## ABSTRACT

Techniques relating to the management of ship maintenance programs are cataloged on the basis of their characteristics and applications. Brief descriptions are given of each technique, together with references to other documents providing greater detail.

## ABBREVIATIONS

AAW	-	Antiair Warfare
APL	-	Allowance Parts List
ASW	-	Antisubmarine Warfare
CASREPT	-	Casualty Report
CER	-	Cost-Estimating Relationships
CID	-	Component Identification (Number)
CINCPACFLT	-	Commander-In-Chief, U.S. Pacific Fleet
CLMDP	-	CAPTOR Logistics Management Data Program
COMSERVPAC	-	Commander Service Force, Pacific
COSAL	-	Coordinated Shipboard Allowance List
CPIC	-	Coastal Patrol & Interdiction Craft
CSMP	-	Current Ship's Maintenance Project
ECP	-	Engineering Change Proposals
EIC	-	Equipment Identification Code
EMC	-	Electromagnetic Compatibility
EMI	-	Electromagnetic Interference
EOC	-	Extended Operating Cycle

PART I  
INTRODUCTION

## PART I - INTRODUCTION

ARINC Research Corporation has provided considerable support to the Navy in assisting the management of ship maintenance programs. Toward that end, the Corporation has applied a wide variety of techniques (some developed in-house) pertaining to maintenance management. This report catalogs these techniques on the basis of their characteristics and applications.

Figure 1 is a summary matrix of tasks accomplished by ARINC Research in support of ship maintenance management versus the techniques resulting from or applied in each of these projects. Each identified technique is cataloged in Part II of this report in the form of a Technique Description Sheet (see sample, Figure 2) containing the following information:

- a. Item No. - A sequence number in this catalog
- b. Title
- c. Description - A narrative statement identifying the technique in terms of its purpose and general application, and the procedural steps associated with its implementation. Where appropriate, the description is supplemented by figures, tables, or other information contributory to an understanding of the technique.
- d. Type of Technique - Identification of mechanical aspects of applying the technique - whether it includes a math model or computer program, whether it is essentially an engineering procedure (based on application of engineering principles) or a management procedure (based on management principles), etc. It should be noted that a given technique may involve more than one of the above categories, e. g., it may be classified as an engineering procedure and having a math model as its basis.
- e. Cost Parameters - The cost area that the technique addresses - development, procurement, installation, maintenance, operation, management/technical service, and modification. \* In cases where the technique addresses total cost, the "Life Cycle" block is marked.

\*These cost areas are defined in ARINC Research publication 509-01-2-564, Cost-Effectiveness Evaluation Procedures for Shipboard Electronic Equipment and Systems, Vol. I, Feb. 1966.

**TECHNIQUE DESCRIPTION SHEET**

**Figure 2. Sample of Technique Description Sheet**

In cases where the technique does not address any aspect of cost, the "None" block is marked.

- f. Effectiveness Parameters – The aspect of system effectiveness that the technique addresses, i.e., performance capability, availability, reliability, maintainability, or other effectiveness elements. Techniques that do not specifically address any of these parameters are classified "None".
- g. Status – The status of the technique, i.e.:
  - 1) The technique exists in conceptual form, but requires further development before it can be applied.
  - 2) The technique has been sufficiently developed to permit application, but application hasn't as yet been attempted.
  - 3) The technique has been applied once to date.
  - 4) The technique has been applied recurrently.
- h. Type of System/Equipment – The specific ship system to which the technique applies, based on the first level of definition in the Ship Work Breakdown Structure (SWBS). Techniques applicable to an entire ship are marked "Total Ship". Techniques limited in their application to a particular type of ship are so indicated at the bottom of block 8 by a filled-in notation of ship type.
- i. Life Cycle Phase – The life cycle phase(s) to which the technique applies – concept formulation, development, validation, acquisition, or operation.
- j. Functional Areas Supported – The functional area(s) of ship maintenance management that the technique supports. These functional areas are listed alphabetically in Table 1. Each Technique Description Sheet lists in block 10 the particular areas from Table 1 that the technique supports.
- k. References – Those publications, both of ARINC Research and the government, that either describe the technique or illustrate its application.

**TABLE 1. LISTING OF FUNCTIONAL AREAS OF SHIP MAINTENANCE MANAGEMENT SUPPORTED BY TECHNIQUES CATALOGED IN APPENDIX A**

a. Configuration Management	x. Maintenance Program Management Information System
b. Criticality (of Equipment) Ranking	y. Material Condition Assessment
c. Electrical Design Analysis	z. Pre-Overhaul Test and Inspection
d. Electronic Test Equipment	aa. Planned Maintenance System
e. EMI/EMC	bb. Production Planning and Control
f. EOC Maintenance Management	cc. Reliability Demonstration
g. Failure Analysis	dd. Reliability Engineering Analysis
h. Fleet Modernization Program	ee. Reliability Measurement
i. Habitability	ff. Reliability Prediction
j. Life Cycle Cost Analysis	gg. Reliability Program Evaluation
k. Light-Off Examination	hh. Reliability Trend Analysis
l. Logistics Management Information System	ii. ROH Cost Analysis
m. Logistic Management Program	jj. ROH Effectiveness Analysis
n. Logistic Support Planning	kk. ROH Planning
o. Maintainability Demonstration	ll. ROH Work Package Development
p. Maintainability Measurement	mm. Ship's Force Overhaul Management System
q. Maintainability Prediction	nn. Spares Inventory Determination
r. Maintainability Trend Analysis	oo. Specific Operational Requirements
s. Maintenance Budgeting	pp. Structural Design Analysis
t. Maintenance Cost Analysis	qq. Testing
u. Maintenance Engineering Analysis	rr. Training
v. Maintenance Manpower Analysis	
w. Maintenance Strategy Planning	

The Technique Description Sheet also shows areas in which the methodologies have potential utility, although not yet applied by ARINC Research. An "X" in blocks 4 through 9 indicates current characteristics and applicability, and the letter "P" denotes potential characteristics or applicability. For example, certain techniques may be marked in block 8 with an "X" opposite "Propulsion" and a "P" opposite "Electric Plant". This reflects the fact that the technique has been applied to propulsion system equipment and could be applied to electric plant equipment.

Figure 3 is a matrix showing the specific functional areas supported by each of the techniques cataloged in Part II. Additional visibility is provided by Figure 4, which summarizes the techniques in terms of their classification(s) by:

- a. Type of technique
- b. Cost parameters
- c. Effectiveness parameters
- d. Status
- e. Type of ships system/equipment
- f. Life cycle phase

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>3</b>		2. Title <b>Communication Electronics Systems Configuration Management Analysis</b>		
3. Description <b>This technique provides for identifying, acquiring, analyzing and reducing the data necessary to generate management planning aids for communication-shipalt configuration management planning. The aids resulting from the process provide visibility regarding shipalt requirements, shipalt completion status, and onboard configuration for all ships of a given class. The technique has been applied to all types of Service Force ships in the Pacific Fleet. The technique can be applied to the electronics suite of any type of ship. Its application is illustrated in the following figure.</b>

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>7</b>		2. Title <b>Reliability Prediction (of Mechanical Shipboard Equipments) by Regression</b>						
3. Description <b>This technique provides for the development of reliability prediction equations for shipboard mechanical equipments such as pumps, valves, turbines, motor-generator sets, diesel engines, etc. The equations are based on regression analysis involving operational and design parameters such as operating pressures, operating temperatures, number/type of bearings, etc. The prediction equations were based on data from several ship types (see ref. 5). Reliability indices covered in this technique include mean time between failures (MTBF) and mean time between maintenance (MTBM).</b>

**TECHNIQUE DESCRIPTION SHEET**

1. Item No.  8	2. Title  <b>Reliability Prediction by Summation of Failure Rates</b>			
3. Description  <b>Reliability prediction by summation of failure rates essentially involves developing a reliability block diagram, determining the population of parts, summing the part failure rates (as determined from a common source such as MIL-HDBK-217A or FARADA), and calculating the reliability of the system/equipment, based on the block diagram. This technique, described basically in MIL-STD-756, has been applied to certain armament and electronic systems (see ref. 2 through 4).</b>

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>21</b>		2. Title <b>Maintainability Prediction (of Mechanical Shipboard Equipments) by Regression</b>			
3. Description  <p>This technique involves the development of maintainability prediction equations for shipboard mechanical equipments such as pumps, valves and turbines. The equations are based on regression analysis involving operational parameters (e. g., pressure, temperature) and design parameters (e. g., number of bearings). The prediction equations are based upon data from 17 destroyers. The maintainability indices included in the technique include mean time to repair (MTTR) and mean down time (MDT).</p>

**TECHNIQUE DESCRIPTION SHEET**

1. Item No. <p align="center">24</p>	2. Title <p align="center">LO-MIX Maintenance Engineering Analysis (LMMEA) Technique</p>			
3. Description <p>A technique was developed for performing a maintenance engineering analysis of HM&amp;E, ordnance, and electronic equipments on the LO-MIX class of ships in a manner that is less time-consuming and less costly than analyses performed in accordance with MIL-M-24365A (ref. 1).</p> <p>The technique is versatile because it is applicable to equipments for which there are no historical maintenance data, and which have not been subjected to maintenance engineering analysis conforming to MIL-M-24365A. Analyses performed per this technique are compatible with the input requirements of the Trident Integrated Logistic Support System. Under the technique, any one of three classes of analysis can be performed, depending on the nature of the item. The analysis classes are described on the attached sheet.</p>

TECHNIQUE DESCRIPTION SHEET

1. Item No.	2. Title
24 (Cont)	LO-MIX Maintenance Engineering Analysis (LMMEA) Technique (Cont)
<p>The Class I LMMEA is reserved for those units undergoing test and development. It is an in-depth analysis of units for which neither a standard MEA nor historical maintenance data are available. The engineer proceeds by collecting all available information in the form of drawings, design specifications, design criteria, and similar sources. This information is analyzed to determine what operating equipments the unit resembles. The operating equipments similar to the unit are analyzed to determine the unit's maintenance engineering requirements. These requirements are entered on the LMMEA Analysis Sheet. The Class I LMMEA is considered a unique class because of the time required for raw-data identification and collection. However, a Class I LMMEA can usually be completed in less than three months.</p> <p>The Class II LMMEA identifies the maintenance engineering requirements of a lead unit for an equipment group through an in-depth analysis of existing data on the unit. The engineer assembles all identifiable data on the unit, using the LMMEA Analysis Sheet as a guide. If the unit is in the Case I or Case II category of data availability, little more than the standard MEA will be necessary. For units that are in the Case I or Case II category, a Class II LMMEA can be produced in less than two weeks. If the unit is in the Case III category, documents such as technical manuals, drawings, TRSs, APLs, Maintenance History Analyses, MIL-Standards, and others will be required. The LMMEA Analysis Sheet is used as a guide in researching and analyzing the documentation collected, and the data are entered on the LMMEA Analysis Sheet. For units in the Case III category, a Class II LMMEA can be produced in less than three weeks.</p> <p>The Class III LMMEA is a method of identifying the maintenance engineering requirements of a follow-on unit of an equipment group. The engineer analyzes the requirements identified for the lead unit of that equipment group and relates those requirements to the unit of interest. The documentation required is a description of the unit under consideration and the completed LMMEA for the lead unit of the equipment group to which the unit under consideration belongs. A Class III LMMEA can be produced in less than three days.</p>

<sup>5</sup> Some corrective-maintenance events have been omitted as nonrepresentative.  
<sup>6</sup> Excludes DLG-10, -12, -13, and -14 data.  
<sup>7</sup> Includes only Generation I NDCS data (July 1966 to December 1969).  
<sup>8</sup> Excludes DLG-9 data.  
<sup>9</sup> Includes only DLG-6, -7, and -8 data.  
<sup>10</sup> For DLG-6 and DLG-15 only (after AAW conversion).  
<sup>11</sup> Average ship steaming hours between corrective-maintenance events.

Reliability and Maintainability Summary for DLG-9 Class Propulsion-System Equipment

**TECHNIQUE DESCRIPTION SHEET**

1. Item No.  <p align="center">26</p>	2. Title  <p align="center"><b>Analysis of Corrective Maintenance Resource Consumption</b></p>			
3. Description  <p><b>A procedure was developed for identifying and ranking ship systems/equipments on the basis of maintenance resource consumption. The applicable maintenance resource measures include number of corrective maintenance actions, man-hours required and parts cost. The procedure was applied to a sampling of 108 destroyers involving seven classes (DE-1040, DE-1052, DEG-1, DLG-6, DLG-16, DLG-26, and DDG-2). The technique, based on use of MDCS data, includes methodology for using results to identify areas for further engineering analysis. The attached figure illustrates results of applying this technique.</b></p>

---	---

Item	Maintenance Factor	Formula
1	Percent replacement parts within assembly, by equipment by vendor	$\frac{\text{Total number of parts replaced within a given assembly}}{\text{Total parts replaced within next higher assembly}} \times 100$
2	Type of equipment failure (High 5). Rank in descending order, by equipment, by vendor.	Total of given types of failures
3	Cause of equipment failure (High 5). Rank in descending order, by equipment, by vendor.	Total of a given failed part type/name
4	Number of cluster removals	Total number of corrective maintenance actions occurring within successive 30-day intervals which required two or more part replacements for each equipment, by vendor.
5	Manufacturers of high-replacement-rate equipments (High 2). Rank in descending order, by vendor.	Total parts replaced, by equipment by vendor Total operating hours, by equipment by vendor
6	Technician's level and rating for majority of equipment repairs requiring part replacements	List technician levels or grades used during equipment maintenance requiring part replacement and the corresponding percent of total maintenance performed by each grade, by equipment, by vendor.
7(a)	Number "Hits"	Number of satisfied stock requests by equipment, by vendor.
7(b)	Number "Misses"	Number of unsatisfied stock requests* by equipment, by vendor.
8	Mean time awaiting parts	Same as Item 16, Table 2 (MELA)
9	Number of parts replaced due to equipment failure (corrective maintenance)	Total parts replaced due to equipment failure, by equipment, by vendor.
10(a)	Number of parts replaced during planned maintenance	Total parts replaced during planned maintenance, by equipment, by vendor.
10(b)	Number of parts replaced during preventive maintenance	Total parts replaced during preventive maintenance, by equipment, by vendor.
11	Number of maintenance actions	Total maintenance actions by equipment, by vendor, by ship.
12	Percent of total maintenance actions by equipment within system. Rank in decreasing order.	$\frac{\text{Total maintenance actions by equipment}}{\text{Total maintenance actions by system}} \times 100$
13	Technician's levels and ratings for all maintenance actions	List number of technician levels or grades used for equipment maintenance and the corresponding percent of total maintenance performed by each grade, by equipment, by vendor.
14	Ratio of troubleshoot man-hours to total maintenance man-hours	$\frac{\text{Total troubleshoot man-hours by equipment, by vendor}}{\text{Total maintenance man-hours by equipment, by vendor}}$
15	Number of preventive maintenance actions	Total number of preventive maintenance actions by equipment, by vendor.
16	Average number of parts used per maintenance action	$\frac{\text{Total parts used}}{\text{Total maintenance actions}}$

\* As used here, an unsatisfied stock request means any stock request that is not satisfied immediately upon submittal.

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>29</b>		2. Title <b>Reliability and Maintainability Indices for Shipboard Equipments</b>						
3. Description  <p>A procedure for utilizing 3M data to compute reliability and maintainability indices was developed and applied to selected shipboard systems. The procedure utilizes computer programs for identifying and classifying MDCS maintenance events and calculating the indices: mean time between failures (forced shutdown), mean time between corrective maintenance, mean time to repair and median time to repair. The technique was applied to selected shipboard main propulsion and auxiliary equipment for all types of ships, and compiled into a data bank for shipboard machinery. The attached figure illustrates the format and content of the data bank.</p>

<b>1. Item No.</b>  31	<b>2. Title</b>  Analysis of Planned Maintenance System Effectiveness
------------------------------	---

**3. Description**

**This technique is an engineering process designed to determine the degree of readiness improvement attributable to the Planned Maintenance System (PMS). The procedure involves the following steps:**

- a. Evaluate all pertinent Navy reports to determine indicators of equipment readiness and PMS accomplishment rates.
- b. Develop data acceptance guidelines to eliminate any data source that may bias the overall results.
- c. Correlate equipment readiness indicators with PMS accomplishment rates.
- d. Evaluate the validity of the results with respect to sample size and any basic assumptions.
- e. Recommend any necessary further actions.

**Application of the above procedure to selected equipments and ships is illustrated by ref. 1.**

Procedure for Measuring/ Assessing Material Condition

TECHNIQUE DESCRIPTION SHEET

1. Item No. 33		2. Title Life-Cycle Cost Categorization				
3. Description The technique permits assessing/estimating life-cycle cost-of-ownership using a structured set of cost categories. In the procedure, life cycle cost is defined as consisting of eight major categories, each of which is further broken out into elemental cost factors (see attached figure). The cost categorization system has been applied, using historical data, to a sampling of shipboard electronic equipments to determine life cycle cost of ownership (see ref. 1).

TECHNIQUE DESCRIPTION SHEET

1. Item No. 38		2. Title Extended Operating Cycle Systems Analysis						
3. Description EOC systems analysis is an engineering process that evaluates the design and experience of a selected ship system and develops an overhaul maintenance plan for the item. Outputs of the process are compiled in an system maintenance plan, which contains: <ul style="list-style-type: none"> <li>a. A concise statement of the system maintenance concept</li> <li>b. A summary of major maintenance actions, or maintenance profile (as illustrated in the attached Figure 1)</li> <li>c. A detailed tabulation of maintenance requirements (as illustrated in Figure 2)</li> <li>d. A statement of material condition standards</li> <li>e. A description of material condition assessment requirements</li> </ul> <p>The technique is applicable to any ship system/equipment.</p>

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>39</b>		2. Title <b>Class-Level Critical Equipment List Development</b>		
3. Description <p>This technique consists of the development of a ship class-level ranked equipment list based on the following factors:</p> <ul style="list-style-type: none"> <li>a. Maintenance burden</li> <li>b. CASREPT frequency</li> <li>c. Mission criticality</li> </ul> <p>The objective of the technique is to provide visibility for establishing work priorities in the maintenance program. The technique is based on utilization of a variety of source data, including CASREPTs, MDCS, and baseline repair profiles. The technique has been applied to the FF-1052 class, with the results partially illustrated by the attached figure. The technique can be applied to any ship class for which source data are available.</p>

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>43</b>		2. Title <b>PEB/LOE Preparation Program</b>		
3. Description <p><b>A technique for providing assistance to ship's force in preparing for LOE has been developed and applied to a variety of destroyer ROH programs (see references). The program consists of the following:</b></p> <ul style="list-style-type: none"> <li><b>a. Task 1: Assist SF in review of SARP for LOE items.</b></li> <li><b>b. Task 2: Assist SF in establishing specific milestones for accomplishment of Plan and Outlines</b></li> <li><b>c. Task 3: Review SFOMS data entry forms for LOE items, completeness, and correctness.</b></li> <li><b>d. Task 4: Instruct SF in implementation and utilization of SFOMS.</b></li> <li><b>e. Task 5: Instruct SF in data entry of SFOMS information.</b></li> <li><b>f. Task 6: Provide weekly SFOMS reports.</b></li> <li><b>g. Task 7: Provide assistance to SF in LOE preparation.</b></li> <li><b>h. Task 8: Monitor progress in meeting LOE preparation milestones.</b></li> <li><b>i. Task 9: Make revisions to the Plan and Outlines.</b></li> <li><b>j. Task 10: Establish baseline for evaluation of the assistance program.</b></li> </ul>

TECHNIQUE DESCRIPTION SHEET

1. Item No.		2. Title			
44		Pre-Overhaul Training of Ship Personnel			
3. Description					
<p>A procedure for indoctrinating ship's force personnel during initial ROH planning has been developed and applied to destroyer ROH programs. The procedure consists of briefing ship's force personnel using a script, slides, and handout material. Separate packages were developed for naval and commercial shipyard situations. The procedure, while specific to destroyer ROH programs, can be adapted for other types of ship.</p>

1. Item No. <p align="center">46</p>		2. Title <p align="center"><b>ROH Advance Planning Using Network of Significant Activities/Milestones</b></p>						
3. Description <p>An approach to ROH planning utilizing a network of planning activities has been developed and applied to various Service Force ships. The planning network, while varying from case to case, is of the general form illustrated by the attached figure. Specific applications of the generalized network can be found in ref. 4, appendixes A and B. These examples show how the illustrated planning network can be extended by inclusion of schedule and responsibility.</p>

TECHNIQUE DESCRIPTION SHEET

<p>1. Item No.</p> <p>47 (Cont)</p>	<p>2. Title</p> <p>Pre-Overhaul Test and Inspection Procedure (Cont)</p>
<p><b>PHASE I: CRITIQUE</b></p> <p>The first phase of POT&amp;I is a critique of the subsystem of interest with cognizant ship's force personnel. The critique will normally be performed by overhaul planning personnel from the overhaul activity or PERA responsible for putting together the overhaul repair package. The objective is to determine the general status of the subsystem and its interfaces, thus permitting the emphasis in more detailed inspections to be placed upon those areas suspected of requiring overhaul or extensive repair.</p> <p>The critique will include 1) discussions of the condition of the subsystem with respect to past performance, operating hours, corrective and preventive maintenance performed, and isolated and recurring problems/malfunctions or failures; and 2) an attempt to establish if gradual deterioration has been taking place. Information obtained during these discussions is to be recorded on the Phase 1 data sheet (see Figure 1).</p> <p><b>PHASE II: VISUAL INSPECTION</b></p> <p>A systematic visual inspection will be performed, utilizing the Pre-Overhaul Test and Inspection Evaluation Form (see Figure 2) specifically tailored to the subsystem under investigation. This inspection will normally be performed by shipboard personnel as part of the overhaul planning process. If properly performed, the visual inspection will provide the status information needed for realistic evaluations of the need for partial or complete overhauls, and for estimating the cost of parts and man-hours required to perform the overhaul.</p> <p><b>PHASE III: OPERATIONAL AND/OR SPECIALIZED TESTS</b></p> <p>If the visual inspection conducted during Phase II indicates marginal or doubtful conditions as far as determining overhaul work requirements is concerned, operational or specialized tests will be conducted. These tests (Phase III) may require additional detailed test procedures, but will usually consist of observing normal operations and recording conditions.</p> <p>The purposes of the Phase III tests are to 1) demonstrate the operating condition of the machinery and the nature of its defects, and 2) afford a means of judging the full extent of repairs or alterations necessary to improve efficiency, or to restore the system to a condition fit for further service. During these tests, those areas defined as marginal in the detailed visual inspection of Phase II will be reevaluated.</p> <p>Where indicated, Phase III tests designed for each specific subsystem will be performed. The detailed inspection and testing for Phase III will consist of the performance of those major preventive maintenance actions that will either restore the equipment to satisfactory performance or indicate that complete overhaul or replacement is required. Results of the Phase III trials and tests will be incorporated in the applicable Remarks column of the Phase II POT&amp;I Evaluation Form (Figure 2).</p>

Ship: KAWISHIWI AO-146      Date: _____      System/Equipment: Fire and Flushing Pump Observer: _____						
Applicable Documents: AO 143-S4805-H123364-E, 635-D, 636-E, 637-E						
Item No.	Nomenclature or Service	Ship's Part No.	Material List Mark No.	Location	Inspected	Results/Remarks
10.0	Fire and flushing pump			Fire room, hold, stbd.	Yes No	Inspection Criteria/Notes 1. Casing: Check for leaks around the casing flange, loose or stripped casing studs, general preservation. 2. Suction Nozzle: Check for leaks around flange, loose or stripped flange studs/nuts, general preservation. 3. Discharge Nozzle: Same as 2. 4. Bedplate support brackets and foundation (ship frame): Check rigidity of pump mounting. Look for worn, loose, stripped or corroded mounting bolts and brackets. Check ship frame for weakness caused by rust and corrosion. Perform MR F-17 (A-1) during this check, i. e., sound and tighten foundation bolts. Record in Remarks the general condition of preservation.

TECHNIQUE DESCRIPTION SHEET

1. Item No. 48		2. Title Development of Standardized Work Requests for ATF/ARS Ships		
3. Description  A set of standardized work requests applicable to high recurrency jobs normally accomplished during regular overhaul of ATF/ARS ships was developed based on prior history. The objectives of the set is to increase the accuracy of certain key data items essential for ROH planning, and reduce the administrative burden of ship's force during ROH planning. The set consists of 225 items covering yard, tender, and ship's force work. The attached figure is a sample of the standardized work request. The package has been applied in ROH planning for an ATF class ship. While the package itself is limited in applicability to this one type of ship, the approach is considered applicable to ROH planning for any type of ship having a reasonable population.

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>49</b>		2. Title <b>Scoping and Estimating Ship's Force Regular Overhaul Work</b>						
3. Description <b>A procedure and a set of guidelines was developed as an aid to ship's force for (1) identifying key operations associated with recurring ship's force jobs, (2) estimating the manpower required to accomplish each key operation, and (3) scheduling key operations. The guidelines, consolidated into manual format, are specifically intended to support preparation of Ship's Force Overhaul Management System (SFOMS) input data for destroyer-type ships. However, the approach, and to a extent the guidelines, can apply to other types of ship. The attached figure illustrates the format and content of the guidelines.</b>

TECHNIQUE DESCRIPTION SHEET

1. Item No. 50		2. Title Estimating Nonindustrial Labor Requirements for Ship's Force During ROH		
3. Description A procedure and associated guidelines for estimating nonindustrial (i. e., leave, administrative tasks, military duties, etc.) labor requirements for ship's force during ROH was developed for destroyer-type ships. The estimating factors were derived from review and analysis of prior ROH history. The purpose of the procedure is to assist ship's force in estimating the quantity of manpower that will be available during ROH for performance of maintenance. The attached figure 1 is a sample of the guidelines. A unique set of estimating factors was established for each type of work center and each type of ship. Figure 2 describes the procedure and shows the format to be used in making the estimates.

TECHNIQUE DESCRIPTION SHEET

1. Item No.	2. Title
50 (Cont)	Estimating Nonindustrial Labor Requirements for Ship's Force During ROH (Cont)
<p>The procedure for estimating nonindustrial labor requirements for ship's force during regular overhaul comprises the six steps described below. The circled numbers (e.g., ①) in Figure 2 identify the specific blocks of information associated with each step.</p> <ol style="list-style-type: none"> <li>a. <u>Step 1</u> - Fill in ship name and hull number, work center, and date.</li> <li>b. <u>Step 2</u> - Identify each week (e.g., February 1, February 8, etc.), starting with the first and ending with the last week of the ROH.</li> <li>c. <u>Step 3</u> - Compute and record in line 27 the number of man-hours assigned for each week of the ROH. This is determined by multiplying the number of men assigned to the work center by the number of normal working hours in that week (i.e., exclusive of holidays). For example, if there are 10 men assigned to a work center, four work days in the week, and seven work hours per day, the number of man-hours available is 280. Appendix G of the manual identifies the normal number of workdays for each calendar week through 1980.</li> <li>d. <u>Step 4</u> - Estimate the number of man-hours required for each nonindustrial function. This quantity is based on the percentage of total manpower expected to be assigned for each function during each week. The guidelines contained in Appendixes A through E of the manual provide assistance in formulating these estimates.</li> <li>e. <u>Step 5</u> - Add the man-hours computed for lines 1 through 25, and enter the total non-industrial manpower requirements in line 26.</li> <li>f. <u>Step 6</u> - Subtract line 26 from line 27 to determine the number of productive man-hours available during each week of the ROH.</li> </ol>

**TECHNIQUE DESCRIPTION SHEET**

1. Item No. <b>51</b>		2. Title <b>Effectiveness Analysis of Ship Regular Overhaul</b>		
3. Description <b>This technique involves tracking scheduled and actual accomplishment of regular overhaul to determine and assess effectiveness of the ROH in terms of schedule adherence, assessment of material condition problems encountered, and various other significant effectiveness parameters. Principal data sources used include the ROH work package generated by ship's force, departure reports, and other related documentation. The technique has been applied to a variety of AO, ATF, AE, AOG and ARS types of ships (see references), and resulted in sets of recommendations for application in subsequent ROHs.</b>

TECHNIQUE DESCRIPTION SHEET

1. Item No. 52		2. Title Economic Analysis of Ship Regular Overhaul		
3. Description  This technique entails post-ROH review of departure reports and related cost data, summarizing this information on the basis of SWBS/EIC, and analysis in consideration of factors such as accomplishing activity, priority and other factors. The purpose of the analysis is to identify and rank systems/equipments in terms of cost burden, and to compare estimated and actual costs. In a broader sense, an objective of the procedure is to accumulate a data bank of cost data that can be used to support more effective planning of future overhauls. The technique has been applied to a variety of overhauls involving AO, ATF, ARS, and AE types (see references). Typical results of an economic analysis of ROH are shown in the attached figure.

1. Item No.  55	2. Title  Logistics Management Information System			
3. Description  This technique includes a set of procedures, guidelines, forms, and formats designed to provide the inputs, analyses, and outputs essential to performance of Navy logistics management. While the technique was designed primarily to support the navy of the Republic of South Viet Nam, the general concepts are considered applicable to any moderately sized naval logistics program. The attached figure illustrates the logistics functions supported by the system described in ref. 1.

9-4	Tiers should not be more than 3 high.	1 2	II 2. c. (1) 5. b. (3)(a)									
9-5	Berths should be of the type shown in Dwg 805-1409485 with 3-in. mattresses (locker-under-bunk type).	1	II 2. c. (1)									
9-6	The clear vertical distance above mattresses should be not less than 18 inches on ships under 300 ft; not less than 20 inches on ships over 300 ft. Bottom of lower berth mattress should be at least 6 inches above the deck.	1 2	II 2. c. (3) 5. b. (3)(a)									
9-7	Adjacent tiers separated by a privacy divider from 7 in. above deck to 21 in. above frame of top berth (per NAVSHIPS Dwg 805-1646044). Divider extends from frame at head of berth to minimum of 36 in. Partitions at end should be in accordance with Dwg 805-2214469.	1 2	II 2. c. (4) 5. b. (3)(a)									
9-8	In living spaces located adjacent to noisy spaces, berths should be located as remotely as possible from noise source.	1	II 2. c. (5)									
9-9	Access should provide for free movement of men within space, with a minimum of men passing berth.	1	II 2. d. (1)									
9-10	Where practicable, crew berths should not be installed more than 2 tiers in tandem without a 24 in. athwartship passage at one end (not applicable for berths at longitudinal boundaries of space).	1 2	II 2. d. (1) 5. b. (3)(a)									
9-11	Access to berths from main passage should be avoided where possible. Lockers or partial lightweight joiner partitions should be used to shield berthed men from traffic.	1 2	II 2. d. (2) 5. b. (3)(a)									
9-12	Berths should be located as far from access ladders as possible. Recreation facilities should be located near access and lockers and partitions used as means of separation between recreation area and berths.	1	II 2. d. (3)

**TECHNIQUE DESCRIPTION SHEET**

1. Item No. <b>59</b>		2. Title <b>Development of Habitability Improvement Plans for Ships/Classes</b>		
3. Description <b>A procedure for developing class/ship Habitability Improvement Plans was developed and applied. The procedure consists of identifying a set of improvement projects based on conduct of a habitability survey (see item 58), and compiling descriptive, priority, schedule, responsibility and interface data using the format illustrated in the attached figure. The procedure, which has been applied to an AO-22 class ship, is applicable to any type of ship.</b>

TECHNIQUE DESCRIPTION SHEET

1. Item No. <b>60</b>		2. Title <b>Determination of Spare Parts Inventory for Weapon System</b>						
3. Description <b>This technique consists of the calculation of spare parts requirements for a given shipboard weapon system, based on a given maintenance scenario. The technique is based on calculation of spare parts requirements in terms of either usage or failure rates, as appropriate. The technique was applied in calculation of a 2-year spares inventory requirement for a fleet of coastal patrol and interdiction craft (see ref. 1).</b>

**TECHNIQUE DESCRIPTION SHEET**

1. Item No. <b>61</b>	2. Title <b>Logistic Support Planning for Ship Class</b>			
3. Description  <b>This technique entails the development of a Logistic Support Plan (LSP) for a small ship class. The plan describes the actions that must be taken by appropriate authorities during the ship acquisition phase to ensure that all ships of the class are properly supported in all logistic areas after delivery. Ref. 1 illustrates an LSP developed for the T-ATF 166 class.</b>
