PREFACE

This report presents the results of a detailed Air Force Occupational Survey of the Instrument Trainer career ladder (AFSCs 34131, 34151 and 34171). The project was directed by USAF Program Technical Training, Volume 2, dated February 1977. Authority for conducting occupational surveys is contained in AFR 35-2. Computer outputs from which this report was produced are available for use by operating and training officials.

The survey instrument was developed by Second Lieutenant Linda A. Wiekhorst, Inventory Development Specialist. Captain Frederick B. Bower, Jr. and Mr. Guy B. Cole, Occupational Survey Analysts, analyzed the data and wrote the final report. This report has been reviewed and approved by Lieutenant Colonel Jimmy L. Mitchell, Chief, Airman Career Ladders Analysis Section, Occupational Survey Branch, USAF Occupational Measurement Center, Randolph AFB, Texas, 78148.

Computer programs for analyzing the occupational data were designed by Dr. Raymond E. Christal, Occupational and Manpower Research Division, Air Force Human Resources Laboratory (AFHRL), and were written by the Project Analysis and Programming Branch, Computational Sciences Division, AFHRL.

Copies of this report are available to air staff sections, major commands, and other interested training and management personnel upon request to the USAF Occupational Measurement Center, attention of the Chief, Occupational Survey Branch (OMY), Randolph AFB, Texas 78148.

This report has been reviewed and is approved.

SUMMARY OF RESULTS

1. Survey Coverage: Inventory booklets were administered to Instrument Trainer personnel during the period December 1977 through April 1978. Survey results are based on responses from 185 of the 262 incumbents assigned, or 71 percent of the total assigned career ladder population.
2. Career Ladder Structure: Six major groupings of jobs were identified within the career ladder. The largest group (43 percent of the sample) was that of Instrument Trainer Instructor Personnel. These members were involved with providing cockpit procedures instruction to students and pilots. Other groups included various types of instrument trainer maintainers, operator maintainers, and supervisory personnel.
3. DAFSC Differences: Because of the division between maintenance and instructor duties, jobs analyzed by DAFSC were heterogeneous. There was a distinct difference between the jobs performed by 5-skill level personnel and those performed by the 7-skill level supervisors, but the difference was primarily due to the inclusion of supervisory tasks. Seven skill level personnel continue to spend the majority of their time performing technical tasks and duties.
4. AFR 39-1 Evaluation: The current AFR 39-1 specialty descriptions were found to be complete and accurately portrayed the duties and responsibilities of personnel in the career ladder.
5. STS Evaluation: Overall the STS was found to be up to date and complete in providing general training requirements.
6. Comparison to Previous Survey: No major differences were noted between the results of the previous and current surveys. The basic jobs have remained relatively the same over the years. However, the levels of job interest, expressed utilization of talents and training, and reenlistment intentions have declined since the previous survey.
7. Implications: Many Instrument Trainer personnel serve almost exclusively as instructors and perform few, if any, maintenance and repair tasks. Personnel in these kind of assignments do not have an opportunity to use the electronic principles taught in the basic course. This division of job may warrant further investigation to determine whether the current structure provides for the best utilization of personnel in this ladder.

OCCUPATIONAL SURVEY REPORT
INSTRUMENT TRAINER CAREER LADDER
(AFSCs 34131, 34151, AND 34171)

INTRODUCTION

↘ This is a report of an occupational survey of personnel in the Instrument Trainer career ladder completed by the Occupational Survey Branch, USAF Occupational Measurement Center, during October 1978. A previous occupational survey of this career ladder was conducted and results published in March 1976.

Responsible primarily for maintenance, operation, and instruction on instrument and cockpit procedure trainers, personnel usually enter the Instrument Trainer career ladder by first attending the C3ABR34131 Instrument Trainer Specialist course at Chanute AFB, Illinois. These personnel may be either "pipeline" students from basic training or retrainees from other specialties. Upon completion of the 19 week basic course, graduates are awarded the 3-skill level. They are then assigned to operational units possessing instrument and cockpit procedures trainers. Only one percent of the authorizations for this career ladder are assigned overseas. This AFS is primarily an Air Training Command resource with 77 percent of the personnel assigned to that command. Presently this career ladder is under strength in the first enlistment, the six through ten year service groups, and the grades of E-6 and E-7 as reported in the current USAF Retraining Advisory. ←

This report is intended to examine the Instrument Trainer career ladder based on tasks performed by survey respondents. Topics discussed in this report include: (1) development and administration of the survey instrument; (2) the job structure found within the career ladder and the relationship to skill level and experience level groupings; (3) comparisons of the job structure with current career ladder documents such as the AFR 39-1 Specialty Descriptions and the Specialty Training Standard (STS); (4) comparison of the results of this study with results from the previous survey; and (5) background data relative to job satisfaction.

The survey instrument used to collect the data for this report was designed to survey all seven Training Devices career ladders. Therefore, it was possible to compare this specialty with the other ladders in the career field. An analysis of the AFS 341XX Training Devices career field is attached as an Addendum to this report. Since all career ladders in this field combine at the 9-skill level, the analysis of AFS 34197 personnel is also included in the addendum.

APPROVED FOR PUBLIC RELEASE; DISTRIBUTION UNLIMITED

INVENTORY DEVELOPMENT

The data collection instrument for this occupational survey was USAF Job Inventory AFPT 90-341-322. The survey instruments from previous studies of career ladders in the Training Devices career field served as the starting point for development of this new task inventory. The previous task lists were expanded and refined through a thorough research of career field publications and directives. Inventory developers then conducted personal interviews with 44 subject matter specialists at eight separate facilities to review the tentative task list for completeness and accuracy. This process resulted in a final comprehensive "career field" inventory of 1144 tasks grouped under 21 duty headings and a background section that requested information about the respondents such as grade, TAFMS, duty title and job interest.

INVENTORY ADMINISTRATION

During the period December 1977 through April 1978, consolidated base personnel offices in operational units worldwide administered the inventory to job incumbents holding DAFSC 341XX. These job incumbents were selected from a computer generated mailing list obtained from personnel data tapes maintained by the Air Force Human Resources Laboratory (AFHRL). Each individual who completed the inventory first completed an identification and biographical information section (background section), and then checked each task performed in their current job.

After checking all tasks performed, each incumbent then rated each of these tasks on a nine-point scale showing relative time spent on that task as compared to all other tasks checked. The ratings ranged from one (very-small-amount time spent) through five (about-average time spent) to nine (very-large-amount time spent). To determine relative time spent for each task checked by a respondent, all of an incumbents ratings are assumed to account for 100 percent of the individuals time spent on the job and are summed. Each task rating is then divided by the total task responses and the quotient multiplied by 100. This procedure now provides a basis for comparing tasks not only in terms of percent members performing but also in terms of the average percent time spent performing any given task.

SURVEY SAMPLE

Personnel were selected to participate in this survey so as to insure a balanced representation across MAJCOM and DAFSC groups. Table 1 reflects the percentage distribution, by major command, of assigned personnel in the AFS 341X1 career ladder as of March 1978. Also reflected is the distribution of incumbents in the final survey sample. The 185 respondents making up the final sample represent 71 percent of the 262 members making up the Instrument Trainer career ladder.

Tables 2 and 3 reflect the distribution of the survey sample in terms of DAFSC and TAFMS groups. As indicated in Table 2, the percentage of 3-skill level airmen in the survey sample is considerably below that of the 3-skill levels assigned at the time of the survey. With this exception, however, the sampling distribution seems to be representative of the overall career ladder population.

CAREER LADDER STRUCTURE

A key aspect of the occupational survey program is to examine the job structure of career fields or ladders on the basis of what people are actually doing in the field, rather than on the basis of how official career field and ladder documents say they are structured. This analysis of actual job structure is made possible by the use of the Comprehensive Occupational Data Analysis Programs (CODAP). By using CODAP, job functions are identified on the basis of similarity in tasks performed and relative time spent performing the tasks. By using the job structure as a starting point, it is possible to first describe the career field or career ladder as it presently exists, and then, in turn, evaluate the pertinent career ladder documents, such as AFR 39-1 Specialty Descriptions and the Specialty Training Standard.

The career ladder structure analysis process consists of determining the functional job structure of career ladder personnel in terms of job types, clusters, and independent job types. A job type is a group of individuals who perform many of the same tasks and also spend similar amounts of time performing them. When there is a substantial degree of similarity between different job types, they are grouped together and labeled as clusters. Finally, there are often cases of specialized job types that are too dissimilar to be grouped into any cluster. These fairly unique groups are labeled independent job types.

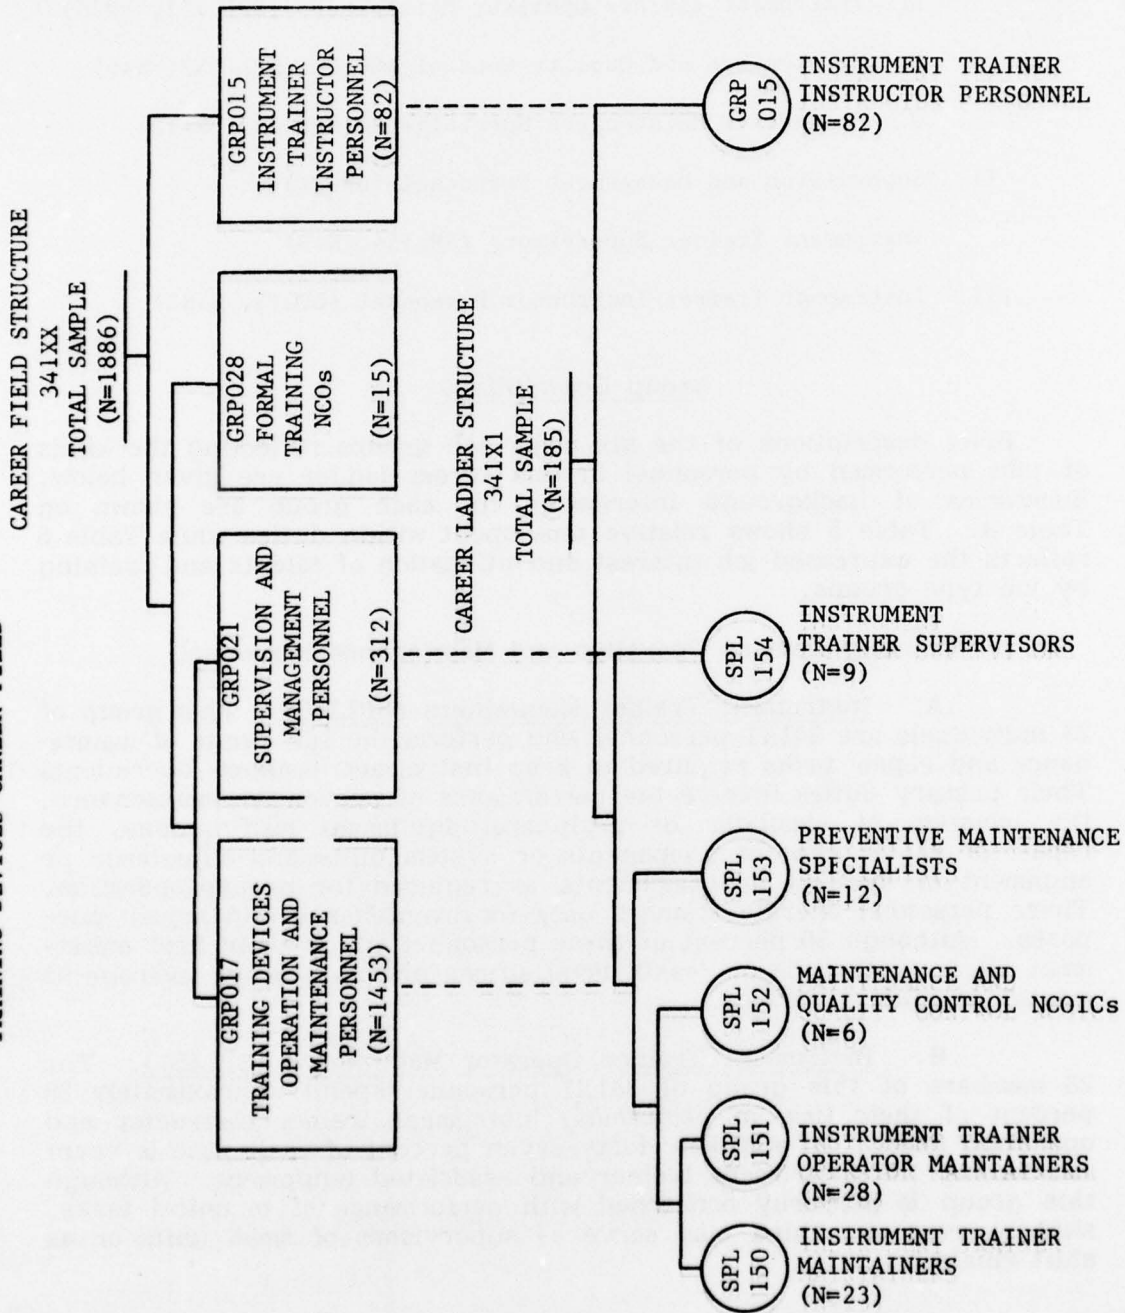

The job structure for this career ladder was determined by performing a job type analysis of the 1886 survey respondents working within the Training Devices career field. This analysis identified four primary clusters or kinds of jobs performed by these personnel, and is discussed in the Career Field Addendum attached to this report. Within each of these clusters, a number of job types were identified. Members of this career ladder were extracted from these job type groups and displayed as job types in accordance with the original groupings in the career field structure analysis. This provided a means of reflecting the kinds of work performed by personnel in this ladder as compared to personnel in the other career ladders of the Training Devices career field.

As shown in Figure 1, four major clusters of jobs were identified by the career field grouping analysis. These included, I. Training Devices Operation and Maintenance Personnel (GPO17), II. Supervision and Management Personnel (GPO21); III. Formal Training Instructors (GPO28), and IV. Instrument Trainer Instructor Personnel (GP015).

Instrument trainer personnel were found to be working in three of these major clusters, as shown in Figure 1. The specific job types identified for this ladder are as follows:

FIGURE 1

RELATIONSHIP BETWEEN INSTRUMENT TRAINER CAREER LADDER AND TRAINING DEVICES CAREER FIELD

- I. Training Devices Operation and Maintenance Personnel (GP017)
 - A. Instrument Trainer Maintainers (SPL150, N=23)
 - B. Instrument Trainer Operator Maintainers (SPL 151, N=28)
 - C. Maintenance and Quality Control NCOICs (SPL 152, N=6)
 - D. Preventive Maintenance Specialists (SPL 153, N=12)
- II. Supervision and Management Personnel (GP021)
 - Instrument Trainer Supervisors (SPL154, N=9)
- III. Instrument Trainer Instructor Personnel (GP015, N=82)

Group Descriptions

Brief descriptions of the six major job groups reflecting the kinds of jobs performed by personnel in this career ladder are given below. Summaries of background information for each group are shown on Table 4. Table 5 shows relative time spent within duties while Table 6 reflects the expressed job interest and utilization of talents and training by job type groups.

I. Training Devices Operation and Maintenance Personnel

A. Instrument Trainer Maintainers (SPL150). This group of 23 individuals are 341X1 personnel who perform the full range of maintenance and repair tasks required to keep Instrument Trainers operational. Their primary duties involve the performance of preventive maintenance, the isolation of simulator or peripheral equipment malfunctions, the repair or replacement of components or system units and adjustment or alignment of systems or components as required for proper operation. These personnel operate trainers only for maintenance and repair purposes. Although 30 percent of these personnel are in their first enlistment all are either 5- or 7-skill level airmen and as a group average 95 months of military service.

B. Instrument Trainer Operator Maintainers (SPL151). The 28 members of this group of 341X1 personnel spend approximately 38 percent of their time in performing instrument trainer instructor and operating tasks. In addition, forty-seven percent of their time is spent maintaining the instrument trainer and associated equipment. Although this group is primarily concerned with performance of technical tasks, slightly over one third also serve as supervisors of small units or as shift chiefs.

C. Maintenance and Quality Control NCOICs (SPL152). This small group of six personnel serve either as supervisors of small maintenance units or perform or supervise Quality Control functions. In addition to directing maintenance of instrument trainer equipment, these personnel also perform a number of technical tasks including visually inspecting, isolating malfunctions, and adjusting, aligning or removing and installing system components as required to keep simulators operational. This group, like the instrument Trainer Maintenance Group (SPL150), primarily perform only maintenance functions for trainers. A majority of these personnel are E-5s or E-6s and have over eight years of service and eight years or more experience in the career field.

D. Preventive Maintenance Specialists (SPL153). This group is composed of 12 personnel who spend a majority of their time in performing preventive maintenance, and making the more routine adjustments or repairs to the simulators. Although all group members are 5-skill level or above, their average experience level is below that of any of the other groups identified, consequently the emphasis on preventive maintenance and less difficulty is understandable. Like the training maintenance and quality control NCOICs, operating or instructing tasks are performed by very few members of this group.

II. Supervision and Management Personnel

Instrument Trainer Supervisors. Eight of the nine members of this group supervise the operation and maintenance of Instrument Trainer units while one member serves as a T-45 console operator. Approximately 80 percent of the work time of this group is devoted to the performance of tasks within supervisory or administrative duties. Although approximately half of the group is responsible for trainer maintenance, the primary emphasis is on accomplishing the Instrument Trainer instruction program. As an example, in addition to performing supervisory and management tasks, four of the nine personnel also operate trainer consoles and instruct in Instrument procedures. Only one of this group, however, performs any maintenance tasks. One third of these personnel also supervise Analog Flight Simulator Specialists (341X3) and Analog Navigation/Tactics Simulator Specialists (341X5).

III. Instrument Trainer Instructor Personnel (GPO15)

This group contains 82 Instrument Trainer Personnel who operate instrument trainers while instructing students and pilots in instrument and cockpit procedures. Over 80 percent of the work time of this group is spent on tasks within the duties of performing instrument trainer instruction functions and operating training devices. Almost no repair or maintenance tasks are performed by this group. Seventy-seven percent of this group are 5-skill level personnel. Twenty-two percent however, are 7-skill level personnel who in addition to serving as first line supervisors spend over half of their work time in instructing students.

Summary

The structure analysis of this career ladder shows that in addition to supervisors, there are essentially three distinct types of jobs within this ladder: 1. Personnel who maintain the simulators, 2. Personnel who instruct and maintain, and 3. Personnel who only instruct.

ANALYSIS OF DAFSC GROUPS

In conjunction with examining the job structure of the career ladder, DAFSC groups are also examined as part of each occupational analysis. This analysis allows for the identification of skill level differences and for comparison of similar skill level personnel across various career ladders (See Career Field Addendum). This data by DAFSC groups is used in the analysis of career ladder documents such as the AFR 39-1 Specialty Descriptions and the Specialty Training Standard (STS).

Jobs within the Instrument trainer career ladder represent a relatively heterogeneous grouping around duties and tasks specific to performing instrument trainer operation and maintenance, and instrument trainer instruction. Table 7 depicts the relative percent time spent by skill level groups on the various duties listed in the job inventory. There is clearly a differentiation between the 5-skill level technical specialists and the 7-skill level supervisors. As would be expected, those jobs requiring more supervisory, management, or technical skill are performed by higher skill level personnel. As previously stated, personnel in this career ladder average less time in the performance of maintenance tasks and duties than personnel in similar ladders because of the large number of airmen performing primarily instructor functions. This also accounts for the heterogeneity of the career ladder (See Table 8).

Skill Level Groups

An analysis of DAFSC 34131 was not attempted as a survey sample of five respondents was not large enough from which to gain any meaningful data. The 5-skill level personnel however, comprise 68 percent of the survey sample. Averaging 130 tasks performed, these airmen spend 50 percent of their time operating training devices and performing instrument trainer instruction. This figure can be misleading though, as many of these individuals perform exclusively as operator instructors while others perform strictly as trainer maintainers. Common tasks are few (see Table 9). Both jobs are for the most part non-supervisory. Only nine percent of the group's time is spent performing supervisory and management duties and only 14 percent indicated they were supervisors.

At the 7-skill level, tasks performed shift from technical toward supervisory tasks. This accounts for the differentiation between the 5- and 7-skill level personnel (see Table 10). While assuming supervisory responsibility 7-skill level personnel still perform most of the tasks performed by their 5-skill level subordinates. This group is somewhat more homogeneous than 5-skill level personnel, but as Table 11 indicates, this apparent homogeneity is based on performing common supervisory tasks rather than technical tasks. The 7-skill level group, however, continue to spend a majority of their time performing technical tasks and should be considered to be functioning as technician supervisors.

ANALYSIS OF AFMS GROUPS

An analysis was also made comparing job differences among individuals grouped by time in service. Very similar conclusions to those for DAFSC groups were noted.

Table 12 reflects the relative percent time spent on duties by AFS 341X1 personnel grouped by enlistment period. As previously indicated, personnel in this AFS tend to continue to spend the largest percentages of their time performing technical duties, even at the 7-skill level and even into the fifth enlistment. It is not until after the 20 year AFMS period that individuals can be identified who spend more time on supervisory duties than on technical duties. The time spent performing instrument trainer instruction remains high for all enlistment groups.

In looking at the jobs performed by first enlistment airmen (1-48 months AFMS) it was found that they performed an average of 111 tasks. The most common tasks performed by members of this group are shown in Table 13. Again there is no great degree of homogeneity because of the job division between instrument trainer instructors and instrument trainer maintainers. In addition, as shown in Table 14, there is no primary simulator operated or maintained by this career ladder.

COMPARISON OF AFR 39-1 SPECIALTY DESCRIPTIONS
WITH SURVEY DATA

The AFR 39-1 specialty descriptions for AFSCs 34131/34151 and 34171 were compared against the survey data. Both specialty descriptions appear to be complete, and accurately portray the duties and responsibilities of the personnel in this career ladder. All the duties and responsibilities mentioned in the specialty descriptions could be matched to tasks in the job inventory, and sufficient numbers of survey respondents were found performing those functions to warrant their inclusion in the descriptions.

A discussion concerning the commonalities of the job descriptions for all the ladders in the Training Devices career field is included in the Career Field Addendum to this report.

COMPARISON OF THE SPECIALTY TRAINING STANDARD (STS)
WITH SURVEY RESULTS

A review of the current STS 341X1, dated March 1977, was made for the 3-, 5- and 7-skill levels. Each of the STS subparagraphs containing task knowledge or performance requirements were compared to the survey results. Subparagraphs containing only general information or subject knowledge proficiency level requirements were not evaluated.

Overall, the STS appears to be up to date and complete in providing general training requirements. Survey respondents were performing tasks relating to the STS subparagraphs that could be evaluated. This document is however, subject knowledge oriented making much of the STS difficult to compare with survey data. No comment is made on these areas but a comparison of task and knowledge areas across all the ladders in this career field is included in the Career Field Addendum.

ANALYSIS OF TASK DIFFICULTY

From the listing of airmen identified to receive the occupational survey inventory, incumbents from various commands and locations who held a 7- or 9-skill level DAFSC and PAFSC were identified to also receive a task difficulty booklet. This booklet contained only the duty/task list section of the original occupational survey inventory. The survey respondent was instructed to rate all of the tasks on a nine-point scale from extremely low to extremely high, with difficulty being defined as the length of time it requires an average incumbent to learn to do the task. Interrater agreement (as assessed through components of variance of standardized group means) among the 56 raters who returned booklets was .96. Ratings were adjusted so that tasks of average difficulty have ratings of 5.00.

Of the 1144 tasks in the job inventory, 603 were rated above average in difficulty. Tasks shown in Table 15 are representative of the more difficult tasks performed by AFS 341X1 personnel. These tasks are technical in nature and all pertain to either operating training devices or performing instrument trainer instructor functions. This is consistent with the findings in the career ladder structure section where it was found that more personnel in this ladder were performing as instructor operators than were performing as trainer maintainers. Of the 14 tasks listed, 13 are performed by 50 percent or more of first enlistment personnel. This is an indication that first enlistment airmen in this career ladder are not limited to the performance of more routine tasks. In fact there are 21 tasks rated above average in difficulty performed by 50 percent or more of this group. As with the total group, all of these tasks relate to trainer operation and instrument trainer instruction.

Tasks rated as being below average in difficulty which are performed by AFS 341X1 respondents are illustrated by the tasks listed in Table 16. Again, because of the assignment of personnel between both instructor and maintainer duties, there are no large numbers of airmen performing any large block of tasks. Even among first enlistment airmen there are only nine tasks performed by 50 percent or more of that group. The low number of below average tasks common to the first enlistment group is however, further indication that the first job in this career ladder is one of a difficult and responsible nature.

TABLE 15

REPRESENTATIVE TASKS RATED ABOVE AVERAGE IN DIFFICULTY PERFORMED BY DAFSC 341X1 RESPONDENTS

| TASKS | DIFFICULTY INDEX | PERCENT TOTAL SAMPLE PERFORMING | PERCENT FIRST ENLISTMENT MEMBERS PERFORMING |

Job Difficulty Index (JDI)

Having computed the task difficulty index for each inventory item, it was then possible to compute a Job Difficulty Index (JDI) for any group identified in the survey analysis. The index provides a relative measure of which jobs, when compared to other jobs identified in the analysis, are more or less difficult. The JDI is based on an equation using number of tasks performed and the average difficulty per unit time spent. The indices are then adjusted so that the average job difficulty index is 13.00. The JDI was computed for the major job groups identified in the specialty structure, and this information is presented in Table 17.

TABLE 17

COMPARISON OF CURRENT SURVEY TO PREVIOUS SURVEY

The results of this survey were compared to those of Occupational Survey Report AFPT 90-341-218, Instrument Trainer Career Ladder, dated 31 March 1976. At the time of the survey 354 personnel were assigned to the career ladder. The survey sample was 84 percent of assigned or 299 respondents. This compares to the current sample of 71 percent of the 262 personnel assigned or 185 respondents.

The career ladder structure has remained relatively stable since the previous survey, as shown in Table 18. Despite a reduction in personnel authorized of 26 percent since the previous survey, most of the major jobs identified in 1976 are still being performed. The Standardization/ Evaluation and Training Specialist jobs were distributed among the other job types identified in the current survey.

Background data such as average pay grade, DAFSC, TAFMS, and time in career ladder were similar between surveys. However, the level of job interest and perceived utilization of talents and training have decreased as have reenlistment intentions.

Overall, the comparison revealed that the 341X1 career ladder has remained relatively unchanged despite a substantial reduction in personnel strength. Since the previous survey was compared to the results of another occupational survey conducted in 1971, with no major job differences noted, the career ladder can be considered to have remained relatively stable in terms of jobs performed since 1971.

SUMMARY OF BACKGROUND INFORMATION

Assignment To Career Ladder

Seventy-four percent of the AFS 341X1 survey respondents indicated they were initially assigned to the career ladder after completing resident technical training. Another 17 percent were retrainees who attended resident technical training and four percent entered the career ladder through conversion from another Air Force specialty without training. Five percent responded that they entered the career ladder by other than normal classification methods.

Relative Job Satisfaction

Table 19 displays the various percentages by AFMS groups of the responses to questions regarding job interest and perceived utilization of talents and training. In order to provide a better understanding of these figures, comparisons with individuals in mission equipment maintenance AFSCs surveyed in 1977 are also included by AFMS groups. These comparative AFSCs include such specialties as communications electronics systems, avionics systems, missile maintenance, and aircraft maintenance.

Sixty-four percent of AFS 341X1 first enlistment respondents found their job interesting. This is comparable to the average reported by this enlistment group in the 1977 comparative studies. However, the perceived utilization of talents and training are slightly below that reported by first enlistment personnel in the comparative sample.

The job interest and perceived utilization of talents and training reported by second enlistment personnel parallel those of the first enlistment group. While their job interest level compares with that of the second enlistment personnel in like AFSCs, their utilization of talents and training are below the comparative averages. Career airmen continue this trend, but the differences are greater. Not only do these airmen perceive their talents and training being utilized to a lesser degree than career airmen in the comparative sample, but they possess a job interest level that is even lower than that for second enlistment personnel. It should also be noted that the job interest and perceived utilization of talents and training expressed by AFS 341X1 personnel are the lowest found in the Training Devices career field.

Reenlistment Intentions

The expressed intentions toward reenlistment by AFS 341X1 survey respondents are displayed in Table 20. First and second enlistment respondents showed an intention to reenlist at a slightly lower rate than their mission equipment maintenance contemporaries surveyed in 1977. On the other hand, career airmen showed an intention to reenlist at a slightly higher rate than the career airmen in the comparative sample.

EQUIPMENT MAINTENANCE AFSCs SURVEYED IN 1977.

IMPLICATIONS

In analysis of the survey data, it was found that the Instrument Trainer career ladder was the least maintenance oriented career ladder in the Training Devices career field. Although, there are AFS 341X1 airmen performing trainer maintenance, there are other instrument trainer personnel being utilized exclusively as trainer operators and instructors. Such operator jobs do not involve maintenance and repair of instrument trainers and thus do not permit the individual to use the electronic principles and maintenance training taught in the basic resident technical course. The performance of such non-maintenance jobs may also be one reason why the AFS 341X1 respondents reported lower average job satisfaction levels and reenlistment intentions than any other career ladder in the Training Devices career field (see attached Career Field Addendum). Another point discussed in the Career Field Addendum is the similarity of the job of the instrument trainer maintenance personnel to the job of the AFS 341X3, Analog Flight Simulator, personnel. Discussions with personnel in the field and at the Chanute Technical Training Center indicate that instrument trainer maintenance can be and has been performed by both AFS 341X1 and AFS 341X3 personnel.

Overall the AFS 341X1 career ladder has remained relatively stable in recent years as evidenced by the fact that only slight changes have occurred in the job structure since the last occupational survey. However, there are indications that there are major similarities between the maintenance functions performed by personnel in this career ladder and those same functions performed by personnel in other ladders within the overall Training Devices career area. For a more detailed analysis of these similarities, refer to the accompanying Career Field Addendum.

SUMMARY OF RESULTS

1. Survey Coverage: Inventory booklets were administered to all 2,480 incumbents assigned to the Training Devices career field during the period December 1977 through April 1978. Survey results are based on responses from 1,886 airmen or 76 percent of the assigned career field population.
2. Career Field Structure: Four major groups of jobs were found within the career field. The operation and maintenance group contained 13 subgroups. These were differentiated by the number and kinds of tasks performed, the type of equipment maintained, and the percent of time spent performing various maintenance and supervisory duties. The remaining three groups were composed of personnel assigned as supervisors and managers, formal training personnel, and airmen performing primarily as instrument trainer instructors.
3. DAFSC Differences: Jobs performed by 3- and 5-skill level incumbents were fairly homogeneous. They consisted of tasks relating to performing preventive maintenance, operating training devices, and removing or replacing system components. However, 5-skill level airmen perform a higher average number of tasks than typical 3-skill level airmen. DAFSC 3417X personnel were less homogeneous due to the diversity of technical tasks performed. While functioning as supervisors, they still spend a majority of their time performing technical tasks and duties. DAFSC 34197 personnel are clearly the managers in this career field.
4. Similarities and Differences In Task Performance: There is a great deal of similarity among maintainers in all career ladders in the areas of operating training devices, performing preventive maintenance, and in performing general malfunction isolation procedures. There are also distinct differences between instrument trainer instructor operators and the other ladders; equipment maintainers. In addition, each ladder is different from the others in operation and maintenance of career ladder unique equipment.
5. AFR 39-1 Review: Specialty descriptions were found in general to be accurate depictions of career ladder duties and responsibilities. However, there is considerable commonality among these specialty descriptions, differentiated mainly through the highlighting of equipment unique to each ladder.
6. STS Review: The first 10 paragraphs of each STS in the career field are essentially the same. There is additional commonality in STS paragraphs among the career ladders responsible for operating and maintaining aircrew training devices.

CAREER FIELD ADDENDUM
TRAINING DEVICES CAREER FIELD
(AFSCs 341X1, 341X2, 341X3, 341X4, 341X5, 341X6, 341X7, AND 34192)

INTRODUCTION

The principle purpose of constructing a comprehensive job inventory for the Training Devices career field was to provide data in a format that would allow an in-depth analysis of similarities and differences across all the specialties within the career field. Such an analysis was performed and is contained in this addendum which is attached to each Training Devices career ladder Occupational Survey Report.

A great deal of Major Air Command and Air Staff interest exists concerning the collapse of career ladders within the Training Devices career field to create fewer, easier to manage, less expensive to train career specialties. This report is therefore designed to display the survey data in a manner that would facilitate personnel managers in making decisions concerning the future of the career field structure. This report will include: (1) the job structure found within the career field and the relation to skill level and experience level groups; (2) a discussion of the similarities and differences among career ladders; (3) background data relative to job satisfaction; and (4) an analysis of the DAFSC 34197 skill level personnel.

SURVEY SAMPLE

Personnel were selected to participate in this survey so as to insure a balanced representation across MAJCOM and DAFSC groups. A sufficient response was achieved from all career ladders in the Training Devices career field so that the desired comparisons could be made. Table 1 reflects the percentage distribution, by career ladder, of assigned personnel in the AFS 341XX career field as of March 1978, and the distribution of incumbents in the final survey sample. The 1,886 respondents making up the final sample represent 76 percent of the 2,480 members making up the total Training Devices career field. Thirty-two individuals (or 2 percent of the total sample) did not indicate their specific ladder and are shown only with the generic 341XX specialty code. This error rate is within acceptable limits and is not considered a serious problem for data analysis.

Table 2 reflects the distribution, by major command, of assigned personnel with DAFSC 34197 as of March 1978, as well as the distribution of incumbents in the final survey sample. The 102 respondents making up the final sample represent 61 percent of the 168 members assigned as Training Devices Superintendents.

TABLE 1
DISTRIBUTION OF CAREER FIELD SURVEY SAMPLE BY CAREER LADDER

| CAREER LADDER | TOTAL ASSIGNED | TOTAL IN SAMPLE | PERCENT OF LADDER SAMPLE | PERCENT OF TOTAL SAMPLE |
|---|-------------------|-----------------------|--------------------------------|-------------------------------|
| 341X1 INSTRUMENT TRAINER | 262 | 185 | 71% | 10% |
| 341X2 DEFENSIVE SYSTEM TRAINER | 174 | 137 | 79% | 7% |
| 341X3 ANALOG FLIGHT SIMULATOR | 596 | 483 | 81% | 26% |
| 341X4 DIGITAL FLIGHT SIMULATOR | 531 | 415 | 78% | 22% |
| 341X5 ANALOG NAVIGATION/TACTICS TRAINING DEVICES | 235 | 159 | 68% | 8% |
| 341X6 DIGITAL NAVIGATION/TACTICS TRAINING DEVICES | 396 | 277 | 70% | 15% |
| 341X7 MISSILE TRAINER | 118 | 96 | 85% | 5% |
| 34197 TRAINING DEVICES SUPERINTENDENT | 168 | 102 | 61% | 5% |
| 341XX (DAFSC NOT INDICATED) | | 32 | | 2% |
| TOTAL | 2480 | 1886 | 76% | 100% |

TABLE 2

TOTAL ASSIGNED - 168
 TOTAL SAMPLED - 102
 PERCENT OF SAMPLE - 61%

CAREER FIELD STRUCTURE

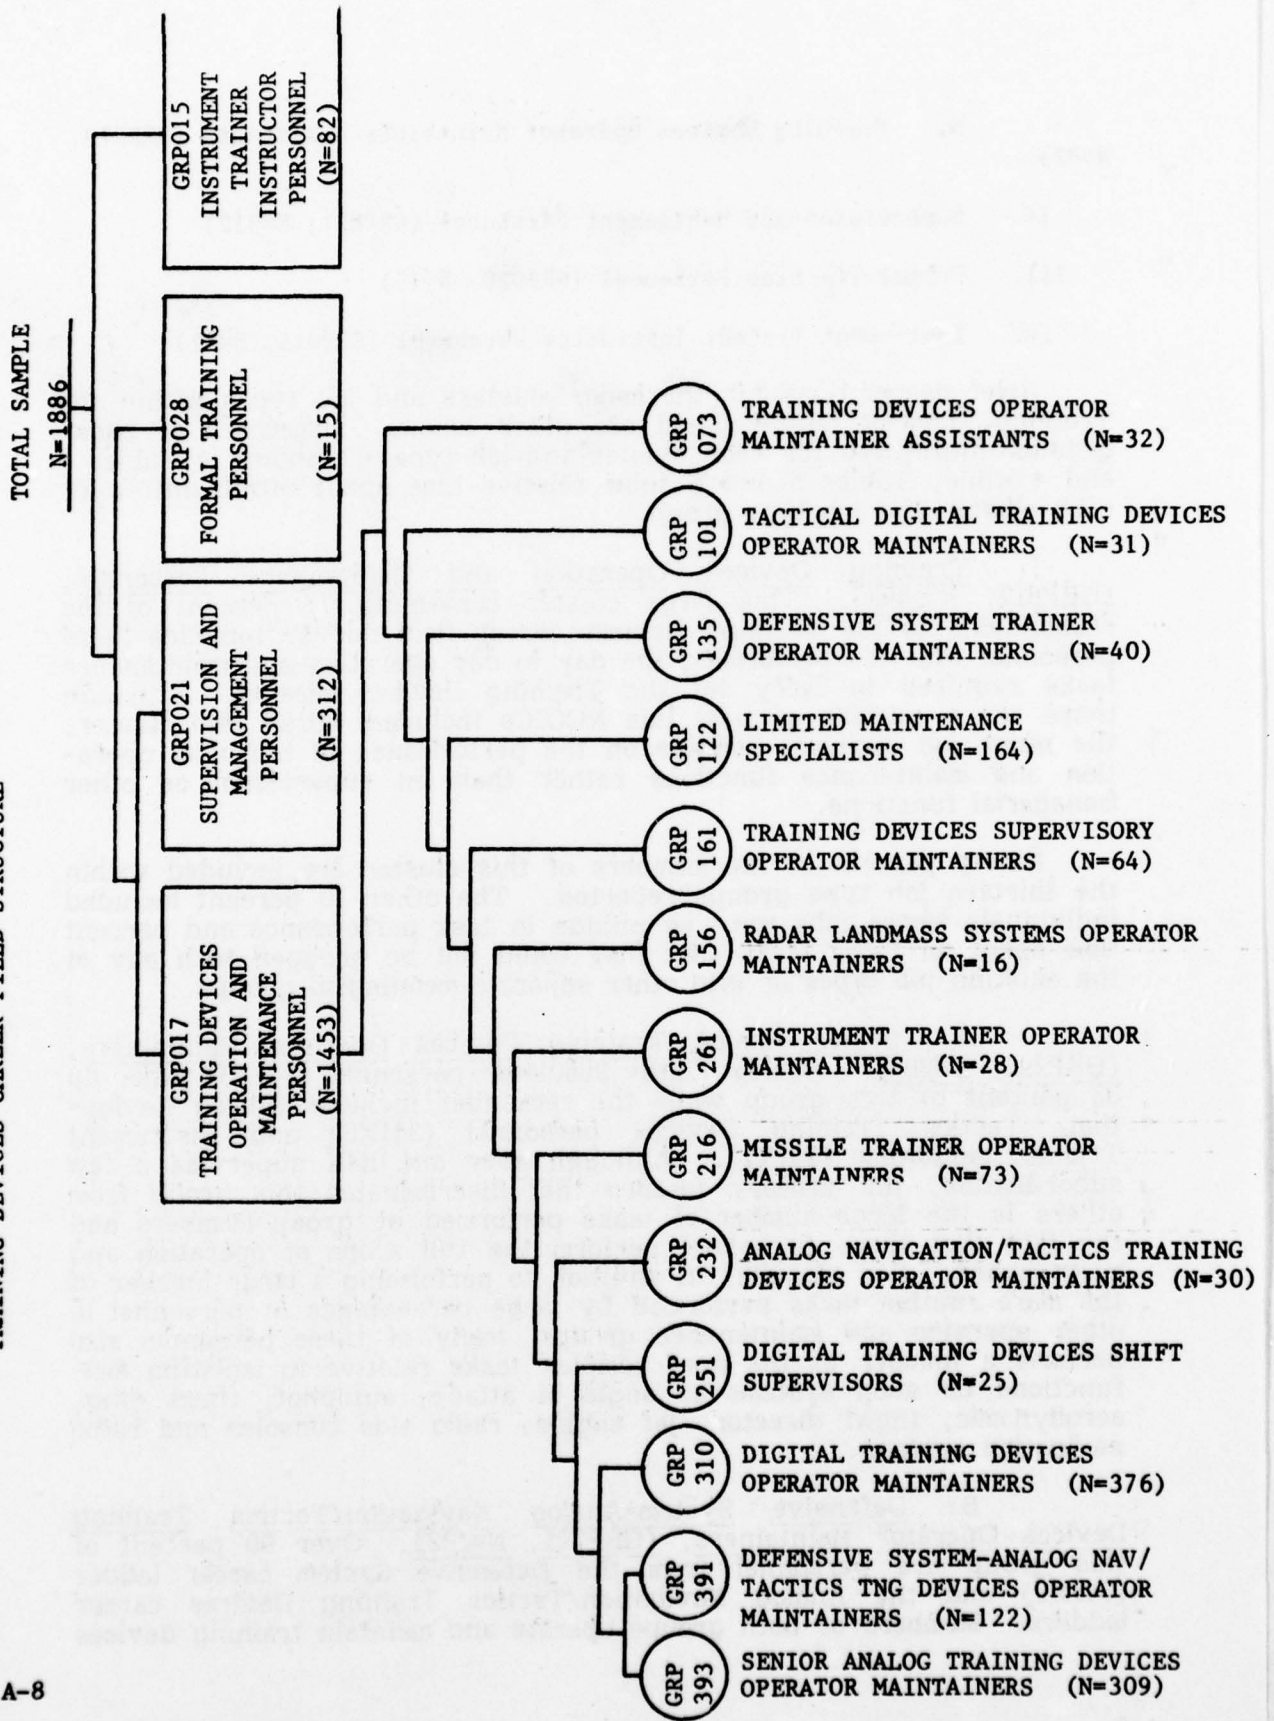

An analysis of the career field structure was conducted by using the Comprehensive Occupational Data Analysis Programs (CODAP), as described in the career ladder section in the main body of this report. In fact, the career ladder structures were extracted from the career field structure diagram with the exception of AFS 341X4 and AFS 341X6. Because of their high degree of task similarity, these specialties did not cluster independently, thus requiring separate cluster diagrams in order to perform complete career ladder analyses.

Based on task similarity and relative percent time spent, the most realistic division of the jobs performed in the 341XX career field is illustrated in Figure 1. These job clusters and job types are listed below. The GRP number shown beside each title is a reference to computer print out information included for use by classification and training officials.

- I. Training Devices Operation and Maintenance Personnel
(GRP017, N=1,453)
 - A. Senior Analog Training Devices Operator Maintainers
(GRO393, N=309)
 - B. Defensive System - Analog Navigation/Tactics Training
Devices Operator Maintainers (GRP391, N=122)
 - C. Digital Training Devices Operator Maintainers
(GRP310, N=376)
 - D. Digital Training Devices Shift Supervisors (GRP251, N=25)
 - E. Analog Navigation/Tactics Training Devices Operator
Maintainers (GRP232, N=30)
 - F. Missile Trainer Operator Maintainers (GRP216, N=73)
 - G. Instrument Trainer Operator Maintainers (GRP261, N=28)
 - H. Radar Landmass Systems Operator Maintainers (GRP156, N=16)
 - I. Training Devices Supervisory Operator Maintainers
(GRP161, N=64)
 - J. Limited Maintenance Personnel (GRP122, N=164)
 - K. Defensive System Trainer Operator Maintainers (GRP135,
N=40)
 - L. Tactical Digital Training Devices Operator Maintainers
(GRP101, N=31)

FIGURE 1

TRAINING DEVICES CAREER FIELD STRUCTURE

M. Training Devices Operator Maintainer Assistants (GRP073, N=32)

II. Supervision and Management Personnel (GRP021, N=312)

III. Formal Training Personnel (GRP028, N=15)

IV. Instrument Trainer Instructor Personnel (GRP015, N=82)

Brief descriptions for the major clusters and job types within the Training Devices Career Field are given below. Summaries of background information for each cluster and job type are shown in Tables 3 and 4 while, Tables 5 and 6 show relative time spent within duties for each cluster and job type group.

I. Training Devices Operation and Maintenance Personnel, (GRP017, N=1453). This large cluster containing 77 percent of the respondents to the Training Devices career field survey includes those personnel who are performing the day to day operation and maintenance tasks required to carry out the Training Devices mission. Although there are a number of first line NCOICs included within this cluster, the major job emphasis remains on the performance of technical operation and maintenance functions rather than on supervision or other managerial functions.

Ninety percent of the members of this cluster are included within the thirteen job type groups reported. The other 10 percent included individuals whose jobs were so unique in task performance and percent time spent on those tasks that they could not be grouped with any of the existing job types or into other separate meaningful groups.

A. Senior Analog Training Devices Operator Maintainers, (GRP393, N=309). Analog Flight Simulator personnel (341X3) make up 82 percent of this group while the remainder includes Analog Navigation/ Tactics Training Devices personnel (341X5) and Instrument Trainer personnel (341X1). Although over one half supervise a few subordinates, the primary feature that discriminates this group from others is the large number of tasks performed by group members and the fact that these personnel perform the full scope of operation and maintenance. For example, in addition to performing a large number of the more routine tasks performed by large percentages of personnel in other operator and maintenance groups, many of these personnel also perform a number of the more complex tasks relative to isolating malfunctions on such systems as angle of attack, autopilot, fixed wing, aerodynamic, flight director, jet engine, radio aids consoles and radio navigation systems.

B. Defensive System-Analog Navigation/Tactics Training Devices Operator Maintainers, (GRP391, N=122). Over 90 percent of this group are personnel from the Defensive System career ladder (341X2) and the Analog Navigation/Tactics Training Devices career ladders. Members of both groups operate and maintain training devices

which involve similar principles of operation. While this group performs many of the same general operator and maintenance tasks as many of the other groups, these personnel tend to be more involved in maintenance of T1, T4 and T10 trainers. Some of the tasks which are relatively exclusive to this group include isolation of malfunctions on doppler systems, timing systems, radio navigation systems, comparators, and composite video signals. In addition, approximately one third of this group adjust multi-channel tape recorders, phasing, radar display units, T-10 terrain data signal generators and target intensity. These tasks were performed by very few of the members of other groups in the career field structure analysis.

C. Digital Training Devices Operator Maintainers, (GRP310, N=376). This relatively large group contains personnel who operate and maintain digital training devices. Sixty percent are from the Digital Flight Simulator career ladder (341X4) while 35 percent are from the Digital Navigation/Tactics Training Devices career ladder (341X6). Although a few of these individuals serve as shift chiefs and perform a number of first level supervisory tasks, the primary purpose of personnel in this group is to accomplish the day-to-day operation and maintenance of digital training devices.

Within this job type there appeared to be no real differences between the jobs performed by AFS 341X4 personnel and AFS 341X6 personnel. In fact, a review of the grouping process indicates that 341X4 and 341X6 personnel within the same organizations perform essentially the same jobs.

D. Digital Training Devices Shift Supervisors, (GRP251, N=25). This small group, like the preceding group is composed primarily of 341X4 and 341X6 personnel. Again, there appears to be no specific grouping by ladder. These personnel, perform somewhat fewer tasks than the preceding group and in addition spend considerably more time on supervisory functions. Characteristically members of this group are 7-skill level and call themselves Shift Chiefs but spend a majority of their time on the technical operation and maintenance tasks.

E. Analog Navigation/Tactics Training Devices Operator Maintainers (GRP232, N=30). Members of this group are primarily Analog Navigation/Tactics Training Devices personnel (341X5) and are engaged in operation and maintenance of analog navigation/tactics training devices for T-10, C-5A or C-141 trainers. A small percentage also operate or maintain navigation/tactics training devices for B-52 simulators. Although forty percent of these personnel supervise and many work as section chiefs or shift supervisors, their primary functions are the operation and maintenance of training devices.

Members of this group perform fewer tasks than those of preceding groups. Most of these tasks are the normal routine functions common to other groups. However, a few unique tasks were performed by substantial percentages of these personnel. These included the operation of closed circuit T.V. systems and digital readout units

(DROS), the isolation of malfunctions and removal or installation of parts of closed circuit simulators or visual attachments, and the operation of digital computers and control panels.

F. Missile Trainer Operator Maintainers (GRP216, N=73). Seventy-one members (97 percent) of this group are missile trainer personnel (341X7). These individuals perform a large number of tasks including many of those general operation and maintenance tasks common to most personnel in this career field. In addition, they perform those tasks unique to missile trainers including the duties of operating missile procedures trainers and the isolation of malfunctions on missile procedures trainers. A more detailed discussion of this group can be found in the Career Ladder Structure section of the Missile Trainer Career Ladder Occupational Survey Report, AFS 341X7, under the Missile Procedures Trainer Maintainers Group (SPL750).

G. Instrument Trainer Operator Maintainers (GRP261, N=28). The 28 members of this group are all members of the Instrument Trainer career ladder, 341X1. These personnel spend approximately 38 percent of their time performing instrument trainer instructor and operation tasks. In addition, 47 percent of their time is spent maintaining the instrument trainer and associated equipment. Although this group is primarily concerned with the performance of technical tasks, slightly over one third also serve as supervisors of small units or as shift chiefs.

H. Radar Landmass Systems Operator Maintainers (GRP156, N=16). This group is made up of personnel from the 341X4 (38 percent) and 341X6 (62 percent) career ladders. Fifty-six percent of these personnel (including personnel from both ladders) are assigned to SAC, operating and maintaining FB-111 mission simulators. The remainder work in TAC organizations and are operating and maintaining simulators for F-4E and F-111 aircraft. Tasks which are unique to this group include: adjust landmass gantry drive systems; remove or install radar scopes; and isolate malfunctions on attack radar systems, CPUS radar landmass systems, and target generation systems. In addition, personnel from this group also perform a variety of other general operation and maintenance tasks common to other operator maintainers within the Training Devices career field.

I. Training Devices Supervisory Operator Maintainers (GRP161, N=64). This group is composed primarily of 7-skill level personnel who in addition to performing supervisory and administrative tasks also perform operator and maintenance tasks for over 50 percent of their work time. Personnel from all of the Training Devices career ladders were found in this group. However, over 50 percent were from the Analog Flight Simulator career ladder (341X3). A majority of this group were in SAC and MAC, but ADC, TAC and ATC were also represented. Primarily tasks from supervisory duties formed the basis for the grouping of these personnel. These included such tasks as, direct shop housekeeping, assign work priorities, make entries on simulator maintenance forms, counsel personnel on personal or military related

problems, and prepare APRs. Also a number of general preventive maintenance tasks were performed by high percentages of the group indicating a day-to-day involvement in the actual maintenance function. These included; visually inspect test equipment for serviceability; visually inspect electrical systems, wire harness, cables, or connector plugs; and physically check for loose mountings or connections. Several simulators were maintained by personnel in this group, however the most common included the KC-135, maintained by 23 percent of the group; the T-1, maintained by 19 percent and the T-4 maintained by 22 percent. Smaller percentages maintained simulators for the B-52, the C-130 or F-106 aircraft.

J. Limited Maintenance Specialists (GRP122, N=164). Members of this group characteristically are in their first enlistment, are 3- or 5-skill level and have an average of only 27 months in the training device career field. Approximately three-fourths of these personnel are from the Analog Flight Simulator career ladder. The remainder include small numbers of personnel from the other ladder in this career field. These personnel perform a variety of tasks which are common to most simulator operation and maintenance functions, but require only minor specialized knowledges of their specific simulator in order to perform them.

K. Defensive System Trainer Operator Maintainers (GRP135, N=40). All but two of this group are from the Defensive System Trainer (341X2) career ladder. These personnel are primarily 5-skill level airmen who average slightly over five years average experience in the career ladder. Tasks which are common to large percentages of the members of this group are primarily the general preventive maintenance and remove and replace tasks which are common to most operator maintenance personnel within this career field. Some operator tasks however, which were somewhat unique to this group were operate flight director controls, fire control radars, graphic display units, and ground track recorders. Thirty percent or more of this group also isolated malfunctions on a variety of systems which were maintained by few members of other groups. These included signal analyzer ECM systems, simulated automatic and manual jamming systems, chaff dispenser ECM systems and flare ECM systems. In addition, approximately one third adjust fire control systems, and multi-channel tape recorders, tasks performed by very few personnel in other groups.

L. Tactical Digital Training Devices Operator Maintainers (GRP101, N=31). This rather heterogeneous group is made up of 18 Digital Flight Simulator and 13 Digital Navigation/Tactics Training Devices personnel. Most of these personnel operate and maintain simulators for tactical aircraft such as the F-4E, F-111F and F-15A. In addition to performing a variety of general operation and maintenance tasks common to most other operator maintainer groups, there were several operator tasks performed by higher percentages of this group than any other group within the career field. Typical examples of these included operating instructor consoles (87 percent), operating digital computer control panels (87 percent), setting up ground targets

(71 percent), operating digital radar landmass systems (64 percent), serving as ground crew during simulator missions (58 percent), and operating armament systems (45 percent). Also included within this group were four airmen from SAC who were assigned as command development technicians.

M. Training Devices Operator Maintainer Assistants (GRP073, N=32). This is a very heterogeneous grouping of training devices personnel who perform a variety of general operating and maintenance tasks which are common to most of the other groups within the career field. Fifty-six percent of these airmen are from the 341X4 career ladder while twenty-eight percent are 341X6 personnel. The remainder are from the 341X1, 341X3 and 341X5 career ladders.

These personnel have the least time in military service and experience in the career field of any of the career field groups. All work in organizations within the CONUS.

II. Supervision and Management Personnel (GRP021, N=312). In addition to 95 of the 102 Training Devices Superintendents responding to the survey, this group includes a number of 7-skill level personnel performing high level supervisory, management or special technical functions within the career field. From the standpoint of tasks performed, the jobs identified within this cluster are very heterogeneous. Few tasks are common to 70 percent or more of this group. This is understandable considering the different kinds of jobs represented by this group. The majority of these personnel (68 percent) serve as supervisors in such positions as Training Devices Superintendent or Branch Chief, positions where their primary function is the supervision of the operation and maintenance of training devices for air crew training. The remainder are involved in a number of specialized support or management type jobs. Examples of some of these include Training Development Team members, MAJCOM Training Devices Representatives; Quality Control Inspectors, Maintenance and/or Supply Coordinators, and Technical Representatives of the Contracting Office (TRCOs). It was interesting to note that a majority of the Training Development Team technicians were from either the Digital Flight Simulator or the Digital Navigation/Tactics Training Devices career ladders. This may be indicative of the increasing emphasis on digital technology in the design and development of new training devices within the field.

III. Formal Training Personnel (GRP028, N=15). This small cluster of 15 personnel was primarily composed of technical school instructors teaching in the basic courses at Chanute AFB. Characteristically members of this group performed very few tasks, almost all of which were specifically related to the conduct of classroom training such as developing curricula or plans of instruction, writing test questions, evaluating progress of trainees, counseling trainees, demonstrating operation of equipment and administering or scoring tests. Although most individuals also performed a few equipment operation and maintenance tasks, these were often unique to the particular portion of the course taught and not common to other personnel in this

group. Although there were a number of other training instructor personnel included within the occupational survey, this cluster was the only group in which instructor tasks were preponderant and characterized the job. Since instructors normally perform a number of operator and maintenance tasks as a part of, or in addition to their instruction, many of these airmen grouped with personnel who operated and maintained the same type of equipment in the field as that taught in the classroom. This is especially true of those Field Training Detachment (FTD) instructors maintaining operational training devices at Vandenberg AFB and Castle AFB.

IV. Instrument Trainer Instructor Personnel (GRP015, N=82). This group contains only personnel in the Instrument Trainer career ladder and are described in detail in the AFS 341X1 Occupational Survey Report.

Summary

The clustering analysis of this career field revealed four distinctly different kinds of jobs. Two major clusters containing almost 94 percent of the survey respondents included those airmen who operate and maintain training devices as their primary job and the supervisors or managers of training devices functions. The other two small clusters contained those members of the Instrument Trainer career ladder who served as Instrument Trainer Instructors and personnel who planned and or conducted formal training for training devices personnel.

Characteristically, operation and maintenance personnel in this career field perform a rather large number of tasks that are common to all career ladders. These are general preventive maintenance, operating, isolating malfunctions, and removing and replacing components of units. These common tasks tend to group personnel from all of the ladders and was a major factor in the career field structuring process. Other factors which were instrumental in the grouping process included the degree of supervision exercised, the kind of computers (digital or analog) operated and maintained, and the number of tasks performed.

A review of the group job descriptions and background information within the training devices operation and maintenance cluster reveals that several of these groups contained rather large percentages of two or more career ladders. For example, the Senior Analog Training Devices Operator Maintainers was composed of 12 percent of respondents from the 341X1 ladder, 52 percent of 341X3 ladder respondents, and 17 percent of 341X5 ladder respondents. Airmen in the Defensive Systems-Analog Navigation/Tactics Training Devices Operator Maintainer group were from the 341X2 and the 341X5 ladders. While the Digital Training Devices Operator Maintainers group contained 54 percent of 341X4 respondents and 48 percent of 341X6 respondents. The other operator maintainer groups were made up primarily of personnel from one ladder, except in supervisory groups where supervisory tasks were the primary grouping factors and in the limited performance groups where performance was limited to a small number of routine operation and maintenance tasks common to most ladders.

TABLE 3

PERCENT TIME SPENT ON DUTIES BY CLUSTER GROUPS WITHIN THE TRAINING DEVICES CAREER FIELD
(PERCENT MEMBERS PERFORMING)

| DUTIES | TRAINING DEVICES OPER & MAINT PERSONNEL | SUPERVISION & MAINT PERSONNEL | FORMAL TRAINING PERSONNEL | INSTRUMENT TRAINER INS' PERSONNEL |

ANALYSIS OF DAFSC GROUPS

An analysis by DAFSC of the Training Devices career field was conducted in order that comparisons could be made of each career ladder sample against the total career field sample to determine similarities and differences by skill level. The DAFSC 34197 is included in this analysis because personnel holding the 9-skill level can be placed in positions of supervisory responsibility in any of the seven career ladders within the career field.

With the exception of the time spent by DAFSC 341X1 personnel in the area of performing instrument trainer instruction functions, career field DAFSC groups are quite similar to the DAFSC groups of each career ladder. Table 7 illustrates the relative percent of time spent by the skill level groups on the various duties listed in the job inventory. There is clearly a differentiation between the 3- and 5-skill level technical specialists and the 7- and 9-skill level supervisors. However, there is also a relatively high degree of homogeneity in the total sample, indicating that supervisors also perform technical functions. As Table 8 depicts, there are 23 technical tasks performed by 60 percent or more of the total career field sample.

Skill Level Groups

As illustrated in the DAFSC analysis of each career ladder in the Training Devices career field, 3- and 5-skill level personnel are primarily technicians performing a majority of their time in three duty areas; performing preventive maintenance, operating training devices, and removing or replacing components or system units. Three-skill level personnel spend 52 percent of their time performing these duties while 5-skill level personnel spend 49 percent of their time on the same functions. There were 58 tasks performed by 50 percent or more of the 123 3-skill level respondents. Tasks performed by 67 percent or more of those airmen are listed in Table 9. The 5-skill level group is even more homogeneous. Ninety-three tasks are performed by 50 percent or more of the 1036 DAFSC 3415X respondents. Tasks performed by 70 percent or more of these airmen are listed in Table 10. As a review of the two tables shows many of the high performance tasks are performed by both 3- and 5-skill level airmen. There is more homogeneity of task performance displayed by the 5-skill level airmen but this is probably due to the larger average number of tasks performed and the experience level of the group rather than a distinct change in the type of jobs performed.

As a group, DAFSC 3417X personnel are less homogeneous than the 3- and 5-skill level groups. As shown in Table 11, tasks performed by large percentages of 7-skill level personnel tend to be supervisory and management in nature. However, only 40 percent of their time is spent performing technical duties. Since the tasks are more diverse, this creates a lower average of members performing for each task in the technical function areas. There is little doubt, though,

that 7-skill level airmen within this career field are performing more as technicians than as managers.

On the other hand, DAFSC 34197 personnel are clearly managers. Spending 86 percent of their time performing supervisory and management functions, these personnel comprise a homogeneous group of superintendents assigned to senior enlisted management positions across all the career ladders in the Training Devices career field. Typical tasks performed by DAFSC 34197 airmen are shown in Table 12. Eighty-eight percent of the members in this group indicated they were direct supervisors of personnel. Table 13 displays the various DAFSCs 9-skill level personnel supervise. It is important to note that the members of this group do have supervisory responsibility across the entire spectrum of DAFSCs in the Training Devices career field. Survey data also showed that there were members in this group that had progressed to the 9-skill level from each of the career ladders in the career field.

ANALYSIS OF AFMS GROUPS

An analysis was also conducted comparing job differences among individuals grouped by time in service. Very similar conclusions to those for DAFSC groups were noted.

Table 14 displays the relative percent of time spent on duties by AFS 341XX personnel grouped by enlistment period. The same trend is exhibited here as was found in the separate analyses of the career ladders. Throughout all enlistment periods, airmen tend to move into positions of greater supervisory and management responsibility as they gain time in service. The longer individuals have in service, the less time they spend performing technical tasks and duties. However, it is not until the 20 year service point before personnel spend more time in supervisory and management functions than they do performing technical functions. Even at this point though, the rise in the time spent performing supervisory and management functions can be attributed to the inclusion in this table of DAFSC 34197 personnel. Fifty-one percent of the personnel in the 241 + months TAFMS group are Training Devices Superintendents. So for the most part, regardless of experience level, most AFS 341XX airmen will function as "hands-on" equipment technicians throughout their Air Force career.

A look at tasks performed by first enlistment airmen (148 months TAFMS) continues to show a high degree of homogeneity of the first job across the Training Devices career field. Of the 1144 inventory tasks, 85 are performed by 50 percent or more of this group. The average number of tasks for this group is 187. First enlistment airmen show a particularly high degree of task commonality in the duties of performing preventive maintenance, and removing or replacing components or system units as shown in Table 15.

SIMILARITIES AND DIFFERENCES IN TASKS PERFORMED AMONG CAREER LADDERS IN THE TRAINING DEVICES CAREER FIELD

Since all the career ladders surveyed perform jobs related to the maintenance of training devices, it can be assumed that there are certain tasks that would be common for all these specialties. At the same time, it can be assumed that since each career ladder maintains different types of training devices, the tasks performed by each specialty would be different. This section will show the similarities and differences in task performance among the various Training Devices career ladders. As the data presented will illustrate, both assumptions mentioned above are correct. Career ladders are very similar in the areas of performing preventive maintenance and removing or replacing system components, but are very different in the maintenance of specific equipment.

This section will examine the similarities and differences in task performance by first grouping the Flight Simulator and Navigation/Tactics Training Devices career ladders (AFSCs 341X3, 341X4, 341X5, and 341X6), comparing and contrasting them, and then comparing and contrasting the task performance of each of the other Training Devices career ladders to the data of that combined group. The 1-48 month TAFMS groups in each career ladder were chosen for the comparison because they represent the largest groups of individuals in each of the specialties.

Flight Simulator and Navigation/Tactics Training Devices Career Ladders

The Analog and Digital Flight Simulator career ladders (AFSCs 341X3 and 341X4), and the Analog and Digital Navigation/Tactics Training Devices career ladders (AFSCs 341X5 and 341X6), when combined form a very homogeneous group. As shown in Table 16, there are 59 tasks performed by 50 percent or more of the airmen in the 1-48 month TAFMS groups of each of these career ladders. When looking at a figure of 30 percent or more of each group performing, the number of common tasks rises to 142. In order to better demonstrate this commonality in tasks performed Table 17 lists the average number of tasks performed by first enlistment personnel in each career ladder. Clearly, the majority of tasks usually performed by the members of these groups are common across the four career ladders.

When comparing the similarities between the two AFSCs associated with analog training devices (AFSCs 341X3, 341X5) or those associated with digital training devices (AFSCs 341X4, 341X6), the results are even more dramatic. There are 177 tasks performed by 30 percent or more of first enlistment personnel in both AFSCs 341X3 and 341X5, and 254 tasks performed by 30 percent or more of both AFS 341X4 and 341X6 first enlistment groups.

There are however, tasks unique to each of these career ladders. There are 20 tasks of which only 30 percent or more of AFS 341X3 first enlistment personnel were found to be performing. These tasks listed in Table 18 are primarily related to the isolation of malfunctions on simulator systems with analog computers, and alignment and adjustment procedures. The 22 tasks shown in Table 19 exclusive to AFS 341X5 first enlistment airmen also fall in the same areas. There are only five tasks exclusive to the AFS 341X4 first enlistment group (See Table 20), but there are 31 tasks listed in Table 21 unique to the AFS 341X6 first enlistment personnel. The tasks of sole responsibility for this group lie primarily in the areas of operating training devices and malfunction isolation on simulator systems with digital computers.

Defensive System Career Ladder

The AFS 341X2, Defensive System, first enlistment group was found to possess a high degree of task commonality with the other groups maintaining flight related training devices. Of the 59 tasks listed in Table 16, 55 were also performed by 50 percent or more of this group. In addition, there were 122 tasks performed by 30 percent or more of first enlistment personnel in each of these five AFSCs. Although 122 common tasks are fewer for AFS 341X2 personnel than the other career ladders discussed, this group averages fewer tasks performed (167).

Defensive system personnel perform far more tasks in common with digital trainer maintenance personnel than with analog trainer maintenance personnel. AFS 341X2 first enlistment airmen perform 154 tasks common to 30 percent or more of each AFS 341X4 and 341X6 first enlistment groups but only 132 tasks common to 30 percent or more of each AFS 341X3 and 341X5 first enlistment groups.

This career ladder has more in common with the navigation/tactics training devices career ladders than with the flight simulator career ladders. There were 153 tasks performed by 30 percent or more of this career ladder and both AFSCs 341X5 and 341X6. There were 181 tasks performed by 30 percent or more of both AFSCs 341X3 and 341X6. Logically then, greater commonality was found to be with the Digital Navigation/Tactics Training Devices career ladder. There were however, some differences in tasks performed. Seventeen tasks were identified as being performed exclusively by Defensive System personnel and are listed in Table 22. As expected, they pertain to the operation and maintenance of specific defensive system training devices.

Missile Trainer Career Ladder

Although AFS 341X7 Missile Trainer personnel do not maintain equipment that simulates flight crew functions they do possess a great deal of task commonality with the Training Devices career ladders previously discussed. Of the 59 tasks listed in Table 16, 54 were also

performed by 50 percent or more of this group. There were 112 tasks performed by 30 percent or more of both AFS 341X7 first enlistment personnel and the first enlistment personnel in AFSCs 341X3, 341X4, 341X5, and 341X6. However, Missile Trainer personnel were found to exhibit the most task commonality with other personnel maintaining training devices with digital computers. There were 151 tasks performed by 30 percent or more of first enlistment airmen in the AFSCs 341X7, 341X4, and 341X6, and 170 tasks performed by 30 percent or more of both AFSC 341X7 and 341X6 groups.

There were also many very distinct differences in the tasks performed by Missile Trainer personnel as illustrated in Table 23. Again, as would be expected, the 56 tasks listed pertain primarily to the operation and maintenance of specific and unique missile trainer systems.

Instrument Trainer Career Ladder

When compared as a total group, there is very little commonality between Instrument Trainer personnel and the other Training Devices career ladders. Of the 59 tasks listed in Table 16, only four are performed by 50 percent or more of first enlistment personnel in this specialty. The number of tasks performed by 30 percent or more of the personnel in AFSC 341X1 and each of the flight simulator and navigation/tactics training devices career ladders is only 41. Although, as reported in the Occupational Survey Report for this career ladder, some AFS 341X1 personnel were found to be performing in a trainer maintenance capacity similar to Analog Flight Simulator (AFS 341X3) personnel, the majority of AFS 341X1 airmen however, function as instructor operators and are not actively involved in the maintenance of simulator equipment. Therefore, the common maintenance tasks linking the other Training Devices career ladders are not performed by large numbers of personnel in this specialty.

Instrument Trainer personnel are unique however, in their performance of instructor duties as illustrated by Table 24. The 43 tasks listed all pertain to performing instrument trainer instructor functions.

Summary

There is a great deal of task commonality and similarity among career ladders in the Training Devices career field. There is task commonality among personnel maintaining aircrew training devices, among personnel maintaining flight simulators, among personnel maintaining analog training devices, and among personnel maintaining digital training devices regardless of their AFSC. There is much similarity among maintainers in all career ladders in the areas of operating training devices, performing preventive maintenance, and in general malfunction isolation procedures.

There are also differences among the career ladders. Instrument Trainer instructor operators are very different in task performance from training devices maintainers. In addition, each career ladder is different from the others in the career field in terms of operation and maintenance of career ladder unique equipment. However, except for the unique instructor tasks performed by AFS 341X1 personnel, the exclusive tasks performed within any of the other career ladders are only a small part of the total job of that specialty.

COMPARISON OF AFR 39-1 SPECIALTY DESCRIPTIONS

In evaluating the AFR 391 specialty descriptions of each ladder in the Training Devices career field, it became apparent that similar wording was being used to describe the duties and responsibilities of each specialty. As illustrated in Table 25, each paragraph in the Duties and Responsibilities section of the 3-/5-skill level specialty descriptions for each career ladder begin with essentially the same key italicized wording. The Specialty Summary is also essentially the same for each of the 3-/5-skill level descriptions. Although the paragraphs are not as closely aligned in the 7-skill level specialty descriptions, Table 25 shows that they too, are very similar in wording. Only the type of equipment maintained or operated changes from one description to the next.

The fact that the AFR 39-1 specialty descriptions for the ladders in the Training Devices career field describe similar duties and responsibilities is not to imply that the jobs are essentially the same. Rather the question should be raised as to whether these jobs should be classified as seven distinct specialties, each requiring an AFSC, or whether there should be fewer specialties within the career field. As these descriptions are currently written, there does not appear to be sufficient differentiation in job functions between the specialties to justify separate AFSCs. If these career ladders are to remain separate, specialty descriptions need to be written that emphasize the distinct and unique duties and responsibilities of each career ladder that were pointed out in the Occupational Survey Report for each of these specialties.

This similarity in job function displayed in the AFR 39-1 specialty descriptions has already been illustrated in the career field structure and the analysis of task performance. It is also evident in the construction of Specialty Training Standards.

COMPARISON OF THE TRAINING DEVICES SPECIALTY TRAINING STANDARDS (STS) FOR SIMILARITIES AND DIFFERENCES

A comparison of similarities and differences of STS tasks and knowledges across all ladders of the Training Devices career field was also accomplished. Since a comparison of each STS to the survey data was conducted and reported previously in the career ladder Occupational Survey Reports, this section will not readdress the findings.

Table 26 lists the similarities in the STS paragraphs for the various Training Devices career ladders. As is illustrated, the first 10 paragraphs are essentially the same for each specialty. Further similarities can also be noted, especially among the flight simulator and navigation/tactics career ladders. It appears that all the specialties possess certain common areas in which similar training is required, thus providing further evidence to substantiate the need for consolidation of some of the AFSCs in this career field.

Of course, each career ladder STS contains tasks and knowledges unique to that specialty. It is not within the scope of this report to determine whether these tasks and knowledges are appropriate for inclusion in the STS or whether they would be more appropriate in an AF Form 797, Job Proficiency Guide. That is a decision for training managers to make in cooperation with the major using agencies of Training Devices personnel. However, there is little question that like the AFR 39-1 specialty descriptions, the STS's within this career field possess a great deal of similarity in their training requirements.

COMPARISON OF CURRENT SURVEYS TO THE PREVIOUS SURVEYS
FOR AFSCs 341X3, 341X4, 341X5, and 341X6

In March 1974, an Occupational Survey Report was published covering the AFS 342X0 Flight Simulator, and AFS 343X0 Navigation/Bomb/Tactics Trainer career ladders. In April 1976, these two specialties were split to form the Analog and Digital Flight Simulator, and the Analog and Digital Navigation/Tactics Training Devices career ladders. Since this reorganization has made individual survey comparison very difficult, the four current surveys were compared as one to the previous survey and is included in this addendum.

Sample sizes for both surveys were representative. There were 1,166 respondents representing 67 percent of the career ladders' population in the previous survey. There were 1,334 respondents from the four AFSCs in the current survey, or 76 percent of the total assigned population.

Although there is little resemblance in career ladder structure between the two surveys, one factor has remained stable over time. In both studies, personnel tended to group by the type of equipment operated or maintained. In the first survey, it was by type of aircraft simulator. In the current survey, it was by computer type (analog or digital) of the simulator system. This tendency to group by computer type was also noted in the 1974 survey. It was realized then that as the fully integrated flight and navigation/tactics mission simulators entered the Air Force inventory the distinction between the separate jobs of the flight simulator personnel and the navigation/tactics trainer personnel would become blurred. This has indeed occurred as shown by survey results.

While the job structure appears to have changed through changes in equipment, the job satisfaction levels and reenlistment intentions of these airmen have remained relatively the same. Job satisfaction levels and reenlistment intentions were high in the first survey, and if anything, may be higher in the current survey.

Overall, the analysis of these career ladders over time seems to indicate that the job structure has changed and should continue to change as new and more sophisticated simulators become operational. At the same time, however, the jobs have remained and should continue to remain challenging and satisfying to the airmen that perform them.

SUMMARY OF RELATIVE JOB SATISFACTION

Table 27 displays the various percentages by career ladder of the responses to questions regarding job interest and perceived utilization of talents and training. As in the Occupational Survey Reports for each specialty, the percentages of responses from individuals in mission equipment maintenance AFSCs surveyed in 1977, are included for purposes of comparison.

Only the AFS 341X1 career ladder displayed lower job interest or perceived utilization of talents and training than the responses in the comparative sample. It is interesting to note that this career ladder, while classified as a maintenance specialty, actually has the majority of its personnel performing non-maintenance type jobs. It is not uncommon to find personnel that have been identified and trained for one type of job but performing in another to be dissatisfied with their work.

On the other hand, AFSCs 341X4, 341X6, and 341X7 are considerably more satisfied with their jobs than their career field contemporaries or their counterparts surveyed in 1977. No explanation for this can be given although, they do maintain newer and more sophisticated electronic equipment and perform a higher number of more difficult tasks in doing so.

Table 28 presents the responses to job interest and perceived utilization of talents and training of the first enlistment group for each career ladder. Results are similar to those described for the career ladder comparisons.

** BASED ON A SUMMARY OF OVER 9900 RESPONSES FROM FIRST ENLISTMENT PERSONNEL IN MISSION EQUIPMENT MAINTENANCE AFSCs SURVEYED IN 1977

A CORRELATION OF CAREER FIELD TRENDS WITH OCCUPATIONAL SURVEY RESULTS

At this time, there are a number of independent factors bearing on this career field that have created a certain amount of turmoil and uncertainty among the personnel assigned to operate and maintain Air Force training devices. This section will review the principle highlights of the survey results for each career ladder and discuss them in relation to the current trends affecting the career field.

In the case of AFS 341X1 Instrument Trainer personnel, the majority were found to be performing primarily as instructor operators and not as equipment maintainers. Although they receive six weeks of resident electronic principles training, they show the least utilization of this training of any Training Devices career ladder as reported in the Occupational Survey Report, Summary for AFSCs Trained In Electronic Principles at Chanute AFB, published in February 1978. The inability of AFS 341X1 personnel to fully utilize their electronic principles training does not show proper utilization of training resources. In addition, the introduction of the Undergraduate Pilot Training - Instrument Flight Simulator has severely impacted on jobs performed by these airmen. Currently maintained by either contractor or AFS 341X4 personnel, and operated by either contractor or civilian federal employees, the instrument flight simulator does not require Instrument Trainer personnel. It has also severely reduced the use of the old instrument trainers which do require them. Discussions with personnel in the field indicate the instrument trainers will, in the near future, be either replaced by a new digital trainer maintained by AFS 341X4 personnel and operated by a rated pilot or just abandoned altogether. In any case, it appears there will be very little left on which to justify a separate career ladder for this specialty.

AFS 341X2 Defensive System Trainer personnel displayed a high degree of task commonality with other AFSCs operating and maintaining aircrew training devices, especially with AFS 341X6 Digital Navigation/Tactics Training Devices personnel. Although there is insufficient data for recommending combination of this specialty with another AFSC, consideration should be given to including this career ladder in any discussions involving reorganization of the aircrew training devices career ladders (AFSCs 341X3, 341X4, 341X5, and 341X6) since the defensive system trainers are also aircrew training devices.

As with AFS 341X1 personnel, airmen assigned as AFS 341X3 Analog Flight Simulator personnel face an uncertain future. As the analog flight simulators are replaced with the more sophisticated digital mission simulators, the requirement for these individuals will steadily decrease. This is currently reflected in the projected resident course load of only 20 students during FY 79 and none for FY 80. If the career ladder is programmed for elimination, it is best to consider now, where in the classification system these airmen should be placed and whether training prior to reclassification will be necessary. Conversations with personnel in the field inciate an awareness of the situation.

A solution probably best for moral would be a classification change as soon as possible and a manning of 341X3 positions by special experience identifier (SEI) until the positions are deleted.

The situation looks much better for airmen in the AFS 341X4 Digital Flight Simulator career ladder. As the new digital mission simulators enter the Air Force inventory, the manning of this specialty will increase. Since this career ladder will soon be the largest specialty in the career field, it should serve as the basic ladder for any classification action that might result in specialty shreds.

Like the analog flight simulators, analog navigation/tactics training devices are rapidly being replaced by newer digital systems. Consequently, the requirement for AFS 341X5 Navigation/Tactics Training Devices personnel will also decrease. Only 11 are projected for training during the FY 79-80 time frame. Any decisions made concerning the AFS 341X3 career ladder would also apply to this specialty.

The manning of the AFS 341X6 Digital Navigation/Tactics Training Devices career ladder should also increase as the new digital training devices replace the old analog systems. However, in April 1977, at the Career Field 341XX Review Conference held at Chanute AFB, Ill., representatives from TAC recommended that AFSCs 341X4 and 341X6 be combined because of the high similarity in the utilization of these personnel. Survey data supports this recommendation. The tasks performed and the percent of time spent on those tasks was so similar that the two AFSCs could not be distinguished separately in the career field job cluster analysis. Identification of job types within each AFSC required separate cluster diagrams. This concept is also supported by conversations with field supervisors who readily admit that they often use AFS 341X4 and 341X6 personnel interchangeably.

AFS 341X7 Missile Trainer personnel, while not performing maintenance on air crew training devices, still possess a great deal of task commonality with the other ladders in the career field, especially those maintaining digital computer systems. Although there is insufficient evidence to suggest this career ladder could be combined with another aircrew training devices career ladder, survey data does support this specialty as a shredout of a more broadly named digital training devices AFSC that would also include AFSCs 341X2, 341X4, and 341X6.

There is little question that with over 200 new simulators and training devices on order and scheduled to enter the inventory over the next four years that the Training Devices career field is in a rapid state of change. As electronic technology has advanced and new training devices replace the old, the differences in the jobs performed within the various career ladders have become less distinguishable. The time for a hard look at restructuring this career field has arrived. Career field managers should review the situation, apply the information available to them, and resolve the existing problems as soon as possible so the high moral, job satisfaction, and job performance of the airmen in the Training Devices career field will be maintained.

IMPLICATIONS

In the analysis of the survey data, it was found that the Training Devices career field is composed, for the most part, of fairly homogeneous, reasonably satisfied individuals whose job is to operate and maintain aircrew and missile training devices. There is a high degree of commonality across all the career ladders in the areas of performing preventive maintenance, operating training devices, and general malfunction isolation procedures. There are also distinguishing differences among the career ladders, especially in the areas of performing instructor operator duties and in the operation and maintenance of equipment unique to each career ladder. The implications of such findings are many and varied.

Certainly, there is sufficient occupational survey data, coupled with agreement among major users, to recommend consolidation of the AFS 341X4 and AFS 341X6 career ladders. The future of the jobs in these specialties is assured, and as more and more training devices utilizing digital computers enter the Air Force inventory, the necessity of having knowledge in this newer technology in order to adequately function at the 9-skill level will surely be an advantage to the individuals now maintaining digital equipment. What then of the other airmen in the career field? As the analog training devices are replaced by digital systems, what will happen to these personnel? During this transition period, should the AFS 341X1, AFS 341X3, AFS 341X5 remain distinct specialties until the changeover is complete? Should all the aircrew training devices be combined now and instrument flight and analog simulator positions identified through either a specialty shredout or a special experience identifier (SEI)? Is the defensive system trainer an aircrew training device and is there enough similarity in the jobs performed by AFS 341X2 airmen to consider this AFSC in any plans concerning the ladders maintaining aircrew training devices? Is the Missile Trainer career ladder really so different and unique that it should remain a separate AFSC; or should it be a specialty shredout of a digital training devices career ladder; or could the job be performed by airmen from an aircrew training devices career ladder?

There is little doubt that much time and considerable effort on the part of everyone concerned with this career field will be needed to answer these questions. A comprehensive plan to provide stability and order to personnel management during this period of equipment transition must be formulated and implemented as soon as possible to minimize personnel turmoil, insure that the technical training center will provide the students with the quality training necessary to perform the job in the field, and to especially maintain the high degree of job satisfaction currently exhibited by the airmen now serving in the Training Devices career field.
