390664

The EWAMS has been designed to fulfill three basic needs of potential users.
First, it can be used as an information retrieval system. The EWAMS allows
users to retrieve data on the historical, political actions taken by countries
as far back as 1966. Second, the system can be used as a monitoring system.
Users can monitor the entire international political environment on a daily
basis. Third, the EWAMS can be used as a warning system. It allows users to
receive numerical assessments of the probability of a crisis on a monthly
basis.

The EWAMS is conprised of several independent computer programs. This users
guide contains an overview of these programs and a description of their
operation. The EWAMS program is designed to be implemented on a Tektronix
4051 in interaction with a PDP/11-70 computer.

1.0 INTRODUCTION

The Early Warning and Monitoring System (EWAMS) is being developed, tested, and transferred at the direction of the Cybernetics Technology Office of the Defense Advanced Research Projects Agency (DARPA/CTO). The EWAMS is being developed to assist the intelligence community by providing them with an interactive computer-based system of political, economic, and domestic indicators for daily monitoring of international and intranational affairs and for warning of crisis and conflict.

The EWAMS has been designed to fulfill three basic needs of potential users. First, it can be used as an information retrieval system. The EWAMS allows users to retrieve data on the historical, political actions taken by countries as far back as 1966. Second, the system can be used as a monitoring system. Users can monitor the entire international political environment on a daily basis. Third, the EWAMS can be used as a warning system. It allows users to receive numerical assessments of the probability of a crisis on a monthly basis.

1.1 The DARPA Crisis Management Program (CMP)[1]

The Early Warning and Monitoring System is being developed as one of two lead projects in DARPA's Crisis Management Program, the objective of which is to develop, test, and transfer technology in the following areas:

---

[1] In the interests of standardization of products from the many CMP projects, this section borrows liberally from CACI, Incorporated-Federal, "Executive Aids for Crisis Management: Sample Output." Arlington, VA: CACI, Incorporated, November, 1977.

1. Computer-based early warning and monitoring
    systems;

2. Computer-based executive aids for crisis
    management;

3. New quantitative methods for advanced warning,
    monitoring, and management.

From 1974-1976 DARPA-sponsored basic research efforts
designed to build the base required for effective technology
development in the social sciences. By late 1976 progress
was such that the Crisis Management Program had two major
thrusts--crisis management and crisis forecasting. Research
results in these areas were then integrated with state-of-
the-art computer technology to yield user-oriented, computer-
based aids for:

o   assisting alert centers in identifying the indi-
     cator and warning patterns which signal the onset
     of crisis and monitoring "normal" patterns on a
     daily basis;

o   developing option-generation and action-selection
     aids to assist crisis managers after a crisis had
     begun.

1.2 The Early Warning and Monitoring Project

The Early Warning and Monitoring Project is contributing
two types of research products to the Crisis Management
Program:

o   integration of past and on-going I&W-relevant
     research performed in both the academic and policy
     communities and further testing of this research
     to enhance its utility to the I&W community.

This research is presented in two forms:

o   an interactive, computer-based, user-oriented
     Early Warning and Monitoring System which allows
     the analyst to track international political

indicators on a global, regional, country-pair and single-country basis and which will eventually include economic and domestic indicators;

o   reports on the testing of a variety of political and economic indicators, software development, integration of computer-based political and military I&W systems and modifications to the Early Warning and Monitoring System in response to user needs.

The conceptual and analytical integration of I&W-relevant research began in early 1976 and included the synthesizing of both research results and data sets to begin giving substance to the design for a fully integrated Crisis Early Warning and Monitoring System.[2] Software development of the first-stage system began in mid-1976 with a demonstration system comprised of four historical crisis cases and ten years of selected data on an interactive graphics terminal. The demonstration system contained data for nine countries with quantitative international political indicators aggregated by month, quarter, and year.

The combination of input from potential users who viewed this demonstration system, and intensive research the project performed with the system, resulted in a new "real-time" version in early 1977. This demonstration system is front-ended with Joint Chiefs of Staff (JCS) regions and allows the user to access almost thirteen years of data for all countries in the world; to track combinations of country-pairs, regions, and the world with quantitative international political indicators; and to create his own region. The remainder of 1977 was devoted to rigorous testing of extant indicators and forecasting methods, development of new ones,

---

[2]See Stephen J. Andriole, Progress Report on the Development of an Integrated Crisis Warning System (Technical Report 76-19). McLean, VA: Decisions and Designs, Incorporated, December, 1976.

extensive interaction with potential users, especially those of DIA/NMIC (Defense Intelligence Agency/National Military Intelligence Center), and exploration of possible amalgamation of the Early Warning and Monitoring System with military indicator systems. All of this is, of course, on-going.

In late 1977, the project moved from reliance on a commercial time-sharing service to DARPA/CTO's Demonstration and Development Facility (DDF) where extensive changes to the Early Warning and Monitoring System are now in progress. As always, we are continuing to work closely with other CMP contractors to give substance to components of the design for the fully integrated system.

1.3 The Approach to Early Warning and Monitoring

The Early Warning and Monitoring System project initially addressed several problems.

o   the development, evaluation, and improvement of procedures for warning and monitoring of inter-national security crises;

o   the identification and observation of quantitative political indicators for crisis warning; and

o   the integration of a variety of indicators and methods into an interactive, user-oriented, com-puter-based crisis warning system.

Research has resulted in significant progress on many aspects of these general problems.[3] Furthermore, as is usually the case, progress has revealed a new set of cor-responding problems including:

o   supplementing the warning system with monitoring and retrieval systems;

---

[3]For a description of this progress see Judith Ayres Daly and Thomas R. Davies, Early Warning and Monitoring System: A Progress Report (Technical Report 78-17-39). McLean, VA: Decisions and Designs, Incorporated, July, 1978.

o   integrating the hardware, software, and method-
     ologies of extant computer-based I&W systems;

o   tailoring the EWAMS to user needs; and

o   implementing an efficient and effective transfer
     to the user community.

1.4 Program Structure

The EWAMS is comprised of several independent computer
programs.[4]   An overview of these programs can be found in
Section 3.0, and a description of their operation is included
in Section 4.0.

As shown in Figure 1, there are seven main components:

o   Initial Input
     -    Enter initial information such as actors,
          flow, and time parameters

o   Probabilistic Forecasts
     -    Monthly estimates of crisis probabilities

o   Primary Menu
     -    Selection of system options

o   QCS1 (Quality Control System 1)
     -    Change initial input information

o   Tables
     -    Tabular, numerical display, and analysis of
          the political indicators

o   Plots
     -    Graphic analysis and display of the political
          indicators

o   Text
     -    Retrieval and display of textual data

_____

Project Research Memorandum #21). McLean, VA: Decisions and
Designs, Inc., February, 1978.
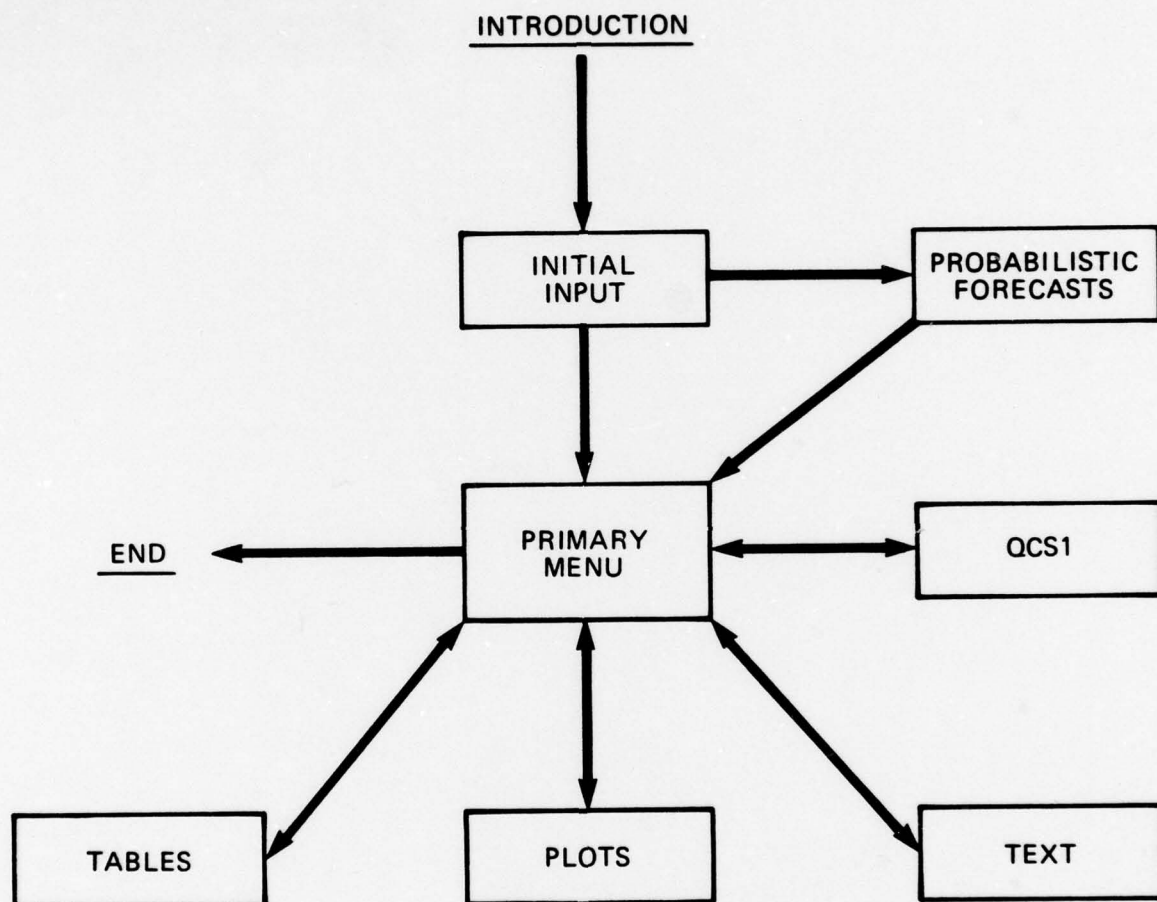

Figure 1

THE EARLY WARNING AND MONITORING SYSTEM

2.0   THE TEKTRONIX 4051 TERMINAL

Introduction

The Early Warning and Monitoring System (EWAMS) program
is designed to be implemented on a Tektronix 4051 in inter-
action with a PDP/11-70 minicomputer. The EWAMS now resides
at the Development and Demonstration Facility (DDF) of the
Defense Advanced Research Projects Agency's Cybernetics
Technology Office.[1]

2.1   Accessing the EWAMS Program

When the user is working at a Tektronix 4051 terminal,
he is connected to the PDP/11-70 computer through a phone
line. Thus, each user is "sharing time" with one computer.

A series of steps must be executed in order to activate
the terminal and access the EWAMS. In general, the user
will have to
- o   turn on the power,
- o   call the DDF operating system,
- o   type the user number, and
- o   type the password.

This procedure is called logging in.[2] The login procedures

---

[1] For further details on the DDF see, J.F. Wittmeyer,
III, J.J. Allen, Jr., R.A. Winter, and C.E. Herdt, Cyberne-
tics Technology Office Demonstration and Development Facility
(CTO/DDF): Overview and FY79 Plan, (Technical Report CCA-78-
12). Cambridge, MA: Computer Corporation of America, October,
1978.

[2] For a more detailed description of how to get started
see K. Thompson and D.M. Ritchie, "UNIX Programmer's Manual,"
Sixth Edition, Bell Telephone Laboratories, Inc., May, 1975.
The user can also telephone the system administrator at the
DDF for assistance by calling (703)243-8664.

have been successfully executed when the system responds
with a '%'. Having logged in, the user can then proceed to
the EWAMS by typing in the name of the program.

2.2   Operation of the Tektronix 4051 terminal

The material presented here is not intended to cover
every detail of the Tektronix 4051. Rather, its purpose is
to introduce the user to the Tektronix 4051 microprocessor
and its basic operating procedures.[3]

2.2.1   The keyboard - The primary input device for the
Tektronix 4051 terminal is the keyboard (Figure 2). Each
time a key is pressed, the character is shown on the display
screen. Thus, the keyboard is used to input information and
to control a program that is in progress.

The arrangement of the keyboard is similar to
that of a typewriter keyboard. The letters and numbers are
in standard positions along with several special characters.
There is also a numeric pad, located to the right of the
main keyboard, that resembles a calculator keyboard. This
latter group of keys can be used to enter numeric data.
Many of the characters repeat their function if the key is
held down for more than a second. Some of the more useful
keys are:

RETURN   This key should be pressed at the
                                          end of each user response. When
                                          this key is pressed, the display
                                          cursor returns to the left-hand
                                          margin and skips down one line.
                                          The previous line statement is then
                                          transmitted to the computer and
                                          executed. The program will not
                                          respond to the input until the
                                          return key is pressed.

---

[3]More detailed information can be obtained from the
"4051 Graphic System Operator's Manual" (Tektronix, Inc.,
1976) which is used as the basis for this section.

THE TEKTRONIX 4051

9

SPACE BAR	Pressing the space bar moves tne cursor one space to the right. It is used to type spaces and blanks.
SHIFT	This key is used to type the upper-case positions on the keys. Letters are printed in lower case unless this key is pressed simultaneously with the letter.
BACKSPACE	Pressing the backspace key moves the cursor one space to the left. It does not delete the previous character.
HOME PAGE	This key clears the entire display screen and returns the display cursor to the upper left corner of the screen.
BREAK	This key is used to interrupt a program.

There are also several front panel lights which indicate the following status conditions:

BREAK	The program has been interrupted.
I/O	An I/O (input/output) operation is in progress.
POWER	Power is being applied to the system.

2.2.2 _The display_ - The Tektronix 4051 has a display unit on which characters are imprinted. The display unit is sometimes referred to as a cathode ray screen. The display allows the user to monitor the communications that take place between him and the system.

The blinking rectangular display cursor, visible on the screen, indicates the location of the next keyboard character to be typed in. Sometimes it is necessary to press the HOME PAGE key to clear the screen for the cursor to become visible. The cursor will move around the screen during the program.

The display operates at different intensity levels. During normal intensity levels the display will remain visible on the screen. If the system is active--for example, when information is being typed in--the display will continue to operate at the normal intensity level. However, if all activity stops for about 90 seconds, the display will go to a reduced intensity level. At this level the displayed information is dimmed and the cursor disappears. To re-establish normal intensity, the user can press the SHIFT key.

2.2.3 <u>Power switch</u> - To power on the Tektronix 4051, it is necessary to locate the power switch under the right-front edge of the keyboard. It is a rocker-type switch that provides the power for the terminal. To turn it on, the user must press the right side of the switch. To power off the terminal, the user must press the left side of the switch.

2.2.4 <u>Hard copy generation</u> - The user can make a permanent copy of the display on the terminal screen when a hard copy unit, such as a Tektronix 4631, is attached. This may be done at any time since it does not affect the status of the program. To make a paper copy, the user must press the MAKE COPY key on the Tektronix 4051 keyboard or the COPY key on the hard copy unit.

2.3 <u>Potential Problems</u>

Many of the EWAMS components contain error diagnostic checks, designed to check for errors in user input that could abort the program. When an error is detected, the user will receive a message indicating the source of the error. The question or request will then be repeated, allowing the user to enter a new response.

2.3.1 <u>Correcting typing mistakes</u> - The terminal has a special character which executes backspace deletes. This

11

character will delete the previous character typed. However, since deletion occurs within the computer, the deleted character will remain visible on the display screen. If, for example, the user types in the wrong character when entering a response and wants to correct the error before pressing the RETURN key, he can use the backspace delete character. To erase or delete a character press SHIFT and a '#' simultaneously. For continuous deletions this process must be repeated. Once all the errors have been deleted, the correct symbols can be entered.

3.0   DESCRIPTION OF USER OPTIONS

Introduction

This section is designed to provide the user with an overview of the many options within the Early Warning and Monitoring System (EWAMS). After reading this section, the user should have the foundation necessary to follow the detailed examples included in Section 4.0.

Selection of a particular option is accomplished by entering the appropriate responses to the questions and requests. The responses considered appropriate will vary depending on where the user is located in the execution of the program. Upon entering a response, either the operation will be performed directly or another request will be displayed.

3.1   Initial Input

Once the introductory credits have been given, a series of displays will appear on the screen one at a time. This initial set of questions and requests will allow the user to specify the information needed to execute the subsequent analyses.

When the display appears, the user must enter the appropriate information for his particular analysis. When the user presses the RETURN key, a new display will request additional information. This process will be repeated until the program has all the information needed to execute the initial analyses.

Five types of information must be specified prior to execution of the analyses: actor type, actor name, activity flow, time increment, and time parameters.

Actor Type

At this stage the user must select the type of actor to be monitored. The system currently recognizes both countries and regions. Regional actors include Joint Chiefs of Staff (JCS) regions as well as the world in its entirety. The regional actor option also allows the user to build his own special purpose region which can be saved for future analyses.

Actor Name

The system allows the user to select from a list of 183 countries (see Appendix A). The country actors include both governmental and non-governmental ones. Three-character alphabetical codes, assigned to the 183 country actors, are used for identification purposes.

The user can request a listing of all countries and multilateral groups within a specified region.

Each regional actor also has a corresponding three-character alphabetical code that is used for identification purposes.

Activity Flow

This option allows the user to specify the direction of the political event/interactions to be monitored. The one-way flow options differ on the basis of which actor is to be considered the initiator and which actor is to be the target. Initiators and targets are identified by the direction of the arrows. If the user selected a two-way activity flow all political events exchanged between the actors would be examined.

```
Are your actors:
   1. Countries
   2. JCS regions
   3. Both
```

```
Please select two countries(usa,usr):
```

```
                    *** REGIONAL OPTIONS ***
JCS REGIONS

1.  North America (NAM)
2.  Central and South America (CSA)
3.  Western Europe--Mediterannean Atlantic (WEM)
4.  Eastern Europe--Soviet Union (ESU)
5.  Middle East and North Africa (MEA)
6.  East Asia and Pacific (EAP)
7.  South Asia and Sub-Saharan Africa (SAS)
8.  World (WOR)
9.  Special Purpose Region (SPR)

Do you want a list of actors in a region(y/n)?
```

```
Specify activity flow:
   0. one way (usa >>> usr)
   1. one way (usa <<< usr)
   2. two way (usa <-> usr)
```

14

Time Increment

The user can choose among three different calendar time intervals: months, quarters, or years.

Time Parameter

The time parameters allow the user to specify beginning and ending dates for the analysis. The first two numeric characters of the four digit number indicate the year. The second two numeric characters indicate the appropriate month. The time parameter cannot include more than 36 time intervals.

Select time increment:
1. monthly
2. quarterly
3. yearly

Set time parameters(7501-7712):

3.2 Probabilistic Forecasts

Once the initial information has been received, the system will then go to processing. During the processing period the program searches the database for the appropriate data and carries out all the required computations. When the system is finished processing, it will display the total number of events found.

If the user had chosen monthly time increments, he would then be given the option of examining the probabilistic forecasts. The probabilistic forecasts are derived from a series of retrospective tests carried out on the database examining the fluctuations in a conflict indicator during historical crises.

To receive a tabular display of the monthly crisis probabilities the user simply enters 'y' for yes. A 'n', which is a no response, will instruct the system to proceed to the primary menu.

Do you desire 30 day probablistic forecasts(y/n):

3.3 Primary Menu

The primary menu is the central component of the EWAMS for it allows the user to directly access all other system components. Furthermore, the system always returns to the primary menu when the analytic options have been fully executed.

This is the principle menu of options available within the system. To execute any given option the user must type the appropriate name. For example, if the user wanted to select the plot option, he would type the word 'plots'. Each of these five primary options is described in the following sections.

```
       SYSTEM OPTIONS :

   tables    -    (tabular output)
   plots     -    (graphical output)
   text      -    (textual output)
   acsl      -    (change input parameters)
   end       -    (terminate execution)

Any of these commands typed after the "%" will
cause execution of the chosen function.

   %
```

17

3.4 Tables

The table option allows the user to receive numerical readings taken on the political indicators in a tabular format. If the tables option on the primary menu is selected, the system will automatically display numerical readings for all five political indicators. The tables are structured and labeled on the basis of the initial input.

Event Frequencies

To receive a tabular display of the event fre-
quencies for the ten cooperative event types and
the twelve conflictual ones the user must enter
'y' for yes. A 'n', which is a no response, will
instruct the system to return to the primary menu.

Do you want event frequencies(y n)?

18

3.5 Plots

The plot option permits the user to receive many different types of graphic output from the system. The user can specify the type of graphic display as well as the number of displays. The graphs are scaled and labeled automatically on the basis of the initial input.

Multiplots

Selection of this option allows the user to examine a multiplot display of the political indicators. A multiplot simply refers to a joint, simultaneous display of several line plots all on one set of axes.

POLITICAL INDICATORS

	Total Activity	Coop Activity	Conflict Activity	Tension Level	Uncert Level
Raw Data	1	3	5	7	9
Z-Score	2	4	6	8	0

Do you want more than one plot per graph (y or n)

If the user chose to examine a multiplot display he would then be asked to pick among several options. He would indicate his choice by entering either '1', '2', '3', or '4'. Option '3', for example, would result in a multiplot display of the tension and uncertainty indicators using the raw data.

```
You have these choices:
    1 = graphs 1,3 + 5
    2 = graphs 2,4 + 6
    3 = graphs 7 + 9
    4 = graphs 8 + 10
Please pick one :
```

Type of Graphic Display

If the user did not elect to examine a multiplot display of the political indicators he would then be asked to specify the type of graphic display. The response 'g' produces line plots and the 'b' response results in bar charts.

Number of Graphic Displays

By entering a number between one and six the user can specify the number of line plots or bar-charts to be displayed separately on one screen.

Indicator Identification

To identify which political indicators are to be displayed the user must enter a series of numbers between one and ten. Each number should correspond to a different political indicator as indicated in the plot menu. The total number of entries should equal the number of graphic displays specified in the previous response.

Probabilities

This option allows the user to receive probability plots in addition to indicator plots. This question will only be displayed when the user has chosen to examine political indicators one through five and the total number of plots requested is two or less.

Plot Magnification

After displaying the initial plots the system allows the user to magnify a specific graph. To blowup or magnify a specific plot the user must enter the number that corresponds to the political indicator and press RETURN. There is no limitation on the number of times this process can be repeated.

Do you want graphs or bar-charts (g or b)

How many charts do you want (1-6)

Please type in the 2 chart numbers you would like displayed in the form (1,2,3 ... 6)

Do you want probabilities (y or n)

3.6   Text

The text option allows the user to receive textual output from the EWAMS. Associated with each political event in the database is a concise, narrative statement. The statement summarizes and describes the context surrounding the event. For example, references are often made to public officials involved in the event and to important underlying issues. Execution of the text option causes the system to search for and display the specified textual information.

Event Type(s)

The user can request that the system retrieve and display the textual data for any combination of event types. If the user entered the number '2', for example, he would receive textual data for all conflictual events exchanged.

Event Types

Cooperative Events:
    01 Yield (YLD)   06 Grant (GRNT)
    02 Comment (CMNT)   07 Reward (REWD)
    03 Consult (CNSL)   08 Agree (AGRE)
    04 Approve (APPR)   09 Request (RQST)
    05 Promise (PRMS)   10 Propose (PROP)

Conflictual Events:
    11 Reject (RJCT)   17 Threat (THRT)
    12 Accuse (ACUS)   18 Demonstrate (DEMO)
    13 Protest (PROT)   19 Reduce (RDUC)
    14 Deny (DENY)   20 Expel (EXPL)
    15 Demand (DMND)   21 Seize (SEIZ)
    16 Warn (WARN)   22 Force (FRCE)

Please Specify Event Types:
    1. All cooperative events
    2. All conflictual events
    3. All events
    4. Combination

If the user had selected option '4', a combination of event types, this next display would allow him to enter the individual event types. This capability is particularly valuable to the user who wants to carry out very detailed historical searches.

Enter event types: (e.g. 01,02,21..)

Dates

At this point the user must enter new beginning and ending dates. The format of this input is identical to that used to specify the time parameters. However, this new set of dates is valid only for the text option. The original time parameters will be employed if the user returns to either the 'plots' or 'tables' options.

Specify dates: (e.g. 6601-6604)

21

3.7 QCS1 (Quality Control System 1)

The qcs1 option allows the user to change the initial input information. The option also permits the user to review the current status of the input parameters.

Change Inputs

The selection of the 'qcs1' option presents the user with a number of alternatives for changing the initial input information. The menu permits the user to alter either the actors, the flow, the time parameters, or all input parameters. Once the new information is entered the system will automatically begin to process the data. The initial input will continue to be valid for sub-sequent analyses if the user elects not to change it at this point.

```
Specify:
    a - change actors
    f - change flow
    t - change time
    p - change all input parameters
```

4.0   OPERATING THE EARLY WARNING AND
MONITORING SYSTEM (EWAMS)

Introduction

The purpose of this section is to illustrate and de-
scribe the operating procedures of the EWAMS. This section
should provide the user with a complete and detailed under-
standing of the entire system and its operation.

The operating instructions are described through the
use of trhee examples, each selected to highlight specific
components and options of the early warning system. Also,
the examples have been chosen to illustrate how the infor-
mation retrieval, monitoring, and warning capabilities of
the system can be used to maximum advantage.

4.1   Example 1:   Initial Input and Plots

The first example focuses on Soviet Union-East European
political relations during the year 1968. During the month
of August the Soviet Union and other Warsaw Pact forces,
excluding Rumania, invaded Czechoslovakia.

Two components of the system receive exclusive atten-
tion in this example: the initial input component, which
allows the user to specify the important input information,
and the plots component. The latter serves to illustrate
how the graphic capabilities of the EWAMS might be used to
both monitor political relations and warn the user of im-
pending crises.

1. After turning the power on and executing the log-in procedures, the user responds to the system prompt by typing in 'crisis' and pressing RETURN.*

% crisis

2. The display, at right, introduces the user to the Early Warning and Monitoring System (EWAMS). Instructions for activating the system are also provided.

********** EARLY WARNING AND MONITORING SYSTEM **********

The Early Warning and Monitoring System was originally developed for the Defense Advanced Research Projects Agency's Cybernetics Technology Office (ARPA/CTO) by Decisions and Designs, Incorporated (DDI); current development is being performed by the International Public Policy Research Corporation (IPPRC).

This version of the system shows how a computer-based warning system comprised of quantitative political indicators might be used by intelligence analysts in "real-time" to monitor international affairs and forecast international crises. The analyst can use the system to track single countries, country-pairs, JCS regions, regions of his own creation, or the entire international system. The system includes data from 1966 to the present so that the analyst can do historical analyses if he so desires.

Future versions of the system will add quantitative military and economic indicators to the political ones to give the analyst a multi-track indicator system for early warning and monitoring.

****

Please press RETURN to activate the system:

3. The user chooses to select both countries and regions for his first analysis.

*** EARLY WARNING AND MONITORING SYSTEM ACTIVATED ***

Are your actors:
  1. Countries
  2. JCS regions
  3. Both   3

4. Nine regional options are displayed on the screen. The user decides to get a listing of the actors within the Eastern European Region, the fourth one.

*** REGIONAL OPTIONS ***

JCS REGIONS

1. North America (NAM)
2. Central and South America (CSA)
3. Western Europe--Mediterannean Atlantic (WEM)
4. Eastern Europe--Soviet Union (ESU)
5. Middle East and North Africa (MEA)
6. East Asia and Pacific (EAP)
7. South Asia and Sub-Saharan Africa (SAS)
8. World (WOR)
9. Special Purpose Region (SPR)

Do you want a list of actors in a region(y/n)?y
Enter region number: 4

*Unless indicated differently, all user responses are underlined. Also, even though it is not displayed, all user responses are executed by pressing the RETURN key.

24

5. The system provides the user with a listing of the countries and groups within the Eastern European Region. After reviewing the list of actors he decides not to examine another one.

```
######### 4. EASTERN EUROPE - SOVIET UNION #########

Albania (ALB)                        Hungary (HUN)
Berlin/East (EBE)                    Poland (POL)
Bulgaria (BUL)                       Rumania (RUM)
Czechoslovakia (CZE)                 USSR (USR)
Germany/Democratic Republic (GME)    Yugoslavia (YUG)

Warsaw Pact (WAP)

###############################################################

Do you want a list of actors in another region(y/n)? n
```

6. Once again the user has the opportunity to examine the regional options. Asked to select his actors, he chooses the Soviet Union and then the Eastern European region using the designated three-character codes.

```
                    ### REGIONAL OPTIONS ###
JCS REGIONS

1.  North America (NAM)
2.  Central and South America (CSA)
3.  Western Europe--Mediterannean Atlantic (WEM)
4.  Eastern Europe--Soviet Union (ESU)
5.  Middle East and North Africa (MEA)
6.  East Asia and Pacific (EAP)
7.  South Asia and Sub-Saharan Africa (S&S)
8.  World (WOP)
9.  Special Purpose Region (SPR)

Select a country and a region(usa,mea):  usr,esu

Specify activity flow:
    0. one way (usr >>> esu)
    1. one way (usr <<< esu)
    2. two way (usr <-> esu)  2

Select time increment:
    1. monthly
    2. quarterly
    3. yearly                 1

Set time parameters(7501-7712):  6801-6812
```

Having chosen to examine the political interactions between the Soviet Union and Eastern Europe the user specifies the activity flow. The selection of a two way flow allows the user to examine all political interactions exchanged between these two actors.

Next, he is asked to enter the time increment to be used in the analysis. A monthly time interval is chosen so events will be grouped into monthly time periods.

He now enters the last input information. The user has decided to examine all political events exchanged between January 1968 and December 1968.

7. The system goes to processing. During this time the system searches the database for all political event/interactions exchanged between the Soviet Union and the actors of Eastern Europe during the year 1968.

```
PROCESSING
```

8. The system indicates the processing has been
    completed. A total of 297 political events
    were exchanged between the Soviet Union and
    Eastern Europe during 1968.

    Since the user has chosen to analyze the
    interactions at monthly time intervals he is
    given the option of examining the probabil-
    istic forecasts. He decides to execute this
    option.

9. A display of the monthly probabilities of a
    crisis occurring between the Soviet Union and
    Eastern Europe. He presses RETURN to proceed.

10. This display allows the user to choose one of
    the primary options in the system. The user
    selects the plot option which will allow him
    to examine graphical displays of the political
    indicators.

11. What are the political indicators? The political indicator menu describes five political indicators--total, cooperative and conflictual activity as well as tension and uncertainty levels. These five indicators are treated from two different but related perspectives. First, using the raw data, the user can receive readings on each indicator at specified time intervals. Second, with the z-scores, the user can receive an indication of how unusual or different any given reading is compared to the actions taken by the actors in earlier time periods.

Choosing to receive a multiplot for his first graphical display, the user decides to examine the three activity indicators. Option '1' will give him three simultaneous line-plots of total, cooperative, and conflictual activity using the raw data.

POLITICAL INDICATORS

	Total Activity	Coop Activity	Conflict Activity	Tension Level	Uncert Level
Raw Data	1	3	5	7	9
Z-Score	2	4	6	8	0

```
Do you want more than one plot per graph (y or n)y
You have these choices:
    1 = graphs 1,3 + 5
    2 = graphs 2,4 + 6
    3 = graphs 7 + 9
    4 = graphs 8 + 10
Please pick one :1
```

12. The display, at right, shows the multiplot of
    the three political indicators. Both conflict
    and total increase substantially several
    months prior to the invasion and reach their
    peak during the crisis month of August.

    After examining the multiplot the user presses
    RETURN and the system responds with the next
    question. He decides to request another
    graph.

30

16. The line-plots for the three indicators using
    both raw data and z-scores. Noting that
    there is a great deal of similarity in the
    patterns, he decides to "blow up" the tension
    plot. The increased magnification is achieved
    by entering the number '7' which is the menu
    number for the tension indicator.

ussr ⟷ eastern europe-soviet union

Jan 1968 - Dec 1968 by month

31
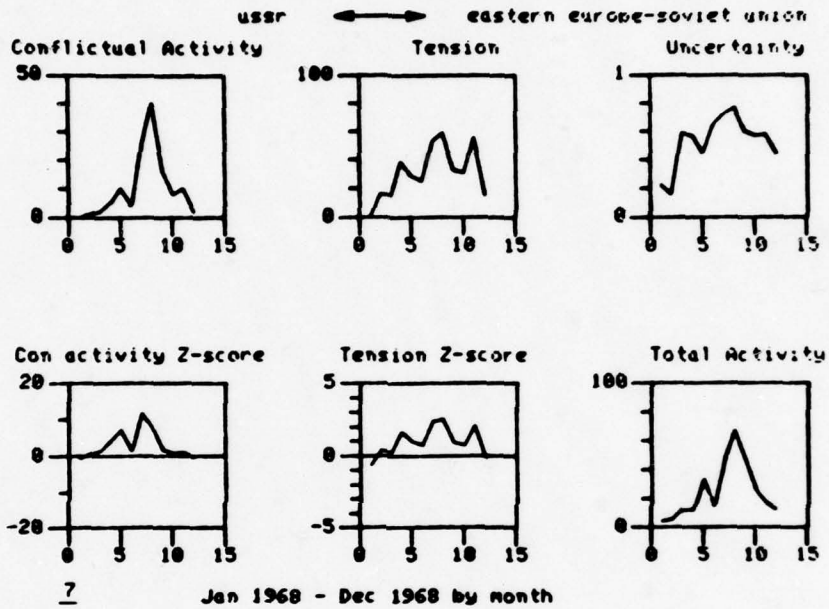

17. The blow up of the tension plot allows the
    user to examine the fluctuations in greater
    detail. He decides not to receive another
    graphic display.

ussr ←——→ eastern europe-soviet union

Tension

Jan 1968 - Dec 1968 by month

Another display (y or n): n
18. Having terminated his graphic analysis of the
    political indicators, the user decides to
    change some of his input information in
    preparation for a new analysis.

SYSTEM OPTIONS :

    tables   -   (tabular output)
    plots   -   (graphical output)
    text   -   (textual output)
    qcsi   -   (change input parameters)
    end   -   (terminate execution)

Any of these commands typed after the "%" will
cause execution of the chosen function.

% qcsi

4.2 Example 2: QCS1 and Tables

The second example focuses on United States-Soviet Union political relations during the period January 1975-June 1978. Specifically, the analysis examines only those political events initiated by the Soviet Union and targeted at the United States.

This second example also focuses on two different components of the EWAMS. First, attention is devoted to the QCS1 component which allows the user to change initial input information such as actors and flow. Second, the analysis numerical component of the EWAMS.

1. The QCS1 system option allows the user to *change actors, flow, time, or all parameters.* Prior to making this decision the user has a chance to review the current status of his input parameters. Here, for example, the user decides to carry out a completely new analysis and elects to change all current input information.

2. In this analysis the user chooses to select only countries as his two actors. By entering the appropriate three-character country codes, he chooses the United States and the Soviet Union.

This time the user chooses to examine a one way *flow of events.* He chooses option '1' which allows him to look at only those political events initiated by the Soviet Union and targeted at the United States. All other events exchanged between the two countries will be excluded from the analysis.

The user also decides to change the time *increments and parameters.* By focusing on the quarterly time increments from January 1975 through June 1978 he takes more of a long-term perspective. However, he is still limited to 36 total time increments.

```
####### QCS1 #######
Current input parameters:
    Actors: usr,esu
    Flow: two way (usr <-> esu)
    Time: 6801-6812 by month

Specify:
    a - change actors
    f - change flow
    t - change time
    p - change all input parameters   p

   ### EARLY WARNING AND MONITORING SYSTEM ACTIVATED ###

Are your actors:
    1. Countries
    2. JCS regions
    3. Both          1
Please select two countries(usa,usr):  usa,usr

Specify activity flow:
    0. one way (usa >>> usr)
    1. one way (usa <<< usr)
    2. two way (usa <-> usr)   1

Select time increment:
    1. monthly
    2. quarterly
    3. yearly                 2

Set time parameters(7501-7712):  7501-7806
```

3. The system goes to processing after having
received all the necessary input information.

4. The system indicates there were 465 political
events initiated by the Soviet Union and
directed at the United States during this
time period. RETURN is pressed in order to
continue.

5. Having returned to the primary menu display
the user elects to carry out a numerical,
tabular analysis of United States-Soviet
Union political relations.

6. The first table displayed presents the user
with the numerical readings on three indi-
cators at quarterly time increments. The
three indicators of political activity are
all designed to measure the volume of actions
exchanged between actors.

The first column indicates the time period
under consideration which, in this case, is
measured in quarters. Thus, the period
labeled Jan 75 refers to the quarter beginning
in January 1975 and ending in March. The
second column refers to the number of events
exchanged during the quarter for that par-
ticular indicator. The 16 for Jan 75 means
there were 16 total events initiated by
the Soviet Union and targeted at the United
States during this quarter. The third column
provides a numerical assessment of the un-
usualness of the quarterly reading compared
to earlier ones. The closer the z-score is
to zero the greater the similarity between
the quarterly reading and previous readings
taken on the indicator. A positive z-score
indicates a higher than "normal" reading
whereas a negative z-score means a lower than
"normal" reading.

Press RETURN to continue:

7.   Pressing the RETURN key produces a second
tabular display, this time for the two indi-
cators of tension and uncertainty. These two
indicators are designed to tap a different
dimension of political interactions--the
variety of action exchanged. More specifi-
cally, tension measures the degree to which
conflictual actions tend to dominate coopera-
tive ones. It takes on values between 0 and
100 with the former indicating no tension and
the latter maximum tension. The H-rel or
uncertainty indicator assesses variation in
the type of events exchanged. H-rel ranges
in value between 0 and 1 with the former in-
dicating maximum certainty and the latter
maximum uncertainty.*

The user wants to examine the types of poli-
tical events in more depth so he decides to
look at the event frequencies.

```

Press RETURN to continue:

9. Again pressing RETURN the next table, to the
   right, focuses solely on the conflictual
   events directed at the United States by the
   Soviet Union. There are twelve conflictual
   event types: reject, accuse, protest, deny,
   demand, warn, threat, demonstrate, reduce,
   expel, seize, and force. The numbers within
   this table refer to the number of events for
   each event type. For example, the 24 in the
   accusation (acus) column means there were 24
   accusations directed at the United States by
   the Soviet Union during the second quarter of
   1978.

4.3   Example 3: QCS1 and Text

The third, and last, example focuses on the political interactions between Rhodesia and a group of highly developed, industrialized Western countries. This group is comprised of the United States, West Germany, France, and the United Kingdom. The tim eperiod under consideration extends from January 1975 through June 1978.

Once again the analysis focuses on two components of the EWAMS. The QCS1 component is used to change part of the current input information from the previous example. The example also demonstrates the operation of the text component of the EWAMS which allows the user to retrieve and display textual information.

1. The QCS1 option allows the user to review the current status of the input parameters. The user decides to change only the current actors so he types in the appropriate character 'a'. Thus, the flow and time parameters will not be changed.

```
******* QCS1 *******
Current input parameters:
    Actors: usa,usr
    Flow: one way (usa <<< usr)
    Time: 7501-7806 by quarter

Specify:
    a - change actors
    f - change flow
    t - change time
    p - change all input parameters  a
```

2. The user chooses to examine the interactions between a country and a region.

```
*** EARLY WARNING AND MONITORING SYSTEM ACTIVATED ***

Are your actors:
    1. Countries
    2. JCS regions
    3. Both       3
```

3. A listing of the regional options is displayed. He decides to get a list of the actors in region nine, the Special Purpose Region (SPR).

```
*** REGIONAL OPTIONS ***

JCS REGIONS

1. North America (NAM)
2. Central and South America (CSA)
3. Western Europe--Mediterannean Atlantic (WEM)
4. Eastern Europe--Soviet Union (ESU)
5. Middle East and North Africa (MEA)
6. East Asia and Pacific (EAP)
7. South Asia and Sub-Saharan Africa (SAS)
8. World (WOR)
9. Special Purpose Region (SPR)

Do you want a list of actors in a region(y/n)?y
Enter region number: 9
```

4. The SPR is an option which allows the user to construct his own regional grouping of actors. He decides not to receive another regional listing.

5. The user selects two actors. First is the country of Rhodesia and the second actor is the Special Purpose Region. Since he only needs one SPR he enters 'sp1'.

6. Since this is the first time the user has built this particular region it does not already exist. Thus, he enters the four countries that will make up his new region.

7. The system allows the user to review the actors within the region. He is satisfied with this composition and he decides not to add or delete any of the actors.

    The user plans to examine this particular group of countries again in the near future so he saves the region and gives it the name 'western'. The user could have used any label as long as it did not exceed twelve characters in length.

######## 9. Special Purpose Region 1 ########

The Special Purpose region option refers to a build your own region capability.

To exercise this regional option specify SP1 if only one actor is a special purpose region (e.g. NAM,SP1). Specify SP1 and SP2 if both actors are special purpose regions (e.g. SP1,SP2)

##

Do you want a list of actors in another region(y/n)? n

REGIONAL OPTIONS

JCS REGIONS

1. North America (NAM)
2. Central and South America (CSA)
3. Western Europe--Mediterannean Atlantic (WEM)
4. Eastern Europe--Soviet Union (ESU)
5. Middle East and North Africa (MEA)
6. East Asia and Pacific (EAP)
7. South Asia and Sub-Saharan Africa (SAS)
9. World (WOR)
9. Special Purpose Region (SPR)

Select a country and a region(usa,mea): rho,sp1

######## 9. Special Purpose Region 1 ########

Does your region already exist(y/n)? n
Enter maximum of 20 actors for your region (enter end to discontinue region entry):

1. usa
2. unk
3. frn
4. gmu
5. end

######## 9. Special Purpose Region 1 ########

1. usa   (usa)
2. united kingdom   (unk)
3. france   (frn)
4. germany/fed rep   (gmu)

##

Do you wish to change any of these actors(y/n)?n
Do you want to save this region(y/n)? y
Enter name for this region: western

8. Having received the new set of actors, which
    is the only input parameter the user changed,
    the system goes to processing. Since all
    other input parameters are still valid,
    the system searches for those political
    events initiated by any member of the Western
    group and targeted at Rhodesia for the period
    January 1975-June 1978 at quarterly time
    increments.

9. Processing is completed and the system reports
    the total number of political events that
    fulfill the input parameter specifications.

10. The user chooses to exercise tne text option.

11. The text option allows the user to specify
    the type of political event. Here he nas
    chosen to examine the textual data for all
    events initiated by the Western group
    and targeted at Rhodesia.

    Since the user is interested in only the more
    recent exchanges he decides to focus on the
    August 1978-September 1978 time period.
