This monograph traced the growth of Army aviation from 1955 to 1962. The work done during these years on helicopter armament and airmobile concepts provided the groundwork for large scale airmobile combat operations. Emphasis is placed on the role of the United States Continental Army Command, but Department of the Army and Transportation Corps activities are also considered.
HISTORY OF ARMY AVIATION
1950 - 1962

Phase II: 1955 - 1962

November 1976
FOREWORD

This monograph, which covers the history of Army aviation during the years 1955 to 1962, represents a continuation of Army aviation history begun by a CONARC monograph published in 1971. A third phase, which was to have covered the Howze Board and its implications, has been cancelled.

Although this monograph presents the subject of Army aviation from the point of view of the United States Continental Army Command, activities of the Department of the Army staff and the Transportation Corps have been included to present a more complete and coherent picture.

The developments which took place in Army aviation during the period 1955 to 1962 provided a basis for its remarkable successes achieved later in Southeast Asia. It is hoped that this and the preceding monograph will provide a better understanding of the origins and development of Army aviation.

BROOKS E. KLEBER
Chief Historian
During the period covered by this monograph, Army aviation not only introduced new aircraft which significantly improved its capability, but also began the development of new doctrinal concepts. The work done during these years on helicopter armament and airmobile concepts provided the groundwork for the large scale airmobile combat operations which the Army would conduct during the following decade. In this monograph emphasis is placed on the role of the United States Continental Army Command in both training and combat developments related to Army aviation.

Because of the complexity of the subject, it has been necessary to organize this monograph topically rather than chronologically. Cross references are inserted where it is considered necessary to provide clarity. The development of Army aviation programs and policies during the entire period covered by this monograph is followed by a chapter covering the organizational changes at all levels which resulted from these policies. The birth of the airmobile concept is then covered in two chapters dealing with the development of armament and with organization and doctrine. Separate chapters cover the growth of aviation training, the introduction of new types of aircraft, and supply and maintenance activities.

Most of the primary documentary sources cited in the footnotes are located in the Federal Records Center of the National Archives and Records Service at Suitland, Md. Copies of many of these documents have been retained in the TRADOC Historical Office files. The published reports and secondary sources dealing with the Transportation Corps may be found in the library of the United States Army Transportation School at Fort Eustis, Va. The semiannual historical reports of OCAFF and CONARC are in the files of the TRADOC Historical Office and the United States Army Center of Military History. The annual historical summaries of Department of the Army staff elements are also located in the files of the Center of Military History.

The preparation of this monograph would not have been possible without the cooperation and assistance of the staffs of the Transportation Museum and library of the United States Army Transportation School at Fort Eustis, the United States Army Aviation Museum, United States Army Aviation Digest, the library of the United States Army Aviation School at Fort Rucker, Ala. the National Archives and Records Service, the United States Army Center of Military History, and the Historical Office, United States Army Materiel Development and Readiness Command. The monograph was typed by Mrs. Janet S. Cromer.

RICHARD P. WEINERT
Historian

vii
Chapter I

BACKGROUND

The growth of Army organic aviation from its establishment on 6 June 1942 until 1962 was dramatic. Just prior to the Korean War, the Army possessed 1,186 fixed wing aircraft and 56 helicopters. By 1954, this figure had grown to 2,518 fixed wing and 1,140 rotary wing aircraft, and at the end of 1962 the Army possessed 2,918 fixed wing and 2,942 rotary wing aircraft. Not only did the size of Army aviation increase greatly during these two decades, but the missions assigned to organic aviation also changed and expanded. Limited during World War II to artillery observation and liaison missions, Army aviation expanded during the Korean conflict into transportation and medical evacuation missions. By the late 1950's it began to become a factor in combat operations.

As the above figures indicate, the helicopter proved to be the key factor in this sudden expansion of Army aviation. Introduced in small numbers in the years just prior to the Korean conflict, the versatility of the helicopter soon proved to be the answer to many Army problems. It could be used for observation, liaison, medical evacuation, and for light transportation. Its vertical takeoff ability permitted its use in terrain that was impossible for ground vehicles. By 1954, the Army began to realize that the helicopter offered possibilities of providing a flying gun platform.¹

Technical limitations in helicopter development delayed the full impact of this aircraft's versatility until late in the 1950's. Although transport units were developed using the H-19, H-21, and H-34, it was not until the introduction of the HU-1 and HC-1 that the Army could fully begin development of airborne combat concepts. Not only were these helicopters much better transport aircraft, but the HU-1 also was capable of efficiently carrying armament.

The formation of helicopter transportation companies had permitted their use in large-scale maneuvers as early as 1951 on a small scale. In the following years, increasing numbers of Army aircraft participated in field exercises as new types of equipment,

¹ (1) FOR AV PPRD Memo for Record, 1 Mar 65, subj: Aircraft Inventory. (2) B. Franklin Cooling, "A History of U.S. Army Aviation," Aerospace Historian, Vol. 21, No. 2 (Summer 74), pp. 102 - 08.
new organizations, and new tactical concepts were tested. The use of Army aircraft on the battlefield for transport and gunship support revived the controversy with the Air Force over responsibilities and missions of Army aviation.

Fixed wing aircraft also were significantly improved during these two decades. Throughout the Korean War, fixed wing aviation was limited to light observation airplanes such as the L-19 and a few small liaison type utility aircraft. During the years following that war, fixed wing transport aviation was developed first with the U-1 and then with the AC-1. While the L-19 continued in service, increased reconnaissance requirements and the development of sophisticated electronic equipment led to the adoption of the AO-1 reconnaissance airplane.

The rapid expansion of Army aviation which began in 1950 resulted in a parallel increase in training operations. The Army Aviation School had been established at Fort Sill in 1953 and moved to Camp Rucker, Ala., the following year. The Air Force still provided primary flight training for Army pilots, but negotiations were begun in 1954 to transfer this responsibility to the Army. The Department of Defense finally authorized the transfer of training responsibility in early 1956, and the Army acquired Wolters Air Force Base and Gary Air Force Base. The U.S. Army Primary Helicopter School was established at Camp Wolters in late 1956.

The Transportation School began field maintenance training support of Army aviation during 1954, while organizational maintenance training continued to be conducted at the Army Aviation School. During 1954, the Army became convinced that adequate logistical support of its aviation could not be attained relying on Air Force depot support. After extended negotiation, the Air Force agreed in 1955 to transfer the depot functions to the Army. The Transportation Corps began the difficult task of developing a supply and maintenance system to support Army aviation. In subsequent years, the major portion of Transportation Corps activities centered around Army aviation.

During the period from 1950 to 1954, the Army had established a firm foundation for the expansion of its aviation activities. Its dependence on the Air Force for training and logistical support began to be phased out. A strong and flexible training base had been established. Tactical aviation units had been formed and some actual combat experience had been acquired in Korea. Helicopter procurement difficulties posed a problem, but Army aviation only awaited technological developments in order to reach its full potential.

The growth of Army aviation was punctuated by a series of disagreements and misunderstandings between the Army and the Air Force. The National Security Act of 1947, which had established
the independent Air Force, provided that "in general the Army shall include land combat and service forces and such aviation and water transport as may be organic therein." As Army aviation expanded, increasing difficulties were encountered in delineating the missions which were performed by Army and Air Force aircraft. Put in its simplest terms, the Air Force would not agree to any expansion of Army aviation missions beyond those conducted during World War II.

The growing discord between the services during the Korean conflict, as Army aviation became involved in medical evacuation and limited transport operations, resulted in an attempt to clarify roles and missions. On 2 October 1951, Secretary of the Army Frank Pace, Jr., and Secretary of the Air Force Thomas K. Finletter signed a Memorandum of Understanding which attempted to define Army organic aviation in order to ensure that the Army could employ aircraft necessary for its own requirements in the conduct of land operations, without infringement upon the functions assigned to the Air Force. The Key West Agreement of 1948 had attempted the same thing without noticeable success. In 1949, the Army and Air Force had agreed on limiting the weight of Army fixed wing aircraft to 2,500 pounds and rotary wing aircraft to 3,500 to 4,000 pounds. The most significant aspect of the 1951 memorandum was elimination of this weight restriction on Army organic aircraft in favor of a definition solely in terms of the functions to be performed.

The memorandum provided that Army organic aviation would consist of light fixed wing utility aircraft and rotary wing aircraft used by the Army within the combat zone as an integral part of its components to expedite and improve ground combat and logistical procedures. Army aviation was still limited, however, by the proviso that such aircraft would not duplicate the functions of the Air Force in providing close combat support, assault transport and troop carrier airlift, aerial photography, tactical reconnaissance, and interdiction. The memorandum provided that the combat zone would not normally exceed fifty to seventy-five miles in depth.

Army organic aircraft were to perform the following functions: (1) aerial observation for the purpose of locating, verifying, and evaluating targets, adjusting fire, studying terrain, and obtaining information on enemy forces not otherwise obtained by air reconnaissance agencies of the other services; (2) control of Army forces; (3) accomplishment of command, liaison, and courier missions; (4) performance of aerial wire laying; and (5) transportation of supplies, equipment, and small units within the combat zone.2

1 R. Earl McClendon, Army Aviation, 1947-1953, Documentary Research Division, Research Studies Institute, Air University, Maxwell AFB, Ala., pp. 22-23. (2) Ltr, General J. E. Hull, VCoS, CAFF, 8 Oct 51, subj: Memorandum of Understanding Between the Secretary of the Army and the Secretary of the Air Force, w/incl.
Disputes regarding interpretation began as soon as the 1951 Memorandum of Understanding was signed. Army plans for the activation of helicopter transport battalions and requests for additional helicopters for transportation missions in Korea ran into strong Air Force opposition. The Army based its request for helicopter transports on the alleged failure of the Air Force to provide sufficient airlift to meet Army requirements. The dispute reached the Department of Defense and led, on 4 November 1952, to the signing of a new Memorandum of Understanding.

The new memorandum once again imposed a weight limitation on Army fixed wing aircraft, but the maximum was increased to 5,000 pounds. This restriction was subject to review by the Secretary of Defense upon the request of either service secretary. No weight restrictions were put upon helicopters, and they remained defined solely in terms of functions. Air transportation of Army supplies, equipment, personnel, and small units within the combat zone was now a primary rather than a limited or emergency function of Army aviation. The combat zone was redefined to extend normally from 50 to 100 miles in depth. While the functions of Army aviation within the combat zone were more clearly delineated, the primary functions of the Air Force in support of the Army were in effect somewhat restricted. Although the 1951 and 1952 Memoranda of Understanding did place limitations on the Army aviation, the overall effect was to leave the Army free to develop fully the potential of light aviation within its combat units. The Army was still dependent upon the Air Force for close air support, reconnaissance, and tactical transport to and from the combat zone, but within the combat zone itself the Army was virtually free to develop its own aviation as required.

The 1952 Memorandum of Understanding provided the basic ground rules under which Army aviation developed until 1962. It did not, however, bring an end to the disputes between the Army and the Air Force over missions and functions. The significant technological advances in helicopter design during the next few years and the successful experiments in helicopter armament would lead the Army to press for expanded aviation missions.

The history of Army aviation falls conveniently into four time periods. From 1942 to 1950, organic aviation found a small but accepted place in the ground army. Between 1950 and 1954, the introduction of the helicopter and combat experience in Korea led to a realization of the potential of Army aviation and the establishment of a firm training base. During the period 1955 to 1962, technological advances in aircraft design and the development of aircraft armament led to entirely new concepts in the use of light aviation in combat. The basic conceptual and organizational decisions had been made by the time the final period in Army aviation history began in 1962. The work of the U.S. Army Tactical Mobility Requirements Board (Howze Board) marked the beginning of large scale
use of airmobility by the Army. The decade of the 1960's was to see Army aviation finally achieve its full potential.

The following chapters will trace development of Army aviation from 1955 to 1962. Significant organizational changes took place at all levels from the Department of the Army to aviation companies and detachments in response to the expanding missions of Army aviation. For the first time, a coherent long-range plan governing the development of Army aviation was adopted. Successful experimentation--begun initially on an informal level at the Army Aviation School--led to the acceptance of the armed helicopter by 1962.

Aviation training expanded to keep pace with the growth of Army aviation. All training responsibilities were finally transferred from the Air Force to the Army. Camp Wolters became a key element in the training base with the establishment of the U.S. Army Primary Helicopter School. Maintenance training was expanded at both the Army Aviation School and the Transportation School.

A significant advance for the Army during this period was the transfer of logistical support responsibilities from the Air Force. The Transportation Corps now had full responsibility for the supply and maintenance support of the Army aircraft. The complexity of this task resulted in a major reorganization of the Transportation Corps' supply system.

Technological research and development during the period led to rapid advances. The introduction of the turbine engine and its application in the HU-1 and the HC-1 provided the vehicles needed to apply the new airmobility concepts. Fixed wing aircraft development kept pace with the introduction of the AO-1 reconnaissance airplane and the AC-1 transport. A large amount of research and development effort during this period was expended upon convertiplanes and verticle lift vehicles, in addition to proven tactical aircraft.
Chapter II

PLANS AND PROGRAMS

The development of Army aviation between 1955 and 1962 must be viewed against the general background of national defense policy during that period. The late 1950's were in many ways a time of uncertainty and difficulty for the Army. Following the end of the Korean conflict, came a series of strategic decisions known collectively as the "New Look." The basic premise of this new strategic policy was defined by Secretary of State John Foster Dulles in his "massive retaliation" speech in January 1954.

The keystone of this doctrine was the threat of the use of nuclear force and the selected use of weapons tailored to United States strategy rather than to moves or presumed intent of the enemy. This strategy was based on the belief that the threat of the use of nuclear weapons against an enemy's homeland or his armed forces could substitute for military manpower. Working from this hypothesis, the United States placed greater reliance on strategic nuclear air power and de-emphasized land, naval, and tactical air forces. For the Army, this policy meant that both men and money would be hard to come by for the development of any new missions or tactical concepts.

General Matthew B. Ridgway, the Chief of Staff of the Army, strongly opposed the "New Look." He believed that whether nuclear weapons were used or not, it was the ground soldier who must finally achieve victory. General Ridgway realized, however, that the Army which had fought in World War II and Korea could not meet the challenge of the prospective nuclear battlefield. One solution for the Army to the problem created by the atomic age appeared to be a greater use of air power.

General Ridgway believed that if the Army was to become a streamlined, hard-hitting force, as many elements as possible must be transportable by air, both between continents and on the battlefield. Fixed land lines of communication and huge supply dumps would probably no longer be possible. More than ever before, aircraft would have to provide the means of troop transport, resupply, evacuation, and communications.

Of great concern to General Ridgway, was the failure of the United States Air Force to make adequate provision for the future requirements of the Army. With the "New Look," the Air Force devoted most of its attention to the formation of a strategic bomber force supported by high performance jet interceptors. Little interest
was shown in the development of close air support or in "low and slow" type aircraft needed by the Army. The Army required what amounted to aerial trucks and jeeps and combat aircraft which could serve as flying gun platforms. The Air Force made no effort to develop such aircraft. General Ridgway maintained that if the Air Force would not undertake such projects, the Army would have to in order to survive on the modern battlefield. He therefore determined that Army aviation would have to undergo an extensive reorganization to prepare it for the future. In order to provide adequate guidance for future developments, General Ridgway directed that a comprehensive Army aviation plan be developed.¹

Army Aviation Plan

On 4 September 1954, General Ridgway directed that a comprehensive review of the Army aviation program be undertaken as a first step in the preparation of the comprehensive Army aviation plan which he had called for. Thus, for the first time, the Army attempted to prepare a long range program for aviation. In response to a Department of the Army request for input to the overall plan, the Office of the Chief of Army Field Forces (OCAFF)² developed separate plans for Army aviation training, combat developments, and testing and development of Army aviation equipment. These plans were forwarded to the Department of the Army on 30 September. The training plan provided separate courses, course locations, and student inputs for instruction through 1960. The combat developments plan outlined the role of OCAFF in the combat developments function, including the relationship with the Army Aviation School. The testing and development plan provided for the establishment of an Army aviation plan.

² Army Ground Forces was redesignated the Office of the Chief of Army Field Forces on 10 March 1948. OCAFF was the field operating agency of the Department of the Army within CONUS for the general supervision, coordination, and inspection of the training of all units and individuals employed in a field army. OCAFF also retained functions relating to the development of tactical and technical doctrine and the supervision of research and development. The six CONUS armies and the Military District of Washington were made major commands under the direct control of the Chief of Staff of the Army. Jean R. Moenk, A History of Command and Control of Army Forces in the Continental United States, 1919 - 1972, CONARC, 15 Aug 72, p. 29 (hereafter cited as Moenk, Command and Control).
Aviation Board, located at the Army Aviation School, to assume the responsibility and missions performed by the Army Aviation Service Test Division of OCAFF Board No. 6, Camp Rucker; the Aviation Branch, Aviation and Metro Division, Army Electronic Proving Ground, Fort Huachuca; and the Air Transportation Division, Transportation Research and Development Command, Fort Eustis.

On 9 November, the Department of the Army forwarded to OCAFF for review and comment the proposed Army Aviation Plan, FY 1955 – FY 1959, which was designed to provide long-range Department of the Army guidance on the development of Army aviation. OCAFF, in turn, asked the service schools concerned, the Command and General Staff College, and the Army War College for comments and recommendations. Responding to the Department of the Army, OCAFF pointed out on 1 December two basic issues which had to be resolved prior to acceptance or rejection of the proposed Army Aviation Plan. First, definition was needed of what aviation missions were to be performed by the Army and the Air Force. Second, a decision then had to be made as to how Army aviation was to be organized to perform those missions. Until these issues could be resolved, OCAFF recommended that the plan not be presented to the Chief of Staff of the Army.

The Army Field Forces took this opportunity to make a number of specific recommendations regarding Army aviation. These included the establishment of a career management program for aviators, the expansion of training facilities, the establishment of an Army Aviation Center, and the assumption by the Army of the responsibility for depot supply and maintenance. OCAFF also recommended that aircraft requirements be considered as tentative and valid for short range planning only pending the completion of OCAFF studies. Also needed was authority, together with appropriate agencies at the Department of the Army level, to investigate means of shortening the aircraft development-procurement cycle.

On 7 December, a conference was held on the Army Aviation Plan attended by General John E. Dahlquist, the Chief of Army Field Forces, Maj. Gen. R. M. Montague, the Deputy Chief of Combat Developments, OCAFF, and Maj. Gen. Paul D. Adams, the Deputy Assistant Chief of Staff, G-3, Department of the Army. At this conference, OCAFF once again recommended the establishment of an Army Aviation Center and that the Department of the Army should proceed immediately to solve the career problems of Army aviators that had arisen. OCAFF also recommended that training should be re-emphasized and that the

3 (1) DA ACoFS G-3 Army Avn Div Summary of Major Events and Problems, FY 55, p. 1 (TOP SECRET — Info used is UNCLASSIFIED).
(2) CONARC Summary of Major Events and Problems, FY 55, G-3 Sec Doc & Req Div, Jul - Dec 54, p. 7.
Department of the Army should initiate action to take over depot maintenance and supply. Conference discussions also included the Army's maximum use of Air Force and Navy procurement facilities. OCAFF wanted assurances that the proposed expansion of the Department of the Army G-3 Army aviation functions would not duplicate those of OCAFF.

On 18 December, the Department of the Army asked OCAFF for concurrence and comment on a draft summary sheet for the Chief of Staff of the Army. This document summarized the planned expansion of Army aviation and the proposed Army Aviation Plan. It also included comments from the field and recommended courses of action. These actions included the centralized control over aviation personnel by the Department of the Army, G-1, and the establishment of an Army Aviation Center and Army Aviation Board at Camp Rucker. Moreover, a general officer with the responsibility for overall supervision and coordination of the Army aviation program should be added to the Office of the Assistant Chief of Staff, G-3, Department of the Army.

The Chief of Army Field Forces would be charged with conducting all flight and technical training of Army aviation personnel in the zone of the interior. He also would be charged with making recommendations to the Department of the Army concerning all aspects of the combat and service development of aviation used by the Army in the field to include organizational matters, integration of aviation into units, tactical and logistical employment of aviation, and recommending the types, characteristics, and capabilities of aircraft best suited for use by the Army in the field. The Department of the Army recommended the Army assumption of depot supply and maintenance responsibilities and the implementation of planning studies and tests to resolve the basic problems of Army aviation as related to personnel, organization, developments, construction, procurement, supply and maintenance, and command. OCAFF, with most of its previous objections satisfied, concurred in the content of this summary sheet on 22 December 1954.4

While the comments from the field on the proposed Army Aviation Plan were generally favorable, they were not unanimously so. For this reason, G-3 submitted specific recommendations relating to Army aviation to the Chief of Staff of the Army rather than the complete plan. On 11 January 1955, the Army Policy Council approved

these Army aviation recommendations, including those relating to OCAFF. As a result of this decision, the Department of the Army directed the Commanding General, Continental Army Command (CONARC) to recommend the mission and organization for the Army Aviation Center and the Army Aviation Board. The Army Aviation Center had been officially established at Camp Rucker on 1 February. CONARC Board No. 6 was also established at Camp Rucker to replace the Army Aviation Test Division of CONARC Board No. 5. The Department of the Army requested CONARC to provide plans under which it would execute its responsibilities for all aviation flight and technical training of Army aviation personnel in the zone of the interior.

On 12 April, the Department of the Army requested that CONARC prepare detailed plans for training sufficient aviators in FY 1956 to meet all aviator requirements Armywide by the end of fiscal years 1956-1957. CONARC recommended on 29 April a means of reaching the objectives by the end of FY 1957. The Department of the Army revised the desired requirements and recommended a plan which was approved by the Army Aviation School on 11 May and by CONARC three days later. The FY 1956 Fixed Wing Training Plan was published by the Department of the Army on 13 June and was forwarded by CONARC to the Army Aviation School for implementation on 27 June.

5 The Office of the Chief of Army Field Forces was reorganized and redesignated as Headquarters, Continental Army Command, on 1 February 1955. The command had responsibility over the six numbered armies in the continental United States (CONUS), the Military District of Washington, and such other units, activities, and installations as were assigned by the Department of the Army. CONARC was charged with the general direction, supervision, coordination, and inspection of all matters pertaining to the development of tactics, techniques, organization, doctrine, and materiel for use by the Army in the field. At the same time, it was responsible for the training and training inspection of the Army in the field within CONUS. On 1 January 1957, the command was redesignated as Headquarters, United States Continental Army Command. Moenk, Command and Control, pp. 35-36.

7 CONARC Summary of Major Events and Problems, FY 55, Vol. VI, G-3 Sec Tng Div, Jan - Jun 55, p. 15.
Despite the failure of the original Army Aviation Plan to gain approval, the Army Aviation Division of G-3 still strongly believed that a document was required which would outline official guidance for the development of the Army aviation program. On 17 September 1955, therefore, the Department of the Army forwarded to CONARC for comments a draft plan for Army aviation for fiscal years 1956 to 1960. The plan outlined seven primary functions of Army aviation and discussed required aircraft, personnel, training, installations, and research and development programs. In comments submitted on 11 October, CONARC nonconcurred with the Army assumption of a function of close air support within the time frame of the plan and recommended that a requirement for optimum close support aircraft be placed on the Air Force.

After seeing the revised Army Aviation Plan, General Dahlquist on 30 December again voiced strong objections to the Department of the Army G-3 about Army plans for procuring and testing currently available aircraft in the close support role. He pointed out that CONARC's comments on Project ABLE BUSTER, submitted earlier that month, had also included this recommendation. General Dahlquist stated that he was not aware of any reductions which could be made in the field army as the result of adding organic light attack aircraft to perform the close support role. If the Army were to assume this new function, it should first determine the most advanced weapon system it could attain by the early part of the 1960-1970 decade and then concentrate on the development of an optimum weapon system which would meet the requirements of warfare during that period. He charged that the plan overlooked the urgent necessity of placing a firm requirement on the Air Force for the development of an optimum close support aircraft. General Dahlquist therefore recommended again that this requirement be placed on the Air Force while the Army simultaneously initiated a comprehensive study of weapons systems, which might include aircraft, to undertake the missions being performed by close support aircraft. He did not consider that the procurement and testing of currently available light aircraft and munitions would contribute toward that goal.

Because controversy continued regarding various aspects of the Army Aviation Plan, the Department of the Army convened a conference

---

8 For a discussion of Project ABLE BUSTER, see below, Ch. IV, pp. 87 – 89.

in Washington on 24 January 1956 to settle on the recommendations to be made to the Chief of Staff of the Army. Attending the conference were General Dahlquist, Lt. Gen. Willard G. Wyman, the CONARC Deputy Commanding General who was to succeed General Dahlquist in March, and, from the Department of the Army, the DCSPER, DCSLOG, DCSOPS, Director of Army Aviation, and the Director of Development and Chief of Aircraft and Electronics from the Office of the Chief of Research and Development. The purpose of the conference was to agree on a position for the Army's requirement for direct support aviation, National Guard and Army Reserve aviation units, the need for a heavy helicopter, and the requirement for a fixed wing cargo aircraft of greater than 5,000 pounds empty weight.

The conferees agreed that the Army should proceed without delay in the development of aircraft to control the trajectory of ground launched missiles against point targets. They recommended that the Army request the Air Force to develop an aircraft specifically designed for the close support mission. The Army would participate in all phases of the development, but use Air Force funds. In combat, these aircraft were to be placed under the operational control of the Army. This recommendation was later modified by the Chief of Staff of the Army; he simply dispatched a memorandum to the Chief of Staff of the Air Force stating the Army's requirement for close air support and asking how the Air Force intended to meet that requirement. The Army Aviation Plan, as originally presented to the conference, had included a provision that unless the Air Force met the request for a close air support aircraft, the Army would sue for revision of support functions to allow it to assume responsibility for development of such aircraft. But neither the majority of the members of the conference nor the Army Chief of Staff was willing to go that far in this controversial area.

The conference recommended that the twenty-seven National Guard divisions be provided aircraft for their organic aviation. Army procurement was limited to a 40-division force, nineteen of which were Regular Army. The six National Guard divisions with the highest mobilization priority would receive 100 percent of authorization. Total aircraft for fifteen divisions would then be distributed among the remaining twenty-one National Guard divisions. No aircraft would be authorized to Army Reserve divisional units, and only such support units in the Army Reserve necessary for the support of the first forty divisions should receive organic aircraft. The conference also recommended that no pure aviation units should be activated in the National Guard. Separate aviation units should be activated in the Army Reserve, as necessary, to provide required support for the forty division force, but the level of equipment would be subject to the availability of funds.

The conferees concurred in the requirement contained in the plan for a heavy helicopter to provide an interior 5-ton lift and to
operate as a crane with a capacity of eleven tons for short hauls. They believed that successful development of the H-16 helicopter would meet both these requirements. The conference also supported the requirement for a fixed wing cargo aircraft of greater than 5,000 pounds empty weight. This support was based on the belief that this probably would be the largest fixed wing aircraft capable of operation in forward areas and that it would be an economical and essential complement to the helicopter for troop movement and logistical support within the combat zone.

Maj. Gen. Hamilton H. Howze, who had become the first Director of Army Aviation on 1 January 1956, presented the recommendations of the conference to General Maxwell D. Taylor, the Chief of Staff of the Army, later the same day. The latter approved all of the recommendations on 5 March, with the exception noted above regarding close air support. The Army Aviation Plan, FY 1956-1960, was then revised and approved for publication on 16 March.10

As a result of a presentation on the status of the Army Aviation Program made by the Director of Army Aviation to the Commanding General, CONARC, on 12 September 1956, six days later CONARC provided the Department of the Army with recommendations on the scope and content of the program. CONARC pointed out that many of the controversial aspects of the Army Aviation Program which were mentioned during the Director of Army Aviation's presentation possessed such far-reaching implications that CONARC could not furnish definitive answers to the problems without considerable study, testing, and detailed evaluation.

On 18 September, CONARC also furnished a summary of aircraft required in proposed TOE's for the ROCAD (armored), ROTAD (airborne), and ROCTD (infantry) divisions and for the experimental helicopter reconnaissance unit scheduled for testing in the SKY CAV II troop test during Exercise SLEDGE HAMMER.11 This summary indicated that 60 or 70 aircraft would be required to perform the normal missions of a division aviation company plus SKY CAV missions and about 26 aircraft would be required in SKY CAV type units.

11 For a description of SKY CAV and Exercise SLEDGE HAMMER, see below, Ch. V, pp. 118 - 19, 126 - 30.
CONARC still felt that the division commander had a continuing day-to-day need for the light cargo helicopters for tactical movements of small units, for SKY CAV roles, and for emergency resupply. CONARC also felt that the program for twelve aviation battalions should not be revised downward from a required lift point of view. CONARC advised that the program be reviewed in light of industry's ability to support it, the capacity of the training establishment and manpower resources to provide the qualified personnel to man the units, and also the advisability of transferring a portion of the program to the Reserve Components.

CONARC's position on maintenance within the twelve battalion program was that maintenance should be at battalion level rather than decentralized to companies. As regards the advisability of a part of the twelve helicopter battalion program being transferred to the Reserve Components, CONARC stated that this could be determined only after an exhaustive investigation of the sources of qualified Active Army personnel to man the units and provide maintenance. Other considerations were the availability of sufficient interested Reserve Component aviation personnel in the proper grades and ranks, and the ability of the Active Army training establishment to provide necessary training support.

Another matter which had been discussed at CONARC on 12 September was an aero reconnaissance concept, under which a special type unit equipped with Army aircraft would, in addition to the three principal elements found in a SKY CAV type unit, possess a fourth element equipped with helicopters armed for offensive operations. CONARC on 18 September pointed out that the aero reconnaissance concept differed from the SKY CAV concept in tactics and techniques. CONARC felt that a light cargo helicopter was needed to transport ground vehicles along with ground reconnaissance elements. In addition, the larger helicopter was of greater value than the utility helicopter in tactical movements of small units and in emergency resupply operations. The employment of armed helicopters offered interesting prospects worthy of further development and test.12

Late in 1956, the Army Aviation Directorate undertook the first revision of the Army Aviation Plan. The title was changed to "The Army Aviation Guidelines for the Development of Doctrine and Organization through FY 1961," which more accurately reflected the purpose.

---

and the contents of the document. In December, the Department of the Army forwarded the document to CONARC for comment and concurrence. While this plan was not to be considered inflexible, it was regarded as firm guidance to agencies and commands concerned with Army aviation matters, subject to annual revision.

On 8 January 1957, CONARC forwarded to the Department of the Army its views on the proposed document after consulting the CONUS armies, selected units, and certain of the combat arms service schools. One of the matters of major policy significance was whether the Army or the Air Force had primary interest in the conduct of battlefield surveillance in the combat zone. The draft document contained a definition of battlefield surveillance which indicated that, "The basic responsibility for aerial surveillance will be that of the Air Force," with the Army using its observation aircraft and surveillance helicopters to "thicken Air Force coverage over the immediate battle area."

CONARC's comments to the Department of the Army pointed out that the policy decision of the Secretary of Defense on 26 November 1956 had stated in part that, "The Army Aviation Program will consist of those types of aircraft required to carry out the following Army functions envisaged within the combat zone: ...Observation visual and photographic reconnaissance fire adjustment and topographical survey." In view of this Department of Defense policy statement, CONARC recommended to the Department of the Army that the definition of battlefield surveillance be amended to include the following: "The Army has a primary interest in the conduct of battlefield surveillance in the combat zone. Air Force tactical reconnaissance will assist the Army in this function. Aerial surveillance beyond the combat zone is the responsibility of the Air Force." The Department of the Army accepted this amendment, and the Chief of Staff approved the revised plan on 14 February 1957.13

Department of Defense Policies

Controversy regarding the interpretation of their aerial missions as they related directly to ground combat had existed between the Army and the Air Force ever since the National Security Act of 1947. Attempts had been made to clarify these missions with the Key West Agreement of 1948 and two memoranda of understanding signed by Secretary of the Army Frank Pace, Jr., and Secretary of

1)

the Air Force Thomas K. Finletter on 2 October 1951 and 4 November 1952. The latter memorandum placed a weight restriction on Army fixed wing aircraft of 5,000 pounds. This limitation was subject to review by the Secretary of Defense upon the request of either service secretary. The helicopter was defined solely in terms of performance of functions.

The air transportation of Army supplies, equipment, personnel, and small units within the combat zone became a primary rather than a limited or emergency function of Army aviation. The combat zone was redefined so as to extend normally from 50 to 100 miles in depth. Other primary functions included aerial observation; control of Army forces; command, liaison, and courier missions; and aerial wire laying within the combat zone. Two activities, not previously included, were added at this time -- artillery and topographic survey and aeromedical evacuation within the combat zone. Evacuation was to include battlefield pickup of casualties, air transport to the initial point of treatment, and any subsequent move to hospital facilities within the combat zone.

Primary functions of the Air Force in support of ground operations were restricted to the following: (1) airlift of Army supplies, equipment, personnel, and units from the outside to points within the combat zone; (2) airlift for the air movement of troops, supplies, and equipment in the assault and subsequent phases of airborne operations; (3) airlift for the evacuation of personnel and materiel from the combat zone; and (4) aeromedical evacuation of casualties to points outside the combat zone.\(^{14}\)

The reorganization of Army aviation and the initiation of a long range Army aviation program by General Ridgway led to growing concern on the part of the Air Force. General Nathan Twining, the Chief of Staff of the Air Force, charged that the proposed expansion of Army aviation could bring duplication and waste. This charge resulted from the proposal in the Army Aviation Plan to increase aircraft from 3,516 to 8,486 by 1959, while at the same time increasing personnel from 13,024 to 48,479. Another source of concern to the Air Force was the Army's interest in the jet T-37 reconnaissance airplane.

In January 1956, Secretary of the Army Wilber M. Brucker decided to request the removal of the 5,000 pound limit on fixed wing aircraft contained in the 1952 Memorandum of Understanding. General Taylor, Frank G. Millard, the Army General Counsel, and the Military

\(^{14}\) Weinert, Army Aviation, pp. 12, 24 - 26, 48 - 49.
Council all cautioned against making such a proposal because of the adverse impact it might have on the pending Joint Chiefs of Staff decision on the T-37 question.

Secretary Brucker waited until September before he broached the subject of removing the weight restriction to Secretary of Defense Charles E. Wilson. Negotiations between Brucker and Wilson continued through October and into November. Wilson indicated he might agree to an amendment of the weight restriction rather than its complete removal. Brucker then proposed a maximum payload radius capacity of 1,200 ton-miles to permit development of an airplane capable of operating from forward landing areas less than 600 feet in length and carrying a 4-ton cargo for a mission radius of 300 nautical miles. Secretary Wilson on 20 November, however, informed the Armed Forces Policy Council that he wanted to retain the weight restriction, but would consider making exceptions for specific aircraft. In response to this statement, Secretary Brucker asked for procurement authority for five new observation aircraft and five new 3-ton transports which exceeded the weight restriction. Secretary Wilson approved the transport procurement exception.

On 26 November 1956, Secretary Wilson issued a memorandum which attempted to clarify the previous service agreement and again defined the missions of the services. The Wilson memorandum retained the 5,000 pound limit on fixed wing aircraft and imposed a 20,000 pound weight limit on helicopters. Secretary Wilson did permit the Army to request specific exceptions to these limitations. A significant change made by the Defense secretary was the redefinition of the combat zone as an area not more than 100 miles forward of the general line of contact. The extension of the combat zone to the rear of the general line of contact was to be designated by the appropriate field commander, but normally would also be 100 miles. Within this 200 mile combat zone, it was proper for the Army to use organic aircraft.

In his attempt to define missions, Secretary Wilson forbade Army aircraft from strategic and tactical airlift during airborne operations, airlift and medical evacuation from points within the combat zone to points without, medical evacuation from an airhead where the airborne operation included air landed logistical support by the Air Force, tactical reconnaissance, interdiction of the battlefield, and close combat air support.

Despite the apparent restrictiveness of the 26 November memorandum, the door was left open for the continued expansion of Army aviation. The provision for exceptions to the weight limitations permitted the Army to develop larger aircraft. The memorandum did not limit the performance of Army aircraft in the combat zone, although the weight limitation did affect performances. The new definition of the combat zone gave Army aircraft twice the operational
distance than did the Pace-Finletter memorandum of 1952.\footnote{15}

On 18 March 1957, Department of Defense Directive 5160.22 was issued reaffirming the previous provisions of the Pace-Finletter agreement and the modifications made by Secretary Wilson. The directive reaffirmed the Air Force roles in strategic and tactical airlift, tactical reconnaissance, interdiction, and close air support. It also stipulated that there should be no unnecessary duplication or overlapping among the services, a proviso that would lead to continuing controversy.\footnote{16}

In October 1959, the Army tested the use of divisional combat reconnaissance companies equipped with armed helicopters. The decision prompted Air Force speculation that this might be the first move toward eventual Army assumption of the functions of battlefield interdiction and close combat air support. In the field of tactical surveillance, the Army had made considerable progress in the use of electronically equipped fast drones, to monitor enemy movements, acquire target information, and report on the results of missile firings. Another significant increase in battlefield surveillance had been made with the mounting of side-looking airborne radar on aircraft, which flew parallel to the area being scanned instead of traversing hostile territory.

Despite the limitations imposed by the Department of Defense, the Army intended to take full advantage of the air for travel, observation, and communication to ensure the success of the land battle. The Army asked private industry for assistance in developing some major technological improvements in aircraft design to tailor aircraft to the jobs they must perform instead of tailoring battle missions to the capabilities of existing aircraft.\footnote{17}

\footnote{15} (1) Draft ms., History of Army Aviation, Ch.VII, pp. 41 - 43, in CMH files. (2) DA DCSOPS Army Avn Dir Summary of Major Events and Problems, FY 57, pp. 1 - 2 (TOP SECRET -- Info used is UNCLASSIFIED).

Personnel Policies

All the planning and policy directives relative to Army aviation would be meaningless unless the necessary number of aviators could be obtained and given the career incentive to remain in the program. Army aviation had its own peculiar personnel problems. Since Army aviation was a specialty and not a branch, problems arose in providing an adequate number of pilots while ensuring proper career development and progression for aviators. The grade distribution of aviators also caused concern early in the period. The use of a greater number of warrant officer pilots and the training of senior officers as aviators helped to solve this problem. Despite difficulties, the Army during this period continued to develop a corps of highly trained and motivated pilots to meet the needs of the expanding program.

Review of Officer Grades for Army Aviators

An Army Aviation Officer Career Program had been formulated by the Department of the Army G-1 in 1950, but had been suspended the following year until the rapid Korean conflict personnel expansion was over. General Ridgway's directive in 1955 reorganizing Army aviation reinstituted this program. Studies made by the Department of the Army G-1 indicated that the existing grade spread for Army aviators was greatly at variance with the overall grade structure of the Army. The bulk of Army aviators by May 1955 were predominantly in the lower officer grades, only 4 percent being above the grade of major.

On 6 July 1955, G-3, Department of the Army, requested the assistance of CONARC in the solution of the problems with the grade structure of Army aviation officer personnel. Correction of this situation, G-3 pointed out, was necessary in the interest of developing an Army Aviation Officer Career Program which would attract and retain capable officers.

A related problem cited by G-3 resulted from the requirement for keeping a sufficient number of these officers assigned to higher command and staff positions in other types of activity, over and above the number actually needed to fill positions requiring rated aviators. This measure was necessary in order to keep officers from becoming overspecialized; it also ensured enough technically trained personnel for the expansion of Army aviation activities during mobilization. Under existing TOE and TD grade authorizations, however, most Army aviators were in the grade of captain or lower, whereas many of the higher command and staff positions through which it was desirable to rotate these officers called for field grade officers.
As an "immediate and partial" solution to these problems, G-3 proposed three measures. First, the maintenance of authorized overages of Army aviation officers in the higher grades. Second, a review of current TOE to determine whether the Army aviation grade authorizations were realistic and equitable. Third, a careful scrutiny of the experimental TOE being tested in the ATFA project to assure that the grade authorizations for Army aviation positions were commensurate with the duties and responsibilities of such positions. CONARC was requested to recommend the desired percentage of overage in each grade, and review the Army aviation space authorizations in current TOE's and recommend revisions where appropriate. They were also to carefully scrutinize the grade authorizations in the experimental TOE for suitability of the grades authorized.

CONARC concluded that it was undesirable to remedy defects of the grade structure by authorizing overages in certain grades. Authorization of grade overages for Army aviation officers would result in proportional reductions in other branches in order for the Army to stay within its overall officer grade ceilings. Moreover, the projected expansion of Army aviation would absorb some of the excess of company grade aviators and thus bring the grade distribution more nearly in line with the Armywide distribution. CONARC determined that the number of Army aviators authorized for the current year provided an adequate base for expansion during mobilization. The Army aviators authorized as of 1 September 1955 would be adequate to support an Army expansion of approximately four times its current strength.

CONARC replied to the Department of the Army on 1 September, suggesting that a better way to strengthen the Army aviation mobilization base would be to procure more aviators in the Reserve Components. The headquarters pointed out that, in the current National Guard troop basis, approximately 1,000 TOE spaces were authorized for aviators, but as of 1 June 1955, only 810, or 73 percent, of these spaces were filled. The current Army Reserve troop basis contained 2,821 aviator spaces, but as of 30 June 1955, only 1,018, or approximately 36 percent, were filled.

As requested by the Department of the Army, CONARC reviewed all current TOE which contained spaces for rated aviators. A study of the grade spread of aviation officers authorized in the type field army as compared to that of all officers in the type field army disclosed numerous inequities. Accordingly, CONARC recommended upgradings or downgradings of aviator spaces in twenty of the TOE's.

18 For a discussion of ATFA, see below, Ch. III, pp. 60 - 61.
Thus, in the case of the infantry division, which was authorized 1 lieutenant colonel, 5 captains, and 22 lieutenants, CONARC recommended that these 28 spaces be regraded to 1 lieutenant colonel, 1 major, 5 captains, 16 lieutenants, and 5 warrant officers. Because only 4.8 percent of the 919 commissioned officer spaces in the type field army were of field grade, CONARC recommended that this be raised to 5.6 percent.

The most sizeable reallocation of grades recommended by CONARC was the conversion of 42.6 percent of the rated aviator spaces in the type field army to warrant officers. This recommendation was based on a previous CONARC view that aviator duty positions requiring tactical or technical knowledge in addition to skill as a pilot should be filled by warrant officers. The analysis of aviator grade authorizations in the ATFA tables was held in abeyance pending completion of Exercises BLUE BOLT II and Exercise SAGE BRUSH.

As the result of CONARC's recommendations and its own studies, the Department of the Army G-1 instituted a new Army Aviation Officer Career Program. One solution to the problem of the shortage of senior aviator officers was the sending of senior and general officers to flight training prior to assignments involving aviation. By July 1959, there were eleven generals on flight status. The Chief of Transportation in 1954 had also proposed the use of warrant officer aviators and during 1955 applications began to be accepted from enlisted men throughout the Army for training at Fort Rucker as Warrant Officer Candidates.19

Recommendations for Warrant Officer Aviators

In addition to the 1954 recommendation of the Chief of Transportation, CONARC on 30 March 1955, forwarded to the Department of the Army results of a study concerning the desirability and feasibility of utilizing warrant officer and enlisted pilots (fixed wing) in lieu of officer pilots. The study included information regarding the number of TOE and TD positions in which warrant officer pilots could be used in lieu of officers; the number of warrant officer pilot spaces required during fiscal year 1956; the scope of OCS-type training deemed desirable for enlisted men taking flight training for duty as warrant officer pilots; the location; feasible starting date; and required input for such OCS-type training.

19 (1) CONARC Summary of Major Events and Problems, FY 56, Vol. II, G-3 Sec Org & Equip Div, Jul - Dec 55. (2) Draft ms., History of Army Aviation, Ch. VIII, pp. 7 - 9, in CMH Files. (3) Camp Rucker was redesignated 13 October 1955 as Fort Rucker and established as a permanent Department of the Army installation.
CONARC recommended that enlisted personnel not be used as pilots at that time and that warrant officer pilots be used in the combat arms and technical services where the requirement for command and leadership was not present. As regards requirements for warrant officer pilots, CONARC reported that of the 3,190 aviator spaces that would be required by the Army during fiscal year 1956, 1,227 could be filled by warrant officers and that, of these, 439 should be fixed wing qualified and 778 should be rotary wing qualified only. These figures were exclusive of Transportation Corps requirements, but included the three proposed fixed wing transport aviation companies.

CONARC also recommended that OCS-type training of ten weeks' duration be given at the Army Aviation School prior to flight training. Based on an overall attrition rate of 50 percent, CONARC recommended that the total input to this training be 3,054, but that it be phased over a 3-week period. CONARC estimated that six months lead time would be required for the Army Aviation School to initiate the proposed pre-flight or OCS-type training and that seventeen officers and fifty-four enlisted men would be required to conduct the training. CONARC's recommendations were accepted for the most part and training of warrant officer candidates began at Camp Wolters in November 1956.

Aviator Requirements

As a result of White House and Congressional interest in reducing the costs involved in proficiency flying, Department of Defense Directive 1340.4, Proficiency Flying Programs, was published on 29 May 1959. This directive required that the services institute a program to review and validate requirements for aviators to ensure that only those with a real potential were retained on flying status. Only the minimum flying essential for retention of aeronautical skill was permitted. As a corollary to this directive, AR 600-105, Army Aviation Officer Career Program, was republished on 21 August 1959. This regulation for the first time established four categories of assignment for Army aviators. Category I included positions where the primary duty was pilot, or the direct command of aircraft in a unit below battalion level. Command staff positions where flying was a prerequisite skill, but not required as the primary duty, were encompassed in Category II. Category III comprised career development assignments necessary to improve the aviator's qualification as an Army officer, provided such assignments did not exceed two consecutive years' duration. Finally, aviators assigned to primary duties other than those described above...
would be placed in Category IV and be indefinitely suspended from flying status for the period of such duties. If such duties extended for more than three years, the individual would be eliminated from the Army aviation program.21

An annual review and validation of requirements for aviators was required by the Department of Defense directive. To accomplish this review, the Deputy Chief of Staff for Personnel, Department of the Army, appointed an ad hoc committee to recommend FY 1961 requirements and authorizations for Army aviators, forecast in general terms the requirements for aviators through FY 1970, and generally review the career development of Army aviators. The committee developed criteria for determining Army aviator positions. It also queried the major field commands as to their requirements for aviators. The committee made an individual review of all field grade positions. Future requirements were computed on the basis of projected aircraft inventories and a continuation of existing organization and employments of Army aviation.

The ad hoc committee determined that the FY 1961 Army aviator authorizations be set at 6,449 — 5,299 officers and 1,150 warrant officers — and apportioned to the major commands by grade and branch as a ceiling under which assignments would be made. The committee also recommended that a small increase be made in training field grade officers, to include eight colonels, and that the Department of the Army DCSPER consider greater utilization of warrant officers. The existing 20 percent career management factor for officer aviators below the rank of colonel would be retained and branch qualifying assignments for officer aviators would be accorded the highest priorities.22

The rapid aviation expansion as a result of the Berlin Crisis negated many of the findings of the committee. The committee's deliberations, however, were a reflection of the Army's continuing efforts to come to grips with its long term aviator requirements.

Planning for Future Development

With the formal adoption of a helicopter weapons system, the successful development of the air cavalry troop, and the plans for

the proposed utility tactical transport company,\textsuperscript{23} the time had come to formulate a unified airmobile program. During 1960 and 1961, CONARC formed two committees and a board to study the future of Army aviation. The Rogers Board, officially designated as the Army Aircraft Requirements Review Board, met early in 1960 to study the Army's future needs for aircraft. This was followed by the Rogers Committee on Army Aviation which developed a training program to support Army aviation expansion. In 1961, the Ad Hoc Committee to Study Aircraft Armament Systems was convened.\textsuperscript{24}

Army Aircraft Requirements Review Board (Rogers Board)

On 15 January 1960, the Chief of Staff of the Army directed the establishment of the Army Aircraft Requirements Review Board. Chaired by Lt. Gen. Gordon B. Rogers,\textsuperscript{25} the board was directed to recommend as a matter of first priority the course of action to meet the requirements during the 1960 - 1970 time period for light observation aircraft and to explore the possible courses of action to improve the Army's capabilities in the areas of surveillance and tactical transport. The board was to recommend a priority for development to include the specific developments to be initiated with FY 1961 research, development, test, and experimentation funds. Finally, the board was to submit its best estimate of the Army's requirements during the 1960 - 1970 time period, supported by a proposed procurement program, to include cost and quantities by year, of current and future types of aircrafts.

Some steps already had been taken in the development of a long range aircraft program. In October 1959, the Chief of Research and Development had initiated a plan which would develop firm guidance for Army aviation for the period, 1960 - 1970. Army Study Requirements (ASR's) describing broad development objectives in the area of light observation, manned surveillance, and tactical transport aircraft were prepared and presented to industry on 1 December 1959. The latter submitted 119 design concepts as solutions to the problems presented by the ASR's.

Industry design concepts were evaluated during February 1960 in two phases. During Phase I -- 1 to 15 February -- a technical

\textsuperscript{23} See below, pp. 26 - 31, and Ch. V, pp. 117 - 19.

\textsuperscript{24} For the recommendations of the Ad Hoc Committee to Study Aircraft Armament Systems, see below, Ch. IV, pp. 110 - 15.

\textsuperscript{25} One of General Rogers' functions as Deputy Commanding General, CONARC, was to provide particular command supervision for matters pertaining to combat developments and materiel developments. Organization and Functions Manual, HQ CONARC, 1 Jan 59, p. 04.00.
evaluation was conducted under the direction of the Chief of Transportation. In Phase II -- 16 to 28 February -- an operational evaluation was conducted under the direction of the Chief of Research and Development. The Phase II operational evaluation teams prepared and presented their results to the Rogers Board.

After receiving general background orientation briefings, the Rogers Board received the reports of the three operational evaluation teams. Following each presentation, the members of the teams concerned and consultants from the National Aeronautics and Space Agency, Bureau of Weapons, Marine Corps, Transportation Corps, and Signal Corps were questioned by the board. The board's conclusions and recommendations were made against this background and submitted to the Department of the Army on 10 March 1960.

The Rogers Board recommended that a design competition be conducted to develop a light observation aircraft. More than one design should be selected and at least two be developed through flying prototype testing prior to selection of the final production design. The selected design would be procured in FY 1964 to meet the requirement for the light observation aircraft. Existing observation aircraft -- the L-19, H-13, and H-23 -- would be phased out and replaced by the new helicopters. Long range research efforts for the light observation aircraft mission should be continued toward improvement of helicopter performance, economy, and efficiency of operation in the field.

The board's recommendations regarding surveillance aircraft were dependent on the development of equipment and techniques. It recommended that increased effort be placed in FY 1961 on the development and testing of sensory devices for manned aircraft. Increased emphasis also was needed for the development of secure data link transmission systems capable of transmitting information gathered deep in hostile territory to ground stations with minimum time delay and loss of quality. Equipment and techniques for receiving, processing, and interpreting the data collected by airborne surveillance systems needed to be developed simultaneously and with the same priority as the surveillance systems. The requirement for an organization for processing and interpretation activities should be reviewed by CONARC. The board recommended that a study on survivability should be completed prior to 1 January 1961 for use in the preparation of the military characteristics of a new manned deep penetration surveillance aircraft. Subject to the outcome of studies on aircraft survivability and satisfactory assurance of the availability of suitable surveillance equipment, the Rogers Board recommended that a new manned deep penetration surveillance aircraft be developed beginning with FY 1962 funds, with the objective of providing operational aircraft not later than 1970.
The Rogers Board recommended establishing a policy of replacing each aircraft model at least every ten years, or sooner if warranted by operational requirements or state-of-the-air advances.

The board recommended that operational studies be made to determine specific requirements for Army airlift of supplies, equipment, and personnel within the combat zone to support contingency plans, with emphasis on the equipment of the Strategic Army Corps (STRAC) in specific operational areas. If these operational studies did not establish a high priority requirement for a larger than 3-ton aircraft, the board recommended that a program be established with the objective of providing a vertical/short take off and landing (V/STOL) replacement for the HC-1 helicopter and the AC-1 airplane, with initial production deliveries in the early 1970's. These two aircraft were just entering service in 1960 and, by the board's criteria, would be due for replacement in the 1970's. Research and study should continue to determine the technical and operational feasibility of V/STOL aircraft to meet future Army requirements.

The areas of study, research, and development listed below, in order of priority, were those required to support the board's conclusions and recommendations:

(1) Continuation of aircraft under development to include projects in direct support of these aircraft.

(2) Development of a new light observation aircraft.

(3) Studies and tests on aircraft survivability and operation of aircraft at low altitude and high speed to provide information required prior to initiating development of a manned surveillance deep penetration aircraft.

(4) Development and test of sensors, processing, and interpretation equipment, and avionics equipment.

(5) Studies on the requirements for airlift to support contingency plans.

Three of the six divisions that formed the Strategic Army Forces (STRAF) in CONUS were reduced in strength and lacked essential combat support; their main function was training recruits. The other three divisions formed the STRAC, a CONUS-based reserve maintained to meet immediate force development requirements of cold, limited, or general war. At this time it was composed of approximately 115,000 men in the Headquarters, XVIII Airborne Corps, and the 82d Airborne Division, 101st Airborne Division, and 4th Infantry Division. U.S. Army Expansion, 1961 - 62, OCMH, 1963, p. 22.
H-19 CHICKASAW Utility Helicopter
(6) Development of V/STOL research aircraft for technical and field evaluation.

(7) Study and tests on noise level and downwash problems.

(8) Long range research to improve helicopter performance.

(9) Research on propulsion systems.

(10) Research on ground effects machines.

The board developed a procurement program for the coming decade. The proposed light observation aircraft would be introduced as rapidly as practicable and, by FY 1970, would nearly meet active Army TOE requirements. The L-19, H-13, and H-23 aircraft were provided as interim substitutes until the higher performance aircraft became available to meet the needs of table of allowance (TA) and Reserve Component units. By about 1973, all requirements were expected to be met with the new aircraft.

The procurement program gave first priority support to the HU-1 utility helicopter. By 1970, all foreseen Active Army TOE requirements would be provided, in addition, to some TA. Orderly phase-out of L-20, H-19, H-21, and H-34 aircraft would take place through transfer to the TA and Reserve Forces Training Base as new aircraft became available. The HC-1 transport helicopter and the AC-1 transport airplane were to be introduced at a rate compatible with production capacity and to meet the requirements of planned TOE Active Army units by 1968 - 1969. Existing U-1A airplanes and H-37 helicopters would be phased out simultaneously into the training base or disposed of. The AO-1 surveillance aircraft would be bought at the most advantageous pace so as to achieve a reasonable Active Army TOE capability by 1965 - 1966. The quantitative requirement generated by this aircraft would be the subject of restudy by the staff.

The Rogers Board believed that by 1965 the current research and development effort would produce air-to-surface point and area weapons ready for installation in one or more tactical aircraft. The funds earmarked by the board were an estimate of those required to provide installation of these weapons on Army aircraft. A small fund was also earmarked for limited purchases of essentially commercial model aircraft for training and for augmentation of the L-23 fleet.

Funds also earmarked by the board in modest amounts late in the 1960's provided for initial procurement of a deep penetration surveillance aircraft, that would be a replacement for the AC-1 and the HC-1, and an aerial crane. The board could not predict the quality or the timing for these aircraft. The board's philosophy
in submitting these three items was to point out the major problem implicit in these areas. At the same time it wished to indicate the earliest time in which funding support must begin to provide a significant capability by about 1975.

Maj. Gen. Hamilton H. Howze, who was then serving as Chief, Military Advisory Group, Korea, submitted a memorandum to the Rogers Board which had far reaching implications. He pointed out that the latest studies had assigned combat units additional quantities of light aircraft. While substantial benefits would accrue from this, these assigned and attached aircraft would simply improve the ability of units to execute their conventional missions. The employment of aircraft would be restricted to those missions.

General Howze proposed that the Army proceed at once with the development of fighting units whose mode of tactical employment would take maximum advantage of the unique mobility and flexibility of light aircraft. These aircraft would provide not only mobility for some riflemen and machine gunners, but also direct fire support, artillery and missile fire adjustment, command, communications, security, reconnaissance, and supply benefits.

Missions which General Howze believed to be appropriate for assignment to these airborne -- which he called air cavalry -- units were: the seizure of critical terrain in advance of larger forces, delaying action and cover for the withdrawal of larger forces, raids, penetration of shallow enemy positions and the disruption of enemy rear areas, pursuit and exploitation, the protection of a long flank, and wide reconnaissance. He felt that new weapons developments would provide air cavalry units with destructive fire power. Air cavalry would be particularly appropriate in any battle area in which the threat of area weapons forced wide troop dispersion and in "brush fire" actions against relatively unsophisticated opponents.

To test the concept, General Howze recommended the formation of an experimental air cavalry unit in one of the airborne divisions. Assuming that the concept proved sound, he estimated that one air cavalry regiment consisting of about 175 utility helicopters and 85 light observation helicopters would be needed for each corps of 3 divisions. For the Active Army this would mean about 5 regiments totaling about 875 utility and 425 light observation helicopters. General Howze admitted that this concept would be costly, but considered this development a vital requirement in the evolution of a modern Army.

The Rogers Board found that the aircraft acquisition objectives it had developed for the HU-1 and light observation helicopters were compatible with the development of General Howze's concept. Sufficient aircraft could be found in the existing inventory to permit
activation of the proposed experimental unit. The board recommended that DCSOPS, Department of the Army, and CONARC be directed to study the feasibility of the concept of air fighting units and their armament. They also were to look into the desirability of activating an experimental unit to test the feasibility and develop materiel requirements.

The aircraft procurement figures developed by the Rogers Board provided part of the basis for the training program later proposed by the Rogers Committee. Of greater importance, however, was the influence of the Rogers Board on the Howze Board two years later.27

Rogers Committee on Army Aviation

Following the completion of the work of the Rogers Board on aircraft requirements, the next logical step was to develop a training plan. On 28 July 1960, General Bruce C. Clarke, the Commanding General, CONARC, directed General Rogers to chair a committee to study the training requirements to support the Army Aviation Program, 1960-1970, developed by the Rogers Board earlier in the year. The Rogers Committee convened at Fort Monroe on 15 August and, in conjunction with working groups, continued in session until 22 December. Information was compiled from trips, special questionnaires, working group meetings, discussions, and interviews with selected individuals.

General Clarke directed the committee to submit appropriate findings and recommendations in the following areas: (1) the degree to which Department of the Army approved operations and training programs for Army aviation were compatible with resources made available to CONARC; (2) the adequacy and suitability of Army aviation construction programs to meet current and projected training requirements; (3) the degree to which the current and projected training programs for Army aviation would provide the correct skills in the proper proportion to meet the requirements of the Department of the Army Aviation Program; and (4) the extent of Army aviation activities that could be consolidated, reduced, or eliminated without significant loss of operational effectiveness.28

27 (1) Ltr, Lt Gen Gordon B. Rogers to CofSA, 10 Mar 60, subj: Army Aircraft Requirements Review Board, w/19 incl. (2) CONARC Summary of Major Events and Problems, FY 60, Vol. V, Mat Dev Sec Army Avn & Abn Div, Jan - Jun 60, p. 6. (3) DA DCSOPS Summary of Major Events and Problems, FY 60, pp. C-1 - C-6 (TOP SECRET -- Info used is UNCLASSIFIED).

The committee submitted its final report on 22 December. It found that modifications to the current Army Aviation Training Program -- which had been published on 19 September 1958 as part of the Army Aviation Guidelines for the Development of Doctrine and Organization Through Fiscal Year 1963 -- were necessary in order to provide the correct skills in the proper proportions to meet the requirements of the Department of the Army Aviation Program. The approved FY 1961 operation and training programs for Army aviation were not compatible with the resources made available to CONARC. The Army's current and planned construction programs were not adequate to meet the needs of the Army Aviation Program.

Based on these conclusions, the committee made numerous recommendations. Among the sixteen which the Commanding General, CONARC, could implement were the initiation of helicopter gunnery training in the advanced tactics phase of the observation and utility/transport helicopter course and the revision of the current preflight training program for warrant officer candidates, to include combined arms tactical training similar to that presented in existing officer candidate courses. The committee also recommended that the CONARC commander revise the current applicable programs of instruction of the service schools to provide detailed instruction of officers in duties and responsibilities for exercising command and tactical employment of Army aviation units.

The committee recommended the establishment of the aviation program as a designed program of special interest under an activity monitor to ensure coordination and timely actions in programing and budgeting. Two recommendations related specifically to training facilities. Programing actions were needed to provide additional resources at Camp Wolters, Fort Rucker, Fort Benning, and Fort Stewart necessary for implementing the revised training program beginning in FY 1963. A satellite test activity of the Aviation Board should be established at Fort Benning, or another suitable site, to permit continuation of planned and future tests involving jet aircraft. The committee felt that plans should be developed for providing a long-range Army aviation training complex to support the quantitative and qualitative growth potential and mobilization requirements of the expanding program.

In addition to actions which the CONARC commander could take, the committee made twenty recommendations for consideration by the Department of the Army, most of which were related to personnel changes. The committee recommended the establishment of the enlisted, officer, and warrant officer aviator requirements as valid planning objectives for the period through FY 1970 and the modification of the current imposed aviator rated ceilings in order to be in consonance with the recommended personnel planning objective.
A major problem since the beginning of Army aviation had been the maintenance of adequate career development for officer aviators. The committee recommended that officer aviators spend at least one year out of every five on basic branch material assignments in order to maintain branch proficiency and that the policy apply to all officer aviators through the grade of major. Assignments for colonels and lieutenant colonels would be dictated by requirements determined by the career branch. The committee also recommended modification of the grade distribution for officer aviators to provide qualified individuals in the program for the optimum period of time in order to reduce replacement training costs. Warrant officer aviators should be assigned to those branches of the service that had a requirement for them, and regulations pertaining to the current warrant officer career program should be revised to provide for an adequate warrant officer aviator career field. The committee proposed modification of the criteria to permit substitution of warrant officer aviators for certain officer aviator positions in combat and support type units, and the subsequent modification of the TOE to reflect these conversions. Further, the committee recommended a review and adjustment of warrant officer utilization after experience had been obtained and performance and utilization factors analyzed.

Like the findings of the Rogers Board, many of the recommendations of the Rogers Committee on Army Aviation were soon overtaken by events or were modified by the Howze Board in 1962. Nevertheless, the work accomplished by the committee provided the foundation for the rapid expansion of aviation training which was to take place in the 1960's.29

The Berlin Crisis

The partial mobilization of Reserve Forces and the expansion of the Active Army in the fall of 1961 as a result of the crisis in Berlin created problems for Army aviation. Although plans were under development for an orderly long range expansion of the aviation program, the Berlin crisis required an immediate and unexpected expansion.

The Berlin crisis, which began to escalate in the summer of 1961, occurred at a most inopportune time for the Army. President John F. Kennedy, who had recently assumed office, directed a thorough

29 Ltr, Lt Gen Gordon B. Rogers to CG CONARC, 22 Dec 60, subj: Requirements for Training in Support of the Army Aviation Program, 1960-70, w/2 app.
reappraisal of strategic plans, force levels, and military programs with a view to determining their adequacy to fulfill commitments. He directed the Secretary of Defense to develop a force structure in harmony with United States military requirements. This structure was to be determined without regard to arbitrary or pre-determined budget ceilings. At about the same time, the Army began to take steps to reorganize its tactical division organization as a result of experience with the PENTOMIC organization. The ROAD division would have greatly increased aviation assets. Both the reappraisal of the force structure and the division reorganization would have a significant impact on the form and extent of the aviation program.

The Army build-up which resulted from the Berlin crisis mobilized 119,622 members of the Reserve Components and an increase of 86,481 in the Active Army. Included in the reserve mobilization was the 32d Infantry Division and the 49th Armored Division. Most of the increase in the Active Army went to bringing a 6-division STRAF force and the units in USAREUR to full strength. After considerable debate, the Department of Defense agreed to a permanent increase of two divisions in the force structure. This required the activation of the 5th Infantry Division and the 1st Armored Division in early 1962 so they could complete organization and training before the relief of the two National Guard divisions from active duty.

Problems were encountered in equipping the National Guard divisions, including a shortage of helicopters. The helicopter shortage also had a serious effect on several mobilized non-divisional units. One temporary solution was the redistribution of equipment from low priority units to those oriented to reenforcing Europe. For example, on 23 March 1962, the Department of the Army directed withdrawal of fifteen H-19 helicopters from Active Army units and the further redistribution of ten H-19 helicopters within CONARC to meet the training requirements of four Reserve medical air ambulance companies. The Department of the Army also diverted to those companies six new H-23D helicopters destined for the U.S. Army, Pacific (USARPAC).

An amendment to the FY 1962 budget permitted the Army to procure ten additional AO-1 surveillance aircraft and seventy-six H-23

---

30 For a discussion of the PENTOMIC and ROAD organization, see below, Ch. III, pp. 61 - 67, 70 - 76.
observation helicopters. These aircraft were scheduled for delivery by 30 June 1962.31

Aviator Shortages

The buildup of the Army during 1961, coupled with past and projected shortfalls is programmed inputs to the Army Aviation School, resulted in substantial shortages of aviators necessary to fill TOE/TD positions, worldwide. The Army's end FY 1961 aviator strength was 6,531 against a requirement of 7,149. This disparity was expected to increase in FY 1962 when the anticipated strength of aviators would be approximately 6,700 versus a requirement for 7,900. Included in aviator requirements, in addition to allowances for training, train- sients, and patients, was a 20 percent factor which represented those aviators on branch qualifying ground duty. The Army was faced with the problem of meeting flying requirements at the expense of branch tours or vice versa. Long lead time training made it difficult to overcome these difficulties on a short term basis.

This critical shortage of aviators was reflected in CONARC units. To alleviate this shortage, the Department of the Army reemphasized aviator recruiting and provided additional guidance pertaining to applications for aviation duty and effective use of current assets. Another step taken was the training of additional warrant officer aviators and the conversion of certain commissioned officer spaces to warrant officers. CONARC directed the CONUS army commanders personally to encourage qualified lieutenants and enlisted men to volunteer for aviation training. Until increased procurement could ease the situation, effective use of available assets supplemented by exceptions to permanent change of station restrictions to reassign aviators returned to aviator duty afforded some relief. These measures resulted in some improvement in the situation by the end of FY 1962, but increased requirements placed a constant drain on resources.32

Mobilization of Reserve Aviation Units

Eight major Army aviation units were called to active duty for a period of one year during the partial mobilization in the fall of 1961. These units were:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Mobilization Station</th>
</tr>
</thead>
<tbody>
<tr>
<td>32d Aviation Company, 32d Infantry Division</td>
<td>Fort Lewis</td>
</tr>
<tr>
<td>149th Aviation Company, 49th Armored Division</td>

</tr>
<tr>
<td>152d Medical Company (Air Amb)</td>
<td>Fort Ord</td>
</tr>
<tr>
<td>317th Medical Company (Air Amb)</td>
<td>Fort Sam Houston</td>
</tr>
</tbody>
</table>

The 136th Transportation Company and the 24th, 152d, and 317th Medical Companies were assigned to the STRAC. The 32d and 149th Aviation Companies, 1063d Transportation Company, and 132d Medical Company were assigned to an additional 2-division force consisting of the 32d Infantry Division and the 49th Armored Division.

All of the mobilized aviation units experienced much the same problems. These mainly involved administration, qualification of personnel, lack of training, and shortages of equipment. Much difficulty was experienced in updating personnel records and procuring adequate copies of Army regulations, other administrative publications, and training publications. Flight records were often not forwarded to active duty stations, particularly for filler personnel. Incorrect and incomplete processing of flight physicals for filler personnel resulted in long delays in receiving flight status orders. A number of Army Reserve aviators could not meet required medical standards.

A large number of enlisted men and some officers were assigned a duty MOS they were not capable of performing. Many primary MOS's had been awarded based only on two weeks of on-the-job training at a summer camp. A number of aviators who were former Navy or Air Force pilots had not attended the tactical flight training course.
at the Army Aviation School and did not qualify as Army aviators. Specific details as to service school requirements were not known in most units. As a result, in many cases quotas were available, but requirements were unknown to higher headquarters.

Preparation Overseas Replacement (POR) and Preparation Overseas Movement (POM) training had not been emphasized while in Reserve status. A delay in the regular training program resulted after the unit reported for active duty until such required training was complete. Few aviators in helicopter units were qualified in anything but the observation helicopter. Individuals generally were not qualified in their primary MOS. Delays were experienced in sending these people to school. In many cases, unit training was handicapped by the temporary loss of these men while in school. Shortages of equipment, including aircraft, excessively delayed training.

Existing critical shortages of aircraft and support equipment were exacerbated by the call-up. Although aircraft were redistributed within the Active Army and large numbers of observation helicopters were withdrawn from the National Guard, it was still impossible to attain full authorizations of aircraft. All aviation units attained a reasonable degree of training readiness despite equipment shortages.33

Deployments to Europe

By January 1962, more than 40,000 Active Army troops had been sent to Europe as part of the Berlin buildup. Included in these deployments were three Army aviation units, the 90th Transportation Company (Medium Helicopter) from Fort Knox, the 45th Medical Company (Air Ambulance) from Fort Bragg, and the 15th Medical Detachment (Helicopter Ambulance) from Fort Ord.

After lengthy high level discussion, the decision was made to preposition equipment in Europe for two additional divisions and ten nondivisional units rather than actually deploying the units. Full authorizations of H-34 and L-20 aircraft were prepositioned in USAREUR for the 4th Infantry Division and the 2d Armored Division. At the same time, efforts were made to modernize the equipment of the forces permanently stationed in Europe. Despite the serious shortages of aircraft in CONUS, quantities of HU-1 helicopters and

AO-1 airplanes were sent to Europe during this period.34

With the release of the mobilized Reserve Components units and individual in August 1962, the permanent strength of the Active Army was established at 960,000 men. For the force structure, this meant an increase of 90,000 men and two divisions. Except for the aviation units for the two new divisions, there was no immediate impact on the Army aviation program which had been developed before the mobilization. The experience gained during the mobilization, however, would be of use three years later when the rapid expansion for Vietnam began.

Southeast Asia Deployments

Even while attention was focused on Berlin and preparations to reenforce Europe, another major crisis was developing. Organized Communist guerrillas threatened to overthrow the government of the Republic of Vietnam. The United States developed countermeasures to meet this increased Communist threat and gave increasing support in equipment and advisor teams to the established government.

At the same time that the Berlin crisis was causing the deployment of aviation units to Europe, the deteriorating situation in Vietnam led to the deployment of six Army aviation units to Southeast Asia. These units were:

<table>

</table>

These units originally deployed on a temporary change of station basis, a status subsequently changed to permanent change of station.

In addition, the 33d Transportation Company (Light Helicopter) (H-21) at Fort Ord was alerted for movement to USARPAC on 15 March 1962, an order which was cancelled a week later.35

Accomplishments of the Period

The years from 1954 to 1962 proved to be crucial to the development of Army aviation. Although disputes regarding missions and functions continued with the Air Force, the decision of Secretary Wilson in fact gave the Army authority to form and equip the types of aviation units which suited its needs.

Of key importance was General Ridgway's order to formulate a coherent Army aviation plan. Though the plan encountered obstacles and appeared at various times under various guises, it provided for the first time an overall program for the development, expansion, and use of Army aviation. The program developed during this period was limited by the technical limitations of available aircraft. By 1960, however, greatly improved aircraft were becoming available which increased the capabilities of the Army's air arm. The recommendations of the Rogers Board and Rogers Committee pointed the way to an even more expanded aviation program in the following decade. Even though the Howze Board was to radically change the course of Army aviation, the findings of this board were based upon the foundation established by General Ridgway's aviation plan and the Rogers reports.

The formation and deployment of aviation units during the Berlin crisis and the first year of active United States involvement in Southeast Asia was on a limited scale. Nevertheless, the experience gained in these actions was to prove valuable in the following years during the dramatic expansion of Army aviation to meet requirements in Southeast Asia.

The planning and program development at the Department of Defense, Department of the Army, and CONARC would have been of limited practical value with the organization which existed in 1954. In the following chapter, the organizational changes at Department of the Army, Transportation Corps, and CONARC levels necessary to carry out the expanded Army aviation program will be examined. From the Department of the Army down to company level significant changes took place to reflect the new doctrine, equipment, and role of Army aviation.

35

Chapter III

ORGANIZATIONAL DEVELOPMENT

Since its beginning, organizational responsibility for Army aviation had been badly fragmented at all levels of command. With the rapid growth of Army aviation following the end of the Korean War, a better organizational structure emerged. The key element in this reorganization was the approval by the Chief of Staff of the Army in January 1955 of the establishment of an Aviation Division in the Department of the Army G-3 for overall staff supervision. The Director of Army Aviation in G-3 became the focal point of all Department of the Army actions relating to the program. Army aviator assignment authority was also centralized in the Department of the Army G-1.

At the CONARC level, most of the functions related to Army aviation were drawn together into an Army Aviation Section in the special staff in October 1956. The Army Aviation Center, including an aviation test board, was established at Fort Rucker in February 1955. Of vital importance to the growth of Army aviation was the assumption by the Army of depot maintenance and supply responsibilities and certain changes in procurement control procedures. ¹

A significant expansion of Transportation Corps activities in regard to Army aviation also took place. The assumption of depot responsibility from the Air Force led to the establishment by the Transportation Corps of an extensive aviation maintenance and supply system. Management of this system was centralized in the Transportation Supply and Maintenance Command at St. Louis. The Transportation Corps also had a number of other field agencies which were devoted to a varying degree to different aspects of aviation transportation.

The expanding tactical use of Army aviation was reflected in the organization of the combat field elements of the Army. As the Army division evolved from the triangular organization of World War II and Korea to the ATFA concept, the PENTOMIC divisions, and finally the ROAD divisions, the aviation component in the division structure steadily increased. In addition to the aviation expansion in division organizations, new separate Army aviation units were developed in response to equipment improvements and new concepts in the employment of aviation.

Organization Changes in the Department of the Army

The Army Aviation Branch, Organization and Training Division, in the Office of the Assistant Chief of Staff, G-3, had been established in the Department of the Army on 21 April 1954. Within the year, the expanded use of aviation, particularly in combat elements, greatly increased the size, scope, and complexity of G-3's responsibilities in relation to Army aviation. General Ridgway in January 1955, as a result of the comprehensive review of the aviation program, directed that Army aviation functions be consolidated in one element of the staff in order to give the program greater visibility and to provide firmer supervision.

As a result of General Ridgway's decision, on 1 February the Army Aviation Branch was discontinued and a separate Army Aviation Division was created in G-3. To indicate the importance of the program and of the Army Aviation Division, it was to be headed by a general officer. The division was established with an authorization of 11 officers, 1 warrant officer, and 5 civilians.

The general officer position was not immediately filled, and on 3 January 1956 the Army Aviation Division was expanded into a Directorate of Army Aviation. Maj. Gen. Hamilton H. Howze was appointed the first Director of Army Aviation. Although not an aviator himself at the time of his appointment, General Howze was to become the key figure in the growth of Army aviation during the next six years. The directorate originally had the same staff as the Army Aviation Division, but in March 1956 a manpower control survey authorized three additional military and two additional civilian spaces.2

In addition to the G-3, which became the Deputy Chief of Staff for Operations in 1956, several other elements of the Army staff were concerned with Army aviation. The Chief of Research and Development was directly responsible to the Chief of Staff of the Army for the overall supervision of all Army research and development programs. In this capacity, he assisted and coordinated the many activities of the Transportation Corps and CONARC related to the development of aircraft and equipment for the Army aviation program.

2 (1) DA ACoS G-3, Summary of Major Events and Problems, FY 55, p. 5, and Army Avn Div, p. 1. (2) DA DCSOPS Summary of Major Events and Problems, FY 56, Army Avn Dir, p. 1 (Both TOP SECRET -- Info used i. UNCLASSIFIED). (3) For additional information on the Army Aviation Plan, see above Ch. II.
The Assistant Chief of Staff, G-1, who became the Deputy Chief of Staff for Personnel in 1956, had responsibility for the assignment of aviation personnel. The expansion of the aviation personnel program posed problems which had to be resolved at a high staff level. The responsibilities of the Department of the Army G-1 included recruiting new personnel for the program, managing the careers of those in it, and screening records of officers of doubtful future value.\(^3\)

**Organization Changes in the Transportation Corps**

The Office of the Chief of Transportation had been reorganized early in 1953 when the Transportation Corps assumed logistical responsibility for Army aircraft from the Ordnance Corps. To direct the Transportation Corps' Army aviation activities, including staff and technical control of the field installations involved, an Air Transport Division, monitored by the Assistant Chief of Transportation for Operations, was established.

Because of the newness of the mission and the rapid growth of the program, Army aviation was temporarily excluded from the reorganization of the Transportation Corps in the fall of 1953. In view of the growing program, however, the position of Assistant Chief of Transportation (Army Aviation) was created in March 1954. He directed the activities of the Army Aviation Division (a redesignation of the Air Transport Service Division) and supervised the Transportation Corps Army aviation field installations. The Army Aviation Division consisted of the following components: Plans and Programs Office, Training Branch, Engineering and Development Branch, Procurement and Supply Branch, and Maintenance Branch.

To handle procurement and production, supply control, and maintenance functions of the program in the field, the Transportation Corps established the Transportation Corps Army Aviation Field Service Office (TCAAFSO). This field agency, located at St. Louis, began operations in January 1953.\(^4\)

---

When the Transportation Corps began planning in 1954 to assume the depot functions from the Air Force, one of its first considerations was the organizational realignment of materiel functions. The separate Army aviation structure had been regarded as a temporary expedient, and one which was fundamentally at variance with the basically functionalized organization of the Transportation Corps. Action to combine TCAAFSO with the Transportation Materiel Command -- which was only concerned with surface materiel -- and to consolidate materiel functions in the Office of the Chief of Transportation had been deferred pending the attainment of a greater degree of maturity in the aviation logistic support mission. Since two of the three planned transportation sections at the general depots would soon be handling air as well as surface items, the Transportation Corps deemed essential that the merger of the two field elements be accomplished prior to the scheduled initiation of the interservice transfer of responsibilities on 1 July 1955. Office space limitations and the pressure of time, however, made an immediate physical merger impossible. As an interim measure, a joint skeleton staff, drawn from both field commands, was formed to build and develop the new headquarters and to make detailed plans for the phased integration of the two commands. The Transportation Supply and Maintenance Command (TSMC) was established at St. Louis on 1 March 1955, and was placed in command of TCAAFSO and the Transportation Materiel Command. By 1 July, though the absorption of the commands was still in progress, TSMC had attained operational status.

At the same time, a focal point in the Office of the Chief of Transportation was established for the direction and guidance of the new field agency. In the spring and summer of 1955, responsibilities pertaining to procurement, production, and supply distribution of Transportation Corps air materiel were transferred from the Army Aviation Division to the Supply and Maintenance Division.

Experience after the assumption of depot responsibility pointed to defects in this organization. Along with other responsibilities relating to the Army aviation program, the Army Aviation Division continued to handle end item requirements determination, engineer change proposals, monitorship of aircraft utilization, and the computation of flying hour factors. Although there was some shifting of functions from the Army Aviation Division to materiel elements in the Office of the Chief of Transportation and TSMC, these problems were not fully resolved until late 1958. At that time, the Army

5 For additional information on the transfer of depot responsibilities, see below, Ch. VIII.
Aviation Division was discontinued, and its remaining materiel functions were turned over to the Supply and Maintenance Division. At the same time, the position of Assistant Chief of Transportation (Army Aviation) was discontinued and functions relating to training and military personnel were given to the Training and the Organization and Military Personnel Divisions. Remaining staff functions dealing with overall planning and coordination and systems analysis were brought directly under the Deputy Chief of Transportation for Aviation, a position which had been established in August 1958 to give direction to all phases of the Transportation Corps' Army aviation program.6

On 1 July 1959, the Transportation Corps underwent another reorganization. The position of Deputy Chief of Transportation for Aviation was retained to serve as the Chief of Transportation's principal assistant and advisor on Army aviation. The Deputy Chief of Transportation for Aviation continued to be responsible for the execution of approved plans and programs pertaining to all phases of the Transportation Corps Army aviation program. He evaluated overall policies and practices in the light of objectives and progress achieved, making changes in the best interest of the Chief of Transportation. To fulfill this responsibility, he coordinated Transportation Corps activities with the other Army agencies involved in Army aviation.

The Assistant Chief of Transportation (Military Operations) was responsible for development of concept and doctrine, preparation of plans, and supervision of the Transportation Corps portion of the Army Aviation Training Program, and also directed military personnel activities. Aviation activity constituted the major responsibility of the Assistant Chief of Transportation for Materiel. He was responsible for timely and adequate materiel support by the Transportation Corps; for staff and technical supervision over materiel, standardization, requirements, cataloging, procurement, production, supply distribution, storage and depot operations, maintenance, and disposal; and for industrial mobilization activities. The Transportation Supply and Maintenance Command was redesignated as the Transportation Materiel Command in October 1959 and actually performed this mission. The Assistant Chief of Transportation for Research and Development was responsible for the development and execution of the research and development program for all Army aviation.

Following the FY 1959 reorganization, the Chief of Transportation and the Assistant Chief of Transportation for Materiel investigated TSMC and provided suggestions for helping the command control its serious problems. These problems had also led to investigation by the Army Inspector General in March 1959 and the General Accounting Office in September. A Department of the Army DCSLOG team inspected the National Inventory Control Point in October and by the end of 1960, most of these problems had been solved or were well on the way to solution.

The major complaint about organization and management concerned the Procurement and Production Division of the Transportation Materiel Command which had divided its aircraft procurement staffs and lacked quality control and cost analysis offices. These defects were remedied. To shorten the commander's span of control, four deputy commanders were appointed, one to handle administration, another supply management, a third maintenance, and the fourth research, development, and testing. The investigators also noted the lack of maturity and skills among procurement and maintenance personnel, a problem which TSMC had begun to attack during FY 1958. About 500 jobs were reevaluated. An accelerated and intensive recruiting program, with schooling for about 125 individuals in various procurement and maintenance management courses, laid the basis for orderly progress. The publication of a handbook of principles for Transportation Corps commodity managers also helped.

These basic management improvements were essential for better supply effectiveness, procurement, and maintenance, but more important, they were mandatory to the assumption of further responsibilities in Army aviation support.

In addition to the Transportation Materiel Command, the Transportation Corps had several other field agencies devoted to Army aviation. The Transportation Research and Engineering Command at Fort Eustis contained an Aviation Division which conducted research and development related to Army aircraft. The command was subsequently redesignated the Transportation Research Command. The Transportation Army Aviation Coordinating Office at Wright-Patterson Air Force Base, Ohio, provided coordination for the Chief of Transportation and Transportation Corps agencies with certain agencies of the Air Force and the Navy. This office supervised the execution of the Army's research and development program performed for the Army by the Air Force, Navy, and Civil Aeronautics Administration. The Transportation Aircraft Test and Support Activity at Fort Rucker came under the control of the Transportation Materiel Command. Its primary mission was the conduct of phase F (logistical evaluation) tests of new types of aircraft. These tests were conducted to determine service life of components, inspection cycles, improve technical publications, and to develop quick change kits and modifications. The Transportation Training Command and Transportation School located at Fort Eustis were responsible for maintenance

training and training in other aspects of the Transportation Corps mission relating to aviation.\footnote{OCofT Summary of Major Events and Problems, FY 60, pp. 4, 59, 61. (2) "Responsibilities of the TC with Respect to Army Aviation," no date /FY 60/. pp. 1 - 5.}

The 1962 reorganization of the Army abolished the Office of the Chief of Transportation. Transportation Corps functions relating to training were transferred to CONARC, those relating to logistics were transferred to the United States Army Materiel Command, and those involving research and development were split between the United States Army Materiel Command and the United States Army Combat Developments Command.

Organization Changes in CONARC

Establishment of Army Aviation Section

The establishment of the Director of Army Aviation at the Department of the Army level in January 1956 had a direct impact on CONARC. A difference of opinion existed between CONARC and the Department of the Army as to the direction the Army aviation program should take.

On 28 May 1956, General Willard G. Wyman, the CONARC commander, wrote to General W. B. Palmer, The Vice Chief of Staff of the Army, regarding future functions and responsibilities of CONARC. General Howze had recently visited the headquarters to urge that the rapid expansion of Army aviation required a special degree of coordination at each level of command. He felt that the lack of an identifiable coordinating agency at CONARC was a missing link in the structure. While General Wyman did not agree completely with General Howze's views, he took the opportunity to suggest to General Palmer that if the G-3 Aviation Division continued in the operational and training fields it properly belonged at the CONARC level. General Wyman agreed that the procurement and distribution of aircraft, together with worldwide analysis of aircraft utilization, availability of aviation personnel, and correlated matters, belonged at the Department of the Army level. General Wyman believed, however, that action to relieve difficulties that arose in organization and training, establishment and review of training policies, and all other functions pertaining to Army aviation in the United States were CONARC's responsibility, except for broad supervision at the Department of the Army level. Instead of establishing a distinct aviation element in CONARC headquarters, General Wyman urged the transfer of the G-3
Aviation Division to CONARC. He informed General Palmer that this would require no increase in space allocations and might possibly lead to some reductions.

The Department of the Army did not favorably consider General Wyman's suggestion to transfer the Army Aviation Division to CONARC. General Palmer informed the CONARC commander that there were many aspects of the aviation program which would have to be handled by the Department of the Army, even if the division were transferred to CONARC. He recognized CONARC's responsibilities in the indicated areas and told Wyman to establish an Army aviation section at CONARC. But General Palmer made it clear that there would be no transfer of Department of the Army functions relating to Army aviation to CONARC.8

The Army Aviation Section of Headquarters, CONARC, was organized on 22 October 1956, consisting of the Training, Operation, Doctrine, and Organization Division; the Materiel, Maintenance, and Supply Division; and the Administrative and Analysis Division. The mission of the section was to advise the commanding general and the staff on matters pertaining to Army aviation activities; within established policies, direct and control courses, curricula, and instruction at Army aviation schools; review and revise existing organization, doctrine, tactics, and techniques; determine the state of training of individuals and units; determine and formulate requirements for product improvement of materiel; and assist appropriate staff sections in the direction, coordination, and inspection of Army aviation activities. The section had an authorized strength of 1 general officer, 2 colonels, 2 lieutenant colonels, 4 majors, 1 master sergeant, and 5 civilians. The general officer space was not filled and CONARC subsequently revised the authorized strength to 4 colonels, 2 lieutenant colonels, 3 majors, 1 warrant officer, and 5 civilians.

On 4 April 1957, Army Regulation 10-7 established new policies, functions, and activities for the organization and functions of CONARC. Basically, the new regulation covered the same aviation activities and functions as before. The scope of the aviation activities, however, was expanded to provide specifically for the direction, supervision, coordination, and inspection of all matters pertaining to organization and training of all Army aviation units and personnel within CONUS, except Army aviation activities directly

8

(1) Ltr, General W. G. Wyman to General W. B. Palmer, 28 May 56. (2) FONECON, Palmer and Wyman, 6 Jul 56.
assigned to the Chief of Transportation.  

Prior to the establishment of this section, responsibilities for aviation had been diffused throughout the headquarters. Although the various general and special staff sections retained the same functions and responsibilities for aviation as for other arms, services, and activities, the Army Aviation Section served as the focal point for this rapidly growing, complex, and many-sided field.

During 1961, the Army Aviation Section was reorganized and given a more detailed statement of missions and functions. The number of divisions in the section was increased to four: Program, Safety, and Airspace; Materiel, Facilities, and Armament; Training; and Organization, Plans, and Doctrine.

The mission of the Army Aviation Section was now stated in the following terms:

The Army Aviation Officer advises the Commanding General and the staff on Army Aviation and air space matters, provides staff supervision over Army Aviation operations throughout the Command and assists the general staff in actions involving Army Aviation activities and functions.

The Army Aviation Section was responsible for exercising direction, supervision, coordination, and inspection of all matters pertaining to the organization and training of Army aviation units and personnel within the continental United States, except for those Army aviation units and personnel directly associated with field and depot maintenance and supply and those aviation activities directly assigned to the Chief of Transportation. It recommended to the Deputy Chief of Staff for Operations, Plans, and Training appropriate aviation elements for operational, training, and other missions.

The section was responsible for the preparation, review, and revision of current and proposed organization, doctrine, tactics, techniques, and training literature for all Army aviation type units involving the employment of organic manned and unmanned aircraft. It directed and controlled the courses, curricula, and instruction at the Army Aviation School and CONARC aviation courses of instruction to include those operated under civilian contract.

---

10 Organization and Functions Manual, HQ, CONARC, 1 Jan 59, Change 21, 10 Oct 61.
The Army Aviation Section initiated and coordinated qualitative materiel requirements as well as requirements for product improvement for air support operations involving the employment of organic manned and unmanned aircraft. It prepared detailed comments and recommendations on feasibility studies; proposed military characteristics; items under development; plans for user (service and troop) tests; reports of user and engineering tests and classification of materiel as to type; and basis of issue. The section also prepared and supervised tactical troop tests and combined troop tests of units and equipment.

The Army Aviation Officer recommended to the Deputy Chief of Staff for Operations, Plans, and Training priorities for the allocation of critical items of equipment and allocation of equipment and aircraft for training of units and individuals of the Active Army, Reserve Components, and the ROTC. The section ensured that the organization and training program of Army aviation fixed wing and rotary wing transport units and organic aviation sections and units and the availability of equipment were coordinated.

The section established and implemented the CONARC Army Aviation Safety Program; reviewed accident investigation reports on aircraft under operational control of CONARC; and reviewed aircraft accident report analyses, determining adequacy of corrective action taken and recommending further action. It reviewed plans for the activation, organization, and stationing of Army aviation units and submitted comments and recommendations thereon to the Deputy Chief of Staff for Operations, Plans, and Training.

The growing Army interest in air traffic control was shown by the responsibility for directing, coordinating, and reviewing all matters pertaining to and affecting the establishment, utilization, retention, modification, and revocation of Army assigned airspace at all Army installations within the continental United States. The section also exercised direction, review, and revision of flight regulations for Army aircraft operations within the continental United States.

The Army Aviation Section assisted other staff elements in the preparation of personnel and MOS training requirements for training and mobilization; tables of distribution and allotment of personnel required to conduct instruction at schools and training commands; Army extension course programs and extension course material; policy governing attendance of personnel at schools, quotas, and prerequisites for attendance; new concepts of organization, doctrine, tactics, and techniques; mobilization and capabilities plans and primary programs; programs and procedures concerned with supply of units; training and maintenance directives and guidance to include Army training programs and Army training tests; policy, doctrine, and procedures affecting the Reserve Components and ROTC; and logistic actions incident to training or operation of aviation units or schools.

In coordination with the appropriate staff sections, the Army Aviation Section reviewed policies concerning the allocation and assignment of officers, warrant officers, and enlisted men of Army aviation; procedures pertaining to the flow of officers, warrant officers, and enlisted men into, through, and out of the Army aviation training system; instruction pertaining to Army aviation at other schools; Army aviation aspects of the CONARC Human Research and Operations Research Office activities; requests, requirements, and assignment of tasks placed upon the Army Aviation School and courses; and operational and training concepts and requirements to ensure that they were integrated into the systems management programs for Army aircraft. 11

Although the Army Aviation Section was the CONARC staff element mainly responsible for Army aviation, many other offices were involved with the program to a varying degree. The rapid changes in aviation equipment and organization intimately involved the Organization and Equipment Division and the Doctrine and Requirements Division of the G-3 Section, the General Division of the Combat Developments Section, and the Army Aviation and Airborne Division of the Materiel Developments Section. The G-2 Section and the Transportation Section also became involved in various Army aviation matters. The organization of Headquarters, CONARC, before the advent of the Army Aviation Section (1955) and at two later dates (1957 and 1959) is shown in Charts 1, 2, and 3.

1962 Reorganization

During 1962, a major reorganization of the Army took place which established the United States Army Materiel Command, placed the technical service schools -- including the Transportation School -- under the command of CONARC, and removed the combat development function from CONARC with the establishment of the United States Army Combat Developments Command. This organization of the Army was to remain unchanged until 1973.

The reorganization eliminated all special staff sections, including the Army Aviation Section, within Headquarters, CONARC. Aviation staff officers were decentralized throughout the headquarters, but there was an Aviation Division in the Office of the Deputy Chief of Staff for Unit Training and Readiness. The Aviation Division consisted of four branches: Training Branch, Plans and Operations Branch, Aviation Safety and Airspace Branch, and Equipment Requirements Branch. The functions of the division remained

---

11 Ibid.
much the same as in the old Army Aviation Section except for the removal of the responsibility for individual training to the Office of the Deputy Chief of Staff for Individual Training and doctrinal matters to the United States Army Combat Developments Command.12

Establishment of the Army Aviation Center

As a result of recommendations submitted by the Chief of Army Field Forces to the Department of the Army in the fall of 1954, an Army Aviation Center was established at Camp Rucker, the site of the Army Aviation School, during the latter half of fiscal year 1955. Establishment of this center was expected to aid materially in the successful conduct of operations of the Army Aviation School in support of the continuing expansion of Army aviation as an element of the Army's field forces.

While the Army Aviation Center was officially established, effective 1 February 1955, by Department of the Army General Orders 17, 2 March 1955, the mission and proposed elements of the center were not officially determined until near the end of the fiscal year. As recommended by CONARC on 18 March and approved by the Department of the Army on 12 April, the Army Aviation Center comprised the following major elements: Army Aviation Center Headquarters; Army Aviation School; school troops; and the Army Aviation Flight Safety Board.13

The U.S. Army Aviation Flight Safety Board, consisting of 2 officers, 1 enlisted man, and 2 civilians, had originated at Fort Sill, before the transfer of the school, as the Aircraft Accident Review Board. Until 24 September 1956, the mission for the organization, operation, and support of the Army Aviation Flight Safety Board was vested in the Army Aviation School. The establishment of the responsibility for prescribing and coordinating safe practice and safe operating standards applicable to flight operations of Army aircraft in the Office of the Director of Army Aviation, Department of the Army, resulted in a reevaluation of the mission of the Army Aviation Safety Board.

As a result of this reevaluation, and with the concurrence of CONARC, the board was reorganized and transferred to the Army Aviation Center, effective 24 September 1956. AR 15-76, 3 January 1957, announced the establishment of this board and the mission, composition, tasks, direction, and control and administrative responsibility for its operation. On 25 April 1957, the Army Aviation Safety Board was officially established as a Class II Activity at Fort Rucker under the jurisdiction of the Deputy Chief of Staff for Military Operations, Department of the Army, to conduct research and determine what improvements could be made in aviation materiel, operations, supervision, personnel, and training. Based on this research, the board recommended appropriate actions to enhance the durability, reliability, and efficiency of Army aviation, particularly in its combat environment. The board was authorized direct communications with any agency or individual on aircraft accidents, accident investigation, and accident prevention, to accomplish this mission. On 25 July 1957, the board was redesignated as the U.S. Army Board for Aviation Accident Research (USABAAR).

Aircraft Systems Management

On 28 February 1957, the Department of the Army proposed to CONARC the establishment of a coordinating board for new Army aircraft. So it was that during the second half of FY 1957, CONARC assisted the Department of the Army in laying groundwork for the establishment of a system under which all significant actions pertaining to a given type or model of Army aircraft -- from the time of introduction into the Army inventory until withdrawal as a result of obsolescence -- would be accomplished in accordance with a program developed well in advance of the time at which the various actions were to be taken.

The Department of the Army proposed that the introduction of specific aircraft should be accompanied by a board created to monitor all phases of the introduction of the item, from the time of issuance of development contracts through the cycle of procurement, distribution, and utilization in training and operations. CONARC concurred in the need for coordinating action within the Army to cover all phases of the introduction and utilization of new types of aircraft and allied equipment, but did not favor the creation of an individual board for each item.

14

Instead, CONARC recommended that a long range committee be established to draw up a phased program applicable to the development of aircraft and associated equipment and for the introduction of these items into the Army inventory. The timing of such a program would be based on backward planning from the date established for initial distribution of production items. The program would set the time such actions as funding, revision of TOE's, development of ground support equipment, changes in doctrine, and arrangement for factory training of mechanics and instructor personnel should be initiated and completed. CONARC also contemplated that the specific responsibility for each such action would be established and the program published as an Army regulation.

A conference, which included representatives from the principal Department of the Army general staff divisions, CONARC, and the Chief of Transportation, was held at DCSOPS, Department of the Army, on 27 March. The conferees determined that the guiding agency, at least for launching the program, should be the Army Aircraft Systems Coordinating Group, composed of representation from the Deputy Chiefs of Staff for Personnel and Logistics, Department of the Army, CONARC, and the Chief of Transportation, and chaired by a DCSOPS, Department of the Army, representative.

At the suggestion of CONARC, it was agreed that a draft Army regulation should be prepared to identify the types of actions which would be taken under an Aircraft Systems Management Program and to determine the proponency for and timing of the required actions. As a framework within which the Aircraft Systems Management Program would operate, it was decided that a master schedule for phasing out and replacing all current aircraft types should be prepared. The Chief of Transportation was given the tasks of preparing the draft regulation and the aircraft replacement schedule, with such assistance as he might require from other agencies. On 4 June, CONARC officially concurred in the establishment of the proposed Aircraft Systems Coordinating Group and designated a principal and an alternate member.15

Doctrine on Employment of Army Transport Aviation

On 9 July 1954, the Department of the Army requested OCAFF to prepare training literature for the employment of helicopter companies as tactical combat units. As an initial step toward meeting

the requirement for training literature which reflected concepts on
the employment of Army transport aviation. OCAFF/CONARC during fis-
cal year 1955 prepared a new training circular on this subject.
Published by the Department of the Army as TC 1-7, Employment of
Army Transport Aviation, on 29 March 1955, the new circular replaced
Department of the Army TC 19, 1940, Transport Helicopter Company
(Army) (T/O&F 55-17).

The new circular was based on the concept that the primary
function of Army transport aviation was combat support, with ser-
vice support as an additional function. In accomplishment of the
primary function, Army transport aviation units were to have the
specific mission of moving Army combat units operationally by air.
Heretofore, employment of Army transport aviation had been en-
visaged principally as having a service support role, including such
missions as delivery of supplies and replacement personnel and units
and aeromedical evacuation. While rotary wing aircraft, organized
in helicopter companies and battalions, constituted the existing
structure of Army transport aviation at the time of the circular's
preparation, it was contemplated that fixed wing transport airc-
raft companies and battalions would be incorporated into the
structure.

In support of the new doctrine contained in the circular,
CONARC in May 1955 announced a long-range plan for the preparation
of field manuals by various Army service schools. The Infantry
School would prepare, coordinate, and submit to CONARC the manu-
script for a new field manual in the 57-series entitled Army Trans-
port Aviation - Combat Operations. This manual would provide interim
guidance until such time as the subject matter was sufficiently firm
to be included in branch manuals.

The Command and General Staff College was directed to prepare
two publications. The first, a change to FM 100-5, Operations,
would provide the general concept of employment contained in both
TC 1-7 and the manual prepared by the Infantry School. The second,
a new field manual in the 100-series, would cover the employment of
Army transport aviation in logistical support of Army operations.
The Army Aviation School was responsible for a new field manual in
the 1-series covering the organization and operation of Army avia-
tion transport units. The Chief of Transportation was to prepare
a manual covering the organization and operation of maintenance and
supply units in support of Army aviation.16

Army Aviation in the New Division Organizations

The Army began the development of a new divisional organization immediately following the Korean War. Rapid advances in technology and the implications of tactical nuclear weapons required a more flexible organization than was possible with the triangular divisions which had been used in World War II and Korea. A primary consideration in the design of the new divisions was that any massing of troops or units during atomic operations would be disastrous. Units would have to be small, powerful, and self-sustaining. Success would depend on a high degree of mobility, rapid and efficient communications, and devastating fire power.17

ATFA and PENTANA

Only slight organizational changes had been made to the triangular divisions of World War II. In April 1954, at the direction of General Ridgway, a study began to improve the combat-to-service manpower ratio in the divisions and the ultimate reorganization of units. The problem was to develop organizational concepts which would permit formation of combat units with greater mobility and less vulnerability to atomic attack. The study which eventually emerged was known as the Atomic Field Army-1 1956 (ATFA-1). The ATFA study derived many of its concepts from the organization of the World War II armored division. The division structure envisioned in ATFA-1 was to be made of three independent tactical headquarters (combat commands) to which independent battalions and other organic divisional units could be attached or detached as required. Logistical support for the division would be provided by a Divisional Logistical, or Support, Command. At the same time as the ATFA study, the Operations Research Office of Johns Hopkins University proposed a radically new organization. This study recommended a break with the triangular tactical grouping by using a five-figured tactical structure. Five battalions would be grouped to form a combat command. The combat command would be solely a tactical headquarters. A corps would be formed of five combat commands, the division being eliminated.18

During FY 1955, a major portion of OCAFF/CONARC's effort was devoted to preparation of TOE's for new infantry and armored divisions and for the accompanying combat and service support units to make up the experimental field army called for by Project ATFA-I. The proposed infantry division was evaluated during Exercise FOLLOW ME and the armored division during Exercise BLUE BOLT.

The Operations Research Office study was one of many prepared under CONARC's direction that assisted in the preparation of the Pentagonal Atomic-Nonatomic Army (PENTANA) study. This study, begun by CONARC in September 1955, developed the organizational and doctrinal concepts for the field army in the decade, 1960 - 1970. The PENTANA study proposed a field army with the capability of conducting sustained operations with or without the use of nuclear weapons. The field army envisioned by PENTANA was to contain five corps and an army support command. Each of the corps was to contain five divisions and two tank brigades. The universal-type PENTANA division would contain five integrated combat groups, a general support artillery battalion, and other combat and service support units. Operations of the PENTANA army would be in greater depth and involve greater dispersion of units than before.

Aviation in the PENTOMIC Divisions

The PENTOMIC organization was derived from the PENTANA studies. General Maxwell D. Taylor, the Chief of Staff of the Army, apparently assumed that as long as the strategy of massive retaliation remained the national military policy any future war would be fought with nuclear weapons. He therefore saw that the Army would have to make an interim adjustment to the environment of the nuclear battlefield. To this end, the Army would have to create a single fixed standard division organization built around tactical nuclear weapons.

The new PENTOMIC organization was basically the same as that proposed in the PENTANA study. The 101st Airborne Division was the first unit organized under this concept. The program under which this reorganization took place was designated Reorganization of the Airborne Division (ROTAD). Field testing of the organization began in November 1956 when the 101st Airborne Division participated in Exercise JUMP LIGHT. Further testing of the PENTOMIC concept took place in the spring of 1957 with more than 20,000 troops from the 1st Infantry Division, 1st Armored Division, and 101st Airborne Division.

* When assigned to a field army.

Division, together with personnel from III Corps, XVIII Airborne Corps, 3d Infantry Division, and 82d Airborne Division participated in Exercise KING COLE in Louisiana.

Increases in combat infantry strength were achieved in the infantry battle group -- the PENTOMIC division's primary fighting element -- while reducing the size of the unit. This gave the ROCID (Reorganized Combat Infantry Division) a small, more self-sufficient combat unit, somewhat larger than a battalion. Through increased firepower, mobility, and communications, the PENTOMIC organization enabled the division to operate with greater dispersion among the five battle groups.21

During the Korean conflict, divisions had found it necessary to consolidate their separate aviation sections into provisional aviation companies. These provisional units provided adequate supervision and control of aircraft maintenance and supply, developed and implemented an effective integrated retraining program, and coordinated and controlled aircraft utilization. The division structure devised under Project ATFA-1 included many of the changes that had been battle tested in Korea and carried forward in the PENTANA study and the PENTOMIC organization. Army aviation elements were consolidated into company-size units at division, corps, and army levels. The introduction of the combat aviation company into each division increased the organic aircraft in an infantry division from 26 to 50, in an armored division from 28 to 50, and in an airborne division from 26 to 53.22 Army aviation in the type field army is shown in Table 1.

Advanced plans for the TOE's of Army aviation organizations for the revised type corps and field army were prepared by the Army Aviation School. CONARC reviewed these plans, established a command position, and submitted them to the Department of the Army G-3 for placement in final advance plan format and for submission to the Department of the Army for concept approval. The TOE's for the Fixed Wing Aviation Company (Light) were given priority because certain aviation units were scheduled for reorganization under these tables in the second quarter of FY 1958. The TOE's were published for the new PENTOMIC infantry, armored, and airborne division aviation companies during the second quarter of FY 1957.

21 Ibid., pp. 52 - 56.

Reorganization of the various divisional aviation companies under these TOE's was initiated in the third quarter of that year. Plans were completed during the year to provide additional personnel, equipment, and facilities required to support the reorganization. Minor revisions of the TOE's resulted from troop tests and field exercises. An example of the revisions was the consolidation of all aircraft into the ROTAD (airborne) division aviation company from the airborne division reconnaissance troop and consolidation of first and second echelon aircraft maintenance. These changes resulted in moving 18 additional aircraft and approximately 107 personnel into the airborne division aviation company.\(^{23}\)

The consolidation of Army aviation into company-sized units improved maintenance and logistical support. This reorganization permitted the attainment of a high degree of training and technical proficiency. Although it greatly improved the use of Army aviation, problems were soon evident with the new organization.

It did not always provide the immediate aviation support enjoyed previously by certain subordinate elements of the division. To a great extent this problem was aggravated by inadequate allocations of aviation support and excessive maintenance requirements. The need for continuous aviation support quickly outstripped the resources of the approximately fifty aircraft in the aviation company. Fresh studies indicated that divisions could fully utilize from 90 to 100 aircraft, and that at least 20 organic transport helicopters should be included in the total.\(^{24}\)

The following units containing Army aviation were included in the organizational structure of the field army under the PENTOMIC concept:

Army Aviation Company, Headquarters Field Army, provided the army headquarters and its elements with aerial observation, reconnaissance, transportation, and other aerial missions within its capabilities.

Signal Battalion, Army, had an organic aviation section within the headquarters and headquarters company.

\(^{24}\) Army Aviation Handbook, p. 4.
Aerial Reconnaissance Support Battalion had a signal air photo reproduction and delivery company which provided finished aerial photo materiel down to division levels.

Headquarters, Air Defense Artillery Brigade, had a small organic aviation section within the brigade headquarters which contained two reconnaissance helicopters and one observation airplane.

Air Defense Artillery Group contained an aviation section equipped with one observation airplane and one reconnaissance helicopter.

Artillery Battalion, 280-mm. Gun, had two observation airplanes within its organic aviation section.

Aviation Company, Armored Cavalry Regiment, increased the combat effectiveness of the regiment by providing the regiment and its elements with immediately responsive aviation support.

Sky Cavalry Squadron, U.S. Army Missile Command (Medium), performed reconnaissance through the use of a combination of ground and air reconnaissance elements over wide fronts and extended distances. The sky cavalry troop of the squadron also provided security by surveillance and by the air transport of the airborne reconnaissance platoon to critical areas.

Army Ambulance Company (Rotary Wing) had thirty-eight utility helicopters which were allocated and controlled by the field army surgeon to provide normal aeromedical evacuation support.

Army Aviation Operating Detachment provided flight information and planning data; coordinated day, night, and instrument flights; provided enroute navigational aids; provided air traffic control; and provided operations service for Army aviation units.

Headquarters and Headquarters Detachment, Aviation Group, provided command, control, staff planning, and administrative supervision to assigned or attached Army aviation units.

Headquarters and Headquarters Detachment, Transportation Transport Aircraft Battalion, provided command, control, staff planning, and administrative supervision for two to seven transport aircraft companies.

Aviation Fixed Wing Light Transport Company provided air transport to expedite tactical operations and logistical support in the combat area.
Transportation Company, Light Helicopter, and Transportation Company, Medium Helicopter, both provided air transport to expedite tactical operations and logistical support within the combat zone.

Corps Aviation Company provided corps headquarters and its elements with aerial observation, photography, reconnaissance, tactical transport, and other aerial missions within its capabilities.

Corps Artillery Aviation Company provided corps artillery units with immediately available and responsive aviation support.

Corps Signal Battalion contained a 2-aircraft aviation section.

The PENTOMIC division Army aviation organizations consisted of the following units:

Armored Division Aviation Company increased the combat effectiveness of the armored division by providing the division and its elements with immediately responsive Army aviation support.

Infantry Division Aviation Company increased the combat effectiveness of the infantry division and its elements with on call aviation support.

Airborne Division Aviation Company provided the airborne division and its elements with aerial observation, reconnaissance, resupply, and transportation.

Fixed Wing Light Transport Companies

A significant event in the development of Army transport aviation had been the development by OCAFF of a type transportation light aircraft company, and the activation of one of these companies by the Department of the Army.

Because of difficulties in the procurement of H-21 helicopters to equip transportation helicopter companies, and in light of the highly favorable comparison of the OTTER fixed wing aircraft on an initial cost, manhour maintenance, payload, operational radius, POL consumption, and general performance basis, OCAFF in July 1954 had recommended to the Department of the Army that the OTTER be adopted as substitute standard for the 1½-ton payload helicopter and that approximately 100 of these aircraft be procured to equip one battalion of transportation cargo aircraft companies (light) in

25

lieu of one programmed battalion of transportation helicopter companies (light).

The Department of the Army approved these recommendations on 30 September 1954 and directed OCAFF to prepare a TOE for a light cargo fixed wing company. The early activation of these fixed wing transport companies was approved at this time. To meet this requirement, CONARC prepared and forwarded to the Department of the Army on 19 March 1955 TOE 55-107, Transportation Light Airplane Company. This table, published on 15 April as TOE 1-107 (Tentative), Army Aviation Company (Fixed Wing - Tactical Transport), called for a unit equipped with twenty-one OTTER type aircraft. The Department of the Army on 5 May directed the activation of the first of these companies -- the 14th Aviation Company -- at Fort Riley. The second company was activated during FY 1956 and the final company in August 1956.26

The Department of the Army advised CONARC that only officer aviators would be assigned to the 14th Aviation Company since the fixed wing training program for warrant officers had not yet been approved. The Army Aviation Unit Training Command at Fort Riley was responsible for supervision of the activation and for unit training. The 14th Aviation Company received the OTTER aircraft, beginning in August.27

Medium Helicopter Aviation Company

During the fall of 1955, CONARC formulated a concept for an Army aviation medium helicopter company to be equipped with 6,000-pound payload twin-engine helicopters, forwarding in December the concept and a proposed TOE to the Department of the Army for review and concept approval. The proposed company was to be equipped with sixteen H-37 MOJAVE helicopters, delivery of which was expected to begin during February 1956. These aircraft were at that time the largest helicopters in production in the United States. CONARC considered that four of these companies, operating together, would have a capability of airlifting 192 tons -- the weight of the assault echelon of an infantry battalion. The internal organization of the company was to consist of a company headquarters,

27 CONARC Summary of Major Events and Problems, FY 55, Vol. VI, G-3 Sec Tng Div Sp Tng Br, pp. 16 - 17.
four flights of four aircraft each, and a maintenance element and twenty-eight pilots. Subject to Department of the Army concept approval. CONARC foresaw the activation of the first of these companies during calendar year 1956.28

Critical shortages of special tools and instructional equipment in FY 1958 delayed H-37 pilot and mechanic training courses. During April 1957, the Army Aviation School had requested supply action to provide special tools and equipment for the conduct of pilot and mechanic training for the H-37. Delivery of helicopters to the school began in January 1958, with concurrent delivery of special tools.

On 1 February 1958, the 4th Transportation Company (Medium Helicopter) became the first company to be equipped with the H-37. CONARC advised the Deputy Chief of Staff for Logistics, Department of the Army, that mechanic training could not be initiated without minimum quantities of special tools, the conversion of H-34 companies to H-37's could not be accomplished until trained mechanics were available, and that delivery of new production H-37's could not be accepted until trained operating and maintenance personnel were available at the receiving unit. The Chief of Transportation agreed to place new production helicopters in limited storage at a depot pending verification of the availability of tools necessary to initiate crew transition training and development of a balanced capability at receiving units to operate the aircraft.

On 8 April 1958, the Chief of Transportation indicated that tools critical to the initiation of crew transition training would be available at Fort Rucker by 30 April. Training courses were started at the Army Aviation School on 5 May, with four complete crews being graduated during the latter part of June. Conversion of the 54th Transportation Company at Fort Sill started on 1 July and a second company, the 64th at Fort Knox, converted late in the second quarter of FY 1959.29

Army Aviation in the ROAD Organization

The PENTOMIC structure had never been intended as more than an interim solution to the Army's organizational problems. Field

28

29
tests of the PENTOMIC organization continued after its adoption in 1956 and revealed significant weaknesses. A major problem was the marked imbalance between the PENTOMIC division's nuclear and non-nuclear capabilities. In the PENTOMIC division, tactical nuclear weapons had become the mainstay of the ground forces.

Experience had shown the PENTOMIC divisions to be relatively inflexible, fixed organizations. They had only a single echelon between the division commander and the company commander, giving the division commander a span of control that included sixteen units. Field tests had shown that this span of control was much too large.30

Development of the ROAD Concept

During 1959, CONARC prepared an organization study entitled the Modern Mobile Army 1965 - 70 (MOMAR I). The purpose of the study was to supply a common, unifying long-range objective to focus Armywide efforts aimed at modernization of equipment, organization, doctrine, techniques, and procedures. The MOMAR I study was published in February 1960.

The MOMAR I study assumed that limited, rather than general, war was the most likely. Such a war would be characterized by limited objectives, restricted geographical areas of combat, restrictions upon types of weapons employed, limitations upon the forces participating, and restrictions on the phasing and timing of operations. The forces employed by the Army would require a capability to employ both conventional and special weapons in a graduated and selective mix best suited to the immediate situation.

The MOMAR I division would be composed of five combined arms combat commands, each capable of semi-independent operations. The division could be tailored to fit particular environmental or mission requirements by the attachment or detachment of combat commands in any combination. The MOMAR I field army would also have air transportable combat brigades for rapid reaction in cold or limited war situations. These brigades would be multi-capable, fighting organizations which could be transported by a minimum of strategic aircraft to any point in a matter of hours or a few days. There would also be fire support brigades composed of air-transportable composite fire support units, designed to provide multi-capability (nuclear, chemical, biological, and conventional) and multi-purpose

support for local indigenous forces.31

By the end of 1960, the Army had decided that the MOMAR I organization lacked the necessary flexibility to meet the Army's needs. Drawing heavily upon MOMAR I, CONARC published in September 1960 a new study -- Field Army-75 (FA-75). This study extended the field army portion of MOMAR I into the 1970 - 1975 time frame. In FA-75, a universal type division would have to have sufficient flexibility to enable it to be tailored readily to the requirements of the traditional infantry, armor, or airborne roles under a wide range of strategic and tactical conditions. FA-75 assumed that two-thirds or more of the units attached to a division would form a nucleus which would remain relatively stable, while additional units would be added or removed as required for specific conditions.32

The decision during the spring of 1961 to shift emphasis within the Department of Defense from nuclear to nonnuclear warfare led to the abandonment of the PENTOMIC organization. CONARC had been directed in December 1960 to undertake yet another study to develop an optimum infantry, mechanized, armored vision organization -- this time for the period 1961 - 1965. The new study -- Reorganization Objective Army Division (ROAD) 1965 -- was submitted by CONARC to the Department of the Army on 1 March 1961 and approved by General George H. Decker, the Army Chief of Staff, a month later. Shortly thereafter Secretary of the Army Elvis J. Stahr, Jr., recommended the abandonment of the PENTOMIC organization and adoption of the new concept. Following approval by the President, the conversion from PENTOMIC to ROAD began in early 1962.

The ROAD division had three brigades and each brigade could control from two to five maneuver battalions. An integral aspect of the ROAD division was its high degree of flexibility, achieved by rapid tailoring of the number and type of combat units. The division base contained the elements required by all divisions, regardless of type. It had the command and control elements, including the three brigade headquarters, the division artillery, and the division support command, composed of administrative and service support units. Divisions of various types were formed by combining varying mixes and numbers of combat maneuver battalions -- infantry, airborne infantry, mechanized infantry, and armor -- with the division base.33

32 Ibid., pp. 63 - 68.

CHART 4 -- AVIATION IN THE ROAD DIVISION

Basic Concept for Assignment of Aircraft

As depicted in the DOD's, each ROAD division contained 103 organic aircraft, approximately twice the number in the PENTOMIC division organization. Forty-five of these aircraft were in the division aviation battalion, which replaced the company-size unit found in the PENTOMIC divisions, 25 were in an airmobile company, and 20 were in a general support company. The remaining 58 aircraft were allocated as follows: 18 in the brigade headquarters and headquarters companies (6 in each); 27 in the air cavalry troop of the reconnaissance squadron; 12 in the division artillery headquarters and headquarters battery; and 1 in the aircraft maintenance company of the maintenance battalion.

Aircraft in the ROAD divisions were centralized in the aviation battalion when their utilization elsewhere in the division was not full-time. Aircraft assigned to units other than the aviation battalion were assigned on the basis that full-time support of the unit was required. This arrangement did not preclude temporary attachment of aircraft between organizations as dictated by operational requirements. Distribution of aviation assets in the ROAD division is shown in Chart 4.

The Army Aviation Battalion

The mission of the division Army Aviation Battalion was to provide aviation support for division headquarters, division support command, and other divisional units which did not have organic aircraft. The battalion staff supplemented the division aviation special staff section. The forty-five aircraft in the battalion were available for surveillance, logistical support, command, liaison, and the support of small airmobile operations. The battalion also operated the division surveillance drone system, as directed by the division intelligence officer. The battalion included a headquarters and headquarters company, an airmobile company, and an aviation general support company. A total of 51 officers, 26 warrant officers, and 373 enlisted men made up the battalion.

The aviation battalion in airborne divisions differed slightly in organization from the others in that a flight operations center was provided for operations outside of the field army or corps air traffic system. Moreover, the airborne battalion did not contain a drone section. The battalion staff had an additional major who was the assistant division aviation officer.

The headquarters and headquarters company was composed of 13 officers, 1 warrant officer, and 62 enlisted men. The company included a battalion headquarters, company headquarters, and communications, maintenance, and medical sections.
The aviation general support company, commanded by a major, had 26 officers, 6 warrant officers, and 125 enlisted men. The company was composed of a general support, an aerial surveillance, and a service platoon. The general support platoon had a tactical support section with ten light observation helicopters and a utility section with six HU-1B's. In the aerial surveillance platoon, the aerial radar section had two AO-1's, the aerial infrared section two AO-1's, and the drone section contained twelve drones. The service platoon provided maintenance for aircraft, drones, and communications, as well as airfield service.

The mission of the aviation general support company was to provide support for the division headquarters, support command, and other divisional units without organic aircraft. In addition, the company provided medium range aerial surveillance to acquire combat intelligence and target information and limited general support and reinforcement to units with organic aircraft. The company had the capability of aerial observation, reconnaissance, and surveillance of enemy areas for the purpose of locating, verifying, and evaluating targets, studying terrain, and adjusting fire. It could provide rapid spot aerial photography consisting of daylight vertical and oblique photography and night vertical photography from piloted and drone aircraft, radar and infrared surveillance, and radiological survey. The company had the capability for command control, liaison, reconnaissance, and augmentation of aeromedical evacuation from the immediate battlefield.

Commanded by a major, the airmobile company contained 13 officers, 19 warrant officers, and 86 enlisted men. Its components were company headquarters, three airlift platoons, and a service platoon. The company's twenty-four HU-1's were in the airlift platoons, while the one HU-1 in the service platoon was primarily for emergency transport of critical parts and maintenance personnel. Each of the airlift platoons was subdivided into two airlift sections of four aircraft each for more effective control.

The airmobile company provided tactical air movement for combat troops in airmobile operations and of combat supplies and equipment within the division area. The company provided supplemental fire support to maneuver elements of the division. It had a continuous operations capability during visual weather conditions and limited operations during instrument weather conditions. It furnished airlift, in a single lift, for one infantry company or one dismounted mechanized infantry company. The airmobile company also was capable of aerial fire support, utilizing organic detachable weapons, and it could augment aeromedical evacuation.34

---

Aviation in Separate Brigades

Since the divisional brigades were not designed for permanent independent operations, separate brigades were developed to fill the need for brigade-sized forces. The same organizational concept for aircraft used in the division was applied in the development of the separate brigades. Fifty-five aircraft were organic to each infantry, armored, and mechanized brigade, twenty-seven of which were in the brigade aviation company. The air cavalry troop of the reconnaissance squadron had twenty-seven aircraft, and the maintenance company of the brigade support battalion had one.\(^{35}\)

Army Organization for the Period 1965-1970

In June 1961, the Command and General Staff College submitted the preliminary report on CONARC combat development study requirement, "Army Organization for the Period 1965-1970 (RODAC-70)". In this study, which concentrated on corps and field army organization, all transport aviation units for the field army were assigned to an aviation group at field army. Surveillance aircraft and drones were organized in a company at corps and surveillance squadron at field army. An Army air traffic regulation and identification (AATRI) company was assigned to the field army air defense brigade.

Internal staffing of the report at CONARC resulted in several changes. One corps tactical aviation battalion was added, consisting of a headquarters and headquarters company, corps aviation company, and a surveillance airplane company. Also added was one corps airmobile battalion with its headquarters and headquarters company, airmobile company (HU-1), airmobile company (HC-1), and airmobile company (AC-1). These units were drawn from the field army aviation group to provide the corps with an organic airmobile capability. A corps artillery aviation company (battery) was assigned to the corps artillery. A tactical aviation battalion, consisting of the army aviation company, AATRI company, drone surveillance company, and surveillance airplane company, was assigned to the army headquarters. The aviation group, minus the units assigned to each corps, was placed in the field army support command (FASCOM).

The Vice Chief of Staff of the Army was briefed on the preliminary report, as changed, in July 1961. Although several modifications were directed at the completion of the briefing, the aviation organization was not affected. On 12 August, the Command

\(^{35}\) CONARC Summary of Major Events and Problems, FY 62, Vol. VI, Army Avn Sec, Jul - Dec 61, pp. 6 - 10.
and General Staff College received guidance for preparation of the final report on this study which it submitted to CONARC on 3 November.

Staffing at CONARC produced two additional changes to aviation organization. An airmobile battalion was withdrawn from the aviation airlift group in the FASCOM and assigned to the army headquarters. An aerial weapons company was placed in the tactical aviation battalion in each corps. This unit, in concept only, had been undergoing wargaming at CONARC and appeared worthy of consideration for this overall army organizational concept. CONARC forwarded this final study to the Department of the Army on 5 February 1962.

**Composite Aviation Battalion**

On 7 December 1961, the Department of the Army directed CONARC to develop specific tactics, procedures, and techniques for operations against irregular forces. CONARC was also to ascertain the augmentation in units and equipment required by a brigade of a ROAD division to conduct such operations. This augmentation, to include both divisional and non-divisional support requirements, was to address three levels: minimum brigade air mobility; complete brigade air mobility; and complete division air mobility.36

**Special Warfare Aviation Detachment**

A proposed organization, and plan of implementation, for an Army aviation unit to support counterinsurgency operations was submitted by CONARC to the Department of the Army on 28 November 1961. The concept was approved by the department on 31 January 1962 with certain modifications, including the substitution of HU-1B for H-34 helicopters. The Department of the Army did not look favorably on the inclusion of AO-1 MOHAWK surveillance aircraft, believing that necessary long range reconnaissance would be accomplished by the Air Force.

The Department of the Army forwarded to CONARC the approved advance plan for a Special Warfare Aviation Detachment, Light Aviation Special Support Operations (LASSO), on 27 February. This plan consisted of cellular organizations for performance and operation of specific missions, functions, activities, and equipment. A tentative TOE was prepared on a high priority basis and published by CONARC on 14 March.

---

This concept permitted flexibility in organization for requirements of varying conditions in connection with training teams and operational teams and provided a capability to operate as a unit with primary missions assigned to one or more teams composed of aerial reconnaissance, aerial assault, and airmobile elements. The flexibility of the organization permitted rapid organization of platoon teams specifically tailored to accomplish the mission assigned. When a mission did not require the entire unit, only those essential elements were committed.

The 22d Special Warfare Aviation Detachment was activated at Fort Bragg on 21 March 1962 and began training on 16 April. The detachment had an authorized strength of 19 officers, 80 warrant officers, and 123 enlisted men.37

Army Aviation Air Traffic Operations

Army Aviation Operating Detachments

In December 1956, CONARC recommended that implementation of an interim air traffic control system be completed in the field at the earliest possible date by activating Army aviation operating detachments (AAOD). On 17 January 1957, the Department of the Army recommended to CONARC that a proposed schedule of activation for AAOD's be submitted by CONARC for consideration for inclusion in the Strategic Reserve troop basis. The Department of the Army further recommended that, upon activation, the detachments be assigned to tactical units and undergo intensive training to enable them, within the limits of available equipment, to handle the traffic load expected to be imposed by combat.

On 1 February, CONARC recommended that two AAOD's be activated 1 September 1957 and assigned to Third Army and that two additional detachments be activated at the same time and assigned to Fourth Army. Consideration should also be given to activating four more AAOD's for assignment to the other CONUS armies. This program was subsequently modified so that CONARC on 18 March proposed activation of the first AAOD at Fort Benning on or about 1 September, with the second unit to be activated in the third quarter of fiscal year 1958 at Fort Bragg, with assignment to the XVIII Airborne Corps.

Activation for eventual overseas deployment of one AAOD in each quarter during fiscal years 1959 and 1960 until unit overseas requirements were satisfied was also suggested. The Department of the Army approved the proposed activation schedule and, at the request of Third Army, CONARC activated the first detachment at Fort Bragg and the second at Fort Benning.

The mission of the Army aviation operating detachment was to provide assistance to Army aviation elements in the combat and communications zones to enable these elements to operate at night and in adverse weather conditions. In accomplishing this function, the AAOD provided flight information and planning data; navigational facilities at major Army airfields; airfield lighting and instrument approach facilities at major airfields; air traffic coordination and control under all flight conditions; a means of integrating Army flight operations with existing air defense systems; airfield service at major Army airfields; weather services by means of an attached weather cell; warning and in-flight assistance for Army aircraft; and communications incident to the performance of the above functions. Normal assignment was one detachment per corps, army, and major Army airfield in the communications zone. These units were not self-sufficient and were attached to other units for administration, mess, and supply. The detachment was 25 percent mobile utilizing organic automotive transportation.

Each detachment had 4 officers, 2 warrant officers, and 26 enlisted men. The operating elements of the AAOD were the flight operations section, air traffic control team, approach control team, and airfield service section. An airfield augmentation team, added when handling a daily average of over 50 aircraft, provided services for up to 200 aircraft. The first detachments were organized under TOE 1-207C of 15 September 1957.38

The 6th Aviation Operating Detachment (Army), the first of the new units, was activated at Fort Bragg on 4 September 1957. In November, a revised TOE for AAOD's prepared by CONARC was approved and published by the Department of the Army as TOE 1-207D, 4 October 1957. The revised table provided additional communications and control equipment.

The Department of the Army and CONARC completed an inspection of the flight operations center (FOC) van and a mock-up of a portable control tower on 20 November 1957. At that time, CONARC took action to ensure delivery of the FOC van to the 6th Aviation

Operating Detachment and the U.S. Army Aviation Board at an early
date. The U.S. Army Signal Engineering Laboratories, Fort Monmouth,
N.J., in conjunction with a contractor, developed the portable control
tower. The first FOC van was delivered to the 6th Aviation Operating
Detachment on 1 December, and a second unit went to the U.S. Army Aviation Board at Fort Rucker on 30 December. Both would undergo a 2-month service test.

The 6th Aviation Operating Detachment began unit training under its Army Training Program on 19 December and began performing its support mission after completing its training test in May 1958. CONARC recommended to the Department of the Army that the activation of the second AAOD -- the 70th Aviation Operating Detachment (Army) -- take place at Fort Benning on 1 March 1958.

During the first half of fiscal year 1959, CONARC reviewed the results of a troop test of Army aviation air traffic operations. It was concluded that the detachment organized under TOE 1-207D was adequate to control the safe and orderly flow of traffic for a limited time only, that supplemental radio communication was necessary when aircraft were beyond range or radio line of site, that authorized equipment was not completely adequate, and that the air traffic control system was compatible with air defense at such times as they were functioning as a team.

To correct the deficiencies, CONARC proposed that a second AAOD van with an operating crew be provided as an alternate means of control during displacement. Procedures for aircraft radio relay of control instructions were incorporated in the Army Aviation Air Traffic Operating Manual. CONARC requested that the Chief Signal Officer correct deficiencies in the FOC van and recommend TOE revisions for generators.

Observations by CONARC during Exercise ROCKY SHOALS indicated that the 6th Aviation Operating Detachment was capable of controlling air traffic after landing on shore and that Army and Navy air traffic control systems were compatible.

Army organizational and operational air traffic regulation doctrine continued to develop. A study on the subject, covering

1959 to 1965, prepared jointly by the Army Aviation School and the Air Defence School and reviewed by other CONARC field agencies, was received in late December 1959. After review and modification, CONARC returned the study to the Army Aviation School on 14 June 1960 for the development of an advanced plan TOE.

The conclusions of this study were that the existing organization, concepts, and procedures for Army air traffic control were inadequate. Undesirable restrictions on air defense reaction time and Army aviation freedom of action were inherent in the existing system and both procedures and organization were inadequate for high traffic densities. The study recommended that an Army air traffic regulation and identification (AATR&I) group be organized at field army level and that the Signal Corps be responsible for the activation, training, and operation of the AATR&I system.

Modification to this study, made by CONARC, included reducing the AATR&I group to an AATR&I company and designating responsibility for the system to Army aviation instead of the Signal Corps. The reduction in the size of the AATR&I unit was made to save men and to retain air traffic control of airfields and ground control approach radar responsibility within the subordinate units. This action was in consonance with the principle of maximum freedom of utilization of Army aviation by subordinate units and maximum responsiveness to the ground commander. Assignment of responsibility for the AATR&I system to Army aviation was based on the mission of the system which was to regulate the flight of aircraft -- a function of Army aviation.41

The AATR&I company was to replace the existing TOE 1-207D Army aviation operating detachment, which required revision for greater efficiency. The AATR&I company TOE advance plan was staffed at CONARC during the first half of fiscal year 1961 prior to submission to the Department of the Army for advance plan approval.42

Use of Restricted Airspace

The Federal Aviation Act of 1958 authorized and directed the Administrator, Federal Aviation Administration (FAA), to develop plans and formulate policy with reference to the navigable airspace and to assign by rule the terms, conditions, and limitations

necessary for the safe use of the airspace. Accordingly, the FAA Administrator notified all agencies of his intention to assume the airspace responsibility. He recommended abolition of the Airspace Division of the Air Coordinating Committee. This resulted in discontinuance of Army representation on the Regional Subcommittees, the pertinent portions of AR 15-95 no longer being applicable. Procedures for airspace assignment and utilization were to be accomplished in accordance with FAA regulations.

The Department of the Army requested comments from CONARC on a proposal to provide full-time assignment of qualified field grade Army aviators as Army liaison officers to the FAA Regional Offices and designation of a qualified officer from each CONUS army headquarters to serve as the army commander's representative, on a part-time basis, in coordinating airspace and air traffic control matters of direct interest to the field army. This action was eventually initiated.

Authorization was given for an increase of one officer space to establish a Army liaison officer from CONARC with the FAA Regional Offices at New York, Fort Worth, Kansas City, and Los Angeles. These officers were assigned to the CONUS armies in which the regional offices were located. Each CONUS army and the U.S. Army, Caribbean, continued to retain a qualified officer on the army staff to coordinate airspace and air traffic control matters within the army area. Since CONARC had an overall interest in airspace allocation and utilization, it was kept informed of all negotiations.43

The FAA took numerous actions pertaining to modification and revocation of special use airspace designated used by Army agencies. The FAA in many cases initiated action as the result of Army reports on utilization of airspace. Because it was clear that the FAA would continue aggressive action to reduce the amount of special use airspace, it became incumbent upon Army agencies to prepare and process airspace actions carefully to preclude loss of required special use airspace.

CONARC was represented at a meeting at the Department of the Army in March 1960 which was held for the purpose of discussing airspace problems and to provide guidance for handling airspace actions. The meeting was attended by representatives of all CONUS armies as well as U.S. Army, Alaska, and U.S. Army, Pacific. Verbal guidance

given at the meeting was the basis for handling the majority of air-
space actions due to the obsolescence of AR 15-95.  

To meet the new FAA requirements, ODCSOPS, Department of the
Army, with CONARC help, rewrote AR 15-95 to clarify and update
special use airspace responsibilities. This new regulation, pub-
lished in January 1961, clearly defined responsibilities, methods,
and time of reporting, and established airspace officers and airspace
officers and airspace liaison officers. It placed CONARC in the
reporting chain, charged it with the logistical support of the four
Department of the Army airspace representatives, and put most air-
space actions through the Army Aviation Sections in the CONUS army
headquarters.  

U.S. Army Tactical Air Navigation and Landing Aids System

During FY 1955, the Office of the Chief Signal Officer plan-
ted to test and evaluate the OCAFF proposed Tactical Air Navigation
and Landing Aids System as well as an air traffic control system
proposed by the Army Aviation School.

An interim system for air traffic control and navigation of
Army aircraft was approved by the Department of the Army and pub-
lished as Training Circular 1-8, 12 October 1955, Army Aviation
Operating Detachment. The same system was included in the ATFA type
field army organization and doctrine. A study of Army aviation
electronic equipment was initiated by CONARC for the period through
1965.

A report on the Army Aviation Electronics Program was completed
in draft form on 30 August 1956 and coordinated with CONARC and with
external agencies. This report was, in effect, an overall summary

83
of the Army aviation electronics program, including equipment and related optional concepts for the period through 1965.

On 21 December, CONARC recommended to the Department of the Army that the implementation of an interim Army air traffic control system be completed in the army in the field at the earliest possible date. This was to be done by the activation of additional Army aviation operating detachments utilizing the latest equipment on the basis of one per corps and field army, both in CONUS and overseas.48

The existing systems utilizing ground based non-directional radio beacons, marker beacons, terminal radar, and airborne automatic direction finders were known to be incompatible with advanced concepts of tactics. The long range CONARC concept envisioned air navigation independent of ground aids. Major elements of the proposed system were self-contained navigators, pictorial terrain and air navigation viewers, and absolute altimeters, which combined with a secure IFF system, would permit Army aircraft to navigate without reference to ground beacons, or air defense agencies. Qualitative materiel requirements were expressed and development was started on all items of the air traffic control, communication, and navigation system. Schedules indicated, however, that an operational capability could not be reached before 1965. The concern of the Commanding General, CONARC, over this situation was expressed on 29 April 1958 in a letter to Lt. Gen. Arthur Trudeau, the Chief of Research and Development, Department of the Army. General Trudeau replied on 19 May that increased funding and effort was being directed to the solution of these requirements and further indicated that the major problems were technical and required advances in the state-of-the-art for solution.

A series of joint CONARC/Department of the Army conferences on the expedited development program were scheduled. The first of these conferences was held at CONARC on 1 and 2 July 1957 to establish agreements with regard to specific equipment and the engineering and service test plans for this equipment. A second conference, on 6 and 7 January 1958, established separate working committees to study communication, combat surveillance, and avionics. The conclusions and recommendations of these committees formed the basis for the 1958 Research, Development, and Testing Program. A similar meeting was held at Fort Monroe, 5 - 6 August, to consider items of signal equipment which should be accorded expedited development procedures.

---

Common TA for Army Airfields

On 1 August 1955, the Department of the Army requested CONARC comments and recommendations relative to a study conducted by the Office of the Chief of Signal Officer to place Signal Corps equipment requirements for Army airfields in tables of allowances (TA) rather than to provide such support by the special projects system. CONARC on 27 August concurred in the concept, but stated that such TA's should include all equipment for Army airfields as well as Signal Corps items. The Department of the Army agreed with this position and requested that CONARC prepare a common type TA for CONUS Army airfields. CONARC requested the Army Aviation School on 6 October to prepare a draft of a proposed type TA in which all equipment requirements would be provided for Army airfields operating within CONUS. It was also recommended that a type table of distribution be submitted for each class of airfield authorized equipment by this table. CONARC felt that there was sufficient similarity of requirements by all CONUS airfields to permit their grouping in representative categories or classes, based upon the volume and type of operations. The Army Aviation School submitted the proposed TA on 21 March 1956 and CONARC forwarded it to the Department of the Army on 25 September.

Organizational Progress

Progress in the development of Army aviation was assured by organizational changes which took place at both staff and tactical levels. The establishment of the Directorate of Army Aviation in the Department of the Army and its counterpart, the Army Aviation Section, at CONARC were essential to manage the growing aviation assets and to plan for the future development of Army aviation. The increasing importance of organic aviation was recognized in the expanded number of aircraft in the PENTOMIC division which was to double with the conversion to the ROAD organization. At the same time, new aircraft and new doctrine for their employment dictated the formation of new types of aviation organizations. By the end of the period under review, Army aviation had become an integral part of the ground combat army.

At the same time that these organizational changes were taking place, the concept of airmobility was born and was rapidly taking form. The next two chapters will deal first with the adoption of armed aircraft by the Army and then with the doctrinal and organizational developments that took place relating to airmobility, once the necessary armament and aircraft were available.
The potential of the helicopter to provide the ground combat soldier additional mobility had long been recognized. During the Korean War the first attempts to use airmobility had been made mainly by the Marines, but the limited number of helicopters and their technical limitations had prevented any conclusive demonstration. As helicopter units became available to the Army, their use was included in field exercises. The first attempts to move units as such were made during Exercise SNOWSTORM in March 1953 and Exercise FLASHBURN in April and May 1954.1

These exercises proved inconclusive. Strong Air Force opposition to troop transport by Army aircraft further delayed the development of airmobile doctrine. It was apparent that successful airmobile operations required the use of armed helicopters. The arming of helicopters had been proposed in World War II and various attempts had been made during the Korean conflict. The development of a suitable helicopter -- the HU-1 -- and the successful efforts to develop an aerial weapons system laid the foundation of Army airmobility.

Weapons System Development

Project ABLE BUSTER

The Army's interest in arming helicopters and other light aircraft after the Korean War was originally limited to the development of a flying tank destroyer. On 1 February 1955, the Department of the Army requested that CONARC conduct necessary tests to determine the desirability and the feasibility of employing Army aircraft as tank destroyers. The tests were to establish requirements, doctrine, tactics, and techniques which, on confirmation of requirements and feasibility, would lead to the establishment of military characteristics for aircraft more suitable than those presently available to the Army. It was envisioned that these armed light aircraft would be organized into Army Aviation Attack Companies operating in direct support of regimental combat teams and combat

1 Weinert, Army Aviation, pp. 39 - 40, 42.
commands. Operating against enemy armor, the attack companies were to deliver aerial armaments in a minimum time following a request for support.

CONARC, on 15 April, directed the Army Aviation School to conduct tests, designated Project ABLE BUSTER, during the period, 15 April - 1 July, to determine the desirability and practicability of the concept so that a decision as to the requirement for subsequent testing could be reached by 1 July. The Army Aviation School also was to make preparations for combined troop testing to be conducted during the period, 1 July to 1 September, provided the requirement was established by the first phase testing.

The Army Aviation School, utilizing civilian off-the-shelf and Army aircraft to fire munitions including small arms, rockets, and chemicals, conducted tests during May and June and submitted a first interim report on 15 June. For testing, the school had been assigned one T-34 trainer, and Fltucher FD-25 and TEMCO M-33 light aircraft, in addition to L-19's, L-20's, and L-23's. Helicopters were briefly evaluated, but were rated as poor performers. One of the first problems encountered concerned ordnance. No appropriate aerial rockets were available from Army Ordnance Corps sources. Modern aerial rockets had been designed to be released from aircraft traveling several hundred miles an hour, while the Army's aircraft flew much slower. This problem was never completely overcome; however, numerous rockets were tested and it was determined that a fixed fin rocket was the most suitable for this type of launch platform. The Army Aviation School concluded that no aircraft assigned to the Army or any of the special aircraft tested were suitable for the antitank role. The Army use of Air Force or Navy fixed wing aircraft was proposed, but this suggestion was never pursued. The Army Aviation School recommended that a separate project designed to determine requirements and characteristics of an optimum close support aircraft was required.2

On 25 October, the Army Aviation School submitted its final report on the feasibility test. The school concluded that employment of light aircraft of types organic to the Army in the antitank role was feasible and recommended the conduct of troop tests with modified civilian aircraft to be procured by the Army. It also recommended than an efficient aerial weapons platform be developed

for this one particular mission and not be expected to carry cargo or fly command liaison missions. CONARC nonconcurred with the Army Aviation School recommendations on 7 December, and recommended to the Department of the Army that no further tests be conducted using currently available aircraft and munitions.\(^3\)

**Army Aviation School Experiments**

The failure of Project ABLE BUSTER and the unfavorable report on the SKY CAV experiment conducted during Exercise SAGE BRUSH\(^4\) resulted in a serious setback to the development of an armed helicopter and of airmobile doctrine. Brig. Gen. Carl I. Hutton, the Commandant of the Army Aviation School, was a firm believer in the future of the armed helicopter. General Hutton's opportunity to proceed on his own with the development of the armed helicopter came in June 1956. On 4 June, CONARC issued Training Memorandum No. 13, Organization and Training for Mobile Task Force-Type Operations, which emphasized the need for new concepts in mobility and flexible organization and required commanders to conduct experiments in this area.

Upon receipt of Training Memorandum No. 13, General Hutton immediately took two actions. First, he asked Col. Jay D. Vanderpool, Chief of the Combat Development Office of the school to undertake the fabrication and testing of weapons systems to be used on Army helicopters. Secondly, General Hutton on 27 June wrote to General Wyman that the mobility of task forces was still no greater than it had been during World War II. He believed that the only solution to the problem was putting the soldier into aerial vehicles. At that time, the Army only had aircraft designed as transports, but General Hutton believed that the development of fighting aerial vehicles was necessary. General Hutton requested approval to experiment with existing helicopters, organized into tactical formations, and to run some problems similar to those contained in Training Memorandum No. 13. As far as he had been able to determine there was nothing in the regulations to prohibit this testing, and it was only a question of policy and whether the Army Aviation School should conduct the experiments.

\(^3\) CONARC Summary of Major Events and Problems, FY 56, Vol. IV, Cbt Dev Sec Gen Div, Jul - Dec 55, pp. 3-4.

\(^4\) For the development of the SKY Cav concept and Exercise SAGE BRUSH, see below pp. 118 - 26.
General Wyman agreed on 13 July that air vehicles were a promising means of increasing mobility. He pointed out that the scope of Army aviation in the PENTANA Army 5 represented a great stride forward. Although the quantity and types of aircraft in that army were considered to be all the "state-of-the-art" and the budget could provide during the early part of the next decade, he felt that no opportunity should be missed to improve on the PENTANA concept. He therefore approved General Hutton's plan and requested that details be submitted to CONARC by 24 August. The plan was to include a statement of the purpose, the objective, and an outline of the method of accomplishment. General Wyman directed that coordination should be made with the Infantry School. He also approved experimentation with existing helicopters to run problems similar to those in Training Memorandum No. 13, providing this effort was also coordinated with the Infantry School and that it would in no way retard the accomplishment of the primary mission of the Army Aviation School. General Wyman did not tell General Hutton to use armed helicopters, nor did he tell him not to use them. 6

On 23 August, the Army Aviation School published its proposal, entitled The Armed Helicopter Mobile Task Force. This proposal expanded earlier Army Aviation School and Infantry School studies of airmobile doctrine to include the tactical use of armed Army aircraft. The school stressed that these weapons were intended only to provide suppressive fires during the assault. At that time, the concept envisioned the use of existing Army aircraft equipped with standard weapons.

The primary objective of the Army Aviation School study was to determine the effectiveness of existing aircraft and weapons in this new role. Following the full evaluation of these concepts, the development of requirements for new or modified equipment and recommendations to higher staff offices would follow. The Army Aviation School was responsible for the details of organization and the methods of employing men and equipment during the evaluation.

5
See above, Ch. III, pp. 60 - 61.

6
First Attempt to Fire Rockets From H-13 Helicopter
The Infantry School provided assistance in forming this special force, test problems for inclusion in the program, and observers/umpires to evaluate the tactical feasibility of the concepts.

The 351st Regimental Combat Team, a school troop unit at Fort Rucker, furnished the nucleus of the experimental unit. Aircraft and operating and maintenance personnel were taken from existing resources of the Army Aviation School. The establishment of the composite unit assisted in determining the logistical support demands of this type of unit. Believing it had adequate funds to organize and test the unit, the Army Aviation School made no request for additional money.7

The first problem was determining whether existing helicopters could be successfully armed. Colonel Vanderpool, starting work on the project with a cadre of five people, selected the H-13 helicopter as the first test vehicle. The cadre originally had been assigned to Project ABLE BUSTER, and they used armament remaining from the project. By early July, without awaiting General Wyman's formal approval, the first live fire test was conducted using a kit consisting of two .50-caliber machine guns and four Oerlikon 8-cm. rockets.

The tests were conducted with extreme caution since no one knew exactly what would happen when rockets and machine guns were fired from a helicopter. The H-13 was first securely anchored to an elevated wooden platform. The machine guns were fired singly and then in pairs with increasingly long bursts. Inspection revealed that there was no structural damage to the helicopter. The rockets were then fired by remote signal. Test firings both singly and in ripple revealed a much smaller dispersion pattern than had been expected and again no damage to the aircraft. The weapons were then fired while the helicopter hovered and when it was in forward flight at an altitude of approximately 100 feet. Having proven that weapons could be fired successfully from a helicopter, the testers turned their attention to the fabrication and improvement of the armament system.

The Army Aviation School was now ready to study armed airborne tactical organizations or formations. General Hutton directed Colonel Vanderpool on a Friday afternoon to develop a conceptual sky cavalry -- an airborne tactical force of company size; determine the aircraft requirements; determine troop and pilot requirements; sketch a troop maneuver scenario; assemble the pilots, troops, and aircraft on the parade ground Sunday morning for briefings; and conduct a maneuver Sunday afternoon. Using helicopters taken from the school training fleet, selected instructor pilots were picked and infantrymen were drawn from the school troops.

7 Weston and Stephens, Helicopter Armament, Pt I, pp. 5 - 8.
This first exercise demonstrated the potentialities of the concept and during the remainder of 1956 and early 1957, Colonel Vanderpool's group worked on experimental weapons systems during weekdays and experimented with tactics and techniques on weekends when the school was closed. Since funds were not available, these tests were conducted with volunteer pilots from the school.  

Aerial Combat Reconnaissance Company

The success of the experiments and tests conducted in 1956 and early 1957 led to the approval of the Army Aviation School recommendation to continue testing of the doctrine, techniques, and tactics of the airmobile concept. On 5 March 1957, the Army Aviation Center directed the organization of a Sky Cavalry Platoon (Provisional) to continue the testing of the concept. On 8 July, this unit, consisting of 11 officers, 16 enlisted men, and 10 helicopters, was placed under the operational control of the Department of Tactics of the Army Aviation School. These people were assigned on special duty, and the equipment was provided on a temporary loan basis.

The Sky Cavalry Platoon was divided into four flights, equivalent to squads. The reconnaissance flight consisted of seven flying officers with seven aircraft. Six of the aircraft were helicopters, while the seventh was a fixed wing observation airplane. The infantry flight was equipped with a cargo helicopter to carry its integral infantry squad. The weapons flight had one flying officer and one armed utility helicopter. The maintenance section contained five enlisted men and a test engineer. The new platoon, including the experimental armed helicopter, was officially unveiled on 6 June at Fort Rucker before an industrial-military symposium sponsored by the Association of the United States Army.

In order to eliminate the confusion that existed over different types of "Sky Cavalry," the unit was redesignated in November 1957 as the Aerial Combat Reconnaissance Platoon, Provisional (Experimental).

For a definition of the various types of Sky Cavalry, see below, Ch. V, pp. 118 - 19.
An H-34 armed with 2 20-mm. Machine Guns, 3 50-caliber Machine Guns, 6 30-caliber Machine Guns, 2 pods of 20 2.75-inch Rockets, and 2 5-inch Rockets
Then, on 24 March 1958, the platoon was expanded to a full company or troop size unit and redesignated as the 7292d Aerial Combat Reconnaissance Company (Provisional). The company was organized under TD 92-7292 and assigned the following mission: "To support the Army Aviation School with 100 percent of its personnel and equipment in the conduct of approved training programs and in the development of tactical doctrine, organizational data, operational concepts, materiel requirements, tactics, techniques, and procedures for employment of a completely airmobile combat force." After its reorganization, the unit was placed under the 2d Battle Group, 31st Infantry, as part of the school troops at Fort Rucker. The company was subsequently redesignated on 25 March 1959 as the 8305th Aerial Combat Reconnaissance Company.11

Concurrent with the tactical tests and weapons experimentation, the platoon and later the company held demonstrations before several military and civilian groups. On 27 March 1957, two teams gave the first off-post demonstrations of emerging airmobile tactics before the U.S. Armor Association at Fort Knox and an industrial symposium at Fort Benning. By mid-1957, the platoon had acquired 6 OH-13's, 2 CH-21's, 1 H-25, and 1 UH-19. As mentioned above, an impressive display of experimental weapon systems was presented at the Army Aviation-Industry Symposium conducted at Fort Rucker on 6 June 1957. The demonstration was repeated with some change in armament on 10 June for the Ordnance Association Conference at Redstone Arsenal. Additional demonstrations were conducted during the Joint Civilian Operations Conference at Fort Benning in October 1957 and again in 1958 and at Fort Bliss in July 1958. All of these exercises generated a great deal of command interest in the armed helicopter.12

**Formal Armament Program**

In March 1957, the Chief of Research and Development, Department of the Army, directed the Chief of Ordnance to implement recommendations of the Deputy Chief of Staff for Operations, Department of the Army, for development of a single machine gun installation on the H-13, H-21, and H-34 helicopters and a 4-gun kit for the YH-40. This represented the first formal program for the development of helicopter armament. Because the helicopter armament program crossed responsibility lines of several agencies, a

3-member engineering steering committee was formed to coordinate and exchange information among the agencies concerned. The committee consisted of representatives from the Office of the Deputy Chief of Staff for Operations, the Chief of Transportation, and the Chief of Ordnance.

This formal adoption of an armament program not only caused concern within the Air Force, but it also met strong objections in the Army staff. The Deputy Chief of Staff for Logistics, Department of the Army, nonconcurred in arming helicopters for tactical use against enemy soldiers and positions. He had no objections, however, to the passive use of helicopter armament to retaliate against enemy ground fire that interfered with the accomplishment of the helicopter's mission. The implementation of the Army Aviation School's Armair Brigade concept\(^{13}\) and the creation of weapons for this new role was strongly opposed. Much of the opposition of the Department of the Army staff was based on the desire not to aggravate the Air Force. Development of an Army attack helicopter would appear to infringe on the Air Force mission of close air support. Therefore, any armament on Army aircraft should be theoretically for defensive purposes only. Another factor causing a lack of enthusiasm for armed helicopters in certain quarters, was the Transportation Corps view that helicopters should be primarily used for transportation purposes under its control and not as a weapons system in the combat arms. The Chief of Research and Development, Lt. Gen. Arthur Trudeau, and Lt. Gen. Carter B. Magruder, the Deputy Chief of Staff for Logistics reached a compromise by formally stating that the helicopter was too vulnerable to attack enemy ground forces and that because of its normal low level flying techniques would be unable to locate or hit targets.

By the terms of an agreement reached in July 1957, the Transportation Corps received prime responsibility for the helicopter while the Ordnance Corps was delegated responsibility for the weapons and the weapons system. The Transportation Corps would handle budgeting and funding, transferring funds to the Ordnance Corps as necessary. The Ordnance Corps would contract for the necessary modifications to the helicopters and for all attachments and mounts that were to be a permanent part of the aircraft. Upon completion of testing, the operational evaluation of the weapons system would be accomplished at Fort Rucker. After the completion of this phase, disposition of the equipment would be made upon instructions from the Deputy Chief of Staff for Research and Development.\(^{14}\)

\(^{13}\) For a description of the Armair Concept, see below, Ch. V, pp. 131 - 35.

An HU-1 Helicopter Showing Mountings for Machine Guns and 2.75-inch Rockets
In 1958, the Department of the Army directed the development of the single flexible machine gun system. The contract for this first funded project was awarded to the Townsend Company and was supervised by Springfield Armory. The contract resulted in the Townsend fire suppression kit. Another program was begun with the General Electric Company, again supervised by the Springfield Armory, to install a 40-mm. grenade launcher on the H-34A helicopter.\footnote{Weston and Stephens, Helicopter Armament, Pt I, pp. 91 - 92, Pt II, pp. 18 - 41, Pt III, pp. 1-A9 - 1-B5.}

In April 1958, the Ordnance Weapons Command outlined in detail and recommended a series of potential projects in support of Army aviation. Since the Ordnance Weapons Command had furnished liaison officers to Fort Rucker since 1957, it was acquainted with the projects under development there concerning the aerial combat reconnaissance company. Fort Rucker had requested the Ordnance Corps to install two 20-mm. M39 guns on a helicopter for the Army Aviation School and had also made various requests to test rocket launchers. The Ordnance Weapons Command realized that the character of this work and its relationship with Fort Rucker would be greatly improved by providing a formal research and development project with adequate funds.

Areas of great interest at this time were the use of rockets on Army aircraft in an antitank role and upgrading the stability of the gun and rocket platforms. Work in the latter area would provide valuable information for the whole program of improving the accuracy of aerial armament kits. The basic need at the moment, however, was to have an available research and development category where user input could be evaluated and prototypes could be developed.

The Ordnance Weapons Command outlined ten categories to be examined: The fabrication of mounting structures required for installing standard Ordnance materiel on Army aircraft; the modification of the aircraft as required; the simple modifications to the Ordnance items as required by the installation; the purchase of commercially available ancillary equipment; the fabrication of components to complete the system; the purchase of test quantities of nonstandard munitions not otherwise available; functional testing to determine that the system operated as intended and was safe for further testing; the conducting of design studies on aircraft armament installations; the conducting of tests of aircraft installations to obtain data for use in systems refinement, for systems effectiveness studies, and to establish parameters of design of complete systems; and the preparation of system performance specifications. The Ordnance Weapons Command sought the appropriation of
moderate funds to finance work requested in support of projects at Fort Rucker.16

Airborne Troop Test of SS-10 Missile System

A major area of interest in arming helicopters continued to be the search for a flying anti-tank weapons system. Testing of various types of ordnance to meet this requirement continued under CONARC direction. In August 1958, the CONARC commander directed the Commanding General, Third Army, the Commandant of the Army Aviation School, and the President of the Army Aviation Board to conduct a troop test for the airborne launching and guidance system for the SS-10 missile.17 The test was to be conducted at the Army Aviation Center at Fort Rucker and was to be a combined organization and tactical test. Firing demonstrations were also to be conducted at the Armor School and the Infantry School. Equipment required to conduct the test was to be furnished by the Army Aviation Center, except a minimum of two H-13H helicopters to be furnished to the Army Aviation School by the Army Aviation Board. Airborne guidance and launching equipment for the SS-10 missile was to be installed on both helicopters.

The troop test had several objectives. First, it would test doctrine, tactics, techniques and procedures, and concepts for the organization and employment of the airborne-launched SS-10 in support of infantry and armor. Tactics should include aerial maneuvers used in the attack at a target to include a comparison between the tactics for the SS-10 and those used with free rockets. Additional modifications desired for the installation of airborne guidance and launching systems on the reconnaissance type helicopter which were not reported during the ordnance safety test and the CONARC Board user service test were to be determined. Information also was needed for the preparation and revision of training literature, technical manuals, and supply bulletins and to ascertain the maintenance support required for the airborne missiles and launching and guidance system. Any reorganization required in the ROCID, ROCAD, and ROTAD divisional aviation company to provide for ground handling and loading of the missile was to be determined, as were training requirements for firing crew and organizational maintenance personnel.

On 10 November 1958, the interim report of the troop test was submitted to CONARC. The content of the report was general in nature,

17 The SS-10 was a wire-guided antitank rocket developed by the French.
outlining what had been done, what remained to be done, and deficien-
cies noted in the early phases of the troop test. 18

CONARC had forwarded to the Department of the Army on 18 July 1958 a proposed qualitative materiel requirement for an armed air-
craft weapons system. On 19 December, the Department of the Army stated that action was deferred in view of the Department of Defence policy limiting Army aircraft armament to suppressive fire systems for helicopters. 19

Adoption of the Armed Helicopter

On 22 July 1959, CONARC sent the Army Aviation School a study directive for Army Aerial Vehicle Weapons System Requirements. The headquarters needed a study that would determine weapon systems requirements for use on Army aerial vehicles. The increasing emphasis placed on these vehicles in support of the field army dictated that they have weapon systems capable of delivering suppressive anti-tank fires and of providing defense against low performance aircraft.

The study was to determine requirements for weapon systems for use on Army aerial vehicles in the 1960 - 1965 period. The following types of missions were to be considered: aerial combat reconnaissance, aerial tactical troop movement, anti-personnel, anti-tank, anti-materiel, and defense against low performance aircraft. The systems to be examined included, but were not limited to, automatic weapons, recoilless rifles, guided and ballistic rockets and missiles, electronic control of air and ground launched devices, and infrared, microwave, or other target seeking systems. The system would consider various types of warheads to include those of fractional atomic yield. 20

20 (1) CONARC Summary of Major Events and Problems, FY 60, Vol. VI, Cbt Dev Sec Gen Div, Jul - Dec 59, pp. 15 - 16. (2) Warheads of fractional atomic yield referred to small tactical weapons of less than one kiloton power.
On 4 February 1960, CONARC submitted to the Department of the Army a study, which had been held in a deferred status, on the Armed Helicopter Weapon System. The Department of the Army had established a requirement for a system of armament capable of rapid mounting and demounting on Army utility helicopters. The armament system could consist of weapons and ammunition from current weapons systems of advanced design, nuclear and nonnuclear, together with synchronized sighting, mounting, and firing devices providing for elevation, depression, and traverse, where required. A mounting system would be provided to permit attachment of various combinations of weapons to fit the mission. The system would be employed as an elevated firing platform in support of offensive and defensive ground combat operations, and it would provide for full utilization of new weapons and ammunition and the maneuverability of Army helicopters.

On 15 March 1960, the Chief of Research and Development, Department of the Army, assigned to the Transportation Corps the responsibility for coordinating all work of the technical services in developing helicopter weapons for suppressive fire, armor for both aircraft and crew, and equipment for smoke laying, missile guidance, and aircraft stabilization. By the end of FY 1960, the Chief of Research and Development accepted a 10-year program proposed by the Office of the Chief of Transportation as an official guide for future developments. Weapons to be considered for suppressive fire included machine guns, rockets, and missiles.

The first qualitative materiel requirement for armed helicopter weapons systems was approved by the Department of the Army on 16 May 1960 and disseminated by CONARC to interested agencies on 8 June. This qualitative materiel requirement had undergone extensive staffing in CONARC during 1959 and had been forwarded to the Department of the Army on 4 February 1960.

On 21 November 1960, CONARC submitted to the Department of the Army a basis of issue for kits arming the H-13 helicopter with dual machine guns. The following list was approved by the department on 23 December:

CONARC Summary of Major Events and Problems, FY 60, Vol. VI, Cbt Dev Sec Gen Div, Jan - Jun 60, pp. 14 - 15 (CONFIDENTIAL -- Info used is UNCLASSIFIED).

This marked the first approval for standard armament on Army helicopters. Also in November, a tentative basis of issue for armament of utility and transport helicopters was submitted to the Department of the Army. The XM138 grenade launcher was proposed to be issued on the basis of one per HU-1 helicopter armed with a wire-guided antitank missile and one per platoon of HU-1 helicopters in the proposed utility tactical transport company. The M153 7.62-mm. machine gun kit would be issued one per platoon in the transportation light helicopter company, transportation medium helicopter company, and utility tactical transport company. A procurement order was placed for 150 .30-caliber machine gun kits for the H-13 helicopter and 16 SS-11 missile kits for the HU-1B helicopter. The SS-11 kits were to be delivered to CONARC for the conduct of troop evaluations beginning in January 1962.23

**CDEC Experiments**

A major concern in the development of Army aviation was the vulnerability of low flying aircraft to forward area ground fires. To a great extent, the practicality of the entire emerging airmobile concept depended on the ability of Army aircraft to survive in the forward battle area. The first attempt to answer the vulnerability question was an experiment scheduled to begin at the Combat Development Experimentation Center (CDEC) at Fort Ord on 26 August 1957.

---

23 (1) CONARC Summary of Major Events and Problems, FY 61, Vol. VI, Army Avn Sec, Jul - Dec 60, pp. 6 - 7. (2) DA DCSOPS Dir of Army Avn, Summary of Major Events and Problems, FY 61, p. B-II-1 (TOP SECRET -- Info used is UNCLASSIFIED).
The experiment required the use of a considerable number of helicopters. Since Fort Ord could not fill the requirement, it was forwarded to CONARC. As a result, the 33d Transportation Company (Light Helicopter) (H-21), augmented by the 573d Transportation Detachment, was moved from Fort Riley to Fort Ord to support this experiment. These units arrived at Fort Ord on 29 June.24

Experimentation conducted during FY 1958 was but a prelude to the major work to be conducted in FY 1959. Training of aircraft pilots, umpire troops, and Aggressor forces began on 29 July 1957, but owing to the lack of special photographic equipment and a shortage of personnel, the main experiment was postponed until the next fiscal year. A platoon-size experiment was conducted between 17 and 25 September.

CONARC boards and the Army Ballistics Research Laboratories had already compiled considerable data on the probability of hits and kills, but not on the likelihood that ground troops could detect and react in time to fire. Information on the reaction of ground troops was required to make better judgments about such questions as aircraft armor, suppressive fire, and flight tactics. The experimenters set up trials employing the M-1 rifle, the automatic rifle, the M-42 twin 40-mm. gun, and the M16 dual .50-caliber anti-aircraft machine gun. Cameras mounted on the weapons recorded sighting pictures of the target L-19 airplanes and H-21 helicopters at the instant of simulated firing. Results of the experiment were limited by the partial failure of the gun cameras.25

In related activity, CDEC assisted the Army Aviation School in preparing an outline plan of test for a helicopter suppressive fire experiment which was begun on 26 May 1958 and was scheduled for completion on 26 August. A CDEC team of one officer and one scientist participated in the conduct of the experiment. Cameras were used to determine their feasibility as a substitute for the gun on aircraft for determining hits. Concurrently, the Engineer Research and Development Laboratories at Fort Belvoir, Va. were investigating the feasibility of developing infrared devices which could be used to simulate ground-to-air and air-to-ground fire.26

26 CONARC Summary of Major Events and Problems, FY 58, Introductory Narrative, Ch. V, pp. 40 - 41.
As a result of the limited accomplishments of the 1957 experiment at CDEC, CONARC directed a second experiment addressing the same question in broader terms. The latter was to investigate the vulnerability of several types of low flying aircraft, expected to be available to the Army in 1965, to ground fires from Aggressor forward battle area weapons during the same period. Types of aircraft employed during the experiment included Army fixed wing and rotary wing, Army experimental jet models, and Air Force F-100C's. Record runs were conducted at Hunter Liggett Military Reservation between 8 October and 29 November 1958. Low, medium, and high performance aircraft flew at speeds of 75, 200, 325, and 450 knots and at altitudes of contour and 300 feet, in formation of 1, 3, and 9 aircraft, over tactical ground dispositions of representative forward area troops and weapons. Fifty-nine gun cameras mounted on automatic weapons and M-1 rifles exposed some 17,000,000 frames of 16-mm. movie film and 18,000 frames of 35-mm. film, respectively. Also, fifty-nine recorders operated during the record runs to collect time data.

A preliminary report based on a partial analysis was published on 15 June 1959 and distributed in July. The final report was published on 30 November, with distribution in December.

Aircraft participating in the experiment encountered a higher kill probability when operating over areas defended by the REDEYE-type missile than when operating over areas defended by other types of weapons tested. During periods of good visibility, 75 and 200 knot aircraft operating over open areas in the airspace immediately above the forward edge of the battle area experienced prohibitively high kill probabilities from REDEYE-type weapons. At speeds of 75 and 200 knots, aircraft flying over wooded areas were less vulnerable to REDEYE-type weapons than were aircraft flying over open areas. Only half as many rounds were fired by these missiles in wooded areas as by the same weapon in open areas. Generally, the REDEYE did not have time to fire effectively at aircraft flying at speeds of 325 and 450 knots over wooded areas.

Aircraft flying at 75 knots at both contour and 300-foot altitudes were highly vulnerable to VIGILANTE-type weapons within engagement ranges of 1,200 yards. Vulnerability to these weapons

27 REDEYE, man-portable and shoulder-fired, was the smallest guided missile system that gave the soldier an effective defense against low flying aircraft.

28 The VIGILANTE was a 37-mm. 6-barrel gatling gun mounted on a tank chassis or trailer with a 15,000-foot range and firing rate of 48 rounds per second.
for 200 knot aircraft was less than for the 75 knot aircraft, but was still high. Vulnerability to VIGILANTE-type weapons for 75 and 200 knot aircraft flying at contour altitudes decreased sharply at ranges beyond 1,200 yards.

The capability of conventional hand held weapons to track aircraft was low. Their best performance was achieved against 75 knot aircraft flying at contour altitude and overhead flight paths. In more than 75 percent of the cases in which Aggressor gunners were confronted with a sequential combination of aircraft targets, they did not switch or change targets during the course of that run, even when the second aircraft proved to be a more lucrative target.29

Based on the above conclusions, the CDEC experimenters recommended the development of effective countermeasures against weapons of the REDEYE and VIGILANTE type and urged more testing with more variables controlled. The basic conclusion of the report was that low flying aircraft were highly vulnerable to ground weapons.

The CONARC position on the evaluation report was forwarded to the Department of the Army on 16 April 1960. The command had rejected the major conclusion of the report, that low flying aircraft were highly vulnerable to ground weapons, pointing out that criteria of vulnerability, such as operating techniques, evasive air tactics, and suppressive fire, had not been considered in the experiment. The command concurred in the recommendations of the report with the exception of one which said that Army aircraft should have a speed of 200 knots or better. It was not feasible that all Army aircraft be required to have the capability to fly at speeds in excess of 200 knots, especially light observation aircraft. CONARC recommended that the conclusions of the report not be accepted as final until additional study and experimentation were completed. The report was valuable as a source of data for use by agencies developing future air vehicles. It also provided a measure of the vulnerability problem, thereby furnishing a basis for further study and evaluation.30

During the last half of FY 1960, the Combat Operations Research Group (CORG) undertook an unprogrammed study of the survivability of surveillance aircraft in combat use during the 1965 – 1970 period. Several previous studies had investigated specialized portions of the aircraft survivability problem. In addition, many

(1) CONARC Summary of Major Events and Problems, FY 60, Vol. VI, Cbt Dev Sec Gen Div, Jan – Jun 60, p. 16. (2) Romjue, Field Experimentation, pp. 115 – 17 (SECRET — Info used is UNCLASSIFIED).
studies on the subject of survivability of aircraft in a hostile environment had been conducted for the Air Force and the Navy by industry. To the extent possible, existing studies and military judgment were to provide the basic information for the successful completion of the CORC study. Using this information, aircraft performing missions over a hostile environment would be studied to estimate survivability as a function of altitude-speed-terrain parameters. The completed study, forwarded to the Department of the Army on 3 October 1960, supplied planners with estimates of performance characteristics and mission profiles required to produce high survivability rates. It also provided survivability estimates to determine the feasibility of the development of a manned deep penetration aircraft. In addition, the study indicated a plan of future research to fulfill the long range aircraft survivability requirements.

Following CONARC direction, CDEC conducted further experimentation with the REDEYE during April and May 1960. Vulnerability and kill probabilities were not considered. The experiment concentrated on the REDEYE's actual operational performance against aircraft under varied combat conditions. This was followed by an experiment in May and June 1961 at CDEC to determine the capabilities of Army aircraft using evasive tactics to survive in forward areas in which units equipped with REDEYE air defense weapons were operating. The field exercises of the troops were designed to provide a tactical background and realistic battlefield environment for the employment of aircraft and the REDEYE air defense weapons. The combat situations included attack, defense, advance, and rear guard actions; retrograde movements; and bivouac and assembly. The exercises were controlled in accordance with prepared scenarios to the extent necessary to provide the situations for realistic missions of the organic and supporting aircraft. The assigned aircraft missions included reconnaissance, surveillance, resupply and evacuation, suppressive fires, and airmobile operations. The aviation units and pilots were allowed maximum latitude in selection of routes, use of suppressive fires, evasive tactics and other means to accomplish successfully the assigned missions. The REDEYE teams were employed in accordance with the latest doctrine. They were controlled by their organic or support unit commanders and were subjected as realistically as possible to the normal confusion and distraction of the battlefield.

Once again the air defense weapons scored a high percentage of kills. But it had become increasingly apparent that the findings of the succession of experiments conducted by CDEC since 1957 were considerably biased. The survival of aircraft depended on several factors and the idealized conditions of these experiments left many of these factors uncontrolled. The aircraft for the most part were not permitted to take the evasive actions which would be expected in combat, and they did not have the opportunity to use suppressive fire. While valid in the context of the stated experimental assumptions, the findings could not be projected to general tactical situations.32

During the last half of FY 1961, CDEC conducted an experiment to obtain basic data to be used by Ordnance Corps agencies in feasibility studies of weapons for Army aircraft, weapon design, and fire control equipment requirements. The objective of Phase I of the experiment was to determine the capability to detect ground targets and the types of ground targets most likely to be detected and identified. It also was to measure the accuracy of range estimation by an observer without the aid of mechanical ranging devices. Phase II of the experiment measured the ability of a pilot to select from a map the most desirable nap-of-the-earth route to a specific target, to fly a given route, and to identify and attack a specific target. It also measured the accuracy of range estimation by the pilot without the aid of mechanical range finders and the capability of an observer to locate, identify, and report location while flying nap-of-the-earth.

Within an area of eight square kilometers, various types of equipment were placed in defensive positions. The targets were located on preselected positions and utilized natural cover and camouflage to avoid detection from project aircraft. During Phase I of the experiment, helicopters entered the target area from eight different points and flew an S-shaped pattern across the target area on a predetermined flight path. During the course of the flight, a photographic aircraft flew above the project helicopter. Upon notification of a target detection and identification by the observer, a photo was taken recording the helicopter's position at the time. Radio communication from the pilot, and by the control agencies, were taped and time recorded. During Phase II of the experiment, each pilot was given a mission of locating and destroying a specific target while flying a given course at nap-of-the-earth level. Again,

a photo aircraft took pictures of the project helicopter during the entire flight and a pen scriber and tape recorder at the control center recorded times and actions during the flight. Firing on the specific target was simulated and recorded by a gun-type camera activated by the pilot. The project aircraft did not attack targets of opportunity, but an observer in the aircraft recorded the location of such targets as the pilot pointed them out. All data collected in this experiment were released to the Ballistic Research Laboratories, Aberdeen Proving Ground, for subsequent analysis and submission of a final report.33

During the fall of 1961, the Combat Development Experimentation Center conducted a helicopter armament range estimation experiment. This experiment represented an extension of the previous helicopter armament experiment and was to obtain basic data on the capability of air observers to estimate range. Data accumulated were used by Ordnance Corps agencies in subsequent feasibility studies of weapons and fire control equipment for Army aircraft.

The experiment had three objectives. First, to determine the accuracy with which an observer or pilot using the "pop-up" technique could estimate the slant range from a helicopter to a ground target from three different altitudes. Second, to determine the accuracy with which an observer could initially estimate the slant range to a target while in forward flight at three different altitudes. Finally, to determine the accuracy of sequential range estimates made while closing on a target, again at three different altitudes.

The Human Engineering Laboratories, Aberdeen Proving Ground, provided Ordnance Corps personnel for project coordination and guidance during planning, training, and field experimentation and established the data collection requirements. This organization also analyzed the data collected. The Commanding General, CDEC, was responsible for the design and conduct of the experiment.

On three different record courses, panels were placed at varying distances from targets to a maximum range of 2,200 meters. Eighteen pilots acting as observers were flown over each record course twice; once using pop-up technique and once on a straight run to target. Each observer estimated from a prescribed altitude the range to the target as he passed over the panels along each of the courses. An after action report was forwarded to CONARC on 12 October 1961.34

Army Aircraft Armament Ad Hoc Committee

At the conclusion of a briefing on 26 April 1961, Lt. Gen. Gordon B. Rogers, the Acting Commanding General, CONARC, requested that the CONARC DCSOPS provide him with the current status of Army aircraft armament systems and recommended actions to expedite procurement and issue of these systems to troops. On the following day, General Herbert B. Powell, the Commanding General, CONARC, directed the formation of a CONARC Ad Hoc Committee to Study the Army Aircraft Armament Program. General Powell recommended to the Chief of Staff of the Army action to expedite procurement and issue of required armament kits and ammunition and the establishment of an early Department of the Army/CONARC conference to resolve these problems. On 10 and 12 May, a preliminary committee developed terms of reference and a draft directive to establish an ad hoc committee. On 13 June, Maj. Gen. Louis W. Truman, the CONARC Deputy Chief of Staff for Operations, Plans, and Training, presented CONARC recommendations at a Department of the Army/CONARC conference in the Pentagon. The directive establishing the Army Aircraft Armament Ad Hoc Committee was approved by the commanding general on 16 June. Definitive CONARC quantitative requirements for Army aircraft armament systems and ammunition were presented at the second Department of the Army/CONARC conference by General Truman on 27 June, and the ad hoc committee convened for the first time on 29 June at Fort Monroe.

During the period, July through August, Maj. Gen. T. F. Van Natta, the CONARC Deputy Chief of Staff for Combat Developments, chaired an ad hoc committee which was to determine requirements and establish implementing procedures for Army aircraft armament systems for the period 1961 to 1970. The following areas were considered: missions of armed aircraft; type and number of aircraft to be armed; caliber and type of armament for each aircraft recommended; personnel, materiel, and facility support requirements for testing, operations, and training; and ways and means of expediting the development, testing, procurement, and issue to troops of the present armament systems.

The final report was submitted to the commanding general on 26 August. General Powell submitted it to the Department of the Army on 1 September, recommending approval. Among other things, the report recommended machine gun, anti-tank guided missile, rocket, and grenade launcher armament for helicopters within the Army's combat divisions and armored cavalry regiments, as they were reorganized under the ROAD concept, and certain armament for the MOHAWK fixed

---

An HU-1 Helicopter Armed with SS-11 Antitank Rockets
wings of aircraft.\(^{36}\)

Chief among the CONARC revisions was the deletion of the anti-tank guided missile and rocket-armed helicopters from the reorganized divisions in favor of an armed helicopter unit at the corps level. CONARC also recommended the reduction in the weight of the armed observation helicopter by use of a one-gun system as a follow-on to the dual machine gun system currently in production.

The Department of the Army approved the modified report for planning on 1 December. On 29 December, the Department of the Army decisions and comments on the report were presented in a briefing to General Powell. Subsequently distributed by CONARC to the CONUS army commanders and selected Department of the Army agencies in the form of a memorandum for record, the briefing represented a consolidation of the Department of the Army/CONARC position on the requirements for Army aircraft armament.

The committee's report dealt with requirements for three time-frames. The briefing for General Powell on 29 December dealt in some detail with the requirements for the FY 1961 through FY 1963 time-frame and discussed only in general terms the requirements for the FY 1964 - 1966 and the FY 1967 and beyond periods. For the FY 1961 - 1963 period, four weapons systems were discussed, including appropriate Department of the Army production and procurement plans.

The basis of issue of the XM-1 machine gun system for the observation helicopter within the reorganized combat divisions was 6 for the aviation battalion, 10 for division artillery, 10 per cavalry squadron, and 6 for each of the three brigades. Issue of 150 of the XM-1 machine gun kits was to take place between January and June 1962. In addition, CONARC recommended procurement of 200 kits with FY 1962 funds and 168 with FY 1963 funds. This quantity allowing for anticipated helicopter shortages, was described as sufficient to equip 14 divisions, 2 brigades, and 5 armored cavalry regiments and to satisfy school training requirements for the armed observation helicopter by FY 1964.

The basis of issue of the SS-11 antitank guided missile mounted on the HU-1B helicopter was three per general support company of the aviation battalion and four per air cavalry troop. Sixteen

limited production SS-11 systems were to be issued for troop evaluation during March and April 1962. CONARC recommended the purchase of an additional 84 systems and 14,000 missiles during FY 1962 and FY 1963.

The basis of issue of the 2.75-inch rocket mounted on the HU-1B helicopter was the same as the SS-11 system. Complete development and production of the 2.75-inch rocket system could not be accomplished prior to March 1963. To meet immediate high priority requirements, however, limited production 2.75-inch rockets mounted on H-34 helicopters could be made available in June 1962. CONARC recommended procurement of 100 2.75-inch rocket systems for FY 1962 and FY 1963.

The basis of issue for the XM-153 quad machine gun system mounted on the HU-1B helicopter was nine per air cavalry troop. This system was still under development, with 125 systems programmed and funded through FY 1963.

CONARC noted that if the various follow on procurement plans were effected in fiscal years 1962 and 1963, in accordance with its recommendations, the Army would progressively have sufficient armed helicopters to support requirements of the Special Warfare Center, equip ten combat divisions and four non-divisional air cavalry troops, and satisfy CDEC and school requirements.

In addition to the four weapons systems discussed above, the ad hoc committee's recommendations for arming the MOHAWK airplane were under consideration by the Department of the Army and would be handled as a separate action. In this connection, since October 1960 the Army Aviation Board at Fort Rucker had accumulated sufficient information to begin testing the MOHAWK with the armament proposed in the ad hoc committee report. Testing would begin upon receipt of the Department of the Army approval.

The briefing of General Powell concluded with a summarization of the actions which CONARC was currently taking, or proposed to take at an early date, for implementing those portions of the Army Aircraft Requirements report which had been approved by the Department of the Army. TOE's were to be revised to reflect changes in quantities of aircraft armament prior to submission of the final reorganized (ROAD) division TOE's to the Department of the Army. A concept for an aerial weapons unit at corps level had been developed and was to be tested in war games. Revisions of qualitative materiel requirements and military characteristics to reflect concept changes stemming from the recommendations of the ad hoc committee report would have to be made. In coordination with the Chief Chemical Officer, further development of requirements for aircraft-mounted CBR weapons was necessary.
At the conclusion of the briefing, General Powell stated that CONARC should recommend sufficient quantities of aircraft armament to the Department of the Army to equip sixteen divisions. He also stated that CONARC should reopen with the Department of the Army the need for further procurement of H-34 helicopters to alleviate serious shortages.37

The report of the ad hoc committee provided a firm basis for establishment of a comprehensive program for arming Army aircraft. It served as a guide to Department of the Army agencies for preparing research and development plans and distribution schedules of aircraft armament systems. The published working papers of the committee provided a compilation of data pertinent to the subject of arming Army aircraft. The report of the CONARC Ad Hoc Committee to Study Army Aircraft Armament Systems, along with the report of the Rogers Committee on Army Aviation, provided the basis on which the Howze Board in 1962 was to revolutionize Army aviation.

Department of the Army approval of the recommendations of General Powell in regard to a program for arming Army aircraft provided a firm basis for development of qualitative materiel requirements for Army aircraft armament systems. Accordingly, CONARC directed on 26 December that qualitative materiel requirements be prepared by the Army Aviation School with the assistance of the Army Aviation Board. Five distinct qualitative materiel requirements (QMR’s), were to be developed for the following armament systems: light weapons, area weapons, point weapons, air-to-air weapons, and a target marking system. These QMR’s were to replace the existing ones for an Army helicopter weapons system.

As finally developed, the air-to-air weapons system was dropped and the Army helicopter weapons system was revised. The five qualitative materiel requirements were forwarded to the Chief of Research and Development, Department of the Army, on 21 May 1962. The revised QMR for the armed helicopter weapons system was an updating of the existing version to include the weapons which were currently programmed. An area weapons system was proposed to be mounted on Army utility helicopters and used in support of ground combat operations to deliver area fires against such targets as groups of men and vehicles and supply installations. This system was to be a

follow on to the existing 2.75-inch rocket. The proposed light weapons system provided for a reliable lightweight armament capable of rapid mounting and demounting from Army observation and utility helicopters for the mission of neutralizing or destroying hostile elements as part of reconnaissance, screening, security, or self protection against land or air forces. A target marking system with a reliable, lightweight armament for installation on selected Army aircraft would be used for marking tactical targets for air strikes and other fire support means. Finally, the proposed QMR for point weapons systems provided two distinct, reliable, lightweight armament systems for installation on Army utility helicopters for the mission of destruction of such point targets as armored vehicles, unarmored vehicles, and fixed emplacements. These would be an anti-heavy armor and an anti-light armor system. These systems were to be a follow on for the SS-11 missile and 20-mm. gun.38

Armament and Airmobility

The development of aircraft armament by the Army was to change completely the orientation of Army aviation. Until the successful mounting of weapons on helicopters and light airplanes took place, Army aviation had been limited to a role of logistical support and aerial observation. The emphasis on transport aircraft had naturally led to a dominant position in the aviation field of the Transportation Corps. With the acceptance of the armed helicopter and the shift toward combat operations, CONARC became the focal point of aviation developments.

Many Army officers had long envisioned a much broader mission for Army aviation. General Matthew Ridgway, Maj. Gen. James Gavin, and Maj. Gen. Hamilton Howze all put forth concepts for the use of light aviation directly in combat operations. The realization of these concepts depended on two things -- the provision of proper aircraft and the arming of Army aircraft.

Experiments with armament actually began before the new aircraft entered service. The speed with which a successful helicopter armament system was developed resulted from the imagination and dedication of such officers as Brig. Gen. Carl Hutton and Colonel Jay Vanderpool rather than of a concerted Army directed development program.

115
At about the same time that development of aircraft armament began, a new doctrine and organization for Army aviation began to evolve. In the following chapter we will trace the growth of the airmobility concept. The introduction of the aircraft needed to implement this concept will be covered in a later chapter.
Chapter V
THE BEGINNING OF AIRMOBILITY

At the same time that weapons systems were being developed for the armed helicopter, experiments were conducted on airmobile tactical organization and doctrine. These two fields of development were closely interrelated and led eventually to the Army's airmobility concept.

Development of the Air Cavalry Concept

In April 1954, Maj. Gen. James M. Gavin, the Assistant Chief of Staff, G-3, Department of the Army, published an article entitled "Cavalry, And I Don't Mean Horses," which was to have a profound impact on military thinking during the next few years. General Gavin stated that armor was not sufficiently mobile to properly execute the missions historically associated with cavalry. With the introduction of atomic weapons, it was apparent that armies in the future would have to be deployed over a much larger area and that cavalry screening operations would have to be conducted over much greater distances and with much greater rapidity.

To achieve the mobility required on the modern battlefield, General Gavin advocated a new type of cavalry: "I mean helicopters and light aircraft, to lift soldiers armed with automatic weapons and hand-carried antitank weapons, and also lightweight reconnaissance vehicles, mounting antitank weapons the equal (or better) of the Russian T-34s." General Gavin concluded, "Today, even the most casual awareness of the historical lesson should suggest that in ground combat the mobility differential we lack will be found in the air vehicle. Fully combined with the armored division, it would give us real mobility and momentum."

Maj. Gen. Hamilton H. Howze became the apostle of this new doctrine after he assumed the position of Director of Army Aviation in early 1956. Speaking before the convention of the Association of the United States Army that year he summarized the following functions of Army aviation in providing aerial mobility as follows: observation; rapid movement of troops and equipment; movement of critical supplies; air mobility for ground reconnaissance -- the Sky Cavalry concept; command, control, and liaison; and battlefield

casualty evacuation.\(^2\)

By the following year, General Howze was ready to go beyond this somewhat conventional view of the functions of Army aviation. He believed that the use of light aircraft should have a revolutionary effect on the tactics of the Army. The problem was how to convince the Army as a whole that this was true. General Howze wrote:

The major part of the solution to the problem must be provided by Army Aviation itself. This capability must be developed partly by the creation of new and better aircraft types, and that development must in turn come from a properly conducted research program. We must take our capability, combine it with courage, and display the result to the rest of the Army in such fashion that the utility of aviation will be completely and convincingly obvious.\(^3\)

It was about this time that General Howze began using the term "airmobile" to describe his concept of the employment of Army aviation. In October 1957, he described his concept in the following terms:

In the more distant future looms the probability of large, completely airmobile units -- sky cavalry. The possibilities for its employment in the fluid phase of the ground struggle excite the imagination: as covering forces operating in front of heavier ground elements, protecting long, vulnerable flanks of the main forces of the field army, striking enemy formations from unexpected directions with maximum surprise. We are just beginning to investigate these ideas, haltingly and with some trepidation, but with hope.\(^4\)

---

**Sky Cavalry**

Generals Gavin and Howze were not alone in visualizing the potential of Army aviation to provide increased mobility to the

---

ground forces. In the next few years, the Army began to experiment with Sky Cavalry — a term that was descriptive but, because of its differing definitions, not always informative. In fact, there were at least three distinct versions of Sky Cavalry which emerged during this period.

The Fort Rucker concept of Sky Cavalry was discussed in the previous chapter. To avoid confusion with the other forms, the Fort Rucker version in 1957 was redesignated as aerial combat reconnaissance. The Intelligence Corps visualized Sky Cavalry in a completely passive target acquisition role utilizing such devices as television, radar, and infrared. There was no intention to use aggressive tactical efforts to obtain intelligence. The Armor Branch developed a Sky Cavalry concept which provided for the addition of a light helicopter company and some fixed wing aircraft to the existing armored reconnaissance battalion of the armored division to obtain additional means for gathering combat intelligence through aerial surveillance, observation, and reconnaissance. It was this concept which was tested in Exercises SAGE BRUSH and SLEDGE HAMMER.

The Army Aviation School's version of Sky Cavalry included the functions contained in the Intelligence and Armor versions, but was not restricted to passive tactical roles. The Fort Rucker unit was intended to be a "completely air-mobile, air-mounted, fast moving, hard-hitting, flexible means of searching out, fixing the enemy, and performing the traditional missions of cavalry at an accelerated rate on the battlefield of tomorrow." This was truly the type of use of Army aviation that had been advocated by General Gavin.5

Exercise SAGE BRUSH

On 9 July 1954, General Gavin wrote to the Chief of Army Field Forces that the heretofore important function of logistical support by helicopters should be relegated to secondary importance and that the combat arms should develop the application of airlift by helicopter to meet their doctrine and techniques. From this time onward, the Department of the Army became increasingly interested in the tactical applications of the helicopter rather than considering it as just another means of logistical transport.

On 9 March 1955, the Department of the Army proposed to CONARC the organization and training of an experimental reconnaissance troop combining Army aircraft reconnaissance and transport capabilities with ground reconnaissance facilities, integrating the

The Department of the Army proposed to test and evaluate such a unit as a replacement for the reconnaissance unit in the infantry and airborne divisions. CONARC concurred in the proposal and recommended phasing. On 27 April, the Department of the Army directed the necessary implementation of the plan and cooperative action by the Chief Signal Officer and the Chief of Engineers.

CONARC furnished instructions and assigned responsibilities for implementation of the plan on 20 May. The plan called for the Commanding General, Third Army, beginning 1 June 1955, to organize, equip, and train the Provisional Reconnaissance Troop (SKY CAV) in accordance with the TOE furnished by CONARC. The provisional troop was to be trained by the 82d Airborne Division during the period, June to September, tested as part of the Aggressor Forces in Exercise SAGE BRUSH in October, and evaluated by the Deputy Director (Army), Exercise SAGE BRUSH, during December 1955 and January 1956.6

The Provisional Reconnaissance Troop (SKY CAV) was activated on 1 June by the 82d Airborne Division. The nucleus of the unit was provided by the 82d Airborne Reconnaissance Company. Men and equipment were attached to the troop from the 8th Transportation Battalion (Helicopter), The Army Pictorial Center, The Army Electronic Proving Ground, XVIII Airborne Corps Artillery, the 25th Reconnaissance Battalion at Fort Hood, and miscellaneous other sources. Completely formed in early August, the unit conducted a limited training program at Fort Bragg during August, September, and October.

The primary objective of the test was to determine whether Army aircraft reconnaissance and transport capabilities, ground reconnaissance facilities, and the latest electronic surveillance devices could be combined to form an effective unit with a high degree of mobility and flexibility. The test was also to determine whether a unit so constituted could improve the reconnaissance and target acquisition capabilities of division, corps, and army and if it was suitable either to replace or to become a component of mechanized reconnaissance units.

Exercise SAGE BRUSH, involving 110,000 Army and 30,000 Air Force personnel, was the largest exercise conducted in the continental United States after World War II. Maneuver plans created a

Friendly Infantry Troops Boarding an H-34 Helicopter for Movement into the Combat Zone of the Louisiana Maneuver area for Exercise SAGE BRUSH
theater-scale setting in which atomic, chemical, biological, and electronic weapons were used extensively. The maneuver took place in Louisiana between 31 October and 15 December 1955. The Provisional Reconnaissance Troop (SKY CAV) was composed of 33 officers, 28 warrant officers, and 374 enlisted men with 14 light cargo helicopters, 5 reconnaissance helicopters, 4 utility airplanes, and 5 observation airplanes.

Prior to and during Exercise SAGE BRUSH, the employment of Army aircraft proved to be the most controversial aspect of the SKY CAV concept. The legal controversy stemmed from the 1952 Memorandum of Understanding between the Army and the Air Force concerning the roles of Army aviation in the combat zone. The Air Force desired to limit the Army to the terms of this agreement, while the Army wanted the agreement changed to exploit developments in organic tactical aviation.

An expression of this differing view was contained in a letter from General Dahlquist to Lt. Gen. John H. Collier, Commanding General, Fourth Army. He pointed out that the Army position regarding helicopters was that they were not suitable for joint airborne operations and the Army had no requirement for Air Force helicopter lift. For this reason, the planning for Exercise SAGE BRUSH avoided use of Army helicopters in any operation which might be called a joint airborne operation. The Air Force planned to have a number of helicopters available during the exercise. General Dahlquist told General Collier that, should the Air Force urge Army employment of their helicopters, he could use them provided they were placed under Army command. If this condition were not met, General Collier was to decline the use of Air Force helicopters.

The technical controversies over SKY CAV were related to the technical limitations in range, speed, and vulnerability of current models of Army aircraft. Aircraft employed by Army units during Exercise SAGE BRUSH were often assigned missions which they were technically not designed to perform. There was no opportunity during the exercise to conduct a valid test of helicopter vulnerability.

Of much more importance were the tactical controversies resulting from the SKY CAV test which were a direct outgrowth of the

7 For additional information regarding Exercise SAGE BRUSH, see Jean R. Moenk, A History of Large-Scale Army Maneuvers in the United States, 1935 - 1964, Hq CONARC, Dec 69, pp. 205 - 20 (hereafter cited as Moenk, Large-Scale Maneuvers).

8 Ltr, Dahlquist to Collier, 1 Nov 55.
manner in which the Army aircraft were employed during Exercise SAGE BRUSH. The tactics of employment of Army aviation during the exercise were generally poor, particularly with regard to helicopters. Some observers were quick to form unfavorable opinions of the potential value of helicopters on the basis of what had been demonstrated.9

All phases of the project except evaluation were completed during the maneuver phase of Exercise SAGE BRUSH, and on 19 December the SKY CAV provisional organization was ordered terminated. This was done despite the recommendation by the Commanding General, Third Army, that the troop be retained at Fort Bragg and further developed at corps level in support of the XVIII Airborne Corps.10.

The final report of the evaluation of the Provisional Reconnaissance Troop (SKY CAV) contained the recommendation that organizational doctrine of the Army provide for the combination of Army aircraft reconnaissance and transport capabilities, certain air transportable ground reconnaissance facilities, and the latest electronic surveillance devices in one unit. The report also recommended that the revised SKY CAV concept of organization and operation be applied to units designed to provide reconnaissance and target acquisition means for division, corps, and the field army. As a result of the problems encountered during the exercise, it was recommended that SKY CAV units not be used to replace, or to become a component of the mechanized reconnaissance units of divisions, corps, and armies.11

The test of the SKY CAV concept was not the only aspect of Army aviation to be evaluated during Exercise SAGE BRUSH. An attempt was made to use transport helicopters as an integral part of the transportation support during the exercise. The transport helicopters, however, received limited employment under conditions which made virtually impossible any firm conclusions as to their adequacy or effectiveness. Much of the difficulty resulted from the fact that the transport aviation units were understrength and lacked

11 Final Report Evaluation of Provisional Reconnaissance Troop (SKY CAV).
operating experience with their equipment. Instead of the four companies authorized, the transport helicopter battalion had only 1 1/3 light helicopter companies. The full company, which had recently been equipped with twenty-one H-34 helicopters was late in arriving in the maneuver area. The company's equipment was immediately grounded for correction of technical difficulty with the fuel systems. As a result, the only available helicopter lift until late in the exercise was a platoon of seven H-21 helicopters.

A tactical airlift operation, scheduled for the third phase of the exercise, was dropped because of insufficient time to coordinate plans with the supported unit. During the final phase of the exercise, the helicopter battalion supported the 3d Infantry Division in its assault across the Red River. As a result of the delays in transmitting the request for the use of the transport helicopters and sporadic liaison between the battalion commander and the division, planning was not completed until immediately before the operation got underway. Because of the training status of the pilots and the absence of facilities for night maintenance, the transport helicopters were made available for only a limited daylight period. Since the infantrymen and the pilots had never worked together, no one at the loading sites knew who should do what. After some confusion, the pilots supervised the slinging of cargo and the infantry provided the labor. Because of refueling limitations, the helicopters were dispatched in "merry-go-round" fashion. A mass lift would have been more efficient and more in keeping with the objective of tactical surprise. In addition, for reasons of safety, the helicopters came in at about 300 feet, a height from which they could easily be spotted, instead of employing contour flying.

The exercise demonstrated that official doctrine regarding the tactics and techniques of Army transport aircraft employment required amplification. In view of the slow speed, readily identifiable flight noise, and vulnerability to air attack and ground fire, there was need for further study of the suitability of transport helicopters for use over enemy held territory. Other findings indicated the need for improved or additional communications, maintenance and cargo landing equipment, and for a terminal service unit to locate and operate loading and unloading sites. It was urged that greater stress be placed on joint training of transport helicopter and Army combat units.

The controversy between the Transportation Corps and the combat arms over who should control Army aviation surfaced as a result of the findings of the final maneuver report. The portion of the report dealing with transportation concluded that the placing of surface and air capabilities in a single transportation service was sound, while the portion concerned with Army aviation concluded that the arrangement was undesirable. It indicated that the most recent doctrine contained in Department of the Army Training Circular...
1-7, 29 March 1955,\(^{12}\) called for Army transport aviation to be used primarily for combat support, with logistic support as an additional function. It was proposed that until sufficient Army transport aircraft were available for both types of support, the principal emphasis should be placed on their use with tactical elements. To this end, and to simplify channels, it was recommended that transport aircraft be placed under the general staff supervision of the G-3 and the special staff supervision of the Army aviation section, rather than under the G-4. Consideration should be given to the establishment of an Army air arm to provide a career program for the development of necessary specialized aviation personnel.

The Chief of Transportation took exception to these recommendations. He contended that the concept of integrating surface and air transport capabilities was sound. The assignment of the air capability to G-3 would interfere with the G-4 staff responsibility for transportation of units, personnel, and supplies by water, highway, railway, and air. The employment of transport helicopters for either combat and service support missions would provide flexibility and priority could be given when required to tactical missions. The Chief of Transportation also nonconcurred in the need for a separate Army air arm although he had already agreed to a proposed Armywide career development program.\(^{13}\)

**Exercise SLEDGE HAMMER**

Following the evaluation of the SKY CAV test in Exercise SAGE BRUSH, CONARC recommended to the Department of the Army that further tests of the concept be conducted in a project designated SKY CAV II. It was planned to add a SKY CAV troop to the 1st Armored Division reconnaissance battalion and conduct further tests of the original concept of improving the capability of ground reconnaissance units by the addition of Army aviation elements and electronic surveillance devices. The testing was to be conducted during Exercise SLEDGE HAMMER in early 1957.\(^{14}\)

On 23 April 1956, CONARC recommended to the Department of the Army that SKY CAV II be organized as recommended by the test reports of Exercise SAGE BRUSH, with certain modifications and changes deemed appropriate by CONARC. The SKY CAV unit would be combined

\(^{14}\) CONARC Summary of Major Events and Problems, FY 56, Vol. VIII, Cbt Dev Sec Gen Div, Jan - Jun '56, p. 3.
with, and made organic to, the 1st Armored Division's armored cavalry battalion for test in Exercise SLEDGE HAMMER. On 19 July, the Department of the Army informed CONARC that it had no objection to the test evaluation of the SKY CAV concept during Exercise SLEDGE HAMMER. It pointed out that the test of the SKY CAV concept could be conducted without major budgetary implications, interference with existing programs, and without the necessity for reorganizing elements of a high priority general reserve division if existing resources and facilities were utilized. The Department of the Army therefore directed that a transportation light helicopter company currently available to CONARC be used as the basic unit without reorganization. Additional necessary reconnaissance aircraft and aviators were to be provided to the helicopter company from CONARC resources. A provisional surveillance platoon, to include drone aircraft from signal test resources, was to be attached to the helicopter company on or after 1 February 1957 for the duration of the test. On 21 September, CONARC provided instructions for the organization, testing, and evaluation of the SKY CAV company (SKY CAV II) in Exercise SLEDGE HAMMER. CONARC furnished TOE 17-48T, Sky Cavalry Company, Armored Cavalry Battalion, Armored Division, on 15 October.15

The test of SKY CAV in Exercise SAGE BRUSH had shown that the unit was deficient in the nonair-transportable elements of the unit and was therefore not suitable for fulfilling the division's requirement for ground and aerial reconnaissance. SKY CAV II was an effort to accomplish the original objective by utilizing the reconnaissance battalion of an armor division and adding an organic Sky Cavalry company. This company would contain the necessary aerial reconnaissance and transport, and electronic and photographic surveillance devices to enable the battalion to fulfill the division's requirement for greater speed and accuracy in obtaining target information and intelligence, greater terrain coverage, and greater mobility in the performance of all missions of the reconnaissance battalion. SKY CAV II was not only a test of the SKY CAV company, itself, but also was a test of a concept for a new division reconnaissance battalion which included aerial reconnaissance and transport capabilities and electronic and photographic surveillance devices.

On 25 October, Fourth Army informed CONARC that if the helicopter company designated for SKY CAV II did not arrive at Fort Polk by 1 December, the test would be invalidated due to lack of

---

15

training with the division. CONARC informed Fourth Army on 10 November that the company would not be available before January 1957, and indicated that this date should provide adequate time to organize and train the unit. Actually, the 64th Transportation Company (Light Helicopter) with its H-34 helicopters and attached 544th Transportation Detachment did not move from Fort Sill to Fort Hood until 29 January and did not arrive at Fort Polk to begin training until 10 February. The late arrival of the company at Fort Polk was to have an adverse impact on the effectiveness of the unit during the exercise.16

Exercise SLEDGE HAMMER was conducted in the Louisiana Maneuver Area from 6 to 16 May 1957. Because of personnel shortages in the 1st Armored Division, the scope of the exercise was reduced to the conduct of troop tests of SKY CAV II and the Assault Pipeline and Bulk Supply of Armor. The final report of Exercise SLEDGE HAMMER was highly critical of the SKY CAV concept. One conclusion stated that the reconnaissance squadron did not have the capability of effectively supporting, operationally or logistically, a Sky Cavalry company. It was also concluded that the reconnaissance squadron was incapable of simultaneously carrying on a ground combat action in one area and planning and conducting airborne reconnaissance activities for the division in another area. Fourth Army felt that the SKY CAV concept of combining reconnaissance and cargo helicopters, reconnaissance aircraft, and armored reconnaissance elements in a single battalion was operationally and administratively unsound. The report contained the recommendation that the concept of Sky Cavalry as an organizational entity be discarded. Instead, in commenting on the final report Fourth Army recommended that the division aviation company be augmented by an additional four fixed wing reconnaissance aircraft and five reconnaissance helicopters to operate in tactical support of the reconnaissance squadron, with nine additional light cargo helicopters assigned to the division aviation company. Pending development of effective electronic and photographic devices, Fourth Army recommended that these items be deleted from current TOE.

Both Fourth Army and CONARC strongly objected to the recommendation to discard the SKY CAV concept. Both believed that the concept of improving reconnaissance capabilities by combining aerial reconnaissance, surveillance, and transport capabilities within the division was basically sound. CONARC in its comments pointed out

16 (1) Msg 1360 AKADC-E, Fourth Army to CONARC, 041630Z May 57. (2) Ltr ATNG-D&R 353.01/188(ATT)(21 Sep 56), CONARC to Distr, subj: Instructions for Organization, Testing, and Evaluation of Provisional Sky Cavalry Company (SKY CAV II). (2) DF, G-3 to CofS, 10 Nov 56, subj: Helicopter Support for Sky Cav II.
that Exercise SLEDGE HAMMER was not conducted to test the concept, but to determine whether the efforts of a SKY CAV unit could be combined with the armored division reconnaissance squadron. CONARC also believed that the electronic and photographic devices should not be deleted from TOE's, but that issue of such items should be limited to specific tests pending development suitable for general issue. Fourth Army stated that no test had been made of the concept or the effectiveness of Sky Cavalry as a separate organizational entity in a primary role as an information gathering agency in support of a more flexible and timely intelligence effort and urged further exploration of this area.17

On 27 September, CONARC forwarded to the Department of the Army an evaluation of the test of SKY CAV II. The evaluation concluded that there was a requirement for continued tests designed to develop doctrine for organization, equipment, and employment of such units, and particularly the units employing surveillance devices. It was uneconomical and unproductive to employ experimental surveillance equipment during maneuvers unless such tests were supported on a sufficient scale to ensure their success and unless the equipment had been through adequate engineering and user tests. CONARC believed that continued experimentation to develop surveillance devices was essential to meet the increased combat surveillance and target acquisition requirements of the field army.

CONARC recommended that the Commanding General, Fourth Army, be directed to develop, through experimentation, the optimum SKY CAV organization and technique of tactical employment, this experimentation to include the feasibility and desirability of including armed helicopters into such organizations. CONARC indicated that the 1st Reconnaissance Squadron (SKY CAV), 16th Cavalry, 2d U.S. Army Missile Command, at Fort Hood was the logical unit to serve as the test vehicle.

CONARC also recommended several actions to be taken by the Department of the Army. The Deputy Chief of Staff for Personnel should take action to fill the 1st Reconnaissance Squadron, 16th Cavalry, to authorized strength. The Chief Signal Officer should make available surveillance devices when they had reached a stage of development permitting troop testing of the reconnaissance and surveillance platoon of the reconnaissance squadron. The Director of Army Aviation should provide such additional equipment as was required in connection with the investigation of the desirability and feasibility of including armed helicopters in the SKY CAV organization.

17

129
CONARC went on to recommend that a test of a SKY CAV-type unit be scheduled for Exercise GRAND BAYOU, scheduled for the second quarter of FY 1960. Operation and maintenance personnel for the surveillance-type units organic to the new infantry, airborne, and armored divisions and the missile commands should be trained by the Combat Surveillance and Target Acquisition Training Unit at Fort Huachuca. The U.S. Army Combat Developments Experimentation Center should conduct experiments to test the integral elements of surveillance units scheduled for the PENTOMIC Army.

On 26 December, the Department of the Army concurred in the conclusions of CONARC, although designation of the 1st Reconnaissance Squadron, 16th Cavalry, as the organization responsible for further development of SKY CAV concepts was not favorably considered because the availability of special devices and equipment and the requirements of other units would preclude fully equipping these four reconnaissance troops within the foreseeable future. The Department of the Army considered that further testing should be restricted to that which could be accomplished by Troop A, 1st Reconnaissance Squadron, 16th Cavalry, and U.S. Army Combat Developments Experimentation Center as equipment could be made available to these units. Testing within the missile command would be limited to perfecting doctrine and concepts applicable to that type organization, primarily target acquisition, rather than an extension of ground reconnaissance.

The Department of the Army stated that the feasibility of using armed helicopters had been fully established. Whether armed helicopters should be integrated into ground reconnaissance of SKY CAV-type units was considered an appropriate subject for evaluation in a field exercise or maneuver in the near future. The Department of the Army believed that future tests of a SKY CAV unit should be conducted as rapidly as adequate equipment and supervision could be provided and personnel trained. Any test of such a unit must also evaluate the logistical support load thrown upon a field army. The use of CDEC to test the integral elements of surveillance units was considered appropriate; however, in view of the existing requirement for additional information and guidance in this field, tests should be applied to present or near future organizations in addition to those planned for the PENTOMIC Army.

---

18 This exercise was cancelled in 1959 due to lack of funds. Moenk, Large-Scale Maneuver, p. 222.

The Armair Brigade Study

During 1956 and 1957, the Army Aviation School initiated and largely developed a study entitled "The Armair Brigade." The concept proposed by the Army Aviation School was an extension and enlargement of the SKY CAV organization. The brigade included sky cavalry organizations as subordinate units and provided for a completely airmobile combined arms unit with a capability for sustained operations. The brigade concept provided a high degree of mobility and gave the commander the means of attaining a high degree of freedom of movement.\textsuperscript{20}

The organic aircraft of the Armair Brigade provided surveillance information, reconnaissance, and battlefield observation to all echelons of command. The brigade was also able to provide direct application of firepower. The limited Army aviation assigned to the new ROCID division had no appreciable effect on the speed at which the entire ground force moved. In the Armair Brigade, by contrast, movement was geared to the speed of its helicopters and not the pace of the foot soldier.

The Armair Brigade's advantages of faster reaction time, flexibility, high mobility, and direct fire support, were offset by some inherent and complex deficiencies. A troop test and evaluation was proposed to study these problems. The major unresolved problem was the vulnerability of helicopters to light enemy ground fire. Another significant problem was the necessity of moving large quantities of aircraft fuels and lubricants to advanced or separate battlefield locations. The adverse effects of bad weather and poor visibility were also important considerations. A serious shortcoming of the helicopter was the extensive and constant need for maintenance and repair.

The Army Aviation School staff planners made certain basic assumptions regarding the vulnerability of helicopters to enemy ground fire. This problem was not investigated in detail until the experiments conducted by the U.S. Army Combat Developments Experimentation Center in 1959.\textsuperscript{21} It was possible at the time of the Armair Brigade study, however, to ascertain with a degree of accuracy the requirements for fuel and lubricants that logistics organizations would have to provide. Everything was to be carried in airmobile

\textsuperscript{20} This section is based on Weston and Stephens, Helicopter Armament, Pt I, pp. 30 - 47.

\textsuperscript{21} See above, Ch. IV, pp. 103 - 09.
vehicles and this imposed a tremendous requirement in regard to forecasting, handling, and delivery of the quantities of petroleum, oil, and lubricants (POL) necessary to support a completely air-mobile brigade. The concept devised to solve this problem was the use of bulk delivery from Army supply points to the brigade using a system of aircraft tankers or collapsible fuel cells. Deliveries within the brigade would then be made by the tankers of the aviation POL company. Since the brigade had no facilities to stockpile fuel, deliveries from the tankers of the support group would be made on a rigid schedule whenever the unit was engaged in operations. Refinement of this concept awaited the results of troop tests and organizational development.

Despite the recognized requirement of extensive maintenance of brigade helicopters, no technical service organization was proposed to be included in the unit. This arrangement was in keeping with the principle of reducing to the absolute minimum the service support personnel in the brigade, but was in direct opposition to the requirements for specially trained and highly skilled maintenance men. This contradiction was circumvented by creating within the brigade a pool of technical service personnel. The pool, located in the support group, was expected to provide assistance in major maintenance requirements. The support group was to consist of two emergency repair companies and a rear support company. The rear support company was divided into teams of technical personnel that were to be placed in a direct support or attached basis to each of the combat elements of the brigade.

This concept of maintenance operations was based on restricting equipment down time to a 24-hour limit. Any equipment requiring more time than this to repair would be evacuated by the Army aviation maintenance unit in support of the brigade. Normal maintenance would require the assistance of the combat units' organic personnel as well as the teams from the support group. Although this maintenance concept was a major innovation of the Armair Brigade study, indications that it was feasible were derived from experience gained by the 101st Airborne Division in Operation JUMP LIGHT. The proposed maintenance system was described as the "functionalized" approach.

The maintenance concept contained in the Armair Brigade study received a number of critical evaluations. The functionalization of maintenance would require additional skills from the supporting personnel. This, in turn, would require greater training and experience on the part of technicians, resulting in increased and more complex training requirements. It remained questionable whether the technical service people could perform the variety of work required. The proposed system was also ambiguous as to where the ultimate responsibility for maintenance resided -- with the combat unit commander or with the direct support group commander.
During non-combat periods, the brigade would depend heavily upon technical service support as its own maintenance capacity would be inadequate unless periodic support was provided. It was obvious that complete consideration of this maintenance concept was not possible until a full scale troop test could be held.

The brigade was organized as much as possible along standard lines. Deviations from existing organizations were made only where the unique requirements of a helicopter mobile combined arms group made them necessary. A major consideration in the design of the Armair Brigade was to ease the transition of troops and equipment into the new brigade.

The Armair Brigade was to consist of a headquarters and headquarters company, a reconnaissance-attack company, a Sky Cavalry group, an infantry battle group, an airphibious artillery battery, and a support group. Certain accepted and proposed units were used in the brigade concept. The existing units adopted for use were:

- Sky Cavalry Troop
- Aero Infantry Company (ROCID TOE 7-17C)
- Infantry Battle Group (ROCID TOE 7-11C)
- Field Artillery Battery, 762-mm. Rocket (ROTAD TOE 6-238T-Airphibious)
- Airborne Maintenance Battalion (ROTAD TOE 29-657T)
- Tactical Transportation Battalion
- Artillery Battery, 318-mm. Rocket

The headquarters company performed the normal command, control, staff planning, and supervision functions. The reconnaissance-attack company combined aerial maneuver and air-to-ground fire power. The fire power of the company, combined with the other arms in the brigade, provided maximum on-target effect. The Sky Cavalry group was to perform aerial and ground reconnaissance, provide security to the unit to which assigned or attached, and provide delaying actions through offensive and defensive actions. The unit was designed to exploit aerial mobility, surprise, and shock action inherent in its distinctive equipment. The infantry battle group added aerial mobility to its traditional mission of closing with the enemy. This unit also had the command structure to create and control task forces on independent missions.

To obtain artillery capabilities despite the weight of most existing artillery equipment, the airmobile concept called for the use of the lightweight, air-transportable 318-mm. LITTLE JOHN rocket.
This rocket had a nuclear capability. The LITTLE JOHN battery provided long-range aerial artillery support and reinforcing fires to units of the Armair Brigade.

The brigade was manned on an austere basis to enable it to move rapidly over long distances. The matter of limited personnel would present problems only in a sustained combat situation; a role for which the brigade was not designed. Each unit contained the men necessary to perform its combat mission, only, and reductions were achieved in the normal complement of administrative, mess, and ground vehicle support personnel.

A limitation on the Armair Brigade at the time of its conception in 1956 was the available aircraft. The brigade was to use existing aircraft. Although the study included the use of armed helicopters, the actual development of this armament had just begun. The adaptability of machine guns to helicopters was by this time widely practiced and accepted, but the practicality of heavier armament still had not been proven. The H-34 and H-21 helicopters were used in the Armair Brigade study as armed troop carriers for tactical operations. The tactical transport battalion contained H-37 helicopters.

The use of fixed wing airplanes was severely limited in the Armair concept. Except for limited command, control, and liaison aircraft, no fixed wing airplane was considered standard for the brigade. The use of fixed wing airplanes was limited because airfield and aircraft requirements were incompatible with those of helicopters. Even though small in number, coordinating the different needs of fixed wing and rotary wing aircraft would add to the complexity in logistics, maintenance, and supply channels.

The H-21 and H-34 helicopters were capable of transporting a full squad, while mounting two machine guns or several aerial rockets. The armed helicopters would be able to deliver troops quickly to the area of the objective. The transport helicopters, in conjunction with the armed reconnaissance and weapons helicopters, would be capable of providing suppressive fire in the landing zone. The weapons helicopters would be available to respond on call to deliver their heavier firepower when needed. The transport helicopters would move using cover and concealment to protect them from ground fire and aid in maintaining the element of surprise.

Although the Armair Brigade proposal never received the troop test and evaluation necessary to properly evaluate and develop the concept, the study is significant in the history of Army aviation. In this 1956 study appear many of the concepts that were to be fully developed in the air assault division tests and organization of the airmobile division in the 1960's and the development of the air cavalry combat brigade in the 1970's.
H-21 SHAWNEE (Flying Banana) Transport Helicopter
Helicopter Carrier Tests

The employment by the United States Marine Corps of troop carrying helicopters based on aircraft carriers offered a new dimension to amphibious operations. In 1958, the Army began to investigate the feasibility of operating its helicopters from aircraft carriers.

Exercise ROCKY SHOALS was held in the vicinity of San Simeon Point, Calif., during the period, 1 to 10 November 1958. Approximately eighty Army aircraft participated in this maneuver. Participating units with Army aircraft included the III Corps Aviation Section, 4th Aviation Company (Infantry Division), 33d Transportation Company (Light Helicopter) (H-21), 57th Transportation Company (Light Helicopter) (H-21), and 416th Signal Company (-).

The experience of this exercise pointed to notable advantages of helicopter landings as opposed to amphibious landings, the most apparent of which were the ability to land beyond the beach, independent from surf conditions, speed and maneuverability, and increased dispersion of shipping.

An assault helicopter aircraft carrier transported five H-21 helicopters to an off-shore position. Only the top deck of the carrier contained helicopters because the ship's elevator was too small for helicopter storage below deck. Additional Army aircraft participating in this amphibious maneuver were flown to the exercise area because of the limited number of ships. Air traffic control was assumed by the Army forces upon passing corps control ashore.

A reinforced infantry company from the carrier USS Thetis Bay landed by helicopter on an objective seven miles inland. Other actual cargo helicopter missions included movement of Aggressor forces, delivery of rations to forward units, and delivery of critical ordnance supplies, including a jeep engine. The hilly terrain of the maneuver area indicated a need to plan for aircraft automatic radio relay.22

During the period, 13 to 23 April 1959, one observer from CONARC and seven from Second and Third Armies and the Army Aviation School observed Marine helicopter operations from the USS Boxer at Vieques, Puerto Rico. The observer group concluded that special training was necessary for operation of Army helicopters from Navy aircraft carriers and that appropriate field publications should be

developed and tested. Recommendations of this group included a directive to the Army Aviation School for development of a training text, a letter to Third Army advising helicopter employment from a carrier during the next spring and summer, and a letter to the Department of the Army requesting direct coordination with the Navy and the Marine Corps for pilot instruction and Navy helicopter carrier utilization.23

On 18 August 1959, CONARC pointed out to the Department of the Army that the necessity for dispersion of a landing force and for early seizure of inland objectives had established the role of the helicopter and the helicopter carrier in amphibious operations. Army experience with helicopter carrier operations had been limited to Exercise ROCKY SHOALS, and Army training literature for such operations did not exist.

CONARC proposed the development of a training text for operating helicopters from helicopter carriers during amphibious operations, followed by a training exercise, in coordination with the Navy and the Marine Corps, to test and evaluate this training text. CONARC asked the Department of the Army to obtain from the Navy a suitable helicopter carrier for the training exercise. In addition, a nucleus of approximately twelve Army aviation instructor pilots needed Marine Corps training in helicopter carrier operations.

On 9 November, the Department of the Army approved this proposed action and requested that Navy and Marine Corps support be made available. The Army Aviation School prepared the initial manuscript of TT 1-( ), Helicopter Operations from Helicopter Carriers, and the Commanding General, Third Army, was directed to test and evaluate this training text. To assure an effective evaluation, four each H-37, H-34, H-21, and HU-1A helicopters were to be used and a minimum of two pilots and two crew chiefs for each type of helicopter employed plus selected aviation ground handling personnel were to receive training conducted by Marine Corps instructors.

Temporary duty Marine Corps instructors conducted preliminary carrier training for aircraft crews at Fort Bragg during the period, 25 May - 15 June 1960. Actual carrier operations and training exercises were conducted from the USS Antietam, 21 to 24 June, within the Pensacola, Fla., training area.24

Organizational Developments

The potential of aviation gave rise to a number of proposals for its tactical use. Various types of new units were proposed and tests helped develop doctrine for the combat employment of Army aviation.

On 13 December 1957, General Howze briefed General Wyman, the CONARC commander, on a concept for establishing an armed helicopter unit at Fort Bragg. This unit was to be designated an air cavalry unit and would be approximately battalion (-) in size. Upon completion of the briefing, General Howze requested that General Wyman submit a CONARC position to the Department of the Army on the establishment of this type of unit. On 19 February 1958, CONARC recommended to the Department of the Army that an aerial battalion (infantry) be activated at Fort Benning during the fourth quarter of FY 1959. The proposed unit was to be a TD unit in order to allow for the conduct of experiments. Its mission would be to test the validity of the use of armed helicopters, development of organizational data, tactics, and techniques of employment. The Commanding General, Third Army, would be responsible for the conduct of the tests with assistance from the Army Aviation School.25

On 2 July 1958, the Department of the Army requested CONARC to prepare a study to develop initial concepts for employment of Army aircraft in conjunction with ground combat forces during the period, 1958 - 1970. In summary, the study group concluded that aircraft with suppressive fire capability could be employed to increase the mobility of ground forces. It also concluded that an aerial combat reconnaissance platoon be included in the cavalry squadrons of the infantry and armored divisions and that an aerial combat reconnaissance company be organic to the armored cavalry regiment.

The study group recommended that the Department of the Army direct training programs for airmobile operations in overseas theaters. CONARC would be authorized to organize, equip, and train an aerial combat reconnaissance platoon as an organic part of the cavalry squadron of one infantry division and as an organic part of the armored cavalry squadron of one armored division. One aerial combat reconnaissance company was to be an organic part of an cavalry regiment. CONARC forwarded the study to the Department of the Army on 25 July.26

25 Ibid., FY 58, Vol. II, Army Avn Sec, Jan - Jun 58, p. 5.

In accordance with a Department of the Army directive in December 1958, a troop test of the aerial reconnaissance and security troop was conducted at Fort Stewart in January 1960. The objectives set forth for this test included determination of the optimum organization for a company-size aerial reconnaissance and surveillance unit (ARST) and doctrine for its tactical employment. Organizational and supporting supply and maintenance requirements for ARST units were also to be determined. Another test objective was the determination of the feasibility of employment of the ARST unit on modern battlefields and of the best location of the unit in the division structure.

Third Army conducted the test in accordance with a plan prepared by the Armor School. The test had two phases -- first, the unit operated as an integral part of the armored cavalry squadron, and second, with the unit operated directly under division control. A sufficient variety of situations was included in each phase to provide a representative picture of its capabilities.

CONARC forwarded the final test report to the Department of the Army on 9 August 1960. One recommendation asked that the concept of the aerial reconnaissance and security unit be accepted as valid and that no further testing be accomplished. It was further recommended that company-size units of this type be integrated into the Army structure as organic elements of the armored cavalry squadrons of infantry and armored divisions and as a separate element under the armored cavalry regiment headquarters. The organization, as tested, should be accepted as basically sound and used for the basis for preparation of advance plan TOE changes to TOE's 17-45D, 17-55D, and 17-85D. The final recommendation was that the title for this type unit be changed from aerial reconnaissance and security to air cavalry. CONARC also reported to the Department of the Army that there was no requirement to test battalion-size units of this type.27

A CONARC ad hoc committee met during the period, 19 - 21 April 1961, to determine how a provisional air cavalry troop with supporting maintenance detachment could be organized from CONARC resources. Consideration was given to the 8305th Aerial Combat Reconnaissance Company at Fort Rucker and the 2d Aviation Company at Fort Benning. The committee developed TOE's for these provisional organizations with a strength of 32 officers, 3 warrant officers, and 1 warrant officer.

officers, and 121 enlisted men. Major items of equipment consisted of twelve H-34 and fifteen H-13 helicopters. CONARC informed the Department of the Army on 3 May that Third Army had determined that the 2d Aviation Company could best meet the equipment and personnel requirements to activate an air cavalry troop and an aircraft field maintenance detachment. Third Army was instructed on 23 May to activate these units.28

The 2d Air Cavalry Troop (Provisional) and the supporting 2d Transportation Aviation Aircraft Field Maintenance Detachment were activated at Fort Benning using the 2d Aviation Company, 2d Infantry Division, as a nucleus. These units attained operational status on 15 July 1961. Their purpose was to provide the Army with an immediate air cavalry capability until an air cavalry troop could be organized at Fort Knox and become operational under TOE 17-108E. Expansion of the Army, however, required that the 2d Infantry Division be brought up to full strength to meet higher Strategic Army Corps priority. Because of this requirement, the 2d Aviation Company was relieved of its mission of providing the provisional air cavalry troop. The 8305th Aerial Combat Reconnaissance Company (Provisional) at Fort Rucker was then used as a nucleus to activate the 2d Air Cavalry Troop with supporting field maintenance detachment. This unit became operational at Fort Rucker on 23 November 1961.29

Airmobility

Army aviation was about to enter a dramatic new era. By early 1962, all the factors needed to give the Army a real airmobile capability existed. The armed helicopter had been adopted, a doctrine of airmobile employment was being developed, and suitable aircraft were just entering service.

The development of the doctrine had begun with the proposals of General Gavin. Most of the actual formulation of doctrine took place at the Army Aviation School, Infantry School, and Armor School with guidance provided by the Director of Army Aviation and CONARC. The Armair Brigade Study of the Army Aviation School expressed many of the concepts that were to become a part of airmobile doctrine.

28 Ibid., FY 61, Vol. IV, G-3 Sec Doc & Req Div, Jan - Jun 61, p. 12.

Although much progress had been made, some felt in early 1961 that the evolution of organization and tactics involving integrated aviation had been overly cautious. General Clyde D. Eddleman, the Vice Chief of Staff of the Army, told an Association of the United States Army Aviation Symposium at Fort Rucker on 23 March 1961 that the air cavalry troop was a good example of the evolution problem. General Eddleman stated that it would be desirable to add this capability to the ground forces, but in order to form this type of unit other units must be given up. The substitutes had to be carefully considered. There was now a schedule of deployment for air cavalry troops and recent tests had confirmed that the concept was sound. These troops could be substituted for a ground troop of the reconnaissance squadrons of the infantry and armored divisions and might replace one troop of the separate armored cavalry regiments.

General Eddleman realized that there had been sound reasons for proceeding with deliberation in forming air cavalry units, notable the early state-of-the-art in helicopter weapons systems. But he warned not to let development of concepts of employment wait for ideal air vehicles. Alluding to the work of the Rogers Board, General Eddleman stated that a 10-year plan had a subtle implication attached to it. He warned that if all attention were focused on 1970, the Army might be in danger of falling short of its intermediate goals. By promising the 1970 soldier everything, little or nothing might be produced for the soldier of the 1960's.

The concerns of General Eddleman were reflected in the shift of national defense policy which began in 1961. This shift was to lead in the following year to the proceedings of the Howze Board and the beginning of a new era in airmobility and Army aviation.

Chapter VI
MATERIEL DEVELOPMENT

The final link in the development of an airmobile capability for the Army was the provision of suitable aircraft. In 1957, General Howze wrote, "We expect improvement in our aircraft. While what we have are now very useful, we need aircraft that are simpler and easier to maintain, with greater capacities, better performance, and a greater ability to land and take off from very small unimproved fields."¹

Two years later, Brig. Gen. Clifton F. Von Kann, the Director of Army Aviation, speaking at Fort Eustis said, "Our goal in the immediate future is to simplify the models and types of Army aircraft to a minimum in order to reduce their cost of procurement, operation and especially maintenance."² General Von Kann went on to say that the Army had a requirement for new light observation aircraft -- 3,000 aircraft by 1970 -- and a flying crane. In 1959, the Army had about 5,000 aircraft with a requirement for 6,500. Of this inventory, 68 percent were in the light observation area. General Von Kann believed that the aviation budget must be increased at least threefold to make sure the Army increased its mobility potential rather than experience a steady decline.

Many of the aircraft and equipment developments which took place between 1955 and 1962 have been described in the preceding chapters. The successful implementation of the airmobility concept required much more sophisticated aircraft than were in service in 1955. The introduction of the XH-40 helicopter -- subsequently redesignated the HU-1 -- eventually proved to be the key element in making real airmobility possible. Late in the period, the development of the HC-1 CHINOOK helicopter and the AC-1 CARIBOU fixed wing transport further expanded the Army's ability to move significant forces by air within the combat zone. The search for an adequate reconnaissance aircraft produced the AO-1 MOHAWK airplane and testing was well underway to choose a new light observation helicopter. Army aircraft during this period are shown in Table 2.

² Address by Brig Gen Clifton F. Von Kann to the Senior Officers Army Aviation Logistics Course, Ft Eustis, 26 Oct 59.
U.S. Army Aviation Board

The Army Aviation Division of Army Ground Forces Board No. 1 had been established in 1945 at Fort Bragg. To facilitate coordination and interchange of ideas, the division -- by then known as the Army Aviation Service Test Division -- in June 1954 was transferred to Fort Sill, the location of the U.S. Army Aviation School. In October 1954, the Army Service Test Division followed the school to Camp Rucker. For administrative purposes, the division at Camp Rucker was placed under direct control of Army Field Forces Board No. 5, located at Fort Bragg.

Early in 1955, it became apparent that the test division could not cope with the tremendous amount of testing required by the rapid growth of Army aviation. Consequently, CONARC Board No. 6 was established at Fort Rucker on 1 August 1955. The board was redesignated the U.S. Army Aviation Board on 1 January 1957. The U.S. Army Aviation Board function was similar to other CONARC boards. Items that passed engineering tests were distributed to appropriate CONARC boards for user tests. After examining the items carefully, the boards recommended to CONARC whether or not the items had military potential.

In May 1956, the Chief of Staff of the Army directed the establishment of Transportation Corps and Signal Corps test activities at Fort Rucker. The U.S. Army Transportation Aircraft Test and Support Activity (TATSA) was organized in July as a Class II activity of the Office of the Chief of Transportation. Its primary mission was performance of logistical evaluation of new types of aircraft and equipment. The U.S. Army Signal Aviation Test and Support Activity (SATSA) was established in September as a Class II activity under the Chief Signal Officer. Its mission included the evaluation of the suitability of spare parts, tools, and test equipment used in the avionics field. In August 1962, TATSA and SATSA were combined with the U.S. Army Aviation Board to form the U.S. Army Aviation Test Board.3

The Development and Procurement Cycle

When the United States Air Force was established as a separate service in 1947, responsibility for Army aircraft development and procurement was transferred to it. In 1956, the Army was given responsibility for all phases of aircraft planning through disposition of its own aircraft except for procurement and engineering.

3 (1) U.S. Army Aviation Center and Army Aviation School History, 1954 - 1964, p. 50. (2) CONARC GO 14, 15 Jul 55. (3) CONARC GO 1, 1 Jan 57.
These two functions could be assigned to either the Air Force or the Navy. The Army in 1960 requested and was given authority to purchase off-the-shelf items, prepare specifications for Army air items, establish and conduct appropriate boards for evaluation and inspection, participate with developing services in all phases of the testing of Army air items, and to assign qualified personnel to Air Force and Navy development and procuring services. The Air Force objected to the Army assumption of these responsibilities, but the Department of Defense affirmed the new policy.  

Responsibilities for research, development, supply and maintenance, and training were assigned and modified by a series of inter-service agreements, memoranda of understanding, and Department of Defense directives. By 1962, these responsibilities were distributed as follows:

Developmental Objectives for Army Aviation

On 22 October 1958, the Department of the Army directed CONARC to conduct a comprehensive study entitled "Study of the Developmental Objectives of Army Aviation." This study was to expand or modify the concepts developed in a previous CONARC study entitled "Army Aircraft and Ground Mobility 1958 - 1970." As a result of the new study, CONARC materiel requirements for Army aircraft might be materially changed. In December, CONARC advised the Chief of Research and Development, Department of the Army, of the status of CONARC qualitative materiel requirements and military characteristics for Army aircraft. It recommended that the qualitative materiel requirements and military characteristics prepared be used for guidance only, finalization to be held in abeyance pending completion of the study. The new study was to be completed by 31 August 1959 and covered the following areas: type air vehicles (including drones) or a listing of their desirable characteristics to be developed on a phased basis; personnel aspects; provision for reconnaissance and surveillance; integration and pooling of air vehicles; logistical concepts; and optimum organizational concepts for employment of Army aircraft at each echelon at which assignment of aircraft was appropriate.

The study was to be conducted under the overall monitorship of CONARC with various agencies contributing to the study by the preparation of sub-studies. The following agencies were to assist by preparing sub-studies to be used as input data to the overall study: Army Aviation School; Transportation Corps Combat Development Group, Fort Eustis; and Army Logistical Management Center, Fort Lee. A working committee, consisting of representatives of cognizant staff sections and responsible for the preparation of the final report, was established at CONARC.

The Ist Logistical Command recommended that the organization, role, and operational concepts relative to Army aviation within the framework of the theater army organization be included in the studies. CONARC determined that the information could be obtained by expansion of the study of Army aviation developmental objectives. Accordingly, the Transportation Corps Combat Development Group and the Army Aviation School were requested to include in their respective sub-studies comments and recommendations on the general role of Army aviation within the framework of the theater of army organization.

During the last half of FY 1959, the Infantry School received CONARC approval for a sub-study aimed primarily at determining infantry requirements for aerial vehicles in the 1959 - 1970 period. Sub-studies were received during this period from the Army Aviation School, the Infantry School, and the Transportation Corps Combat Development Group. The second phase of the Infantry School
HU-1 (UH-1) IROQUOIS Utility Tactical Helicopter
study, covering the period 1965 - 1970 was withheld by the school pending additional guidance from the MOMAR-70 Study.\(^5\)

Additional sub-studies were submitted during the first half of FY 1960 by the Army Artillery and Missile School, the Transportation Corps Combat Development Group, and the Army Aviation School. The Infantry School also completed the second part of its study during this period. The entire study was completed and approved by the Commanding General, CONARC, and forwarded to the Department of the Army on 9 May 1960. Although CONARC distributed the report throughout the combat development system in CONUS, copies were not furnished to agencies outside the Army since the report had not yet been approved by the Department of the Army.\(^6\)

The Army Aircraft Development Plan which began to take shape during this period provided for an orderly aviation development through the decade, 1960 - 1970. According to the plan, the L-19, H-13, and H-23 observation aircraft were obsolete and should be replaced. After approving the plan, the Chief of Staff of the Army created the Army Aircraft Requirements Review Board (Rogers Board) whose deliberations have been discussed above.\(^7\)

**Helicopter Development**

**HU-1 IROQUOIS**

The Army Equipment Development Guide of 1952 had stated a requirement for a helicopter for medical evacuation, instrument trainer, and general utility missions. As a result of changes made at this time and advances in the state of the art, revised military characteristics were prepared and forwarded to the Department of the Army in November 1953. Existing utility helicopters either were too large for operations in anticipated conditions or they had inadequate performance. Furthermore, they were more complex and difficult to maintain than was desired and some were not satisfactory as an aircraft ambulance because of the difficulty of litter stowage and handling.

---

\(^7\) (1) OCoT, Summary of Major Events and Problems, FY 61, p. 21. (2) See above, Ch. II, pp. 25 - 31.
In June 1955, the Bell Aircraft Corporation was successful in a competition to select a new utility helicopter for the Army. The Bell XH-40 was designed specifically to meet Army military characteristics and requirements. It was a closed cabin helicopter of all metal construction employing one 2-bladed main rotor and a 2-bladed anti-torque tail rotor. Powered by one Lycoming gas turbine engine, it was the Army's first turbine-powered engine, eight fixed wing or rotary. The XH-40 was designed for a payload, excluding fuel, oil, and pilot, of 800 pounds which could be carried as cargo or as 3 passengers with 200 pounds of baggage, or with 1 medical attendant with 2 litter patients and 100 pounds of cargo. Development progressed sufficiently so that the Mock-Up Inspection Board, including one CONARC representative, conducted an inspection in mid-November 1955. As a result, 106 minor changes were proposed of which 96 were approved by the board for incorporation in the 3 experimental aircraft.

The first of the three prototypes XH-40's was flown on 22 October 1956, less than sixteen months after design work began. Even before the first flight, a service test batch of six YH-40's had been ordered, and these were delivered by August 1958. One remained with Bell, together with the XH-40's, 1 went to Eglin Air Force Base, Fla., for climatic and cold weather testing, 1 to Edwards Air Force Base, Calif., for Air Force testing, and 3 to Fort Rucker for Army trials. Numerous small changes were made in the YH-40's, including a 13-inch lengthening of the fuselage to increase cabin capacity to four stretchers, an increase of ground clearance by four inches, wider crew door, and changes in the controls.

In December 1958, it was determined, subject to satisfactory completion of the remainder of the service test, that the YH-40 was suitable for Army use under desert conditions. CONARC forwarded the results of the service test to the Department of the Army in March 1959. Various deficiencies in the YH-40 were listed for correction when the aircraft went into production as the HU-1. Subject to the results of further service testing of the HU-1, the aircraft was considered suitable as a utility helicopter.

9 The "X" designation normally indicated a prototype, while the "Y" designation was given to indicate service test status.
In October 1958, CONARC directed the Army Aviation School to troop test the HU-1A. The objectives of the test were to determine changes in organization and equipment required for operation and maintenance of the HU-1A, when issued as a replacement for the H-19 utility helicopter, and to develop and prepare for publication new and revised operational instructions. In March 1959, the Army Aviation School pointed out to CONARC that the YH-40 service test conducted by the Army Aviation Board had already answered the objectives of the proposed troop test of the HU-1A and recommended that the test be cancelled.

In May, CONARC agreed to cancel the HU-1A troop test. The Army Aviation School, however, was to review the interim and final reports of the service test of the YH-40 to determine necessary changes in Army aviation doctrine, publications, and TOE's when the HU-1A replaced the H-19. The Army Aviation School submitted its recommendations in these areas to CONARC in June.10

While the final steps were being taken in the adoption of the HU-1, CONARC began preparation of the training program for the new helicopter. On 3 October 1958, CONARC approved the program of instruction for the HU-1A maintenance course. The purpose of this 2-week course was to train enlisted men in organizational maintenance of the HU-1A helicopters. The first class, consisting of eleven 101st Airborne Division mechanics, reported on 24 June 1959. One hundred and fifteen mechanics were programmed for the course in FY 1960. On 14 January 1959, CONARC approved the program of instruction for the HU-1A Instructor Pilot Transition Training Course. The purpose of this 5-week course -- which was reduced to four weeks on 22 June -- was to train commissioned and warrant officer Army aviators as unit instructors in the HU-1A helicopter. The first class, consisting of two 101st Airborne Division aviators, reported on 10 June. Twenty-two aviators were programmed for the course in FY 1960.11

Delivery of the first nine pre-production HU-1A's took place on 30 June. A contract for 100 of the helicopters had been announced in March. These helicopters were generally similar to the YH-40's, with a 700 h.p. Lycoming turbine engine. In July, CONARC furnished the Department of the Army with its requirements for HU-1A helicopters. CONARC concurred in a proposal to retain H-34 helicopters.

in the airborne divisions until an adequate tactical transport helicopter became available. CONARC recommended that eight H-13 helicopters in each airborne division be replaced by a like number of HU-1A's. CONARC also recommended that the number of utility helicopters in the infantry and armored divisions not be increased until evaluation of the proposed D series of aviation company TOE's.

Of the original order, fourteen HU-1A's were delivered to the Army Aviation School as instrument trainers with dual controls and provision for blind flying instrumentation. The priority distribution schedule for the first forty-seven HU-1A's included four instrument trainers for the Army Aviation School and provided for filling the requirements of the 82d Airborne Division.12

Following delivery of a HU-1A to the Army Aviation Board in July for further testing, deliveries were made to the 82d Airborne Division, 101st Airborne Division, and 57th Medical Detachment (Helicopter Ambulance). During the first half of 1960, the airborne divisions conducted a tactical evaluation of the employment of the HU-1A. The primary purpose of this evaluation was to provide information to determine the suitability of the HU-1A for assignment to the TOE of the airborne division as replacement for the H-34's. As a result of these evaluations, CONARC recommended the replacement of twenty light transport helicopters in each division with thirty-two HU-1A's.13

Prior to FY 1961, production deliveries of the HU-1 had reached a rate of ten aircraft per month. During FY 1961, actions taken in the development of the FY 1962 budget enabled the production rate to be increased to thirty aircraft per month. Distribution to the field placed these helicopters in the hands of the troops in the Pacific, Europe, and Alaska as well as the STRAC units in CONUS.

Deliveries of the HU-1A were completed in June 1961. An improved model appeared in 1960 with the successful flight of the first of four HU-1B's. This model had a 1,000 h.p. Lycoming engine and accommodated eight passengers. The first production HU-1B's were delivered in March 1961 and successfully passed their service test. Late in 1961, a further contract for the 274 HU-1B's was

announced. Still another model, the HU-ID, had a 1,100 h.p. Lycoming engine and an enlarged cabin to accommodate twelve fully equipped troops. The first HU-ID flew on 16 August 1961, and eight more were ordered later in the year.\textsuperscript{14}

**Light Observation Helicopter**

In July 1953, as a result of a requirement in both the Combat Development Objective Guide and the Army Equipment Development Guide, OCAFF submitted to the Department of the Army military characteristics for a 2-place reconnaissance helicopter. In May 1954, OCAFF again emphasized the need for such an aircraft and recommended procurement of troop test quantities of the YH-32 helicopter for evaluation. The YH-32 was a small ultra-light helicopter with a 2-blade rotor powered by a ramjet at each blade tip. Engineering tests, however, subsequently indicated that the YH-32 possessed so many inherent deficiencies that it could not meet the requirement for a new 2-place reconnaissance helicopter. CONARC therefore recommended that procurement and troop test of ten YH-32's be cancelled.

On 11 October 1955, CONARC recommended the initiation of a development project to produce a new standard 2-place reconnaissance helicopter as a replacement for the command, liaison, and reconnaissance functions performed by the H-13 and H-23 helicopters. The H-13 and the H-23 had been used to perform aeromedical evacuation in addition to these functions. The H-19 utility helicopters were being used in increasing numbers for aeromedical evacuation and the introduction of the H-40 was expected to eliminate any further need for the H-13 and H-23 for this purpose.

On 19 March 1956, CONARC pointed out to the Department of the Army that the need for an inexpensive reconnaissance helicopter was not being recognized in the current research and development programs. Unless a replacement for the H-13 and H-23 were developed, the Army would be confronted with continued expensive and marginal product improvement of obsolete aircraft or the procurement of off-the-shelf aircraft, neither of which would be capable of adequately fulfilling the Army's needs.

CONARC believed that the availability of a suitable replacement for the H-13 and H-23 would help the widespread integration of aircraft at the lower echelons of all arms and services. Such a goal could be achieved only if the aircraft were inexpensive in mass production, had a high availability rate, could be readily maintained at the echelon used, and was specifically designed to meet an Army requirement. The Chief of Research and Development Department of the Army, agreed to include the requirement for a new reconnaissance helicopter in the Transportation Corps research and development budget for FY 1957.15

The new military characteristics prepared by CONARC called for a reconnaissance helicopter which would be used by battalion and separate unit commanders of all arms and services for command transportation, route and position reconnaissance, and observation of assigned areas of operations. The helicopter should not require a prepared airfield. It should operate on standard vehicle fuels, be easy to camouflage and maintain, and simple to operate. The helicopter would normally be employed singly, carrying a pilot and passenger or observer, in the forward areas at low altitudes and within friendly lines. In addition, the helicopter should be suitable for use in the primary training of helicopter pilots.16

To meet this requirement for a reconnaissance helicopter, three different models were initially considered. Completed in October 1958 was the service test of the French YHO-1 DJ, a reconnaissance helicopter powered by a gas turbine compressor. The desert and temperate testing of the Hughes YHO-2 HU was completed in October 1959. This helicopter was found to be the most suitable of the light 2-place helicopters tested, but not suitable as a replacement for the H-13H due to its limited load carrying capability. User test of the YHO-3 BR was cancelled due to design deficiencies revealed by engineering test.17

16

Ltr ATSWD-G 452.1(C), CONARC to DA, 19 Mar 56, Incl 3.

17

No immediate action was taken to adopt a new reconnaissance helicopter following the failure of the first three models to meet Army requirements. In answer to a request from the Office of the Chief of Transportation on 27 March 1960, the Bureau of Naval Weapons on 31 March consented to let contracts for the competition for a new light observation helicopter. The Office of the Chief of Transportation furnished the Navy with the military characteristics of the proposed new helicopter on 18 May, and the Navy passed this information on to industry. Clarification of the military characteristics came on 16 June at a meeting between thirty-six representatives of industry and a panel of Army and Navy officers at the Bureau of Naval Weapons. Invitations went out to twenty-five companies on 14 October. Of these, twelve sent in nineteen designs by the end of January 1961.

Six committees established by CONARC during the first week of February examined the designs to determine which ones met operational requirements. On 13 April, the Joint Army-Navy Technical and Operational Evaluation Groups met to combine their findings. The Navy had narrowed its choice to the Hiller model while the Army selected the Bell model first and the Hiller second. Further joint meetings on 18 April and 3 May resulted in a recommendation to the Light Observation Helicopter Design Selection Board that both the Bell and Hiller designs should be developed.

The Light Observation Helicopter Design Selection Board, established by the Chief of Staff of the Army on 17 April and chaired by General Rogers, met on 3 and 4 May. On 6 May, the board notified the Chief of Research and Development that it accepted the findings of the joint groups. DCSOPS, Department of the Army did not concur, suggesting that the Hughes design should also be developed. The Army members of the board met on 17 May and recommended that the Chief of Staff of the Army authorize the Chief of Research and Development to procure the Hughes design separately. The manufacturers were notified of these decisions on 19 May.

Ordinarily the Navy would have carried this program to completion. A ruling by the Department of Defense on 10 December gave the Army permission after 1 July 1961 to procure off-the-shelf aircraft directly from industry rather than through the Air Force or the Navy. The Chief of Research and Development on 12 June 1961 informed the Chief of Transportation that the test models from Bell and Hiller could be procured directly as permitted.

Contrary to all previous contracts for aircraft procurement, the manufacturers were free to draw the detailed designs and make all decisions on subsequent design and engineering matters. The Army would introduce no changes as long as the designs complied with Federal Aviation Agency Specifications for airworthiness. The Transportation Corps hoped that the time interval between design and procurement would be six and a half years -- a goal which
eventually was surpassed. Tests of the Bell HO-4, Hiller HO-5, and Hughes HO-6 had not yet taken place at the close of 1962.18

Cargo Helicopters

Army interest in a heavy cargo helicopter had centered on the development of the H-16B. This helicopter would carry forty-seven troops or 8,500 pounds of cargo. The program encountered many problems, but in March 1955, CONARC recommended that the development of the H-16B be continued with the objectives of obtaining a flying test aircraft by mid-calendar year 1958. In September, the Senior Research and Development Board indicated that the requirement for a heavy helicopter was not questioned. But in view of its size, cost, and complexity, the board doubted the utility of the H-16B in forward combat areas. It therefore recommended cancellation of the H-16B project; development funds were to be used to determine a better method of meeting the requirement. CONARC still considered that the H-16B development was the most versatile, economical, and practical way to meet the requirement.19

Despite CONARC's objections, the Department of the Army cancelled the H-16B program in April 1956. In June, the department informed CONARC that it was exploring alternate courses of action to achieve the heavy lift capability which was to have been met by the H-16B. It requested CONARC to review the Army requirement for a heavy lift helicopter and to furnish the general operational requirement. CONARC responded that its Combat Development Objective Guide of February 1956 contained a requirement for a heavy transport helicopter which should have a normal payload of 5 tons at an operating radius of 100 nautical miles, an overload capacity of 8 tons at an operating radius of 100 nautical miles, and substantially greater payloads at shorter distances. The helicopter would be employed as a basic transport of troops, supplies, and equipment in the combat zone, including aeromedical evacuation, and heavy lift in the field army area.20

Consideration was given to the CH-1 flying crane being developed by the Navy, an optimized configuration of the H-37A, a flying crane version of the H-37, and the British Fairey Rotodyne.

20 Ltr OPS AV OR-3, DA DCSOPS to CONARC, 26 Jun 56, subj: H-16 Replacement, w/1st Ind.
No further significant progress was made in the development of a heavy cargo helicopter as interest shifted to light and medium cargo aircraft. On 30 September 1958, the Department of the Army requested that CONARC reevaluate and restate the requirements for light and medium cargo aircraft to furnish guidance for the Army staff in support of a revised 5-year materiel program. The recommendations of CONARC were to include the relative priority of procurement of the Vertol CHINOOK helicopter (3-ton payload) and/or a 3-ton short takeoff and landing (STOL) airplane and the relative priority of procurement of an improved light cargo (1½ - 2-ton) payload helicopter.

On 9 October, CONARC recommended priorities for procurement of the light transport 3-ton STOL, the light transport helicopter, and the CHINOOK in that order. A strong stand was taken that, if the CHINOOK could not be procured because of budgetary limitations, it was necessary that both the 3-ton STOL and a new or improved light transport helicopter be developed and placed in service as soon as feasible. It was further recommended that none but essential decisions be made in the aircraft developmental field pending the outcome of a Department of the Army directed study on developmental objectives for Army aviation.

The Army placed a contract in July 1958 for ten YHC-1A CHINOOK helicopters. The CHINOOK was a tandem rotor transport helicopter with two turbine engines. It could carry twenty men or fifteen litters. Development of the much larger YHC-1B resulted in reducing the order for the YHC-1A to three aircraft. Five YHC-1B's were ordered in June 1959 for service tests and the first aircraft flew in September 1961. The Army ordered five more HC-1B's in 1960, 18 in February 1961, and another 24 in December 1961. While basically similar to the YHC-1A, the HC-1B was able to carry a maximum of forty troops with full equipment and the fuselage was large enough to contain all the components of the PERSHING missile system. A 6,000-pound payload could be carried a distance of 100 nautical miles or a maximum external load of some 6 tons could be carried 20 nautical miles. The CHINOOK had several novel features, including a rear loading provision and the location of the fuel tanks in the fuselage side blisters. The HC-1B was developed to meet the requirement for a new transport helicopter and was expected to replace the H-21, H-34, and H-37 helicopters.

---

Flying Crane

On 27 August 1958, CONARC approved a Qualitative Materiel Requirement for a flying crane vehicle and forwarded it to the Department of the Army. As a result of staffing with field agencies and within the CONARC headquarters, it was determined that the payload should be specified as twelve tons. Military characteristics were prepared and forwarded to the Department of the Army on 14 November 1958. CONARC recommended that the military characteristics be approved, but in view of the limited application of the vehicle and high cost of development and production, development items to meet the requirement be held in abeyance.23

In October 1961, the Department of the Army requested CONARC to conduct a preliminary review covering operational and organizational concepts, essentiality, and priority of the aerial crane development. The department proposed a 5-year program aimed at the development of a 20-ton payload aerial crane. The program would require 15 percent of the research, development, test, and evaluation funds earmarked for improving Army mobility for the fiscal year 1962 - 1967 period. The program included purchase and evaluation of six Model S-64 Sikorsky flying cranes of 8-ton capacity. On 24 November, CONARC affirmed its position that it had never stated a requirement for an aerial crane. CONARC considered that the HC-1 CHINOOK helicopter could fulfill the essential requirements for tactical lift of heavy equipment and that the development of an aerial crane should not be accorded a priority which would jeopardize or significantly affect development of more critical requirements. CONARC recommended that the Department of the Army monitor West German evaluation of the S-64, and if further testing were required, efforts be made to procure not more than two aircraft on a rental or loan basis from Sikorsky for that purpose.

CONARC felt that continued research be conducted leading to development of heavy transmissions and to hot cycle pressure jet motor systems for aerial crane applications. It also recommended that consideration be given to product improvement of the HC-1 helicopter with the ultimate goal of achieving an 11-ton payload capacity for external lift and that the existing qualitative materiel requirement be modified. CONARC further stated that it could not agree to a high priority for such a qualitative materiel

requirement when more critical programs were inadequately funded. It recommended that more funding emphasis be placed on development of the Lockheed rigid rotor system and evaluation of the British Hawker Siddeley P1127 V/STOL aircraft (XV-6A).\textsuperscript{24}

Despite CONARC's objectives, the Department of the Army continued with the development of the Sikorsky flying crane. The first flight of the twin-engine CH-54A took place on 9 May 1962. The CH-54A carried a 10-ton payload and was designed to carry its cargoes externally. By means of a hoist it could pick up or deposit loads without landing.\textsuperscript{25}

Development of Fixed Wing Aircraft

The development of a high performance observation airplane received considerable attention during the period under review. The Army Equipment Development Guide for 1954 had stated a requirement for development of a high performance aircraft for observation, long range adjustment of fire, reconnaissance, command, and utility use. Army experiments with borrowed Air Force T-37 jet trainers were of considerable help in the development of doctrine and organization for the use of higher performance aircraft. Up to this time, Army experience in fixed wing observation aircraft had been limited to the O-1 (L-19) BIRD DOG, which had been introduced during the Korean War. In 1959, the AO-1 MOHAWK entered Army service to fill the observation role. Although the O-1 continued to be used for artillery spotting missions, the radar equipment of the MOHAWK gave the Army a much more sophisticated reconnaissance capability.

T-37 Troop Test

On 21 June 1954, OCAFF requested that the Department of the Army procure ten T-37 jet aircraft for test in the Army aerial observation/reconnaissance role.\textsuperscript{26} The Army formally requested procurement of the aircraft on 23 November. The jet aircraft were desired for the purpose of testing the concept and for developing

\textsuperscript{24} Ibid., FY 62, Vol. VII, DCSCD Cbt Arms Div Tac Br, Jul - Dec 61, pp. 10 - 12 (SECRET -- Info used is UNCLASSIFIED).

\textsuperscript{25} Army Aviation, Feb - Mar 64, p. 57.

\textsuperscript{26} The T-37 was a jet trainer designed and built by the Cessna Aircraft Company. The first prototype had flown in October 1954 and the first Air force models were flown in September 1955. The aircraft was a simple, low-mid wing all metal monoplane, having two turbojet engines and side-by-side seating. Swanborough, Military Aircraft, pp. 124 - 25.
doctrine for relatively high speed aircraft which could replace the L-19's. In making the original request, General Dahlquist admitted that such aircraft might accomplish a portion of the tactical reconnaissance for which the Air Force was responsible, nonetheless, he called for an Army expansion in this area.

General Gavin, the Army Assistant Chief of Staff, G-3, doubted that the Air Force had complete primary responsibility for tactical air observation, but he could not officially agree with General Dahlquist's suggestion that the Army intrude into an area which was clearly the Air Force's responsibility. He pointed out, however, that the agreements with the Air Force in 1951 and 1952 had given the Army responsibility for conducting aerial observation to amplify and supplement other methods in locating, verifying, and evaluating targets, adjusting fire, terrain study, or obtaining information on enemy forces not obtained from the other services. General Gavin therefore felt that the request for the T-37's could be justified in accomplishing these missions under the changed conditions of the modern battlefield.

The Army staff interpreted the wording of the agreements to mean that "observation," a short range activity, was clearly the province of Army aviation. "Reconnaissance," which was the undisputed mission of the Air Force, involved long range, deep penetration of enemy air space. In order to avoid Air force contention of mission duplication, General Taylor, soon after he succeeded General Ridgway as the Chief of Staff of the Army, directed that the word "observation" be used rather than "reconnaissance" when discussing the need of the Army for the T-37. Another term which caused problems was "high performance aircraft," which meant jet combat aircraft to the Air Force. The Army staff was directed to refer to the function of the T-37 as "higher performance," which meant higher than the existing liaison type aircraft.27

The Army did not make public its intention of procuring the T-37's until May 1955, when General Ridgway announced to the Armed Forces Policy Council that a test quantity of ten aircraft would be purchased from the manufacturer. General Twining, the Chief of Staff of the Air Force, immediately objected to General Ridgway's definition of the mission of the T-37's. The Army received no support at this time from the Navy or the Marine Corps. On 14 June, Harold E. Talbott, the Secretary of the Air Force, charged that the procurement

---

161
of the aircraft was a distinct infringement upon an Air Force function, that the T-37 could not survive over enemy territory, and that it was uneconomical and duplicatory of Air Force missions.

At this point, Secretary Wilson ordered the Army to stop procurement of the T-37 and referred the entire matter to the Joint Chiefs of Staff. After lengthy deliberations, the Joint Chiefs of Staff in August directed the loan of T-37's to the Army from Air Force stocks to test their suitability as a light observation aircraft. To support the Army position before the Joint Chiefs of Staff, CONARC in July had revised its concept of the use of the T-37, which originally had not been in consonance with the Army position being presented. At the same time, CONARC urged that once the procurement of the T-37 had been approved, it was vital that the troop test for this aircraft be designed to determine and exploit its maximum capabilities.

The Joint Chiefs of Staff did not specify the number of aircraft to be loaned by the Air Force, and the Army assumed that it would be the original request of ten. When the Army asked for ten aircraft for two years, the Air Force replied that informal agreements by the Joint Chiefs of Staff had stipulated only two aircraft for one year. After lengthy negotiations with the Air Force, General Twining finally agreed to loan three T-37's for one year, with an option to extend the loan for an additional year. General Taylor, rather than prolonging the argument and possibly endangering the test, reluctantly agreed to the Air Force terms. 28

While the Department of the Army and the Air Force argued over the T-37, CONARC continued to plan for the troop test. On 12 July, CONARC requested that the aircraft be modified to include electronic and photographic equipment for test purposes. At the request of CONARC, the Department of the Army partially concurred in modification of the aircraft and on 21 November requested the Air Force to furnish delivery schedules, training of personnel, and modifications of the aircraft. 29

On 7 January 1956, CONARC directed the Army Aviation School to prepare an outline test plan for ten T-37 aircraft to determine organization and operational concepts for higher performance observation aircraft. CONARC forwarded the approved outline test plan,

28  

29  
CONARC Summary of Major Events and Problems, FY 56, Vol. IV, Jul - Dec 55, pp. 6 - 7 (SECRET -- Info used is UNCLASSIFIED).
with recommended changes, to the Department of the Army on 13 March. On 31 May, the Department of the Army informed CONARC that the number of aircraft had been reduced from ten to three and that the delivery date had been slipped from September 1956 to February - April 1957. The department requested a revised plan based on the reduction in aircraft and the change in delivery dates.30

The Army Aviation School submitted the revised plan on 12 June. On 30 May, CONARC informed CONARC that the number of aircraft had been reduced from ten to three and that the delivery date had been slipped from September 1956 to February - April 1957. The department requested a revised plan based on the reduction in aircraft and the change in delivery dates.30

The Army Aviation School submitted the revised plan on 12 June. The test was designed to determine organizational and operational concepts for the employment of higher performance observation aircraft to supplement the L-19 and was not to determine the suitability of the T-37 as the specific aircraft for these missions. The test was to be conducted in three phases. During Phase I, the test detachment would be organized and the pilots and maintenance personnel trained. Phase II would be conducted by the test detachment at the Infantry, Armor, and Artillery and Guided Missile Schools and would be concerned with developing operational procedures for support of the various combat arms. Phase III originally envisaged employment of the test detachment in Exercise GULF STREAM which was scheduled to be conducted at Fort Polk in April 1958.31

On 14 September, the Department of the Army approved the plan, subject to additional changes. CONARC then asked the Army Aviation School to submit personnel requisitions for the test unit, a detailed budget estimate, detailed plans for conduct of Phase II of the test, and a proposed TA for the test unit. The test unit for Project LONG ARM, as the T-37 test program was called, was activated by Third Army as the 7292d Aviation Unit on 5 November.

A conference was held at the Pentagon on 10 December to complete the modification program and delivery schedule for the aircraft. Delivery of three aircraft with KA-20 camera and DPN-31 radar beacon installation was changed from March 1957 to 15 July 1957, necessitating a rescheduling of the test program. Discussions were also held with the Air Force concerning transition of pilots. On 26 December, CONARC approved the proposed Air Force training program.

30 (1) CONARC Summary of Major Events and Problems, FY 56, Vol. VIII, Cbt Dev Sec Gen Div, Jan - Jun 56, p. 2 (SECRET -- Info used is UNCLASSIFIED). (2) DA DCSOPS Army Avn Dir, Summary of Major Events and Problems, FY 56, p. 1 (TOP SECRET -- Info used is UNCLASSIFIED).

31 Ltr ATSWD-G 452.1, CONARC to Oklahoma Air Materiel Area, Tinker AFB, 6 Jul 56, subj: T37A Project.
Cessna conducted the transition training for the Air Force under contract.32

The troop test of the T-37, as prepared by the Army Aviation School, had five objectives. First, to determine the most effective organization, the training, and logistical implications for higher performance Army observation aircraft within the field army, and to prepare tentative training literature. Second, to obtain an evaluation of higher performance observation aircraft vulnerability and survival probability when operating at various speeds and altitudes in the vicinity of enemy ground weapons, antiaircraft weapons, and surface-to-air guided missiles. This evaluation was to be based upon the limitations of present and planned radar and weapons systems, and the reaction time of troops manning the weapons. Third, to determine the relative observation capabilities at various altitudes and speeds in both day and night operations. This objective would include determination of the capabilities for target identification, observer visibility transition training requirements, and observer adaptability from low to high speed aircraft and other factors affecting observation. Fourth, to develop and test operational procedures for target acquisition, damage assessment, surveillance, and adjustment of fire by higher performance Army observation aircraft. Finally, to recommend performance characteristics for a higher performance Army observation aircraft.33

The test unit completed its unit training at Fort Rucker and then took part in tests covering employment with artillery and armor units at Fort Sill and Fort Knox, respectively, during the first half of FY 1958. In Phase III of the test program, the unit participated in Exercise CUMBERLAND HILLS34 at Fort Bragg from 19 to 30 May 1958. The test unit returned to Fort Rucker on 4 June.

32

33

34

Exercise GULF STREAM had been cancelled in November 1957 because of a curtailment in funds.
On 28 March 1958, the Department of the Army approved the extension of the T-37 test detachment through FY 1959 and extended the loan of the T-37 aircraft until January 1959. Long before the aircraft were returned to the Air Force, however, the Army had lost interest in Project LONG ARM. The Department of the Army was convinced that Air Force opposition had so influenced the thinking of the Joint Chiefs of Staff and the Department of Defense that it was not feasible to pursue the project. Additionally, the success in the development of the AO-1 MOHAWK airplane had met most of the observation requirements being studied in the tests. At the conclusion of the loan of the T-37's from the Air Force, it was anticipated by DCSOPS, Department of the Army, that the test detachment would be equipped with SLAR equipped L-26 aircraft and eventually with the MOHAWK airplane.35

The Army Aviation School submitted the interim report on Phase III on 22 October 1958 and Third Army submitted on 30 July the report of the test conducted during Exercise CUMBERLAND HILLS. Both these reports were forwarded by CONARC, along with copies of the Phase II report of Project LONG ARM, to its interested staff sections. As a result of the staffing, CONARC positions were furnished to Third Army on the CUMBERLAND HILLS test and to the Department of the Army on the Phase III interim report. On the CUMBERLAND HILLS report, CONARC acknowledged the desirability of a medium observation aircraft organization in the field army. Third Army was advised that the size of a test unit to continue this program would be established after consideration of current limitations on personnel spaces and equipment. CONARC stated that it was premature to initiate courses of instruction for operation and use of medium observation aircraft. Instead, the Army Aviation School would be directed to integrate instruction for the employment of the medium observation aircraft into current programs of instruction. Field manuals would be revised to reflect approved doctrine arrived at as a result of Exercise CUMBERLAND HILLS and previous testing.

In regard to the Phase III interim report, CONARC recommended to the Department of the Army that approval be given to further testing to determine mission requirements for the medium observation aircraft at army, corps, division, and missile commands. It favored approval of the organization of a TD experimental medium observation aircraft test unit at the Army Aviation School to conduct necessary tests, using the T-37 test unit to form the basis

(1) CONARC Summary of Major Events and Problems, FY 58, Vol. VI, Cbt Dev Sec Sp Div, Jul - Dec 57, p. 4 and Gen Div, Jan - Jun 58, pp. 16 - 18 (CONFIDENTIAL -- Info used is UNCLASSIFIED). (2) Draft ms., History of Army Aviation, Ch. VII, p. 40.
for the new experimental test unit. At the same time, CONARC recommended disapproval of the retention of the three T-37 aircraft by the Army Aviation School in view of the limited value which would accrue from further testing; it suggested that the T-37 aircraft be returned to the Air Force on 31 December 1958. CONARC recommended that negotiations be entered into with the Department of the Navy to procure, on a loan basis, three T-28 propeller aircraft to support the new experimental test unit.36

The final report and comments of the various reviewing agencies on Project LONG ARM were received at CONARC during the first half of FY 1960. Testing of combat surveillance equipment and aircraft was a continuing process conducted under a program established by CONARC on 8 May 1959. The final report of Project LONG ARM was used as background information in the conduct of these tests.

CONARC initiated action relative to the assignment of medium observation aircraft, training of crews, preparation of training literature, determination of appropriate avionics equipment, and test of combat surveillance equipment. It felt that the Project LONG ARM test and actual troop testing of the medium observation aircraft would further develop support requirements and would indicate any changes considered necessary.

The purpose of the troop test was to determine the organization, tactics, and techniques of employment of medium observation aircraft in support of tactical operations of the field army. The objectives were: to determine the most effective organization, the training and logistical implications for higher performance observation aircraft within the field army, and to prepare tentative training literature; to obtain an evaluation of higher performance observation aircraft vulnerability and survival probability; to determine the relative observation capabilities at various altitudes and speeds in day and night operations; and to develop and test operational procedures for target acquisition, damage assessment, surveillance, and adjustment of fire by higher performance Army observation aircraft. The test was not conducted as an evaluation of the merits of the T-37, but of the concept of operation of an aircraft which generally performed in a manner similar to the T-37. Completion of the Project LONG ARM tests completed action on this project.37

---

AO-1 (OV-1) MOHAWK Combat Surveillance Airplane
Despite the completion of the T-37 tests, the Army still maintained an interest in the possible adoption of jet aircraft. In April 1961, the Office of the Chief of Research and Development directed CONARC to conduct a comparative flight evaluation of three types of jet airplanes. The Army Aviation Board was directed to conduct the evaluation between the Fiat G-91, the Northrop N156 (F-5), and the Douglas A4D-2N. Testing was accomplished throughout the last quarter of FY 1961. CONARC recommended on 20 September 1961 that further evaluation be conducted prior to final selection of an Army close support airplane. In the event of an emergency requiring an immediate selection, the A4D aircraft was probably the most suitable of the types tested.  

AO-1 MOHAWK

The Army Equipment Development Guide of 1954 included a requirement for development of a high performance aircraft for observation, long range adjustment of fire, reconnaissance, command, and utility use. A conference was held by the Office, Chief of Research and Development, Department of the Army, on 15 February 1956, at which time six manufacturers presented design studies for an Army-Navy (USMC) higher performance observation airplane. Because this airplane had to be operationally available during calendar year 1958 to 1960, its plans needed to be of an inherently simple design, with no special complicated high lift device, which would ease development and production at the lowest possible cost in dollars and time. At the direction of the Department of the Army, CONARC prepared military characteristics for an Army higher performance observation aircraft which it submitted on 12 March 1956. Immediately following Secretary Wilson's decision in November 1956 regarding weight restrictions on Army aircraft, the Department of the Army forwarded a memorandum requesting two exceptions to the 5,000-pound limitation on fixed wing aircraft. The first exception was for procurement of the de Havilland DHC-4 light transport and the second was for authorization to continue participation with the Marine Corps in the development of an improved observation airplane. Secretary Wilson approved both these exceptions.  

(1) Ibid., FY 56, Vol. VII, Dev & Test Sec Army Avn & Abn Div, p. 1 (SECRET -- Info used is UNCLASSIFIED). (2) DA DCOPS Army Avn Dir, Summary of Major Events and Problems, FY 57, p. 2 (TOP SECRET -- Info used is UNCLASSIFIED).
The AO-1 MOHAWK fixed wing observation airplane was originally developed to meet joint Army and Marine Corps requirements. The Marines withdrew from the project before the first flight, leaving the Army to continue development alone. The requirement was for an aircraft capable of rough field operation with short take-off performance and equipped for tactical observation and battlefield surveillance missions.

The first Army contract -- placed in 1957 through the Navy Bureau of Aeronautics which administered the program on behalf of the Army -- was for nine test items, designated as the YAO-1AF. The first flight took place in April 1959. Later that year, the Army contracted for thirty-five production model MOHAWK's to be used for test, training, and assignment to high priority units. This order was later increased to a total of seventy-seven airplanes, to be delivered in three models. First were thirty-six AO-1AF's, with a KA-30 camera in the fuselage, which could be rotated from the cockpit to left or right oblique positions. Upward ejecting flares were carried for night photography, with 104 flares being mounted in two pods. The AO-1BF was similar, but carried side-looking airborne radar (SLAR) in a long external pod. This equipment provided a permanent radar photographic map of the ground on each side of the flight path, with a developed photograph available in the cockpit within seconds of the film being exposed. Seventeen of the first seventy-seven MOHAWK's were ordered as AO-1BF models; the first flew in 1960. The third MOHAWK series was the AO-1CF, of which twenty-four were ordered from the initial contracts. This model differed from the AO-1AF only in having UAS-4 infrared mapping equipment.40

On 25 October 1960, an interim report was submitted based upon the Army Aviation Board's participation in the Navy trials and approximately 200 hours of flight time at Fort Rucker. The report recommended that the distribution of AO-1 airplanes be limited to CONUS activities pending the correction of discrepancies described in the report. CONARC concluded in June 1961 that the AO-1 was suitable for Army use as a combat surveillance airplane, provided that suitable engines were furnished and the deficiencies and shortcomings disclosed by the service test were corrected. CONARC recommended that action be taken to extend the service life and improve the reliability of the T-53 turbine engine.41

CONARC Summary of Major Events and Problems, FY 61, Vol. II, Div Sec Avn & Abu Div, Jul - Dec 60, p. 6, and Jan - Jun 61 (SECRET -- Info used is UNCLASSIFIED).
Planning for MOHAWK training began even before the first aircraft flew. In July 1958, Brig. Gen. Ernest F. Easterbrook, the Director of Army Aviation, requested that CONARC prepare at an early date plans for specialized training. On 7 October, CONARC submitted a plan for initiating training for operational and maintenance personnel and including recommendations on actions required by the Department of the Army. Personnel to support the test activities and to initiate school training on the MOHAWK would be given specialized training by Grumman and Lycoming on a contract basis.

Before attending these factory training courses, pilots had to undergo indoctrination training in high altitude flying and ejection seat operation. Because the Army did not have the capability to conduct this training, CONARC recommended that arrangements be made with the Air Force or the Navy to provide this type of training for Army personnel.

Major problems developed as a result of the multiplicity of systems involved in the MOHAWK and delays in qualification and production of acceptable turbine engines, radar and infrared surveillance sensors, photographic systems, and ground support equipment. CONARC crew training was originally scheduled to begin in May 1960, but slippage in the availability of aircraft required repeated rescheduling; as a result, training did not start until April 1961. CONARC representatives attended systems management meetings at the Department of the Army on 24 August and 15 November 1960 in order to coordinate corrective actions with all agencies involved.

Forty MOHAWK's had been produced by the end of FY 1961; two were issued to the Army Aviation School, the balance were involved in tests or were at the Grumman plant awaiting the results of tests to establish a firm electronic configuration. Ground support equipment generally was not in existence or was in short supply. Small items, such as oxygen masks and attachments, photographic flares, and ejection seat cartridges, had not been programmed. During the year, actions continued in the development of a distribution schedule for the AO-1 to CONUS and overseas commands. Problems centered around the establishment of pipeline support of spare parts to overseas areas and CONUS posts for the airframe, engine, the new camera, signal electronics, and avionics equipment.

Because of the numerous deficiencies, CONARC conducted in additional series of confirmatory tests on the MOHAWK which disclosed that not all the problems previously reported had been corrected. CONARC recommended on 26 March 1962 that corrective action be taken. These problems, however, did not prevent the deployment of the first AO-1's to Vietnam. During FY 1962, the Department of the Army developed a surveillance concept using armed AO-1's. In addition to their normal surveillance mission, the aircraft were armed and capable of attacking ground targets or could be used to provide close air support. The use of the MOHAWK in this role was to cause serious problems with the Air Force in the following years. The 23d Special Warfare Aviation Detachment was equipped with the armed MOHAWK and deployed to Vietnam during FY 1962.44

Even as the MOHAWK entered service, the Army began development of the next generation of observation aircraft. In September 1961, CONARC began active participation in the development of a new manned surveillance aircraft by designating a representative to the U.S. Army Transportation Research Command System Phasing Group which was conducting the research on the project. The objective of the group was to provide and coordinate the essential elements of information for defining the technical and operational characteristics of the aircraft configuration. The group findings would be provided as input into an Office of the Chief of Research and Development study being done by Canadair on survivability of the manned surveillance aircraft. This type aircraft had been recommended for development by the Rogers Board. In December, the Department of the Army directed CONARC to furnish a member of the Project Advisory Group for the new surveillance aircraft. This group would provide advisory and coordinating functions with respect to the overall objectives of the Systems Phasing Group.45

**AC-1 CARIBOU**

Immediately after Secretary Wilson's memorandum of November 1956 reconfirmed the 5,000-pound weight limitation on fixed wing aircraft, the Department of the Army requested an exception in order to procure five de Havilland DHC-4 airplanes for evaluation of their suitability to meet the requirement for a 3-ton payload

45 CONARC Summary of Major Events and Problems, FY 62, Vol. VII, DCSCD Cbt Arms Div Tac Br, Jul - Dec 61, pp. 8 - 10 (SECRET -- Info used is UNCLASSIFIED).
transport having a short take off and landing capability. Secretary Wilson approved this request, and the aircraft were delivered in February 1959. DCSOPS, Department of the Army, recommended the purchase of an additional twenty aircraft to organize and equip a company for test purposes.46

Distribution of the troop test directive for the AC-1 CARIBOU, the Army designation given to the de Havilland transport, had been made on 18 June 1959. The troop test was to be conducted in four phases beginning in the spring of 1960. Final responsibility for the troop test was assigned to the Commanding General, Third Army. The Commanding Generals, Second and Fourth Armies, had responsibilities for the conduct of certain phases of the test as well as for comments in the final report. The 1st Aviation Company was designated as the test unit and was reorganized under TOE 1-107T with initial equipment of four AC-1 CARIBOU and eight U-1A OTTER. The final phase of the test provided for participation in Exercise BRIGHT STAR employing the maximum number of CARIBOU aircraft that could be made available to the unit.

The objectives of the troop test of the AC-1 were to develop doctrine, tactics, techniques, and operational and organizational concepts for Army 3-ton short takeoff and landing transport aircraft units. These objectives were to be accomplished through operational experience in four phases over a 7-month period. The initial training of the 1st Aviation Company and the first phase of the troop test were to be conducted at Fort Benning.

The initial phase of the training was originally scheduled to start on 1 April 1960 and last for three months. The first phase of the troop test was scheduled for one month. The second phase was also scheduled for one month, beginning 1 August, and was to be conducted at Fort Sill, followed by a third phase of one month at Fort Knox. The fourth and last phase provided for participation in Exercise BRIGHT STAR for a 15-day period beginning in October. This phase was to be conducted at Fort Bragg and Fort Campbell. A provisional maintenance unit was provided by the Chief of Transportation to accomplish third echelon maintenance and supply functions in support of the test unit.47

47

The start of the troop test was delayed as a result of the late receipt of aircraft. Also, the test director made recommendations that certain test objectives be revised to permit accomplishing the test within specified periods. CONARC published a new test directive in early January 1961 which provided for five phases of testing. Phase I would take place, 1 September 1960 - 15 January 1961, at Fort Benning and would include pretest training as well as the Army Training Test. Phase II, 22 January - 22 February, at Fort Sill and Phase III, 1 March - 31 March, at Fort Knox would accomplish the test objectives. Phase IV, 1 July - 31 July, at Fort Benning would cover the logistical test objectives. The troop test concluded with Phase V, which consisted of participation in Exercise SWIFT STRIKE.\textsuperscript{48}

Delays continued to affect the start of the troop test. In February 1960, the phase at Fort Benning was slipped to February - April 1961 and in December it was further slipped to April - June 1961. Interim doctrine for employment of fixed wing aviation companies was submitted by the Army Aviation School as a revision to Chapter 3 of FM 1-5, Army Aviation Organizations and Employment, and was approved for test purposes by CONARC on 1 June 1960. A Pretest Training Schedule and an Army Training Test, submitted by the Army Aviation School for use in attaining training objectives by fixed wing aviation companies, were approved for troop test purposes by CONARC on 19 May 1960.\textsuperscript{49}

Despite the delays in the troop testing, sufficient aircraft were obtained to conduct the service tests of the CARIBOU. Three YAC-1's were turned over to the Army on 8 October 1959, followed by two more in November. Extensive service tests were conducted which uncovered numerous deficiencies which needed correction before the aircraft went into production.\textsuperscript{50}

The service tests of the AC-1 had proved so promising by February 1960 that the Transportation Corps was ready to request

a Standard A classification in order to procure greater quantities of the aircraft. Seven additional aircraft were at that time on order and procurement had started for fifteen more to be delivered by the end of FY 1960.

A request for a Standard A classification ran into trouble from two sources when brought before the Transportation Corps Technical Committee on 17 March. The Surgeon General did not like the number of litters being fitted into the aircraft and objected to the type of supports being inserted for them. The Surgeon General consulted with de Havilland and the Transportation Corps to resolve the difficulties. CONARC wanted to extend the limited production classification until after the completion of service tests. Such action need not prevent procurement of the fifteen additional aircraft and would ensure that any deficiencies found in the test would be corrected by the manufacturer. The Chief of Research and Development agreed with this view on 7 April, commenting that the AC-1 would undoubtedly qualify as Standard A at the end of testing in June. The fifteen aircraft were purchased with FY 1960 funds under the limited production classification.

As the service tests continued, reports constantly indicated that the AC-1 performed well. On 13 May, the Transportation Corps Technical Committee coordinating subcommittee reopened the subject of type classification. Approval of the Standard A classification came on 21 July. The Federal Aviation Agency certified the AC-1 to be airworthy on 23 December and, in the same month, the Transportation Corps contracted through the Air Force for thirty-four additional aircraft.51

From early February to mid-June 1961, the Commanding General, Third Army, conducted a thorough series of troop tests with four AC-1's at Fort Benning. The general objectives were to test and evaluate TOE 1-107T, Aviation Company, Fixed Wing, Light Transport, modified to accommodate sixteen AC-1's, and to determine the adequacy and suitability of organization, equipment, missions, doctrine, tactics, procedures, and techniques for the support of combat units of the field army. Each exercise evolved from a tactical problem played out on maps. Distances, timing, and restrictions to air corridors had meaning when tied to a definite combat situation. The 124th Terminal Service Detachment of the 11th Transportation Battalion made all weight and balance computations and loaded and unloaded the cargo, personnel, and equipment. The transport aviation company landed the transports on partially prepared fields and in open meadows within landing zones which varied in length from 1,600 to 4,000 feet. Flights at night and during heavy weather added to the realism.

51 OCofT, Summary of Major Events and Problems, FY 61, p. 25.
The troop test was conducted by the Infantry School using the 1st Aviation Company, equipped with four AC-1's and eight U-1A OTTER's. The final report of the test, submitted on 12 July by Third Army, recommended that TOE 1-107T be changed to an organization of three flight platoons of eight AC-1's each, with an aggregate personnel strength of 210. The report also recommended that aviation companies equipped with AC-1's be assigned on the basis of one company per corps and one company per field army and that a field maintenance detachment be developed to provide on site support to the unit.

Third Army forwarded the report on 26 July, concurring in recommendations for minor revisions. At the time this report of troop test was under consideration at CONARC, the final positions were established on the RODAC-70 study and on an aviation unit TOE prefix study. These actions, plus the conclusion that a 24-aircraft company structure was too large for use in a tactical or logistical role, prompted a modification of the troop test recommendations. CONARC informed the Department of the Army on 16 February 1962 that a requirement existed within the field army for two types of AC-1 aviation companies, one (built around approximately nine aircraft) to support tactical operations and the other (built around approximately eighteen) to support logistical operations. Assignment of AC-1 equipped units was to be in accordance with organizational concepts contained in the RODAC-70 concept. Field maintenance support would be provided by the existing Transportation aircraft direct support companies.

Convertiplanes and Vertical Lift Research Vehicles

In addition to the development of the fixed wing and rotary wing aircraft for immediate tactical use, the Army participated in numerous experimental developments of convertiplanes and vertical lift research vehicles. It was hoped that the various convertiplane designs tested would eventually lead to the development of a fixed wing aircraft which could take off vertically like a helicopter. The vertical lift vehicles generally fell into the class of providing the individual soldier a limited flying ability or to provide a flying jeep.

Convertiplanes

Typical of the convertiplanes was the McDonnell XV-1, which made its first conversion flight in March 1955. The Army procured

two of these aircraft which had a helicopter rotor for lift and a small jet engine for horizontal flight. The Bell XV-3 also combined the characteristics of the helicopter and the airplane. The project started in 1951 under a joint Army-Air Force contract which called for Bell Helicopter Company, Doak Aircraft Company, and Ryan Aeronautical Company to develop a convertiplane for Army consideration.

Bell began extensive testing, and later the other two companies dropped out of the program. Bell completed two XV-3's in February 1955 and placed them in a ground test program. The initial flight of an XV-3 took place on 23 August, but the aircraft was destroyed on 25 October 1956 in an accident caused by instability of the 3-blade prop-rotor. The prop-rotors were replaced on the second XV-3 with a 2-blade, semi-rigid model which proved satisfactory.

The XV-3 achieved 100 percent in-flight conversion of its tilting rotors on 18 December 1958. The full conversion was the world's first by a tilting-rotor fixed wing aircraft. The XV-3 conversion took about ten seconds if done continuously or it was accomplished by a gradual step-by-step basis. This process entailed transferring the lift from the rotors to the wings without loss of altitude. The XV-3 ultimately went through more than 100 full conversions, but the project was terminated at the conclusion of the tests.

The convertiplanes and vertical lift research vehicles tested by the Army between 1955 and 1962 are shown in Table 3.53

Flying Saucer

A briefing by representatives of Aircraft Armaments, Inc., of Cockeysville, Md., on the flying combat vehicle was given to senior officers and representatives of the CONARC staff sections on 21 August 1957. As a result of this briefing, a letter was sent to the Chief of Research and Development, Department of the Army, on 22 October, stating CONARC interest in the flying saucer concept and requesting initiation of a feasibility study of a "manned flying saucer." The Chief of Research and Development replied on 21 November, advising that he had reviewed a current Air Force project with AVRO Aircraft, Ltd., of Canada, which was similar to the Aircrafts Armaments proposal and which appeared promising. CONARC was

53

(1) DA ACOFS G-3 Army Avn Div, Summary of Major Events and Problems, FY 55, p. 2 (TOP SECRET -- Info used is UNCLASSIFIED).
(2) Tierney and Montgomery, Army Aviation Story, pp. 272 - 83.
(3) Army Aviation, Vol. 12 (Feb - Mar 64), pp. 65 - 68. (4) Army Aviation, Vol. 8, No. 9 (Sep 60), p. 546.
invited to attend an AVRO presentation at the Pentagon on 29 November. After this briefing, the Chief of Research and Development forwarded copies of an AVRO brochure to CONARC, requesting review and recommendations on the AVRO proposal. This project was considered important because the impact of a successful flying saucer concept could revolutionize the Army's aircraft development and vehicle program and might be capable of reducing the Army's inventory of aircraft and vehicles to a minimum.54

On 22 January 1958, CONARC representatives visited the Chief of Research and Development to determine the status of the AVRO proposal to build two Avromobiles for research purposes and to determine the schedule of availability of test items. The Commanding General, CONARC, had concurred in purchasing two items at a cost of $2,028,670. Manufacture of the two vehicles would be in accordance with the following schedule: mock-up of first model in late September or early October; first vehicle rolled out twelve months after date of contract; ground and flight testing by the contractor six to nine months after roll-out of first vehicle; second vehicle rolled out twenty months after date of contract; availability of several models for testing by Army troops estimated to be mid-1962.

The Chief of Research and Development commented that the Avromobile (flying saucer) as currently seen, with a payload of 1,000 pounds, would satisfy the requirement for a utility helicopter and a utility fixed wing airplane with VTOL capabilities. The Avromobile would replace the H-40 helicopter after 1962. A requirement would still exist for a simple 2-place reconnaissance helicopter and possibly for small observation airplanes. The aerial jeep was basically a research vehicle and was considered as a stepping stone from ground surface pressure vehicles to the AVRO or zero ground pressure vehicles. If the AVRO concept proved successful, the aerial jeep would be abandoned.

The Chief of Research and Development went on to say that there still would be a possible requirement for a flying crane device since it was not known if the AVRO concept would be operationally suitable as an external load carrying vehicle. Eventually, the larger versions of the AVRO would replace the medium and light transport helicopters and airplanes. The AVRO vehicle would satisfy all requirements for reconnaissance drones and possibly the other drone systems, including cargo.

---

54 CONARC Summary of Major Events and Problems, FY 58, Vol. VI, Cht Dev Sec Sp Div, Jul - Dec 57, p. 3.
The Office of the Chief of Transportation advised CONARC that the signed AVRO contract had been returned to the Air Force for their signature on 23 June 1958.55

The saucer-shaped craft, designated as the VZ-9V by the Army, was powered by three Continental J69 turbojet engines. These drove the central fan which provided a peripheral air curtain and ground cushion for VTOL operation. The air intakes for the engine were in the center, while the focusing ring control was located around the bottom edge. The body of the saucer was designed for aerodynamic lift in forward flight, and the craft was intended to have a maximum speed of 300 m.p.h. at high altitude and a range of 1,000 miles. Two craft of this type were built by AVRO for the Army and tested from 1959 to 1961. The project was discontinued in late 1961 due to problems with internal aerodynamic losses and uncontrollable pitching.56

The Status of Aircraft Development

By 1961 most of the types of aircraft needed by the Army to implement fully the airmobile concept had been developed. The early expectations regarding the numerical expansion of Army aircraft however, had not been achieved. In 1955, it had been estimated that the Army would be operating 8,500 aircraft in 1959. By 1961, the Army was still 3,000 aircraft short of this goal and inventory forecasts for 1970 also fell short of the target. Twelve helicopter battalions had been estimated for 1959, including a heavy lift capability. There were only twenty helicopter companies in existence in 1961, and the H-37 helicopter -- the largest in the Army inventory -- was limited to about a 3-ton capacity.

Planning in the mid-1950's had assumed a larger Army and larger budgets than were actually provided. The Army had also proved over-optimistic in forecasting certain technical advances in the area of all-weather flight and advances in speed, range, and load carrying capacity of helicopters. Development had not progressed at the anticipated pace.57

Despite these shortfalls of Army expectations, the progress made during the period was remarkable. In the next few years, the

56 Info furnished by Transportation Museum, Fort Eustis, 17 Nov 75.

182
the numbers of aircraft and aviation units would increase far beyond anything imagined in the 1950's. This rapid expansion was made possible by the accomplishments of the late 1950's. The aircraft developed during this period were to prove far more versatile than had been expected and were to meet fully the requirements of air-mobility.
Chapter VII

DEVELOPMENT OF AVIATION TRAINING

The Army had developed a firm foundation for its aviation training with the establishment of the United States Army Aviation School at Fort Rucker. The most aggravating training problem as 1955 began was the continued sharing of Army aviation training with the Air Force. The efforts to consolidate all training under Army control bore fruit during the next two years. At the same time, the Army Aviation School continued to grow, and new unit training commands were established.

Transfer of Training from the Air Force

Early Interest in Training Consolidation

Attempts had been made to consolidate all Army aviation training under Army control since before the Korean conflict. Financial problems and Air Force reluctance to transfer the responsibility had aborted the latest effort in early 1954. In November 1954, the Secretary of the Army noted in a memo to the Secretary of Defense that the increased Army use of helicopters and fixed wing aircraft in an effort to increase battlefield mobility made it essential to maintain maximum efficiency and flexibility in the training of Army personnel in the use of such aircraft. The Army was convinced that by managing all aviation training, its personnel would be better utilized and more responsive to special needs. The Secretary of the Army therefore urged that the Secretary of Defense transfer to the Army the primary pilot and mechanic training of Army aviation personnel then being conducted by the Air Force at Gary Air Force Base.

The Secretary of the Army presented two possible solutions. The Army could use contractor-furnished facilities for primary fixed wing training and for primary helicopter training, thus freeing Gary Air Force Base for other Air Force use. As an alternative, Gary Air Force Base could be transferred to the Army for use by contractors for primary helicopter and fixed wing training if the Air Force had no other requirements for that base. Either solution provided full utilization of existing facilities without duplication.

Because the Air Force successfully contracted with civilian flying schools for all primary pilot training of Air Force pilots, the Secretary of the Army believed that contract training was economical and effective. If full responsibility for Army Aviation training were to be assigned to the Army, the Army would propose to conduct all primary flight training by contract with civilian
flying schools. The Army had extensive experience with contract training and was fully qualified to administer contracts of that type.\footnote{1}

As a follow-up to the request of the Secretary of the Army, Assistant Secretary of Defense (Manpower and Personnel) Carter L. Burgess, reported to the Deputy Secretary of Defense in late January 1955 that disagreement between the Air Force and the Army over training responsibilities had resulted in duplicate requests for funds to conduct primary flight training in the FY 1956 program. The Army insisted that control of all aviation training would be more efficient and economical and that it in no way duplicated Air Force training. The Air Force disagreed, claiming that duplication already existed. The Assistant Secretary of Defense therefore proposed a detailed study of the problem to determine appropriate training responsibility for aviation personnel required by the Army. A study of the flying and technical training programs of both the Air Force and the Army would be conducted to determine Air Force capability to provide trained personnel requirements of the Army within the existing Air Force training program. The relative costs involved in the conduct, or separation, of Army aviation courses as against Army utilization of Air Force facilities to meet Army needs would also be compared.\footnote{2}

The Department of the Army informed CONARC that action had been taken to include $1,800,000 in the FY 1956 budget for civilian contract primary flight training for cargo helicopter pilots. The Department of the Army on 25 March requested CONARC to establish and supervise the training. Final proposals were received from the Army Aviation School on 31 May, and CONARC submitted its recommendations to the Department of the Army on 6 June. Ten days later, the Department of the Army designated Third Army as the negotiator of the contract and established 1 October as the starting date.\footnote{3}

Because of funding and negotiating difficulties the tentative date of the contract was delayed from 1 October to 1 May 1956 and the original contract would continue through fiscal year 1957 for a

Ozark Army Airfield, Fort Rucker, 1968. The field was renamed Cairns Army Airfield in 1959.
total of fourteen months. It was contemplated that the training of helicopter pilots by civilian contract would continue indefinitely as an economy measure.  

In late 1955, the Air Force requested that part of the Army's input to primary fixed wing classes conducted at Gary Air Force Base be directed to Spence Air Force Base, Moultrie, Ga. The twenty-seven students in Class 56-7 began training on 3 January 1956 and became the first Army students to receive training in the L-19 from a civilian contractor.

Army Assumption of Training Responsibility

After thorough consideration of all factors involved in Army aviation training and discussions with the Secretaries of the Army and the Air Force, the Department of Defense concluded on 19 April 1956 that the Department of the Army should have responsibility for the conduct of aviation training required in support of current Army activities. This responsibility was to include the four aviation training courses then being conducted for the Department of the Army by the Air Force.

As a matter of economy and of operational efficiency, it was desirable to utilize existing facilities and in-place equipment to minimize additional and highly specialized construction. Those purposes would best be served by utilizing existing facilities at Wolters and Gary Air Force Bases for Army aviation training rather than establish and operate these activities on additional non-government facilities. Both of these bases were surplus to Air Force requirements and had been scheduled for inactivation. The Army was to conduct primary fixed wing pilot training by civilian contractor at Gary Air Force Base, San Marcos, Tex., and primary helicopter pilot training by civilian contractor at Wolters Air Force Base, Mineral Wells, Tex. In addition to the training elements, other activities that could utilize these facilities would be conducted on the installations.

This transfer of program and command responsibilities also would relieve the Air Force of providing maintenance personnel support for elements of Army aviation training. The Secretary of the Army, in coordination with the Secretary of the Air Force, was

---

4 Ibid., FY 56, Vol. II, G-3 Sec Tng Div Special Tng Br, pp. 5 - 6.

directed to formulate plans for the orderly, effective, and timely assumption of the transferred responsibilities and submit such plans to the Secretary of Defense for approval. The Secretaries of the Army and the Air Force were directed to develop guidelines for the transfer agreement and submit them jointly to the Secretary of Defense for approval by 1 May 1956.6

CONARC assisted in the development of an Army position through participation in a conference conducted by the Deputy Chief of Staff for Operations, Department of the Army, 23 through 25 April. Other participants included representatives of the Air Force, the Army Aviation School, and Fourth Army. On 27 April, CONARC assigned to the Commanding General, Fourth Army, the command of Gary and Wolters at such time as the transfer became effective and designated the Commandant, Army Aviation School, as a technical adviser to assist Fourth Army in the development and consummation of the necessary planning.

On 2 May, the Department of the Army directed CONARC to initiate planning and to take necessary action to accomplish the transfer of training. This included the phasing in of contract training for fixed wing pilots at Gary Air Force Base, with the target date of 15 November, and the initiation of mechanics courses and officer helicopter courses at Fort Rucker. CONARC would initiate contract primary training of cargo helicopter pilots at Wolters Air Force Base, with a target date of 1 January 1957.

In order to accomplish the required detailed planning at all levels of command, the Department of the Army requested that it be furnished military and civilian personnel space requirements, identified by grade and MOS, and Maintenance and Operation funds required by project, giving details and indicating bases and method of computation. The department also requested CONARC to report the capability of the CONUS armies concerned to meet enlisted personnel requirements from their own resources. Maintenance and Operation repairs and utilities projects which would require Department of the Army approval would also be reported, indicating costs. Construction line item priority lists and detailed justification sheets for construction projects recommended for inclusion in the FY 1958 Military Construction, Army (MCA) program would be in integrated sequence to indicate their appropriate

6

(1) Memo, Dep Sec of Def to Secs of Army and Air Force, 19 Apr 56, subj: Responsibility for the Conduct and Administration of Army Aviation Training. (2) CONARC Summary of Major Events and Problems, FY 56, Vol. VI, G-3 Sec Tng Div Sp Tng Br, Jan - Jun 56, pp. 2 - 4. (3) DA DCSOPS Army Avn Dir Summary of Major Events and Problems, FY 56, p. 1 (TOP SECRET -- Info used is UNCLASSIFIED).
priority within line items previously submitted.

CONARC, on 9 May, directed Fourth Army to furnish directly to the Department of the Army information pertaining to personnel spaces and Maintenance and Operation fund requirements for Gary and Wolters and estimated costs of repairs and utilities projects. Fourth Army would complete detailed plans and implement them by joint coordination between its headquarters and the Air Training Command or the Continental Air Command of the Air Force. On 10 May, CONARC assigned to the Army Aviation School the responsibility for the Officer Rotary Wing Pilot Course and the two enlisted mechanics courses being conducted at Gary Air Force Base and directed that phased plans for the orderly assumption of these additional missions be submitted.

A major concern of CONARC during this transition period was the optimum distribution of the various Army aviation training courses among the three installations soon to be at its disposal. Another problem was the orderly phasing out of the various types of training being conducted for the Army by the Air Force and the timely rescheduling of this training, in some cases at new locations, in others, under civilian contract. CONARC submitted its plan for the accomplishment of these objectives to the Department of the Army on 9 June. Both the Department of the Army and the Department of the Air Force approved the CONARC plan.

The plan provided that the Fixed Wing Officer Pilot Course (Army Primary Flight Training) would be retained at Gary. By terminating Air Force instruction as of 1 December 1956 and resuming instruction under civilian contract beginning on or about 1 January 1957, the scheduled course input could still be maintained. The Officer Rotary Wing Pilot Training Course would be transferred from Gary to Rucker. Input to this course at Gary was to terminate in June 1956, with the last students phasing out in August. The first class scheduled for Rucker would begin on 13 July 1956. The Enlisted Fixed Wing Maintenance Course and the Enlisted Rotary Wing Maintenance Course would also be transferred from Gary to Rucker. Inputs to these courses at Gary were to terminate on or about 1 September, with the remaining students phased out by December. The new classes at the Army Aviation School would begin on or about 1 October.

(1) Ltr OPS AV OR 7, DA to CONARC, 2 May 56, subj: Transfer of Responsibility for Army Aviation Training, and 1st Ind ATNG-TNG 322.011, 9 May 56. (2) CONARC Summary of Major Events and Problems, FY 56, Vol. VI, G-3 Sec Tng Div Sp Tng Br, Jan - Jun 56, pp. 4 - 5.
The Army Aviator Transport Pilot Course (Phase II) was to be implemented at Camp Wolters as an 18-week contract primary helicopter flight training course on 7 January 1957. This training was to be followed by a 12-week Army Aviator Transport Pilot Course (Phase III) at the Army Aviation School starting in May 1957. The more advanced training in utility and cargo helicopters would be implemented at the Army Aviation School to qualify the student as a transport helicopter pilot with a complete check out in the H-34 or H-21 upon graduation from the Army Aviation School. Army aircraft and helicopters assigned to the Air Force for the training of Army students would be turned over to the Army by 1 January 1957.

The Department of the Air Force would still be responsible for the completion of the funding of projects under construction at the time of the transfer. The Department of the Army would be responsible for the justification and funding of any modification of projects under construction and for new projects that might be required after the assumption of command.

Since the enlisted students would be sent to Wolters on permanent change of station, it was decided, in the interest of economy, to transfer the 4-week preflight officer candidate school training being conducted at the Army Aviation School to Camp Wolters. The transfer was to be effective with the establishment of contract training at Wolters, with the first preflight class scheduled to begin in November 1956. The planned shifting of courses was designed to provide maximum utilization of facilities and to minimize the travel and temporary duty (TDY) costs. On 21 June 1956, the Department of Defense approved the guidelines which had been submitted jointly by the Army and the Air Force. A Department of the Army message on 22 June constituted authority to implement the transfer. On 1 July, Army training at Spence Air Force Base was terminated and the two classes in residence were transferred to Gary Air Force Base to complete their primary fixed wing training. In the short time that Spence Air Force Base was used, 128 Army students completed their primary training.9

---

Warrant Officer Candidate Class, Camp Wolters, 1961

H-23 RAVEN Observation and Training Helicopter
As a result of the assumption of training responsibility by the Army, it became necessary to move primary helicopter training for rated pilots from Gary Air Force Base to Fort Rucker while negotiations were completed for the Army take over of Wolters Air Force Base for use as its primary helicopter school. Wolters Air Force Base passed to Army control on 1 July and officially became Camp Wolters. The first primary rotary wing pilot course conducted under Army sponsorship began at Fort Rucker on 13 July 1956. Because of a shortage of rotary wing instructor pilots, the Army began to look for new sources of qualified helicopter pilots. The U.S. Marine Corps permitted the resignation of twenty-four pilots, who were accepted in the Army as chief warrant officers. These men reported to Fort Rucker in early August and were given an accelerated course as rotary wing instructor pilots.

Camp Wolters became the U.S. Army Primary Helicopter School on 26 September 1956. A contract was negotiated with Southern Airways Company to provide flight instruction, ground school instruction, and the maintenance of government aircraft and equipment at the school. During August and September, twenty-seven civilian instructor pilots were sent to Fort Rucker for standardization training. Problems of support for the course and the orderly transfer of equipment and training aids involved the Fourth Army and the Army Aviation School, under the monitorship of CONARC.10

The phaseout of Air Force activity at Gary Air Force Base -- which was redesignated Camp Gary -- and the phase in of instruction by contract was completed by December. Camp Gary officially became an Army installation on 15 December. Five classes were cancelled to facilitate this transfer, the first contractor supported course starting in January 1957. CONARC transferred the responsibility for the conduct of Phase I and Phase II of the Army Aviator Transport Pilot Course from the Commandant, Army Aviation School, to the Commanding General, Fourth Army. The latter was directed to establish a contract school for this training at Camp Wolters. A contract was negotiated and training under this new arrangement began on 26 November.11 To support this course, H-23 helicopters were moved from Fort Rucker to Camp Wolters.

10

11

On 7 January 1957, the first class began training at Camp Gary with W. J. Graham and Sons, Inc., conducting primary fixed wing flight instruction. A staff of twenty-two officers and twenty-two enlisted men were responsible for the military operations at Camp Gary and provided quality control of the contractor's job performance. By 1 July 1959, 2,151 student pilots had successfully completed primary training at Camp Gary.12

On 29 January 1957, the Department of the Army informed CONARC that the requirements for warrant officer pilots and student inputs into Camp Wolters were being reduced because of rescheduling and reduction in the number of helicopter units. The Department of the Army requested CONARC to consider the feasibility of transferring some of the training from the Army Aviation School to Camp Wolters to ensure that the training load commitments at Camp Wolters were maintained. To meet this requirement, CONARC requested Fourth Army and the Army Aviation School to consider conducting the primary phase of the Army Helicopter Aviation Tactics Course at Camp Wolters and the tactics phase at Fort Rucker. When the Army Aviation School objected to this split, CONARC informed the Department of the Army on 26 March that the mission of training one-half of the scheduled input into the course for FY 1958 would be transferred from Fort Rucker to the Primary Helicopter Training Unit at Camp Wolters. This vertical rather than horizontal split of the course satisfied the objections of the Army Aviation School.13

Both Camp Wolters and Fort Rucker continued to conduct primary helicopter training until 1958. The last primary class to be trained at Fort Rucker graduated on 6 September 1958, at which time the entire course was consolidated at Camp Wolters.14

On 20 April 1959, the Department of the Army directed CONARC to inactivate Camp Gary by 30 September 1959 and to terminate all Army aviation training there not later than 30 June. The Army

14 History U.S. Army Aviation Center and Army Aviation School, 1954 - 1964, p. 11.
Aviation School, in conjunction with Third and Fourth Armies, Camp Gary, and CONARC, had previously prepared and obtained Department of the Army approval of a plan for the transfer of primary fixed wing training to Fort Rucker. There were 988 Active Army officers either on orders or programmed for fixed wing training between the cut-off class at Camp Gary and 30 June 1960. The Army Aviation School only had an FY 1960 input capability of 780 officers. It was anticipated by the Department of the Army that this consolidation of training would save the Army approximately $2,000,000 annually.15

The last fixed wing primary class in residence at Camp Gary moved to Fort Rucker where students received the remainder of their advanced training. Camp Gary was inactivated on 30 September 1959. Most of the instructor pilots from Camp Gary moved to Fort Rucker along with approximately 190 L-19 aircraft. On 11 September, the first primary fixed wing class with seventy-eight students began training at Low Army Air Field with the Hawthorne School of Aeronautics conducting the primary phase of training. The contractor conducted both the officer Fixed Wing Aviator Course and the Fixed Wing Qualification Course.16

Army Aviation Unit Tactical Training

On 19 October 1954, OCAFF had recommended to the Department of the Army that two Army Aviation Unit Training Commands (AAUTC) be established in two phases. These AAUTC's had the mission of activating and training aviation companies. Phase I would utilize the commander and staff of an assigned headquarters and headquarters detachment, transportation helicopter battalion, as the commander and staff of the AAUTC. During Phase II, a separate TD unit would be established. OCAFF recommended that one command be established at Fort Sill for single rotor training and one command at Fort Riley for tandem rotor helicopter and transport airplane training.17

The Department of the Army stated on 6 December that personnel shortages prevented the establishment of TD units, but recommended that the mission be assigned to the 71st Transportation Battalion at Fort Riley and the 45th Transportation Battalion at Fort Sill. CONARC assigned the training mission to the 71st Transportation Battalion on 24 January 1955. On 31 May, CONARC directed Fifth Army to establish a Provisional Training Command at Fort Sill by using the 45th Transportation Battalion and a TD augmentation of fourteen officer and enlisted spaces provided by the Department of the Army.18

The AAUTC at Fort Sill was activated and became operational on 1 July 1955. The aircraft used at this center were the H-19 and H-34 helicopters. Slippage of helicopter production at the Sikorsky plant during the first half of fiscal year 1956 created a shortage of aircraft at the Fort Sill AAUTC. This slippage seriously curtailed the AAUTC's training mission because it delayed transition flight training for a large number of pilots. CONARC recommended to the Department of the Army that the assignment of flight personnel be scheduled to coincide with the actual delivery of aircraft and also took action to divert some of the pilots at Fort Sill to duty with exercise SAGE BRUSH.

The AAUTC at Fort Riley was organized and became operational on 18 February 1955, although it was not formally organized until 1 August. This AAUTC used H-25 and H-21 helicopters and U-1A OTTER airplanes. Production slippage on the U-1A's, due to a labor strike at the de Havilland plant, delayed development of the U-1 training program.19

In early April 1956, CONARC noted that the current warrant officer cargo helicopter pilot, upon completion of training at the Army Aviation School, was not properly prepared for duty in a helicopter company. Because twelve of the scheduled thirty-six helicopter companies were trained and it was estimated that by the end of fiscal year 1957 twenty-five companies would be operational, the normal assignment for new helicopter pilots soon would be as replacements in operational companies. To prepare the graduate to serve as a replacement, it was necessary that action be taken to

---

18 (1) Ltr ATTNG-TNG 322(S), CONARC to Fourth Army, 31 May 55, subj: Advanced Transport Aviation Training. (2) CONARC Summary of Major Events and Problems, FY 55, Vol. VI, G-3 Sec Tng Div Sp Tng Br, Jan - Jun 55, p. 16, and Vol. V, G-1 Sec Manpower Control Div, Jan - Jun 55, p. 4.

revise the current course to include familiarization training to
the degree necessary to qualify the graduate as a co-pilot in a
cargo helicopter and to permit him to continue flight transition
in a company training program.

CONARC desired that the change be made with the establishment
of the civilian helicopter training program. Limited experience
in helicopter transition training at Fort Riley indicated that the
warrant officer graduate would qualify for a cargo helicopter more
rapidly by going directly from the reconnaissance to the cargo
helicopter and omitting training in the utility helicopter. The
Army Aviation School was considering that procedure in the prepara-
tion of a study to provide the following information by 15 May 1956:
amount of flying time in the cargo helicopter which was required to
familiarize the graduate only to the degree necessary to act as co-
pilot in H-21 or H-34 helicopters and to be capable of continuing
training under a company training program; the time during the 12-
week basic training phase when the cargo helicopter would be intro-
duced; the amount, type, and schedule of equipment required to
support the revised training program; the amount of lead time re-
quired to implement training on receipt of the equipment; personnel
impact, if any, of the program recommended; and the estimated in-
crease in costs and where these costs could be included in the FY
1957 budget.20

Revision in Helicopter Company Activation Schedule

The aviation training requirements placed on CONARC intimately
related to the aviation unit activation schedule. The Chief of
Staff of the Army had approved in August 1952 the organization of
twelve helicopter battalions. This program was modified in the
following years, but it did provide the basis on which the aviation
training program was developed.

Early in 1956, one class of the H-34 Helicopter Pilot Transi-
tion Course had to be cancelled because of a shortage of H-34 heli-
copters at Fort Sill and the urgent need for completion of training
newly activated and organized helicopter companies. Organizations
which had quotas cancelled were authorized to transition train
pilots to fly H-34 helicopters if qualified instructor pilots were
available locally.21

20 Ltr ATTN-G-TNG 352 (Army Avn Sch), CONARC to Army Avn
School, 5 Apr 56, subj: Integration of H-21 and H-34 Flight Transi-
tion in Cargo Helicopter Pilot Course.

21 Ltr ATTN-G-TNG 452.1, CONARC to DA DCSOPS, 18 Jan 56,
subj: Shortage of Helicopters for Training Purposes at Fort Sill.
Originally twenty-one rotary wing companies had been scheduled for activation by the end of FY 1956. Shortages of equipment -- mainly resulting from delays in deliveries of H-34's -- and training facilities resulted in a stretch-out of the training schedule. Deliveries of the H-34's were back on schedule by the third quarter of FY 1956, but the limited training facilities precluded overcoming the delay in training new companies. By the end of FY 1956, fourteen rotary wing companies had been activated.22

On 18 January 1956, the Deputy Chief of Staff for Operations, Department of the Army, directed that CONARC review a revised schedule for the activation of helicopter companies. CONARC did not agree with the Department of the Army proposed program due, primarily, to facility limitations at Fort Riley and on 10 March forwarded its own activation and stationing program based on facilities capabilities.

Meanwhile, the Department of the Army on 10 February directed CONARC to take necessary action to ensure that construction requirements, based upon the Department of the Army's proposed helicopter stationing plan, be included in the FY 1958 MCA program of the CONUS armies to provide airfield facilities. CONARC recommended that planned stationing of helicopter units at Forts Ord and Polk be deferred until hangar and shop space was constructed, and that special consideration not be given to aviation facilities for FY 1958, but be left to the discretion of the CONUS army commanders. On 12 April, the Department of the Army requested CONARC comments on a revised helicopter stationing schedule which incorporated previous CONARC recommendations. CONARC submitted its concurrence, in general, with the Department of the Army program and further stationing recommendations on 14 May. The Department of the Army on 15 June forwarded the activation and deployment schedule of transportation helicopter battalions and the aviation unit activation and stationing schedule.23

On 18 September 1956, a conference was held at CONARC with Col. H. D. Edson, the Deputy Director of Army Aviation, and other Department of the Army staff representatives to discuss several problems regarding the transportation helicopter program. Three major subjects were discussed at the conference. Deficiencies

22 DA DCSOPS Army Avn Dir, Summary of Major Events and Problems, FY 56, p. 1 (TOP SECRET -- Info used is UNCLASSIFIED).

existed in, and mitigated against the attainment of the objectives of the program involving aviation unit activation and the stationing schedule. Short range requirements had to be determined for transportation helicopter unit support during the remainder of FY 1957. Finally, consideration needed to be given to projected unprogramed future requirements established in regard to ROTAD and the SKY CAV tests and the impact of these requirements upon the Army aviation and transportation helicopter unit programs.

The Army Aviation Unit Training Commands at Fort Riley and Fort Sill were unable to organize, activate, train, and deploy fixed wing tactical transport and transportation helicopter units in accordance with the current activation and stationing program primarily due to a lack of trained personnel, particularly in the fields of organizational and field maintenance. Among the major requirements for helicopter support was the ROTAD organization, training, and test of the 101st Airborne Division and the support of the division during Exercise JUMP LIGHT. It was also necessary to provide organic TOE aircraft and aviation personnel on an assigned basis to the 101st Airborne Division to ensure the division's full operational capability by 1 March 1957. Finally, helicopter support of the SKY CAV II test unit, which was to be provisionally organized and trained at Fort Polk commencing in January 1957 and to be tested during Exercise SLEDGE HAMMER, was an additional requirement.24

Projected and unprogramed new requirements for aircraft, pilots, and maintenance personnel for the new organizations to be included within the Army by the end of FY 1958 were estimated at approximately 900 aircraft of all types, 900 additional fixed and rotary wing pilots, and 1,500 maintenance personnel. These new and unprogramed requirements superimposed on the current lagging program indicated that a complete review and revision of the aviation and helicopter programs was essential.

As a result of the conference, CONARC recommended to the Department of the Army on 28 September that the current activation program for Army aviation and transportation helicopter units be temporarily suspended. CONARC also recommended that a new program be developed with consideration given to the requirements for equipment and trained personnel to support an accelerated activation and testing program for new type units. CONARC requested at the same time that action be taken to provide necessary cargo helicopter support for Exercise JUMP LIGHT, the SKY CAV II test in Exercise SLEDGE HAMMER, and to provide aircraft and aviation personnel to the

---

24 See above, Ch. V, pp. 126 - 30.
101st Airborne Division to ensure full operational capability upon its assumption of the Western Hemisphere reserve mission.

The Department of the Army reply on 25 October failed to support fully the CONARC recommendations. Pending the completion of a revised Army Aviation Plan, the Department of the Army agreed to suspend temporarily the activation schedule. The revised activation schedule coincided with scheduled aircraft production receipts and output of pilot personnel. It was recognized that men and equipment might be diverted on occasion from assignment to new units. The Department of the Army considered such diversions preferable to the transfer of men and equipment from units in the process of formation.

On 26 November, CONARC reminded the Department of the Army of the immediate requirements and commitments for transportation helicopter units for which there were no adequate means of support. A conference in Washington on 4 November between Lt. Gen. Clyde D. Eddleman, the Department of the Army DCSOPS, and Lt. Gen. Edward T. Williams, the Deputy Commanding General of CONARC, reached several decisions regarding specific units which to a great extent met CONARC's requirements.

Another conference with Department of the Army representatives was held at Fort Monroe on 7 December to determine a system of priorities for the allocation of light cargo helicopters to support the reorganization of airborne and armored divisions to the ROTAD and ROCAD organization structure and to support the activation of Field Artillery Atomic Support Commands. CONARC recommended that priority for the assignment of light cargo helicopters and allied personnel should be established to support the reorganization of divisions and the activation of Atomic Support Commands. In the event that the activation of additional helicopter companies and helicopter field maintenance detachments competed with these reorganizations and activations for personnel and equipment, CONARC recommended that the activation of the helicopter companies should be delayed accordingly. CONARC also recommended that the activation of additional helicopter companies should be accomplished at the two existing Army Aviation Unit Training Commands to take maximum advantage of these existing and experienced organizations.

On 5 March 1958, the Department of the Army recommended the discontinuance of the Army Aviation Unit Training Commands at Fort

Riley and Fort Sill due to a reduction in the number of aviation units required under the FY 1959 troop structure. CONARC concurred in this proposal on 14 April and recommended that the Fort Riley AAUTC be discontinued on or about 30 June and that the Fort Sill AAUTC be discontinued on or about 31 December. CONARC requested retention of the 45th and 71st Transportation Battalions for support of the Fourth and Fifth Army aviation programs. On 3 June, the Department of the Army informed CONARC that it planned to reduce the table of distribution augmentations of the Headquarters and Headquarters Detachments, 45th and 71st Transportation Battalions, by sixty-seven military and six civilian spaces. The effective reduction dates were in the first quarter and second quarter of FY 1959, respectively. 26 The mission of conducting individual training was transferred to the Army Aviation School at the beginning of fiscal year 1959.

Growth of the Army Aviation School

Formal aviation training had begun at the Field Artillery School during World War II. When the rapid growth of Army aviation began during the Korean conflict, the U.S. Army Aviation School was officially established on 1 January 1953 at Fort Sill as a Class I activity under the Commanding General, Fourth Army. Congestion and inadequate facilities at Fort Sill led to the selection of Camp Rucker as the permanent school location in 1954. The Army Aviation School completed the transfer from Fort Sill to Camp Rucker during the last half of 1954.

Organization

Within the concept guidance furnished by CONARC, the Army Aviation School developed doctrine, organization, procedures, tactics, and techniques relating to the operation and employment of Army aviation, up to and including the Army Aviation Group, in joint and unilateral operations, airborne operations, and amphibious operations. The school instructed and trained officers, warrant officers, and enlisted men of all components, branches, and services of the Army in the functions of Army aviation, and in the relationship of Army aviation between branches and services within the Department of Defense. Instruction included normal employment, capabilities, and limitations of Army aviation at all levels. The school also conducted, coordinated, and supervised instruction in flight training.

of officers, warrant officers, and enlisted men in primary, basic, and advanced flight training in fixed and rotary wing aircraft and such other specialized flight courses as might be required. The school presented instruction in employment, tactics, logistics, and techniques of Army aviation.

In addition to its training mission, the Army Aviation School developed and prepared for dissemination to other elements of the Armed Forces, Army aviation doctrine, tactics, logistics, and techniques. It assisted in the development of Army aviation equipment and prepared statements of requirements for new equipment or improvement of existing equipment. The school developed proposed organizations as directed by CONARC. It evaluated and made recommendations on Army extension course revisions as directed; administered the Army extension course aviation program, and assisted in the development and production of training aids.27

The Army Aviation School was organized with the usual Commandant, Assistant Commandant, and Office of the Secretary. (The organization of the school in 1958 is shown in Chart 5.) The Aviation Medical Advisor provided technical advice and conducted training on matters pertaining to aviation medicine. The Combat Development Office provided for early integration of the latest concepts of Army aviation organizations, equipment, doctrine, tactics, techniques, and procedures into the Army structure. Among the functions of the office was the development, revision, and evaluation of doctrine, tactics, techniques, organizations, and equipment as they effected Army aviation. The office determined new requirements concerning equipment, materiel, and new systems. It monitored troop testing of organization, tactics, techniques, and materiel and their usage. The office also supervised and coordinated feasibility tests of organization and equipment assigned to the Army Aviation School for that purpose.

Upon the movement of the Army Aviation School from Fort Sill to Camp Rucker in 1954, the Director of Instruction was established as the principal assistant to the assistant commandant. The Director of Instruction planned, supervised, and coordinated all resident and nonresident instruction, arranged for special training of students, staff, and faculty, and formulated instructional standards.

The Department of Fixed Wing Training conducted flight training in fixed wing aircraft and academic instruction for fixed wing and rotary wing students. The Department of Rotary Wing Training conducted all flight training in rotary wing aircraft.

27 This section is based on Organization and Functions Manual, U.S. Army Aviation School, 29 Oct 58.
The Department of Tactics prepared, conducted, and presented advanced, intermediate, and basic level instruction in organization and tactical employment of Army aviation units. Among the department's functions was the preparation and conduct of field exercises, demonstrations, and special presentations in support of instructional activities.

The Department of Maintenance conducted personnel training of all components of the Army in subjects relating to pilot maintenance phases of instruction and enlisted maintenance courses designed to support rotary and fixed wing aircraft.

The Department of Publications and Nonresident Instruction was responsible for the preparation, editing, and revision of Department of the Army type publications and special texts pertaining to Army aviation; the preparation of extension courses; and the publication of the U.S. Army Aviation Digest. It was also responsible for the storage and distribution of training publications and instructional material for the Army Aviation School, including requirements for issue to outside agencies and nonresident students.

Operations

During the first few months of operation at Camp Rucker, fixed wing training fell behind schedule primarily due to a lack of facilities. Only Ozark Air Field was available on the post, necessitating the use of civilian airfields. By mid-1955, engineers had completed three fixed wing stage fields and ten surfaced strips. Following these improvements, fixed wing training began to meet the programmed schedule. By late 1955 - 1956, thirty-seven off-post tactical strips had been constructed on leased property. The first field exercises were conducted from makeshift field strips located on the post. In March 1955, two large tactical sites were opened and field exercises improved.

A class of twenty-five officer and warrant officer candidates, which had begun training in October 1954, was the first rotary wing class at Camp Rucker. This class graduated on 30 April 1955. The first Army Helicopter Aviation Tactics Course class reported to Camp Rucker on 11 January, having received primary helicopter training from the Air Force at Gary Air Force Base.

As more aircraft arrived at Camp Rucker, heliports were established in abandoned motor parks. By mid-1955, the flight training was confined to three small stage fields. The school consequently selected various off post tactical sites for use in rotary wing training and began negotiations with the Mobile District Engineer to acquire training sites. With a shortage of instructors and inadequate facilities, flight training fell behind schedule. Despite a 6-day week, classes remained behind schedule until the fall of 1955.
Late in 1955, negotiations began to acquire real estate for off post tactical sites and the first was made available to the Department of Rotary Wing Training early in 1956.28

The Army Aviation Center was authorized forty utility helicopters for aviation training during FY 1956. On 28 July 1955, the center requested the Department of the Army to furnish seventy-four additional utility helicopters to support the program of instruction and to provide the POI Flight Section with three flyable aircraft daily. The need for the additional utility helicopters was based on a new training program that would be initiated due to the CONARC approved program of instruction for Phase III of the Army Helicopter Aviation Tactics Course. On 24 February 1956, CONARC stated that if certain additional factors were met the requirement could be reduced from 74 to 48 additional aircraft or a total of 92 utility helicopters.

This reduction could be made only if there was strict Department of the Army cooperation with the implementation of the CONARC policy of disapproval of any loan of aircraft or support of any Army aviation demonstration which would seriously interfere with training. Revision of contractual negotiation procedures would be necessary to permit the Army Aviation School to negotiate a civilian maintenance contract more favorable to the Army. An improved supply of spare parts was also required.

Utility helicopters needed for the training mission assigned to the Army Aviation School by CONARC were included in a proposed revision of TA 60-4, with the following bases of issue:

1 per 1.26 students, Army Cargo Helicopter Pilot Course
1 per 1.77 students, Army Aviation Basic Flight Training (Helicopter) Course
2 per Army Aviation School (each type) (Class 012 or Class 26)

This proposed authorization was concurred in by the Chief of Transportation.29

28 U.S. Army Aviation Center History, 1954 - 1964, pp. 6, 10, and 15.
In September 1957, Lowe Army Air Field at Fort Rucker was completed. The new field had a modern flight instructor building, maintenance hangers, fire stations, control tower, and four 2,000 foot runways. At this time, all fixed wing flight training moved to Lowe Army Air Field with the exception of the instrument flights which continued to use the Ozark facility. In early 1959, the Department of Primary Fixed Wing Training was formed at Fort Rucker and located at Lowe Army Air Field, while advanced contact training moved to Cairns Army Air Field, the former Ozark Army Air Field. On 6 July 1959, the first class of rated officers began a fixed wing qualification course. Previously, warrant officers had been limited to rotary wing training. A prerequisite for selection for the course was that pilots have a minimum of 350 flying hours.

On 5 October 1959, the Department of Rotary Wing Training of the Army Aviation School moved into its new home at Hanchey Army Air Field. With ample parking space, maintenance facilities, and modern classrooms located on the field, the department was centralized for the first time. By this time, the department had complete control of the eastern portion of the Fort Rucker reservation and had expanded off-post with one stagefield and sixty-five tactical training sites. On 24 July 1961, another modern stagefield was acquired.

The roles and missions being assigned to Army aviation and development of new hardware and tactics pointed out the need for an Army Aviation Staff Officers Course. The first class started on an 8-week program of instruction on 23 October 1957 and was composed of twenty senior company grade and field grade officers. On 24 October 1960, the length of the course was changed to six weeks, with an average input of thirty-five officers per class. On 12 January 1962, the course was reduced to three weeks.

The Department of Rotary Wing Training organized the H-37 transition course in 1957, with the first class beginning on 8 July 1957. On 1 April 1959, it was necessary to organize a transition course for the HU-1A. In 1962, the CH-21 transition course was organized with the first class beginning on 6 July 1962. The Army's acceptance of the CH-47A helicopter necessitated a transition course which was established on 29 April 1962.

The Army Aviation School submitted an initial staff study to CONARC in May 1959 which recommended, among other things, that an aerial gunnery program be established at the school. In August 1959, CONARC indicated that the recommendations were premature, but directed the school to keep the matter under review. The study continued throughout 1960, with the Department of Tactics reviewing troop test results and making liaison visits to nearby installations in an effort to locate adequate range facilities and training areas. In the fall of 1960, the Rogers Board recommended that aerial gunnery

training using machine guns, missiles, and rockets be incorporated into the Rotary Wing Aviator Course beginning in FY 1963.

The school prepared another staff study on aerial suppressive fire which was submitted (along with a proposed program of instruction) on 27 July 1961. The Army Aviation School received the mission to train twenty-six officers on the UH-1B/SS-11 missile system, with training to begin on 1 February 1962. During the next few months, programs of instruction and lesson plans were written, training areas located, and instructor pilots trained. On 12 September, CONARC informed the school that the SS-11 project would be delayed, but that preparations should continue.

During the second week of October 1961, the school received a commitment to train six officers in observation helicopter machine gun fire techniques. Another crash program was set in progress preparing for the class. Training was scheduled to be completed prior to Christmas, 1961, but the class was delayed until early 1962, and the first Rotary Wing Machine Gunners Instructor Course was not graduated until 20 April. Then, the Department of Tactics again turned its attention to SS-11 training. The first special course began on 28 May 1962, with eight students graduating on 8 June. The first training class in the UH-1B/XM-6 system graduated on 28 September.30

The types of course, their names, and their numbers offered at the Army Aviation School from 1955 to 1962 underwent constant change. The major courses presented at the school during this period are shown in Table 4. Maintenance courses offered at the Army Aviation School are shown in Tables 5 and 6 in Chapter VIII, below.

Training Developments

By 1955, the Army aviation program had gone through a significant expansion. In addition to the regular flight and maintenance training programs being conducted, additional training requirements became necessary. A milestone in the history of Army aviation was the 1955 program to train senior officers as Army aviators. For the aviation program to continue to expand it was imperative that it have the highest caliber of senior leadership. Another vital concern impacting on expansion was the provision of an instrument flight capability.

---

Courses for Senior Officers

On 16 February 1955, the Department of the Army advised CONARC that plans had been developed to train from nine to twelve senior colonels annually as Army aviators to give the program depth and prestige. The scope, purpose, and course length were to be recommended by CONARC. The Army Aviation School and CONARC prepared a recommended 35-week course consisting of 25 weeks of fixed wing and 10 weeks of rotary wing training. The first class, consisting of twelve colonels and lieutenant colonels, started training on 6 September 1955.

During FY 1956, a requirement was established for a course of instruction to acquaint senior Army officers with pertinent aspects of Army aviation personnel, organization, and procurement problems, doctrine, tactics, and employment techniques, capabilities and limitations, training considerations, and research and development trends. Officers taking the course had to be assigned to a position which required knowledge of the subject matter covered in the course. The first class, originally cancelled because of under-subscription by Army commanders, got underway on 5 February 1956.

Mountain Flight Training for Army Helicopter Pilots

The Chief of Transportation on 2 June 1955 advised CONARC that funds and training spaces had been provided for eighteen Army aviators to take a 4-week course in helicopter operations in mountain terrain. The course was conducted by Okanagan Helicopter Limited, Vancouver, B.C. CONARC allocated these spaces to instructor pilots at the Army Aviation School and the Army Aviation Unit Training Commands at Fort Sill and Fort Riley. In efforts to evaluate the training, the students were required to submit critiques of the course. Based upon student comments, CONARC directed the Commandant, Army Aviation School, to study the subject of high altitude mountain flying techniques and, if appropriate, submit to CONARC recommended changes in helicopter pilot training courses and publications reflecting these techniques. In September 1956, CONARC asked Fifth Army about the feasibility of using Fort Carson as a helicopter mountain training site. One suggestion by CONARC was the assigning of a helicopter mountain training command mission to

the helicopter company which was scheduled to be stationed at Fort Carson.\textsuperscript{33}

**Instrument Training**

The Army Aviation School in December 1954 had begun investigating helicopter instrument flying. In March and April 1955, an evaluation was conducted of the H-19 and H-25 helicopters. Stability characteristics varied between the single rotor H-19 and the tandem rotor H-25, and the H-19 proved to be more stable in straight and level flight. It also had less tendency to pitch, roll, and yaw. Another factor was that excessive vibrations on the H-25 instrument panel during climbs, descents, autorotations, and airspeed transitions caused instrument interpretations to be difficult. The H-19 was determined to be the more suitable instrument trainer and was the only helicopter used in the early months of the program.\textsuperscript{34}

The first helicopter instrument class began on 3 May 1955. The students were selected at random from the H-19 instructor pilots at the school and were scheduled to become instrument instructors.

A CONARC study revealed that approximately 2,000 Army aviators had to be instrument qualified at the beginning of FY 1956 to meet the requirements of SR 95-15-5. On 8 June 1955, CONARC outlined to the Department of the Army an instrument training program by civilian contract to train 540 aviators per year until the backlog was eliminated. The Department of the Army on 26 June indicated that no funds were available, but requested that plans be prepared to include training and TDY costs, the agency to conduct the training, the type of aircraft to be used, and the number of personnel per class. In October, the Department of the Army provided guide lines indicating the FY 1957 budget limitations in travel, per diem, training costs, and number of students. This information was forwarded to the CONUS armies to be used in the revision of plans previously submitted for possible implementation during FY 1957.\textsuperscript{35}

\item \textsuperscript{35} CONARC Summary of Major Events and Problems, FY 56, Vol. II, G-3 Sec Tng Div Sp Tng Br, Jun - Dec 55, p. 5.
\end{itemize}
The Department of the Army approved the CONARC plan in October and provided the necessary budgetary guidelines. The CONUS armies had indicated that fixed wing instrument training could be conducted by contract within existing budget guidelines. CONARC requested the Department of the Army to advise it of any funds available from the FY 1957 budget.36

Another part of the test and evaluation program conducted by the Army Aviation School consisted of the Instrument Helicopter Experimental Course, which began on 26 March 1956 with fourteen students and lasted four weeks.

While experimentation continued with the ability to fly helicopters under instrument conditions, steps were taken to improve the fixed wing instrument training program. The Department of the Army, CONARC, and the Army Aviation School worked together to make all Army aviators fully instrument qualified. Additional instrument training was added to the fixed wing pilot course as a prerequisite for fully qualified instrument aviators. Civilian contract training in the CONUS armies was also conducted to reduce the backlog of unqualified pilots.37

Recognizing the inadequacy of existing equipment and the urgency of the helicopter instrument requirement, the Army Aviation School and CONARC Board No. 6 agreed to join in a mutual effort to expedite the entire program. The school determined operational procedures and requirements for helicopter instrument flight while the board concurrently determined the suitability and adequacy of the equipment. CONARC approved the complete equipping for instrument flight of the two H-21's and two H-34's belonging to the board.38

On 29 June 1956, CONARC requested that a special electronic and instrument configuration be provided for H-21 and H-34 helicopters for use in integrated instrument-visual flight training.

38 Ltr ATBG-DG 452.1, CONARC Board No. 6 to CONARC, 15 Jun 56, subj: Request for Equipment for Helicopter Instrument Flight.
This request was approved by the Deputy Chief of Staff for Military Operations, Department of the Army, with delivery scheduled for June 1957. No helicopters modified in accordance with this request, however, were available for student training at the end of FY 1958. Vigorous follow-up action showed that engineering change proposals and contract change notices were not negotiated to incorporate these requirements in current production H-21's and that retrofit kits would have to be installed. An engineering change proposal for modification of the H-34's was received at the Department of the Army during February 1958 and was not approved in time to ensure delivery during the calendar year. The Army Aviation School capability was limited to eight students per class until additional equipment was available.39

Despite the equipment shortages, the Army Aviation School had continued to press the development of helicopter instrument flight. On 7 May 1957, it had reported to CONARC that up to that date there had been approximately 2,635 hours of simulated instrument flight time flown and approximately 126 hours of actual flight. The actual flights were conducted by H-19, H-25, and H-34 helicopters, an H-19 being the first helicopter to be flown under actual instrument conditions on 19 January 1956. The Army Aviation School requested that Army regulations be revised to allow the operation of helicopters under instrument conditions. A set of proposed changes were drawn up by the school and submitted for approval on 19 May 1958. Generally, they involved the rewording of regulations to include helicopters in a number of existing regulations. Specifically, the proposals requested that rotary wing takeoff minimums be made lower than those applied to fixed wing aircraft and also that helicopters be allowed lower minimums at destination and alternate airports. Most of these changes were approved in late 1958.

By mid-1958, CONARC had approved a helicopter instrument flying course and the first class began on 14 July. Immediately following the graduation of this class, a helicopter instrument examiner course was established and the graduates began training on 22 September.40

Army ROTC Flight Training Program

At a Department of the Army conference on 29 November 1955, a CONARC representative was advised of an immediate requirement for a tentative plan to initiate flight instruction as part of the ROTC program. CONARC developed such a plan and presented it to the Department of the Army on 21 December. The plan was used as a basis for a Department of the Army briefing of the Senate Armed Services Committee in January 1956. Public Law 879, 84th Congress, established authority to initiate and conduct the Army ROTC Flight Training Program during school year 1956 - 1957.

CONARC planned to implement the Army ROTC Flight Training Program in selected institutions as soon as practicable in FY 1957. Selection of institutions for the program was based on the following criteria: best qualified; wide geographical spread throughout the United States; the availability of a Civil Aeronautics Administration approved flying school in close proximity to the institution; joint Army-Air Force ROTC units were possible; and budgetary limitations.

The Army ROTC Flight Training Program was offered on an extracurricular basis and did not alter the prescribed ROTC program. The following criteria applied to the selection of students for the program; enrolled in Military Science IV ROTC instruction and scheduled to graduate in one academic year; volunteer for flight training; parental or guardian approval obtained in writing; pass a Class I physical examination; pass a flight aptitude test; agree to volunteer for Army aviation training and assignment while on active duty; agree to an extended period of active duty (three years) or two years subsequent to completion of the Army Aviation School, whichever was the shorter period; and have an academic standing in the upper half of the class.41

Due to unforeseen difficulties encountered in negotiating contracts and completing physical examinations, only twenty-five of the selected institutions elected to commence the program during the first year. From these institutions, 464 applications for flight training were received. Of this number, 162 were disqualified for physical reasons. A total of 202 students successfully completed the course prior to the end of school year 1956 - 1957. A quota of 800 had originally been allocated by the Department of the Army.

A survey of interested students conducted in the spring of 1957 indicated that the Department of the Army quota of 650 for school year 1957-1958 would not be met unless the number of participating institutions was increased. During the period, June to December 1957, ten more were authorized, bringing the total to fifty-eight participating institutions.

Successful completion of the ROTC Flight Training Program prepared ROTC seniors to qualify for a private pilot's license, though receipt of such a license was not considered by the Army as a requirement for successful completion of the course. Graduates of the program were qualified, following completion of officer basic branch courses, to attend the Army Primary Flight Training Course at Camp Gary. The program created a pool of Army pilots which might be used in the event of national emergency.

In the summer of 1958, the CONARC training memorandum on the Army ROTC Flight Training Program was revised, coordinated with the Civil Aeronautics Board and the Civil Aeronautics Administration, and published. The new memorandum removed the requirement for a specific number of hours to be devoted to the various subcourses of the in-flight training, giving the flight instructor more flexibility in the conduct of the course. The number of hours for in-flight instruction was increased from 36½ to 39½ when considered necessary to improve the flying proficiency of the student. The memorandum also authorized further expansion of the program as deemed necessary by the CONUS army commanders to ensure a sufficient base to fulfill assigned quotas. CONARC retained final approval of all schools entering the program.

Ten additional institutions, including the University of Alaska, were authorized to conduct the program during FY 1959. This brought the number of institutions participating to sixty-nine. An evaluation of reports on the progress of the Army ROTC Flight Training Program indicated that fifty-six institutions participated in the program in 1957-1958, and 436 students successfully completed the course of instruction. Reports of performance of graduates attending the Primary Fixed Wing Course at Camp Gary indicated that only 4 percent of the graduates of the program failed to successfully complete this course during their active duty tour. The quota for the program

42

43

CONARC Summary of Major Events and Problems, FY 58, Vol. IV, G-3 Sec RC Div, Jan - Jun 58, p. 9.
During school year 1958 - 1959, sixty-six institutions actually participated in the program, producing 349 completions with commissions and 133 completions who were not commissioned, due primarily to failure on their part to achieve requirements for a baccalaureate degree. The majority of these were later commissioned upon completion of their academic requirements. Due to the success of the program, the Department of the Army increased the student quota to 500 spaces for school year 1961 - 1962 and to 600 spaces for school year 1962 - 1963.45

Prior to 1955, the responsibility for supply and maintenance of Army aircraft was split between the Department of the Army and the Department of the Air Force. The Army was responsible for field maintenance of aircraft, computation of requirements, and funding for spare parts requirements. The Air Force was responsible for depot storage of aircraft and parts, and for major overhaul maintenance. Because of this dual responsibility in a single logistics area, the Army encountered several major problems which retarded proper support for Army aircraft. The lack of adequate and timely stock status information required the Department of the Army to employ an excessive administrative lead time in computing its anticipated requirements for replenishment procurement. The non-availability of current inventory status reports made it impossible to integrate properly the stocks on hand with requirements for provisioning spare parts support for new aircraft coming into the system.

Another problem was the lack of issue experience and clear delineation between recurring and non-recurring issues that prohibited proper budgeting for procurement of aircraft repair parts. Frequently, there was loss from Army equity of aircraft parts returned to Air Force depots from Army installations for rebuild. The excessive administrative leadtime between the critical supply situations at the depots and the reporting of such situations to the Army agency competent to take corrective supply action resulted in additional difficulties. There was no worldwide inventory report including quantities of available Army supplies in overseas depots due to the lack of information from Air Force reports.

The Army maintenance concepts contained three echelons of maintenance -- organizational, field, and depot -- located separately, while the Air Force, although recognizing these three echelons, merged organizational and field maintenance at base shops. This dissimilarity in the two maintenance systems caused difficulty in computing allowable lots of parts, technical order compliance requirements for depot maintenance of parts, and funding for spare parts consumption. The division of responsibility for aircraft maintenance and budgeting made it impossible to develop reliable operational and cost accounts on the effectiveness and efficiency of Army aircraft maintenance.1

Transfer of Depot Responsibility

During 1954, the Army had come to the conclusion that adequate logistical support of its aviation could not be attained under the existing alignment of responsibilities. The Air Force, which had earlier opposed the idea, at the same time exhibited willingness to go along with a transfer of depot functions. The Transportation Corps immediately began planning for the assumption by the Army of the depot support mission. The initial Transportation Corps plan, prepared by Transportation Corps Army Aviation Field Service Office in September 1954, laid down the broad outlines for the Army assumption of depot support responsibilities over a 2-year period, beginning 1 July 1955.2

On 14 March 1955, the Army and the Air Force signed a memorandum of agreement laying down the general principles for the transfer of depot support functions. By the terms of the agreement, the Army would store and issue Army aircraft and all common and peculiar spares and spare parts to include airframes, engines, instruments, accessories, communications and electronics equipment, ground handling equipment, overhaul and maintenance tools, paint, hardware, raw materials, and other supplies and equipment used in direct support of Army aircraft.

The transfer of storage, issue, and depot maintenance responsibilities would begin on 1 July 1955 and be accomplished progressively according to a schedule devised by a joint working committee. Army equities of serviceable items in Air Force depot stocks were to be exhausted by normal attrition, physical transfer from Air Force depots to Army depots, or transfer to the Air Force of those items excess to Army requirements. Stocks purchased by the Air Force for the depot maintenance of Army aircraft and allied equipment would be turned over to the Army. The Air Force would continue to process overhaul reparable items pending the date of the transfer of this responsibility. And it would continue to budget for the support of depot supply and maintenance of Army air items for FY 1957, with the Army assuming responsibility in FY 1958.3

In May 1955, a Department of Defense decision suspended action on the transfer of the depot support functions. Planning by both

2 For the organizational changes within the Transportation Corps which resulted from this plan, see above, Ch. III.

219
services was temporarily suspended pending the submission and evaluation of the total recommended adjustments between the departments in the materiel field. On 26 October, Assistant Secretary of Defense Thomas P. Pike approved the transfer in principle and the general plan for effecting it, as presented by the Chief of Transportation. The Department of Defense approval of the plan, it was made clear, would not preclude later reexamination and changes dictated by fund readjustments and changes in construction requirements as implementation proceeded. The Army was not to create any depot facilities, either in CONUS or overseas, where adequate facilities existed. All CONUS maintenance would be performed by contract or by cross servicing with the Air Force or the Navy. On 26 November, the Assistant Secretary of the Army requested a periodic progress statement on the status of the assumption of the depot functions. The Deputy Chief of Staff for Logistics, Department of the Army, formally assigned the responsibility for Army aviation depot support to the Chief of Transportation on 13 December.\(^4\)

**Army Aviation Depot Plan**

### Provisions of the Plan

As soon as the depot responsibility was assigned to the Chief of Transportation, work began on updating and revising the Army implementation plan. A revised Army Aviation Depot Plan was completed on 15 January 1956. It was necessary to make changes in the time phasing of the transfer of functions and in resources requirements. As a result of a restudy of the depot sites, the Transportation Corps decided to have four, rather than three, Transportation Sections located at depots. Adjustments also had to be made in the plan as a result of the restrictions imposed on depot maintenance by the Department of Defense. Requests for additional construction funds were turned down, and the strength of depot support battalions, planned for oversea service, was reduced. The Deputy Chief of Staff for Logistics, Department of the Army, approved the revised Army Aviation Depot Plan on 30 March.

The supply system developed in the plan was based on normal Army supply procedures, with centralized accountability maintained at the Transportation Supply and Maintenance Command (TSMC) and with stocks held at Transportation Sections of New Cumberland General Depot, Pa., Atlanta General Depot, Ga., Sharpe General

\(^{4}\)

(1) Report on Aircraft Maintenance and Supply, p. 3.
The supplies currently stocked at fourteen Air Force depots would be used for supply actions to reduce levels by attrition. Receipts from procurement and returns from overhaul would be placed in Army depots beginning 1 April 1956. The Transportation Corps anticipated supplies in the Air Force depots would be negligible by 1 July 1958.

The Department of the Air Force would continue to budget through FY 1957 for depot maintenance. Major repair and overhaul of aircraft components, except for limited capability prior to 1 July 1957, would be performed by contract or cross-servicing agreements entered into by TSMC. The maintenance facilities established at the depots would enable the Transportation Corps to perform the following functions: fourth echelon maintenance, beyond the capability of field maintenance centers, and contingency maintenance; technical order compliance on reparables and serviceable stock; area support of crash damaged aircraft; and minor unscheduled maintenance by appropriate contracts.

Overseas, supplies would be placed in Army Supply Centers, with requisitions passing through normal Army supply channels at a date to be determined by the theater commanders. Maintenance facilities overseas were to be established in FY 1956, with TD personnel, using available tools and equipment, until replaced by TOE units when they became available.

Implementation of the plan would proceed on a phased basis, beginning on 1 April 1956, with the diversion of supplies under procurement to Army depots until independence from the Air Force depot system was virtually achieved by 30 June 1958. During the third and final year, efforts would be made toward completing construction, obtaining final personnel allocations, cleaning up residual Army assets in Air Force depots, and attaining a full area maintenance support capability at the Army depot shops.

Army Regulation 700-210, 14 August 1956, described the phased transition of depot support for Army aircraft from the Air Force to the Army. On 17 September, CONARC requested information from the Department of the Army for planning and budgetary purposes. The department informed CONARC that it would continue the liberal aircraft assembly exchange policy which existed for support of

---

5

(1) Revised Army Aviation Depot Plan, 15 Jan 56, TSMC.
Army aircraft. The Army Aviation Depot Plan contemplated absorbing from the existing CONUS army field maintenance shops that portion of fourth echelon requirements above the capability of the army shops. No additional funds, personnel spaces, tools, and equipment or facilities would be required. Depot support would be accomplished by cross-servicing agreement, contractual services, and depot facilities. The specific target date for the transfer of responsibility for the depot support of Army aircraft was 1 April 1957, but the program was phased in as requirements existed.6

Implementation of the Plan

The air materiel capabilities of the Army depots had to be developed from scratch. Warehouse and storage space was acquired at the four depots and new procurement and excess supplies from the CONUS army areas were brought in as initial stock. Arrangements were made for construction during FY 1957 and FY 1958 of area support fourth echelon shops, including hangars, runways, and related facilities.

Although the timing of the changeover in supply support proceeded according to plan, the expected improvements in the accuracy and responsiveness of the support did not immediately materialize. Recovery from the expected slowdown which resulted from transition from the Air Force to the Army supply system was slow. Increasing workloads, limitations in resources and manpower, excessive and improper requisitioning, difficulties in item identification, and other problems necessitated concentration on overcoming backlogs and on meeting current needs.

The rapid growth of Army aviation had been one of the basic causes of the problems which developed. The original 1956 plan was based on a worldwide fixed and rotary wing aircraft population of approximately 3,500. By the end of 1957, this number had increased to approximately 4,500, and more increases were certain in the years to come. The number of air support spare parts to be managed was originally estimated at 36,000, but by the end of 1957 had reached nearly 70,000, with 100,000 expected in FY 1959. Original plans were based on receiving requisitions for 14,000 air line items per month, while rate of receipt had reached 22,000 per month in 1957. The estimated workload was expected to increase to 40,000 during 1958. The plan contemplated that approximately 1,000 air line

items per month would be purchased by TSMC. During 1957, the figure was closer to 3,000 per month.\textsuperscript{7}

The Deputy Chief of Staff for Logistics directed in August 1957 a time-phased program to improve the Transportation Corps supply effectiveness. Intended to correct both short and long range problems, the program had several major objectives. To reduce the need for time-consuming procurement actions on requisitions, the Transportation Corps sought to assure a greater correlation between stockage and demand. Existing provisioning procedures, which had been intended primarily for Air Force use, were replaced. Attempts were made, through CONARC and the CONUS Army Commanders, to achieve standardization of types and models of aircraft at installations and, where possible, on an area-wide basis. Problems of requisition identification and processing were to be eliminated and improper requisitions reduced.

As a result of this program, the Transportation Corps made steady, if sometimes slow and erratic, progress in improving its supply system. While neither its overseas nor domestic supply performance had come up to the DCSLOG criteria by the end of 1958, definite improvement was evident. The Transportation Corps expected steady progress toward the objective of meeting Army standards of supply effectiveness as a result of continuing the existing program, together with benefits drawn from increased experience and expanded automatic data processing operations.\textsuperscript{8}

During the transition period, many exceptions to Army regulations had to be requested and many regulations peculiar to aviation were published. These measures were due in part to assuming practices which had been common to the Air Force and could not be quickly changed and in part to the large number of technicians employed by the Transportation Supply and Maintenance Command who were former Air Force employees trained in the Air Force method of doing business. TSMC expended much effort in revising procedures and practices to conform to standard Army patterns, and, as time went on, fewer and fewer exceptions to Army regulations had to be requested. By early 1960, the only regulations which dealt exclusively with aviation equipment were based on the peculiarities of that equipment and not upon Air Force practices.

\textsuperscript{7} (1) The Army Aviation Depot System: Its Origins and Development, pp. 16 - 23. (2) Report on Army Aircraft Maintenance and Supply, pp. 12 - 13. (3) By 1960, there were about 6,000 aircraft in the Army inventory.

The transition period culminated in calendar year 1959. The attrition of Air Force stocks had taken place much more quickly than expected. Anxious to clear Army equities from its depots, the Air Force pressed for earlier transfer of stocks and offered to pay certain transportation costs. The Army also placed increased emphasis on expediting the transfer of disposal of its assets in Air Force depots. By 30 June 1958, almost $78 million worth of stock had been issued by or transferred from Air Force depots. Residual stocks, valued at about $1.6 million, were subsequently transferred or disposed of as rapidly as possible.

During FY 1960, the Transportation Materiel Command was responsible for the supply and maintenance of 5,461 Army aircraft with a value of $427,000,000. The Master Authorized Stockage List (MASL) reflected the efficiency of supply stockage and supply distribution. During FY 1960, the list was expanded to embrace all items in the Transportation Corps supply system to be provided within a relatively short time, as contrasted with items supplied on an "as required" basis. The expansion of the MASL along with improved management techniques raised the number of requisition line items matching the MASL from 60 percent in FY 1959 to 80 percent in FY 1960. Slow procurement action, and the expansion itself, also kept a large percentage of items at a zero balance, which was improved after the close of the fiscal year. A 50 percent reduction in the number of critical air items to only 13 was encouraging even though it did not meet the target of zero. Measured by the Department of the Army DCSLOG criteria that at least 80 percent should be delivered on time, the Transportation Materiel Command met the target for CONUS troop support, an improvement of 12 percent over 1959, though it still lagged for overseas troop support. These improvements in supply effectiveness could be ascribed to the perfecting of internal controls over the MASL and to the correction of errors in depot inventories.

Warehouse refusals at the beginning of FY 1960 were well above the target of 3 percent, causing the Transportation Materiel Command to attack the problem by examining the inventory of depot stocks, by purifying them, and by emphasis on correct identification and cataloging. The Transportation Corps sections of the four general depots were closed, in turn, between April and November 1959, and nearly 40,000 line items were adjusted by proper identification, classification, or correction of balances.

---

During the first half of FY 1960, procurement lagged because of a lack of funds, resulting in many priority item requests and a decline in the filling of requisitions. Additional funds for the last half of the year reversed these trends. Some 60,000 stock replacement items were procured during the year, a decrease of 25 percent from the previous year.10

Army Procurement of Aircraft

In September 1959, at the direction of the Office of the Secretary of Defense, the Chief of Transportation submitted a plan for direct engineering and procurement of Army aircraft to begin on 1 July 1961. During 1960, the Transportation Corps obtained 122 fixed wing aircraft and 304 helicopters through interservice procurement actions with the Air Force and the Navy. The Office of the Secretary of Defense did not believe that the Transportation Corps had the capability in engineering fields to undertake direct procurement of aircraft, therefore the Transportation Corps submitted a revised plan in January 1961 omitting this area. On 1 July 1960, the Office of the Secretary of Defense refused to permit full procurement of all aircraft, but indicated that a beginning could be made by the Transportation Corps in purchasing off-the-shelf items, including aircraft and components certified by the Federal Aviation Agency. The Transportation Corps could also prepare specifications, establish evaluation boards, conduct mock-up inspections, and participate with the other developing services in engineering and functional flight tests.11

Maintenance Personnel Problems

Maintenance was a major continuing problem of Army aviation. The maintenance of Army aircraft grew steadily more difficult and costly. Despite efforts at standardization and simplification, aircraft, particularly helicopters, increased in complexity as well as in size and number. Design deficiencies and modifications, short service life of components, the necessity for frequent tear down, inspection, and overhaul, and the wide dispersion of aircraft combined to complicate maintenance. Even the simplest aircraft required approximately ten hours of maintenance per hour of flight.12

10. OCofT Summary of Major Events and Problems, FY 60, pp. 58, 61 - 64.
11. Ibid., FY 60, p. 64.
On 4 May 1955, G-3, Department of the Army, had requested the assistance of CONARC in the solution of certain problems concerning the adequacy of the enlisted grade structure of helicopter mechanics in the transportation helicopter company and other TOE units that contained aircraft. At an Aviation Conference conducted at the Department of the Army on 29 April 1955, the adequacy of the rank of helicopter mechanics in the transportation helicopter company had been questioned, and the desirability of designing a specific position as crew chief so as to retain capable and competent maintenance personnel in the service was proposed.

A related problem was cited on 23 May in a letter from the Chief of Transportation to the Commanding General, CONARC, which stated that an evaluation of experience data clearly indicated the inadequacy of the method for computing aircraft mechanic requirements as established in SR 310-30-15, which contained organization and equipment authorization tables. The normal availability of helicopters assigned to transportation helicopter companies was 57 percent instead of the 66 2/3 percent planned for in the TOE. This availability objective was not being attained because of a lack of men to meet the high maintenance requirements. The Chief of Transportation recommended that the aircraft mechanic authorization contained in SR 310-30-15 be changed to increase the number of aircraft mechanics authorized in aviation units.

A CONARC study of the aircraft maintenance authorizations and the grade structure concluded that the number of mechanics authorized in existing TOE's was not adequate to perform required maintenance, and that the present grade structure for aircraft maintenance personnel should be raised one grade under the new specialist grade system. These measures would provide the incentive to encourage competent and highly trained mechanics to remain in the service.

On 3 June, CONARC recommended to the Department of the Army, that the method of computing aircraft mechanics by SR 310-30-15 be changed. In order to raise the grades of aircraft maintenance personnel one grade, CONARC recommended that it would be necessary to change the standards of grade authorization contained in AR 611-201. CONARC proposed the following changes in titles for aircraft mechanics: aircraft mechanics helper be changed to airfield service crewman; senior helicopter mechanic be changed to helicopter crew chief (mechanic); and helicopter mechanic helper in field maintenance organizations be changed to aircraft maintenance apprentice. CONARC also recommended that the position of crew chief be authorized on the basis of one per aircraft.

CONARC representatives participated in a conference at the Department of the Army on 16 September concerning the requirements for additional mechanics for transportation helicopter companies.
The G-3 representatives stated that they were in agreement with recommendations made by the Chief of Transportation and the Commanding General, CONARC, concerning a need for an increased number of mechanics in helicopter companies. It was indicated, however, that CONARC's proposed change to SR 310-30-15 would increase the number of fixed wing aircraft mechanics as well as rotary wing mechanics in various TOE. The G-3 representatives felt that there was ample evidence presented to support an increase of rotary wing mechanics, but not to increase the number of fixed wing mechanics. Because there was an immediate requirement to increase the number of mechanics in TOE 55-75R, Transportation Helicopter Company, this TOE should be revised accordingly and the Department of the Army would grant a waiver of the provisions for SR 310-30-15 for this revision. When sufficient factors were available for both fixed and rotary wing mechanic equivalents, a change would be published to SR 310-30-15. The conferees concluded that CONARC should publish a revision of TOE 55-75R, to include the increased number of mechanics required based on statistical data of operation experience to be furnished CONARC by the Chief of Transportation. The Department of the Army G-I was instructed to furnish CONARC with an advance copy of the MOS and grade structure revision for aircraft mechanics to include in the revision of TOE 55-75R.

The Department of the Army on 23 September formally directed CONARC to make the revision. CONARC forwarded the revised TOE to the Department of the Army on 15 November for approval and publication. This revision increased the number of helicopter mechanics from 33 to 61 based on a maintenance workload of 7 hours of maintenance for each hour of flying time for H-21 light cargo helicopters and 4 hours of maintenance for each hour of flying time for H-13 reconnaissance helicopters. The position of crew chief on the basis of one per helicopter was also included in this revision. This action was considered an initial step in improving the Army Aircraft Maintenance Program. When all the actions recommended to the Department of the Army were completed, an increase in aircraft mechanics in forty-five TOE's would be required.13

Depot Maintenance Support

Fifth Echelon Maintenance

On 1 July 1955, the Transportation Supply and Maintenance Command assumed the depot level maintenance responsibility after 13

making a preliminary survey of commercial facilities and negotiating initial contracts. While cross-service agreements were employed where feasible, the bulk of the fifth echelon work on Transportation Corps air items was performed by commercial contract.14

To accomplish the contractual maintenance of aircraft end items, the Transportation Corps established an new Standard Configuration and Modernization Program (SCAMP). While retaining the concept of scheduling aircraft through the depots on a 3-year cycle, as under Air Force programs, SCAMP was intended to avoid the difficulties which had been experienced earlier. SCAMP consisted of the inspection of aircraft, the performance of all maintenance work which had fallen due, the installation of product improvement and modification kits, and the restoration of aircraft to their scheduled level of depreciation. This program was expected to maximize maintenance effectiveness, correct deficiencies and discrepancies left unremedied at lower echelons, and simplify parts support. At the same time, reparable components were removed from aircraft and after restoration to serviceable condition were returned to depot stocks for reissue.

The Transportation Corps experienced great difficulty during FY 1958, the first complete year in which it had the depot maintenance responsibility, in assuring timely and efficient negotiation and execution of contracts for aircraft component overhaul and repair. Despite difficulties, TSMC did make progress in the program. It was apparent, however, that the accomplishment left much to be desired. Contract awards lagged and long delays were experienced in getting aircraft through and out of maintenance facilities.

14 There were five Army maintenance categories. First echelon was maintenance performed by the user or operator of the equipment. Second echelon maintenance was performed by specially trained personnel in the using organization and was beyond the capabilities and facilities of the first echelon. Third echelon was performed by specially trained units in direct support of using organization. The first two echelons were performed in the using units, while the third echelon was performed by attached aviation maintenance units. Fourth echelon maintenance was performed by units organized as semifixed or permanent shops to serve lower echelon maintenance usually for return to supply channels. Fifth echelon involved the rebuilding of major items, assemblies, parts, accessories, tools, and test equipment.
Steps were taken by the Transportation Corps to assure that the situation would be more orderly in FY 1959. Efforts were made to obtain the early release of funds and promptly to obtain bids and make awards of contracts. Indefinite quantity contracts were used to facilitate adjustments to changes in funds and workloads. Implementation of the FY 1959 depot maintenance program, however, was adversely affected by delays in obtaining Department of the Army approval of contracts and by shortages of contractor-furnished and government-furnished parts. New Department of the Army restrictions on the scope of the SCAMP program caused additional difficulties. With the establishment of fourth echelon maintenance at the depot sites, TSMC was directed to eliminate from SCAMP contracts any provision for performance of lower echelon maintenance tasks that should have been accomplished prior to delivery to the contractor. The Transportation Corps believed that it was both logical and economical to perform at the SCAMP site all aircraft repairs which had fallen due or would shortly become due. The deferral or omission of these repairs would probably lead to the grounding of aircraft on their return to using activities.15

Under cold war plans, mobilization capabilities and training facilities were essential for an instant readiness posture. Consequently, the Office of the Secretary of Defense on 22 December 1959 authorized Transportation Corps in-house assumption of about 40 percent of fifth echelon maintenance to be phased in over the next three years. The Transportation Materiel Command immediately established a Directorate of Maintenance Operations to move ahead on a 2-phase plan. The first phase contemplated inaugurating fifth echelon maintenance in general depots on components, excluding engines, transmissions, and aircraft themselves. The second phase -- fifth echelon maintenance of engines, transmissions, and aircraft -- required more extensive facilities than the Army had available. After careful analysis of available facilities of the Air Force and the Navy, the Naval Air Station at Corpus Christi, Tex., seemed to be the most promising.

Just as the Transportation Corps supply and maintenance sections in the general depots were getting ready for increased maintenance duties, the Quartermaster General on 2 September 1959 announced plans for a new concept which would eliminate the technical service sections. The technical service staff would be limited to staff guidance in the accomplishment of the depot's mission. This concept would remove the Transportation Corps staff officer from direct control over the aircraft supply and maintenance operations. The Chief

of Transportation requested that Transportation Corps aircraft maintenance be set up in each of the general depots as a Class II activity. On 1 February 1960, the Department of the Army DCSLOG agreed to this proposal. The Quartermaster General desired to test this concept in one depot; the year's trial began at Sharpe General Depot in July 1960.16

Fourth Echelon Maintenance

The Army Aviation Depot Plan provided for shops as part of the Transportation Sections at the general depots to handle fourth echelon maintenance workloads beyond the capabilities of field maintenance activities. It was contemplated that the shops would have limited capabilities by 1 July 1958 and be fully operational by the end of the following year.

By late 1956, it had become evident that delays in the construction program for the shops, along with the lead time involved, would preclude completion of the aircraft maintenance facilities until at least mid-1958. The limited capability of the field maintenance shops, coupled with the delay in completing the new depot facilities, threatened to affect adversely the maintenance support of Army aircraft. Because of the urgency of the situation, the Department of the Army DCSLOG directed the Chief of Transportation in December 1956 to establish a limited interim fourth echelon capability using available existing facilities at the depots.

The unanticipated acceleration in the scheduled buildup of fourth echelon capabilities at the depots caused difficulties. The CONUS army commanders were reluctant to submit estimates of work beyond the capabilities of their field maintenance shops, making it impossible to develop firm workloads for the depot shops. Considerable lead time was also necessary to secure the tools and equipment needed for the depot shops.

At the suggestion of the Transportation Corps, facilities construction at the depots was deferred for eighteen months or until such time as a definite idea of the amount of work that would be accomplished at the shops could be obtained. This decision made it impossible for the depots to absorb the load in excess of the capabilities of the field maintenance shops and caused CONARC to resort to expensive contractual maintenance.

---

16 OCofT, Summary of Major Events and Problems, FY 60, pp. 66 - 68.
As a result of this deteriorating situation, the DCSLOG, Department of the Army, in February 1958 ordered the facilities construction program reinstated. On 19 March, the Chief of Transportation was directed to assume responsibility for all fourth echelon maintenance support of Active Army, National Guard, and Army Reserve aircraft on 1 July 1958. With the exception of large contracts at Fort Rucker, Camp Wolters, and Camp Gary, which had large aircraft populations, the CONUS armies would be responsible for only third echelon maintenance.

The Transportation Corps took action to speed up the delivery of tools, shop equipment, and supplies to the depot sites. Plans were developed for the phased transfer of fourth echelon workloads from the CONUS armies to the depots, beginning on 1 July 1958, with the depots achieving a 100 percent capability by 1 January 1959. Progress was made during the first half of FY 1959, but the desired 100 percent capability was not achieved by 1 January. Resources shortages continued and backlogs tended to grow. This, in turn, made it necessary to give priority to the repair of aircraft and components to be returned to users at the expense of reconditioning items for depot stock. Problems continued with the construction program.

The successful accomplishment of the CONUS field maintenance mission required a close correlation of the CONUS army and depot shop capabilities. The Transportation Corps, CONARC, and other interested agencies developed a coordinated plan for aircraft maintenance support in CONUS. Task groups were established to device a program tailored to current peacetime conditions. The plans were expected to provide for efficient utilization of available dollar, manpower, and facility resources, to assure the necessary back-up of overseas commands with military personnel spaces and units; to determine the types, missions, strengths, and command control of required maintenance units; and to establish means for coordinating and budgeting and programming of funds for maintenance support. 17

Maintenance Training

In May 1954, the Department of the Army considered the consolidation of all Army aviation maintenance instruction at the Transportation School. Both the Army Field Forces and the Army

Aviation School voiced objections to the proposal. The Army Aviation Program approved in 1955 retained organizational aircraft maintenance instruction at the Army Aviation School and field and depot aircraft maintenance instruction at the Transportation School. In May 1959, the transfer of organizational maintenance instruction to the Transportation School again came under study. The Transportation School study to determine its capability to assume the additional workload concluded that it could be done provided programed construction and limited improvements of existing facilities were completed. Once again, the proposed transfer was dropped from consideration. A year later, the Transportation School again studied the feasibility of consolidating aviation maintenance training at one installation. This study summarized savings in training time, instructor manpower capabilities, aircraft requirements, facility analysis and classroom requirements, shop space, and temporary and permanent construction at Fort Eustis and Fort Rucker. No changes resulted from this study. Finally, the Transportation School in 1962 once more studied the possibility of consolidation at the direction of CONARC. Again, no changes in maintenance training were made. 18

The major maintenance courses taught at the Army Aviation School and the Transportation School from 1954 to 1962 are shown in Tables 5 and 6.

Army Aviation School

The Department of Aviation Maintenance of the Army Aviation School, which began to move from Fort Sill to Camp Rucker on 20 November 1954, began the first instruction at the new site on 26 November. Two courses were conducted at this time: the Army Helicopter Maintenance Course (sixteen weeks) and the Twin-Engine Transition Maintenance Course (two weeks).

The actual move to Camp Rucker was conducted in phases and completed on 17 December. During the move, one class from each course was cancelled and the first Helicopter Maintenance class, with twenty-four students, was scheduled for graduation on 8 January 1955. Due to the enthusiasm of the instructors and students, however, the class was accelerated and graduated before Christmas. Like all the other departments of the Army Aviation School, the Department of Aviation Maintenance at first suffered with inadequate

facilities at Camp Rucker. An old vehicle shop building was used as a classroom. The Department of Academics was formed in September 1955 in an effort to consolidate general subjects and maintenance training. The new department was headed by the former director of the Department of Aviation Maintenance. In August 1957, the Department of Academics was discontinued and the Department of Maintenance was formed. At this time, general subjects instructors were transferred to the Department of Fixed Wing Training.19

The Department of the Army in mid-April 1956 had reported to CONARC in its analysis of the program of instruction of airplane repair, reconnaissance helicopter repair, and tandem rotor helicopter repair courses that course content was consistent with the MOS and skill level for which each course trained and that course purpose statements conformed to establish procedures. The department emphasized that course titles should, whenever possible, be expressed in terms of the subject matter taught. Course titles should be revised for the single rotor helicopter repair course to utility and cargo single rotor helicopter repair and for tandem rotor helicopter repair course to utility and cargo tandem rotor helicopter repair. The Department of the Army believed that prior experience in airplane repair activity was essential and should be included in the prerequisites for the courses.20

In mid-March 1956, CONARC approved the proposed program of instruction for the Aircraft Maintenance (Entry) Course and revised the course purpose to read: "to provide enlisted personnel with basic fundamentals required to enable them to participate in the operation of Army airfields and airstrips and in the servicing and maintenance of fixed wing and rotary wing aircraft." With the implementation of a new MOS system, certain aviation mechanics courses were added and others deleted. At Gary Air Force Base, the Army Helicopter Mechanic and the Army Airplane Mechanic courses were deleted and the Army Maintenance (Entry) Course was added. At the Army Aviation School, the Army Helicopter Maintenance, Twin Engine Transition Maintenance, Army Helicopter Maintenance (H-25), Army Helicopter Maintenance (H-19), Army Helicopter Maintenance (H-21), and Army Helicopter Maintenance (H-34) were deleted, and Airplane Maintenance, Reconnaissance Helicopter Maintenance, Utility and Cargo Single Rotary Wing Helicopter, and Utility and Cargo Tandem

20 Ltr AGTP-M 352.11, DA to CONARC, 20 Apr 56, subj: Proposed Program of Instruction for Aircraft Repair Courses.
Rotor Helicopter courses were added. Implementation of training under the new courses and deletion of the old courses was effective on 1 July 1956.21

Third Army in June 1956 desired that schools be established to transition train automotive maintenance and other available personnel to aircraft maintenance crewmen (MOS 670) and to more specialized MOS's. The high number of aircraft in the Army area were causing increasing maintenance problems. It was recommended that those schools include a minimum of two hours per day of organized classroom instruction in addition to on-the-job training. Following a period of attendance at local transition schools combined with on-the-job training, individuals who demonstrated the necessary aptitudes and skills would be awarded the MOS. Local schooling would be continued following the awarding of the MOS until the mechanic reached a sufficiently high degree of skill for the awarding of MOS's 671, 672, 673, as appropriate. If advanced training could not be given at the station or unit level, quotas would be obtained from Third Army to send those men requiring such training to the Army Aviation School. Excess individuals who could not be absorbed into the locally established transition schools would be carefully screened and sent to the Army Aviation School to pursue a course for the award of MOS 670 followed by the specialized course in the type of aircraft assigned to their units.

Third Army reported on 6 August that aircraft maintenance transition schools were established at Third Army stations as a stop gap measure only because the replacement system was not providing enough trained aircraft mechanics to enable aviation units to maintain assigned aircraft. Third Army felt that aircraft maintenance was too complex a subject to be taught at station level only. It was intended that retrained automotive mechanics eventually would attend formal training in aircraft maintenance. Third Army recommended that the input to aircraft maintenance schools be increased in order to provide sufficient fully qualified aircraft mechanics for assignment to aviation units.

In August 1956, the Fixed Wing Maintenance Course conducted at Camp Gary began moving to Fort Rucker. By January 1957, the move was completed with many of the civilian instructors from Camp Gary making the move to Fort Rucker. A labor dispute in November

temporarily grounded the school's aircraft fleet. With the contract personnel on strike, students and instructors moved from the classrooms to the flight line and performed the necessary maintenance.

The Army Aviation School in May 1956 had suggested to CONARC that it would be feasible to establish an organizational aircraft maintenance officers course at the school and recommended that it be of fourteen weeks duration. The school also suggested that the course should have a minimum class of 8 and a maximum class of 16 dual rated officers, with a minimum annual input of 48. Based on two classes in residence, 5 additional primary instructors, 10 practical maintenance instructors, and 2 classrooms (1 conference type and 1 laboratory type) would be required. These additional resources would cost $86,200.

The Army Aviation School requested 120 days lead time for implementation of the course. The school also determined that there was a need for two additional courses -- organizational aviation supply and technical inspector -- for officer and enlisted students. These courses would each be 3 weeks in length, have a minimum class size of 8 students, and have a minimum course annual input of 128. Each course would require 3 additional instructors, 2 conference-type classrooms, and a lead time of 120 days.22

CONARC reported to the Department of the Army early in July that the establishment of the aircraft organizational maintenance officer course would have little or no effect on the existing aircraft maintenance officer course conducted at the Transportation School. Present input into that course came primarily from agencies engaged in field and depot, rather than organizational maintenance activities. Furthermore, the program of instruction for the existing course was slanted toward field and depot maintenance. Under the circumstances, CONARC would take necessary action to establish the aircraft organizational maintenance course at such time as the additional funds and instructor spaces were made available by the Department of the Army. The existing aircraft maintenance officer course would be continued at the Transportation School.

On 10 April 1957, CONARC gave interim approval to the program of instruction for a 10-week Organizational Maintenance Officer Course. Final approval came on 17 August. The purpose of the course was to provide officers with basic knowledge and fundamentals

22 Ltr AASDI 352.11 Gen, Army Avn School to CONARC, 10 May 56, subj: Organizational Aircraft Maintenance Officer's Course.
required to enable them to supervise and instruct the mechanics of aviation units in all forms, records, and technical publications, and to provide officers with a thorough knowledge of aircraft maintenance, organizational (first and second echelon) through limited field maintenance (limited third echelon). Formal announcement of the course was made by CONARC on 5 September. The course length was subsequently reduced to five weeks in December 1957.23

On 10 April 1959, the Department of the Army approved a recommendation by CONARC to eliminate the Organizational Maintenance Officer Course. Unit commanders could not spare the personnel, time, and funds, and -- especially in small units -- needed the potential students on the job, as trained in previous flight courses. Because everyone agreed that officer organizational maintenance training was essential to reduce overall maintenance costs and to increase the availability of aircraft for operational use, CONARC and the Army Aviation School studied a proposal to integrate more maintenance training in the initial flight training course.24

CONARC announced in May 1957 the prerequisites for the 8-week Flight Simulator Operations and Maintenance Course, the purpose of which was to train enlisted men to operate and maintain those flight simulators needed to provide instruction in instrument flight techniques to rated Army aviators. These prerequisites included normal color perception, normal use of both hands, good hearing, twelve months or more of service remaining following the completion of the course, and a standard score of 100 or higher aptitude area GT.

CONARC informed the Army Aviation School in October that it was revising school loads for the third and fourth quarters of fiscal year 1958. The revision was based on budget cuts and revised MOS requirements, and would in some instances affect inputs into certain school courses. The Aircraft Maintenance Course was to continue to be offered until a revised schedule of classes reflecting new inputs was submitted to CONARC. The revised schedule was to be in conformance with the school's recommendation for a weekly flow of students.25

The introduction of new aircraft resulted in the development of new maintenance courses at the Army Aviation School. During July 1958, the Department of Maintenance organized a transition course for crew training on the H-37 MOJAVE helicopter. Because of the many complicated systems of the aircraft, the training was conducted for complete crews including the pilot, copilot, and crew chief. This course continued until February 1959, when it was replaced by the H-37 Helicopter Maintenance Course for mechanics only. With the introduction of the HU-1 IROQUOIS, a mechanics course for that aircraft was adopted on 1 April 1959. A year later, the first class of AO-1 MOHAWK mechanics met with twelve students. This was followed on 10 May 1960 with a new maintenance course of instruction for AC-1 CARIBOU mechanics. In July 1961, a course was organized by the Department of Maintenance to provide instruction on the automatic stabilization equipment which was installed on some H-34's and all H-37 helicopters. This course was discontinued in July 1962, and the instruction integrated into the regular maintenance course for H-37 mechanics.

In April 1960, the Department of Maintenance organized the first U.S. Army Aviation School Organization Aircraft Maintenance Supervisors Mobile Instruction Team whose mission was assistance for unit commanders in training maintenance personnel on station. The three teams organized from military instructors within the Department of Maintenance presented forty hours of instruction at major installation throughout the CONUS army areas.26

Transportation School

The major emphasis in resident instruction at the Transportation School shifted in 1954 to the aviation maintenance training program. Rail and marine subjects made up over 60 percent of the courses given by the school in 1954, while aviation maintenance courses accounted for almost 60 percent of the courses given in 1958. The first aviation maintenance course began in late June 1954 with the opening of six classes. An additional course began that July.

Late in 1955, the Defense Department studied the feasibility of having all nontactical Army aviation training, including aviation maintenance, conducted by the Air Force. The Department of the Army strongly recommended that the Army be given responsibility for all Army aviation training, and the proposed change was not made.

26 History U.S. Army Aviation Center and Army Aviation School, pp. 14 - 15.
Attrition rates were a matter of concern in both the advanced and specialist aviation maintenance courses. In order to improve the qualifications of enlisted men attending the advanced maintenance courses, the Transportation School recommended that the Department of the Army School Catalog be revised to provide for formal examination by the Aviation Department. If found deficient, a man would then be required to attend MOS 680 entry training or be returned to his unit. CONARC concurred in this recommendation.

When the Transportation School began instruction in aviation maintenance, certain items of equipment were still in critically short supply. These included special tools required for assembly and disassembly of aircraft components, major items of shop equipment, and L-20 and L-23 aircraft. Due to nonreceipt of major items of shop test equipment, the first class of the Aircraft Instrument and Electrical System Repairman Course (MOS 3559) was sent to the Norfolk Naval Air Station for two weeks, and the second class was rescheduled. The lack of these special tools and major items of equipment continued as a major problem for the next two years. With respect to aircraft components and special tools, the aviation supply process, linked with provisioning, procurement, production, storage, and priority field distribution, imposed unreliable delivery dates ranging from one to twenty-four months. The shortage of aircraft also continued to be a limiting factor on maintenance training for the next several years.27

In November 1956, CONARC approved a draft program of instruction for the Aircraft Maintenance Officer Course. The revised program of instruction increased the course length from fourteen to fifteen weeks. The increase in the course length was necessary to provide greater emphasis on supply production control, management, and other subjects which had increased in importance with the assumption of Army aviation depot maintenance.

On 7 January 1957, CONARC formally announced the prerequisites for the revised Aircraft Maintenance Officer Course which would train officers to coordinate and supervise field, depot, and organizational maintenance, including technical maintenance inspection of Army aircraft. The officer could be Regular Army or Reserve Component whose assignment, actual or anticipated, was to a position involving direction of organizational or higher level aircraft maintenance activity or to a staff position.28

28 (1) Ltr TCTC-TS-DOI-3, Trans Sch to Trans Tng Cmd, 21 Aug 56, subj: Program of Instr for Aircraft Maint Officer Course (55-0-16) MOS 4823, w/3 ind. (2) Ltr ATNG-TNG 352/1(TC Sch)(7 Jan 57), CONARC to Distr, 7 Jan 57, subj: Announcement of the Aircraft Maintenance Officer Course.
In early 1956, CONARC requested the Chief of Transportation to comment on the feasibility of establishing a Special Aircraft Officer Maintenance Course. Acting on the request of the Chief of Transportation, the Transportation Training Command announced that a special course of instruction for National Guard officers had been established at the Transportation School. The 2-week course would emphasize procedures, forms, and records of aircraft maintenance and would be based on programs of instruction then being utilized in the Aviation Officers Maintenance Course. Items common to both organizational and field maintenance would be stressed, with inspection methods predominant. The Transportation Training Command recommended that the starting date be 14 May 1956, with a reporting date at Fort Eustis of 10 May.

The National Guard Bureau in January 1957 requested the establishment of the special aviation officer maintenance course, estimating that sixty officers would be available to attend such a course, provided it would be conducted in May. CONARC approved the course in March 1957, provided that training could be conducted within school facilities. Since the training would be on a one-time basis, submission of a program of instruction was not required. The Transportation Center at Fort Eustis proposed a starting date of 13 May with the closing date being 18 May. The anticipated attendance was forty-five students.

In the summer of 1959, the Aviation Department of the Transportation School provided six instructors for aviation maintenance support training of U.S. Army Reserve and National Guard units at Camp Drum, N.Y., for nineteen days, and two instructors of National Guard units at Fort Ripley, Minn. This experiment evolved into the Mobile Aviation Maintenance Training Teams, as directed by the Office of the Chief of Transportation, which officially became part of the school's mission in December 1959. The program was enlarged in 1961 when two teams of eleven men each were sent out by the school. When the 1962 teams were organized, the Aviation Maintenance Training Branch had 222 military instructors authorized, but only 92 assigned. Because of this, it was decided to cut each team to six men. The Transportation School felt that units did not take full advantage of the instruction available because of field training and support requirements.

(1) Ltr NG AROTS, National Guard Bur to CONARC, 23 Mar 56, subj: Special Aircraft Officer Maintenance Course, w/5 Ind.
(2) Ltr TCTTC-G3-AIR 360, Trans Tng Comd to CoFt, 26 Apr 56, subj: Special Aircraft Officer Maintenance Course, w/1 incl.
The Army Aircraft Maintenance Management Course had been given three times in 1959 - 1960. In 1960, in order to comply with a change to AR 600-201, this course was dropped and replaced by three separate courses designed to train qualified personnel in accordance with the new MOS structure. The new courses were Fixed Wing Technical Inspector (679.4), Rotary Wing Technical Inspector (679.5), and Aircraft Maintenance Supervisor (679.6). Because previously aviation maintenance personnel had been trained either in fixed wing or rotary wing aircraft and the new 679.6 MOS required the supervisor to be qualified in both, the Transportation School had to train its own instructors in order to qualify them for the MOS conversion. To do this, the school set up a training course for its instructors which followed closely the 679.6 supervisor course.

In FY 1960, the emphasis in MOS enlisted training at the Transportation School shifted further toward aviation as all rail courses were stopped and several marine courses were cancelled. In 1958, 55 percent of the enlisted training courses had been in aviation maintenance; by the end of 1962, this figure had risen to slightly over 80 percent. The increases in the aviation courses were primarily in MOS 673.2, Single Rotor Helicopter Repair, and MOS 685.1, Aircraft Electrical Repair. While the actual input of students into the aviation maintenance courses in FY 1960 represented only a 15 percent increase over FY 1959, these courses required a lower instructor-student ratio and more intricate and expensive equipment. In FY 1959, FY 1961, and FY 1962, the input into the aviation courses at the Transportation School averaged about 1,225; in FY 1960 it reached 1,425.30

---

Chapter IX

SUMMARY

Army aviation made significant advances between 1955 and 1962. Starting with the firm foundation which had been established prior to 1955, the Army during the next seven years began to realize the full potential of its organic aviation. Technological and organizational advances led to the beginning of a completely new concept in combat operations -- airmobility.

Basic to the rapid expansion of Army aviation during this period was the formulation of the first coherent long range plan to serve as guidance for future development. The impetus for this plan came from General Ridgway’s call for a comprehensive review of Army aviation. Its implementation was carried out within the framework of policies adopted by the Department of Defense. Continued disputes between the Army and the Air Force over missions and functions led Secretary of Defense Charles E. Wilson in 1956 to modify the Memorandum of Understanding regarding aviation functions which had been signed by the service secretaries in 1952. He maintained the weight restrictions on Army aircraft, but left the door open for the continued expansion of Army aviation. The Wilson memorandum expanded the size of the combat zone within which Army aircraft could operate. No restrictions were placed on their performance within this zone.

Despite -- or often because of -- this Department of Defense ruling, the Army throughout the period encountered Air Force opposition to the expansion of Army aviation. At the root of this dispute were the widely differing viewpoints on the proper role and means of employment of aviation assets. This problem had originated long before World War II and was aggravated by the creation of the independent Air Force in 1947. The Army believed that aviation assets, both combat and transport, existed primarily to support the ground combat forces. In order to be responsive to the needs of the ground units in combat, the ground commander had to exercise a relatively high degree of control over aviation units. The Air Force, as the Army Air Force before it, believed that the most efficient and economical use of air power could be attained only with centralization of command and control under the air commander. To this position was added the feeling that the 1947 reorganization had vested in the Air Force responsibility for almost everything that flew.

Even while admitting Air Force responsibility in most areas of aviation, the Army still faced the problem of securing adequate air
support of ground units. Air Force interest in the 1950's was mainly focused on strategic bombardment. Little attention and few resources were devoted to tactical transport and close air support. Recognizing the value of aviation in the accomplishment of its mission, the Army was forced to make up for the shortcomings of Air Force support. Light tactical transports were developed -- both rotary wing and fixed wing -- and eventually armament was installed on Army aircraft. During the period under study, this armament was theoretically defensive, but it gave the Army the potential of furnishing some of its own close air support.

To meet the more complex demands of the expanded aviation program, organizational changes took place at all levels of the Army. At the Department of the Army level, all activities relating to Army aviation -- except those of a purely logistical nature and some aspects of the research and development program -- were drawn together into a new Directorate of Army Aviation. The appointment of Maj. Gen. Hamilton H. Howze as the first Director of Army Aviation had a profound effect on the development of the program. General Howze became the apostle of airmobility. Not only in his official activities as Director of Army Aviation, but also in countless speeches and articles, General Howze advocated the expansion of the Army aviation program and the introduction of airmobility into combat operations. His influence in the Department of Defense reached its apex with the Howze Board of 1962, but already he had prepared the way for the introduction of full-scale airmobility.

The Transportation Corps, which at the beginning of the period had undisputed primary responsibility for aviation, underwent a significant reorganization. The assumption of supply and maintenance responsibilities from the Air Force resulted in the establishment of the Transportation Supply and Maintenance Command. The staff of the Office of the Chief of Transportation was reorganized to reflect the fact that the majority of Transportation Corps activities were becoming centered around aviation. The United States Continental Army Command also adjusted its organization to provide for its increasing involvement in aviation activities. The command believed in 1956 that it should have greater responsibility for the overall direction of the aviation program. The Department of the Army remained firm, however, that direction and guidance would originate in the Directorate of Army Aviation. To complement the Directorate of Army Aviation, CONARC created a focal point in its headquarters in the Army Aviation Section. As tactical combat uses for Army aviation became increasingly important, responsibility for more and more of the Army aviation program shifted to CONARC.

During this same period, the ground army underwent an extensive reorganization. The acceptance of Army aviation was reflected in the AFTA experiment and the increased number of aircraft in the PENTOMIC divisions. But these were only interim solutions to the Army's combat problems, and the adoption of the ROAD division.
organization saw the number of Army aircraft in divisions approximately doubled. In addition to the expansion of Army aviation in divisional organizations, separate aviation units also multiplied. New company organizations were developed for the improved fixed wing transports and medium helicopters. In response to the combat situation in Southeast Asia, Special Warfare Aviation Detachments were formed.

Perhaps in the long run the most significant advance during this period was the successful development of aircraft armament systems. Beginning with an unsuccessful attempt to find a flying tank destroyer during Project ABLE BUSTER, rapid strides were made in the development of aircraft armament. A few officers at the Army Aviation School had faith in the ability of the helicopter to carry weapons. Under the guidance of Brig. Gen. Carl T. Hutton, and with the tacit consent of CONARC, the Army Aviation School conducted a series of experiments with various types of armament which eventually led to several practical weapons systems. The school initiated weapons development on its own, not as an official Army research and development project. The imagination and dedication of the officers and men of the school helped prove that weapons could be fired from light aircraft. The success of the efforts of the Army Aviation School and CONARC resulted in official approval of the armed helicopter by the Department of the Army in 1960.

A major result of the armament experiments at the Army Aviation School was the development of units to use armed helicopters. The arming of the helicopter was to have a profound effect on both Army organization and combat doctrine. Various types of Sky Cavalry were organized and tested. While Sky Cavalry was basically a reconnaissance unit, the possibilities of much broader application of armed helicopters were quickly seen. The Armair Brigade Study by the Army Aviation School, although never really field tested, pointed the way to the airmobile employment of infantry supported by helicopter gunships.

An underlying result of this growth of tactical employment of Army aviation -- which is hard to document -- was the continuing friction between the Transportation Corps and CONARC. Brig. Gen. William B. Bunker warned in the late 1950's that the Transportation Corps was doing nothing to develop aviation doctrine for the PENTOMIC army and had made no progress in aviation unit organization since 1951. As a consequence, the Combat Development Group at Fort Rucker, the Army Aviation School, and many other agencies were taking over the responsibility for the fulfillment of the transportation mission in the Army in the future.

The frustrations of the Transportation Corps surfaced again in late 1961 when DCSOPS, Department of the Army, recommended on the advice of CONARC that two separate types of companies be formed to fly the HC-1 and two separate types to fly the AC-1. This action would establish distinct logistical and tactical units. Maj. Gen. Frank S. Besson,
the Chief of Transportation, charged that some elements of the Army intended to eliminate the flying role of the Transportation Corps and urged that the corps have an aviation mission in the combat zone. Happily for the future of Army aviation, this internal dispute over the control of aircraft ended with the 1962 Army reorganization that abolished the Office of the Chief of Transportation. As a result of this reorganization, CONARC assumed most responsibilities for aviation except combat and materiel developments.1

The great progress made by Army aviation between 1955 and 1962 was made possible by development of new aircraft. The search for a utility helicopter led to the adoption of the HU-1. This aircraft quickly proved adaptable for medical evacuation, as a gunship, and as a transport for small units. Using a turbine engine, the HU-1 proved to be a more rugged and reliable aircraft than the earlier utility helicopters. The search for a cargo helicopter produced the H-37 as a temporary solution and eventually the adoption of the tandem rotor HC-1. Teamed together, the HU-1 and the HC-1 became the workhorses in the evolving airmobility concept. Fixed wing transport aviation came of age with the adoption of the U-1. As the period ended, the AC-1 offered even greater possibilities in the use of fixed wing transports from unimproved airfields. The search for an improved reconnaissance aircraft resulted in extensive tests to find a new light observation helicopter. At first unsuccessful, by 1962 the program began to show results. A concurrent search for a higher performance observation aircraft led to troop tests with the jet T-37. Strong Air Force opposition resulted in the termination of the project without significant results. At the same time, the Army developed the propeller driven AO-1 which, equipped with sophisticated new electronic devices, proved suitable for Army requirements.

Aviation training made steady progress during the period under CONARC. Consolidation of all flight training under Army direction was a notable accomplishment. The Department of Defense ordered the transfer of primary flight training from the Air Force in 1956, bringing to an end several years of Army efforts to achieve consolidation. Primary helicopter training was established at the U.S. Army Primary Helicopter School at Camp Wolters, while primary fixed wing training was conducted at Camp Gary until the eventual shift to Fort Rucker. Advanced training for both fixed wing and rotary wing pilots took place at the Army Aviation School at Fort Rucker.

1
(1) Speech by Brig Gen William B. Bunker to First Senior Officers Aviation Maintenance Indocrtination Conference, no date.
(2) Memo TCCAD-SP, Maj Gen F. S. Besson to DCSLOG, 29 Nov 61, subj: Prefix Numbers for Army Aviation Units.
In order to properly train the large number of aviation units being activated, CONARC established Army Aviation Unit Training Commands at Fort Sill and Fort Riley. Difficulties beset the operation of these centers because of slow delivery of aircraft, shortages of maintenance personnel, and changes in the number of units included in the troop program. The Department of the Army discontinued the two commands during FY 1959 with the concurrence of CONARC.

The Army Aviation School at Fort Rucker steadily expanded to meet the growing training requirements. New courses reflected changes in doctrine and in equipment. The physical facilities of the school were improved and enlarged. The instrument qualification of most pilots enhanced the capabilities of aviation units.

The Army encountered numerous problems because of the split in supply and maintenance responsibility between the Army and the Air Force. Approval for the transfer of all supply and maintenance responsibilities to the Army finally came in 1955. The Transportation Corps developed an Army Aviation Depot Plan to govern its new responsibilities. To oversee the operations in this field, the Transportation Supply and Maintenance Command -- redesignated the Transportation Materiel Command in 1959 -- was established. Although there were many growing pains in the development of depot operations, by 1962 the Transportation Corps oversaw a functioning system. More maintenance training was needed to support the growing number of aviation units.

The Berlin Crisis of 1961 resulted in an immediate and unexpected expansion of Army aviation. The partial mobilization disrupted the orderly development of aviation, but provided valuable experience for the much larger growth which was soon to take place as a result of Vietnam. Shortages in equipment and aviators added to the Army's problems, but the crisis eased in 1962. At about the same time, the deteriorating situation in Southeast Asia began to impose additional requirements upon the aviation structure. By the end of 1962, Army aviation units were beginning to arrive in South Vietnam.

The sudden contingency requirements in both Europe and Asia coincided with the Army's new programs for aviation expansion. In early 1960, the Army Aircraft Requirements Review Board (Rogers Board) had formulated plans for aircraft development and acquisition for the coming decade. Immediately thereafter, the Rogers Committee on Army Aviation developed a training program to support the expansion of Army aviation. In 1961, the CONARC Ad Hoc Committee to Study Aircraft Armament made recommendations to expedite the procurement and distribution of the new aircraft weapons systems. Although many of the findings of these three groups were soon overtaken by events, they provided a valuable background for the Howze Board in 1962.
Many of the Army's plans and proposals for future expansion were severely limited by Department of Defense policies. Since 1954, the Army had been working under the grave handicap of the national defense policy of massive retaliation. President Kennedy directed Secretary of Defense McNamara to undertake a thorough reappraisal of strategic plans, force levels, and military programs. Were they adequate for the present situation and for the future? Thus, a policy emerged that called for an American force structure designed to provide strong limited as well as general war forces.2

Secretary McNamara was dissatisfied with the existing program for attaining an improved Army tactical mobility capability. He wanted the Army to reexamine its quantitative and qualitative requirements for aviation through an extended program of analyses, exercises, and field tests in order to evaluate revolutionary new concepts of tactical mobility. The Army was to recommend actions which would provide it with the maximum mobility in the combat area. He pointed out that completed Army studies of airmobile divisions, airmobile reconnaissance regiments, aerial artillery, and similar units, indicated the type of doctrinal concepts which could be evolved. Results of the Army study were to be presented in terms of both cost and transport effectiveness.3

To initiate these studies, Secretary McNamara established the Army Tactical Mobility Requirements Board (Howze Board) in April 1962. The recommendations of the Howze Board were to open a new era in the history of Army aviation.4
