SA 347 helicopter, rotorcraft and separately prepared papers and requirements for aerodynamics p0047 N73 21018
Analytical factors in design of blade tip shapes of rotary wing aircraft and mathematical models of rotary wing flow characteristics p0047 N73 21019
Flight characteristics and performance of forestry type helicopter rotor p0048 N73 21028
Evaluation of helicopter handling qualities based on ground based piloted flight simulator tests p0049 N73 21030
Development of a rotor with variable geometry blades for improved performance of helicopters in forward flight p0049 N73 21033
Parameters for improved performance of helicopter rotors [illegible] p0049 N73 21036
Improvements in basic rotary wing aerodynamic tools to meet future helicopter performance p0050 N73 21038
Analysis of rotary wing dynamic stability in forward flight and research problems to be solved - discussion of rotor mechanics p0050 N73 21041
Effects of rotary wing aerodynamics on helicopter stability and control [illegible] p0051 N73 21045
Discussion of effect of rotor configuration on helicopter performance and flight characteristics p0051 N73 21050
Analysis of stability and control properties of rotary wing aircraft for use in preliminary design development and evaluation of helicopters
[AGARD LS 63] p0027 N73 22948
Fundamentals of rotary wing aerodynamics and hydrodynamics to performance considerations of helicopters p0027 N73 22950
Basic dynamics of rotary wings applied to helicopter flight and aerodynamic characteristics of advanced rotary wing concepts and configurations p0027 N73 22951
Flight tests of [illegible] p0028 N73 22959
Dynamic stall
[NASA CR 136473] p0018 N74 11050

Influence of turbulence on helicopter design and operation analysis of structural loads pilot workload and passenger comfort affected by atmospheric turbulence
p0059 N74-17736

HELICOPTER WAKES

Analytical and experimental techniques to define geometry of vortex field of hovering rotary wing and effect on rotor performance p0049 N73 21032

Development of actuator disc theory for predicting time averaged downwash distribution and response characteristics of helicopter rotors in forward flight
p0049 N73 21033

Development of procedure for determining geometry and strength distribution of vortex wake generated by single bladed hovering helicopter rotor p0049 N73 21035

Analysis of unsteady aerodynamic loading on reference section of helicopter rotor blade in axial or hovering flight under compressible flow conditions p0050 N73 21044

Development of technique for rotor blade design and measurement of pressure distributions along the blade chord and across blade wake near rotor tip in flight
p0051 N73 21047

Analysis of aerodynamic noise produced by rotary wings and methods for noise reduction based on shed vortex wakes and blade tip modification p0052 N73 21053

Proceedings of conference on rotary wings to investigate rotor wakes aerodynamic characteristics at hover and high advance ratio and aerodynamic noise properties
[AGARD AR 61] p0052 N73 21931

HELICOPTERS

Vibration effects on performance of helicopter flight crews p0068 N71 20355

Post crash fire safety of helicopter turbine engine fuels
p0250 N72 11608

Breakdown of automatic pilots or auxiliary stabilization systems on helicopters p0031 N72 11918

Possibilities and limitations of rotary and fixed wing compatible Doppler sensor designs p0031 N72 11923

System for increasing helicopter stability
p0033 N72 11932

Advanced Doppler inertial navigation system for transport helicopters p0033 N72 11935

Army helicopter accident analysis for defining impact injury problems and helicopter crashworthiness
p0099 N72 19129

Central digital computers for helicopter guidance and control systems p0156 N72 21223

Application of model helicopter rotor experiments to determining dynamic stall of rotary wings and predicting aerodynamic loads developed p0017 N73 14002

Numerical analysis of unsteady aerodynamic forces on helicopter rotor blades to determine lift distribution as function of velocity component normal to blades
p0017 N73 14003

Helicopter flying in poor light and featureless terrain and color vision abnormality p0078 N73 19075

Application of night vision technology helicopter night scouts p0303 N73 19970

Analysis of procedures and problems involved in operating helicopters from decks of ships p0046 N73 21010

Reliability and operational safety of mechanical helicopter transmission gears p0047 N73 21012

Aerodynamic dynamic and aeroelastic problems of rotary wing design for helicopters and V/STOL aircraft with application to hingeless rotor systems p0051 N73 21051

Analysis of helicopter internal and external noise levels for various flight conditions and tuning of acoustical spectra p0052 N73 21055

Fundamentals of helicopter noise generation and propagation to include noise control procedures and cost effectiveness of noise reduction p0017 N73 22953

Analysis of operational problems associated with wind tunnel testing of V/STOL aircraft and helicopters
p0173 N73 26140

Scaling laws constructional problems and optimum model size associated with wind tunnel tests of helicopters and rotary wing aircraft p0173 N73 26246

Application of glass reinforced and carbon reinforced composite materials for helicopter structures and rotary wings p0211 N73 27483

Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews
[AGARD AR 62] p0055 N73 31954

Technical evaluation report on Fluid Dynamics Panel Specialists Meeting on Aerodynamic Drag
[AGARD AR 58] p0018 N74-10935

Problems of estimating the drag of a helicopter correlation of flight test data and scale model test data
p0019 N74 14715

HELIOS PROJECT

Design development and characteristics of telemetry receiving station using HELIOS spacecraft as example
p0194 N72 19508

HELIUM

Turbulent mixing layer between two different gas streams such as nitrogen and helium p0178 N72 20295

HELMETS

Protective helmets designed to lessen effects of head injury due to impact in aircraft accidents
p0104 N72 19163

Models for head injury prediction and tolerance and prediction of optimum helmet performance
p0104 N72 19164

Design development and testing of helmets for flight crews p0104 N72 19162

Biomedical problems with helmet mounted sight and visual target acquisition system p0303 N73 19969

HIGH ALTITUDE

Polarization coupling losses on sky wave paths at high altitude p0129 N72 21145

Conferences on biophysical approaches to solving problems of ionizing and nonionizing radiation effects during high altitude flight manned space flight and ground based equipment
[AGARD CP 95 PT 3] p0075 N72 26045

Integrated SAVVAN VOR and DME system for locating and controlling high altitude aircraft p0232 N73 23695

HIGH ALTITUDE ENVIRONMENTS

Environmental effects on parachute impact injuries at 6 000 to 10 000 feet using parabolic apex vented static line deployed parachute p0101 N72 19137

HIGH ENERGY PROPELLANTS

Possible high energy fuels for supersonic aircraft
p0251 N72 11670

HIGH FREQUENCIES

Side scatter propagation at higher frequencies for monitoring air pollution using remote optical radio and radar techniques p0122 N72 16097

Propagation loss spectral spreading and temporal spreading of high altitude HF signal transmission
p0129 N72 21144

HF measurements of ocean wave directional spectra using Bragg backscatter angle p0148 N74 13867

HIGH PRESSURE

Soot formation in rich kerosine flames at high pressure
p0219 N74 14289

HIGH SPEED

Flight test evaluation of military aircraft low altitude high speed performance p0029 N71 23421

Discussion of speed record establishment by SA 341 helicopter to include aircraft preparation procedures and requirements for successful completion
p0047 N73 21018

HIGH SPEED CAMERAS

Applications of lasers as indirect light source for high speed photography p0200 N72 25504

HIGH STRENGTH ALLOYS

Standardization of test procedures for determining stress corrosion cracking in high strength alloys and steels under various environments conference
[AGARD CP 98] p0285 N72 21900

Stress corrosion tests of 7XXX series high strength aluminum alloys in laboratory environment
p0285 N72 21903

Cantilever bending tests for determining susceptibility of high strength alloys to stress corrosion cracking
p0287 N72 21911

Analysis of crack initiation and crack propagation in high strength Al alloys in different environments
p0288 N72 21918

HIGH STRENGTH STEELS

Properties and selective applications of high strength steels p0205 N71 27040

Standardization of test procedures for determining stress corrosion cracking in high strength alloys and steels under various environments conference
[AGARD CP 98] p0285 N72 21900

Determination of stress corrosion cracking parameters for 300M steel p0286 N72 21906

Threshold stress intensity values and crack propagation rates for stress corrosion of high strength steels in aqueous environment p0287 N72 21913

An electrochemical method for determining crack growth rate in high strength cantilever beam type specimens
p0287 N72 21917

Some recent developments in fatigue and fracture mechanics relating to fracture resistance of high strength steels p0204 N74 23110

HIGH TEMPERATURE

Thermodynamic stability diagrams of high temperature O2 corrosion reactions p0201 N73 23602

HIGH TEMPERATURE ENVIRONMENTS

Human factors requirements when working in extreme climatic environments p0079 N71 20362

Conference on high temperature corrosion of alloys for aerospace application
[AGARD CP 120] p0201 N73 23592

Design and manufacturing of composite materials with organic matrices for use in aerospace vehicle structures subjected to high temperatures p0212 N73 27489

HIGH TEMPERATURE GASES

Advanced cooling systems and heat resistant materials for turbine blades of high temperature aircraft engines
[AGARD CP 73 71] p0251 N71 273 2

High enthalpy temperatures for improved performance of thermogenerators and gas turbine engines
p0252 N71 11373

Heat transfer and pressure measurements on cooled turbine blades in high temperature combustion chamber
p0251 N71 11378

Effectiveness of multiple cooling systems for high temperature gases
[NASA TM X 66792] p0258 N73 11386

Design of gas turbine power plant for operating temperature
p0258 N71 11386

Design and performance of thermosiphon fluid cooled high velocity temperature axial flow turbine
p0260 N71 17399

Computerized optimization of thermal resistant gas turbine blades p0260 N71 17400

HIGH TEMPERATURE LUBRICANTS

Assessment of high temperature stability of synthetic lubricants for aircraft gas turbines p0254 N72 11635

Analysis of lubricant system used in civil supersonic gas turbine engine p0254 N72 11697

Synthetic high temperature lubricants thickened by complex esters for supersonic aircraft p0255 N72 11701

HIGH TEMPERATURE RESEARCH

Conference on high temperature turbines detailing effect of film cooling on blade profile loss
[NASA TM X 67123] p0261 N71 22699

Research organizations investigators and programs in high temperature research from eleven NATO countries and Spain
[AGARD R 585 71] p0302 N71 36382

Low cycle fatigue testing at high temperatures
[AGARD R 604] p0292 N73 18916

High temperature corrosion scale for heat resistant alloys p0201 N73 23598

HIGH TEMPERATURE TESTS

High temperature environmental testing of gas metal interactions to simulate severe operating conditions
p0202 N73 23606

Analysis of heat transfer properties and thermophysical properties of materials used for aircraft and spacecraft construction
[AGARD R 606] p0300 N73 25968

HIGHWAYS

Pattern recognition technique for automatic detection of vehicles in aerial photographs of highways
p0152 N72 11183

HISTOGRAMS

A contribution to the electrostagmographic method concerning the interpretation of nystagmus characteristics vestibular tests to assess motion sickness and disorientation susceptibility p0168 N74 20739

HISTOLOGY

Personal observations of 340 fatal aircraft accidents for confirmation of lacerations to victims p0099 N72 19124

HOLOGRAPHY

Holographic pattern recognition using hybrid matched correlator p0153 N72 11194

Principles of holography and various methods for production of holograms p0199 N72 25495

Mathematical models and numerical analysis of coherent optical systems used as holographic software systems
p0199 N72 25496

Application of aerodynamic holography for optical recording and flow analysis in wind tunnels and research facilities p0199 N72 25498

Principles for producing holograms and methods of recording interference pattern between reference beam and reflected light waves p0199 N72 25499

Calculation of diffraction efficiency and signal to noise ratio for two dimensional and volume diffuse signal beam holograms p0199 N72 25500

Development and characteristics of holography camera for use with Q switched ruby lasers
[NASA CR 126767] p0199 N72 25503

Characteristics of solid state ruby laser and application for holographic recording p0200 N72 27532

HONEYCOMB STRUCTURES

Controlling free stream turbulence of passive devices
[AGARD R 598] p0182 N72 33267

HOOKS

Development and characteristics of dual cargo hook system for use on military transport helicopters
p0048 N73 11822

HORIZONTAL TAIL SURFACES

Wind tunnel tests with aeroelastic simulation of tailplane rudder of European airbus models p0004 N71 19374

Computer program for calculating deflection effects of wing horizontal tail and fin downwash in subsonic flow p0004 N71 29342

HORMONE METABOLISMS

Human pituitary and adrenal hormone reserve as a measure of stress tolerance p0105 N73 19150

HOT PRESSING

Manufacturing titanium carbide cermets by hot pressing p0258 N72 12503

HOT WIRE ANEMOMETERS

Flow visualization techniques and hot wire anemometer data for shear flow turbulence p0178 N72 20290

Hot wire measurements of subsonic two dimensional turbulent jets p0178 N72 20294

HOVERING

Analysis of operational requirements and feasibility of system for precise IFR helicopter hovering
p0023 N72 11934

Evaluation of hovering stability of helicopter using use of IFR landing system VOR/ILS aircraft p0224 N72 22631

Analytical and experimental techniques to define geometry of vortex field of hovering rotary wing aircraft effect on rotor performance p0049 N73 21032

Development of procedure for determining geometry and strength distribution of vortex wake generated by single bladed hovering helicopter rotor p0049 N73 21035

HOVERING STABILITY

Parameters for evaluating performance and stability of rotary stability and p0249 N73 21016

Experiments of 'box' rotary wing design and tests to determine effects on helicopter performance
p0050 N73 21038

Development of method for predicting performance of heavily loaded propellers and rotors in steady hovering flight
p0050 N73 21040

HS 748 AIRCRAFT

Landing accidents investigations for Hawker Siddeley 748 aircraft with performance measurements on rough surfaces
p0028 N71 23417

HUMAN BEHAVIOR

Information systems retrieval and user behavior
p0301 N71 23505

HUMAN BEINGS

Human tolerance requirements when working in extreme climatic environments
p0070 N71 20367

Human orientation, motivation, and assimilation of information and its transfer
p0301 N71 23503

Linear acceleration of impact type causing human injuries conferences
[AGARD CP 98 71]
p0098 N72 19119

Theoretical mechanics for the assessment of human impact tolerance using two-mass vibration systems
p0100 N72 19132

Clinical observation of massive injury, blood serum enzyme activity, and after-crash accidents
p0101 N72 19138

Biological effects of UHF electromagnetic radiation on human organism
p0036 N72 26053

HUMAN BODY

Metabolic imbalances and body fluid alterations during food deprivation for 30 days
p0070 N71 20364

Fundamental principles and physiological effects of accelerative forces on the body
p0094 N71 23339

Exposure to extreme forces through normal, abnormal and survival flight
p0093 N72 19125

Safety level limits for human protection from impact and acceleration
p0100 N72 19111

Clinical investigation of the use of abuse and therapeutic medications
p0081 N71 23357

Chromosomal and biochemical methods for detecting radiation levels of genetic significance and cancer risk
p0081 N71 23338

Effects of human body rhythms on performance, and drug evaluation
p0092 N73 21119

HUMAN CENTRIFUGES

Biodynamic aspects of the human vibration response, human tolerance, test facilities, and bibliography
[AGARD-CP-80-RAPs (5)]
p0094 N71 23337

Human spatial and angular disorientation during application of multiaxis dynamic stimuli
p0094 N71 23342

Human centrifuge tests to determine aircraft pilot ejection limits and aircraft stabilization limits
p0093 N72 26051

HUMAN FACTORS ENGINEERING

Human factors problems in flight simulators
[AGARD-CP-79-71]
p0071 N71 18592

Human factors considerations in high-speed ships
p0071 N71 18605

Selected human engineering problems for small flight vehicles
p0071 N71 18606

Human factors investigations of pilot performance during the final approach
[NASA-TM-X-66883]
p0072 N71 18619

Human factors considerations in the design of helicopter operational equipment
[AGARD-R-586-71]
p0226 N71 23214

Human factors and safety engineering for aircraft ejection seats
p0067 N71 23254

Human factors and safety engineering for general aviation
p0069 N71 23421

Human factors and man-machine relationships during the development of jets
p0073 N71 23424

Human factors considerations in the design of helicopters for operations in the NATO countries
p0067 N71 23435

Human factors engineering of the crew station and related cockpit facilities for a wide-body commercial transport airplane
p0073 N72 19136

Human factors data handbook: data applicable to aerospace vehicle development
p0223 N72 22632

Human factors engineering considerations in the design of military helicopters
p0223 N72 22634

Human factors engineering criteria for aerospace vehicle equipment and personnel performance
p0224 N72 22628

Human factors engineering considerations in the design of helicopters for antisubmarine warfare missions
p0223 N72 22633

HYDRAULIC EQUIPMENT
Hydraulic equipment for high Reynolds number testing in transonic wind tunnel
[NASA TM X 67418] p0015 N72 11880
Characteristics of power generating systems and application to missiles for production of hydraulic and electric energy p0065 N73 19044
Influence of adiabatic oil compression on power of hydraulic motors and pumps p0066 N73 19055
Hydraulic compressor wind tunnel p0174 N74 16992
HYDRAULIC FLUIDS
Influence of adiabatic oil compression on power of hydraulic motors and pumps p0066 N73 19055
HYDROCARBON FUELS
Possible high energy fuels for supersonic aircraft p0251 N72 11670
Cooling advanced engines by endothermic reactions of hydrocarbon fuels by absorbing sensible and latent heat p0251 N72 11672
Analytical techniques applied to additive and contaminant analysis in advanced hydrocarbon fuels with polar compound and fluorine impurities p0251 N72 11673
Adiabatic compression method for determining self ignition delay in hydrocarbon air fuel mixtures p0252 N72 11682
HYDRODYNAMIC EQUATIONS
Hydrodynamic calculations and experimental observations of ionospheric shock front propagation following nuclear explosion p0137 N73 14150
HYDRODYNAMICS
Numerical approximation of non Cauchy Kowalewska systems in hydrodynamics p0181 N72 27295
HYDROGEN
Ultrahigh vacuum for determining effects of hydrogen on fatigue and fracture properties of Ti 200 p0287 N72 21916
HYPERBOLIC NAVIGATION
Optimization of integrated navigation systems combining several independent navigation sensors to provide self contained aircraft navigation capability p0229 N73 20694
Aircraft inertial system testing and evaluation in the United Kingdom p0237 N74 14352
HYPERCAPNIA
Physiological responses to alternating stresses of exercise and hypercapnia under acute and chronic exposure to ambient P sub CO2 of 21 mm Hg p0070 N73 20370
HYPERSONIC AIRCRAFT
Kerosene type fuel for supersonic and hypersonic aircraft p0251 N72 116
HYPERSONIC FLOW
Aerodynamic drag
[AGARD CP 124] p0018 N74 14709
Drag in hypersonic rarefied flow effects of cold pressure drag and friction drag p0021 N74 14730
The influence of wave drag on hypersonic entropy wake observations flow regimes in wake of blunt body visualized by schlieren photography p0022 N74 14733
Review of drag measurements from flight tests of manned aircraft with comparisons to wind tunnel predictions p0022 N74 14735
HYPERSONIC NOZZLES
Starting conditions of mixed compression axisymmetric hypersonic inlet p0267 N72 16215
HYPERSONIC SPEED
Heat transfer and pressure distribution rates and pitot pressure profiles for turbulent boundary layers at subsonic and hypersonic speeds p0179 N72 20301
HYPERSONIC WIND TUNNELS
Facilities for aerodynamic testing at hypersonic speeds p0174 N74 16993
HYPERTENSION
Elevated blood pressure in aircrew p0085 N74 13787
HYPERVELOCITY PROJECTILES
Sequential spark electron beam fluorescence probe and electrostatic probe array methods for measuring turbulent wake properties in hypersonic spheres p0178 N72 20296
HYPOXIA
Partial cerebral hypoxic attacks in pilots as cause of hypoxia incidents p0088 N74 18786
HYSTERESIS
Analysis of effect of damping on response of structure to acoustic excitation and experimental method for determining damping coefficients p0293 N73 29917

I

ICE FORMATION
Airborne remote radar sensor for depth sounding of Antarctic ice p0123 N72 16099
ICE MAPPING
Analysis of remote Arctic ice pack boundary data obtained by submarine sonar airborne radar and infrared scanning imagery p0121 N72 16088
Design and performance of microwave radiometer for airborne sensing of sea ice thickness p0121 N72 16089
IGNITION
Adiabatic compression method for determining self ignition delay in hydrocarbon air fuel mixtures p0252 N72 11682
Theoretical analysis of the relation between pressure and ignition delay time as function of temperature at low limit of hot ignition p0252 N72 11683
Crash safe turbine fuel program using gelled fuels p0253 N72 11687
ILLUMINATION
Applications of lasers as indirect light source for high speed photography p0200 N72 25504
Application of incoherent and coherent light sources for underwater illumination and comparison of efficiency for various conditions p0242 N73 33633
IMAGE CORRELATORS
Holographic pattern recognition using multichannel correlator p0153 N72 11184
Techniques for predicting effects of thermal and saline inhomogeneities on optical imaging systems with application to optical properties of sea water p0241 N73 33625
Effects of resolution signal to noise ratio and contrast on underwater imaging systems performance p0242 N73 33631
IMAGE ENHANCEMENT
Application of spatial filtering and image restoration to underwater photographs of floodlit images p0242 N73 33637
IMAGES
Radar pattern recognition for image data processing with meteorological radar systems p0151 N72 11181
IMAGING TECHNIQUES
Algorithm for reducing redundancy during image transmission p0131 N73 10189
Techniques for predicting effects of thermal and saline inhomogeneities on optical imaging systems with application to optical properties of sea water p0241 N73 33625
Effects of resolution signal to noise ratio and contrast on underwater imaging systems performance p0242 N73 33631
Application of spatial filtering and image restoration to underwater photographs of floodlit images p0242 N73 33637
IMPACT
Catapult system for launching automobiles and impact studies p0103 N72 19153
IMPACT DAMAGE
Lethal head injuries to man swimming underwater caused by detonation of fission bomb p0100 N72 19135
Necropsy and radiographic observation of spinal fracture and a frontal facet derangement patterns in rhesus monkeys
[AMRL TR 71 17] p0101 N72 19139
IMPACT TESTS
Crash safe turbine fuel program using gelled fuels p0253 N72 11687
Crash injury research including pathology and protection p0098 N72 19120
Theoretical mechanics for expressing kinematics of human impact acceleration using two coordinate systems p0100 N72 19132
Equipment designed for accurately measuring mechanical response of man during impact p0102 N72 19145
Instrumentation for vehicle impact p0103 N72 19154
Accelerator protection system design impact testing of restraint harnesses and ejection seat cushions and implications p0104 N72 19157
Anthropometry for protective equipment evaluation and human impact acceleration experiments p0084 N73 23066
IMPULSES
Relationship of tolerance to impulsiveness and acceleration to perceptual motor performance in human beings p0069 N71 20361
IN FLIGHT MONITORING
Airborne equipment for approach path reduction of aircraft noise trajectories on Boeing transport aircraft p0029 N71 23425
In flight data acquisition and processing systems p0195 N73 10452
Onboard computer systems for in flight monitoring of space shuttle in support of flight crew p0289 N73 23893
INCOMPRESSIBLE FLOW
Unsteady pressure measurements on harmonically oscillating swept wing with two control surfaces in incompressible flow p0013 N71 25350
Equations for time mean values of an incompressible turbulent flow and eddy viscosity dependent on second invariant of deformation tensor p0176 N72 20280
Part 3 Theoretical equations for calculating three dimensional incompressible laminar boundary layers p0177 N72 20285
Analysis of velocity profiles in boundary layer of plane incompressible flow during takeoff p0241 N73 15201
Singularity method for calculating two dimensional incompressible flow around cascades with separation p0269 N73 19862
INCOMPRESSIBLE FLUIDS
Navier Stokes equations of motion for incompressible fluid in rotating axes p0181 N72 27298
INDEXES (DOCUMENTATION)
Selected and additional articles on aeroelasticity (Dec 1970)
[AGARD R 578 71] p0021 N71 17432
A computer produced keyword ordering system for terms of reports in the library of the Aircraft Research Association Limited p0159 N74 16926
Real time research facilities and services
[AGARD R 609] p0304 N74 17661
INDUSTRIES
Heat exchangers for process and power industries p0299 N72 18949
Design and operational services of small data centers to technical users
[AGARD CP 117] p0158 N73 24201
Functions of small industrial information center p0158 N73 24203
Information dissemination services to industry p0159 N73 24210
INERTIAL GUIDANCE
Inertial guidance systems components and technology applied to control and guidance of tactical missiles p0227 N72 27690
Inertial guidance techniques for midcourse guidance and terminal guidance systems with application to control and guidance of tactical standoff missiles p0227 N72 27691
Development and evaluation of failure detection and isolation technique for use with four gimbaled inertial measuring units p0228 N73 20687
Development of low cost inertial measurement unit with navigational accuracy performance based on optimum use design of inertial instruments and platform p0228 N73 20690
Design optimization of SRAM inertial navigation and guidance p0230 N73 20705
Laboratory tests of accelerometers used in inertial guidance systems in French military programs p0231 N73 20714
Introductory remarks Test technology trends applied to performance tests of inertial guidance systems p0236 N74 14346
PIGA Acceleration tests on vertical 10G 3 hertz table centrifuge and vibration tests of inertial guidance systems p0236 N74 14347
Inertial guidance system centrifuge testing development and characteristics of test equipment p0236 N74 14348
Laboratory evaluation of electro optically aided space navigation systems demonstration of design concept and hardware performance p0236 N74 14350
Aircraft Navigation systems testing with a high precision reference development of Completely Integrated Reference Instrumental on System (CIRIS) p0237 N74 14353
Inertial guidance system sled testing p0237 N74 14354
INERTIAL NAVIGATION
Gyroscope theory and applications to inertial guidance and navigation vehicle fabrication and related subjects bibliography
[AGARD R 582 71] p0189 N71 2 002
Advanced Doppler inertial navigation system for transport helicopters p0033 N71 [illegible]

Jet blowing for intake boundary layer control in V STOL aircraft p0764 N72 16697
Performance criteria including engine air flow matching requirements of axisymmetric mixed compression intake for supersonic transport p0765 N72 16703
Free jet tests of full scale supersonic intake engine combination of Concorde power plant p0765 N72 16704
Design problems of inlets and nozzles used in supersonic and V STOL propulsion systems
[NASA TM X 67741] p0767 N72 21819

INTEGRATED CIRCUITS
Development and characteristics of microelectronic equipment for improved reliability and reduced weight and size of electronic components p0191 N72 19484
Computer aided design for electronic circuits conference
[AGARD CP 130] p0165 N74 13906
Unit transistor Model of bipolar transistor having continuous parameters as the geometric dimensions p0166 N74 13917
Structure and application of computer program ICAN Integrated circuit AC analysis p0167 N74 13926
Computer aided design analysis of modern large scale circuits and subsystems p0167 N74 13928
SIGMA An integrated system of computer aided complex circuit designs p0168 N74 13932
Computer aided placement and routing of high density chip interconnection systems p0168 N74 13937

INTELLIGENCE
Research and development program for military geographic information system using airborne radar and multispectral photographic data p0171 N72 16086

INTERFERENCE
Program design for study of engine aircraft interference problems p0263 N72 16686

INTERFERENCE DRAG
Aerodynamic interference characteristics of airframe propulsion systems of transport and military aircraft
[AGARD CP 71 71] p0001 N71 19353
Wind tunnel vortex flow study on body of revolution with or without wings p0001 N71 19355
Optimization of interferences between aircraft components in supersonic flow p0001 N71 19356
Finite element computer program for estimating airplane aerodynamic interference
[NASA TM X 66884] p0001 N71 19357
Lift and drag interference characteristics of delta winged half cones with leading edges p0002 N71 19359
Numerical analysis of downwash interference on wings of missile tails p0002 N71 19360
Calculation of drag for wing body interference at drag on supersonic aircraft in stationary or nonstationary flow p0002 N71 19362
Interference flow field of tri flat plate configuration in supersonic turbulent boundary layer channel p0003 N71 19365
Flight and wind tunnel evaluations of flow field effects on performance of supersonic underwing exhaust nozzle at transonic speeds
[NASA TM X 66887] p0003 N71 19366
Aircraft afterbody and engine nozzle interferences at subsonic transonic and supersonic speeds
[NASA TM X 66888] p0003 N71 19368
Interference effect between oscillating and distorted inlet flow on compressor stall p0003 N71 19370
Wind tunnel surveys of flow fields about wing fuselage store configuration inlets of transonic and supersonic aircrafts
[NASA TM X 66885] p0004 N71 19371
Aerodynamic flow field interference effects on supersonic intakes p0004 N71 19372
Wind tunnel tests with jet simulation of airplane interference on European airbus models p0004 N71 19374
Aerodynamic interference caused by rear fuselage mounted power plants on BAC aircraft p0004 N71 19375
Wind tunnel evaluation of interference drag of tailplane engine wing configuration of subsonic aircraft p0004 N71 19376
Computer program for determining low speed interference effects of flow fields about arbitrary bodies by superposition p0005 N71 19377
Photographic recording of aerodynamic interference in wind tunnel simulation of jettisoned drop tanks from aircraft p0005 N71 19378
Flow field interference beneath swept wing fuselage store installation on aircraft p0005 N71 19380
Computerized prediction of interference flow field for wing fuselage store location on bomber aircraft p0005 N71 19381
Wind tunnel study of external store induced flow field instability effects on longitudinal stability of arrow wing aircraft p0005 N71 19382
Flight test measurements on store interference and severe drag effects caused by ejection of external stores from F 2 aircraft p0006 N71 19384
Computerized prediction of flow field interference effects and increments on aircraft stores at subsonic speeds p0006 N71 19385
Correlations of theoretical calculations and wind tunnel tests of interactions between engine flow and wing-canard-body combinations at wind tunnel p0010 N71 36480
Computation of response to unsteadiness in engine airframe interference p0011 N71 36482
Wing characteristics for angles with interference at transonic wind tunnel tests p0011 N71 36484
Interference problems of airframe engine integration in aircraft design optimization
[AGARD LS 53] p0037 N72 27016
Engine airplane interference corrections calculating model aircraft performance from wind tunnel test data p0037 N72 27017
Integration of foreBody and forebody wing flow fields into airplane design criteria p0037 N72 27018
Wind tunnel models for determining inlet interference and performance of inlet airframe combination in supersonic aircraft design p0037 N72 27019
Wind tunnel test results of exhaust nozzle airframe interference drag for optimization of subsonic aircraft design p0037 N72 27020
Wind tunnel test requirements for simulating nozzle parameters and nozzle airframe interference characteristics p0037 N72 27021
Determination of thrust and drag characteristics for integrated aircraft engine design optimization p0038 N72 27023
The drag of externally carried stores Its prediction and alleviation drag reduction by redesign or development of new aircraft installations p0021 N74 14729
Sting interference effects on afterbodies at transonic speeds p0022 N74 14737

INTERFERENCE LIFT
Aerodynamic interference effects between wing and fuselage junctions p0001 N71 19354
Lift and drag interference characteristics of delta winged half cones with leading edges p0002 N71 19359
Computerized prediction of aerodynamic lifting characteristics for wing horizontal tail and canard wing configurations
[NASA TM X 66886] p0002 N71 19361
Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in unsteady supersonic and subsonic flow including interference lift
[AGARD CP 80 71 PT 1] p0007 N71 29333
Wing interference lift fine lattice simulation and application to aerodynamic loads on tandem wings in unsteady flow p0008 N71 29336
Interfering lifting surfaces in unsteady subsonic flow Comparison between theory and experiment
[AGARD R 614] p0023 N74 18654

INTERFEROMETERS
Principles for producing holograms and methods of recording interference pattern between reference beam and reflected light waves p0199 N72 25499

INTERFEROMETRY
Application of laser beams for measurement of aerodynamic flow fields at supersonic and hypersonic speeds p0200 N72 25503

INTERMODULATION
Multipath transmission models for predicting signal distortion and intermodulation in tropospheric scatter propagation p0119 N71 23463

INTERNATIONAL COOPERATION
Proposal for international air pollution information analysis center p0113 N71 19531
Feasibility of creating international maritime pollution information analysis center p0113 N71 19532
International survey of air pollution by aircraft engines and fuels
[AGARD AR 40] p0217 N72 21590
German cooperation in the field of aeronautical research p0304 N73 20959
International collaborative research and p0306 N74 23495

INTERVALS
Gravity wave effects on the time ranges of data causing ionospheric disturbances p0138 N73 14156

INTOXICATION
Physiological for determining cases of alcohol intoxication based on correlational heating systems p0972 N72 25939
Alcohol odored perspiration, heatproof system and detection of alcohol intoxication in pilots p0375 N72 26063

INVISCID FLOW
Development of procedures for determining planar mixed subsonic supersonic flow over airfoils
[AGARD AG 156] p0016 N72 22001
Summary analysis of vortex flows due to accelerating cylinder and impulsive motion of body in subsonic flow p0181 N72 27302
Extension of two dimensional technique for unsteady inviscid flow to three dimensions p0182 N72 27303
Computation of transonic inviscid flow with embedded shock waves p0182 N72 27306
Development of algorithms for calculating flows about arbitrary configurations and their application to analyzing various supersonic wing configurations p0951 N73 21048

ION ACOUSTIC WAVES
Asymptotic theory for statistical and single event studies of radio auroral morphology and scattering mechanisms p0127 N72 21127
Radar echoes at frequency of 1295 MHz p0127 N72 21130
Backscatter perturbation cross p0127 N72 21131

IONIZATION
Ionospheric radio scatter effects over great circle paths at VHF and UHF in Northern Hemisphere p0130 N72 21152

IONIZING RADIATION
Natural ionizing radiation effects on multiplication of unicellular organisms and Drosophila melanogaster development p0075 N72 26050

IONOGRAMS
Ionograms and morphological statistics of polar slant E condition emphasizing two stream or plasma type wave instability p0130 N72 21148

IONOSPHERE
Characteristics and effects of Arctic ionosphere on radio and radar propagation conference
[AGARD CP 97] p0126 N72 21121
Models of Arctic ionosphere p0126 N72 21122
Intensity of weak scattering from electron density irregularities in ionosphere p0128 N72 21134
Development of optical striations and Doppler spectrum broadening due to barium plasmas in ionosphere p0128 N72 21136
Radio signals from Explorer 22 for ionospheric electron content p0128 N72 21141
Diurnal variations in ionospheric tilt near magnetic dip equator due to gravity waves p0138 N73 14160
Total electron content of ionosphere with emphasis on North Atlantic region
[AGARD AG 166] p0187 N73 22350

IONOSPHERIC DISTURBANCES
Ionospheric irregularities causing high latitude satellite scintillation p0128 N72 21140
Sweep frequency backscatter radars as detectors of high latitude ionospheric phenomena p0129 N72 21147
High frequency backscatter observations of high latitude field aligned irregularities in F region p0130 N72 21149
Ionospheric refraction effect on geometry of field aligned ionization at HF and UHF in Northern Hemisphere p0130 N72 21152
Nuclear source model for generating ionospheric disturbances through acoustic gravity waves p0135 N73 14141
Full wave solution for electron density perturbations caused by gravity waves in F2 region p0136 N73 14145
Ionospheric oscillations caused by infrasonic waves propagating from thunderstorms p0136 N73 14148
Ionospheric gravity wave electron amplitudes and spectra p0137 N73 14149
Hydrodynamic calculations and experimental observations of ionospheric shock front propagation following nuclear explosion p0137 N73 14150
High frequency radar backscattering technique for determining ionospheric structure and gravity wave disturbances p0137 N73 14155
Continuous wave Doppler radar observations of ionospheric disturbances generated by Saturn Apollo launchings p0138 N73 14157
Ionospheric disturbance effects on sky wave ranging measurement p0138 N73 14159
Infrasonic detection of propagating atmospheric shock waves caused by supersonic aircraft p0138 N73 14161
Theoretical plasma perturbation model for calculating coupling effects between acoustic gravity waves and electromagnetic waves in ionospheric disturbances p0138 N73 14162
Nonlinear propagation and ionospheric coupling of atmospheric waves following nuclear explosion p0140 N73 14168
E layer electron density fluctuations and disturbances following nuclear explosion at ionospheric height p0140 N73 14169
Effects of acoustic gravity wave turbulence from nuclear explosion on ionospheric electron density irregularities p0140 N73 14170

IONOSPHERIC F SCATTER PROPAGATION
Solar radio interferometry for locating ionospheric disturbance detection p0138 N73 14158

IONOSPHERIC PROPAGATION
Ionospheric propagation at mid and application to high latitude HF radar propagation p0130 N72 21153
Observations of vortex motion and ion emission during magnetic storm caused by ionospheric auroral electrojets p0135 N73 14138
Electromagnetic and acoustic gravity wave frequency dependence techniques for measuring atmospheric gravity wave ionospheric disturbances p0137 N73 14153
Atmospheric gravity wave effects on polar thunderstorm radio wave propagation in presence of traveling ionospheric disturbances p0139 N73 14164

IONOSPHERIC STORMS
Relationship between atmospheric gravity wave and spread F disturbance caused by solar activity p0136 N73 14146

IONOSPHERICS
Arctic ionospheric physics and communication p0126 N72 21125

ISOTHERMAL PROCESSES
Role of isothermal stresses in crystal twinning at lattice and grain boundaries p0202 N73 23665

ISOTROPIC TURBULENCE
Effect of isotropic turbulence on the transition in the laminar boundary layer of circular cylinders p0180 N72 26938

ITALY
Italian thermal conditions affecting acceleration tolerance and psycho-motor performance of flying personnel
p0084 N73 23068

ITERATIVE SOLUTION
The double iteration method in structural optimization
p0298 N74 15615

J

JAMMING
Kalman filtering algorithm for detecting continuous wave interference signals in digital telecommunications
p0133 N73 10210

JET AIRCRAFT
Wind tunnel tests with jet simulation of airframe interference on European Airbus models
p0004 N71 19374
Synthesis and properties of aliphatic ester for turbine lubrication in jet aircraft
p0054 N72 11696
Role of flight surgeon and physician pilot in evaluation and treatment of jet fighter pilots
p0095 N72 14094
Methods for evaluating and predicting airfield performance of turbojet and turbofan short-operating-range conventional and short takeoff modes
p0053 N73 24044
Development of two methods for optimizing design of subsonic swept wing jet transport aircraft
p0054 N73 24054

JET ENGINE FUELS
Jet fuel specifications for military aircraft
p0251 N72 11659
European jet fuel specifications
p0252 N72 11678
Flammability properties of jet fuels and techniques for fire and explosion suppression under simulated hostile operating environment conditions
p0252 N72 11681
Problems of chemical pollution by aircraft. The airport and its immediate environment
p0218 N74 14281
Ground contamination by fuel jettisoned from aircraft
p0218 N74 14283

JET ENGINES
Properties and service applications of high strength steels, aluminum and titanium alloys, polymeric adhesive materials and composite materials in aerospace engineering
[AGARD LS 51 71]
p0205 N71 27038
Properties and selective applications of stainless alloys in airframes and jet engines
p0236 N71 27045
Analysis of test techniques and apparatus used in conduct of test of jet aircraft engine models in wind tunnels
p0053 N73 26246
Photometric measurements of exhaust smoke trails by jet engines
p0221 N74 14316
The problem of noise and a mode for a typical engine of a two jet transport aircraft
p0021 N74 14322

JET FLAPS
A 126 jet flap research aircraft development and test testing
p0027 N71 20066
Development of jet flap airfoil and application to heavy lift optical and propane vehicle design
p0048 N73 21022
Transonic drag rise characteristics of jet flap, jet aileron
p0029 N74 14323

JET FLOW
Propulsive jet flow for vertical takeoff aircraft
p0265 N72 16255
Turbulent boundary layer jets and wakes in confined ducts
[AGARD CP 93]
p0175 N72 20233
A study of flow separation in the base region and its effects on the powered flight external base flow/exhaust plume interaction flow
p0020 N74 14324

JET IMPINGEMENT
Analysis of surface pressure distributions due to impingement of a two dimensional flat plate wall jet upon the bottom of a VTOL aircraft with extremely low flaps
p0292 N73 29976

JET MIXING FLOW
Rapid mixing nozzle, device to control exhaust noise of supersonic jets, as STOL aircraft
p0266 N72 16693
Conservation equations for analyzing compressible and mixing flow regions of supersonic inlets
p0083 N73 22243
Free stream Mach number effects on the mixing of a free jet with a free stream
p0183 N73 17253
Acoustic and interference related problems in the design of STOL aircraft with upper surface blowing
[AGARD-CP-KAPPA 173]
p0194 N74 18421

JET NOZZLES
A mixing system for supersonic flow of air and gas
p0260 N71 33196
Flow and noise measurements of round and rectangular jet exhaust nozzles
p0278 N72 20274

JET PROVOST AIRCRAFT
Modification of Jet Provost and Strikemaster training aircraft to provide later pilot training requirements
p0242 N73 10032

JET STREAMS (METEOROLOGY)
Dispersion measurements of a chemically reacting supersonic jet exhausting into a subsonic flow
p0176 N72 20231
Flowing smoke - tool for experimental study of jet mixing
p0176 N73 14317

JETTISONING
Photographic recording of aerodynamic interference in wind tunnel simulation of jettisoned drop loads from aircraft
p0005 N71 19378
Computerized prediction of separated store trajectories dropped from bomber aircraft at high speed
p0005 N71 19379
Flight test measurements on store interference and aerodynamic drag effects caused by jettisoning of external stores from F 2 aircraft
p0006 N71 19384
Wind tunnel evaluation of ejection body store configurations for captive flight drag and separation characteristics
p0006 N71 19386
Static aerodynamic prediction of external store separation characteristics from aircraft
p0006 N71 19388
Ground contamination by fuel jettisoned from aircraft
p0218 N74 14283

JOINTS (ANATOMY)
Necropsy and radiographic observation of spinal fracture and articular facet derangement patterns in rhesus monkeys
[AMRL TR 71 17]
p0101 N72 19139

JOINTS (JUNCTIONS)
Aerodynamic interference effects between wing and fuselage junction
p0007 N71 19354

K

KALMAN FILTERS
Kalman filtering algorithm for detecting continuous wave interference signals in digital telecommunications
p0133 N73 10210
Fault detection tests for integrated navigation system employing Kalman filtering
p0143 N73 20212

KALMAN SCHMIDT FILTERING
Recursive filters for aperiodic sampling Bayes optimal adaptive filtering algorithms with automatic data
p0153 N72 11189
Development and application of Kalman filter techniques for satellite orbit determination
p0226 N72 27685
Application of Kalman filtering to inertial system and Kalman filter applications based on inertial sensor
p0229 N73 20205

KERNEL FUNCTIONS
Method for the calculation of unsteady aerodynamic forces between wing and tail
p0009 N71 29345
Evaluation of pressure distributions over wings with application of supersonic kernel function lifting surface method
p0009 N71 29346

KEROSENE
Kerosene type jet fuel supply and distribution aircraft
p0251 N72 11673

KINEMATICS
Kinematics of rotor blade motion, a basis for helicopter design
p0078 N71 29339
Kinematic experimental evaluation of unsteady aerodynamic loads at the wing tip test apparatus and preliminary experimental results
p0152 N72 11182
Experimental study of flow separation and vortex formation in three dimensional unsteady flow
p0153 N72 11183

L

LABORATORY EQUIPMENT
Calibration equipment for measuring instruments
p0283 N72 29314

LABYRINTH
Application of labyrinth theory to flow of compressible gases
p0108 N74 20237

LABYRINTHECTOMY
Quantitative determination of the effects of labyrinthectomy on the vestibulo-ocular reflex and on the dynamic properties of the oculomotor system
p0139 N74 20745

LAMB WAVES
Excitation of Lamb waves in plates
p0139 N71 33143

LAMINAR BOUNDARY LAYER
Boundary layer control by means of a laminar flow body
p0260 N73 19803

LAMINAR FLOW
Laminar diffusion flames of complex geometry
p0261 N72 20045
Analysis of laminar flow in a porous channel with injection and suction
p0261 N73 19844
Application of the Karman Pohlhausen method to the analysis of laminar flow in porous channels
p0262 N73 19845
Boundary layer transition and separation on smooth and roughened walls
[AGARD-CP-168]
p0144 N75 12043

LAMINATES
Response of general laminated plates to applied loads with coupling between bending and extensional modes of deformation
p0212 N73 27483
Computer aided design of moldings printed circuit cards
p0168 N74 13934
Optimizing automatic routing of printed circuit boards
p0168 N74 13935

LAND USE
Analysis of satellite multispectral imagery data for tropical land use interpretation
p0124 N72 16111

LANDING AIDS
Requirements for using Tatar 4 landing aid as portable ground station in tactical helicopter operations
p0032 N72 11925
Development of heads up flight data display for aircraft approach and landing during all conditions of visibility
p0233 N73 23702

LANDING SIMULATION
Accuracy of vertical contact analog display in simulating carrier landings as affected by display lateral temporal loading and control complexity
p0225 N72 27642
Simulator of pilot decision making process in manual landing operation during flare
p0280 N73 23899

LANGUAGE PROGRAMMING
Question answering system DEACON and its extension to programs to express semantic content of English sentences in procedural intermediate language
p0151 N72 11177

LARGE SCALE INTEGRATION
Application of test techniques to large scale integrated digital circuits
p0168 N74 13933

LASER MATERIALS
Properties of operation of ruby laser materials neodymium glass and YAG for generation of ultra energy levels
p0199 N72 25494
Operating characteristics of solid state ruby laser and application to holography
p0201 N72 25502

LASER MODE LOCKING
Numerical analysis of amplitude and frequency modulation for laser mode locking
p0202 N73 29335

LASER MODES
Properties of gas optical cavity modes and laser oscillation in cavity with spherical mirrors and three level atoms
p0199 N72 25494

LASER OUTPUTS
Proceedings of conference on application of laser technology for aerodynamic measurements
[AGARD LS 49]
p0199 N72 25492
Properties of laser operation with rotating Q switch and cylindrical laser rod
p0194 N72 25494
Properties of holographic and various techniques for producing them
p0199 N72 25495
Generation of coherent and incoherent light sources and wide angle light scattering for optical measurements
p0199 N72 25497
Development of high efficiency solid state pulsed laser for use with Q switched ruby lasers
[NASA-CR-126767]
p0199 N72 25501
Operation of solid state ruby laser at 4 degrees Kelvin
p0200 N72 25502
Application of laser interferometer system for measurement of low frequency vibrations
p0200 N72 25503
Application of laser velocimeter to high speed photography
p0200 N72 25504
Development of a laser velocimeter for measurement of velocity vector fields of unsteady incompressible flow with application to vortex wake behind a rotating wing
p0200 N72 25508
Application of laser velocimeter to measurement of turbulence
p0194 N72 25509
Application of laser velocimeter to measurement of mean velocity and turbulence in the boundary layer of a flat plate
p0242 N73 11633

LASER RANGE FINDERS
Analysis of pulsed laser rangefinder performance using fluctuation and probability theory techniques
p0194 N72 19513

LASER RANGER TRACKER
Analysis of the Apollo C band radar tracking system
p0124 N72 16108
Application of laser velocimeter to measurement of turbulence
p0194 N72 25509

LASERS
Development of a laser velocimeter for measurement of velocity vector fields of unsteady incompressible flow with application to vortex wake behind a rotating wing
p0200 N72 25508
Application of laser velocimeter to measurement of turbulence
p0194 N72 25509
Application of laser velocimeter to measurement of mean velocity and turbulence in the boundary layer of a flat plate
p0242 N73 11633
Safety considerations in the operation of lasers
p0276 N72 20257

LATERAL CONTROL
Effect of lateral control system characteristics on pilot aircraft coupling tendencies
p0044 N71 19418

LATITUDE
Effect of latitude on the performance of a high altitude balloon
p0127 N72 21478

LATTICES (MATHEMATICS)
Kinematics of subsonic unsteady airloads on multiple lifting surfaces p0008 N71 29339

LEADING EDGE SLATS
Design aspects of stall of powered lift aircraft with externally blown flaps and methods for predicting increment in maximum lift coefficient due to power p0042 N73 15011

LEADING EDGE SWEEP
Flaps and leading edge modifications for improved aerodynamic control stability of military aircraft p0029 N71 23422

LEADING EDGES
Representation of flow separation bubbles near airfoil leading edge p0027 N71 20064
Development of method for calculating small separation zones near leading edge of airfoil at incidence p0041 N73 15002

LEARNING MACHINES
Recursive filters for supervised learning Bayes optimal adaptive pattern recognition with continuous data p0153 N72 11189

LENSES
Characteristics of lenses and ports for underwater imaging systems to compare depth of field and relative aperture for several lens port combinations p0242 N73 33635

LESIONS
Optokinetic nystagmus its value in the diagnosis of certain vestibular lesions human abnormal neurophysiological responses in the presence of brain stem lesions p0109 N74 20742

LIBRARIES
Problems of library and information services to large research center p0158 N73 24204

LIFE SUPPORT SYSTEMS
Effectiveness of phased dilution compared to current demand diluter oxygen delivery system p0083 N73 23565

LIFT AUGMENTATION
Aerodynamics and applications of lift augmentation devices AGARD lecture series
[AGARD LS 43 71] p0025 N71 20051
High lift systems design for combat aircraft p0026 N71 20059
Lift augmentation devices effect on STOL engine Part 1 interface problems between engine and airframe p0026 N71 20061
Lift augmentation devices effect on STOL engine Part 2 thermodynamic problems p0026 N71 20062
Optimizing propulsive lift system for turbofan STOL aircraft considering cost effectiveness p0026 N71 20063
High lift wing characteristics wing with plain hinged flaps and boundary layer control and wing with drag and high lift devices extended p0027 N71 20065
Aerodynamics of two dimensional flow on high lift systems p0027 N71 20067
Propulsive lift technology program for development of short takeoff aircraft propulsion systems and lift augmentation devices p0055 N73 27009
Design development and evaluation of Boeing Spey Augmentor Wing research aircraft using internally blown flap for lift augmentation p0055 N73 27010

LIFT DEVICES
Aerodynamics and applications of lift augmentation devices AGARD lecture series
[AGARD LS 43 71] p0025 N71 20051
Aerodynamic effects of mechanical high lift devices on conventional airfoils p0025 N71 20052
Aerodynamics of pneumatic high lift devices p0025 N71 20053
Flow separation concepts for high lift airfoils p0025 N71 20055
Two dimensional wind tunnel tests on airfoils with high lift devices p0025 N71 20056
Three dimensional testing of high lift devices models p0026 N71 20057
High lift applications in transport aircraft design p0026 N71 20058
High lift systems design for combat aircraft p0026 N71 20059
Lift augmentation devices effect on STOL engine Part 1 interface problems between engine and airframe p0026 N71 20061
Lift augmentation devices effect on STOL engine Part 2 thermodynamic problems p0026 N71 20062
High lift wing characteristics wing with plain hinged flaps and boundary layer control and wing with drag and high lift devices extended p0027 N71 20065
Aerodynamics of two dimensional flow on high lift systems p0027 N71 20067
Kinematics of subsonic unsteady airloads on multiple lifting surfaces p0008 N71 29339
Application of lifting surface theory to wing and control surfaces in unsteady subsonic flow p0009 N71 29342
Transonic wind tunnel tests of effectiveness of high lift devices on swept and delta planforms controlling flow separation p0012 N72 11062
Development of new experimental approach for a three dimensional flow on high lift devices p0012 N72 11063
Applying lifting surfaces unsteady subsonic flow theory to helicopter rotary blades
[AGARD R 614] p0023 N74 18664

LIFT DRAG RATIO
Transonic wind tunnel determination of blunt trailing edge effects on drag and lift characteristics of wing profile p0012 N72 11862

LIFT FANS
Thrust measurement interpretation for V STOL models and transition performance of lift fan configurations p0264 N72 16693

LIFTING BODIES
Techniques and procedures for conducting flight tests of lifting body type aircraft during transonic and supersonic flight conditions
[NASA TM X 68306] p0035 N72 20986
Drag of lifting bodies for pilots at high altitude p0021 N74 14731

LIGHT (VISIBLE RADIATION)
Characteristics of imaging radiometers installed in meteorological satellites for observing infrared and visible regions p0192 N72 19497

LIGHT ALLOYS
Development of experimental program for determining response and sonic fatigue resistance of lightweight aircraft structures p0294 N73 29923

LIGHT SCATTERING
Effect of ocean depth on light scattering and attenuation parameters to include optical properties influenced by concentration size and shape of particulate matter p0241 N73 33626
Mathematical theories for determining light propagation thru sea water p0241 N73 33627
Light scattering by particles in sea water based on volume scattering function and point spread function p0242 N73 33628
Measurement of light scattering at various angles using point spread function and modulation transformation function techniques p0242 N73 33629
Effect of various parameters on long range underwater vision for narrow and broad beam illumination p0242 N73 33630
Application of Fourier techniques to calculate spread of scattered light for circular spot Gaussian profile and linear slope cases p0242 N73 33632

LIGHT TRANSMISSION
Proceedings of conference on electromagnetic and optical properties of sea water for application to surveillance mapping communications and visibility
[AGARD CP 61] p0241 N73 33619
Radiance distribution as function of depth in upper layers of ocean and numerical analysis of inherent and apparent optical properties p0241 N73 33621
Optical properties of pure and turbulent sea water p0241 N73 33624
Effect of ocean depth on light scattering and attenuation parameters to include optical properties influenced by concentration size and shape of particulate matter p0241 N73 33626
Light scattering by particles in sea water based on volume scattering function and point spread function p0242 N73 33628
Effect of various parameters on long range underwater vision for narrow and broad beam illumination p0242 N73 33630
Application of Fourier techniques to calculate spread of scattered light for circular spot Gaussian profile and linear slope cases p0242 N73 33632
Application of incoherent and coherent light sources for underwater illumination and comparison of efficiency for various conditions p0242 N73 33633

LINCOLN EXPERIMENTAL SATELLITES
Application of satellite location sensors operating in visible spectra for control of Lincoln Experimental Satellites p0192 N72 19500

LINE SHAPE
Integrated preprocessing system for one extra line in highly polished p0153 N72 11192

LINEAR PROGRAMMING
Reduction of nonlinear programming problems to sequence of linear programming problems p0283 N71 29133
Recent developments in the Case optimization program using Rotherham approximation programming approach p0296 N74 15602
Integer programming algorithms for optimum structural design p0298 N74 15604
Sequential unconstrained minimization algorithms for constrained optimization problems p0297 N74 15605

LINEAR SYSTEMS
Numerical analysis of adaptive equations yielding exact solutions for linear systems applied to optimal control of launch vehicle p0226 N72 27684

LINEAR TRANSFORMATIONS
Multiple notch method for analysis of nonstationary narrow band signal p0125 N72 16114

LININGS
Sound field generated by stenosis flow through a lined tube and effects of wall properties p0014 N72 11676

LIPID METABOLISM
Triglyceride and hydrocarbon systematic lipid profiling patterns of the USAFSAM cardiovascular disease study p0087 N74 13893

LIQUID BEARINGS
Development of gas lubricated journal bearing for advanced gas turbine engine p0229 N73 29909

LIQUID BREATHING
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure relations in dogs breathing air and liquid fluorocarbons in whole body water immersion respirator
[NASA CR 117199] p0068 N71 20358

LIQUID COOLING
Design and performance of thermosiphon fluid cooled high entry temperature axial flow turbine p0260 N71 17399

LIQUID METALS
Heat transfer in liquid metal cooled gas turbine blades p0260 N71 17398
Development of superconducting homopolar machines with multiple discs and superconducting field winding using liquid metals for armature sliding contacts p0064 N73 19037

LIQUID PROPELLANT ROCKET ENGINES
Heat transfer processes in liquid propellant rocket engines
[AGARD AG 148 71] p0299 N72 12950

LIVER
Management of asymptomatic carriers of hepatitis associated antigen in Hellenic Air Force personnel p0083 N73 23060

LOADS (FORCES)
Response of general laminated plates to applied loads with coupling between bending and extensional modes of deformation p0212 N73 27488
Summaries of papers presented to AGARD conference on random load fatigue
[AGARD AR 54] p0292 N73 28884

LOGIC CIRCUITS
Using cellular logic for pattern recognition p0154 N72 11198
Specification and design languages for logic systems p0168 N74 13930

LOGIC DESIGN
Computer aided placement and routing of high density chip interconnection systems p0168 N74 13937

LOGISTICS
Development and characteristics of dual cargo hook system for use on military transport helicopters p0048 N71 21022

LONG TERM EFFECTS
Residual effects of hypnotic drugs on human nervous function and performance p0080 N73 21106
Pilot performance and sleep patterns in long duration flights and control of hypnotic drug and alcohol use p0080 N73 21107
Physiological aspects of sleep reduction in aircrews after prolonged flight times p0080 N73 21108
Effects of isoniazid treatment on pilot performance p0080 N73 21111

LONG WAVE RADIATION
Statistical evaluation of fading caused by intermodal station combined long wave broadband propagation
[CNET NT EST APH 1] p0117 N71 21433

LONGITUDINAL CONTROL
Influence of load and wing load distribution on lateral and longitudinal maneuverability of aircraft p0044 N73 16998

LONGITUDINAL STABILITY
Effects of thrust characteristics on longitudinal stability supersonic flight p0044 N73 16997
Influence of pilot and flight characteristics on structural loads in operational flight requirements for improvements in flight requirements to reduce control problems
[AGARD R 608] p0058 N74 17728

LORAN
Navigation guidance computer requirements for integrated navigation systems using combination of outputs of inertial Doppler and loran equipment p0157 N72 21424
Application of long inertial hybrid system and Kalman filter algorithm to fixed feedback gain p0229 N73 29701
Characteristics of a hyperbolic area navigation system and application to aircraft control functions p0231 N73 29698
RF measurements of groundwave time and spectra using Bragg backscatter angle p0148 N74 13867

LORAN C
Application of airborne digital computers to loran C D and Omega navigation and guidance systems p0157 N72 21225

LORAN D
Application of airborne digital computers to loran C D and Omega navigation and guidance systems p0157 N72 21225

LOW ALTITUDE
Flight test evaluation of radar and all low altitude flight speed performance p0029 N71 23423
Integrated low altitude flight control system for military helicopters p0032 N72 11924
Terrain avoidance radar for US Army rotary wing aircraft p0042 N72 11927

LOW SPEED STABILITY
Analysis of parameters affecting aircraft stall and post stall behavior with emphasis on spin susceptibility and pilot performance p0043 N73 14999

LOW SPEED WIND TUNNELS
Low speed wind tunnel test of a powered airplane model with various auxiliary devices for short takeoff and landing p0267 N72 16718

Low speed wind tunnel investigation of body leading edge flow along streamwise corner
p0180 N72-20352

Objectives of dynamic tests in low speed wind tunnels and techniques for measuring oscillatory derivatives and transient motion effects p0173 N73-26244

Fluid motion problems in design and operation of low speed and transonic wind tunnels
[AGARD R-602] p0183 N73-26279

Problems of wind tunnel design and testing
[AGARD R-600] p0173 N74-16987

Some considerations of future low speed tunnel for Europe p0173 N74-16988

LOW TEMPERATURE ENVIRONMENTS

Human adaptation requirements when working in extreme climatic environments p0070 N71-20367

LOW VISIBILITY

Method for calculating weather minima for small sites to determine economic to automate approach performance requirements for military helicopters p0003 N72-11919

LUBRICANT TESTS

Properties evaluation of lubricants and fuels by use advanced gas chromatography
[NASA-CR-122842] p0264 N72-11634

LUBRICANTS

Aircraft fuels, lubricants and fire safety conference
[AGARD-CP-84-71] p0251 N72-11468

European jet fuel/lubricity evaluation p0252 N72-11479

Development of a safe fuel and lubricants to aid be protective measures against fire safety
[AGARD-AR-44] p0255 N72-27611

LUBRICATING OILS

Analytical methods for early stage detection of deterioration in gas turbine oil p0254 N72-11698

The evaluation of lubricating properties of the aircraft engines p0254 N72-11699

LUBRICATION

Synthetic fluid properties of additives for use in advanced aircraft p0254 N72-11696

LUMINANCE

Relationship between luminance and visibility for electronic displays and experimental investigation of immediate response to flashing light sources and luminance gradients p0223 N72-22621

LUNAR MODULE

p0193 N73-30101

M

MACH NUMBER

Measurement of dynamic derivatives
p0023 N74-14738

MACHINE ORIENTED LANGUAGES

Generation of natural language interfaces for man-machine communication in computer systems p0251 N72-11479

Development of software engineering aids for real-time aerospace applications p0193 N73-13502

Extended computer language for graphic interaction of process with the user system p0273 N73-23892

MAGNETIC EQUATOR

Energy distribution of protons and helium nuclei in the equatorial magnetosphere p0238 N73-14702

MAGNETIC FIELDS

Plasma sheet and boundary layer electron spectra and related electron currents in the vicinity of the earth
[NASA-CR-122749] p0265 N72-26802

Analysis of effect of operation of electrical systems on the magnetic fields with application to spacecraft
p0283 N73-19014

Development of high-speed, high-energy, lightweight, reliable, and high-current-density switches for applications in pulsed-power energy storage p0283 N73-19035

Application of superconductivity to magnetic energy storage and determination of optimum operating parameters for magnetic energy storage p0284 N73-19041

MAGNETIC LENSES

Analysis of performance of pulsed operation electron microscope with regard for variable magnetic lens focusing p0284 N73-19052

MAGNETIC PROPERTIES

Effects of electromagnetic forces on superconductors and large losses in design of superconducting coils for energy storage systems p0284 N73-19043

MAGNETIC STORMS

Observations of weak magnetic disturbances during magnetic storms caused by energetic protons and electrons p0235 N73-14733

The effect of the August 1972 magnetic storms on satellites p0237 N74-14788

MAGNETOHYDRODYNAMIC GENERATORS

Development of large hydrogen cooled turbine generator utilizing liquid nitrogen by-pass cycle, and advanced energy generators p0284 N73-19038

Development of method for analyzing performance of magnetohydrodynamic generators having power density, power conditioning, and flow instabilities p0285 N73-19053

MAGNETOMETERS

Analysis of effect of dynamic operation of spacecraft superconducting magnetic system with alternately stabilized conductor p0283 N73-19034

MAGNUS EFFECT

Magnus characteristics of arbitrary rotating bodies
[AGARD-AG-171] p0018 N74-13210

MAINTENANCE

Fault isolation and maintenance concept of advanced inertial navigation system p0231 N73-20711

MAN/MACHINE SYSTEMS

Human factors in aircraft simulation
[AGARD-CP-79-70] p0171 N71-36060

Engineering analysis of flight mechanics for simulation of pilot behavior in aircraft p0172 N71-36068

Conference papers on artificial intelligence with emphasis on interactive, cognitive, and man-machine interactive problem solving
[AGARD-CP-94-71] p0151 N72-11174

Selection of natural language for effective man-machine communication in control and control systems p0151 N72-11178

Man-machine approach toward solving various routing, scheduling, and network problems p0244 N72-11199

Designing waveform classification systems by interactive and machine methods p0154 N72-11262

Problem solving using man-machine interaction for pattern recognition and machine learning p0155 N72-11278

Development of new concepts for automated control of spacecraft operations p0193 N72-19506

Guidance and control displays for the pilot and aircraft operation
[AGARD-CP-96] p0023 N72-22621

Pertinent aircraft characteristics for satisfactory pilot performance and system design - Proceedings of the 42nd Meeting of the Panel p0273 N72-22626

Assessment of design and operation of aircraft display systems p0274 N72-22629

Pilot-vehicle performance p0044 N73-16990

Analysis of the human operator as an element in the flight control and navigation systems p0235 N73-23715

A computer simulation technique for the analysis of man-machine systems p0235 N73-23716

Design of adaptive logic decision trees for automatic processing of data p0278 N73-23885

Computerized simulation of cockpit controls for high-speed aircraft with variable-feel characteristics p0279 N73-23886

Systems studies and operations research for automatic control of manned operations p0239 N73-23887

Optimum controller design for a flight-simulator motion system - Report of Flight Task Group p0280 N73-23893

Man-machine aspects of flight performance measurement and space systems p0280 N73-23894

Computer test selection and application of advanced aircraft systems p0281 N73-23911

Computerized logical flight simulation of the pilot-vehicle system under guidance and control tasks p0281 N73-23916

MANAGEMENT

Management of computerized automation for aircraft information display and flight management p0206 N72-14030

MANAGEMENT METHODS

Educational system - Handbook of basic concepts and suggested techniques for managing the p0301 N71-35502

Application of NASA technology to improve management techniques in the DoD acquisition process for defense systems p0302 N73-15964

Application of management techniques to the development of a new aircraft p0302 N73-15965

Management methods for development of complex systems p0250 N73-24203

MANEUVERABILITY

Feasible type of control system to analyze or predict performance of aircraft p0011 N72-11931

Relationship between maximum rate of control and stability and control parameters p0044 N73-16989

Effect of control system characteristics on attainable and optimal maneuverability of aircraft p0044 N73-16990

Influence of powered controls on handling qualities of aircraft p0045 N73-17008

MANNED SPACE FLIGHT

Conference on biological and medical problems of manned space flight - Proceedings of conference held in Moscow, USSR, 30 Jan. - 4 Feb. 1967
[AGARD-CP-95-71] p0271 N72-25555

Biological effects of cosmic radiation during long duration space flight p0070 N72-26048

Psychophysiological aspects of habitation design and its effect on long duration space flight p0070 N72-26049

MANUAL CONTROL

Systems of manual control displays for aircraft and their evaluation with emphasis on the pilot as a controller
[NASA-CR-120256] p0273 N72-22627

Control of flexible vehicles - Proceedings of the Symposium p0245 N73-17001

MANUFACTURING

Manufacturing quality assurance for composite hot-bonded pressing p0270 N72-12501

MAP MATCHING GUIDANCE

Application and operational experience with pilot-aided map-navigation systems in mobility helicopters p0034 N72-11938

MAPS

Automatic map display system using television input and combined map, CRT, and electromechanical large-scale format displays p0274 N72-22634

MARKING

Markings for projectile components
[AGARD-AR-56] p0057 N74-12713

MARTENSITIC STAINLESS STEELS

Effects of heat treatment and specimen type on test environment-stress corrosion cracking of precipitation-hardened stainless steels during stress corrosion cracking tests p0288 N72-21923

MASS FLOW

Analytical approach for use in a helicopter net source of disadvantages of transonic flow including axial mass flow variations p0268 N73-19800

MASS RATIOS

Mathematical models of aircraft mass and performance p0053 N71-24047

MASS SPECTROMETERS

Quadrupole mass spectrometer and vacuum system for lunar surface application and analysis of atmospheric composition p0192 N71-19494

MASS TRANSFER

Model for compressible turbulent boundary layer applicable to flows with pressure gradient and surface mass transfer p0126 N73-20283

Characteristics of boundary layer transition and separation on delta wings with sweptback leading edges p0180 N72-21904

MATERIALS

Structural materials, manufacturing and fabrication processes for future aircraft - Conference proceedings p0285 N72-21907

Computer aided design of composite parts p0165 N74-11912

MATERIALS HANDLING

Development and fabrication of optical coating equipment for production handling and inspection p0048 N71-21022

MATERIALS SCIENCE

Systems analysis of fiber composite applications and materials p0265 N71-22039

Analysis of radiation damage from the viewpoint of physical properties of materials, and statistical analysis of experimental results p0270 N72-26119

MATERIALS TESTS

Development and evaluation of nondestructive testing procedures for use at various stages in the fabrication and installation of aircraft engine parts
[AGARD-R-581-71] p0285 N72-20449

Standardization of test methods for stress-rupture data p0285 N72-21902

Effect of heat treatment and mechanical deformation of cold-rolled and annealed sheet metal working properties - bending
[AGARD-AG-145] p0292 N72-28902

Analysis of materials and structures for aerospace vehicles subjected to high temperature and the development of new testing techniques p0228 N73-16952

Analysis of heat exchanger performance for optimum properties of materials and fabrication techniques
[AGARD-R-] p0300 N73-20908

Development of [illegible] p0304 N73-22664
[AGARD-R-] p0304 N73-22664

MATHEMATICAL MODELS

Digital simulation of aircraft and helicopter for real time p0033 N71-36064

Analytical and experimental study of [illegible] p0283 N71-20128

Rational approximations to the effects of [illegible] p0118 N71-34428

Transfer function identification using orthogonal functions and its application to [illegible] p0268 N73-19800

Mathematical model for [illegible] p0206 N73-21210
[AGARD-R-] p0206 N73-21210

Mathematical model for [illegible] p0118 N73-21452

Mathematical model for [illegible] p0119 N73-21464

Statistical model for [illegible] p0120 N73-21471

Experimental and [illegible] p0214 N73-23824

Mathematical model for [illegible] p0122 N73-25102

Linear and nonlinear [illegible] p0123 N73-25103

Mathematical model for [illegible] p0126 N73-25284

Influence of [illegible] p0126 N73-25285
[NASA-CR-121904] p0123 N73-25285

Mathematical models for calculating turbulent boundary layer injected with gas p0180 N72 20303
Mathematical models for determining flight performance of Concorde aircraft p0234 N72 20978
Kraft model for determining susceptibility of Zn Mg Cu aluminum alloys to stress corrosion crack growth p0287 N72 21915
MATHEMATICAL MODEL FOR FLUID MECHANICS p0182 N72 27308
Ejector flow model for predicting performance characteristics of supersonic ejector systems p0183 N73 17251
One and two D core theories for analyzing ducted mixing and burning of coaxial streams p0183 N73 17253
Finite difference procedure for computing behavior of two dimensional boundary layers and turbulence model to predict location and extent of transition region p0268 N73 19796
Analytical approach for loss and deflection behavior of cascades in transonic flow including axial mass flow variation p0268 N73 19800
Calculation method for external heat transfer to turbine blades p0269 N73 19807
Method for prediction of turbulent boundary layer flow in variable radial diffuser and experimental validation p0270 N73 19809
Mathematical model for prediction of axial compressor performance including effect of annulus wall boundary layers p0270 N73 19812
Model for inherent contrast conditions in full form objects p0303 N73 19966
Mathematical models for measuring inertial qualities of spherical gyroscope rotors with electric suspension p0228 N73 20691
Mathematical model for measuring operating functions and performance of gyroscope with two degrees of freedom p0229 N73 20696
Estimation procedures for in flight vertical misalignment of platforms p0230 N73 20707
Modelling environ set sensory of digital filters for alignment of inertial platforms p0230 N73 20708
Differential method for evaluating performance of accelerometers p0231 N73 20715
Mathematical models of aircraft and performance p0053 N73 24047
Mathematical theories for determining light propagation by sea water p0241 N73 33627
Computational and analytical determination of HCS p0144 N74 11956
Use of radio modelling data for radio target assessment p0145 N74 11965
Unipolar transistor Model of bipolar transistor based on continuous parameters as the geometric dimensions p0166 N74 13917
Theoretical study of the residual evolution of polluting products in turbojet exhausts p0220 N74 14294
Development and verification of an analytical model for predicting emissions from gas turbine aircraft combustors during low power operation p0220 N74 14295
Modelization of turbomachine combustors for pollution studies p0220 N74 14298
Necessary and sufficient conditions for global structural optimality p0295 N74 15592
Shape optimization using mathematical programming and modeling techniques p0297 N74 15605
Numerical treatment of fluid dynamical stability problems p0185 N74 22921

MATRICES (MATHEMATICS)
Wing interference lift fine lattice computation and application to aerodynamic loads on tandem wings in unsteady flow p0008 N71 24336
Applying the least squares to matrix of black and white dots for numerical recognition p0153 N72 11191

MATRIX METHODS
Matrix method for calculating adaptive pre whitening filter for radar echo signal processing p0132 N73 10197

MAXWELL EQUATION
Maxwell field theory for solving wave path reliability in tropospheric scatter propagation p0119 N71 23467

MEASURING INSTRUMENTS
Equipment designed for accurately measuring mechanical response of machining impact p0102 N72 19145
Procedure for determining noise levels in flight test engine testing systems p0195 N73 19456

MECHANICAL DEVICES
Aerodynamic effects of mechanical high lift devices on conventional airfoils p0025 N71 20052

MECHANICAL DRIVES
Reliability and operational safety of mechanical helicopter transmission boxes p0047 N73 23012

MECHANICAL PROPERTIES
Cobalt and nickel based alloys metallurgy for high temperature gas turbine materials p0253 N71 17189
Structural data on brittle nonmetallic materials for use in designing reliable parts [AGARD AG 152 71] p0205 N71 29027
Properties and selective applications of magnesium alloys aluminum alloys and titanium alloys nonmetallic materials reinforced materials and composite materials in aerospace engineering [AGARD LS 51 71] p0205 N71 29038
Properties and selective applications of high strength steels p0205 N71 29040
Properties and selective applications of refractory materials p0205 N71 29041
Mechanical properties of fiber reinforced materials p0206 N71 29043
Properties and selective applications of aluminum alloys in airframe construction p0206 N71 29044
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference [AGARD CP 83 71] p0206 N72 12492
Mechanical properties of silica fiber reinforced epoxy composite materials p0207 N72 12493
Temperature and fiber orientation effects on mechanical behavior of silicon dioxide epoxy composite materials p0207 N72 12499
Techniques applications and scope of fractography [AGARD AG 155 71] p0285 N72 13882
Structural and mechanical characteristics of human connective tissue p0101 N72 19140
Mechanical properties and stress corrosion of hot rolled alloy plates p0289 N72 21931
Relationship between effective properties of fiber composite materials and mechanical and geometric properties of their constituents p0209 N72 29590
Techniques for measuring elastic coelastic ultimate strength thermal and electrical properties of fiber reinforced composites p0209 N72 29593
Comparing characteristics of advanced composites with those of conventional airframe materials p0210 N72 29595
Chemical and mechanical properties of aircraft gas turbine engine components p0201 N73 23600
Metallurgical aspects of fatigue and fracture toughness conference on effects of microstructure on mechanical properties of airframe materials [AGARD R 610] p0204 N74 23108

MEDICAL ELECTRONICS
Processing and display of time varying spectral forms with application to solar wave and medical signals p0154 N72 11200

MEDICAL EQUIPMENT
Equipment and facilities for biodynamic research in US and Canada p0095 N71 23342
Equipment and facilities for biodynamics research NATO European countries p0095 N71 23343
Practical problems in clinical nystagmography Guidelines for selection of equipment facility for vestibular tests p0108 N74 20734

MEDICAL SCIENCE
Automatic method of diagnosis using computer sequential pattern classification procedures p0152 N72 11184

MEDICAL SERVICES
Role of flight surgeon and physiologist in evaluation and treatment of jet fighter pilots p0095 N72 14094

MEDICINE
Sports medicine parameters necessary for mathematical competitive form p0081 N73 21114

MEDITERRANEAN SEA
Numerical models of total electron content over Europe and the Mediterranean and model station correlation comparisons [AGARD AG 166A] p0181 N74 14084
A numerical model of the circulation Mediterranean sea p0187 N74 14086

MENTAL HEALTH
Handbook of aviation medicine for safe mental and physical health of aircrew during flight [AGARD AG 154] p0071 N72 24058

MENTAL PERFORMANCE
Diagnostic physiology of and physiological criteria in geriatrics p0092 N71 22312
Mental and physiological environmental requirements in manned flights p0088 N74 14782

METABOLISM
Metabolic water and body hypohydration during food deprivation to 10 days p0070 N71 20368
Influence of long duration flight on various metabolic and endocrine functions of pilots and navigators p0106 N73 19152

METAL FATIGUE
Ultrahigh vacuum for determining effects of hydrogen on fatigue and fracture properties of Ni 200 p0287 N72 21916

METAL MATRIX COMPOSITES
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference [AGARD CP 83 71] p0206 N72 12492
Structural fatigue behavior of boron fiber reinforced aluminum composites having various fiber lay ups p0208 N72 12504
Analysis of stress and deformation between fibers and matrix in composites p0208 N72 12512
Analysis of properties of the reinforced materials welded metal matrix interface properties and application to gas turbine engine p0210 N73 27426
Production of high performance components by rolling of powder with strong reinforcing wires and applications to aerospace vehicle components p0210 N73 27428
Application of composite materials to weight saving structures for low cost improved performance aircraft p0211 N73 27485
Development of theoretical techniques for materials for application to an integrating engine design and aircraft engine and airframe components p0212 N73 27497

METAL OXIDE SEMICONDUCTORS
Application of complementary metal oxide semiconductors to design of integrated circuits used with spacecraft electronic equipment and commercial equipment p0191 N72 19486
Application of complementary MOS circuits in pulse code modulation systems for photogrammetry of X ray region of solar corona and in operation of quartz clock with PCM output p0192 N72 19501

METAL PLATES
Analysis of response and fatigue characteristics of light alloy integrally machined planks with emphasis on acoustic fatigue properties p0293 N73 29912
Improvement of the properties of high strength Al Zn Mg Cu alloys by thermomechanical procedures ductility toughness and stress corrosion properties of steel plates and forgings p0204 N74 23111

METAL SURFACES
Intermodulation interference effects of metal surface transmitters and receivers in near field locations of transmission system p0134 N73 10212
Influence of surface preparation surface texture and initial oxidation on metal surface crystallinity p0201 N73 23603

METAL WORKING
Improvement of the properties of high strength Al Zn Mg Cu alloys by thermomechanical procedures ductility toughness and stress corrosion properties of steel plate and forgings p0204 N74 23111

METALS
Dilatometric thermal expansion measurements on high temperature structural materials [AGARD AR 31 71] p0213 N71 25358
Materials and designs of protective cover p0102 N72 19143
Standardization of test methods for stress corrosion of metals p0285 N72 21902

METEOR TRAILS
Radar observations of meteor trails for detecting high altitude gravity waves p0113 N73 14154

METEOROLOGICAL PARAMETERS
ATS 5 spacecraft 15 GHz signal propagation experiment ground based radio and meteorological data p0115 N71 21418
Tropospheric radio wave propagation and predictions of transmission path fluctuations [AGARD CP 70 71] p0117 N71 23451
Radio attenuation prediction methods using stratified atmospheric refractivities p0120 N71 23468
Meteorological effects on tropospheric propagation predictions for selected circuits p0120 N71 23470
Statistical forecasting of signal attenuation with tropospheric scatter using meteorological parameters p0120 N71 23471
Tropospheric propagation in an equatorial region p0148 N74 13865
Turbulence at the tropopause and high flight levels numerical forecasting techniques for clear air turbulence p0057 N74 17721
Turbulence and measured horizontal temperature structure gradients in the lower stratosphere factors affecting frequency of occurrence and intensity of fine scale p0057 N74 17723
A statistical experience of turbulence availability of atmospheric turbulence through air traffic control meteorological wave reports and pilot experience p0058 N74 17727

METEOROLOGICAL RADAR
Real time weather radar data on tropospheric microwave attenuation by rain p0114 N71 21416
Radar patterns of precipitation for image data processing with meteorological satellites p0114 N72 11182
Ultrahigh frequency propagation attenuation measurements by ATS 5 weather satellite and radiometer p0153 N73 26142

METEOROLOGICAL SATELLITES
Characteristics of imaging radiometers installed on meteorological satellites for observing infrared and visible regions p0192 N72 19497

METHANE
Effects of chemical fire extinguishing agents containing bromochlorodifluoromethane and bromotrifluoromethane on respiratory and nervous systems of dogs monkeys and baboons [AGARD R 599] p0072 N73 17106

MICROELECTRONICS
Development and characteristics of microelectronic equipment for improved reliability and reduced weight and size of electronic components p0191 N72 19484
Application of microelectronic circuits for spacecraft equipment to improve reliability and save weight p0191 N72 19485

MICROFILMS
Multichannel facsimile system with high resolution and high speed transmission of microfilm data for remote display and storage of engineering and technical information p0157 N72 23569
Design and development of a computer controlled microfilm technique for application to aerospace photographic data p0158 N72 23571
Integrated microfilm retrieval system for control of engineering drawings p0159 N73 24279
Microfilm retrieval equipment p0160 N74 10932
Reliability considerations in automated microfilm retrieval p0161 N74 10933

MICROPHOTOGRAPHS
New developments in storage retrieval dissemination of aerospace information
[AGARD CP 136] p0159 N74 16925
Retrieval of microfiche - Random access p0160 N74 16934
A microfiche system for small users p0160 N74 16935
A computer controllable microfiche terminal p0160 N74 16936
Abstracts on microfiche for on line retrieval p0161 N74 16937

MICROSTRUCTURE
Properties and selective applications of high strength steels p0305 N77 27040
Microstructure and stress corrosion behavior of welded steel joints p0286 N72 21910
Microscopic characteristics of stress corrosion cracking in steel with high yield strength p0289 N72 21925
Analysis of microplasticity of materials used in inertial navigation systems to show friction stress yield stress and rate of strain hardening in microstrain region p0278 N73 20697
Metallurgical aspects of fatigue and the role of microstructural origins of fatigue crack nucleation in aerospace alloys
[AGARD R 610] p0204 N74 23108
Some recent developments in fatigue and the role of microstructural origins of fatigue crack nucleation in steels p0204 N74 23110

MICROWAVE ATTENUATION
Real time weather data on tropospheric microwave attenuation by rain p0214 N72 21459
Measurements of microwave attenuation by rain using ATS 5 satellite beacons p0215 N72 21479
Water evaporation rate and vertical phase equivalence by tropospheric microwave propagation over sea surface p0240 N73 26125
Attenuation and phase dispersion of microwaves in precipitation p0241 N73 26126
Rain degradation of earth to satellite communication links p0241 N73 26127
Rain attenuation and depolarization measurements at 19 and 28 GHz p0241 N73 26133
Rain attenuation and depolarization at 18 GHz for future satellite telecommunication systems p0242 N73 26134
p0242 N73 26135

MICROWAVE CIRCUITS
State of the art and trends in the use of computer aided design of microwave integrated circuits p0266 N74 13918
Computer optimization of microwave integrated circuit design p0266 N74 13920
DAP Distributed Array Processor - A progress report on the development of microwave circuits p0266 N74 13921
Microwave circuit analysis by finite elements p0266 N74 13922

MICROWAVE EQUIPMENT
Feasibility evaluation of microwave and all digital landing equipment for helicopter approach and landing guidance systems p0334 N75 11936
All weather microwave radar sensors for marking and detection systems used in remote area search and rescue missions p0227 N72 22693
Microwave solid state low cost photography display for real time weather surveillance p0237 N73 14352
Development and flight test of microwave landing system with emphasis on the final approach and flare equipment p0234 N73 23709
Development of Doppler microwave landing system and techniques for evaluating effects of multipath signals p0234 N73 23706

MICROWAVE FREQUENCIES
ATS 5 synchronous 35 GHz signal propagation experiment to provide selected data to meteorological data p0215 N73 21418

MICROWAVE IMAGERY
Airborne real time passive microwave infrared and photographic remote sensing systems for protection of life and resources - Oil spill measurements [AGARD CP 90 71] p0121 N72 16088
Ground wave optics theory for microwave high resolution imaging of sea surface phenomena by remote sensing data interpretation p0124 N72 16332

MICROWAVE RADIOMETERS
Design and performance of microwave radiometer for airborne remote sensing applications p0121 N72 16084

MICROWAVE SCATTERING
Scattering of microwaves through heavy atmospheric rain p0141 N73 26133
Estimating attenuation and scattering due to rain for satellite ground systems p0147 N74 13856
Some aspects of measured and theoretical side lobe behavior p0147 N74 13858

MICROWAVE SENSORS
Statistical extraction of atmospheric parameters from microwave radiometer measurements p0125 N72 16111

MICROWAVE TRANSMISSION
Digital microwave propagation measurements over sea p0116 N71 21477
Tropospheric effects on microwave propagation over diffractive paths p0117 N71 21436
Presentation diagrams of a terrestrial microwave line of sight systems radiation pattern of paraboloidal and cassegrain terrestrial relay systems p0147 N74 13859

MIDAIR COLLISIONS
Performance tests of air traffic control system to determine effectiveness in prevention of midair collisions p0235 N73 23713

MIDCOURSE GUIDANCE
Design of Pershing missile inertial navigation system and midcourse guidance p0231 N73 20711

MILITARY AIR FACILITIES
Aircraft unscheduled escape aided by U S military forces and development of improved air traffic control systems p0232 N73 23690

MILITARY AIRCRAFT
Physical vulnerability of aircraft volume 1
[AGARD AR 47 VOL 1] p0067 N74 23511
Physical vulnerability of aircraft volume 2
[AGARD AR 47 VOL 2] p0067 N74 23512
Military applications of V STOL aircraft
[AGARD CP 126 VOL 2] p0067 N74 23514
High lift system design for tactical aircraft p0026 N71 20059
Flight testing a tilt rotor transport aircraft to determine its performance in STOL applications p0026 N71 20060
Flight test evaluation of military aircraft low and high speed handling qualities p0029 N71 23421
Role of flight engineer and system panel in evaluation and maintenance of flight test p0095 N72 14094
Flight test to date of the suitability of an aircraft for operation on small airfields p0036 N72 20988
Flight test procedures for determining handling qualities of tilt wing aircraft p0036 N72 20989
Electronic countermeasures systems for military aircraft p0225 N72 22631
A survey of military aircraft stressed by sporadic gust data p0073 N72 29934
Statistical analysis of military aircraft accidents to determine deficiencies caused by inflight structural failure p0073 N72 29935
Psychophysiological factors involved in military aircraft accidents and effects of flying experience, training, and aptitude p0073 N72 29936
Proceedings of conference on high speed vertical flight state of the art of tilt rotor and tilt wing aircraft
[AGARD R 102] p0041 N73 14938
Aerodynamic testing of a powered model of a tilt rotor aircraft for application to the design of the Canadian CL 84 aircraft p0043 N73 15027
Correlation between full scale fatigue test failures and in service failures for a military aircraft p0291 N73 16902
Future role and position of military aircraft under three different scenarios p0291 N73 16903
Relation between measured C G vertical acceleration and load at the center of gravity of aircraft p0291 N73 16904
Operational suitability standards for military aircraft p0044 N73 16906
Application of inertial guidance systems and platforms to agricultural aerial spraying aircraft p0229 N73 07015
Development of a helicopter simulator for aircraft manufacturer, customer, and operator p0214 N73 23704
Development and flight tests of forward looking radar for helicopter and fixed wing aircraft p0234 N73 23738
Tactical stores and weapons systems for Swedish military aircraft p0274 N73 23881
Research on V STOL aircraft and operational applications of V STOL aircraft to satellite service and proposed research projects to meet civil requirements
[AGARD CP 126 VOL 1] p0054 N71 27020
Review of V STOL aircraft research and development programs to increase effectiveness of aircraft and their improvements p0054 N73 27041
Design concept operational utility and development of AV 8A Marine aircraft p0054 N73 27042
Design development and flight characteristics of VAK 191 B V STOL strike reconnaissance aircraft p0054 N73 27006
Design development requirements for short takeoff transport aircraft and applications of powered lift p0055 N73 27015
Steering and control techniques for measuring flight data of US Navy fighter plane and simulator flight research facility with wind tunnel data p0122 N74 24734
Helicopter vulnerability factors analysis of helicopters in US Army Aviation p0107 N74 18804

MILITARY AVIATION
Design of aircraft for military missions with emphasis above 10 GHz
[AGARD AR 42] p0145 N74 24104
Operational aspects of the Italian Air Force plans above 10 GHz
[AGARD AR 92 REV] p0144 N73 24104
Operational characteristics and system evaluation of multinose p0191 N73 16784
A human factors military field research p0085 N74 13792

MILITARY HELICOPTERS
Flight safety performance of V STOL Harrier military aircraft having jet control p0329 N71 23427
Helicopter guidance and control systems - conference
[AGARD CP 86 71] p0036 N72 11915
US Army helicopter experience in Vietnam and future helicopter requirements and developments p0030 N72 11916
Optimization of automatic flight control concepts for flight helicopters with all weather capability p0030 N72 11917
Method for calculating weather minima for small sites to determine instrument or automatic approach performance requirements for military helicopters p0031 N72 11919
Low cost all weather self contained navigation system for military helicopters p0031 N72 11921
Some problems in developing automatic flight control systems for light helicopters p0031 N72 11922
Integrated low altitude flight control system for military helicopters p0032 N72 11924
Requirements for vision 1 star 4 landing aid as portable ground station in tactical helicopter operations p0032 N72 11925
Automatic approach and hover coupler for rescue helicopters p0032 N72 11926
Terrain avoidance radar for US Army rotary wing aircraft p0032 N72 11927
Effects of servo rigid rotors on helicopter dynamic type design p0032 N72 11928
Design of stability augmentation system for WG 13 light helicopter p0033 N72 11930
Application of and operational experience with projected map navigation systems as used by the helicopter p0034 N72 11938
Instrumentation of military helicopter flight test techniques to provide data for safety and reliability p0047 N73 21033
Development of a flying prototype of heat image flight system for use on military transport helicopter p0048 N73 21022

MILITARY PSYCHOLOGY
Clinical psychology and psychiatry of the aerospace operational environment - conference
[AGARD CP 331] p0088 N74 18779
Results of behavioral therapy - flooding
p0088 N74 18782
Characteristics of the stress reaction pattern of military aviators p0089 N74 18787
Individual and group factors affecting operational flying efficiency A system oriented approach p0089 N74 18791

MILITARY TECHNOLOGY
Soviet tactical missiles to 1985 a viewpoint Volume 1 Summary
[AGARD AR 57 VOL 1] p0107 N74 23514
Soviet tactical missiles to 1980 and beyond Volume 2 Executive summary
[AGARD AR 57 VOL 1] p0107 N74 23514 1
Soviet tactical missiles to 1980 and beyond
[AGARD AR 57 VOL 2] p0107 N74 23515
Integrated hyperspectral wave propagation for remote sensing applications p0214 N73 21419
Real time data transfer via satellite and digital data transmission systems for military vessels and aircraft p0233 N73 20705
Automated technical control system for military communications facility p0233 N73 20707
Laboratory test of an electro optical terminal guidance system for laser guided missiles p0233 N73 20714
AGARD Aerospace Medical Panel symposium on recent advances in development and use of simulators for training and research p0304 N74 21610

MILLIMETER WAVES
Measurements of rainfall attenuation at millimeter wavelengths p0114 N71 21435

MINICOMPUTERS
A minicomputer based navigation system p0159 N74 16927
Aerospace information service - Progress with the ESRO ELDO computerized information network p0160 N74 16928

MINKOWSKI SPACE
Navigation and guidance system analysis using Minkowski space and interplanetary mission applications p0153 N72 11193

MIRAGE 3 AIRCRAFT
Flight control system - Digital fly by wire control of the Mirage 3 S aircraft p0064 N71 27002

MISALIGNMENT
Effects of misalignment errors on the performance of strapdown platforms p0278 N73 20702

MISS DISTANCE
Application of Bayes theorem to the estimation of miss distance statistics p0227 N72 22684

MISSILE COMPONENTS
Proceedings of the symposium on the impact of computers on advanced missile and space systems - conference
[AGARD CP 104] p0301 N73 19030
Digital computer applications to inertial navigation systems and guidance for missiles and space vehicles p0305 N73 19044

MISSILE CONFIGURATIONS
Small tactical missiles for 1980 and beyond. Volume 1: Summary
[AGARD AR 57-1 VOL 1] p0306 X74 73503
Small tactical missiles for 1980 and beyond. Volume 2: Executive summary
[AGARD AR 57 VOL 1] p0307 X74 73504
Small tactical missiles for 1980 and beyond. Volume 2
[AGARD AR 57 VOL 2] p0307 X74 73505
Numerical analysis of downwash interference on wings of missile tails p0002 N71 19360
Angle of attack effects on induced rolling moment of low aspect ratio missile at transonic speed p0002 N71 19363

MISSILE CONTROL
Techniques for control and guidance of tactical missiles with emphasis on cost reliability and performance
[AGARD LS 52] p0226 N72 27681
Application of control systems requirements to development of tactical missile weapon systems p0226 N72 27683
Numerical analysis of adjoint equations yielding error sensitivities in linear systems applied to guidance and control of tactical missiles p0226 N72 27684
Optimizing linear system against quadratic cost function and application to guidance and control system for tactical missiles p0226 N72 27685
Development and application of Kalman filter techniques to guidance and control of tactical missiles p0226 N72 27686
Analysis of digital and analog computer techniques for simulation of missile guidance and control and application of hybrid simulation procedures p0226 N72 27687
Characteristics of electro-optical terminal guidance systems: area correlators and gated trackers used for guidance and control of tactical missiles p0227 N72 27688
Application of guidance laws to control and guidance of tactical missiles to reduce amount of miss distance p0227 N72 27689
Inertial guidance systems components and technology applied to control and guidance of tactical missiles p0227 N72 27690
Inertial guidance techniques for midcourse guidance and terminal guidance systems with application to control and guidance of tactical standoff missiles p0227 N72 27691
Characteristics of command to line of sight guidance and semi-active homing missile systems applied to guidance and control of tactical missiles p0227 N72 27692
Application of microwave guidance sensors for tracking and fire control systems used in missile attack on small tactical targets p0227 N72 27693
Role of simulations in the study and development of the CROTALE system: ground to air close defense weapon system p0237 N74 14355
Terminal guidance system testing: based on independent live tests and verification; cited live firings to increase test cost effectiveness p0237 N74 14356

MISSILE DESIGN
Small tactical missiles for 1980 and beyond. Volume 1: Summary
[AGARD AR 57-1 VOL 1] p0306 X74 73501
Techniques for control and guidance of tactical missiles with emphasis on cost reliability and performance
[AGARD LS 52] p0226 N72 27681
Mission requirements for use of an missile and digital computer program to synthesize requirements into preliminary design p0226 N72 27682
Application of control systems requirements to development of tactical missile weapon systems p0226 N72 27683
Numerical analysis of adjoint equations yielding error sensitivities in linear systems applied to guidance and control of tactical missiles p0226 N72 27684
Optimizing linear system against quadratic cost function and application to guidance and control system for tactical missiles p0226 N72 27685
Development and application of Kalman filter techniques to guidance and control of tactical missiles p0226 N72 27686
Analysis of digital and analog computer techniques for simulation of missile guidance and control and application of hybrid simulation procedures p0226 N72 27687
Characteristics of electro-optical terminal guidance systems: area correlators and gated trackers used for guidance and control of tactical missiles p0227 N72 27688
Application of guidance laws to control and guidance of tactical missiles to reduce amount of miss distance p0227 N72 27689
Inertial guidance systems: components and technology applied to control and guidance of tactical missiles p0227 N72 27690
Inertial guidance techniques for midcourse guidance and terminal guidance systems with application to control and guidance of tactical standoff missiles p0227 N72 27691
Characteristics of command to line of sight guidance and semi-active homing missile systems applied to guidance and control of tactical missiles p0227 N72 27692

MISSILE SIMULATORS
Techniques for control and guidance of tactical missiles with emphasis on cost reliability and performance
[AGARD LS 52] p0226 N72 27688

MISSION PLANNING
Relationship between mission requirements of piloted aircraft stability and maneuverability p0044 N73 16995

MIXING LENGTH FLOW THEORY
Characteristic scales and mixing length methods for determining turbulent boundary layers with mass transfer p0180 N72 20304

MODAL RESPONSE
Mathematical modelling of aircraft structural response modes to active control system p0007 N71 27212

MODELS
Models for head injury prediction and helmets and prediction of optimum helmet performance p0104 N72 19161

MODULATION
Application of chirp modulation to improve effectiveness of satellite to aircraft communication p0194 N72 19514

MODULUS OF ELASTICITY
Extensometric measurements of elastic modulus on resin fiber composite materials p0207 N72 12455

MOLECULAR STRUCTURE
Computer aided input of graphic information on chemical structures by keyboarding under visual control of display screen p0153 N72 22170

MOMENTUM
Bursts and streamwise momentum defects in wall region and turbulent boundary layer p0175 N72 20277

MONKEYS
Age and exercise factors of sensory osteoporosis bone strength and acceleration tolerance investigated using rhesus monkeys
[AMRL TR 70-74] p0068 N71 20359
Necropsy and radiographic observations of spinal fracture and articular facet derangement patterns in rhesus monkeys
[AMRL TR 71-115] p0135 N72 19139
Advantages of breeding Rhesus monkeys in compounds for biomedical research p0083 N73 23063

MONTE CARLO METHOD
Monte Carlo statistical error probability distribution sensing system scanned by reflective index of sensed spectrum p0125 N72 26115
Monte Carlo statistical analysis of missile task sequencing considering pilot performance degradation p0280 N73 23899

MORPHOLOGY
Isoenzyme and morphological statistics of polar stand condition emphasizing twin stream of plasma and wave instability p0130 N72 21148

MORTALITY
Weather factors of fatal civil transport aircraft accidents p0030 N71 23423
Lethal headings keyed to mass/vulnerable water areas by detonation of bird strike p0100 N72 19135

MOTION SICKNESS
Development of theory concerning human reactions to whole body motion and explanation of clinical illness due to motion effects p0072 N72 25044
Combined stress effects of simulator motion and motion sickness susceptibility p0104 N73 19 44
Predictability of motion sickness in pilot selection
[AGARD CP 109] p0078 N73 21092
Three different bases for susceptibility prediction to motion sickness p0078 N73 21093
Clinical procedures for selecting pilots resistant to motion sickness p0078 N73 21094
Adaptability and its relation to other factors affecting susceptibility to motion p0078 N73 21095
Real time assessment of vestibular responses in pilots for motion sickness susceptibility and tasks p0079 N73 21096
Motion sickness questionnaire and its independence as predictor of susceptibility in Naval aviation training p0079 N73 21097
Bureau simulator incorporating standardized motion stimulus for selection, testing and rehabilitation of motion sensitive pilots p0079 N73 21098
Physiological stability for pilot flight safety studies: physical Bell and Howell for pilot selection p0079 N73 21099
Motion sickness: Medical Review Board Report: Committee on motion sickness and motion stress p0079 N73 21100
Self-rotation sensation, gaze control, vestibular function, balance, body stability, and motion sickness: effects of experimental variation of gravitoinertial force vector p0199 N74 20744

MOTIVATION
Human orientation and individual and organizational adjustment and its transfer p0361 N71 23503
Critical study of use of aerial ads: motivation by military flight crews p0088 N74 18785

MOUNTAINS
Radio wave diffraction due to a number of knife edges p0146 N74 13851

MOUNTING
Aerodynamic coefficients measured by wind tunnel tests on helicopter pylon BAC p0004 N71 19177

MTDF
Measure of distance between two probability distributions p0140 N71 36785

MULTICHANNEL COMMUNICATION
The interrelation of propagation effects and design factors for fixed service communications satellite systems p0149 N74 13871

MULTIPATH TRANSMISSION
Optimal multiple access systems and tropospheric path parameters for space communications p0115 N71 21421
Angular diversity propagation paths of spaced antennas in tropospheric transhorizon scatter link p0118 N71 23459
Multipath transmission models for predicting signal distortion and intermodulation in tropospheric scatter propagation p0119 N71 23463
Frequency correlation measurements on multipath tropospheric scatter propagation p0119 N71 23465
Path loss prediction methods for tropospheric radio scatter propagation links and comparison with performance tests p0120 N71 23469
Development of Doppler microwave landing system and techniques for eliminating effects of multipath transmission p0234 N73 23706

MULTIPLEXING
Analysis of amplitudes and frequencies of signal fading in satellite to aircraft radio links due to multiplexing of radio signals p0194 N72 19509

MULTISPECTRAL BAND SCANNERS
Conference on propagation ranges of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements
[AGARD CP 90-71] p0121 N72 16085
History and future developments in ultraviolet and visible spectral remote sensing devices
[NASA TM X-62496] p0123 N72 16103
Multispectral satellite surveys in near infrared visible regions for planning remote multiband terrain photography p0124 N72 16109
Analysis of color multispectral image data for optical and use interpretation p0124 N72 16111

MULTISPECTRAL PHOTOGRAPHY
Conference on propagation ranges of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements
[AGARD CP 90-71] p0121 N72 16085
Airborne remote multispectral photographic infrared and side looking radar sensing for locating logistic type materials p0121 N72 16087
Aerial multispectral color photography for remote reconnaissance of soils and crops p0124 N72 16110

N

NACELLES
Wind tunnel tests of afterbody, thrust and injection for models with simplified bellows nacelles p0267 N72-16589

NARCOTICS
Chromatographic and potentiographic methods for determining metabolic levels of hypnotic drugs in blood plasma and urine of man p0081 N73 21118

NASA PROGRAMS
Advanced NASA and DOD technology management techniques and applications to NATO programs by reference and abstract p0302 N73 15968
NASA programs on life science research in aerospace environments employing centrifuge systems p0083 N73 23058

NAVIER STOKES EQUATION
Three approximation methods for full Navier Stokes equations for two and three dimensional unsteady flow p0181 N72 22296
Supersonic flow of viscous incompressible fluid in bounded domains p0181 N72 22297
Navier Stokes equations of viscous incompressible flow in bounded domains p0181 N72 22298
Numerical analysis of Navier Stokes equations for time dependent compressible flow p0181 N72 22299
Advances in numerical fluid dynamics
[AGARD LS 64] p0184 N74 22914
Numerical integration of Navier Stokes equations p0185 N74 22932

NAVIGATION AIDS
Application and operational experience with type test navigation systems in military helicopters p0034 N72 11918
Hamilton-Jacobi navigation display and computer software test and evaluation means of steering and selection coordinates and command data superimposed on map p0224 N72 22633
Airborne application system using electronic countermeasures (ECM) data from a guided missile p0224 N72 22634
Integrated SACLANT VOR and DME system for surface and low flying high and dry aircraft p0232 N73 23695
Operational cost complexity and reliability evaluation for several area navigation system configurations p0234 N73 23697
Operational evaluation of a Decca system with helicopter display for Omega navigation p0280 N73 23895
Inertial navigation test techniques applied to helicopter navigation tests of inertial guidance systems p0236 N74 14346
Integrated evaluation of electronic equipment and aircraft navigation systems: operational and economic aspects of hardware performance p0236 N74 14350

Aircraft inertial system testing and evaluation in the United Kingdom p0237 N74 14352

NAVIGATION INSTRUMENTS

Autonomous navigation system for SA 330 helicopter and flight test methods p0032 N72 11929

Inertial guidance systems components and technology applied to control and guidance of tactical missiles p0227 N72 27690

Development of low cost inertial measurement unit with navigational accuracy performance based on optimum use design of inertial instruments and platform p0228 N73 20690

Development of rapid initialization of inertial navigation system using azimuth wander mechanization p0228 N73 20693

Optimization of integrated navigation systems combining several independent navigation sensors to provide self contained aircraft navigation capability p0229 N73 20694

Characteristics of airborne area navigation equipment and application to air traffic control functions p0233 N73 23698

NAVIGATION SATELLITES

Selection of computers for satellite based navigation and guidance systems designed for aircraft use p0157 N72 21226

Analysis of North Atlantic air route structure to determine impact of inertial navigation and satellite surveillance on separation reduction p0233 N73 23699

NAVIGATORS

French school for training navigator personnel p0036 N72 20993

Color aptitude of dyschromatopsic French navigators and pilots p0037 N73 19068

Influence of long duration flight exposure on metabolic and endocrine functions of pilots and navigators p0106 N73 19152

NAVY

Navy requirements information for atmospheric environmental effects on human performance p0076 N72 26054

NERVOUS SYSTEM

Cardiac and central effects of UHF radiant energy on frogs p0068 N71 26354

NETWORK ANALYSIS

Man machine approach toward solving various routing scheduling and network problems p0154 N72 11199

Computer aided design for electronic circuits — computer program

[AGARD CP 133] p0165 N74 13925

The teaching of CACD in Denmark p0165 N74 13927

Linear passive stationary HF network analysis — Adaptation between measurements and analysis by computer p0166 N74 13916

A computer program for analyzing waveguide structures p0166 N74 13919

DAP (Network Analysis Program) — A program for the analysis and design of microwave circuits p0166 N74 13921

Microwave circuit analysis by digital computer p0166 N74 13922

Computer aided analysis of electronic circuits — a survey p0167 N74 13925

Structure and application of computer program ICAN (Integrated circuit AC analysis) p0167 N74 13926

NETWORK SYNTHESIS

Economics of CAD — A new approach p0165 N74 13926

Computer design of equal ripple equalizers p0167 N74 13924

A computer aided microwave system design — integrated digital networks p0167 N74 13951

NETWORKS

Operational performance of the Defense Communications Satellite Program (DSCS) worldwide Defense Communications network p0133 N72 10604

Feasibility of a digital implementation of worldwide analog communications systems p0133 N73 10709

NEURONS

Cortical electrical potentials of groups of neurons during conditioning p0074 N72 25358

NEUROPHYSIOLOGY

Optokinetic nystagmus — Visual evoked potentials of enhancement inhibition — Temporal summation of signal responses in the parietal cortex of cats p0109 N74 20742

NEUROPSYCHIATRY

Neuropsychiatric and other causes for non-medical grounding of French Air Force flying personnel p0096 N72 14708

Aeromedical rehabilitation of flying personnel suffering from acute psychoneurosis p0098 N74 13736

NICKEL

Strength variation for different alloy heats of hydrogen gas fatigue and fracture properties of Ni 200 p0282 N72 27916

NICKEL ALLOYS

Galvanic cell — between Ta and Hastelloy B in high temperature gas turbine materials p0059 N73 13789

Thermal fatigue behavior of thermal barrier coatings on gas turbine blades p0059 N73 13796

A theoretical investigation of the thermal fatigue resistance of metallic coatings p0273 N74 21851

Comparison of creep ductility and stress rupture properties of hot corrosion resistant p0273 N73 23042

NIGHT

Air to ground target acquisition with flare illumination p0303 N73 19968

NIGHT VISION

Application of night vision technology helicopter night flights p0303 N73 19970

NITRIC OXIDE

Parameters controlling nitric oxide emissions from gas turbine combustors p0219 N74 14291

A preliminary study on the influence of fuel staging on nitric oxide emissions from gas turbine combustors p0221 N74 14301

NITRIDES

Borides carbides and nitrides of silicon oxidation resistant refractory compounds for use in gas turbines and reentry vehicles p0203 N73 23616

NITROGEN

Turbulent mixing layer between two different gas streams such as nitrogen and helium p0178 N72 20295

NITROGEN OXIDES

Reduction of NO formations by premixing p0217 N74 14272

Nitrogen oxides nuclear weapon testing ozone and stratospheric ozone p0217 N74 14275

A new analytical technique for continuous NO detection in the range from 0.1 to 5000 PPM p0218 N74 14280

NO formation in fuel rich flames — A study of the influence of the hydrocarbon structure p0219 N74 14287

NOISE INJURIES

Effects of long term exposure on auditory thresholds for detection of a signal and recovery from temporary threshold shift p0067 N71 20353

Structural characteristics of noise effects on human aerospace operations

[AGARDOGRAPH 151] p0076 N73 17098

Airborne noise in aerospace operations and bioacoustics effects on man p0076 N73 17100

Current aspects of sonic boom forecast applied to flying personnel p0085 N74 13800

NOISE INTENSITY

Effects of high intensity noise exerts on human vestibular systems and models of vestibular stimulation and trauma

[AMRL TR 71 58] p0072 N72 25038

Procedure for determining noise levels in flight test measuring systems p0195 N73 10456

Airborne noise in aerospace operations and bioacoustics effects on man p0076 N73 17100

Analysis of helicopter internal and external noise levels for various flight conditions and tuning of acoustical spectra p0052 N73 21055

NOISE PROPAGATION

Design of lined walls for transonic wind tunnels with analysis of parameters affecting noise generation p0184 N73 26285

NOISE REDUCTION

Active system for approach path control of reduced noise trajectories on Boeing transport aircraft p0029 N71 23425

Augmentor flap wing testing and augmentor nozzle and core nozzle tests of STOL aircraft

[NASA CR 114540] p0264 N72 16698

Analysis of aerodynamic noise produced by rotary wings and methods for noise reduction based on velocity waves and blade spanwise gust p0052 N73 21053

Aeroacoustical of helicopter engine and airframe noise — Available noise suppression and cost effectiveness p0071 N73 22053

NOISE SPECTRA

A study of helicopter internal and external noise levels for various flight conditions and tuning of acoustical spectra p0052 N73 21055

Noise spectrum characteristics of the Lockheed Model 1329 Super G turbojet transport at takeoff and approach p0052 N73 21057

A study of aircraft fuselage wall thickness effects on low frequency noise transmission p0123 N73 26347

Development of a method for the analysis of helicopter noise and vibration spectra in flight and ground test p0292 N73 29937

NOISE THRESHOLD

Effect of signal frequency uncertainty on auditory detection of tones in noise p0067 N71 20353

NONDESTRUCTIVE TESTS

Application of ultrasonic pulse techniques to the nondestructive testing of aircraft structures p0291 N72 19488

Survey and analysis of aircraft nondestructive inspection methods for small aircraft

[AGARD R 587 71] p0197 N72 19547

Nondestructive tests of fiber reinforced composites — Lamination bonded structures welded joints and rotating components p0292 N72 19542

A critical survey, bibliography and index of nondestructive inspection literature on aircraft and spacecraft materials — 1968 to 1970 p0297 N72 19543

Nondestructive test for failure experience and capability — Fracture mechanics and nondestructive testing

[AGARD R 593] p0296 N72 24434

Ultrasonic radiographic eddy current and acoustic emission techniques for nondestructive tests of carbon fiber reinforced polymers and failure mechanisms p0290 N72 24935

Nondestructive tests applied to quality control of aluminum made of boron composites p0290 N72 24936

Terminal guidance system testing based on nondestructive tests and verification by limited live firings to increase test cost effectiveness p0237 N74 14356

NONLINEAR PROGRAMMING

Reduction of nonlinear programming problems to sequence of linear programming problems p0283 N71 20133

Feasible direction algorithms for solving general nonlinear programming problems p0284 N71 20135

Structural design applications of geometric programming p0293 N74 15601

The optimization of statically indeterminate structures by means of approximate geometric programming p0296 N74 15602

NONLINEARITY

Application of dynamic programming technique to random search — Various nonlinear constrained structural optimization problems p0296 N74 15603

NORTH ATLANTIC TREATY ORGANIZATION (NATO)

North Atlantic Treaty Organization conference on adaptation and communication in aerospace medicine

[AGARD CP 82 71] p0067 N71 20351

Equipment and facilities for biodynamic research in NATO European countries p0095 N71 22343

Consideration by NATO of transonic wind tunnel requirements to support evolution of aeronautical and aerospace systems during next decade

[AGARD AR 35 71] p0175 N71 25013

Inventory of acoustic fatigue test facilities in NATO countries

[AGARD R 584 71] p0172 N71 34253

AGARD report on engine and airframe reference and validation transonic wind tunnel tests

[AGARD AR 36 71] p0010 N71 36490

Aerodynamic testing at high Reynolds numbers and transonic speeds in NATO

[AGARD R 588 71] p0016 N72 12978

Research and development of NATO countries in high temperature corrosion of aerospace alloys

[AGARD R 591] p0201 N72 20491

Advanced NASA and DOD technology management techniques and strategies for NATO programs for defense and civil use p0302 N72 15968

Directors annual report 1970 to the NATO Military Committee p0305 N74 23492

The AGARD charter p0306 N74 23493

International conference management p0306 N74 23495

Directors annual report to the North Atlantic Military Committee 1971 p0306 N74 23496

AGARD handbook including AGARD by laws p0306 N74 23497

Highlights — AGARD's twentieth anniversary 1952 — 1972 p0306 N74 23498

Directors annual report to the North Atlantic Military Committee 1972 p0306 N74 23499

Highlights of progress of AGARD panels p0306 N74 23500

Instructions to authors of AGARD manuscripts — To be used by the printer instructions to authors of AGARD manuscripts — To be prepared camera ready p0306 N74 23501

NORWAY

The 1971 AGARD Avionic Meeting p0306 N74 23494

NOSE (ANATOMY)

Ground, off ground, new generation tactical and target vehicles p0097 N72 14166

Basic and applied studies at U.S. Army Aeromedical Research Laboratory p0097 N72 14167

NOTCH SENSITIVITY

Cantilever bending test fixture for measuring the sensitivity of high strength alloys to stress corrosion cracking p0287 N72 27911

NOZZLE DESIGN

Design considerations of a variable throat nozzle for a 5 pound thrust propulsion system

[NASA TM X 67741] p0267 N72 27819

NOZZLE FLOW

An experimental investigation of the effect of nozzle performance on flow angularity p0021 N74 14726

The nozzle flow fusion p0174 N74 16997

NOZZLE GEOMETRY

Supersonic and transonic flow over a cylinder with a conical nose with boundary layer

p0262 N72 26212

Calculation of gas flow in a three engine separation aircraft configuration

[AGARD CP 83 71] p0033 N72 22016

Wind tunnel tests of exhaust nozzle afterbody configurations for subsonic aircraft p0033 N72 22020

Wind tunnel testing techniques for boundary layer parameters and nozzle afterbody interference p0033 N72 22021

NOZZLES

Supersonic underexpanded exhaust plumes — Nozzle and engine performance

[AGARD CP 91 71] p0263 N72 16685

Full scale thrust performance tests of prototype dual stream propelling nozzle p0263 N72 16691
Augmentor flap wing ducting and augmentor nozzle and noise reduction for jet STOL aircraft [NASA CR 125540] p0264 N72 16698
Rapid mixing nozzles thrust vector control and thrust augmentation for V STOL aircraft p0265 N72 16699

NUCLEAR EXPLOSIONS
Health hazards and efficiency reductions of personnel exposed to simulated nuclear shock waves in protective shelters p0100 N72 19136
Acoustic gravity wave propagation modes in ionosphere and neutral atmosphere following nuclear explosion [CONTRIB 1799] p0135 N73 14140
Nuclear source model for generating ionospheric disturbances through acoustic gravity waves p0135 N73 14141
Infrasonic wave generation and atmospheric propagation of gravity acoustic waves p0136 N73 14142
Hydrodynamic calculations and experimental observations of ionospheric shock front propagation following nuclear explosion p0137 N73 14150
Acoustic gravity wave effects in traveling ionospheric disturbances following nuclear explosions p0139 N73 14166
Effects of traveling ionospheric disturbances following nuclear explosion on high frequency band propagation p0139 N73 14167
Nonlinear propagation and ionospheric coupling of atmospheric waves following nuclear explosion p0140 N73 14168
F layer electron density fluctuations and disturbances following nuclear explosion at ionospheric height p0140 N73 14169
Effects of acoustic gravity waves following nuclear explosion on ionospheric electron density and high frequency communications p0140 N73 14170

NUCLEAR RESEARCH
Abstracts on microfiche for on line retrieval p0161 N74 16937

NUMERICAL ANALYSIS
Calculation methods for wing body interference at subsonic aircraft in stationary or nonstationary flow p0002 N71 19362
Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in unsteady supersonic and subsonic flow including interference eff [AGARD CP 80 71 PT 1] p0007 N71 29333
Numerical method for evaluating discontinuous downwash distribution for steady flow over sweep and rectangular wing p0010 N71 29349
Methods for calculation and prediction of viscoelastic constants of composite materials p0209 N72 12508
Numerical techniques for determining flow characteristics of supersonic turbulent boundary layer in adverse pressure gradient p0179 N72 20300
Development of numerical process for extracting aerodynamic coefficients from flight test data p0036 N72 20991
Numerical analysis of one two and three dimensional fluid flow conferences [AGARD LS 48] p0181 N72 27293
Mathematical aspects of fluid mechanics and numerical analysis of partial differential equations p0181 N72 27294
Numerical approximation of non Cauchy Kowaleska systems in hydrodynamics p0181 N72 27295
Numerical analysis of Navier Stokes equations for time dependent turbulent fluid flow p0181 N72 27299
Numerical analysis of viscous gas flow and shock formation p0181 N72 27300
Computation of one dimensional shocked flow p0181 N72 27301
Numerical analysis of inviscid gas flow due to a rotating cylinder and computation of steady subsonic flow p0181 N72 27302
Extension of time dependent technique for inviscid rotational body flow to viscous flow p0182 N72 27303
Numerical analysis of time dependent gas dynamics and accuracy in regions of constant flow p0182 N72 27304
Computation of transonic twisted flow with imbedded shock waves p0182 N72 27306
Numerical analysis of three dimensional ideal gas flow and Euler equations of motion p0182 N72 27307
Computational and analytical determination of RCS p0144 N74 11956
Advances in numerical fluid dynamics [AGARD LS 64] p0184 N74 22914

NUMERICAL CONTROL
Numerical control of delta modulated serial signals in an navigation teleprocessing system p0131 N73 10194

NUMERICAL INTEGRATION
Numerical integration of Navier Stokes equations p0195 N74 22917

NUMERICAL WEATHER FORECASTING
Turbulence at medium and high flight levels Numerical forecasting techniques for clear air turbulence p0057 N74 17721

NYSTAGMUS
Procedure for determining axes of rotation of eye based on coordinate of fixation nystagmus p0012 N72 25039
Algorithm for detecting rotational nystagmus and detection of start of vestibular stimulation p0035 N72 25060
The use of nystagmography in aviation medicine aerospace medicine meeting on nystagmus [AGARD CP 128] p0107 N74 20732
Clinical application of nystagmography in diagnosis of human nervous system pathology p0108 N74 20733
Practical problems in clinical nystagmography 1 Guidelines for selection of equipment facility for vestibular tests p0108 N74 20734
Practical problems in clinical nystagmography 2 Sources of error p0108 N74 20735
Use of nystagmography in the study of airview with spatial disorientation oculogiravic testing of flight crews p0108 N74 20736
Interest of nystagmography in flying navigation personnel p0108 N74 20738
A contribution to the electronystagmographic method concerning the interpretation of nystagmus characteristics vestibular tests to assess motion sickness and disorientation susceptibility p0108 N74 20739
Differential diagnosis of the caloric nystagmus qualitative characteristics of labyrinthine or CNS abnormalities p0108 N74 20740
Nystagmography An useful tool in basic and applied investigations of human neurophysiological systems p0108 N74 20741
Optokinetic nystagmus Its value in the diagnosis of certain vestibular lesions human aboriginal neurophysiological responses in the presence of brain stem lesions p0109 N74 20742
Visual vestibular interaction The role of the labyrinth in the production of optokinetic nystagmus and optokinetic after nystagmus effects of labyrinthectomy and eye movements on optical tracking task p0109 N74 20743
Self motion sensation pseudo coriolis effects and motion sickness induced by optokinetic stimuli psychophysiological experiments on human motion perception p0109 N74 20744
Mathematics for the sequential bithermal binaural caloric test p0109 N74 20746
Thermode for stimulation of the labyrinth by Peltier regulated radiant heat p0109 N74 20748
Computer aided nystagmography evaluating the influence of psychopharmacological drugs on vigilance p0109 N74 20749
Aeromedical research a clinical applications of averaged electronystagmography computer techniques for precise measurements of average eye movements p0110 N74 20750
Automated nystagmus analysis on line computer technique for eye data processing p0110 N74 20751
A model for the prediction of the nystagmic response to angular and linear acceleration stimuli mechanism of saccadic generation in vestibulo ocular reflex p0110 N74 20752
Vertigo in diving p0110 N74 20753
Effects of increased middle ear pressure on the vestibular system human vestibular due to pressure changes in Eustachian tubes p0110 N74 20755

O

OAO
OAO pointing and attitude sensors [NASA TM X 67384] p0277 N72 12863

OCEAN SURFACE
Doppler microwave propagation on the various path profiles p0116 N71 21427
Ray tracing analysis of duct effects on line of sight wave propagation above sea surface p0116 N71 21428
Atmospheric stratifications causing anomalous signal propagation at 170 and 15600 MHz over sea surface beyond horizon p0116 N71 21429
Boundary layer theory and meteorological parameters for radar range prediction over sea surface p0121 N71 23474
Remote sensing of ocean surface effects and their relation to sea clutter models p0127 N72 16096
Error correction procedures for radiometric infrared sea surface temperature measurements p0174 N72 16105
Error sources in sea surface temperature measurements by satellite borne scanning infrared sensor p0124 N72 16107
Analysis of radar backscatter from the sea theoretical predictions of maximum and signal range radar measurements p0126 N72 16519
Preliminary considerations on the magnetic and optical properties of sea water for application to surveillance mapping communications and visibility [AGARD LS 61] p0241 N73 33619
Explanation of very low field strength levels on line of sight paths over sea due to meteorological conditions p0148 N74 13868

OCULOGRAVIC ILLUSIONS
Use of nystagmography in the study of airview with spatial disorientation oculogiravic testing of flight crews p0108 N74 20736
Self motion sensation pseudo coriolis effects and motion sickness induced by optokinetic stimuli psychophysiological experiments on human motion perception p0109 N74 20744
Vertigo in diving p0110 N74 20753

OMEGA NAVIGATION SYSTEM
Application of airborne digital computers to Joint C D and Omega navigation and guidance systems p0157 N72 21225
Characteristics of airborne area navigation equipment and application to air traffic control systems p0233 N73 23698

ON LINE PROGRAMMING
Heuristic on line picture processing pointer and recognition system p0151 N72 11180
On line computer technique for evaluating reconnaissance image compression algorithms p0131 N73 10191

ONBOARD EQUIPMENT
Characteristics of attitude control system and onboard computer used with ANS astronomical satellite for ultraviolet and X ray measurements in space p0191 N72 19491

ONE DIMENSIONAL FLOW
Computation of one dimensional shocked flow p0181 N72 27301

OPERATING TEMPERATURE
Aerodynamic and thermodynamic performance of sweat cooled gas turbine engine blades p0258 N71 17387
Temperature field measurements within convection cooled pilot blade of gas turbine engine p0259 N71 17387

OPERATIONAL PROBLEMS
Technological aspects of film cooling for blades in high temperature gas turbines p0261 N71 17404
Methods for solving engine airplane interference and wall corrections in transonic wind tunnel tests for predicting aerodynamic performance of airplane design p0014 N72 11877
Problems of brain and information services to large research centers p0158 N73 24204

OPERATIONS RESEARCH
Accident investigations flight control systems and operational recordings for improved aircraft flight mechanics [AGARD CP 76 71] p0027 N71 23410
Design concept operational performance and system employment of AV BA Harrier aircraft p0054 N73 27005

OPERATOR PERFORMANCE
Measurement of human operator performance in single axis tracking task during simulated turbulent conditions p0040 N72 32034
The application of airview opinions of cockpit tasks and equipment to flight safety research p0107 N74 18802

OPERATORS (PERSONNEL)
Safety codes for operations of glow experiments p0076 N72 26057
Education and technical training for technical information p0160 N74 16931

OPHTHALMODYNAMOMETRY
Ophthalmological supervision of diabetic flying personnel p0086 N74 13798

OPHTHALMOLOGY
Ophthalmological reasons for grounding pilots of German Air Force p0097 N72 14108
Ophthalmological examination of applicants to pilot training p0082 N73 21122

OPTICAL CORRECTION PROCEDURE
Automatic approach and landing system with flash warning signal for Caravelle aircraft control p0030 N71 23429

OPTICAL DATA PROCESSING
Heuristic on line picture processing pointer and recognition system p0151 N72 11180
Edge detection algorithms two dimensional filter transforms and linguistic methods for on line processing of natural scenes p0152 N72 11186
Method for automatic recognition and classification of three dimensional objects by the submanifold p0152 N72 11189
Optical processing is useful tool for compressing pattern information to be retransmitted p0154 N72 11195
Image processing and pattern recognition systems some variant images using TV cameras and matrix computers p0154 N72 11196
Principles of very high density holographic storage of pictorial information p0154 N72 11197
Interactive graphic terminals for handling of pictures and applications to pattern recognition and artificial intelligence p0154 N72 11203
Digital filtering problems in line scanned photographic images p0156 N72 11204
Detecting features of objects in pictures p0156 N72 11205

OPTICAL EQUIPMENT
Some optical and photographic aspects in the tests of collimated optical systems and accessories [NASA TM X 66956] p0079 N71 20321
Comparison of infrared and light sources to show advantages of infrared light for optical experiments p0199 N72 25497
Method for comparing synthetic and measured target detection based on probability of signal being separated from background at bandwidth p0242 N73 33634
Characteristics of basic principles of operating optical systems for image display of target scenes and application for several tactical problems p0242 N73 33635
Test equipment for measuring the wavefront of angulating infrared systems p0242 N73 33636

OPTICAL PROPERTIES
Comparison of coherent and conventional light sources to show advantages of coherent light for optical experiments p0199 N72 25497
Application of aerodynamic holography for optical recording and flow visualization in wind tunnels and research facilities p0199 N72 25498
Proceedings of conference on electromagnetic and optical properties of sea water for application to surveillance, mapping, communications, and visibility
[AGARD LS 61] p0241 N73 33613
Radiance distribution as function of depth in upper layers of ocean and numerical analysis of inherent and apparent optical properties p0241 N73 33621
Optical properties of pure and turbulent sea water p0241 N73 33624
Techniques for predicting effects of thermal and saline inhomogeneities on optical imaging systems with application to optical properties of sea water p0241 N73 33625
Effect of ocean depth on light scattering and attenuation parameters to include optical properties influenced by concentration, size, and shape of particulate matter p0241 N73 33626
Light scattering by particles in sea water based on volume scattering function and point spread function p0242 N73 33628
Effect of various parameters on long range underwater vision for narrow and broad beam illumination p0242 N73 33630
Effects of resolution, signal to noise ratio, and contrast on underwater imaging systems performance p0242 N73 33631
Application of Fourier techniques to calculate spread of scattered light for circular spot, Gaussian profile, and linear stripe cases p0242 N73 33632
Characteristics of lenses and ports for underwater imaging systems to compare depth of field and relative aperture for several lens port combinations p0242 N73 33635
Computer programs for analyzing optical properties of sea water p0243 N73 33638

OPTICAL RADAR
Some comments on methods of avoiding the effects of turbulence, infrared radiometers and Doppler lidar for detecting clear air turbulence p0060 N74 17746

OPTICAL REFLECTION
Geometrical optics solution for plane electromagnetic wave passage and reflection in nonhomogeneous isotropic medium p0123 N72 16100

OPTICAL TRACKING
Visual vestibular interaction: The role of the labyrinths in the production of optokinetic nystagmus and optokinetic after nystagmus, effects of labyrinthectomy on eye movements in optical tracking task p0109 N74 20743

OPTIMAL CONTROL
Maxwell field theory for solving wave path controllability, in ionospheric scatter propagation p0139 N71 23462
Optimization of automatic flight control concepts for the helicopters with all weather capability p0030 N72 11917

OPTIMIZATION
Optimization of interference between aircraft components in subsonic flow p0091 N71 19356
Optimal bomb release intervals for B-52 aircraft bombing system p0095 N71 19383
On constrained numerical formulations of constrained problems and penalty functions p0284 N71 20134
Optimization of gene assembly constraints for aircraft design using differential equation steepest gradient and finite element approximation
[NASA CR 117198] p0284 N71 20133
Computer and optimization techniques in aircraft design p0285 N71 20149
Comparison of performance predictions and flight data for optimizing transport wind tunnel design p0014 N72 11811
Optimality criteria in structural design with applications to undamped vibrations of solid two- and three-dimensional bodies
[AGARD R-589] p0014 N72 15958
Optimization techniques for the take-off, climb, and cruise performance p0294 N72 16699
Model for head-eye motions and recognition and prediction of optimum viewing performance p0304 N72 19367
Interference problems of a flying engine nacelle operation in aircraft design considerations
[AGARD LS 53] p0037 N72 22016
Optimizing tow-cable-towed-payload configurations for application to missile weapon system test for tactical missiles p0226 N73 27495
Methods for optimum design of composite structures p0259 N72 29494
Measurement techniques and data analysis for ground terminals for optical satellite communications p0133 N72 10203
Synthesis of optimum control systems using gain and time scale adjustable regulators p0314 N74 13863

ORGANIC MATERIALS
Application of glass reinforced plastic composite and PRD 49 organic fiber material for aerospace vehicle applications p0273 N73 27482

ORIENTATION
Determination of body orientation from an elongated source p0233 N73 20793

OSCILLATING FLOW
Prediction of buffet onset for aircraft: recent progress in wind tunnel and flight test data correlation p0021 N74 14725

OSCILLATIONS
Objectives of dynamic tests in low speed wind tunnels and techniques for measuring oscillatory derivatives and transient motion effects p0173 N73 26244

OXIDATION
Influence of surface preparation, surface texture, and initial oxidation on metal surface crystallization p0201 N73 23603
Role of isothermal stresses generated during oxidation and modes of stress relaxation p0202 N73 23605
High temperature environmental testing of gas metal interactions to simulate severe operating conditions p0202 N73 23606
Effects of oxide dispersions and rare earth elements on oxidation of Cr and Al containing alloys p0202 N73 23608
Multicomponent diffusion theory as applied to oxidation, corrosion, and sulfation of complex heat resistant alloys p0202 N73 23609
Soot oxidation kinetics at combustion temperatures p0219 N74 15290

OXIDATION RESISTANCE
Transport properties of oxide scales formed on oxidation resistant alloys p0201 N73 23604
Addition of chromium or aluminum to improve oxidation resistance of nickel and cobalt alloys p0203 N73 23611
Oxidation resistant refractory metal alloys for use in high temperature environments p0203 N73 23615
Borides, carbides, and nitrides of silicon: oxidation resistant refraction compounds for use in gas turbines and reentry vehicles p0203 N73 23616
Methods of oxidation and corrosion resistance in refractory metal alloys used in gas turbine engines p0203 N73 23617
NATO national reports on high temperature corrosion of aerospace alloys p0203 N73 23618

OXIDES
Transport properties of oxide scales formed on oxidation resistant alloys p0201 N73 23604

OXYGEN
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure relations in dogs breathing air and liquid fluorocarbon in whole body water immersion respirator
[NASA CR 117199] p0068 N71 20358
Laminar diffusion flames of acetylene-oxygen mixtures p0253 N72 11684
Effectiveness of phased dilution compared to current demand diluter oxygen delivery system p0080 N73 23065
Thermodynamic stability diagrams of high temperature O2 corrosion reactions p0201 N73 23602

OXYGEN CONSUMPTION
Oxygen consumption and heart rate measurements for estimating exercise tolerance of military personnel p0091 N71 22308
Oxygen consumption and work capacity in fitness evaluations in Canadian Armed Forces personnel p0092 N71 22...
Hashish smoking effects on human oxygen consumption during physical stress and safe diving ability p0081 N73 21115

OXYGEN SPECTRA
Absorption and phase dispersion of radio wave in atmosphere due to oxygen microwave spectrum p0145 N73 26125

OZONE
Reaction of ozone with nitrogen oxides at high altitudes p0211 N74 14274
Nitrogen oxides, nuclear weapons testing, ozone and stratosphere ozone p0212 N74 14275

P

P 1127 AIRCRAFT
Stability and control flight test techniques for a STOL aircraft as general and specific application to P 1127 and Hawker aircraft p0035 N72 20980

PAIN
Chronic pain: Light effects on thresholds, level, pain in chronic arthritis p0092 N73 22303

PANEL FLUTTER
Application of computer program for determination of transonic unsteady aerodynamics and comparison with wind tunnel flutter data analysis
[AGARD R-596] p0041 N73 18030
Effect of surface pressure fluctuations in response of panel, underlying attached and separated cavity, to hypersonic turbulent boundary layer p0292 N73 29916

PANELS
Analysis of propagation of waves in orthotropic composite materials and panels with development of theory for wave propagation in developable shapes and stresses in composite plate p0293 N73 29918
Optimization of plate and panels p0292 N74 15607

PARABOLIC FLIGHT
Blood flow response to transient changes in gravitational field p0029 N73 21127

PARACHUTING INJURY
Environmental effects on parachute impact injuries at 6,000 to 10,000 feet using parabolic apex vented static line deployed parachute p0101 N72 19137

PARAMETERIZATION
Use of Kelly Repertory Grid Techniques for assessing subjective estimates of important parameters for target acquisition p0304 N73 19923
An optimization technique to calculate bipolar transistor parameters: iterative computer method p0166 N74 13915

PARTIAL DIFFERENTIAL EQUATIONS
Partial differential equations for calculating three dimensional incompressible turbulent boundary layers p0177 N72 20285

PARTICLE ACCELERATION
Effects of accelerated particles and cosmic rays on light flashes in human eye
[NASA TM X-68460] p0075 N72 26051

PARTICLE DIFFUSION
Analysis of structural diffusion mechanism between beryllium fiber and aluminum matrix p0208 N72 12503

PARTICLE SIZE DISTRIBUTION
Effect of ocean depth on light scattering and attenuation parameters to include optical properties influenced by concentration, size, and shape of particulate matter p0241 N73 33626

PARTICLES
Particle precipitation in polar upper atmosphere p0126 N72 21122

PASSENGERS
Restraints for passengers in automobiles p0098 N72 19122

PATHOLOGY
Crash injury research: fatality pathology, and protection p0098 N72 19120
Personal observations of 340 fatal aircraft accidents for confirmation of laceration of victims p0099 N72 19124
Necropsy and radiographic observation of spinal fracture and articular facet derangement patterns in rhesus monkeys
[AMRL TR 71-17] p0101 N72 19139

PATTERN RECOGNITION
Conference papers on artificial intelligence with emphasis on pattern recognition and man machine interactive problem solving
[AGARD CP 94-71] p0151 N72 11174
Heuristic on line picture processing, learning and recognition system p0151 N72 11180
Radar pattern recognition for image data processing with meteorological radar systems p0151 N72 11181
Application of pattern recognition techniques with Doppler radar for detection of personnel moving at rate comparable with clutter, odor, or gravel movement p0152 N72 11187
Pattern recognition technique for automatic detection of vehicles in aerial photographs of highways p0152 N72 11183
Automatic medical diagnosis using nonparametric sequential pattern classification procedures p0152 N72 11184
Problems in application of adaptive and self organizing algorithms for pattern recognition p0152 N72 11185
Method for automatic recognition and classification of three dimensional objects by computer p0152 N72 11188
Recursive Bayes decision-directed learning: Bayesian classification with unknown a priori data p0153 N72 11189
Adaptive and nonadaptive approach to pattern recognition with Bayesian and non-Bayesian decision rules p0153 N72 11190
Nonparametric pattern recognition using nearest neighbor decision rules: communication of average Mahalanobis distances on space p0153 N72 11191
Integrated preprocessing system for the extraction of binary patterns p0153 N72 11192
Holographic pattern recognition using Boltzmann machine p0153 N72 11194
Digital processing of multispectral data for pattern information by feature extraction p0154 N72 11195
Image processing and pattern recognition techniques for variant shapes using the Karhunen-Loeve expansion p0154 N72 11196
Unsupervised learning pattern recognition p0154 N72 11198
Decision-theoretic methods for pattern recognition that are invariant under the group of linear transformations p0154 N72 11202
Interactive graphic techniques for the diagnostic data and application to pattern recognition p0154 N72 11203
Problem-oriented programming for pattern recognition by dynamic control of logic p0155 N72 11206
Pattern recognition and estimation of the dimensionality of situations p0332 N73 19901
Target data fusion: radar and reference sensor data and radar p0144 N74 11900
Radar focusing and feature extraction p0144 N74 11901

PELTIER EFFECTS
Peltier effect in semiconductor thermoelectric cooling (p0154 N74 20748

PEOLE SATELLITES
Passive gravity gradient method for stabilization of Eole and Peole satellites p0278 N72 12867
PERCEPTION
Relationship of interaction of impulsiveness and anxiety to perceptual motor performance in human beings p0069 N71 20367
PERFORMANCE
Mean time between failure as index to system performance p0190 N71 36785
Performance tests of protective clothing to determine effectiveness against air blast during high speed ejection p0102 N72 19147
Mathematical models for measuring inertial qualities of spherical gyroscope rotors with electric suspension p0228 N73 20691
Differential method for evaluating performance of nonlinear accelerometers p0231 N73 20715
Influence of various aerodynamic forces on rectangular wing performance with harmonic movement parallel to stream flow movement p0050 N73 21043
Performance of aircraft gas turbine components in hot corrosion environments p0201 N73 23599
Performance and fatigue strength of compressor blades fabricated from carbon fiber composites and boron composite wires p0213 N73 22496
PERFORMANCE PREDICTION
Heat transfer prediction for turbine blade design p0257 N71 17374
Operational design criteria for gas turbine engines p0261 N71 17402
Finite element computer program for estimating airplane aerodynamic interference [NASA TM X 66884] p0001 N71 19357
Computerized prediction of aerodynamic lifting characteristics for wing horizontal tail and canard wing configurations [NASA TM X 66886] p0002 N71 19361
Statistical prediction of external store separation characteristics from aircraft p0006 N71 19388
Tropospheric scatter propagation and prediction of radio transmission characteristics [AGARD CP 70 71] p0017 N71 23451
Radio attenuation prediction method using stratified atmospheric level indices p0120 N71 23468
Meteorological effects on tropospheric propagation predictions for telecommunication p0120 N71 23470
Statistical forecasting of attenuation with tropospheric scatter using meteorological parameters p0120 N71 23471
Mathematical prediction model for tropospheric radio transmission loss over rough surfaces p0120 N71 23472
Boundary layer theory and meteorological parameters for radar range prediction over sea surface p0121 N71 23474
Conclusions and recommendations concerning wind tunnel tests of interaction between engine flow and wall corrections in transonic wind tunnels p0010 N71 36401
Computation of response as to questionnaire on engine airframe interference in transonic tests p0011 N71 36402
Procedure for measuring performance of aircraft fire extinguishing powders p0253 N72 11691
Transonic wind tunnel testing for predicting flight performance characteristics of aircraft p0013 N72 11865
Correlation of transonic wind tunnel test data with flight test results on slender wing airplanes for double delta configuration development p0013 N72 11868
Comparison of wind tunnel and theoretical techniques for determining full scale aerodynamic flight drag factors [NASA TM X 67413] p0013 N72 11869
Comparison of performance predictions and flight data for optimizing transonic wind tunnel design p0014 N72 11871
Performance and operational characteristics of high Reynolds number blowdown and shock wind tunnels for transonic model testing p0016 N72 11884
Methods for calculating and predicting viscoelastic constants of composite materials p0209 N72 12508
Analysis of methods for predicting aircraft performance and recommendations for computer programs to provide accurate prediction capability p0040 N72 32036
Aerodynamic configurations of swept wings to improve lift performance at stall in higher range of subsonic speeds p0042 N73 15010
Predicting flying qualities by wind tunnel tests p0045 N73 17050
Prediction of aeroelastic horizontal tail effects on stability and control p0045 N73 17506
Designs and performance predictions for high performance supersonic ejector systems [AGARDOGRAPH 163] p0183 N73 17248
Procedure for predicting performance characteristics of second throat diffusers in ejector systems p0183 N73 17250
Ejector flow model for predicting performance characteristics of supersonic ejector systems p0183 N73 17251
Development of method for analyzing performance of magnetohydrodynamic generator based on thermodynamic properties and flow characteristics p0050 N73 19051
Correlation tests as predictive indicators of flying test performance p0078 N73 19078
Mathematical models for measuring operating methods and performance of gyroscope with two degrees of freedom p0229 N73 20696
Methods employed to obtain datum position and velocity information for evaluation of inertial navigation systems and identification of error sources p0232 N73 20716
Analysis of factors inhibiting performance of rotary wing aircraft and mathematical models of rotary wing flow characteristics p0047 N73 21019
Development of method for predicting performance of heavily loaded propellers and rotors in steady hovering flight p0050 N73 21040
Development of algorithm for calculating inviscid flow about arbitrary planform rotors and application to analyzing various rotary wing configurations p0050 N73 21048
Three different bases for susceptibility prediction to motion sickness p0078 N73 21093
Motion sickness questionnaire and field independence scores as predictors of success in Naval aviation training p0079 N73 21097
Alcohol reference method for predicting drug modifications of central nervous system activity and pilot performance decrease p0081 N73 21112
Exponential probability distribution analysis for extrapolating aerospace system performance statistics from test results p0281 N73 25903
Development and application of aircraft performance prediction methods for subsonic and supersonic transport and fighter aircraft [AGARD LS 56] p0052 N73 24042
Numerical methods for determining range and radius of action performance of transport and combat aircraft and effects of various parameters on performance p0052 N73 24043
Methods for evaluating and predicting airfield performance of turbojet and turbofan aircraft operating in conventional and short takeoff modes p0053 N73 24044
Development of methods for predicting aircraft flight maneuver and climb performance to show effects of excess power and load factor p0053 N73 24045
Analysis of parameters affecting choice of engines for transport and combat aircraft during design process p0053 N73 24048
Development of computer program for determining minimum time trajectory and comparison with gradient method of computation p0053 N73 24053
Use of differential phase and gain for predicting performance of ultrahigh frequency telecommunication system p0141 N73 26132
On the prediction of aerodynamic loads on oscillating wings in transonic flow [AGARD R 612] p0025 N74 18053
Full scale fatigue requirements for rational fatigue life prediction p0061 N74 19657
PERFORMANCE TESTS
Performance of aluminide coatings in simulated high temperature tests on gas turbine engine blades [NASA CR 116374] p0259 N71 17393
Flight simulator and airframe test stand for evaluating operational performance of aircraft flight control system p0027 N71 23413
Operational performance of automatic V STOL flight control systems using jet thrust as a feed p0028 N71 23415
Operational performance and handling safety requirements for single engine boundary layer controlled aircraft in STOL mode p0028 N71 23419
Flight safety performance of V STOL Harrier military aircraft having jet control p0029 N71 23427
Flight mechanics problems in accident investigation for VJ 101 aircraft p0030 N71 23428
Transonic performance of double flux engine nacelle air intake and jet tests at high Reynolds numbers p0013 N72 11866
Comparison between conventional blow down and tube driven transonic wind tunnels for high Reynolds number range p0015 N72 11881
Performance characteristics of high Reynolds number tube wind tunnel [NASA CR X 67419] p0015 N72 11882
Full scale thrust performance tests of prototype dual stream propelling nozzle p0263 N72 16691
Development of techniques for evaluating performance of air breathing engines and measurement of significant operating parameters [NASA TM X 68305] p0035 N72 20983
Flight tests to determine reliability of aircraft for operation in cirrus clouds p0035 N72 20988
Methods for conducting acceptance tests and reliability tests of gyros operating as part of extra platform quality control procedures p0228 N73 20689
Laboratory tests of accelerometers used in inertial guidance systems in preliminary programs p0231 N73 20714
Evaluation of helicopter handling qualities based on ground based piloted flight simulator tests p0049 N73 21032
Performance tests of an inertial navigation system to determine effectiveness in presence of interfering noises p0235 N73 20713
Proj A: Air elevator tests on vertical 100 g heavy table centrifuge and vibration tests of inertial guidance systems p0236 N74 14347
Inertial guidance system centrifuge testing: development and performance tests of test equipment p0236 N74 14348
Trends towards standardized software and hardware for test systems: based on process computer with interface unit and input output peripherals p0236 N74 14351
Inertial guidance system sled testing p0237 N74 14354
Terminal guidance system testing: based on nondestructive tests and verification by limited live firings to increase test cost effectiveness p0237 N74 14356
Some considerations of future low speed tunnels for Europe p0173 N74 16988
PERIPHERAL VISION
Peripheral acuity with complex stimuli at two viewing distances p0303 N75 19965
PERSONALITY TESTS
Personality traits and flight aptitude p0089 N74 18789
PERSONNEL
Navy research and instrumentation for analyzing noise and vibration effects on human personnel p0076 N72 26054
PERSONNEL SELECTION
Predictability of motion sickness in pilot selection conferences [AGARD CP 109] p0078 N73 21092
Reaction assessment of vestibular disorientation stress for aircrew selection using visual displays and tasks p0079 N73 21096
Curriculum development and personnel training for information centers p0158 N73 24205
PERTURBATION
Complex turbulent flows as perturbations of classical free shear layers and application of Prandtl approximation p0175 N72 20274
PH
Microelectrode for measuring pH gradients during stress corrosion of aluminum alloys and 1020 steel exposed to potassium chloride p0286 N72 21909
PHARMACOLOGY
Effects of education and pharmacodynamics on adaptability of human beings to degraded sensorial environments p0069 N71 20364
PHASE CONTROL
Attenuation and phase constancy propagation criteria of tactical satellite communications using mobile ground terminals p0132 N73 10201
PHASE DEMODULATORS
Digital receiver for detecting moderate data rate phase shift keyed signals in real time p0132 N73 10196
PHASE DEVIATION
Water evaporation interference in phase measurements by transhorizontal microwave propagation over sea surface p0140 N73 26125
Attenuation and phase dispersion of radio waves in atmosphere due to oxygen microwave spectrum p0141 N73 26126
PHASE MODULATION
Interchannel interference and Gaussian noise effects on phase modulated digital microwave radio systems p0134 N73 10211
PHASE SHIFT
Ultrahigh frequency coherent radio signal transmission for differential phase shift measurements due to vapor and oxygen absorption lines p0141 N73 26131
Use of differential phase and gain for predicting performance of ultrahigh frequency telecommunication system p0141 N73 26132
PHENOLIC RESINS
Ultrasonic measurements of silica glass and silica phenolic sheets in rapid heating rate p0207 N72 12494
Physical and mechanical properties of high strength high modulus carbon fibers and organic resin composite materials p0210 N73 22475
PHOTOCHEMICAL REACTIONS
Reaction of ozone with nitrogen oxides at high altitudes p0217 N74 14274
Photooxidation of aircraft engine emissions at low and high altitudes p0218 N74 14277
Effect of supersonic transport upon the ozone layer: studied in a two dimensional photochemical model with transport p0218 N74 14278
PHOTODISSOCIATION
Chemical kinetics in the stratosphere: atmospheric composition and atmospheric chemistry based on hydrogen, nitrogen and chlorine reactions p0218 N74 14279
PHOTOELECTRICITY
Method for comparing effects of electron and photographic detectors based on product of signal to noise ratio times spatial bandwidth p0242 N73 33634
Techniques for long range visual underwater viewing using gating and display with parallax technique p0242 N73 33636
PHOTOGRAPHIC EQUIPMENT
Meteorological tracking radar systems: A state of the art review p0160 N74 16932
PHOTOGRAPHIC MEASUREMENT
Laser plerogram technique for measuring spatial scaling of passive scalar in turbulent wake p0139 N72 20297
PHOTOGRAPHIC RECORDING
Mathematical models and numerical analysis of document optical systems used as holographic scanning systems p0199 N72 27496
Principles for performing holographic and methods of reconstructing interference pattern between reference and reflected light waves p0199 N72 27499

Method for comparing photo electronic and photographic detectors based on product of signal to noise ratio times spatial bandwidth p0242 N73 33634

PHOTOGRAPHS

Heuristics in the picture processing, learning and recognition system p0151 N72 11180

Detecting boundaries of objects in gray pictures p0155 N72 11205

Problem solving using man-machine interaction for pattern recognition by dynamic pictorial information p0155 N72 11206

PHOTOINTERPRETATION

Pattern recognition technique for automatic detection of vehicles in aerial photographs of highways p0152 N72 11183

Analysis of satellite multispectral imagery data for tropical land use interpretation p0124 N72 16111

On line computer technique for evaluating reconnaissance image compression algorithms p0131 N73 10191

PHOTOMETERS

Photometric measurements of exhaust smoke trails by jet engines p0221 N74 14395

PHOTOOXIDATION

Photooxidation of aircraft engine emissions at low and high altitudes p0218 N74 14277

PHOTORECEPTORS

Three cone receptor of Young Helmholtz and opponent color types of information processing p0072 N73 19066

PHYSICAL EXAMINATIONS

Aeromedical requirements and examination techniques for aircrews: conference
[AGARD CP 95 PT 2] p0073 N72 25048

Medical examination of students undergoing primary flight training p0073 N72 25049

Ametropometry and medical evaluation of pilots p0074 N72 25055

Technical evaluation report: conclusions and recommendations - cardiophysiological standards for flying personnel certification p0085 N74 13785

German Air Force experiences with certification criteria for granting a waiver p0087 N74 13805

PHYSICAL FITNESS

Physiological effects of flying, prolonged and aging effects on flight crew performance
[AGARD CP 81 71] p0091 N71 22305

Physiological test program to evaluate physical fitness of flying personnel p0091 N71 22302

Diagnostic and functional measurements of human physical fitness p0091 N71 22303

Physical fitness training schedules for Canadian Forces flying personnel p0091 N71 22305

Physical exercise effects on stress tolerance of trained and untrained subjects p0091 N71 22306

Physical exercise and fitness tests for German Air Force flying personnel p0091 N71 22307

Physical exercise and environmental emotional psychotherapeutic methods in aerospace medicine p0092 N71 22310

Oxygen consumption and work capacity as fitness evaluations on Canadian Armed Forces personnel p0092 N71 22311

Cardiovascular disease effects on aging flying personnel on physical exercise performance p0093 N71 22312

Formula for predicting physical fitness of flying personnel in Belgian Air Force during aging process from spirometric measurements p0094 N71 22321

Handbook on aviation medicine for safe mental and physical health of aircrew during flight
[AGARD AG 154] p0071 N72 24058

Aeromedical requirements and examination techniques for aircrews: conference
[AGARD CP 95 PT 2] p0073 N72 25048

Raised arterial blood pressure levels - review, methods p0074 N72 25054

Specific medicine parameters relevant for maintaining competence form p0081 N73 21114

PHYSICAL PROPERTIES

Systems analyses for selection and application of materials p0206 N71 27033

Properties and selective application of polymeric materials p0205 N71 27034

Properties and selective application of thermoplastic and thermoplastic polymers p0205 N71 27052

Physical structure of turbulent separated boundary layer flow
[AGARD AR 46] p0182 N73 11241

PHYSICAL WORK

Human factors research in whole body motion in extreme climatic environments p0092 N71 22316

PHYSIOLOGICAL EFFECTS

Physiological and psychological basis of human response to abnormal environments p0092 N71 22301

Fundamental principles and physiological effects of acceleration on human body p0094 N71 22310

Effects of high gravitational acceleration on the human visual system and prediction of deterioration of performance
[AMRL TR 71 58] p0092 N72 25039

Occurrences of vertigo in operational aircraft and among aerial workers with theoretical explanations of otolithic involvement p0092 N72 25044

Detection and measurement of human responses to whole body motion and implications of vestibular illusions to motion effects p0092 N72 25044

Physiological and psychological effects of low and high magnetic fields on man
[NASA CR 127049] p0076 N72 26055

Atmospheric Pollution by Aircraft Engines
[AGARD CP 125] p0217 N74 14271

Pollution levels at London Heathrow Airport and methods for reducing them p0218 N74 14284

PHYSIOLOGICAL FACTORS

Statistical study of physiological and psychological factors in grounding of Italian Air Force flight crews p0095 N72 14091

Physiological method for selecting and observing violent pilots in Belgian Air Force for motion sickness p0079 N73 21099

Physiological aspects of sleep reduction in aircrews after prolonged flight times p0080 N73 21108

Mental and physiological environmental research aspects of manned flights p0088 N74 18780

PHYSIOLOGICAL RESPONSES

Physiological responses to interacting stresses of exercise and hypercapnia under acute arc chronic exposure to ambient P sub CO2 of 21 mm Hg p0070 N71 20370

Physical fitness assessment of older pilots in relation to flight requirements and physiological responses p0091 N71 22304

Hormones in stress and physiological changes caused by acceleration and ejector stresses p0102 N72 19146

Procedure for determining cases of mild intoxication based on postural oculomotor nystagmus p0072 N72 25039

Effects of sound on the vestibular system of guinea pigs and rodents p0179 N74 20745

A model for the prediction of the vestibular response to angular and linear accelerations and mechanisms of saccadic generation of vestibular nystagmus p0179 N74 20752

PHYSIOLOGICAL TESTS

Physiological test programs to evaluate physical fitness of flying personnel p0091 N71 22302

Diagnostic and functional measurements of human physical fitness p0091 N71 22303

Physical exercise and fitness tests for German Air Force flying personnel p0091 N71 22307

Computer simulation and psychological stress in aerospace operations p0092 N71 22312

Physiological tests for selecting classes of drill instructors based on postural oculomotor nystagmus p0072 N72 25039

Physiological effects of vestibular stimulation by caloric irrigation to determine effects of positive acceleration on dynamics of vestibular system of rhesus monkeys
[AMRL TR 71 59] p0072 N72 25040

The repeatability of an answering 2 hearing loss in relative test - discussion of diagnostic value p0087 N74 13806

PHYSIOLOGY

On the conservation of muscle protein during starvation and its relation to the activity of the ubiquitin dependent proteolytic system p0165 N72 19138

PILOT ERROR

Alcohol, radiation and performance degradation: a pilot and crewmember approach to the issue p0081 N73 21113

Behavioral aspects of pilot error: conference on psychological factors in pilot error and flight safety
[AGARD CP 132] p0106 N74 18792

Pilot factors in aircraft accidents of the German Federal Armed Forces p0126 N74 18798

Human factors problems in aircraft accident analysis: brief talk on human engineering considerations in aircraft accidents p0182 N74 18799

PILOT PERFORMANCE

Human factors aircraft systems
[AGARD CP 79 70] p0071 N71 16065

Simulating the pilot visual scene and training by pilots in flight simulators p0071 N71 25064

Techniques and problems in assessing pilot workload p0073 N71 16066

Psychological factors connected with performance of military tasks p0071 N71 16067

Experimental analysis of pilot behavior for application to pilot loading and aircraft handling qualities
[NASA TM X 66218] p0072 N71 16069

Physiological factors in piloting high performance aircraft
[AGARD CP 81 71] p0091 N71 22301

Physiological factors in piloting high performance aircraft p0091 N71 22304

Exercise effects on physiological function and work performance in man and animals p0091 N71 22305

Effects of prolonged acceleration on the visual system of the pilot p0092 N71 22309

Application of psychological principles to the prediction of pilot error p0092 N71 22314

Physiological factors in piloting high performance aircraft
[AGARD CP 81 71] p0092 N71 22315

Stress factors in aircraft pilots

PILOTS

[illegible] p0071 N72 25053

PILOTS (PERSONNEL)
Role of flight surgeon and physician pilot in evaluation and treatment of jet fighter pilots p0055 N72 14094
Physiological factors possibly contributing to coronary risk among German Air Force pilots p0097 N72 14104
Ophthalmological reasons for grounding pilots of German Air Force p0097 N72 14108
Psychological factors in pilot grounding in German Air Force p0098 N72 14111
Radiological observations of spinal injuries to pilots caused by sudden ejection p0102 N72 19148
Color aptitude of dyschromatopsia French navigators and pilots p0077 N73 19068
Influence of long duration flight missions on metabolic and endocrine functions of pilots and navigators p0106 N73 19152
Management of asymptomatic carriers of hepatitis associated antigen in Hellenic Air Force personnel p0083 N73 23060
Clinical psychology and psychiatry of the aerospace operational environment conference [AGARD CP 133] p0088 N74 18779
Fear of flying and its treatment in military pilots p0088 N74 18781
Results of behaviour therapy in flying phobia p0088 N74 18782
Assessment of behaviour therapy in the treatment of flying phobias p0088 N74 18783
Partial cerebral hypoxic attacks in pilots as cause of hypoxia incidence p0088 N74 18786
Characteristics of life stress in a population of military aviators p0088 N74 18787
Influence of social relational factors on operational flying capacity A system-oriented approach p0089 N74 18791
PLAN POSITION INDICATORS
Digital filtering procedures for fine images with plan position indicators p0155 N72 11204
PLASMA CONTROL
Application of superconducting magnetics for plasma physics experiments and as component for future thermonuclear reactors p0063 N73 19033
PLASMA DYNAMICS
Analysis of performance of pulsed coaxial guns based on snowplow model allowing for variable initial mass loading distribution p0066 N73 19057
PLASMA GENERATORS
Application of superconducting magnetics for plasma physics experiments and as component for future thermonuclear reactors p0063 N73 19033
PLASMA GUNS
Analysis of performance of pulsed coaxial guns based on snowplow model allowing for variable initial mass loading distribution p0066 N73 19057
PLASMA JETS
Analysis of performance of pulsed coaxial guns based on snowplow model allowing for variable initial mass loading distribution p0066 N73 19057
PLASMA PHYSICS
Development of optical striations and Doppler spectrum broadening due to barium plasmas in ionosphere p0128 N72 21136
PLASMA TURBULENCE
Theoretical plasma perturbation model for calculating coupling effects between acoustic gravity waves and electromagnetic waves in ionospheric disturbances p0038 N73 14162
PLASMA WAVES
Ionograms and morphological statistics of polar stratified condition emphasizing two stream or plasma ion wave instability p0130 N72 21148
PLASMAS (PHYSICS)
Spatial distribution of plasma in polar ionosphere based on satellite data p0126 N72 21124
Ion acoustic waves in auroral plasma and radio wave scattering p0127 N72 21132
PLATES (STRUCTURAL MEMBERS)
Mechanical properties and stress corrosion of hot rolled alloy plates p0089 N72 21971
Analysis of dynamics of stiffened plates using finite element modeling of flat and curved stiffened panels p0293 N73 29911
Improvement of the properties of high strength Al Zn Mg Cu alloys by thermomechanical procedures ductility toughness and stress corrosion properties of steel plates and forgings p0254 N74 23111
PLATINUM
Thermal expansion behavior of platinum Al2O3 fiber sapphire whiskers and graphites [AGARD AR 38] p0293 N72 24960
PLUGS
Thermoelectric stimulation of the labyrinth by Peltier regulated galvanic plug p0109 N74 20748
PLUMES
A study of flow separation in the base region and its effects during powered flight interaction between propulsive jet and free stream flow p0020 N74 14774
PNEUMATIC EQUIPMENT
Aerodynamics of pneumatic high lift devices p0026 N71 20963
Pneumatic system used with 3D satellite attitude control system p0278 N72 12858
Development of data path control systems for supersonic aircraft based on pneumatic power generation p0066 N73 19056
PNEUMOTHORAX
Idiopathic spontaneous pneumothorax in flying personnel p0083 N74 13793
PODS (EXTERNAL STORES)
Technical and operational aspects of externally mounted aircraft equipment p0305 N74 21617
POINTING CONTROL SYSTEMS
OAO pointing and attitude sensors [NASA TM X 67384] p0277 N72 12863
POLAR REGIONS
Particle precipitation in polar upper atmosphere p0126 N72 21122
Spatial distribution of plasma in polar ionosphere based on satellite data p0126 N72 21124
Polar propagation effects on HF radar in auroral and subauroral regions p0129 N72 21142
POLARIZATION (WAVES)
Radio wave polarization in auroras p0127 N72 21133
Debye polarization theory for determining electromagnetism of sea surface p0241 N73 33620
POLARIZATION CHARACTERISTICS
Polarization coupling losses on sky wave paths at high altitude p0129 N72 21145
POLARIZED ELECTROMAGNETIC RADIATION
Rain depolarization of linearly and circularly polarized microwaves p0141 N73 26127
POLYIMIDES
Design fabrication and test of boron polyimide reinforced titanium fan disks to operate at high temperatures p0213 N73 27491
POLYMERS
Properties and selective applications of thermosetting and thermoplastic polymers p0205 N71 27042
POROSITY
Age and exercise factors influencing osteoporosis bone strength and acceleration tolerance investigated using rhesus monkeys [AMRL TR 70 74] p0068 N71 20359
PORTABLE EQUIPMENT
Requirements for using Tafa 4 landing aid as portable ground station in tactical helicopter operations p0032 N72 11925
POSTURE
Posture effects on flight crew tolerance to positive acceleration p0068 N71 20357
POTENTIAL FLOW
Calculated values of air forces on oscillating thin wings obtained by linearized potential flow [AGARD R 583 71] p0010 N71 35198
POWDER (PARTICLES)
Procedure for measuring performance of aircraft fire extinguishing powders p0253 N72 11691
POWER AMPLIFIERS
Characteristics of solid state power amplifiers for direct application using doublers and limiters and application to interplanetary space probes p0194 N72 19510
Generation of superhigh frequency power using negative impedance characteristics of avalanche diodes in reflection amplifiers p0194 N72 19511
POWER EFFICIENCY
Production and efficiency of small gas turbine engine for helicopter and surface vehicles [AGARD LS 46 71] p0261 N71 26951
Thermodynamic cycle and power output parameters of gas turbine p0262 N71 26954
Influence of adiabatic compression on power of hydraulic motors and pumps p0066 N73 19055
POWER PLANTS
Production and efficiency of small gas turbine engine for helicopter and surface vehicles (AGARD LS 46 71) p0261 N71 26951
Cost effectiveness as critical selection requirement for small gas turbines in military and commercial operations p0262 N71 26952
Thermodynamic properties of small gas turbines for power generation in aeronautics space and industry p0262 N71 26957
POWER SPECTRA
Power spectrum method for determining structural frequency response functions in dynamic aircraft tests p0207 N71 23211
Rational calculation of design gust loads in relation to present and proposed airworthiness requirements effects of atmospheric turbulence on aeroelastic configurations of short haul aircraft p0059 N74 17740
PRANDTL NUMBER
Compressible subsonic flows and perturbations of class of thin shear layers and application of Prandtl approximation p0175 N72 20274
PRECIPITATION (METEOROLOGY)
Airborne measurements of X band attenuation and radar reflectivity by precipitation by microwave frequencies p0115 N73 21412
Measurements of microwave attenuation by precipitation by ATS 5 satellite beacon p0115 N73 21419
Precipitation models from radar and rain gauge data for predicting radio attenuation statistics p0146 N74 13854
Measurements of precipitation attenuation at 11.6 GHz p0147 N74 13855
Estimating attenuation by rain and clouds along earth to satellite or satellite ground system p0147 N74 13856
Analysis of 11 GHz band propagation Portugal for rain accumulation prediction p0148 N74 13869
PRECIPITATION PARTICLE MEASUREMENT
Multipath rainfall measurements for planning ultrahigh frequency radio link p0142 N73 26137
Ultrahigh frequency precipitation attenuation measurements by ATS 5 weather radar and radiometer p0143 N73 26142
PREDICTION ANALYSIS TECHNIQUES
Development and application of aircraft performance prediction methods for subsonic and supersonic transport and fighter aircraft [AGARD LS 56] p0052 N73 24042
Development of procedures for predicting fatigue life of aircraft structures based on fracture mechanics crack propagation and residual static strength analysis [AGARD LS 62] p0294 N73 29924
Development of fatigue life prediction procedures based on measured stress time histories and mathematical model for description of random vibrations p0294 N73 29926
Effect of environment and stress cycling on in service structural failure of airframes and procedures for predicting safe operational conditions p0295 N73 29929
Application of growth rate data and analytical retardation models for predicting crack growth under variable amplitude loading p0295 N73 29932
Analysis of errors in fatigue life prediction procedures and methods for improving accuracy of prediction analysis techniques p0295 N73 29934
Specialists Meeting on Helicopter Rotor Prediction Methods [AGARD CP 122] p0055 N74 10908
Prediction of helicopter rotor loads based on alternating aerodynamic loads imposed on rotary wing and rotor hub p0056 N74 10911
Helicopter rotor loads predictions assumptions and techniques for numerical analysis of aerodynamic loads p0056 N74 10912
Rotor system design and evaluation using a general purpose helicopter flight simulation program p0056 N74 10913
Integrated rotor body loads prediction p0057 N74 10916
Introductory survey to session 4 Propagation data for interference probability determinations p0147 N74 13861
A survey of drag prediction techniques applicable to subsonic and transonic aircraft design p0019 N74 14711
Aerodynamic drag and lift of general body shapes at subsonic transonic and supersonic Mach numbers p0019 N74 14712
On some basic and new aspects about the drag problem of wings and bodies in supersonic flows p0019 N74 14713
Aircraft drag prediction for project appraisal and performance estimation p0019 N74 14716
Appendix A data item service for aircraft drag estimation collection dissemination and development of aerodynamic drag prediction data p0020 N74 14717
Remarks on methods for predicting viscous drag aerodynamic drag prediction for high angles of attack and multielement airfoils p0020 N74 14718
Prediction of buffet onset for aircraft recent progress in wind tunnel and flight test data correlation p0021 N74 14725
A model for the prediction of the oculogyric response to angular and linear accelerations stimulus mechanism of saccade generation vestibulo ocular reflex p0110 N74 20752
PRESSURE
Physiological responses to alternating stresses of exercise and hypercapnia under acute and chronic exposure to ambient P sub CO2 of 21 mm Hg p0070 N71 20370
PRESSURE BREATHING
Positive pressure breathing for increased human acceleration tolerance p0106 N73 19156
PRESSURE DISTRIBUTION
Approximation of pressure distribution on wing body configurations at subsonic speeds p0003 N71 19364
Calculation of pressure distributions over wings with harmonic oscillating control surfaces using kernel function method p0009 N71 29346
Asymptotic expansion technique to define pressure rating effects on wings with tubular elastomer surfaces p0010 N71 29348
Reynolds number effect on flow past body of revolution at transonic speed p0012 N72 11864
Pressure plotting tests on sweptforward wing for analyzing scale effect at high subsonic speeds p0013 N72 11867
Heat transfer and pressure distribution rates and pitot pressure probes for future air boundary layers at subsonic and hypersonic speeds p0179 N72 20351
Application of blockage corrections for flutter model wind tunnel test measurements of aircraft pylons p0042 N73 15006
Analysis of separated turbulent incompressible flow past unpowered and powered airfoils at high lift attitudes p0042 N73 15007
Analysis of surface pressure distributions from jet impingement on a flat plate with application to design of vertical and oblique jet V/STOL aircraft p0292 N73 29909
Drag characteristics of rarefied flow effects of base pressure drag and skin friction drag p0021 N74 14730
Strong interference effects and wave drag at transonic speeds p0022 N74 14737
PRESSURE EFFECTS
Improved rotating method for future rotor blades p0250 N71 12397

PRESSURE GRADIENTS
Transformation function for turbulent boundary layers with optional pressure gradient p0176 N72 20078
Coupling effects between wall heating and axial pressure gradients in turbulent boundary layer flow [NASA CR 125903] p0176 N72 20281
Model for compressible turbulent boundary layer applicable to flows with pressure gradient and surface mass transfer p0176 N72 20283
Compressible turbulent boundary layer velocity and temperature profiles with zero pressure gradient p0177 N72 20287
Streamwise pressure gradient effects on two-dimensional compressible turbulent boundary layers at high Reynolds number p0177 N72 20289
Effects of adverse pressure gradient on compressible turbulent boundary layer flow p0179 N72 20299
Numerical techniques for determining flow characteristics of supersonic turbulent boundary layer in adverse pressure gradient p0179 N72 20300
The drag resulting from three-dimensional separations caused by boundary layer diverters at transonic, subsonic, and supersonic flow p0021 N74 14728

PRESSURE MEASUREMENTS
Unsteady pressure measurements on harmonically oscillating swept wing with two control surfaces in compressible flow p0010 N71 29350
Development of two experimental approaches for analyzing two dimensional flow on high lift devices p0042 N73 15025
Comparison of various methods for calculating profile drag from pressure measurements in the near wake at subsonic speeds p0020 N74 14721
Effects of excessive hydrostatic pressure on the vestibular system — human vertigo due to pressure changes in Eustachian tubes p0110 N74 20755

PRESSURE OSCILLATIONS
Inlet ramp pressure fluctuation effects on turbojet engine stall characteristics p0037 N72 27022

PRIMATES
Three primate species undergoing weightlessness p0099 N72 19127

PRINTED CIRCUITS
Computer aided design of multilayer printed circuit boards p0168 N74 13934
Optimizing automatic tracking of multilayer boards p0168 N74 13935
A parallel processor for printed circuit boards p0138 N74 13936

PROBABILITY THEORY
Modeling approximation probability of acquiring guided target as function of its range as target is approached p0302 N73 19962
Probability of acquiring targets by search aircraft which flies along enemy line of communication p0304 N73 19973

PROBLEM SOLVING
Asymptotic expansion techniques to define pressure testing effects on wings with unbalanced control surfaces p0010 N71 29348
Numerical method for evaluating downwash distribution for steady flow over swept and rectangular wings p0010 N71 29349
Man machine approach toward solving various routing scheduling and network problems p0154 N72 11199

PRODUCT DEVELOPMENT
Computer aided design concepts p0165 N74 13912

PRODUCTION ENGINEERING
Engineering aspects and manufacturing of gas turbine engines for helicopters and ground transportation vehicles p0262 N71 26951
Systems analysis for selection and application of materials p0205 N71 27039

PRODUCTION PLANNING
Production and efficiency of small gas turbine engines for helicopters and surface vehicles [AGARD LS 46 71] p0261 N71 26951

PROGRAMMING LANGUAGES
Automatic operational control aerodrome systems using high level symbolic languages p0167 N74 13929
Specification and design of languages for high systems p0168 N74 13930

PROJECT PLANNING
Program design for study of engine aircraft reference systems p0253 N72 16686

PROJECTILES
Measurement of drag on a dark target p0023 N74 14738

PROPAGATION MODELS
Acoustic gravity wave propagation models in ionosphere and neutral atmosphere following nuclear explosions [CONTRIB 1799] p0235 N73 14146

PROPELLER BLADES
Markings for propeller conspicuity [AGARD AR 56] p0092 N74 12753

PROPRIOCEPTION
Vestigial labyrinth p0110 N74 20753

PROPULSION
Engine aircraft interference thrust losses, nozzles and propulsion systems interference [AGARD CP 91 71] p0263 N72 16685
Research development methods and trends at Propulsion Test Center, France p0263 N72 16693
Inlet, engine and exhaust nozzle tests for supersonic propulsion system [NASA TM X 67494] p0263 N72 16692
Propulsion jet flow for vertical takeoff aircraft p0265 N72 16700

PROPULSION SYSTEM CONFIGURATIONS
Design problems of inlets and nozzles used in supersonic and V/STOL propulsion systems [NASA TM X 67741] p0267 N72 21819
Design parameters and characteristics of intermittent pulse jet engine for use as auxiliary power source p0065 N73 19047

PROPULSION SYSTEM PERFORMANCE
Fuel related problems in aircraft fuel systems emphasizing hydrogenated fuel p0252 N72 11677
Feasibility analysis of solid lubricated ball bearings for aircraft propulsion systems application p0255 N72 11710
Destabilizing factors affecting supersonic inlets and turbofan engines of propulsion system p0266 N72 16711
Analysis of gas turbine engine requirements and performance when main power system furnishes auxiliary power source p0065 N73 19050

PROTECTION
Protective aspects of passive restraints for vehicles p0103 N72 19156

PROTECTIVE CLOTHING
Materials and design of protective gloves p0102 N72 19143
Performance tests of protective clothing to determine effectiveness against blast during high speed ejection p0102 N72 19147
Failure standards and techniques involved in testing protective headgear p0104 N72 19163
Anthropometric equipment evaluation and human impact acceleration experiments p0084 N73 23066

PROTECTIVE COATINGS
Refractory metal alloys with protective coatings for use in structural components of nuclear engines p0203 N73 23674

PROTEIN METABOLISM
Protein losses in flying personnel p0087 N74 14832

PROTOTYPES
Passive systems interpretation and simulation techniques based on prototype of Canadian ocean surveillance transport aircraft p0075 N72 26052

PSYCHIATRY
Application of psychotherapy in aviation psychiatry for treatment of syndromes of reactive nature p0069 N71 20365
Psychiatric reasons for permanent grounding of flight crew members in Royal Air Force p0098 N72 14110

PSYCHOACOUSTICS
Effects of high intensity noise levels on human vestibular system and production of dizziness, ataxia and nausea [AMRL TR 71 58] p0072 N72 25038

PSYCHOLOGICAL EFFECTS
Physiological and psychological limits and ranges of human response to acoustic stress p0067 N71 20352
Physiological and psychological effects of low and high magnetic fields on man [NASA CR 120491] p0076 N72 26055
Analysis of aircraft controller responses under stress conditions to show effects of air traffic quality and comprehensiveness of available data p0235 N73 23714

PSYCHOLOGICAL FACTORS
Statistical study of physiological, psychological factors surrounding crash of Royal Air Force Hunter jet aircraft p0095 N72 14091
Psychological factors in pilot grounding in German Air Force p0098 N72 14111
Human factors applicable to aircraft accident analysis, classification of human errors and remedial ways for reducing human error in aircraft accidents p0107 N74 18799
The human factor in civil aircraft accident patterns, statistical analysis of CF 104 aircraft accident patterns p0107 N74 18800
The psychologist's role in aircraft accident investigation p0107 N74 18803

PSYCHOLOGY
Psychological training for French Air Force flying personnel p0098 N72 14112
Sports medicine parameters necessary for maintaining competitive form p0081 N73 21114

PSYCHOMETRICS
Use of psychometric tests to account for subjective variations in operators performance relative to target acquisition p0034 N73 19974
Selection of test procedures and standards for Belgian Air Force flying personnel p0088 N74 18788

PSYCHOMOTOR PERFORMANCE
Systematic investigation of display design based on operations with pilot psychomotor activity [NASA CR 126756] p0273 N72 27627
Combined noise and vibration effects on human reaction and psychomotor performance [AMRL TR 71 135] p0105 N73 19147
Human performance as an essential task requisite for assessment of perceptual motor skills, pilot flight class p0176 N73 19353
Measurements of human operator stress effects on pilot eye movement ability and flight control performance [AMRL TR 72 3] p0186 N73 19356

PSYCHOPHYSIOLOGY
Aging effects on pilot psychophysiological abilities and flying proficiency p0093 N71 22319
Occurrences of vertigo in hyperbaric atmospheres and among underwater divers with theoretical explanations of etiology involved p0072 N72 25043
Human stress expenditures in operational aircraft on specific flights p0106 N73 19151

PSYCHOSOMATICS
Drug therapy effects on flying effectiveness and psychosomatic illness of flying personnel p0080 N73 21103

PSYCHOTHERAPY
Application of psychotherapy in aviation psychiatry for treatment of syndromes of reactive nature p0069 N71 20365
Physical exercise and environmental emotional psychotherapeutic methods in aerospace medicine p0092 N71 22310
Aeronautical rehabilitation of flying personnel suffering from acute psychiatric disturbances p0086 N74 13796
Assessment of behaviour therapy in the treatment of flying phobias p0088 N74 18783

PSYCHOTIC DEPRESSION
Depressive overview p0088 N74 18784

PULMONARY FUNCTIONS
Respiratory gas analyzer for in flight pulmonary function measurements [NASA TM X 68370] p0074 N72 25057

PULSE CODE MODULATION
Application of complementary MOS circuits to pulse code modulation systems for photoelectricity of X ray region of solar corona and incorporation of quartz clock with PCM output p0192 N72 19501
Development of pulse code modulation system for encoding and formatting data using airborne onboard equipment p0193 N72 19503
Development of high speed PCM telemetry encoder for data storage and processing being space research p0193 N72 19504
Noise and error effects in differential pulse code modulation transmission of sampled aerial imagery p0331 N73 10195

PULSE COMMUNICATION
Conference on unexploded aerospace telecommunication system requirements and digital data transmission methods [AGARD CP 103] p0139 N73 10187
Interference and interference cancellation effects on phase modulated digital microwave radio systems p0134 N73 10211
Proceedings of conference on spread spectrum techniques and applications to satellite communications systems [AGARD LS 58] p0143 N73 32053
Feedback for improved communication theory by multiple transmission of redundant signals and use of discrete time signals p0143 N73 32054
Characteristics of digital communication systems and processing of bandpass digital passive spread spectrum techniques for data transmission p0143 N73 32055
Principles and operational spread spectrum communication system with application to satellite communications systems p0143 N73 32056
Performance of spread spectrum communication systems to include effects of various forms of channel noise and synchronization aspects of systems p0143 N73 32057
Application of spread spectrum communications techniques to avionics systems p0143 N73 32058

PULSE DURATION
Effects of accelerated stress and cycle duration on flight lifetimes of turbine wheels [NASA TM X 68445] p0075 N72 26051

PULSEJET ENGINES
Design parameters and characteristics of intermittent pulse jet engine for use as auxiliary power source p0065 N73 19047

PYROLYTIC GRAPHITE
Boundary layer effects at combustion temperatures p0259 N74 14290

PYROLYTIC MATERIALS
Properties and selective application of ceramic materials p0265 N71 27041

Q

Q SWITCHED LASERS
Analysis of cavity systems used with Q switched laser range finding and target tracking systems p0194 N72 19513
Development of radiation resistant optical components for use with Q switched ruby lasers [NASA CR 126767] p0199 N72 20501

QUALITY CONTROL
Development of systems for improved quality control of semiconductor devices and design of spacecraft electronic equipment p0191 N72 19487
Application of automatic scanning microscopy for failure analysis and prediction tests of semiconductor devices p0197 N72 19488
Engine test and checkout facility, initial delivery, acceptance test and checkout of prototype T56 engine for Canada, Armed Force p0036 N72 26987

Nondestructive test for failure inspection and quality control of composite structures and materials conference
[AGARD R 690] p0290 N72 24934
Nondestructive tests applied to quality control of airframes made of boron composites p0290 N72 24936
QUANTUM MECHANICS
Wave mechanics theory for assessing remote sensing in atmospheric turbulence with refractivity variations p0125 N72 16116
QUASI STEADY STATES
Development and characteristics of high intensity direct reading heat flux gage of quasi steady state type
[SC DR 710194] p0190 N71 36789

R

RADAR
Cardiac and neural effects of UHF radar energy on frogs p0068 N71 20354
Characteristics and effects of Arctic ionosphere on radio and radar propagation conference
[AGARD CP 97] p0128 N72 21121
Auroral radar network for statistical and single event studies of radio aurora morphology and scattering mechanisms p0127 N72 21127
Radar aurora studies using backscatter radar p0127 N72 21129
Radar aurora at frequency of 1295 MHz p0127 N72 21130
Ionospheric propagation model and application to high latitude HF radar propagation p0130 N72 21153
RADAR BEACONS
HF auroral backscatter scintillation theory and satellite beacon recordings p0130 N72 21150
RADAR CLUTTER MAPS
Remote sensing of ocean surface effects and formulation of sea clutter models p0122 N72 16096
Radar sea clutter sea state effects on cross sectional echo characteristics p0145 N74 11962
RADAR CROSS SECTIONS
Determination and use of Radar Scattering Characteristics
[AGARD LS 59] p0143 N74 11954
Computational and analytical determination of RCS p0144 N74 11956
Static pull scale measurements of RCS p0144 N74 11957
Dynamic full scale measurement of RCS p0144 N74 11958
Radar Echoing areas of flying animals p0144 N74 11961
Radar sea clutter sea state effects on cross sectional echo characteristics p0145 N74 11962
Presentation and storage of radar cross section data p0145 N74 11964
The use of RCS data for radar systems design p0145 N74 11966
State of the art and future prospects p0145 N74 11967
RADAR DATA
Presentation and storage of radar cross section data p0145 N74 11964
State of the art and future prospects p0145 N74 11967
RADAR DETECTION
Radar observations of meteor trains for detecting high altitude gravity waves p0137 N73 14154
RADAR ECHOES
Airborne measurements on radio attenuation and radar reflectivity by precipitation by microwave frequencies p0115 N71 21417
Airborne remote radar sensor for depth sounding in Antarctic ice p0123 N72 16099
Matrix method for real time adaptive pre whitening filter for radar echo signal processing p0132 N73 10197
Detection of tropospheric turbulence and gravitational waves by radar sounding p0137 N73 14151
Determination and use of Radar Scattering Characteristics
[AGARD LS 59] p0143 N74 11954
Modelling methods of determining radar echo characteristics optical ultrasonic and radio methods p0144 N74 11959
Radar Echoing areas of flying animals p0144 N74 11961
The use of target and clutter data for different methods of discrimination between targets and unwanted clutter processing of incoherent video and coherent radar signals p0145 N74 11963
RADAR EQUIPMENT
Sweep frequency backscatter radars as diagnostic tools of high latitude ionospheric phenomena p0129 N72 21147
Biological effects of UHF electromagnetic radar emissions on human organisms p0076 N72 26053
Analyses of airborne design techniques and development of specifications for airborne construction
[AGARD AR 63] p0140 N73 23108
RADAR IMAGERY
Radar imaging applications for study of earth resources p0121 N72 16090
Radar imagery for land ice characterization frequencies of radar slopes on geographic mapping p0122 N72 16091
Interpretation of side looking airborne radar imagery for vegetation mapping
[NASA CR 125451] p0122 N72 16092
Backscatter properties of ground vegetation for radar waves at X band and Ka band frequencies p0122 N72 16093
Narrow pulse width radar system for measuring ocean wave heights p0122 N72 16094
Remote sensing of ocean surface effects and formulation of sea clutter models p0122 N72 16096
BOAC experience with turbulence performance requirements for clear air turbulence detecting sensors p0058 N74 17726
RADAR MAPS
Presentation and storage of radar cross section data p0145 N74 11964
RADAR MEASUREMENT
Static pull scale measurements of RCS p0144 N74 11957
Dynamic full scale measurement of RCS p0144 N74 11958
Target characteristics radar measurements on scaled models p0144 N74 11960
RADAR NAVIGATION
Terrain avoidance radar for US Army rotary wing aircraft p0032 N72 11927
Computerized multistage decision process for radar operator aid in collision avoidance trajectory control p0279 N73 23886
RADAR PHOTOGRAPHY
Airborne remote multispectral photographic infrared and side looking radar sensing for locating construction materials p0121 N72 16087
Microwave radar detection and photography of gravitational waves in troposphere p0137 N73 14152
RADAR RANGE
Boundary layer theory and meteorological parameters for radar range prediction over sea surface p0121 N71 23474
RADAR SCATTERING
Analysis of radar backscatter from the sea dielectric properties of materials and slant range radar measurements p0126 N72 16119
High frequency radar backscattering technique for determining ionospheric structure and gravity wave disturbances pc137 N73 14155
Determination and use of Radar Scattering Characteristics
[AGARD LS 59] p0143 N74 11954
Introductory lecture Target scattering characteristics of importance to radars p0144 N74 11955
Target characteristics radar measurements on scaled models p0144 N74 11960
State of the art and future prospects p0145 N74 11967
RADAR SIGNATURES
High frequency radar backscattering technique for determining ionospheric structure and gravity wave disturbances pc137 N73 14155
RADAR TARGETS
Determination and use of Radar Scattering Characteristics
[AGARD LS 59] p0143 N74 11954
Introductory lecture Target scattering characteristics of importance to radars p0144 N74 11955
Use of radio modeling data for radar target assessment p0145 N74 11965
The use of RCS data for radar systems design p0145 N74 11966
RADAR TRANSMISSION
Tropospheric characteristics and their effects on electromagnetic wave propagation and radio signal transmission
[AGARD CP 70 71 PT 1] p0114 N71 21409
Improved tropospheric wave propagation for military applications p0114 N71 21410
Satellite cloud cover observations for determining radio and radar propagation characteristics p0114 N71 21414
Tropospheric stratification effects on radio propagation and signal distortion p0116 N71 21423
Polar propagation effects on HF radar in auroral and subauroral regions p0129 N72 21142
RADIAL FLOW
Design and component testing of cooled radial gas turbine engine p0258 N71 17381
RADIANT FLUX DENSITY
Radiance distribution as function of depth in upper layers of ocean and numerical analysis of inherent and apparent optical properties p0241 N73 13621
RADIATION DOSAGE
Passive dosimetry for measuring cosmic radiation dosage and its effects during manned space flight p0075 N72 26048
Passive dosimetric interpreter of cosmic radiation dose rate onboard free flight prototype of Concorde 001 supersonic transport aircraft p0075 N72 26052
RADIATION EFFECTS
Conference on biological effects and possible hazards of microwave radiation
problems of sampling and measuring gradient effects during flight altitude flight unmanned space flight and ground based equipment
[AGARD CP 95 PT 3] p0075 N72 26045
Biological effects of UHF electromagnetic radar emissions on human organisms p0076 N72 26053
Navy research and instrumentation for analyzing nonionizing radiation effects on human personnel p0076 N72 26054
RADIATION HAZARDS
Biophysical hazards of cosmic radiation during SST and manned space flight p0035 N72 26046
RADIATION INJURIES
Naval research on laser caused visual acuity decrement in monkeys and ocular injury in humans p0076 N72 26056
Safety codes for operators using laser equipment p0076 N72 26057
RADIATION MEASUREMENT
Statistical estimating techniques for inversion of radiative transfer equation in determining atmospheric temperature from microwave radiation measurements p0125 N72 16113
RADIATION MEASURING INSTRUMENTS
Navy research and instrumentation for analyzing nonionizing radiation effects on human personnel p0076 N72 26054
RADIATION PROTECTION
Active dosimetry for protection and control of cosmic rays in supersonic aircraft p0075 N72 26047
RADIO ATTENUATION
Measurements of rainfall attenuation at millimeter wavelengths p0114 N71 21415
Airborne measurements on radio attenuation and radar reflectivity by precipitation by microwave frequencies p0115 N71 21417
Tropospheric attenuation of low incidence satellite radio signals at 15 to 2m wavelengths p0115 N71 21420
Radio attenuation prediction method using stratified atmospheric level indices p0120 N71 23468
Analysis of 11 GHz band propagation in Portugal for rain accumulation prediction p0148 N74 13869
RADIO BEACONS
Measurements on microwave attenuation by precipitation by ATS 5 satellite beacon p0115 N71 21419
Tropospheric scattering field strength analysis by synchronously offset radio beacon transmissions p0118 N71 23455
Design development and application of flight recorders and crash location instruments used in NATO nations
[AGARD AR 39] p0195 N72 32457
RADIO COMMUNICATION
Analysis of amplitudes and frequencies of signal fading in satellite to aircraft radio links due to multiplexing of radio signals p0194 N72 19509
Interchannel interference and Gaussian noise effects on phase modulated digital microwave radio systems p0134 N73 10211
Conference on acoustic gravity wave effects in atmospheric transmission of radio communication signals
[AGARD CP 115] p0134 N73 14131
RADIO ECHOES
Modelling methods of determining radar echo characteristics optical ultrasonic and radio methods p0144 N74 11959
RADIO ELECTRONICS
Systems performance and safety in helicopter approach and landing and radioelectronic guidance array p0024 N72 11939
RADIO FREQUENCIES
Development and characteristics of three axis radio frequency altitude sensor for geostationary satellite p0191 N72 19492
RADIO FREQUENCY INTERFERENCE
Interchannel interference and Gaussian noise effects on phase modulated digital microwave radio systems p0134 N73 10211
Conference on acoustic gravity wave effects in atmospheric transmission of radio communication signals
[AGARD CP 115] p0134 N73 14131
Atmospheric gravity wave effects on ionospheric transequatorial radio wave propagation in presence of traveling ionospheric disturbances p0139 N73 14164
Effects of traveling ionospheric disturbances following nuclear explosion on high frequency band propagation p0139 N73 14167
The interpretation of propagation effects and design factors for fixed service communications satellite systems p0149 N74 13871
RADIO HORIZONS
Very high frequency and ultrahigh frequency transhorizon signal propagation modes p0116 N71 21426
RADIO INTERFEROMETERS
Characteristics of directional polarization antenna array for very high frequency radio interferometer p0134 N73 10213
RADIO METEOROLOGY
Climatology and atmospheric radio noise models for worldwide radio wave propagation p0114 N71 21412
RADIO RELAY SYSTEMS
Rain attenuation and multipath fading in ultrahigh frequency radio relay systems p0142 N73 26134
Rain attenuation statistics for ultrahigh frequency microwave link using meteorological data p0142 N73 26135
Multipath signal measurements for planning ultrahigh frequency radio link p0142 N73 26137
Effects of tropospheric turbulence on ultrahigh frequency space ground radio relay p0143 N73 26141

The radiation diagrams of antennas used in terrestrial microwave line of sight systems radiation patterns of parabolic antennas in terrestrial relay system p0147 N74 13859

RADIO SCATTERING

Ray tracing computations of high frequency signal propagation and dispersion in traveling ionospheric disturbances p0139 N73 14165

Multiple scattering and attenuation of radio signals caused by rainfall p0140 N73 26122

Precipitation models from radar and rainfall data for predicting radio scattering in rainstorms p0146 N74 13854

Measurements of precipitation scatter at 11.8 GHz p0147 N74 13855

RADIO SIGNALS

Tropospheric attenuation of low incidence satellite radio signals at 15 to 2m wavelengths p0115 N71 21420

Ducting in microwave propagation on transhorizon path over sea p0116 N71 21427

High latitude studies of scintillation in radio signals from radio sources and satellites p0128 N72 21137

RADIO SOURCES (ASTRONOMY)

High latitude studies of scintillation in radio signals from radio sources and satellites p0128 N72 21137

RADIO SPECTRA

Use of radio modeling data for radar target assessment p0145 N74 11985

RADIO TELEMETRY

Tropospheric turbulence effects on superhigh frequency transmissions at low elevation angles p0115 N71 21422

RADIO TELESCOPES

Homologous deformation of stiffened shells for radio telescope structures p0298 N74 15616

RADIO TRANSMISSION

Climatology and atmospheric refraction models for worldwide radio wave propagation p0114 N71 21412

Satellite cloud cover observations for determining radio and radar propagation characteristics p0114 N71 21414

Real time weather radar data on tropospheric microwave attenuation by rain p0114 N71 21416

ATS 5 down link 15 GHz signal propagation compared to ground based radio and meteorological data p0115 N71 21418

Tropospheric stratification effects on radio propagation and signal distortion p0118 N71 21423

Radio reflectivity calculations for tropospheric elevated layers during transhorizon propagation p0116 N71 21424

Very high frequency and ultrahigh frequency transhorizon signal propagation modes p0116 N71 21426

Very high frequency signal fading in diffraction scatter path propagation p0117 N71 21431

Tropospheric scatter propagation and prediction of radio transmission characteristics [AGARD CP 70 71] p0117 N71 23451

Tropospheric refractivity variation effects on radio wave scatter propagation p0117 N71 23452

Antenna response patterns, Doppler spectra and amplitude distributions of transhorizontal microwave scatter propagation p0117 N71 23453

Scanning forward scatter mapping and turbulent layer model for tropospheric scatter propagation analysis p0118 N71 23454

Tropospheric scattering field strength analysis by synchronously offset radio beam transmissions p0118 N71 23455

Atmospheric circulation model for analyzing tropospheric ultrahigh frequency signal fading p0118 N71 23456

Mathematical model for partial reflection from tropospheric layers in radio transhorizon propagation p0118 N71 23457

A gyle diversity propagation paths of spaced antennas in tropospheric transhorizon scatter link p0118 N71 23458

Maxwell field theory for solving wave path correlativity in tropospheric scatter propagation p0119 N71 23462

Multipath transmission models for predicting signal distortion and intermodulation in tropospheric scatter propagation p0119 N71 23463

Mathematical model for frequency correlation factor of tropospheric scatter channel p0119 N71 23464

Impulse response measurements and radio test link for evaluating tropospheric scatter propagation channel capacity p0119 N71 23466

Computerized simulation of tropospheric scatter channel distortion using Monte Carlo method p0119 N71 23467

Path loss prediction methods for tropospheric radio scatter propagation links and comparison with performance tests p0120 N71 23469

Mathematical prediction model for tropospheric radio transmission loss over high orders p0120 N71 23472

Ray tracing computations of high frequency signal propagation and dispersion in traveling ionospheric disturbances p0139 N73 14165

Nonspherical raindrop depolarization of electromagnetic wave in ultrahigh frequency radio link p0140 N73 26123

Multipath propagation and phase delay in ultrahigh frequency radio wave scattered by atmospheric discontinuity p0140 N73 26124

Attenuation and phase dispersion of radio wave in atmosphere due to oxygen microwave spectrum p0141 N73 26126

Ultrahigh frequency coherent radio signal transmission for differential phase shift measurements due to water and oxygen absorption lines p0141 N73 26131

Point rainfall rate statistics for predicting ultrahigh frequency radio propagation p0142 N73 26136

Calculation of electromagnetic wave absorption by rain for frequencies close to 30 GHz p0142 N73 26138

Thunderstorm cloud height and fading statistics for ATS 5 ultrahigh frequency signal transmission to earth p0142 N73 26141

Propagation effects of frequency sharing [AGARD CP 127] p0145 N74 13846

The propagation of electromagnetic waves over irregular terrain radio wave diffraction and transmission loss p0148 N74 13848

Radio wave diffraction due to a mountain of volcanic origin p0148 N74 13851

Tropospheric propagation in an equatorial climate p0148 N74 13865

Measurement of atmospheric attenuation at the frequencies of 15, 19 and 34 GHz atmospheric effects on microwave transmission p0149 N74 13870

RADIO WAVE REFRACTION

Slant path attenuation of ultrahigh frequency signals from sun tracking radiometers p0142 N73 26140

Tropospheric influence on the screening effect due to a mountain ridge on 3 GHz radio transmission loss due to atmospheric refractivity p0146 N74 13853

Ducting properties of elevated layers p0147 N74 13867

RADIO WAVES

Tropospheric characteristics and their effects on electromagnetic wave propagation and radio signal transmission [AGARD CP 70 71 PT 1] p0114 N71 21409

Tropospheric scattering and delay effects on electromagnetic wave propagation in space communications p0114 N71 21413

Statistical evaluation of fading caused by intermodulation in combined long wave broadband propagation [CNET NT EST APH 1] p0117 N71 21433

Characteristics and effects of Arctic ionosphere on radio and radar propagation conference [AGARD CP 97] p0126 N72 21121

Auroral radar network for statistical and single event studies of radio aurora morphology and scattering mechanisms p0127 N72 21127

Radio waves steering from auroral formation [NASA TM X 68302] p0127 N72 21131

Ion acoustic waves in auroral plasma and radio wave scattering p0127 N72 21132

Radio wave time delay in auroras p0127 N72 21133

Angular deviations of radio waves from horizontal stratification p0128 N72 21139

Effects of Arctic ionospheric characteristics on radio and radar propagation [AGARD AR 33] p0130 N72 22136

Atmospheric gravity wave effects on ionospheric transionational radio wave propagation in presence of traveling ionospheric disturbances p0139 N73 14164

Variations in diffraction loss due to tropospheric effects at frequencies between 180 MHz and 10 GHz in hilly terrain p0146 N74 13852

RADIOACTIVE MATERIALS

Development and characteristics of instrument landing system using reradiative materials along runways for glide slope and alignment information p0234 N73 23707

RADIOGRAPHY

Necropsy and radiographic observations of spinal fracture and articular facet derangement patterns in rhesus monkeys [AMRL TR 71 17] p0101 N72 19139

RADIOLOGY

Radiological observations of spinal injuries in pilots caused by sudden ejection p0102 N72 19149

Radiological spinal examination of combat pilots and seating angle for ejection p0074 N72 25057

RADIOMETERS

Error correction procedures for radiometric infrared sea surface temperature measurements p0124 N72 16105

Effects of cloud inhomogeneities on infrared radiometric atmospheric temperature measurements p0124 N72 16106

Characteristics of imaging radiometers, installed on meteorological satellites for observing infrared and visible regions p0191 N72 15497

Measurement of atmospheric attenuation at the frequencies of 15, 19 and 34 GHz atmospheric effects on microwave transmission p0149 N74 13870

Some comments on methods of reducing the effects of both terrain and sea reflections and the precision of height finding radar data p0161 N74 17745

RADOME MATERIALS

Analysis of radome design techniques and development of specifications for radome structure [AGARD AR 53] p0141 N73 23108

RADOMES

Analysis of radome design techniques and development of specifications for radome structure [AGARD AR 53] p0141 N73 23108

RAIN

Measurements of rainfall attenuation at microwave wavelengths p0114 N71 21415

Real time weather radar data on tropospheric microwave attenuation by rain p0114 N71 21416

Point rainfall rate statistics for predicting ultrahigh frequency radio propagation p0142 N73 26136

Effects of rain and atmospheric turbulence on ultrahigh frequency space communication radio link p0143 N73 26143

RAINDROPS

Conference on atmospheric attenuation and rainfall effects on ultrahigh frequency telecommunication systems [AGARD CP 107] p0140 N73 26121

Multiple scattering and attenuation of radio signals caused by rainfall p0140 N73 26122

Nonspherical raindrop depolarization of electromagnetic wave in ultrahigh frequency radio link p0140 N73 26123

Rain depolarization of linearly and circularly polarized microwaves p0141 N73 26127

Horizontal radio link system for measuring ultrahigh frequency absorption spectrum due to rain p0141 N73 26130

Scattering in transhorizon ultrahigh frequency radio link due to rain p0141 N73 26133

Rain attenuation and multipath fading in ultrahigh frequency radio relay systems p0142 N73 26134

Rain attenuation statistics for ultrahigh frequency microwave link using meteorological data p0142 N73 26135

Calculation of electromagnetic wave absorption by rain for frequencies close to 30 GHz p0142 N73 26138

RAINSTORMS

Precipitation models from radar and rainfall data for predicting radio scattering in rainstorms p0146 N74 13854

RAMJET ENGINES

Design and characteristics of auxiliary power source to operate electrohydraulic and pneumatic subsystems of ramjet powered aerospace vehicles p0065 N73 19048

RANDOM LOADS

Summaries of papers presented to AGARD conference on random load fatigue [AGARD AR 54] p0292 N73 28884

RANDOM PROCESSES

Modeling of random human visual search performance based on physical properties of eye p0302 N73 19961

RANGEFINDING

Techniques for long range viewing underwater using range gating and dual scan with parallax techniques p0242 N73 33636

RARE EARTH ELEMENTS

Effects of oxide dispersions and rare earth elements on ductility of Cr and Mo at low temperatures p0202 N73 23608

RAREFIED GAS DYNAMICS

Drag in hypersonic rarefied flow effects of base pressure drag and friction drag p0021 N74 14730

RATES (PER TIME)

Analysis of 11 GHz band propagation in Portugal for rain accumulation prediction p0148 N74 13869

RAY TRACING

Ray tracing method for calculating paths of a point and gravity waves in atmosphere p0134 N73 14133

Computerized simulation of gravity wave perturbed traveling ionospheric disturbances using radio ray paths p0139 N73 14163

Explanation of very low field strength levels received in night paths over sea due to meteorological conditions p0148 N74 13868

REACTION KINETICS

Chemical Kinetics in the stratosphere atmospheric response to sea atmospheric chemistry based on global circulation rate tests p0218 N74 14279

REACTION TIME

Stresses and adaptation problems associated with large scale long range rapid real time aerial troop deployments p0069 N73 29360

Pilot performance under catapult launch and helicopter type deceleration p0080 N73 21170

Computer electroencephalography for evaluating the influence of psychopharmacological drugs on vigilance p0109 N74 20749

READERS

A computer controllable optical character reader p0160 N74 16936

A research worker's view on the future of automatic reading machines p0161 N74 16938

REAL TIME OPERATION

Description and checkout of a computer program for real time control of aerospace vehicles p0135 N72 21215

Digital receiver for data relay moderate data rate phase shift keyed system real time p0132 N73 10196

Real time analysis of multichannel electroencephalographic recordings p0181 N73 33664

RECEPTORS (PHYSIOLOGY)

Alkylating agents as mutagens and antineoplastic agents p0078 N71 21095

RECTANGULAR WINGS

Numerical method for evaluating the compressible flow past thick wash free wings with leading and trailing edge separation p0301 N72 29349

Influence of various airfoil sections on the longitudinal characteristics of low aspect ratio wings with leading edge separation p0301 N73 21043

REDUNDANCY

Algorithm for redundancy reduction of digital speech codes p0113 N71 19780

REENTRY VEHICLES

Structural optimization of metallic material for use in flight vehicles [AGARD AG 157 V3] p0206 N71 24227

Techniques for measuring heat transfer in short duration and rapidly varying flows
[AGARD-AG-165] p0300 N73 20945
Effects of environmental stresses on materials used in constructing glide reentry vehicles p0201 N73 23601

REFLEXES
A model for the prediction of the nystagmic response to angular and linear acceleration stimuli - mechanism of saccadic generation in vestibulo ocular reflex p0110 N74 20752

REFRACTION
Geometrical optics solution for plane electromagnetic wave propagation and reflection in nonhomogeneous isotropic medium p0123 N72 16100
Ionospheric refraction effect on geometry of field aligned ionization at HF and UHF in Northern Hemisphere p0130 N72 21152

REFRACTIVITY
Monte Carlo calculation on error probability distribution in sensing systems caused by refractive index of sensed medium p0125 N72 16115

REFRACTORY MATERIALS
Advanced cooling systems and heat resistant materials for turbine blades of high temperature aeronautical gas turbine engines
[AGARD CP 73 71] p0257 N71 17372
Thermal stress and low cycle fatigue reliability analyses on high temperature structural machine materials p0261 N71 17403
Structural data on brittle nonmetallic materials for use in designing reentry vehicles
[AGARD AG 152 71] p0205 N71 20027
Borides carbides and nitrides of silicon oxidation resistant refractory compounds for use in gas turbines and reentry vehicles p0203 N73 23616

REFRACTORY METAL ALLOYS
Thermal control coatings for refractory gas turbine materials p0259 N71 17391
Refractory metal alloys with protective coatings for use in structural components of turbine engines p0203 N73 23614
Oxidation resistant refractory metal alloys for use in high temperature environments p0203 N73 23615
Methods of oxidation and corrosion resistance in refractory metal alloys used in gas turbine engines p0202 N73 23617

REFUELING
Aviation fueling facilities and fueling ope... p0... N72 11678

REGENERATIVE COOLING
Design and component testing of cooled radial gas turbine engine p0258 N71 17381

REGRESSION ANALYSIS
Regression analysis of estimation tests and system operating data p0189 N71 36778

REGULATIONS
Procedures for application and revision of Federal Aviation Regulations in determining handling qualities and performance of aircraft p0018 N72 32020

REINFORCED PLASTICS
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference
[AGARD CP 83 71] p0206 N72 12492
Mechanical properties of silica fiber reinforced epoxy composite materials p0207 N72 12493
Extensometric measurements of elastic modulus of resin fiber composite materials p0207 N72 12495
Linear and nonlinear stress characteristics of epoxy silica composite materials p0207 N72 12496
Axial tension test for stress strain response of matrix and reinforcing fibers in glass epoxy resin composites p0207 N72 12500
Electrical conductance measurements for determining stress strain time life of glass fiber to resin interfacial bond in reinforced plastic materials exposed to water p0208 N72 12505
Ultrasonic radiographic eddy current and acoustic emission techniques for nondestructive tests of carbon fiber reinforced polymers and failure mechanisms p0290 N72 24935
Physical and mechanical properties of high strength high modulus reinforcing fibers and organic resin composite materials p0210 N73 27475
Analysis of properties of fiber reinforced materials with plastic and metallic matrix composition and application to gas turbine engines p0210 N73 27476
Characteristics of carbon fiber composite materials and structures with reduced weight fatigue reduction and corrosion resistance p0210 N73 27477
Production of fiber metal composites by rolling of powder with strong reinforcing wires and application to aerospace vehicle structures p0210 N73 27478
Design of filamentary composite materials for application to construction of airframes and spacecraft structures p0210 N73 27479
Construction of gliders and all wing glass fiber and carbon fiber reinforced plastic composite materials for weight reduction and increased strength p0211 N73 27486
Application of random composite materials for construction of aeronautical gas turbine engines p0212 N73 27494
Development of fiber reinforced composite materials for application to air breathing engines aerospace vehicles and spacecraft components p0212 N73 27495

REINFORCED SHELLS
Computerized design of stiffened cylindrical shells and ablating composite heat shield p0284 N71 20137

REINFORCEMENT (STRUCTURES)
Characteristics of carbon fiber composite materials and application for structures with reduced weight fatigue reduction and corrosion resistance p0210 N73 27477
Application of composite materials to reinforce metallic structures for low cost improvement in structural stability of airframes p0211 N73 27485
Analysis of dynamics of stiffened plates using finite element modelling of flat and curved stiffened panels p0293 N73 29911

REINFORCING FIBERS
Thermal fatigue behavior of fiber reinforced nickel alloy gas turbine blades p0259 N71 17390
Mechanical properties of fiber reinforced materials p0206 N71 27043
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference
[AGARD CP 83 71] p0206 N72 12492
Error sources in elastic stress measurements on fiber reinforced composite materials p0207 N72 12498
Temperature and fiber orientation effects on mechanical behavior of silicon dioxide epoxy composite materials p0207 N72 12499
Tensile strength measurements on steel wire reinforced aluminum alloys p0208 N72 12501
Explosive bonding technique for strengthening aluminum with beryllium wires p0208 N72 12502
Photoelastic measurement of monofilament wetting by reinforcing resins of composite materials p0208 N72 12506
Analysis of structural diffusion mechanism between beryllium fiber and aluminum matrix p0208 N72 12507
Fundamental principles for selecting reinforcements for composite materials p0209 N72 29591
Application of glass composites all carbon composites and PRD 49 organic fiber material for airframe and spacecraft construction p0211 N73 27482

RELATIVE BIOLOGICAL EFFECTIVENESS (RBE)
Relative biological effects of heavy cosmic ray ions on living tissue p0075 N72 26049

RELEASING
Optimal bomb release intervals from B 52 aircraft bomb ... system p0005 N71 19383

RELIABILITY
Reliability estimation including failure effect analysis of avionic systems p0189 N71 36777
Effectiveness of reliability programs for avionic equipment p0189 N71 36779
Techniques for determining reliability of electronic equipment after acceleration tests p0190 N71 36786
Benefits of totally integrated reliability test program p0190 N71 36787
Operational considerations and systems reliability of military user p0190 N71 36788

RELIABILITY ANALYSIS
Optimum structural design and reliability analysis p0284 N71 20138
Improvements in military helicopter flight test techniques to provide data for safety maintainability and reliability p0047 N73 21013
Procedures for evaluating fatigue quality of aircraft structures based on fatigue life crack propagation and residual strength p0294 N73 29925
Application of high strength structural materials for aerospace vehicles and use of fracture control procedures for improved damage tolerance p0294 N73 29928

RELIABILITY ENGINEERING
Cost effectiveness failure analysis and design techniques for measuring reliability of avionics systems
[AGARD LS 47 71] p0189 N71 36776
Linear modular design techniques for system reliability p0190 N71 36781
Techniques for determining system and equipment reliability requirements p0190 N71 36783
Measurement accuracy and flow simulation for transonic testing in wind tunnels
[NASA TM X 67415] p0014 N72 11872
Performance tests of protective clothing to determine effectiveness against blast during high speed ejection p0102 N72 19147
Development of system for improved quality control of semiconductor devices used in design of spacecraft electronic equipment p0191 N72 19487
Analysis of simple and complex subsystems for helicopter and operation of EUROPA 3 liquid vehicle p0191 N72 19490
Methods for conducting accelerated tests and reliability tests of gyroscopes and inertial platform quality control procedures p0278 N73 20689
Reliability and improvement safety of underwater electrotechnical lines p0047 N73 21012
Development of fatigue life prediction procedures based on measured stress time histories and mathematical models for the operational loading environment p0294 N73 29926

RELIEF MAPS
Radar imagery for producing cumulative frequency curves of terrain slopes in geographic mapping p0122 N72 16091

REMOTE CONSOLES
Microfilmed text access system which automatically retrieves scans and transmits to remote display terminals utilizing wideband transmission network p0157 N72 22169
Feasibility analysis of packet switching networks for remote access computing systems p0158 N72 22171

REMOTE SENSORS
Conference on propagation ranges of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements
[AGARD CP 90 71] p0121 N72 16085
Research and development program for military geographic information system using airborne radar and multispectral photographic data p0121 N72 16086
Airborne remote multispectral photographic infrared and side looking radar sensing for locating construction materials p0121 N72 16087
Analysis of remote Arctic ice pack sensing data obtained by submarine sonar airborne laser and infrared scanning imagery p0121 N72 16088
Design and performance of microwave radiometer for airborne sensing of sea ice thickness p0121 N72 16089
Radar imaging applications for studying earth resources p0121 N72 16090
Radar imagery for producing cumulative frequency curves of terrain slopes in geographic mapping p0122 N72 16091
Interpretation of side looking airborne radar imagery for vegetation mapping
[NASA CR 125451] p0122 N72 16092
Backscatter properties of ground vegetation for radar waves at X band and Ka band frequencies p0122 N72 16093
Narrow pulse width radar system for measuring ocean wave heights p0122 N72 16094
Remote satellite microwave sensing of sea surface roughness using water brightness temperature to determine wind fields p0122 N72 16095
Remote sensing of ocean surface effects and formulation of gravity models p0122 N72 16096
Side scatter propagation at higher frequencies for monitoring air pollution using remote optical radio and radar techniques p0122 N72 16097
Effects of atmospheric layers on remote sensing by electromagnetic wave reflections p0123 N72 16098
Airborne remote radar sensor for depth sounding in Antarctic ice p0123 N72 16099
Ultrahigh resolution radar for sensing refractive index structure of troposphere p0123 N72 16101
Underwater acoustic beam width effects on signal scattering at rough surface of sea floor p0123 N72 16102
History and future developments in infrared and multispectral remote sensing devices
[NASA TM X 67496] p0123 N72 16103
Scattering and attenuation of remote infrared imaging instrument signals during atmospheric propagation p0123 N72 16104
Error correction procedures for radiometric infrared sea surface temperature measurements p0124 N72 16105
Effects of cloud thickness on infrared radiometric atmospheric temperature measurement p0124 N72 16106
Error sources in sea surface temperature measurements by satellite borne scanning infrared sensor p0124 N72 16107
Multispectral reflectivity ... in near infrared and visible regions for planning remote multiband terrain photography p0124 N72 16109
Aerial multispectral color photography for remote reconnaissance of soils and rocks p0124 N72 16110
Analysis of satellite multispectral imagery data for tropical land use interpretation p0124 N72 16111
Geometric optics theory for microwave brightness temperatures of rough sea surface emissions for remote sensing data interpretation p0124 N72 16112
Monte Carlo calculation on error probability distribution in sensing systems caused by refractive index of sensed medium p0125 N72 16115
Wave mechanics theory for assessing remote sensing atmospheric turbulence with celestial body variations p0125 N72 16116
Development and characteristics of three axis station frequency attitude sensor for geostationary satellite p0191 N72 19497
Characteristics of sensors for spacecraft attitude determination by celestial earth/atmosphere visible and infrared spectra p0192 N72 19495
Characteristics of sensor system for spin stabilized spacecraft to determine satellite attitude during transfer orbit p0192 N72 19496
Development of high precision sensor for attitude control of ATS F geology satellite p0192 N72 19499
Application of earth's atmosphere spectral emission and absorption for control of Nimbus Experimental Satellite p0192 N72 19500
Space environment effects on sensing the effects of turbulence ... infrared radiometers and Coherent lidar to detect ... clear air turbulence p0060 N74 17744

REPORTS
Publication ... of AGARD publications To be set by the publications ... to differ ... of AGARD publications To be prepared ... annually p0306 N74 21501

REPRODUCTIVE SYSTEMS
Natural ionizing radiation effects on multiplication of unicellular organisms and Drosophila melanogaster development p0075 N72 26050
Advantages of breeding Rhesus monkeys in compounds for biomedical research p0083 N73 23063

REQUIREMENTS
Application of control system requirements to development of tactical missile weapon systems p0228 N72 27683

RESCUE OPERATIONS
Automatic approach and hover coupler for rescue helicopters p0032 N72 11928

RESEARCH AND DEVELOPMENT
Research and development of NATO countries high temperature corrosion of aerospace alloys [AGARD R 591] p0201 N72 20491
Role of free flight models in aircraft research and development p0045 N73 17002
Annual AGARD meeting in Brussels Belgium p0304 N73 21881
The role of OSTI in information research and development p0160 N74 16929
AGARD Annual Meeting 1973 Conference on research and development in Greece and use of science and technology to meet military requirements at reduced costs p0304 N74 21610
Research and development activities in Greece p0305 N74 21611
Research work and costs the role of data processing in aircraft production p0305 N74 21617
Director's annual report 1970 to the NATO Military Committee p0305 N74 23492
Highlights AGARD's twentieth anniversary 1952 1972 p0306 N74 23498
Director's annual report to the North Atlantic Military Committee 1972 p0306 N74 23499
Highlights spring 1973 of progress of AGARD panels p0306 N74 23500

RESEARCH FACILITIES
Research organizations investigations and programs in high temperature research from eleven NATO countries and Spain [AGARD R 585 71] p0302 N71 36582
Research equipment methods and facilities at Propulsion Test Center France p0263 N72 20030
Organization and operation of US Air Force Test Pilot School p0036 N72 20994
Research activities of electronics laboratory in development of inertial navigation systems with possible applications for space missions and commercial aviation p0227 N73 20686
Problems of library and information services for large research center p0158 N73 24204
Directory of research activities on composites [AGARD R 609] p0304 N74 17664

RESEARCH MANAGEMENT
The 1973 AGARD Annual Meeting p0306 N74 23494
Director's annual report to the North Atlantic Military Committee 1971 p0306 N74 23496
AGARD handbook concerning AGARD by laws p0306 N74 23497

RESEARCH PROJECTS
Research and development investigations and programs on high temperature research from eleven NATO countries and Spain [AGARD R 585 71] p0302 N71 36582
Review of research programs on aircraft handling qualities vehicle stability and control characteristics p0040 N72 32038
Air force research and development programs on aircraft electrical power systems to show planning process for developing specific classes of technology p0056 N73 19057
Research activities of electronics laboratory in development of inertial navigation systems with possible applications for space missions and commercial aviation p0227 N73 20686
German air research and aerospace activities p0304 N73 27959
Proceedings of conference on military application of V/STOL aircraft including design and propulsion problems associated with operating environments [AGARD CP 126 Vol II] p0054 N73 27008
United States Department of Transportation research programs in fluid mechanics p0217 N74 14273
Technical Evaluation Report on the Flight Mechanics Panel Symposium on Aircraft Operational Problems p0217 N74 14275

RESEARCH VEHICLES
Experimental aspects of aerodynamic and control research vehicles capable of hypersonic gliding and/or sustained horizontal flight at low altitude p0152 N72 11987

RESIN BONDING
Elastic analysis for stress concentrations in laminated wing stress skin with elliptical cutouts and reinforcements at the cutouts p0208 N72 12501

RESONANT FREQUENCIES
Analytical expressions for resonant frequencies and associated masses for a uniform cantilevered wing by finite element method [AGARD R 592] p0290 N72 33935

RESPIRATION
Respiratory gas analyzer for aircrew pulmonary function measurements [NASA TM X 68370] p0074 N72 25057

RESPIRATORS
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure relations in dogs breathing air and liquid fluorocarbons in whole body water immersion respirator [NASA CR 117199] p0066 N71 20358

RESPIRATORY RATE
Formula for predicting physical fitness of flying personnel in Belgian Air Force during aging process from spirometric measurements p0094 N71 22321

RETINA
Effects of accelerated particles and cosmic rays on light flashes in human eye [NASA TM X 68460] p0075 N72 26051
Modeling of random human visual search performance based on physical properties of eye p0302 N73 19961

RETIREMENT
Coronary system diseases in aging flight crews and removal from flying status p0093 N71 22315

REYNOLDS NUMBER
Conference on theoretical methods and wind tunnel facilities for transonic aerodynamic testing of aircraft at high Reynolds numbers [AGARD CP 83 71] p0011 N72 11854
Scale effects in flows past swept wings at transonic speeds p0011 N72 11855
Reynolds number effects in viscous inviscid interactions on transonic swept wings p0011 N72 11856
Method for estimating transonic buffet boundary and Reynolds number effects for straight and swept wings p0011 N72 11857
Minimum level of Reynolds number for reliable flow simulation in transonic test facilities [NASA TM X 67412] p0012 N72 11859
Transonic wind tunnel determination of Reynolds number effect on jet flapped airfoil drag divergence pressure distribution and buffet onset p0012 N72 11861
Wind tunnel measurements of Reynolds number effect on force and pressure coefficients for slender delta wing at transonic speed p0012 N72 11863
Reynolds number effect on flow past body of revolution at transonic speed p0012 N72 11864
Transonic wind tunnel testing requirements for simulating transonic aerodynamic data at flight Reynolds numbers p0014 N72 11873
Equivalent body of revolution for simulating high Reynolds number effect on transonic flow past two dimensional airfoil p0014 N72 11874
Wind tunnel model boundary layer reduction through suction for accurate simulation of high Reynolds number full scale aircraft characteristics p0014 N72 11875
Aerodynamic suitability of Freon 12 for wind tunnel testing of transport aircraft models at increasing Reynolds numbers and subsonic and supercritical Mach numbers [NASA TM X 67417] p0015 N72 11879
Comparison between conventional blowdown and Ludwieg tube driven transonic wind tunnels for high Reynolds number range p0015 N72 11881
Performance characteristics of high Reynolds number tube wind tunnel [NASA TM X 67391] p0015 N72 11882
Specifications for high Reynolds number wind tunnel design for flow simulation on swept wing aircraft development tests p0015 N72 11883
Performance and operational characteristics of high Reynolds number blowdown and shock wind tunnels for transonic model testing p0016 N72 11884
Transonic wind tunnel design for model testing at high Reynolds number p0016 N72 11887
Analysis of effects of Reynolds number on aerodynamic stalling of rotary wings a circular concept of Reynolds number to aerodynamic coefficients of blade elements p0018 N73 22957
Influence of free stream Reynolds number on transition in boundary layer on oil ice swept wing p0183 N73 26280
Present and future need for high Reynolds number testing facilities critical analysis of design criteria and requirements p0183 N73 26282

RHYTHM (BIOLOGY)
Long term electrocardiographic analysis of rhythm heart data base of German Air Force p0097 N72 14103
Statistical analysis of linear and nonlinear performance to evaluate therapeutic effects p0083 N73 21116
Effects of hypoxia hypothermia chemotherapy and drug overdose p0083 N73 21119

RIGID ROTORS
Effect of elastic flapping of rotor blades on stability and control of helicopter equipped with hingeless rotor system p0047 N73 21016
Flight tests of Westland Scout helicopter fitted with reduced scale version of rigid rotor to determine airworthiness and handling characteristics p0047 N73 21017
Analysis of fatigue factor in hub for hingeless rotor system [AGARD R 607] p0052 N73 21920
Loads prediction methods for hingeless rotor helicopters p0053 N74 10735
The hingeless rotor A concept for helicopter missions effectiveness at reduced costs p0377 N74 21616

RIGID WINGS
Calculation of induced load effects on controllability of rigid and flexible aircraft p0045 N73 17004

RIOMETERS
Spatial correlation of auroral radio absorption using riometers p0129 N72 21146

RIVETED JOINTS
Nondestructive tests and their application for inspection of adhesive bonded structures welded joints and riveted or bolted joints p0197 N72 19542

ROCKET ENGINE CASES
Failure analysis of fiber reinforced composite rocket engine case using distortional energy and maximum strain theories of failure p0213 N73 27500

ROCKET ENGINES
Application of gas analysis techniques to determine combustion efficiency in turbine engines and rocket engine combustion chambers [AGARD AG 168] p0300 N73 31830
Gas sampling and analysis in combustion phenomena [AGARDOGRAPH 168(FR)] p0111 N74 22799

ROCKET LAUNCHERS
External store interference caused by rocket launcher pod positioning on aircraft wing p0006 N71 19387

ROCKET PROPELLED SLEDS
High Reynolds number aerodynamic ground testing by moving test specimens on rocket sleds p0016 N72 11885
Inertial guidance system sled testing p0257 N74 14354

ROLLING
Production of fibrous metal composites by rolling of powder with strong reinforcing wires and application to aerospace vehicle structures p0210 N73 27478

ROLLING MOMENTS
Angle of attack effects on induced rolling moment of low aspect ratio missile at transonic speed p0007 N71 19363

ROTARY WINGS
Effects of semi rigid rotors on helicopter autostabilizer design p0032 N72 11928
Design of stability augmentation system for W'11 rigid rotor helicopter p0033 N72 11930
Proceedings of conference to analyze static and dynamic loads exerted on helicopter rotary wings and application to improved helicopter design [AGARD R 595] p0016 N73 14000
Developments in unsteady aerodynamics of helicopter rotary wings to analyze stall flutter transient effects of interference and wake induced instabilities p0017 N73 14001
Application of model helicopter rotor experiments to determining dynamic stall of rotary wings and predicting aerodynamic loads developed p0017 N73 14002
Numerical analysis of unsteady aerodynamic forces on helicopter rotor blades to determine lift distribution as function of velocity component normal to blades p0017 N73 14003
Proceedings of conference on rotary wing aircraft developments to include operational experience flight tests and evaluation of structural concepts [AGARD CP 71] p0046 N73 21008
Effect of elastic flapping of rotor blades on stability and control of helicopter equipped with hingeless rotor system p0047 N73 21016
Flight tests of Westland Scout helicopter fitted with reduced scale version of rigid rotor to determine airworthiness and handling characteristics p0047 N73 21017
Analysis of factors affecting performance of rotary wing aircraft and mathematical models of rotary wing flow characteristics p0047 N73 21019
Survey of problems associated to prediction of structural design loads and aeroelastic stability margins during development of rotary wing aircraft p0048 N73 21020
Structural concepts of rotary wing system substitutes to show changes in design of specific vertical takeoff aircraft components p0048 N73 21021
Aerodynamic characteristics of circulation controlled rotor and fundamental problems of stopped rotor aircraft p0048 N73 21024
Development of jet flap rotor and application to heavy helicopter and stoppable rotor designs p0048 N73 21025
Development of rotary wings with cold hot and mixed cycle turbojet propulsion systems and application to torque free rotor drive system p0048 N73 21026
Review of tilting rotor technology and comparison of tilting rotor performance with standard rotary wings p0048 N73 21027
Development of advanced blade concept rotary wing aircraft and investigation of critical areas p0048 N73 21029
Proceedings of conference on fluid dynamics of rotary wings and aerodynamic characteristics of rotary wing systems [AGARD CP 111] p0049 N73 21033
Analytical study of helicopter rotary wing stability derivatives held of hovering rotary wing and effect on rotor performance p0049 N73 21032
Development of a program for theory for predicting hover averaged downwash distribution and response characteristics of an open rotor forward flight p0049 N73 21031
Procedures for measuring velocity distribution through helicopter rotor blade tip vortex using single hot wire probe p0049 N73 21034

ROTATING BODIES

Development of procedure for determining geometry and strength distribution of vortex wake generated by single bladed hovering helicopter rotor p0049 N73 21035
Parameters for enhancing performance of helicopter rotors during stationary flight p0049 N73 21036
Wind tunnel tests of rotary wing to determine retreating blade stall at several preset parameters and effect of reverse flow area p0049 N73 21037
Improvements in basic rotary wing design and tests to determine effects on helicopter performance p0050 N73 21038
Aerodynamic characteristics of rotary wings under axial flow conditions, and development of numerical analysis techniques p0050 N73 21039
Development of method for predicting performance of heavily loaded propellers and rotors in steady hovering flight p0050 N73 21040
Analysis of unsteady aerodynamic environment of rotary wings and research projects to improve understanding of rotor unsteady airloads p0050 N73 21041
Analysis of unsteady aerodynamic loading on reference section of helicopter rotor blade in axial or hovering flight under compressible flow conditions p0050 N73 21044
Effect of rotary wing airfoil modifications on performance, stability and control of helicopters p0051 N73 21045
Developments in techniques for analyzing boundary layer characteristics of rotary wings based on unsteady viscous inviscid interaction p0051 N73 21046
Development of technique for rotor blade design and measurement of pressure distributions along the blade chord and across blade wake near rotor tip in flight p0051 N73 21047
Development of algorithm for calculating inviscid flow about arbitrary planform rotors and application to analyzing various rotary wing configurations p0051 N73 21048
Development of concept of circulation control applied to rotary wings to show effects on hover transition and high speed cruise performance p0051 N73 21050
Aerodynamic dynamic and aeroelastic problems in rotary wing design for helicopters and V STOL aircraft with application to hingeless rotor systems p0051 N73 21051
Analysis of aerodynamic noise produced by rotary wings and methods for noise reduction based on shed vortex wakes and blade tip modification p0052 N73 21053
Generation of aerodynamic noise by turbulent wake behind rotary wing airfoil and relationship to drag and lift coefficients p0052 N73 21054
Noise spectrum characteristics and directivity patterns for rotary wings as function of blade tip speed, total rotor thrust and angle of rotor disk plane p0052 N73 21055
Analysis of helicopter blade flutter for both hinged and hingeless rotor blades
[AGARD R 607] p0052 N73 21920
Proceedings of conference on rotary wings to investigate rotor wakes aerodynamic characteristics at hover and high advance ratio and aerodynamic noise properties
[AGARD AR 81] p0052 N73 21931
Analysis of aerodynamic and dynamic properties of rotary wing aircraft for application to design development and evaluation of helicopters
[AGARD LS 63] p0017 N73 22948
Aerodynamic characteristics of helicopters with emphasis on airboards aeroelasticity and mechanical instabilities p0017 N73 22949
Fundamentals of rotary wing aerodynamics and application to performance considerations of helicopters p0017 N73 22950
Basic dynamics of rotary wings, mechanics of helicopter flight and aerodynamic characteristics of advanced rotary wing concepts and configurations p0017 N73 22951
Effects of aeroelasticity on performance of rotary wings and procedures for predicting aerodynamic forces on rotary wing blades p0017 N73 22952
Effects of aerodynamic drag on rotary wing performance and methods for reducing influence of stall and compressibility parameters p0017 N73 22954
Procedures for testing rotary wing aircraft models in wind tunnels to include design of test facilities, cost of models and facilities and methods for obtaining data p0018 N73 22955
Analysis of effects of Reynolds number on aerodynamic stalling of rotary wings and relationship of Reynolds number to aerodynamic coefficients of blade elements p0018 N73 22957
Analysis of effects of aerodynamic and dynamic parameters on design synthesis of rotary wings and application of optimization techniques p0018 N73 22958
Flight test procedures for rotary wing aircraft with emphasis on performance and flying qualities p0018 N73 22959
Application of glass reinforced and carbon reinforced composite materials for helicopter structures and rotary wings p0211 N73 27483
Specialists Meeting on Helicopter Rotor Prediction Methods
[AGARD CP 122] p0055 N74 10908
Rotary wing design methodology based on nonlinear aeroelastic blade loads analysis p0056 N74 10909
Current loads technology for helicopter rotors, based on rotor loads computer program for determining fatigue design loads p0056 N74 10910
Prediction of helicopter rotor loads, based on alleviating aerodynamic loads imposed on rotary wing and rotor hub p0056 N74 10911
Helicopter rotor loads predictions, assumptions and techniques for numerical analysis of aerodynamic loads p0056 N74 10912
Rotor system design and evaluation using a general purpose helicopter flight simulation program p0056 N74 10913
The prediction of loading actions on high speed semi-rigid helicopters p0056 N74 10914
Loads prediction methods for hingeless rotor helicopters p0056 N74 10915
Integrated rotor body loads prediction p0057 N74 10916
Dynamic stall
[NASA CR 136473] p0018 N74 13709

ROTATING BODIES

Magnus characteristics of arbitrary rotating bodies
[AGARD AG 177] p0018 N74 13710

ROTATING DISKS

Fabrication of cobalt alloy and nickel alloy gas turbine blades and disks p0259 N71 17392
Design fabrication and test of boron polyimide reinforced titanium fan disks to operate at high temperatures p0213 N73 27498
Performance and endurance of compressor disks bound with boron composite wires p0213 N73 27499

ROTATING ENVIRONMENTS

Stabilization of turbulent shear layer flow in rotating systems by coriolis force. p0180 N72 20305

ROTATING GENERATORS

Development of superconducting homopolar machines with multiple discs and superconducting field winding using liquid metals for armature sliding contacts p0064 N73 19037

ROTATING SHAFTS

Methods of testing rotating components of turbomachines compared with tests on complete turbomachines
[AGARD AG 107] p0271 N72 26800
AGARD flight test instrumentation series Volume 4 The measurement of engine rotation speed
[AGARD AG 160 VOL 4] p0196 N74 14116

ROTATING STALLS

Interference effect between oscillating and distorted inlet flow on compressor stall p0003 N71 19370

ROTATION

Intuitive graphical and simplified mathematical treatment of rotational dynamics as applied to human centrifuges p0004 N71 23340

ROTOR AERODYNAMICS

Proceedings of conference on rotary wings to investigate rotor wakes aerodynamic characteristics at hover and high advance ratio and aerodynamic noise properties
[AGARD AR 81] p0052 N73 21931

ROTOR BLADES

Development of advancing blade concept rotary wing and wind tunnel tests of full scale model p0048 N73 21029
Procedures for measuring velocity distribution through helicopter rotor blade tip vortex using single full scale rotor blade p0049 N73 21034
Wind tunnel tests of rotary wing to determine retreating blade stall at several preset parameters and effect of reverse flow area p0049 N73 21037
Development of technique for rotor blade design and measurement of pressure distributions along the blade chord and across blade wake near rotor tip in flight p0051 N73 21047
Analysis of helicopter blade flutter for both hinged and hingeless rotor blades
[AGARD R 607] p0052 N73 21920
Application of boron aluminum composite material for construction of turbine blades with low notch sensitivity in high cycle fatigue p0213 N73 27497

ROTOR BLADES (TURBOMACHINERY)

Temperature field measurements within convection cooled rotor blade of gas turbine engine p0259 N71 17387
Impact cooling method for turbine rotor blades p0260 N71 17397
Heat transfer and thermal stress calculations for gas turbine rotor blade design p0261 N71 17401

ROTORS

Flight characteristics and performance of Fenestron type helicopter tail rotor p0048 N73 21028

S

S-3 AIRCRAFT

Role of flight simulation in development of S-3 and F-14 aircraft p0045 N73 17001

SA-330 HELICOPTER

Autonomous navigation system for SA-330 helicopter and flight test methods p0032 N72 11929

SACCADIC EYE MOVEMENTS

Computer simulation approach in evaluating the influence of psychopharmacological drugs on vigilance p0109 N74 20749

SAFETY DEVICES

Safety device study for human protection during impact acceleration p0100 N72 19131
Structural crashworthiness performance of conventional automobile and performance of structural devices designed for protection p0101 N72 19142

SAFETY FACTORS

Safety measures to eliminate aircraft trailing vortex hazards
[NASA TM X 67125] p0028 N71 23418
Speed and field length safety factors for approach and landing mechanics of Breguet aircraft p0028 N71 23420
Human factors and control system failures in jet upsets during turbulence encounters p0029 N71 23424
Flying safety factors in close to ground operational design of XH-51 helicopter p0030 N71 23430
Markings for propeller conspicuity
[AGARD AR 58] p0057 N74 12713

SAFETY MANAGEMENT

Safety codes for operators using laser equipment p0076 N72 26057

SANDWICH STRUCTURES

Development of aerodynamic structural design data to reduce effects of acoustic fatigue on flat and singly curved sandwich panels Part 2
[AGARD AG 162 PT 2] p0290 N73 14898
Application of composite materials and sandwich structures to reduce vulnerability of aircraft structures to projectile impact p0212 N73 27487
Sonic fatigue characteristics of titanium sandwich structures and numerical analysis of natural frequencies and static stress values p0293 N73 29919

SATELLITE ATTITUDE CONTROL

Satellite attitude control systems NATO conference
[AGARD LS 45 71] p0277 N72 12861
Rotational dynamics for satellite attitude stabilization p0277 N72 12862
OAO pointing and attitude sensors
[NASA TM X 67384] p0277 N72 12863
Passive and semi-active attitude control for multiple spin satellites p0277 N72 12864
Passive and semi-active attitude control for flexible satellites p0277 N72 12865
Angular momentum exchange systems jet expulsion systems and magnetic torquers for active satellite attitude control p0277 N72 12866
Pneumatic system used with TD satellite attitude control system p0278 N72 12868
Sirio satellite attitude measurement and control system components p0278 N72 12869
Characteristics of attitude control system and onboard computer used with ANS astronomical satellite for ultraviolet and X-ray measurements in space p0191 N72 19491
Development and characteristics of three axis radio frequency attitude sensor for geostationary satellite p0191 N72 19492
Design development and application of electrically driven flywheels for stabilization of synchronous satellites p0192 N72 19493
Characteristics of sensor system for geostationary spinning satellite to determine satellite attitude during transfer and final orbit p0192 N72 19496
Development of Canopus star sensor for stabilization of X4 technology satellite p0192 N72 19499
Application of earth location sensors operating in visible spectra for control of Lincoln Experimental Satellites p0192 N72 19500
Computerized simulation of multiaxis attitude control system for satellite with flexible booms p0279 N73 23890

SATELLITE CONTROL

Passive gravity gradient method for stabilization of Echo and Peole satellites p0278 N72 12867

SATELLITE GROUND SUPPORT

Application of digital computers for automatic testing and data processing during checkout of satellites p0193 N72 19505

SATELLITE INSTRUMENTS

OAO pointing and attitude sensors
[NASA TM X 67384] p0277 N72 12863
Characteristics of satellite television recording system using continuous line scanning with constantly open aperture p0192 N72 19498

SATELLITE NETWORKS

Orbit sharing and deployment problems of high power satellite communication systems p0133 N73 10205

SATELLITE OBSERVATION

Satellite cloud cover observations for determining radio and radar propagation characteristics p0114 N71 21414
Development of pulse code modulation system for encoding and formatting data using satellite onboard equipment p0193 N72 19503

SATELLITE ORBITS

Orbit sharing and deployment problems of high power satellite communication systems p0133 N73 10205

SATELLITE ORIENTATION

Characteristics of sensor system for geostationary spinning satellite to determine satellite attitude during transfer and final orbit p0192 N72 19498

SATELLITE ROTATION

Rotational dynamics for satellite attitude stabilization p0277 N72 12862

SATELLITE TRACKING

Analysis of tracking systems used with Q switched laser range finders and application to tracking various satellites p0194 N72 19513

SATELLITE TRANSMISSION

Amplitude fading of superhigh frequency geostationary communications satellite signals considering atmospheric refraction p0142 N73 26135

SATELLITE BORNE INSTRUMENTS
Remote satellite microwave sensing of sea surface roughness using water brightness temperature to determine wind fields p0122 N72 16095
SATELLITE BORNE PHOTOGRAPHY
Analysis of satellite multispectral imagery data for tropical land use interpretation p0124 N72 16111
SATELLITES
Ionospheric irregularities causing high latitude satellite scintillation p0128 N72 21140
SCALARS
Laser planogram technique for measuring spatial mixing of passive scalar in turbulent wake p0179 N72 20297
SCALE (CORROSION)
Transport properties of oxide scales formed on oxidation resistant alloys p0201 N73 23604
Vaporization thermodynamics of Cr2O3 protective scales under transonic flow conditions p0202 N73 23607
Oxidation resistant refractory metal alloys for use in high temperature environments p0203 N73 23615
SCALE EFFECT
Scale effects in flows past swept wings at transonic speeds p0011 N72 11855
Pressure plotting tests on swept wings for analyzing scale effect at high subsonic speeds p0013 N72 11867
Characteristic scales and mixing length methods for determining turbulent boundary layers with mass transfer p0180 N72 20304
SCALE MODELS
Comparison of wind tunnel and theoretical techniques for determining full scale aerodynamic flight drag factors [NASA TM X 57413] p0013 N72 11869
Transonic wind tunnel testing requirements for simulating transonic aerodynamic data at flight Reynolds numbers p0014 N72 11873
Coherent approach for calculating backscatter from ten scale rough surfaces [NASA CP 125452] p0125 N72 16117
Aerodynamic coefficients for calculating transport aircraft performance using wind tunnel and scale models p0053 N73 24046
Modelling methods of determining radar echo characteristics optical ultrasonic and radio methods p0144 N74 11959
Target characteristics radar measurements on scaled models p0144 N74 11960
The propagation of electromagnetic waves over irregular terrain radio wave diffraction and transmission loss p0146 N74 13848
Radio wave diffraction due to a mountain of volcanic origin p0146 N74 13851
SCALING LAWS
Scaling laws, constructional problems, and optimum model size associated with wind tunnel tests of helicopters and rotary wing aircraft p0173 N73 28246
SCATTER PROPAGATION
Tropospheric scatter propagation and prediction of radio transmission characteristics [AGARD CP 70 71] p0117 N71 23451
Tropospheric refractivity variation effects on radio wave scatter propagation p0117 N71 23452
Scanning forward scatter mapping and turbulent layer model for tropospheric scatter propagation analysis p0118 N71 23454
Transmission loss in tropospheric transhorizon propagation on 12 GHz scatter link p0118 N71 23458
Angular diversity propagation paths of spaced antennas in tropospheric transhorizon scatter link p0118 N71 23459
Formulas for calculating depolarization effects on dipole radiation in statistically homogeneous and isotropic dielectric constant medium p0119 N71 23460
Ultrahigh frequency antenna scatter propagation disturbance by vegetation p0119 N71 23461
Maxwell field theory for solving wave path controllability in tropospheric scatter propagation p0119 N71 23462
Multipath transmission models for predicting signal distortion and intermodulation in tropospheric scatter propagation p0119 N71 23463
Mathematical model for frequency correlation function of tropospheric scatter channel p0119 N71 23464
Frequency correlation measurements on multipath tropospheric scatter propagation p0119 N71 23465
Impulse response measurements and radio test link for evaluating tropospheric scatter propagation channel capacity p0119 N71 23466
Computerized simulation of tropospheric scatter channel distortion using Monte Carlo method p0119 N71 23467
Statistical forecast of signal attenuation with tropospheric scatter using meteorological parameters p0120 N71 23471
Side scatter propagation at higher frequencies for monitoring air pollution using remote optical radio and radar techniques p0122 N72 16097
Measurements of precipitation scatter at 11.6 GHz p0147 N74 13855
SCATTERING FUNCTIONS
Light scattering by particles in sea water based on volume scattering function and point spread function p0242 N73 33628
SCHEDULING
Man machine approach toward solving vehicle routing scheduling and network problems p0154 N72 11193
SCHLIEREN PHOTOGRAPHY
Mathematical models and numerical analysis of coherent optical systems used as holographic schlieren system p0199 N72 25486
High speed schlieren film of pulsating flow in transonic turbine cascade p0271 N73 19818
SCHOOLS
Organization and operation of US Air Force Test Pilot School p0036 N72 20994
Procedures for training pilots in assessment of flight systems during attendance at Empire Test Pilot School England p0036 N72 20995
Organization operation and curriculum of U S Navy Test Pilot School at Patuxent Naval Air Station Maryland p0037 N72 20996
SCIENTIFIC SATELLITES
Development and characteristics of data storage equipment for use on small scientific spacecraft p0193 N72 19502
SCINTILLATION
High latitude studies of scintillation in radio signals from radio sources and satellites p0128 N72 21137
Intensity variations in satellite scintillations in F region p0128 N72 21138
Ionospheric irregularities causing high latitude satellite scintillation p0128 N72 21140
HF auroral backscatter scintillation theory and satellite beacon recordings p0130 N72 21150
The effect of the August 1972 magnetic storms on scintillation p0187 N74 14088
SCREENING
Effect of terrain screening on the different mechanisms of propagation p0146 N74 13850
SE 210 AIRCRAFT
Automatic approach and landing system with flash warning signal for Caravelle aircraft control p0030 N71 23429
A new approach to gust alleviation of a flexible aircraft using an open loop device application to control system of SE 210 aircraft p0060 N74 17745
SEA ROUGHNESS
Narrow pulse width radar system for measuring ocean wave heights p0122 N72 16094
Remote satellite microwave sensing of sea surface roughness using water brightness temperature to determine wind fields p0122 N72 16095
Geometrics optics theory for microwave brightness temperatures in rough sea surface emissions for remote sensing data interpretation p0124 N72 16112
SEA STATES
Radar sea clutter sea state effects on cross sectional echo characteristics p0145 N74 11962
SEA WATER
Precracked cantilever beam and long term beam exposure tests for determining stress corrosion of Al alloys in sea water p0288 N72 21919
Proceedings of conference on electromagnetic and optical properties of sea water for application to surveillance mapping communications and visibility [AGARD LS 61] p0241 N73 33619
Debye polarization theory for determining electromagnetism of sea surface p0241 N73 33620
Radiance distribution as function of depth in upper layers of ocean and numerical analysis of inherent and apparent optical properties p0241 N73 33621
Debye polarization theory for determining electromagnetic wave propagation in sea p0241 N73 33622
Optical properties of pure and turbulent sea water p0241 N73 33624
Techniques for predicting effects of thermal and saline inhomogeneities on optical imaging systems with application to optical properties of sea water p0241 N73 33625
Effect of ocean depth on light scattering and attenuation parameters to include optical properties influenced by concentration size and shape of particulate matter p0241 N73 33626
Mathematical theories for determining light propagation by sea water p0241 N73 33627
Light scattering by particles in sea water based on volume scattering function and point spread function p0242 N73 33628
Effect of various parameters on long range underwater vision for narrow and broad beam illumination p0242 N73 33630
Effects of resolution signal to noise ratio and contrast on underwater imaging systems performance p0242 N73 33631
Computer programs for analyzing optical properties of sea water p0243 N73 33638
SEARCH PROFILES
Robot data screening process to select relevant variables in data search p0151 N72 11176
SEAT BELTS
Safety belts and air bags for highway accident prevention p0099 N72 19126
Air bag and seat belt and passenger restraints in various injury European car collisions p0099 N72 19130
SECONDARY FLOW
Experiments with cascade secondary flows p0270 N73 19811
SECONDARY INJECTION
Performance prediction for turbine blade film cooling with injection through holes [NASA CR 116376] p0259 N71 17388
SELECTIVE DISSEMINATION OF INFORMATION
Harwell heat transfer and fluid flow information analysis center p0113 N71 19530
Profile construction cost benefits economics and user surveys in transfer of technology and selective dissemination of information p0301 N71 23506
Design and operational services of small data centers to technical users [AGARD CP 117] p0158 N73 24201
Information dissemination services to industry p0159 N73 24210
Information dissemination services of technical information service of National Research Council of Canada p0159 N73 24211
SELF ADAPTIVE CONTROL SYSTEMS
Problems in application of adaptive and self organizing algorithms for pattern recognition p0152 N72 11185
SELF ALIGNMENT
Advanced procedures for self alignment and calibration of inertial platforms p0230 N73 20708
SEMANTICS
Question answering system DELFI for automatic generation of programs to express semantic content of English like sentences in procedural intermediate language p0151 N72 11177
SEMICIRCULAR CANALS
The moelectric stimulation of the labyrinth by Peltier regulated ear canal plug p0109 N74 20748
SEMICONDUCTOR DEVICES
Development of system for improved quality control of semiconductor devices used in design of spacecraft electronic equipment p0191 N72 19487
Application of scanning electron microscopy for failure analysis and nondestructive tests of semiconductor devices p0191 N72 19488
SEMICONDUCTORS (MATERIALS)
Application of complementary metal oxide semiconductors to design of integrated circuits used with spacecraft electronic equipment and commercial equipment p0191 N72 19486
SEMIEMPIRICAL EQUATIONS
Semiempirical methods for designing ejectors for various applications p0183 N73 17252
SENSORIMOTOR PERFORMANCE
Relationship of interaction of impulsiveness and anxiety to perceptual motor performance in human beings p0089 N71 20361
SENSORY DEPRIVATION
Effects of education and pharmacodynamics on adaptability of human beings to degraded sensorial environments p0069 N71 20364
SENSORY PERCEPTION
Sensory factors of motion vision and hearing for piloted flight simulation p0171 N71 16064
SEPARATED FLOW
Flow separation concepts under high lift conditions p0025 N71 20055
Representations of flow separation bubbles near airfoil leading edge p0027 N71 20064
Analysis of laminar part of separation bubbles in two dimensional incompressible flow for various shaped objects p0041 N73 15000
Development of method for calculating small separation zones near leading edge of airfoil at incidence p0041 N73 15002
Influence of various aerodynamic forces on rectangular wing performance with harmonic movement parallel to even flow movement p0050 N73 21043
Drag and separation effects of separated flow on aerodynamic drag p0020 N74 14722
A study of flow separation in the base region and its effects during powered flight interaction between propulsive jet and free stream flow p0020 N74 14724
The drag resulting from three dimensional separations caused by boundary layer diverters and nacelles in subsonic and supersonic flow p0021 N74 14728
SEPARATORS
Dual purpose filter separators for dirt and water removal from fuel p0252 N72 11676
SEQUENTIAL COMPUTERS
Serial digital data bus for integrated avionics system interface p0281 N73 23902
SEQUENTIAL CONTROL
Monte Carlo simulation for man machine task sequencing considering pilot performance degradation p0280 N73 23899
SERVICE LIFE
Hybrid microcircuit technology for spacecraft electronics equipment to improve reliability and service life p0191 N72 19485
Development of procedures for predicting fatigue life of aircraft structures based on fracture mechanics crack propagation and residual static strength analysis [AGARD LS 62] p0294 N73 29924
Development of fatigue life prediction procedures based on measured stress time histories and mathematical model for description of random processes p0294 N73 29926
Procedures for predicting fatigue life of aircraft flying under various mission conditions using data obtained by recording accelerometer p0294 N73 29927

Effect of environment and stress cycling on in service structural failure of airframes and procedures for predicting safe operational conditions p0295 N73 29929

The role of the major fatigue test in the acceptance certification and safe utilisation of strike aircraft p0061 N74 19658

SERVOCONTROL

Servocontrol infrared optometer applied to study of volitional control of human visual accommodation [NASA TM X 68955] p0070 N71 20371

SERVOMECHANISMS

Flight test of three axis hydrofluidic stability augmentation system in helicopter p0034 N72 11937

SHEAR FLOW

Turbulent boundary layers jets and wakes conferences [AGARD CP 93] p0175 N72 20273

Turbulent shear flow model for axisymmetric free jet two dimensional free shear layer and flat plate boundary layer [NASA CR 125904] p0177 N72 20286

Flow visualization techniques and hot wire anemometer data for shear flow turbulence p0178 N72 20290

Physical structure of turbulent shear flows in nonreacting gase flow [AGARD AR 46] p0182 N73 11262

SHEAR LAYERS

Complex turbulent flows as perturbations of classical thin shear layers and application of Prandtl approximation p0175 N72 20274

Stabilization of turbulent shear layer flow in rotating systems by coriolis forces p0180 N72 20305

SHEAR STRESS

Improved mixing length model applied to three dimensional boundary layer assuming turbulent shear stress in same direction as laminar p0177 N72 20284

Turbulent shear stress models ranging from classical Prandtl mixing theory to kinetic energy models p0178 N72 20291

Application of transport equation to Reynolds shear stress to calculating two dimensional flow in turbulent flow shear layers p0179 N72 20298

SHELLS (STRUCTURAL FORMS)

Homologous deformation of stiffened shells for radio telescope structures p0298 N74 15616

SHELTERS

Health hazards and efficiency reductions of personnel exposed to simulated nuclear shock waves in protective shelters p0100 N72 19436

SHIPS

Satellite communication terminal for ships p0133 N73 10204

Determination of ships orientation from accelerometer signals p0230 N73 20703

Analysis of procedures and problems involved in operating helicopters from decks of ships p0048 N73 21010

SHOCK DISCONTINUITY

Numerical analysis of viscous gas flow and shock formation p0181 N72 27300

SHOCK LOADS

Feasibility of transonic wind tunnel testing of large cord swept wing panel model for simulating wing shock location at Flight Reynolds number [NASA TM X-67414] p0013 N72-11870

SHOCK TUNNELS

Comparison between conventional blowdown and Ludwieg tube driven transonic wind tunnels for high Reynolds number range p0015 N72 11881

Performance and operational characteristics of high Reynolds number blowdown and shock wind tunnels for transonic model testing p0016 N72 11884

Measurement of drag in a shock tunnel p0023 N74 14738

SHOCK WAVE GENERATORS

Auroral infrasonic shock wave generation by supersonic electrojet arcs p0135 N73 14137

Acoustic gravity wave generation by transient sources in isothermal atmosphere p0135 N73 14139

SHOCK WAVE INTERACTION

Interaction of shock wave with turbulent boundary layer at moderate supersonic Mach numbers p0271 N73 19815

Shock wave boundary layer interaction in compressor cascades p0271 N73 19818

SHOCK WAVE PROPAGATION

Acoustic gravity wave propagation modes in ionosphere and neutral atmosphere following nuclear explosion [CONTRIB 1799] p0135 N73 14140

Infrasonic wave generation and atmospheric propagation of gravity acoustic waves p0136 N73 14142

Excitation of Lamb atmospheric edge mode by fall of large atmospheric explosion p0136 N73 14143

Hydrodynamic calculations and experimental observations of ionospheric shock front propagation following nuclear explosion p0137 N73 14150

Continuous wave Doppler radar observations of ionospheric disturbances generated by Saturn Apollo launchings p0138 N73 14157

Infrasonic detection of propagating atmospheric shock waves caused by supersonic aircraft p0138 N73 14161

SHOCK WAVES

Computation of one dimensional shocked flow p0181 N72 27301

Computation of transonic inviscid flow with imbedded shock waves p0182 N72 27309

Effect of surface pressure fluctuations on response of panels underlying attached and separated turbulent boundary layers and shock waves p0292 N73 29910

Survey of computational methods for three dimensional supersonic inviscid flows with shocks p0185 N74 22919

A survey of computational methods for 2D and 3D transonic flows with shocks p0185 N74 22920

SHORT HAUL AIRCRAFT

Rational calculation of design gust loads in relation to present and proposed airworthiness requirements effects of atmospheric turbulence on aerodynamic configuration of short haul aircraft p0059 N74 17740

SHORT RANGE BALLISTIC MISSILES

Design optimization of SRAM inertial navigation and guidance p0230 N73 20705

SHORT TAKEOFF AIRCRAFT

Flight testing military transport aircraft for handling and performance in STOL applications p0026 N71 20060

Lift augmentation devices effect on STOL engine Part 1 interface problems between engine and airframe p0026 N71 20061

Lift augmentation devices effect on STOL engine Part 2 thermodynamic problems p0026 N71 20062

Optimizing propulsive lift system for turbofan STOL aircraft considering cost effectiveness p0026 N71 20063

Accident investigations flight control systems and operational findings for improved aircraft flight mechanics [AGARD CP 76 71] p0027 N71 23410

Design modifications on short takeoff Bronco aircraft resulting from combat operations tests p0028 N71 23416

Operational performance and handling safety requirements for single engine boundary layer controlled aircraft in STOL mode p0028 N71 23419

Augmentor flap wing ducting and augmentor nozzle and noise reduction for jet STOL aircraft [NASA CR 125540] p0284 N72 16696

Analysis of factors affecting lateral directional handling qualities of aircraft during short takeoff flight p0040 N72 32033

Development of jet flap rotor and application to heavy helicopter and stoppable rotor designs p0048 N73 21025

Analysis of short takeoff and landing aircraft landing guidance systems and application of air traffic control procedures for improved sequencing p0233 N73 23703

Methods for evaluating and predicting airfield performance of turbojet and turbofan aircraft operating in conventional and short takeoff modes p0053 N73 24044

Flight tests for determining handling qualities and operational characteristics of Breguet 941 STOL aircraft p0054 N73 27008

Propulsive lift technology program for development of short takeoff aircraft propulsion systems and lift augmentation devices p0055 N73 27009

Design development and evaluation of Buffalo Spey Augmentor wing research aircraft using internally blown flap for lift augmentation p0055 N73 27010

Design development and requirements for short takeoff transport aircraft for military applications using civil aircraft production procedures p0055 N73 27011

Analysis of aerodynamic characteristics affecting selection of short takeoff transport aircraft p0055 N73 27012

Analysis of research and development programs involving construction of short takeoff transport aircraft in Germany p0055 N73 27013

Aerodynamic characteristics of high lift wing concepts for application to commercial short takeoff transport aircraft p0292 N73 29908

The effect of gusts and wind shear for automatic STOL approach and landing simulation and flight test of flight control system for short takeoff aircraft p0058 N74 17730

Data requirements on turbulence in the earths atmospheric shear layer for STOL design criteria development of low altitude gust model for determining importance of gust parameters on STOL aircraft performance p0059 N74 17737

SIDE LOOKING RADAR

Conference on propagation ranges of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements [AGARD CP 90 71] p0121 N72 16085

Interpretation of side looking airborne radar imagery for vegetation mapping [NASA CR 125451] p0122 N72 16092

SIDELOBE REDUCTION

Introductory survey to session 3 Control of antennae side lobes p0147 N74 13857

Some aspects of near and far angle sidelobes in double reflector antennas p0147 N74 13858

Synthesis of aperture distributions for optimum gain with noise and interference rejection p0147 N74 13860

SIGNAL ANALYSIS

Signal analysis and computer graphics for signal classification systems p0154 N72 11201

Multiplex coding method for analyzing radiation distribution in infrared imagery signal p0126 N72 16114

SIGNAL DETECTION

Kalman filtering algorithm for detecting continuous wave interference signals in digital telecommunications p0133 N73 10213

SIGNAL DETECTORS

Digital receiver for detecting coherent data base phase shift keyed signals in real time p0132 N73 10196

SIGNAL DISTORTION

Computerized simulation of tropospheric scatter channel distortion using Monte Carlo method p0119 N71 23467

Scattering and attenuation of remote infrared imaging instrument signals during atmospheric propagation p0123 N72 16104

Monte Carlo calculation on error probability distribution in sensing systems caused by refractive index of sensed medium p0125 N72 16115

SIGNAL FADING

Tropospheric characteristics and their effects on electromagnetic wave propagation and radio signal transmission [AGARD CP 70 71 PT 1] p0114 N71 21409

Very high frequency signal fading in diffraction scatter path propagation p0117 N71 21431

Statistical evaluation of fading caused by intermodulation in combined long wave broadband propagation [CNET NT EST, APH 1] p0117 N71 21433

Atmospheric circulation model for analyzing tropospheric ultrahigh frequency signal fading p0118 N71 23456

Analysis of amplitudes and frequencies of signal fading in satellite to aircraft radio links due to multiplexing of radio signals p0194 N72 19509

Nonspherical raindrop depolarization of electromagnetic wave in ultrahigh frequency radio link p0140 N73 26123

Multipath propagation and phase delay of ultrahigh frequency radio wave caused by atmospheric discontinuity p0140 N73 26124

Rain attenuation and multipath fading in ultrahigh frequency radio relay systems p0142 N73 26134

Point rainfall rate statistics for predicting ultrahigh frequency radio propagation p0142 N73 26136

Calculation of electromagnetic wave absorption by rain for frequencies close to 30 GHz p0142 N73 26138

Amplitude fading of superhigh frequency geostationary communications satellite signals considering atmospheric refraction p0142 N73 26139

Slant path attenuation of ultrahigh frequency signals from sun tracking radiometers p0142 N73 26140

Thunderstorm cloud height and fading statistics for ATS 5 ultrahigh frequency signal transmission to earth p0142 N73 26141

Effects of rain and atmospheric turbulence on ultrahigh frequency space communication radio link p0143 N73 26143

Tropospheric influence on the screening effect due to a mountain ridge on 3 GHz radio transmission loss due to atmospheric refractivity p0146 N74 13853

SIGNAL PROCESSING

Processing and display of time varying spectral information with application to sonar voice and medical signals p0154 N72 11200

Fast Fourier transform digital processor as spectrum analyzer and adaptive filter p0132 N73 10198

SIGNAL RECEPTION

Fundamental concepts of communication theory to include transmission of continuous signals and use of discrete time signals p0143 N73-32054

SIGNAL REFLECTION

Tropospheric characteristics and their effects on electromagnetic wave propagation and radio signal transmission [AGARD CP 70 71 PT 1] p0114 N71 21409

Radio reflectivity calculations for tropospheric elevated layers during transhorizon propagation p0116 N71 21424

Mathematical model for partial reflection from tropospheric layers in radio transhorizon propagation p0118 N71 23457

SIGNAL TO NOISE RATIOS

Calculation of diffraction efficiency and signal to noise ratio for two dimensional and volume diffuse sigma beam holograms p0199 N72 25500

Signal to noise ratio performance of optimum digitalized FM demodulator p0131 N73 10195

Attenuation and phase constancy propagation criteria of tactical satellite communications using mobile ground terminal p0132 N73 10201

Effects of resolution signal to noise ratio and contrast on underwater imaging systems performance p0242 N73 33631

Method for computing photoelectronic and photographic detectors based on product of signal to noise ratio times spatial bandwidth p0242 N73 33634

The use of target and clutter data for different methods of discrimination between targets and unwanted clutter processing of incoherent video and coherent radar signals p0145 N74 11963

SIGNAL TRANSMISSION

Application of chirp modulation to improve efficiencies of satellite to aircraft communication p0194 N72 19514

Propagation loss spectral spreading and time spreading of high altitude HF signal transmission p0129 N72 21144

SIGNATURE ANALYSIS

Radar Echoing areas of flying animals p0144 N74 11961

SIGNS AND SYMPTOMS

Application of psychotherapeutic evaluation modality for treatment of syndromes of reactive nature p0069 N73 20365

SILICON

Boundless carbides and nitrides of silicon insulation resistant refractory compounds for use against hypersonic reentry vehicles p0209 N73 23516

SILICON DIOXIDE
Elastic properties and testing methods of organic matrix composites and the fabrication and interface problems of beryllium aluminum composite materials conference [AGARD CP 63 71] p0206 N72 12492
Mechanical properties of silica fiber reinforced epoxy composite materials p0207 N72 12493
Ultrasonic measurements on silica epoxy and silica phenolic sheets in liquid filled tank p0207 N72 12494
Extensometric measurements of elastic modulus on resin fiber composite materials p0207 N72 12495
Linear and nonlinear stress characteristics of epoxy silica composite materials p0207 N72 12496
Theoretical and experimental determination of elastic constants in silica epoxy composite materials p0207 N72 12497
Temperature and fiber orientation effects on mechanical behavior of silicon carbide epoxy composite materials p0207 N72 12499

SIMULATION
Simulated crash tests to assess fire resistance of aircraft fuels containing polymeric additives p0254 N72 11692
Guided sled apparatus for simulation of automobile collisions p0103 N72 19152
Linear and angular acceleration terminology human acceleration simulation airplane airbag restraint systems, and mathematical models of automobile crash loads p0103 N72 19155
Simulation of frontal collisions and injuries sustained by cadavers using safety belts and air bags p0104 N72 19159
Simulation and investigation of scattering mechanisms of radio aurora p0128 N72 21135

SIMULATORS
Development of procedures for exposing aviators to effects of spatial disorientation in ground based simulators p0073 N72 25045

SINGULARITY (MATHEMATICS)
Singularity method for calculating incompressible flow through cascades with separation p0269 N73 19802

SIRENS
Application of siren as test technique for determining response and life of aircraft structures subject to engine noise field excitation p0294 N73 29922

SIRIO SATELLITE
Sirio satellite attitude measurement and control system components p0278 N72 12869

SKIN (ANATOMY)
Structural and mechanical characteristics of human connective tissue p0101 N72 19140

SKIN (STRUCTURAL MEMBER)
Acoustic fatigue tests of aluminum alloy structural elements under narrow band random loading with zero mean stress in skin p0294 N73 29921

SKIN FRICTION
Review of drag measurements from flight tests of manned aircraft with comparisons to wind tunnel predictions p0022 N74 14735

SKY WAVES
Ionospheric disturbance effects on sky wave bearing measurement p0138 N73 14159

SLEDS
Guided sled apparatus for simulation of automobile collisions p0103 N72 19152

SLEEP DEPRIVATION
Pilot performance and sleep patterns in long duration flights and control of hypnotic drug and alcohol use p0080 N73 21107
Physiological aspects of sleep and circadian rhythms in prolonged flight times p0080 N73 21108

SLENDER WINGS
Wind tunnel measurements of Reynolds number effect on force and pressure coefficients for slender delta wings at transonic speed p0012 N72 11863
Correlation of transonic wind tunnel test data with flight test results on slender wing airplanes for double delta configuration development p0013 N72 11868
Comparison of flight test and wind tunnel data to determine areas of agreement where cost penalties appear in aerodynamic refinements of slender wing aircraft p0036 N72 20990

SLOTTED WIND TUNNELS
Design of ventilated walls for transonic wind tunnels with analyses of parameters affecting noise generation p0184 N73 26780

SMOKE
Influence of altitude and drugs on cerebral circulation in smokers and nonsmokers p0082 N73 21125
Smoke suppressant additive effects on particulate emissions from gas turbine combustors p0221 N74 14799
Photometric measurements of exhaust smoke trails by jet engines p0221 N74 14805

SOCIAL PSYCHIATRY
Clinical psychology and psychiatry of the aerospace environment [AGARD CP 143] p0088 N74 18720
Influence of social relational factors on rates of airflying capacity A system of interactions p0089 N74 18721

SODIUM
Sodium and potassium ion transport in nerve membranes p0260 N73 23659

SOIL MOISTURE
Ground contact radar by backscattered from a soil p0218 N74 14283

SOLAR ACTIVITY EFFECTS
Relationship between atmospheric gravity waves and spread F conditions caused by solar activity p0136 N73 14146

SOLAR CORONA
Application of complementary MOS circuits in pulse code modulation systems for photogrammetry of X ray region of solar corona and in operation of quartz clock with PCM output p0192 N72 19501

SOLAR ENERGY
Influence of solar energy absorption and air water interactions on seasonal thermocline of sea p0241 N73 33823

SOLAR RADIO EMISSION
Solar radio interferometry for traveling ionospheric disturbance detection p0138 N73 14158

SOLID LUBRICANTS
Feasibility analysis of solid lubricated ball bearings for aircraft propulsion systems application p0255 N72 11700

SOLID STATE DEVICES
Development and characteristics of microelectronic equipment for improved reliability and reduced weight and size of electronic components p0191 N72 19484
Solid state electroluminescient materials for display devices p0225 N72 22638
Display principle for 3 D or multicolor solid state 2 D panel displays p0225 N72 22640
Characteristics of solid state ruby laser and application for holographic recording p0200 N72 25502
Application of solid state switching multiplexing and electrically programmable logic to aircraft electrical systems p0066 N73 19053
Development of electrical generation and distribution systems for supersonic aircraft using solid state switching and remote control of protective devices p0066 N73 19054

SONAR
Processing and display of time varying spectral information with application to sonar voice and medical signals p0154 N72 11200
Conference on propagation ranges of microwave infrared and photographic remote sensing systems for pollution detection and sea state roughness measurements [AGARD CP 90 71] p0121 N72 16085
Underwater acoustic beam width effects on signal scattering at rough surface of sea floor p0123 N72 16102

SONIC NOZZLES
Velocity distribution measurement of subsonic axisymmetric inlet for compressor matching p0267 N72 10714

SOOT
Soot formation in rich kerosine flames at high pressure p0219 N74 14289
Soot oxidation kinetics at combustion temperatures p0219 N74 14290

SOUND FIELDS
Sound field generation by transonic flow over perforated surface liners in wind tunnels p0014 N72 11876

SOUND GENERATORS
Sound field generation by transonic flow over perforated surface liners in wind tunnels p0014 N72 11876
Application of siren as test technique for determining response and life of aircraft structures subject to engine noise field excitation p0294 N73 29922

SOUND TRANSMISSION
Fundamentals of helicopter noise generation and propagation and possible noise control procedures and cost effectiveness of noise reduction p0017 N73 22953

SOUND WAVES
Conference on acoustic gravity wave effects on atmospheric transmission of radio communication signals [AGARD CP 115] p0134 N73 14131
Comparison of ionospheric radio wave propagation and acoustic gravity wave propagation p0134 N73 14132
Acoustic radiation sound wave generation and downward propagation into lower atmosphere p0134 N73 14134
Effects of acoustic gravity wave diffraction at atmospheric boundaries p0135 N73 14136
Acoustic gravity wave generation by transient sources in isothermal atmosphere p0135 N73 14139
Nuclear explosion code for calculating atmospheric disturbances through acoustic gravity waves p0135 N73 14141
Excitation of tsunami and atmospheric edge waves by fall of large atmospheric explosion p0136 N73 14143
Ionospheric oscillations caused by infrasonic waves propagating from underground explosions p0136 N73 14148
Electromagnetic emission of atmospheric very low frequency propagation techniques for measuring acoustic gravity waves in ionospheric D region p0137 N73 14153
Nonlinear propagation and atmospheric coupling of atmospheric waves following nuclear explosion p0140 N73 14168

SOUNDING ROCKETS
Testing of an attitude control unit for sounding rockets p0236 N74 14149

SPACE COMMUNICATION
Tropospheric scattering and deep space electromagnetic wave propagation research conference p0114 N71 21413
Measurement of the fall attenuation at microwave wavelengths p0114 N73 21415
Optical multiple access systems and ionospheric path parameters for space communications p0115 N71 21421
Development of multi beam antenna system and combiner switch for producing variable coverage radiation pattern for satellite communication system p0193 N72 19507
Design development and characteristics of telecommunication links using HELIOS space probe as example p0194 N72 19508
Analysis of amplitudes and frequencies of signal fading in satellite to aircraft radio links due to multiplexing of radio signals p0194 N72 19509
Facilities and techniques for measuring antenna radiation patterns of spacecraft telemetry and telecommand antennas p0194 N72 19512
Application of chirp modulation to improve effectiveness of satellite to aircraft communication p0194 N72 19514
Conference on expanded aerospace telecommunication system requirements and digital data transmission methods [AGARD CP 103] p0130 N73 10187
Digital telecommunication techniques and network planning for aerospace systems p0131 N73 10188
Noise and error effects on differential pulse code modulation transmission of sampled aerial imagery p0131 N73 10190

SPACE FLIGHT
BIOSTACK experiment on Apollo 16 for studying combined action of heavy high energy loss nuclei and space flight factors on resting biological systems p0083 N73 23082

SPACE GLOSSARIES
AGARD Glossary of Aerospace Medical Terms [AGARD AG 153 71] p0067 N71 26076

SPACE MISSIONS
Development and operation of programmable PCM telemetry encoder for data storage and processing during space missions p0193 N72 19504

SPACE NAVIGATION
Proceedings of conference on inertial navigation components and systems with emphasis on concepts and techniques involving cost and performance tradeoffs [AGARD CP 116] p0227 N73 20684
Testing philosophy and methods of guidance and control systems and subsystems applied to navigation systems for aircraft spacecraft and missiles [AGARD LS 60] p0236 N74 14345

SPACE PROBES
Characteristics of solid state power amplifiers for direct amplification using varactor diodes and application to interplanetary space probes p0194 N72 19510

SPACE SHUTTLES
Hot salt stress corrosion cracking of titanium alloys used as radiative heat shields in space shuttles [NASA TM X 68304] p0289 N72 21926
Proceedings of conference on inertial navigation components and systems with emphasis on concepts and techniques involving cost and performance tradeoffs [AGARD CP 116] p0227 N73 20684
Operational cost and technological development aspects in design of space shuttle avionic systems p0278 N73 23884
Simulation model for optimum spaceborne computer system design controlling shuttle booster subsystems p0279 N73 23891
Onboard computer system for in flight monitoring of space shuttle in support of flight crew p0280 N73 23893
Application of a design analysis system to a space shuttle design p0298 N74 15613

SPACE VEHICLE CHECKOUT PROGRAM
Development of wing pilot system for performing checkout of space launches and aircraft systems p0191 N72 19489

SPACEBORNE ASTRONOMY
Characteristics of attitude control system and onboard computer used with ANS astronomical satellite for ultraviolet and X ray measurements in space p0191 N72 19491

SPACEBORNE PHOTOGRAPHY
Application of complementary MOS circuits in pulse code modulation systems for photogrammetry of X ray region of solar corona and in operation of quartz clock with PCM output p0192 N72 19503

SPACECRAFT ANTENNAS
Facilities and testing for measuring antenna radiation patterns of spacecraft telemetry and telecommand antennas p0194 N72 19512

SPACECRAFT COMMUNICATION
Tropospheric attenuation of low angle earth space signals at 15 to 20 cm wavelengths p0115 N71 21422
Absorption and phase stability propagation aspects of tactical satellite communications using mobile ground terminals p0132 N73 10200
Written and facsimile satellite communications systems using onboard processing p0132 N73 10202
Measurement methods and error analysis by ground terminals of satellite communication links p0133 N73 10203
Satellite communication terminal for ships p0133 N73 10204
Orbit sharing and deployment problems of high power satellite communication systems p0133 N73 10205
Investigation of propagation effects and design factors for 4 and 6 GHz communication satellite systems p0149 N74 13871

SPACECRAFT COMPONENTS
Sirio satellite attitude measurement and control system components p0278 N72-12869
SPACECRAFT CONTROL
Feasibility of automated spacecraft monitoring using real time computer telemetry p0279 N73-23888
Mathematical models for human performance in manned spacecraft control p0280 N73-23897
SPACECRAFT DESIGN
Application of a design analysis system to a space shuttle preliminary design p0298 N74-15013
SPACECRAFT ELECTRONIC EQUIPMENT
Models for determining failure modes and stress limits of spacecraft equipment p0190 N71-36782
Proceedings of conference on avionics in spacecraft covering component technology, instrumentation, satellite subsystems, and satellite systems
[AGARD CP-87-71] p0190 N72-19483
Hybrid microcircuit technology for spacecraft electronic equipment to improve reliability and service life p0191 N72-19485
Application of complementary metal oxide semiconductors to design of integrated circuits used with spacecraft electronic equipment and commercial equipment p0191 N72-19486
Development of system for improved quality control of semiconductor devices used in design of spacecraft electronic equipment p0191 N72-19487
Application of scanning electron microscopy for failure analysis and nondestructive tests of semiconductor devices p0191 N72-19488
Characteristics of electronically operated mass spectrometer for satellite applications and analysis of atmospheric data acquisition p0192 N72-19494
SPACECRAFT GUIDANCE
Software and hardware technology for application of computer systems to guidance and control of aerospace vehicles
[AGARDOGRAPH 158] p0155 N72-21211
Hardware organization and system design of guidance and control computers p0155 N72-21214
Programming characteristics of future guidance and control computers p0156 N72-21216
Fault isolation capabilities for general purpose digital computer used in guidance and control applications p0156 N72-21220
SPACECRAFT INSTRUMENTS
Proceedings of conference on avionics in spacecraft covering component technology, instrumentation, satellite subsystems, and satellite systems
[AGARD CP-87-71] p0190 N72-19483
SPACECRAFT LAUNCHING
Continuous wave Doppler radar observations of ionospheric disturbances generated by Saturn Apollo launchings p0129 N73-14157
SPACECRAFT POSITION INDICATORS
Characteristics of sensors for spacecraft attitude determination by reference to earth horizon in visible and infrared spectra p0192 N72-19495
SPACECRAFT STRUCTURES
Proceedings of conference on application of composite materials in construction of aerospace vehicles and propulsion systems
[AGARD CP-112] p0210 N73-27474
Design and manufacturing of composite materials with organic matrices for use in aerospace vehicle structures subjected to high temperatures p0212 N73-27489
Development of fiber reinforced composite materials for application to air breathing engines, aeronautical vehicles and spacecraft components p0212 N73-27491
SPATIAL DISTRIBUTION
Multiplex coding method for analyzing radiation distribution in infrared imagery signal p0125 N72-16114
Laser planogram technique for measuring spatial tuning of passive scalar in turbulent wake p0179 N72-20297
Spatial correlation of auroral radio absorption using riometers p0129 N72-21146
Metrasnum and Meclocin under double blind comparison test conditions against motion sickness p0079 N73-21100
Method for comparing photo electronic and photographic detectors based on product of signal to noise ratio times spatial bandwidth p0242 N73-33634
SPECTRAL REFLECTANCE
Multispectral reflectivity curves of near infrared and visible regions for planning remote multiband terrain photography p0124 N72-16109
SPECTRUM ANALYSIS
Variable coefficient in parabolic equation of diffusion for analyzing inhomogeneous media through magneto telluric penetration spectra p0125 N72-16118
Temperature fluctuations and spectral distributions for temperature and velocity in turbulent boundary layer p0175 N72-20276
SPEECH RECOGNITION
Operational description of two different systems for automatic speaker recognition p0151 N72-11079
Structural vibration and noise effects on man in aerospace operations
[AGARDOGRAPH 151] p0076 N73-17098
Noise effects on hearing conservation in aircrew and ground support personnel of aerospace operations p0077 N73-17101
SPHERES
A review of supersonic sphere drag from the continuum to the free molecular flow regime p0022 N74-14732
SPIN DYNAMICS
Rotational dynamics for satellite attitude stabilization p0277 N72-12862
SPIN STABILIZATION
Satellite attitude control systems NATO conference
[AGARD LS 45-71] p0277 N72-12861
Passive and semi active attitude control for multiple spin satellites p0277 N72-12864
SPINE
Necropsy and radiographic observation of spinal fracture and articular facet derangement patterns in rhesus monkeys
[AMRL TR 71-17] p0101 N72-19139
Radiological observations of spinal injuries to pilots caused by sudden ejection p0102 N72-19148
Radiological spinal examination of combat pilots and limiting angle for scoliosis p0074 N72-25056
Aircrew's fitness for flying duties after vertebral fractures and spinal surgery p0086 N74-13794
SPREAD F
Relationship between atmospheric gravity waves and spread F conditions caused by solar activity p0136 N73-14015
STABILITY DERIVATIVES
Analysis of factors in stall and post stall operating conditions and effect on aircraft configurations p0039 N72-32029
Analysis of stall and post stall characteristics of F-111 aircraft and development of regression techniques to obtain aerodynamic derivatives p0043 N73-15013
STABILIZATION
Breakdown of automatic pilots or auxiliary stabilization systems on helicopters p0031 N72-11918
Design of stability augmentation system for WG13 rigid rotor helicopter p0033 N72-11930
System for increasing helicopter stability p0033 N72-11932
Flight test of three axis hydrofluidic stability augmentation system in helicopter p0034 N72-11937
Design development and application of electrically driven flywheels for stabilization of synchronous satellites p0192 N72-19493
CSAS design for good handling in turbulence development of design criteria for stability augmentation systems for alleviation of gust effects p0059 N74-17741
STABILIZED PLATFORMS
Numerical analysis of effects of various parameters affecting accuracy and stability of strapdown inertial navigation systems p0227 N73-20685
Research activities of electronic laboratory in development of inertial navigation systems to include applications for space missions and commercial aviation p0227 N73-20686
Development and evaluation of failure detection and isolation technique for use with four gimbaled inertial measuring units p0228 N73-20687
Development of single degree of freedom gyroscope for application to strapdown inertial guidance system p0228 N73-20688
Methods for conducting acceptance tests and reliability tests of gyroscopes as part of inertial platform quality control procedures p0228 N73-20689
Development of low cost inertial measurement unit with navigational accuracy performance based on optimum size design of inertial instruments and platform p0228 N73-20690
Optimization of integrated navigation systems combining several independent navigation sensors to provide self contained aircraft navigation capability p0229 N73-20694
Three axis gyro stabilized torpedo platform p0230 N73-20702
Application of cluster rotation to improvement of existing platforms in strike aircraft p0230 N73-20704
Testing philosophy and methods of guidance and control systems and subsystems applied to navigation systems for aircraft, spacecraft and missiles
[AGARD LS 60] p0236 N74-14345
Introductory remarks Test technology trends applied to performance tests of inertial guidance systems p0236 N74-14346
PIGA Acceleration tests on vertical TOG 3 hertz table centrifuge and vibration tests of inertial guidance systems p0236 N74-14347
Inertial guidance system centrifuge testing development and characteristics of test equipment p0236 N74-14348
Laboratory evaluation of electro optically aided space navigation systems demonstration of design concept and hardware performance p0236 N74-14350
Aircraft inertial system testing and evaluation in the United Kingdom p0237 N74-14352
Aircraft navigation systems testing with a high precision reference development of Completely Integrated Reference Instrumentation System (CIRIS) p0237 N74-14353
Inertial guidance system sled testing p0237 N74-14354
STAGNATION POINT
Distortion of grid generated turbulence in stagnation region of two dimensional body p0180 N72-20307
STANDARDIZATION
Standardization of test procedures for determining stress corrosion cracking in high strength alloys and steels under various environments - conference
[AGARD CP-98] p0285 N72-21900
Standardization of test methods for stress corrosion in metals p0285 N72-21902
Standardization of tests and classification of color perception abnormalities in military personnel p0077 N73-15071
STANDARDS
Factors standards and techniques involved in testing protective headgear p0104 N72-19163
Application of linear elastic fracture mechanics to developing stress corrosion cracking test standards
[NASA TM X-68303] p0286 N72-21905
STAR TRACKERS
Development of Canopus star sensor for stabilization of X4 technology satellite p0192 N72-19499
STARTING
Starting conditions of mixed compression assymmetric hypersonic inlet p0267 N72-18715
STATISTICAL ANALYSIS
Formulas for calculating depolarization effects on dipole radiation in statistically homogeneous and isotropic dielectric constant medium p0119 N71-23460
Statistical study of physiological and psychological factors in grounding of Italian Air Force flight crews p0095 N72-14091
Statistical estimating techniques for inversion of radiative transfer equation in determining atmospheric temperature from microwave radiation measurements p0125 N72-16113
Exponential probability distribution analysis for extrapolating aerospace system performance statistics from test results p0281 N73-23903
Measurement of atmospheric attenuation at the frequencies of 15 19 and 34 GHz - atmospheric effects on microwave transmission p0149 N74-13870
STATISTICAL CORRELATION
Statistical forecast of signal attenuation with tropospheric scatter using meteorological parameters p0120 N71-23471
STATISTICAL DISTRIBUTIONS
Pattern of accident distribution for V/STOL aircraft in United States of America p0029 N71-23426
Analysis of deterministic and random flight data p0195 N73-10455
STATISTICAL WEATHER FORECASTING
Analysis of 11 GHz band propagation in Portugal for rain accumulation prediction p0148 N74-13869
STEADY FLOW
Numerical method for evaluating discontinuous downwash distribution for steady flow over swept and rectangular wings p0010 N71-29349
STEADY STATE
Inlet steady state and dynamic performance tests with F-111A and YF-12 aircraft
[NASA TM-X-67495] p0266 N72-16709
STEELS
Tensile strength measurements on steel wire reinforced aluminum alloys p0208 N72-12501
Materials and designs of protective armor p0102 N72-19143
Microelectrodes for measuring pH gradients during stress corrosion of aluminum alloys and 1020 steel exposed to potassium chloride p0286 N72-21909
Microstructure and stress corrosion behavior of welded steel joints p0286 N72-21910
Microscopic characteristics of stress corrosion cracking in steel with high yield strength p0289 N72-21925
Influence of thermomechanical treatment on stress corrosion cracking in steel p0289 N72-21930
STIFFENING
Analysis of dynamics of stiffened plates using finite element modelling of flat and curved stiffened panels p0293 N73-29911
STRAIN RATE
Accelerated slow strain rate tensile method p0288 N72-21924
Strain rate experiments to evaluate resistance to stress corrosion cracking p0289 N72-21927
STRAPDOWN INERTIAL GUIDANCE
Proceedings of conference on inertial navigation components and systems with emphasis on concepts and techniques involving cost and performance tradeoffs
[AGARD CP-116] p0227 N73-20684
Numerical analysis of effects of various parameters affecting accuracy and stability of strapdown inertial navigation systems p0227 N73-20685
Development of single degree of freedom gyroscope for application to strapdown inertial guidance system p0228 N73-20688
Dynamically tuned gyros in strapdown systems p0229 N73-20697
Development of electrostatic gyro system p0229 N73-20698
Inertial grade instrumentation for precision strapdown reference system p0229 N73-20699
STRAPS
Negative g strap for restraint and performance during aircraft acrobatics vibration and crash impact p0104 N72-19158

STRATIFICATION
Angular deviations of radio waves from horizontal stratification p0128 N72 21139

STRATOSPHERE
Nitrogen oxides nuclear weapon testing concorde and stratospheric ozone p0217 N74 14715
Effect of supersonic transport upon the ozone layer studied in a two dimensional photochemical model with transport p0218 N74 14278
Chemical Kinetic in the stratosphere atmospheric composition and atmospheric chemistry based on photodissociation reactions p0218 N74 14279
measure of minor constituents in the stratosphere by Concorde 001 p0219 N74 14288

STRATOSPHERE RADIATION
Reaction of ozone with nitrogen oxides at high altitudes p0217 N74 14274

STRESS (PHYSIOLOGY)
Stresses and adaptation problems associated with large scale long range rapid reaction time aerial troop deployments p0069 N71 20360
Physiological responses to interacting stresses of exercise and hypercapnia under acute and chronic exposure to ambient P sub CO2 of 21 mm Hg p0070 N71 20370
Physical exercise effects on stress tolerances of trained and untrained subjects p0091 N71 22306
Analysis of spatial disorientation reports by flying personnel during 14 year period [NASA CR 126786] p0071 N72 25032
Combined stress effects on human communication and motion sickness body kinetics p0104 N73 19144
Temperature and noise irradiation effects on human energetic metabolism during vigilance task p0106 N73 19155
Reaction assessment of vestibular disorientation stress for aircrew selection using visual displays and tasks p0079 N73 21096
Hashish smoking effects on human oxygen consumption during physical stress and safe driving ability p0081 N73 21115

STRESS (PSYCHOLOGY)
Stresses and adaptation problems associated with large scale long range rapid reaction time aerial troop deployments p0069 N71 20360
Combined stress effects in human communication and motion sickness biodynamics p0104 N73 19144
Characteristics of life stress in a population of military aviators p0088 N74 18787
In flight psychic load in student pilots evaluated by means of Vanil Mandelic Acid (VMA) changes in urinary excretion p0089 N74 18790

STRESS ANALYSIS
Heat transfer and thermal stress calculations for gas turbine rotor blade design p0261 N71 17401
Thermal stress and low cycle fatigue reliability analyses on high temperature structural machine materials p0261 N71 17403
Stressing systems and environmental methods used by European Federation stress corrosion tests p0285 N72 21904
Smooth beam and precracked specimen testing of stress behavior of aluminum alloys p0288 N72 21920
Analysis of aircraft structural loads in operational flight to determine effects of pilot performance and aircraft characteristics [AGARD R 608] p0055 N73 27895
Analysis of effect of damping on response of structure to acoustic excitation and experimental method for determining damping coefficients p0293 N73 29917
Analysis of programs for acoustic testing of composite material components and development of theory for predicting natural frequencies mode shapes and stresses in composite panels p0293 N73 29918
Development of rational analytic theory for analyzing fatigue of airframes based on maximum stress field parameter and maximum load excursion ratio p0295 N73 29931
Development of procedure for estimating fatigue life of airframes to eliminate errors caused by neglecting effect of stress redistribution after localized yielding p0295 N73 29933
Analysis of errors in fatigue life prediction procedures and methods for improving accuracy of prediction analysis techniques p0295 N73 29934
Acoustic fatigue design data part 3 design criteria for aircraft structural elements to reduce effects of acoustic stress [AGARDOGRAPH 162 PT 3] p0293 N74 19550

STRESS CORROSION
Standardization of test procedures for determining stress corrosion cracking in high strength alloys and steels under various environments conference [AGARD CP 36] p0285 N72 21900
Stress corrosion cracking in aircraft structures and various materials historical review p0285 N72 21901
Standardization of test methods for stress corrosion in metals p0285 N72 21902
Stress corrosion tests of 7XXX series high strength aluminum alloys in laboratory environment p0285 N72 21903
Stressing systems and environmental methods used by European Federation stress corrosion tests p0285 N72 21904
Application of linear elastic fracture mechanics to developing stress corrosion cracking test standards [NASA TM X 68303] p0286 N72 21905
Determination of stress corrosion cracking parameters for 300M steel p0286 N72 21906
Effects of repassivation and crack velocity on stress corrosion cracking in alloys p0286 N72 21907
Stress corrosion index for measuring coparal action between stress and corrosion in stress corrosion of Al alloys p0286 N72 21908
Microelectrodes for measuring pH gradients during stress corrosion of aluminum alloys and 1020 steel exposed to potassium chloride p0286 N72 21909
Microstructure and stress corrosion behavior of welded steel joints p0286 N72 21910
Cantilever bending tests for determining susceptibility of high strength alloys to stress corrosion cracking p0287 N72 21911
Stress corrosion tests of titanium alloys and electron beam welded titanium alloys p0287 N72 21912
Threshold stress intensity values and crack propagation rates for stress corrosion of high strength steels in aqueous environment p0287 N72 21913
Laboratory equipment for testing stress corrosion of bolt loaded WOL specimens and monitoring crack growth p0287 N72 21914
Krafft model for determining susceptibility of Zn Mg Cu aluminum alloys to stress corrosion crack growth p0287 N72 21915
Precracked cantilever beam and long term beam exposure tests for determining stress corrosion of Al alloys in sea water p0288 N72 21919
Stress corrosion in two aluminum alloys p0288 N72 21921
Stress corrosion behavior of die forgings made from Al Zn Mg Cu alloys p0288 N72 21922
Effects of heat treatment size specimen type and test environment on two precipitation hardened stainless steels during stress corrosion cracking tests p0288 N72 21923
Microscopic characteristics of stress corrosion cracking in steel with high yield strength p0289 N72 21925
Hot salt stress corrosion cracking of titanium alloys used as radiative heat shields in space shuttles [NASA TM X 68304] p0289 N72 21926
Strain rate experiments to evaluate resistance to stress corrosion cracking p0289 N72 21927
Techniques for studying crack morphology contaminants and electrochemistry in stress corrosion p0289 N72 21928
Influence of thermomechanical treatment on stress corrosion cracking in steel p0289 N72 21930
Mechanical properties and stress corrosion of hot rolled alloy plates p0289 N72 21931
Summary of conference on stress corrosion testing methods [AGARD AR 52] p0292 N73 18931

STRESS CYCLES
Survey and analysis of literature on fatigue damage accumulation in aircraft materials and structures [AGARD AG 157] p0290 N72 22918

STRESS MEASUREMENT
Error sources in elastic stress measurements on fiber reinforced composite materials p0207 N72 12498
Stress corrosion index for measuring coparal action between stress and corrosion in stress corrosion of Al alloys p0286 N72 21908
Measures to determine psychophysiological reactions of military flight crews to flying stress p0105 N73 19148

STRESS RELAXATION
Role of isothermal stresses generated during oxidation and modes of stress relaxation p0202 N73 23605

STRESS STRAIN DIAGRAMS
Axial tension tests for stress strain response of matrix and reinforcing fibers in glass epoxy resin composites p0207 N72 12500
Stress strain fatigue mechanisms of beryllium reinforced aluminum composites having rough or smooth surfaces p0208 N72 12504

STRESS STRAIN TIME RELATIONS
Thermal stress and low cycle fatigue reliability analyses on high temperature structural machine materials p0261 N71 17403
Electrical conductance measurements for determining stress strain cycle of glass fiber to resin interfacial bond in reinforced plastic materials exposed to water p0208 N72 12505

STRESSES
Stress effects of temperature and altitude on human performance p0069 N71 20363
Models for determining failure modes and stress limits of spacecraft equipment p0190 N71 36782

STRUCTURAL ANALYSIS
Assessment of structural design philosophy in combining computerized structural analysis with mathematical programming p0283 N71 20130
Analysis of acoustic fatigue life of structures subjected to jet noise and application to design of aircraft structures Part 1 [AGARD AG 162 PT 1] p0290 N72 29893
Proceedings of conference on acoustic fatigue to show effects of aerodynamic loads response of structures structural design and fatigue test methods [AGARD CP 113] p0292 N73 29905
Analysis of dynamics of stiffened plates using finite element modeling of flat and curved stiffened panels p0293 N73 29911
Analysis of response and fatigue characteristics of an alloy integrally machined planks with emphasis on acoustic fatigue properties p0293 N73 29912
Analysis of structural response to acoustic loading and preparation of data sheets for various conditions of acoustic loads p0293 N73 29914
Structural response and endurance tests of aircraft structural components to determine effect of critical environment on acoustic fatigue p0294 N73 29920
Acoustic fatigue tests of aluminum alloy structural elements under narrow band random loading with zero mean stress in skin p0294 N73 29921
Development of fatigue life prediction procedures based on measured stress time histories and mathematical model for description of random vibrations p0294 N73 29926
Application of high strength structural materials for aerospace vehicles and use of fracture control procedures for improved damage tolerance p0294 N73 29928
Application of growth rate data and analytical retardation models for predicting crack growth under variable amplitude loading p0295 N73 29932
Development of procedure for estimating fatigue life of airframes to eliminate errors caused by neglecting effect of stress redistribution after localized yielding p0295 N73 29933
The design of compatible structures p0297 N74 15606
Application of a design analysis system to a space shuttle preliminary design p0298 N74 15613

STRUCTURAL DESIGN
Heat transfer prediction for turbine blade design p0257 N71 17374
Efficiency of air cooling blade design for Olympus 593 gas turbine engine p0257 N71 17376
Boundary layer optimization for small turbine blade design with cusped trailing edge p0258 N71 17380
Heat transfer and thermal stress calculations for gas turbine rotor blade design p0261 N71 17401
Mathematical programming techniques applied to aerospace structural design algorithmic tools applications and literature review [AGARD AG 149 71] p0283 N71 20128
Basic concepts of mathematical programming applied to structural design of aerospace vehicles p0283 N71 20129
Design optimization of aerospace structures made of elastic perfectly plastic materials p0283 N71 20131
Mathematical programming applications to structural design optimization literature review p0283 N71 20132
Computer programs for optimum least weight design of complex elastic aerospace structures p0284 N71 20126
Optimum structural design and reliability analysis p0284 N71 20138
Flying safety factors in close to ground operational design of XH 51 helicopter p0030 N71 23430
Comparison of performance predictions and flight data for optimizing transonic wind tunnel design p0014 N72 11871
Transonic wind tunnel design for model testing at high Reynolds number p0016 N72 11887
Optimality criteria in structural design with application to sandwich structures solid sections and three dimensional bodies [AGARD R 589 71] p0034 N72 15958
Design and aerodynamic performance of clamshell target thrust reverser p0284 N72 18695
Biodynamics of sports injuries applied to sports equipment design p0099 N72 19128
Second Symposium on Structural Optimization [AGARD CP 123] p0295 N74 15596
Survey of the state of the art of optimization technology within NATO countries p0296 N74 15598
Application of optimality criteria approaches to automated design of large practical structures p0296 N74 15599
Recent developments in the Case optimization program using mathematical programming approach p0296 N74 15600
Structural design applications of geometric programming p0296 N74 15601
The optimisation of statically indeterminate structures by means of approximate geometric programming p0290 N74 15602
Application of discriminate function technique to random search in nonlinear constrained structural optimization problems p0296 N74 15603
Integer programming algorithms for optimum structural design p0296 N74 15604
Shape optimization using mathematical programming and modelling techniques p0297 N74 15605
The design of compatible structures p0297 N74 15606
Optimization of stiffened panels p0297 N74 15607
Optimal joint positions for space trusses p0297 N74 15608
Application of a general method for flutter optimization p0297 N74 15609
Minimum weight design of surface effect vehicles using the sieve search technique p0297 N74 15610
Automated sizing of large structures by mixed optimization methods p0297 N74 15611
Optimization of aircraft structures with multiple stiffness requirements p0297 N74 15612

Optimization and design of the rear fuselage of the A 300 B aircraft structure p0298 N74 15614
The double iteration method in structural optimization p0298 N74 15615
Homologous deformation of stiffened shells for radio telescope structures p0298 N74 15616
Optimization of the layout of trusses combining strategies based on Michell's theorem and on the biological principles of evolution p0298 N74 15617

STRUCTURAL DESIGN CRITERIA
Development of aerodynamic structural design data to reduce effects of acoustic fatigue on flat and singly curved sandwich panels. Part 2 [AGARD-AG-162-PT-2] p0290 N73-14898
Analysis of structural response to acoustic loading and preparation of data sheets for various conditions of acoustic loads p0293 N73-29914
On turbulence environment and design criteria. application of power spectral techniques for analyzing gust loads at low altitudes p0059 N74-17734
Design problems of military aircraft as affected by turbulence. analytical prediction of pilot task proficiency under vibration environment p0059 N74-17735
Structural loads and gust criteria. comparison of gust load analysis methods for application to aircraft design p0059 N74-17739

STRUCTURAL ENGINEERING
Structural data on brittle nonmetallic materials for use in designing reentry vehicles [AGARD-AG-152-71] p0205 N71-20057
Second Symposium on Structural Optimization [AGARD-CP-123] p0295 N74-15[illegible]
Necessary and sufficient conditions for global structural optimality p0295 N74-15597

STRUCTURAL FAILURE
Models for determining failure modes and stress limits of spacecraft equipment p019 N71-30782
Structural and mechanical characteristics of human connective tissue p0101 N72-19140
Stress corrosion cracking in aircraft structures and various materials. historical review p0285 N72-21901
Nondestructive test for failure inspection and quality control of composite structures and materials. conference [AGARD-R-590] p0290 N72-24934
Address on problems of acoustic fatigue p0292 N73-29908
Techniques for controlling time to fatigue crack initiation in design of aircraft structures and application of residual stress analyses p0295 N73-29930
Development of rational analytic theory for analyzing fatigue of airframes based on maximum stress field parameter and maximum load excursion ratio p0295 N73-29931
Application of growth rate data and analytical retardation models for predicting crack growth under variable amplitude loading p0295 N73-29932
Analysis of errors in fatigue life prediction procedures and methods for improving accuracy of prediction analysis techniques p0295 N73-29934

STRUCTURAL MEMBERS
Analysis of programs for acoustic testing of composite material components and development of theory for predicting natural frequencies, mode shapes, and stresses in composite panels p0293 N73-29918

STRUCTURAL RELIABILITY
Structural crashworthiness performance of conventional automobiles and performance of structural devices designed for protection p0101 N72-19142

STRUCTURAL STABILITY
Application of composite materials for structural purposes to show limitations and failure characteristics p0211 N73-27481
Application of high strength structural materials for aerospace vehicles and use of fracture control procedures for improved damage tolerance p0294 N73-29928
Development of rational analytic theory for analyzing fatigue of airframes based on maximum stress field parameter and maximum load excursion ratio p0295 N73-29931
Development of procedure for estimating fatigue life of airframes to eliminate errors caused by neglecting effect of stress redistribution after localized yielding p0295 N73-29933

STRUCTURAL STRAIN
Effect of environment and stress cycling on in-service structural failure of airframes and proced ures for predicting safe operational conditions p0295 N73-29929

STRUCTURAL VIBRATION
Structural vibrations in aerospace operations and effects on man p0076 N73-17093

STRUCTURAL WEIGHT
Components for low weight, small volume aircraft gas turbine engines p0262 N71-26956

SUBCRITICAL FLOW
Approximation of pressure distribution on wing body configurations at subcritical speeds p0003 N73-19364

SUBMERGING
Effects of positive Gz acceleration on blood oxygen saturation and pleural pressure at pressures breathing air and liquid fluorocarbons in whole body, water immersion respirator [NASA-CR-111799] p0068 N71-20358

SUBSONIC AIRCRAFT
Wind tunnel evaluation of interference drag in turbofan engine-wing configuration of subsonic aircraft p0004 N71-13376
Computerized prediction of flow field interference forces and moments on aircraft stores at subsonic speeds p0006 N71-19385

SUBSONIC FLOW
Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in unsteady supersonic and subsonic flow including interference lift [AGARD-CP-80-71-PT-1] p0007 N71-29333
Aerodynamic load predicting for control surfaces in unsteady supersonic and subsonic flow p0007 N71-29334
Numerical analysis of aerodynamic loads and coefficients for tandem and T tail surfaces harmonically oscillating in subsonic flow p0007 N71-29335
Computer programs for evaluating subsonic flow over wing-tail, wings with folded tips, T tails, and cruciform tail surfaces p0009 N71-29341
Computer programs for calculating airforce coefficients of wing-horizontal tail and fin-horizontal tail oscillating in subsonic flow p0009 N71-29342
Application of lifting surface theory to wing with control surfaces in unsteady subsonic flow p0009 N71-29347
Time dependent technique applied to subsonic and transonic flow nozzle solutions p0268 N72-16712
Velocity distribution measurement of subsonic axisymmetric inlet for compressor matching p0267 N72-16714
Numerical analysis of inviscid gas flow due to accelerating cylinder and computation of steady subsonic flow p0181 N72-27302

SUBSONIC FLUTTER
Developments in unsteady aerodynamics of helicopter rotary wings to analyze stall flutter, transient effects of interactions and wake induced instabilities p0017 N73-14001

SUBSONIC SPEED
Pressure plotting tests on swept wings for analyzing scale effect at high subsonic speeds p0013 N72-11867
Aerodynamic configurations of swept wings to improve lift performance at stall in higher range of subsonic speeds p0047 N73-15010
Numerical analysis of minimum time climbing procedure and minimum fuel climbing procedure for typical subsonic aircraft p0053 N72-24052
A survey of drag prediction techniques applicable to subsonic and transonic aircraft design p0019 N74-14711

SUBSONIC WIND TUNNELS
Analysis of problems involved in operation of large wind tunnels at subsonic and supersonic speeds [AGARD-R-601] p0172 N73-26239
Influence of free stream turbulence on turbulent boundary layer in relation to wind tunnel testing at subsonic speeds p0184 N73-26283

SUBSTRATES
Effects of substrates on stability of superconductor and electrical properties of superconductors for various conditions p0063 N73-19031

SULFIDES
Mullins-Rhines diffusion theory as applied to oxidation corrosion and sulfation of complex heat resistant alloys p0202 N73-23609

SULFUR
Sulfur, sodium, and chloride contaminants in gas turbines p0202 N73-23610

SUMMARIES
Small tactical missiles for 1980 and beyond. Volume 1: Executive summary [AGARD-AR-57-VOL-1] p0307 X74-73504

SUNSPOTS
A numerical model of TEC over Europe for sunspot minimum conditions. 2 p0187 N74-14085

SUPERCONDUCTING MAGNETS
Application of superconducting magnetics for plasma physics experiments and as component for future thermonuclear reactors p0063 N73-19033
Analysis of effect of mass on operation of airborne superconductor magnetic system with aluminum stabilized conductor p0063 N73-19034
Characteristics of large, lightweight, saddle coil superconducting pole magnet for airborne magnetohydrodynamic generators p0064 N73-19038
Characteristics of superconducting electric generators to show effect of electromechanical, electromagnetic, and cryogenic parameters on design p0064 N73-19039
Features and characteristics of superconducting electrical machines and design of synchronous electric generator for airborne use p0064 N73-19040

SUPERCONDUCTIVITY
Proceedings of conference on application of superconductivity techniques to auxiliary power systems for aircraft and missiles [AGARD-CP-104] p0063 N73-19030

SUPERCONDUCTORS
Effects of substrates on stability of superconductor and electrical properties of superconductors for various conditions p0063 N73-19031
Analysis of alternating current loss mechanisms in superconductors with comparison of performance of coil and cable configurations p0063 N73-19032
Development of high magnetic fields using superconductors with high current densities and application to power conversion and energy storage p0063 N73-19035
Characteristics of conventional alternators and aircraft electrical power systems and comparison with electric systems using superconductors p0064 N73-19036
Development of superconducting homopolar machines with multiple discs and superconducting field winding using liquid metals for armature sliding contacts p0064 N73-19037
Utilization of superconductors to store and discharge electric energy p0064 N73-19041
Application of superconducting coils for energy storage and determination of optimizing parameters for inductive energy storage p0064 N73-19042
Effects of electromagnetic forces, energy radiation, and discharge losses on design of superconducting coils for energy storage elements p0064 N73-19043

SUPERCRITICAL FLOW
Development of procedures for determining planar inviscid supercritical flow over airfoils [AGARD-AG-156] p0018 N72-22001

SUPERCRITICAL WINGS
Aerodynamic Drag [AGARD-CP-124] p0018 N74-14709
Drag of supercritical airfoils in transonic flow, comparison with conventional airfoil drag coefficients p0020 N74-14719

SUPERHIGH FREQUENCIES
Development of multi beam antenna system and combiner switch for producing variable coverage radiation pattern for satellite communication system p0193 N72-19507
Generation of superhigh frequency power using negative impedance characteristics of avalanche diodes in reflection amplifiers p0194 N72-19511
Amplitude fading of superhigh frequency geostationary communications satellite signals considering atmospheric refraction p0142 N73-26139

SUPERPOSITION (MATHEMATICS)
Computer program for determining low speed interference effects of flow fields about arbitrary bodies by superposition p0005 N71-19377

SUPERSONIC AIRCRAFT
Flight and wind tunnel evaluations of flow field effects on performance of supersonic underwing exhaust nozzle at transonic speeds [NASA-TM-X-68887] p0093 N71-19368
Wind tunnel surveys of flow fields about wing fuselage store configuration inlets of transonic and supersonic aircrafts [NASA-TM-X-68895] p0004 N71-19371
Aerodynamic flow field interference effects on supersonic intakes p0004 N71-19372
Possible high energy fuels for supersonic aircraft p0251 N72-11670
Kerosene type fuel for supersonic and hypersonic aircraft p0251 N72-11671
Synthetic high temperature lubricants thickened by complex esters for supersonic aircraft p0255 N72-11701
Design problems of inlets and nozzles used in hypersonic and V/STOL propulsion systems [NASA-TM-X-67741] p0267 N72-21859
Active dosimetry for protection and control of cosmic rays in supersonic aircraft p0075 N72-26047
Wind tunnel models for determining inlet interference and performance of inlet airframe combination in supersonic aircraft design p0037 N72-27019
Comparison of flying quality criteria documents for United Kingdom and US aircraft to show areas of inadequacy in assessing acceptability of aircraft p0038 N72-32019
Analysis of criteria for evaluation of high performance aircraft and results obtained on aircraft equipped with control augmentation systems p0039 N72-32025
Infrasonic detection of propagating atmospheric shock waves caused by supersonic aircraft p0138 N73-14161
Effect of engine failure on aerodynamic characteristics of supersonic aircraft p0045 N73-17003
Application of active controls to suppression of flutter for supersonic aircraft p0045 N73-17005
Artificial stabilization to correct control deficiencies for high performance aircraft p0045 N73-17009
Development of electrical generation and distribution systems for supersonic aircraft using solid state switching and remote control of protective devices p0066 N73-19054

SUPERSONIC BOUNDARY LAYERS
Numerical techniques for determining flow characteristics of supersonic turbulent boundary layer in adverse pressure gradient p0179 N72-20300

SUPERSONIC COMMERCIAL AIR TRANSPORT
Development of criteria specification for supersonic transport aircraft and application to safe handling qualities for all regimes of flight operations p0039 N72-32027

SUPERSONIC DRAG
Aerodynamic interference characteristics of airframe propulsion systems of transport and military aircraft [AGARD-CP-71-71] p0001 N71-19353
Swept wing body configurations for reduced drag at supersonic speed p0002 N71-19358
Aerodynamic configuration effects of propulsion system integration into supersonic transport design p0004 N71-19373

SUPERSONIC FLIGHT
Biophysical hazards of cosmic radiation during SST and manned space flight p0075 N72-26046
Effects of thrust characteristics on longitudinal stability in supersonic flight p0044 N72-16937

SUPERSONIC FLOW
Optimization of interferences between aircraft components in supersonic flow p0001 N71 19356
Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in supersonic and subsonic flow including interference lift [AGARD CP-80-71-PT-1] p0007 N71 29333
Aerodynamic load predicting for control surfaces in unsteady supersonic and subsonic flow p0007 N71 29334
Box collocation method for calculating aerodynamic loads on tandem delta wings with oscillations in supersonic flow p0008 N71 29337
Tables of half cone angles for Mach numbers 3 to 20 [AGARD-GRAPH 137 PT 3] p0175 N72 15239
Inlet, engine, and exhaust nozzle tests for supersonic propulsion system [NASA TM-X-67494] p0283 N72 16692
Designs and performance predictions for high performance supersonic ejector systems [AGARDOGRAPH 183] p0183 N73 17248
Conservation equations for analyzing supersonic and mixing flow regimes of supersonic ejectors p0183 N73 17249
Ejector flow model for predicting performance characteristics of supersonic ejector systems p0183 N73 17251
Interaction of shock wave with turbulent boundary layer at moderate supersonic Mach numbers p0271 N73 19915
Boundary layer behavior in supersonic straight and annular blade cascades of fixed and mobile types p0271 N73 19917
On some basic and new aspects about the drag problem of wings and bodies in supersonic flows p0019 N74 14713
Aerodynamic interference induced by reaction controls flow distribution of sonic or supersonic gaseous jets interacting with transverse external flow [AGARDOGRAPH 173] p0184 N74 18923
Survey of computational methods for three-dimensional supersonic inviscid flows with shocks p0185 N74 22919

SUPERSONIC INLETS
Controller independent of other intake controllers and aircraft data systems and wind tunnel testing of supersonic intake control system p0266 N72 16706
Forebody and forebody wing configuration data for supersonic inlet performance and distortion during maneuvering flight p0268 N72 16715
Destabilizing factors affecting supersonic inlets and turbofan engines of propulsion system p0266 N72 16711
Velocity distribution at supersonic compressor inlet in wind tunnel tests p0267 N72 16713
Inlet design and thermodynamic cycle of turbojet engine at supersonic speeds with normal shock p0267 N72 16717
Low speed wind tunnel tests of supersonic air intake with various auxiliary intakes using twin engine aircraft configuration p0267 N72 16718

SUPERSONIC SPEEDS
Calculation methods for wing body interference drag on supersonic aircraft in stationary or nonstationary flow p0002 N71 19362
Jet effects on boattail pressure drag at supersonic speeds in single or twin propulsive jets p0266 N72 16708
Heat transfer and pressure distribution rakes and pitot pressure profiles for turbulent boundary layers at subsonic and hypersonic speeds p0179 N72 20305
Analysis of requirements, instruments, and procedure for measurement of aircraft temperatures up to Mach 2.1 and altitudes up to 80,000 feet [AGARD-AG-186-VOL-2] p0196 N73 20499

SUPERSONIC TRANSPORTS
Aerodynamic configuration effects of propulsion system integration into supersonic transport design p0004 N71 19373
Performance criteria including engine air flow matching requirements of axisymmetric mixed compression intake for supersonic transport p0265 N72 16703
Reduction of NO formation by premixing p0217 N74 14272
Effect of supersonic transport upon the ozone layer studied in a two dimensional photochemical model with transport p0218 N74 14278

SUPERSONIC TURBINES
Analysis of lubricant system used in civil supersonic gas turbine engine p0254 N72 11697

SUPERSONIC WIND TUNNELS
Interference flow field of the flat plate configuration in supersonic turbulent boundary layer channel p0003 N71 19365
The operation of a vertical p0124 N74 16995

SUPPORT INTERFERENCE
Analysis of interference problems in subsonic and transonic wind tunnels caused by model support systems p0173 N73 26242

SURFACE COOLING
Effective heat transfer coefficients for cooling systems of gas turbine surfaces p0261 N71 27395

SURFACE FINISHING
Influence of surface preparation, surface texture, and initial oxidation on metal surface crystallization p0201 N73 23693

SURFACE NAVIGATION
Proceedings of conference on inertial navigation components and systems with emphasis on concepts and techniques involving cost and performance tradeoffs [AGARD-CP-116] p0227 N73 20684

SURFACE PROPERTIES
Influence of surface preparation, surface texture, and initial oxidation on metal surface crystallization p0201 N73 23803
Debye polarization theory for determining electromagnetism of sea surface p0241 N73 33820

SURFACE ROUGHNESS EFFECTS
Perturbation method for calculating surface roughness effects on electromagnetic wave propagation in an inhomogeneous atmosphere p0117 N71 21432
Landing accidents investigations for Hawker Siddeley 748 aircrafts with performance measurements on rough surfaces p0028 N71 23417
Mathematical prediction model for tropospheric radio transmission loss over rough surfaces p0120 N71 23472
Statistical model for tropospheric radio propagation loss in rough surface path between transportable and mobile antennas p0120 N71 23473
Stress strain fatigue mechanisms of beryllium reinforced aluminum composites having rough or smooth surfaces p0208 N72 12504
Remote sensing of ocean surface effects and formulation of sea clutter models p0122 N72 16096
Coherent approach for calculating backscatter from two scale rough surfaces [NASA-CR-125456] p0125 N72 16117
Tropospheric inhomogeneities on the screening effect due to a mountain ridge in Gray Zone radio transmission loss due to atmospheric refractivity p0146 N74 13853
HF measurements of ocean wave directional spectra using Bragg backscatter angle p0148 N74 13867

SURFACE TO SURFACE MISSILES
Design of Penguin missile inertial navigation system for midcourse guidance p0231 N73 20711

SURFACE VEHICLES
Production and efficiency of small gas turbine engine for helicopter and surface vehicles [AGARD-LS-48-71] p0261 N71 26951
Design and performance of gas turbine engines for helicopters and surface transportation vehicles p0262 N71 26953
Engineering aspects and manufacturing of gas turbine engines for helicopters and ground transportation vehicles p0262 N71 26955
Comparison of small gas turbine and diesel engine power plants for aircraft and ground vehicle propulsions p0262 N71 26958
Pattern recognition technique for automatic detection of vehicles in aerial photographs of highways p0152 N72 11183

SURFACTANTS
Use of fluorocarbon surfactants to extinguish aircraft fuel fires p0254 N72 11693

SURGERY
Idiopathic spontaneous pneumothorax in flying personnel p0086 N74 13793
Aircrew fitness for flying duties after selected fractures and spinal surgery p0086 N74 13794
Current aspects of the clinical function applied to flying personnel p0086 N74 13800

SURVEILLANCE
Application of pattern recognition techniques with Doppler radar for detection of personnel moving at rate comparable with flutter producing environment p0152 N72 11182

SURVEILLANCE RADAR
The use of target and clutter data for different methods of discrimination between targets and unwanted clutter processing of incoherent video and coherent radar signals p0145 N74 11963

SUSPENDING (HANGING)
Dynamically tuned gyros in strapdown systems p0229 N73 20697

SWEAT COOLING
Aerodynamic and thermodynamic performance of sweat cooled gas turbine engine blades p0258 N71 17382
Heat transfer in air cooling and sweat cooling rigs for high temperature gas turbine engine components p0258 N71 17383
Transpiration cooled blades for high temperature rotors in gas turbine engines p0258 N71 17384

SWEEP ANGLE
Application of method for predicting laminar boundary layer transition on swept wings p0183 N73 26281

SWEEP FREQUENCY
Sweep frequency bases altimeter radars as data for ionospheric irregularity phenomena p0179 N72 21147

SWEPT WINGS
Swept wing tests, configurations for natural laminar supersonic speed p0002 N71 19358
Flow field interference at the health swept wing fuselage store installation in aircraft p0026 N71 19387
Numerical method for evaluating the transonic flow past isolated swept wings p0029 N71 29349
Unsteady pressure measurements on flutter of a cropped swept wing with tip control surfaces in transonic flow p0031 N71 29355
Shock effects on flow past swept wings at transonic speeds p0031 N72 11805
Reynolds number effects in viscous inviscid interactions on transonic swept wings p0011 N72 11856
Method for estimating transonic buffet boundary and Reynolds number effects for straight and swept wings p0011 N72 11857
Transonic wind tunnel tests of effectiveness of high lift devices on swept and straight wings in controlling flow separation p0012 N72 11860
Pressure plotting tests on swept wings for analyzing scale effect at high subsonic speeds p0013 N72 11867
Feasibility of transonic wind tunnel testing of large cord swept wing panel model for simulating wing shock location at flight Reynolds number [NASA TM-X-67414] p0013 N72 11870
Specifications for high Reynolds number wind tunnel design for flow simulation in swept wing aircraft development tests p0015 N72 11883
Transonic wind tunnel model measurements of buffet loads and boundaries at various sweep and aspect ratio wing roots p0016 N72 11886
Development of two methods for optimizing design of subsonic swept wing jet transport aircraft p0054 N73 24054
Influence of free stream Reynolds number on transition in boundary layer on infinite swept wing p0183 N73 26280

SWEPTBACK WINGS
Analysis of aerodynamic stall characteristics of wing sections with high lift devices in two dimensional flow p0042 N73 15008
Aerodynamic configurations of sweptback wings to improve lift performance at stall in higher range of subsonic speeds p0042 N73 15010

SYNCHRONOUS SATELLITES
Solar satellite attitude measurement and control system components p0278 N72 12869
Development and characteristics of three axis radio frequency attitude sensor for geostationary satellite p0191 N72 19492
Design development and application of electrically driven wheels for stabilization of synchronous satellites p0192 N72 19493
Characteristics of sensor system for geostationary spinning satellite to determine satellite attitude during transfer and final orbit p0192 N72 19496

SYNTAX
Abbreviated test language for avionics systems [AGARD-LS-54] p0061 N74 22634

SYNTHESIS
Synthesis and properties of alpha-1 ester for turbine lubrication of jet aircraft p0254 N72 11696

SYNTHETIC ARRAYS
Synthesis of aperture distributions for optimum gain with noise and interference rejection p0147 N74 13860

SYNTHETIC FIBERS
Physical and mechanical properties of high strength high modulus reforming fiber and organic resin composite materials p0210 N73 27475
Design of filamentary composite materials for application to construction of airframes and space vehicle structures p0210 N73 27479
Failure analysis of fiber reinforced composite rocket engine case using distortional energy and maximum stress theories of failure p0213 N73 27500

SYSTEM EFFECTIVENESS
Organizational constraints and effectiveness of specialized educational courses p0113 N73 19529

SYSTEM FAILURES
Breakdown of a dynamic process and early stabilization systems for recognition p0031 N72 11918
Fault isolation approaches for general purpose digital computer used in aerospace and control applications p0156 N72 21229
Failure detection procedures in integrated navigation system employing Kalman filtering p0231 N73 20712
Fault detection and maintenance concepts of advanced inertial navigation systems p0231 N73 20713

SYSTEMS
Mean time between failure as index to system performance p0193 N71 36785

SYSTEMS ANALYSIS
High bypass turbofan powered propulsion simulation for advanced aircraft integration analyses at subsonic and supersonic speeds p0003 N71 19369
Feasibility and application of model and test techniques for [AGARD-CP-98-71] p0113 N71 19526
Quantitative aspects of operational planning information analysis p0113 N71 19528
Systems analysis for the design and application of aircraft p0230 N71 27639
Application of [illegible] p0230 N71 27640
Aerospace [illegible] p0230 N71 27641
Aerospace [illegible] p0230 N72 11824
Analysis of [illegible] p0230 N72 11825
Mathematical [illegible] p0230 N72 21222
Mathematical [illegible] [AGARD-LS-49] p0234 N72 24424

SYSTEMS ENGINEERING

Survey of aerospace industry to determine various techniques used in considering interactions of handling qualities stability control and load alleviation devices on structural loads
[AGARD R 593] p0040 N71 11020
Present and future need for high Reynolds number transonic wind tunnels including analysis of design selection and requirements p0043 N73 26282
The use of RCS data for radar systems design p0145 N74 11966
Trends towards standardized software and hardware for test systems based on process computer with interface unit and input/output peripherals p0238 N74 14351
Technical and operational aspects of externally mounted aircraft equipment p0305 N74 21614

SYSTEMS ENGINEERING

Regression analysis of estimation tests and system operating data p0189 N71 36778
Lunar module design techniques for system reliability p0190 N71 36781
Techniques for determining system and equipment reliability requirements p0190 N71 36783
Operational considerations and systems reliability of military user p0190 N71 36788
Operational description of two different systems for automatic speaker recognition p0151 N72 11179
Analytical methods for early stage detection of oil deterioration in aircraft engines p0254 N72 11698
Feasible flight augmentation system to utilize increased performance of modern helicopters p0033 N72 11931
Theory and operation of proposed helicopter IFR flight path control system p0033 N72 11933
Analysis of operational requirements and feasibility of system for precise IFR helicopter hovering p0033 N72 11934
Design development and characteristics of telecommunication links using HELIOS space probe as example p0194 N72 19508
Advantages and disadvantages of federated and integrated computer system organizations for utilization in current aerospace systems p0155 N72 21213
Optimizing linear system against quadratic cost function and application to guidance and control system for tactical missiles p0226 N72 27685
Development of airborne flight data acquisition and data processing systems
[AGARD LS 50] p0195 N73 10450
Design of aircraft flight test instrumentation systems p0195 N73 10451
Designs and performance predictions for high performance supersonic ejector systems
[AGARDOGRAPH 163] p0183 N73 17248
Semi-empirical methods for designing ejectors for various applications p0183 N73 17252
Characteristics of power generating systems and application in missiles for production of hydraulic and electric energy p0065 N73 19044
Design principles of auxiliary power units of secondary power system for operation of aircraft equipment p0065 N73 19046
Design and characteristics of auxiliary power source to operate electric hydraulic and pneumatic subsystems in rocket powered aerospace vehicles p0065 N73 19048
Design and operational services of small data centers to telemetry users
[AGARD CP 117] p0158 N73 24201
Design and operation of foreign information systems p0158 N73 24202
Management methods for developing information systems p0159 N73 24269
Design engineering for satellite communication systems considering tropospheric transmission characteristics p0241 N73 26129
Guidance for optimizing total performance of telemetry system considering radar tracking and meteorological measurements p0241 N73 26139
Hydraulic compressor with turbine p0174 N74 16992
The bugeaboo ratio A concept to increase aircraft effectiveness at reduced costs p0305 N74 21616

T

T TAIL SURFACES

Numerical analysis of aerodynamic loads and downwash for tandem and T tail surfaces in three dimensional incompressible subsonic flow p0007 N71 29345
Aeroelastic and flutter analysis for T tail configuration p0029 N73 23944

TABLES (DATA)

Tables of thermodynamic equilibrium properties of air for temperatures from 1000 to 15000 degrees Kelvin p0094 N71 23338
Tabulated and graphical summary of boundary layer data for prolonged acceleration systems p0094 N71 23345
Operational flight data analysis for increased flight safety tasks p0021 N71 29341
Comparison of experimental and theoretical wall pressures and forces on wings in incompressible subsonic flow p0009 N71 29352
Tables of ballistic damping for Mach number 1 to 3 [AGARDOGRAPH 137 PT 3] p0179 N72 19469

TACAN

Digital computers for navigation and guidance systems and fire control systems in tactical aircraft p0157 N72 21227

TACTICS

Helicopter flight performance in tactical environment p0048 N73 21009
Operational performance of helicopters in French Army p0045 N73 21011

TAIL ASSEMBLIES

Method for calculating flutter using interference aerodynamic forces between wing and tail p0009 N71 29345
Relation between measured C.G. vertical accelerations and loads at T tail of military aircraft p0291 N73 16934

TAIL SURFACES

Numerical analysis of downwash interference on wings of missile tails p0002 N71 19360
Computer programs for evaluating subsonic flow over wing tail wings with folded tips T tails and cruciform tail surfaces p0009 N71 29341

TAKEOFF

Analysis of procedures and problems involved in operating helicopters from decks of ships p0046 N73 21010
Methods for evaluating and predicting takeoff performance of turbojet and turbofan aircraft operating in conventional and short takeoff modes p0053 N73 24044
Numerical analysis of aircraft takeoff performance based on phases of takeoff and forces exerted on aircraft as basis for aircraft design p0053 N73 24051

TAKEOFF RUNS

Properties of atmospheric turbulence at low altitudes and effect on aircraft during landing approach and takeoff p0039 N72 32030
Analysis of factors affecting lateral directional handling qualities of aircraft during short takeoff flight p0040 N72 32033
Analysis of velocity profiles in boundary layer produced by incompressible flow during takeoff p0041 N73 15001

TANDEM WING AIRCRAFT

Wing interference lifting lattice simulation and application to aerodynamic loads on tandem wings in unsteady flow p0008 N71 29336
Box collocation method for calculating aerodynamic loads on tandem delta wings with oscillations in supersonic flow p0008 N71 29337

TAPE RECORDERS

Development and characteristics of data storage equipment for use on small scientific spacecraft p0193 N72 19502
Use characteristics portable tape recording system for long term ECG recording of flying personnel p0073 N72 25051
Analog computer program for analysis of extended electrocardiograph monitoring p0074 N72 25053

TARGET ACQUISITION

Application of microwave guidance sensors for tracking and fire control systems used in missile attack on small tactical targets p0227 N72 27693
AGARD conference on air to ground target acquisition
[AGARD CP 100] p0302 N73 19559
Application of extra foveal vision to predicting target acquisition rate in ground search p0302 N73 19960
Modeling target acquisition probability of acquiring designated target as function of its range as target is approached p0302 N73 19962
Calculation and simulation of effects of complex search situations p0302 N73 19963
Relationship between subjective effect of structured target backgrounds on acquisition performance p0303 N73 19964
Peripheral units with complex stimuli at two viewing distances p0303 N73 19965
Model for correct cyclical coordinates of four objects p0303 N73 19966
Air to ground visibility of lights at low background levels p0303 N73 19967
Air to ground target acquisition with flare illumination p0303 N73 19968
Biomedical problems with helmet mounted sight and visual target acquisition system p0303 N73 19969
Application of night vision to helicopter night search p0303 N73 19970
Probability of acquiring targets for search aircraft with fire and evade tactics of opponent p0304 N73 19971
Effects of shading form and target attributes on performance of airborne p0304 N73 19972
Use of eddy response (psychological) techniques for assessing subjective estimates of important parameters for target acquisition p0304 N73 19973
Use of [illegible] tests to analyze for subjective variations in operators performance relative to target [illegible] p0304 N73 19974

TARGET RECOGNITION

Correlation between subjective effects of structured target backgrounds on acquisition performance p0303 N73 19964
[illegible] p0303 N73 19964
[AGARD LS 50] p0143 N74 19964
Digital [illegible] p0144 N74 19965
Design [illegible] data [illegible] p0145 N74 11963
Use of radio modeling data for radar target assessment p0145 N74 11965
State of the art and future prospects p0145 N74 11967

TASK COMPLEXITY

Human performance in sequential task training for acquisition of perceptual motor skills under flight stress p0106 N73 19153
Pilot performance under certain hypnotic tranquilizer and barbiturate type drugs p0080 N73 21110

TASKS

Psychological and environmental factors in selecting pilot simulator tasks p0172 N71 16067

TD SATELLITES

Pneumatic system used with TD satellite attitude control system p0278 N72 12868
Semi satellite attitude measurement and control system components p0278 N72 12869

TECHNICAL WRITING

A computer produced keyword indexing system for technical reports in the library of the Aircraft Research Association Limited p0159 N74 16926
Current ASLIB research on mechanist p0160 N74 16930

TECHNOLOGY ASSESSMENT

Survey and analysis of application of nondestructive inspection methods to aircraft structures
[AGARD R 587 71] p0197 N72 19541
State of art and future trends of computer aided design of microwave integrated circuits p0166 N74 13918
Survey of the state of the art of optimization technology within NATO countries p0296 N74 15598
AGARD Annual Meeting 1973 conference on research and development in Greece and use of science and technology to meet military requirements at reduced costs p0304 N74 21610
Impact of technology on cost reduction in aircraft production p0305 N74 21618

TECHNOLOGY TRANSFER

Acquisition retrieval dissemination and management of information systems
[AGARD LS 44] p0301 N71 23501
Information systems transfer of technological information and management of technology transfer p0301 N71 23502
Profile construction cost benefits economics and user surveys in transfer of technology and selective dissemination of information p0301 N71 23506
Spacecraft display technology applied to aircraft guidance and control displays p0226 N72 27643
Advanced NASA and DOD technology management techniques and application to NATO programs for defense and civil needs p0302 N73 19968

TECHNOLOGY UTILIZATION

Feasibility and applications of scientific and technical information analysis centers
[AGARD CP 78 71] p0113 N71 19526
Concept mission and operation of scientific and technical information analysis centers p0113 N71 19527
Impact of technological development on airborne data acquisition system and ground data processing station p0195 N73 10457

TELECOMMUNICATION

Meteorological effects on tropospheric propagation predictions for telecommunications p0120 N71 23420
Design development and characteristics of telecommunication links using HELIOS space probe as example p0194 N72 19508
Feasibility analysis of packet switching networks for remote access computing systems p0158 N72 22171
Advanced digital visual communications systems for telecommunication and video storage p0158 N72 22172
Design and operation of communications system utilizing computer control or microfilm technique for application to commercial organization p0158 N72 22173
Conference on expanded aerospace telecommunications systems requirements and digital data transmission methods
[AGARD CP 103] p0130 N73 10187
Digital telecommunication techniques and network planning for aerospace systems p0131 N73 10188
Digital computer techniques for editing and transmission of telemetered data p0131 N73 10192
New principal output of data acquired via satellite and navigation telecommunications systems p0131 N73 10194
Attenuation and phase stability prediction criteria of earth satellite communications using ionospheric models p0132 N73 10201
Worldwide satellite communications systems using optical techniques p0132 N73 10202
Measurement of tropospheric effects on ground terminals for monitoring satellite communications p0133 N73 10203
Satellite communication terminal for ship p0133 N73 10204
Orbit sharing and technical problems of high power satellite communication systems p0133 N73 10205
Real time computerized message switching and data handling system for military communications networks p0133 N73 10206
Automatic telemetry system for military communications p0133 N73 10207

Operational performance and transmission measurements on worldwide Defense Communications System network p0133 N73 10208

Feasibility of all digital implementation of worldwide analog communications systems p0133 N73 10209

Kalman filtering algorithm for detecting continuous wave interference signals in digital telecommunications p0133 N73 10210

Intermodulation interference effects of metal surface transmitters and receivers in near field locations of transmission system p0134 N73 10212

Conference on atmospheric attenuation and rainfall effects on ultrahigh frequency telecommunication systems [AGARD CP 107] p0140 N73 26121

Design engineering for radio communication systems considering tropospheric transmission characteristics p0141 N73 26128

Criteria for planning ultrahigh frequency telecommunication system considering radioelectrical and meteorological measurements p0141 N73 26129

Horizontal radio link system for measuring ultrahigh frequency absorption due to rain p0141 N73 26130

Use of differential phase and gain for prediction performance of ultrahigh frequency telecommunication systems p0141 N73 26132

Effects of rain and atmospheric turbulence on ultrahigh frequency space communication radio link p0143 N73 26143

Propagation effects of frequency sharing [AGARD CP 127] p0145 N74 13846

Introductory survey to session 1 Propagation over irregular terrain telecommunication transmission loss prediction p0145 N74 13847

TELEMETRY

Development and operation of programmable PCM telemetry encoder for data storage and processing during space missions p0193 N72 19504

Facilities and techniques for measuring antenna radiation patterns of spacecraft telemetry and telecommand antennas p0194 N72 19512

Introductory survey to session 4 Propagation data for interference probability determination p0147 N74 13861

TELEOPERATORS

Computerized teleoperator applications in manned aerospace systems p0281 N73 23904

TELEPHONY

Automatic equalizers of telephone channels for fast transmission of digital data p0132 N73 10133

TELEVISION CAMERAS

Image processing and pattern recognition system for time variant images using TV cameras and digital computer p0154 N72 11196

TELEVISION EQUIPMENT

Characteristics of satellite television recording system using continuous line scanning with constantly open aperture p0192 N72 19498

TELEVISION RECEPTION

Characteristics of satellite television recording system using continuous line scanning with constantly open aperture p0192 N72 19498

TELEVISION TRANSMISSION

Advanced digital video communication systems for television transmission and video storage p0168 N72 22172

TELLURIC LINES

Variable coefficient separable exponential diffusion for analyzing inhomogeneous media through magneto telluric penetration spectra p0175 N72 16118

TEMPERATURE

Stress effects of temperature and altitude on human performance p0069 N71 20363

TEMPERATURE DISTRIBUTION

Temperature fluctuations and spectral distributions for temperature and velocity in turbulent boundary layer p0175 N72 20276

TEMPERATURE EFFECTS

Temperature and time dependent effects on mechanical behavior of solid propellant composite materials p0297 N72 12499

TEMPERATURE MEASUREMENT

Catalytic surface effects on thermocouple gas temperature measurements in jet engines p0257 N71 17379

Error correction procedures for aircraft infrared sea surface temperature measurements p0124 N72 16105

Error analysis of sea surface temperature measurements by satellite borne scanning infrared sensor p0124 N72 16107

Analysis of requirements instruments and procedures for measurement of aircraft temperatures up to Mach 2.3 and altitudes up to 80,000 feet [AGARD AG 160 VOL 2] p0196 N73 20493

Techniques for measuring heat transfer in short duration and rapidly varying flows [AGARD AG 165] p0302 N73 20945

TEMPERATURE MEASURING INSTRUMENTS

Heat transfer and heat flux measuring sensors for gas turbine engines p0257 N71 17377

Development and application of high intensity direct reading heat flux gage of gas steady state type [SAE AIR 799] p0190 N71 36781

TENSILE STRENGTH

Tensile strength measurements of steel wire reinforced aluminum alloys p0288 N72 21923

TENSILE STRESS

Accelerated slow strain rate tensile method p0288 N72 21924

TENSORS

Equations for time mean values of incompressible turbulent flow and eddy viscosity dependence on second invariant of deformation tensor p0176 N72 20280

TERMINAL BALLISTICS

Theoretical analysis of fuel ignition by hot projectile and ignition delay time as function of temperature and width of hot gas region p0252 N72 11683

TERMINAL FACILITIES

Satellite communication terminal for ships p0133 N73 10204

Analysis of terminal air traffic control procedures to determine impact of automation on air traffic controller personnel p0233 N73 23700

Numerical analysis of optimal control and sequencing of air traffic control operations in near terminal area p0233 N73 23701

Analysis of development program for improving US air traffic control procedures for 1980 time period p0235 N73 23718

Wake Vortex Avoidance System program (WVAS: design and implementation of ground based monitoring and predictive system for safety from wake vortices p0058 N74 17732

TERMINAL GUIDANCE

Characteristics of electro optical terminal guidance systems area correlators and gated trackers used for guidance and control of tactical missiles p0227 N72 27688

Inertial guidance techniques for midcourse guidance and terminal guidance systems with application to control and guidance of tactical standoff missiles p0227 N72 27691

Characteristics of command to line of sight guidance and semi active homing missile systems applied to guidance and control of tactical missiles p0227 N72 27692

Application of microwave guidance sensors for tracking and fire control systems used in missile attack on small tactical targets p0227 N72 27693

Terminal guidance systems testing based on nondestructive tests and verification by limited live firings to increase test cost effectiveness p0237 N74 14356

TERRAIN

Universal system for assigning colors to terrain [AGARD AG 159] p0187 N72 25346

Effect of terrain screening on the different mechanisms of propagation p0146 N74 13850

TERRAIN ANALYSIS

Radar imagery for producing cumulative frequency curves of terrain slopes in geographic mapping p0122 N72 16091

Interpretation of side looking airborne radar imagery for vegetation mapping [NASA CR 125451] p0122 N72 16092

Multispectral reflectivity curves near infrared and visible regions for planning remote multiband terrain photography p0124 N72 16109

Aerial multispectral color photography for remote reconnaissance of soils and rocks p0124 N72 16110

Introductory survey to session 1 Propagation over irregular terrain telecommunication transmission loss prediction p0145 N74 13847

The propagation of electromagnetic waves over irregular terrain radio wave diffraction and transmission loss p0146 N74 13848

The radiation diagrams of antennas used in terrestrial microwave line of sight systems radiation patterns of parabolic antennas in terrestrial relay systems p0147 N74 13859

TERRAIN FOLLOWING AIRCRAFT

Terrain avoidance radar for US Army rotary wing aircraft p0032 N72 21927

TEST CHAMBERS

Problems of wind tunnel design and testing [AGARD R 600] p0173 N74 16987

TEST EQUIPMENT

Effectiveness of reliability programs to avionic equipment p0189 N71 36779

Cost effectiveness of built in test provisions in aircraft operations p0189 N71 36780

Proceedings of conference on applications of laser technology for aerodynamic measurements [AGARD LS 49] p0199 N72 25493

Mathematical models and numerical analysis of coherent optical systems used as holographic scanning systems p0199 N72 25496

Principles for producing holograms and methods of reconstructing radiation patterns between plane coherent collimated light waves p0199 N72 25499

Development at Chalmers of holography cameras for use with Q switched ruby lasers [NASA CR 126762] p0199 N72 25501

A new analytical technique for continuous NO detection in the range from 0.1 to 5000 PPM p0219 N74 14281

Testing philosophy and methods of guidance and control systems and subsystems applied to navigation systems for aircraft spacecraft and missiles [AGARD LS 60] p0236 N74 14345

Introductory remarks Test technology trends applied to performance tests of inertial guidance systems p0235 N74 14346

PIGA Accelerator tests on vertical 100 3 hertz table centrifuge and vibration tests of inertial guidance systems p0236 N74 14347

Inertial guidance system centrifuge testing development and characteristics of test equipment p0236 N74 14348

Testing of an attitude control unit for sounding rockets p0236 N74 14349

Laboratory evaluation of all electro optically aided spare navigation systems navigation algorithm design concept and hardware performance p0236 N74 14350

Trends towards standardized software and hardware for test systems based on process computer with interface unit and input output peripherals p0236 N74 14351

Inertial guidance system sled testing p0237 N74 14354

Role of simulation in the study and development of the CROTALE system ground to air close defense weapon system p0237 N74 14355

Problems of wind tunnel design and testing [AGARD R 600] p0173 N74 16987

Project study of a large European transonic Ludwieg Tube wind tunnel p0174 N74 16989

The development of an efficient and economical system for the generation of quiet transonic flows suitable for model testing at high Reynolds number p0174 N74 16990

Facilities for aerodynamic testing at supersonic speeds p0174 N74 16993

Directory of research activities in subsonic aerodynamics [AGARD R 659] p0304 N74 17664

TEST FIRING

Inertial guidance system testing based on accelerated type tests and check at only selected points to guarantee test cost effectiveness p0237 N74 14356

TEST PILOTS

Development and application of [illegible] and performance and handling criteria [illegible] p0019 N72 12028

TEST VEHICLES

Missile simulation and test vehicle p0103 N72 13151

TESTS

Results of total systems tests of the [illegible] p0190 N71 36781

TF 30 ENGINE
Inlet random pressure fluctuation effects on turbojet engine stall characteristics p0037 N72 27022
THERMAL CONTROL COATINGS
Thermal control coatings for refractory gas turbine materials p0259 N71 17391
Performance of aluminide coatings in simulated high temperature tests on gas turbine engine inlets [NASA CR 116374] p0259 N71 17393
THERMAL ENVIRONMENTS
Heat tolerance of athletes during muscular exercise in various thermal environments p0070 N71 20366
THERMAL EXPANSION
Dilatometric thermal expansion measurements on high temperature structural materials [AGARD AR 31 71] p0299 N71 2[illegible]358
Thermal expansion behavior of platinum Al2O3 tungsten alloys and graphites [AGARD AR 38] p0299 N72 24960
THERMAL FATIGUE
Thermal fatigue behavior of fiber reinforced nickel alloy gas turbine blades p0259 N71 17390
Thermal stress and low cycle fatigue reliability analyses on high temperature structural machine materials p0261 N71 17403
THERMAL PROTECTION
Hot salt stress corrosion cracking of titanium alloys used as radiative heat shields in space shuttles [NASA TM X 68304] p0289 N72 21926
THERMAL RESISTANCE
Computerized optimization of thermal resistant gas turbine blades p0260 N71 17400
THERMAL STABILITY
Assessment of high temperature stability of synthetic lubricants for aircraft gas turbines p0254 N72 11695
Thermal stability of trimethyl propane ester based lubricating oil for aircraft engines p0254 N72 11699
Thermodynamic stability diagrams of high temperature O2 corrosion reactions p0201 N73 23602
THERMAL STRESS
Combined environmental stress effects on human performance p0069 N71 20362
THERMAL STRESSES
Heat transfer and thermal stress calculations for gas turbine rotor blade design p0261 N71 17401
Role of isothermal stresses generated during oxidation and modes of stress relaxation p0202 N73 23605
THERMOCLINES
Influence of solar energy absorption and air water interactions on seasonal thermocline of sea p0241 N73 33623
THERMOCOUPLES
Catalytic surface effects on thermocouple combustion gas temperature measurements in jet engines p0257 N71 17379
THERMODYNAMIC CYCLES
Thermodynamic cycle and power output parameters of gas turbine p0262 N71 26954
THERMODYNAMIC PROPERTIES
Thermodynamic properties of small gas turbines for power generation in aeronautics, space and industry p0262 N71 26957
Inlet design and thermodynamic cycle of turbojet engine at supersonic speeds with normal shock p0267 N72 16717
Techniques for measuring elastic viscoelastic ultimate strength thermal and electrical properties of fiber reinforced composites p0209 N72 29593
Development of method for analyzing performance of magnetohydrodynamic generator based on thermodynamic properties and flow characteristics p0065 N73 19051
Analysis of heat transfer properties and their influence properties of materials used for aircraft and spacecraft construction [AGARD R 605] p0300 N73 25968
THERMONUCLEAR POWER GENERATION
Application of superconducting magnetics for plasma physics experiments and as components for future thermonuclear reactors p0063 N73 19033
THERMOPHYSICAL PROPERTIES
Analysis of heat transfer properties and thermophysical properties of materials used for aircraft and spacecraft construction [AGARD R 306] p0300 N73 25968
THERMOSIPHONS
Design and performance of thermosiphon fluid cooled high density temperature axial flow turbine p0260 N71 17399
THICKNESS
Airborne remote radar sensor for depth sounding of Antarctic ice p0123 N72 18999
THIN WINGS
Calculated values of air forces in oscillating flow theory obtained by linearized potential flow [AGARD R 593 71] p0010 N71 35198
THREE DIMENSIONAL BOUNDARY LAYER
Partial differential equations for calculating three dimensional incompressible turbulent boundary layers p0127 N72 20285
THREE DIMENSIONAL FLOW
Three dimensional testing of high lift device models p0026 N71 20067
Three finite state model for analysis of propulsion structure and dynamics p0114 N71 21411
Improved mixing length model applied to three dimensional boundary layer assuming turbulent shear stress in same direction as laminar p0177 N72 20284
Numerical analysis of three dimensional ideal gas flow and Euler equations of motion p0182 N72 27307
Application of functional analysis to obtain exact semianalytical solutions of boundary layer flows under turbulent and laminar conditions p0041 N73 15003
The drag resulting from three dimensional separations caused by boundary layer diverters and nacelles in subsonic and supersonic flow p0021 N74 14728
Survey of computational methods for three dimensional supersonic inviscid flows with shocks p0185 N74 22919
THROATS
Procedure for predicting performance characteristics of second throat diffusers in ejector systems p0183 N73 17250
THRUST
Engine aircraft interference thrust inlets nozzles and propulsion systems conference [AGARD CP 91 71] p0263 N72 16685
Wind tunnel tests of afterbody, thrust and configuration for models with simplified hollow nacelles p0263 N72 16689
Full scale thrust performance tests of prototype dual stream propelling nozzle p0263 N72 16691
Thrust measurement interpretation for V STOL models and transient performance of lift fan configurations p0264 N72 16693
Determination of thrust and drag characteristics for integrated aircraft engine nozzle optimization p0038 N72 2707[illegible]
Effects of thrust characteristics on longitudinal stability in supersonic flight p0044 N73 16997
THRUST AUGMENTATION
Augmentor flap wing ducting and augmentor nozzle and noise reduction for jet STOL aircraft [NASA CR 125540] p0264 N72 16698
Rapid mixing nozzles, thrust vector control and thrust augmentation for V STOL aircraft p0265 N72 16699
THRUST MEASUREMENT
Presentation of helicopter level flight performance as power coefficient compared with tip speed or advance ratio for range of thrust coefficients p0047 N73 21014
THRUST REVERSAL
Design and aerodynamic performance of clamshell target thrust reverser p0264 N72 16695
THRUST VECTOR CONTROL
Advantages of thrust vectoring in advanced air combat simulation p0266 N72 16694
Rapid mixing nozzles, thrust vector control and thrust augmentation for V STOL aircraft p0265 N72 16699
THUNDERSTORMS
Ionospheric oscillations caused by infrasonic waves propagating from thunderstorms p0136 N73 14148
Thunderstorm cloud height and fading statistics for ATS 5 ultrahigh frequency signal transmission to earth p0142 N73 26141
TILTING ROTORS
Review of tilting rotor technology and comparison of tilting rotor performance with standard rotary wings p0048 N73 21027
Wind tunnel tests to determine effects of blade twist and aeroelasticity on tilt rotor performance from hover to mach number 0.7 p0051 N73 21049
Aerodynamic dynamic and aeroelastic problems in rotary wing design for helicopters and V STOL aircraft with application to flingless rotor systems p0051 N73 21051
TIME DEPENDENCE
Time dependent technique applied to subsonic and transonic flow nozzle solutions p0266 N72 18712
Nonlinear time dependent problems in fluid dynamics p0185 N74 22916
TIMING DEVICES
Economic analysis of integrated time frequency systems for aircraft p0235 N73 23717
TIP DRIVEN ROTORS
Development of rotary wings with cold hot and mixed cycle tip jet propulsion systems and application for torque free rotor drive system p0048 N73 21026
TIP SPEED
Presentation of helicopter level flight performance as power coefficient compared with tip speed or advance ratio for range of thrust coefficients p0047 N73 21014
TISSUES (BIOLOGY)
Relative biological effects of heavy cosmic rays on living tissue p0075 N72 28049
TITANIUM ALLOYS
Properties and selective applications of titanium alloys in airframes and jet engines p0206 N71 27945
Stress corrosion tests of titanium alloys in electrolytes and welded titanium alloys p0287 N72 21912
Hot salt stress corrosion cracking of titanium alloys used as radiative heat shields in space shuttles [NASA TM X 68304] p0289 N72 21926
Failure of welded joints in Ti Al Sn alpha type alloys in CCl4 vapor p0289 N72 21929
Design fabrication and test of titanium compressor and turbine fan disks to operate at high temperature p0213 N73 27499
TOOTH DISEASES
Cardiovascular flight effects on tooth development in aircraft pilots p0092 N71 22309
TORPEDOES
Three axis gyro stabilized torpedo platform p0230 N73 20702
TORQUERS
Angular momentum exchange systems jet expulsion systems and magnetic torquers for active satellite attitude control p0277 N72 12866
TOXICITY
Ophthalmological examination of antimalarial drugs effects on performance of navigation personnel p0082 N73 21122
TOXICITY AND SAFETY HAZARD
Effects of chemical fire extinguishing agents containing bromotrifluoromethane on cardiovascular and nervous systems of dogs monkeys and baboons [AGARD R 599] p0077 N73 17106
TOXICOLOGY
Environmental toxicological impact of aircraft operations p0222 N74 14306
TRAILING EDGES
Boundary layer optimization for small turbine blade design with cusped trailing edge p0258 N71 17380
Transonic wind tunnel determination of blunt trailing edge effects on drag and lift characteristics of wing profile p0012 N72 11862
New investigations for reducing the base drag of wings with a blunt trailing edge effects of splitter plates and splitter wedges on aerodynamic drag coefficients p0020 N74 14723
TRAINING SIMULATORS
Evaluation of the role of the simulator training airborne ASW operations p0107 N74 18801
TRAJECTORY OPTIMIZATION
Computerized multistage decision process for radar operator and missile avoidance trajectory control p0279 N73 23886
Development of computer program for determining minimum time trajectories and comparison with gradient method of computation p0053 N73 24053
TRANQUILIZERS
Residual effects of hypnotic drugs on human nervous function and performance p0080 N73 21106
Pilot performance under certain fast acting tranquilizer and barbiturate type drugs p0080 N73 21110
Spectral analysis on human circadian rhythms performance to evaluate tranquilizer effects p0081 N73 21116
Flight safety factors in prescribing tranquilizing drugs for flying personnel p0082 N73 21123
Comparison of chlorpromazine and diazepam effects on human mental and psychomotor functions p0082 N73 21126
Computer electroencephalography in evaluating the influence of psycho pharmacological drugs on vigilance p0199 N74 20742
TRANSEQUATORIAL PROPAGATION
Electronics and space activities in Greece radio wave propagation and electron density research p0305 N74 21612
TRANSFER FUNCTIONS
Transfer functions in modeling human pilot dynamic structural aircraft responses [AGARD R 580 71] p0006 N71 23276
Computation and measurements of dynamic aircraft transfer functions to atmospheric turbulence p0007 N71 23213
Human factors for defining transfer functions in pilot modeling p0007 N71 23214
Measurement of light scattering at various angles using point spread function and modulation transformation function techniques p0242 N73 33629
TRANSFORMATIONS (MATHEMATICS)
Transformation functions for turbulent boundary layers with optional pressure gradient p0176 N72 20278
TRANSHORIZON RADIO PROPAGATION
Tropospheric scatter propagation and prediction of radio transmission characteristics [AGARD CP 70 71] p0117 N71 23451
Boundary layer theory and meteorological parameters for radar range prediction over sea surface p0121 N71 23474
Water evaporation interference in phase measurements by transhorizontal microwave propagation over sea surface p0140 N73 26125
Scattering in transhorizon ultrahigh frequency radio links due to rain p0141 N73 26133
Ducting properties of elevated layers p0147 N74 13862
The occurrence of very high field strengths at beyond the horizon propagation over sea in the frequency range 60 5000 MHz p0147 N74 13863
Interference measurements at 15.7 GHz over a long transhorizon path tropospheric radio scattering mechanisms p0148 N74 13864
Statistics of high level TV carrier signals at 2.295 and 7.6 GHz and measurements of the variation of the arrival angle structure radio interference and tropospheric scatter p0148 N74 13866
TRANSISTORS
Characteristics of solid state power amplifiers for direct amplification using doublers and triplers and application to interplanetary space probes p0194 N72 19950
Linear transistor models of RF network analysis Adapter between measurements and analysis by computer p0166 N74 13916
TRANSITION FLOW
Thrust measurement and interpretation for V STOL models and transient performance of lift fan configurations p0264 N72 16691

TRANSMISSION EFFICIENCY
Near infrared measurements on erbium laser transmission in carbon dioxide atmosphere p0124 N72 18108

TRANSMISSION LOSS
Transmission loss in tropospheric transhorizon propagation on 12 GHz scatter link p0118 N71 23458
Path loss prediction methods for tropospheric radio scatter propagation links and comparison with performance tests p0120 N71 23469
Mathematical prediction model for tropospheric radio transmission loss over rough surfaces p0120 N71 23472
Statistical model for tropospheric radio propagation loss in rough surface path between transportable and mobile antennas p0120 N71 23473
The propagation of electromagnetic waves over irregular terrain radio wave diffraction and transmission loss p0146 N74 13848
Variations in diffraction loss due to tropospheric effects at frequencies between 180 MHz and 10 GHz in hilly terrain p0146 N74 13852
Estimating attenuation scintillation and scattering due to rainfall for satellite ground systems p0147 N74 13856
Interference measurements at 15.7 GHz over a long transhorizon path tropospheric radio scattering mechanisms p0148 N74 13864
Troposcatter propagation in an equatorial climate p0148 N74 13865
Examination of very low field strength levels on line of sight paths over sea due to meteorological conditions p0148 N74 13868
Synthesis of passive filters with infinite attenuation poles realized with weak nonlinear components applied to high degree Cauer filters p0167 N74 13923

TRANSMITTER RECEIVERS
Intermodulation interference effects of metal surface transmitters and receivers in near field locations of transmission system p0134 N73 10212

TRANSONIC FLOW
Scale effects in flows past swept wings at transonic speeds p0011 N72 11855
Reynolds number effects in viscous inviscid interactions on transonic swept wings p0011 N72 11856
Method for estimating transonic buffet boundary and Reynolds number effects for straight and swept wings p0011 N72 11857
Flow model for shock induced leading edge transonic flow turbulence and rear separation in low speed stall of airfoil p0011 N72 11858
Minimum level of Reynolds number for realistic flow simulation in transonic test facilities [NASA TM X 67412] p0012 N72 11859
Transonic wind tunnel tests of effectiveness of high lift devices on swept and straight wings in controlling flow separation p0012 N72 11860
Transonic wind tunnel determination of Reynolds number effect on jet flapped airfoil drag divergence pressure distribution and buffet onset p0012 N72 11861
Transonic wind tunnel determination of blunt trailing edge effects on drag and lift characteristics of wing profile p0012 N72 11862
Reynolds number effect on flow past body of revolution at transonic speed p0012 N72 11864
Transonic performance of double flux engine nacelle air intake and afterbody at high Reynolds numbers p0013 N72 11866
Measurement accuracy and flow simulation for transonic testing in wind tunnels [NASA TM X 67415] p0014 N72 11872
Equivalent body of revolution for simulating high Reynolds number effect on transonic flow past two dimensional airfoil p0014 N72 11874
Sound field generation by transonic flow over perforated surface liners in wind tunnels p0014 N72 11876
Hydraulic equipment for high Reynolds number testing in transonic wind tunnel [NASA TM X 67418] p0015 N72 11880
Computation of transonic inviscid flow with imbedded shock waves p0192 N72 27706
Analytical approach for loss and deflection behavior of cascades in transonic flow including axial mass flow variation p0268 N73 19890
Vaporization thermodynamics of Cr_2O_3 protective waxes under transonic flow conditions p0202 N73 23667
On the prediction of aerodynamic loads on oscillating wings in transonic flow [AGARD R 617] p0723 N74 18654
A survey of computational methods for 2D and 3D transonic flows with shocks p0185 N74 22320

TRANSONIC FLUTTER
Comments on NASA Langley research on transonic unsteady aerodynamics and flutter of plates and wings [NASA TM X 69997] p0023 N74 19157

TRANSONIC NOZZLES
Tune dependent temperature applied to solve axisymmetric transonic flow nozzle solutions p0266 N73 19712

TRANSONIC SPEED
Wind tunnel measurements of Reynolds number effects on force and pressure coefficients for the leveled delta wing at transonic speed p0011 N72 11863
Free flight models for research testing at high Reynolds numbers [NASA TM X 67416] p0015 N72 11878
Flow phenomena and test facilities for transonic airfoils [AGARD AR 35 71] p0175 N71 25072
Flight tests to determine buffet characteristics of four high performance aircraft during transonic maneuvers p0043 N73 15017
Analysis of minimum run times required for instationary measurements at transonic speeds during wind tunnel tests p0173 N73 26243
A survey of drag prediction techniques applicable to subsonic and transonic aircraft design p0019 N74 14711

TRANSONIC WIND TUNNELS
Consideration by NATO of transonic wind tunnel requirements to support evolution of aeronautical and aerospace systems during next decade [AGARD AR 35 71] p0175 N71 25073
AGARD report on engine airplane interference and wall correction in transonic wind tunnel tests [AGARD AR 36 71] p0010 N71 36400
Conclusions and recommendations concerning wind tunnel tests of interaction between engine flow and wall corrections in transonic wind tunnels p0010 N71 36401
Compilation of responses to questionnaire on engine airframe interference in transonic tests p0011 N71 36402
Wall corrections for airplanes with interference lift in transonic wind tunnel tests p0011 N71 36403
Conference on theoretical methods and wind tunnel facilities for transonic aerodynamic testing of aircraft at high Reynolds numbers [AGARD CP 83 71] p0011 N72 11854
Transonic wind tunnel testing for predicting flight performance characteristics of aircraft p0013 N72 11865
Comparison of performance predictions and flight data for optimizing transonic wind tunnel design p0014 N72 11871
Measurement accuracy and flow simulation for transonic testing in wind tunnels [NASA TM X 67415] p0014 N72 11872
Transonic wind tunnel testing requirements for simulating transonic aerodynamic data at flight Reynolds numbers p0014 N72 11873
Sound field generation by transonic flow over perforated surface liners in wind tunnels p0014 N72 11876
Methods for solving engine airplane interference and wall corrections in transonic wind tunnel tests for predicting aerodynamic performance of airplane design p0014 N72 11877
Hydraulic equipment for high Reynolds number testing in transonic wind tunnel [NASA TM X 67418] p0015 N72 11880
Comparison between conventional blowdown and Ludwieg tube driven transonic wind tunnels for high Reynolds number range p0015 N72 11881
Performance and operational characteristics of high Reynolds number Ludwieg tube transonic wind tunnels for transonic model testing p0016 N72 11884
Transonic wind tunnel design for model testing at high Reynolds number p0016 N72 11887
Aerodynamic testing at high Reynolds numbers and transonic speeds in NATO [AGARD R 588 71] p0016 N72 12978
Data and recommendations for transonic tests of inlets p0263 N72 16687
Analysis of problems involved in operation of large wind tunnels at subsonic and supersonic speeds [AGARD R 691] p0172 N73 26239
Development of numerical methods for predicting wall constraints in transonic wind tunnels with ventilated walls p0173 N73 26241
Fluid mechanic problems in design and operation of low speed and transonic wind tunnels [AGARD R 602] p0181 N73 26279
Present and future need for high Reynolds number transonic wind tunnels with emphasis on design selection and improvements p0183 N73 26282
Effects of turbulence and nonuniformities of test measurements at transonic speeds p0184 N73 26284
Design of ventilated walls for transonic wind tunnels with analysis of parameters affecting noise generation p0184 N73 26285
Problems of wind tunnel design and testing [AGARD R 600] p0173 N74 18987
Practicability of a large European transonic Ludwieg Tube wind tunnel p0174 N74 16989
The development of efficient and economical systems for the generation of quiet transonic flows suitable for model testing at high Reynolds number p0174 N74 16990
Hydraulic survey report wind tunnel p0174 N74 16992

TRANSPORT AIRCRAFT
High lift applications to transport aircraft design p0026 N73 20054
Flight testing of fully instrumented small fly by wire jet transport (FBW JET) airplane p0026 N73 20055
Aerodynamic suitability of Canard 12 for wind tunnel testing of transport aircraft models at transonic Reynolds numbers and selected angles of attack at Mach number [NASA TM X 67417] p0033 N72 11873
Advanced flight test techniques and facilities for short haul routes p0033 N72 11915
Analysis of data gained during flight tests of flight control systems installed in flight simulators for transport aircraft p0046 N73 22057
Criteria for design of automatic control systems for military helicopters p0046 N73 22058
Flight investigation of the effects of [illegible] flight p0046 N73 22059

Development and characteristics of dual cargo hook system for use on military transport helicopters p0048 N73 21022
Numerical methods for determining range and radius of action performance of transport and combat aircraft and effects of various parameters on performance p0052 N73 24043
Aerodynamic coefficients for calculating transport aircraft performance using wind tunnel and scale models p0053 N73 24046
Analysis of parameters affecting choice of engines for transport and combat aircraft during design process p0053 N73 24048
Development of two methods for optimizing design of subsonic swept wing jet transport aircraft p0054 N73 24054
Analysis of aerodynamic characteristics affecting selection of short takeoff transport aircraft p0055 N73 27012
Analysis of research and development programs involving construction of short takeoff transport aircraft in Germany p0055 N73 27013
Aerodynamic characteristics of high lift wing concepts for application to commercial short takeoff transport aircraft p0292 N73 29908
The problem of installing a modern high bypass engine on a twin jet transport aircraft. p0021 N74 14727
Theoretical horizontal tail loads and associated aircraft responses of an autopilot controlled jet transport flying in turbulence analysis of problem areas associated with rigid aircraft controlled by simple autopilot p0049 N74 17742

TRANSPORT PROPERTIES
Transport properties of oxide scales formed on oxidation resistant alloys p0701 N73 23604

TRAVELING IONOSPHERIC DISTURBANCES
Asymptotic methods for determining propagation angles of internal gravity waves traveling at ionospheric heights p0136 N73 14144
Traveling ionospheric disturbance generation by tropopause jet stream p0136 N73 14147
Gravity wave effects on occurrence time changes of daily traveling ionospheric disturbances p0136 N73 14156
Solar radio interferometry for traveling ionospheric disturbance detection p0138 N73 14158
Computerized simulation of gravity wave perturbed traveling ionospheric disturbances using radio ray paths p0139 N73 14161
Ray tracing computations of high frequency signal propagation and group traveling ionospheric disturbances p0139 N73 14165
Acoustic gravity wave effects on traveling ionospheric disturbances following nuclear explosions p0139 N73 14166
Effects of traveling ionospheric disturbances following nuclear explosions on high frequency band propagation p0139 N73 14167

TREADMILLS
Retraining astronauts with abnormal exercise tests and normal procedure programs to flying status p0085 N74 13788

TROPOSPHERE
Ultrahigh resolution radar for sensing detailed fine scale structure of troposphere p0123 N72 16101
Microwave radar detection and photography of spectral gravity waves troposphere p0137 N73 14152

TROPOSPHERIC SCATTERING
Tropospheric characteristics and their effects on satellite communication wave propagation and radio signal transmission [AGARD CP 70 71 PT 1] p0114 N71 21409
Three layer model for analysis of tropospheric structure and dynamics p0114 N71 21411
Tropospheric scattering and delay effects on ultra high data rate wave propagation in space communication p0114 N71 21413
Tropospheric attenuation of low angle satellite earth signals at 15 to 2 cm wavelengths p0115 N71 21420
Optimal multiple access systems and tropospheric path parameters for space communications p0115 N71 21421
Tropospheric turbulent layer effects on superhigh frequency transmission at low elevation angles p0115 N71 21422
Tropospheric scintillation effects on radio wave propagation and orbital distortion p0116 N71 21423
Radio reflectivity calculations for tropospheric elevated layers during transhorizon wave propagation p0116 N71 21424
Tropospheric effects on microwave propagation over slant paths p0117 N71 21430
Very high frequency signal fading in reflection scatter path propagation p0117 N71 21431
Tropospheric wave propagation and limitations to microwave communications [AGARD CP 70 71] p0117 N71 21451
Tropospheric refractive radio wave scatter propagation p0117 N71 21452
Scattering of electromagnetic waves from turbulent fluctuations in tropospheric scatter propagation problems p0118 N71 21454
Tropospheric scatter multiband diversity analysis by synthesis of sufficient statistics p0118 N71 21455
Tropospheric scatter propagation measurements at 4.6 GHz over a 185 km path p0118 N71 21458
Radio wave propagation studies in the troposphere using the geostationary satellite ATS 3 as a source p0121 N71 21469

TROPOSPHERIC WAVES

Meteorological effects on tropospheric propagation predictions for telecommunication p0120 N71 23470
Amplitude fading of superhigh frequency geostationary communications satellite signals considering atmospheric refraction p0142 N73 26139
Slant path attenuation of ultrahigh frequency signals from sun tracking radiometers p0142 N73 26140
Variations in diffraction loss due to tropospheric effects at frequencies between 180 MHz and 10 GHz in hilly terrain p0146 N74 13852
Tropospheric influence on the screening effect due to a mountain ridge on 3 GHz radio transmission loss due to atmospheric refractivity p0146 N74 13853
Introductory survey to session 4 Propagation data for interference probability determinations p0147 N74 13861
Interference measurements at 15.7 GHz over a long transhorizon path tropospheric radio scattering mechanisms p0148 N74 13864
Troposcatter propagation in an equatorial climate p0148 N74 13865
Statistics of high level beyond horizon signals at 2.2 GHz and 2.8 GHz and measurements of the variation of the arrival angle structure radio interference and tropospheric scatter p0148 N74 13866

TROPOSPHERIC WAVES

Improved tropospheric wave propagation for military applications p0114 N71 21410

TRUSSES

Optimal joint positions for space trusses p0297 N74 15608
Optimization of the layout of trusses combining strategies based on Michell's theorem and on the biological principles of evolution p0298 N74 15817

TUNGSTEN

Thermal expansion behavior of platinum Al2O3 tungsten alloys and graphites [AGARD AR 38] p0299 N72-24960

TURBINE BLADES

Advanced cooling systems and heat resistant materials for turbine blades of high temperature aeronautical gas turbine engines [AGARD CP 73 71] p0257 N71 17372
Heat transfer prediction for turbine blade design p0257 N71 17374
Mathematical model for calculating blade temperatures in convective cooled gas turbines p0257 N71 17375
Efficiency of air cooling blade design for Olympus 593 gas turbine engine p0257 N71 17376
Heat transfer and exchange measurements on fixed turbine blades in high temperature combustion chamber p0257 N71 17378
Boundary layer optimization for small turbine blade design with cusped trailing edge p0258 N71 17380
Aerodynamic and thermodynamic performance of sweat cooled gas turbine engine blades p0258 N71 17382
Transpiration cooled blades for high temperature inlets in gas turbine engines p0258 N71 17384
Performance prediction for turbine blade film cooling with injection through holes [NASA CR 116376] p0259 N71 17388
Thermal fatigue behavior of fiber reinforced nickel alloy gas turbine blades p0259 N71 17390
Fabrication of cobalt alloy and nickel alloy gas turbine blades and vanes p0259 N71 17392
Film cooling of gas turbine blades by air injection through holes p0260 N71 17394
Heat transfer in liquid metal cooled gas turbine blades p0260 N71 17398
Computerized optimization of thermal resistant gas turbine blades p0260 N71 17400
Technological aspects of film cooling for blades in high temperature gas turbines p0261 N71 17404
Conference on high temperature turbines detailing effect of film cooling on blade profile loss [NASA TM X 67123] p0261 N71 22699
Corrosion resistant materials for nozzle guide vanes and turbine blades subject to vanadium containing fuel combustion p0203 N73 23613
Production of lamellar and fibrous composite materials from directional solidification of eutectic alloys and application to gas turbine blades and vanes p0212 N73 27492
Directional solidification of eutectic alloys and application to turbine blades and gas turbine engine components p0213 N73 27494

TURBINE ENGINE

Reduction of harmful emissions of turbine engine exhaust system p0251 N72 11679
Post crash fire safety of helicopter turbine engine fuels p0253 N72 11688
Refractory metal alloys with protective coatings for use in structural components of turbine engines p0203 N73 23614
Application of gas analysis techniques to determine combustion efficiency in turbine engines and rocket engine combustion chambers [AGARD AG 168] p0111 N73 21830
Gas sampling and analysis in combustion phenomena [AGARDOGRAPH 168(FR)] p0111 N74 22799

TURBINES

Synthesis and properties of aliphatic ester for turbine lubrication in aircraft p0254 N72 11696
High speed photographic film of pulsating flow in transonic turbine cascade p0271 N73 19818

TURBOCOMPRESSORS

Influence of axial velocity density ratio on compressor cascade performance in compressible flow p0269 N73 19805
Mathematical model for prediction of axial compressor performance including effect of annulus wall boundary layers p0270 N73 19812
Shock wave boundary layer interaction in compressor cascades p0271 N73 19816

TURBOFAN ENGINES

High bypass turbofan powered propulsion simulator for airframe engine integration analyses at subsonic and supersonic speeds p0003 N71 19369
Wind tunnel evaluation of interference drag in turbofan engine wing configuration of subsonic aircraft p0004 N71 19376
Optimizing propulsive lift system for turbofan STOL aircraft considering cost effectiveness p0026 N71 20063
Destabilizing factors affecting supersonic inlets and turbofan engines of propulsion system p0266 N72 18711
Analysis of intake duct noise of turbofan engine and effect on duct structure due to acoustic fatigue p0293 N73 29916
Detailed exhaust emission measurements of three different turbofan engine designs p0217 N74 14276

TURBOGENERATORS

High entrance temperatures for improved performance of turbogenerators and gas turbine engines p0257 N71 17373

TURBOJET ENGINES

Reduction of NO formations by premixing p0217 N74 14272
Theoretical study of the residual evolution of polluting products in turbojet exhausts p0220 N74 14294
Modelization of turbomachine combustors for pollution studies p0220 N74 14298

TURBOMACHINE BLADES

Universal curves which relate general properties of two dimensional boundary layers on turbomachine blades p0268 N73 19795
Predictions of boundary layer transition on turbomachine blades p0268 N73 19797
Optimization method for turbomachine blade design based on boundary layer concepts p0269 N73 19801
Role of boundary layers in axial flow turbomachines and prediction of their effects p0269 N73 19806
Calculation method for external heat transfer to turbine blades p0269 N73 19807
Boundary layer behavior in supersonic straight and annular blade cascades of fixed and mobile types p0271 N73 19817

TURBOMACHINERY

Effectiveness of turbine cooling systems for high temperature inlets [NASA TM X 66702] p0256 N71 17385
Boundary layer effects in turbomachines [AGARD AG 164] p0268 N73 19794
Method for calculating three dimensional turbulent boundary layer separation applied to simple turbomachine case p0270 N73 19808
Methods of testing rotating components of turbomachines compared with tests on complete turbomachines [AGARD AG 167] p0271 N73 28800
Application of boron aluminum composite material for construction of turbine blades with low notch sensitivity in high cycle fatigue p0253 N73 27497

TURBOPROP ENGINES

Exhaust emission measurements on the GE 164 7 turboprop engine p0212 N74 14286

TURBULENCE

Optical properties of pure and turbulent sea water p0241 N73 33624
Digital techniques in turbulence research [AGARDOGRAPH 174] p0184 N74 18924
Numerical treatment of fluid dynamical stability problems p0185 N74 22921

TURBULENCE EFFECTS

Tropospheric turbulence effects on superhigh frequency transmissions at low elevation angles p0115 N71 21422
Measurement of human operator performance in target tracking task during simulated turbulent conditions p0040 N72 32014
Influence of degree of turbulence on aerodynamic coefficients of cascades p0268 N73 19798
Effect of free stream turbulence level on turbulent boundary layer behavior p0268 N73 19799
Influence of free stream turbulence on the turbulent boundary layer in relation to wind tunnel testing at subsonic speeds p0184 N73 26281
Effects of turbulence and pressure gradient on heat transfer measurements at transonic speeds p0184 N73 26284
Aircraft response to turbulence new concept assessments using power spectral density methods factors affecting operational efficiency of crew in low level gust environment p0058 N74 17729
The effect of wind shear on the approach and landing performance and flight test of flight control system for short takeoff aircraft p0058 N74 17730
The data link of aircraft wake vortices development of a test and acquisition system for vortex detection p0058 N74 17731
Vortex wake research in the United States status of aircraft wake generation by U S aircraft p0058 N74 17733
On turbulence environment and design criteria application of power spectral techniques for analyzing gust loads at low altitudes p0059 N74 17734
Design problems of military aircraft as affected by turbulence analytical prediction of pilot task proficiency under vibration environment p0059 N74 17735
Influence of turbulence on helicopter design and operation analysis of structural loads pilot workload and passenger comfort effected by atmospheric turbulence p0059 N74 17736
Data requirements on turbulence in the earth's atmospheric shear layer for STOL design criteria development of low altitude gust model for determining importance of gust parameters on STOL aircraft performance p0059 N74 17737
Experience with a low altitude turbulence model for autoland certification correlation of gust model data with statistical analyses of flight test results p0059 N74 17738
Structural loads and gust criteria comparison of gust load analysis methods for application to aircraft design p0059 N74 17739
Rational calculation of design gust loads in relation to present and proposed airworthiness requirements effects of atmospheric turbulence on aerodynamic configuration of short haul aircraft p0059 N74 17740
C S A S design for good handling in turbulence development of design criteria for stability augmentation systems for alleviation of gust effects p0059 N74 17741
Theoretical horizontal tail loads and associated aircraft responses of an autopilot controlled jet transport flying in turbulence analysis of problem areas associated with rigid aircraft controlled by simple autopilot p0059 N74 17742
The design of automatic flight control systems to reduce the effects of atmospheric disturbances flight tests of experimental automatic pilots on BAC 111 aircraft p0060 N74 17743
Application of energy management concepts to flight path control in turbulence strategy for control of airspeed and flight path with emphasis on landing approach p0060 N74 17744
A new approach to gust alleviation of a flexible aircraft using an open loop device application to control system of SE 210 aircraft p0060 N74 17745

TURBULENT BOUNDARY LAYER

Interference flow field of an flat plate configuration in supersonic turbulent boundary layer channel p0003 N71 19365
Turbulent boundary layers jets and wakes conference [AGARD CP 93] p0175 N72 20273
Experimental studies of flow distribution near wall in turbulent boundary layer p0175 N72 20275
Temperature fluctuations and spectral distributions for temperature and velocity in turbulent boundary layer p0175 N72 20276
Bursts and streamwise momentum defects in wall region and turbulent boundary layer p0175 N72 20277
Transformation function for turbulent boundary layers with optional pressure gradient p0176 N72 20278
Approximation of two dimensional turbulent boundary layer under arbitrary wall and free flow conditions p0176 N72 20279
Coupling effects between wall heating and axial pressure gradients in turbulent boundary layer flow [NASA CR 125903] p0176 N72 20281
Model for compressible turbulent boundary layer applicable to flows with pressure gradient and surface mass transfer p0176 N72 20283
Partial differential equations for calculating three dimensional incompressible turbulent boundary layers p0177 N72 20285
Compressible turbulent boundary layer velocity and temperature profiles with zero pressure gradient p0177 N72 20287
Turbulent boundary layer measurements on large thermally insulated flat plate at Mach numbers 2.5 to 4.5 p0177 N72 20288
Streamwise pressure gradient effects on two dimensional compressible turbulent boundary layers at high Reynolds number p0177 N72 20289
Application of transport equation for Reynolds shear stress to axial plane two dimensional flow of turbulent boundary layers p0179 N72 20298
Effects of adverse pressure gradient on compressible turbulent boundary layer flow p0179 N72 20299
Numerical techniques for determining flow characteristics of supersonic turbulent boundary layer in adverse pressure gradient p0179 N72 20300
Heat transfer and pressure distributions on cone and pitot pressure probes for turbulent boundary layers at subsonic and hypersonic speeds p0179 N72 20301
Low speed wind tunnel investigation of turbulent separated flow along streamwise corner p0183 N72 [illegible]
Measurements of jets issuing tangentially into turbulent boundary layer injected with gas p0183 N72 20303
Characteristics scales and energy budget methods for interacting turbulent boundary layers with mass transfer p0183 N72 20304
Effects of pressure gradient on turbulent heat transfer boundary layer development on flat plate p0183 N72 20305

Universal curves which relate general properties of two dimensional boundary layers on turbomachine blades p0268 N73 19795

Effect of free stream turbulence level on turbulent boundary layer behavior p0268 N73 19799

Optimization method for turbomachine blade design based on boundary layer concepts p0259 N73 19801

Method for calculating three dimensional turbulent boundary layer separation applied to simple turbomachine case p0270 N73 19808

Method for prediction of turbulent boundary layer flow in vaneless radial diffuser and experimental validation p0270 N73 19809

Interaction of shock wave with turbulent boundary layer at moderate supersonic Mach numbers p0271 N73 19815

Influence of free stream turbulence on turbulent boundary layer in relation to wind tunnel testing at subsonic speeds p0184 N73 26283

Effect of surface pressure fluctuations on response of panels underlying attached and separated turbulent boundary layers and shock waves p0292 N73 29910

Measurements of the drag of some characteristic aircraft excrescences immersed in turbulent boundary layers p0019 N74 14714

Numerical treatment of boundary layer problems : finite difference solutions p0185 N74 22918

TURBULENT FLOW

Complex turbulent flows as perturbations of classical thin shear layers and application of Prandtl approximation p0175 N72 20274

Equations for time mean values of incompressible turbulent flow and eddy viscosity dependence on second invariant of deformation tensor p0176 N72 20280

Existence of velocity potential for viscous fluid flow and role of compressibility in turbulent subsonic or supersonic flow p0176 N72 20282

Turbulent shear flow model for axisymmetric free jet two dimensional free shear layer and flat plate boundary layer [NASA CR 125904] p0177 N72 20286

Flow visualization techniques and hot wire anemometer data for shear flow turbulence p0178 N72 20290

Fluctuating properties of turbulent flow due to convection diffusion production dissipation and pressure transport p0178 N72 20293

Hot wire measurements of subsonic two dimensional turbulent jets p0178 N72 20294

Stabilization of turbulent shear layer flow of rotating systems by coriolis forces p0180 N72 20305

Distortion of grid generated turbulence in stagnation region of two dimensional body p0180 N72 20307

Controlling free stream turbulence of passive devices [AGARD R 596] p0182 N73 33267

Physical structure of turbulent shear flows and interacting gase flow [AGARD AR 46] p0182 N73 11262

Application of functional analysis to obtain exact semi analytical solutions of boundary layer flows under turbulent and laminar conditions p0041 N73 15003

Finite difference procedure for computing behavior of two dimensional boundary layers and turbulence models to predict location and extent of transition region p0268 N73 19796

Analysis of aerodynamic noise prediction for rotary wings and methods for noise reduction based on shedding wake and blade tip modification p0252 N73 21953

Effects of stream line curvature on turbulent flow applied to boundary layer conditions on wing sections and turbomachine blades [AGARD AG 169] p0184 N74 12642

TURBULENT HEAT TRANSFER

Heat exchangers and forced convection liquid metal heat transfer p0299 N72 18948

TURBULENT MIXING

Turbulent shear stress models ranging from classical Prandtl mixing theory to kinetic energy models p0178 N72 20291

Turbulent mixing layer between two different gases streams such as nitrogen and helium p0178 N72 20295

TURBULENT WAKES

Spectral analysis of hot wire anemometer and photographic probe data methods for measuring turbulent wake properties in hypersonic spheres p0178 N72 20296

Large planoramic technique for measuring spatial decay of passive scalar contaminant wake p0179 N72 20297

Analysis of helicopter rotor performance in hover using a wake and vortex model of rotary wing flow characteristics p0247 N73 27011

Comparison of aerodynamic noise prediction with near wake behavior of rotary wings for advanced high speed helicopter rotors p0252 N73 27554

Comparison of various methods for calculating profile drag from pressure measurements in the near wake at subcritical speeds p0020 N74 14721

The detection of aircraft wake vortices : development of acoustic and wind pressure sensors for vortex detection p0168 N74 17132

Wake Vortex Avoidance System program (AVOSS) : design and implementation of a ground based computer aided pilot warning system for safety in the approach p0168 N74 17132

Vortex wake research : full scale measurements of trailing wake energy decay by C-5A aircraft p0168 N74 17133

TURKEY

Design and operation of Turkish information systems p0158 N73 24202

TURNING FLIGHT

Development of methods for predicting aircraft flight maneuver and climb performance to show effects of excess power and load factor p0053 N73 24045

TWILIGHT GLOW

Air to ground visibility of lights at low background levels p0303 N73 19967

TWISTED WINGS

Wind tunnel tests to determine effects of blade twist and aeroelasticity on tilt rotor performance from hover to mach number 0.7 p0051 N73 21049

TWO DIMENSIONAL BODIES

Distortion of grid generated turbulence in stagnation region of two dimensional body p0180 N72 20307

TWO DIMENSIONAL FLOW

Two dimensional wind tunnel tests on airfoils with high lift devices p0025 N71 20056

Aerodynamics of two dimensional flow on high lift systems p0027 N71 20067

Coexistence of two dimensional and asymmetric flow in channel with constant cross section p0267 N72 16776

Streamwise pressure gradient effects on two dimensional compressible turbulent boundary layers at high Reynolds number p0177 N72 20289

Application of transport equation for Reynolds shear stress to calculating two dimensional flow in turbulent flow shear layers p0179 N72 20298

Application of functional analysis to obtain exact semi analytical solutions of boundary layer flows under turbulent and laminar conditions p0041 N73 15003

Development of two experimental approaches for analyzing two dimensional flow on high lift devices p0042 N73 15005

Comparison of various methods for calculating profile drag from pressure measurements in the near wake at subcritical speeds p0020 N74 14721

TWO REFLECTOR ANTENNAS

Some aspects of near and far angle sidelobes in dual reflector antennas p0147 N74 13858

U

ULTRAHIGH FREQUENCIES

Cardiac and neural effects of UHF radar energy on dogs p0068 N71 20354

Very high frequency and ultrahigh frequency transionospheric signal propagation modes p0116 N71 21476

Atmospheric circulation model for analyzing tropospheric ultrahigh frequency signal fading p0118 N71 23456

Coherence of atmospheric attenuation and rainfall effects on ultrahigh frequency telecommunication systems [AGARD CP 102] p0140 N73 26121

Multipath propagation and phase delay of ultrahigh frequency radio wave caused by atmospheric discontinuity p0140 N73 26124

Criteria for planning ultrahigh frequency telecommunication systems considering adverse tropical and meteorological measurements p0141 N73 26129

Horizontal radio line systems for measuring ultrahigh frequency absorption spectrum due to rain p0141 N73 26130

Ultrahigh frequency coherent radio signal transmission for differential phase shift measurements due to vapor and oxygen absorption lines p0141 N73 26131

Scattering by the chaotic ultrahigh frequency refractive index due to rain p0141 N73 26133

Point rainfall rate statistics for predicting ultrahigh frequency radio propagation p0142 N73 26135

Multipath spatial measurements for planning ultrahigh frequency radio link p0142 N73 26137

Calculation of electromagnetic wave absorption by rain for frequencies close to 30 GHz p0142 N73 26139

Statistical estimation of ultrahigh frequency signal fluctuations from training flights p0142 N73 26140

Tropical storm and hail rate statistics for ATS 5 ultrahigh frequency signal transmission p0142 N73 26141

Locating frequency interference sites by triangulation measurements by ATS 5 weather radar and radiometer p0143 N73 26142

ULTRAHIGH VACUUM

Ultrahigh vacuum for interplanetary effects of hydrogen on fatigue and fracture properties of N-155 p0281 N73 21915

ULTRASONIC RADIATION

Modern quiet electric engine propulsion systems : operational requirements and design criteria p0144 N74 11911

ULTRASONIC TESTS

Ultrasonic nondestructive testing of composites and adhesive bonds p0237 N73 27414

ULTRAVIOLET RADIATION

Reaction of vacuum with nitrogen oxides and ultraviolet photons p0227 N74 24274

Fatigue studies in near weightlessness : testing equipment and experimental design p0221 N74 14275

ULTRAVIOLET SPECTROMETERS

A new analytical technique for measuring NO2 gas in the range from 0.1 to 500 PPM p0218 N74 14285

UNDERWATER ACOUSTICS

Analyses of remote Arctic ice pack sensing data obtained by submarine sonar airborne laser and infrared scanning imagery p0121 N72 16088

Underwater acoustic beam width effects on signal scattering at rough surface of sea floor p0123 N72 16102

UNDERWATER EXPLOSIONS

Lethal head injuries to man swimming underwater caused by detonation of firecracker p0100 N72 19135

UNDERWATER OPTICS

Effects of resolution signal to noise ratio and contrast on underwater imaging systems performance p0242 N73 33631

Application of incoherent and coherent light sources for underwater illumination and comparison of efficiency for various conditions p0242 N73 33633

Characteristics of lenses and ports for underwater imaging systems to compare depth of field and relative aperture for several lens port combinations p0242 N73 33635

Techniques for long range visual underwater using range gating and dual scan with parallax techniques p0242 N73 33636

UNDERWATER PHOTOGRAPHY

Application of optical filtering and image restoration to underwater photographs of flooded images p0242 N73 33637

UNITED STATES OF AMERICA

Equipment and facilities for aerodynamic research in US and Canada p0095 N71 23342

UNSTEADY FLOW

Numerical analysis of aerodynamic loads on wing and tail surfaces with oscillations in unsteady supersonic and subsonic flow including interference eff [AGARD CP 80 71 PT 1] p0007 N71 29333

Aerodynamic load prediction for control surfaces in unsteady supersonic and subsonic flow p0007 N71 29334

Wing interference lift and lattice size step and application to aerodynamic loads on tandem wings in unsteady flow p0308 N71 29336

Symposium on unsteady aerodynamic forces loads and configurations for aeroelastic analysis of interacting surfaces [AGARD CP 80 71 PT 2] p0008 N71 29338

Kinematics of subsonic unsteady, oblique, or multiple wing surfaces p0008 N71 29339

Unsteady pressure measurements on a two dimensional oscillating swept wing with two dimensional flow in incompressible flow p0010 N71 29350

Three approximation methods for full Navier Stokes equations for two and three dimensional unsteady flow p0187 N72 27296

Numerical solution of viscous incompressible fluid in boundary domain p0181 N72 27297

High speed subsonic flow of propeller flow in transonic turbine cascade p0271 N73 19816

Analysis of unsteady aerodynamic environment of rotary wing and research projects to improve understanding of rotor unsteady airloads p0050 N73 21041

Comments on NASA Langley research on transonic unsteady aerodynamics flutter calculation methods [NASA TM X 69997] p0023 N74 18652

Interfering lifting surfaces in unsteady subsonic flow : Comparison between theory and experiment [AGARD R 614] p0023 N74 18654

UNSWEPT WINGS

Method for estimating transonic buffet boundary and Reynolds number effects for straight and swept wings p0011 N72 11857

Transonic wind tunnel tests of effectiveness of high lift devices on swept and straight wings with rolling flow separation p0012 N72 11860

UPPER ATMOSPHERE

Particle precipitation in polar upper atmosphere p0126 N72 21127

Radar observations of meteor trains for detecting high altitude gravity waves p0137 N73 14154

URINALYSIS

Urinalysis methodology for detection of abusive and therapeutic drugs : review p0087 N73 21137

Project apollo investigative support : [Apollo 7 mission] p0087 N74 13807

In flight cryptic fluid or solid deposits evaluated by means of Gas Mass Spectrometry and VMA changes in urinary excretion p0089 N74 18790

Rapid mixing nozzles thrust vector control and thrust augmentation for V/STOL aircraft p0265 N72 16699
Stability and control flight test procedures for V/STOL aircraft in general and specific application to P 1127 and Kestrel aircraft p0035 N72 20980
Design problems of inlets and nozzles used in supersonic and V/STOL propulsion systems [NASA TM-X-67741] p0267 N72 21819
Design guidelines for pictorial integrated flight control and guidance displays for V/STOL aircraft [NASA CR 126653] p0224 N72 22830
V/STOL display requirements for approach and landing under adverse weather conditions p0224 N72 22832
Proceedings of conference on handling qualities and performance criteria for conventional and V/STOL aircraft [AGARD CP 106] p0038 N72 32017
Revisions to handling qualities criteria for V/STOL aircraft with emphasis on instrument flight characteristics p0038 N72 32021
Development of V/STOL aircraft handling qualities criteria specification and analysis of deficiencies p0038 N72 32022
Display systems for all weather terminal operational capability of V/STOL aircraft [AGARD R 594] p0196 N73 11407
Revisions to V/STOL handling qualities based on criteria p0044 N73 16994
Analysis of aircraft instruments and display devices for approach control and landing of V/STOL aircraft [AGARD AR 51] p0196 N73 18439
Proceedings of conference on rotary wing aircraft developments to include operational experience, flight tests and evaluation of structural concepts [AGARD CP 121] p0046 N73 21008
Aerodynamic, dynamic and aeroelastic problems in rotary wing design for helicopters and V/STOL aircraft with application to hingeless rotor systems p0051 N71 21051
Analysis of factors involved in design of wind tunnel for testing V/STOL aircraft models p0018 N73 22956
Analysis of operational problems associated with wind tunnel testing of V/STOL aircraft and helicopters p0173 N73 26240
Scaling laws, constructional problems and optimum model size associated with wind tunnel tests of helicopters and rotary wing aircraft p0173 N73 26246
Proceedings of conference on military applications of V/STOL aircraft to include current and proposed research projects to meet military requirements [AGARD CP 126 VOL 1] p0054 N73 27000
Review of V/STOL aircraft research and development programs to increase effectiveness of aircraft and develop mission improvements p0054 N73 27001
Review of V/STOL development programs to compare basic characteristics of XC-142A, X-19 and X-22A aircraft under various flight conditions p0054 N73 27002
Design, development and characteristics of Do 31 V/STOL aircraft to include solution of operational problems caused by ground effect and transition flight p0054 N73 27004
Design, development and flight characteristics of VAK 191 B V/STOL strike reconnaissance aircraft p0054 N73 27006
Handling characteristics of V/STOL aircraft based on data obtained from flight tests, simulator operation and analytical studies [AGARD R 577 PT 2] p0055 N73 27906
Development of method for calculating near field noise level of free jet and influence of ground effect on noise produced by V/STOL aircraft operation p0292 N73 29907

VANADIUM
Corrosion resistant materials for nozzle guide vanes and turbine blades subject to vanadium containing fuel combustion p0203 N73 23613

VANELESS DIFFUSERS
Method for prediction of turbulent boundary layer flow in vaneless radial diffuser and experimental validation p0270 N73 19809

VAPORIZING
Vaporization thermodynamics of Cr2O3 protective scales under transonic flow conditions p0202 N73 23507

VARIABLE GEOMETRY STRUCTURES
Interfering lifting surfaces in unsteady, subsonic flow. Comparison between theory and experiment [AGARD R 614] p0023 N74 18454

VARIABLE SWEEP WINGS
Aerodynamics of variable sweep aircraft design p0025 N71 20054

VARIATIONS
Use of psychometric tests to account for subjective variations in operations performance relative to target acquisition p0304 N73 19974
Importance of the 4 - 5 c/sec rhythm in the EEG to determine military flying fitness - psychological factors in EEG patterns p0086 N74 13797

VEGETATION
Ultra high frequency antenna scatter propagation over an area by vegetation p0119 N71 23461
Interpretation of side looking airborne radar imagery for vegetation mapping [NASA CR 125451] p0122 N72 16792

VELOCITY DISTRIBUTION
Velocity distribution at transonic compressor inlet in wind tunnel tests p0267 N72 16713
Velocity distribution measurement of subsonic asymmetric inlet for compressor matching p0267 N72 18714
Temperature fluctuations and spectral distributions for temperature and velocity in turbulent boundary layer p0175 N72 20278
Procedures for measuring velocity distribution through helicopter rotor blade tip vortex using single full scale rotor blade p0049 N73-21034

VELOCITY MEASUREMENT
Procedures for measuring velocity distribution through helicopter rotor blade tip vortex using single full scale rotor blade p0049 N73 21034
Computer electronystagmography in evaluating the influence of psycho pharmacological drugs on vigilance p0109 N74 20749

VERTEBRAL COLUMN
Nonfatal ejection vertebral fracture comparison between US British and Swedish armed services p0083 N73 23059
The risk of minor spinal abnormalities in aircrews. Evaluation of ejection cases p0086 N74 13795

VERTICAL FLIGHT
Parameters for enhancing performance of helicopter rotors during stationary flight p0049 N73 21036

VERTICAL LANDING
Evaluation of integrated flight display for hovering phase of IFR landing of VTOL aircraft p0224 N72 22831

VERTICAL TAKEOFF AIRCRAFT
Military applications of V/STOL aircraft. Volume 2 [AGARD CP 126 VOL 2] p0082 X74 73507
Possibilities and limitations of rotary and fixed wing compatible Doppler sensor designs p0031 N72 11923
Propulsion jet flow for vertical takeoff aircraft p0285 N72 16700
Evaluation of integrated flight display for hovering phase of IFR landing of VTOL aircraft p0224 N72 22831
Structural concepts of rotary wing system capabilities to show changes in design of specific vertical takeoff aircraft components p0048 N73 21021
Development and application of composite materials for vertical takeoff aircraft airframes and effect on improved aircraft performance p0048 N73 21023
Aerodynamic characteristics of circulation controlled rotor and fundamental problems of stopped rotor aircraft p0048 N73 21024
Development of jet flap rotor and application to heavy helicopter and stoppable rotor designs p0048 N73 21025
Development of rotary wings with cold hot and mixed cycle tip jet propulsion systems and application for torque free rotor drive system p0048 N73 21026

VERTIGO
Proceedings of conference on medical aspects of spatial disorientation and effects on safe aircraft operation [AGARD CP 95 PT 1] p0071 N72 25031
Analysis of spatial disorientation reports by flying personnel during 14 year period [NASA CR 126786] p0071 N72 25032
Analysis of spatial disorientation occurrences among military pilots and classification according to types of aircraft and nature of accidents p0071 N72 25033
Analysis of military aircraft accidents caused by spatial disorientation p0071 N72 25034
Statistical analysis of military aircraft accidents to determine incidents caused by spatial disorientation p0071 N72 25035
Psychophysiological and environmental factors involved in aircraft accidents of military aircraft and effect of flying experience in reducing spatial disorientation p0071 N72 25036
Effects of high intensity noise levels on human vestibular system and production of disorientation and nausea [AMRL TR 71 58] p0072 N72 25038
Analysis of aircraft pilot reports on occurrence of unreality and detachment during flight and relationship to spatial disorientation p0072 N72 25042
Occurrences of vertigo in hyperbaric atmospheres and among underwater divers with theoretical explanations of etiology involved p0072 N72 25043
Development of procedures for exposing aviators to effects of spatial disorientation in ground based simulator p0073 N72 25045
Application of methods of simulation of instrument flying as means of reducing occurrences of spatial disorientation in flight p0073 N72 25046
Clinical evaluation and medical treatment of spatial disorientation problems in flying personnel p0073 N72 25047
Aptitude for recovery from vertigo in flying personnel p0074 N72 25059
Vertigo in diving p0110 N74 20753

VERY HIGH FREQUENCIES
Very high frequency and ultra high frequency transhorizon signal propagation modes p0116 N71 21426

VESTIBULAR TESTS
Physiological tests of vestibulo ocular reflex by counterroll to determine effects of positive acceleration on dynamics of vestibular system of rhesus monkeys [AMRL TR 71 59] p0072 N72 25040
The use of nystagmography in aviation medicine aerospace medicine meeting on nystagmus [AGARD CP 128] p0107 N74 20722
Practical problems in clinical nystagmography. 2 Sources of error p0108 N74 20735
Use of nystagmography in the study of aircrew with spatial disorientation oculographic testing of flight crews p0108 N74 20736
Interest of nystagmography in flying navigation personnel p0108 N74 20738
A contribution to the electronystagmographic method concerning the interpretation of nystagmus characteristics vestibular tests to assess motion sickness and disorientation susceptibility p0108 N74 20739
Differential diagnosis of the caloric nystagmus qualitative characteristics of labyrinthine or CNS abnormalities p0108 N74 20740
Optokinetic nystagmus its value in the diagnosis of certain vestibular lesions human abnormal neurophysiological responses in the presence of brain stem lesions p0109 N74 20742
Visual vestibular interaction The role of the labyrinth in the production of optokinetic nystagmus and optokinetic after nystagmus effects of labyrinthectomy on eye movements in optical tracking task p0109 N74 20743
Self motion sensation pseudo coriolis effects and motion sickness induced by optokinetic stimuli psychophysiological experiments on human motion perception p0109 N74 20744
Effects of sound on the vestibular system of guinea pigs and monkeys p0109 N74 20745
Aeromedical research and clinical applications of averaging techniques in nystagmography computer techniques for precise measurements of average eye movements p0110 N74 20750

VESTIBULES
Cochlear and vestibular injuries during diving inner ear damage and auditory defects p0110 N74 20754

VHF OMNIRANGE NAVIGATION
Integrated SAVVAN VOR and DME system for locating and controlling high altitude aircraft p0232 N73 23695

VIBRATION EFFECTS
Vibration effects on performance of helicopter flight crews p0069 N71 20355
Environmental tests of V/STOL vibration effects on human comfort [NASA TM-X-66956] p0068 N71 20356
Analysis of response and fatigue characteristics of light alloy integrally machined planks with emphasis on acoustic fatigue properties p0293 N73 29912
Analysis of structural response to acoustic loading and preparation of data sheets for various conditions of acoustic loads p0293 N73 29914
PIGA - Acceleration tests on vertical 100-3 heavy table centrifuge and vibration tests of inertial guidance systems p0236 N74 14347

VIBRATION TESTS
Development of method for determining response of box type structures subjected to high intensity acoustic loading p0293 N73 29915

VIBRATIONAL STRESS
Structural vibration and noise effects on man in aerospace operations [AGARDOGRAPH 151] p0076 N73 17098

VIDEO DATA
Video storage and transmission systems for documentation and dissemination of information conferences [AGARD CP 92] p0157 N72 27168

VIDEO EQUIPMENT
Advanced digital visual communication systems for television transmission and video storage p0158 N72 22172

VISCOUS DAMPING
Analysis of effect of damping on response of structure to acoustic excitation and experimental method for determining damping coefficients p0293 N73 29917

VISCOUS DRAG
Reynolds number effects in viscous inviscid interactions on transonic swept wings p0011 N72 11855

VISCOUS FLOW
Existence of velocity potential for viscous fluid flow and role of compressibility in turbulent subsonic or supersonic flow p0176 N72 20282
Numerical analysis of viscous gas flow and shock formation p0181 N72 27300
Extension of time dependent technique for inviscid blunt body flow to viscous flow p0182 N72 27303
Development of procedure for determining characteristics of high lift systems where viscous effects dominate p0042 N73 15009
Effect of axial velocity ratio on aerodynamic coefficients of compressor cascade in viscous flow p0269 N73 19804
Developments in techniques for analyzing boundary layer characteristics of rotary wings based on unsteady viscous inviscid interaction p0061 N73 21080

VISCOUS FLUIDS
Nonstationary flow of viscous incompressible fluid in bounded domain p0181 N72 27297
Navier Stokes equations of viscous incompressible fluid in bounded domain p0181 N72 27298

VISIBILITY
Effect of various parameters on long range underwater vision for narrow and broad beam illumination p0247 N73 33630

VISION
Drug effects on vision of flying personnel p0082 N73 21123

VISUAL ACCOMMODATION
Servocontrol infrared optometer applied to study of volitional control of human visual accommodation
[NASA TM X 66955] p0070 N71 20771
VISUAL ACUITY
Naval research on laser caused visual acuity decrement in monkeys and ocular injury in humans
p0076 N72 26056
AGARD conference on air to ground target acquisition
[AGARD CP 100] p0302 N73 19959
Peripheral acuity with complex stimuli at two viewing distances p0303 N73 19965
Air to ground target acquisition with flare illumination
p0303 N73 19968
VISUAL PERCEPTION
Human perceptual characteristic data relating to individual electronic flight display design p0223 N72 22622
Application of extra foveal vision to predicting target acquisition in air to ground search p0302 N73 19960
Modeling of random human visual search performance based on physical properties of eye p0302 N73 19961
Modeling prediction of probability of acquiring a gimbaled target as function of its range as target is approached
p0302 N73 19962
Calculation and simulation of effects of complex search situations p0302 N73 19963
Relationship between subjective effect of structured target backgrounds on acquisition performance
p0303 N73 19964
Model for wheel of contrast conditions on full form objects p0303 N73 19966
Biomedical problems with helmet mounted sight and visual target acquisition system p0303 N73 19969
VISUAL STIMULI
Peripheral display with complex stimuli at two viewing distances p0303 N73 19965
Optokinetic nystagmus - its value in the diagnosis of acute labyrinthine lesions - human abnormal nystagmic responses in the presence of brain stem lesions
p0109 N74 20742
Visual vestibular interaction - the role of the labyrinth in the production of optokinetic nystagmus and optokinetic after nystagmus - effects of labyrinthectomy on eye movements in optical tracking task p0109 N74 20743
VISUAL TASKS
Air to ground visibility of lights at low background levels p0303 N73 19967
VJ 101 AIRCRAFT
Flight mechanics problems - a guided investigation for VJ 101 aircraft p0030 N71 23428
Analysis of aerodynamic characteristics of VJ 101C and DO 31E V/STOL aircraft and comparison with criteria contained in handling requirements documents
p0039 N72 32024
VOICE
Processing and display of time varying spectral information with application to social voice and radial signals
p0154 N72 11200
VOICE COMMUNICATION
Numerical control of delta modulated vocal signals in air navigation telecommunication system
p0131 N73 10194
VORTEX GENERATORS
Safety measures to eliminate aircraft trailing vortex hazards
[NASA TM X 67125] p0028 N71 23416
VORTEX SHEETS
Development of procedure for determining geometry and strength distribution of vortex wake generated by single bladed hovering helicopter rotor p0049 N73 21035
VORTICES
Wind tunnel vortex flow study of body of revolution with or without wings p0001 N71 19359
Procedures for measuring velocity distribution through helicopter rotor blade tip vortex using very small full scale rotor blade p0049 N73 21034
The detection of aircraft wake vortices - development of acoustic and wind pressure sensors for vortex detection p0058 N74 17731
Vortex wake research - flight investigation of flight and wake generated by C 5 aircraft p0058 N74 17733
VULNERABILITY
Physical vulnerability of aircraft volume 1
[AGARD AR 47 VOL 1] p0061 N74 73501
Physical vulnerability of aircraft volume 2
[AGARD AR 47 VOL 2] p0061 N74 73501
Aircraft survivability, analysis and model
[AGARD AR 47 VOL 3] p0061 N74 73502

W

WAKES
Turbulent boundary layers, jets and wakes - collected reviews
[AGARD CP 93] p0175 N72 20273
WALL FLOW
AGARD report on engine airplane interference and wall correction in transonic wind tunnel tests
[AGARD AR 36 71] p0030 N71 36400
Experimental studies of flow distortion near wall in turbulent boundary layer p0175 N72 20275
Burst and downsweep characteristics of small regions and bulges in turbulent boundary layer p0175 N72 20277
Approximation of two dimensional turbulent boundary layer under arbitrary wall and free flow conditions
p0176 N72 20279
Analysis of laminar part of separation bubbles in two dimensional incompressible flow for various shaped objects p0041 N73 15000
Development of numerical methods for correcting wall constraints in transonic wind tunnels with ventilated walls
p0173 N73 26241
WALL TEMPERATURE
Coupling effects between wall heating and axial pressure gradients in turbulent boundary layer flow
[NASA CR 125903] p0176 N72 20281
WATER
Effects of positive Gy acceleration on blood oxygen saturation and pleural pressure relations in dogs breathing air and liquid fluorocarbons in whole body water immersion respirator
[NASA CR 117199] p0068 N71 20358
Electrical conductance measurements for determining stress strain time life of glass fiber to resin interfacial bond in reinforced plastic materials exposed to water
p0208 N72 12505
WATER POLLUTION
Feasibility of creating international maritime pollution information analysis center p0113 N71 19532
WATER VAPOR
Water evaporation - reference in phase measurements by transhorizontal microwave propagation over sea surface p0140 N73 26125
WAVE AMPLIFICATION
Introductory survey to session 1 - Propagation over irregular terrain - telecommunications transmission loss prediction p0145 N74 13847
WAVE DEGRADATION
The radiation diagrams of antennas used in terrestrial microwave free of sight systems - radiation patterns of parabolic antennas in terrestrial relay systems
p0147 N74 13359
WAVE DIFFRACTION
Radio wave diffraction due to a mountain of volcanic origin p0146 N74 13851
Variations in satellite location due to tropospheric effects at frequencies between 180 MHz and 10 GHz in hilly terrain p0146 N74 13852
WAVE EXCITATION
Mathematical model for acoustic gravity wave excitation by moving air masses p0134 N73 14135
WAVE FRONT RECONSTRUCTION
Principles of holography and wavefront reconstruction - application to sonar p0199 N72 25495
WAVE PROPAGATION
Characteristics and effects of Arctic troposphere on radio and radar propagation - conference
[AGARD CP 97] p0126 N72 21121
Power spectral densities, Doppler shifts, and phase fluctuations of frequency distribution in auroral HF propagation p0129 N72 21143
Effects of Arctic ionosphere characteristics on radio and radar propagation
[AGARD AR 33] p0130 N72 22138
Comparison of ionospheric radio wave propagation and acoustic gravity wave propagation p0134 N73 14132
Ray tracing method for calculating paths of acoustic and gravity waves in atmosphere p0134 N73 14133
Asymptotic method for determining propagation angles of ionospheric gravity waves, traveling at ionospheric heights
p0136 N73 14144
Design criteria and theory for determining electromagnetic wave propagation over sea p0241 N73 33627
Role of atmospheric factors in the phenomenological treatment of millimeter wave propagation p0145 N74 13849
Effect of tropospheric scattering on the performance of operational Polaris communications p0146 N74 13850
Ionospheric investigations and their importance for the reference probability determinations p0147 N74 13861
WAVE REFLECTION
Ionospheric disturbance effects on sky wave loaning measurements p0138 N73 14159
The power of low very high field strengths at beyond the horizon propagation over sea - the frequency range 60 - 1000 MHz p0147 N74 13863
WAVEFORMS
Design of waveform tasks adaptively tested by interactive man machine methods p0154 N72 11202
WAVEGUIDES
A computer program for analyzing waveguide structures p0166 N74 13979
WEAPON SYSTEMS
Role of simulations in the study and investigation of the CROTALE system - ground to air close defense weapon systems p0237 N74 14356
WEAPONS DEVELOPMENT
Application of control system requirements to development of solid fuel missile weapon systems
p0220 N72 22003
WEATHER
Weather factors - fatal civil transport aircraft accidents p0183 N71 23431
WEATHER DATA RECORDERS
Radar attenuation statistics for optical ground receivers using meteorological data p0142 N73 26113
WEIGHTLESSNESS SIMULATION
Human eye movements during various forms of linear acceleration and weightlessness - electronystagmographic recordings of human and fish responses to gravitoinertial conditions p0109 N74 20747
WELDED JOINTS
Nondestructive tests and their application for inspection of adhesive bonded structures, welded joints, and riveted or bolted joints p0197 N72 19542
Microstructure and stress corrosion behavior of welded steel joints p0286 N72 21910
Failure of welded joints in Ti Al Sn alpha type alloys in CCl4 vapor p0289 N72 21929
WESTLAND AIRCRAFT
Flight tests of Westland Scout helicopter fitted with reduced scale versions of rigid rotor to determine airworthiness and handling characteristics p0047 N73 21017
WETTABILITY
Photoelastic measurement of monofilament wetting by reinforcing resins of composite materials
p0208 N72 12506
WHIPLASH INJURIES
Three primate species undergoing whiplash injuries
p0099 N72 19127
WHISKER COMPOSITES
Application of directionally solidified eutectics for design and construction of gas turbine engines
p0213 N73 27493
Directional solidification of eutectic alloys and application to turbine blades and gas turbine engine components
p0213 N73 27494
Application of glass and carbon fibers reinforced structures for gas turbine engine components to operate in high temperature environments p0213 N73 27495
WIDEBAND COMMUNICATION
Tropospheric characteristics and their effects on reflection, scatter, wave propagation and radio signal transmission
[AGARD CP 70 71 PT 1] p0114 N71 21409
Improved tropospheric wave propagation for military applications p0114 N71 21410
Statistical evaluation of fading caused by time modulation in combined long wave broadband propagation
[UNET NTEST APH 1] p0117 N71 21433
Wideband tactical satellite communications systems using onboard processing p 132 N73 10202
WIND (METEOROLOGY)
Review of data and prediction techniques for wind profiles around manmade surface obstructions - summary of analytical models and calculational procedures
p0057 N74 17724
WIND EFFECTS
Problems in the simulation of atmospheric boundary layer flows - natural winds simulated in atmospheric boundary layer for aerospace and meteorological applications
p0057 N74 17722
Review of data and prediction techniques for wind profiles around manmade surface obstructions - summary of analytical models and calculational procedures
p0057 N74 17724
WIND PRESSURE
Effects of Q forces on human beings during ejection extraction escape in USAF p0102 N72 19144
Performance tests of protective clothing to determine effectiveness against air blast during high speed ejection
p0102 N72 19147
Traveling ionospheric disturbance generation by supersonic aircraft p0136 N73 14143
WIND PROFILES
Review of data and prediction techniques for wind flow - especially around manmade surface obstructions - summary of analytical models and calculational procedures
p0057 N74 17724
WIND TUNNEL APPARATUS
Performance characteristics of high Reynolds number transonic wind tunnel
[NASA TM X 67419] p0015 N72 11882
Analysis of factors involved in design of wind tunnel for testing V/STOL aircraft models p0018 N73 27965
Analysis of problems involved in operation of large wind tunnels at subsonic and supersonic speeds
[AGARD R 601] p0172 N73 26239
Analysis of interference phenomena in wind tunnel tests with flow disturbed by model support system
p0173 N73 26242
Objectives of dynamic tests on low speed wind tunnel aircraft models for measuring aerodynamic derivatives of transient motion effects p0173 N73 26244
Analysis of the interference phenomena in wind tunnel tests of helicopter rotors in forward flight
p0173 N73 26248
Assessment of the use of the automatic digital data system performance on the 40 by 80 foot wind tunnel
p0027 N74 14729
Strut interference effects on afterbody at transonic speeds p0022 N74 14737
Some considerations of future low speed tunnels for V/STOL p0174 N74 16980
Project Isaac - a large European transonic wind tunnel p0174 N74 16980
The development of an efficient acoustic lining system for the generation of turbulent boundary layer flows suitable for model tests at high Reynolds number p0174 N74 16980
Facilities for aerodynamic testing at hypersonic speeds p0174 N74 16981

WIND TUNNEL DRIVES

Some considerations of future low speed tunnels for Europe p0173 N74-16988

Project study of a large European transonic Ludwieg Tube windtunnel p0174 N74 16989

The development of an efficient and economical system for the generation of quiet transonic flows suitable for model testing at high Reynolds number p0174 N74 16990

The injector driven tunnel p0174 N74 16991

Facilities for aerodynamic testing at hypersonic speeds p0174 N74-16993

WIND TUNNEL MODELS

Wind tunnel tests with jet simulation of tailplane interference on European airbus models p0004 N71-19374

Photographic recording of aerodynamic interference in wind tunnel simulation of jettisoned drop loads from aircraft p0005 N71 19378

Three dimensional testing of high lift device models p0026 N71-20057

Conference on theoretical methods and wind tunnel facilities for transonic aerodynamic testing of aircraft at high Reynolds numbers [AGARD-CP-83 71] p0011 N72 11854

Flow model for shock induced leading edge transonic flow turbulence and rear separation in low speed stall of airfoil p0011 N72 11858

Feasibility of transonic wind tunnel testing of large cord swept wing panel model for simulating wing shock location at flight Reynolds number [NASA TM X 67414] p0013 N72 11870

Wind tunnel model boundary layer reduction through suction for accurate simulation of high Reynolds number full scale aircraft characteristics p0014 N72 11875

Methods for solving engine airplane interference and wall corrections in transonic wind tunnel tests for predicting aerodynamic performance of airplane design p0014 N72 11877

Specifications for high Reynolds number wind tunnel design for flow simulation in swept wing aircraft development tests p00.5 N72 11883

Transonic wind tunnel model measurements of buffet loads and boundaries at various sweep and aspect ratio wing roots p0016 N72-11886

Transonic wind tunnel design for model testing at high Reynolds number p0016 N72-11887

Engine airplane interference corrections in calculating model aircraft performance from wind tunnel test data p0037 N72 27017

Wind tunnel test requirements for simulating nozzle parameters and nozzle airframe interference characteristics p0037 N72 27021

Application of blockage correction factors to wind tunnel test measurements on aircraft models p0042 N73 15006

Development of advancing blade concept rotary wing and wind tunnel tests of full scale model p0046 N73 21029

Wind tunnel tests to determine effects of blade twist and aeroelasticity on tilt rotor performance from hover to mach number 0 7 p0051 N73 21049

Wind tunnel tests to determine effects of nonrotating components on helicopter performance and application for helicopter design optimization p0051 N73 21052

Procedures for testing rotary wing aircraft models in wind tunnels to include design of test facilities cost of models and facilities and methods for obtaining data p0018 N73 22955

Analysis of factors involved in design of wind tunnel for testing V/STOL aircraft models p0018 N73 22956

Aerodynamic coefficients for calculating transport aircraft performance using wind tunnel and scale models p0053 N73 24046

Analysis of operational problems associated with wind tunnel testing of V/STOL aircraft and helicopters p0173 N73 26240

Analysis of interference occurring in subsonic and transonic wind tunnels caused by model support system p0173 N73 26242

Analysis of techniques and equipment required to conduct test of jet aircraft engine models in wind tunnels p0173 N73 26245

Scaling laws constructional problems and optimum model size associated with wind tunnel tests of helicopters and rotary wing aircraft p0173 N73 26246

WIND TUNNEL STABILITY TESTS

Two dimensional wind tunnel tests on airfoils with high lift devices p0025 N71 20055

Three dimensional testing of high lift device models p0026 N71 20057

Transonic wind tunnel tests of effectiveness of high lift devices on swept and straight wings in controlling flow separation p0032 N72 11880

Transonic wind tunnel testing for predicting flight performance characteristics of aircraft p0013 N72 11865

Correlation of transonic wind tunnel test data with flight test results on slender wing airplanes for do nate data configuration development p0013 N72 11868

Comparison of wind tunnel and free flight model tests for determining full scale aerodynamic flight drag factors [NASA TM X 6741 3] p0013 N72 11869

Methods for solving engine airplane interference and wall corrections in transonic wind tunnel tests for predicting aerodynamic performance of airplane design p0014 N72 11877

Aerodynamic suitability of Freon 12 for wind tunnel testing of transport aircraft models at increasing Reynolds numbers and subcritical and supercritical Mach numbers [NASA TM X 67417] p0015 N72 11879

Hydraulic equipment for high Reynolds number testing in transonic wind tunnel [NASA TM X 67418] p0015 N72 11880

Flow distortion and performance measurements on 12 in fan in wing model for range of forward speeds and angle of attack settings in closed wind tunnel p0265 N72 16702

Controller independent of other intake controllers and aircraft data systems and wind tunnel testing of supersonic intake control system p0266 N72 16706

External drag characteristics of jet engine exhaust nozzles using wind tunnel tests p0266 N72 16707

Velocity distribution at supersonic compressor inlet in wind tunnel tests p0267 N72 16713

Comparison of flight test and wind tunnel data to determine areas of agreement when nonlinearities appear in aerodynamic coefficients of slender wing aircraft p0036 N72 20990

Wind tunnel tests to obtain pre flight estimates of stall speed and low air speed performance of Boeing 747 aircraft p0043 N73 15016

Procedures for testing rotary wing aircraft models in wind tunnels to include design of test facilities cost of models and facilities and methods for obtaining data p0018 N73 22955

WIND TUNNEL TESTS

Predicting flying qualities by wind tunnel tests p0045 N73 17000

Analysis of operational problems associated with wind tunnel testing of V/STOL aircraft and helicopters p0173 N73 26240

Analysis of minimum run times required for instationary measurements at transonic speeds during wind tunnel tests p0173 N73 26243

Objectives of dynamic tests in low speed wind tunnels and techniques for measuring oscillatory derivatives and transient motion effects p0173 N73 26244

Analysis of techniques and equipment required to conduct test of jet aircraft engine models in wind tunnels p0173 N73 26245

Scaling laws constructional problems and optimum model size associated with wind tunnel tests of helicopters and rotary wing aircraft p0173 N73 26246

Analysis of acoustic factors involved in wind tunnel tests to show contributions from various sources p0173 N73 26247

Influence of free stream turbulence on turbulent boundary layer in relation to wind tunnel testing at subsonic speeds p0184 N73 26283

Measurements of the drag of some characteristic aircraft excrescences immersed in turbulent boundary layers p0019 N74 14714

Problems of estimating the drag of a helicopter correlation of flight test data and scale model test data p0019 N74 14715

Transonic drag due to lift of planar jet flapped airfoils p0020 N74 14720

Sting interference effects on afterbodies at transonic speeds p0022 N74 14737

WIND TUNNEL WALLS

Development of numerical methods for correcting wall constraints in transonic wind tunnels with ventilated walls p0173 N73 26241

WIND TUNNELS

Survey of wind tunnel testing procedures for nozzles and exhausts p0263 N72 16688

Wind tunnel tests of afterbody thrust and correction for models with simulated hollow nacelles p0263 N72 16689

Development and characteristics of local Doppler velocity instrument to measure velocities of flowing fluids p0200 N72 25505

Development and characteristics of dual scatter laser Doppler velocimeter for flow distribution measurement in wind tunnels helicopter downwash and cross high lift wing sections p0200 N72 25506

Developments in aerodynamic test facilities to show past experience present status free flight techniques and future plans [AGARD R 603] p0172 N73 19250

Existing position and future prospects of wind tunnels in Europe research [AGARD AR 60] p0172 N73 20269

Analysis of operational problems associated with wind tunnel testing of V/STOL aircraft and helicopters p0173 N73 26240

WING FLAPS

High lift wing characteristics of wing with plain hinged flaps and boundary layer control and wing with dropped nose high lift devices extended p0027 N71 20065

WING LOADING

Effect of flat plate wing load distribution on take off and flight characteristics and maneuverability of aircraft p0044 N73 16998

WING OSCILLATIONS

Aerodynamic damping of vertical tail surfaces with oscillations in steady supersonic and subsonic flow including interference effects [AGARD-CP-80-71-PT-1] p0007 N71 29333

Aerodynamic methods for calculating aerodynamic loads on tail surfaces with oscillations in supersonic flow p0008 N71 29335

Calculated values of air forces on oscillating thin wings obtained by linearized potential flow [AGARD-R-583-71] p0010 N71 35198

Calculation and measurement of aerodynamic forces on oscillating airfoil with and without aerodynamic stalling p0060 N73 21042

On the prediction of aerodynamic loads on oscillating wings in transonic flow [AGARD R 612] p0023 N74 18853

WING PLANFORMS

Development of algorithm for calculating inviscid flow about arbitrary planform rotors and application to analyzing various rotary wing configurations p0051 N73 21048

Aerodynamic characteristics of high lift wing concepts for application to commercial short takeoff transport aircraft p0292 N73 29308

New investigations for reducing the base drag of wings with a blunt trading edge effects of splitter plates and splitter wedges on aerodynamic drag coefficients p0020 N74 14723

WING PROFILES

Transonic wind tunnel determination of blunt trailing edge effects on drag and lift characteristics of wing profile p0012 N72 11862

WING FUSELAGE STORES

Aerodynamic interference characteristics of airframe propulsion systems of transport and military aircraft [AGARD CP 71 71] p0001 N71 19353

Aerodynamic interference effects between wing and fuselage junctions p0001 N71 19354

Wind tunnel surveys of flow fields about wing fuselage store configuration inlets of transonic and supersonic aircrafts [NASA TM X 66885] p0004 N71 19371

Aerodynamic configuration effects of propulsion system integration into supersonic transport design p0004 N71 19373

Wind tunnel evaluation of interference drag in turbofan engine wing configuration of subsonic aircraft p0004 N71 19376

Flow field interference beneath swept wing fuselage store installation on aircraft p0005 N71 19380

Computerized prediction of interference flow field for wing fuselage store location on bomber aircraft p0005 N71 19381

Wind tunnel studies of external store induced flow field instability effects on longitudinal stability of arrow wing aircraft p0005 N71 19382

External store interference caused by rocket launcher pod post arming on aircraft wing p0006 N71 19387

Procedures for calculating normal wash in nonplanar configurations and interference between wings and bodies p0008 N71 29340

WINGED VEHICLES

Wind tunnel vortex flow study on body of revolution with or without wings p0001 N71 19355

WINGS

Computer programs for evaluating subsonic flow over wing tail wings with folded tips T tails and cruciform tail surfaces p0009 N71 29341

Method for calculating flutter using interference aerodynamic forces between wing and tail p0009 N71 29345

Calculation of pressure distributions over wings with harmonic oscillating control surfaces using kernel function method p0009 N71 29346

Application of lifting surface theory to wing with control surfaces in unsteady subsonic flow p0009 N71 29347

Asymptotic expansion techniques to define pressure loading effects on wings with unbalanced control surfaces p0010 N71 29348

Forebody and forebody wing configuration data for supersonic inlet performance and distortion during maneuvering flight p0266 N72 16710

WIRE

Tensile strength measurements on steel wire reinforced aluminum alloys p0268 N72 12501

Explosive bonding technique for strengthening aluminum with beryllium wires p0268 N72 12502

WORK CAPACITY

Oxygen consumption and work capacity in fitness evaluations on Canadian Armed Forces personnel p0092 N71 22311

Health hazards and efficiency reductions of personnel exposed to simulated nuclear shock waves in protective shelters p0100 N72 19136

WORK REST CYCLE

Automatic analysis of ECG at rest during and after exercise with two computer systems p0073 N72 25052

X

XH 51 HELICOPTER

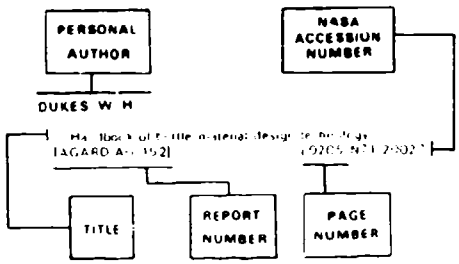
Flying safety factors in fixed ground operational design of XH 51 helicopter p0031 N71 23431

Flight tests of XH 51 helicopter to determine effects of gyroscope and control spring modifications on stability and control p0047 N73 21015

PERSONAL AUTHOR INDEX

AGARD INDEX OF PUBLICATIONS (1971-1973)

TYPICAL PERSONAL AUTHOR INDEX LISTING



Listings in this index are arranged alphabetically by personal author. The title of the document provides a brief description of the subject matter. The report number helps to indicate the type of document cited. The page number identifies the page in the abstract section (Part I) on which the citation appears while the NASA accession number denotes the number by which the citation is identified on the abstract page. Under each author's name, the accession numbers are arranged in ascending number order.

A

AARONS, J
Satellite scintillations in the high latitude F layer irregularity region p0128 N72 21138
HF auroral backscatter and the scintillation of satellite signals p0130 N72 21150
Total electron content and scintillation studies of the ionosphere [AGARD AG 166] p0187 N73 22350
Numerical models of total electron content over Europe and the Mediterranean and multi station scintillation comparisons [AGARD AG 166A] p0187 N74 14084
Multi station observations, December 1971 - March 1972 p0187 N74 14087
The effect of the August 1972 magnetic storms on scintillation p0187 N74 14088

ABBOTT, F T
On the use of freon 12 for increasing Reynolds number in wind tunnel testing of three dimensional aircraft models at supercritical and supersonical Mach numbers [NASA TM X 67417] p0015 N72 11879

ABEL, N
Observations on a 12 GHz scatter link over a 210 km path p0118 N71 23458
Some observations of scattering from ionosphere at 12 GHz trans horizon link p0141 N73 26133

ABEL, S M
Optokinetic nystagmus: Its value in the diagnosis of certain vestibular lesions p0109 N74 20742

ACKERMAN, G H
Cooling of advanced engines by endothermic reactions of hydrocarbon fuels p0251 N72 11672

ACUS, R W JR
Self contained guidance technology p0227 N72 27690
Application of inertial technology to ASW missiles p0227 N72 27691

ADDIS, L
The electroluminescent lighting research program p0226 N72 22644

ADDY, A L
The analysis of supersonic ejector systems p0193 N73 17251
A study of flow separation in the base region and its effects during powered flight p0020 N74 14724

ADEY, A W
Theory and field tests of a microwave radiometer for determining sea ice thickness p0121 N72 16089

ADOLPH, C F
Criteria trends obtained from analysis of current aircraft p0039 N72 32025

ADSHEAD, H G
Optimising automatic tracking of multilayer boards p0168 N74 13935

AJOY, V
A model for the study and prediction of auroral effects on HF radar p0130 N72 21153

AHA, R S
Establishing requirements for artificial intelligence in the airborne and space environments p0151 N72 11175

AHARRAH, R C
Low altitude high speed flight experience p0029 N71 23421
Flight simulation - A significant aid in aircraft design p0045 N73 17001

AHRENSDORF, K
Fatigue design practice p0060 N74 19654

AIKEN, W S
NASA propulsive lift STOL technology program p0035 N73 27009

AKAMATSU, Y
Representation of a wing in the lifting line application of the interaction calculations of two wings in tandem p0008 N71 29336

AKGUEL, M
Application of discriminate function technique to random search p0296 N74 15603

ALBRECHT, C O
Factors in the design and fabrication of powered dynamic aerodynamic STOL wind tunnel models appendix I p0018 N73 22956

ALBRECHT, H J
The identification and unitary utilization of frequency bands above 10 GHz [AGARD AR 42] p0149 K74 73498
The identification and unitary utilization of frequency bands above 10 GHz [AGARD AR 42 REV] p0149 K74 73499
Tropospheric radio wave propagation: part 1 Conference proceedings [AGARD CP 70 71 PT 1] p0114 N71 21409
Tropospheric path parameters with multiple access systems in space communications p0115 N71 21421
Daily and hourly forecast of tropospheric propagation parameters p0120 N71 23470
Propagation Effects on monitoring atmospheric fine structure using side scatter on appropriate frequencies p0122 N72 16097
Propagation criteria with tactical satellite communications p0132 N73 10201
System considerations in tactical satellite communications p0132 N73 10202

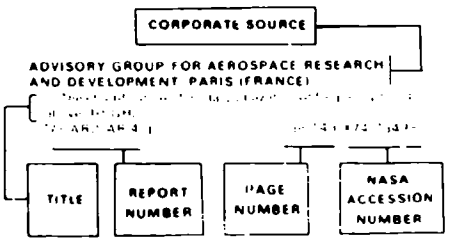
CORPORATE SOURCE INDEX

AGARD INDEX OF PUBLICATIONS (1971-1973)

TYPICAL CORPORATE SOURCE INDEX LISTING



Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (i.e. translation). The page number identifies the page in the abstract section (Part II) on which the citation appears. The NASA accession number denotes the number by which the citation is identified on that page. The titles are arranged under each corporate source in ascending accession number order.

Spectral shape and parameter adaptive pattern recognition - Part I - Supervised learning p0153 N72 11189
Statistical and wave scattering attenuation of two Texas lakes p0142 N73 26141

TEXAS UNIV. GALVESTON

TEXAS UNIV. GALVESTON
Impulsiveness and anxiety, related to perceptual motor performance p0069 N71 203[illegible]
THOMSON-CSF, BAGNEUX (FRANCE)
Role of simulations in the study and development of the CROTALE system p0237 N74 14355
TORONTO UNIV (ONTARIO)
Optokinetic nystagmus - its value in the diagnosis of certain vestibular lesions p0109 N74 20742
TOULOUSE UNIV (FRANCE)
Evidence on the effect of natural ionizing radiation on biological stimulation p0075 N72 28050
Microwave circuit analysis by digital computer p0166 N74 13922
TRANSOCIATES LTD., LONDON (ENGLAND)
Education and technical training for technical information p0160 N74 16931
TRANSPORTATION SYSTEMS CENTER, CAMBRIDGE, MASS
Automatic detection of vehicles in aerial photographs of highways p0152 N72 11183
The detection of aircraft wake vortices p0058 N74 17731
TRW SYSTEMS GROUP, REDONDO BEACH, CALIF.
Sea brightness temperatures at microwave frequencies p0124 N72 16112
Computers for satellite based navigation and guidance systems p0157 N72 21226
Pulsed laser holography [NASA CR 126787] p0199 N72 25501
Ruby laser holography p0200 N72 25502
Conceptual analysis of ICNI systems p0235 N72 23719
TULANE UNIV., NEW ORLEANS, LA.
Clinical application of nystagmography p0108 N74 20733
TYCO LABS., INC., WALTHAM, MASS.
Measuring the degree of conjoint action between stress and corrosion in stress corrosion p0286 N72 21908

U

ULM UNIV. (WEST GERMANY)
Computer electronystagmography in evaluating the influence of psycho pharmacological drugs on vigilance p0109 N74 20749
UNION CARBIDE CORP., TARRYTOWN, N.Y.
High field plasma arc plated Nb3Sn superconducting solenoids p0063 N73 19034
UNITED AIRCRAFT CORP., EAST HARTFORD, CONN.
Practical calculations of transitional boundary layers p0268 N73 19796
Rotor wakes - Key to performance prediction p0049 N73 21032
UNITED AIRCRAFT CORP., STRATFORD, CONN.
A feasible feel augmentation system for helicopters p0033 N72 11931
Impact of new structural concepts on system capabilities p0048 N73 21021
Development of the ABC rotor p0048 N73 21029
Aerodynamic factors influencing overall hover performance p0050 N73 21038
Helicopter rotor loads predictions p0056 N74 10912
UNITED AIRCRAFT OF CANADA, LTD., LONGUEUIL (QUEBEC)
An experimental cooled radial turbine p0259 N73 17391
The state of the art of small gas turbine engines for helicopters and surface transport p0262 N71 26953
UNITED KINGDOM ATOMIC ENERGY AUTHORITY, HARWELL (ENGLAND)
The Harwell heat transfer and fluid flow information analysis centre p0113 N71 19530
UNITED STATES STEEL CORP., MONROEVILLE, PA.
Microscopic identification of stress corrosion cracking in steels with high yield strength p0289 N72 21925
UNIVERSIDADE TECNICA DE LISBOA (PORTUGAL)
Mach number effects in turbulent flow p0178 N72 20282
UNIVERSITY COLL., LONDON (ENGLAND)
Cellular logic and its significance in pattern recognition p0154 N72 11198
UNIVERSITY OF SOUTHERN CALIF., LOS ANGELES
Intermittent structures in turbulent boundary layers p0275 N72 20272
UNIVERSITY OF SOUTHERN CALIF., MARINA DEL REY
A parallel printed circuit board design system p0168 N74 13936
UNIVERSITY OF TECHNOLOGY, LEICESTER (ENGLAND)
The effects of blowing on transonic flow past circular arcs p0024 N73 19972
UPPSALA IONOSPHERIC OBSERVATORY (SWEDEN)
Traveling ionospheric disturbances initiated by low altitude nuclear explosions p0139 N73 14168
UPPSALA UNIV. (SWEDEN)
Boundary conditions for stable one-step approximations of hyperbolic differential equations p0185 N74 22935

V

VANDERBILT UNIV., NASHVILLE, TENN.
A man-machine approach toward solving various routing scheduling and network problems p0154 N72 11139
VEREINIGTE FLUGTECHNISCHE WERKE G.M.B.H., BREMEN (WEST GERMANY)
Velocity and density measurements in a free jet p0178 N72 20293
VAK 191 B experimental program for a V/STOL Strike Recce aircraft p0054 N73 27006
VEREINIGTE FLUGTECHNISCHE WERKE-FOKKER G.M.B.H., BREMEN (WEST GERMANY)
Evaluation of an integrated flight display for the manual IFR landing of VTOL aircraft p0224 N72 22831
VEREINIGTE FLUGTECHNISCHE WERKE FOKKER G.M.B.H., MUNICH (WEST GERMANY)
Subsonic unsteady airloads on multiple lifting surfaces p0008 N71 29339
Transient aeroelastic analysis for Fokker F 28 p0009 N71 29344
VIRGINIA POLYTECHNIC INST., BLACKSBURG
Effects of strong axial pressure gradients on turbulent boundary layer flows [NASA CR 125903] p0176 N72 20281
VON KARMAN INST. FOR FLUID DYNAMICS, RHODE SAINT GENESE (BELGIUM)
Design of small dimension turbine blade by theoretical analysis p0258 N71 17380
Application of film cooling to gas turbine blades p0260 N71 17394
Fundamental aspects of flow separation under high lift conditions p0025 N71 20055
Flow analysis in assymmetric subsonic inlets of small gas turbines p0265 N72 16701
Introductory remarks p0181 N72 27294
On the two dimensional boundary layers as they appear on turbomachine blades p0266 N73 19795
Blade optimization based on boundary layer concepts p0269 N73 19801
Secondary flow research at the von Karman Institute p0270 N73 19811
Shock wave boundary layer interaction in cascades p0271 N73 19816
Review of some problems related to the design and operation of low speed wind tunnels for V/STOL testing p0173 N73 26240
Numerical integration of Navier Stokes equations p0185 N74 22917
VOUGHT AERONAUTICS, DALLAS, TEX.
Application of solid state switching and multiplexing to aircraft electrical systems p0066 N73 19053

W

WALTER REED ARMY MEDICAL CENTER, WASHINGTON, D.C.
Predicting visual performance in aviator's refractive error p0078 N73 19074
WARREN SPRING LAB., STEVENAGE (ENGLAND)
Relative air pollution emissions from an airport in the UK and neighbouring urban areas p0218 N74 14282
WARWICK UNIV. COVENTRY (ENGLAND)
The behaviour of composite superconducting materials under ac conditions p0063 N73 19032
WASHINGTON UNIV., SEATTLE
Multiple scattering effects on wave propagation through rain p0140 N73 26132
WASHINGTON UNIV., ST. LOUIS, MO.
Robot data screening - An intelligent data search technique p0151 N72 11176
WEAPONS RESEARCH ESTABLISHMENT, SALISBURY (AUSTRALIA)
Ionospheric tilt measurements near the magnetic dip equator p0138 N73 14160
Ray tracing of gravity wave perturbed ionospheric profiles p0139 N73 14163
WELDING INST., CAMBRIDGE (ENGLAND)
Stress corrosion testing of weldments p0286 N72 21910
WESTERN ONTARIO UNIV., LONDON
Electrostatic waves in aurora p0127 N72 27132
Angular deviation of radio waves p0128 N72 27139
WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
Superconducting rotating machinery p0064 N71 19040
WESTINGHOUSE RESEARCH LABS., PITTSBURGH, PA.
An application for stress corrosion testing with fatigue pre-cracked WOL specimens p0287 N72 21914
WESTLAND AIRCRAFT, LTD., YEOVIL (ENGLAND)
The structure of the rotor blade tip vortex p0049 N73 21034

Use of composites in helicopters - Advantages and disadvantages p0211 N73 27483
WESTLAND HELICOPTERS, LTD., YEOVIL (ENGLAND)
Ground and flight test experience with the Westland [illegible] p0042 N73 21012
Materials for blades and rotor hubs p0048 N73 21023
The use of a helicopter as a flying test bed p0052 N73 21026
Flight testing for performance and flying qualities p0018 N73 22959
Wind tunnel requirements for helicopters p0173 N73 26246
The prediction of loading actions on high speed semi-rigid helicopters p0056 N74 10914
WILCOX ELECTRIC CO., INC., KANSAS CITY, MO.
Decisions for the 70's p0232 N73 23692
WISCONSIN UNIV., MADISON
The identification of inhomogeneous media from transient diffusion of electromagnetic fields p0125 N72 16118
WISCONSIN UNIV., MIDDLETON
Electromagnetic sounding of ice thickness p0123 N72 16099
Effect of beam width on acoustic signals scattered at a rough surface p0123 N72 16102
WRIGHT CO., KETTERING, OHIO
Armor materials for life support p0102 N72 19143
WRIGHT STATE UNIV., DAYTON, OHIO
Vibration p0076 N72 17099
Noise p0076 N73 17100

Y

YALE UNIV., NEW HAVEN, CONN.
Environmental effects on gas-metal reactions at elevated temperatures p0202 N73 23606

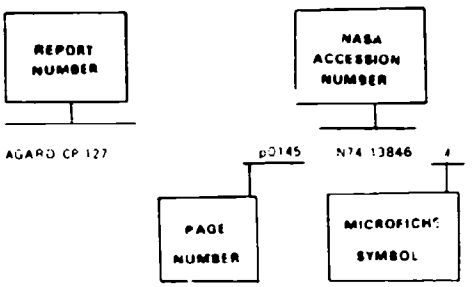
Z

ZENTRALSTELLE FUER MASCHINELLE DOKUMENTATION (ZMD), FRANKFURT (WEST GERMANY)
Problems of data recording and data interchange p0159 N73 24207

REPORT/ACCESSION NUMBER INDEX

AGARD INDEX OF PUBLICATIONS (1971-1973)

TYPICAL REPORT ACCESSION NUMBER INDEX LISTING



Listings in this index are arranged alphanumerically by AGARD report number. The page number identifies the page in the abstract section (Part I) on which the citation appears. The NASA accession number denotes the number by which the citation is identified on that page. A pound (#) sign indicates that the item is available on microfiche. A plus sign (+) indicates that document was not microfiched but that a one-to-one facsimile copy may be available. Microfiche or hard copy are available from the purchase agencies listed on the back cover.

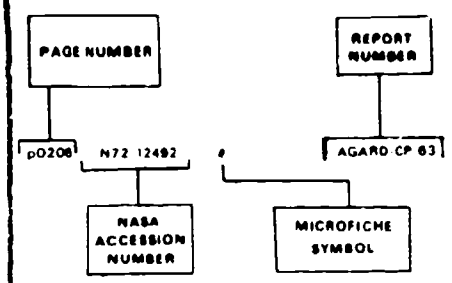
ACCESSION/REPORT NUMBER INDEX

GARD INDEX OF PUBLICATIONS (1971-1973)

TYPICAL ACCESSION REPORT NUMBER INDEX LISTING



Listings in this index are arranged numerically by NASA accession number. The page number identifies the page in the abstract section (Part I) on which the citation appears. All report numbers that were cataloged are listed. A pound sign (#) indicates that the item is available on microfiche. A plus sign (+) indicates that the document was not microfiched but that a one-to-one facsimile copy may be available. Microfiche or hard copy are available from the purchase agencies listed on the back cover.

NOTE: "NO REPORT NUMBER" indicates that the reference is one of the papers contained in the AGARD Series Number preceeding it, e.g., p0171 N 71-16061 # is contained in AGARD CP-79-70. Papers which also possess a reference number in a non-AGARD report series have been identified, e.g., "p0172 N 71 16069 # ..... NASA-TM-X-66583", but such papers are also contained in the preceeding AGARD Series Number (e.g., in this case, AGARD CP-79-70).
