## PREFACE

The design study and subsequent performance evaluation of the Quick-Disconnect Housing Assembly were accomplished during February 1978 through July 1978 under Project 1M664612D415. Principal investigators were John Allison of Mine Neutralization Division, Countermeasures Laboratory; Hayward Glaspey and John Tyler of the R&D Model Fabrication Division, Services and Support Directorate.

## **QUICK-DISCONNECT HOUSING ASSEMBLY DESIGN REVIEW AND PERFORMANCE EVALUATION**

### **I. INTRODUCTION**

The Quick-Disconnect (QD) Housing Assemblies (Part Numbers (PN) 13222E0052 and 13222E0053) have been sources of problems for the Minefield Roller Program from the onset of field trials. In an effort to correct the many deficiencies, the QD mechanism has undergone four generations of modifications. The final item described by Appendix A solves all problems encountered to date and is felt to be the best system attainable without total design change. Basically, the fourth generation unit is composed of the following changes:

- a. Enlarged jaws to permit freedom of movement of the cable eye, thus avoiding bending and shearing of pins and spline shafts during both lock and release operations, excessive jaw wear, and excessive post deformation.
- b. Improved material characteristics and compatibility through carefully planned heat treatments and judicious selection of material.
- c. Positive cam indexing through careful plunger adjustment.
- d. Lengthened piston travel to permit full travel jaw release.

### **II. PURPOSE**

This series of tests was an effort to verify performance characteristics of the QD model in such a manner as to simulate actual field conditions or, at least, to verify performance under worse conditions than those encountered in the field. Performance depended upon:

- a. Ability to release reliably.
- b. Ability to lock, thus avoiding inadvertent release under adverse conditions.
- c. Ability to operate without component failure.

### III. TEST PROCEDURE

The test setup and the equipment used are shown in Figures 1, 2, and 3. The test procedure for the release tests follows:

- a. Open valves A and B in order to insure against an inadvertent release of the cable eye and possible injury to test personnel. This provides hydraulic fluid flow into the reservoir, not to the QD mechanism.
- b. Set up the load simulation as shown in Figure 2.\*
- c. Close QD mechanism, insuring that the yoke (PN 13222EOO34) is fully closed. When fully closed, the yoke will have "snapped" into position denoting that the piston is fully retracted and the cam is in a locked position.
- d. Extend the 10-ton hydraulic jack by closing the jack bleed valve and pumping the handle. This forces the forklift away from the QD mechanism, thereby increasing tension on the chain and cable eye force on the base plate assembly.
- e. Continue to extend the jack until the desired cable load is achieved. Then clear the area of all personnel.
- f. Close valve B.
- g. Utilizing the hydraulic pump, increase hydraulic pressure to the QD mechanism.
- h. Monitor hydraulic pressure, recording the maximum pressure required to actuate the QD mechanism thereby releasing the cable eye.
- i. Following release of the cable eye, open valve B allowing the pressure to return to 0 lb/in<sup>2</sup>g.

The locking-test setup is shown in Figures 1 and 4. The test procedure follows:

- a. In order to insure against an inadvertent release of the cable eye and possible injury to test personnel, open valves A and B (Figure 1). This establishes hydraulic fluid flow into the reservoir, not to the QD mechanism.

\* The angle of application is adjusted by varying the height of the forklift tines. Regardless of angle, the test procedure remains the same.

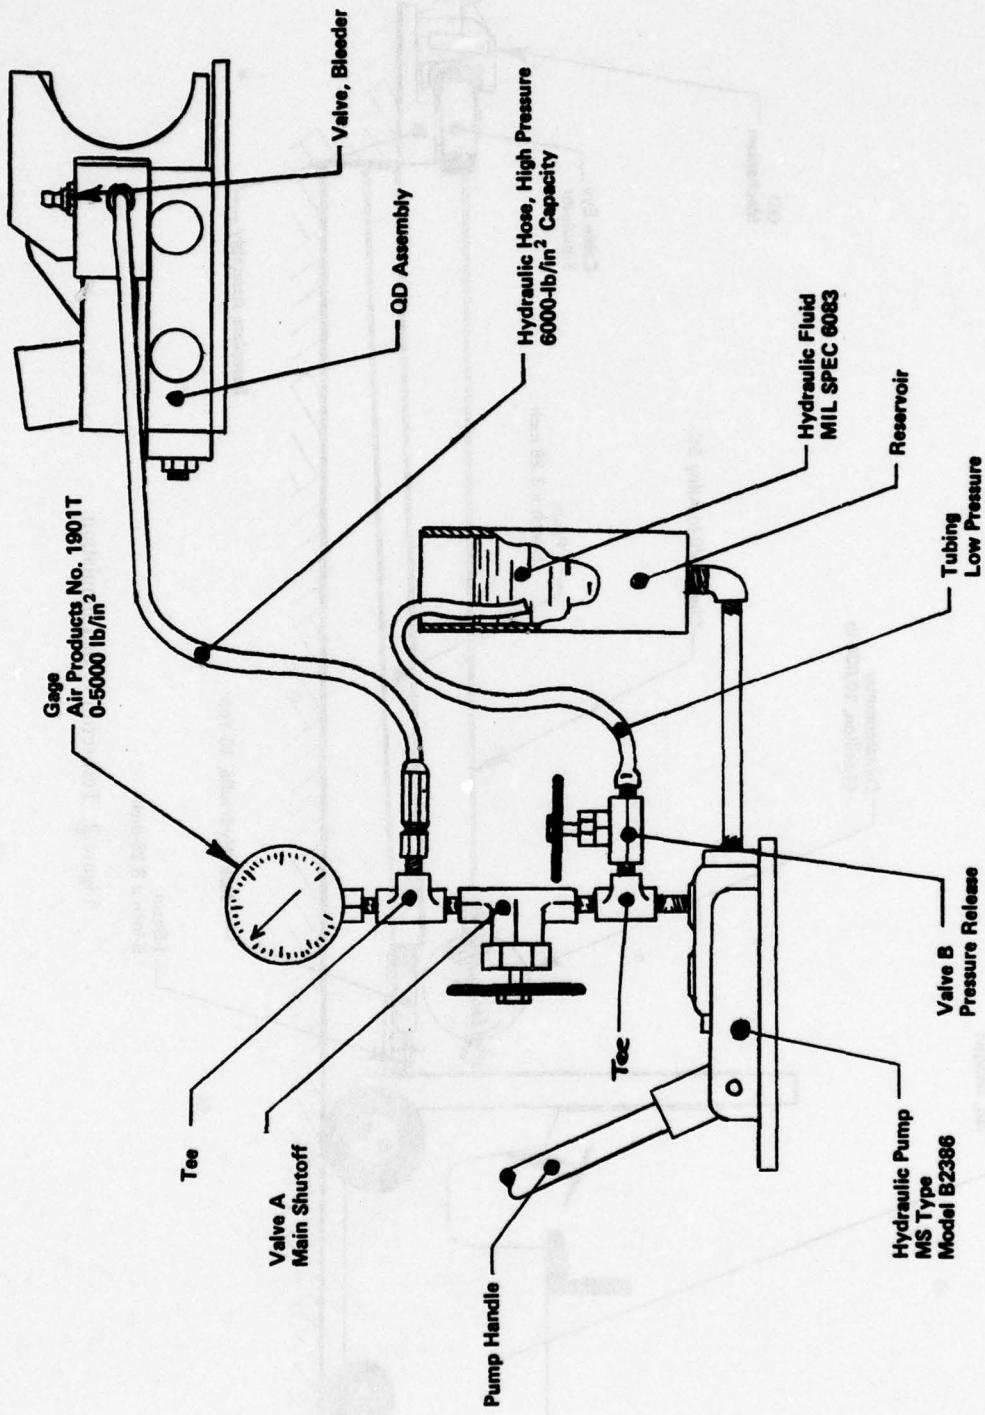

Figure 1. Test setup – hydraulic circuit simulation.

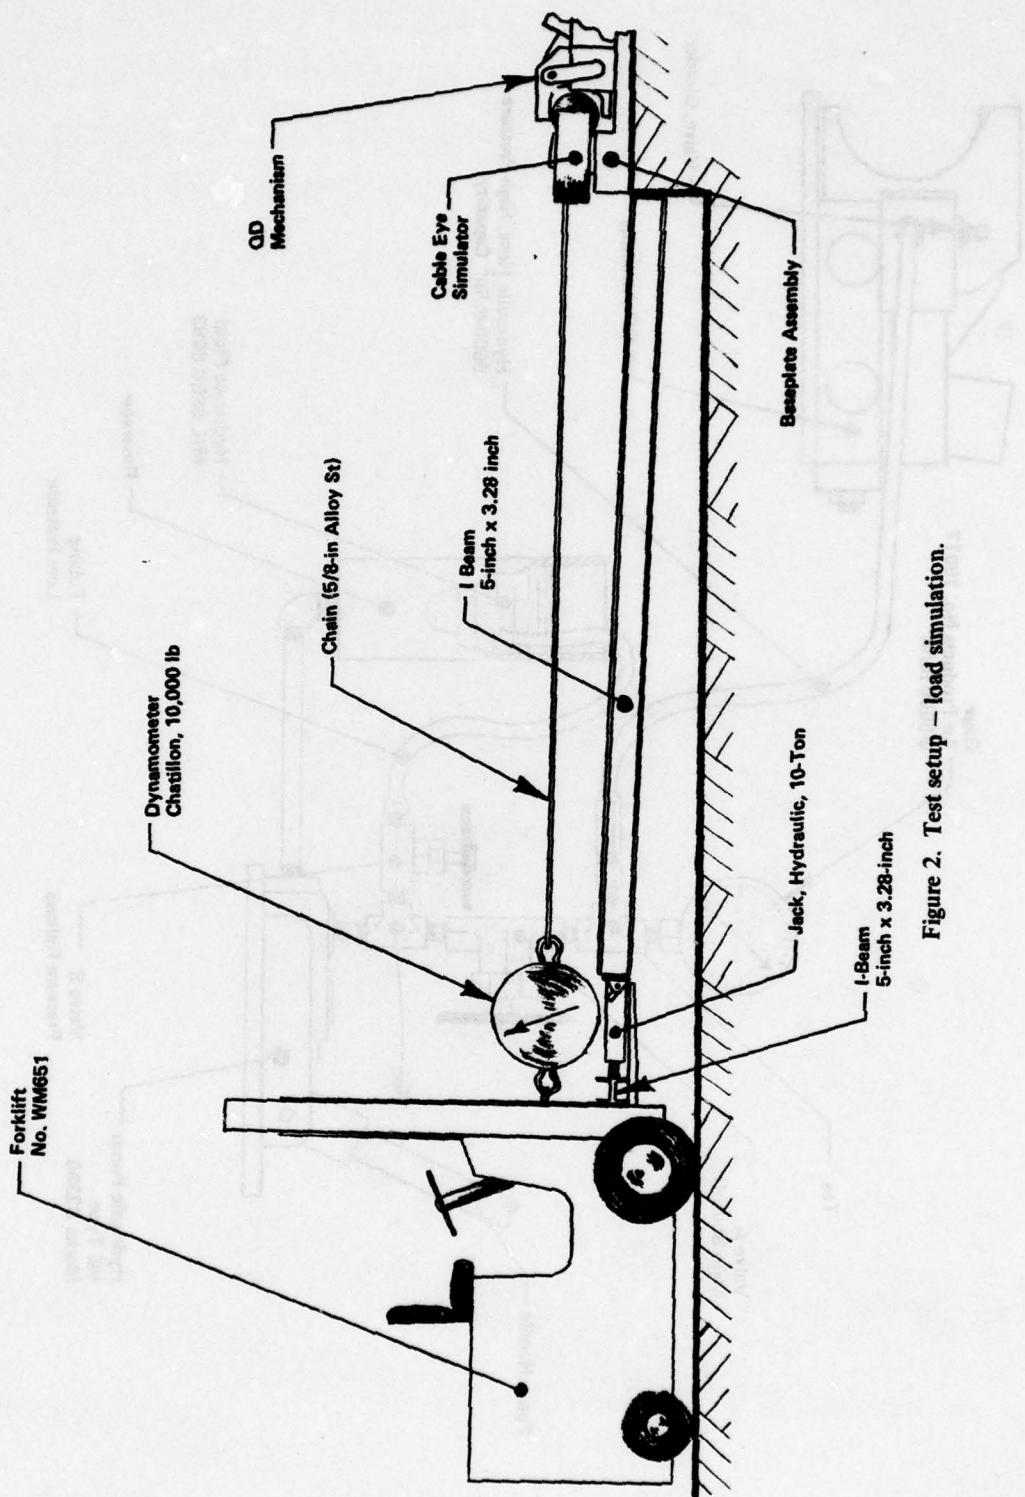

Figure 2. Test setup – load simulation.

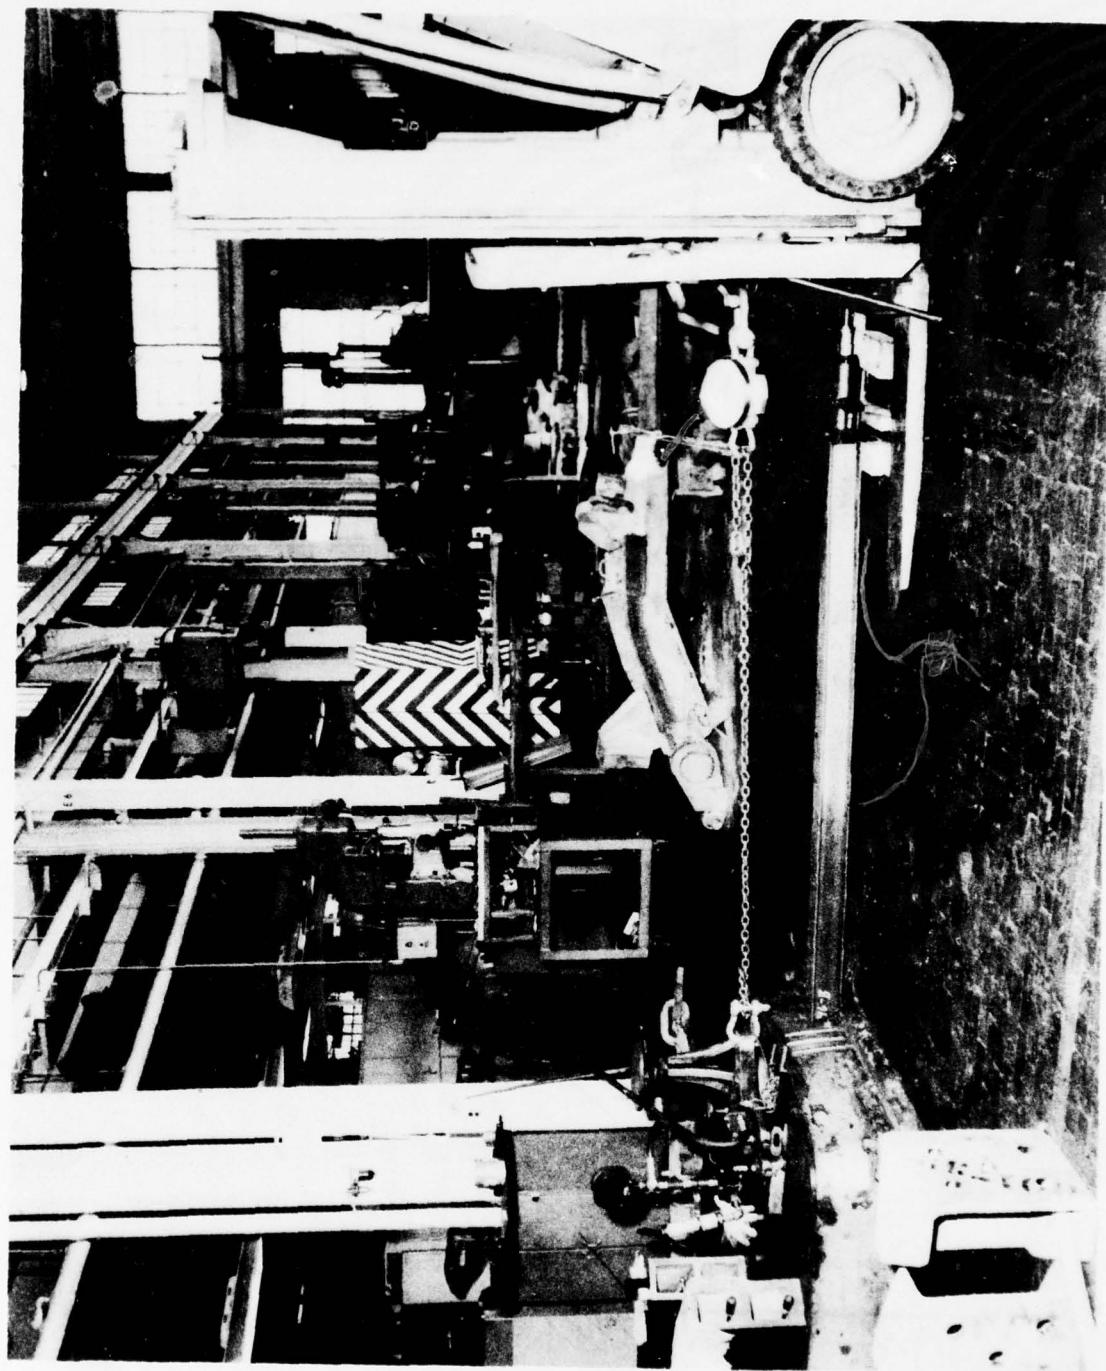

Figure 3. Equipment used in load simulation test.

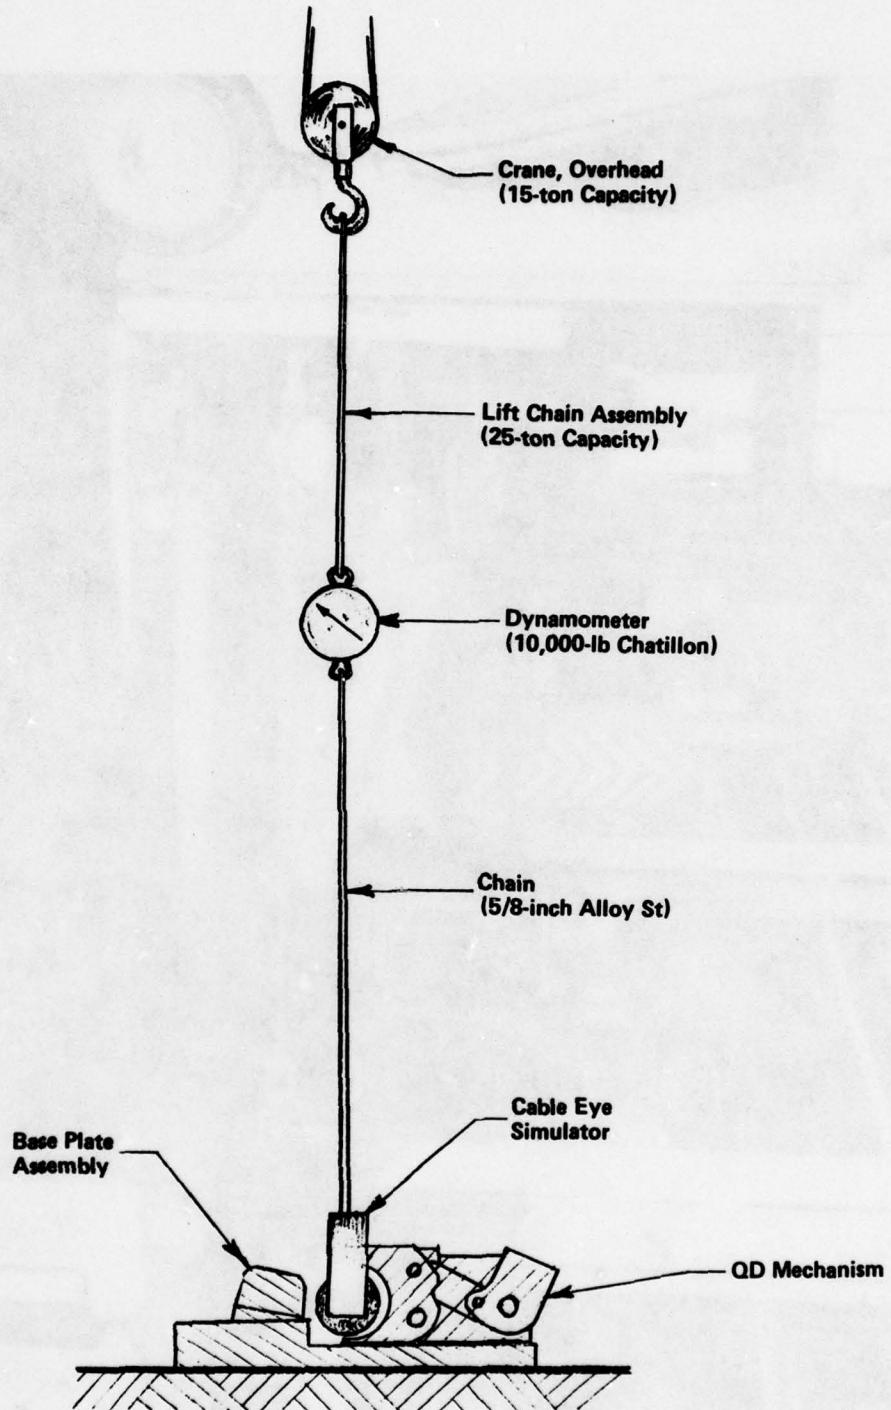

Figure 4. Test setup – locking test.

- b. Set up the load simulation as shown in Figure 4.\*
- c. Close QD mechanism, insuring that the yoke (PN 13222EOO84) is fully closed. When fully closed, the yoke will have "snapped" into position denoting that the piston is fully retracted and the cam is in the locked position.
- d. Prior to load application, insure that the test area is clear of personnel. Raise the remote controlled crane as rapidly as possible until the desired load appears on the dynamometer. Release the load.
- e. Check the mechanism carefully for signs of release (opening of the yoke).

#### IV. RESULTS

The fourth generation model of the Quick-Disconnect Housing Assembly has undergone 561 releases of cable loads varying from 0 to 10,000 pounds applied at angles varying from  $-40^\circ$  to  $+10^\circ$  (Figure 5). During this period, four release failures were noted (0.7 percent failure). However, all of these failures were due to badly worn and deformed posts, and the cable eye simulator was of 4130 steel in the annealed state.

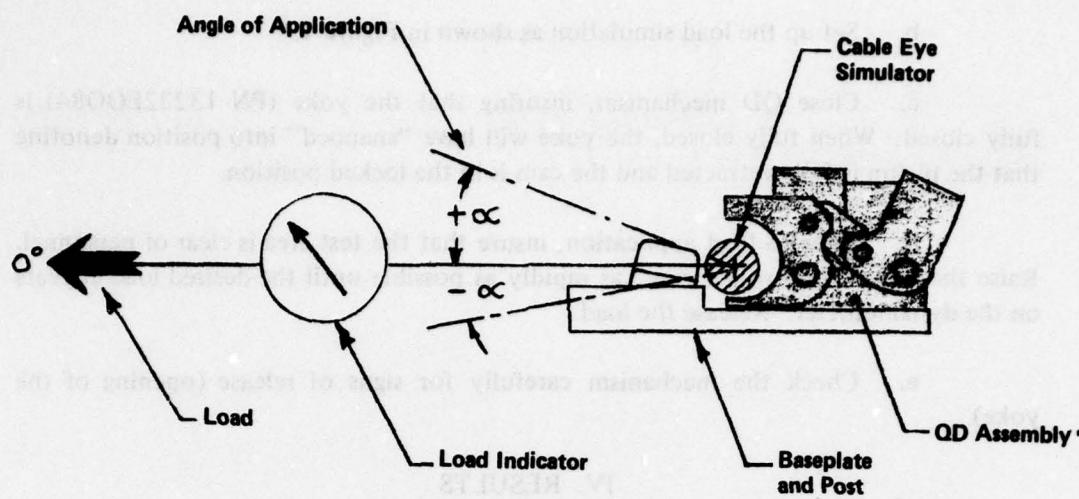

Following the release tests, the assembly was subjected to vertical pull tests (shown in Figure 6). After 50 rapidly exerted pulls varying from loads of 1,000 pounds and 10 pulls at  $45^\circ$  exerted as shown in Figure 7 (5 at 5,000 pounds and 5 at 10,000 pounds), it was concluded that the modifications in no way jeopardized the locking capability of the mechanism.

Having completed all scheduled testing, the mechanism was disassembled and inspected for damage or wear. The assembly was found to be in original condition.

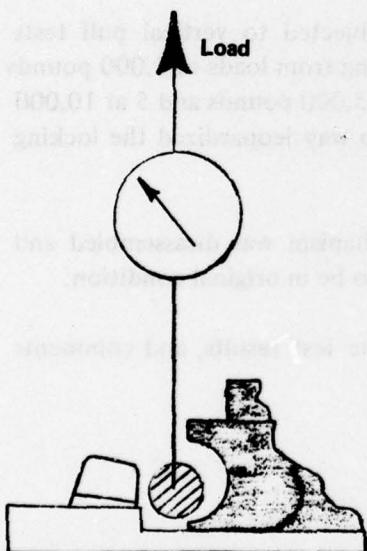

A complete breakdown of the tests conducted, the test results, and comments are shown in Appendix B.

---

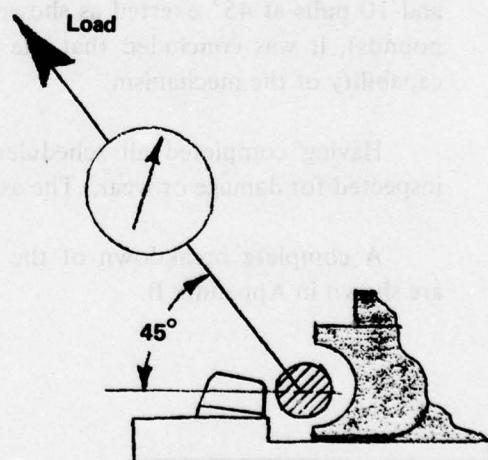

\* Angle of application is adjusted by varying the position of the overhead crane with respect to the QD mechanism.

3. In an effort to explain the inconsistency of release, the hydraulic cylinder assembly was studied carefully under load conditions. It was apparent that the piston was travelling  $\frac{1}{4}$  inch prior to engagement of the cam.

This coupled with the obvious fact that the "yoke" did not lift the cable eye far enough to provide a positive and reliable release gave rise to the placement of a  $\frac{1}{4}$ -inch plate against the cam face. Five actuations were made against a 2,000-lb load with five successful releases. Thus, it was concluded that piston travel was sufficient to provide a positive and reliable cable release (100% of the time) if one of the following changes were made:

- a. Relocate cylinder mounting holes to move cylinder 0.25 inch to the rear.
- b. Add  $\frac{1}{4}$  inch face to the cam surface.
- c. Or increase the piston length 0.25 inch.

For field expediency, item c was chosen. Results are as shown below. In the interest of best design, however, item a should be the implemented choice. Item c leads to a piston that will eventually bend and jam the mechanism. The following are the results of further testing:

| No. | Cable Load<br>(lb) | Cable Angle<br>to Horizon (°) | Actuator Pressure (lb/in <sup>2</sup> g) |       |            |

NOTE: 47 through 50 – increases about 200 lb during release.

51 through 52 – increase of 600 lb during release.

NOTE: Simulated cable yoke worn down to inoperable condition – replaced and test was continued – 53rd sequence.

56 – increase of 600 lb during release.

– No Data Taken

4. At this point, testing was discontinued and the piston shortened 0.06 inch. This was done for two reasons:

- a. To ensure manual-locking conditions.
- b. To obtain a max design condition.

\*No release — pin hung up; eventually released by jiggling and banging.

7. At this point a new piston was fabricated with a overall length of 2.41 inches (an increase of 0.15 inch). The unit was assembled utilizing an unmodified (except for yoke ) QD mechanism. All systems locked both open and closed with 0 clearance between the piston and the cam in the closed position. This is to be subjected to a retest of the above for 300 cycles providing the base plate assembly (namely the pin) and the cable eye survive. The pin already shows some deformation.

— No Data Taken

The previous nine trials verified the modification of the new piston. The following is the 1 through 300 series necessary to verify reliability:

**DESIGN CHANGES  
FOR  
QUICK-DISCONNECT HOUSING ASSEMBLIES  
(PART NUMBERS 13222EO052 AND 13222EO053)  
(1ST, 2ND, AND 3RD GENERATION)**

## 1ST GENERATION

### REBUILD OF QUICK-DISCONNECT HOUSING ASSEMBLY

Two quick-disconnect housing assemblies (shop numbers 15 and 16) have been modified as noted below.

#### Modification

| Part No.                    | RH Assembly No. 16  | LH Assembly No. 15      |
|-----------------------------|---|-------------------------|
| 13222EOO89<br>Housing       | Clean, repaint, and<br>change locator dowel<br>pins to $.375 \pm .0002$<br>.0000<br><br>X 1.00 long hardened<br>alloy steel dowel pins. | Same as 16              |
| 13222EOO79<br>Cover         | Clean, repaint, and<br>modify as shown on<br>drawing QDHA 1.  | Same as 16              |
| 13222EOO96<br>Actuator Assy | Utilize the longer pis-<br>ton and cylinder as<br>previously noted and<br>fabricated.   | Same as 16              |
| 13222EOO85<br>Link          | Modified per drawing<br>QDHA-2. Hardness<br>final $R_c$ 32.   | Hardness final $R_c$ 36 |

#### Final Dimensional Checks

|                  |                  |
|------------------|------------------|
| A 2.663          | A 2.654          |
| B 1.117          | B 1.125 to 1.135 |
| C 1.497          | C 1.492          |
| D 0.70           | D 0.70           |
| E 0.633 to 0.635 | E 0.635 to 0.637 |

**Modification**

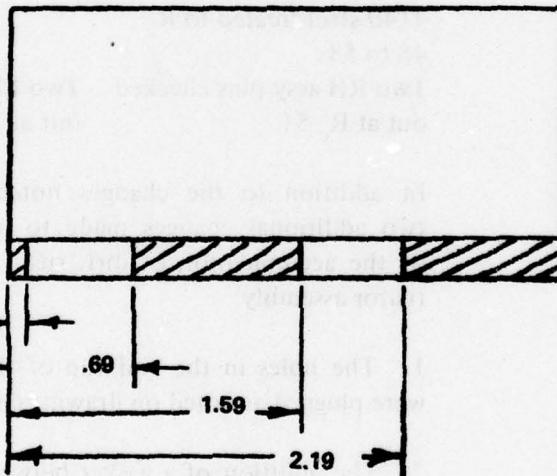

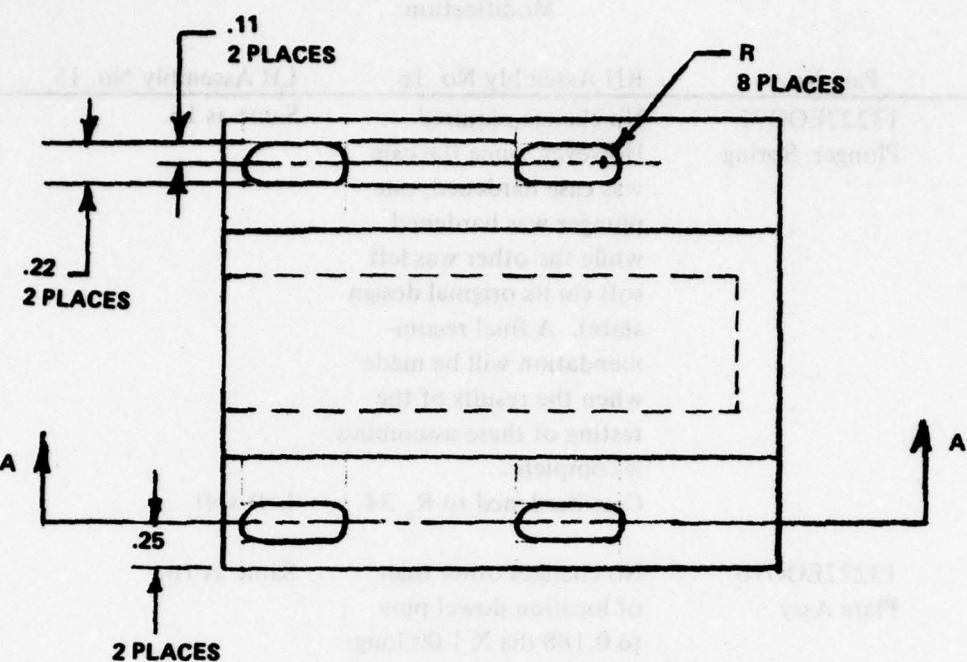

| <b>Part No.</b>                 | <b>RH Assembly No. 16</b>   | <b>LH Assembly No. 15</b>   |
|---------------------------------|---|---|
| 13222EOO84<br>Yoke              | Complete remake of yoke – newly fabricated.<br>Modified as per drawing QDHA 3. Hardness final $R_c$ 40.   | Hardness final $R_c$ 41   |
| <b>Final Dimensional Checks</b> |   |   |
|                                 | A 2.172<br>B 0.623<br>C 1.004<br>D 0.850<br>E 0.806<br>F 1.563  | A 2.169<br>B 0.626<br>C 1.000<br>D 0.860<br>E 0.800 to 0.804<br>F 1.560 |
| 13222EOO83                      | No changes other than straightening of existing part and heat treatment.<br>$R_c$ 41/42<br>Modifications to this piece require using 4140 steel and an $R_c$ of 48 to 52. Recommend a more prudent range of $R_c$ 40 to 45.                         | Same as 16.<br>$R_c$ 40/42<br>Same as 16.                               |
| 13222EOO82<br>Shaft Spline      | No changes other than tank straightening of splines on existing part and heat treatment.<br>Actual $R_c$ 38/40<br>Modifications to this piece required using 4140 steel and an $R_c$ of 48 to 52. Recommend a more prudent range of $R_c$ 40 to 45. | Same as 16.<br>Actual $R_c$ 37/41<br>Same as 16.                        |
| 13222EOO87<br>Lever             | No change required.   |   |

**Modification**

| <b>Part No.</b>               | <b>RH Assembly No. 16</b>   | <b>LH Assembly No. 15</b>                               |
|-------------------------------|---|---|
| 13222EOO92<br>Plunger, Spring | No change required.<br><br>However, since the cam was case hardened, one plunger was hardened while the other was left soft (in its original design state). A final recommendation will be made when the results of the testing of these assemblies is complete.<br>Case hardened to $R_c$ 34 | Same as 16.<br><br>Left soft                            |
| 13222EOO76<br>Plate Assy      | No changes other than of location dowel pins to 0.188 dia X 1.00 long hardened alloy steel dowel pins.  | Same as 16.   |
| 13222EOO86<br>Pin             | No dimensional change; only a material change to 4140 steel treated to $R_c$ 48 to 53.<br><br>Two RH assy pins checked out at $R_c$ 51.   | Same as 16.<br><br>Two LH pins checked out at $R_c$ 47. |

In addition to the changes noted above, there were two additional changes made to help in the reduction of the accumulation of dirt, rust, and water in the actuator assembly:

1. The holes in the end cap of the actuator assembly were plugged as noted on drawing QDHA-4.
2. The addition of a gasket between the cover (13222EOO92) and the actuator assembly as noted on drawing QDHA-5.

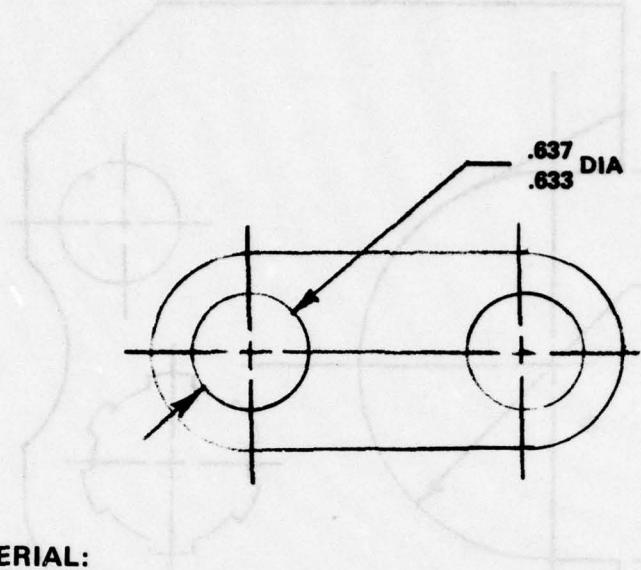

**SECTION AA**

**MOD:**

Hole Slots: To facilitate MTG when using longer actuator assembly and a seal gasket between cover and actuator assembly.

**COVER**  
(PN 13222E0079)

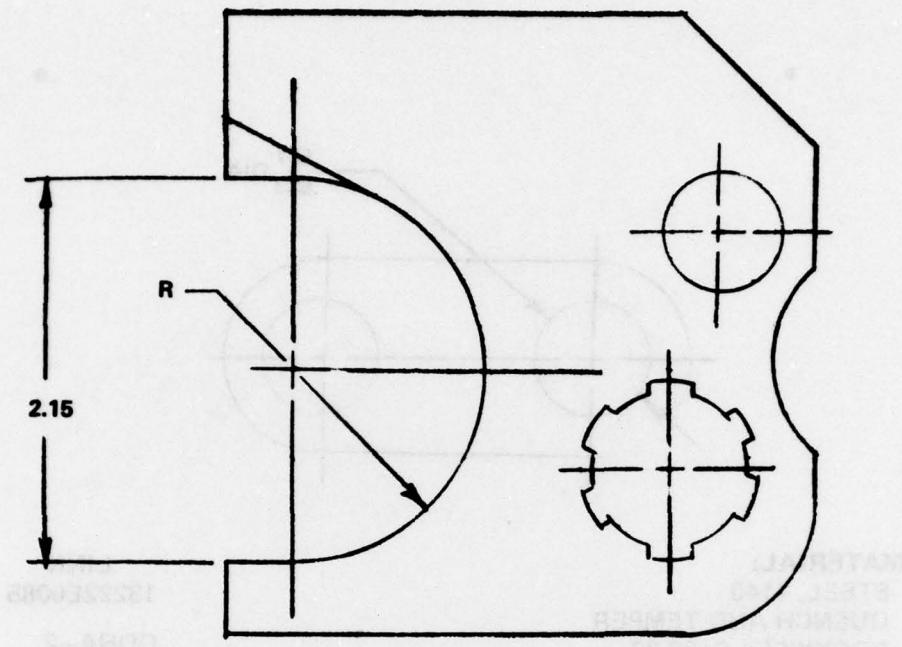

QDHA-1

MATERIAL:  
STEEL, 4140  
QUENCH AND TEMPER  
ROCKWELL C 28-32

LINK  
13222E0085  
QDHA-2

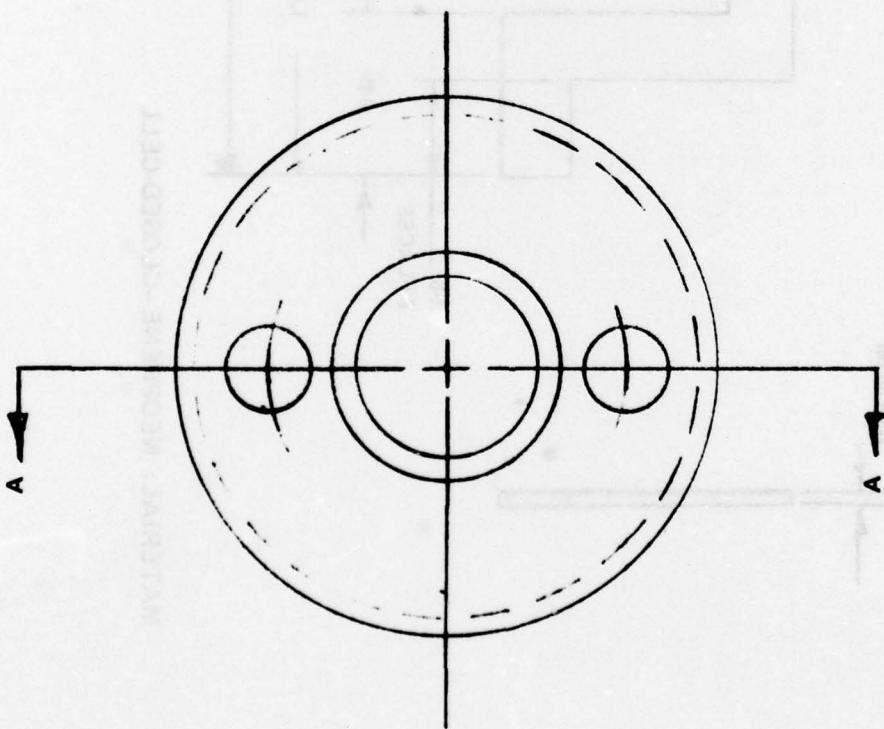

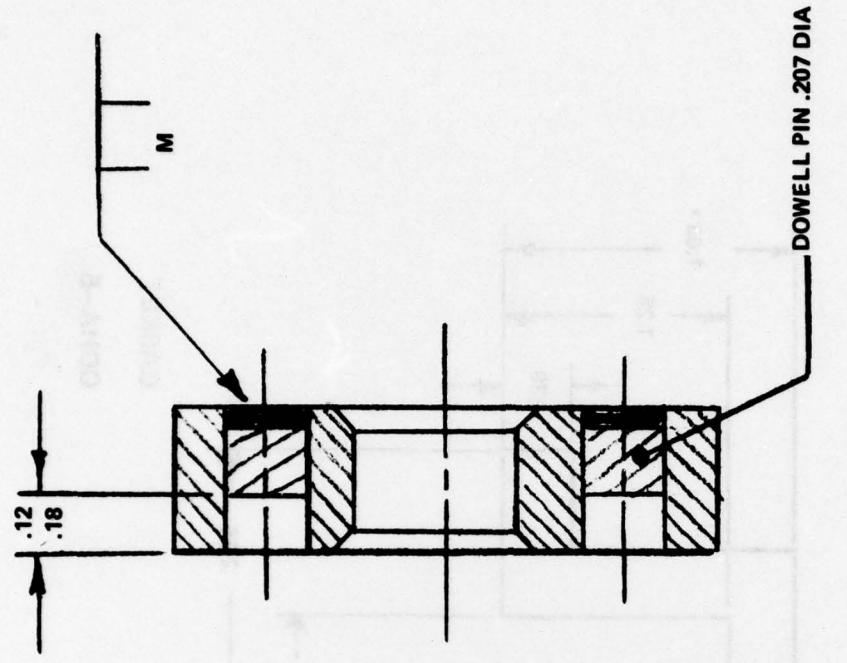

Further Recommend:  
Rc 30 to 35 to coincide with lever and yoke  
Dia be reduced — .631 to 6.35

**MATERIAL:**  
STEEL 4140  
QUENCH AND TEMPER  
ROCKWELL C 30-35

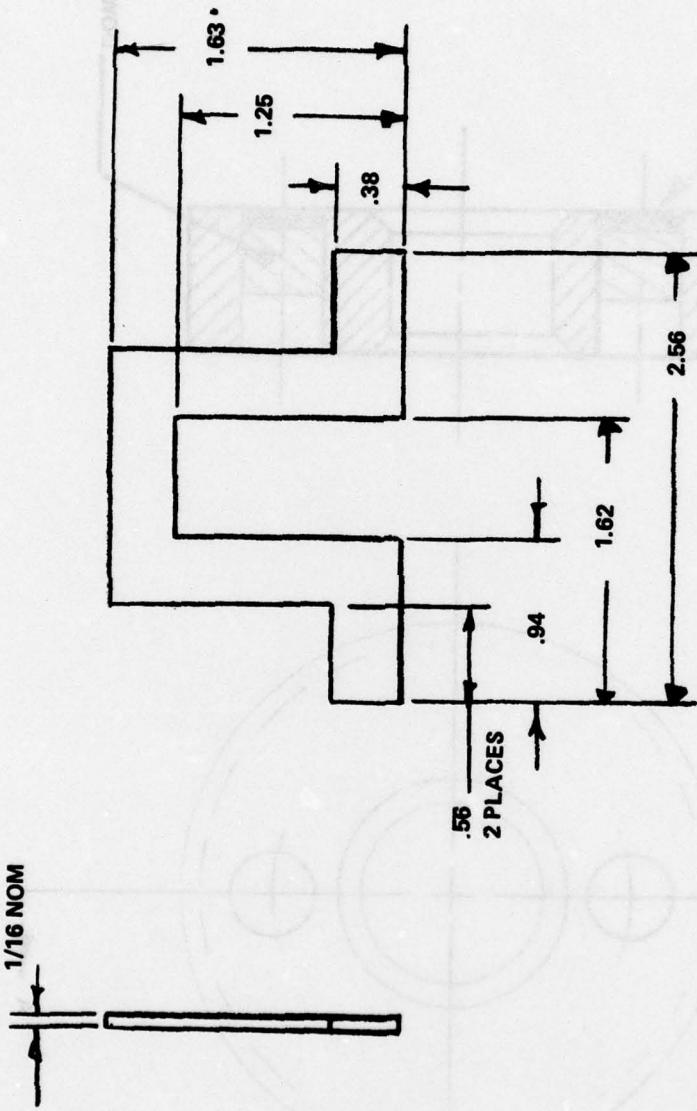

**YOKE**  
13222E0084  
QDHA-3

**Further Recommend:**  
The tolerances are  $\pm .03$ ; change the 2.15  
diameter to 2.18 and move the hole center  
.18 inch to the right.

## 2ND GENERATION

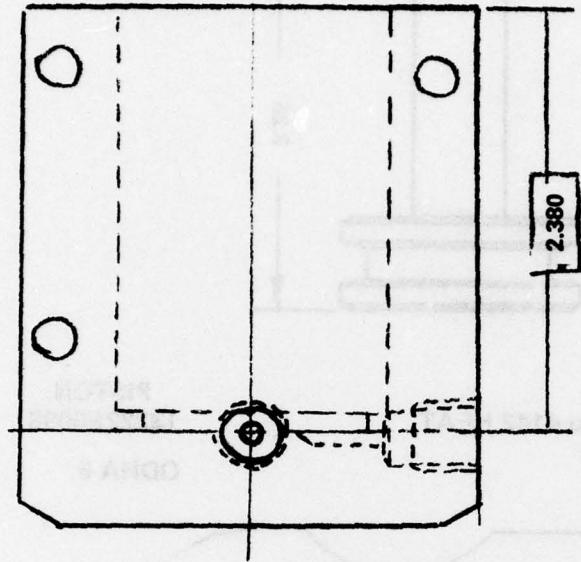

### REBUILD OF QUICK-DISCONNECT HOUSING ASSEMBLY

Two quick-disconnect housing assemblies have been modified as noted below:

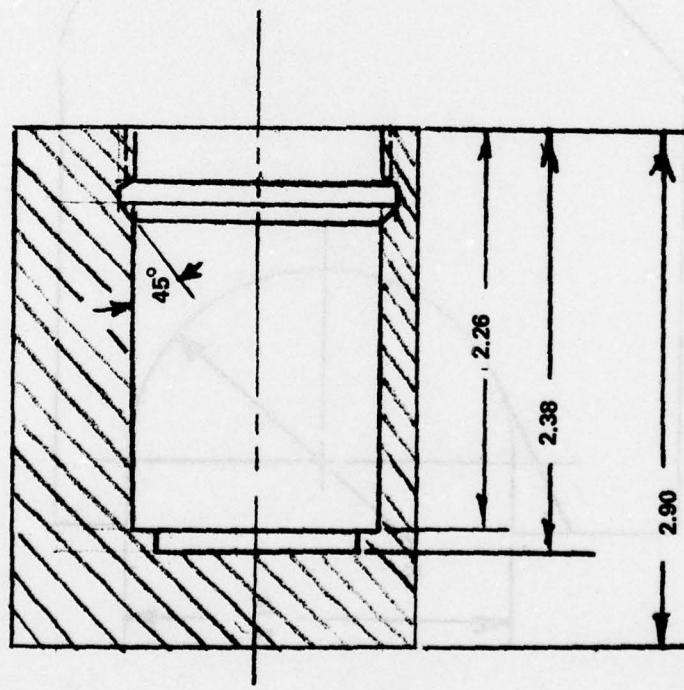

| Part No.                    | Modification  |
|-----------------------------|---|
| RH Assembly                 | LH Assembly   |
| 13222EOO89<br>Housing       | Clean, repaint, and change locator dowel pins to .375<br>$\pm .0002$ X 1.00 long hardened allow steel dowel pins.<br>.0000  |
| 13222EOO79<br>Cover         | Clean, repaint, and modify as shown on the drawing<br>QDHA-1 inclosed with the first generation rebuild<br>package.   |
| 13222EOO96<br>Actuator Assy | Utilized the longer piston and matching cylinder as<br>previously noted and fabricated. New ones were made<br>for each assembly. See QDHA-6 and -7 for changes.<br>New pistons hardened to $R_c$ 38. Note also that chamfer<br>added to this to facilitate assembly without "O" ring<br>damage. |
| 13222EOO85<br>Link          | Modified as shown on drawing QDHA-2 and as done on<br>first generation modification, and heat treated to an $R_c$<br>of 34. Dimensions are as previously noted.   |
| 13222EOO84<br>Yoke          | Modified existing yokes per drawing QDHA-8. However,<br>ends deformed slightly due to previous damage encountered<br>at APG. Heat treated to $R_c$ 42. Actual measurement of gap opening is 2.1814 for both.  |
| 13222EOO83<br>Shaft, Spline | No changes other than straightening of existing part and<br>heat treatment to $R_c$ 48.   |
| 13222EOO82<br>Shaft, Spline | No changes other than straightening of existing part,<br>and heat treatment to $R_c$ 47 to $R_c$ 50.  |
| 13222EOO87<br>Lever         | No changes required.  |

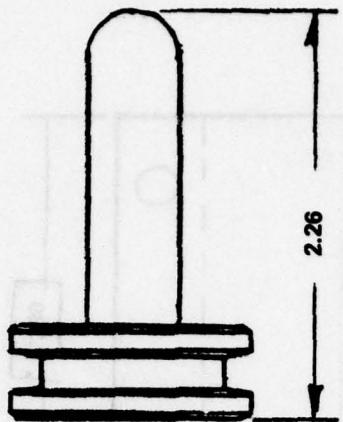

~~NOTE~~ Modification

| Part No.                      | RH Assembly  | LH Assembly   |
|-------------------------------|--|---|
| 13222EOO92<br>Plunger, Spring | The only change was to case-harden the plungers to R <sub>c</sub> 50.  |   |
| 13222EOO76<br>Plate Assy      | No changes other than of locator dowel pins to .188 dia X 1.00 long hardened alloy steel dowel pins.   |   |
| 13222EOO86<br>Pin             | No dimensional change; only a material change to 4340 steel treated to R <sub>c</sub> 48/49. In addition to the changes noted above, there were two additional changes made to aid in reducing the accumulation of dirt, water, and rust in the actuator assembly. | <ol style="list-style-type: none"><li>1. The holes in the end cap of the assembly were plugged as noted on drawing QDHA-4 of the first generation mods.</li><li>2. The addition of a gasket between the cover and the actuator assembly as denoted on QDHA-5 of the first generation mod.</li></ol> |

### 3RD GENERATION

#### REBUILD OF QUICK-DISCONNECT HOUSING ASSEMBLY

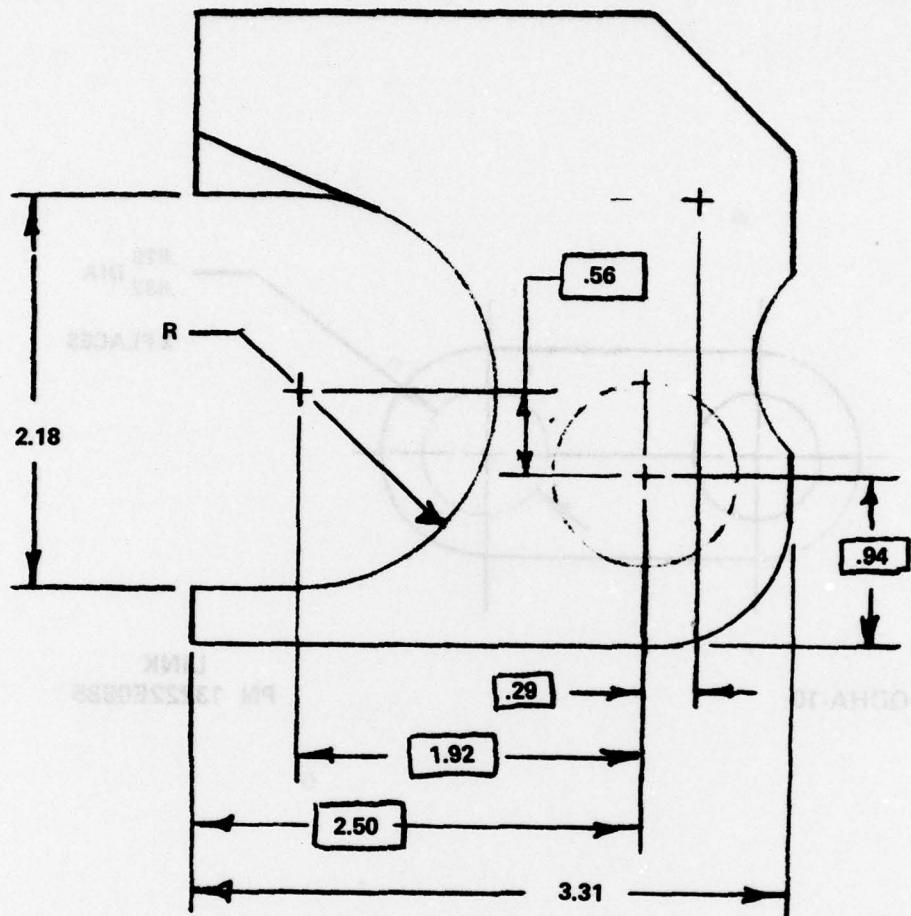

Two quick-disconnect housing assemblies (QDHA) have been modified as noted below:

##### Modification

| Part No.                      | RH Assembly   | LH Assembly |
|-------------------------------|---|-------------|
| 13222EOO89<br>Housing         | Clean, repaint, and change locator dowel pins to .375<br>$\pm .0002$ X 1.000 long hardened alloy steel dowel pins<br>.0000  |             |
| 13222EOO79<br>Cover           | No cover plates available at this time. If they are utilized, they will be as drawing QDHA-1 depicts.   |             |
| 13222EOO96<br>Actuator Assy   | Utilized the longer piston and matching cylinder as previously noted and fabricated for 2nd generation QDHA. Now pistons hardened to $R_c$ .                                  |             |
| 13222EOO85<br>Link            | Modified per drawing QDHA-10 and heat-treated to an $R_c$ of 42 to 44 (design level 35 to 40).  |             |
| 13222EOO84<br>Yoke            | Modified existing yokes per drawing QDHA-9. However, end deformed slightly due to previous damage encountered at APG. Heat-treated to $R_c$ 40 to 42 (design level 35 to 40). |             |
| 13222EOO83<br>Shaft, Spline   | No changes other than straightening of existing part and heat treatment to $R_c$ 43.5 (design level 40 to 45).  |             |
| 13222EOO82<br>Shaft, Spline   | No changes other than straightening of existing part and heat-treating to $R_c$ 42 (design level 40 to 45).   |             |
| 13222EOO87<br>Lever           | No changes other than reheat treating to $R_c$ 42 (design level 35 to 40).  |             |
| 13222EOO92<br>Plunger, Spring | Had to remanufacture both units completely due to no serviceable items. Copy of original. The plunger was case hardened to $R_c$ 63.  |             |

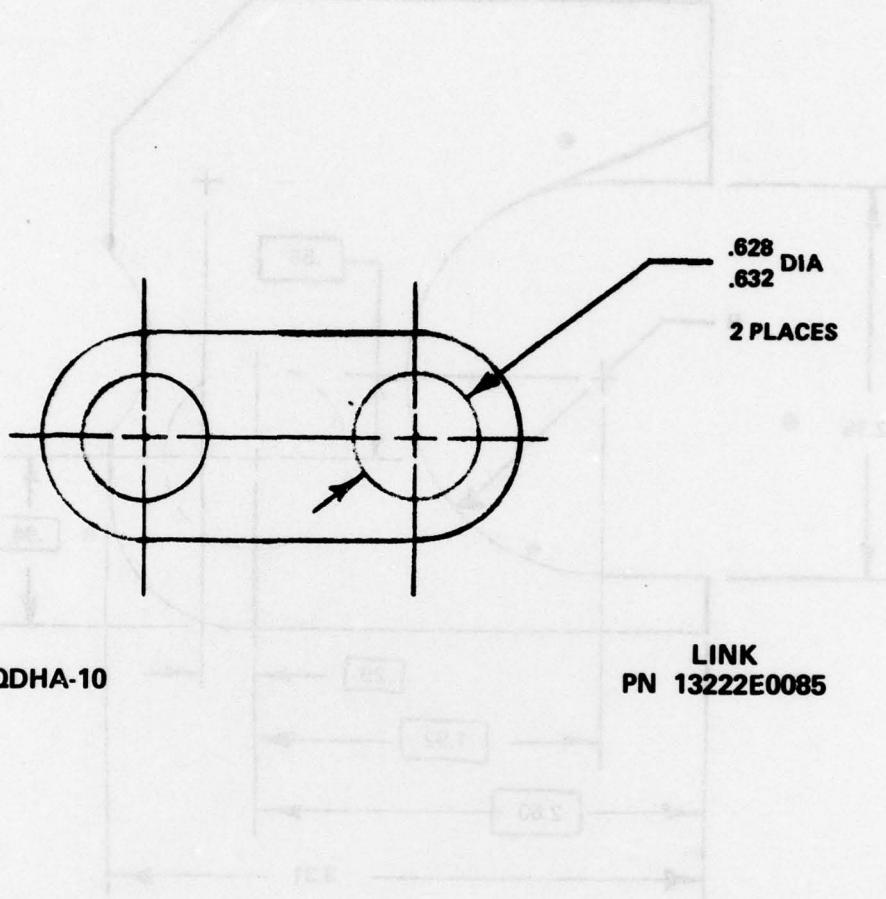

**Modification**

| <b>Part No.</b>          | <b>RH Assembly</b>   | <b>LH Assembly</b>  |
|--------------------------|--|---|
| 13222EOO76<br>Plate Assy | No changes other than of locator dowel pins to .188 dia X 1.00 lg hardened alloy steel dowel pins.                               |   |
| 13222EOO86<br>Pin        | No dimensional change; only a material change to 4340 steel treated to $R_c$ 48/49 (recommend only 40 to 45 on all future pins). |   |
|                          |  | In addition to the changes noted above, one additional change was made to aid in reducing the accumulation of dirt, water, and rust in the actuator assembly. |
|                          |  | The holes in the end cap of the assembly were plugged as noted on drawing QDHA-4 of the first generation model.   |
|                          |  | Had the cover (PN 13222EOO79) been available, it also would have been modified as shown on QDHA-1, and the gasket depicted by QDHA-5 would have been added.   |
